## PARTIAL LIST OF CONTRIBUTORS TO VOLUME XIV

- ALLEN, T. GEORGE**  
Secretary, Haskell Oriental Museum, University of Chicago
- HIEROGLYPHICS**
- ALLRED, B. HARVEY**  
Speaker of the Idaho House of Representatives, 1918
- IDAHO**
- ANDERSON, FREDERICK L., A.B., A.M., B.D.**  
Professor of New Testament Interpretation, Newton Theological Institution, Newton Centre, Mass.
- INCARNATION**
- AYRES, S. G., D.B.**  
Garrett Biblical Institute
- HYMNOLOGY**
- BALDWIN, CHARLES SEARS, Ph.D.**  
Professor of Rhetoric and English Composition, Columbia University
- IDEA OF A UNIVERSITY, THE**
- BARNES, HARRY ELMER, Ph.D.**  
Associate Professor of History, Clark College, Clark University
- HISTORY: ITS RISE AND DEVELOPMENT**
- BELDING, GEORGE R.**  
Secretary Business Men's League
- HOT SPRINGS, ARK.**
- BOTHNE, GISLE, A.B.**  
Professor of Scandinavian Languages and Literature, University of Minnesota
- HOME, THE  
ICELANDIC LANGUAGE  
ICELANDIC LITERATURE**
- BOTSFORD, GEORGE WILLIS, Ph.D.**  
Late Professor of Ancient History, Columbia University
- HISTORY, ANCIENT**
- BREWSTER, WILLIAM T., A.M.**  
Professor of English, Columbia University
- HYPATIA, OR NEW FOES WITH AN OLD FACE**
- BURNHAM, SYLVESTER, D.D., S.T.D.**  
Formerly Dean of the Seminary Faculty, Colgate University
- HIGHER CRITICISM, THE**
- CAIRNS, WILLIAM B., Ph.D.**  
Assistant Professor American Literature, University of Wisconsin
- HOOSIER SCHOOLMASTER, THE  
HOUSE OF THE SEVEN GABLES**
- CALKINS, MARY WHITON, A.B., A.M., LL.D.**  
Professor of Philosophy and Psychology, Wellesley College
- HOBBS, THOMAS**
- CALLAHAN, JAMES M., Ph.D.**  
Professor of History and Political Science, West Virginia University
- HAWAIIAN ISLANDS, DIPLOMATIC  
RELATIONS OF THE UNITED  
STATES WITH**
- CANFIELD, ARTHUR G., A.M.**  
Professor of Romance Languages, University of Michigan
- HEPTAMERON, THE**
- CARVER, THOMAS N., Ph.D., LL.D.**  
Professor of Political Economy, Harvard University
- INCOME**
- CHAMBERLAIN, CHARLES J., Ph.D.**  
Professor of Morphology and Cytology, University of Chicago
- HYBRIDS IN PLANTS**
- CHANDLER, FRANK W., Ph.D.**  
Professor of English and Comparative Literature, University of Cincinnati
- HEDDA GABLER**
- COCHRANE, CHARLES H.**  
Author of "Modern Industrial Progress"
- HYDRAULIC  
HYDRO-ELECTRIC DEVELOPMENT**
- COUMBE, CLEMENT W.**  
Technical Art Expert
- HEART IN ART AND SYMBOLISM  
HELMETS AND HELMS  
HORSE IN ART AND SYMBOLISM**
- CREIGHTON, JAMES E., Ph.D., LL.D.**  
Professor of Logic and Metaphysics, Cornell University
- IDEALISM**
- CROSS, WILBUR L., Ph.D.**  
Professor of English, Yale University
- HUMPHRY CLINKER**
- CUTLER, FRANCES W., M.A.**  
Instructor in English, Vassar College
- HYPERION**
- DARTON, NELSON H.**  
Geologist, United States Geological Survey
- HYDROLOGY**
- DEBEL, N. H.**  
Professor of Economics, Goucher College
- ILLINOIS, STATE OF**
- DE GARMO, CHARLES, Ph.D.**  
Emeritus Professor of Education, Cornell University; Author of "Herbart and the Herbartians"
- HERBART, JOHANN FRIEDRICH**
- DICKINSON, THOMAS H., Ph.D.**  
Associate Professor of English, University of Wisconsin; Author of "The Temporary Drama of England"
- HEROD**

Contributors to Volume XIV—Continued

**DODGE, CHARLES RICHARD**

Textile Fibre Expert

HEMP

**DOLSON, GRACE NEAL, Ph.D.**

Professor of Philosophy, Wells College

HEDONISM

**DRUM, WALTER, S.J., A.B.**

Professor of Scripture, Woodstock College, Maryland

IGNATIUS OF ANTIOCH  
IMMACULATE CONCEPTION  
INDEX LIBRORUM PROHIBITORUM

**DUDLEY, PEMBERTON, M.D., LL.D.**

Late Dean of Hahnemann Medical College and Hospital of Philadelphia.

**COPELAND, ROYAL S., M.D.**

Dean New York Homœopathic Medical College and Flower Hospital

HOMŒOPATHY

**DUNN, WALDO H., Litt.D.**

Professor of English Languages and Literature, The College of Wooster

HERBERT, EDWARD, LORD HERBERT  
OF CHERBURY, AUTOBIOGRAPHY  
OF

**EISERHARDT, EWALD, Ph.D.**

Professor of German, University of Rochester

IMMENSEE

**ERSKINE, JOHN, Ph.D.**

Professor of English, Columbia University

HERBERT, GEORGE  
HERRICK, ROBERT

**ESTES, DAVID FOSTER, D.D.**

Professor of New Testament Interpretation, Colgate University

HBBREWS, EPISTLE TO THE

**FARROW, EDWARD S., C.E.**

Major, U. S. A.; Consulting Civil and Military Engineer

HOSPITALS, FIELD  
HYGIENE, MILITARY

**FINEGAN, THOMAS A., M.A., LL.D.**

Deputy Commissioner of Education and Assistant Commissioner for Elementary Education, The State Department of Education, Albany, N. Y.

HEALTH EDUCATION

**FOWLER, HENRY THATCHER, Ph.D.**

Professor of Biblical Literature and History, Brown University

HOSEA, BOOK OF

**GALLOWAY, BEVERLY T., B.Agr.Sc., LL.D.**

United States Department of Agriculture, Washington, D. C.

**H**AWAII, hā-wī'ē, a Territory of the United States; geographically, the HAWAIIAN (formerly SANDWICH) ISLANDS, the northeasternmost group of the Pacific, lying near the northern edge of the tropics (lat. 18° 54' to 22° 15' N.; long. 154° 50' to 160° 30' W.), 2,100 miles southwest of San Francisco. It consists of eight inhabited islands, viz., Hawaii, Maui, Kahoolawe, Lanai, Molokai, Oahu, Kauai and Niihau besides several rocky islets. They extend from Hawaii on the southeast 390 miles to Kauai on the northwest, and are continued in a chain of islets, sand banks and shoals 1,200 miles farther to Midway Island. The total area of the group is 6,454 square miles, of which Hawaii contains nearly two-thirds or 4,015 square miles; the next island, Maui, 728; the third, Oahu (which takes the lead in wealth and population, and contains the capital and chief seaport), 598; and the fourth, Kauai, 547 square miles.

**Topography.**—The islands are entirely volcanic, consisting in fact of the summits of a gigantic submarine mountain chain rising from the bottom of the ocean, which is three miles deep within 30 to 50 miles from the shores. The volcanic action seems to have moved from northwest to southeast, Kauai being the oldest island.

The last but one, Maui, contains the vast extinct crater of Haleakala, which is at its highest point 10,032 feet above sea-level, 20 miles in circumference and 2,000 feet deep; while Hawaii is made up of four volcanic mountains, Mauna Kea (White Mountain), 13,805 feet high, the loftiest peak in the Pacific; Mauna Loa (Long Mountain), 12,675 feet; Hualalai, 8,273 feet; and Kohala, 5,490 feet high. Of these Hualalai has been dormant since 1801, but Mauna Loa is still active at intervals, having an oval summit crater, 9.5 miles in circumference, with nearly vertical inner walls 500 to 600 feet high. Twenty miles to the southwest is the famous crater of Kilauea, eight miles in circumference and 4,000 feet above the sea. It is almost constantly in action.

The windward sides of Oahu and Molokai, and the northwest side of Kauai, present precipices 2,000 feet in height, while the northeast slopes of Hawaii and Maui end in bluffs several hundred feet high, furrowed by deep and narrow canyons cut by the streams. "In West Maui and Kauai may be found valleys that almost rival Yosemite" (Dutton). Coral reefs

line the greater part of the shores of Kauai, Oahu and the southern shore of Molokai, but are nearly absent from Hawaii and Maui.

The best harbors are found in Oahu at Honolulu, and at Pearl Harbor, seven miles west, but Hilo Bay, Hawaii, only needs a breakwater to make a commodious harbor. The only rivers worthy of the name are found in the island of Kauai. Several of them were formerly crossed by ferries.

**Climate and Rainfall.**—The climate of the islands is much cooler than that of other countries in the same latitude. This is due not only to the northeast trade winds, which blow 9 or 10 months in the year, but also to the return ocean current from the region of Bering Straits. At sea-level the mean temperature is 73° F., the maximum and minimum being 89° and 52°, respectively. The islands are entirely exempt from the cyclones which so often make havoc in the central and western Pacific. The contrast in climate between the windward and leeward sides of each island is very striking, the northwest slopes being rainy and heavily wooded, while the opposite coast has a warm and dry climate. From the differing elevations and exposures there is an extraordinary variety in the rainfall even within narrow limits. Thus the annual rainfall in the district of Hilo, Hawaii, averaged 136 inches in 20 years, from 1880 to 1900, while in Honolulu it averaged 30.9 inches, and at Luakaha, in the valley back of Honolulu, 128.9 inches.

**Production and Industries.**—The Hawaiian Islands, from the lack of coal and metals, are an agricultural country. There are, however, according to recent statistics, 500 industrial establishments in the Territory, employing a total of 7,572 persons.

The soil of the islands in general is poor, with the exception of the valleys and some of the coast plains, which are of limited extent. The greater part of the interior consists of rugged, barren mountain sides, extensive tracts covered with lava, and forest land, which needs to be protected for the preservation of the water supply. Extensive tracts of formerly barren land, however, have been made productive by irrigation and the use of fertilizers. On Oahu there are over 200 artesian wells, yielding daily from 250,000,000 to 300,000,000 gallons, and on some plantations pumps are employed which raise over 10,000,000 gallons of water a day, and in some places to an elevation of 350 feet.

In Kauai electricity generated by water-power in the Wainiha Valley is carried 30 miles by wire to run the pumps of the McBryde plantation. Extensive aqueducts have been made in western Kauai, Maui and northern Hawaii, consisting largely of tunnels driven generally through solid rock. Numerous reservoirs have also been formed by damming the canyons. The Planters' Association employs a large staff of experts in chemistry, entomology and scientific agriculture, with the result that the yield of sugar per acre is the highest in the world. The average annual yield is four and one-half tons per acre, but the average for irrigated plantations is six tons to the acre. The total crop for 1914 was over 617,038 tons. Only Java and Cuba have a greater gross product. The power for the sugar mills is obtained entirely from burning the bagasse or cane refuse. The sugar is so completely extracted from the juice that no molasses is made, the remainder being thrown into fertilizers. The total number of employees on the sugar plantations in 1910 amounted to 44,048, including Japanese, 28,832; Koreans, 1,787; Chinese, 2,861; Portuguese, 3,752; Filipinos, 2,096; Hawaiians, 1,139; Porto Ricans, 1,941; Russians, 103; Spanish, 579; Americans, 614; others, 344.

The first importation of Chinese took place in 1852. In 1878 their number had risen to 5,916, and in 1886 to 21,000, at which time a strict exclusion act was passed. In 1878 the first Portuguese immigrants arrived from the Azores, and during the next 10 years about 7,000 of these people came to the islands, where they have given great satisfaction as industrious and law-abiding citizens. In 1886 a labor convention was concluded with Japan and a stream of immigrants set in, which increased the number of Japanese in the islands from 116 in 1884, to 24,400 in 1886, and 61,111 in 1900. Porto Ricans were imported in 1901 to the number of about 2,500. Both as laborers and as citizens they have proved to be very unsatisfactory. Beginning with the year 1903, up to 31 Dec. 1905, about 7,000 Koreans arrived in the Territory, who have done well as laborers. In the spring of 1907 several thousand immigrants were imported from Spain and the Azores, with the understanding that they should be given small freeholds of their own by the planters.

The danger of depending upon a single crop has long been recognized, and persistent efforts have been made to develop minor industries. The culture of rice was commenced in 1860, and it soon became the second crop in importance, amounting to about 15,000 tons annually of cleaned rice, most of which is consumed in the Territory. The quality of Hawaiian coffee is equal to that of Mocha, but the industry is depressed by the competition of Brazilian and Central American low-grade coffees. The crop in 1910 amounted to about 2,000 tons. The amount exported in 1910 was valued at \$330,228. The pineapple canneries in 1909 had an output of 510,000 cases of two dozen cans each. There are several sisal plantations, and two promising rubber plantations. Experiments with tobacco have been successful. The castor oil bean grows wild, but the manufacture of the oil has not yet been profitable. Nearly all the fruits of the tropical and some of the temperate zone grow well in the islands, and the total export

in 1910 of fruit and nuts, not canned, was valued at \$1,794,001. The native staff of life is the taro root, or Colocasia, reduced to a paste called poi. There are about 20 stock and sheep ranches, which exported \$56,425 worth of wool in 1910. The export of honey and wax amounts to about \$40,000 a year.

**Commerce.**—The total exports in the year ended 30 June 1915 were valued at \$62,368,356, of which amount \$62,306,507 must be credited to shipments to the United States. Imports were valued at \$26,064,855 (\$22,772,632 from the United States). In 1915, vessels numbering 456, of 1,605,925 tons entered, and 436 of 1,574,845 tons cleared at the ports of the islands.

**Transportation.**—For steamship lines see article on HONOLULU. There are 20 steamers and as many schooners engaged in the inter-island trade. There are about 307 miles of railroads on the islands, the principal line being on Oahu, and others on Maui and Hawaii. The principal islands are connected by wireless telegraph, each island being encircled by telephone lines. The trans-Pacific submarine cable laid in 1903 connects the islands with both continents.

**Finances.**—The bonded debt assumed by the United States on annexation was \$4,000,000, leaving \$951,000 to be paid by the Territory of Hawaii. The debt of the Territory had increased by 30 June 1910 to \$4,079,000. On 1 July 1915 it amounted to \$7,873,000. The assessed valuation of taxable property had increased by 1 Jan. 1910 to \$150,268,467. In 1915 it was \$176,601,222. The taxes are 1 per cent on property and 2 per cent on incomes above \$1,000 a year. For the year ended 30 June 1915 the receipts of the government were \$2,796,146 and its disbursements \$2,747,270.

**Education.**—There is a good free-school system, graded, with compulsory attendance from 6 to 15, with an excellent normal training school, besides industrial and high schools. The school law requires that the English language shall be the basis and medium of instruction in all schools.

The department is administered by a superintendent and six commissioners, aided by three traveling inspectors.

In 1915 there were 170 public schools with 735 teachers and 28,827 pupils; 46 private schools with 314 teachers and 7,702 pupils.

The total cost of the government schools was \$841,588 for the year ended 30 June 1915. The private schools are mostly endowed, as Oahu College and the Kamehameha Schools, founded by the late Mrs. Bernice Bishop; or managed by missionary boards or religious orders, as Saint Louis College.

**Charitable Institutions.**—Among these may be mentioned the Lunalilo Home for aged and indigent Hawaiians, the Asylum for the Insane, the numerous hospitals, eight of which are under the Board of Health, but the most important is the leper settlement established in 1866 on a peninsula of Molokai, shut off from the rest of the island by a precipice 2,000 feet in height. The number of lepers has decreased from 1,200 to 652. The territorial government provides them comfortable homes, food, clothing and medical attendance free of cost, aided by the devoted Franciscan Sisters and the Brothers of the Sacred Heart.

**HAWAII.**

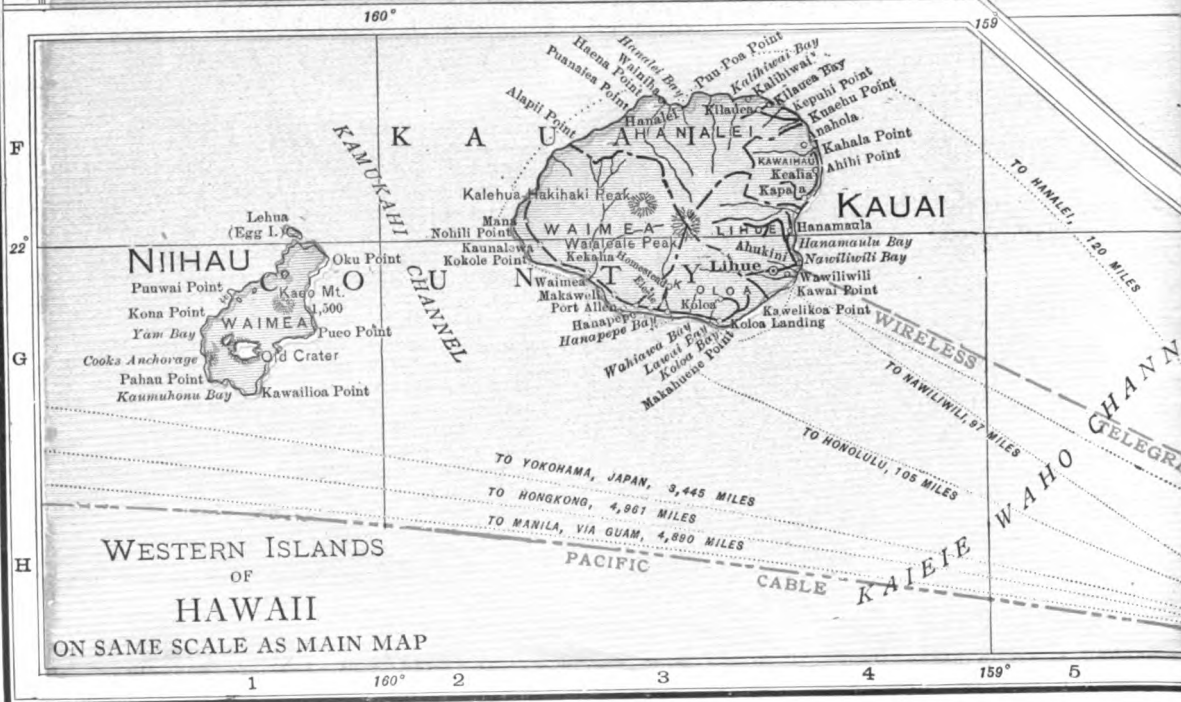

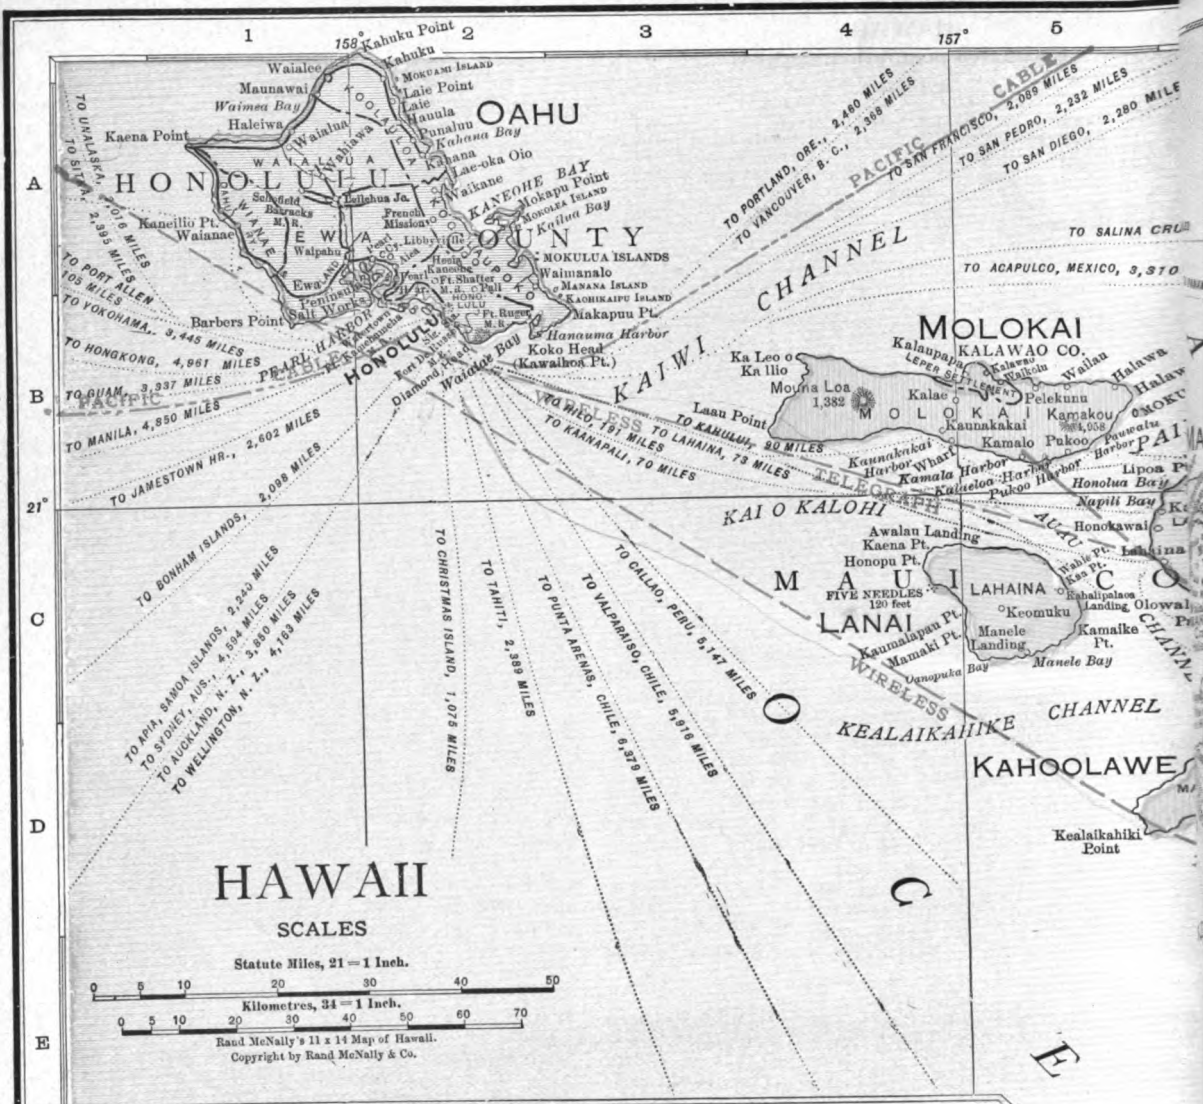

**Estimated population, 215,741**

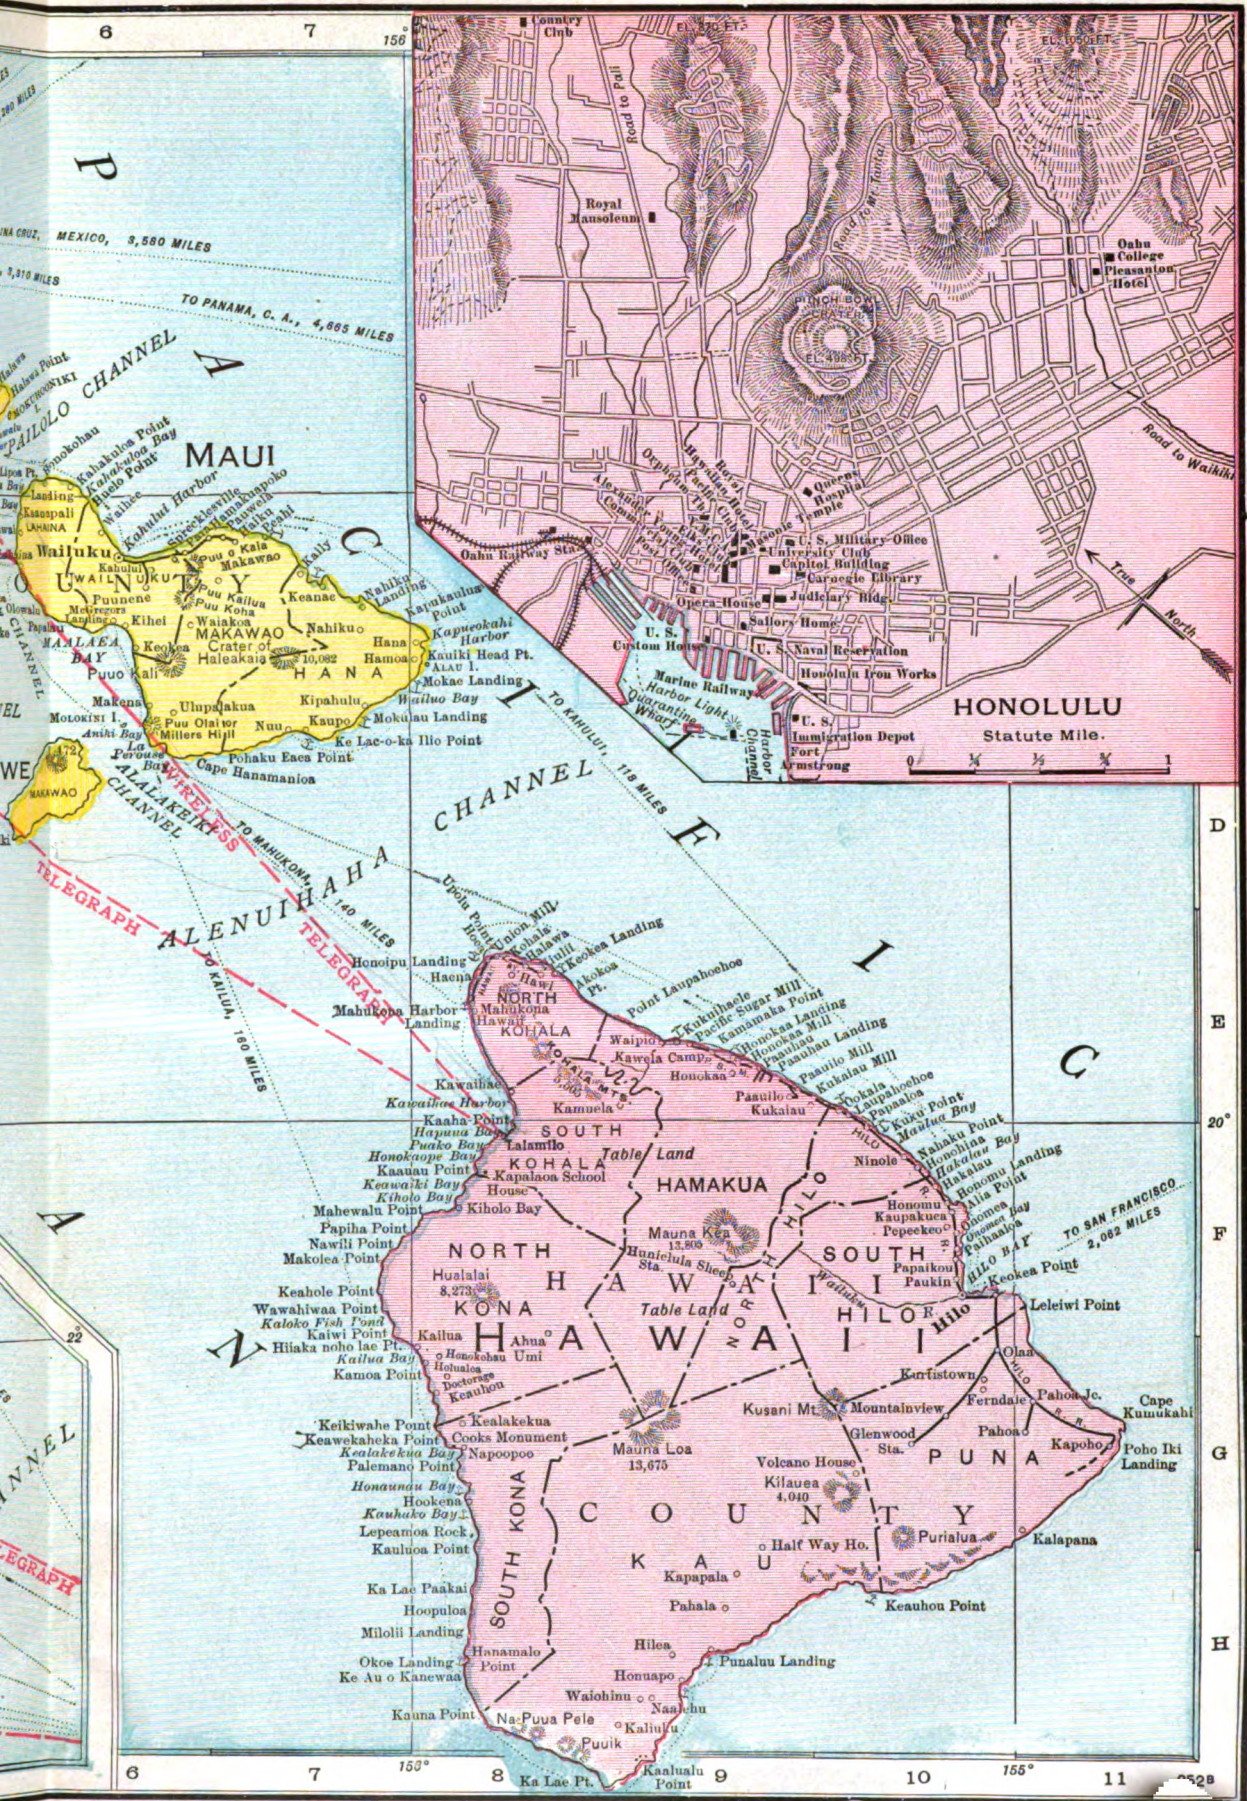

**ISLANDS**

**Population.**—The census of 1910 divides the population as follows: Hawaiians, 26,099; Part-Hawaiians, 12,485; Portuguese, 22,294; Americans and other Caucasians, 14,684; Chinese, 21,698; Japanese, 79,663; other foreigners (Spanish, Filipinos, etc.), 14,986; total, 191,909. Of the islands, Hawaii had 55,382; Oahu (including Honolulu, about 50,000), 82,028; Kauai and Niihau, 23,952; Kahoolawe, Lanai, Maui and Molokai, 29,762. Estimated population on 1 July 1915, 322,856.

**Government.**—The new territorial government was inaugurated at Honolulu 14 June 1900, and the first territorial legislature began its sessions at Honolulu 20 Feb. 1901. The legislature is composed of two houses—the senate of 15 members, holding office four years; and the house of representatives of 30 members, holding office two years. The legislature meets biennially, and sessions are limited to 60 days.

The executive power is lodged in a governor, a secretary, both appointed by the President, and holding office four years, and the following officials appointed by the governor, by and with the consent of the senate of Hawaii: an attorney-general, treasurer, commissioner of public lands, commissioner of agriculture and forestry, superintendent of public works, superintendent of public instruction, auditor and deputy surveyor, high sheriff, and members of the boards of health, public instruction, prison inspectors, etc. They hold office for four years, and must be citizens of Hawaii.

The judiciary of the Territory is composed of the Supreme Court with three judges, the Circuit Court and such inferior courts as the legislature may establish. The judges are appointed by the President of the United States. The Territory is a Federal judicial district, with a district judge, district attorney and marshal, all appointed by the President. The district judge has all the powers of a circuit judge.

The Territory is represented in Congress by a delegate, who is elected biennially by the people.

**History.**—According to documents in the Spanish archives, the islands were discovered in 1555 by Juan Gaetano, who named Hawaii "La Mesa." They were rediscovered by Capt. James Cook in 1778, and named the Sandwich Islands; in 1792 Captain Vancouver visited the islands, and introduced the first cattle and sheep. Kamehameha I, a chief of northern Hawaii, after nine years of war, became master of the whole island in 1791. In 1795 he conquered Maui and Oahu, the decisive battle being fought in Nuuanu Valley back of Honolulu. Having united the group under one strong government, he died 8 May 1819. His son, Kamehameha II, abolished the ancient tabu system in the following September. The first American missionaries arrived at Kailua, Hawaii, 4 April 1820, and met with remarkable success. The first Catholic missionaries arrived 7 July 1827. In the same year the first written laws were printed. The first constitution was proclaimed 8 Oct. 1840. On 25 Feb. 1843, the native government was compelled by Lord Paulet to make a provisional cession to Great Britain, but its independence was restored 31 July of the same year by Admiral Thomas. The feudal tenure of land was abolished in 1848, and a liberal con-

stitution was adopted in 1852. The Kamehameha dynasty ended with the death of Kamehameha V, 11 Dec. 1872. David Kalakaua was elected by the legislature 12 Feb. 1874. In 1876 a reciprocity treaty was ratified with the United States, which assured prosperity to the islands. The king, however, labored to build up a reactionary party, and to restore autocratic government, until he was compelled by the civilized element to sign a revision of the constitution, which limited his powers, in 1887. A Royalist insurrection was put down in 1889. His sister, Liliuokalani, succeeded him in 1891, and in January 1893 undertook to abrogate the constitution, and establish an absolute monarchy. Upon this the constitutional party de-throned her, and established a provisional government. During the following year the republic of Hawaii was organized with S. B. Dole as President. An annexation treaty was negotiated with President Harrison, which was withdrawn by President Cleveland in April 1893, but brought up again on the accession of President McKinley. After long delays, Hawaii was admitted into the Union by a joint resolution passed 7 July 1898. It was finally organized as a Territory 14 June 1900, with S. B. Dole as governor, who was succeeded by Geo. R. Carter 23 Nov. 1903, by Walter F. Frear in 1907 and by L. E. Pinkham in 1913. Consult Blackman, W. F., 'The Making of Hawaii' (New York 1899); Boyce, W. D., 'The Hawaiian Islands,' etc. (Chicago 1914); Dibble, S., 'A History of the Sandwich Islands' (Honolulu 1909); Gerould, K. F., 'Hawaii: Scenes and Impressions'; Goodrich, J. K., 'The Coming Hawaii' (Chicago 1914); United States Statutes: 'Bills and Acts Relating to Hawaii' (Washington 1900).

W. D. ALEXANDER,

*Formerly Surveyor-General Hawaiian Islands.*

**HAWAIIAN ISLANDS, Diplomatic Relations of the United States with.** Immediately following the close of the Revolution, American vessels engaged in the Northwest trade began to stop at the Sandwich Islands, which had been discovered by Captain Cook in 1778. In 1791 Capt. Joseph Ingraham, the mate of the *Columbia*, returning from a trip around the world via Nootka and Canton, brought with him a native Crown Prince Oppe whose visit to New England was the beginning of American friendship with Hawaii. In September of the same year, he re-embarked for the Pacific on the *Hope*, taking with him Oppe who, after aiding in the discovery of the Marquis group, was returned to his own island home. The Sandwich Islands became the principal place of resort for American trading vessels in the Pacific. In 1811, they were visited by John Jacob Astor who was seeking to engage supplies and men to aid in the fur trade on the Northwest coast where he founded Astoria in 1812. In 1814 they were visited by Lieutenant Gamble whom Captain Porter had left in command of Madison Island in the Marquis group after its occupation in the name of the United States in 1813.

In 1820, American influence which was already considerable in the islands was increased by the arrival of missionaries from Boston to begin religious and humanitarian work. At the same time the importance of the islands

## HAWAIIAN ISLANDS

was recognized by the American government in the appointment (by President Monroe) of John C. Jones as agent there for commerce and seamen.

By 1825 the American government, as a result of steadily increasing American interest, recognized the need of the occasional presence of a public force at the islands to prevent desertions, mutinies and other difficulties, and began to send naval vessels which had already been doing Pacific duty along the west coast of South America during the period of the Spanish-American revolts. In 1826, Capt. Thomas Catsby Jones, ordered to the Hawaiian Islands to protect commerce, to relieve the islands of seamen who had improperly deserted from whalers, to arrange to prevent future desertions and to secure debts due American citizens, negotiated a treaty by which the king agreed to permit trade, to aid wrecked vessels, to assist in preventing desertions, and in time of war to protect American ships and citizens in the islands against all enemies. This treaty, though never ratified, was observed as a tacit understanding. Unfortunately, however, trade relations and other conditions were still unsatisfactory, possibly partly as a result of the disagreement between foreign merchants and the missionaries. Captain Finch, who was sent in the United States ship *Vincennes* in 1829 to improve relations in the Pacific, saw at Oahu many indications of irregularities in commerce, severity to crews and bad effects of desertion. While assuring the king that the United States desired to preserve his sovereign right and to send war vessels for protection only where native governments failed to protect, he advised him to prevent secretion of deserters, to liquidate his debts, to retire from competition in the tavern business, to learn English and to spend his time more usefully. At the same time Consul Jones, referring to the growing importance of the islands, and to the increasing American trade, recommended semi-annual visits of American war vessels to reduce desertions and mutinies and to punish the guilty.

Other sources of dispute arose, including the refusal of the king to allow foreigners to transfer real estate. On these subjects Commodore E. P. Kennedy of the United States ship *Peacock* opened negotiations in 1836 but failed to obtain an agreement.

In 1832, J. N. Reynolds, who sailed with the Potomac punitive expedition to the coast of Sumatra and returned via Oahu, reported that crews of whalers, after attempts at mutiny or desertion, became outlaws on the shore, and as a means of controlling the causes of disorder, he recommended in addition to regular visits of war vessels an increase in the number of consuls. In 1834, he and J. Q. Adams also revived and stimulated the project for explorations in the Pacific, proposed for the South Seas as early as 1812 and finally realized in the Wilkes expedition of 1839-43 which stopped twice at Hawaii.

Meantime through the introduction of French Catholic priests in 1826, and their reintroduction in 1839, after banishment in 1831, French influence had increased. In 1842, induced by the arrival of a French vessel with new demands, the king invited the United States, England and France to negotiate new treaties for the guarantee of the independence

and neutrality of the island. The American government, seeking no exclusive control or advantage, and desiring only that American rights should be respected and guarded, and also opposing interference by foreign powers, advised the Hawaiian commissioners to begin the diplomatic negotiations in England. In 1843, coincident with American renewal of negotiations for acquisition of Mexican territory reaching to the Pacific, occupation of the islands by a British naval commander (promptly disavowed by the English government) induced the American government to contemplate interference to prevent the conquest of Hawaii by a great European power, and to submit a calm expression of disapproval which doubtless influenced England and France to recognize Hawaiian independence and later to enter into a joint declaration (1845) agreeing never to take possession even under a protectorate.

Feeling the need of closer relations, the American government also began the appointment of diplomatic officials; and in December 1849, doubtless influenced by the acquisition of California, concluded a treaty of friendship, commerce, navigation and extradition.

Meantime French and English as well as American diplomatic relations had been unsatisfactory. After a French naval vessel resorted to force in 1849 to support the demands of the French consul for reparation (an action later disavowed by the French government), Secretary Clayton notified France that the United States, because of its relations with the islands, could never with indifference allow them to pass under the dominion or exclusive control of any other power.

In 1851, when the Hawaiian government, apprehensive of French designs, adopted a provisional cession of the islands to the United States, the American government through Secretary Webster declined to accept annexation, still advocating independence—at least until some pressing necessity might give the subject a new aspect or increased importance. However, it instructed the Navy Department to keep the Pacific armament in a position requisite for the safety of the Hawaiian government. Suggestions of annexation met with more favor two years later. In September 1853, Secretary Marcy issued official instructions that the United States would not allow other powers to exact special privileges or to establish a protectorate over the island. Later in the same year, while hoping to obtain Lower California by negotiations and stating that conditions in the islands and their connection with American industries in which American interests were paramount made American control appear inevitable, he sounded the French government on its policy or views in regard to the matter. In 1854, he authorized, in case of emergency, negotiations for a complete transfer of the islands to the United States as a territorial possession; and the Hawaiian king, in the face of warnings from the British and French consuls, agreed to a draft treaty providing for admission of the islands as a State of the American Union, but died while negotiations for the final execution of the treaty were still pending.

American influence, kept alive through the channels of industry, was especially increased by

interest in the rise of the sugar industry which at the close of the Civil War became the basis of agitation for a treaty of reciprocity. In 1867, such a treaty, more liberal than that of 1855, and regarded as a means of making American influence dominant, and also in line with the policy of future annexation, was negotiated by written invitation of the Hawaiian government but after delayed action was rejected by the American Senate in June 1870.

Meantime, in July 1867, Secretary Seward, indicating that lawful peaceful annexation was more desirable than reciprocity, had authorized the American Minister to sound the Hawaiian government on the subject and confidentially to receive overtures; but in 1868, seeing the American mind absorbed with domestic questions, he prudently avoided giving further encouragement to Hawaiian-American annexation. In 1871, and in 1873, the American government was again asked to accept the opportunity to annex the islands, and in 1873 Secretary Fish authorized inquiries as to the views of the Hawaiian government concerning the policy and conditions of annexation.

In 1875, to meet the wishes of the California sugar interests, the American government negotiated a favorable reciprocity treaty which granted to the United States certain exclusive privileges. The principle of this treaty, representing a policy of commercial assimilation and virtually establishing an American protectorate, was renewed in 1884 by a treaty (ratified in 1887) giving the United States exclusive right to enter Pearl Harbor and to establish a coaling station there. Secretary Bayard declined the British proposal for a tripartite Anglo-American-German guarantee of the neutrality of the islands.

After various disturbances and apprehended crises, resulting in an increasing annexation sentiment, in 1893 following the deposition of Queen Liliuokalani, a newly-established provisional government, aided by the American minister, applied for annexation, and its commissioners negotiated at Washington a treaty of annexation which was submitted to the Senate by President Harrison but later withdrawn by President Cleveland pending an investigation of the Hawaiian situation.

The refusal of the Cleveland administration to accept the results of the revolution of 1893 only delayed the inevitable incorporation of Hawaii, which had been rendered more necessary by the recent occupation of other islands of the Pacific by Germany and other European powers. The new mid-ocean republic of 1894 favored annexation, and in 1897 negotiated a treaty of annexation which was pending in the Senate at the beginning of the Spanish-American War. Soon thereafter, friends of annexation introduced a joint resolution of annexation, which passed both houses by large majorities and was signed 7 July 1898, vesting the government in the President until Congress should pass suitable legislation. Formal cession was made on 12 Aug. 1898. An act of 30 April 1900 fully organized the Territory and extended provisions of the Constitution and laws of the United States and conferred American citizenship upon all citizens, including Chinese born or naturalized in the island.

Islands, 1820-93' (Sen. Exec. Doc. 1893); Callahan, J. M., 'America in the Pacific and the Far East' (1901); Foster, J. W., 'American Diplomacy in the Orient' (1903); Moore, J. B., 'Digest of International Law' (1906).

JAMES M. CALLAHAN,  
*Professor of History and Political Science,  
University of West Virginia.*

**HAWES' SHOP, Cavalry Engagement Near.** General Grant had crossed to the south bank of the North Anna, in Virginia, and finding General Lee too strongly posted to be attacked, and his own army in a false and critical position, he withdrew, on the night of 26 May 1864, to the north bank, and moved down the north bank of the Pamunkey to turn Lee's right. Torbert's and Gregg's divisions of cavalry, under Sheridan, together with the Sixth corps led the advance. Torbert crossed the Pamunkey at Hanover Ferry on the 27th, after considerable skirmishing in which he took about 60 prisoners, and the two cavalry divisions, supported by Russell's division of infantry, pushed on to Hanover Town and bivouacked for the night. On the morning of the 28th Sheridan was directed to make a demonstration and discover the enemy's position. Gregg's division, advancing on the Mechanicsville road, encountered the two cavalry divisions of Wade Hampton and Fitzhugh Lee and Butler's South Carolina cavalry brigade about a mile beyond Hawes' Shop. The Confederate cavalry was dismounted and had thrown up a barricade of rails covering the road. Gregg attacked, and there ensued one of the most severe cavalry engagements of the war, which continued several hours, neither side yielding ground. Finally late in the day, Custer's brigade of Torbert's division came up, dismounted, took position in the centre of Gregg's line, formed in close column of attack, the whole line charged and, after a hard struggle at close quarters, the Confederates were driven from the position and retreated upon their infantry at the Totopotomoy. Gregg's loss was 256 killed and wounded; the entire Union loss was 44 killed and 306 wounded. The Confederate loss is not known. Consult 'Official Records' (Vol. XXXVI); Humphreys, 'The Virginian Campaign of 1864-65'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. IV).

**HAWESVILLE, hāz'vīl, Ky.,** city, county-seat of Hancock County, on the Ohio River, and on the Louisville, Henderson and Saint Louis Railroad, about 65 miles above Evansville, Ind., and 80 miles west by south from Louisville. It is situated in an agricultural and coal-mining region. Its chief manufactures are flour, lumber, hubs and furniture. It has a number of tobacco factories or stemmeries, and its trade is chiefly in tobacco, coal, articles of home manufacture and agricultural products. Pop. 1,002.

**HAWFINCH,** one of the largest of European finches (*Coccothraustes vulgaris*), so called in England from the belief that it subsisted principally on the fruit of the hawthorn. It resembles the chaffinch in color, but is distinguished by its enormous beak and larger size. It feeds on all kinds of berries.

**HAWK**, any diurnal bird of prey not an eagle or a vulture. As the general characteristics of this group have been given under **FALCONIDÆ**, and the use of falcons in sport under **FALCONRY**, the general term "hawk" will be treated from the point of view of economic relations. Hawks are found in all parts of the world and number about 450 species. All are of moderate size, and some Old World species are no larger than a robin. All seek their prey by daylight and are endowed with great swiftness of flight, immense clutching power in their talons, hooked and toothed beaks adapted to cutting and tearing flesh and remarkable keenness of vision. (See **EYESIGHT OF ANIMALS**). All are exclusively carnivorous and rarely taste anything they have not themselves killed. Hawks show great boldness in attacking quarry, seeking it as a rule by patiently watching from an elevated perch until a prospective victim appears, then pouncing on it; but some search for food in suitable places, flying to and fro in the hope of catching sight of a moving animal, or of scaring one from its hiding-place. When it has been caught by a rapid swoop it is borne away in the talons to be eaten at leisure, or carried to the nestlings.

Most hawks are dressed plainly in browns and whites, with darker markings, although some have bright feathers in their plumage, but none has in either sex ornamental crests or plumes. The sexes always differ in size, the female being the larger, often conspicuously so; and the plumage of the young varies much from that of the adults. They nest in forest trees, on rock-ledges or on the ground, and usually lay four or five whitish eggs, heavily blotched with brown, red and lavender. A few, as, for example, the duck-hawk (peregrine), and the fish-hawk (q.v.) (osprey), repair and use the same nest many years in succession, but most species get a new mate and make a new nest every season. The voice of most hawks consists of loud screams, and none sings in any proper sense of the word. Hawks, as a rule, are solitary birds, but in the annual migrations (which affect most species) they sometimes travel in considerable flocks. Few are tameable, yet the osprey and the sparrow-hawk are inclined to accept artificial nesting accommodations near houses when made welcome.

North America has hawks of all kinds, including about 34 species north of Mexico, representing the families *Falconidæ*, *Buteonidæ* and *Pandionidæ*. Taking these in systematic order and passing by the southern kites elsewhere described (see **KITE**), we come to the three species that may properly be termed "hen-hawks," since to these three alone may commonly be attributed the loss of poultry suffered on farms and in villages.

**True Hen-Hawks.**—All are small, fierce and powerful, addicted to the capture of birds, wild and tame, although many wild mice and other small mammals, and a few frogs, lizards and insects, are also eaten. The first of them is the sharpshin (*Accipiter velox*), a summer resident of all North and Central America, and retiring in winter only to the Southern States. It is known as bird-hawk, chicken-hawk, bullet-hawk and sparrow-hawk. Birds constitute nine-tenths of its fare, speaking generally; and it is able to strike down and carry off fully-grown chickens, quails or grouse, as well as small

birds, whose only safety is to make a quick dive into some thick bush. The sharpshin may be known by its small size (length 11 to 13.5 inches, wing-spread about 15 inches); long tail, square at the end; slender legs and feet and very long toes. In color it is uniformly bluish-gray or slate-colored, dark on the crown; under parts white, heavily barred with reddish-brown, except the throat, which is narrowly streaked; wing-quills blackish; tail with five blackish crossbars and narrowly tipped with white; feet yellow. Immature young, brownish above, streaked white below.

Cooper's hawk, or the blue darter (*Accipiter cooperi*), is closely similar in color and proportions, but is nearly a third larger, has stouter feet, and the tail is rounded, not square, at the end, and is indistinctly barred. This species does not go far north, but from southern Canada southward is one of the most abundant of American hawks, and like the sharpshin it retreats in winter only from the more northern border of its range. It is known to farmers and sportsmen as chicken-hawk, quail-hawk, swift-hawk and darter.

The third bird-killer is the goshawk (*Astur atricapillus*), which inhabits Canada and northern Europe, where it has always been one of the favorites of falconers. It is much larger than the others, measuring 22 to 24 inches from bill-tip to tail-end; and when adult is bluish above, crown darker, has a broad whitish stripe over the eye, the whole under surface finely marked with gray and white, and the long tail crossed by four narrow dark-brown bars. Immature young are dusky brown, mottled with reddish and buff. This bold northern marauder is variously called blue hen-hawk, blue darter, dove-hawk, etc., but it is rarely seen in the United States except in midwinter.

The three falcons described above are the true "hen-hawks" and are unprotected by law. They, and they alone, are responsible for virtually all the loss of poultry and game-birds. The description of the methods of the sharpshin given by W. B. Barrows in his admirable "Birds of Michigan" (Lansing 1912) will answer for those of the others:

This is the common "chicken-hawk" of the farmers, and probably is responsible for most of the loss of small chickens. The bird has a habit of dashing suddenly among the poultry, picking up a small chicken in its claws, and carrying it away so quickly that it is commonly impossible to kill the robber. It is very likely to return the same day or the next, and to repeat its visits indefinitely until killed. Unlike the buzzard-hawks, the Cooper's and sharpshin seldom wheel aloft on the lookout for food, but fly swiftly and silently from place to place, flapping the wings rapidly for a few seconds and then gliding noiselessly, always alert and watchful, and ever ready to drop like an arrow on some unsuspecting victim.

Two other small falcons, the pigeon-hawk and the sparrow-hawk, catch small birds when their young are in the nest, and need tender food, but the former is so uncommon, and the latter so little addicted to chicken-stealing, that they need not be feared. Both live principally on insects and mice, the beautiful little sparrow-hawk being particularly helpful by its constant pursuit of grasshoppers and crickets. The duck-hawk, or peregrine, is an enemy to game-birds and waterfowl, but is now rare and extremely shy of humanity.

**Beneficial Hawks.**—The large hawks so often seen in the country sailing above the fields or perched on some tree at the edges of

the woods belong to the genera *Buteo* and *Archibuteo*, and are known as "buzzard-hawks." They do not possess the knightly qualities we admire in the falcons, but unfortunately have constantly to answer for the sins of those dashing gentry. Familiar species in the Eastern States and provinces are the red-tailed, the red-shouldered, the broad-winged and the rough-legged buzzard-hawks. The roughleg, so called because feathered down to the toes, is a northern species, visiting the United States only in winter, when it ranges the fields in search of mice; it is entirely harmless and should be rigidly protected by farmers. Another species deserving of special mention because it is everywhere numerous and a valuable ally of the hard-working agriculturist is the marsh-hawk (*Circus cyaneus*). It is to be seen only in low, open places where, flying slowly and low, and nesting on the ground, it gets great numbers of mice, frogs and grasshoppers, but no birds. No hawk is more harmless or serviceable, especially as a destroyer of field-mice, that worst pest of the farmer, and it should never be killed. It is easily recognized by its low flight, bluish tint and conspicuous white rump.

Most of these big, slow hawks range across the continent in western varieties; and in addition several species belong exclusively to the plains and mountains of the West, while the southwestern border of the United States is entered by several subtropical species, some of which range in summer far up the Californian coast. While indignant and indiscriminating farmers and poultrymen are likely to call all or any of these "hen-hawks," the mischief of which they are guilty in the nesting-season is so small that it is negligible in comparison with the benefit they render all the year round by their destruction of rabbits, ground-squirrels, gophers, field-mice, grasshoppers, crickets and other injurious creatures that cost the farmer and gardener enormous aggregate loss. No poultry will be sacrificed, even to the bold sharpshin and blue darters when it is housed or brush-sheltered and cared for as good poultry ought to be; and it is the height of folly to shoot hawks indiscriminately. Consult Fisher, 'Hawks and Owls of the United States in their Relation to Agriculture' (Washington 1893); Forbush, 'Useful Birds and their Protection' (Boston 1907); Weed and Dearborn, 'Birds in their Relation to Man' (Philadelphia 1903); and general works mentioned under BIRDS.

ERNEST INGERSOLL.

**HAWK-MOTHS**, a family of large moths forming the family *Sphingida*. They have stout bodies, large heads with prominent eyes, and thick spindle-shaped antennæ, ending in a hook. The fore-wings are long, narrow, more or less pointed, and always much longer than the hind-wings. They are insects of rapid flight and dart about in the twilight; some species also during the day. Their caterpillars are hairless, smooth, often green, with transverse stripes on the sides and nearly always a horn on the back of the second last segment, and always have 10 pro-legs. They are leaf-eaters and often greatly destructive to cultivated plants, the tomato-worm being a prominent example. They change to pupæ

either on the surface of the ground or in a cell underground, but make no cocoon. Some of the South American species resemble humming-birds so closely, especially when poisoning before a flower on whirring wings and sucking its nectar, that they can hardly be distinguished, and popular belief asserts that the one is transmutable into the other. A great number of forms exist in all parts of the world, the United States having about 100 species. All are plainly dressed in grays and browns, and one of the most remarkable is the death's-head (q.v.).

**HAWKBIT**, a genus (*Leontodon*) of plants of the family *Cichoriaceæ*, closely related to the dandelion, from which they differ in having feathery pappus. The name is due to the peculiar shape of the lacerations of the leaves. Numerous species are natives of Europe and Asia and a few have become naturalized in eastern North America.

**HAWKE**, Edward, Lord, English sailor; b. London, 1705; d. Sunbury-on-Thames, 17 Oct. 1781. Early in 1720 Hawke entered the navy and was appointed in 1733 to the command of the *Wolf*. Being promoted to the command of a squadron in 1747 he totally defeated the French fleet off Belle Isle. In 1759 he was sent in pursuit of the Brest fleet, which he came up with in Quiberon Bay and signally defeated (20 November). This is regarded as the naval counterpart of the battle of the Plains of Abraham, by which the fate of the New World was decided. He now received a pension of £2,000, and in 1768 became admiral of Great Britain and commander-in-chief of the fleet. From 1766 to 1771 he was First Lord of the Admiralty. In 1776 he was advanced to a seat in the House of Lords by the style of Baron Hawke of Towton. Consult the 'Life' by Burrows; and Mahan, 'Types of Naval Officers' (1901).

**HAWKESBURY**, hawks'ber-I, Canada, village in Prescott County, Ontario, on the Ottawa River, half-way between Montreal and Ottawa, on the Grand Trunk and Canadian Northern railways. It has ferry communication with Grenville, across the river. Its chief industrial establishments are paper and pulp mills, flour mills and large saw and planing mills. The largest sulphite paper mill in the British Empire is located here. It has an extensive lumber trade. Pop. 4,400.

**HAWKING**. See FALCONRY.

**HAWKINS**, Anthony Hope, English novelist, known by the pen-name "ANTHONY HOPE": b. London, 9 Feb. 1863. He was educated at Balliol College, Oxford, was admitted to the bar of the Middle Temple in 1887 and practised until 1894 on the London and Midland circuit. He contested South Bucks as a Liberal in 1892, but unsuccessfully. In 1894 he achieved a striking literary success with his 'Prisoner of Zenda,' the scene of which is laid in an imaginary independent state of South Germany. Other books of his are 'The Dolly Dialogues' (1894), cited as models of keen if somewhat shallow repartee; 'The Chronicles of Count Antonio' (1895); 'Rupert of Hentzau' (1898); 'The Intrusions of Peggy' (1902); 'Double Harness'; 'A Servant of the Public' 'Tales of Two People' (1907); 'The Great Miss

Driver' (1908); 'Second String' (1910); 'Miss Maxon Protests,' 'A Young Man's Year' (1915).

**HAWKINS, Hamilton Smith**, American military officer: b. South Carolina, 1834; d. Glen Springs, N. Y., 28 March 1910. He was graduated at the United States Military Academy in 1855. He entered the army in 1861, was made captain in the Sixth Infantry in 1863 and brevetted major in October 1865. In 1888 he became commandant at West Point, and in 1894 was promoted colonel. When war was declared against Spain he went to the front as a brigadier-general of volunteers. He led the charge at San Juan, Cuba, 2 July 1898 and was made major-general of volunteers 8 July 1898 and later was made brigadier-general. He was retired 1904.

**HAWKINSVILLE**, Ga., village, county-seat of Pulaski County on the Ocmulgee River, at the head of navigation, and on the Southern, the Hawkinsville and Florida Southern and other railroads, about 48 miles south of Macon. It is situated in a fertile agricultural region. It has a cotton factory, cotton compresses, cotton gins, cottonseed-oil mills, barrel factories, carriage and wagon works, fertilizer factory, hardwood mill, a brickyard, etc. Its trade is chiefly in cotton, lumber, naval stores, fruits and vegetables. The electric-light plant and the waterworks are municipally owned. Pop. 3,420.

**HAWKSBEARD**, perennial composite plants allied to hawkweed, but of the genus *Crepis*, about 250 species of which are known in the northern hemisphere. Several are European weeds which have become naturalized in the United States, and there are several native species. The flowers are dandelion-like and yellow or orange.

**HAWKSBILL**, a great marine turtle (*Chelone imbricata*) allied to the green turtle, but which has the plates of the shell overlapping; and these plates form the tortoise-shell (q.v.) of commerce. The flesh is not good for eating, but the eggs are good. The animal inhabits the Indian Ocean, the Pacific and the warmer parts of the Atlantic. This is one of the sea-turtles called "caret," but that term belongs more properly to the loggerhead. See TURTLE.

**HAWKWEED**, or **RATTLESNAKE WEED**, a genus (*Hieracium*) of plants of the family *Cichoriaceæ*, with mostly low hairy stems and yellow or orange heads of flowers. One species, the European orange hawkweed (*H. aurantiacum*), is frequently cultivated for the sake of its fine orange flowers. The name "hawkweed" in English, and various similar names in use among the peasants of continental Europe, are based on an ancient belief that birds of prey used the juice of the species to strengthen their vision. Several species grow in the United States, where they have been called "rattlesnake weeds" from a popular belief that they were of value in curing the poison of snakes.

**HAWKWOOD**, **Sir John de**, English soldier: b. Hedingham Sibil, Essex; d. Florence, Italy, 17 March 1394. He was styled by Hallam the first distinguished commander who had appeared in Europe since the destruction of the Roman Empire. It is said that he fought at

Crécy and Poitiers, and for his bravery was knighted by Edward III. However that may be, in 1359 he was the leader of a troop of free lances preying upon France and northern Italy. With this band, the "White Company," he served the Marquis of Montserrat, later the republic of Pisa, and still later Florence, upon whose side he oftenest fought in the civil disturbances of Italy. As commander-in-chief he directed the successful war against Milan (1390-92). He was pensioned by the Florentines and entombed with great ceremony in the Duomo.

**HAWLEY, Gideon**, American missionary to the Indians: b. Stratford, now Bridgeport, Conn., 11 Nov. 1727; d. Marshpee, Mass., 3 Oct. 1807. He was graduated at Yale College in 1749, and commenced his labors at Stockbridge in 1752, opening a school at that place, in which he instructed a number of Mohawk, Oneida and Tuscarora families. In 1754, under the patronage of Sir William Johnson, he began a mission among the Iroquois, or Six Nations, on the Susquehanna River; but in 1756 was obliged by the disturbances of the French war to leave that region, when he became a chaplain in the army marching against Crown Point. The campaign being over, he re-engaged in his missionary work at Marshpee, where he was installed as pastor in 1758, and there passed the remainder of his life in his benevolent labors.

**HAWLEY, Joseph**, American statesman: b. Northampton, Mass., 1723; d. 10 March 1788. He was graduated at Yale College, and followed the profession of law at Northampton, in which he rose to eminence. At the time of the disputes between Great Britain and America, he took a prominent part in advocating the cause of the colonies. "We must fight," he wrote to the delegates of Massachusetts, "if we cannot otherwise rid ourselves of British taxation. The form of government enacted for us by the British parliament is evil against right, utterly intolerable to every man who has any idea or feeling of right or liberty." He was several times elected a member of the council, but declined, preferring to enter the State legislature, of which he was a member 1764-66.

**HAWLEY, Joseph Roswell**, American politician and legislator: b. Stewartville, N. C., 31 Oct. 1826; d. Washington, D. C., 17 March 1905. He was graduated at Hamilton College, Clinton, N. Y., 1847, and began the practice of law at Hartford, Conn., in 1850. The Republican party in Connecticut was organized in the office of the *Charter Oak*, of which he was the editor. He afterward became editor of the *Hartford Evening Post*, the new Republican paper. When the Civil War broke out he recruited the first company of volunteers raised in the State—Company A of the First Connecticut regiment—of which he took command. He saw service throughout the whole war and was mustered out in 1866 with the brevet rank of major-general. He was elected governor of Connecticut the same year. He was defeated for re-election in 1867, and again turned to journalism. He purchased the *Hartford Courant* and united it with the *Press*, and made it one of the most influential Republican newspapers in the country. He took a leading part in the councils of the Republican party. In

1872 he was elected to Congress; at the end of the term, 1879-81, was sent to the United States Senate, to which he was re-elected 1887, 1893 and 1899. He was president of the United States Centennial Committee 1873-76. Fourteen days before his death, he was placed on the retired list of the army with the rank of brigadier-general.

**HAWORTH**, há'wérth, **Adrian Hardy**, English naturalist: b. Hull, 1767; d. Chelsea, 24 Aug. 1833. He was educated for the law, but did not practice, devoting his time to entomology and botany. He was the founder of the Entomological Society of London. The Hull Botanical Gardens were planned by him and laid out under his direction. His collections were large and important, and his works are still standard. He wrote 'Observations on the Genus *Mesembryanthemum*' (1794); '*Prodromus Lepidopteorum Britannicorum*' (1802); and '*Synopsis Plantarum Succulentarum*' (1812); and many minor papers.

**HAWORTH**, **Joseph**, American actor: b. Providence, R. I., 1855; d. 29 Aug. 1903. His first appearance was as a member of Ellsler's stock company at Cleveland, Ohio, and subsequently he supported Edwin Booth, Lawrence Barrett and John McCullough. From 1883 he toured for several years as a star in 'The Bells,' 'The Leavenworth Case,' 'Hamlet,' and other productions; in 1896-98 was Macbeth to Modjeska's Lady Macbeth, and later Storm in Caine's 'Christian,' Vinicius in Stange's adaptation of Sienkiewicz's 'Quo Vadis,' and Casius in the Mansfield presentation of 'Julius Cæsar.'

**HAWSER**, a manila or wire rope used in mooring or towing boats, etc., over four or three inches in circumference respectively. The name is now usually applied to all large ropes, though formerly it signified ropes "hawser-laid," that is, with three "plain-laid," three-stranded ropes laid up left-handed, now usually called a cable-laid rope.

**HAWTHORN**, or **WHITE THORN** (*Crataegus oxyacantha*), a small spiny European tree, rising sometimes to the height of 20 to 25 feet, much admired for the beauty of its foliage. The leaves are smooth, shining, more or less deeply lobed, and of a beautiful green color; the flowers are white, sometimes with a reddish tinge disposed in corymbs, and possess an agreeable perfume. The species of *Crataegus* are all shrubs or small trees, spiny, with red fruit resembling in miniature that of the apple, from which plant they are distinguished chiefly by their seeds, and are arranged with it in the family *Malacææ*. In the last 25 years more than a thousand species have been described from North America, but the number of valid species is undoubtedly much lower. When young the hawthorn springs up rapidly, a shoot of a single year being sufficient for a walking-stick. It thus, if well pruned and kept down, quickly grows into a thick and intricately woven hedge.

**HAWTHORNE**, há'thörn, **Julian**, American novelist and journalist, son of Nathaniel Hawthorne (q.v.): b. Boston, Mass., 22 June 1846. He was graduated from Harvard University in 1867 and afterward studied civil engineering in Dresden, but soon forsook this oc-

cupation for literature. His first successful story was 'Bressant' (1872), the forerunner of a long list of novels, of which may be particularized 'Garth' (1875); 'Sebastian Strome' (1884); 'Archibald Malmaison' (1884); 'A Fool of Nature' (1896). He has also published 'Saxon Studies' (1876); and 'Nathaniel Hawthorne and His Wife' (1885); 'Confessions and Criticisms' (1886); 'American Literature' (1891); 'History of the United States' (1899; 1912); 'Hawthorne and His Circle' (1903); 'The Subterranean Brotherhood' (1914), a record of his prison experiences in Atlanta. His best work suggests more than one element that distinguishes his father's stories. There is a psychologic accent, the touch of mystery, and the avoidance of the stock properties of romance. See MORTON, W. J.

**HAWTHORNE**, **Nathaniel**, American novelist: b. Salem, Mass., 4 July 1804; d. Plymouth, N. H., 19 May 1864. The founder of the family in America was William Hathorne (as the name was then spelled), a typical Puritan and a public man of importance. John, his son, was a judge, one of those presiding over the witchcraft trials. Of Joseph in the next generation little is said, but Daniel, next in descent, followed the sea and commanded a privateer in the Revolution, while his son Nathaniel, father of the romancer, was also a sea captain. This pure New England descent gave a personal character to Hawthorne's presentations of New England life; when he writes of the strictness of the early Puritans, of the forests haunted by Indians, of the magnificence of the provincial days, of men high in the opinion of their towns-people, of the reaching out to far lands and exotic splendors, he is expressing the stored-up experience of his race. His father died when Nathaniel was but four and the little family lived a secluded life with his mother. He was a handsome boy and quite devoted to reading, by an early accident which for a time prevented outdoor games. His first school was with Dr. Worcester, the lexicographer. In 1818 his mother moved to Raymond, Me., where her brother had bought land, and Hawthorne went to Bowdoin College. He entered college at the age of 17 in the same class with Longfellow. In the class above him was Franklin Pierce, afterward 12th President of the United States. On being graduated in 1825 Hawthorne determined upon literature as a profession, but his first efforts were without success. 'Fanshawe' was published anonymously in 1828, and shorter tales and sketches were without importance. Little need be said of these earlier years save to note that they were full of reading and observation. In 1836 he edited in Boston the *American Magazine for Useful and Entertaining Knowledge*, but gained little from it save an introduction to 'The Token,' in which his tales first came to be known. Returning to Salem he lived a very secluded life, seeing almost no one (rather a family trait), and devoted to his thoughts and imaginations. He was a strong and powerful man, of excellent health and, though silent, cheerful, and a delightful companion when he chose. But intellectually he

was of a separated and individual type, having his own extravagances and powers and submitting to no companionship in influence. In 1837 appeared 'Twice Told Tales' in book form: in a preface written afterward Hawthorne says that he was at this time "the obscurest man of letters in America." Gradually he began to be more widely received. In 1839 he became engaged to Miss Sophia Peabody, but was not married for some years. In 1838 he was appointed to a place in the Boston custom house, but found that he could not easily save time enough for literature and was not very sorry when the change of administration put him out of office. In 1841 was founded the socialistic community at Brook Farm: it seemed to Hawthorne that here was a chance for a union of intellectual and physical work, whereby he might make a suitable home for his future wife. It failed to fulfil his expectations and Hawthorne withdrew from the experiment. In 1842 he was married and moved with his wife to the Old Manse at Concord just above the historic bridge. Here chiefly he wrote the 'Mosses of an Old Manse' (1846). In 1845 he published a second series of 'Twice Told Tales'; in this year also the family moved to Salem, where he had received the appointment of surveyor at the custom house. As before, official work was a hindrance to literature; not till 1849 when he lost his position could he work seriously. He used his new-found leisure in carrying out a theme that had been long in his mind and produced 'The Scarlet Letter' in 1850. This, the first of his longer novels, was received with enthusiasm and at once gave him a distinct place in literature. He now moved to Lenox, Mass., where he began on 'The House of Seven Gables,' which was published in 1851. He also wrote 'A Wonder-Book' here, which in its way has become as famous as his more important work. In December 1851 he moved to West Newton, and shortly to Concord again, this time to the Wayside. At Newton he wrote 'The Blithedale Romance.' Having settled himself at Concord in the summer of 1852, his first literary work was to write the life of his college friend, Franklin Pierce, just nominated for the Presidency. This done he turned to 'Tanglewood Tales,' a volume not unlike the 'Wonder-Book.' In 1853 he was named consul to Liverpool: at first he declined the position, but finally resolved to take this opportunity to see something of Europe. He spent four years in England, and then a year in Italy. As before, he could write nothing while an official, and resigned in 1857 to go to Rome, where he passed the winter, and to Florence, where he received suggestions and ideas which gave him stimulus for literary work. The summer of 1858 he passed at Redcar, in Yorkshire, where he wrote 'The Marble Faun.' In June 1860 he sailed for America, where he returned to the Wayside. For a time he did little literary work: in 1863 he published 'Our Old Home,' a series of sketches of English life, and planned a new novel, 'The Dolliver Romance,' also called 'Pansie.' But though he suffered from no disease his vitality seemed relaxed: some unfortunate accidents had a depressing effect,

and in the midst of a carriage trip into the White Mountains with his old friend, Franklin Pierce, he died suddenly at Plymouth, N. H., early in the morning, 19 May 1864.

The works of Hawthorne consist of novels, short stories, tales for children, sketches of life and travel and some miscellaneous pieces of a biographical or descriptive character. Besides these there were published after his death extracts from his notebooks. Of his novels 'The Scarlet Letter' is a story of old New England: it has a powerful moral idea at bottom, but it is equally strong in its presentation of life and character in the early days of Massachusetts. 'House of the Seven Gables' presents New England life of a later date: there is more of careful analysis and presentation of character and more description of life and manners, but less moral intensity. 'The Blithedale Romance' is less strong: Hawthorne seems hardly to grasp his subject. It makes the third in what may be called a series of romances presenting the molding currents of New England life: the first showing the factors of religion and sin, the second the forces of hereditary good and evil, and the third giving a picture of intellectual and emotional ferment in a society which had come from very different beginnings. 'Septimius Felton,' finished in the main but not published by Hawthorne, is a fantastic story dealing with the idea of immortality. It was put aside by Hawthorne when he began to write 'The Dolliver Romance,' of which he completed only the first chapters. 'Dr. Grimshaw's Secret' (published in 1882) is also not entirely finished. These three books represent a purpose that Hawthorne never carried out. He had presented New England life, with which the life of himself and his ancestry was so indissolubly connected, in three characteristic phases. He had traced New England history to its source. He now looked back across the ocean to the England he had learned to know, and thought of a tale that should bridge the gulf between the Old World and the New. But the stories are all incomplete and should be read only by the student. The same thing may be said of 'Fanshawe,' which was published anonymously early in Hawthorne's life and later withdrawn from circulation. 'The Marble Faun' presents to us a conception of the Old World at its oldest point. It is Hawthorne's most elaborate work, and if every one were familiar with the scenes so discursively described, would probably be more generally considered his best. Like the other novels its motive is based on the problem of evil, but we have not precisely atonement nor retribution, as in his first two novels. The story is one of development, a transformation of the soul through the overcoming of evil. The four novels constitute the foundation of Hawthorne's literary fame and character, but the collections of short stories do much to develop and complete the structure. They are of various kinds, as follows: (1) Sketches of current life or of history, as 'Rills from the Town Pump,' 'The Village Uncle,' 'Main Street,' 'Old News.' These are chiefly descriptive and have little story; there are about 20 of them. (2) Stories of old New England,

as 'The Gray Champion,' 'The Gentle Boy,' 'Tales of the Province House.' These stories are often illustrative of some idea and so might find place in the next set. (3) Stories based upon some idea, as 'Ethan Brand,' which presents the idea of the unpardonable sin; 'The Minister's Black Veil,' the idea of the separation of each soul from its fellows; 'Young Goodman Brown,' the power of doubt in good and evil. These are the most characteristic of Hawthorne's short stories; there are about a dozen of them. (4) Somewhat different are the allegories, as 'The Great Stone Face,' 'Rappacini's Daughter,' 'The Great Carbuncle.' Here the figures are not examples or types, but symbols, although in no story is the allegory consistent. (5) There are also purely fantastic developments of some idea, as 'The New Adam and Eve,' 'The Christmas Banquet,' 'The Celestial Railroad.' These differ from the others in that there is an almost logical development of some fancy, as in case of the first the idea of a perfectly natural pair being suddenly introduced to all the conventionalities of our civilization. There are perhaps 20 of these fantasies. Hawthorne's stories from classical mythology, the 'Wonder-Book' and 'Tanglewood Tales,' belong to a special class of books, those in which men of genius have retold stories of the past in forms suited to the present. The stories themselves are set in a piece of narrative and description which gives the atmosphere of the time of the writer, and the old legends are turned from stately myths not merely to children's stories, but to romantic fancies. Mr. Pringle in 'Tanglewood Fireside' comments on the idea: "Eustace," he says to the young college student who had been telling the stories to the children, "pray let me advise you never more to meddle with a classical myth. Your imagination is altogether Gothic and will inevitably Gothicize everything that you touch. The effect is like bedaubing a marble statue with paint. This giant, now! How can you have ventured to thrust his huge disproportioned mass among the seemly outlines of Grecian fable?" "I described the giant as he appeared to me," replied the student. "And, sir, if you would only bring your mind into such a relation to these fables as is necessary in order to remodel them, you would see at once that an old Greek has no more exclusive right to them than a modern Yankee has. They are the common property of the world and of all time" ('Wonder-Book,' p. 135). 'Grandfather's Chair' was also written primarily for children and gives narratives of New England history, joined together by a running comment and narrative from Grandfather, whose old chair had come to New England, not in the *Mayflower*, but with John Winthrop and the first settlers of Boston. 'Biographical Stories,' in a somewhat similar framework, tells of the lives of Franklin, Benjamin West and others. It should be noted of these books that Hawthorne's writings for children were always written with as much care and thought as his more serious work. 'Our Old Home' was the outcome of that less remembered side of Hawthorne's genius which was a master of the de-

tails of circumstance and surroundings. The notebooks give us this also, but the American notebook has also rather a peculiar interest in giving us many of Hawthorne's first ideas which were afterward worked out into stories and sketches.

One element in Hawthorne's intellectual make-up was his interest in the observation of life and his power of description of scenes, manners and character. This is to be seen especially, as has been said, in his notebooks and in 'Our Old Home,' and in slightly modified form in the sketches noted above. These studies make up a considerable part of 'Twice Told Tales' and 'Mosses from an Old Manse,' and represent a side of Hawthorne's genius not always borne in mind. Had this interest been predominant in him we might have had in Hawthorne as great a novelist of our everyday life as James or Howells. In the 'House of Seven Gables' the power comes into full play: 100 pages hardly complete the descriptions of the simple occupations of a single uneventful day. In Hawthorne, however, this interest in the life around him was mingled with a great interest in history, as we may see, not only in the stories of old New England noted above, but in the descriptive passages of 'The Scarlet Letter.' Still we have not, even here, the special quality for which we know Hawthorne. Many great realists have written historical novels, for the same curiosity that absorbs one in the affairs of everyday may readily absorb one in the recreation of the past. In Hawthorne, however, was another element very different. His imagination often furnished him with conceptions having little connection with the actual circumstances of life. The fanciful developments of an idea noted above (5) have almost no relation to fact: they are "made up out of his own head." They are fantastic enough, but generally they are developments of some moral idea and a still more ideal development of such conceptions was not uncommon in Hawthorne. 'Rappacini's Daughter' is an allegory in which the idea is given a wholly imaginary setting, not resembling anything that Hawthorne had ever known from observation. These two elements sometimes appear in Hawthorne's work separate and distinct just as they did in his life: sometimes he secluded himself in his room, going out only after nightfall; sometimes he wandered through the country observing life and meeting with everybody. But neither of these elements alone produced anything great, probably because for anything great we need the whole man. The true Hawthorne was a combination of these two elements, with various others of personal character, and artistic ability that cannot be specified here. The most obvious combination between these two elements, so far as literature is concerned, between the fact of external life and the idea of inward imagination, is by a symbol. The symbolist sees in everyday facts a presentation of ideas. Hawthorne wrote a number of tales that are practically allegories: 'The Great Stone Face' uses facts with which Hawthorne was familiar, persons and scenes that he knew, for the presentation of a conception of the ideal. His novels, too, are full of symbol-

ism. 'The Scarlet Letter' itself is a symbol and the rich clothing of Little Pearl, Alice's posies among the Seven Gables, the old musty house itself, are symbols, Zenobia's flower, Hilda's doves. But this is not the highest synthesis of power, as Hawthorne sometimes felt himself, as when he said of 'The Great Stone Face,' that the moral was too plain and manifest for a work of art. However much we may delight in symbolism it must be admitted that a symbol that represents an idea only by a fanciful connection will not bear the seriousness of analysis of which a moral idea must be capable. A scarlet letter A has no real connection with adultery, which begins with A and is a scarlet sin only to such as know certain languages and certain metaphors. So Hawthorne aimed at a higher combination of the powers of which he was quite aware, and found it in figures and situations in which great ideas are implicit. In his finest work we have, not the circumstance before the conception or the conception before the circumstance, as in allegory. We have the idea in the fact, as it is in life, the two inseparable. Hester Prynne's life does not merely present to us the idea that the breaking of a social law makes one a stranger to society with its advantages and disadvantages. Hester is the result of her breaking that law. The story of Donatello is not merely a way of conveying the idea that the soul which conquers evil thereby grows strong in being and life. Donatello himself is such a soul growing and developing. We cannot get the idea without the fact, nor the fact without the idea. This is the especial power of Hawthorne, the power of presenting truth implicit in life. Add to this his profound preoccupation with the problem of evil in this world, with its appearance, its disappearance, its metamorphoses, and we have a clue to Hawthorne's greatest works. In 'The Scarlet Letter,' 'The House of Seven Gables,' 'The Marble Faun,' 'Ethan Brand,' 'The Gray Champion,' the ideas cannot be separated from the personalities which express them. It is this which constitutes Hawthorne's lasting power in literature. His observation is interesting to those that care for the things that he describes, his fancy amuses, or charms or often stimulates our ideas. His short stories are interesting to a student of literature because they did much to give a definite character to a literary form which has since become of great importance. His novels are exquisite specimens of what he himself called the romance, in which the figures and scenes are laid in a world a little more poetic than that which makes up our daily surrounding. But Hawthorne's really great power lay in his ability to depict life so that we are made keenly aware of the dominating influence of moral motive and moral law. See HOUSE OF THE SEVEN GABLES; MARBLE FAUN; SCARLET LETTER, THE; TWICE TOLD TALES.

EDWARD EVERETT HALE, JR.,  
Professor of English, Union College, Schenectady, N. Y.

**HAWTREY, Charles Henry,** English actor-manager and playwright: b. Eton 1858, son of Rev. John Hawtreay. He was educated at Eton and Oxford, and became an actor when he was 23 years old. His greatest success was in 'The Private Secretary,' adapted from Von Moser's 'Der Bibliothekar,' first produced in Cambridge in 1883. Other plays in which he has been successful are: 'Jane,' 'Mr. Martin,' 'A Message from Mars' and 'The Man from Blankley's.' With the last two plays he several times visited the United States.

**HAXO SYSTEM OF FORTIFICATION.** A bastion system of fortification introduced by Baron Francis Nicolas Benoit Haxo, a prominent French military engineer, employed by Napoleon, and later commanded at the siege of Antwerp in 1832. Casemated batteries of the system have earthen parapets along their front and are provided with arches mantled with earth. Apertures in front of the guns open into embrasures formed in extension of the parapet at these points. Being open in the rear the free circulation of air obviates the inconvenience of confined smoke.

The siege of this system of fortification is calculated to last 50 days and there are five distinct periods of breaching batteries: (1) Against the reduit of the salient place of arms and the ravelin. (2) Against the reduit of the re-entering place of arms, the coupures and the reduit of ravelin. (3) Against the bastionet and the counter-guard. (4) Against the retrenchment. (5) Against the bastion. The front is 360 yards long. The perpendicular is only 40 yards, and the faces 72 yards. The flanks are perpendicular to the lines of defense. The bastions contain interior retrenchments entirely separated from the rear by a ditch. A *chemin-des-rondes* surmounts the scarp of the enciente. The tenaille is not revetted and it has flanks that can mount three guns. The main ditch is 20 yards wide. The ravelin is made very salient, with a casemated traverse in capital, and coupures cut across its faces. In rear is a reduit of the ordinary outline, and behind is a casemated caponiere of bastionet, the roof of which carries 10 guns. The counterscarp of the main ditch is produced to within 10 yards of this bastionet, and in front of it slants a glacis, which closes the ditch of the ravelin and that of the reduit. The bastionet sweeps the interior glacis and co-operates with the flanks of the inner works to impede the construction of the counter-batteries.

The Haxo Casemate is a work built inside the parapet, arched and covered with earth, opening in the rear to the terreplein. The guns

are protected from the enemy's fire, and can be entirely hidden by masking the embrasures.

**HAY, John Milton**, American statesman: b. Salem, Ind., 8 Oct. 1838; d. near Newbury, N. H., 1 July 1905. He was graduated from Brown University in 1858, and soon after leaving college entered the office of his uncle, Milton Hay, a former partner of Abraham Lincoln, in Springfield, Ill., to study law. In 1861 he was admitted to the bar, but did not practise; he took an active part in the campaign preceding Lincoln's first election and in 1861 went with Lincoln to Washington as one of the President's private secretaries. During the Civil War period he was also Lincoln's adjutant and aide-de-camp, and served in the field for some time under Generals Hunter and Gillmore. He was brevetted lieutenant and lieutenant-colonel.

After the death of Lincoln he went to Paris as secretary of legation, remaining there till 1867, when he returned to the United States. In the summer of the same year he became chargé-d'affaires at Vienna. After holding this post for a year, during which he had some opportunities for European travels, he resigned and returned to the United States, but was sent almost immediately to Madrid as first secretary of legation, where he remained till 1870.

During his service abroad he gained a valuable knowledge not only of the language and literature of the chief European nations, but also of foreign diplomacy and politics. On his return to the United States he took up journalism, was for a time on the editorial staff of the *New York Tribune*, and published, mostly in its columns, his 'Pike County Ballads.' After about five years of service on the *Tribune* he married a daughter of Amasa Stone of Cleveland and went to that city to live. He devoted himself mainly to literary work, and occasionally took part in politics, writing and speaking in presidential campaigns. In 1879 he accepted an offer from President Hayes to become first assistant Secretary of State under Mr. Evarts. He held this position till the end of the Hayes administration in March 1881; then he took charge of the *Tribune* during Whitelaw Reid's absence in Europe, and conducted it with marked success through the trying period of Garfield's assassination and death. The period 1881-97 was devoted to the business interests of his wife's family, to travel and especially to the writing, with T. G. Nicolay, of their monumental biography of Abraham Lincoln. During these years he also found more leisure to devote to other literary work, the result of which in the form of poems and a few prose articles was published in various magazines.

In March 1897 President McKinley appointed him United States Minister to England, and the selection was declared by all without distinction of party to be most suitable. In London he was well received, did much to bring about friendly understanding between England and the United States and to keep relations between the two countries on a most friendly basis during the difficult era of the war with Spain. His London experience was also most valuable training for the important position to

which he was appointed in August 1898, when he became Secretary of State. Very few of those who had been at the head of the State Department had dealt with so many important questions as Secretary Hay, and probably none had been more thoroughly trained diplomats. At the time of the Boxer outbreak in China he was successful in obtaining justice for the Chinese, and preserving the integrity of the Chinese Empire, in 1899 he directed the United States Ambassadors at London, Berlin and Saint Petersburg to propose that each of these governments make a declaration in favor of the "open door" policy in China. They were invited to give assurances: first, that there would be no interference with any treaty port or vested interest; second, that the existing Chinese customs tariff would be continued without discrimination and administered by Chinese officials; third, that there would be no discrimination in harbor dues and railroad rates. France, Italy and Japan were afterward included in the negotiations. No treaties were exchanged, but all the governments approached pledged themselves by definite promises to the "open door" policy. He also negotiated and signed the Hay-Pauncefote Treaty (q.v.), and several reciprocity treaties, including one with Cuba; gave support to The Hague Conference (q.v.), and induced the Powers demanding indemnity from Venezuela to refer the question to The Hague tribunal; and, in 1903, signed within 48 hours of each other a treaty with the Colombian government granting right of way for the Panama Canal, and a treaty with Great Britain providing for the submission of the Alaskan boundary question to arbitration. During McKinley's first administration, also, Secretary Hay's position was of a peculiar significance, because, owing to the death in November 1899 of Vice-President Hobart, Hay would have become McKinley's successor had the President died or resigned before the end of the term. A similar condition existed after McKinley's assassination and death, when, by Roosevelt's succession to the Presidency, the Vice-Presidency became vacant again. Immediately upon Roosevelt's succession, the latter urged Hay to continue as Secretary of State, which he also did after his re-election. During the last few years of his service in the State Department John Hay's health was in a very precarious state and he continued in office only out of a deep sense of duty and in response to a general demand. He held honorary degrees of LL.D. from Western Reserve, Brown, Princeton, Dartmouth, Yale and Harvard. He is buried in Lake View Cemetery, Cleveland. In November 1910 the John Hay Library, built in his memory out of funds contributed by Andrew Carnegie and 28 other friends and admirers, was opened at his alma mater, Brown University, Providence.

Early in life he showed a deep interest in literature, an interest which he maintained from then on. He wrote a number of poems while still at college, among them the class poem which was considered quite above the average. His busy life, however, left comparatively little leisure to devote to literary work and his list of publications, therefore, is not very long. It includes 'Pike County

*Ballads* (Boston 1871); *'Castilian Days'* (Boston 1871), one of the best books on Spain in the English language; *'The Bread Winners'* (published anonymously, New York 1884); *'Poems'* (Boston 1913); *'The Complete Poetical Works of John Hay'* (Boston 1916). His addresses were published after his death as *'Addresses of John Hay'* (New York 1906). In collaboration with J. G. Nicolay (q.v.) he wrote *'Abraham Lincoln: A History'* (10 vols., New York 1890). It first appeared in serial form in the *Century Magazine* and is considered the most comprehensive and authoritative biography of Lincoln. Together with the same he edited *'Complete Works of Abraham Lincoln, etc.'* (2 vols., New York 1894). Consult Brown University, Providence, R. I., *'The Dedication of the John Hay Library, Nov. 11, 1910'* (Providence 1911); Chapman, A. S., *'Boyhood of John Hay'* (in *Century Magazine*, Vol. LXXVIII, (n. s. Vol. LVI), p. 444, New York 1909); Howells, W. D., *'Hay in Literature'* (in *North American Review*, Vol. CLXXXI, p. 343, New York 1905); Hunt, G., *'The Department of State of the United States; Its History and Functions'* (New Haven 1914); Sears, L., *'John Hay, Author and Statesman'* (New York 1914); Stedman, E. C., *'John Hay'* (in *'Poems,'* Boston 1908); Thayer, W. R., *'The Life and Letters of John Hay'* (2 vols., Boston 1915); Ticknor, C., ed., *'A Poet in Exile; Early Letters of John Hay'* (Boston 1910); United States, State Department, *'History of the Department of State of the United States, etc.'* (Washington 1901); id., *'Papers Relating to the Foreign Relations of the United States, etc.'* (Washington 1898-1905).

**HAY, or FORAGE**, the stems and leaves of grasses and other plants cut for fodder and dried in the sun. In haymaking the object of the farmer is to preserve the hay for winter use in the condition most nearly resembling the grass in its natural state. Of the various ingredients which compose grass, those portions which are immediately soluble in water are the most fitted for the purposes of nutrition; and therefore the mowing should be done when the plants contain the largest amount of sugar and other soluble matter. During the latter part of the process of fructification, when the seeds have arrived at maturity, the stem and leaves begin to decay; so that if the grass is not cut when in flower, a great amount of nutriment will be wasted. On the third day after mowing, if the weather is fine, the newly made hay will be ready for gathering into large windrows for carrying and stacking; but otherwise it will have to be put up into large cocks, and the carrying deferred until the next day. It is not desirable that grass should be too rapidly made into hay under a burning sun, as it is liable to scorch and lose its nutritive value. Great care must also be taken to preserve the hay from dew and rain, as water washes away the soluble salts and other matters, and when in the stack will cause fermentation, which, if excessive, destroys some of the most valuable properties of the hay. Some farmers salt their hay in stacking; others do not. Salt is generally commended. A good plan, when the hay harvest has been accompanied by wet weather, is to place a few layers of straw in the stack at intervals to absorb the moisture from the

heating hay. On large farms the spreading out of the hay after it is cut down is performed by a haymaking machine drawn by a horse, which will do the work of 12 or 15 haymakers, and distribute the grass more thinly and evenly as it crosses the field. It is only for the haymaking of the true grasses, however, that it is adapted, as clover must not be shaken so violently. To be transported to markets at a distance, hay is now compactly pressed into bales by presses worked by hand or power. In fact baled hay has increased the importance of haymaking, owing to the readiness with which it can be transported by rail or water. On the Pacific Coast, especially in California, hay cut from alfalfa is very productive and profitable, and three or more crops a year are frequently obtained. In the United States 61,691,166 acres of land were utilized in cultivating hay and forage in 1900, the entire crop amounting to 84,011,299 tons, valued at \$484,256,846.

The average value per acre of the hay and forage crop is \$8. Included in the above estimate were 4,759,353 tons of cornstalks which were cut from fields cultivated mainly for the grain. These figures for 1900 show an increase in area since 1889 of 8,742,369 acres, or 16.5 per cent, and in production of 12,420,466 tons or 18.6 per cent.

Of this total area, 6.7 per cent was devoted to clover, 50.7 per cent to tame and cultivated grasses other than clover, 6.3 per cent to grains cut green for hay, 5.1 per cent to forage crops, 3.4 per cent to alfalfa or lucerne, 2.8 per cent to millet and Hungarian grasses, and 25.1 per cent to wild, salt and prairie grasses.

The North Central division contained 57.8 per cent of the total hay and forage acreage of the country, the North Atlantic 21.0 per cent, the Western 11.4 per cent, the South Atlantic 3.5 per cent and the South Central 6.3 per cent.

The rate of increase in area devoted to hay and forage since 1889 was greatest in the South Central division, being 103.0 per cent. The Western division shows an increase of 91.4 per cent, the South Atlantic of 12.2 per cent and the North Central of 10.7 per cent. The North Atlantic division shows a decrease of 2.2 per cent.

The total value of the hay and forage crop of 1900 averaged \$135 per farm. The average yield per acre, exclusively of cornstalks, was 1.28 tons, and the average value per ton \$6.11. The average yield per acre of the various classes was as follows: Forage crops, 2.62 tons; alfalfa or lucerne, 2.49 tons; millet and Hungarian grasses, 1.64 tons; grains cut green for hay, 1.28 tons; clover, 1.26 tons; tame grasses other than clover, 1.14 tons; and wild, salt and prairie grasses, 1.12 tons.

**HAY FEVER**, a nervous affection of the mucous membranes of the eyes, nose, mouth, pharynx, larynx, and bronchi, characterized by a profuse flow of secretion from the nose, and of tears from the eyes, and accompanied in some cases by asthma. It is induced by the lodgment on the mucous membranes of the eye, nose and throat of the wind-borne pollen of certain plants. The disease varies in its severity according to certain atmospheric conditions and the amount of pollen in the air. Occurring at the haying season the disease received its title through that association. The prevalence of

JOHN HAY

catarrhal symptoms in summer separates it from an ordinary "cold in the head"; while their combination with difficulty of breathing prevents it being mistaken for spasmodic asthma, in which there is seldom any catarrh. There are three combining causes of this affection, which is largely nervous: First, a predisposing cause in some nervous disease, with a probable lesion in the fourth ventricle of the brain. Second, deformity, such as a deviating septum, in the nasal region. Third, inhalation of a special pollen. Removal to the seashore or the mountains is beneficial in most cases, and a sea voyage, or other complete removal from pollen afflicted regions brings entire release. The succinimide of mercury affords relief in many cases, and arsenic, iodides, bromides, and other nerve specifics benefit others. For the asthma, iodide of potash, 5 grains with 5 minims of tincture of belladonna in syrup of orange-peel should be taken every two hours. Calcium chloride is also very effective where asthmatic symptoms are marked. Inhalations of nitre-paper, stramonium leaves, etc., with wine of coca internally, are also useful.

These remedies are, however, merely palliative, and scientific men have been for some time making investigations which may eventually lead to the discovery of a radical cure.

Professor Dunbar, of Hamburg, who has been studying the subject for seven years, is one of those who hold out the hope for curing hay fever by a rational treatment.

According to him, the disease is caused by the pollen of grasses, but not by mechanical irritation. He has extracted from the pollen a protein poison, or toxin, which is insoluble in ether and alcohol, but soluble in water and weak saline solutions, tears, the mucus of the nose and the serum of blood. A solution of this toxin dropped into the eye or nose at once produces the characteristic symptoms of hay fever. The same symptoms in an aggravated form occur when the solution is injected hypodermically.

This discovery suggested treatment by the serum method and Dr. Dunbar set to work to produce a curative serum by inoculating animals with pollen toxin, and a serum was eventually obtained which, when dropped into the eye or nose together with pollen toxin, completely prevented the attack which the latter alone would have caused. In practical use, however, both the serum and the vaccination treatments have failed, and it is now generally admitted that the only completely effective treatment is avoidance of the cause.

Recent investigations have established the fact that hay fever is a distinctly preventable disease. Where there is none of the poisonous pollen the disease does not exist. The fact of prime importance is that only wind-borne pollen produces the disease. The pollen of golden rod, daisies, dandelions, and sunflowers will produce the symptoms if directly inhaled, but at a little distance such plants are harmless: their pollen is too heavy to be carried by the wind. On the other hand it has been found that some pollen travels several miles on the wind, but the farther it goes the more widely it is scattered, and it is rarely in sufficient quantity to produce the disease beyond half a mile from its source. Another established fact of importance is that immunity from the

disease does not imply that the immune person is not inhaling pollen, but simply that he is not inhaling more than his system can resist. It is only when the pernicious toxin of the pollen is assimilated beyond the capacity of resistance that the symptoms appear. After an attack is definitely begun, a much smaller addition of the toxin is sufficient to keep it going. The very wide degree of personal resistance to the pollen toxin explains the susceptibility of some persons and the immunity of others breathing the same pollen and in the same quantities. Unfortunately an attack of the disease leaves the patient more susceptible than before. Curiously, however, farm workers who are continually breathing pollen do not have hay fever.

The earlier summer cases of hay fever are attributed to the pollen of several of the grasses, and to that of the yellow dock (*rumex crispus*). The midsummer cases are said to be due to "careless weed" (*amaranthus spinosus*) and cocklebur (*xanthium Canadense*). The much larger proportion of cases of the early autumn are unquestionably due to the pollen of the ragweeds *ambrosia trifida* and *ambrosia elatior*. The marsh elder (*iva ciliata*) is also credited with a share in the scourge. The official experiment of cutting the ragweeds in and about New Orleans in the summer of 1915 resulted in shortening the "season" of hay fever in that city by several weeks. The output of pollen was so reduced within a half-mile distance from the city as to render it innocuous except to the most susceptible, and these eventually escaped by temporary removal to the centre of the city, beyond the reach of the pollen-laden winds.

**HAY-PAUNCEFOTE TREATY**, signed 18 Nov. 1901, which replaced the Clayton-Bulwer Treaty (q.v.) as an Anglo-American agreement of policy regarding an isthmian canal, then supposed to be fixed as across Nicaragua. It was drawn up by John Hay, Secretary of State, and Sir Julian Pauncefote, ambassador from Great Britain. Public feeling for some years had been growing so sore over the Clayton-Bulwer Treaty's restriction on the independent action of the United States, that there was grave fear lest Congress might abrogate it by open violence, a great blow to future amicable action. President McKinley voiced the feeling by the declaration, in his annual message for 1898, that the canal had become a national necessity. Fresh negotiations were opened with Great Britain; that country had no wish beyond that of neutralizing the canal, and sent one of her best diplomats with very liberal instructions, to concede whatever did not nullify that essential principle. The draft treaty was sent to the Senate by the President 5 Feb. 1900. It provided that a canal might be constructed by the United States, or under its direction; should be permanently neutralized on the basis of the Suez Canal agreement—to be kept open at all times, either of war or peace, to all vessels, without discrimination, and no fortifications to be constructed commanding the canal or the waters adjacent, and that other powers should be invited to join in this guaranty of neutrality. The provisions excited intense hostility, and Senator Davis offered an amendment adopted by the committee on foreign affairs, canceling the very features for

which it was drawn up, and which made the spirit of the previous one. It provided that the neutralization clause should not prevent the United States from any measures it thought needful for its own defense or the preservation of order, declared the Clayton-Bulwer Treaty specifically abrogated, and struck out the third clause inviting the concurrence of other powers. In this form it was ratified by the Senate 20 Dec. 1900, but Great Britain refused to accept the transformed treaty, and it expired by limitation on 5 March 1901. Undiscouraged, the two diplomats set to work on a compromise, which was signed by them 18 Nov. 1901, sent to the Senate by President Roosevelt, and ratified by them 16 December. The chief differences were in dropping as far as possible all specific guaranties, requirements or prohibitions, leaving its interpretation and application to the chapter of fate and the certainty that the strong hand would decide in any event. The neutrality of the canal is not guaranteed at all except by the terms of the agreement, the Clayton-Bulwer Treaty is abrogated by name, and the United States is not forbidden to construct fortifications, nor required to keep the canal open in time of war.

Prior to the opening of the Panama Canal to traffic on 15 Aug. 1914, a controversy with Great Britain respecting the interpretation of the Hay-Pauncefote Treaty had arisen. Under the Panama Canal Act of 1912, passed by Congress; American vessels engaged in the coastwise trade were to be exempted from canal tolls. Sir Edward Grey, the British Foreign Secretary, lodged a protest against the passing of the measure, and claimed that the act was a discrimination against British and other foreign vessels in contravention of the treaty, and requested that the bill be held in abeyance in the Senate in order that a detailed statement might be sent; but President Taft signed the act on 24 Aug. In the formal protest subsequently lodged (9 Dec.), Sir Edward Grey declared that "while the Hay-Pauncefote Treaty left the United States free to build and protect the canal, it expressly maintained the principle of Article VIII of the Clayton-Bulwer Treaty of 1850, guaranteeing to England the use of the canal on a complete equality with the United States of America"; and he later (27 Feb. 1913) pressed for arbitration. In the United States the British contention was generally regarded as an attempt to interfere with that country's sovereign rights to deal with its own commerce, and to use the canal in whatsoever manner it saw fit—though a minority, led by Senator Root, stoutly held that the British objection was based on solid grounds. All the correspondence on the subject had passed before President Wilson came into office. On 5 March 1914 he sent a message to Congress strongly urging the repeal of the exemption. He regarded the exemption as a plain breach of the Hay-Pauncefote Treaty, and declared that it was only in the United States that there was any doubt as to its language. He proposed a "voluntary withdrawal from a position everywhere questioned and misunderstood." In spite of strong opposition, repeal of the exemption was finally accepted, but not before a proviso had been inserted in the bill expressly reserving to the United States the right to exempt ships in the future.

**HAY RIVER**, a stream which rises in the Rocky Mountains in Athabasca, Canada, and flows northeast into Great Slave Lake. It is navigable for about 140 miles from its mouth; its entire length is about 360 miles. The two Alexandra Falls (named after Princess Alexandra, now Queen Alexandra of England) are found in the upper course; they average about 250 feet in height and 900 feet in width.

**HAY-WORM**, the caterpillar of a medium-sized pyralid moth (*Pyralis costalis*), injurious to clover hay, and to other hay when mixed with clover. Its depredations can be prevented by keeping the hay dry and well ventilated, as the insect preferably breeds in moist or matted material such as is to be found in the lower parts of stacks; here the hay becomes filled with webbing of the "worms" and their excrement, rendering it unfit for feeding. The webbed material should be burned and the place thoroughly cleaned.

**HAYASHI**, hä'ya-shē, Count Tadasu, Japanese statesman and diplomat b. Sakura, 1850; d. Tokio, 10 July 1913. As a boy he lived in the house of an American missionary to learn English, and later was one of the first students sent by the Japanese government to London, where he studied at the University College School. Entering the civil service on his return home he became secretary in the Central government and subsequently governor of Kagawa-ken and Hyogo-ken. He served as Vice-Minister in the Foreign Office from 1891 to 1896, when he was appointed Minister at Peking. In 1898 he was transferred to Saint Petersburg (Petrograd) and in the following year to London. During the six years he spent in London he was largely responsible for the promotion of the two treaties between Great Britain and Japan in 1902 and 1905, both of which he signed. In 1904 the Japanese legation in London was raised to the dignity of an embassy, and Viscount Hayashi thus became the first Japanese Ambassador. The rank of count was conferred on him in 1907. He held ministerial portfolios in the Saïori cabinets in 1911 and 1912. At the farewell banquet given in his honor by the Lord Mayor of London, the Ambassador assured his audience that the Japanese people firmly intended to maintain the word and spirit of their engagements, and that the sympathy of the British Empire toward Japan was reciprocated to the fullest extent. Count Hayashi was the recipient of honorary degrees from the universities of Oxford and Cambridge. In 1903 he published in English a book entitled 'For his People,' and has also translated into Japanese several English and European classical works on politics and political economy.

**HAYDEN**, Ferdinand Vendeveer, American geologist: b. Westfield, Mass., 7 Sept. 1829; d. 22 Dec. 1887. He was graduated from Oberlin College, Ohio, studied at the Albany Medical College, and during the greater part of 1853-62 was employed in surveys in the northwest. He served as surgeon in the Union army during the Civil War, and was professor of mineralogy and geology in the University of Pennsylvania 1865-72. In 1867-69 he made a geological survey of Nebraska, and was afterward director of the geological survey of the Territories of the United States, until in 1879 the various national surveys were combined in

the geological survey of the United States. Till 1886 he remained at the head of the Montana division. He published many papers, besides numerous and valuable government reports, and was a member of many scientific societies at home and abroad.

**HAYDN**, há'dn (Ger. hí'dn), **Franz Joseph**, Austrian musical composer: b. Rohrau, on the borders of Hungary and Lower Austria, 31 March 1732; d. Vienna, 31 May 1809. He was the son of a traveling wheelwright who was fond of music and taught his 12 children. Young Franz showing exceptional talent, he was trained by his cousin, a schoolmaster at Hainburg, where from six to eight years of age he learned reading, writing, singing by note, and to play on such instruments as his childish strength would admit of his handling. His voice attracted the notice of the parish priest, who recommended him as a choir-boy to the chapel-master of Saint Stephen's in Vienna, and at eight Haydn was received into the choir. With the exception of some Latin and much practical music he seems here to have been taught nothing; in the theory and science of the art he received but two lessons from his master in eight years. At last in his 16th year, his voice began to break and he lost his place, but helped by some friends he took up his abode in an attic in the Austrian capital, intending to live by his art. At that time the first six sonatas of Emmanuel Bach fell into his hands. "I could not leave my instrument," he said in his old age, "until I had played them through; and anyone who knows me must perceive how much I owe to Emmanuel Bach, that I studied him carefully, and comprehended him." After a time he became acquainted with Metastasio, the greatest operatic librettist of the time. The poet had charge of the education of a Signora Martinez, and Haydn was employed to give her elementary instructions in music. This afforded him an opportunity for mastering Italian, and what was of more immediate importance, procured him board and lodging. Metastasio introduced the struggling young artist to Porpora, a celebrated Italian musician, then in Vienna. As Porpora's accompanist he attracted the attention of Gluck and other masters, and his prospects from this time onward grew steadily brighter. He was often engaged to play at the musical entertainments given by the Austrian nobles, was appointed organist of two churches, sang tenor parts in the choir of another and pupils rapidly became more numerous. He wrote a short comic opera, 'Der hinkende Teufel' (The Limping Devil), which was given three nights with applause, but owing to the satirical character of the libretto was forbidden by the police. Having now the means, Haydn purchased and studied the theoretical works of Emmanuel Bach, Mattheson and Fux. In 1759 Count Morzin engaged him as music composer and director at a salary of 200 florins, with free lodgings and table with his secretaries and other officials. The following year he became assistant-kapellmeister to Prince Paul Esterhazy, and in 1766 full kapellmeister or musical director to Prince Nicholas Esterhazy, remaining in their service for 30 years. Anything like a catalogue of his compositions during this time is impossible; much was destroyed on three separate occasions when his house was burned down and much was

scattered; but they included 163 pieces for the baryton, an obsolete instrument in size between the viola and the violoncello; about 120 symphonies for full orchestra; more than 100 works of chamber music of the higher forms, and 12 Italian operas performed in his patron's private theatre. Haydn married in 1759 but the union was incompatible and resulted in a separation. On the death of Prince Esterhazy, in 1790, Haydn visited London where the musical world received him with the greatest enthusiasm. Oxford University conferred on him the degree of Doctor of Music, and his stay lasted 18 months. Here he produced an opera, 'Orfeo,' nine symphonies, six quartettes, 11 sonatas, several songs and canzonets and the accompaniments to more than 100 Scotch songs. He visited London a second time in 1794, his stay lasting a like period, and on his return to Vienna set about composing the music of the oratorio, 'Creation,' the words adapted by Linley from Milton's 'Paradise Lost.' Haydn thought the text too long, and not being thoroughly acquainted with English, had it translated and curtailed by Baron von Swieten. It was produced 19 March 1799, when its author was in his 66th year. It obtained a great success and he was induced to undertake the music of another text prepared from Thompson's 'Seasons.' This work wants the freshness and vigor of the previous work; which may have resulted in some measure from the barren unpoetical text. Among the compositions of his declining years were some of his finest chamber music, the Austrian national Anthem and several masses; the last, his mass in C minor, was written in 1802. He died during Napoleon's occupation of Vienna, and many French officers were among the mourners at his funeral. Consult Cowan, F. H., 'Haydn' (New York 1912); Brenet, M., 'Haydn' (Paris 1909); Nohl, L., 'Life of Haydn' (Chicago 1889); Pohl, C. F., 'Mozart and Haydn in London' (Vienna 1867); id., 'Josef Haydn' (2 vols., Leipzig 1875-82).

**HAYES, Augustus Allen**, American chemist: b. Windsor, Vt., 1806; d. Brookline, Mass., 21 June 1882. He began his studies under Dana, and was successful throughout his career in improving the resources of applied chemistry to a remarkable extent. He was the first to extract the alkaloid sanguinarin from the blood root, *Sanguinaria Canadensis*. He also improved the common method of reducing pig to malleable iron and discovered new processes in copper-smelting. His researches led him also to a new formula for the production of chloroform. He was for many years employed by the State of Massachusetts as assayer.

**HAYES, Isaac Israel**, American arctic explorer: b. Chester County, Pa., 5 March 1832; d. 17 Dec. 1881. He was graduated in medicine at the University of Pennsylvania in 1852, and began his arctic experiences as surgeon in the second Grinnell expedition sent out under Captain Kane in 1853, in search of Franklin. Becoming convinced of the existence of an open polar sea, he was enabled to obtain funds for the expedition on which he sailed in the ship *United States* from Boston in 1860. He had two astronomers on board and according to their observations reached lat. 81° 35' N., long. 70° 30' W., the farthest point north hitherto

recorded in any voyage. In 1869 he made a voyage to Greenland. He received gold medals from the geographical societies of Paris and London. His published works comprise 'An Arctic Boat Journey' (1860); 'The Open Polar Sea' (1867); 'Cast Away in the Cold' (1868); and 'The Land of Desolation' (1872).

**HAYES, Patrick Joseph**, American Roman Catholic prelate: b. New York city, 20 Nov. 1867. He was educated at Saint Andrew's parochial school, De La Salle Institute, and in 1888 was graduated at Manhattan College. His theological studies were made at Saint Joseph's Seminary, Troy, and on 8 Sept. 1892 he was ordained to the priesthood. After ordination he attended the Catholic University, Washington, from which he received the degree of D.D. Father Hayes was appointed assistant of Saint Gabriel's, in East 37th street, and for a time served as secretary to Archbishop Farley, who in 1903 made him chancellor of the archdiocese and rector of the newly-founded Cathedral College. On 28 Oct. 1914 Father Hayes was consecrated titular bishop of Tagaste, becoming also auxiliary bishop of New York. In 1915 he was made permanent rector of Saint Stephen's, New York. In 1917-18 Bishop Hayes was bishop ordinary of all Catholic chaplains of the United States forces. On 27 Feb. 1919 was announced his appointment to the archbishopric of New York in succession to the late Cardinal Farley.

**HAYES, Rutherford Birchard**, 19th President of the United States: b. Delaware, Ohio, 4 Oct. 1822; d. Fremont, Ohio, 17 Jan. 1893. He was the third son of Rutherford and Sophia (Birchard) Hayes. His earliest paternal ancestor in America was George Hayes, a Scotchman, who, prior to 1680, settled in Windsor, Conn.; was married to Sarah Dibble, and in 1698 removed to the Salmon brook district, Simsbury, now in Granby township. In 1817 the family moved to Ohio from Brattleboro, Vt. An uncle took particular interest in young Rutherford, and supplied his eager demand for books. In 1834 he took up the study of Latin and Greek under the direction of Judge Sherman Finch, of Delaware, who had been a tutor at Yale. He continued his studies in the Norwalk (Ohio) Academy, and completed his preparatory course at Middletown, Conn., under Isaac Webb. At 16 he entered Kenyon College, from which he was graduated in 1842 as the valedictorian of his class. The following year he entered the law school of Harvard University, where he remained until 1845, at the same time studying French and German and attending the lectures of Agassiz on natural science and of Longfellow on literature. He was admitted to the Ohio bar at Marietta, 10 May 1845, established himself at Lower Sandusky, now Fremont, and in April 1846 formed a law partnership with Ralph P. Buckland, then a member of Congress and later a major-general in the Civil War. Early in 1848 his health having failed, he wanted to enlist in the war with Mexico, but he was forbidden to do so by his physician, and, after trying the climate of New England and of Canada, he spent the following winter in Texas. Returning to Ohio with health fully restored, he settled in Cincinnati in December 1849. In 1856 he was nominated for

the office of common pleas judge, but declined the honor. His public life began two years later, when the office of city solicitor became vacant, and he was elected by the council to complete the unexpired term. In 1859 he was elected to the same office by the citizens, and he performed his duties with ability until April 1861, when he was defeated for re-election.

A Whig in politics, Hayes had cast his first vote for Henry Clay in 1844, his second for General Taylor in 1848, and his third for Winfield Scott in 1852; but having been opposed to slavery from his youth, he joined the Republican party and supported Frémont with enthusiasm in 1852, and Lincoln in 1860. On 13 April 1861, at a mass-meeting, called in response to President Lincoln's proclamation asking for 75,000 troops, he was made chairman of the committee appointed to draw up resolutions expressive of the intense feeling which had now been aroused. Forthwith the members of his literary club organized a military company and he was chosen captain. President Lincoln sent him a commission as colonel of volunteers, but he declined it. Later, 1 June 1861, he accepted a commission from Governor Dennison as major of the 23d Ohio Volunteer Infantry, a body of 900 men, of which W. S. Rosecrans was colonel and Stanley Matthews, lieutenant-colonel. This regiment was ordered into West Virginia, under Gen. George B. McClellan, to aid in driving the Confederates from that section. From 19 Sept. 1861 Major Hayes was judge-advocate of the Department of the Ohio for about two months. During the summer of 1862 his command was transferred to the Army of the Potomac, and participated in the battle of South Mountain, where, though wounded in the arm, he led a charge and held his position at the head of his men. For his conspicuous gallantry on this occasion, he was made colonel of the 23d Regiment on 24 Oct. 1862. He was detailed from his regiment to act as brigadier-general in command of the celebrated Kanawha division; checked the raid of the Confederate, John Morgan, in July 1863, and aided in preventing his force from re-crossing the Ohio and in compelling its leader to surrender. He commanded a brigade under General Crook in the spring of 1864, which took part in cutting the principal lines of communication between Richmond and the Southwest, and he led it in storming a fortified position on the crest of Clay's Mountain. Later, still under Crook, he joined Hunter's army in the march against Lynchburg, and covered the retreat in the dangerous passage of the Alleghanies. In the first battle of Winchester, 24 July 1864, Colonel Hayes and Col. James Mulligan were ordered to charge what proved to be a greatly superior force. Mulligan fell, but Hayes flanked and conducted the retreat of his brigade with great intrepidity and skill, eventually checking the pursuit. At Perryville he also served with credit and at the second battle of Winchester, 19 Sept. 1864, performed an act of signal bravery. Advancing against a battery situated on an eminence, he suddenly came to a deep slough, some 50 yards in width. Nevertheless, he plunged in at once, and, although his horse sank in the mire, he extricated himself, climbed to the top of the other bank, and, with about 40 who followed, charged the battery and put its defenders to flight. He led a division at Fisher's Hill,

**RUTHERFORD BIRCHARD HAYES**

**Nineteenth President of the United States**

22 Sept. 1864, where he gained the enemy's rear and routed them, capturing several pieces of artillery. A month later, he was engaged at Cedar Creek, where while in retreat he had a horse shot under him and he was slightly wounded in the head. A few days later he was made brigadier-general and on 13 March 1865 was brevetted major-general for his distinguished services at Fisher's Hill and Cedar Creek. While still in the army, 6 Aug. 1864, he was nominated for Congress from the Second Ohio district. He was elected to the 39th Congress, and he was nominated for governor by the soldiers in the field. In August 1866, he was renominated by acclamation and was elected to the 40th Congress by a large majority. In Congress he was appointed chairman of the library committee and succeeded in greatly amending the copyright law, as well as in trebling the area, contents and usefulness of the Congressional Library. His votes in matters affecting the reconstruction of the South were given with his party; his first vote was for a resolution affirming the sacredness of the public debt and denouncing every form of repudiation. He sustained the movement for the impeachment of President Johnson. In 1867 he was nominated for Governor of Ohio by the Republicans. He was elected with his Republican associates in November. He steadily increased in personal popularity and was re-elected governor in 1869. During his administration he carried out a comprehensive geological survey of Ohio, which was of great advantage in the development of the mineral resources of the State. The State debt was reduced by nearly \$3,000,000 and considerable reforms brought about in regard to the debt incurring powers of municipalities. In 1872, he returned to Cincinnati determined to retire from public life, and in 1873 he moved to his old home at Fremont. In 1875, however, he was nominated governor and was with difficulty induced to accept the nomination. The great issue of the campaign was the money question, which though properly a national issue, had been forced into State politics. There were those who believed and publicly contended that all that was needed to make money was the stamp of the government of the United States, that it was not necessary to have back of it any intrinsic value. Hayes, however, stood for "sound money," and after an active campaign won the election, thus becoming governor of Ohio for the third time.

The Republican State Convention of Ohio named him as its choice for President in the Republican National Convention. When the latter body met, at Cincinnati, 14 June 1876, his name was presented, as were the names of other prominent leaders of the party, including that of James G. Blaine. It soon became evident that none of the recognized candidates could be nominated and a "dark horse" was looked for. On the seventh ballot the opposition to Mr. Blaine gave Mr. Hayes the nomination. The Democratic party nominated Samuel J. Tilden, whose reputation as a reformer brought him the support of many dissatisfied Republicans. The result of the election was a question of long and bitter contest. The electoral votes of Louisiana, Florida and of South Carolina were in dispute and both sides charged their opponents with fraud. The canvassing

boards of the States in dispute were visited by statesmen of both parties, all blinded in a measure by political prejudice. The governors of the disputed States gave certificates in favor of Mr. Hayes, but other officials gave the same document in favor of Mr. Tilden. At last a commission was appointed to decide which set of papers was legal. This commission consisted of five Senators, five Representatives and five justices of the Supreme Court. When this plan was agreed to chance favored the Democrats, owing to the composition of the Supreme Court; but while the commission was being organized, Justice Davis, who was expected to be a member and to favor Mr. Tilden, was elected a Senator and so forced to resign his seat in the Supreme Court. This led to the substitution of Justice Bradley, a strong Republican, whose vote decided the question, for the commission on every question divided eight to seven. The electoral vote, as decided by the commission was 185 for Hayes and 184 for Tilden. Mr. Hayes was publicly inaugurated 5 March 1877. He at once proceeded to satisfy the Southern States by withdrawing from them the Federal troops and leaving the local government to the people in the two disputed States then under a dual government. This course, while heartily approved by the Democrats, was severely criticized by the Republicans, who thus lost the votes of the Southern States. As regards appointment to office, Mr. Hayes' general policy was to respect the views of the advocates of civil service and his appointments were in general very acceptable. Competitive examinations were instituted and applications were considered irrespective of party affiliations. On 5 May 1877 President Hayes called Congress in extra session, to meet 5 Oct. 1877, to make necessary appropriations for the support of the army. In July he suppressed the railroad riots caused by a strike, on application from the governors of West Virginia, Maryland, Illinois and Pennsylvania, by sending United States troops to the points of disturbance. In his message to Congress, 3 Dec. 1877, he congratulated the country on the peaceable and prosperous condition of affairs in the Southern States; recommended the payment of government bonds in gold; favored the limited coinage of silver; insisted that the Constitution imposed on the President the sole duty and responsibility of the selection of Federal officers and recommended that Congress make a suitable appropriation for the use of the civil service commission; and recommended the passage of laws to protect the forests on lands of the United States—all of which were disregarded. He vetoed the "silver bill," on the ground that the commercial value of the silver dollar was then less than its nominal value, and that its use in the payment of debts already contracted would be an act of bad faith; the bill was passed over his veto. In his message of 1 Dec. 1879 he congratulated the country on the return to specie payment, and urged upon Congress the suspension of silver coinage, fearing that the cheaper coin would eventually be the sole standard of value; and recommended the retirement of United States notes with the capacity of legal tender in private contracts. In his message of 6 Dec. 1880 he again urged civil service reform, competitive examinations for applicants for positions, for a law against

political assessments, and suggested that an act be passed "defining the relations of members of Congress with regard to appointments to office by the President," that the tenure of office act be repealed, etc. Throughout his administration his actions gave great offense to the politicians who had placed him in office, and both Houses of Congress were up in arms against a President who insisted upon putting empty campaign promises into practice. They refused to pass the necessary appropriation bills, even the one for the support of the army. When these measures were eventually carried through, attached to them were certain "riders" repealing obnoxious laws. This proceeding President Hayes considered an infringement on his prerogative, so he vetoed the bills, stood firm, and, in the end, won the battle. Owing to this quarrel with the politicians his re-nomination was out of the question, and on 4 March 1881, he relinquished his office to President Garfield. At the close of his administration, Mr. Hayes returned to private life. His interest in education was shown by the work done as a member of the boards of trustees of the Ohio Wesleyan University at Delaware and the Ohio State University at Columbus. Hayes' Hall at the latter institution bears his name because of his devotion to the cause of manual training. He was also president of the John F. Slater Educational Fund and gave much time to its proper distribution. As president of the National Prison Reform Association he did much to educate the public to a more humane way of thinking about the treatment of convicts, many of his public utterances have become maxims in prison management, and his work along these lines has been exceedingly valuable and permanent in its results. Consult Gladden, 'The Great Commoner of Ohio' (Columbus 1893); Stoddard, 'Hayes, Garfield, and Arthur' (New York 1889); Howard, 'Life, Public Services, and Select Speeches of Rutherford B. Hayes' (Cincinnati 1876); Howells, 'Life of R. B. Hayes' (New York 1876); Conwell, 'Life and Public Services of Governor Hayes' (Philadelphia 1876). Consult also Haworth, 'The Disputed Election of 1876' (Cleveland 1906), and Bigelow (editor), 'Letters and Literary Memorials of Samuel J. Tilden' (Vol. II, New York 1908).

**HAYES RIVER**, Canada, called Hill River in the upper part of its course, rises near Lake Winnipeg and for about 300 miles flows north-east through Oxford or Holy Lake, Knee Lake and several other lakes, into James Bay, near the mouth of the Nelson River. The largest tributaries are the Shamattawa and the Fox.

**HAYESINE**, hä'z'in, a hydrous borate of calcium ( $\text{CaB}_2\text{O}_7 \cdot 6\text{H}_2\text{O}$ ), occurring as snowy-white, silky flakes, floating in the waters of hot springs in Chile, and also as a flocculent sediment on the bottom. It is a somewhat uncertain species and has been regarded as a form of bechillite, but has been identified as ulexite. In the United States, specimens are reported from Bergen Hill, N. J., where it is associated with datolite. (Named in honor of A. A. Hayes (q.v.), an American chemist).

**HAYGOOD**, Atticus Green, American Methodist bishop: b. Watkinsville, Ga., 19 Nov. 1839; d. Oxford, Ga., 19 Jan 1896. He was educated at Emory College, Ga., of which he

was president 1876-84, becoming in 1890 bishop of the Methodist Episcopal Church South. He wrote 'The Monk and the Prince,' a study of Savonarola and Lorenzo de Medici; 'Our Brother in Black' (1881); 'Pleas for Progress' (1889).

**HAYMARKET SQUARE RIOT**, a disturbance resulting in the murder of several policemen in Chicago, 4 May 1886, by a bomb thrown by an anarchist. The labor troubles had long been exploited by the "practical" anarchists (with whom the philosophic anarchists disclaim connection), who denounced the efforts for shorter hours and better wages as tending merely to aggravate capitalistic slavery, and urged instead the general seizure of property and the murder of its owners. In February 1886 the McCormick Reaper Works had been closed on account of a demand for the expulsion of some non-union men, but had reopened. Meantime a great eight-hour strike had left some 50,000 workmen unemployed in the city, and in view of an almost certain conflict with the police, George Engel proposed at a meeting in Bohemian Hall on 2 May, and the meeting indorsed, a plan to blow up the police stations, shoot the emerging police, cut the telegraph wires, fire buildings to engross the service of the fire department and make a general jail delivery, that the prisoners might aid in a social revolution. The next day August Spies and others incited a meeting of the Lumber-shovers' Union, 16,000 or more, principally Germans and Bohemians, to assail the McCormick Works in order to furnish an opportunity for carrying out this plan, though the works had no connection with this union. The mob attacked the works with stones and revolvers, but were driven off. No one was fatally injured, but Spies immediately issued a circular headed "Revenge!" asserting that six workmen had been killed and calling their brethren to arms. He also published a fierce article in his paper, the *Arbeiter Zeitung*, repeating the falsehood and declaring that there had been a "massacre" to terrorize the workmen, who should have had dynamite bombs instead of stones. In the evening a meeting was held at Greif's Hall, at which Engel's plan was adopted. Spies, Albert R. Parsons, Samuel Fielde and Oscar W. Neebe spoke for a mass-meeting to further the plan above mentioned; at Adolf Fischer's suggestion it was fixed for next evening in Haymarket Square, that the dusk and the room for a great crowd might furnish more confusion and better means of escape. Rudolph Schnaubelt wished to have all socialists in other cities notified, so that there might be a general revolution. The signal was to be "Ruhe" (Peace), which was printed in next afternoon's *Arbeiter Zeitung*. Meantime Louis Lingg and others worked all day preparing bombs, of which the newspaper office was found to be an arsenal, along with firearms, and with a confederate carried a satchel of them to a place where others helped themselves. The air was full of rumors of intended violence and the mayor (Carter Harrison, Sr.) ordered the police to mix with the meeting and disperse it if incendiary language were used, and 176 policemen were concentrated at the nearest station. Spies and Parsons spoke first, but the mayor was in the crowd and they used mild language, till his

suspicious were lulled and he left. Then Fielde began a frenzied and bloodthirsty harangue, calling for the "extermination" of the capitalists. The crowd grew so wild that shortly after 10 the police in four divisions appeared and covered the street, and while Fielde was speaking, Captain Ward ordered the crowd to disperse. Fielde called out "We are peaceable" (curiously like "Peace"), and a bomb was at once thrown into the midst of the police, which exploded and caused frightful carnage, killing or mortally wounding eight policemen and injuring a great number more. The mob instantly followed it up with a volley from rifles and revolvers, proving that they had been expecting the signal, but the police at once rallied and charged the mob, dispersing it in disorder. Of the police, besides those killed, 68 were wounded by shot or bombs, many maimed for life. Spies, Parsons, Fischer, Engel, Lingg, Fielde, Michael Schwab and Neebe were arrested and tried as accessories before the fact: the first four were hanged 11 Nov. 1887; Lingg shattered his jaw in prison with a bomb and died; Fielde and Schwab were sentenced to prison for life and Neebe for 15 years. There was considerable dissatisfaction with this verdict throughout the country, even amongst people not in sympathy with the anarchists because none of the men had been clearly proven to have thrown the bomb. The last three were pardoned by Governor Altgeld (q.v.) in 1893, many prominent men of Chicago and throughout the country having petitioned for their release on the ground that the evidence did not connect them with the actual throwing of the bomb, which was true, the evidence pointing strongly to Schnaubelt. Consult Altgeld, J. P., 'Reasons for Pardoning Fielde, Neebe and Schwab' (Chicago 1893); Buchanan, J. R., 'Chicago Anarchists' (in *Outlook*, Vol. LXXVI, p. 117, New York 1904); Hill, F. T., 'Decisive Battles of Law' (New York 1907); Holmes, W., ed. 'The Chicago Martyrs, etc.' (in *Free Society Library*, No. 1, San Francisco 1899); Russell, C. E., 'These Shifting Scenes' (New York 1894); Supreme Court of Illinois, Northern Grand Division, 'August Spies et al. v. the People, etc.' (Chicago 1887).

**HAYNE, Isaac**, American patriot: b. "Hayne Hall," near Jacksonboro, S. C., 23 Sept. 1745; d. Charleston, S. C., 4 Aug. 1781. He was a wealthy planter who took up arms after the invasion of the colony by the English forces, and after the capitulation of Charleston was paroled with the proviso that he would not be ordered to bear arms against his countrymen. He was summoned, however, to the English standard and refusing compliance as a violation of the compact, hastened to the American camp. Being shortly after taken prisoner by the English, he was tried and hanged. Consult Anon., 'Col. Isaac Hayne' (in *Historical Magazine*, Vol. XII, p. 76, 1867); Lee, Henry, 'Memoirs of the War in the Southern Department of the United States' (new ed., New York 1869); Ramsay, D., 'The History of South Carolina, 1670-1808' (Charleston 1809).

**HAYNE, Paul Hamilton**, American poet: b. Charleston, S. C., 1 Jan. 1830; d. Grovetown, Ga., 6 July 1886. He was a nephew of R. Y. Hayne (q.v.) and was educated at the Charles-

ton College, studied law and engaged in journalism. He served in the Confederate army till forced to resign on account of ill health, and lost nearly all his property through the bombardment of Charleston and the subsequent pillage. With the little left to him he retired to Copse Hill, Grovetown, Ga., where he spent the rest of his life, a partial invalid. His verse is marked by grace and melody and he ranks almost the first among distinctively southern poets. He published 'Poems' (1855); 'Sonnets and Other Poems' (1857); 'Legends and Lyrics' (1872); etc. A complete edition of his poems appeared in 1882.

**HAYNE, Robert Young**, American statesman: b. Colleton District, S. C., 10 Nov. 1791; d. Asheville, N. C., 24 Sept. 1839. After studying law he was admitted to the bar in 1812; and served in the second war with Great Britain, returning at its close to his practice in Charleston. He was a member of the State legislature 1814-18, and became Speaker, was attorney-general of the State in 1818-22, and a United States senator 1823-32. He vigorously opposed protection, and in 1832 boldly supported in Congress the doctrine of nullification. Daniel Webster's reply to Hayne upon this theme is classed among the former's ablest speeches. In November 1832 South Carolina adopted an ordinance of nullification, in December Hayne was elected governor, and the State prepared to resist the Federal power by force of arms. A compromise, however, was agreed to, and the ordinance was repealed. Hayne was mayor of Charleston in 1834.

**HAYNE, William Hamilton**, American poet: b. Charleston, S. C., 11 March 1856. He is the son of Paul Hamilton Hayne (q.v.). He received a secondary education, from 1879 contributed extensively to various periodicals, and published 'Sylvan Lyrics and Other Verses' (1892).

**HAYNES, hânz, Arthur Edwin**, American mathematician: b. Van Buren, N. Y., 23 May 1849; d. 12 March 1915. After graduation from Hillsdale College, Mich., in 1875 became instructor of mathematics and physics there in the same year; and was professor, 1877-90. He held the same position in Michigan Mining Schools in 1890-93, and was assistant professor of mathematics at the University of Minnesota, 1893-96, in its engineering department 1896-1901, and professor of engineering mathematics 1901-12. He has published 'The Desirability of Uniformity in the Use of Mathematical Symbols and Terms'; etc.

**HAYNES, hânz, Elwood**, American inventor: b. Portland, Ind., 14 Oct. 1857. He was graduated at the Worcester Polytechnic Institute in 1881 and in 1884-85 took a post-graduate course at the University of Johns Hopkins, Baltimore, Md. He was employed as science teacher at the Eastern Indiana Normal School, Portland, Ind., in 1885-86 and for the following four years was manager of the Portland Natural Gas and Oil Company. From 1890 to 1901 he was field superintendent of the Indiana Natural Gas and Oil Company since 1898. In 1881 he discovered tungsten chrome steel; in 1899 an alloy of nickel and

chromium, and shortly afterward an alloy of cobalt and chromium. The last named alloy was developed by him in 1910 to make it suitable for cutting instruments and the business of its manufacture as a commercial product grew rapidly. In 1893-94 Mr. Haynes designed and constructed a horseless carriage, which is the oldest American automobile in existence and is now on exhibition at the Smithsonian Institution, Washington, D. C. In 1895 he introduced aluminum in automobile construction and in 1903 invented and constructed the rotary valve gas engine. In 1911 alloys of cobalt, chromium and tungsten, and of cobalt, chromium and molybdenum were discovered by Mr. Haynes. He is president of the Haynes Stellite Company which since 1912 has been engaged in the manufacture of tools from this material. He is a member of the American Chemical Society, the Society of Automobile Engineers and of the Iron and Steel Institute of London, England. In 1912 he was a member of the organizing committee of the Eighth International Congress of Applied Chemistry, at New York and Washington.

**HAYNES, John**, American colonial governor: b. Old Holt, Essex, England; d. Hartford, Conn., 1 March 1654. He came with Hooker and his company to Boston in 1633, was soon after chosen assistant, and in 1635 governor of Massachusetts. In 1636 he removed to Connecticut, being one of the prominent founders of that colony. In 1639 he was chosen its first governor, and every alternate year afterward, which was as often as the constitution permitted, till his death. He was one of the five who in 1638 drew up a written constitution for the colony, which was finished in 1639, the first ever formed in America, and which embodies the main points of all our subsequent State constitutions, and of the Federal constitution.

**HAYS, Isaac**, American physician and editor: b. Philadelphia, 5 July 1796; d. there, 12 April 1879. He was graduated from the University of Pennsylvania in 1816 and from its medical school in 1820. In addition to his long service as general practitioner he was for 52 years on the staff of the 'American Journal of the Medical Service.' In 1843 he established a monthly, the *Medical News*, and in 1874 the *Monthly Abstract of Medical Science*. He edited 'Wilson's American Ornithology' (1828); 'Hoblyn's Dictionary of Medical Terms' (1846); 'Lawrence on Diseases of the Eye' (1847); and 'Arnott's Elements of Physics' (1848). He was president of the Philadelphia Academy of Natural Sciences (1865-69).

**HAYS, Willet Martin**, American agriculturist and plant breeder: b. Hardin County, Iowa, 19 Oct. 1859. He received his academic education in Oskaloosa College, after which he spent one year in Drake University. He graduated from the Iowa State College of Agriculture in 1885. He was made an assistant in Agriculture in the Iowa State College in 1886, and became associate editor of the *Prairie Farmer*, at Chicago, in 1887. He then entered the service of the Agricultural College and Experiment Station of the University of Minnesota, where he was engaged from 1888 to 1891,

when he resigned to accept a position as professor of agriculture and agriculturist of the experiment station at the North Dakota Agricultural College. This position he left to accept a similar position at the University of Minnesota, which he held until the end of 1904, when he was appointed assistant secretary of Agriculture at Washington. During the course of his service with the Minnesota Agricultural Experiment Station, he perfected and published methods of breeding and producing new varieties of wheat, corn, flax, alfalfa and other field crops, which have been adopted and widely used by seed-breeding specialists in this country and abroad. He also produced and introduced several new and valuable varieties of wheat. He organized and served as the secretary of the Minnesota Field Crop Breeders' Association, and was the organizer and first secretary of the American Breeders' Association and was the editor of its annual report. He is the author of a number of books, including 'Plant Breeding,' 'Variation in Cross-Bred Wheats,' 'Agricultural Industries and Home Economics,' 'Breeding Plants and Animals,' 'Education for Country Life,' 'Farm Development,' and is co-author (with Edward C. Parker) of 'The Cost of Producing Farm Products.' He served as Assistant Secretary of Agriculture from January 1905, to March 1913.

**HAYS, William Jacob**, American painter: b. New York, 8 Aug. 1830; d. there, 13 March 1875. He studied art under John Rubens Smith, and his 'Dogs in a Field,' exhibited in the Academy of Design in 1850, won him the reputation of an animal painter of remarkable fidelity to nature and spirit in design. He studied the bison in the upper waters of the Missouri and the deer in Nova Scotia. His 'Bison Bull at Bay' and 'Herd of Caribou in Nova Scotia' are characteristic pictures.

**HAYS, William Shakespeare**, American song-writer and composer: b. Louisville, Ky., 19 July 1837; d. 23 July 1907. In 1857 he became a reporter for the Louisville *Democrat*, subsequently was clerk and captain of steamboats on the Ohio and Mississippi, and became marine editor of the Louisville *Courier Journal* and *Times*. He wrote and composed more than 300 songs, among them 'Nora O'Neil,' 'Molly Darling,' 'Write Me a Letter from Home,' 'The Little Old Cabin' and 'Shamus O'Brien'; published 'Poems and Songs' and claimed to be the author of 'Dixie.' His songs sold very extensively.

**HAYS, Kan.**, city, county-seat of Ellis County; on Big Creek, and on the Union Pacific Railroad; about 222 miles west of Topeka. It is in a fertile agricultural region. The chief manufactures are flour, dairy products and machinery. It has grain-elevators, flour mills, machine shops, etc., and there are large annual shipments of grain, flour and live stock. It is the seat of a Normal school and of a State agricultural experiment station. The experiment station is connected with the State Agricultural College, which owns near Hays 2,000 acres of land. The waterworks are municipally owned. Pop. 1,961.

**HAYTI**. See HAITI.

**HAYWARD** (properly "haw-ward," keeper of the haws or hedges, and still no pronounced, or rather as "howard," in country districts; the family name Howard as well as Hayward is from this), a town officer in old New England, whose duty was to keep the cattle on the roads from breaking through the hedges or fences into enclosed grounds and to impound them if they did so. The title came to be generic for a cattle-ward, and the hog-reeve was frequently known as a "hog howard."

**HAYWARD**, Wis., town, county-seat of Sawyer County; on the Namakagon River, and on the Chicago, Saint Paul, Minneapolis and Omaha railroads; about 63 miles by rail southwest of Ashland. It is in the vicinity of the lumber region of the State, and the chief industry is lumbering. Agriculture is also important and it contains a flour and feed mill, a pickle factory, and a creamery. The water system is the property of the town. It has a government Indian school and a public library. Pop. 2,869.

**HAYWOOD, Marshall DeLancey**, American author: b. Raleigh, N. C., 6 March 1871. He was educated at the Raleigh Academy and at Johns Hopkins University. Since 1901 he has served as librarian of the North Carolina Agricultural and Mechanical College, librarian of the State library at Raleigh and editor of the 'Biographical History of North Carolina.' He is a member of numerous historical societies, and has written several books, among them 'Governor William Tryon and His Administration in the Province of North Carolina' (1903); 'Freemasonry in North Carolina and Tennessee' (1906); and 'The Mecklenburg Declaration'; 'Lives of the Bishops of North Carolina' (1910); 'Ballads of Courageous Carolinians' (1914).

**HAZAEEL**, hā'zēel, king of Damascus, who ruled about 850 B.C. The story of his elevation to the throne according to the prophecy of Elisha is contained in II Kings viii, 7-15. He was successful in his struggle to keep Ramoth-Gilead from his enemies, Joram of Israel and Ahaziah of Judah; and wrested all of the trans-Jordanic provinces of Israel from Joram's successor, Jehu. Hazael's attacks against Judah were abandoned at the presentation of tribute from King Jehoahaz. He was succeeded by his son Benhadad.

**HAZARD, Caroline**, American college president: b. Peacedale, R. I., 10 June 1856. She was educated in Providence and in Europe, and in 1899 was appointed president of Wellesley College, Mass., receiving the degrees of M.A. and Litt.D. from the University of Michigan and Brown University the same year. She is a granddaughter of R. G. Hazard (q.v.) and has published 'The Narragansett Friends' Meeting in the 18th Century' (1899); 'Thomas Hazard: a Study of Life in Narragansett in the 18th Century' (1893); 'Some Ideals in the Education of Women' (1900); 'A Scallop Shell of Quiet' (1908); 'The College Year' (1910).

**HAZARD, Ebenezer**, American author: b. Philadelphia, 15 Jan. 1744; d. there, 13 June 1817. He was graduated from Princeton in 1762, in 1782-89 was postmaster-general, and from 1791 was in business in Philadelphia, where he assisted in the establishment of the North Amer-

ican Insurance Company. He published 'Historical Collections' (1792-94) and 'Remarks on a Report Concerning Western Indians.'

**HAZARD, Rowland Gibson**, American manufacturer and philosopher: b. South Kingstown, R. I., 9 Oct. 1801; d. Peacedale, R. I., 24 June 1888. He was a successful business man, being long engaged in the woolen manufacture in Peacedale. He also wrote on philosophical subjects; his works including 'Language, its Connection with the Constitution and Prospects of Man' (1836); 'Essays on the Resources of the United States' (1864); 'Causation and Freedom of Willing' (1869).

**HAZE**, a condition of the atmosphere which deadens the blueness of the sky and obscures the sharp outlines of distant objects. Haze is due to fine dust in the air or to extreme heat, the latter being known as heat-haze. In certain parts of China the haze is like a thin fog. Extensive forest fires create a smoke-haze, of a dense blue color, which drifts like rain clouds hundreds of miles from the scene of the fire. Volcanic eruptions throw fine dust into the air in enormous quantities, forming a haze which is carried many hundreds of miles. See DUST.

**HAZELNUT**, or **FILBERT**, a genus (*Corylus*) of shrubs and trees of the family *Betulaceae*, confined to the northern hemisphere. The male flowers are in long cylindrical aments or catkins; and the fruit, a nut, is marked at its base with a large cicatrix. The inflorescences of the hazel are developed in the year preceding their appearance; the male flowers last over the winter, naked; the female inflorescence is enclosed in a bud. In early spring the male catkins elongate and produce an abundance of dry pollen, while the female inflorescences are distinguishable from the leaf buds only by their larger size and projecting red stigmas. The nut is enveloped at the base by a sheath of succulent bracts.

The European hazel (*C. avellana*), from cultivation has produced several varieties, differing in the size, shape and flavor of the nuts, which are commonly known under the name of filberts. It grows in all situations and is easily cultivated, but a light and tolerably dry soil is the most suitable. The best nuts come from Spain, where they are baked in large ovens before export, in order to ensure their preservation. Other species occur in southern Europe and Asia. The American hazel (*C. americana*) very much resembles the European, but is lower in stature. It is common in most parts of the eastern United States, but has not been cultivated. A second species (*C. rostrata*) also occurs in eastern North America and a third is found in California.

The oil which is obtained from hazelnuts by pressure is little inferior in flavor to that of almonds, and chemists employ it as the basis of fragrant oils artificially prepared and used by perfumers, because it easily combines with and retains odors. In many parts of England hazels are planted in coppices and hedge-rows for several useful purposes, but particularly to be cut down periodically for charcoal, poles, fishing-rods, etc. In brewing, the dried twigs were used as a substitute for yeast when they were soaked in fermenting liquor. Being extremely tough and flexible, the branches are used for

making hurdles, crates and springles to fasten down thatch. They are formed into spars, handles for implements of husbandry, and when split are bent into hoops for casks. Charcoal made from hazel is much in request for forges, and when prepared in a particular manner is used by painters and engravers to draw their outlines. The roots are used by cabinet-makers for veneering; and in Italy the chips of hazel are sometimes put into turbid wine for the purpose of fining it. Finally forked twigs of the European hazel were formerly used by diviners to determine the position of water, gold, etc.

**HAZELTINE**, hā'zēl-tīn, Mayo William-son, American journalist and literary critic: b. Boston, Mass., 24 April 1841; d. Atlantic City, N. J., 14 Sept. 1909. He graduated from Harvard, studied also at Oxford, practised law until 1878 and was then appointed literary editor of the *New York Sun*. He became widely known as a critic for his reviews in the *Sun*, and has published in book form 'Chats about Books' (1883); 'British and American Education'; 'The American Women in Europe.'

**HAZEN**, Charles Downer, American college professor: b. Barnet, Vt., 17 March 1868. Studied at Dartmouth and the universities of Göttingen, Berlin and Paris, and returned to take his Ph.D. in Johns Hopkins in 1893. He was head of the department of history in Smith College (1894-1914); lecturer in Columbia University (1910-11) and in Johns Hopkins (1915-16). He is author of 'Contemporary American Opinion of the French Revolution' (1897); 'Old Northampton' (1904); 'Europe Since 1815' (1910); 'Modern European History' (1916). He has also written for scientific periodicals and is co-author of 'Historical Sources in Schools.' 'Alsace-Lorraine under German Rule' appeared in 1917.

**HAZEN**, John Douglas, Canadian statesman: b. Oromocto, N. B., 5 June 1860. He is a graduate of the University of New Brunswick and was called to the bar in 1883. He represented Saint John city and county in the House of Commons 1891-96; was elected to and became leader of the opposition in the local legislature in 1899, and premier 1908-11. In 1911 he re-entered the House of Commons and in that year was appointed Minister of Marine and Fisheries in the Borden administration.

**HAZEN**, William Babcock, American soldier: b. West Hartford, Vt., 27 Sept. 1830; d. Washington, D. C., 16 Jan. 1887. He was graduated at West Point in 1855, went to the front in the Civil War in command of 41st regiment of Ohio Volunteers, which he himself had recruited in 1861, served actively in Ohio, Kentucky and through the Atlanta campaign and in Sherman's march through Georgia, and in 1865 took command of the 15th army corps. He observed the Franco-Prussian War on French territory and was at Vienna as military attaché to the United States legation during the Turko-Russian War. Appointed chief signal officer in 1880, with the rank of brigadier-general, he employed scientists as observers, introduced "cold-wave" signals and suggested the standard-time meridians at present in use. He published 'The School and the Army in Germany and France, with a Diary

of Siege Life at Versailles' (1872); 'Our Barren Lands' (1875); and 'A Narrative of Military Career' (1885).

**HAZLETON**, hā'zēl-tōn, Pa., city situated in Luzerne County, on the Pennsylvania and the Lehigh Valley railroads, about 24 miles south of Wilkes-Barre. The city was settled in 1820, incorporated as a borough in 1840 and chartered as a city in 1890. It occupies a picturesque site at an elevation of 1,700 feet and is popular as a summer resort. It is situated in the anthracite coal region and its industrial interests are largely connected with the mining and shipping of coal. Its chief manufactures are foundry and machine-shop products, carriages, paper boxes, shirts, underwear, lumber, beer, baking-pans, cattle-powder, cigars, coffins and caskets. It has knitting mills, silk mills, three daily and eight weekly newspapers. It contains a State hospital for miners, 30 churches, a city hall, Hazel Park, a summer resort, United Charities Home, three banks, a convent, high school and Saint Gabriel's Academy. Hazleton adopted the commission form of government in 1913. Pop. 27,511.

**HAZLITT**, hāz'lit, William, English critic and essayist: b. Maidstone, Kent, 10 April 1778; d. Westminster, 18 Sept. 1830. His father, a friend of Benjamin Franklin, was a Unitarian minister, and with his family was in the United States 1783-87, locating at Philadelphia and Boston. In 1793 William became a student in the Unitarian College at Hackney. He devoted more time, however, to literature and art than to theology, and upon leaving college resolved to become a painter. He painted portraits with only tolerable success and finally renounced art, and in 1805 opened his literary career with an essay 'On the Principles of Human Action,' in which much metaphysical acumen was displayed. In 1811 he settled in London, deriving his principal support from his contributions of political articles and theatrical and art criticisms to the newspapers, and his occasional lectures and publications. In 1813 he delivered at the Russell Institution a course of lectures on "English Philosophy," and subsequently delivered courses of lectures on the English poets generally, the comic poets and the Elizabethan poets. Later in life he contributed to the *Edinburgh Review* and some smaller magazines. He was a good art critic, but his tendency to prejudice and paradox, and his almost contemptuous regard for the productions of contemporary genius, render him a less safe authority than his knowledge and talents would lead us to expect. It is said of him that he never altered an opinion after he had reached the age of 16, and never read any book through after the age of 30. It is as a literary critic and essayist that Hazlitt achieved his chief success. Saintsbury has said that "long before Sainte-Beuve, Hazlitt had shown a genius for real criticism." He has probably not been surpassed by any English critic. Yet his recognition, in view of this fact, has been singularly inadequate to his merits. His judgment was, it is true, often marred by prejudice and by his paradoxes. But in the main it was discriminating and duly appreciative. His equipment might not now be thought adequate, but it was almost certainly in most respects superior to that of his Georgian con-

temporaries. He was able to write interestingly of a wide range of topics. He was bitterly attacked, after the custom of the times, by writers, particularly journalists, of adverse political views. But as a controversialist he was more than the equal of any of these, bold in epigram and invective. His style has been highly praised for its combination of vigor and ease, its rhythm, its clearness and the aptness of its epithets. Not only in critical analysis but as well in narrative and description it is excellent. Hazlitt lectured in 1818-21 at the Surrey Institute. Northcote states that had he continued his art work he would have become a great painter. The best of his essays for the *Examiner* appeared in 1817 under the title 'The Round Table.' The 'Spirit of the Age, or Contemporary Portraits,' also a significant work and by some critics considered his best, was published in 1825. Further essays are grouped in 'The Plain Dealer' and 'Sketches and Essays.' Among other well-known works of Hazlitt are 'Characters of Shakspeare's Plays' (1817); 'A View of the English Stage' (1818); 'Lectures on the English Poets' (1818); 'Lectures on the English Comic Writers' (1819); 'Lectures on the Elizabethan Age' (1821); 'Life of Napoleon Bonaparte' (4 vols., 1828). There is an edition of the 'Works' with an introduction by Henley (1902), and a 'Life' by Augustine Birrell (1902). Consult also the 'Memoirs,' by W. Carew Hazlitt (1867), and Saintsbury, 'Essays in English Literature' (1890); 'History of Criticism' (1900).

**HAZLITT, William Carew**, English author: b. London, 22 Aug. 1834; d. 8 Sept. 1913. He is a grandson of William Hazlitt (q.v.). He was at first a civil engineer, relinquished that profession for journalism and finally took up that of literature. Among his numerous works are 'History of the Venetian Republic' (1860); 'Memoirs of William Hazlitt' (1867); 'Bibliographical Collections and Notes' (1876-92); 'Letters of Charles Lamb' (1886); 'Four Generations of a Literary Family' (1897); 'Leisure Intervals,' poems (1897); 'Coins of Europe' (1893-97); 'Lamb and Hazlitt' (1900); 'Shakespeare: the Man and His Work' (1908); 'Faiths and Folklore' (1905); 'Some Prose Writings' (1906); 'A Roll of Honour' (1908).

**HAZOR, or CHAZOR** (Heb., enclosure), the name of several places in ancient Palestine, the best known of which was the seat of Jabin, a Canaanitish king of considerable power, who, with his allies, was defeated by Joshua (Josh. xi, 1-13). Though it recovered and oppressed Israel, it was conquered a second time by Barak (Judges iv) and remained in the possession of Israel until the invasion of Tiglath-pileser. Solomon made it a northern frontier fortress (1 Kings ix, 15). Its site has been variously placed. Consult Hastings' 'Dictionary of the Bible' (1899).

**HAZZARD, David**, American politician and jurist: b. Broadkill Neck, Sussex County, Del., 18 May 1781; d. 8 July 1864. He served as an ensign in the War of 1812, was elected governor on the American Republican ticket in 1829, and subsequently was State senator and an associate judge. During his administration as governor, a constitutional convention was held at Dover, Del., by which, among various re-

visions, the governor's term was changed from three to four years. Hazzard was a member of the Constitutional Convention of 1852.

**HEAD, Barclay Vincent**, English numismatic scholar: b. Ipswich, Suffolk, 2 Jan. 1844; d. 12 June 1914. In 1864 he became an assistant in the British Museum, where in 1893 he was made keeper of the department of coins and medals. He was also appointed joint-editor of the *Numismatic Chronicle*. His chief work is the 'Historia Numamorum' (1887), a valuable study, and the standard one in its department. Among further publications by him are 'History of the Coinage of Bœotia' (1881), and 'Guide to the Coins of the Ancients' (1881).

**HEAD, Sir Edmund Walker**, English colonial administrator and author: b. near Maidstone, Kent, 1805; d. London, 28 Jan. 1868. He was educated at Oriel College, Oxford, became a Fellow of Merton, studied law, was a poor-law commissioner in 1841, and in 1847-54 lieutenant-governor of New Brunswick. From 1854 to his retirement in 1861 he was governor-in-chief of Canada. During his administration the seigniorial tenures (see CANADA—SEIGNIORIAL TENURE) and the clergy reserves (see CANADA—THE CLERGY RESERVES) were abolished. He was afterward governor of the Hudson's Bay Company. He was an art critic of some importance, and published a 'Handbook of Painting of the German, Dutch, Spanish and French Schools' (1848), and other works. His poetical contributions to *Fraser's Magazine* appeared in 1868 in book-form.

**HEAD, Sir Francis Bond**, English colonial administrator and author: b. near Rochester, Kent, 1 Jan. 1793; d. Croydon, Surrey, 20 July 1875. Educated at Woolwich, he became first lieutenant of engineers in 1811, was at Waterloo and at Fleurus, retired from the army in 1825, and went to South America as a prospector in gold and silver mines. Of some of his experiences there he gave an account in 'Rough Notes of a Journey in the Pampas and Andes' (1828). In 1836 he was appointed lieutenant-governor of Upper Canada. His administration was a decidedly unfortunate one. Unfamiliar with the political status of the country, he opposed the union of the provinces, and endeavored to conduct the government without the assistance of a council. This state of affairs may be regarded as the chief cause for the part taken by Upper Canada in the insurrection of 1837. He was recalled in 1838. His numerous publications include 'Bubbles from the Brunnen of Nassau' (1833); 'The Defenceless State of Great Britain' (1850); 'The Horse and His Rider' (1860); 'The Royal Engineer' (1869).

**HEAD, Sir George**, English writer of travels, etc.: b. Higham Parish, Kent, 1782; d. 1855. He held various posts in the army, and was present at most of the great battles of the Peninsula. In 1814 he proceeded to Canada to be chief of the commissariat of a proposed navy on the Canadian lakes, and subsequently published his experiences in 'Memoirs of an Assistant Commissary-General' and 'Forest Scenes and Incidents in the Wilds of North America.' He was knighted in 1831. He also wrote 'Rome, a Tour of Many Days'; 'A Home Tour Through the Manufacturing Districts of England,' and 'A Tour Through

Various Parts of the United Kingdom' and other works.

**HEAD, Natt**, American politician: b. Hookset, N. H., 20 May 1828; d. there, 12 Nov. 1883. He became a railroad and general building contractor, sat in the State legislatures of 1861 and 1862, was adjutant-general of the State in 1864-70, and in that capacity published a four-volume military record of New Hampshire during the Civil War. In 1876 and 1877 he was elected to the State senate and in the latter year was its president. He was governor in 1879-80.

**HEAD**, the anterior or front part of the body of an animal when it is marked off by a difference in size, or by a constriction. The presence or absence of a head was formerly much used as a character in classification. But this line of classification is artificial. The mouth and principal nervous organs are the guides to the anterior end of the body, where the head, when recognizable, is situated. In the protozoa, infusoria and celerenterates, such as the hydra and corals, there is no nervous ganglion, and the mouth is not surrounded by special structures. In the inferior worms the front end becomes marked by the presence of ganglia. The so-called head of parasitic animals, such as the tapeworms, is only the end of attachment, but neither mouth nor ganglia exist in it. In the polyzoa, lampshells, ascidians, and lamellibranch mollusks mouth and ganglia exist, but they are not surrounded by special structures. But in the worms proper, the articulated animals, the land and fresh-water gasteropods and the cuttlefishes a head proper

their character; as the brain becomes specialized, so does the brain-case or skull. In man the brain attains its highest development and the head its greatest complexity, the difference between skull and face being now most pronounced. The vertebrate theory of the skull, first propounded by Goethe, is now accepted to this extent, that the skull or cranium consists of three vertebræ, which are recognizable in the fish, and that the facial bones are not vertebræ, but developed from cartilage which did not form an original part of the vertebral column. A vertebræ consists of a body or centre, from which two processes arch upward and close in the spinal canal with its contents, the spinal cord. The posterior cranial vertebræ is the occipital, consisting of a centre, two lateral pieces, and a superior, the next is the parietal, of which the basisphenoid is the centre, and the great wings of the sphenoid and the parietals the lateral arches; the most anterior is the frontal, with its centre, the presphenoid, and its arch, formed by the orbital plates of the sphenoid and the frontals. The centres of the spinal vertebræ are ossifications around a fibrocartilaginous rod, the *chorda dorsalis*, which ends in the basisphenoid. So far spinal column and skull have a common base; but the spinal vertebræ were preceded by and are in fact modifications of primitive vertebræ, and no representatives of these appear in the development of the skull. It is therefore open to question whether the three divisions just mentioned are really vertebræ, or should not rather be called cranial segments. There is the more reason

DIAGRAM, ILLUSTRATING GOETHE'S THEORY OF THE VERTEBRATE HEAD.

is found. That is, the mouth and the anterior nervous ganglia are placed in a segment of the body which, by structure, is different from the rest. Thus in the worms and articulated animals some of the rings or articles of which the body is made up are fused together, the appendages being not walking limbs, but modified into jaws or jawlike organs. Thus the common shore-worms possess a structural head, though it is not apparent. The head is first best defined in the insects. The snail's head has its cavity shut off by a diaphragm from the rest of the body cavity. The cuttlefishes have, in addition, a remarkable cartilaginous box, which like a skull, protects the ganglia and gives support to the muscles. The head of the vertebrated animals presents a regular series of increasing complexity from the amphioxus upward. In that fish the most anterior part of the nervous cord is lodged in a canal scarcely distinct from that which contains the rest of it. Ascending in the series, it becomes evident that as the anterior nervous mass enlarges, and its ganglia increase in complexity, the anterior vertebræ change

for this that in fishes the basisphenoid and presphenoid are represented by a single bone, the parasphenoid, which underlies the skull, but disappears in the higher vertebrates, and that the presphenoid is not properly connected with the *chorda dorsalis*, but rather belongs to the series of facial bones. The pituitary body which projects from the lower surface of the brain lies in front of the end of the *chorda dorsalis*: from the latter rod and its surroundings a plate of cartilage passes forward on either side of the pituitary body, and these (the *trabeculae*), meeting in front of that body, form the cartilaginous axis around which the vomer, ethmoid, and other facial bones are developed, while the presphenoid is an ossification in this axis just where the two portions meet in front of the pituitary. The sense organs, the ear and the eye, are, so to speak, lodged in capsules of bone which are inserted, the ear between the occipital and parietal, the eye between the parietal and frontal segments. They are accidental, not essential parts of the cranium. The hyoid apparatus and the lower and upper jaws are

developed from the cartilaginous walls of the embryonic skull, and the jaws come in a secondary manner to take part in the composition of the face. (See RESPIRATORY ORGANS). The increasingly globular form of skull in the vertebrates is due to the greater increase of the cerebral hemispheres relatively to that of the base of the brain and axis of the skull; hence the brain comes in man to overhang the face. Of course it is to be remembered that while in the vertebrate animals the head is divided by its axis (commencing at the middle line of the upper jaw and passing backward through the basisphenoid to the vertebral centres) into an upper chamber, lodging the brain, and a lower, lodging the first part of the alimentary canal, in the lower animals the cavity is a single one, the œsophagus piercing the nervous system so as to reach the surface of the body, and thus coming to be surrounded by a pair of ganglia above and a pair below, with the filaments connecting these ganglia. In the vertebrate the head is curved downward, the basisphenoid being the pivot point, so that the mouth is pushed to the lower surface; in the lower animals the under surface of the body curves upward, so as to carry a part of the nervous system past the mouth toward the upper surface. The eyes and feelers of a crab are in fact modified limbs which are thus carried upward; the jaws and sense organs of a vertebrate are entirely distinct from the limbs and other appendages of the trunk.

**HEAD-HUNTING.** See DYAKS.

**HEAD MONEY**, an immigration tax of 50 cents levied by act of Congress 3 Aug. 1882 on every foreigner brought to the United States. Before the passage of this act the State of New York levied a "head tax" on all immigrants arriving at New York, the funds going to the support of the State board of immigration. A test of the legality of the tax being made in the courts, a decision was rendered that the New York statute was void because it infringed on the prerogatives of national government. Subsequently the act of Congress imposing the tax was questioned in the United States Supreme Court, and a decision affirming the constitutionality of the law was made. The national act provides that the tax shall be paid by the master or owner of the vessel bringing the immigrants, to the collector of the port, and by him turned over to the treasury of the United States, to be used by the secretary to defray the expenses of regulating immigration and to relieve immigrants in distress. The tax was increased to \$2 per head in 1903, and by act of 20 Feb. 1907, amended 26 March 1910, was again increased to \$4 per head. See IMMIGRATION.

**HEADACHES**, or pains in the head, arise from a multiplicity of causes. In general they may be divided into two great groups: Those due to changes in tension within the brain, largely brought about by changes in the blood-vessels. Sick headache—so-called congestive headache—or they are really not headaches, but various forms of pain about the head and face—neuralgias of various kinds. Headaches are for the most part of the first variety and are related to changes in the vascularity of the brain structures, which blood-vessel changes result from a complicated series of events. The simplest are the headaches due to blood-vessels'

reactions to infections. These infections may be of various kinds—influenza, measles, typhoid, malaria, etc. The general systemic reaction, as recorded in the brain structures, serves as a notice to consciousness through pain that something is wrong. Quiet is enforced and attention intelligently directed toward finding the faulty function. These headaches are usually self-limited. When the infection involves the brain or meningeal structures then various forms of meningitis arise with their own special type of headache. (See MENINGITIS). Emotional disturbances, however, are the most frequent cause for headaches. Nearly all of the headaches called stomach or intestinal are in reality emotional. The reaction to the emotions—often unconscious, and taking place during the night life even, and often headaches are present on awakening in the morning—is to bring about states of altered pressure within the brain, which are registered as headaches. This form of emotional headache may be thought of as a scapegoat, a bodily carrier for faulty management of unconscious wishes. Similar headaches from pressure of organs within the brain are not infrequent. Thus in growing adolescents, pituitary pressure may cause severe headaches. With enlargement of the sella turcica such headaches may clear up. In certain types of kidney disturbance, severe headaches occur also. Anæmia is mainly the cause here. Poisoning from withheld products healthfully eliminated by the kidneys may also account for some of these. Consult Forscher's 'Therapeutics'—*Treatment of Headaches*.

**HEADLEY**, héd'li, Joel Tyler, American historian: b. Walton, N. Y., 30 Dec. 1813; d. Newburg, N. Y., 16 Jan. 1897. Graduated from Union College in 1846, he took a course in theology at the Auburn Seminary, was pastor at Stockbridge, Mass., and in 1846 became assistant editor of the *New York Tribune*. In 1856-57 he was secretary of State for New York. His works, written in a popular vein, had great currency in their day, and include 'Napoleon and his Marshals' (1846); 'Washington and his Generals' (1847); 'The Adirondacks' (1849), said to be the first book to advocate that region as a health-resort; 'Grant and Sherman, their Campaigns and Generals' (1865); 'The Great Rebellion' (1864), and other works on that subject.

**HEADLEY**, Phineas Camp, American Congregational clergyman: b. Walton, N. Y., 24 June 1819; d. Lexington, Mass., 1903. He was a brother of J. T. Headley, the historian (q.v.). He was admitted to practise at the bar in 1847, but studied theology at Auburn Seminary, held pastorates in various Presbyterian and Congregational churches, and contributed to the *New York Observer* and *Tribune*, and many other newspapers and magazines. Among his works are 'Women of the Bible' (1850); biographies of the Empress Josephine (1851), Kossuth (1852), Lafayette (1853), Mary, Queen of Scots (1856), Ericsson (1863), Faragut (1864), and others; 'Half-Hours in Bible Lands' (1867); 'Court and Camp of David' (1868); and 'Public Men of To-day' (1882).

**HEALTH**, Public, Regulation of, supervision, protective and preventive work through-

out the nation, carried on by the United States Public Health Service, a branch of the Treasury Department, under the directorship of a commissioned medical officer, with the title of Surgeon-General. The headquarters is in Washington, D. C. Important achievements of the service are the suppression of yellow fever in the South; the control of bubonic plague in California, Porto Rico and New Orleans; the discovery of an effective method for the prevention and treatment of pellagra; demonstrations of how malaria may be prevented in practically any locality at a comparatively small cost; the establishment of a series of trachoma hospitals and the institution of educational measures to combat the spread of trachoma in the Appalachian Mountains; and the beginning of a nation-wide campaign for the improvement of rural sanitation, which has already resulted in great diminution of disease in the districts where the methods advocated have been applied. On the entry of the United States into the European War the service took charge of the sanitation of extra cantonment zones, cooperating with the military and State and local health authorities in bringing about the elimination of any insanitary conditions which might threaten the health of the military forces and the civilian population. At the Hygienic Laboratory in Washington, technical studies are carried on, and there also are conducted the tests of preparations necessary for the enforcement of the law regulating the sale of biological products in interstate traffic. The Division of Scientific Research supervises field and laboratory investigations of infectious diseases, industrial and school hygiene, rural sanitation, public health administration, coastal waters, shellfish pollution and water supplies and sewage. Field headquarters and laboratories are located at convenient places throughout the country. The Foreign and Insular Quarantine and Immigration Division supervises the 61 quarantine stations in the United States; 26 stations in the insular stations; 89 stations for the medical inspection of immigrants; while, 18 officers are stationed at foreign American consulates to assist in the administration of the quarantine laws and the medical inspection of emigrants. The Division of Domestic (Interstate) Quarantine supervises measures for the prevention of the spread of infectious and contagious diseases in interstate traffic and the administration of the interstate quarantine regulations relating to food and drink furnished passengers on common carriers. It also cooperates with State and local health authorities in the suppression and eradication of such epidemic diseases as plague, cholera, yellow fever typhus fever, smallpox and leprosy. The establishment of a national home for lepers under the administration of the Public Health Service was approved 3 Feb. 1917 and \$250,000 appropriated for the purpose.

**HEALTH DISTRICT.** See DISTRICT.

**HEALTH EDUCATION.** Health instruction in connection with the schools was inaugurated under the term medical inspection. The original purpose was not to give instruction in health to the children in the schools but to utilize the schools in checking the spread of contagious diseases. The movement was purely voluntary, physicians in leading cities

offering their services without compensation. Probably the first country in the world to require action of any kind in the schools of a health character was France. In 1833 that country required the school authorities to keep all schoolhouses in a cleanly condition, and in 1842 provision was made in France by which physicians were required to visit the schools for the purpose of inspecting the children and also to inspect the sanitary conditions of the school buildings.

The next country to give attention to this subject was probably Germany. In 1874 the city of Brussels began the inspection of its school children, and two years later similar action was taken in the cities of Dresden and Leipzig. Later Weisbaden inaugurated a system of inspection. This city gave the subject greater consideration than had yet been given it either in France or Germany. This city inaugurated a very comprehensive system of physical examination of the school children. The plan required examination of the eyes, ears, nose, throat, lungs, spine, heart and skin. In the case of boys an examination was also made for hernia. A definite record was made of each child and this record was revised from year to year throughout the child's school life. The plan required the school authorities to ascertain the height of each child and the weight of each child twice each year and in the case of children who were below normal standards, such additional examinations as might be necessary. When physical defects were discovered in the children, notice was given to the parents and the parents were required to provide remedial treatment. The school authorities provided no treatment whatever for the children.

Other countries instituted a plan of inspection of school children, although not as effectively as France or Germany, as follows: Hungary, 1877; Norway, 1889; Sweden, 1863; Cairo, Egypt, 1882; Chili, 1888; Japan, 1898. A very complete and scientific system has been in existence in the Argentina for several years. England took no definite or effective action in connection with the treatment of children in the schools until 1908. In that year a medical inspection law was enacted which made it compulsory upon the school authorities of England to provide for the medical inspection of all children in attendance upon school.

New York city has the distinction of being the first city in America to inaugurate health inspection of school children. In 1892 that city appointed a medical school inspector. Boston, however, two years later instituted a very effective system of medical inspection. Chicago began this line of work in its schools in 1895, and in 1898 Philadelphia followed. The work has gradually expanded until nearly every State in the Union does more or less work in health instruction among the children in its schools, and 36 of the States have mandatory statutes requiring the physical examination of all children. The work is thoroughly organized in about 800 of the cities of the country, in many of the smaller villages, and even in the rural districts of several States.

The legal right of school authorities to appoint school physicians, school nurses, etc.,

without direct authority under the statutes has frequently been raised. It is of such vital importance to this subject that the following essential features of an opinion of the Supreme Court of Wisconsin upon the point are given here:

"Education of a child means much more than merely communicating to it the contents of textbooks. But, even if the term were to be so limited, some discretion must be used by the teacher in determining the amount of study each child is capable of. The physical and mental powers of the individual are so interdependent that no system of education, although designed solely to develop mentality, would be complete which ignored bodily health. And this is peculiarly true of children whose immaturity renders their mental efforts largely dependent upon physical conditions. It seems that the school authorities and teachers, coming directly in contact with the children, should have an accurate knowledge of each child's physical condition, for the benefit of the individual child, for the protection of the other children with reference to communicable diseases and conditions, and to permit an intelligent grading of the pupils. All of these considerations, as well as many others unnecessary to mention, convince us that the conclusions of the learned trial judge were entirely right." *State ex rel. Stoltenberg v. Brown*, 112 Minn. 371.

There is one other question in this subject fundamental to the whole plan of health instruction which must be considered. The question is frequently raised as to whether the work which has been done in the schools under the name of medical inspection, physical examination, etc., should be under the direction of the health authorities or the school authorities. At first thought it may be considered desirable to have matters which relate to health under the health authorities. The primary purpose of this phase of work in the public schools is now being accomplished through the schools to provide *better educational advancement* for all the children in attendance upon the schools. It is unfortunate that the terminology used in dealing with this subject at the outset was more of a medical character than an educational character. This was due to the fact that the work was first undertaken, as above stated, for the purpose of checking epidemics, etc. In the large cities where this work was first undertaken it was through the health department and in some of such cities the health authorities still continue to supervise such work. The whole trend of thought during the last 10 years, however, and the general policy pursued throughout the country have been to place health instruction under the school authorities and not the health authorities. About 87 per cent of all the work done in this country in relation to the health of children in the schools is directly under the supervision of the school authorities. The United States Commissioner of Education in his annual report in 1915 said:

"Two gratifying tendencies appear in recent legislative and administrative dealing with medical inspection: The broadening of the scope of medical inspection and the recognition of the educational department as the proper administrative authority. They are interdependent."

Very recently, by an act of Congress, the control of the health work of the schools of the city of Washington was transferred from the board of health of that city to the board of education. In Boston, the second city in the United States to begin this work, the health authorities were responsible for its supervision. Recently the work in that city was transferred from the health department of the city to the board of education.

It is only recently that the educational

forces of the country as well as the people generally have begun to appreciate the service which may be rendered in the improvement of our economic and social conditions by providing thorough and scientific health instruction for every child in the country. The subject of health instruction has not been seriously considered as one of the great problems in the administration of the schools which should be attacked by the State itself. Provision has generally been made for the instruction in physiology and hygiene, in sanitation, etc. Medical inspection has been provided in most of the cities and in rural schools. Open-air schools have been established in several of the cities. Physical training has recently come into prominence. Oral hygiene has received only scant attention and the undernourished child has been considered occasionally. Under State authority all of these various phases of health instruction should be co-ordinated and a general program prepared and carried out in detail by all the schools of the State so that the physical development of every child shall receive the same definite consideration that has for years been given to the intellectual development of the child.

A child has no discretion in this country as to whether or not he shall attend school. Neither have the parents of a child discretion in this matter. The American States have very generally declared under mandatory statutes that the interests of the country demand that every boy and girl from 6 to 14 years of age shall be in attendance upon instruction. If suitable instruction is not provided for a child by his parents either at home or in a private school, such child must attend the public school. The State has, therefore, stretched out its strong arm of authority and declared that every child must be in attendance upon school for a certain number of days each year and generally for a period of eight years. If the State imposes this obligation upon the child, is there not the obligation upon the State to see that such child is properly safeguarded in his physical development as well as in his intellectual development?

The results obtained in all parts of the country through medical inspection, the investigations made by leading foundations and other authorities show that more than 50 per cent of all the children enrolled in the schools are below normal physical standards. If all those having defective eyes and defective teeth were included, the percentage would be much larger. The annual report of the War Department for the year 1916 shows that approximately 133,000 men of military age applied during that year for admission to the United States army. These men may naturally be presumed to have been in good physical condition. They were young men of the best physical type to be found in the country. They were required, in accordance with army regulations, to undergo a rigid physical examination prescribed by the government. Approximately 22,000 of these men were ultimately accepted for service in the army and 111,000 were rejected. If the physical standards prescribed by the government for admission to the army before we entered the World War had been strictly adhered to in creating the army for service in France, less than one-third

of the enrolled men would have been accepted. Thousands of young men were not admitted to the service until they had received treatment and in many cases operations had been performed to cure physical defects from which they were suffering. After this remedial treatment these men were admitted to the service. There are also thousands of boys and girls in school who have physical defects which interfere with their physical and intellectual development. The great function of the school is so to train and develop boys and girls that when they enter into the activities of the social, commercial and industrial life of the nation they shall possess the best equipment possible for efficient service in their own behalf and in behalf of society in general. One of the greatest assets which a girl or boy may possess when leaving school to become a worker and earner is a sound, healthy body. It is as much the function of the school to teach a boy how to care for his body and to see that proper treatment is provided for physical defects which interfere with his normal growth and development or with his progress in school work as it is to teach such boy how to read and to cultivate in him a desire for wholesome literature. It is for this reason that several of the States have, within the last few years, enacted laws requiring medical inspection and laws requiring physical training in all the schools of the State.

One of the effective agencies in this health movement in the schools is the open-air school. These schools are intended for anæmic children and for those who have a predisposition to tubercular troubles. New York city also has the distinction of having organized the first school of this type. In 1904 the board of education of that city organized an open-air school in connection with the Seaside Home for Children at Coney Island. In the same year a school of this kind was organized in Charlottenburg, a suburb of Berlin. Other schools were organized thereafter in some of the German cities and one was established in London in 1907. The school at Coney Island has been in continuous operation since it was first opened. In 1908 an open-air school was organized at Providence, R. I. Nearly all the leading cities of America now have established in their school systems an open-air school and additional schools of this type are being established in each city in the expectation that all anæmic children and predisposed tubercular children shall ultimately be afforded the advantages offered through this type of school. We have not exact figures on the number of children in the public schools who are tubercular but reliable estimates show that there are at least 100,000 enrolled in the public schools of this country who are in the incipient stages of tuberculosis and that there are more than 100,000 others who have been so exposed to this disease that they should be excluded from attendance in the regular grades of the schools. These 200,000 children should be segregated and provision made for their care and instruction in outdoor or open-air schools. These schools provide the three essentials which are necessary in the proper treatment of tubercular cases, which are fresh air, rest and proper nourishment. In some cities an entire building is set aside for the tubercular chil-

dren. In other cities the open-air school is built upon the roof of a school building or in one of the upper corner rooms. A school physician or nurse must be supplied, diet must be furnished and the necessary wraps and clothing must be provided.

The best medical authorities of our time say that many diseases such as rheumatism and infections of various organs including the heart, kidneys, appendix, etc., come from foci of infection. A great proportion of the foci are abscesses at the apices of the roots of teeth or pyorrhea pockets about the teeth. Uncleanliness of the mouth causes the teeth to decay, to be broken down and unfit to properly masticate the food. This results in the food not being broken up into small particles nor mixed with the saliva, the first function of digestion. The stomach and other organs of the alimentary canal are thus called upon not only to assume a burden, but must also receive more or less decayed food, pus and germs from the decaying teeth. Thus unclean mouth conditions result in improper assimilation of the food and nutrition of the body and may cause a poisoning or breaking down of the system.

Considering that not more than 15 per cent of the people make any pretense of taking care of the teeth, that fully 80 per cent of all school children have decayed teeth and 20 per cent of them have dental abscesses which are likely to become foci of infection, it is evident that people as a whole have very little conception of the value of proper mouth conditions. It is strictly an educational problem to bring about a better understanding of Oral Hygiene. No child should leave school who has not been taught to take proper care of his teeth and mouth. No system of health instruction will be effective and complete without a dental clinic.

It is known that in many cities and even in other parts of the country children are sent to school who have not had their breakfast. It is also known that large numbers of children are not provided with the kinds of food which afford the nourishment for the proper physical development and growth of children. This too is a subject which is receiving careful attention in the best school systems of the country, and no general plan of health education will rest upon a sound basis which does not take into consideration instruction in nutrition. When the health examination of a pupil shows that such pupil is under-weight, inquiry will be made to ascertain if the child is also under-nourished. The value of food and economy in food should be considered.

On the question of health, the public, the medical profession, the home and the school have not only been too conservative but have been guilty of gross negligence. All of these agencies have possessed false notions of the propriety of the consideration of certain health and physical conditions on which the children of the country should receive sound, direct, discreet, scientific instruction. This failure in the performance of a sacred duty has resulted in shocking conditions which affect the whole social and moral fabric of the nation. The statement is made by reliable authority that the tests made in certain typical States show that of the 10,000,000 men subject to draft, in the enrollment of the War Department, more than

3,000,000 were afflicted with venereal diseases. This condition is a reflection upon our civilization. There should be great satisfaction and encouragement to those who bear responsibility in this matter in the fact that of the more than 2,000,000 American soldiers serving in France less than 1 per cent was afflicted with these diseases. This fact exemplifies the power and influence of scientific instruction, of publicity and of discipline in dealing with this problem. Surgeon General Gorgas of the United States army recently stated that the army suffers a greater loss in service from its men who have venereal diseases than from its men who are wounded. He further stated that in his judgment very little success will be achieved in correcting this evil until the people generally are educated to believe that it is individual action and individual judgment that are finally going to control in establishing proper standards of life in this respect.

All investigations which have been made show that the need for health instruction in rural communities is greater than the need for such instruction in the cities. Dr. Thomas D. Wood, of Columbia University, a leading authority in this country on the subject of health instruction, makes the following statement:

"It is apparent that, within the last decade, the actual and vaunted physical superiority of country people and children over those living in cities has been reversed, and it is now confidently affirmed that, for the entire population, city dwellers are more healthy than those who dwell in rural districts; city life is more healthy than that of the country. It is just as true, however, and startlingly significant in view of the preceding statements, that most of our best human material for the cities and the nation as well must still come from the country. If rural America is still to be a satisfactory nursery for human life, it must be made healthful and attractive. It must furnish a generous fraction of the best of the population and it must provide conditions favorable for the cultivation of the best."

Health instruction should be given in every schoolroom with the same regularity and definiteness that instruction is given in English or any other subject. The courses of instruction now given in physiology and hygiene should be revised by a competent group of physicians, social hygienists and teachers, and included in the curriculum of every elementary and secondary school in the country under the name of *health* instruction. The examination now improperly called medical inspection or examination or physical examination should be called *health* examination. Every child should look upon a *health* examination as a matter of course and not something unusual in school affairs. The child should expect a *health* examination just as he would expect his history or English examination. The term *health* should be emphasized in every way.

The present system of medical inspection is generally faulty, inefficient and expensive. It will remain so as long as country physicians are employed on a per capita basis in rural schools and part-time physicians are employed in cities. The great bulk of this work should be done by the class-room teacher. No teacher should be graduated from a State normal school, city training school or a training class who has not been trained in her professional course to do the usual health examination work in our schools. No teacher should be licensed to teach who is not qualified to do that work. Special courses should be provided by each State in every city and in suitable centres in

supervisory districts where all teachers in the service may be trained to do this work of *health* instruction. What has been said upon health instruction applies to physical training because physical training is a part of and should be included in health instruction. It is just as essential that a person who goes from an institution for the training of teachers, licensed to teach children, shall be educated and trained to give instruction in health matters as it is that such person shall be educated and trained to teach English, numbers, geography or any other subject in the curriculum. There must, of course, be directors and supervisors of health instruction who shall bear the same relation to health instruction that a supervisor of English or drawing bears to the instruction given in such subjects. The directors and supervisors should be trained in our universities for this work. The leading universities of the country should organize courses for the training of men and women for these supervisory positions. Many of these institutions are so located that they have the advantage of schools of education, medical colleges, courses for registered nurses, health departments and local school systems in which health instruction is given. These various agencies should all be brought into harmonious co-operation so that the schools may have the benefit of their knowledge of and experience in these important health problems.

There is no subject which affects more directly and more vitally the happiness, the social welfare, the industrial productivity and the moral fibre of the nation than the health of its people. While this problem is one which has its embarrassments, it is nevertheless one to be attacked by the schools. It is the duty and obligation of the leaders of public education in this country to predicate the health work of the schools upon standards which will develop men and women who are as fit physically for service in times of peace as the government demands its men shall be in times of war.

Health instruction must not only be given but when the physical examination of a child reveals a physical defect or disability which is an impediment to the normal physical or intellectual development of such child, the teacher in charge of such child should immediately notify the parent of such defect or disability. It is then the legal or moral obligation of the parent to provide such remedial treatment as the child needs. The effectiveness of health instruction depends upon following up cases which need treatment. Unless such treatment is provided, the health instruction partially fails in accomplishing the great end which is intended. A parent should not be permitted to fail to discharge an obligation of this character to his child. Remedial relief should not be provided by school authorities if a parent is able to provide it. This phase of public school work, like all other features of public education, should be administered so as to develop self-respect, independence, and a keen sense of personal obligation. These are all elements of the best standard of good citizenship. When it is known to school authorities that a parent is unable financially to provide such treatment as a child requires, the necessary relief should be provided at public expense by the school authorities.

The question may be raised as to the legal right of the school authorities of a city to compel a parent to supply remedial relief to a child who needs treatment and in case of a parent's inability to provide such relief or treatment, the right of the school authorities to supply the same. It is a well-established common-law rule that a parent is lawfully bound to provide for the support of his infant children. In many States the penal law makes it a misdemeanor for a parent to omit wilfully "without lawful excuse, to perform a duty by law imposed upon him to furnish food, clothing, shelter or medical attendance of a minor." If a parent fails or refuses to provide necessary treatment for his child, the school authorities undoubtedly possess the legal power to provide such treatment.

It is as essential to the economic and social interests to make health instruction mandatory in all the schools of the State as it is to make the teaching of English in all the schools of the State mandatory. There are certain fundamental principles which should be followed in the enactment of compulsory health education statutes. These are as follows:

First: Health education is a school question, and the responsibility for the administration of any school proposition should be placed upon the school authorities. Experience has also demonstrated that the administration of any phase of health education, either medical inspection, physical training, or otherwise, by any other agency will result in waste of funds, in the duplication of effort, in the loss of time and energy on the part of pupils and teachers, and in the usual embarrassments and conflict of authority incident to a division of responsibility of the general direction of any one proposition and will, therefore, result in great inefficiency.

Second: A compulsory school statute of any character will be ineffective unless such statute contains a provision which imposes suitable penalties for the violation of such law or for the failure of the officers who administer the law to properly enforce it. A compulsory health instruction statute should, therefore, contain provisions similar to a compulsory attendance statute by imposing a forfeiture of public funds for failure to enforce the law and by providing for the removal of officers who were charged with administering the law, for failure to perform their duty.

Third: School authorities should be given the same power to employ health instructors, directors and supervisors and school nurses which they possess in relation to the employment of teachers.

Fourth: The courses of study for the training of teachers in public schools must contain adequate provision for instruction in health subjects, and as adequate provision must be made by the State for the training of school nurses, school physicians and other school health workers as is now made for the training of teachers.

Fifth: A State bureau should be maintained in every State department of education which shall give general direction to the health work by providing courses of study, formulating plans for the execution of the work, and developing public sentiment which shall give ade-

quate aid and support for health instruction in every community of the State.

THOMAS E. FINEGAN,  
*Deputy Commissioner of Education and Assistant Commissioner for Elementary Education,  
The State Department of Education, Albany,  
N. Y.*

**HEALTH INSURANCE.** An insurance arrangement for the purpose of providing indemnity for losses sustained because of sickness, these losses being largely of two kinds—loss of earning capacity during the duration of the disease and cost of medical and other aid necessary for recovery. It is known throughout many countries as sickness insurance (*Krankenversicherung*, *L'assurance maladie*), but the term "health insurance" was popularized in the United States by the British National Health Insurance Act of 1911, and this term was adopted in 1915 in discussions of this subject in this country. From the point of view of insurance organization three generic forms of health insurance may be recognized: commercial health insurance, mutual health insurance and social health insurance. See SOCIAL INSURANCE.

Commercial health insurance is being sold to an increasing extent by so-called casualty insurance companies in the United States and Great Britain and to some extent on the Continent. It is a comparatively new branch of the private insurance business, grew out of the accident insurance business and is largely written in connection with accident insurance policies. For many years insurance companies were fearful of writing this business because of the assumed difficulty in avoiding malingering. The earlier policies were limited to certain specified diseases, but though such limited contracts are still in the market, they are less popular than insurance against disability due to any disease. The benefits under this form consist of weekly payments of a specified amount for a limited number of weeks, 26 weeks or 52 weeks or even a longer time. Seldom, if ever, do these contracts provide for the furnishing of medical aid or reimbursement for the expenditure for such medical aid.

**Mutual Health or Sickness Insurance.**—The above described form of commercial health insurance, largely bought by the lower strata of the middle class, occupies only a very small place in the development of health insurance. Mutual health insurance has accomplished very much larger results. Since the continuous possession of good health and the capacity to work is a matter of particularly grave moment to the wage-worker, as compared to other social groups, it is not surprising to find that in most civilized countries the early efforts toward mutual health insurance were made by wage-workers through their manual aid societies. Informal mutual assistance gradually developed into systematic mutual insurance, and largely against the hazards of sickness. Thus developed the strong *Krankenkassen* of the Germanic countries, the *Sociétés de secours mutuels* of France and Belgium, the *Società di Mutuo Soccorso* of Italy, the friendly societies of Great Britain and the fraternal orders of the United States. In some countries this development reached very substantial dimensions, especially during the last 50 years. There are

millions of members in these societies in France as there were in Great Britain before the introduction of the National Insurance Act of 1911.

Notwithstanding this substantial growth, some definite limitations are recognized to the usefulness and efficiency of this form of sickness or health insurance. The need for sick benefits is greater as one goes down the economic ladder. It was usually found, however, that because of the cost, largely the higher groups of the wage-working class insure while the unskilled, low paid laborer seldom purchases such protection. And because the workmen cannot pay much, the service of these mutual insurance societies is usually meagre and inefficient.

*Social health insurance* is usually meant even when the shorter term "health insurance" is used, because of the recognition of the great importance of health for the wage-worker or any other person of modest earnings. The social form presupposes some systematic effort of organized society to extend the benefits of health insurance through appropriate action. Simple regulative legislation has been found to have very little effect and can hardly be expected to have any important effect. It is seldom included under social insurance, unless something more substantial is offered by the state or government—either financial subsidies, or the compulsory principle or both.

Existing systems of social health insurance may be divided into two groups—voluntary subsidized insurance in five countries (Denmark, Belgium, France, Sweden and Switzerland) and compulsory health insurance, which until now has been legislated in 10 European countries, chronologically arranged as follows: Germany, 1884; Austria, 1888; Hungary, 1891; Luxemburg, 1901; Norway, 1909; Serbia, 1910; Great Britain, 1911; Russia, 1912; Rumania, 1912; Netherlands, 1913. In addition many other countries have compulsory health insurance systems for specific industrial groups (particularly mining, railroad and navigation). Compulsory social health insurance has therefore become the predominating form of health insurance for wage-workers.

Under the subsidized form, it is the effort of the state to stimulate the voluntary co-operative efforts through offers of financial aid from the public treasury. These subsidies were very slight in Belgium and France, somewhat higher recently in Sweden and substantial in Switzerland and Denmark; in the latter country they represent nearly one-third of the total cost of insurance. The effect of the subsidies in stimulating insurance is roughly proportionate to the amount of subsidy; Denmark showing the greatest effect, so that nearly 30 per cent of its population is insured.

**Compulsory Health Insurance.**—It is argued in favor of the compulsory method, first introduced on a large national scale in Germany in 1884, that only through compulsion can the neediest and poorest of the wage-workers be brought under and kept under the insurance system, and moreover that only through compulsory system can a part of the cost of the system be placed upon the employers and industry. The rapid extension of the compulsory type of legislation, especially since 1909, seems to indicate a general conversion to this point of view in Europe. It is understood

that but for the European War, several other countries would have been ready to introduce compulsory health insurance systems, and it is generally recognized that at least as far as health insurance is concerned, the compulsory principle has won among expert students of the problem after 25 or 30 years of experimentation in Germanic countries.

Though the 10 compulsory health insurance acts differ considerably in the various details, they agree more or less in certain substantial features. The compulsion is usually made applicable to wage-workers or employed persons within certain income standards. It is not considered necessary to include persons in comfortable circumstances; and persons without an employer are too difficult to keep under the system. For the same or other reasons certain wage-groups are omitted. In all the 10 systems the employer is required to contribute a part of the cost, though the exact amount differs from one-third in Germany to one-half in Hungary. The justification for such contribution from the employer is found partly in the responsibility of industry for a certain portion of the illness among the employees, partly in the responsibility of industry to pay a living wage to the employee, and the recognition that support during, and care of, sickness must somehow come out of the wage, and finally in the consideration that the increased efficiency arising from proper care of the employee will more than compensate the employer for the cost.

The state contribution to compulsory health insurance is a comparatively new principle, though it constituted the backbone of the "subsidized voluntary insurance." Norway made the first effort to include the state subsidy into the compulsory system, but the most important application was found in the British Act of 1911, where the state assumed two-ninths of the total cost, and in addition furnishes various numerous supplementary subsidies, which probably make the state subsidy equal to about one-third of the whole cost.

**Benefits.**—The benefits furnished by the various systems vary in detail, but on the whole follow fairly well-defined standards. The essential two benefits are a weekly allowance and medical aid. The Holland Act of 1913 is the only one which furnishes no medical aid. The weekly benefit is usually fixed on the terms of a percentage of wages (50 to 66½ in various acts, 70 in Holland) but the British act deviates from this in establishing a uniform benefit rate of 10 shillings for men and 8 shillings for women. The duration of these weekly benefits is usually determined at 26 weeks, and thus a line of demarcation is drawn between sickness and chronic invalidity and disability. The British act compensates for invalidity as well, but at a different scale, and after the expiration of the ordinary sickness benefit.

The amount and kind of medical aid required by the act varies, but in actual practice most of the older systems go beyond the requirements of the law in this respect, fairly furnishing hospital aid. Drugs, supplies, etc., must be furnished to the sick according to all the acts except that of Holland. There are two additional benefits which are almost as universal as the two essential ones. Under all the 10 acts, maternity benefits of some kind or other are given to the insured working women

who become mothers, and they usually consist of a special allowance for medical aid, etc. (or such medical and nursing aid in kind) and the regular money benefit for a specified number of weeks (from 4 to 12 weeks) provided the mother abstains from work.

Finally all the acts, with the exception of the British, give a modest funeral benefit. Health insurance cannot undertake to solve the financial problems arising out of the death of the family's breadwinner, but all the systems recognize the necessity of meeting the unexpected funeral expenses at the time when the family is most helpless. In Great Britain this benefit was kept out of the National Insurance Act by the influence of the large industrial life insurance companies, whose policies are held in such large numbers by the wage-workers mainly for the purpose of meeting funeral expenses.

There is a general tendency to extend the benefits of health insurance to the dependents of the insured wage-workers especially as far as medical and funeral and the maternity benefits are concerned. That is already required by the acts of Hungary, Norway and Rumania, and is practised by a good many large German funds. This is based upon the recognition that the efficiency of the health insurance system in improving the general health conditions of the community would be seriously limited by exclusion of the wives and children from the benefits of the improved medical service.

Since the entire method of health insurance has originated in workmen's mutual benefit societies this has considerably influenced the organization of social health insurance. In most acts a certain variety of organization is permitted. The basic or ideal organization is a "local" sick insurance fund, limited to a definite locality; many such funds may, however, exist in the same locality, embracing various industries, or special funds may be organized for employees of individual establishments. These funds are administered according to the requirements of most acts, by joint boards representing employers and employees, according to their respective contributions to the cost. The British system is, however, organized on a very much different basis. The friendly societies had been so strong at the time the act was passed, that to them, under a new designation, "approved societies," was left the practical administration of the health insurance system. The essential difference is that these "approved societies" are administered exclusively by their insured without participation of the employers, that these societies are bound by no geographical or occupational limits, that the choice between any of them is unrestricted. Because of these conditions, it was found impracticable to entrust these societies with the administration of medical aid, which is managed by independent local committees. It is generally admitted that the British plan, from an administrative point of view, is not very efficient.

While these 10 acts are compulsory as to their application and as to certain specified benefits, they usually provide for voluntary extension. Voluntary members within certain economic groups may be admitted and the numerous autonomous funds may extend the various benefits required by the law, either in time, amount or quality, or may add certain other benefits permitted by the act. This is

possible because of the financial autonomy, since under most acts the numerous funds are permitted to charge their insured and the employers as much (within prescribed limits) as is necessary to pay the benefits agreed upon by the representatives of employers and employees. Again the British act is an exception to this rule, since the law determines the weekly contributions which cannot be increased by the individual societies, in which the wage-workers are insured.

**Growth.**—Health insurance is the most developed branch of social insurance next to compensation for industrial accidents, and is probably the largest in actual extent of work done and funds collected and distributed. Probably from 40,000,000 to 50,000,000 wage-workers with their families in Europe enjoyed the protection of compulsory health insurance before the war. In 1912 the German system alone had 21,659 funds with 13,217,705 members, an income of 417,600,000 marks (\$99,400,000) and an expenditure of 395,000,000 marks (\$94,000,000). Of this amount \$39,400,000 was paid in money benefits of various kinds, \$20,400,000 for physicians' services, \$13,000,000 for drugs, \$12,800,000 for hospital treatment and only \$5,140,000, or less than 5½ per cent, for administrative expenses.

**Movement in the United States.**—With the rapid extension of workmen's compensation for industrial accidents in 34 States in the brief period of 1911 to 1916, and also for industrial diseases in a few States, an object lesson in social insurance methods has been given, which quickly developed into a demand for the extension of the same principles and methods to health insurance. In the fall of 1915 the American Association for Labor Legislation issued a tentative draft of a compulsory health insurance act, which was introduced in the spring of 1916 in the legislatures of Massachusetts, New Jersey and New York. These bills failed of passing but led to the appointment of an investigating commission in Massachusetts and a similar commission appointed in 1915 in California had specialized in health insurance. The American Medical Association, the American Public Health Association, the National Conference of Charities and Correction and many similar organizations, as well as State federations of labor, and national or international labor unions have either formally endorsed or shown an earnest interest in health insurance. The United States Commission on Industrial Relations made a report in favor of it, and the United States Public Health Service and the United States Department of Labor have come out in support of it. The public hearings held in Albany in March 1916, in Boston in March 1916 and again in October 1916 and in San Francisco in November 1916, have demonstrated a very live interest in, and growing support of, the social health insurance movement. There is little doubt that the United States stand ready to enter upon a policy of health insurance more or less following various European standards.

raphy); American Medical Association, Social Insurance Pamphlets, 1-7 (1916-17); Health Insurance, Standards and tentative draft of an act, prepared by the American Association for Labor Legislation, 1916. See also references under SOCIAL INSURANCE.

**HEALY, George Peter Alexander**, American painter: b. Boston, 15 July 1813; d. Chicago, 24 June 1894. He went to Paris about 1836, where he remained several years, alternating his residence there with occasional visits to the United States. Among works executed by him abroad are portraits of Louis Philippe, Marshal Soult and General Cass. At home he painted Calhoun, Webster, Pierce and other prominent American statesmen. He occasionally produced large historical pictures, of which 'Webster's Reply to Hayne,' illustrating a well-known scene in American legislative history, completed in 1851, now hangs in Faneuil Hall in Boston. At the exhibition of Paris in 1855 he exhibited a series of 13 portraits and a large picture representing Franklin urging the claims of the American colonies before Louis XVI, for which he received a medal of the 2d class. Portraits by him of Buchanan and Lincoln are in the Corcoran Gallery at Washington.

**HEALY, John**, Irish Roman Catholic archbishop: b. Ballinacorney, County Sligo, Ireland, 14 Nov. 1841. He was educated at Summerhill College, Athlone, and at Maynooth College. In 1867 he was ordained to the priesthood, and became successively professor at Summerhill College, curate at Ballygar, County Galway, curate at Grange, County Sligo, and finally professor of theology at Maynooth from 1867 to 1883. He edited the *Irish Ecclesiastical Record* in 1883-84 and in the latter year was appointed coadjutor to Dr. Duggan, bishop of Clonfert. He succeeded the latter on 15 Aug. 1896 as bishop of Clonfert and in 1903 became archbishop of Tuam. As bishop of Clonfert he greatly advanced the cause of secondary education by founding a college at Cappataggle in 1892; this he subsequently transferred to Esker, Athenry, and in 1901 the college was removed to Ballinasloe. In 1884 Dr. Healy engaged in a controversy with Cardinal Newman on the extent of the inspiration of the Bible. He was senator of the late Royal University of Ireland and is senator of the National University of Ireland and member of the governing board of University College, Galway. He is also commissioner for the publication of the Brehon Laws. He has published 'Ireland's Ancient Schools and Scholars' (1890), the authoritative work in its special field; 'Centenary History of Maynooth College' (1895); 'Record of the Centenary Celebrations of Maynooth College' (1896); 'Life and Writings of Saint Patrick' (1905); 'Irish Essays' (1908) and contributions to 'The Catholic Encyclopedia' (1910), the *Dublin Review*, *Irish Monthly* and the *Irish Ecclesiastical Record*.

**HEALY, Timothy Michael**, Irish political leader: b. Bantry, County Cork, Ireland, 17 May 1855. He was elected to Parliament for Wexford in 1880, County Monaghan in 1883, South Londonderry in 1885, North Longford in 1887 and County Louth, North, in 1895. In

1884 he was called to the Irish bar. He became known as a leader of the Irish Nationalist party, was a founder of the *Dublin National Press* (later combined with the *Freeman's Journal*), and was repeatedly in difficulties because of his public utterances on political matters. He made a lecture tour of the United States with Dillon and Parnell in 1880, and in 1881 participated in the Land League convention at Chicago, when \$250,000 were contributed to the Irish cause. The 'Healy Clause' of the Land Act of 1881, providing that no tenant should pay rent on improvements made by him, was introduced by him. He wrote 'A Word for Ireland' (1886).

**HEAP, David Porter**, American engineer: b. San Stefano, Turkey, 24 March 1843; d. 25 Oct. 1910. He studied at Georgetown College, was graduated from the United States Military Academy in 1864, served in the Civil War with the engineer corps of the Army of the Potomac and was brevetted captain for his services. In 1895 he attained the grade of lieutenant-colonel of engineers. He was for years employed in the construction of fortifications and the improvement of harbors, and in 1881 was military representative of the United States at the Paris congress of electricians. In addition to a 'Report on the International Exhibition of Electricity at Paris' (1884), he published 'Ancient and Modern Light-Houses' (1889); 'Electrical Appliances of the Present Day'; 'Engineer Exhibit, Centennial Exhibition' (1882); and 'History of the Application of Electricity to Lighting the Coasts of France' (1885).

**HEARING**, one of the five senses, the physical organ of which is the ear. See EAR; ACOUSTICS.

**HEARN, h rn, David William**, American Roman Catholic clergyman and educator: b. Boston, Mass., 21 Nov. 1861. He was graduated at Boston College in 1880; took post-graduate courses in literature, science and philosophy for five years, and theological courses for four; entered the Society of Jesus, and was ordained priest of the Roman Catholic Church. He was successively professor in Georgetown University, vice-president of Boston College and vice-president of the College of Saint Francis Xavier, New York. In 1900 he became president of Saint Francis Xavier. His term as president ceased September 1907, and he was appointed dean of Boston College. In 1909 he became head master of Loyola School and rector of Saint Ignatius Loyola Church, New York. He built and opened in 1914 the Regis High School, the first Roman Catholic free high school. His term of office ended 27 Sept. 1915, when he was appointed dean of Canisius College, Buffalo, N. Y.

**HEARN, Lafcadio**, American author: b. Santa Maura (Leucadia), Ionian Islands, 27 June 1850; d. Tokio, Japan, 26 Sept. 1904. His father was an Irish officer, his mother a Greek. Educated in England and France, he came to the United States in 1869, was a journalist in Cincinnati and New Orleans, in 1887-89 was at Saint Pierre, Martinique, French West Indies, and in 1890 went to Japan. He became

a Japanese subject with the name Yakumo Koizumi, and was appointed lecturer in English literature at the Imperial University of Tokio. His 'Stray Leaves from Strange Literature' (1884), and 'Some Chinese Ghosts' (1887), were succeeded by 'Chita: A Memory of Lost Island' (1889), story of the destruction of 'L'Île Dernière,' once the watering-place of Louisiana fashion, which attracted attention by its descriptive powers; and 'Two Years in the French West Indies' (1890), which gained new interest through the Martinique disaster of 1902. Among his further works, dealing almost exclusively with things Japanese and revealing a thorough comprehension of and sympathy with the art, myth, tradition and philosophy of the Orient, are 'Out of the East' (1894); 'Glimpses of Unfamiliar Japan' (1895); 'Kokovo' (1896); 'Gleanings in Buddha-Fields' (1897); 'Exotics and Retrospections' (1898); and 'Kottō, or Japanese Curios' (1902); 'In Ghostly Japan'; 'Japan: An Attempt at Interpretation'; and 'Kwaidan' (1904). Consult the 'Life and Letters' (1906) and the 'Japanese Letters' (1911), ed. by Bisland; the 'Japanese Appreciation' by Noguchi in the *Atlantic Monthly* (1910); Setsuko Koizumi (Mrs. Hearn), 'Reminiscences of Lafcadio Hearn.'

**HEARNE, Samuel**, English explorer: b. London, England, 1845; d. 1792. He entered the service of the Hudson's Bay Company, and was sent out to Fort Prince of Wales on Hudson Bay. After two abortive efforts in 1769, he in 1770 set out on his third and successful attempt to discover the Coppermine River, reached its mouth in July 1771, and returned to Fort Prince of Wales in 1772. Two years later he built Cumberland House, on the Saskatchewan. See Tyrrell's edition of his 'Journey from Fort Prince of Wales Fort in Hudson's Bay to the Indian Ocean,' published by the Champlain Society in 1910.

**HEARST, Phœbe Apperson**, American philanthropist: b. 1842. She was for a time a teacher, and in 1861 married George F. Hearst of California; William Randolph Hearst is her son. She has been active in charitable and philanthropic enterprises and has given largely, especially to educational institutions. In San Francisco she has established kindergarten classes for the children of the poor and a manual training school, and has organized a number of working girl's clubs. She has also given money to build a National Cathedral School for girls; has made donations to the American University at Washington; has established and given largely to public libraries in the mining towns of the West; and maintained a school for mining engineers at the University of California. In 1896 she offered to pay the expenses of an international competition of architects to obtain a suitable plan for a campus and buildings for the University of California, and to erect two buildings in accordance with this plan. See CALIFORNIA, UNIVERSITY OF.

**HEARST, hêrst, Sir William Howard**, Canadian statesman: b. Arran township, Bruce County, Ontario, 15 Feb. 1864. He was educated at Collingwood Collegiate Institute and Toronto University. He was called to the bar in 1888 and

began practise at Sault Sainte Marie, where he held a leading place as counsel. He was elected member for Sault Sainte Marie to the provincial legislature in 1908 in the Conservative interest, became Minister of Lands, Forests and Mines in the administration of Sir James Whitney in 1911, and on the death of that statesman in 1914 succeeded him as Premier of Ontario.

**HEARST, William Randolph**, American newspaper publisher: b. San Francisco, 1863. Educated at Harvard, on leaving college he took charge of the publishing of the San Francisco *Examiner*, formerly owned by his father, Senator Hearst of California. In 1895 he bought the New York *Journal*, the name of the morning edition of which he later changed to the *American*; in 1900 he started the *Chicago American*; in 1904 the *Boston American* and the *Los Angeles Examiner*. He is also proprietor of the *Chicago Examiner*, the *Atlanta Georgian*, the *New York Evening Journal*, the *New York Deutsches Journal*, the *Cosmopolitan Magazine*, *Hearst's Magazine*, *Good Housekeeping*, *Harper's Bazar*, *Motor Magazine* and *Motor Boating Magazine*. In 1902 he presented the Greek Theatre to the University of California. He represented the 11th Congressional District (New York) in the 58th and 59th Congresses. In 1905 and again in 1909 he was defeated for the office of mayor of New York city and in 1906 for governor. Under him so-called "yellow journalism" thrived and the typography of all American newspapers materially changed. He is credited with the invention of the "spread news head." He is in control of the syndicate known as the International News Service.

**HEART, Anatomy and Functions of the.** The continuity of life depends upon nutrition supplied to the individual organs that together constitute the human body. The nutritive material is the blood; its equable distribution is accomplished by a central pumping organ, known as the heart.

**Situation and Anatomical Relation.**— This organ is situated in the central and lower part of the thoracic or chest cavity and rests upon the upper convex surface of the diaphragm. It is pear-shaped, with its base directed upwards, backwards and toward the right side; while its apex points downward and forward to the left side and strikes the chest wall in the space between the fifth and sixth ribs, one to one and a half inches to the right of an imaginary line drawn vertically through the left nipple. The heart is enclosed in a sac called the pericardium. The anatomical relation between the pericardium and the heart is such as to allow the latter, within its envelope, relatively free motion. This is necessary in order to enable the heart to perform the physiological function of controlling the circulation. But to maintain this liberal mobility, and at the same time to keep the heart within its proper boundaries, the pericardium is secured to its adjacent structures; namely, beneath, to the central tendon of the diaphragm; in front, to the breastbone (sternum); laterally, to the sides of the coverings of the lungs facing the pericardium (mediastinal pleura); and behind, to the anterior surface of the food-conducting-tube (œsophagus) and the large wind pipes (trachea and large bronchi).

**Dimensions and Structure.**— The size of

the heart gradually increases until middle life, from which time it remains practically unchanged until old age; then it gradually diminishes. The average weight of the heart has been calculated to be one one-hundred-and-fiftieth ( $1/150$ ) of the weight of the body in the male, and one one-hundred-and-sixtieth ( $1/160$ ) in the female. The dimensions of the heart in adults are about five inches in length, three and a half inches in its greatest width and two and one-half inches in its extreme thickness. Considering the topography of its normal apex and its dimensions and position, it is evident that the major portion of the heart lies to the left of the median line. By virtue of the structure of its component parts the heart is able to direct and control two currents of blood which differ from each other in their chemical composition, and hence in their functions. One of the currents leaves the heart by one channel and, after traversing a designated distance and performing its function, returns to the heart by another avenue, to leave it again through another exit; and ultimately returns to the place where it first left the heart. Because of this uninterrupted circuitous course, Harvey in 1628 named it *Circulation*. This circulation continues throughout the life of the individual.

The heart is a hollow, muscular pouch, whose interior is divided by a longitudinal partition into two cavities, which have no direct communication with each other. From their anatomical position in the chest cavity, these two heart cavities are called, respectively, the right and the left heart. Each of these hearts is in turn subdivided transversely into two compartments; the upper is called auricle and the lower ventricle. The two chambers of each heart communicate freely with each other; that is to say, the right auricle with the right ventricle, and the left auricle with the left ventricle. This is accomplished through openings between them called the auriculo-ventricular openings. These apertures of communication are guarded by valves which are so constructed that they automatically open and close within a given period of time, thereby allowing a stream of blood to pass freely from the auricle to the ventricle, but not in the opposite direction.

The capacity of each chamber of the heart in adults is about three to three and a half ounces. The wall of the heart is composed of three coats. The outer coat is called the epicardium and constitutes one of the component layers of the pericardial sac. The inner surface of the two pericardial layers are required to glide over each other during the movements of the heart. To prevent their undue friction, the sac is provided with a lubricating substance, called lymph or pericardial fluid. The middle coat is actually the muscle of the heart, and is called the myocardium. It is made up of bands and layers of muscular tissue, very intricately arranged. The accounts of their interlacement, given by different investigators, vary. It is certain, however, that three distinct units can be identified, namely, the fibres of the auricles, those of the ventricles and the auriculo-ventricular bundle of His, so named after its discoverer. The work performed by muscles in general depends upon two properties that they possess, extensibility and perfect elasticity. The rhythmic exercise of these two properties by the myocardium creates sufficient kinetic

energy for the propelling of the blood currents. The inner coat, called the endocardium, lines the whole interior of the heart. By its reduplication, the endocardium forms part of the valves at the auriculo-ventricular and arterial orifices, namely, between the auricles and their respective ventricles and the ventricles and the vessels that emerge from them. Each orifice is encompassed by a strong fibrous ring which serves for the attachment of the corresponding auriculo-ventricular muscle and its valve. The rings at the arterial orifices bind the lower margin of the ventricular muscle and its valve. The boundary between the auricles and ventricles is marked by a perceptible groove in which lie the nutrient vessels (coronary arteries) of the heart substance.

**Systems of Control.**—The action of the heart's mechanism is subject to the absolute control of two sets of nerves. These are the cardiac branches of the two nervous systems, the cerebro-spinal and the sympathetic. They pass to the heart and terminate in its wall as ganglionic cells whose filaments in turn are distributed among the muscular fibres of the heart. The action of each of these two systems is antagonistic to that of the other. The sympathetic system produces acceleration of the heart beats and is therefore called the accelerator nerve; while the influence of the cerebro-spinal system is just the opposite and is named the inhibitory nerve, as it checks the augmenting and accelerating action of its opponent.

Under normal circumstances, there exists an equilibrium in their activity, which results in the rhythmic and steady action of the heart. This consists of the simultaneous contraction of both auricles, termed the auricular systole; followed, after a slight pause, by a simultaneous contraction of both ventricles, called the ventricular systole. A general relaxation (diastole) of the whole heart completes the cardiac cycle. The average duration of a cycle is about eight-tenths of a second, which is divided approximately as follows: Auricular systole, one-tenth; auricular diastole, seven-tenths; ventricular systole, three-tenths; ventricular diastole, five-tenths; common pause, four-tenths. The heart rests a little over nine hours out of every 24. During this period of rest, the heart accomplishes for itself what it does for the rest of the body in nearly 14 hours—that is, it feeds itself. This is done by the blood passing through the coronary arteries into the heart, whence the deoxidized blood is returned through the coronary sinus into the right auricle. The blood that feeds the tissues is called arterial blood. Its color is bright red, and it is carried in vessels known as arteries. (Vessels that carry blood from the heart are known as arteries irrespective of the kind of blood they carry and those bringing the blood to the heart are known as veins). During its travel through the system, the blood gives up its nutritive elements and becomes dark red in color; and is then transferred, through the intermediary of microscopic vessels called capillaries, into another set of vessels, termed veins. The veins, through an extensive ramification of vessels throughout the body, collect venous blood, and carry it into the right auricle through two large venous trunks called the superior and inferior vena cava. During the auricular systole, the venous blood is forced into the right ven-

tricle. When this chamber is filled, the auriculo-ventricular bundle of His conveys the impulse of systolic contraction to the ventricle, and the next phase of the cardiac cycle sets in. During this period the auriculo-ventricular valve (tricuspid on the right side, bicuspid on the left) closes to prevent regurgitation of the blood into the auricle. The vibrations resulting from the ventricular contraction and the forcible closure of the valves are productive of the first sound of the heart. At this time the intra-ventricular pressure is high. The closed auriculo-ventricular valves at this instant are subjected to this pressure, since they then form the roofs of the ventricles. To prevent their diverging upward into the auricles, the valves are provided with non-elastic cords (chordæ tendinæ), one end of which is attached to the ventricular wall and the other to the under-surface of the valve. The contraction of the right ventricle forces the blood into the pulmonary artery, the resistance of which causes the closure of the semi-lunar valve guarding its orifice. The closure gives rise to the second sound of the heart. Immediately thereafter, the ventricle relaxes and the auriculo-ventricular valve opens; and the pressure from behind forces the blood into the lung capillaries, where it becomes oxidized by the absorption of oxygen from the alveoli of the lungs. It is then propelled through the pulmonary veins into the left auricle. This constitutes the pulmonary or lesser circulation.

Governed by identically the same physical laws and accompanied by the same phenomena described in the circulation of the right heart (the same action takes place in the left heart simultaneously with the action in the right heart), the blood which is now arterial is propelled from the left auricle into the left ventricle; from there into the aorta (the largest artery in the human body) and traversing the arterial capillary and venous channels, it finally reaches again the right auricle. Thus the greater or systemic circulation is completed.

The systemic circulation controlled by the left heart and the pulmonary circulation controlled simultaneously by the right, together constitute the entire function of the heart.

J. OSHLAG, M.D.

**HEART, Diseases of the.** The heart is a sensitive register of the condition of the entire human system. When an acute disorder sets in in our body, irrespective of the distance from the heart, and even while the heart itself is enjoying absolute integrity, the action of the heart changes almost instantaneously. Whether the lesion is a gouty swelling of the big toe, water around the lungs (pleurisy with effusion), or an abscess in the middle ear, the heart will at once indicate the disturbance by its accelerative action, as it sends an increased force of white blood corpuscles to the seat of the trouble. A decrease in the quantity of the coloring matter of the blood (Hemoglobin) causing anæmia, or a foreign substance circulating in the blood, as bile in the case of jaun-

dice, will at once alter the normal action of the heart.

**Structural Deterioration.**—Temporary embarrassment of the heart caused by any systemic disturbance does not produce any structural derangement in its substance. The elimination of the disease or disturbance as the case may be will be followed, as a rule, by the restoration of the heart to its normal state. If, however, the disturbance continues, and the heart is required to labor under abnormal conditions for a long time, the added exertion leaves an unfavorable effect on its structural soundness; its nutrition becomes impaired, and its working capacity gradually exhausted. These phenomena are due to physical laws of cause and effect, though the cause is often obscure. The gradual progress of deterioration of the heart can in very many instances be traced with precision to the diseased organ which causes it, as for example, in diseases of the kidneys.

The function of the kidneys is to separate the urinary constituents from the blood, which, in order to free itself of its effete materials, such as urea, etc., enters the kidneys through the renal arteries. These arteries divide and subdivide within the substance of the kidneys and finally terminate in collections of capillaries, called glomeruli. The blood is forced into the glomeruli by the heart. In some diseases of the kidneys, as in interstitial nephritis, a permanent destruction of glomeruli takes place, and yet the same quantity of blood as in the normal state of the organ is forced through the remaining capillaries. To accomplish this task a superior force is needed and the heart has to furnish additional energy, the amount of which is in direct proportion to the number of vessels destroyed. This additional work of the heart is made possible by a gradual increase in the thickness of the myocardium. But this increase cannot go on indefinitely, and an incompetency of the heart is finally observed in the general circulation. Such sequential cardiac disability invariably sets in, whenever the heart encounters abnormal and permanent resistance, irrespective of the cause or place of such resistance.

Among other extrinsic influences that lead to cardiac inadequacy, there is one wielded by paroxysmal tachycardia (palpitation). In this condition, there is a derangement in the action of the heart without there being any demonstrable cardiac disease. The number of beats often reaches to about 250 per minute. This extraordinary labor deprives the heart of its rest and proper nutrition, and eventually leads to its exhaustion. The attacks come on in paroxysms and are probably due to some derangement in some of the internal organs, which thereupon reflexly produce the pernicious effect upon the heart's mechanism.

Among the cardinal symptoms of exophthalmic goitre, tachycardia is the most distressing one; and if its influence is not checked it ultimately brings about a morbid condition in the heart's mechanism. The exact cause of tachycardia and the pathology (structural changes) that underlie its promulgation are still definitely undetermined. It is however reasonable to presume that the inhibitory nerve, through some unknown cause, loses its restraining influence on the action of the sympathetic nerve.

The morbid change an organ has to undergo because of a disease existing in another part of the body is called a secondary disease, while the original lesion in any of the organs is known as a primary disease. Most diseases of the heart are secondary. The component parts of the heart are affected individually, each disease constituting an entity and presenting salient symptoms characteristic of the particular part involved. Thus a lesion in the endocardium, called endocarditis, differs from one of the myocardium, known as myocarditis. But the interrelation between the heart's constituents is such that the myocardium is always made to suffer whenever its adjacent structures are affected by disease.

**How the Heart is Infected.**—It is established beyond doubt that the blood, in all infectious diseases of known origin, harbors the specific organisms of those diseases. Impregnated with these disease-generating microbes, the blood, during its travel through the heart, comes in contact with the endocardium. This constant exposure of the endocardium to these infectious agents renders it an extremely susceptible prey to inflammatory processes known as acute endocarditis. The following bacteria have a special predilection for the endocardium and are, therefore, more often prone to excite endocardial trouble: the streptococci, staphylococci, gonococci, pneumococci and micrococcus rheumaticus. The severity of the symptoms, according to which the disease is divided into two classes, namely, simple or mild, and malignant or severe endocarditis, depends upon the virulence of the invading bacteria. The simple form of the disease does not always cause destruction of life directly. The patient usually recovers; but is left with crippled valves which ultimately cause his death; while the malignant type invariably terminates fatally. The left heart is affected more frequently, probably because the blood it carries is relatively rich in oxygen which is essential for microbic growth and activity. The skin and the mucus membranes (the inside lining of the organs) are the portals through which those microbes gain their entrance into the system. Cases are recorded where insignificant injuries to the skin, such as the prick of a needle, were followed by malignant endocarditis, long after the local wounds had healed. The infections that originate in the mucus membranes and are directly responsible for the subsequent development of acute endocarditis are very numerous. The most prominent of these infections are abscesses in the nose and its adjacent sinuses; some diseases of the larynx and trachea; supuration in the mouth, such as abscesses around the teeth; diseased tonsils; ulcerations of the lining of the intestines, which constitute the lesions in typhoid fever, in dysentery and in intestinal tuberculosis; infection of the gall bladder; diseases of the genito-urinary canal such as gonorrhoea, and infections following retention of the afterbirth (placenta); all these are perpetrators of that evil—endocarditis.

Although the whole endocardium of the affected heart-chamber is involved, the valves bear the brunt of the trouble. They lose their superficial layer of cells, called endothelial cells, and the now raw surfaces become covered with white blood corpuscles and fibrin (constituents of the blood). These new elements are known

as vegetations; and as the disease progresses still other structural changes take place in the valve-substance; a new growth of fibrous tissue develops, which causes the valve to become thick, distorted and rigid. This new growth has a tendency to contract and thereby causes a diminution in the dimensions of the valve. Its flaps being shortened do not approximate perfectly, when they are required to do so, and the closure of the auriculo-ventricular, and arterial orifices is rendered imperfect. At other times, the flaps of the diseased valves become adherent either to their surrounding structures or to one another. The valve is then unable to open freely when it should do so. Thus the structural alterations in the valves render them incapable of properly performing their physiological function; that is to say, they do not open at the right time, in order to furnish a free passage to the blood current through the designated orifice. This condition is known as obstruction or stenosis of the valve. On the other hand the contracted valves do not perfectly close the orifices which they are made to guard, and, therefore, are unable to prevent a backward flow of the blood. This condition is known as insufficiency of the valve, also as regurgitation, because of the backward flow of the blood.

Obstruction and insufficiency may coexist in the same valve. Insufficiency of the left auriculo-ventricular valve, known as the bicuspid or mitral, is of the most frequent occurrence among the diseases of the endocardium. The imperfect closure of the orifice during the ventricular contraction allows a part of the blood from the ventricle to regurgitate into the left auricle which is then receiving its normal blood supply from the pulmonary veins. The auricle under pressure is now obliged to accommodate twice as much blood forced into its cavity from the two opposite sources. The forcible encounter of the two waves coming from the opposite directions causes them to rebound, producing a vertiginous movement of the blood which gives rise to a blowing sound called cardiac murmur. As the murmur occurs during the ventricular systole, it is, therefore, known as a systolic murmur. The auricle, in order to accommodate a larger quantity of blood, must expand its cavity. This expansion is accomplished through the forcible stretching of the auricular wall and is known as dilatation. At this time, the over-distended auricle being forced to overcome the greater amount of resistance it encounters in propelling the larger quantity of blood from its cavity, must utilize a proportionately greater amount of force. This is made available by a gradual increase in the bulk of the auricular myocardium known as hypertrophy. The left ventricle which is the recipient of the auricular contents is now subjected to the same structural alterations; namely, to dilatation of its cavity and hypertrophy of its wall.

When the evolution of the cardiac changes are in direct proportion to each other, namely, the more dilatation, the more hypertrophy, the heart is said to be in a state of compensation; at which time the disturbance is still confined to the left cardiac chambers. The great stress thrown on them is not felt in the general circulation, since the greater quantity of blood the ventricle propels with each systole does

not reach the arterial system, but is forced back into the auricle. But this equilibrium is relatively short lived. The left myocardium becomes exhausted from abnormal activity, and the left ventricle can no longer expedite the blood-current. The stagnation which ensues in the ventricle extends into the impotent auricle, and the whole task of maintaining both the systemic and the pulmonary circulations is thrust on the right ventricle. Compensatory hypertrophy, which develops in the right ventricle, enables it to perform its double function but for a short time. The extraordinary resistance it encounters gradually exhausts its myocardium and phenomena of stagnation sets in. The veins, unable to empty themselves freely, become overdistended, and the watery constituent of the blood they contain, transuding through their walls, infiltrate the surrounding tissues and cause œdema (swelling). The stasis in the pulmonary capillaries interfere with the proper oxidation of the blood, and produces the distressing symptom of dyspnea (shortness of breath). The poorly aerated blood becomes bluish in color, giving rise to the third characteristic symptom of a non-compensated heart, namely, cyanosis (blueness). All the other organs, such as the liver, stomach, spleen, kidneys, etc., are in a state of venous stasis (passive congestion). Deprived of proper nutrition, they become crippled, functionate imperfectly, and often in a perverted manner. To relieve itself and alleviate the difficult situation, the heart utilizes its periods of rest by converting them into periods of work, often doubling the number of beats per minute. This tachycardia, as merely an expression of cardiac distress, differs from the paroxysmal variety, which produces distress.

Medical science when judiciously employed can often restore the decompensated heart; and the disorganized members of the human economy are again brought into a harmonious state. This is accomplished through the medium of two groups of remedial agents; one group exerts its restraining influence upon the action of the sympathetic nerve, while the other group acts directly on the inhibitory nerve by augmenting its power of inhibition.

Stenosis and insufficiency of the other valves of the heart cause that organ to undergo practically the same morbid changes as described in mitral insufficiency. There are, however, some modifications which occur during the evolution of the different pathological conditions. But the ultimate result in the heart itself, the disturbed relations and often the perverted functions which ensue in all the other organs of the body are identically the same.

#### HEART IN ART AND SYMBOLISM.

The heart is commonly considered the symbol of Charity. In ecclesiastical lore Pugin says: "The heart is always regarded as the seat of the affections," hence "fitting emblem of the great love of our Redeemer for the human race." In art, he tells us: "The field of the heart

should be of ruby color, as an emblem of the intensity of divine love." In ecclesiastical art an emblematic device is that termed the "inflamed heart"; it is in the form of a conventional heart surmounted by flames. An inflamed heart is frequently placed between the hands of sculptured or painted saints to symbolize, in such cases, their love of God. The inflamed heart symbol is greatly favored by the Jesuits, who frequently represent Jesus Christ holding his robe open and displaying an abnormally large inflamed heart in the centre of the breast. According to Husenbeth the following saints have a heart as attribute: Francis of Sales has been pictured with the sacred heart of Jesus crowned with thorns above him in glory, or holding a heart in his hand; Saint Augustin has been variously depicted holding an inflamed heart, an arrow or two arrows crosswise in a heart; Saint Catherine of Siena has been represented as crowned with thorns, crucifix and inflamed heart, or with a crucifix upon a heart, or holding an inflamed heart; Saint Mary Magdalen of Pazzis has been pictured with an inflamed heart and crown of thorns; Saint Theresa has been depicted with an inflamed heart in her hand; Saint Jane Frances has been represented also holding a heart; Saint Anzano has been pictured carrying a heart and liver. An Egyptian method of interment was that of abstracting the human organs before the process of embalment and placing these separately in vases, termed "canopic" (see VASES). One of the four vases held the heart and lungs and was surmounted by a cover representing a jackal head; it personified Tuamutef (a son of the god Horus) who presided over these two organs. Whether or not traceable to this ancient rite of the Nile dwellers, the fact remains that during the 12th and 13th centuries the burial of the heart in a separate and distant tomb apart from the body of the deceased was a custom frequently carried out. It may have found its impulse in the Crusaders who dying in foreign lands were desirous that their hearts (sometimes supposed to be the seat of the soul) should find final repose on their native soil. The practise of burying parts of the body in different places was forbidden by Pope Boniface VIII (end of 13th century), but Pope Benedict XI, his successor, allowed Philip le Bel to carry out this rite with members of his family. Known heart-burials of exalted persons are: William of Estonville, archbishop of Rouen, at Rouen Cathedral, 1067; Stephen, brother of Alan the Black and Red, at Saint Mary's Abbey, York, 1104; Robert de Arbrissel; founder of the Order of Fontevrault, in a monastery at Orsan, 1117; Giffard, bishop of Winchester, at Waverly Abbey, 1127; King Henry I, at Saint Mary de Pré, Rouen, 1135; William, 3d Earl of Warren, slain by the Turks in the Holy Land, 1147, had his heart sent to England and deposited in Lewes Priory; King Richard I, the Lion-hearted (*Cœur de Lion*), of England, had his heart buried in Rouen, body at Fontevrault (Font-Everard), end of 12th century; Louis VIII, at Auvergne, 1226; Henry III, of England, at Fontevrault (body in Westminster Abbey), 1272; Philip le Hardi, at Saint Denis (bowels at Narbonne), 1285; Eleanor, mother of Edward I, in choir of Friars Predicant, London (body in Westminster Abbey), 1290; Eleanor, wife of Edward I, heart in Black

Friars, body in Westminster Abbey, bowels in Lincoln Cathedral, 1296; Edward I, at Jerusalem, 1307. Robert Bruce, of Scotland, deputed Douglas to bury his heart in Jerusalem, but Douglas was killed in Spain fighting the Moors, and the Bruce heart was found in a silver case fastened to his neck; it was buried in Westminster Abbey, 14th century. Louis XII, found heart-burial at La Chapelle d'Orleans, bowels at Les Celestins, 1515; François I, at Haute Brüyere. Other kings having separate heart burials were Henri II, 1559; François II, 1560; Louis XIII, 1643; Emperor Leopold, 1705; Louis XIV, 1715, etc. The list is so long of such heart-burials so far discovered that they have formed complete works. Consult Pettigrew, T. J., 'Chronicles of the Tombs' (London 1878); Hartshorn, Miss, 'Enshrined Hearts of Warriors and Illustrious People' (London 1865).

CLEMENT W. COUMBE.

**HEART OF MID-LOTHIAN, The.** Sir Walter Scott's novel, published in 1818, takes its title from the Old Tolbooth prison in Edinburgh, the scene of the Porteous riots of 1737, with a description of which the story opens. The narrative involves a varied group of well-drawn figures, English and Scottish, but it is on the family of the uncompromising old Cameronian, Douce Davie Deans, that Scott dwells with the most loving care, producing a portrait of the Scottish national character which is perhaps his very greatest achievement as a novelist.

Effie, the somewhat wayward but not deeply vicious daughter of Davie, has allowed herself to be seduced by George Staunton, alias Robertson, a young Englishman of good birth, dark and turbulent in spirit, but not without virtue, who has led a wild life among the Scottish smugglers. In order to rescue her from prison, where she is awaiting trial for child-murder, Robertson becomes leader of the revengeful mob which broke open the Tolbooth to seize and execute the unpopular Captain Porteous, but Effie, who has the keenest sense of her disgrace, refuses to escape. The real heroine of the story is Jeanie Deans, half-sister of Effie, a plain woman of sterling worth, firm in the Calvinistic faith for which her father has fought and suffered. She is told by Robertson that she can save Effie's life by affirming that her sister had informed her of her condition before the birth of her child. Though she is convinced of Effie's innocence, her conscience will not permit her at the trial to speak aught but the truth. The application of the Scottish statute hinges on this point and Effie is sentenced. There is but one way left to save her, and Jeanie resolves to take it. Alone and mostly on foot, she journeys, a simple Scottish peasant girl, to London, to seek a pardon from the king. Escaping, on the way, from the clutches of the terrible Meg Murdockson and her insane daughter, Madge Wildfire, she presents her case in person to the Duke of Argyle and later through his assistance to Queen Caroline, who, moved by Jeanie's simple eloquence, commutes the sentence to banishment. Returning she finds that the good Duke has provided a home for herself and her father and a living for her excellent lover, Butler, on one of his Highland estates, and that Effie, on her release, has eloped with Staunton. From this point the

deeper interest of the story slackens. Years pass. Staunton falls heir to a great estate and Effie becomes a lady of fashion. Jeanie, coming by chance on a copy of the dying confession of Meg Murdockson, learns that Effie's child is still alive. Staunton, after tracing him into the hands of the Highland maulrauder, Black Donacha, is attacked by the outlaws and slain by the hands of his own son. The latter is sent to Virginia where he meets a violent death. Effie spends some time with her sister and returns to London, carrying with her the sorrow of soul which has always been the punishment for her sin.

'The Heart of Mid-Lothian' is remarkable among Scott's novels in that the local, historical and romantic elements, though present throughout the story, are outweighed in interest by the true and beautiful portrayal of a simple human personality. Jeanie Deans commands the deepest affection and admiration of all Scott's characters. Her fortitude, her righteousness, her self-sacrificing loyalty and her indomitable will, combined with the shrewdness and good sense of the Scottish peasant, make her a heroine of an entirely different stamp from the pale Rowenas of romantic fiction. Simple and modest as she is, she has the courage, born of love, to surmount all obstacles and to stand unawed before dukes and kings. More after Scott's usual manner but scarcely less memorable is the historical portrait of the Duke of Argyle, that noble friend of Scotland, in whom the love of country and a keen relish for the simple virtues of its inhabitants have not been dimmed by rank and power. For references, consult article IVANHOE.

JAMES H. HANFORD.

**HEART-URCHIN**, one of a group of sea-urchins (see ECHINOIDEA) of elongated form and cordate outline from a lateral point of view. The group is best represented by the genus *Spatangus*, common in Europe, but heart-urchins occur elsewhere, and are known as fossils.

**HEARTS-EASE**, a violet (q.v.), especially the common yellow violet of Europe, or a pansy.

**HEAT**. Until the early part of the 19th century, it was generally believed that heat is a substance devoid of weight (imponderable), and diffused through the mass of bodies. This hypothetical substance was called *caloric*. Many phenomena seemed to be explained by the assumption of the existence of caloric, but finally, through the experiments of Davy and Rumford, in which heat was actually created from mechanical energy, the old caloric theory was abandoned. In its place we now have the molecular motion theory. According to this theory heat is nothing but a violent agitation of the molecules of matter. These molecules are extremely minute, but have a definite size and weight for each definite substance. It has been estimated that a molecule of water has a diameter of about one forty-millionth of an inch. Though molecules are small in size, their velocity, even at ordinary temperatures, is very great. In air, in which the molecules dart about in straight lines until they encounter other molecules, they attain a speed of 1,470 feet a second at the freezing temperature. The average length of their path between two encounters—the *mean free path*—is about 1-277,000 inch, and the number of

molecules in a cubic inch of air is 443 million million. Each molecule experiences about 5,000,000,000 collisions a second.

#### Expansion of Solids, Liquids and Gases.

—The molecules of any substance attract one another with a force called cohesion. It is cohesion that prevents a wire from breaking when it supports a heavy weight. The pressure of the atmosphere also helps to hold the molecules of a body together. Opposed to both of these forces is heat. The effect of the agitation of the molecules is to make them jostle one another apart. Thus it is that in general an increase of temperature results in expansion. In solids, in which the cohesion is enormous, the expansion for a given increase of temperature is very slight, especially when the test is made at low temperatures. At higher temperatures, when the molecules have somewhat weakened their mutual hold through having moved further apart, an increase of temperature equal to the previous increase generally results in a somewhat greater expansion. To express such ideas technically we employ the expression *coefficient of linear expansion*, which means the fraction of its length that a bar expands when heated 1° Centigrade. As the length varies with the temperature, the length at the freezing point, 0° C., is taken as the standard length. Using then this expression, we may say that the coefficient of expansion of a solid generally increases with the temperature. The coefficient of linear expansion of a number of substances will be found in the following table:

COEFFICIENTS OF LINEAR EXPANSION OF SOLIDS.			
Aluminum.....	0.0000222	Pine.....	0.0000054
Gold.....	0.0000147	Beech.....	0.0000026

Invar.....	0.00000087	therm. 59 III	0.0000058
		Porcelain.....	0.0000041

Two notable cases may be remarked. It is seen from the table that the coefficient for glass is very close to that for platinum. This fact is taken advantage of in the construction of incandescent electric lamps, and of those scientific instruments where it is necessary to have a wire pass through glass and leave an air-tight joint. In making the joint, the glass around the hole is softened by heat until it gathers closely around the hot platinum wire. In cooling, if the coefficient for platinum were higher than that for glass, the platinum would contract more rapidly than the glass and leave a leaky joint. The second case to be noted is that of Guillaume's nickel steel, known as invar. The coefficient of expansion of this metal is so extremely small that it is eminently suited to the construction of clock pendulum rods, of surveying instruments and of standard scales of length, and to many other purposes in which much expansion now proves an annoyance. Unfortunately the high cost of nickel will preclude the employment of this wonderful alloy in some cases.

The influence of expansion is seen in railroad tracks. On a cold day 60-foot rails may contract so as to draw apart one-half of an

inch. The cables of the Brooklyn bridge support the slightly arched roadway. When they sag down in hot weather through expansion, they tend to make the roadway buckle. This tendency is increased by the expansion of the roadway itself. However, both tendencies were overcome through the foresight of the engineers, who provided a telescoping joint in the roadway at the middle of the span. The parts of this joint play in and out about a foot. On hot days clock pendulums grow longer, and so the clocks lose time. Glass when suddenly and hence unevenly heated expands more at one point than at another, thus introducing internal strains that cause fracture, but vessels made of vitrified quartz, on account of their extremely low expansibility, resist this tendency to crack; they will endure without injury the sudden application of a blowpipe flame.

In liquids the molecules are so far freed from cohesion that they are able to roll around one another and to wander from one position to another. The small remaining cohesion is assisted by the pressure of the atmosphere or by any other pressure to which the liquid may be subjected and so the molecules in the body of the liquid are prevented from flying directly apart. It is on account of this small resistance to expansion that we find liquids very much more expansible than solids. The term *coefficient of cubical expansion* is employed to express the degree of expansibility of a liquid. It means the fraction of its volume that a liquid expands when its temperature is raised 1° C. The cubical coefficient of a substance is three times as great as its linear coefficient, because we measure the effect of expansion in length, breadth and thickness, instead of merely noting the expansion in length. Of course a liquid confined in a tube of unchanging dimension could only expand in length, but the effect in this one direction would be three times as much as it would be if the liquid were allowed to expand proportionally in all three dimensions.

#### COEFFICIENT OF CUBICAL EXPANSION OF LIQUIDS. AT 20° C.

Ethyl alcohol.....	0.0112	Olive oil.....	0.00072
Ether.....	0.00165	Petroleum.....	0.00095
Water.....	0.00021	Glycerine.....	0.00050
Mercury.....	0.000182	Aniline.....	0.00118

The expansibility of water is strikingly irregular. Starting at the freezing point water contracts as the temperature rises until at about 4° C. it has assumed its maximum density. A further increase of temperature now causes the water to expand, which it does at an increasing rate until it begins to boil at 100° C.

Gases surpass even liquids in their expansibility. Because in gases the molecules are relatively very far apart, cohesion counts for nearly nothing, leaving external pressure as almost the sole force restraining expansion. It appears that the coefficient of expansion of a gas is nearly independent of the external pressure, for though a greater pressure tends to restrain expansion more, the greater crowding of the molecules resulting from this pressure causes more frequent blows among the molecules, and makes the expansive force increase

in nearly the same proportion as the external pressure. This law is not perfectly complied with because the molecules in a gas are not quite free from cohesion, especially when much compressed, and because the diameter of the molecule is an appreciable fraction of the distance between two molecules. Another law, fulfilled only approximately for the same reasons, is that all gases have the same coefficient of expansion, as will be seen in the following table, which gives the cubical coefficient referred as a standard to the volume the gas has at 0° C.

**The Convection of Heat.**—When the air in contact with a hot stove becomes warmed, it expands and grows lighter than the other air. Owing to unbalanced forces the hot air rises to the ceiling and then spreads out to the walls. It there becomes cooled and therefore contracts and becomes dense. As a result it descends at the walls and finally returns to the stove only to start again on the journey. During this process, called *convection*, heat is carried by the air from the stove to the most distant parts of the room. Winds consist of convection currents in the atmosphere. Some parts of the earth's surface become more highly heated by the sun than others. The air over the hot areas expands and becomes specifically lighter than the surrounding air. The general result is that the hot air is forced to rise, giving place to the surrounding cooler air, which blows toward the hot area as a surface wind. The hot air risen aloft spreads away toward the cool regions as an upper wind. Corresponding to the ascent of air over the hot areas is a descent of air over the cool areas. Much heat is brought from the tropical regions to temperate regions by regular winds.

Convection phenomena also occur in liquids. A large vessel of water supplied with heat at one side of the bottom becomes through the action of convection currents uniformly heated throughout. Much heat is conveyed from the equator toward the poles by means of the Gulf Stream and other ocean currents. It is probable, however, that with ocean currents differences of temperature have little to do with the motion of the water, but that the motion is caused chiefly by the action of winds that blow with great steadiness in a westerly direction across the equatorial portions of the great oceans. Difference in salinity of the ocean at different latitudes may possibly be a partial cause of the phenomenon.

**Thermometry.**—Before proceeding further in the discussion of heat phenomena, it will be necessary to describe some of the methods employed for measuring temperature or the degree of hotness of a body. Most commonly the methods depend upon the property of expansion. In ordinary thermometers the expanding body is either mercury or colored alcohol. The liquid, say mercury, is held in a glass tube having a fine bore and at one end a spherical or

cylindrical bulb, the other end being simply closed. Above the mercury, which fills the bulb and part of the stem, is a space that is free from air and contains only a small amount of mercury vapor. When the thermometer is warmed, the mercury rises in the tube because the cubical expansion of mercury is greater than the cubical expansion of glass. The glass tube is provided with a scale, sometimes engraved directly on the tube, and sometimes engraved on some other material and mounted at the back of the tube. For a Fahrenheit scale, division number 32 is placed opposite the mercury level when the thermometer is placed in pure crushed melting ice, and division number 212 is placed opposite the mercury level when the thermometer is placed in saturated steam over boiling water. As the temperature of the boiling point depends upon the atmospheric pressure, which is ever varying, the standard boiling point is taken to correspond to the average atmospheric pressure, which is measured by a barometric column of 760 millimetres. The space between these marks, the freezing and boiling points, is divided into 180 equal divisions, and then divisions equal to these are extended above the boiling point and below the freezing point. For the Centigrade scale, which is generally employed in scientific work, the freezing point on the thermometer is marked 0° and the boiling point 100°. For the Réaumur scale, much used for household purposes in Germany, these points are marked 0° and 80° respectively, and finally for the De Lisle scale, which is used in Russia, the direction of the graduation is reversed, the boiling point being marked 0° and the freezing point +150°. With this last thermometer, the greater the intensity of the cold the higher the number representing the temperature. Mercury thermometers permit of the measurement of rather high temperatures, mercury not boiling until the temperature of about 357° C. (674.3 F.) is reached. Still higher temperatures with mercury thermometers may be reached by checking the vaporization of the mercury through the introduction into the upper part of the tube of a compressed gas, such as nitrogen. With such a thermometer the only limitation is the softening of the glass at high heats, and even this trouble is largely lessened by the use of vitrified quartz for the material of the bulb. On the other hand, mercury freezes at about — 39° C. (— 38.2° F.) and so becomes useless for indicating temperatures lower than this. For these lower temperatures alcohol may be employed as the thermometric substance because it resists freezing until temperatures far below any met with in nature are encountered. In addition to this advantage alcohol expands much more rapidly than mercury, thus permitting a much larger bore for the same length of degree. However, for very high temperatures alcohol is not available, as it boils at the moderate temperature of 78.3° C. (173° F.).

In practical work thermometry fairly bristles with errors. For several months after a thermometer is made the bulb gradually shrinks, probably owing to some molecular instability in the glass caused by the excessive heating employed in the process of blowing the bulb. This

causes the thermometer to read too high. After each time a thermometer is used for a very high temperature the bulb on cooling fails to contract promptly to the volume proper to the new temperature, and so now the thermometer for a while reads too low; however, prolonged heating at the temperature of boiling mercury tends to put the glass into a more stable state. Also such troubles are much reduced by the use of hard glass instead of soft glass for the bulbs. Errors also arise from the following causes: non-uniformity of the bore; variations of atmospheric pressure, which cause a yielding of the bulb; failure to have the stem of the thermometer at the same temperature as the bulb; the hydrostatic pressure on the bulb due to the liquid being tested, especially when the thermometer is sunk to great depths; a variation in the internal pressure of the mercury itself on the bulb when the thermometer is inclined from the vertical position to the horizontal; a peculiar jerking motion of the mercury when it ascends a very fine bore; the fact that equal volumes of the bore marked off on the tube do not represent equal expansions of the mercury, since at high temperatures the volume of the bore indicating a degree has increased (this is quite distinct from the matter of the relative expansion of glass and mercury); irregularities in the expansion of the glass of the thermometer; and lastly irregularities in the expansion of the fluid itself, be it mercury, alcohol, air or any other substance. This last source of error is worth much consideration because two thermometers otherwise perfect but containing different liquids, as alcohol and mercury, fail to agree in their indications. Further, we have no right arbitrarily to select any particular fluid as a standard and yet feel that our temperature scale has anything more than an empirical value. It will, however, be explained in the last section how a theoretical definition for temperature measurement can be formulated (the thermodynamic scale), agreeing fairly with ordinary thermometers, very closely with the hydrogen or nitrogen thermometer, and perfectly free from ambiguity.

In the hydrogen thermometer advantage is taken of the increase of pressure of a gas attending an increase of temperature, the volume of the gas being kept constant. The hydrogen is confined in a glass bulb about two inches in diameter which is connected by a thick-walled capillary tube with the top of one side of a U-shaped apparatus consisting of two vertical glass tubes connected by a rubber hose at their lower ends and partly filled with mercury. When the hydrogen in the bulb is warmed it tends to expand and push the mercury down its side of the U and to cause it to rise on the other side, which is open to the atmosphere. This effect is counteracted by raising the glass tube on the open side, the rubber tubing allowing this to be done. The extra back pressure of the mercury forces the hydrogen back to its former volume. In measuring the pressure to which the hydrogen at any time is subjected, the difference in level of the mercury columns must have added to it the length of the barometric column measured at the time. For each

degree Centigrade added to the temperature, the hydrogen is found to increase in pressure about  $1/273$  of its pressure measured at  $0^{\circ}$  C. Similarly for each degree subtracted, the pressure decreases  $1/273$  of the pressure at  $0^{\circ}$  C. If this law held to the limit, we would conclude that at  $-273^{\circ}$  C. the hydrogen would lose all its pressure, thus indicating the cessation of all molecular motion—a veritable absolute zero of temperature. However, at extremely low temperatures the perfect working of this law is interfered with through the dominance of cohesion which reduces unduly the pressure of the hydrogen, and may cause it to assume the liquid or even the solid state. Nevertheless, this limiting temperature as predicted by the hydrogen thermometer agrees almost exactly with the true absolute zero of the thermodynamic scale referred to above. On this absolute scale the temperature of freezing water is approximately  $+273^{\circ}$  Abs., and temperature of boiling,  $+373^{\circ}$  Abs.

Other methods of measuring temperature depend upon change in the electrical resistance of platinum, and upon the electromotive force created when the juncture of two dissimilar metals, as platinum and rhodium, is heated. Very high and very low temperatures may be measured by such methods.

**Conduction of Heat.**—When a sterling silver spoon is placed in a cup of hot tea, the handle of the spoon soon becomes uncomfortably warm to the hand. Heat has been conducted through the silver. The molecules in the bowl of the spoon are the first to have their motion accelerated by contact with the tea. This extra motion is communicated to their neighbors which in turn pass it on until, step by step, the motion reaches the molecules in the handle. It appears that in some substances the character of connection between the molecules is more favorable to conduction than in others. As we might have expected, from the close crowding of the molecules found in solids, that class of bodies furnishes the best conductors; but in gases, in which the molecules are very loosely distributed, we naturally find the poorest conductors. Liquids as conductors occupy a position intermediate between solids and gases. Metals surpass all other materials in conducting power, silver standing at the very head of the list, while near the foot of the list of solids are found organic materials and mineral substances, especially when in the porous or fibrous state, such as horn, leather, magnesia brick, asbestos fibre, sand, cotton wool, cowhair felt and down. Great value is attached to poor conductors of heat. They are called insulators. Bone is used in joining the handles to silver teapots. Our clothes are made of organic material woven so as to leave a multitude of fine pores, a condition favorable to insulation and met with in the fur of animals and in the feathers of birds. Sawdust and mineral wool for the same reason are made to serve as insulators of heat in the outer casing of ice boxes.

In the following table of conductivities the better conductors have the higher numbers. These numbers, called the *coefficient of conductivity*, indicate the amount of heat energy measured in calories (a *calorie* is the amount of

heat energy required to raise the temperature of a gram of water 1° C.) conducted from one face to the opposite face of a centimetre cube of the substance when one of the faces is maintained one degree hotter than the other. The amount of heat energy conducted is proportional to the difference in temperature between the opposite faces.

Specific Heat.—In the last section the expression "heat energy" was employed, and the "calorie," its unit, was defined. If thin glass vessels containing equal weights at equal temperatures of different materials, mercury and water for example, be placed over equal gas flames so as to receive in a given time equal amounts of heat energy (equal numbers of calories), it will be found that the water will require nearly 30 minutes to get as hot as the mercury does in one minute. The water is said to have a greater capacity for heat than the mercury has. Making allowance for the heat capacity of the glass vessels and for radiation and conduction it is found that the heat capacity of mercury is 0.034 that of water. We say that the *specific heat* of the mercury is 0.034, for water is taken as the standard and to its heat capacity is assigned the value 1.0. The value of the specific heat of a number of solids and liquids is given in the following tables:

SPECIFIC HEAT OF SOLIDS.

SPECIFIC HEAT OF LIQUIDS.

Water . . . . .	1.00	Ether . . . . .	0.529
Acetone . . . . .	0.53	Glycerine . . . . .	0.576
Alcohol, ethyl . . . . .	0.548	Mercury . . . . .	0.0332
Benzol . . . . .	0.340	Carbon disulphide . . . . .	0.24
Bromine . . . . .	0.107	Turpentine, sp r'ts . . . . .	0.411

In the first table the atomic weights (the weight of the atom as compared with the weight of an atom of hydrogen) of some of the elements in the solid state are also given. The product obtained by multiplying the specific heat by the atomic weight is given in the last column. It will be observed that these products are approximately equal. This equality indicates that if we took as our standard of comparison equal numbers of atoms of a solid instead of equal weights, all elements in the solid state would have the same heat capacity. It takes about as much heat energy to raise the temperature of an atom of gold one degree as it does for one atom of aluminum. This law of Dulong and Petit also applies with some degree of approximation to compounds in the solid state—not equal heat capacity for the molecules, but for the atoms.

In the cases of gases we have two specific heats according as, on the one hand, the gas is confined to constant volume while being heated, or as, on the other hand, the gas is allowed to expand so as to keep the pressure constant. This is shown in the accompanying table, where it will be seen that the specific heat at constant pressure is greater than the specific heat at constant volume.

SPECIFIC HEATS OF GASES.

SUBSTANCE	Symbol	Constant vol. time equal weights	Constant pressure		Ratio of specific heats, equals col. 3 ÷ col. 2

This difference in specific heat in the same gas is due to two causes. When the gas expands, not only do the molecules acquire greater kinetic energy, but in pushing each other farther apart against the attractive force of cohesion, they require a further amount of energy of the potential sort, and in pushing back the restraining pressure of the atmosphere still another large supply of energy is needed. It appears from several independent considerations that in gases far removed from their liquefying points the cohesion effect is exceedingly small, and so we conclude that the excess of specific heat of an expanding gas is almost entirely due to work done on the external pressure applied to the gas.

In the last column of the table the ratio of the two specific heats of the gases is given. This ratio is found to vary, decreasing from

simple gases like mercury vapor, the molecules of which have single atoms, to complex gases like ether vapor, the molecules of which have 15 atoms. With complex molecules a large part of the energy is internal, much being stored up in the rotating motion of the individual molecules, and in the relative motion of their atoms, leaving the energy of translation of the molecules and the energy due to the pushing back of the external pressure about the same as for mercury vapor. It follows then that the energy associated with the external pressure is a smaller fraction of the whole energy, and that therefore, as observed, the ratio between the heat energy imparted to an expanding gas and the heat energy imparted to a non-expanding gas must be smaller for such complex molecules. The value of this ratio is the principal means of judging of the number of atoms in a molecule of an element in the gaseous state.

Before leaving this subject it should be remarked that the specific heat of water varies slightly with the temperature, and so it is convenient to take as the value of the calorie one hundredth of the heat energy required to raise the temperature of a gram of water from 0° C. to 100° C.

**Latent Heat.**—If heat energy be imparted to a mass of ice at the point of melting, the ice will proceed to melt, but will not grow any warmer as it does so. The heat energy thus added without increasing temperature is called *latent heat*. Latent heat is devoted only to shaking the molecules of ice asunder, not to increasing their speed. Temperature depends upon the energy of motion (kinetic energy) of the molecules; latent heat only stores up energy of position (potential energy) of the molecules, and so does not produce an increase of temperature (this simple statement must be modified in cases of change of polymerization). Again, when water is being boiled, a large amount of heat energy becomes latent. The latent heat of vaporization and of melting for a variety of substances is given below.

It should be remarked that the latent heat devoted to converting a liquid into vapor, besides increasing the internal potential energy of the molecules, also does work in pushing back the atmosphere, but with water this external work bears a very small ratio to the internal work against cohesion, namely, a little more than one-twelfth.

Heretofore we have supposed the energy for melting or for vaporization to be derived from some external source of heat. It is, however, possible to secure a change of state through the consumption of the heat energy of the body

itself. If water be left in an open vessel it will presently have evaporated entirely away. During the progress of this vaporization a thermometer placed either in the water or in the moist air above the water will show a temperature lower than that of the surrounding air. The reason of this is as follows: At the surface of the liquid, with all the irregularities of position and velocity possessed by the molecules, some of them find opportunity to fly off from the liquid surface. On the average it will be the faster going molecules that spring away first, thus leaving the more slowly going ones behind, which is the same as saying that the remaining liquid is cooler. Also in going away, the molecules fly against the back pull of cohesion, and so their velocity is checked. Indeed many are entirely stopped and drawn back into the liquid, though others escape quite beyond the range of cohesion of the liquid and diffuse among the molecules of the air. The reduced motion of these escaping molecules causes the low temperature, referred to above, of the vapor. Common illustrations of cold by evaporation are frequently met with. The function of perspiration is a means of regulating the temperature of the human body. In the healthy state when we are overheated the skin becomes very moist, and the evaporation of this moisture, assisted by a breeze or by fanning, cools the surface. In disease the proper action of the skin may be interfered with, and becoming dry, may fail through lack of evaporation to provide the normal cooling effect. An exalted temperature of the body ensues; in other words, a fever. Certain drugs tend to promote perspiration and thus reduce the temperature of the patient. Another large factor in the temperature regulation of the body is in the water evaporated from the lungs in the process of breathing. The evaporation of ammonia that has been liquefied by pressure furnishes the cold employed in some ice machines. In the case of liquefaction the necessary latent heat may be derived from the body itself. This occurs when a salt is dissolved in water, a process that is generally accompanied by a fall of temperature, though occasionally a rise in temperature is noted. The factors governing the result in such cases are rather complicated. We have to take account of the work done by the solvent in tearing molecules away from the solid lump and in some cases the tearing of these molecules apart into electrically charged parts called ions. On the other hand a certain amount of kinetic energy is furnished by the attraction of the molecules of the dissolving substance by the molecules of the solvent. According as the back pulls or the forward pulls predominate, will the temperature of the solution tend to be lowered or raised. If much chemical combination takes place between the substance and the solvent, the solution is almost always warmed.

There is another reason why ionization tends to cool and chemical combination tends to warm a body; it is because of the increase or decrease in the mere number of separate particles. For temperature depends upon the average kinetic energy of the particles or molecules, small particles at a given temperature making up in speed for what they lack in mass. An increase in the number of particles involves,

if no heat is added from the outside, a subdivision of their energy, a smaller average energy; and, hence, a lower temperature. When particles combine, their energies combine also, and so there is an increase in their average energy and a like increase in their temperature.

The temperature at which melting takes place depends upon external pressure. With a solidlike paraffin, which expands on liquefying, high pressure, which resists expansion, stops melting until a temperature slightly higher than the ordinary melting point is reached. Paraffin that under ordinary conditions melts at 46.3° C. melts at 49.9° C. when subjected to the additional pressure of 100 atmospheres. In the case of ice, which contracts on melting, melting is favored by pressure. The addition of one atmosphere of pressure lowers the melting point of ice by 0.0072° C. This fact accounts for the slipperiness of ice, especially when being skated upon. The sharp edge of the skate exerts great pressure on the ice below it, which melts and furnishes a lubricating film of water. This film of water is cooler than the ice furnishing it, some of the heat of the ice having become latent, and as soon as the skate has passed over, the water immediately resumes the solid state. This process of freezing again is called *regelation*. Regelation is an important factor in glacier motion. The ice as it follows down a tortuous valley is continually being cracked. After the settling following this cracking, the great pressure from the upper ice fields melts the ice at the points of contact of opposite sides of a fracture, and the escaping undercooled water freezes again, thus healing the fracture. In this way the glacier appears to follow down the irregularities of a valley as would a very viscous mass.

Saturated and Unsaturated Vapors.—

When a liquid, water for example, is placed in a vacuous enclosure kept at constant temperature by artificial means, it immediately begins to evaporate, the vapor presently attaining a maximum density and pressure. The vapor as well as the space occupied by it is then said to be *saturated*. Before this maximum pressure was reached the vapor was *unsaturated*. If the temperature of the whole apparatus be now raised, more water will commence to evaporate, and the vapor will increase in density and pressure before it is again saturated. Had the saturated vapor formed in the first place been shut off from the water surface before raising the temperature, it would not become as dense

as when it had the water evaporating into it, and so we would then pronounce the heated saturated vapor as *unsaturated*. On the other hand, if a mass of unsaturated water vapor be cooled, the density of the vapor will at a certain temperature be sufficient to cause saturation. Below this particular temperature, called the *dew-point*, some of the moisture will condense. In some cases, however, when there are no nuclei in the form of dust particles, free ions, etc., the vapor may cool appreciably below the dew-point without immediate condensation. The vapor is then said to be *supersaturated*. The presence of air has only a very small influence on the density and pressure of saturated water vapor in contact with water, especially when the temperature is not high.

When the temperature of water or other volatile liquid is raised so high that the pressure of the saturated vapor becomes as great as that of the atmosphere, bubbles of the vapor begin to form in the body of the liquid. This constitutes the process of boiling. The temperature at which a liquid boils is much influenced by the external pressure. The boiling point is the same as the temperature at which the pressure of the saturated vapor equals the external pressure on the bubble. In the following table these temperatures with their corresponding pressures are given for water.

PRESSURE OF WATER VAPOR.

A saturated vapor in contact with its liquid offers a beautiful instance of dynamic equilibrium. We conceive that molecules are ever leaving the surface of the water, adding themselves to the vapor. At the same time molecules of the vapor coming near to the liquid surface or plunging into it are caught by the cohesion of the liquid, thus subtracting themselves from the vapor. A less dense vapor would lessen the latter process and would allow the vapor to grow denser; a denser vapor would increase it and

allow the vapor to fall to a state—the saturated state—when the rate of evaporation is just equal to the rate of condensation.

The degree of moistness of air is expressed by the phrase *hygrometric state*. The hygrometric state does not express the density of the water vapor present, but, instead, expresses the quotient obtained by dividing the density of the vapor present by the density of the vapor required to saturate the air. If pressures were employed instead of densities in getting the quotient, substantially the same result would be obtained. Still another common way of defining hygrometric state is to take the quotient obtained by dividing the pressure of the vapor corresponding to the dew-point by the pressure of vapor saturated at the temperature of the air, a method closely agreeing with the former ones.

**The Critical State.**—When the temperature rises, the saturated vapor in contact with its liquid becomes denser, while the liquid itself expands and becomes less dense. If the heating of the liquid and vapor takes place in a strong closed vessel containing not too much or too little of the liquid, after a while a temperature is reached at which the saturated vapor becomes as dense as the liquid. At this point they become identical in their physical properties; the

line of demarcation of liquid and vapor fades away, and the two fluids begin to mix. The temperature at which this phenomenon occurs is called the *critical temperature*; the corresponding pressure and density are called the *critical pressure* and *critical density*, and the liquid is said to be at the *critical state*. Above the critical temperature it is impossible to distinguish between a liquid and its vapor. No matter how great the pressure, a gas or vapor cannot be forced into the state of a liquid that is obviously distinct from the vapor unless the vapor be cooled below the critical temperature.

**Radiation.**—We have described two methods by which heat energy may be transferred from one place to another—by conduction and by convection. A third method remains to be studied. How does the heat of the sun reach us? By means of waves in the luminiferous ether. Go to a quiet pond in which a piece of wood may be floating. Standing on the shore, vibrate your hand up and down in the water. Waves run from your hand over the surface of the water to the wood and cause it to vibrate up and down. Energy from the hand has been transferred to the wood by means of waves. These waves consist of the successive vibration of successive particles of water, each particle receiving energy from behind and passing it on to the front. It is much the same with heat waves. The ether, which fills all space, is capable of being set into vibration by vibrating molecules and of handing this vibration on step by step in the form of waves. Molecules acted upon by these waves are themselves set into vibration. The vibrating molecules of the sun generate ether waves, and the ether waves generate vibration of the molecules of bodies on the earth. These ether waves are called *radiant heat*. We now have a very wide range of ether waves under experimental control. From the large waves generated by electrical oscillations used in wireless telegraphy and sometimes several miles long we may pass by insensible gradations, with only two breaks, to the extremely minute waves which constitute Röntgen's X-rays and the Gamma rays of radium. Dark heat waves, or infra-red rays, ordinary light and ultra-violet light belong to the middle of the series. The shortest electrical waves thus far tested are about one-tenth of an inch long, while the length of the longest heat waves is about 1/300 inch. The shortest ultra-violet waves are about 1/300,000 inch long. All ether waves have the same velocity as light, namely, 186,300 miles a second. All may be reflected, refracted, polarized, diffracted, and made to interfere. They may be absorbed by transmission to a degree depending upon the substance used for transmission and the particular wave-length of the rays.

**Thermodynamics.**—The most cogent reason for discarding the caloric theory of heat is that heat may be generated from that which is not in any sense substance—heat may be derived from mechanical energy. Heat is generated when a brass button is rubbed on the carpet, when a bullet is struck with a hammer, and when two pieces of ice are rubbed together, a process resulting in their melting. The rela-

tion between mechanical energy and the heat energy generated by its consumption was first carefully investigated by J. P. Joule before 1850. One pound calorie of heat energy is obtained from 1,399 foot-pounds of mechanical energy. That is to say, the energy due to the fall of 1,399 pounds through the distance of a foot is sufficient if transformed into heat to raise the temperature of a pound of water through one degree centigrade. This number of foot-pounds is called the *mechanical equivalent of heat*, for it has been found that the process is reversible. When by means of an air-engine or a steam-engine one pound calorie of heat is consumed in generating mechanical energy, 1,399 foot-pounds of the latter are obtained. *The first law of thermodynamics* states that when mechanical energy is converted into heat, or when heat is converted into mechanical energy, the quantity of mechanical energy is equivalent to the quantity of heat energy. *The second law of thermodynamics* states that it is impossible for a machine without the consumption of external energy to make heat pass from a body at a low temperature to one at a high temperature. However, when mechanical energy is supplied, such a transfer of energy from a cold body to a hot body becomes possible through the use of a "reversible engine." A heat engine is "perfectly reversible" when a reversal of its cycle of operation is attended by a reversal of all its energy changes, in kind and in amount. Thus, during a direct cycle in a hot air engine, an amount of heat energy,  $H$ , is taken from a high temperature "source" and partly converted into an amount of mechanical energy,  $W$ , and partly transferred as an amount of heat energy,  $H'$ , to the low temperature "escape." Here  $W = H - H'$ , assuming these quantities to be measured in the same equivalent units, such as foot-pounds. Now, when the hot air engine is reversed in motion by the external application of the same amount of mechanical energy,  $W$ , it will, if perfectly reversible, take, during one complete reversed cycle, the amount,  $H'$ , of heat energy from the low temperature escape and, combining with it the mechanical energy,  $W$ , deliver to the high temperature source a quantity of heat energy equal to  $H$ . Of course, the perfect reversibility here supposed is a theoretical ideal to which practical engines only approximate. The ratio of the mechanical energy generated in a perfectly reversible engine to the heat energy drawn from the high temperature source, i.e., the ratio of  $W$  to  $H$ , is dependent upon the temperature of the source and the temperature of the escape. This ratio, sometimes called the *thermodynamic efficiency* of the engine, must, in the case of perfect reversibility, be absolutely independent of the construction of the engine and of the nature of the working substance, be it air, steam, ether vapor, liquid or solid. For, following Carnot, if we suppose that there could be two perfectly reversible engines working between the same hot body as a source and the same cool body as an escape but with different thermodynamic efficiencies, we can imagine that these two engines are coupled together in such a way that the more efficient engine, working directly, will drive the less

efficient engine, working reversely. The result of this combination would be that more heat energy would pass from the cool escape up to the hot source than would pass from the hot source down to the cool escape. In other words, with a self-contained device not employing external energy we would thus succeed in making heat pass from a body at a low temperature to a body at a high temperature, which is contrary to the second law of thermodynamics. The thermodynamic efficiency of a perfectly reversible engine is, then, dependent only upon the two extreme temperatures between which it works. In good practical condensing steam engines, which, of course, are only imperfectly reversible, the thermodynamic efficiency may occasionally exceed 20 per cent. This means that 20 per cent of the heat energy supplied to the engine from the boiler is converted into mechanical energy, the remaining 80 per cent escaping partly, as it should, at the condenser and partly, as it should not, by conduction, radiation, etc. This thermodynamic efficiency may be as much, in a good practical steam-engine, as 70 per cent of the thermodynamic efficiency of an ideal engine working between the same boiler temperature and the same condenser temperature.

Using the provisional absolute scale as indicated by a hydrogen thermometer, experiment shows that the ideal efficiency,  $W/H$ , of a perfectly reversible engine, is roughly represented by the following equation in which  $W$  stands for the mechanical energy realized,  $H$  for the heat (measured in the equivalent foot-pounds) leaving the high temperature source,  $T$  for the temperature of the cooler source, and  $T^1$  for the temperature of the cooler escape.

$$\frac{W}{H} = \frac{T - T^1}{T}$$

This suggests a new definition for a temperature scale, namely, that numerical values of temperatures be so adjusted as to fulfil *exactly* the above formula. Since the formula only fixes a ratio between the temperatures  $T$  and  $T^1$  corresponding to a given efficiency, an infinite number of sets of numerical values for these temperatures could be found to satisfy the formula. But if it be decided that a definite numerical range, say 100 degrees, be comprised between the freezing and boiling points of water, only one set of values become possible. This decision makes the value of the freezing point very nearly  $+273^\circ$  Abs., and the value of the boiling point  $+373^\circ$  Abs. Lord Kelvin was the first to propose this *thermodynamic scale*. Theory shows that its indications would correspond exactly to a thermometer containing a perfect gas. Hydrogen is not quite a perfect gas, for its molecules attract each other slightly and they occupy an appreciable fraction of the space holding the gas. Hence there are small deviations of the hydrogen thermometer from the thermodynamic scale, especially at low temperatures. In spite of these difficulties much progress in the realization of the thermodynamic scale has been achieved through ingenious mathematical considerations relating to two sets of experimental observations: those made by Regnault

on the expansion and on the increase of pressure of hydrogen and other gases when heated, and those made by Joule and Kelvin on the temperature changes suffered by gases in passing through a porous plug. Nevertheless, the thermodynamic scale offers us a theoretical ideal which is independent of the thermal properties of any particular substance, but is only related in a definite way to a fixed universal law.

When a *small* amount of heat is transferred from or to a gram of a substance, the heat transferred (measured in calories), divided by the average absolute temperature of the substance at the time of the transference is called the *change of entropy* of the substance. For convenience, the zero of entropy is generally taken to correspond to water at the freezing point and under the normal atmospheric pressure. It may be shown that when two bodies at different temperatures are placed in contact and their temperatures become equalized, the average entropy rises, for from the above definition of entropy, the heat leaving the hotter body must reduce its entropy less than it increases the entropy of the cooler body into which the heat enters. Consequently, as temperature equalizations are always going on, the average entropy of the universe is constantly rising and tending toward a *maximum*. At the same time, for the same reason, the *availability* of the heat energy of the universe to be converted into mechanical energy is tending toward *zero*, for this availability depends upon difference in temperature of sources and escapes, and is destroyed by temperature equalization resulting from conduction, radiation and mixing.

He was First Assistant Postmaster-General 1897-1900, when he developed the present system of free rural

mail delivery. He was secretary to the Republican National Committee 1900-04. He purchased the Salt Lake *Tribune* (editor and general manager) 1901; established Salt Lake *Evening Telegram* 1903; disposed of both in 1905. He was incorporator and director of the Salt Lake-Los Angeles Railroad, 1901-03. At present he is an investor in various industrial and commercial enterprises.

**HEATH, William,** American soldier: b. Roxbury, Mass., 7 March 1737; d. there, 24 Jan. 1814. When the Massachusetts congress in 1774 voted to enroll 12,000 minute men, volunteers from among the militia, Heath, then a farmer in Roxbury, was commissioned as one of the generals. In June 1775 he received the appointment of brigadier in the Continental army, and in August 1776 was created major-general. When the troops moved to New York Heath was stationed in the Highlands near King's Bridge, with orders to throw up fortifications for the defense of that important pass. In 1777 he was transferred to Boston, and the prisoners of Saratoga were entrusted to him. In June 1779 he was again in New York, at the Highlands, with four regiments, and was stationed near the Hudson till the close of the war. He was the last surviving major-general of the war. His 'Memoirs' (1798) and 'Correspondence' (published in the Massachusetts Historical Collections, 1904-05) are full of interest for students of the Revolutionary period.

**HEATHCOCK, HEATH-HEN.** See BLACKCOCK.

**HEATHCOTE, Caleb,** American merchant: b. Chesterfield, Derbyshire, England, 6 March 1665; d. New York, 28 Feb. 1721. He was successful in a mercantile career in New York from 1692, save for the years 1698-1701, was a councillor of the province, was a petitioner for a license to build Old Trinity, was mayor of New York in 1711-14, and held other posts, among them those of judge of Westchester County; commander-in-chief of the military of the colony; surveyor-general; and receiver-general of customs for North America. His letters and dispatches afford interesting glimpses of the history of his time.

**HEATHS, or HEATHER,** a group of plants, chiefly of the genus *Erica*, of the family *Ericaceæ*. The leaves of the heaths are simple and entire; their flowers ovoid, cylindrical or even swelled at the base; the anthers of many with horn-like appendages. From 400 to 500 species are known, 12 or 15 of which inhabit Europe, and have small flowers, while most of the remainder are natives of South Africa, many of them bearing brilliantly colored flowers, and forming one of the most characteristic genera of that region of dry plains. The common heath of Europe (*Calluna vulgaris*), a low shrub, often covers exclusively extensive tracts of dry land, and is used in domestic economy; mixed with oak bark it is employed in tanning; and also, when tender, for fodder. This species forms the "heather" of British moorlands; but in Scotland are two other species, whose flowers are the "heather-bells" of Scottish song and story. Many South African species, remarkable for the size and beauty of their flowers, are much cultivated in greenhouses, and have been so improved and

hybridized that they exhibit a wonderful richness of color.

**HEATING AND VENTILATION.** Generally speaking, the methods of heating buildings may be divided into two general classes — the direct and the indirect system, or a combination of the two. Heating by means of an open fire, by a stove and by radiators placed in the rooms to be warmed are examples of the former method, while furnace-heating and heating by means of a current of air warmed by indirect steam or hot-water coils are examples of the latter method. When a direct radiator is fitted with a connection to the outer air, it is said to be arranged on the direct-indirect principle. Hot water, steam or electricity may be the vehicle used for conveying heat to radiators. Ventilation is only obtained by supplying air, and in some systems of heating and ventilation the air is made so hot that part of it is available for heating purposes. This is the case in furnace-heating.

It is well known that when two bodies of different temperature exist, heat passes from the warmer to the cooler body until their temperatures are equal. If a building be of a temperature of 70° F. and the outer air of a lower temperature, heat will be transmitted by the walls, windows and other exposed surfaces, and the temperature of the air in the building will be lowered. It is only by supplying to the building an amount of heat equivalent to that transmitted by the walls and windows that it is possible to maintain the building at constant temperature. If we supply more heat than is transmitted by the walls, the temperature of the room rises.

Heat is measured in units which have as exact a value as a ton of coal or a pound of sugar. British physicists have selected as the unit of heat that quantity which will raise the temperature of one pound of water one degree on the Fahrenheit scale when the water's temperature is near 39° F. This unit is designated as the British thermal unit. It is known with reasonable accuracy just how many heat-units are transmitted by each square foot of wall, window and other exposed surfaces of the various materials used in building construction, under such extreme conditions as to building and outside temperature as may exist. With these data and the plans of a building, calculation will show the heat-loss from a building or a room, and the heating-apparatus should be proportioned to supply this amount of heat. Allowances are made for various conditions that may exist, depending upon the judgment and experience of the designer. The heat required can be supplied by radiation from an open fire or from a stove, but this is an unsatisfactory method. Direct radiators supplied with steam or hot water can be placed in a room to furnish the heat necessary, or the heat may be supplied by hot air from a furnace, or by air heated by indirect radiators supplied with steam or hot water.

Heating by hot air is a slightly more expensive method than heating by direct radiation, for to be effective the air must be taken in from outdoors, sometimes at very low temperature, and heated above the temperature of the room to be warmed. If cold air at 40° F. is heated to 100° F., and is supplied to a room at this temperature, it is evident that as soon as

this air is cooled from 100° to 70° no more heat can pass from the air to the room if the temperature of the latter remains at 70°. Under these conditions only one-half of the heat that has been supplied to the air is available for heating the room. This will tend to show why heating by hot air is more expensive, estimated from the cost of fuel, than the direct system. When the advantages of the air supply that accompanies indirect heating are taken into account the increased fuel cost becomes insignificant.

Direct heating is usually obtained by steam and hot-water radiators. Although manufacturers have greatly improved the appearance of direct radiators, at best they are unsightly and objectionable from an artistic point of view. This objection may be overcome by concealing the radiators in boxing beneath windows, when the walls of the building are thick enough to permit the boxing to be built in without projecting into the room. A screened opening is provided in the front of the boxing near the floor, and one at the top over the radiator, to permit a circulation of air, so that the radiators can be effective.

In residence-heating it is frequently the custom to heat the first floor by the indirect method and the upper stories by the direct. When an owner will pay for it, the indirect method is used throughout the building. Such a system is much to be preferred to the direct.

The simplest method of connecting steam-radiators is by the gravity system, and it is usually employed unless steam exhausted by engines is available for heating. This system comprises distributing-mains connecting with the top of the boiler, and with vertical riser-pipes from which horizontal branches lead to the radiators. Usually a return pipe is connected to the opposite end of the radiators from that at which steam is admitted, this return connecting, through return risers and mains, with the boiler at a point below the water-line. As the steam in the radiators condenses, the resulting condensation flows back by gravity through the return pipes to the boiler. The flow and return pipes are made sufficiently large to ensure a practically uniform pressure throughout the system. The system is simplicity itself, as the fire only needs attention. When the boiler is once filled, no more water is required.

It is only recently that the steam exhausted by engines and pumps has been used for heating. Before this time steam direct from the boilers was used in direct radiators for heating mills and factories. The radiators consisted of coils of pipe suspended from the walls or ceilings. Sometimes the condensation was returned to the boilers by a pump or other device; sometimes it was allowed to go to waste. As the steam exhausted by engines, pumps, etc., contains a very large percentage of the heat that it contained upon entering the engine, someone conceived the idea of utilizing this steam for heating buildings, thereby saving the steam direct from the boilers that would otherwise have to be used. This practice is now almost universal where exhaust-steam is available, and the saving that it has occasioned is very great. By placing what is known as a back-pressure valve in the exhaust-pipe, sufficient pressure is maintained to cause the exhaust-steam to circulate through the pipes and radiators of the

heating-system, the latter being connected to the exhaust-pipe between the engine and the back-pressure valve. The condensation that occurs in the heating system can be collected and returned to the boilers by various methods. Usually a pump or similarly acting device is employed.

A hot-water system arranged on the gravity-principle has flow and return pipes similar to the gravity-system of steam-heating described. The entire system is filled with water. As the water is warmed in the boilers it becomes lighter in weight per cubic foot, making a difference in pressure between the flow and return pipes and causing a circulation to begin. The water rises in the flow pipes to the radiators and is there cooled. On its return to the boiler the water is again heated, and so the circulation is maintained. As the difference in weight between the water in the flow and return pipes is very slight, the motive power producing the circulation is very slight also. Hence the pipes have to be relatively larger than for steam-heating and very carefully connected to, avoid excessive friction, which would stop or retard the circulation. As large pipes are costly, in some large plants heated by hot water, a circulation is brought about by pumps.

Direct steam-radiators emit about 250 British thermal units per square foot of radiating surface per hour, and hot-water radiators about 180 heat-units per square foot. Consequently about one-third more radiating surface is necessary with hot water than with steam. The pipes also must be larger, hence the hot-water system is the most expensive in first cost. Hot water, however, is cheaper to operate, for water will circulate with a very low fire and supply the small amount of heat required to warm a building in mild weather.

With direct steam-heat, operating on the gravity system, it is impossible to vary to any appreciable extent the temperature of steam in a radiator; hence with this system the alternative is all the heat the radiator will supply or none at all. This is the principal objection to heating by means of direct steam. Air warmed by the relatively cooler hot-water radiators is thought by some to be more agreeable than air heated by steam-radiators.

With indirect heating the lack of means of regulating the steam-temperature is not of so much moment, for the air-supply can be partly shut off by partly closing a register in mild weather; or else, if the full air-supply is required at all times, arrangements can be made for passing part of the air-supply around the indirect radiators, which is called "by-passing" them. Another method is to divide the indirect radiator into independent sections and place some of the sections under the control of a regulator that automatically shuts off the supply of steam when the room becomes too warm. The method of "by-passing" the radiator, or subdividing it, is used mainly with the fan-system of supplying air.

The cost of indirect hot-water heating is greater than that of indirect heating by steam, as the radiators and pipes must be larger, the same as in direct heating. Hot water is, however, cheaper to operate. The principal objection to its use in indirect heating is the possibility of damage to the indirect radiators through the freezing of the water in them in

severe weather, if the circulation should from any cause be arrested.

The direct-indirect system consists of direct radiators connected with the outer air by means of an opening in the building-walls beneath the window-sill, the radiator being set under the window opposite the opening. With this system there is always the possibility of getting too much air when the wind blows strongly. Furthermore, in situations where the air is smoke-laden or dusty, it is not easy to keep the smoke and dust from entering a building supplied with air by this means.

As has been said, a supply of air may be brought about by the gravity-method or by means of fans. In the gravity-method the heated column of air in the flue is lighter than the outdoor air; hence it rises. As in the case of hot-water heating, the motive power is very slight, and it becomes less as the outdoor temperature increases. For this reason the gravity system is not a positive one, and it cannot be depended upon to supply much air in mild weather. Its use for schoolhouse ventilation is therefore to be deprecated. An important advantage of this system is its simplicity, as no machinery is required with it.

With the fan-system some type of fan is employed, to give a positive supply of air. The air is blown over coils, usually steam, and delivered to the room at a temperature slightly above that of the room, if the air-supply is intended to ventilate only, or at a higher temperature if the air-supply is to carry with it the heat necessary to balance that transmitted by the walls and windows. In the former event the indirect coils act as tempering-coils, being sufficient only to raise the air to about 70° F. If the air-supply is to furnish heat for warming the rooms, additional coils, known as supplementary coils, are provided. These raise the air-temperature from 70° to from 100° to 120° F. Sometimes the supplementary coils are combined with the tempering coils, the whole being divided into several independently controlled sections. In some instances the supplementary coils are divided into a number of small coils, one being placed at the base of each air-supply flue, and so arranged that, by adjusting dampers controlled by hand or automatically, the temperature of the air supplied to any room can be regulated independently of that supplied to other rooms. If all of the air is passed through one group of coils, independent regulation of the temperature of the air in the branch ducts and flues is impossible. This independent regulation can be obtained, however, by the double-duct system. The coils are divided into two groups, one for tempering and one for supplying additional heat. All of the air is passed through the tempering coils, but only part of it through the supplementary coils, the balance "by-passing" the latter coils and flowing through a system of ducts, usually located below the system conveying the air of higher temperature, to the base of the flues. At the junction of the two ducts a mixing-damper is provided, so arranged as to open in one duct as it closes in the other. By adjusting this damper the air can be mixed to give the resultant temperature required.

In situations where direct radiators can be used, either exposed or concealed, it is becoming the practice to provide sufficient heat by means of direct radiation to balance the heat

transmitted by walls, windows, etc., also a supply of tempered air for ventilation only. As previously explained, when heat is supplied by means of air, the fuel-cost is greater than with direct heating; so that a building can be warmed with less coal with the direct than with the indirect system. Furthermore, with the combined system, heating can be done at night, and at other times when air-supply is not required, at minimum cost. This system is particularly adapted for schoolhouse heating and ventilation.

The withdrawal of impure air from rooms is effected by fans connected to a system of vent-flues extending upward to an attic space, or downward to a cellar or basement, if the latter is more convenient. Another method of accelerating the outflow of air through flues rising to the roof of a building is by the use of aspirating coils. These are simply coils of pipe, or radiators, placed in the vent-flues as low down as possible, the coil heating the air and thus causing it to rise. Theoretically the aspirating coil is a more expensive method of moving air than the mechanical method, as far as fuel-cost is concerned. It is simpler, however, than the fan-system.

Fans are of two general types — the disc or propeller fan, and the centrifugal blower. The former is constructed somewhat like a ship's propeller, and the current of air that it produces is mainly in a direction parallel with the shaft of the fan. The centrifugal blower, as usually designed, consists of a wheel with blades, something like a ship's paddle-wheel, enclosed in a casing. The air enters at the axis of the fan, and when the fan-wheel is revolved the air is discharged radially to the casing by the action of centrifugal force. Relatively speaking, the propeller-fan will move a large volume of air with small expenditure of power, but the pressure at which it will deliver air is limited. The centrifugal fan will deliver air under a greater pressure and the power required is therefore greater. In some buildings, where the system is of ducts and flues, is long, and the cross-sections are comparatively small, to save space, quite a pressure is required to force the necessary amount of air through them. For such situations the centrifugal blower is best adapted. When the ducts are short and of ample area, it is best to use the propeller type of fan.

Fans are driven usually by small steam-engines or by electric motors. Sometimes gas-engines have been used with success. Where an engine is used, it is necessary for the boilers to operate under a sufficient pressure to drive the engine, or at least under a higher pressure than is commonly used with the gravity-system of connecting radiators. If the steam exhausted by the engine is condensed in the heating-system, as it usually is, a pump is necessary to return the condensation to the boilers. In large office buildings, public buildings, theatres, etc., where a skilled engineman is employed to care for the plant, the use of a pump, an engine, etc., does not present an objection. On the other hand, in the case of schoolhouses, large residences, churches, etc., which are apt to be looked after by less skilled attendants, an engine, pump and other apparatus that must go with them are open to objection. In such cases electric motors can be used if current can be obtained from an electric-supply company. The

entire heating system can then be operated on the simpler gravity system. Of course the current must be paid for, but in many locations its cost will be more than offset by the greater simplicity of the motor-driven system.

One of the most important developments in recent years in connection with ventilation of buildings is the control of humidity in air supplied for ventilating purposes. One method is to employ an evaporating pan in which a coil of pipe, containing steam at high temperature, is submerged in water. The high steam temperature causes the surrounding water to evaporate and add moisture to the air that is blown over the evaporating pan. An automatic device in the air duct controls the supply of steam to the coil in order that the humidity of the air may be maintained at the desired point.

Another method of adding moisture to air is by means of an air washer which is a large chamber of sheet metal through which the air is passed, with a receptacle for holding water at the bottom. A pump draws water from the bottom of the washer and forces it under pressure through pipes to nozzles which deliver the water in a finely divided spray over the interior of the washer. The air is drawn through the washer and comes in direct contact with the spray which not only cleanses the air but adds moisture to it as well. The amount of moisture absorbed can be varied by varying the temperature of the water by means of a suitable heater, the apparatus also being under automatic control.

In view of the fact that some of the water is vaporized, an amount of heat is abstracted from the air equal in amount to the latent heat of evaporation of the water. The result is that the air is cooled, due to partial evaporation, in passing through the washer. Air washers of this type are, therefore, used to cool the air and they have been used to a considerable extent in certain classes of buildings and manufacturing plants, where air cooling is necessary in hot weather.

It has been found that air cooling is not always satisfactory for the reason that when the air is cooled by means of an air washer, the relative humidity of the air is increased, and air saturated or nearly saturated with moisture is not as pleasant as air at a somewhat higher temperature where the relative humidity is lower. To overcome this objection air cooling plants have been installed where the cooling is carried to such an extent as to lower the temperature of the air considerably below that desired to maintain in a room, and to such an extent to condense part of the moisture that air contains in order that heat may be added to the air after cooling so as to obtain, finally, air at a higher temperature than the temperature of air leaving the washer, but with a lower relative humidity. The net result of this operation is to admit to the room or building air at a lower temperature than the outside air and of a relative humidity that is comfortable. The first cost of apparatus necessary to do this and the cost of operation is considerable, and the expense involved is only justified under special conditions.

Heating by electricity is not done to any great extent, on account of the excessive cost. When coal is burned under a steam-boiler, it is

not uncommon for 60 per cent of the heat in the fuel to be realized in the steam which can be used for heating. If the heat in coal be transformed into electrical energy, and this again transformed into heat, less than 10 per cent of the heat in the fuel will be realized for heating.

HENRY C. MEYER, JR.,  
Consulting Engineer.

**HEATON, Augustus George**, American artist: b. Philadelphia, Pa., 28 April 1844. He was the first pupil from the United States to study at the Paris Beaux-Arts, where he was trained by Cabanel. Later (1878-80) he was in the studio of Léon Bonnat, and exhibited considerably at the Salon. Among his paintings are 'Washington at Fort Duquesne'; 'The Recall of Columbus,' engraved on the 50-cent Columbian Exposition stamp of 1893; portraits of Bishop Bowman and Paul Tulane; and 'Hardships of Emigration,' engraved on the 10-cent Omaha Fair stamp. He is the author of 'The Heart of David—the Psalmist King' (1900); 'Fancies and Thoughts in Verse' (1904), etc.

**HEATON, SIR John Henniker**, English postal reformer: b. Rochester, Kent, 1848; d. 8 Sept. 1914. He was for some time prominent in Australian journalism and sat in the House of Commons for Canterbury from 1885 until his death. He carried the Imperial Penny Postage Scheme in 1898; was instrumental in obtaining Anglo-American Penny Postage, which came into force in the same year, as well as telegraph money orders in England, the parcel post between England and France and other postal reforms.

**HEATON, John Langdon**, American journalist: b. Canton, N. Y., 29 Jan. 1860. He was graduated from Saint Lawrence University in 1880, entered journalism as a member of the Brooklyn Times staff in 1881, and in 1897 became assistant editor of the New York World; now an editorial writer there. His publications are 'The Story of Vermont' (1889); 'Stories of Napoleon' (1895); 'The Quilting Bee' (1895); 'The Story of a Page' (1913).

**HEAVEN**, in a physical sense, is the azure vault which spreads above us like a hollow hemisphere and appears to rest on the limits of the horizon. Modern astronomy has taught that this blue vault is in fact the immeasurable space in which earth, sun and planets, with the countless host of fixed stars, revolve. The blue color of the heavens is due to the action of minute particles in the air upon the blue rays in sunlight.

In ancient astronomy, heaven denoted a sphere or circular region of the ethereal heaven.

The ancient astronomers assumed as many different heavens as they observed different celestial motions. These they supposed to be all solid, thinking they could not otherwise sustain the bodies fixed in them; and spherical, that being the most proper form for motion. Thus they had seven heavens for the seven planets: the moon, Mercury, Venus, the sun, Mars, Jupiter, and Saturn. The eighth was that of the fixed stars, which was particularly denominated the firmament. Ptolemy adds a ninth heaven, which he calls the *primum mobile*. But others admitted many more heavens, according as their different views and hypotheses required: Eudoxus supposed 23; Regiomontanus 33; and Fracastoro no less than 70.

In theology this word denotes the upper and nobler region of God's universe, in contrast with the earth, the lower part assigned to men for their habitation. Of the belief in the existence of some special scene of the presence of Deity, the majority of the known religions of the world bear ample evidence. According to Aristotle all men, whether Greeks or barbarians, had a conception of God; and all united in placing the residence of the gods in the most elevated regions of the universe. This idea runs through the Persian, Egyptian, German, Scandinavian, and indeed all the ancient religions in which the belief in a supreme being assumes any other form than the pantheistic; and even though the pantheistic philosophers may have denied that any peculiar locality could be regarded as the peculiar habitation of the Deity, we find that popular belief and worship is evidently grounded upon a contrary opinion. In addition, however, to its being the special seat of the Deity, heaven also denotes the place or the state or condition of blessed spirits and of the souls of just men either immediately after physical death or at some certain period subsequent to it. All the religious systems which include the immortality of the soul involve, at least in substance, the idea of a future state of happiness as a reward for a virtuous life. The delights of the heavens of the various beliefs and creeds differ greatly in kind. The pleasures of the classical Elysian fields were to a great extent pleasures of sense; the German warrior believed he would be transferred to a region where he would be able to pursue his old fierce enjoyments; and the American Indian cherished the notion that he quits this world for a happier hunting-ground. Among Christians the general belief is that heaven is the abode of the Most High, the holy angels and the spirits of just men made perfect; that this dwelling-place is eternal, its joys entirely spiritual; it is believed also by many that the just who are free from sin are admitted into heaven immediately after death; also that the souls of the patriarchs, prophets, and in general the good, were detained, before the new dispensation, in a temporary abode till the coming of the Redeemer. See IMMORTALITY; also FUTURE LIFE.

**HEAVES**, or **BROKEN WIND**, a disease of the horse generally described as unsoundness of the horse respiratory organs. The disease is not well understood by veterinarians and the treatment is unsatisfactory. It is generally conceded that the disease is incurable. The characteristic symptoms are labored breathing,

dilated nostrils, bloodshot eyes and dependent belly. Horses with this disease often drop down while at work and succumb to congestion of the lungs, hæmorrhage or suffocation, the direct result of the heaves. Upon post-mortem examination the stomach is found distended and to have thinner walls than in the normal horse.

**HEAVYSEGE, Charles**, Canadian poet: b. Huddersfield, England, 1816; d. Montreal, 1879. He was a cabinetmaker by trade, and in 1853 emigrated to Canada, first working at the bench and later joining the staff of the *Montreal Witness*. In 1857 he published 'Saul,' a drama of great creative power, which has been described as "one of the most remarkable English poems written outside of Great Britain." His other works were 'The Revolt of Tartarus'; 'Jephthah's Daughter'; 'Count Filippo.'

**HEBBEL, hē'bēl, Friedrich**, German dramatist: b. Wesselburen (Dithmarschen, Holstein, then belonging to Denmark, now to Prussia), 18 March 1813; d. Vienna, 13 Dec. 1863. His father was a stonemason, his mother a washerwoman, and the conditions of his early youth at home were those of the most frightful poverty. The father particularly was much soured by the family's lot, and had gone so far in his pessimism as to look with disfavor upon even the most innocent pleasures of his two boys, whom he was obliged by bitter necessity to regard as his rivals in the consumption of their scanty meals. Already in his earliest years Friedrich showed a remarkable sensitiveness to impressions of artistic and stylistic character; he tells us, for instance, that such words as *Rippe, Knochen* ("rib," "bone"), by their mere sound aroused his anger, and that he carefully erased them from all his readers and textbooks, while other words, such as *Rose, Lilie, Tulpe*, produced a voluptuous pleasure in him. His father died when the boy was 14 years old, and Sheriff Mohr undertook to bring him up. This man attracted all the repressed hatred and venom of Hebbel's long years of privations, and, by forcing him to consort at table with the lower servants, developed a snobbish tendency in the boy that later occasionally found rather ugly expression. A reading of Uhland's poem, 'Des Sängers Fluch,' taught him the essence of poetry, and was the beginning of a long correspondence, later friendship, between the two men. A number of Hamburg newspaper readers, having seen some of Hebbel's little poetic contributions to the papers, determined to provide him with the means for university study, but their financial aid was so slight that, during his period of preparation, Hebbel was often starving. At this time, while at Hamburg, begins his friendship for Elise Lensing (1804-54), a poor seamstress, who became so infatuated with him that she devoted to him all her earnings, going even so far as to support his mother without his knowledge. His attitude toward her was that of a grateful recipient, who did not quite understand her affection for him. In 1836 he finally began the study of law at Heidelberg, soon giving up both the study and the city and going to Munich in the autumn of the same year. Here,

while attending the lectures of the philosopher Schelling and the mysticist Görres, he soon spent the small sums that Elise Lensing and other persons had given him, and found himself once more in dire want. For two and a half years he never had a warm meal. It is not difficult to understand the illnesses of Hebbel's later years after the privations of his youth and early manhood. At Munich he lived in the family of a poor carpenter, whose daughter, Josefa Schwarz, had considerable influence on him and probably suggested the theme and the treatment of Hebbel's middle-class tragedy 'Maria Magdalena,' written years later (1843). His first tragedy was written after his return to Hamburg (1839), on a subject found in the apocryphal book of Judith in the Old Testament, and suggested to him by Giulio Romano's painting in the Munich Pinakothek. 'Judith' (1840) is the story of a woman who sets out to perform a great deed for her country, but actually executes the deed because the victim (Holofernes) has won her love and insulted her womanhood. Holofernes, Nebuchadnezzar's general, is a picturesque tyrant of Asiatic type, impersonating boundless energy, brutality and gloom, and a peculiar tendency to self-torture that is characteristic of many of Hebbel's most powerful masculine characters in other plays. In 1843, through the intercession of the Danish poet Oehlenschläger, Hebbel, on a visit to Copenhagen, obtained from King Christian VIII of Denmark an annual pension of 600 thalers, to run for two years. "Is it not marvelous?" he writes. "Think of Friedrich Hebbel and 1,200 thalers; could you ever have mentioned the two in the same breath?" He visited Paris in 1843 and Rome in 1844. At the former city he was informed that Elise Lensing had lost their little boy, and that she was distracted in consequence. She was eager to marry Hebbel now, for his society at least, but he was determined not to marry her. He did not communicate this decision to her definitely, however, until he had settled down in Vienna (1845 to his death), where he became acquainted with Christine Enghaus (1817-1910), a famous actress at the Hofburg-theatre, whom he married in 1846, after a heartrending correspondence with Elise. "You surely must understand that my life must either have a larger outlook or come to an end." His letters and his diaries (the latter are of immense importance in any study of Hebbel; they extend from 1835 to his death) are very illuminating in the information they give on this period of his life and the mental struggles it covered. 'Maria Magdalena' is the story of a girl driven by the worthlessness of a brother, the faithlessness of a lover and the cruel severity of a father to seek her own death. The father's words on hearing of her deed: "The world is a riddle to me," are a strong arraignment of a generation of parents who impose moral laws upon their children instead of deriving a system of morality from life. 'Herodes und Mariamne' (in blank verse) is taken, as the name implies, from the tale contained in Flavius Josephus (q.v.), depicting an episode of the transition from

ancient paganism and Judaism to later Christianity. 'Agnes Bernauer' (1851) is a prose tragedy of Bavarian history, a pathetic tale of the love of a noble prince and a burgher maiden. 'Gyges und sein Ring' (1854) is a gloomy and distorted tragedy based on a tale in Plato taken from Lydian history. The Nibelungen Trilogy (finished 1860) has the following sections: 'Der gehörnte Siegfried,' 'Siegfrieds Tod,' 'Kriemhilds Rache,' and deals, like Richard Wagner's famous trilogy, with the old Teutonic legend of Siegfried, but while Wagner's music dramas are based chiefly on the Old Norse version as found in the Eddas, Hebbel's series is taken directly from the Mediæval German Nibelungenlied (q.v.).

Hebbel, like many other German creative artists, was also active as a critical philosopher, his best work in this field being contained in 'Mein Wort über das Drama' (1843), and in the diaries. One of the theories dominating his artistic production was embodied in his principle that the best conflicts for dramatic treatment were those symbolizing the great turning points of history, the transition periods between great historic epochs. An examination of his titles alone will indicate that he was powerfully attracted to the development of subjects involving the clash of hostile and incompatible civilizations. He has had an enormous influence over the intellectual life of the cultured middle class in Germany, but, curiously enough, has been practically ignored in other countries. His gloomy, doctrinaire, sententious manner seem to have excluded him, thus far, from the attention of the Anglo-Saxon community. Other works by him are plays: 'Genoveva' (1841), 'Der Rubin' (1849), 'Der Diamant' (1841), 'Demetrius' (unfinished, 1863); autobiographical: 'Meine Kindheit, ein Bruchstück' (1846); many poems and ballads, including an excellent idyllic epic, 'Mutter und Kind' (1857). 'Werke,' Säkularausgabe (16 vols., Berlin 1912-13). Biography and criticism: Biographies by Emil Kuh (Leipzig 1907), R. M. Werner (Berlin 1905), Walter Bloch (Berlin 1913), Adolf Bartels, 'Kinderland, Erinnerungen aus Hebbels Heimat,' (Leipzig 1914); Scheunert, A., 'Der Pantragismus as System Hebbels' (Hamburg 1903); von Scholz, Wilhelm, 'Hebbel's Dramaturgie' (Berlin 1906); Schmitt, Salomon, 'Hebbel's Dramatechnik' (Dortmund 1907); Horneffer, E., 'Hebbel und das religiöse Problem der Gegenwart' (Jena 1907); Kutscher, A., 'Friedrich Hebbel als Kritiker des Dramas' (Berlin 1907); Münz, B., 'Friedrich Hebbel als Denker' (Wien 1907). In fact, the bibliography is so huge that in 1910 it already filled a large volume: Wütschke, H., 'Hebbel Bibliographie' (Vol. VI of the Publications of the Bibliographische Gesellschaft, Berlin 1910). See MARIA MAGDALENA.

JACOB WITTMER HARTMANN,  
*Assistant Professor of the German Language  
and Literature, The College of the City of  
New York.*

**HEBE**, hē'bē, according to Greek mythology, the goddess of youth, and the cupbearer on Olympus until replaced by Ganymede. She

was the daughter of Zeus and Hera who gave her as a wife to Heracles, in reward of his achievements. At Rome she was worshipped as Juventas. She is described by some authorities as a divinity who had it in her power to make old persons young again. In the arts she is represented with the cup in which she presents the nectar, under the figure of a charming young girl, her dress adorned with roses, and wearing a wreath of flowers. An eagle often stands beside her, which she is caressing.

**HEBEL**, Johann Peter, German poet: b. Basel, 10 May 1760; d. Schwetzingen, 22 Sept. 1826. He received his education at Basel and studied theology at Erlangen; was made church councillor in 1805; director of the Karlsruhe Gymnasium in 1808, and was raised to the prelate in 1819. He published a series of poems in the Alemannic dialect—'Allemanische Gedichte' (1803), which attracted a very favorable notice from Goethe, and attained great popularity for their humor, and their fresh and vigorous descriptive passages. Scherr called Hebel's 'Die Wiese' the 'pearl of German idyllic poetry.' Hebel also wrote excellent stories contained in 'Schatzkästlein des rheinischen Hausfreundes' (Tübingen 1811; new ed., Stuttgart 1869; 1888). There are monuments to Hebel in Karlsruhe, Basel and Schwetzingen. Consult Hebel's 'Sämtliche Werke' ed. by Keller (5 vols., 1905); his correspondence, edited by O. Behaghel (1883); Längin, G., 'Johann Peter Hebel, ein Lebensbild' (Karlsruhe 1874); and Schultheiss, 'Hebels Leben' (Heidelberg 1831).

**HEBER**, hē'ber, Reginald, English Anglican bishop and poet: b. Malpas, Cheshire, 21 April 1783; d. Trichinopoly, India, 3 April 1826. He was educated at Brasenose College, Oxford; distinguished himself by the English prize poem, 'Palestine'; was elected to a fellowship in All Souls' College; traveled in Germany, Russia and the Crimea; entered holy orders in 1807, and became the incumbent of Hodnet, Shropshire. In 1812 he was appointed prebendary of Saint Asaph, in 1815 Bampton lecturer at Oxford, in 1822 preacher at Lincoln's Inn. From 1822 until his death he was bishop of Calcutta, at that time constituting one very extensive diocese, in all parts of which he traveled to the furtherance of the mission work in progress. He completed the establishment of Bishop's College, Calcutta, begun by Bishop Middleton. Heber is best known for his hymns, which include the familiar 'From Greenland's Icy Mountains,' 'Brightest and Best' and 'Holy, Holy, Holy!' His poetical works were published in 1841. In prose he wrote 'A Life of Bishop Jeremy Taylor' (1822), and 'A Journey Through India' (1828). Consult the 'Life' by Geo. Smith (1895), and Montefiore (1904).

**HEBER SPRINGS**, Ark., town and county-seat of Cleburne County, on the Missouri and North Arkansas Railroad, 80 miles north of Little Rock. It has extensive agricultural, live stock and lumber interests and contains saw mills, cotton gins, sash and door works, a planing mill, etc., a new courthouse, public and high schools, and two banks with resources

amounting to \$429,000. The value of its taxable property is estimated at \$528,436. The municipal expenditure reaches an average of \$4,000 annually. The town enjoys a considerable reputation as a health resort, having nine mineral and sulphur springs. It is visited by many health-seekers, both in summer and winter. Pop. 2,000.

**HÉBERT, Jacques René**, zhāk ré-nā ā-bār, French journalist and politician: b. Alençon, Orne, 15 Nov. 1755; d. Paris, 24 March 1794. At the beginning of the French Revolution Lemaire published a journal supporting constitutional principles under the title *Père Duchesne*. The Jacobins soon established a rival *Père Duchesne*, of which Hébert became editor. The journal owed its success to the cynical virulence with which it advocated the popular cause and abused the court and the monarchy, and soon had the field to itself. He was a member of the Revolutionary Commune that approved the massacres in the prisons in September 1792, was soon after substitute attorney of the commune, and employed all his influence in forwarding a project to establish the authority of the commune on the ruins of the national representation. The Girondists, who were at that period contending against the Mountain, had credit enough to procure the arrest of Hébert 24 May 1793. Again restored to liberty, he assisted with all his power and influence in the proscription of the Brissotins. Their downfall hastened his own. With Chaumette he established the *Fest of Reason*, and afterward accused Danton of having violated the nature of liberty and the rights of mankind. This terrified both Danton and Robespierre, who suspended their mutual jealousies to accomplish his destruction; and Hébert, with the greater part of his associates, was arrested and guillotined.

**HÉBERT, Louis Philippe**, Canadian sculptor: b. Sainte Sophie d'Halifax, Quebec, 27 Jan. 1850. He studied for several years in Canada, and later in Paris, where he established his studio. In 1894 he won the Confederation medal awarded by the Canadian government. Among his works are historical subjects executed for public buildings in Quebec, Ottawa and Montreal.

**HEBREW ECCLESIASTICAL COSTUME.** See **COSTUME, ECCLESIASTICAL.**

**HEBREW LANGUAGE AND LITERATURE**, the tongue in which the ancient Jews spoke and wrote, and the books produced by that people during their settlement in Palestine as an independent nation; these latter constitute the Hebrew Scriptures and are looked upon by the Hebrews as containing the inspired word of God. See **JEWS AND JUDAISM** — **HEBREW LANGUAGE**; **JEWISH LITERATURE**; **JEWISH PHILOSOPHICAL WRITERS**; **THE JEW IN ART, SCIENCE AND LITERATURE**; **THE TALMUD**; **THE MASORAH**; **THE CABALA.**

**HEBREW MUSIC.** From the many Bible references to music, the inference necessarily arises that it filled a large part in the life of the ancient Hebrews. It is spoken of not only in the service of religion, where it might naturally have been looked for, but also on the

battlefield, at the harvest feasts and in the home. David, prince of singers, employs it to drive away Saul's melancholy. Elisha prophesies under its inspiration. The victory at the Red Sea, the return of Saul and David after the battle with the Philistines, all important national events are celebrated in song. The details of the Temple music, the names, divisions and functions of the singers and instrumental performers are referred to at length. David utilized no less than 4,000 singers in the Temple service, of whom 288 were "skilful"—i.e., virtuosi. Josephus, describing the preparations for the dedication of the Temple, speaks of a band and chorus of 200,000 trumpets, 40,000 string instruments and 200,000 singers; and, even if these figures are liberally discounted, the number must have been imposing.

Yet, in spite of all that modern research has accomplished in reconstructing the vital facts of Jewish history, very little definite information exists on the subject of Hebrew music. This, in itself, is a strong indication that music was but slightly developed by the Jews. Even among the Greeks, most advanced of the ancient peoples in all that concerned the arts, it had practically no independent existence, but was bound up with poetry and dancing and entirely subservient to their demands. The Greeks spent much effort over the scientific aspects of music and its æsthetic considerations and their speculations on the subject are preserved in fairly elaborate form; but there is no trace of any treatise on either the theory or the practise of music among the Hebrews; not even any suggestion bearing on its use is to be found in the widely varied laws of the Pentateuch. The Bible is bare of any real indication of its form, nature or mechanics. All reasonings on the subject are necessarily a priori.

In any discussion of ancient music it must be borne in mind that a different thing is meant than that which the word connotes in its present-day signification. Music, as an art, has the three dimensions of rhythm, melody and harmony; while at the dawn of civilization it was, as one writer has well put it, a "flatland" of two dimensions only, rhythm and melody. So far as scholars have been able to discover, harmony is entirely a modern development. The terminology of the Bible is a stumbling block in the path of students on the subject, who cannot even identify some of the musical instruments named. There are, for example, several Hebrew names which may mean harp, an instrument undoubtedly in use by them, *kinnor*, *nebel*, *asor*, all translated in the English version of the Psalms as "psaltery." The *ugab*, an invention credited to Jubal, is variously called "organ" and "pipe." The one instrument preserved to the present day is the shophar, a curved trumpet, made of the ram's horn, which is still heard in the synagogue on important holy days. It is the shophar which sounded amid the smoke and thunder of Mount Sinai when the Commandments were given to Moses and to its blast the walls of Jericho fell. While the exact facts are lacking, it is established that the Hebrews had instruments in the three modern categories of stringed, wind and percussion instruments. Save as there may have been interludes between the choral singing

and the chanting of the priests, there seems to have been no independent instrumental music; but it almost invariably accompanied the voice and the dance. Hebrew song was probably a unison chant or song-speech, more or less melodious, but entirely subordinate to the text in rhythm and accent. From the form of much of the verse, it seems to have been, at times, antiphonal. Undoubtedly it was crude and noisy and probably without definite pitch, judged by Occidental standards. Even modern Oriental music sounds so to Western ears.

In his method of intoning prayers, the Orthodox Jew of to-day follows the tradition which has been handed down probably from the remote days of the Temple; but this chanting has very little in common with music. It is, in a sense, rhythmical, but the rhythm is that of the words. It has sequence and variations of tone, but they are based on the syntactical structure of the sentences, not the musical exigencies of melody. When, at times, this chanting approaches music in formal semblance, it is an accident due to textual or syntactical impulse. It is always possible, as it is certainly plausible, that the plain song of the early Catholic service, which, in the course of the first thousand years of the Christian era, developed into a rounded and organized body of chants, appropriate to every branch of religious worship, is the direct descendant of the ritual chant of the synagogue. At all events, the latter could not have been without its influence upon the early members of the Christian clergy.

Although there is no music now extant traceable to the Hebrews of Bible days, a body of music of some size and distinct character has grown up during the past few centuries, which, by long association with the ritual and the home-life of the Jews of all countries, has achieved the right to the title of Hebrew music. Differences may be noted between the music of the Sephardic or Spanish-Portuguese Jews and that of the Ashkenazim or Jews of northern Europe, explainable, in part, however, by differences in environment. Probably the oldest of Jewish melodies now in use is the famous *Kol Nidre*, sung on the eve of the Day of Atonement. It has been popularized through Max Bruch's rather free improvisation. The Chanuka hymn, *Mo'oz Tsur*, the *Oz Yoshir*, sometimes asserted to be Miriam's song of triumph, the *Shir Hama-a-los*, accompanying the grace before meals, the *Addir Hu*, and several other of the Passover songs and the *En Kelohenu*, are known throughout the entire Jewish world. These, and a number of others, with the original texts, were brought together a few years ago in a Hebrew hymnal by Mrs. Solomon Schechter and Lewis M. Isaacs. A real though recent addition to distinctive Jewish music is the Zionist song *Hatikvah*, which is, however, spiritually and atmospherically old.

No account of Hebrew music would be complete without mention of Solomon Sulzer, the foremost name among Jewish cantors. Born in Austria in 1804, he devoted his marked musical talent to the service of the synagogue. In a whole-hearted endeavor to reconstruct the music of the Jerusalemic days—a task which his enthusiasm refused to admit was impossible—he introduced reforms in the ritualistic chanting, which, while sacrificing little of the traditional atmosphere, vastly improved its

musical value. He arranged and composed a large number of responses and settings of psalms and prayers, the best of which are contained in a collection called *Shir Zion*, which have made for themselves a permanent place in the Jewish world.

LEWIS M. ISAACS.

**HEBREWS**, the distinctive name of that branch of the Semitic family which migrated from Mesopotamia into Palestine, thence went to Egypt, and, after a long period of bondage, reconquered Palestine, and finally settled there. Divided, at a later period into two distinct states, that of Judah and of Israel, they were singly overcome, and led into exile. A portion, chiefly descendants of Judah (Jehudah) returned, and founded a new empire. From that time all the members of the Mosaic commonwealth were known by the name of Jehudins, corrupted into Jews. The word *Hebrew* has come down to us through the Greek Ἑβραῖος from the Old Testament word 'ibhri, used of the people who claimed a common descent from Abraham, whose ancestor was Eber or Heber (Gen. x, 21). 'Ibhri itself is derived from 'abhar, to cross over, to wander, and may refer to the nomadic mode of life of this people during its early period. For a continuous sketch of the entire history of this people from the days of Abraham to our own, as well as a brief outline of this language, literature, culture, etc., see JEWS AND JUDAISM; PALESTINE; SEMITES; SEMITIC LANGUAGES AND LITERATURES; HEBREW MUSIC; ZIONISM.

**HEBREWS**, one of the canonical books of the New Testament, usually spoken of as "The Epistle to the Hebrews." The fact that it lacks the introductory formula naming author and recipients, to be expected in every ancient letter, has led some to deny that this writing is a letter. But this form may in this case, as often, have been placed on a separate sheet and become lost, or for some other reason have failed to be copied. At any rate many expressions show that it really was a letter addressed by some individual to a definite group of early Christians. In the King James version it was styled "The Epistle of Paul the Apostle," and thus has been perpetuated an early Alexandrian tradition, which later became the universal opinion for many centuries. But this view was at first unknown in Rome and the West, where are the earliest traces of the use of this writing, and it differs from the acknowledged epistles of Paul in both style and thought. The language is here more idiomatic and choice; clauses and sentences are connected by an array of conjunctions largely different from those used by Paul; instead of his abrupt, almost disconnected course of expression, earnest to vehemence, we find in Hebrews a series of balanced periods, flowing smoothly even when most emphatic and a style abounding in almost artificial devices of rhetoric. There is no less difference in the theological conceptions and their presentation. While not antagonistic to Paul's doctrines, being rather complementary, the doctrinal teachings here are yet variant, as, for example, the teachings as to the divine Sonship of Christ; the nature of faith, and the value of the law of Moses.

While the Pauline authorship is now set aside as out of the question by the practically unanimous judgment of critics of every school, there is no general agreement as to who did write the book. Clement of Rome and Luke have been urged for no reasons except valueless suggestions made by Clement of Alexandria and his pupil Origen. Harnack has conjectured that it may have been written by Priscilla in association with her husband, Aquila, but this view can satisfy only such as regard it as addressed to Roman Christians. The conjecture of Luther that Apollos was the author has been widely accepted, while the later suggestion that it was written by Barnabas has met with the approval of many scholars of the highest rank. The latter view has in its favor, to be sure, the only ancient testimony of real weight, that of Tertullian, but it must be allowed that either Barnabas or Apollos would meet all the requirements of the case so far as they are now known, and consequently that the authorship cannot be positively decided.

There is no less uncertainty in naming the persons to whom it was originally addressed. The title prefixed very early, though in all probability not originally, was "To Hebrews," and the view that it was addressed to Jewish Christians is nearly universal. Not a few scholars, however, have lately declared in favor of the view that it was written rather to Gentile Christians. The decision hinges on the answer to the question whether the danger against which the author warns his readers is relapse into heathenism or relapse into Judaism. On the one side it is urged that relapse into Judaism could not properly be designated "apostasy from the living God," while on the other side it is urged that, while Judaism was in the author's mind good as compared with heathenism, yet its acceptance at cost of a surrender of all that was distinctively Christian might reasonably be styled apostasy. It has certainly seemed to most that the fact that the whole thought of the book is the superiority of Christianity over Judaism proves that the danger against which the first readers were warned was relapse into what the author regarded as relatively worthless because an outgrown and outworn stage of divine revelation, and that the opinion that apostasy into heathenism was the readers' danger is only "an ingenious paradox," even though "an amount of ingenuity has been expended in support of this hypothesis, sufficient to render it plausible."

To some extent the questions as to place and date depend for their answer upon the conclusion as to the character of the first readers. If addressed to Hebrew Christians, it is scarcely possible that its date can be later than 68, just before the Jewish War which resulted in the destruction of Jerusalem, and the final removal of the danger of relapse into Judaism, while the fact that it is addressed to a second generation of believers and the references to the lapse of considerable time make it necessary to set the date as late as possible. If addressed to Gentile Christians, it might be dated as late as 85 or even 90. But that in any case it is a 1st-century production is guaranteed by the use made of it by Clement of Rome before the year 100.

Where the first readers are to be looked for hangs as completely on their character as does the question of date. If Gentile, most would think it probable that they were to be found at Rome, where they may have constituted only a single group of many among the Christians in the city. If, however, they were really Hebrews, it is, if not impossible, at any rate less likely that they were at Rome. The reference to "those from Italy" is ambiguous, but it would seem plausible that Timothy had been imprisoned at Rome rather than that on release he should hasten hither. If the core of the book is a warning against Judaism, it would be natural to look for those needing such a warning nearer the Temple than was Rome. While it is generally regarded as improbable that the letter was addressed to the church at Jerusalem, there may have been many communities within easy reach of that city where such a group of Christians as these "Hebrews" could have been found. Syrian Antioch and Jamnia have been named among other places.

The author very fitly styled his work "a message of appeal." Such it is throughout. To be sure, the first 10 chapters consist largely of argument skilfully marshaled and stated, but all is to strengthen appeal, and exhortation is constantly inwoven with demonstration. The great theme is the superiority of Christianity over Judaism. While this is developed in many phases, it may be briefly summed up in saying that in chapters i-vi the stress is laid on the personal superiority of Christ, as compared with angels, Moses, Aaron, and then (vii, 1-x, 18) the superiority of the work of Christ is set forth. But the whole is one plea for persistence in the Christian profession and life, and while the changes of the centuries have made much in this book peculiarly hard to understand and have robbed other arguments of some of their original force, yet, when understood, this plea for the value of Christianity remains cogent as well as earnest.

DAVID FOSTER ESTES,

*Professor of New Testament Interpretation,  
Colgate University.*

**HEBRIDES**, hēb'ri-dēz, **The, or WESTERN ISLANDS**, Scotland, an archipelago off the west coast, extending from lat. 55° 35' to 58° 32' N.; the most southern island being Islay, and the most northern, Lewis. The group is politically divided between the shires of Ross and Cromarty, Inverness and Argyll, very nearly in the line of their coincidence with the coasts of the respective counties. They number about 500 in all, but many are inconsiderable islets and rocks, and only about 100 are inhabited; area, about 2,812 square miles. They are usually divided into the Outer Hebrides, of which the principal are Lewis and Harris (forming a single island), North Uist, Benbecula, South Uist and Barra; and the Inner Hebrides—Skye, Mull, Islay, Jura, Coll, Rum, Tiree, Colonsay, etc. The Outer are separated from the Inner, and from the mainland, by a strait or channel called the Minch, which at its narrowest part, between Harris and Skye, is about 12 miles broad. Ross and Cromarty,

Inverness and Argyll are the counties to which they belong.

The climate is mild and salubrious, but variable, tempestuous and humid. Snow and frost are almost unknown in the smaller islands, and are but little felt in the larger. There is comparatively little wood in the Hebrides, and on many of the islands none at all. In Lewis, Skye, Islay, Mull and several of the other islands, however, both forest and fruit trees have been planted to a considerable extent. Oats and barley are almost the only cereal crops raised. Potatoes are extensively cultivated. Cattle constitute the staple product. The native breed are small but handsome. The breed of horses in also small, but hardy and docile. The native breed of sheep is very small, but Cheviots have been introduced with success. The productive land is partly occupied as sheep-farms; much of it is held by "crofters," who occupy holdings usually of a very few acres, sometimes with a right of pasturage in common attached. There are also "cotters" who occupy houses, with or without a patch of ground, on the land of the crofter, the farmer or the landlord, and who are often mere squatters paying no rent. Grouse-moors and deer ranges cover a considerable area. Owing to the minute division of the arable land there is in many places an excess of population. The condition of the crofters and cotters, especially in the Outer Hebrides and Skye, is very depressed, their dwellings miserable and their living poor, consisting chiefly of potatoes, milk and oats or barley bread, and in bad harvests it is often insufficient in quantity. The fisheries are not developed to the extent they might be. Limestone and slate are the only minerals worked. Whisky is manufactured in Skye, Islay and Mull. Gaelic is still the language of the majority of the inhabitants of the Hebrides. The Hebrides were the Ebudae of Ptolemy and the Hebudes of Pliny. In remote times they were subject to the kings of Norway, but in 1264 were annexed to the crown of Scotland. They were held by various native chieftains, in vassalage to the Scottish monarch; but subsequently fell into the hands of one powerful chief, a Macdonald, who in 1346 assumed the title of "Lord of the Isles" and began to exercise a practically independent rule. The abolition of heritable jurisdictions in 1748, which put an end to the system of communal ownership of the soil as well as to the rule of the chieftains, was not an unmixed blessing; and it was followed by exorbitant rentals and by great emigrations to North America. The potato blight of 1846 caused great hardships to the population. The entire relations between owner and tenant in the Hebrides were made the subject of investigation by a royal commission in 1884; this was followed by the Crofters Holdings Act of 1886, under which fair rents and fixity of tenure are assured to the crofters, and the hardships of their lot have been considerably mitigated. The inhabitants mostly belong to the United Free (Presbyterian) Church, but in some of the islands Catholicism is predominant. Little was known about the Hebrides until the publication of 'Johnson's Journey to the Western Islands of Scotland' (1775). In more recent times Scott's 'Lord of the Isles,' and the charming novels of William Black, have invested them

with a halo of romance, and the steamers of the Clyde afford ample facilities for tourists who intend visiting the islands. Consult Pennington, 'Tour in Scotland and Voyage to the Hebrides' (1774); Buchanan, 'The Hebridean Isles' (1883); Goodrich-Freer, 'The Outer Isles' (1902); Hartley, 'Wind-Seekers in the Hebrides' (1906).

**HEBRON**, hē'brōn (originally KIRJAT-HARBA, now EL-KHALIL), Asiatic Turkey, a town of great antiquity in Palestine, 18 miles southwest of Jerusalem, 2,830 feet above sea-level. It lies in the narrow valley of Mamre, has narrow streets, high well-built stone houses with flat roofs, extensive covered bazars, with well-furnished shops, exhibiting glass manufactures, consisting of lamps, colored rings, etc., for which the place has long been celebrated. The chief mosque, El-Haram, built around the Cave of Machpelah, from which Christians were rigorously excluded, is esteemed by Mohammedans one of their holiest places. Hebron is one of the oldest existing towns, having been built seven years before Zoan (Num. xiii, 22), and it is mentioned prior to Damascus (Gen. xiii, 18). It is peculiarly rich in traditional sites. Abraham resided here and acquired the Cave of Machpelah as a sepulchre for Sarah and their descendants. It was taken by Joshua and given as an inheritance to Caleb and made a city or refuge. It was David's royal city for seven years. Here Absalom came to be declared king. The town was captured by Judas Maccabæus from the Edomites, and was stormed by the Romans under Vespasian and burnt down. In 1167 it became a Latin bishopric, and in 1187 it fell into the hands of Saladin. Pop. 22,000 (2,000 Jews).

**HEBRON**, Neb., city, county-seat of Thayer County, on the Little Blue River, and on the Chicago, R. I. & P. and the Burlington & M. railroads, about 63 miles southwest of Lincoln. It is situated in an excellent agricultural and stock region. It has a large flour-mill, a creamery and a planing-mill. There are five churches, a high school, three banks and three weekly newspapers. The shipments of wheat and live stock are extensive. Electric and sewage plants and waterworks are municipally owned. Pop. 1,778.

**HECATÆUS**, hek-a-tē'ūs, distinguished Greek historian and geographer: fl. about 500 B.C. He was a native of Miletus and the son of Hegesander, a member of an ancient and illustrious family. Of his public life the only event of which we have any definite knowledge was the part he took in the insurrection of the Ionians against the Persians. Being well acquainted with the resources of Persia, he vainly attempted to dissuade Aristagoras, the planner of the revolt, from his undertaking. Later he went as ambassador to Artaphernes and prevailed on the satrap to win the confidence of the Ionians by lenient treatment. His two great works were his 'Tour of the World,' and his 'Genealogies.' The latter is little more than a prose version of the legends already given in versified form. He improved the map of the world made by Anaximander; and his writings were highly esteemed by Herodotus. The fragments of his works were published by Müller (1841-70).

**HECATE**, hĕk'ă-tĕ, in Greek mythology a goddess whose parentage is variously given. Homer does not mention her. She appears to have been originally a Titan who ruled in heaven, on the earth and in the sea. She could bestow or withhold at pleasure the blessings of wealth, victory and wisdom to mortals, and was the only Titan who retained power under the rule of Zeus. She was subsequently confounded with several other divinities, was the goddess of night and of the lower world, and at length became a mystic goddess having all the magic powers of nature at her command. She was identified with Demeter and Artemis, and was regarded as the mystic Persephone. Magicians and witches prayed particularly for her aid. Sacrifices used to be offered to her on the last day of the month at places where three ways met (whence her epithet *Τριῶ δῖρις*, or in Latin, *Trivia*), and these consisted of dogs, honey and black female lambs. Her mysterious festivals were celebrated annually at Ægina. Her appearance was frightful. She had three bodies or three heads, and serpents hung hissing around her neck and shoulders.

**HECK, Barbara**, one of the founders of American Methodism: b. Ballygarry, County Limerick, Ireland, 1734; d. near Augusta, Ontario, 1804. She was of a colony of German immigrants in Ireland who were among the first to be influenced by Wesley's preaching. In 1760 she came to America with her husband, Paul Heck, and Philip Embury (q.v.). In 1766 she was very active in the organizing of a Methodist society which met at Embury's house, and she also did much toward the building of the Old John Street Methodist Church. Later she and her family removed to the northern part of New York State, and when the Revolution broke out went to Lower Canada (1774), and later settled in Augusta, near Prescott in Upper Canada, and were the founders of Methodism in that province.

**HECKER, Friedrich Karl Franz**, German-American soldier: b. Eichersheim, Baden, 28 Sept. 1811; d. Saint Louis, Mo., 24 March 1881. After studying law in Heidelberg, he abandoned his profession for political life. In 1842 he was elected to the Chamber of Deputies of Baden. On the outbreak of the revolution in Germany in 1848 he endeavored to convert the preliminary convention into a permanent republican assembly. Frustrated in this attempt, he put himself at the head of a band of revolutionists, and invaded Baden from the south. He was defeated at Kändern 20 April 1848, and fled to Basel, Switzerland, where he edited a radical newspaper and published his work 'Die Volks-erhebung in Baden.' He was refused admission to the National Assembly at Frankfurt, although twice elected from Thiengen. In 1849 he removed to the United States, and became a farmer near Belleville, Ill. On the outbreak of the Civil War he raised a regiment of Germans, serving in General Frémont's division as colonel; and afterward for a time commanded a brigade. In his later years he watched with great interest the foundation of the German Empire and its phenomenal growth. He published 'Reden und Vorlesungen' (1872); 'Betrachtungen über den Kirchenstreit in Deutschland und die Infallibilität' (1874).

**HECKER, Isaac Thomas**, American Roman Catholic clergyman: b. New York, 18 Dec. 1819; d. there, 22 Dec. 1888. In early life he was a member of the Brook Farm community, near Boston, where for nearly a year he officiated as baker for the establishment. In 1845 he became a Roman Catholic; went to Germany to study for the priesthood and joined the Redemptorist Fathers in Belgium in 1847. He was ordained priest in London by Cardinal Wiseman in 1849. Returning to New York he founded the order of the Paulists (1858), nearly all converts from Protestantism, and became their superior; established the *Catholic World* (1865), of which he was editor till his death; and was the founder of the Catholic Publications Society. An anonymous French version of Elliott's 'Life of Father Hecker' led to the noted "American" controversy. He wrote 'Questions of the Soul' (1855); 'The Church and the Age' (1888), etc. Consult Sedgwick, 'Father Hecker' (1900).

**HECKEWELDER, hĕk'ĕ-wĕl-dĕr, John Gottlieb Ernest**, American Moravian missionary: b. Bedford, England, 12 March 1743; d. Bethlehem, Pa., 21 Jan. 1823. At the age of 12 he came with his father to Pennsylvania. He accompanied Post in 1762 in his expedition to the Indian tribes on the Ohio, and in 1771 took up his residence among them as a missionary. He assisted Putnam in negotiating with the Indians at Vincennes (1792) and Niagara (1793), and also in the negotiations leading to the surrender of the lands granted to the Christian Indians on the Muskingum in 1797. After some 40 years' missionary service, he went to Bethlehem, the principal establishment of the Moravians in America, and there remained till his death. He wrote several memoirs upon the Delaware and Mohegan Indians: 'Account of the History, etc., of the Indian Nations' (1818); 'Narrative of the Mission of the United Brethren' (1820). Consult the 'Life,' by Rondthaler (1847).

**HECLA**, or **HEKLA**, Iceland, an isolated volcano in the southwest, about 20 miles from the coast. It is of conical shape, terminating in three perpetually snow-clad peaks, the central and loftiest of which, Heklutjall, is 5,110 feet high. The circumference at the base is about 12 miles. It is composed chiefly of columnar basalt and of lava, mostly covered by stones, scoriæ, ashes and other loose volcanic matter. Since the 10th century there are 43 eruptions on record, the most violent occurring in 1157, 1300, 1597, 1636 and 1766. One of the most tremendous occurred in 1783, after which it remained quiescent till 2 Sept. 1845, when it again became active and continued with little intermission for 15 months to discharge itself from three craters, its effects being felt as far as the Orkney Islands, 400 miles distant. The last outbreak was in 1878.

**HECO**, hay'co, **Joseph**, the first or second naturalized American citizen of Japanese birth, founder of the first newspaper in Japan: b. Kamiya, on the Inland Sea, 1837; d. 1892. In April 1850 with his cousin and nine pilgrims he embarked on a junk, with passenger accommodation for 70 persons, to visit the temple of Kompira in Shikoku. Thence from Marugame they sailed to Miyajima. On a later voyage, in the same year, from Yedo

homeward, a storm arose and they were blown out to sea in the *Kuro Shiwo*. After drifting 50 days, they were picked up by the captain of the American bark *Auckland*, and saw foreigners for the first time. In San Francisco, in 1851, he learned the language and some business. Coming to Baltimore, he received education and friendship from Mr. B. C. Sanders, former collector of the Port of San Francisco. In Washington, he saw President Lincoln and was amazed at republican simplicity. In 1859 he left for Japan and being the only native who could speak English there, was made interpreter for the American consulate at Yokohama, and in 1867 for the United States steamship *Wyoming* in the fight at Shimonoseki, in 1868. He established a newspaper, the first in Japan, and again visited the United States. For many years he gave invaluable assistance in smoothing the intercourse between natives and foreigners and was often in danger of his life from hot-headed and ignorant patriots. His 'Narrative of a Japanese' (edited by James Murdoch, 2 vols., 1892) throws strong lights upon the interior history of Japan from 1850 to 1865, while giving pen portraits and impressions of Lincoln, Seward, Sumner, Brooks of *Merrimac* and McDougal of the *Wyoming* fame.

**HECTIC FEVER**, a type of fever which is intermittent and is distinguished by an afternoon or evening quickening of the pulse, and rise of temperature. The eyes of the patient brighten, his cheeks flush and there is some nervous and cerebral excitement. The fever is succeeded by a profuse perspiration. This affection is frequently associated with phthisis, abscess, or septicæmia, and is of dangerous significance. It is a symptom of chronic supuration from some cause, in which the wound is not aseptic or well drained. The rise in temperature is attributed to a form of blood-poisoning from the absorption of some parts of the products of putrefaction. Treatment must be directed to the disease from which it arises in each case and of which it may be considered a grave symptom.

**HECTOR**, Mrs. Annie French ("Mrs. ALEXANDER"), Irish novelist: b. Dublin, Ireland, 1825; d. London, 10 July 1902. She began to write at an early age and was a prolific and popular writer. Among her books, all of which enjoyed a wide popularity in the United States, are 'The Wooing O't' (1873); 'Ralph Wilton's Weird' (1875); 'Her Dearest Foe' (1876); 'The Freres' (1882); 'A Golden Autumn' (1897); 'A Winning Hazard' (1897); and 'Kitty Costello' (1904).

**HECTOR**, in Homeric narrative, the son of Priam and Hecuba, and the bravest of the Trojans, whose forces he commanded. His wife was Andromache, the daughter of Aëtion. He encountered the Grecian heroes in battle, and often gained advantages over them. By his presence Troy was invincible; but when he had slain Patroclus, the friend of Achilles, the latter, forgetting his dispute with Agamemnon, resumed his arms to avenge the death of his beloved companion. Pierced by the spear of Achilles, the body of Hector was dragged at the chariot wheels of the conqueror; but afterward, at the command of Zeus, was delivered

to Priam for a ransom, who gave it a solemn burial.'

**HECUBA**, in Greek legend, the second wife of Priam, king of Troy, to whom she bore 19 children including Hector, Paris, Cassandra and Troilus. After the fall of Troy she was given as a slave to Odysseus, and according to one form of the legend, in despair leaped into the Hellespont.

**HEDDA GABLER**. Ibsen, in 'A Doll's House' (1880) and 'An Enemy of the People' (1883), had preached the necessity of individualism, but, perceiving that he might be misunderstood as an upholder of self-interest in opposition to the welfare of others, he turned in 'Rosmersholm' (1887) and 'Hedda Gabler' (1891) to point the danger and futility of sheer self-assertion. Such a notion is implicit in both plays, although 'Hedda Gabler' seems chiefly a study of character and least of all a drama of ideas. Hedda is an unscrupulous individualist married to a dull pedant in whose rival for an academic position she finds an earlier lover. This rival is a creative scholar of infirm will who has been reformed by Hedda's school friend, Mrs. Elvsted, and inspired to compose a great work. Hedda is jealous of Mrs. Elvsted, fearful lest Lövborg secure the position for which her husband is contending, and curious to discover how far she can determine the fate of another creature. Accordingly, she exerts her malign influence to spur Lövborg into dissipation, and, when he fancies himself forever disgraced by misconduct and the loss of his precious manuscript, she provides a pistol with which he may end his life. Lövborg dies, but Hedda, who had not foreseen that the pistol would be recognized as hers, is involved in the scandal. She can escape it only by according her favors to a libertine judge, aware of all the facts in the case, and prepared to profit by his knowledge. Although Hedda is without a moral qualm, she cannot endure public shame or submission to the will of another. She therefore shoots herself with the second pistol of the pair that she had inherited from her father.

Hedda is a female Mephistopheles, without passion, instinctively and deliberately evil, yet cowardly. As heartless as Becky Sharp, she is far more corrupt. She loathes her husband with his pedestrian mind and bourgeois interests; she loathes her condition as a wife and a mother soon-to-be; and she loathes Mrs. Elvsted as the good angel of Eilert Lövborg. Her prurient curiosity, her morbid dread of scandal, her malevolent delight in burning the manuscript of Lövborg and insidiously suggesting his suicide, are essential features in this portrait of one of the most disagreeable women of all literature. The play was published in 1890, a year before its first performance in Norway, and was translated into English in 1891 by Edmund Gosse. The authoritative version is that of Gosse and William Archer.

FRANK W. CHANDLER.

**HEDDING**, Elijah, American Methodist bishop: b. Dutchess County, N. Y., 7 June 1780; d. Poughkeepsie, N. Y., 9 April 1852. At 19 he entered the Methodist ministry, and was appointed successor of Lorenzo Dow. He extended his travels to Canada, and preached the Gospel in various parts. He became a member of the New York annual conference in 1801, and

was made a bishop in 1824. He was instrumental in the establishment of the *Zion's Herald* at Boston, the first journal published by the Methodist Church in the United States. Consult the 'Life' by D. W. Clark (1855).

**HEDGE, Frederic Henry**, American scholar: b. Cambridge, Mass., 12 Dec. 1805; d. there, 21 Aug. 1890. He studied in Germany 1815-23, was later graduated from Harvard and Harvard divinity school, and after holding Unitarian pastorates in Bangor, Me., Providence, R. I., and Brookline, Mass., was professor of German at Harvard University (1872-81). Deeply read in philosophy, ecclesiastical history, and German literature, he was a finished writer and a much admired orator, and ranked as perhaps the foremost German literary scholar in the United States. Among his writings are 'Reason in Religion' (1865); 'The Primeval World of Hebrew Tradition' (1870); 'Martin Luther and Other Essays' (1888), etc. His 'Prose Writers of Germany' (1848) is a standard work. He translated poems from the German and wrote numerous hymns for the Unitarian Church.

**HEDGE**, a fence formed of living trees or shrubs. Hedges are generally composed of one or more of the following plants: Hawthorn, crab, blackthorn, holly, privet, beech, hornbeam, maple, barberry, furze, broom, alder, poplar, willow, yew, box, arbor-vitæ, sweet-briar, etc. When there are so many different species to select from, plants may be found suitable for almost all kinds of soil — such as wet or boggy, and dry or sandy; for all situations, whether sheltered or exposed; and for all purposes, such as fences against cattle, or simply as ornaments for garden and pleasure grounds.

**HEDGE-SPARROW**, a small brown warbler (*Acceptor modularis*), with a sweet plaintive song, very common in Europe about gardens and roadsides in summer. It is not a sparrow at all, but nearly related to the American water-thrushes (*Seiurus*). In Great Britain it goes by many names, as dunnoek, etc., and is one of the birds most frequently mentioned in books.

**HEDGEHOG**, a small insectivorous mammal of the Old World family *Erinaceidæ*, and especially of the genus *Erinaceus*, characterized by its coat of stiff spines. The family inhabit temperate Europe and Asia, but are not known on sea-girt islands. The best known of the score of species is the common hedgehog (*E. europæus*). It has a long nose, the face, sides and rump covered with strong, coarse, yellowish hair, the back with sharp, strong spines; and is about nine inches long plus a very short tail. Hedgehogs, as their name indicates, reside under hedges and in thickets, where they turn over the leaves and root in the mould for insects (especially beetles), snails, lizards, roots, fallen fruit, etc.; they are, indeed, omnivorous. The hedgehog defends itself against attack by rolling itself up, and thus exposing no part of its body that is not furnished with a defense of spines. It may be rendered domestic to a certain degree, and has been employed in Europe to destroy cockroaches, which it pursues with avidity. In the winter, in cold climates, the hedgehog wraps itself in a warm nest, composed of moss, dried hay and leaves, and remains torpid till the return of spring: The female pro-

duces four or five young at a birth, which soon become covered with prickles. These animals are sometimes used as food, and are said to be very delicate. The long-eared hedgehog (*E. auritus*) of the East is smaller than the common, and is distinguished by the great size of its ears and shortness of tail. Fossil forms as far back as the Miocene differ little from existing species. No true hedgehogs exist in America; the animals often so called being the very different porcupines (q.v.).

**HEDIN, Sven Anders**, svîn ä'n'dérz hî-dén', Swedish geographer and explorer: b. Stockholm, 19 Feb. 1865; was educated at Stockholm, Upsala, Berlin and Haile, at the latter university receiving the degree of doctor of philosophy. In 1885 he began his first journey of exploration through Persia and Mesopotamia. In 1890 he went to Persia as a member of King Oscar's embassy to the Shah, and the next year journeyed through Khorassan and Turkestan. In 1893 he set out on a remarkable journey from the Russian frontier to Peking, through Tibet and the Lob-nor region. He arrived at his destination in 1897, having experienced four years of exciting and harrowing adventures. His second expedition to Central Asia began in 1899. In 1901, writing from Narkhlik, Dr. Hedin tells of finding the ruins of a beautiful Buddhist temple, some rare specimens of wood carving and 12 complete letters written in Chinese on paper and marvelously well preserved. He started from Chinese Turkestan in 1906 for the third journey of exploration in Tibet. During two years he covered some 4,000 miles, discovered the sources of the Brahmaputra and the Indus, several mountain ranges and Lake Chunitso. Early in the European War Dr. Hedin visited the German front, where he was granted special facilities for observation. The result was a book entitled 'A People in Arms' (Leipzig 1915), in which the author poured out a torrent of vitriolic abuse over Great Britain and of fulsome adulation for everything German. The book caused considerable amusement among the Allies, particularly the reference to the German Crown Prince, "tall, slim and royally straight, dressed in a dazzling white tunic and wearing the Iron Cross of the first and second class. . . . Would you like to know what the German Crown Prince eats for supper? Here is the menu. . . ." Dr. Hedin has made numerous valuable contributions to geographical literature. His works include 'A Journey through Persia and Mesopotamia' (1887); 'King Oscar's Embassy to the Shah of Persia' (1891); 'A Journey through Khorassan and Turkestan' (1892); 'Through Asia' (2 vols., 1898); 'Central Asia and Tibet' (1903); 'Adventures in Tibet' (1904); a scientific treatise in German, 'The Results to Geographic Science of my Travels in Central Asia' (1900), and 'The Scientific Results of a Journey in Central Asia 1893-1902 (6 vols., 1904 et seq.).

**HEDONISM** is the name applied to any system of ethics which regards pleasure or happiness as the chief good; as the good, that is, which makes all other goods desirable and to which they are all means. Not only money, health and the like are valuable merely as sources of happiness, but virtue itself has no better claim to independent worth. In fact, for most hedonists, virtue is the name given

to that kind of action which long experience has shown to conduce to happiness. The most important of the many subdivisions of the theory is that which distinguishes psychological from ethical hedonism. According to the first, pleasure is the inevitable content of every choice. Even in those instances of self-sacrifice which seem the most radical contradiction of such a view, the exception is apparent rather than real. For the martyr, death is preferable to denial. If it were not pleasant to him, he would not and could not choose it. Ethical hedonism, on the other hand, makes the choice of pleasure a duty rather than a fact. The two have sometimes been regarded as incompatible, on the ground that what necessarily regulates choice cannot be exalted into an ideal; but the frequent inclusion of both in the same system may have a partial justification in the necessity for the rejection of certain pleasures and the acceptance of certain pains, if the greatest possible happiness is to be attained in the end.

A second division of the forms of hedonism is that between individual and universal, and is based upon the number of persons whose happiness constitutes the good. Individualistic hedonism regards the happiness of the man concerned as his own chief good, while that of other people is either a matter of indifference to him, or else is of importance merely because it forms one of the elements of his own happiness. Evidently psychological hedonism is necessarily individualistic, although its combinations with ethical hedonism have often made it present an appearance of universality not strictly compatible with its original assumptions. Although there are plenty of modern instances of individual hedonism, these do not differ in essentials from the classical forms presented by the Cyrenaicism of Aristippus (cr. 435–356 B.C.) and the Epicureanism that sprang from it (Epicurus 342 or 341–270 B.C.). Both Aristippus and Epicurus taught that individual enjoyment was the supreme good, but they differed in their conception of the nature of enjoyment and of the means by which it was to be obtained. Aristippus advocated seizing the pleasure of the moment, untroubled by regret for the past or dread of the future. Epicurus, while he also preached against fear and regret, maintained that the object of desire was a happy life rather than a succession of pleasant moments, an organized whole, not a mere sum. Another distinction between the conception of the two is found in the nature of the pleasurable state as described by each. For Aristippus its chief characteristic was excitement; for Epicurus, tranquillity; a difference that undoubtedly was largely responsible for the different means advocated by them. The later modifications of both theories show the well-known tendency of hedonism toward pessimism.

Universal hedonism was first brought markedly into notice by the Utilitarians, who found the supreme good, not in each man's own happiness, but in happiness in general, usually expressed by the formula "the greatest good of the greatest number." The moral worth of an action must be judged by the amount of happiness it will tend to bring about in the long run; and the consideration of all the different elements of intensity, length of time, certainty, possible complicating pain, and so forth, known

as the hedonistic calculus, is associated with the name of Jeremy Bentham (1748–1832). John Stuart Mill (1806–73), to whose clear and persuasive mode of statement the theory owes much of its popularity, added to it the distinction between quality and quantity in pleasure. With the exception of Mill, both ancient and modern hedonists have almost invariably regarded pleasures as differing from one another in quantity alone; he, on the contrary, maintained that their differences were primarily qualitative, and that quality must be considered in the conception of the chief good. An action is to be judged, not only from the amount, but from the kind of happiness it causes. Mill's view has met with much adverse criticism, based upon the contention that with qualitative differences in pleasure a non-hedonistic criterion has been introduced, which is inconsistent with the initial assumption of hedonism. The adoption of hedonism by the evolutionists, especially by Spencer, has given it a scientific basis, to which its present currency is partly due. Although the end in such systems is preservation, either of the individual or of the species, or of both, yet the actions best adapted to that end are accompanied by pleasure, and the animal to whom useful actions are painful, does not perform them and is in course of time eliminated. Actions found desirable in the history of the race come to have a feeling of obligation attached to them; and although at present end and means may to the individual consciousness seem incompatible, yet as man becomes better adapted to his environment, all virtuous, that is, useful, actions will bring pleasure directly as well as indirectly.

As a theory of ultimate value hedonism can, of course, be neither proved nor disproved. Its chief advantages are: (1) It provides a simple and self-consistent account of moral action. (2) It makes possible a closer union between ethics and natural science than that allowed by any other theory, and is able to make use of the constantly growing store of knowledge in biology, anthropology and ethnology. The most important objections brought against it are: (1) It confuses origin with value. (2) In regarding the moral end as constituted by feeling alone, it is psychologically inadequate, and psychologically false in so far as it views pleasure as the exclusive object of choice. See also ETHICS; UTILITARIANISM.

GRACE NEAL DOLSON,

*Professor of Philosophy, Wells College.*

**HEEL-FLY.** See BOT-FLY.

**HEER,** hār, Oswald, Swiss naturalist: b. Nieder-Utzwyl, Switzerland, 31 Aug. 1809; d. Lausanne, 27 Sept. 1883. He was educated at the University of Halle; entered the ministry in 1831; was privat docent in botany in the University of Zurich 1834–52, and from 1852 professor of botany at the University and at the

Polytechnicum, and from 1835-83 director of the botanical gardens at Zurich. His most important works were 'Flora Tertiaria Helvetiæ' (1854-56); 'Tertiary Climates in Their Relation to Vegetation' (1860); 'Die Urwelt der Schweiz' (1865); 'Flora Fossilis Helvetiæ' (1877); and 'Flora Fossilis Arctica' (1865-83).

**HEEREN**, hä'ren, Arnold Hermann Ludwig, German historian and philologist: b. Arbergen, near Bremen, 25 Oct. 1760; d. Göttingen, 6 March 1842. He was educated at the cathedral school of Bremen and the University of Göttingen; in 1794 was appointed professor of philosophy and in 1801 professor of history at Göttingen. His chief works are 'Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt' (1793-96, 4th ed. 1824-26); 'Geschichte des Studiums der klassischen Litteratur seit dem Wiederaufleben der Wissenschaften' (1797-1802); 'Geschichte der Staaten des Alterthums' (1799); 'Geschichte des europäischen Staaten-systems und seiner Colonien' (5th ed. 1830); 'Versuch einer Entwicklung der Folgen der Kreuzzüge' (1808) and 'Vermischte historische Schriften' (1803-88).

**HEERMANS**, Forbes, American dramatist: b. Syracuse, N. Y., 25 Oct. 1856. He was graduated from Cornell University in 1878, and is author of the dramas 'Love by Induction' (1889); 'The Silent Witness' (1890); 'Between Two Foes' (1899); 'The Vagabond' (1893); 'Jess of the Bar Z Ranch' (1896); 'Down the Santa Fé Trail'; and the novels 'Thirteen Stories of the Far West' (1887); 'The Rancho of Heavenly Rest' (1892); 'The Investigators'; 'Beacon Island' (1907); and 'Buena Ventura' (1911).

**HEGEL**, hä'gël, Georg Wilhelm Friedrich, German philosopher: b. Stuttgart, 27 Aug. 1770; d. Berlin, 14 Nov. 1831. He attended the gymnasium of his native city, and in 1788 was matriculated at the University of Tübingen, where he studied theology, finishing his course of study in 1793. From 1793 to 1796 he was private tutor in Switzerland, devoting his leisure, meanwhile, to theological and historical studies. In 1797 he accepted a private tutorship in Frankfurt and remained there until 1800. During this period he wrote out the earliest sketch of his philosophical system, and, resolving to devote himself to philosophy, went, in November 1800, to the University of Jena, as privat docent. Here he lectured on philosophy until the troubles which followed the battle of Jena in October, 1806, interrupted for a time his scholarly work. During the years between 1800 and 1806 Hegel's philosophical teachings had assumed a much more highly organized form; he had published a number of important essays; and at the moment of the battle of Jena was just completing his first great systematic treatise, the 'Phänomenologie des Geistes,' i.e., the 'Phenomenology of Mind.' Unable to obtain, for the time, satisfactory opportunity as an academic teacher, Hegel thereafter passed a year as editor of a journal in Bamberg; and then obtained a position as rector of a gymnasium in Nürnberg, in 1808. He married the daughter of a distinguished Nürnberg family in 1811. Thereafter, while still at Nürnberg, he wrote his most important and finished philosophical treatise, the 'Logik,'

in the years 1812-16. In 1816 he was appointed to a professorship of philosophy at the University of Heidelberg. In 1818 he accepted a call to the University of Berlin, where he rapidly won a position of the greatest influence, gathered about him many hearers and disciples, and became the head of a school of philosophy whose influence upon contemporary German thought was of the greatest. During his life he published, in addition to the works already mentioned, a summary statement of his whole system of philosophy entitled 'Encyclopädie der Philosophischen Wissenschaften,' and a treatise on the 'Philosophy of Law.' His lectures on the 'Philosophy of Religion,' on the 'History of Philosophy,' on 'Æsthetics,' and on the 'Philosophy of History,' were published posthumously. His complete works, including his letters, fill 19 volumes, which were edited by a group of his friends, in the years immediately following his death (excepting only the letters, which in their definitive edition, were published as Volume XIX of the works by his son, the historian, Karl Hegel, in 1887).

Hegel's philosophical position can only be understood in the light of his relation to Kant. Immanuel Kant (q.v.) (1724-1804) became, by the publication of his 'Critique of Pure Reason,' in 1781, the leader in the movement of modern German philosophical thought. In an age when the guidance of "Reason" was especially glorified by all the leading liberal and progressive teachers and parties of the day, Kant undertook a systematic inquiry into the nature, the limits and the scope of the human reason. Previous philosophers, in the 17th and 18th centuries, had been especially divided in opinion regarding the question whether experience or reason is the source of our knowledge. Kant undertook to reconcile the conflicting views regarding this problem and at the same time to map out, in a systematic way, the whole field which is accessible to human science. His result was, in substance, as follows: Human knowledge depends upon two factors, experience and our own intelligence. Both factors are equally necessary for knowledge. Experience, when viewed apart from our intelligence, is a collection of mere data of sense, which are given, but which, in so far as they are merely given, are meaningless. The data of sense get their coherence solely through the active work of our intelligence. Our intelligence, whose manner of acting is spontaneous, is indeed awakened to reaction only through sense; and can give us knowledge only with reference to the facts of experience; but the data of sense get all their form, coherence, structure, meaning, only through the fact that our intelligence is guided in its activity by certain "categories," and formative principles, in terms of which we interpret these data, view them as due to coherent "objects of experience," and connect these objects so that the latter form the "world of experience." Without the intelligence, then, with its "forms," no coherent experience is possible. Sense shows us, by itself alone, no objects, no connections of objects, no laws, no facts, no world. That we appear to find, in our world of perception, connected things, subject to laws, is due to the more or less hidden work of our intelligence, which gives form to the otherwise incoherent sensations. That we all have the same phenomenal

world to deal with is due to the fact that intelligence is common to us all, in the same forms.

In consequence, what we know, and what our sciences of experience study, is neither a world of things simply given to us as brute facts from without, nor yet a world of mere sensations. On the contrary, what we know is the world of experience as our active intelligence inevitably *interprets* experience. Hence we know, not "things in themselves," but "phenomena," and not mere "data" of experience, but experiences as interpreted by the active constructive work of our intelligence.

Meanwhile, our intelligence, upon its higher levels, is indeed not content with this mere interpretation of the contents of sense, but—still in its own spontaneous way—defines ideals of objects and of laws which far transcend—according to our own conception—the facts of experience. The "Reason" proper, as distinct from the "Understanding" (that is, from the intelligence which merely interprets and renders coherent our experience), is the part or aspect of our intelligence which is concerned with these other and "transcendent" objects. The objects of the "Reason" proper, are objects which no human experience can reach or exemplify, and which we therefore conceive as lying beyond any possible experience. Such objects are God, the human ego itself, in its true nature, the cosmos in its entirety and the moral law. Such objects we cannot, in any scientific sense, "know," just because our knowledge is limited to our interpretation of experience—an interpretation due to the functions and to the categories of our lower intelligence, i.e., of our "understanding." Yet if the "transcendent" objects of the "pure Reason" cannot be "known," they nevertheless can be and must be "postulated," by virtue of a certain active and spontaneous "faith" which the Reason warrants. For these "transcendent" objects have for us a moral value and give a meaning to life.

We "know" then, "phenomena." Our "Reason," meanwhile, gives us "faith" in certain "Ideas" which relate to the "transcendent" objects. This faith is not knowledge, but is rationally warranted. It is the office of philosophy to bring to consciousness the "categories" in terms of which we inevitably interpret phenomena, and so organize our experience and get our science. It is also the office of philosophy to discover and define the "Ideas" in terms of which we just as inevitably organize our moral conduct and give meaning to our practical life.

So, for Kant, this view of philosophy differs from the view of older philosophy in limiting our inquiries to the business of *interpreting experience and organizing life*. The philosopher then, is above all concerned with the universe, as the human Self, that is, as the Self which is, in type, the same in all of us, sees the universe, acknowledges it, and gives to it, in the form in which we experience its presence, the type of rational coherence. Any world which is not the world as the Self views it, is unknowable, and is a world of "things in themselves."

Hegel, in common with the other post-Kantian German idealists, builds upon the basis of this Kantian analysis of knowledge and of

reason. His dependence upon Kant is shown by the very fact of his frequent and persistent criticism of that philosopher's positions. That Hegel's results are in one sense far removed from those of Kant becomes obvious upon a very brief consideration. But that, however much Kant's doctrine is transformed in Hegel's system, it is still Kant whose views are the principal ones thus transformed, is also certain. The relation can be made more explicit by the following statement of the contrast between Kant and Hegel:

1. The result of Kant's philosophy is that the accessible world is the world as the rational nature of the human Self requires us to interpret it. This result lies at the basis of Hegel's doctrine. But Hegel transforms it by dropping out of consideration, the adjective "accessible," as being superfluous. It is useless to talk of a world of unknowable or inaccessible "things in themselves," as Kant does. The world of reason is simply the world. There is nothing to know except what the nature of our intelligence requires us to acknowledge. Discover the secret of reason and you have discovered the secret of the universe. This is the first characteristic thesis of Hegel's idealism. "Behind the curtain which is said to hide the inner nature of things," says Hegel in the 'Phenomenology,' "there is nothing, unless we ourselves go behind that curtain."

2. Kant furthermore divides the work of our intelligence between the activity of the "Understanding," which interprets special experiences, and the "Ideas" of that "Reason," which "postulates" our relations to ultimate reality. Hegel accepts this distinction as valid within its limits, but not as any absolute distinction. Our intelligence may and often does fix its attention upon fragments of knowledge. In that case it "abstracts" from the whole meaning of its own life, and thereby becomes *ipso facto* an "abstract thinking" or "understanding" of this or that object or law. Such abstractions are useful and inevitable. But they are not final. The truth, however, is in Hegel's phrase, simply "the whole." Only that form of reason therefore which is concerned with the *whole* meaning of life is genuinely philosophical. But since this meaning is, after all, our own meaning, the meaning of the Self, it need not be simply a matter of "Postulates." It can be known to us.

3. Kant limited our knowledge to "phenomena." But this "limitation" loses its significance if once we see that there are no "things in themselves" to know. The world is for us a world of mere "phenomena" only in so far as we do not grasp the principle of which our experience is the expression. But, for Hegel, this principle is simply the absolute principle which lies at the basis of our own nature. As this absolute principle is not foreign to the Self the Self can grasp the principle. When it does so, it sees phenomena as the inevitable expression of the meaning of its own life. And then its phenomena become once more "actualities," as real as any finite facts could be. What we know then is not a mere world of phenomena. It is a world of absolute Truth.

4. Our ethical ideals form, for Kant, a world of their own, which we can never *know* to be real, but which we can, and must, *believe*

**GEORGE WILLIAM FRIEDRICH HEGEL**

to be real. This contrast of ideal and real, of knowledge and faith, Hegel believes to be founded only in a historical difference of certain stages of our own self-development. Faith, if once brought to a clear self-consciousness, becomes a knowledge as to what the absolute Self is and determines. And this knowledge philosophy can attain. Such a knowledge is *ipso facto* a knowledge of truth. For all truth is in and of the true Self, i.e. the Absolute.

5. Kant, in trying to define the categories which lie at the basis of our interpretation of the world, had simply accepted those categories which he observed to be in use in our daily thinking, and in science. He treated them as a fixed set of principles. Regarding the origin and the mutual relations of these categories he has no extended theory. The categories are, for him, ultimate facts of our intelligence, determining its constitution, but of unknown source. Hegel, on the contrary, regards it as one of the principal tasks of philosophy to show why and how we come by just these categories which we use in the interpretation of experience, and in the ordering of life. His principal work, the 'Logic,' is devoted to such a treatment of the categories. And in fact, since, from Hegel's point of view, the world of "Thought" is the only real world, or, in other words, since the constructions of that absolute process which embodies itself in our thought and in our life are constitutive of *all* truth, this Logic, which is to show the true genesis and nature of the Categories, takes the place of all that, in the older philosophical systems, had been called Metaphysics. For the theory of the absolute constructive process which expresses itself in our experience and in our thinking is simply the theory of the universe. There is no other world to know than this world which thought constructs, which experience observes, and which constitutes our life and its meaning.

6. For Kant, nothing absolute is knowable. All our knowledge is relative. For Hegel, absolute knowledge is possible; for whoever knows the principles that determine the true nature of our thought and of our life, finds these principles, as the expression of the true Self, absolute.

This contrast of the positions of Kant and of Hegel may help to give the Hegelian philosophy its proper historical setting, without which it inevitably appears to be a presumptuous attempt to transcend the natural limits of human reason. For Hegel, these limits are not what they seem. That is, they are not absolute limits. For what we have to consider, when we philosophize, is not a foreign world, but is rather the whole truth with regard to the meaning of the very life which we ourselves are experiencing and are living.

In his first great work, the 'Phänomenologie,' Hegel gave an account of the various successive stages through which the human mind, as it appears in history, passes, in its transition from a naive dependence upon the senses to the stage of philosophical reflection. In his 'Logik,' as has just been stated, Hegel undertakes to describe the way in which philosophical reflection leads us to the categories. The categories themselves are successive stages or phases of our interpretation of absolute truth. Their succession itself is determined by a certain "dialectical" procedure, whereby the

lower categories are, through an imminent development, transformed into the higher categories. In the system of Hegel, as he planned the order of its parts, the 'Logik' is next followed by the 'Naturphilosophie,' or 'Philosophy of Nature.' The only connected treatment which this portion of the system ever received is the mere compend contained in the second part of Hegel's 'Encyclopädie.' The 'Naturphilosophie' consequently remained, from Hegel's point of view, imperfectly worked out. The third portion of the system was the 'Philosophy of Mind.' This also was left without adequate working out by the philosopher, although in his 'Rechtsphilosophie,' in the third section of his 'Encyclopädie,' and in his posthumously published lectures, there is a very extended treatment of various parts of this concluding portion of his undertaking. Under the 'Philosophy of Mind' Hegel included, first the whole range of psychology, and the philosophical theory of the relations between nature and mind; secondly, ethics and the philosophical theory of the state; thirdly, philosophical æsthetics, or the theory of the beautiful; and finally the philosophy of religion.

The range and general intention of the Hegelian doctrine are thus suggested although, owing to the vast range of his undertaking, this can here be done only in a very inadequate way. Further characteristics of the philosopher are especially (1) his "dialectical method," and (2) his theory of the Absolute.

By the dialectical method Hegel means a procedure of which some of the dialogues of Plato give us classical instances, and which Kant's "Antinomies" as well as Fichte's method of procedure in philosophy had exemplified, although the systematic use of the method in Hegel's way is due to his own initiative. Truth, according to Hegel, comes to us, in the first place, through the medium of "immediate" experience. Without such experience, we could indeed proceed no further on the way toward insight; and this is the permanent justification for "empiricism" in philosophy, if only we observe that this barely immediate experience, although indispensable, remains meaningless unless we transform experience through the activity of our thought. Thought begins by observing that immediate experience, taken merely as it comes, is, so far, not yet intelligible. The first work of our thought is therefore to classify, to divide, to fix upon distinct aspects of facts, to form generalizations and so to convert what comes to us as immediate into the abstract form of our various *Gedanken*, or conceptual constructions. This is, so far, the work of "the Understanding." Such work first results in our regarding truth as something which, on the one hand, is fixed, *universal*, and abstract, while, on the other hand, this world of truth also appears to us to be a world of infinitely *various* special truths, which relate now to this and now to that individual thing, or fact, or law. So far as our understanding dwells upon the fixity, the universality, the abstract generality of its truths, it finds, or endlessly seeks to find *unity* in the world. But so far as the understanding, even in this very effort to discover unity, singles out now this and now that fact or law, it is confronted by the *variety* of the results which it reaches. There results the well-known problem of "the

One and the Many." In consequence, the understanding is involved in contradictions which are simply inevitable. In the world of the understanding, "everything is self-contradictory," and is so just *because* the understanding makes formal consistency the one test of truth, even at the very moment when it expresses its search for truth in the form of an effort (1) to divide what is inseparable, and (2) to substitute abstractions for life.

The forms which the resulting contradictions assume are well known in the history of philosophy. The interest in abstract unity is shown in extreme form in the Eleatic reduction of the whole world to a simple One Being, by contrast with which all variety is illusory. The Atomistic thesis, which reduces all the qualitative variety of nature to quantitative differences, the material substance of Descartes, whose only attribute is extension, the sole substance of Spinoza,—these are also consequences of the tendency to understand variety by reducing it to an abstract and lifeless unity. On the other hand an equally abstract pluralism, in all the earlier stages of philosophical thought, has emphasized variety, with the result of making it inconceivable how the facts, when regarded as thus mutually isolated, could conspire to make a world at all. Views of one type have, by their very contradictions, led over to views of the opposed type.

The solution of all such difficulties lies in reducing the contradictions to their "ground," which lies in the very "movement" of thought itself. For the truth of such views lies in their synthesis, not in their mere conflict. Such a synthesis is furnished by the discovery that the search for unity and the interest in diversity and variety are but "aspects" or "moments" of that life of self-comprehension in which the very nature of reason consists. When thought, by virtue of a deeper reflection upon the contradictions of the understanding, has reached this higher stage of the reason proper, it therefore views the successive opposing views as inevitably one-sided expressions of different aspects of our rational interest. Our world is indeed one; and in order to bring this fact to our consciousness, we have, upon the stage of the understanding, to emphasize this very aspect of Being and of the life of our own thought to such an extent as to isolate, by our abstraction, the unity upon which we then dwell, from the very variety of which it is the unity. Now unless we pass through the stage of doing this we should never bring the unity of things to light at all, but should leave this aspect of the "immediate" lost in the original obscurity in which, apart from thought, all experience is involved. But so long as we remain upon this stage of abstract reflection, we nevertheless inevitably contradict both experience and ourselves. For experience is of the many, as well as of the unity. And an abstract unity, which is the unity of nothing, is indeed a self-contradiction.

But while our world is indeed also many, and while, in order to bring this aspect of things to light, we must emphasize pluralism, yet the resulting views, taken in their abstraction, are as contradictory as are those of mere monism. The many could never co-operate in one world were they not also one.

Thus we cannot reach truth without pass-

ing through contradictions. For the truth is a synthesis of various points of view. No one of these can be appreciated unless it has first been emphasized. If once emphasized it becomes, however, in its isolation, self-contradictory, just because it has its truth not in its isolation, but in its relations to the other points of view. But in order to be able to see that these very relations are necessary, and are not merely adventitious and empirical, we must see *how* the isolated point of view contradicts itself. The sequence of these isolations of special categories (followed by the resulting contradictions, and by the necessary synthesis), constitutes the "dialectic movement of thought," by which the "immediate" experience, with which we begin, is transformed into the system of truth, wherein all the elements appear in necessary interrelations to one another. The principle of this method is what Hegel calls the "Negativity" of thought. *The denial, or sublation of imperfect stages of insight is the only means whereby the perfect stage can be made explicit.* This is the principle of the dialectical method.

The Hegelian theory of the Absolute is the correlate of this theory of the process whereby truth is acquired. For the dialectical method is not only a method of acquiring insight; but, since thought is, in principle, identical with the very life of the universe, the method by which we come to insight is also the very method by which the life of the world is developed. Man is simply the world come to self-consciousness,—the Spirit explicitly aware of its own life. This is the obverse aspect of the thesis that the true Self is the world. Viewed objectively, the Hegelian doctrine accordingly is that the world-ground, or "the Spirit," also called the Absolute, has a life, or activity, whose forms are expressed in the categories of the 'Logic.' This life has first to manifest itself in experience as a world of immediate facts. This immediately given outer world constitutes what we call Nature. Such a world has to exist, and to be found by us, in order that the forms of thought should be, not *mere* forms, but forms expressed in a concrete and immediate way. In life, and especially in rational beings, the thought which is everywhere present in nature reaches a still higher expression, which at last becomes identical with our own insight, as this insight develops through the historical evolution of humanity. The entire world-process is therefore the complete expression of a rational spirit, which indeed eternally possesses self-consciousness, but which, when viewed historically, appears to us as attaining such self-consciousness, in individual form, in the religious and in the philosophical consciousness of man.

This must suffice as an outline of Hegel's main thoughts. Owing to the interest which he had in viewing the entire course of human history as a series of movements determined by the dialectical processes of which all our life, according to him, consists, Hegel took great interest in the philosophy of history. The influence of his school has been, in consequence, of great importance in affecting the spirit of a great number of modern historical inquiries. The highly ambiguous relations of the Hegelian system to traditional theology proved very momentous for the development of the critical

study of religious dogma, and of religious history, during the generation after his death. While the original Hegelian school ultimately lost its direct influence in Germany, the indirect influence of the Hegelian system still remains very great, and is especially noticeable in English and American thought since 1865.

P. Gurdy 1887); Rosenkranz, K., 'Georg Wilhelm Friedrich Hegel's Leben' (Berlin 1844); Haym, R., 'Hegel und seine Zeit' (ib. 1857); McTaggart, 'A Commentary on Hegel's Logic' (Cambridge 1901); and for brief summaries, the various histories of philosophy by Windelband, Thilly, Höffding and Weber.

JOSIAH ROYCE,

*Late Professor of the History of Philosophy,  
Harvard University.*

**HEGELER, Wilhelm**, popular contemporary German novelist: b. Varel, Oldenburg, 25 Feb. 1870. He studied law at the universities of Munich, Geneva and Berlin, traveled extensively, and returned to Munich in 1895 to settle down to literary work. He moved to Berlin in 1897, to Weimar in 1906, where he has lived ever since, engaged in the production, at first, of naturalistic novels dealing with the life of the population along the river Rhine, later, of humorous satires. His stories were at first characterized by a rather sharp and painful naturalism, but later assumed a convincing and powerful realism. Their popularity in Germany is very great, and Hegeler's books have frequently appeared among the lists of best sellers for certain years (1905, for instance). His more important works include 'Sonnige Tage' (novel, Berlin 1898); 'Ingenieur Horstmann' (his best novel, Berlin 1900); 'Das Ärgernis' (his best satirical novel, Berlin 1907).

**HEGIRA**, hēj'ī-ra, **HEJRA**, or **HIJRA**, an Arabic word meaning "going away," commonly used to indicate Mohammed's flight from Mecca, in 622 A.D. In 639 Caliph Omar instituted a new Moslem calendar, to begin with the first day of the first month of the year in which the flight took place. The Mohammedan year, as a lunar year, is shorter than ours by ten days, 21 hours and 14¾ seconds. A rough and ready method for finding the year in our calendar corresponding to a given year in the Mohammedan is to subtract from the latter 1/33 of itself and add 622 to the remainder. To find the precise year and day multiply the year of the Hegira by 970,224, strike off from the product six decimal figures and add 621.5774; this will give the year of the Christian era; and the day of the year is got by multiplying the decimal figures by 365.

**HEIDELBERG**, hi'dēl'bērg, Germany, an old university town in Baden, on the left bank of the Neckar, here spanned by two bridges, 11 miles by rail east-southeast of Mannheim. It stands on a narrow strip between the river and the rock on which the castle is built, and chiefly consists of the Hauptstrasse, the long main street, and less important steeply-sloping cross and parallel street. The neighborhood abounds in ancient remains and is rich in historic and literary associations. The city has an electric

street railway system. The imposing castle, on a height above the town, an immense ivy-clad ruin begun in the 13th century, exhibits elaborate examples of early and late renaissance architecture. It is often called the "German Alhambra," and was enlarged at different periods from the 13th to the 18th centuries. It was almost destroyed during the wars with Louis XIV in the 17th century and in 1764 was reduced to its present condition by lightning. Two of its buildings have decorated façades in Renaissance style—the Friedrichs-Bau and the Otto-Heinrichs-Bau. It contains several princely halls, a great watch tower, large balcony, dungeons, a museum with pictures and historic relics and a terrace from which a magnificent view is obtained. On this terrace is a statue of Victor von Scheffel, unveiled in 1891. In the town itself the principal buildings are the Gothic church of Saint Peter, the Gothic church of the Holy Ghost, the Roman Catholic Church, the university (q.v.), the town-house, the post-office, gymnasium, real-schule and other schools. The manufactures, comparatively unimportant, include cement, tobacco, cigars, fire-extinguishing apparatus, shoddy, mathematical and surgical instruments, leather, etc., and there are also several breweries. One of the curiosities of the place is the well-known Heidelberg copper tun, kept in the cellar under the castle, and long ranking as the largest wine cask in the world, being 36 feet in length, 26 feet in diameter and capable of holding 49,000 gallons. Heidelberg has fine public walks. The gardens around the castle are well laid out, and at every turn present the finest views of the Neckar and the fertile and richly wooded valley through which it winds to join the Rhine. Behind the town and castle a carriage-road leads by easy ascent to the top of the Königstuhl, the loftiest hill of the district, from which an extensive view is obtained of surpassing beauty. Heidelberg arose around its 13th century castle and was until 1719 the capital of the Palatinate. It was long the centre of German Calvinism and gave its name to a famous Calvinistic catechism. The town suffered greatly during the Thirty Years' War. In 1622, 1688 and in 1693 the French captured and pillaged the city. In 1802 it was united to the grand duchy of Baden. Consult Godfrey, E., 'Heidelberg: Its Princes and its Palaces' (New York 1906); and Oncken, 'Stadt, Schloss und Hochschule Heidelberg' (Heidelberg 1885). Pop. (1910) 56,016.

**HEIDELBERG CATECHISM**, a religious work published at Heidelberg in 1563 by Zachariah Ursinus and Caspar Olevianus for the use of the Reformed Church, and published in the Palatinate. It was approved by the Synod of Dort, and was the model on which the Westminster Assembly framed the Shorter Catechism.

**HEIDELBERG MAN**. The most primitive human being known, represented by a jaw found in 1907 by O. Schœtensack at the base of the sands of Mauer near Heidelberg, Germany. The situation of this relic indicates by the association with it in the same deposit of appropriate animal bones, the second interglacial interval—a long, warm period estimated by Penck to have closed about 200,000 years ago. This jaw is extremely massive, lacks that

frontal protrusion that gives shape to the human chin, and were it not for the unmistakably human teeth, which are excellently preserved, might be taken for that of an anthropoid ape. The teeth are essentially human and show no trace of being intermediate between the dentition of the anthropoid apes and man, although not very large and strong. The canines do not project beyond the line of the other teeth, even as much as in the Piltown skull (q.v.). Seen from above the teeth form a perfect arch, whereas in anthropoid apes the grinding teeth lie in rows parallel to each other. The conclusion is that this jaw represents a race ancestral to the Neanderthal men of Spy, Krapina, etc.—men more primitive, powerful and apelike than they. "All agree," says Osborn, "that Schœtensack's discovery affords us one of the missing links or types in the chain of human development." (See *STONE AGE*). Consult Osborn, H. F., 'Men of the Old Stone Age' (New York 1914).

**HEIDELBERG UNIVERSITY**, Germany, a renowned institution founded by Elector Rupert I in 1386. It was organized by Marsilius von Inghen on the model of the University of Paris, and at the Reformation, from a Catholic became a Protestant stronghold of learning. It flourished until 1622, when Tilly captured the town and the famous collection of manuscripts known as the Bibliotheca Palatina was removed to Rome. The university declined and suspended altogether in 1626. It was restored in 1652 and religious tests for professors were removed. The university again suspended in 1693, although instruction was continued at Frankfort in 1694 and at Weinheim in 1698. In 1700 instruction was resumed at Heidelberg, but the university led a precarious existence until 1802. In 1802 under the administration of the Grand Duke of Baden, a new era was inaugurated and the university rapidly became famous. It is very complete in its details, and comprises faculties of theology, law, medicine and philosophy; the famous library has over 500,000 volumes and 4,700 MSS. There are 196 professors and instructors, while the average annual attendance of students in all departments is over 2,300. Many of the most famous German scholars have been professors here—Melanchthon, Ursinus, Olevianus, Reuchlin, Ecolampadius, Spanheim, Puffendorf, Voss, Schlösser, Creuzer, Gervinus, Paulus, Kuno Fischer, Helmholtz, Bunsen, Blüntschli, etc. The quincentenary of the university was celebrated with elaborate ceremonial in 1886. Consult Buhl, H., 'Zur Geschichte der Universität Heidelberg' (Heidelberg 1902); Hautz, 'Geschichte der Universität Heidelberg' (Mannheim 1862-64); Weber, Georg, 'Heidelberger Erinnerungen' (Stuttgart 1886).

**HEIDELBERG UNIVERSITY**, Ohio, coeducational institution at Tiffin, founded as a college in 1850, under the auspices of the Reformed Church in the United States and reorganized as Heidelberg University in 1890. It has departments of theology, liberal arts, commerce, oratory, art and music, and preparatory and summer schools. It confers the de-

grees of A.B., B.S., P.B. and B.L. In 1916 it had 38 professors and instructors; 650 students; a library of over 25,000 volumes; the grounds and buildings were valued at \$400,000; the productive funds amounted to \$360,000, and the income to \$40,000.

**HEIDENMAUER**, hi'dn-mow-ër. (1) A name given in Germany to the remains of old German and Roman fortresses and ramparts, some of which still exist, especially at Ottilienberg, a hill of the Vosges, in Alsace. (2) The title of a novel by James Fenimore Cooper, who laid the scene of his story in the Vosges during the Middle Ages.

**HEIDENSTAM**, Verner von, Swedish poet and novelist: b. Olshammar, province of Nerike, 6 July 1859. He was at first destined to be a painter, but had to relinquish his studies at the Stockholm Art Academy because of ill health, which caused him to undertake extensive travels in southern Europe and the Orient. He was at once greeted as a poet of promise on the publication of his first collection of poems, *Vallfat och Vandrinadsår*, 1888, which was followed by a second collection, 'Dikter' ('Poems') in 1895. His poems and prose work are filled with a great joy of life, sometimes imbued with a love of Swedish history and scenery, particularly its physical aspects, that avoids none of the excesses of chauvinism. 'Från Col di Tenda till Bloxberg' (1888), and 'Endymion' (1890) are pictures of travel; 'Hans Alienus' (1892) is a long poetic narrative; 'Karolinerna' (2 vols., 1897-98) a series of historical portraits of King Charles XII of Sweden and his cavaliers. In 'Klassizität und Germanismus' (published in German, Vienna 1901), Heidenstam advocates a sort of artistic exclusiveness, appearing as the champion of the classic spirit, which he considers essentially aristocratic, as opposed to the Germanic attitude which he considers democratic and reprehensible. In 1910 a savage controversy was waged in Swedish newspapers between a number of Swedish literary men, on the topic of the proletarian "degradation" of literature, the protagonists of the two opposing camps being August Strindberg (q.v.) and Heidenstam. Professors Lidforss and Böök also took part. Heidenstam's chief contribution was the pamphlet, directed chiefly against Strindberg, 'Proletärfilosofians upplösning och fall' ('The Decline and Fall of the Proletarian Philosophy'). Translations of short stories from *Karolinerna* will be found in the *American-Scandinavian Review* (New York), May 1914, November 1915, and July 1916. The first volume of that work has also appeared in England.

JACOB WITTMER HARTMANN.

**HEIFETZ**, hi'fëts, Jascha, Russian-Jewish violinist: b. Vilna, Russia, 2 Feb. 1901 (or 20 Jan. according to the Russian calendar). At a very early age he began to play the violin, and entered the Royal School of Music at Vilna when he was but five years old. He was graduated at eight, and went immediately to Petrograd, where he studied under Leopold Auer. His first public appearance was made at the age of five. He gave his first recital at Petrograd, before a large audience, at the age of nine, surprising his hearers by his facility

and unusual genius of interpretation. Subsequently, he was soloist of the Symphony Orchestra at Pavlovsk; and later toured Europe. Coming to the United States, he made his first appearance at New York on 27 Oct. 1917. His audience was instantly charmed by the rare combination of the young violinist's skilful technique, lyrical quality of tone and intellectual grasp of his compositions. His tour through the United States has met with the warmest praise and commendation everywhere.

**HEIGHTS, Measurement of.** See **HYPSOMETRY.**

**HEILPRIN, hil'prin, Angelo,** American naturalist: b. Satoralja-Ujhely, Hungary, 31 March 1853; d. New York City, 17 July 1907. He came with his parents to the United States in 1856, but received his education later in Europe, making a special study of natural history. On his return to America, his scientific ability was speedily recognized and he became successively professor of invertebrate palæontology and geology (1880-1900), and executive curator (1883-91) at the Academy of Natural Sciences, Philadelphia. From 1885 to 1890 he was professor of geology at the Wagner Free Institute. He was for five years president of the Geographical Society of Philadelphia, was leader of the Peary Relief Expedition in 1892, and made a journey of research to investigate the cause of the Mont Pelée (q.v.) disaster in 1902. His published works include 'Contributions to the Tertiary Geology and Palæontology of the United States' (1884); 'Town Geology'; 'The Lesson of the Philadelphia Rocks' (1885); 'Geographical and Geological Distribution of Animals' (1887); 'Explorations on the West Coast of Florida and in the Okeechobee Wilderness' (1887); 'The Geological Evidence of Evolution' (1887); 'The Animal Life of our Seashore' (1888); 'The Bermuda Islands: a Contribution to the Physical History and Zoology of the Somers Archipelago' (1889); 'Principles of Geology' (1890); 'The Arctic Problem and Narrative of the Peary Relief Expedition' (1893); 'The Earth and Its Story' (1896); 'Alaska and the Klondike' (1899); 'Mont Pelée and the Tragedy of Martinique' (1903); 'Tower of Pelée' (1905).

**HEILPRIN, Louis,** American scholar: b. Miskolcz, Hungary, 2 July 1851; d. 12 Feb. 1912. He was a brother of Angelo Heilprin (q.v.). In 1856 he came to the United States, where he was privately educated, and where he was connected with various works of an encyclopædic character. He published a valuable 'Historical Reference Book' (1884; 6th ed. 1899) in 'The Concise Knowledge Library.'

**HEILPRIN, Michael,** American author: b. Piobrkow, Russian Poland, 1823; d. New York, 10 May 1888. Carefully educated by his father, in his 20th year he emigrated to Hungary, chafing under Russian conditions. For a time he had a book-store at Miskolcz and was on intimate terms with Kossuth and his party. When the Revolution was quelled, he went to London, there meeting Kossuth, who advised him to go to America. In 1859 he and his

family emigrated to New York, where his literary activity was continuous for nearly 30 years. As coeditor of Appleton's 'Annual Encyclopedia' and reviewer on *The Nation*, he won a distinct rank for his exact and versatile scholarship, especially in the line of Semitic literature. On the arrival of the Russian Jewish refugees in 1881-82, he took a prominent part in seeing to their welfare and personally supervised the colonization of many families. His published works include 'The Historical Poetry of the Ancient Hebrew,' (Vols. I and II, 1880); 'Bibelkritische Notizen. (1893).

**HEIMBURG, him'boorg, Wilhelmine.** See **BEHRENS, BERTHA.**

**HEINE, hī'nē, Heinrich,** German poet: b. Düsseldorf, 13 Dec. 1797 (according to others, 1799); d. Paris, France, 17 Feb. 1856. His father, Samson Heine, of Hanover, was a merchant of honorable family which sprang from Bückeberg. He was good-natured but without marked intellectual gifts and of little business ability. The mother, Peira (Betty) van Geldern, came from one of the oldest and most prominent Jewish families on the Rhine. Her father, Gottschalk, was one of the first Jewish physicians who graduated as *Med.D.* from a German university; her brother, Joseph, was also a graduate. Her uncle, Simon van Geldern, was a strange, adventurous, enthusiastic man. He journeyed all through Europe, went to Jerusalem and returned from there to Germany after a varied and checkered experience. His diary of travel and other writings are still preserved. The fate of this strange relative made a deep impression on the mind of the mature and gifted boy, who first was sent to a private school and then to a lyceum in charge of priests until the year 1814. The greatest influence on his education was exercised by his intellectually gifted mother, who read Rousseau and Goethe and was an enthusiastic German patriot while his father was just as enthusiastic for Napoleon. Between these contrasts Heine in his youth, swayed constantly in both directions. The whole life of the poet can be described in one sentence: He was a German who was born of Jewish parents in a Roman Catholic city on the Rhine in the period of Napoleon's supremacy on the one hand and of flourishing romanticism on the other. In these words lies the entire biography of Heine, everything which uplifted and hampered, all his defects and excellences, and all the deep contrasts and dissonances with which his life was filled.

When he left the gnasium, he was ready with his companions to volunteer in the struggle against Napoleon. His first poems glorify German custom and loyalty, German patriotism. But this spirit soon changed, and soon, like so many eminent Germans of the time, he became one of the most enthusiastic supporters of the emperor's heroic figure, whose fame then filled the entire world. His most ardent wish at that time was to study. But his parents, whose business was already in decline, could not gratify this desire; and even his rich uncle, the celebrated banker, Solomon Heine, in Hamburg, on whose bounty the whole family in reality lived, preferred to have the youth become a clever merchant. So his father in 1815 took him to the

Frankfort Fair (Messe) and placed him there with the banking firm of M. G. Rindskopf. But the position was not long to Harry's taste nor was a grocery more endurable. After a short time he returned to Düsseldorf. The attempt was now made to have him settle in Hamburg, first in his uncle's counting-house and then in an independent concern of his own, which was a branch of his father's business. But he showed little talent as a merchant and in 1818 his firm failed.

In the three gloomy years at Hamburg, however, Heine became a poet. Under the pseudonym "Sy Freudhold Riessenhart" appeared in those days in a Hamburg magazine his first 'Traumbilder' and poems. A luckless love for his rich uncle's fair daughter Amelia filled his heart and aroused those lamentations of deep sorrow which formed the basis of his poetry. The well known poem, "A youth loves a maiden, who chose another" contained almost literally his entire heart's romance. After it was shown that Heine had absolutely no mercantile ability, his uncle finally consented that he might study law.

In October 1819 he entered the University of Bonn, which had just been reopened. A fresh and stimulating spirit prevailed at this university both among teachers and pupils. Men like August Wilhelm v. Schlegel, who interested himself very much in the young poet; E. A. Arndt and others, belonged to the teaching staff. Among the students we find names like Wolfgang Menzel, Hoffmann v. Fallersleben, Hengstenberg, etc. His special friends were Friedrich Steinmann, J. B. Rousseau and Josef Neunzig. In the vacation, after the first year of study, Heine resided in the little town Beuel, near Bonn, and there he worked on his first tragedy, 'Almanson,' the plot of which was placed in the period of Moorish decline in Spain. In the poem, however, Heine wished to present a picture of the battles which Judaism in Germany had to endure. 'Almanson' is a lamentation of crushed and persecuted Judaism. From Bonn Heine went to Göttingen, whose faculty of law was quite famous at that time. But he did not enjoy its instruction very long, for he had to leave the university on account of a duel, and in February 1821 came to Berlin.

His choice of Berlin was fortunate for the young poet. A vigorous intellectual atmosphere prevailed in that era in the Prussian capital. Before everything else he was attracted by the best salon in which Rahel Varnhagen von Ense had her special circle, with a coterie of brilliant spirits. Both she and her husband quickly recognized the poetical power in Heine and admitted him to close intimacy. Her brother, Leopold Robert, who was also a poet, was exceedingly friendly to him, and his wife Friedricka aroused Heine's enthusiastic adoration in sonnets and songs. The second coterie which fascinated Heine was a round table of young poets who gathered in Lutter and Wegener's restaurant, made famous by Ludwig Devrient and E. T. A. Hoffman, which was to become the scene of more than one carouse. These men were Christian Dietrich Grabbe, Friedrich v. Uechtritz, Karl Köchy, L. Gusterf and others. A third circle formed the greatest possible contrast to the others and in this, perhaps, Heine felt more at home. It was

a small body of young men who in a time of general apostasy from Judaism, assumed as their task the reform and development of Judaism which then was regarded as in its decline. At the head of these resolute workers stood Eduard Gans, the celebrated jurist; Moses Moser, a merchant, whom his friend Heine called a living epilogue to Lessing's 'Nathan,' and Leopold Zunz (q.v.), the immortal founder of that branch of critical research called the science of Judaism. Heine took the deepest interest in the labors, hopes and disappointments of this society. A monument of his love for the general cause which was abandoned by them, is embodied in his romance 'The Rabbi of Bacharach,' which was then begun but unfortunately remains a torso. In Berlin, too, the university fairly fascinated him. In particular the philosopher Hegel (q.v.) made a deep impression on the young poet, whose first poems were issued by a Berlin firm in 1823 and aroused general interest, and he was termed a successor of Byron, the first poet of "Welt-schmerz" in Germany. Varnhagen v. Ense and Karl Immermann, both famous writers of the time, showed special ardor in directing the public's attention to the young poet, the new star on the literary horizon, who was already arousing general comment by his 'Tragedie' (Almanson and Ratcliffe) as well as by his 'Lyrical Intermezzo' which appeared in a volume at the same publishers'. When Heine in 1824 went for a second time to Göttingen, in order to undergo his doctor's examination, he was already a well-known personality in literary circles. During this period of his second stay in Göttingen occurred an act on his part which is wholly unintelligible, judged by his previous labors, his writings and letters and which can only be explained by the sad conditions of the time—on 28 June 1825 at Heli-genstadt, near Göttingen, he embraced the Protestant religion. Clearly this act was done only to promote his professional career, for his sympathies in increased degree remained on the side of his coreligionists. Heine regretted the step his entire life.

After his graduation as doctor of law he returned to Hamburg. But all his efforts to maintain his hold there or in Berlin were unavailing despite his baptism. The failure was due either to the prejudices of the time or to other drawbacks. So Heine devoted himself wholly to literature. Two years earlier he made a journey from Göttingen to the Harz Mountains, in the course of which he visited Goethe at Weimar, but met a rather cool reception. This journey he now described in his 'Harzreise,' which had many readers who were delighted with the new and fresh tone in which the varied and picturesque experiences were narrated. In the years 1826-31 Heine's rank as poet was firmly established. That period forms the crown of his life and activity—his high-water mark of achievement. The four volumes, 'Reisebilder' ('Pictures of Travel'), published 1820-31, showed him from an entirely different point of view. His 'Buch der Lieder' ('Book of Songs') gave on the other hand a faithful picture of his lyrical skill, which also struck entirely new paths. Heine had emerged from romanticism. He knew its mysteries and magic spells. Close thereby, or rather far above it,

**HEINRICH HEINE**

stood the well of German popular poetry, out of whose depths he drew such wealth as no other German poet had accomplished. Goethe and Uhland, Brentano and Wilhelm Miller were not without their influence on the matter as well as the metrical form of his poems; yet he was original and his songs aroused a practical revolution in the world of German poesy.

The secret of his originality and of the marvelous influence which he exercised not only on his contemporaries, but also on every age, lies in the peculiar charm which characterizes these songs, as they sound the tenderest tones of the heart, and then in cutting dissonances shatter the sentimental quality which is at their basis, thus producing a humorous-poetical effect incomparable in its way. The subjectivity with which Heine wove his sorrows, whether trivial or serious, in the warp and woof of his verse, was something unheard of in the history of German poetry. There was as little hypocrisy in his feeling of sorrow (*Weltschmerz*) as in that of Lord Byron, but it was truer and deeper, because it was blended with the Jews' sorrow from gray antiquity. His pictures and thoughts, his Oriental sensuousness and his German sensitiveness, all this in its combination formed a poetical *ensemble* which was to destroy romanticism, with its fairyland of legends and to construct the poetry of a new age and a new generation. The verse included a mass of new poetical material; for instance, the description of the sea in the splendid-colored North Sea pictures. In marked contrast was the wonderful effect produced by the form of the poems, which, apparently somewhat careless, was really intentional and just adapted to elevate the mood. With his 'Book of Songs' Heine became at once the first German poet of his time. His prose writings exercised in those days a similar influence. Heine loosened the tongue of the modern man of culture; he taught him what and why he suffers. In an age which was gloomy, depressed and poor in deeds, he unfurled the banner of freedom and announced to the young generation the dawn of new days which had to come. While much in his 'Pictures of Travel' was of transient worth and importance for the history of civilization, of permanent value was the blending of humor and sentiment, wit, and earnest reflection, wherein following his great predecessors, men like Laurence Sterne, Jean Paul and others he created an entirely new *genre*. The modern *Feuilleton* rest wholly on Heine's prose. The "Young Germany" school which gave the death-stroke to romanticism in the 30's of the past century followed in his steps. His travel picture and sketch remained for decades a model for young German writers after which to pattern their prose.

Despite his popularity, however, Heine could never attain a life of entire self-reliance in the conditions of his age. His steady dependence on his rich uncle, who let his nephew feel his power, embittered his stay in Hamburg. Accordingly in 1827 he accepted the offer of Cotta, the publisher, to assume the editorship of the Munich *Political Annals*. But he continued at this work only one winter; then he undertook a journey to Italy, which he described in his incomparable fashion in his 'Pictures of Travel.' He expected to receive on his return a professorship at the Munich

University, which the Bavarian Minister Eduard v. Schenck desired to secure for him from the king; but owing to the intrigues of the clericals all efforts in Heine's behalf were unavailing. In 1828 he was recalled from his Italian trip by the news of his father's death—a man whom Heine had most tenderly loved. The following years were occupied in violent attacks on the poet August v. Platen and his followers, whom Heine regarded as his worst foes, besides literary labors and traveling. When the intelligence of the July Revolution in Paris reached him, the poet could no longer endure the home atmosphere, while the powerful Austrian Chancellor, Mettenich, who found refreshing youth "in the melancholy waters of his lyric," warned him that he was not entirely secure from persecution. It was on a May day in 1831 when Heine forsook his fatherland, of course of his own accord, but in the firm conviction that sooner or later he would suffer the fate of all those who were leaders of freedom in Germany.

In Paris Heine labored from the very start at the great task of his life—to promote an understanding between the French and the Germans. His correspondence in the *Augsburger Allgemeine Zeitung*, his book on 'The Romantic School,' his contributions to 'The History of Religion and Philosophy in German,' are devoted to this great purpose. The first appeared in 1832 as 'French Conditions'; the others—with literary sketches, reflections on the drama and art, poems, etc., as 'Salon' (4 vols., 1832-36). The persecution which the German Diet set in motion against the "Young Germany" school of writers, leading to the ban against their works, was an act of mediævalism which affected the poet deeply. His only compensation was his recognition in his fatherland, the esteem in which he was held in France and the love of a beautiful young Frenchwoman, Mathilde Creszentia Mirat, whom he married in 1841, after having lived with her many years. Despite many storms and although his wife had no idea of her husband's eminence, the marriage was a happy one. The heavy material burden which she obliged Heine to assume forced him in 1836 to receive from the French government, when Guizot was head of the Ministry, a pension of 4,800 francs—a charity which France at that time bestowed on all prominent fugitives. It is to be understood, however, that Heine incurred thereby no obligation to praise or defend the political administration. Nevertheless, later he was violently attacked for this step.

The death of his rich uncle from whom he received an annual sum of 4,000 francs threw him into a terrible state. He was not mentioned in the will, and anxiety was added lest his cousin Carl Heine would refuse the further payment of his stipend unless he would submit his writings to a rigid censure by the family. Violent conflicts followed that cost the poet his rest and his health, which last had long been undermined. A severe nervous trouble had tortured him from his youth, and now as added illness came paralysis of the eye. In 1843-44 Heine visited his old mother in Hamburg. The poetical description of his journey in the winter tale 'Germany,' which appeared in 1846 with his 'New Poems,' and the epic poem 'Atta Troll,' which was issued in 1837, showed an entirely

new line of poetical genius; for both these satirical epics are pearls of poesy. Since 1848 Heine was practically chained to his bed of illness—his famous "mattress grave." He bore his sufferings, however, with true heroism; his intellectual power was not weakened. But a great religious change took place which led him back through the Bible to belief in God and to the memories of his race. The two great works of the last period of his life, 'Romancero' (1851) and 'Confessions' (in 'Lutetia,' 3 vols., 1854), are proofs of this great change, both in poetry and prose. Once more did the poet reveal himself to his admirers in agonizing strains of sorrow, in classical ballads, in Hebrew melodies, in profound lamentations of vivid effectiveness. Once more steps the great writer before us, and in prose of the loftiest beauty and strength he seeks to answer the most vital questions of our human existence.

On 17 Feb. 1856 he died after much suffering. He rests at Montmartre, next to his wife. His grave is adorned with a monument, the work of the sculptor Hasselriis. An artistic memorial was erected by an enthusiastic admirer, the late Empress Elizabeth of Austria, at her country palace Achilleion, near Corfu in the Ionian Sea, with its classic memories. The continued efforts, however, made to place a memorial to the poet in his home on the Rhine have so far been fruitless, and have but led to bitterest conflicts between clericals and anti-Semites on the one side and the large body of his admirers on the other. It is not without significance that the Lorelei fountain, which could find no lodgment in Germany, has been placed in New York, the metropolis of the United States, a country where Charles G. Leland's translation of the 'Pictures of Travel' appeared in 1855, and where the poet's works have appeared in numerous editions and translations. The poet's body of admirers grows from day to day, and with this vast congregation of thoughtful men and women in every land the history of literature, judging without prejudice, gladly recognizes Heine as the greatest German lyric poet, after Goethe, and as one who is and will remain among the most illustrious poets in the world's literature.

**Bibliography.**—Although the first collected edition of Heine's works by A. Strodtmann (22 vols., Hamburg 1861-66) was not brought out until some time after his death, there have been published very many other editions since then. Of these the most important are by G. Karpeles (Hamburg 1885 and Berlin 1893) and by E. Elster (Leipzig 1887-90). There have been almost innumerable editions of his separate works. A very large number of his poems have been set to music, not only by German composers, but also by composers in many other countries. Almost equally as numerous are the translations of his works into different languages, especially into English and French. Of his collected works the most important translations are 'Oeuvres Complètes' (14 vols., Paris 1852-68) and 'The Works of Heinrich Heine' (13 vols., New York 1892-1905). There are also a number of English translations of his poems, the most recent and in many respects the best and most careful being that by Louis Untermeyer (New York 1917). Both books and magazine articles on Heine's work and life have been

written in vast numbers in many languages. A very careful and exhaustive bibliography of these is to be found in Goedeke, K., 'Grundriss der Deutschen Dichtung' (Vol. VIII, Dresden 1908) which also contains a very complete list of editions and translations. GUSTAV KARPELES,

*Author of 'Jewish Literature and other Essays.'*

**HEINEMANN**, hi'ne-man, William, English publisher and author: b. Surbiton, 18 May 1863. He founded the publishing house which bears his name in 1890. He has published under the pen name of "KASSANDRA VIVARIA" 'The First Step,' a play (1895); 'Summer Moths,' a play (1898); 'War, a play (1901).

**HEINRICH VON OFTERDINGEN.**

This fragmentary romance by Novalis (Friedrich von Hardenberg), written 1799-1800 and published by Tieck after the author's death (1801), is the masterpiece of early German Romanticism, the supreme representation of Romantic thought and feeling. The novel was planned consciously to be both a supplement to Goethe's 'Wilhelm Meister' (q.v.) and a refutation of it; the tendency of 'Wilhelm Meister' seemed to the Romantics to be too prosaic and practical. 'Heinrich von Ofterdingen' was to be the glorification of the poetry of life; poetry and life are actually identical; poetry is the pathway to all wisdom. Novalis presents his theme in a symbolic tale, which relates the life of an ideal poet; indeed, the whole substance of the story is included in

the two phrases, substantially identical in meaning: "Heinrich becomes a poet," and "The world becomes a dream." Various experiences are provided for the shaping of the hero's gifts; the culmination of the first period is reached in love and grief, these experiences being directly connected with Novalis's love for Sophie von Kühn and his sorrow at her death.

'Heinrich von Ofterdingen' is divided into two parts: "Expectation" and "Fulfillment," but pathetically enough the author died leaving the second part a fragment; the continuation, so far as we know it through Novalis's notes and Tieck's account of his friend's plans, presents a strange but fascinating medley of miracle, symbol and mysticism.

In the first chapter of the novel the hero related a dream, the vision of the Blue Flower, and the romance consists essentially in the symbolic quest for this flower, which Heinrich ultimately plucks. Through the influence of 'Heinrich von Ofterdingen' the Blue Flower became the symbol of Romantic longing, the realization of the poet's dream, the union of the dream-world and the real world. The hero has only his name in common with a legendary poet of the Middle Ages, who appears in a Middle High German poem "Der Wartburgkrieg" ("The Wartburg Contest"), and is used by Wagner in 'Tannhäuser' and elsewhere in modern mediaevalistic literature, as by Lienhard, Kastropp and others. Translation, Cambridge, Mass., 1842. For criticism consult Brandes, 'Romantic School in Germany'; Wernaer, 'Romanticism and the Romantic School in Germany' and Haym, 'Die Romanische Schule.'

HARVEY W. THAYER.

**HEINTZELMAN**, hīnt'sēl-man, **Samuel Peter**, American military officer: b. Manheim, Pa., 30 Sept. 1805; d. Washington, D. C., 1 May 1880. Graduated at the United States Military Academy 1826, and served during the Mexican War. In 1861 he commanded a division at Bull Run, where he was wounded 21 July. Afterward promoted brigadier-general of volunteers, Heintzelman, during the organization of the army in the winter of 1861-62, held command of a division. On the moving of the Army of the Potomac, in March 1862, the 3d Army corps was placed under his command. His corps formed the right wing of Pope's army at the second battle of Bull Run, 30 Aug. 1862. During the Maryland campaign he commanded the defenses at Washington, and was afterward appointed to the command of the Department of Washington, and of the 22d Army corps, which he held during the battles of Chancellorsville and Gettysburg, in May and July 1863. He retired in 1869, with the rank of major-general.

**HEIR** (Lat. *hæres*), in law, one entitled by descent and right of blood to lands, tenements or other hereditaments. Hence it is an ancient apothegm, that "God only can make an heir." An heir is really one who is born or begotten in lawful wedlock, and on whom the law casts the estate, in lands, tenements or hereditaments immediately on the death of his ancestor. The rights of heirs in the majority of the United States are determined by the principles of the common law unless specially modified by statute. It is a matter of judicial decision that the rights of heirs in the United States are statutory only.

Hence they cannot plead, for instance, that an inheritance tax is unconstitutional. An heir presumptive is one who will be the heir at the death of the owner, as the elder son of a deceased brother in England, or all the children of a brother in the United States, where the owner has no children; for they will be heirs if he dies without issue. As an heir presumptive may lose his heirship by a change of circumstances, he does not become an heir apparent so long as this change is legally probable, though physically or naturally impossible. Thus the nephew of the owner can never be his heir apparent, however aged or feeble or near to death the owner may be; for in contemplation of law it is always possible that a son may be born to him, who would be an heir apparent, and who would therefore supersede an heir presumptive. An heir apparent is one who must be the heir if he survive the owner, as the eldest son in Great Britain, or all the children in the United States.

**HEIRLOOM**, in English and Scots law, a chattel, as furniture, which by will, law or the like descends to the heir with the land; also, any chattel owned by a family for a number of generations. Usually the term includes tables, beds, pans, carts, etc., but it may include ornaments, as jewels. Formerly the term was of more importance than it is to-day. An owner of an heirloom cannot convey it away from the estate, for at his death it goes to the heir or devisee. In popular usage to-day the term is used as synonymous with settled chattels.

**HEISS**, his, **Michael**, American Roman Catholic prelate: b. Pfahldorf, Bavaria, 12 April 1818; d. Milwaukee, 26 March 1890. He studied at the University of Munich and at the Catholic seminary at Eichstädt, and was ordained in 1840. In 1843 he came to the United States, and was first assigned to a church in Covington, Ky.; he next went to Milwaukee as missionary priest and secretary to the bishop. In 1868 he was consecrated as the first bishop of La Crosse, Wis.; in 1880 he was appointed coadjutor to the archbishop of Milwaukee, with the right of succession, and in 1881 became archbishop of Milwaukee. He took an important part in American councils, and was a member of the Vatican Council (1860-70). He wrote 'The Four Evangelists,' and a treatise on marriage (in Latin).

**HEISTAND**, hī'stānd, **Henry Olcott Sheldon**, American soldier: b. near Richwood, Ohio, 30 April 1856. He was graduated from West Point 1878, and was assigned to 11th United States Infantry as second lieutenant. He was appointed government inspector and instructor Ohio National Guard in 1892, and during the Presidential campaign of 1896 was confidential secretary to McKinley. In 1889 was appointed military commissioner to the Paris Exposition of 1900; while on that duty was promoted lieutenant-colonel in 1900, and became adjutant-general and chief of staff in the China expedition for relief of Peking 1900. Has served as adjutant-general at all important military headquarters, including Manila, San Francisco, New York city and Chicago. He has written 'Alaska, Its History and Description' (1898) and numerous professional papers and brochures.

**HEJAZ**, hē-jāz, or **HEDJAZ**, Arabia, since November 1916, a kingdom of which Mecca is

the capital. It comprises the former vilayet of Hejaz, extending from Akaba in the north to Asia in the south; the area is about 96,500 square miles bordering the Red Sea littoral and is a region of desert and oases. There are, however, many populous coastal towns connected by the Hejaz Railway with terminals at Mecca and Medina. The population numbers about 300,000.

**History.**—In June 1916 the Grand Sherif El Hussein ibn Ali of Mecca, with his three sons, revolted against the Turkish authorities and within two months was master of the principal towns. On 27 June he proclaimed his independence of Turkey. The first result of the revolution was the opening of the ports on the eastern shore of the Red Sea, which had been closed by Turkey, for trade with the ports of the Entente Allies, particularly those of Egypt on the opposite shore. Early in September the French government, in full accord with the government of Great Britain, dispatched a delegation of French Moslems to the Grand Sherif of Mecca with the mission of congratulating the new Arabian government on its deliverance from Turkey. It was also the bearer of a substantial sum of money (about 3,000,000 francs) for the purpose of rendering financial aid to the new state. The French government also furnished a vessel for the British and French Moslems in which to resume their annual pilgrimages to Mecca by way of Jeddah. Thousands of such pilgrims took advantage of this free service and it proved an important factor in the development of Franco-Arabian relations. When the date of the pilgrimage drew near the Grand Sherif sent out circulars inviting all "true believers" to come to Mecca. Those pilgrims found a new Mecca, a cleaner city and free of the assassins and robbers of former years. In November 1916 the Grand Sherif assumed the title and office of king at the request of the Ulema and notables of Mecca, approved by the unanimous vote of the people, and has been recognized as king of Hejaz by the Allied governments. See ARABIA; MECCA; TURKEY; WAR, EUROPEAN. Consult 'Current History' (New York October 1916); 'Statesman's Year Book' (1918).

**HEJRA, or HIJRA.** See HEGIRA.

**HELEN,** in Greek legend, the most beautiful woman of Greece, daughter of Zeus by Leda. By advice of Ulysses her numerous suitors were bound by oath to respect her choice of a husband, and to maintain it even by arms. She chose Menelaus, but was afterward carried off to Troy by Paris, the Trojan War arising from the claim made by Menelaus for the fulfillment of the oath. After the death of Paris she married his brother Deiphobus. On the fall of Troy she returned to Sparta with Menelaus, but at his death was driven from the country, and was murdered at Rhodes by the queen of that island.

**HELENA, hēl'ē-nā, Saint,** the mother of the Emperor Constantine the Great. She was of humble origin, probably the daughter of an innkeeper of Bithynia. She captivated Constantius Chlorus, and became his wife; but when Diocletian elevated him to the dignity of Cæsar, in 292 A.D., he was compelled to repudiate her. The succession of her son, and the influence she had exercised in educating him as a Christian,

compensated her for previous humiliations, while her piety and zeal for the propagation of Christianity have made her a saint in the Roman Catholic calendar.

**HELENA, hēl'ē-nā, or hē-lē-nā, Ark.,** city and county-seat of Phillips County, on the Mississippi River, and on the Saint Louis, Iron Mountain and Southern, the Yazoo and Mississippi Valley, the Missouri and North Arkansas railroads, and is the terminus of the Arkansas Central, about 75 miles below Memphis and 95 east by south from Little Rock. It has boat communications with all important river-ports. A conflict between the Federal and Confederate forces took place here 4 July 1863. The Union army, about 4,500, was under General Prentiss, the Confederate, about 9,000, under General Holmes. The Confederate loss was about 1,800, including killed, wounded and prisoners. Helena is in an agricultural and lumbering region; the chief manufactures are lumber, cottonseed oil and foundry products. It has cotton-compresses, a shingle-mill, box factories, stave mills, railroad shops, manufactories of chairs, brooms, spokes and handles, brickyards and large lumber-yards. Some of its educational institutions are the Jefferson High School and the Sacred Heart Academy; it has several banks, a public library, a number of fine church buildings. It contains also several monuments to Civil War heroes and the United States district, State, county and municipal courts. Pop. 10,796.

**HELENA, Mont.,** city and capital of the State and county-seat of Lewis and Clark County, on the Northern Pacific and the Great Northern railroads, about 70 miles north by east of Butte. The city is surrounded on all sides by the Rocky Mountains; on the south and west the mountains are within two miles of the city, while to the north there is a wide valley between the city and the foothills, and the same condition exists on the east. The city is protected from severe wind storms, and in the winter season there is a difference between its temperature and that of the mountain country of from 10 to 20 degrees. The country tributary to Helena is rich in both mineral and agricultural resources. The mines are principally gold-producing, while the products of the farms are cereals and the ordinary vegetables. Also tributary to the city are large areas devoted to the raising of cattle and horses, but this industry is gradually being replaced by diversified farming. Helena is the richest city per capita not only in Montana but in the entire Rocky Mountain country. It is principally a city of homes; cattlemen, miners and others engaged in industries elsewhere in Montana make it their residence because of its church, school and social attractions.

The original of Helena was "Last Chance Gulch"; the town came into existence as a result of discoveries of placer gold in 1864, by four prospectors, John S. Cowan, John Crab, D. J. Miller and Robert Stanley, who came from Alder Gulch, now Virginia City, in the southern part of the State. On 16 July 1864 they sunk two holes to bed rock and in each they found gold. It was the "Last Chance" that turned out favorably and that was the name of the camp until Helena was adopted. The news of the find spread; soon there were

500 men in the camp; such was the nucleus of the present capital.

The educational institutions are the public and parish schools, the Montana Wesleyan University (Methodist), Mount Saint Charles College, Saint Vincent Academy (Catholic) and the State, city and other libraries. Among the principal buildings are the government building, costing \$500,000, State Capitol (cost, with the two new wings, \$1,100,000), County Courthouse (cost, \$100,000), High School building (\$150,000), Saint Helena Cathedral (\$400,000), Y. M. C. A. building (\$115,000), and seven graded school buildings valued at \$250,000. There are also Saint John's Hospital, Saint Peter's Hospital, Saint Joseph's Orphanage, House of the Good Shepherd, several fine churches, Masonic Home and the Odd Fellows' Home. All secret societies are well represented, the leading one being the Masonic fraternity which owns two temples. The city is noted for its clubs, the Montana, Lambs and Elk's being social organizations, and the Helena Commercial Club one of the most active bodies in the West. On the Missouri River, 12 miles from Helena, are located the great power dams of the Montana Power Company, one being located at Canyon Ferry, one at Hauser Lake and one now in process of construction at Holter. These three dams furnish an aggregate of 110,000 horse power which is electrically transmitted to Helena for operating street cars and lighting the city and for manufacturing purposes. Helena is the principal financial centre of the State and has the distinction of having the largest per capita bank deposits of any city in the country. It is also one of the mining centres of the State. The principal gold mines now working within three to eight miles of the city are the Franklin, The Scratch Gravel Gold Mining Company. The Eastern Belle Gold-mining Company in the Scratch Gravel District, the Carbon Hill Mining and Milling Company and the Stem Winder Company in Grass Valley, The Whitlatch Union, The Butte and Helena Whitlatch and the Yellow Boy Mine. The districts tributary to Helena in which mining is active are the Marysville district, the Rimini district, the Lump Gulch, Clancy, Wickes, Corbin, Radersburg, York, Winston, Hassel and Townsend districts, in all of which are producing mines. In the 20 years after the first discovery of gold \$25,000,000 were taken from the ground on which is now located the business part of the city, and it is no unusual thing at the present time, when the foundation for a new building is being prepared, to strike gold in the excavation. This was the case when the excavation was made for the Placer Hotel four years ago, the contractor for the work securing more than \$1,000 from the bed rock on which the foundation is placed.

The government is of the commission form, being vested in a mayor and two councilmen who appoint all subordinate officials. The assessed property valuation is about \$15,000,000. Helena has one of the most extensive ornamental lighting systems in the State. Leading away in all directions to scenic points is a system of splendidly constructed roads, notable among which are the Le Grande Canyon boulevard and the Transcontinental automobile route over Priest's Pass of the main range of the Rocky Mountains. Helena has been the

capital of Montana since 1869. In that year the capital was removed by popular vote from Virginia City. After Montana was admitted as a State two elections were held for the permanent location of the capital and in 1894 Helena was chosen. Its altitude is 4,200 feet. The climate is not severe, the locality having the distinction of possessing the longest season between frost and frost of any section of the State. The average temperature in January and February, the two coldest months in the year, is 20 degrees above zero, with little moisture in the air. In summer the average temperature is 75 degrees. Pop. 15,000.

L. M. RHEEM.

**HELENA, Battle of.** Helena, Ark, is on the west bank of the Mississippi River, about 82 miles below Memphis. Since 13 July 1862, when General Curtis arrived there from western Arkansas, it had been occupied by Union troops, and on 4 July 1863 was held by a division of the 13th corps, under General Salomon, and a brigade of cavalry, in all 4,129 effective men, under command of Gen. B. M. Prentiss. The place is surrounded by hills, and those nearest the city were occupied by strong redoubts; Graveyard Hill in the centre, Fort Righter on the north or right, and Fort Hindman on the south or left, were all connected by a line of bastions and rifle-pits, both ends of which rested on the river. In the river lay a gunboat. Toward the middle of June it was determined by the Confederates to take the place, whereby it was hoped to raise the siege of Vicksburg or, if Vicksburg fell, still to keep the river closed. General Holmes was ordered to move from Little Rock with about 7,600 men, Price's and Marmaduke's divisions, Fagan's brigade of infantry and Walker's brigade of cavalry. Holmes bivouacked about four miles from Helena on the evening of 3 July, and at midnight advanced to within a mile of the outer works. The assault was ordered at daylight. On the Confederate right Fagan with 1,770 men advanced on Fort Hindman, carried all the outer entrenchments and made a desperate attempt to take the fort, but was repulsed with a loss of over 400 men. On the Confederate left Marmaduke's division of infantry and Walker's cavalry brigade, aggregating 2,780 men, attacked Fort Righter and were repulsed. Price, in the centre, with 3,100 men, made a strong assault, carried all the entrenchments in his front, seized Graveyard Hill, and ordered one brigade to move on the town and another to assault Fort Hindman in the rear, but the Union troops checked the advance of the two brigades and drove them back and, the attacks on the right and left being repulsed, the fire of the forts, rifle-pits and gunboat was concentrated on Price, and at 10.30 A.M. Holmes gave the order to withdraw and led his troops back to Little Rock. The Union loss was 57 killed, 146 wounded and 36 missing; the Confederate loss was 173 killed, 687 wounded and 776 missing. Consult 'Official Records' (Vol. XXII); Greene, 'The Mississippi'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. III).

**HELENIN**, a chemical substance extracted by hot alcohol from the root of the elecampane (*Inula helenium*). It has the formula  $C_8H_{16}O$ , and is nearly insoluble in water, but very soluble

in alcohol. The first crystals obtained from the root-extract contain considerable quantities of inula-camphor; but this may be removed by repeated crystallization from alcohol. Pure helenin crystallizes in white prisms or needles, melting at 232° F.

**HELICIDÆ**, hē-lis'ī-dē, the family of terrestrial pulmonate mollusks which includes most of the land and many fresh-water snails. See **SNAILS**.

**HELIGOLAND**, hēl'i-gō-lānd, or **HEL-GOLAND**, hēl'gō-lānt (Dan. "holy land"), a small island fortress and popular sea-bathing resort in the North Sea, belonging to Germany, situated about 40 miles northwest of the mouth of the Elbe. It is about a mile long and one-third of a mile broad, and has an area of about one-quarter of a square mile. It consists of two parts, the Oberland, a flat-topped rock 206 feet high, which since the island was acquired by Germany has been made into a great fortress, from which visitors are excluded. The Unterland is a small stretch of shore at its foot. There are two ports, one on the north and one on the south side, and most of the houses stand on the Oberland. The Unterland gives partial shelter to the shipping. Steamboats ply between the island and Hamburg. The principal buildings are the church, lighthouse and a royal Prussian biological station for the study of the fauna and flora of the North Sea. The bathing facilities, which attract so many visitors, are found in a dune or sand-bank separated from the main island by a channel about a mile wide. This Sandy Island, as it is called, is slowly being reduced in size by the inroads of the sea. The inhabitants are chiefly employed in fishing, and speak a Friesian dialect. The island has cable communication with Cuxhaven and Wilhelmshaven. Christianity was first preached here by Saint Willibrod in the 7th century. Taken from the Danes in 1807, it was ceded to Great Britain in 1814, but was transferred to Germany in 1890. The island was formerly much larger than now, but has been cut away by the attack of the waves. (See **SHORE LINE**). The Bight of Heligoland was the scene of a naval engagement between German and British ships on 28 Aug. 1914, which ended in a British victory. The island held a prominent place in German naval strategy. See **WAR, EUROPEAN**.

**HELIOCENTRIC**, hē'lī-ō-sēn'trīk, "having the sun as centre," a term applied to the Copernican system, as in opposition to the Ptolemaic system, which was geocentric, that is, "having the earth as centre" of the solar system. In modern astronomy the word is applied to calculations in which the sun is referred to as centre of the planetary system. Thus the heliocentric place of a planet is the position it would occupy at a given time when calculated from a point of view in the centre of the sun.

**HELIODORUS**, hē-lī-ō-dō'rūs, the earliest of the Greek writers of romance: b. Emesa, Syria, and lived near the end of the 4th century. He became a believer in the Christian religion, and bishop of Tricca in Thessaly. His youthful work, 'Æthiopica (that is, Æthiopic Affairs), or the Loves of Theagenes and Charicleia,' is a tale in poetical prose, with an almost epic tone. It is distinguished by its strict morality from the other Greek romances, and interests the

reader by the wonderful adventures it recounts. One of the best editions is that of Hirschig in the 'Erotici Scriptorum' (1856). An English translation by R. Smith appeared in 1855. See **ÆTHIOPICA**.

**HELIOGABALUS**. See **ELAGABALUS**.

**HELIOGRAPH**, a signaling instrument using the direct rays of the sun for the transmission of orders or information. The essential parts of the instrument are the mirror which reflects the light, and a telescope so attached to the mirror as to direct the reflected ray to the point where it is to be read. When the position of the sun is such that the ray forms an angle greater than 90 degrees at the mirror, a second mirror is introduced to prevent an undue dispersion of the beam of light. The instrument is mounted on a tripod with a ball and socket joint, and is accurately set with adjusting screws. The code in common use is the Morse telegraph alphabet of dots and dashes, formed by alternately obscuring and displaying the flash from the mirror. In military use special codes are employed. The heliograph is available only when the sun is shining in a clear sky.

**HELIOMETER**, an instrument for measuring small angular distances on the sky, with very high accuracy, particularly the distance of a planet from a nearby star, and the angular distances of neighboring stars from each other. It is from the former kind of measures that until very recently the most accurate determination of the distance from the earth to the sun was deduced: from the latter the distances to certain of the stars were determined with a higher accuracy than was possible in any other way. The heliometer of Bouguer is an astronomical telescope provided with two object-glasses, one of which is movable, and which form two distinct images of the same object, visible through the same eye-glass. A single object-glass cut into two parts, which are relatively movable by a screw, is always employed now. If, in contemplating a celestial body, the object-glasses are placed so as to bring the images to touch each other, the distance of the centres of the glasses gives the diameter of the image. In this manner the instrument gives, for instance, the difference of the diameter of the sun in perigee and apogee. For many decades the heliometer has stood at the head of all astronomical instruments for the precision of its results, especially in the measurement of the parallaxes of the stars and of the sun. Very recently, however, it has been almost wholly superseded for these purposes by the photographic plate, with which as high, or even a higher, accuracy can be attained with a greatly lessened expenditure of labor.

**HELIOPOLIS**, hē-lī-ōp'ō-līs ("City of the Sun"), Egypt, the On of the Hebrew Scriptures, on a site now partly occupied by Matariyah, six miles northeast of Cairo, was one of the most ancient and extensive cities during the reign of the Pharaohs, and so adorned by monuments as to be esteemed among the first sacred cities of the kingdom. During the flourishing ages of the Egyptian monarchy the priests and scholars acquired and taught all the learning of the Egyptians within the precincts of its temples. Its sacred name was Per-Rê (house or city of Rê), of which Heliopolis is the

Greek translation. It may be regarded as having been the university of the land of Misraim, and at the time of Strabo, who visited this town 24 B.C., the apartments were still shown in which, four centuries before, Eudoxus and Plato had labored during 13 years to learn the philosophy of Egypt. Solon and Thales were also reputed to have visited its schools. Here Joseph and Mary are said to have rested with the infant Jesus. Near the village stands the Pillar of On, a famous obelisk, supposed to be the oldest monument of the kind existing in Egypt. Its height is 67½ feet, and its breadth at the base 6 feet. Hieroglyphical characters are sculptured upon it, but are partly illegible. The obelisks known as Cleopatra's Needles, of which one is now in London and the other in Central Park, New York, were originally erected at Heliopolis by Thothmes III. A fierce battle was fought here, 20 March 1800, between the French under Kleber and the Turks, when the latter were defeated. Consult Pauly-Wissowa, 'Real-Encyclopädie der classischen Altertumswissenschaft' (Vol. VIII, Stuttgart 1913).

**HELIOORNITHIDÆ**, hē-lī-ōr-nīth'ī-dē, a family of tropical birds, the fin-foots or sun-birds, placed by some ornithologists among the *Cecomorphae*, and by others, more probably, with the rails. They are about a foot long, mottled brown and white, with long pointed wings and long stiff tails; and frequent the borders of forest streams and ponds, in which they spend much of their time swimming and diving. They feed on small fish, crustaceans, insects and seeds. The best-known species is *Heliornis fulica* of southern South America.

**HELIOS**, hē'lī-ōs, in mythology, the god of the sun (Latin, *Sol*) in the Greek mythology; son of Hyperion and Theia, and brother of Eos (Aurora, the dawn) and Selene (Luna, the moon). He is frequently called by the name of his father. He dwells with Eos in the ocean behind Colchis. From the portals of the morning he rides through the air in an oblique curve to the gates of evening, and after having cooled his horses in the ocean, he drives his chariot into a self-moving golden vessel, made by Hephæstus (Vulcan), which with wonderful rapidity bears him during the night along the northern shore of the ocean back to Colchis, where he bathes his horses in the lake of the Sun, and rests till the dawn of the morning. Other accounts represent him as making this nightly passage while slumbering in a golden bed. His horses and chariot are first mentioned in the Homeric hymn on Helios. Among events in the history of Helios the poets relate his contest with Poseidon for the Isthmus of Corinth, his revealing the secret amours of Ares and Aphrodite, and his disclosure to Demeter of Pluto as the ravisher of her daughter. This idea of his omniscience seems to have been the reason why he was confounded and identified with Apollo, though they were originally quite distinct. As he was descended from the race of the Titans he is often called Titan. The famous Colossus of Rhodes was a representation of Helios. Consult Fairbanks, 'The Mythology of Greece and Rome' (1907).

**HELIOSTAT**, hē'lī-ō-stāt, an instrument designed to reflect the rays of the sun, or the image of a heavenly body steadily in a given

direction notwithstanding their apparent motion relative to the point of observation. It consists of a mirror mounted on an axis made parallel with the axis of the earth, and caused to rotate toward the west with a velocity equal to the angular velocity of the sun or other body being observed. Several forms of the instrument have been devised, the best known being Silberman's; and this too has been variously modified. Aside from its former use in physics, the heliostat has become a valued adjunct to the horizontal telescope, serving to reflect the images of the heavenly bodies into the object glass. (See TELESCOPE). Consult article on the heliostat in *Popular Astronomy* for November 1913. An adaptation of this instrument is used in geodetic surveying to keep a point of reference constantly in view.

**HELIO THERAPY**, the treatment of disease by the action of sunlight. See PHOTOTHERAPY.

**HELIO TROPE**, hē'lī-ō-trōp, a genus (*Heliotropium*) of plants of the borage family, characterized by the undivided ovary prolonged into a style, many of whose species have vanilla-scented blossoms. The one most cultivated is a small shrub (*H. peruvianum*), originally South American, which has small fragrant flowers growing compactly in one-sided spikes. Cuttings taken from the young branches grow readily, and come soon into blossom. The heliotropes are natives of warm climates, and very numerous, several growing wild in the United States. Many delightful varieties have been produced as garden and greenhouse flowers.

**HELIO TROPE**, the bloodstone, is a variety of quartz partaking of the character of jasper and of chalcedony. It is of a deep green color, and is covered with red spots like drops of blood. Many fine antique Greek and Roman intaglios and cameos, also seal rings carved in bloodstone, are preserved in the great gem collections. It is found in Tartary, Persia, Siberia, Colorado, Georgia, Oregon and Orange County, N. Y., in the island of Rum, Scotland, and many other places. It received the name heliotrope, or as some of the older writers give it, elitropia, because it was said that if the mineral be put into water contained in a basin rubbed with the juice of the plant heliotrope, and be exposed to the sun, the water will appear red and the sun blood-like, as if it was eclipsed.

**HELIO TROPISM**, hē-lī-ō-t'ró-pīzm, or **PHOTO TROPISM**, the influence and effect of sunlight on organisms. When a seedling plant is placed in a transparent vessel of water within reach of the light of a window, the stem and leaves gradually bend toward, and the roots from, the light. The former phenomenon is termed positive, and the latter negative, heliotropism. The shoots and leaves of nearly all plants turn toward the light, and the turning of the sunflower toward the sun is familiar to every one. In the case of organs which are positively heliotropic the growth of the side next the light is retarded, and that of the opposite side increased; the result of these combined actions is a concavity on the former, and

a convexity on the latter, thus causing a curvature toward the light. In the case of roots these actions are reversed. That these results are brought about by the action of light is evident; the cells on the concave side become less, while those on the convex side become more, turgid, thus forcing the organ to bend; but the cause of turgescence is unknown.

In animals a similar heliotropism is operative and is plainly manifested in some low forms, as hydra, where it is of great service in their almost automatic food-getting. Heliotropism is closely allied to, and much modified by chemotropism (q.v.) and other influences.

**HELIOZOA**, hē'li-ō-zō'ā, the "sun animalcules," an order of rhizopods (q.v.) with or without silicious skeletons, and having slender and radiant pseudopodia, stable and rarely interlaced. The majority live in fresh water, but some are marine. A common and widespread example is the genus *Actinophrys*.

**HELIUM**, a gaseous element, known to be present in the atmosphere and in certain minerals, and, like argon, characterized by chemical inertness. It is believed that helium is the final product of the disintegration of radium. It is also the ultimate product of the radioactivity of actinium and thorium. The discovery of helium was a consequence of the discovery of argon, and on account of the close chemical, physical and historical relations of the two, reference should be made to the article ARGON, and to the references there given. Helium was known to exist in the sun many years before it was discovered upon the earth. During a total eclipse of the sun, in 1868, Janssen observed a brilliant yellow line in the spectrum of the solar chromosphere, very close to the D lines of sodium, and yet not identical with either of them. The new line was assumed to be due to a previously unknown element, and in the same year Lockyer proposed the name "helium" for this hypothetical element, from the Greek word "helios," meaning the sun. No evidence of the existence of helium upon the earth was adduced until 1882, when an Italian scientist named Palmieri announced that he had obtained the spectrum of helium from certain of the lavas given off by Mount Vesuvius. He made no attempt to isolate the new body, however, and while it is quite possible that his observations were correct, he can hardly be credited with the actual discovery of helium. No further progress was made in this direction until 1895. When argon had been discovered, and its chemical inertness had been established, Mr. Miers, mineralogist of the British Museum, pointed out that the mineral cleveite had been shown to contain nitrogen gas, apparently in the free state, and made the suggestion that part of what had been assumed to be nitrogen might in reality prove to be argon. Professor William Ramsay examined the gas from this source, and found that while it undoubtedly did contain argon, it also showed a brilliant yellow line, which did not appear to coincide with either of the sodium lines, though it was very close to them. He sent a specimen of the gas to Sir William Crookes for a more careful examina-

tion, and Crookes promptly reported that the new line was identical with the helium line. It was therefore proved that helium, which had previously not been certainly known except as a constituent of the solar chromosphere, is also a terrestrial element. Subsequent study revealed the presence of helium in brögerite, uraninite, fergusonite and several other minerals. It is given off from cleveite when that mineral is heated to about 400° F. in an exhausted tube, or when the mineral is treated with sulphuric acid, or with acid sulphate of potassium. By the heating process about half the helium content is secured; with the acid, all of it. All the minerals which contain any considerable quantities of helium also contain uranium, yttrium or thorium. It is not certainly known whether the helium is chemically combined with the mineral, or whether it is merely occluded by it. The latter supposition would appear to be the more probable, judging from the chemical inertness of the gas, and from the fact (presently to be noted) that radium appears to be generating helium continuously. Certain observations upon the mineral fergusonite, however, appear to give some color to the hypothesis that the helium is present in a state of chemical combination. As obtained from minerals helium usually contains 10 per cent of nitrogen and a smaller per cent of argon. Helium has also been found among the gases arising from the waters of certain hot springs, notably those of Maizieres, in which the proportion is 5.34 per cent. It occurs also in the natural gas of Kansas in the proportion of 1.84 per cent.

The presence of helium in the earth's atmosphere was established by means of subjecting the apparently pure argon that had been obtained from this source to a process of diffusion through a series of porous partitions of baked clay. Helium, being much lighter than argon, diffuses far more rapidly, and a mixture in which the two gases exist together may be partially separated into its constituents in this manner. The gas is present in the earth's atmosphere in the proportion of 1 volume of helium in 250,000 volumes of air.

Helium, when pure, has a density of only 1.98, that of oxygen being taken as 16. Its atomic weight cannot be directly determined, because helium has not yet been made to combine with any other substance, although it has been subjected to the same experimental attempts as were tried in the case of argon (q.v.). The only approach to this was in establishing the fact that zinc vaporized in helium has a vapor density 12 per cent greater than when vaporized in nitrogen under identical conditions. It has been found, however, that the ratio of the specific heat of the gas at constant pressure to the specific heat at constant volume is about 1.65, and this indicates that helium is a monatomic gas (see GASES, KINETIC THEORY OF), and that its atomic weight is about  $2 \times 1.98 = 3.96$ ; the atomic weight of oxygen being taken as 16. It therefore has the smallest atomic weight of any of the known elements except hydrogen. The chemical symbol He has been assigned to helium, although, as has been already noted, no compounds of it have as yet been obtained.

Dewar thought he had liquefied helium at the

temperature of melting hydrogen (about 436° F. below zero), but this was not confirmed by subsequent experiments. Success was finally achieved in 1909 by Onnes, using the Linde process. Liquid helium is colorless and very mobile. It has a density of 0.122, being therefore the lightest liquid known. It boils at 4.5° absolute. By evaporating it rapidly a temperature of —454° F. has been attained, but the helium did not solidify. Its critical temperature being nearer to the absolute zero than that of hydrogen, the gas is well adapted for use in thermometers intended for the measurement of exceedingly low temperatures. It has, in fact, been used for this purpose with success, in studying the properties of hydrogen.

A most remarkable and previously unparalleled fact in connection with helium remains to be recorded. It has been known for some time that helium occurs in cleveite, and in other minerals in which the newly discovered element radium is found; but whether this was to be regarded as a mere coincidence, or whether it has some actual physical and chemical significance, has been a subject of considerable discussion. The most striking experiment bearing upon this matter is one that is due to Huggins, who caused the radiation from radium to pass through a spectroscope provided with a quartz prism and to fall upon a sensitive photographic plate. Upon developing the plate after a prolonged exposure, he found that cold radium gives a line spectrum when treated in this manner; and he made the further discovery that nearly all of the lines in the spectrum so obtained are apparently coincident with lines in the spectrum of helium. The full significance of this fact is not yet known; but when taken in connection with the observations of Soddy and Ramsay, which indicate that helium occurs in the gaseous emanation that is given off by radium, it is considered by no means impossible that we have here an instance in which one element is being slowly but continuously transformed into another one. If this inference is corroborated by future experiments, it will throw an altogether new light upon the nature of the chemical elements, and upon their relation to one another. The case is the more noteworthy, since helium has a smaller atomic weight than any other element save hydrogen, and radium has a greater atomic weight than any other element save uranium and thorium. Radium, moreover, appears to be metallic in nature, while helium, by its chemical inertness, resembles nitrogen.

Helium is prepared by separating it from its mixture with nitrogen, argon, krypton, etc. Several methods are in use. If atmospheric nitrogen is passed over heated magnesium (with or without lime) the nitrogen is absorbed and the inert gases collected, to be afterward separated. Helium may also be obtained from liquid air by fractional distillation. The method most commonly used is to heat to redness the powder of helium-bearing minerals in a tube of iron or hard glass, having previously exhausted the air from the apparatus. The gases are collected over mercury. By this process one ounce of cleveite yields about two gallons of helium. The separation of helium from the mixed gases is accomplished by filtering through quartz. At a temperature of 1,850° to 2,200° F. quartz is permeable to helium. A

tube of quartz is so arranged in an atmosphere of the mixed gases that it may be heated to the required degree, and at the same time the interior of this tube is exhausted by an air-pump. Under these conditions the helium passes through the quartz into the tube, from which it may be pumped into a collector. Or the gas mixture is passed into a vacuum tube containing charcoal at the temperature of liquid air. All the gases but neon and helium are condensed, and these are readily separated by the difference of their vapor pressures.

**HELIX**, hē'liks, a spiral, or a thing of spiral form; the advancing curved surface of a thread or a screw is the most familiar illustration. (1) In anatomy, a prominent and incurved margin surrounding the thinner and larger portion of the pinna in the ear. (2) In architecture, the small volute of a spiraled acanthus stalk under the abacus of a Corinthian column. Of these there are in every perfect capital 16: two at each angle and two meeting under the middle of each face of the abacus. Also the spiral of a staircase winding around a central post. (3) In geometry, a curve of a right line formed on a plane wrapped about a cylinder or a cone. The edge of the path of a screw is a helix, as is also the path described by any point of the surface of the thread when moved in the nut. (4) Any coil, as that of an electromagnet. (5) In zoology, the typical genus of the snail family. See SNAILS.

**HELL** as generally understood is the abode of evil spirits; the infernal regions, where the devil rules supreme, and whither lost or condemned souls go after death to suffer indescribable torments and eternal punishment either for wickedness inherited from the sin of Adam or for more or less serious infractions of the divine law. This region was usually thought of as being beneath the earth, in the darkness of vast underground caverns, or in the region of fire supposed—as seemed to be proved by volcanoes—to underlie the whole earth. The word is often used figuratively to describe any place or state of extreme wickedness, suffering or misery; as for instance, "The hells of vice," "he (during illness) suffers the torments of hell," "poverty is hell." This article is concerned only with hell as a purely theological institution.

Hell, in the theological sense, has no place in most primitive religions, nor has heaven. The existence beyond death is almost universally thought of as "something between being and not being." The Hebrew Sheol and the Greek Hades are good illustrations of this. There was no thought of dividing the future state into separate and distinct conditions of existence. Even so late a writer as the author of Ecclesiastes declares that "all (men and beasts) go unto one place" (Eccl. iii, 20) and "there is one event to the righteous and wicked" (Eccl. ix, 2). Much confusion and misunderstanding has been caused through the early translators of the Bible persistently rendering the Hebrew Sheol and the Greek Hades and Gehenna by the word hell. The simple transliteration of these words by the translators of the revised editions of the Bible has not sufficed to appreciably clear up this confusion and misconception. The popular idea of hell as a place of punishment—either re-

demptive or rigidly retributive in character—did not come suddenly and full-formed into existence. It is the product of centuries of thinking on the great problem of reward and punishment which, instinctively almost, man associates with human deeds. In the early stages the idea seems to have been that the souls of the dead appeared before the divine tribunal. The souls that could present a satisfactory record during their earth life were admitted to the presence and abode of the gods, and the souls that could not present such a satisfactory account were cast out not into a place of torment but into an existence more or less deplorable and wretched.

It is not necessary here to discuss the matter as it appears in the different religions of the world; for while there are many and significant variations of detail the main features of hell as conceived by Hindu, Persian, Egyptian, Grecian, Hebrew and Christian theologians are essentially the same. Several ideas enter into the creation of this place which has always loomed large in the Christian as well as other religions. One of the ideas or motives which led to the division of the future state into heaven and hell, a place of reward and a place of punishment, is hinted at in a few Old Testament passages. All the dead, without distinction, so it was believed, went down into Sheol. But according to Isaiah xiv the king of Babylon who had exiled and oppressed Israel, and is therefore accounted an enemy of Jehovah and his people shall "be brought down . . . to the uttermost parts of Sheol." He was to be thrust into the deeper depths where presumably there was greater discomfort. Jehovah would send his enemies into a place much worse than those who served him. This idea wrought mightily in the lives of these people as it did in the lives of many later generations. These exiled and persecuted worshippers of Jehovah gathered consolation and a new endurance as they saw in the after life their enemies cast down into the bottom-most parts of Sheol while they would be in the upper and brighter and happier part. Other ideas and impulses entered into this. Instinctively almost a person feels that the ordering of life is such that a man shall reap what he sows—if he sows wickedness he shall reap all that is bad and hurtful. If he reaps not the painful consequences before he dies he will and must in the hereafter. And so there is a diversity of thought as to the purpose of hell in the "divine economy." Some have thought of it as the place created by the Deity where He punishes with inconceivable severity, and through all eternity the souls of those who through unbelief or by the worship of false or different gods had angered Him. It is the place of divine revenge, untempered, never ending. This has been the idea most generally held among Christians, Catholic and Protestant alike. It is the idea embodied in the Mohammedan's conception. Slightly different from this is the conception of hell as the place where God punishes the soul of man not for unbelief, or failure to believe, or for believing in a wrong or different religion, but for some breach of the moral law. It was only natural that the religious leaders should seek to turn the unbeliever and the misbeliever from the error of his way and the evil-doer from his evil-doing

by graphically picturing to them the terrible doom awaiting all who persist in following along wrong paths. The preaching of future punishment has given to the world a remarkable and extensive literature and has exerted a tremendous influence upon the life and thought of the people for many centuries.

From the first there has been a wide difference of opinion as to the extent and object of the punishment inflicted. Some have argued, basing their arguments on a certain understanding of a few Scriptural passages, and on certain theological theories, that the punishment of hell cannot be less than eternal in its duration. The satisfaction of Deity is the only legitimate object of this future punishment. An infinite being could not be satisfied with less. This, whatever the actual sense of the word Sheol as used by the biblical writers, does not appear to have been the view entertained by the early Christian churchmen—Clement, Origen and others. Although there have always been with the Church men of note who have taken issue with it, the *eternity* of hell's torments has been generally held and most ardently preached. But, at the present time the idea of punishing a soul eternally finds a decreasing number of believers. During the latter half of the 19th century the civil courts in England decided that a clergyman of the Established Church of England was under no sort of obligation to believe or teach the doctrine of eternal punishment. The Presbyterian Church during the early years of the present century was much disturbed by a great demand from its own people that the doctrine of the damnation of non-elect infants be eliminated from its confession and the demand was successful. All this is not a denial of future punishment but simply a disbelief in the eternal duration of that punishment. Naturally enough the men who protested against this punishment being eternal should argue that punishment in hell should be proportioned to the offense and that the object sought should be the redemption or reformation of the sinful soul. This idea stands out prominent in the Persian conception of hell, and the institution of purgatory seems clearly to be an attempt to modify the terrible severity of eternal punishment and square it somewhat with the sentiments of the human heart by providing a future punishment that should purge the soul of its remaining unfitness to enter heaven. Others press the point a little farther and argue that all future punishment must be of a reformatory purpose. Hell thus becomes what might be called the final process in the divine plan of salvation. Still others there are who insist that eternal punishment is impossible. The souls that are purged in hell pass up to a higher sphere, those so confirmed in their wickedness that they grow worse there sink to lower levels until they virtually cease to be. This idea still has its advocates. Volumes have been written on the nature of the punishment inflicted. When it was generally believed that the earth was flat, fixed and at the centre of things, it was simple and inevitable to think of souls being tormented with the most frightful of physical tortures. With the definite establishing of modern astronomy "up to heaven" and "down to hell" became mere figures of speech, and the old idea of hell's torments necessarily underwent a corresponding change. The present understand-

ing of the structure of the universe has enforced upon man a complete spiritual conception of things and so the idea now most generally held is that future punishment is essentially the remorse and misery within the soul. In the words of Milton:

"Which way I fly is hell; myself am hell."

**HELL GATE**, a narrow part of the East River between Long Island and Manhattan and on the east and west sides of Ward's Island. The passage between Ward's and Randall's Island is called Little Hell Gate. It was called Helle Gat by the Dutch settlers of New York. The rocks which were in Hell Gate were of such form and so situated as to make navigation dangerous, and the difference in the times and heights of the two tides which enter East River increased the dangers. The East River receives at one extremity the Sound tide and at the other the tide from off Sandy Hook. "One sailing vessel out of every fifty" was the proportion damaged seriously when trying to pass through the channel between the reefs. Much had been said and written about the necessity of doing something to remove or at least lessen the dangers of Hell Gate, and officials of the United States navy, Lieutenants Davis and Porter, made a survey of Hell Gate in 1848. They reported the necessity of making the channel safe, and suggested the destruction of some of the most dangerous rocks, but nothing was done until the year 1851, when the work of destroying the rocks was begun. The process used was that of surface-blasting introduced by Maillfert. A portion of some of the rocks was removed, but this method of overcoming the dangers to navigation was found practically useless. In 1866 another survey was made by Brevet-Maj.-Gen. John Newton of the United States Engineer Corps, and in 1867 he submitted his report, in which he advised the removal of the reefs—the work to be done by blasting, and the drilling of the surface to be made from a fixed platform. Soon after the work of making Hell Gate safely navigable was resumed and placed in charge of John Newton. For the work Newton invented a steam-drilling cupola scow, which served as a transport and a working platform from which the drilling-engines were operated. The new machine proved satisfactory. A new system of explosion had to be devised in order to protect Ward's and Randall's islands and Astoria. Diamond, Coenties, and Ways reefs were removed, also Pilgrim Rock, before operations were begun on Hallett's Point Reef. The last mentioned was an obstacle to both large and small vessels. The excavations, begun in October 1869, were completed in June 1875. The drilling was completed 25 March 1876. The area operated upon was about three acres. The method of explosion was most successful. No damage was done to the windows or buildings near; it had no perceptible effect on the air, but little on the water, and the underground shock was slight, but was perceptible on Manhattan and the western part of Long Island. The removal of Flood Rock, which was in the middle of Hell Gate, made the navigable capacity of the channel more than double. The work of removing this most formidable obstruction was begun 7 June 1875. Lack of funds caused delay, and the explosion did not take place until 10 Oct.

1885. For the removal of Flood Rock about nine acres were tunneled and drilled; and the aggregate length of the tunnels was 21,670 feet, and of the drill holes, 113,102 feet. The object sought to be gained by removing the rocks and reefs was to make a channel of the uniform depth of 26 feet and of sufficient width for the largest steamers. Dredging which has since been in progress together with the rock removal by blasting now provide a channel 200 feet in width at the narrowest point and with a depth of 26 feet through Hell Gate. A railroad bridge, with a steel span of 977.5 feet supported on concrete bents was constructed across the East River at Hell Gate in 1914-15.

**HELLAS**, hē'l'as, the abode of the Hellenes, was first a town, and afterward, under the name of Phthiotis, a district in Thessaly. The ancients applied this name to the whole of Thessaly. With the spread of the Hellenic people the term embraced a gradually increasing territory, till it came to denote the whole of Middle Greece, and then the whole of Greece, with its islands and colonies. The Hellenes received this name in the belief that they were descended from Hellena, a mythical personage, a son of Deucalion and Pyrrha, or, according to others, of Zeus and Dorippe, and the father of Æolus, Dorus and Xuthus, was said to have been king of Phthia. See GREECE.

**HELLBENDER**, a large salamander (*Cryptobranchus alleghamiensis*) found chiefly in the streams emptying into the Great Lakes and those draining the western slope of the Appalachian Mountains. The hellbender is an ugly looking but perfectly harmless creature from 18 to 24 inches long; with the head and body much flattened and a prominent wrinkled fold of skin along the sides. Although entirely aquatic, no gills are present in the adult, and only a single pair of small pores represents the gill-clefts; the lungs are simple sacs. The limbs are functional, the anterior with four, the posterior with five digits, and the tail is provided with a wide fin. A wide mouth with teeth in both jaws, very small eyes and a slimy skin of a deep mottled brown color are further external characteristics. The giant salamander (*Megalobatrachus maximus*) of Japan is the only known closely related form. The hellbender is a sluggish animal, active chiefly at night, when its voracity causes great annoyance to fishermen whose bait and fish it devours. It is extremely tenacious of life and hibernates during cold weather. Although very common, its breeding habits are yet unknown.

**HELLEBORE**, a genus (*Helleborus*) of the crowfoot family (*Ranunculaceæ*), consisting of perennial erect herbs with scanty, palmately divided leathery leaves and yellowish, greenish or white terminal flowers. They are of interest on account of their poisonous and medical properties. About 10 species are natives of Europe and Asia, one of which (*H. viridis*) has become naturalized in the eastern United States. The Christmas rose (*H. niger*) is the source of the black hellebore of modern pharmacopœias, but the ancient black hellebore, a famous remedy for insanity, was probably obtained from other species. *H. viridis* and *H. fatidus* have emetic and purgative properties. These plants are closely allied to the acornites.

**WHITE HELLEBORE** is a very different plant, a species (*V. album*) of the genus *Veratrum* of the family *Melanthaceæ*, which contains various other poisonous plants. They are profusely leaved, tall herbs growing in rich woods, and their roots contain the peculiar alkaloids veratroidin and jervin, to which their poisonous properties are mainly due. Eastern North America has a widespread species in the Indian poke (*V. viride*), which, like the European species, enters into the pharmacopœia, while its rootstocks are ground into the powder used as an insecticide. Several other species are natives of the western United States.

**HELLENES**, hĕl'ĕnz, a native name for the ancient Greeks.

**HELLENICS**. Walter Savage Landor's collection entitled 'Hellenics' consists of poems on Greek subjects, originally written, for the most part, in Latin. They were translated by Landor and published with additions in 1847. The pieces are properly idylls, in the sense used of the non-pastoral writings of Theocritus, and it is to these works of the Alexandrine school and to their Roman counterparts that Landor's poems bear the closest resemblance. Their classicism is invariably softened by a touch of sentiment and romance.

Some of the 'Hellenics' are brief narratives or epyllia dealing with mythological or semi-mythological incidents; others are little dramatic scenes, portraying, for example, an encounter between Menelaus and Helen at the sack of Troy. Among the tales the loveliest is 'The Hamadryad,' which tells of the unhappy love between a forest nymph and the mortal Rhaicos. But it is in the briefer pieces, such as 'Iphigenia and Agamemnon,' which recounts the sacrifice of Agamemnon's daughter to Diana, and 'Artemidora,' a classical death-bed scene, that Landor is supreme. The statuesque quality of these little poems places them among the highest examples of purely classic art in English. The charge of coldness often made against Landor does not apply here; for beneath the atmosphere of calm beauty there is a deep emotion made more poignant by the poet's conscious reticence. Brevity, purity of style and perfection of external form were Landor's ideals. There is little in his poems to catch the popular ear—no striking phrases, for example, or highly-colored pictures; but for lovers of the classics and to readers of taste and judgment they will always have a strong appeal. Consult 'Works,' edited by C. G. Crump, 1891-93; essays by De-Quincey, Saintsbury, DeVere; see bibliography in Cambridge, 'History of English Literature' (Vol. XII).

JAMES H. HANFORD.

**HELLENISTS**, a name given the Jewish colonists who settled in Egypt after the destruction of the kingdom of Judah, about 600 B.C. Their number was increased by the many colonies of Jews planted by Alexander the Great (336 B.C.), and later by Ptolemy Lagus. Under the reign of the Emperor Augustus they numbered to nearly 1,000,000. They laid the foundation of a new epoch of Græco-Jewish literature, which, from its prevailing character, received the name of the Hellenistic. The Alexandrian Jews were the most influential in

developing Hellenizing tendencies, and to them chiefly is to be referred the formation of the peculiar dialect termed the Hellenistic. In their literature the systems of Pythagoras and Plato were strangely combined with those Oriental fantasies which had been reduced to a system in Egypt, and with which the mystical doctrines of the Gnostics were imbued. The most noted Jewish Hellenistic philosopher was Philo of Alexandria, and the chief of the learned labors of the Alexandrian Jews was the Greek translation of the Old Testament.

**HELLESPONT**, hĕl'ĕs-pŏnt. See **DARDANELLES**.

**HELLGRAMMITE**, hĕl'gra-mīt, the large black aquatic larva of the insect *Corydalus* (q.v.), much used as bait for black bass and other game fish. It lives in streams, preying upon smaller animals, and just before pupation crawls under large stones, where it can be found at about the same time as the bass are biting. It is also called "Dobson" after a maker of artificial baits. See **DOBSON**.

**HELM**, Israel, Swedish colonist in America: b. 1615; d. 1695. He settled on the Delaware River, in 1649; was collector of customs at Philadelphia 1659, and became a member of Captain Carr's council 1668. He was chief interpreter between the colonists and Indians, and rendered valuable service at the meeting of the New Jersey Indians, Governor Andros and the Swedish authorities, in 1675.

**HELMET-SHELL**, a large gasteropod of the genus *Cassis*, family *Cassidae*. Most of the species inhabit tropical shores, but a few are found on the coast of the Mediterranean. The shells of *C. rufa*, *C. cornuta* and *C. tuberosa* (the queen conch), are the material on which shell cameos are usually sculptured.

**HELMETS AND HELMS**. Armor for protection of the head. Often the term casque, the French equivalent, is used synonymously for helmet. The fully developed helmet consists of a skull-piece called "timbre" or "bowl" (a domed piece of metal beaten into a shape closely fitting the back and top of the head); the "crest" (a projection extending from the forehead to the nape of the neck, similar to a cock's comb); a "visor" (protecting the forehead and eyes) containing a slit or cleft, called the "ocularium," in front to allow vision; a "ventail," below the visor, protected the features and had, usually, perforations to admit air; a chin-piece, called "bevor" or "mentonnière"; and, lastly, the neckguard, called either "colletin," "gorget" or "gorgerin." In the rear was often a tube or other device for holding the knightly plumes.

Helmets date back, at least, to the ancient Egyptians and Assyrians, when they were made of strong fabric or leather, then metal. The oldest metal helmets extant are Assyrian (8th century B.C.). Homer's heroes wore elaborate bronze helmets with flowing horsehair bushes, chin-straps and plates protecting the neck, ears and cheeks; later the Greeks adopted an immovable visor with ocularium. These helmets had crests of great height and fantastic forms. The ancient Roman helmets, originally of leather (*cuo*), were soon replaced by bronze (*cassis*) during the republic. The "galea" (Minerva's classic helmet), first of leather,

## HELMETS

- 1 Tilting Casque. German (16th Century)
- 2 Tilting Helmet. French (16th Century)
- 3 Italian Helmet (1510)
- 4 Italian Armet à Rondelle (1475-1500)
- 5 Cabasset. Italian (1550)
- 6 Burganet. Italian (1525)

- 7 Burganet. French (1550)
- 8 Salade-Barbute. Italian (15th Century)
- 9 "Pig-face" Basinet. German (1400)
- 10 Morion-Cabasset. Italian (1555-56)
- 11 Morion. German (1556)
- 12 Morion. Dutch (late 16th Century)

was later made of bronze and encompassed the entire head, cheeks as well, leaving orbicular eye openings and a nasal projection in the centre of the opening. From about 600 A.D. to about 1000 A.D. the "Spangenhelm," a conical or "sugar-loaf" headpiece was in vogue. It was made of leather and reinforced with triangular plates rivetted at the lower extremity to a metal ring, the apex of each piece meeting at top in a button. The Norman helmet in William the Conqueror's time (1066) was of conical shape and had a nasal projection. Cheek pieces and neck defenses were next added to the nasal helmet. A cylindrical, or "barrel" shaped, flat-topped "great helm" or "heaume" (heavy headpiece) came into use in the 12th century, quickly followed by the "round topped" near the close of the century. The great helm was worn over the "coif-de-mailles" (see CHAIN ARMOR), and was followed by the "sugar loaf" helm with conical form and with "camail" attached. The cup-shaped "cervellière" or "basinet" was worn under the helm or by itself; and the "wide-brimmed" iron hat (*Eisenhut*) was worn from now on all through the period of metal armor, in spasmodic intervals. (This is the helmet worn in this century's World War as defense against shrapnel). The sugar-loaf helmet next took on a "beaked" movable visor pivoted at the sides, after the middle of the 14th century. Middle of the 15th century arrives the "salade" with its rear extension protecting the neck. Growing longer in front, with a horizontal "clef" for sight, a movable visor is next attached before the end of the century. Another variety was known as the "Venetian" *salade*; its low neck part was extended round the sides, protecting the ears and cheeks. They were termed "barbutes" as they developed, by the end of the century, into the ancient *galea* form with oval eye apertures and nasal piece. In the 15th century the great jousting helm was in use; it was very heavy and large, with somewhat flat crown, and was fastened to the body armor by screws. To this century belong the wide-brimmed hat-shaped "chapeaux-de-fer." Also in this century developed the greatly admired, perfect head-piece—the "armet." Earliest of these is the "armet à rondelle"; it consists of the "calotte" (skull-piece), or "timbre," which is shaped to the head and prolonged to the nape of the neck; a "visor" protecting the face is movable on side pivots; the "bevor," covering the chin; the "gorgerin" composed of several plates of steel binding the armet to the corselet (see PLATE ARMOR); a "rondelle" or disc, mounted in the nape of the neck, like a mushroom, to the shaft of which was attached a scarf called "voilet" (hinged plate). Later armets ("close helmets") avoided the defect of the open contact of the neck-plate (*gorgerin*) with the body armor by giving the lower edge of the *gorgerin* a half-round (*bead*) projection which overlapped and fitted in a shallow rim in the upper edge of the body armor, thus closing up the joint and allowing the casque to rotate on the corselet. Crests soon appeared in this very light, closely fitting helmet—the armet. The armet was in use through the reign of Henri IV and even under Louis XIII (17th century). Later improvements in the armet were fluting the "timbre"

to strengthen it and thereby allowing reduction in thickness and weight. Next, the visor has two parts (upper and lower) both working on the same pivot; crests come next together with betterment of the *gorgerin*. Out of the armet arose another casque form termed "burgonet" (spelled also *burganet*, *burgonette*, etc.); an "umbril," or "umbrere," was added fixedly to the visor to protect the eyes. It was shaped and acted just like the modern peak of a cap. In some of the early burgonets was an easily detachable chin protection called "bufte," instead of the umbril. A lighter form of burgonet has flaps at the sides to protect the ears, and is free from either visor, umbril or bufte; but the lower part projects rear and front to protect face and neck; ear plates are at the sides. Another development was the extension of the neck protection by overlapping plates; this is the "lobster-tail" burgonet of Cromwell's Ironsides. In the last evolution of the burgonet the laminar neck-piece is raised to nearly horizontal, or is displaced by a horizontal plate; a nasal rod is, on some and can be raised or lowered at will. The lobster-tail and later burgonets belong to the 17th century. A 16th century casque was the "morion" of Hispano-Moresque origin, with grotesque high crest ridge and uptilted peaks front and rear; these developed into the "cabasset," becoming more and more pot-shaped. The morion and cabassets were head defenses of the pikemen, and in the 17th century became the "pikeman's pot" and "iron hat" or "kettle hat." Armor decadence, with advance in fire-arms efficiency, brought about the last remnants of head defenses in the form of metallic "hatlinings" (first solid plate, then perforated, lastly a wattle of metal strips), and the so-called "spider-helmet," in which the strips continue below the cap with spider-like appearance and so jointed as to be conveniently folded together into the smallest space.

CLEMENT W. COUMBE.

**HELMHOLTZ**, hēlm'hōlts, Hermann Ludwig Ferdinand von, German scientist: b. Potsdam, 31 Aug. 1821; d. Charlottenburg, 8 Sept. 1894. He studied medicine in Berlin, and received the appointment of assistant surgeon in the Charité Hospital there in 1842. Next year he went to Potsdam as a military surgeon, but in 1848 he returned to Berlin to assume the duties of teacher of anatomy at the Academy of Art and assistant in the Anatomical Museum. He was called to the chair of physiology at Königsberg in 1849, and six years later went to Bonn as professor of anatomy and physiology. In 1858 he was appointed professor of

physiology at Heidelberg, whence he returned in 1871 to Berlin as professor of physics. In 1888 he was appointed to the post of president of the new Physikalisch-Technische Reichsanstalt (Imperial Physico-Technical Institute) in Charlottenburg. Helmholtz was distinguished alike in physical science, in mathematics and in physiology; but his most valuable and most original work was done in those departments of physics which stand in intimate relations with physiology, especially acoustics and optics. In 1851 he invented the ophthalmoscope, a most useful device and now in universal use. He developed the electromagnetic theory of light and indicated its possibilities. He invented new apparatus in practical physics. He had an eminently philosophical mind, and his works are no less valuable for their masterly exposition of the methods of experimental science than for the important results contained in them. His scientific fame was securely established as early as 1847, when he published 'Über die Erhaltung der Kraft' (On the Conservation of Energy). This subject was pursued further in 'Über die Wechselwirkungen der Naturkräfte' (On the Interactions of Natural Forces) (1854). His greatest works are the 'Handbuch der Physiologischen Optik' (Handbook of Physiological Optics) (1856-66); and 'Die Lehre von den Tonempfindungen' (1862; 5th ed., 1896), translated into English by Ellis under the title 'Sensations of Tone as a Physiological Basis for the Theory of Music' (1875). A collection of 'Vorträge und Reden' reached a fourth edition in 1896, and has been translated into English as 'Popular Lectures on Scientific Subjects' (1873-81). An edition of his scientific treatises was published at Leipzig in three volumes (1882-95), and in 1897 his 'Lectures on Theoretical Physics' appeared in one volume. In his 'Beschreibung eines Augenspiegels' (1851) he described the ophthalmoscope he had recently invented. In 1883 he was ennobled by the German emperor. He visited the United States in 1893, when he was selected an honorary president of the International Congress of Electricians at the Columbian Exposition, Chicago. He contributed papers to the principal scientific Journals of the world. Consult Hall, G. S., 'Founders of Modern Psychology' (New York 1912); Königsberger, 'Hermann von Helmholtz' (Leipzig 1902; Eng. trans., Oxford 1906); McKendrick, 'H. L. F. von Helmholtz' (London 1899); Rücker, A. W. 'Hermann von Helmholtz' in *Fortnightly Review* (November 1894); and reprinted in the *Smithsonian Report* of the same year.

**HELMONT, Jan Baptista van**, Flemish physician and chemist: b. Brussels, 1577; d. near Brussels, 30 Dec. 1644. He devoted his attention to scientific research, and although he put forth some visionary theories on the constitution of man, and on diseases, made some genuine discoveries in chemistry. He was probably the first to introduce the term "gas" into science, and was the earliest observer of the acid reaction of the gastric juice. He published 'Ortus Medicinæ' (1648); and 'Opuscula Medica Inaudita' (1644), works which still possess interest for students.

**HELMUTH, William Tod**, American physician: b. Philadelphia, 30 Oct. 1833; d. New

York, 15 May 1902; graduated Homeopathic Medical College, Philadelphia, 1853; Hahnemann College, San Francisco, 1866. In 1877 he became professor of surgery and dean of the New York Homeopathic College and Hospital. He was an officer in numerous medical associations and a member of the Société Médicale Homeopathique of France. Among his published works are 'Treatise on Diphtheria'; 'Medical Pomposity'; 'System of Surgery'; 'Scratches of a Surgeon'; 'Suprapubic Lithotomy'; and some volumes of poetry.

**HELODERMA**, hē-lō-dēr'ma. See GILA MONSTER.

**HELOÏSE**, ā-lō-ēz, or **ELOISE**. See ABELARD.

**HELOTS**, hē-lōts, were the lowest of the four classes into which the population of ancient Sparta was divided. They are generally supposed to have been the aboriginal population of the country, and to have been reduced to bondage by their Dorian conquerors, their numbers being swelled from time to time by the addition of peoples conquered in war. The name is generally derived from the town of Helos, the inhabitants of which were carried off and reduced to slavery by the Heraclidæ about 1000 B.C., though a more probable derivation is the Greek *helein*, to take, making the name signify captives. They were the property of the state, which alone had the disposal of their life and freedom. The state assigned them to certain citizens, by whom they were employed in private labors, though not exclusively, as the state still exacted certain services from them; and they were attached to the soil—that is, each citizen received the number that belonged to his allotment, without any power to sell or free them. Agriculture and all mechanical arts at Sparta were in the hands of the Helots, since the laws of Lycurgus prohibited the Spartans from all lucrative occupations. But the Helots were also obliged to bear arms for the state, in case of necessity. Their dress, by which they were contemptuously distinguished from the free Spartans, consisted of sheep's skin and a leather cap of a peculiar shape. They were sometimes liberated for their services or for a sum of money; but they were not admitted to the full dignity of citizenship. In 424 B.C. 2,000 of the Helots, who had conducted themselves with distinguished bravery in war, were treacherously put to death. They several times rose against their masters, but were always and finally reduced.

**HELPER, Hinton Rowen**, American author: b. near Mocksville, N. C., 27 Dec. 1829; d. Washington, D. C., 9 March 1909. He published in 1857 'The Impending Crisis of the South,' which the Republican party used as a campaign document with great effect against the continuance of slavery. Later works by him are 'The Three Americas' Railway' (1881); 'Nojoque' (1867); 'The Negroes in Negroland' (1868); 'The Land of Gold' (1865).

**HELPS, Sir Arthur**, English essayist and historian: b. Streatham, 10 July 1813; d. London, 7 March 1875. He was educated at Eton and Cambridge; became private secretary to Lord Montague as Chancellor of the Exchequer, and

**HERMANN LUDWIG FERDINAND VON HELMHOLTZ**

was afterward commissioner of French, Danish and Spanish claims. In 1860 he was appointed clerk of the privy council, and held this post till his death. He was created K.C.B. in 1872. As an essayist he was one of the most popular writers of his day, and his historical works had an extended reputation. He possessed very wide and general culture and sound judgment, was painstaking and accurate in details, and in his historical works displayed considerable breadth of view. His principal works are 'Thoughts in the Cloister and the Crowd' (1835); 'Essays Written in the Intervals of Business' (1841); 'Friends in Council' (1847-57); 'Conquerors of the New World' (1848-52); 'Companions of My Solitude' (1851); 'Spanish Conquest of America' (1855-61); 'Oulita the Serf, a Tragedy' (1858); 'Realmah' (1869); 'Casimir Maremma' (1870); 'Brevia, Short Essays and Aphorisms' (1870); 'Life of Hernando Cortes and Conquest of Mexico'; 'Thoughts upon Government' (1871); 'Social Pressure' (1874).

**HELSINGFORS**, *hēl'sing-fōrs*, Russia, seaport town, capital of Finland, on a small peninsula in the Gulf of Finland, 180 miles by rail west-northwest of Petrograd. It is defended by the fortress of Sveaborg about three miles distant, and is the residence of the governor of Finland, the seat of important courts and public offices. The most noteworthy buildings are the governor's residence, senate house, university buildings, the Russian church, the church of Saint Nicholas (Lutheran), the Athenæum and two modern theatres. Its university, removed from Abo in 1827, has a library of over 190,000 volumes. There are four faculties and about 2,500 students; maintains a hospital, zoological and botanical museums, botanic gardens and an observatory. The town is a popular bathing place, has very many newspapers, of which 40 are in Finnish and about 30 in Swedish. There are manufactories of linen, sail-cloth, tobacco, beer, sugar, liquors, linen, carpets, etc., and an important trade is carried on in agricultural and dairy products with English, German, Russian and Swedish ports. It is the seat of a United States consul. It was founded in 1550 by Gustavus I of Sweden on a site further inland, removed to its present site in 1640 and was destroyed by the Russians in 1713. It was fortified in 1729 and came into the possession of Russia in 1809. It was bombarded by the allied fleet for 48 hours during the Crimean War. Consult Brummer, 'Historiska anteckningar om Helsingfors och Sveaborg' (Helsingfors 1874); Ehrström, 'Helsingfors stads historia från 1640 till Stora Ofrenden' (ib. 1890); id., 'Finland in secler' (ib. 1893); Hertzberg, 'Helsingfors för tre hundra år sedan och i våra dagar' (ib. 1888); Nordham, P., 'Bidrag till Helsingfors stads historia' (ib. 1905-08); and 'Finlandias vyserie' (Vol. I, ib. 1906).

**HELVETIAN REPUBLIC**, the designation of the republic established in Switzerland by France in 1798. See SWITZERLAND.

**HELVETIC CONFESSION**, the name of a document drawn up by Martin Bucer in 1536 to settle the controversy between the Lutherans and the Zwinglians; and also of one drawn up by Bullinger (1566) at the request of Friedrich

III, Elector of the Palatinate, and adopted in Switzerland, the Palatinate, France, Hungary, Poland and Scotland.

**HELVETII**, *hēl-ve'shī-ī*, a former Gallic or Celtic nation, settled between the Rhone and the Rhine, the Jura and the Rætian Alps. They were more numerous and warlike than the neighboring Gallic tribes. They first appear in history 107 B.C., but were not known to the Romans until the time of Julius Cæsar, who, as governor of Gaul, prevented their intended emigration, and after many bloody battles, in which even the Helvetian women fought, pressed them back within their frontiers. The story of their meditated irruption into and seizure of southern Gaul is circumstantially related in the First Book of the Commentaries of the Roman general, who not only repulsed them with terrible slaughter, but almost exterminated them. Not a third of those who left their homes on this ill-fated expedition ever returned. Helvetia, which was less extensive than the present Switzerland, was divided into four districts, which had an entirely democratical constitution. Cæsar subjected the country to the dominion of the Romans, who established several colonies there. After the death of Nero, the Helvetii, for refusing to acknowledge Vitellius as emperor, were mercilessly punished by Cæcina, one of his generals, and thenceforth they almost disappear as a people.

**HELVETIUS**, *ēl-vā-sē-ūs*, Claude Adrien, French metaphysician: b. Paris, January 1715; d. there, 26 Dec. 1771. At the age of 23 he obtained a lucrative post of farmer-general, where he was distinguished by his mildness and indulgence from his colleagues, whose base practices filled him with indignation. He therefore resigned his office, and purchased the place of *maitre d'hôtel* to the queen. Aspiring after literary fame, he first directed his efforts to mathematics, then attempted to rival the dramatic fame of Voltaire by writing a tragedy. In 1758 he published 'De l'esprit,' the materialism of which drew upon him many attacks. It was condemned by the doctors of the Sorbonne, and publicly burned in accordance with a decree of the Parliament of Paris. Helvétius went in 1764 to England, and the year afterward to Germany, where Frederick the Great and other German princes received him with many proofs of esteem. A complete edition of his writings was published at Paris in 1795. Consult Morley, 'Diderot and the Encyclopedists' (1878).

**HEMANS**, Felicia Dorothea Browne, English poet: b. Liverpool, 25 Sept. 1793; d. near Dublin, Ireland, 16 May 1835. She displayed the bent of her genius when a mere child, and wrote some tolerable poetry in her ninth year. She first appeared as an author, in 1808, in a volume entitled 'Early Blossoms,' but it was subjected to harsh criticism, which she took very seriously to heart. A second volume, published in 1812, 'The Domestic Affections,' was much more successful. The same year she married Captain Hemans, from whom she was separated in 1818. She then resumed her literary pursuits, made herself acquainted with Latin and modern languages and wrote much in the periodicals of the time. At the suggestion of Reginald Heber, afterward bishop

of Calcutta, she wrote a tragedy entitled 'The Vespers of Palermo,' which, owing partly to Sir Walter Scott, who wrote an epilogue for it, was favorably received at the Edinburgh theatre, though it had previously, in 1823, proved unsuccessful at Covent Garden. Before this time she had added greatly to her popularity by her poems entitled 'The Restoration of the Works of Art to Italy'; 'The Sceptic'; 'Modern Greece'; and 'Dartmoor.' Later works were 'Lays of Many Lands'; 'Forest Sanctuary'; 'Records of Woman'; and 'The Songs of the Affections' (1830). She visited Sir Walter Scott at Abbotsford, and Wordsworth at Rydal Mount, and left with each the impression of a singularly graceful and gifted woman. Her poetry is essentially lyrical and descriptive, and is always sweet, natural and pleasing. In her earlier pieces she was imitative, but she ultimately asserted her independence, and produced many short poems of great beauty and pathos. Mrs. Hemans had no dramatic power, her effusions being always intensely subjective. A memoir was published in 1836.

**HEMATIN, or HÆMATIN.** See **HÆMOGLOBIN.**

**HEMATITE**, native sesquioxide of iron,  $Fe_2O_3$ , a mineral widely distributed, and constituting a valuable ore of iron. It crystallizes in the rhombohedral system, and also occurs in massive form, sometimes forming beds of great thickness. It has a hardness of from 5.5 to 6.5, and a specific gravity ranging from 4.9 to 5.3. It is usually dark gray or black in color, the earthy varieties being red. It has a metallic lustre, and is sometimes slightly magnetic, occasionally even showing magnetic polarity. Hematite occurs in the rocks of every age. The extensive masses that occur in metamorphic rocks are believed to have been deposited, originally, in marshes, undergoing metamorphosis at the same time as the rocks with which they are now associated. By many it is believed that the great beds in the Lake Superior region were laid down in the sea as iron carbonate or silicate, and later weathered to hematite, after the region became land. Fibrous and columnar forms of the mineral, brownish-red or black in color, are also known, and to these the name "red hematite" is sometimes applied. In crystalline and metamorphic rocks a variety known as "specular iron" is met with, which is distinguished by the presence of crystals having a splendid lustre. Hematite occurs in vast quantities in various parts of the United States, notably in upper Michigan, in the Marquette district, and in the Menominee and Gogebic ranges, in northern Wisconsin; and in Saint Louis County, Minn., in the famous Mesapi Range. Iron Mountain, Missouri, is a hill about 200 feet high, the surface of which consists of loose blocks of hematite, many of which weigh as much as 10 or 20 tons. In 1914, hematite yielded 91 per cent of the iron ore produced in the United States. The name "hematite" is from a Greek word signifying "blood," and was given to the mineral by the ancients from its fancied resemblance to coagulated blood. Hematite is sometimes called "bloodstone" at the present time, though that name is more properly applied to a green variety of quartz, which contains small spots of red jasper.

An allied mineral, consisting of hydrated sesquioxide of iron and known to mineralogists as limonite, is often popularly called "brown hematite." See **IRON ORES.**

**HEMATURIA**, hēm-ā-tū'ri-ā, the presence of blood in the urine, which points to disease of the kidney or bladder. It is a symptom of some gravity. The treatment of the cause will probably remove this affection; in all cases complete rest is very important. See **TREMATODA.**

**HEMIANÆSTHESIA**, hēm-i-ān-ēs-thē'si-i, loss of sensation on one half of the body, right or left.

**HEMIPLEGIA**, hēm-i-plē'ji-ā (lit. "half a stroke," that is, of paralysis), paralysis of one side of the body. It is usually caused by hæmorrhage in the brain cavity, commonly known as apoplexy; often a local accumulation of serum, or a tumor is the cause. The paralysis falls on the side of the body opposite to the lesion in the pyramids of the brain, unless the lesion occurs below the decussation of brain fibres. The treatment of hemiplegia requires the services of a physician. It is amenable to timely remedies, and a cure is generally obtained after the first attack, if it result from apoplexy; but the patient is liable to subsequent attacks.

**HEMIPODE.** See **BUTTON-QUAIL.**

**HEMIPTERA**, hē-mīp'tē-rā, an order of insects. It contains two leading groups, the *Homoptera* and *Heteroptera*. In the former the two pairs of wings when present are applied in rest pent-house fashion to the sides of the body. Several families are wingless. Cicadas, plant-lice (*Aphis*) and the like come here. In the second group the wings, when at rest, placed horizontally across the body, the second pair covered by the upper, which are *hemelytra*, that is, the basal half is leathery, the distal portion membranous. See **BUG.**

**HEMLOCK POISON**, one of various plants. (1) A highly poisonous umbelliferous herb of the genus *Conium*, one species of which is European and the other African. The well-known officinal European one (*C. maculatum*) has become extensively naturalized as a weed in the United States. It is easily recognized by the wavy, crenate ridges of its short, laterally compressed fruit, and also by the disagreeable mouse-like odor when bruised (see **CONIUM**). (2) The water hemlocks or cowbanes of the closely allied genus *Cicuta*, which is both European and American. The common American species is *C. maculata*, which grows in swamps and wet places, and is also dangerously poisonous, especially in its turnip-like cavernous root. See **CICUTA.**

**HEMLOCK**, coniferous trees of the genus *Tsuga* of which two species are recognized, the common northern one (*T. canadensis*), and a more local one of the southern Alleghanies (*T. caroliniana*). The wood is too soft, weak and brittle to be of extensive use as lumber, but the bark is of great importance in tanning. See **FIR.**

**HEMMETER**, John Cohnheim, American physician, physiologist and musical author: b. Baltimore, Md., 25 April 1863. He received his early education in the public schools of Baltimore, and was graduated at Baltimore City

College. Later he studied at the Royal Gymnasium, Wiesbaden, where he remained six years. Returning to Baltimore he took his degree of doctor of medicine at the University of Maryland, then entered the Johns Hopkins University, where the degree of doctor of philosophy was conferred on him in 1893. He holds the degree of doctor of science honoris causa from the University of Maryland and of doctor of laws from Saint John's College, Annapolis. Has been consultant to many hospitals in the city of Baltimore. Holds the position of professor of physiology and clinical professor of medicine and director of the physiologic laboratory of the University of Maryland. He is one of the editors of the *Archives for Digestive Diseases* published in Berlin; also associate editor of the *International Contributions to Diseases of Digestion and Metabolism*, edited by Prof. Adolf Bickel of Berlin. Dr. Hemmeter is the author of the first complete work in the English language on diseases of the stomach. His work, 'Diseases of the Intestines' (2 vols., 1901) is even up to the present time the only complete work on this subject in the English language. He has published 120 various researches and investigations in American and foreign medical and scientific journals. He is at present engaged in editing a 'History of Medicine,' a large part of which has already been published in the form of separate journal articles. Two medical advancements of the greatest importance for which Dr. Hemmeter is well known are his discovery that the X-rays could be used for studying abnormal conditions of the digestive tract (*Boston Medical and Surgical Journal*, June 1896), and that it was possible not only to investigate the stomach contents directly by the introduction of tubes, but also to pass tubes into the upper part of the small intestine, called the duodenum. This latter led to a method of treating gastric ulcers and other conditions of the stomach requiring absolute rest of the organ by introducing a duodenal tube through the stomach into the upper part of the intestine and injecting the food directly into the intestine, skipping the stomach, as it were. It was found that conditions defying all other treatment healed when the stomach was thus absolutely put to rest. Dr. Hemmeter is also a musical author and has published a cantata for male chorus and full orchestra, entitled 'Hygeia.' One of his most recent works is a 'Manual of Physiology' (1912). Being a physiologist as well as a musician, Dr. Hemmeter was singularly fitted to investigate the physiologic and anatomic foundations of piano technique and of vocal tone production. He studied the neuro-muscular co-ordinations necessary in piano technique; also the effect of music on blood pressure and the central conducting paths for tone sensations, the object being to place piano technique, as well as vocal tone production, on a physiologic basis. He is a Fellow of the American Association for the Advancement of Science; member of the Physiologic Society of Germany; one of the presidents at the last International Congress for Physiology held at Groningen, Holland, 1913; member of the Ger-

man Congress for Internal Medicine; member of the Imperial German Academy of Natural Sciences; Kaiserlin, Carolin, Leopoldin, Akademieder Naturforscherl; member of the Imperial Association of Austrian Physicians, Vienna; Fellow of the Royal Society of Arts, England, and member of the Accademie di Scienze, Italy.

**HEMOGLOBIN**, an organic coloring matter, which constitutes about nine-tenths of the weight of dried red blood corpuscles, and serves as a carrier of oxygen from the lungs to the general tissues of the body. It is an exceedingly complex substance, and its formula is not certainly known. It is a chromoprotein and has an interesting history. Iron is found throughout nature and early became incorporate within living matter as an energy transformer. In order to transform energy, oxygen chiefly and yet not by itself, oxidizes and is thus destroyed, a peculiar substance being formed which in plants seems to develop with the protoid of chlorophyll and in animals into what is called hemoglobin. In the lowest worms and mollusks this iron compound is known. In these low forms it is found as a part of the muscle substance itself. When the blood scheme arose in higher animals it then entered into that fluid as an oxygen carrier. The complex uses 40 which it is put lie regarded as more than a guess. According to many authorities, hemoglobin is not a definite chemical compound, but a more or less variable mixture of simple substances. It gives all the general reactions of the proteids, but, unlike most of the proteids, it may easily be obtained in crystalline form, its crystals commonly occurring in rhombic plates or prisms, varying somewhat in shape, according to the source from which the substance is prepared. The exceeding physiological importance of hemoglobin depends upon the fact that it readily combines with oxygen to form a very unstable compound known as oxyhemoglobin. The combination takes place as the blood corpuscles containing the hemoglobin pass through the lungs; and the loosely-combined oxygen is given off again as the corpuscles pass through the capillaries, the oxyhemoglobin being thereby again reduced to hemoglobin. Hemoglobin also combines with carbon monoxide to form a similar but far more stable substance known as carboxyhemoglobin. In poisoning by the inhalation of coal-gas the carbon monoxide present in the coal-gas combines with the hemoglobin in the lungs, and the carboxyhemoglobin so formed does not break up again. As the absorption of the coal-gas proceeds, a continually increasing quantity of hemoglobin is therefore destroyed, so far as its utility as an oxygen-carrier is concerned. In extreme cases of such poisoning, transfusion of blood is resorted to, in order that the patient may have a sufficient supply of hemoglobin to transport the requisite quantity of oxygen from the lungs to the other tissues of the body.

Crystals of hemoglobin have been prepared. Pure hemoglobin has a purplish color, which gradually passes into a scarlet or a yellowish red, as the substance absorbs oxygen and becomes thereby converted into oxyhemoglobin. Carboxyhemoglobin is even more brilliantly red

than oxyhemoglobin. All three of these substances exhibit marked absorption spectra when in solution, and very small quantities of them can be easily detected by the spectroscope. It is said that the presence of one part of hemoglobin in 10,000 parts of water can be distinctly demonstrated by this means.

When oxyhemoglobin is acted upon by acids or alkalis, or by the gastric juice, it is resolved into a proteid substance and a definite compound which has the probable formula  $C_{54}H_{70}N_8Fe_3O_{10}$  and is known as hematin. Hematin may be best prepared by extracting blood clot, directly, with hot alcohol to which a small quantity of sulphuric acid has been added. The extract is next agitated with chloroform, which takes up the hematin. The chloroform is then separated, washed with water to remove the acid, and allowed to evaporate, when the hematin is deposited in the form of a bluish-black powder. Hematin is a very stable compound, and may be heated to 350° F. without decomposition. At higher temperatures it burns with evolution of hydrocyanic acid, leaving an ash composed chiefly of oxide of iron. It is insoluble in water, ether, dilute acids and pure alcohol; but it dissolves readily in solutions of the caustic alkalis, and in alcohol to which a small quantity of sulphuric acid has been added. Consult Stirling, 'Physiology'; Bayliss, 'General Physiology'; Matthews, 'Physiological Chemistry.'

**HEMOPHILIA**, a congenital inherited disease characterized by a tendency to obstinate bleedings. Women are very rarely affected, but transmission of the disease seems to be from the father through the daughters to the grandsons, and from father to son. The disease usually makes itself evident in early life, a slight wound being followed by abundant and uncontrollable hemorrhage, whereby the child becomes known as a "bleeder." Besides the liability to excessive hemorrhage, these subjects are frequently afflicted with trouble in the joints, probably a chronic inflammation, the result of repeated small hemorrhages. Death is always imminent, as the flow of blood tends to continue and is particularly dangerous where large areas of the body are injured. The causes are not completely understood. In some bleeders a calcium deficit is found in the body. This is supposed to influence the nature of the blood-vessel wall permitting a transudation of blood. Various salts of calcium are therefore utilized.

**HEMOPTYSIS**, expelling blood from the lungs, larynx or bronchial tubes by coughing. It may be a symptom of phthisis, but bleeding from the lungs or trachea may result from a number of different disturbances. Profuse bleeding is apt to be phthisical.

**HEMORRHAGE.** See BLEEDING.

**HEMORRHOIDS** (Greek, *haima*, blood, and *rheo*, to flow), literally, a flow of blood. Until the time of Hippocrates this word was used, conformably to its etymology, as synonymous with hemorrhage. It was afterward used in a narrower sense, to indicate the flux of blood at the extremity of the rectum, and in some other cases which were considered analogous to it; thus it was applied to the flow of blood from the nostrils, the mouth, the bladder and the uterus. It is at present used to signify

a particular affection of the rectum, although the disease is not always attended with a flux; in this sense the affection is also called piles. Certain general causes may produce a predisposition to this disease; in some cases, it appears to be the effect of a hereditary disposition; in general, it manifests itself between the period of puberty and old age, although infants and aged people are not entirely exempt from its attacks. Men are oftener affected than women, in whom it is sometimes produced by local causes. It often shows itself in subjects who pass suddenly from an active to a sedentary life, or from leanness to corpulency. Any circumstance which produces a tendency to pressure on the venous return of blood in the pelvis is to be reckoned as a local cause. The accumulation of fecal matter in the intestines as in habitual constipation; efforts to expel urine; the pressure produced by polypi; the obstruction of any of the viscera, especially of the liver; worms; use of drastic purges, particularly of aloes; long continuance in a sitting posture; riding on horseback; pregnancy; the accumulation of water by ascites;—such are some of the ordinary causes of hemorrhoids.

Several varieties of hemorrhoids are distinguished. They are known as external when apparent at the anus; internal when concealed within the orifice; blind or open, regular or irregular, active or passive, periodical or anomalous, etc. There is also a great difference in the quantity of blood discharged; it is usually inconsiderable, but in some cases is so great as to threaten the life of the subject. The quality, color, etc., of the blood, also differ in different cases. The number, seat and form of the hemorrhoidal tumors likewise present a great variety of appearances. When the disease is purely local it is cured more readily; but in the greatest number of cases it is connected with some other affection, or with the constitution of the subject. In these cases, if the piles are not troublesome on account of their size or if the bleeding is not very considerable, cure of the primary affection should be attempted. The best mode of treatment is then to recur to hygienic rather than medicinal influences. The subject should avoid violent exercises, but moderate exercise will be found beneficial. The standing position is to be avoided as much as possible, especially following defecation. The constipation (q.v.) with which the subjects of this disease are liable to be affected should be remedied by hygienic dieting. If the pain is considerable, recourse should be had to sedatives and local application of hot water. If the disease appears under a more severe form, more violent remedies will become necessary. If the discharge of blood becomes excessive, particular care must be taken to regulate it. If the tumors acquire a considerable volume, surgical operations are necessary. At the present time the operative treatment of persistent hemorrhoids is both safe and efficacious.

**HEMP.** The hemp plant proper, or "common hemp," is *Cannabis sativa*, an annual plant belonging to the family *Urticaceæ*. The term hemp, however, is used to designate many other kinds of fibre which are in no way related to the common hemp, such as Manila hemp, from a plantain, sisal hemp from an agave, bow string hemp, from a liliaceous plant, and 30 or

more other kinds. The different kinds of common hems are also specially designated, with prefixes, as Breton hemp, Piedmontese, Russian, English, China and Japanese hems and many others, some of these being trade names, or the names of varieties. The hemp plant proper is a native of that part of Asia which includes China, India and Persia, though, like flax, its culture has been extended to many portions of the world in both temperate and tropical climes. It was used by the Scythians 2,500 years ago, and it was probably known to the Chinese and Europeans many centuries earlier. The Romans used it for sails and cordage, but not until after the dawn of the Christian era. It grows wild in many parts of China and India, where it is regarded as much for its drug product known as chang or hash-eesh as for its fibre. It flourishes on both the east and west coasts of Africa, and has been naturalized in Australia, as well as in several South American countries. In Europe it is cultivated chiefly in France, Italy, Germany and central and southern Russia, and it will grow in Great Britain and Sweden. The plains of Hungary are peculiarly adapted to its culture. It is a favorite textile in China and Japan, the fibre from the last-named country being particularly strong and fine, and at the same time better prepared than many European hems. The plant is an annual, the fibre being produced in the bark of the straight stiff stalks or stems, and is therefore a bast fibre. In the experiments of Roxburgh and others, Russian hemp is taken as the standard of comparison for all other fibres. The stems vary from 3 to 20 feet in height, dependent upon the variety and the soil in which grown. The best kinds have a hollow stem, the wood of which breaks down readily when cleaned for the fibre. While hemp is produced commercially in very few localities of the United States, it will thrive from ocean to ocean and from the Gulf to Canada. Its cultivation as a fibre crop is confined chiefly to Kentucky, Ohio, Indiana, Wisconsin and California, though considerable hemp, in past time, has been produced in New York, and to some extent in Tennessee, Illinois, Nebraska and Minnesota. Lately it has been experimented with in the South, notably in Mississippi and Texas. The bulk of the crop is grown at the present time in Kentucky and California. The 1914 crop was the smallest on record; said to be due to changes in the tariff and in part to the fact that the tobacco crop pays better.

The Kentucky hemp industry is very old, for the fibre was cultivated in the early part of the last century. The annual production, in 1859, reached a total of 75,000 tons, but 20 years later it had fallen off to such an extent that 5,000 tons only were recorded for the entire country. Since that time it has fluctuated between 5,000 and 12,000 tons as the total crop of the country, the annual production in 1914 being but 2,000 tons. In that year the total acreage in the United States devoted to hemp growing was about 5,000 acres. Of this Kentucky had 2,500 acres; Indiana, 1,000 acres; California, 600 acres; Ohio, 500 acres; Wisconsin, 350 acres. The average acre-yields varied

from 1,200 pounds of fibre in California to 600 pounds in Kentucky, and the farm price ranged from four and a half cents to eight cents. In Japan the annual crop is about 10,000 tons, all used in domestic industries; and Japan also imports 15,000 tons annually from India and China. Among the world's hemp producers Russia ranks first and China second.

In its own sphere of usefulness no substitute for hemp has been found satisfactory. American hemp was at one time used to some extent for the rigging of vessels, although its largest use was for bagging. As early as 1824 it was employed in the navy, and efforts were made later by the government toward the production of better grades of hemp by water-retting. The fibre has also been used for twines and for woven fabrics. In late years the demand has been largely for a low grade fibre that could be manufactured into binder twine, but for this purpose it has not been found satisfactory, and the bulk of the binder twine is made from manila and sisal. Very recently there has been a demand for a better grade of fibre, which has resulted in more careful methods, particularly on the Pacific coast, where a fibre has been produced fit for fine twines and cordage. Kentucky and Illinois hems are coarse, dark in color and are not carefully prepared, which is the reason for the low price of 3½ to 6 cents against 8 and 12 cents per pound for finer imported hems. The best hemp comes from Italy, chiefly from the provinces of Bologna and Ferrara, the fibre being very white, very well prepared and of superior strength. Breton hemp from France is almost as good, but rarely imported. Russian comes in several grades, some light, but not as light as the Italian, some dark like the native fibre and low in grade. Some good hemp comes from Austria-Hungary, and a trifle from other portions of Europe. Little if any of the Japan fibre reaches this market, though the best Japanese is as good as the Italian. We consume annually less than 10,000 tons, including both the native and imported.

There are many varieties of the hemp plant, four or five having been grown in the United States, though it is said that the bulk of the seed at present sown is the China hemp and a Japanese variety. In California, Japan hemp has yielded 7,000 pounds to the acre at a total cost of \$67, and a value of eight cents per pound. Five varieties are cultivated in Europe, a common form reaching a height of five to seven feet; Piedmontese or Bologna, an Italian variety that averages 12 feet in height; China hemp, introduced in 1846; a small hemp found in the valley of the Arno and around Tuscany; and Arabian hemp, cultivated for the resinous principle or drug.

Limestone soils, clayey loams and the alluvial soils of the river bottoms are best adapted to hemp culture, and the seed bed should be almost as carefully prepared as for flax. Generous fertilizing both with stable manure and chemical fertilizers is well repaid in quality as well as quantity of crop. One to three bushels of seed are sown per acre broadcast and highly covered. The planting, in Kentucky, usually begins in April, and the crop

may be harvested in 100 days. The most approved practice is to allow the hemp to lie on the ground, turning it over at intervals, till the leaves drop from the stalks. It is then gathered into stacks and water-retted during the following winter. Upwards of 300 machines for breaking hemp have been patented, but the Shely Hemp Gin seems to be the only one which has met with popular favor. It requires a crew of 15 men and turns out 1,000 of clean, straight fibre per working hour. For further particulars regarding the culture and preparation of this fibre, see Special Reports Nos. 1, 8 and 11, office of Fibre Investigations of the Department of Agriculture, and Hemp Culture in the United States, Year-books of Agriculture for 1911 and 1913. See also the 'Dictionary of the Economic Products of India.'

While some 300 patents have been issued in this country for hemp machines, the bulk of the fibre is extracted by means of the old-fashioned, clumsy wooden "slat-breaks" that has been employed from time immemorial and without improvement or change. With one of these breaks a Kentucky negro can extract perhaps 150 pounds of fibre in a day. The breaks used in European hemp countries are little better, though they are smaller and less clumsy. The best foreign hems are water-retted, the stalks dried with great care, often in kilns, and therefore are more evenly prepared and the fibre soft, strong and light in color—almost white as in the Italian and French hemp. On the contrary most of the American hems are dew-retted, and are exposed to alternate freezing and thawing, as the stalks lie on the ground, giving an inferior product, uneven and very dark in color, often a slate gray. Those water-retted bring double the price of the dew-retted. See CORDAGE; CORDAGE INDUSTRIES; FIBRE; FLAX; MANILA HEMP; RAMIE; SISAL.

Consult United States Plant Industry Bureau Bulletins 46 and 221; and Moore, B., 'A Study of the Past, the Present and the Possibilities of the Hemp Industry in Kentucky' (Lexington, Ky., 1905); United States Foreign and Domestic Commerce Bureau's Special Agents' Series No. 74, 'Linen, Jute and Hemp Industries.'

CHAS. RICHARD DODGE.

**HEMP-AGRIMONY.** See EUPATORIUM.

**HEMP-NETTLE**, a genus (*Galeopsis*) of European plants of the mint family, two species of which have become naturalized as weeds in the eastern United States.

**HEMPHILL**, James Calvin, American journalist: b. Due West, Abbeville County, S. C., 18 May 1850. He was graduated at Erskine College in his native town in 1870 and entered journalism as editor of the Abbeville (S. C.) *Medium* in 1871. In 1880 he joined the staff of the *Charleston News and Courier*, of which from 1888 to 1910 he was manager and editor. In 1911 he became editor of the *Charlotte (N. C.) Observer*; joined the editorial staff of the *New York Times* in 1912, and later became Washington correspondent of the *Philadelphia Public Ledger*. He was Brom-

ley lecturer on journalism at Yale in 1909-10, and first vice-president of the Associated Press in 1909.

**HEMPL**, George, American philologist: b. Whitewater, Wis., 6 June 1859. He was graduated at the universities of Michigan in 1879 and of Jena in 1889, and was appointed instructor in German at Johns Hopkins University in 1884. After spending three years abroad (1886-89) in study at Göttingen, Tübingen, Strassburg and Berlin, he became junior professor of English in the University of Michigan, where he has been professor of English philology and general linguistics since 1897. He has been a voluminous writer, and among his technical works may be mentioned 'German Orthography and Phonology' (1897); 'German Grammar' (1901). He was president of the American Philological Association in 1903-04, and assisted in the pronunciations of Pierce's 'French Dictionary.'

**HEMPSTEAD**, N. Y., village, in the town of the same name, in Nassau County, on the Long Island Railroad, about 15 miles east of the borough of Brooklyn, and 10 miles from the ocean. The village was settled in 1643 by people from New England. The Presbyterian Society of Hempstead claim the oldest Presbyterian organization in the country, dating their beginning in this village in 1644. The Episcopal church owns a communion service presented by Queen Anne. Hempstead is located in a section of Long Island in which there are many summer homes of New Yorkers. It has a public library and two parks, and is the seat of Turner Institute. During the war with Spain an encampment for State troops was located at Hempstead; it was called Camp Black after the then governor of the State. The chief industrial interests are market gardening, farming and the manufacturing of cork insoles, phosphates and carriages. The waterworks are municipally owned. Consult Onderdonk, 'The Annals of Hempstead, 1643-1832' (Hempstead 1878). Pop. 4,946.

**HEMPSTEAD**, Tex., town, county-seat of Waller County, on the Houston and Texas Central Railroad, about 50 miles northwest of Houston and 113 miles east by south of Austin. It is situated in a fertile agricultural region, noted for its cotton fields and its vegetable products. It has cottonseed-oil mills, cotton-gins, pickle factories, and its trade is chiefly in cotton, grain, fruits and vegetables. Pop. 1,978.

**HEMS**, or **HOMS**, hōms (Lat. *Emesa*), Syria, an ancient city, near the Orontes and the Lake of Homs, 86 miles northeast of Damascus and having railway connections with the coast. Its temple of the sun-god Elagabalus was famous, and one of its priests became emperor of Rome, assuming its title, in 218. Here in 272 Zenobia was defeated by Aurelian, and in 1832 the forces of the sultan of Turkey by Ibrahim Pasha. The town is still surrounded by its ancient walls, now in a ruinous condition, and has the largest and strongest citadel in Syria. It has some manufactures of silk goods and gold ornaments, and a trade in oil and agricultural produce. Pop. 60,000.

**HEMSTREET, Charles**, American journalist and author: b. New York, 20 Sept. 1866. He entered the profession of journalism as a reporter in 1886, and was connected with the City Press Association until 1900, when he resigned to devote himself to literature and historical research. He has published 'Manhattan' (1888); 'Nooks and Corners of Old New York' (1899); 'The Calendar of Old New York' (1900); 'History of New York City' (1901); 'When Old New York was Young' (1901); 'Nooks and Corners of Old London' (1910).

**HEN-HAWK, or CHICKEN-HAWK**, any kind of hawk which attacks poultry, or is supposed to do so. Two or three large buzzard-hawks are popularly so called in the eastern United States, and at least two smaller falcons. In the West, and in other parts of the English-speaking world, are other species of the same repute, more or less well deserved. In England the analogue of the American marsh-hawk (q.v.) is known as "hen-harrier." Certain owls everywhere kill much poultry where it is not safely housed at night. In North America the best known hen-hawks are the broad-winged, red-tailed and red-shouldered. (See BUZZARD). They are comparatively harmless to poultry, however, feeding mainly on squirrels, mice, frogs, etc. The broad-wing (*Buteo pennsylvanicus*) is one of the most familiar of our hawks, breeding numerously in the woods all over the country. It is 16 inches long, with a tail 7 inches, and the wing 11 inches. The upper parts are dull umber-brown, the tail almost black, crossed by two to four pale brown bands; the lower parts are dull rufous brown, nearly unbroken on the breast. It is rather sluggish in temperament, though capable of swift and bold action, and feeds mainly on mice, but will now and then seize young chickens, ducklings, etc. On the whole, as in the case of the other buzzard-hawks, it is of more service than injury to the agriculturist. The real culprits are two small, swift, agile falcons, Cooper's (*Accipiter cooperi*), and the sharp-shin (*A. velox*). The former is nearly two feet long, grayish-brown on the upper parts and white below, with the sides and breast barred with dusky red-brown and tail barred with blackish. The sharp-shin has much the same colors, but is little more than half as large, and is further distinguished by the triangular shape of the tarsus, giving it an edge in front. These bold and active falcons live mainly on birds, and on farms prey largely on chickens and house-sparrows, compensating somewhat for the former by killing the latter. Consult Fisher, 'Hawks and Owls of the United States' (Washington 1893).

**HENBANE**, a dangerous plant (*Hyoscyamus niger*) of the family *Solanaceæ*, which contains the tobacco, stramonium and other plants abounding in narcotic poisons. The black henbane (*H. niger*) is a species of the Mediterranean region, and springs up in waste places throughout Great Britain and rarely in the eastern United States, where it has become naturalized. It is an annual, somewhat bushy, about two feet high, with large sinuate or

sharply lobed, sessile leaves and large dingy yellow flowers with purplish veins. The whole plant is covered with unctuous hairs and has a nauseous smell. The seeds contain in largest quantity the specific alkaloid hyoscyamin, which crystallizes in stellate acicular crystals of a silky lustre. The symptoms of poisoning by henbane are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine henbane is employed both externally and internally. The leaves are the part commonly used; they are gathered and quickly dried when the plant is in full flower. Fomentations of henbane are applied to painful glandular swellings, parts affected with neuralgia, etc., and are often found to afford relief. An extract of henbane is sometimes employed instead of belladonna to dilate the pupil of the eye. Tincture and extract of henbane are often administered in cases of annoying cough, spasmodic asthma and other diseases requiring sedatives and anti-spasmodics. For many cases it has one great advantage over laudanum, in not producing constipation. The other species of henbane possess similar properties. The dried stalks of *H. albus* are used by smoking in Greece to allay toothache.

**HENDERSON, Charles Belknap**, American public official: b. San José, Cal., 8 June 1873. He studied at the University of the Pacific in 1892 and took a special course in history at Stanford University. In 1895 he was graduated at the law school of the University of Michigan and in the following year established his practice at Elko, Nev. For over 10 years he has served as regent of the University of Nevada. He was appointed member of the United States Senate by Gov. Emmet D. Boyle, on 4 Jan. 1918, to fill the vacancy caused by the death of Francis G. Newlands. In the Spanish-American War he served as second lieutenant in the 2d United States Volunteer Cavalry.

**HENDERSON, Charles Hanford**, American educator and author: b. Philadelphia, 30 Dec. 1861. He was graduated from the University of Pennsylvania in 1882; was lecturer at the Franklin Institute 1883-85, 1885-86; Ph.D. at Zürich in 1892; lecturer on education at Harvard 1897-98; and director Pratt Institute, Brooklyn, 1898-99. He founded Marienfeld Summer Camp for Boys and was its headmaster for 17 years, and was headmaster of the Marienfeld Open-Air School at Lamascond, N. C., 1914-16. Now engaged in writing and research work. He has published 'Elements of Physics' (1900); 'Education and the Larger Life' (1902); 'John Percyfield' (1903); 'The Children of Good Fortune' (1905); 'The Lighted Lamp' (1908); 'Pay-Day' (1910); 'What is it to be Educated?' (1914).

**HENDERSON, Charles Richmond**, American sociologist: b. Covington, Ind., 17 Dec. 1848; d. Charleston, S. C., 29 March 1915. He was graduated at the University of Chicago in 1870 and at Union Theological Seminary in 1873. From 1873 to 1883 he was pastor at Terre Haute, Ind., and from 1883 to 1892 at Detroit. In 1892 he was appointed assistant professor of sociology at Chicago University,

and was afterward advanced to the full professorship. In 1898-99 he was president of the National Conference of Charities, in 1902 president of the National Prison Association and in 1910 of the International Prison Congress. In 1907 he served as secretary of the Illinois Commission on Occupational Diseases. He published 'The Development of Doctrine in the Epistles' (1894); 'The Social Spirit in America' (1896); 'Introduction to the Study of Dependent, Defective and Delinquent Classes' (1893-1901); 'Social Settlements' (1897); 'Social Elements' (1898); and edited 'Abridgment of and Introduction to Edition of Thomas Chalmers' The Christian and Civic Economy of Large Towns' (1900); 'Modern Prison Systems' (1903); 'Modern Methods of Charity' (1904); 'Die Arbeiterversicherung in den Vereinigten Staaten von Nord Amerika' (1907); 'Industrial Insurance in the United States' (1907); 'Social Duties from a Christian Point of View' (1909); 'Education in Relation to Sex' (1909); 'Social Programmes of the West' (1913).

**HENDERSON, David Bremner**, American statesman: b. Old Deer, Scotland, 14 March 1840; d. Dubuque, Iowa, 25 Jan. 1906. He was educated in the public schools and Upper Iowa University; in 1861 entered the army as lieutenant of the 12th Iowa regiment; lost a leg at Corinth (1863), and was discharged from the service. He then became commissioner of the board of enrolment in the 3d Iowa district, but re-entered the army as colonel in 1864. He studied law and was admitted to the bar in Iowa in 1865, and was United States district attorney in the northern division of Iowa 1869-71. He early became prominent in the local politics of his district, and was a delegate to three Republican national conventions. In 1882 he was elected to the House of Representatives, and was re-elected biennially till 1902. He was for many years one of the leaders of the Republicans in the House, served on the Committee of Appropriations for 10 years and was chairman of the Judiciary Committee and a member of the Committee on Rules in the 54th and 55th Congresses. He assisted Speaker Reed (q.v.) in the making of the "Reed rules," was consistently an advocate of sound money and a strong supporter of President McKinley's Cuban policy. At the organization of the 56th Congress in 1899 he was chosen speaker of the House, and re-elected in 1901; he was an impartial presiding officer and took important part in shaping the legislation made necessary by the Spanish War and the acquisition of new territory. In 1902 he declined a unanimous renomination from his district, because he could not support the policy of tariff revision then made a prominent issue by Iowa Republicans.

**HENDERSON, James Pinckney**, American soldier and politician: b. Lincoln County, N. C., 21 March 1808; d. Washington, D. C., 4 June 1858. He practised law in Mississippi; went to Texas in 1836, and became secretary of state of the Texan Republic 1837-39. In the latter year he was sent as a Minister to England and France to secure the recognition of Texan independence, and went to Washington in 1844 to secure annexation. He was a member of the Texas Constitutional Convention 1845, and the

following year was elected first governor of the State. In 1857 he was appointed senator from Texas as a State Rights Democrat. Henderson fought in the Mexican War and Congress gave him a sword for his gallantry.

**HENDERSON, Peter**, American horticulturist: b. Porthead, Scotland, 1823; d. Jersey City, N. J., 17 Jan. 1890. He came to America in 1843 and opened a seed-store in New York city in 1862. He has been called "the father of horticulture and ornamental gardening in the United States." He published 'Practical Floriculture' (1867); 'Gardening for Profit' (1866); 'Gardening for Pleasure' (1875); 'Garden and Farm Topics' (1884); 'How the Farm Pays' (1884).

**HENDERSON, Richard**, American pioneer: b. Hanover County, Va., 1734; d. North Carolina, 1785. He studied law and in 1769 was appointed associate justice of the Superior Court of North Carolina. After the adoption of the Declaration of Independence he declined reelection to the bench, in order to participate in the scheme of the Transylvania Land Company. By this scheme the company organized as a political community with president, legislature and judges, all the territory lying between the Cumberland River, the Cumberland Mountains and the Kentucky River. The State of Virginia annulled the deed of sale of this tract of territory which the Cherokee Indians had given to the Transylvania Land Company, but as a reward for the pioneer work of the company, granted them an area 12 miles square on the Ohio River, below the mouth of the Greene River.

**HENDERSON, William James**, American musical critic and author: b. Newark, N. J., 4 Dec. 1855. He was graduated from Princeton College in 1876, and joined the staff of the *New York Tribune*. Joined the staff of the *New York Times* January 1883. Became music critic of that paper 1887. Since September 1902, has been music critic of the *New York Sun*. He was associate editor of 'The Standard Dictionary' (1892-94). He was lecturer on "History of Music" at New York College of Music, 1889-1903, and on "History of Vocal Art," Institute of Musical Art, since 1905. He is a member of National Institute of Arts and Letters, and member of the National Institute of Social Sciences. He served in naval militia of New York as ensign and afterward lieutenant from 1891 to 1902. Wrote libretto of 'Cyrano,' opera by Walter Damrosch. He has published 'The Story of Music' (1889); 'Preludes and Studies' (1891); 'Sea Yarns for Boys' (1894); 'Afloat with the Flag' (1895); 'Elements of Navigation' (1895); 'The Last Cruise of the Mohawk' (1897); 'What is Good Music' (1898); 'How Music Developed' (1899); 'The Orchestra and Orchestral Music' (1899); 'Richard Wagner' (1901); 'Pipes and Timbrels' (1905); 'Modern Musical Drift' (1906); 'The Art of the Singer' (1904); 'Some Forerunners of Italian Opera' (1911); 'The Soul of a Tenor' (1912).

**HENDERSON, Ky.**, city, county-seat of Henderson County, on the Ohio River, here spanned by a magnificent bridge, and on the Illinois Central, the Louisville and Nashville, the Louisville, Henderson and Saint Louis railroads, about 10 miles below Evansville, Ind.,

and 103 miles, in direct line, southwest of Louisville. It has regular steamboat connection with Louisville, Evansville, Memphis and other river ports. It is one of the oldest settlements on the Ohio River, but it was not incorporated until 1797. It is situated in a fertile agricultural region, rich in timber and coal. The chief manufactures are cotton and woolen goods, flour, hominy, lumber, box factories, tobacco products, furniture, carriages and wagons, foundry products, car-works and agricultural implements. Large shipments are made of corn, wheat, fruit and tobacco. It has large coal and lumber yards, grain-elevators, tobacco-stemmeries, fine fairgrounds and Atkinson Park, the area of which is about 100 acres. It has a sanatorium, a Carnegie library and a number of well-built churches and schools. The charter of 1893 provides for a mayor, who holds office four years and is not eligible for re-election, and a common council. The city owns and operates the electric-light and gas plants and the waterworks. Audubon and Edgewood, two adjoining towns, were annexed in 1905. Pop. 12,192.

**HENDERSON, N. C.**, town, county-seat of Vance County, on the Southern and the Seaboard Air Line railroads, about 12 miles east of Oxford and 42 miles north of Raleigh. Henderson was settled in 1820, but was not incorporated until 1842. It is situated in a cotton and tobacco region of the State. The chief industrial establishments are cotton-gins, cottonseed-oil mills, cotton-mills, knitting-mills, tobacco warehouses, wagon-factories, flour-mills, bagging-mills, buggy and automobile factories and lumber-yards. Its chief trade is in cotton and tobacco. It is governed by a mayor, elected for two years, and a town council. Pop. 4,503.

**HENDERSON, Tex.**, town, county-seat of Rusk County, on a branch of the International and Great Northern Railroad, about 122 miles southeast of Dallas and 165 miles north by east from Houston. It is situated in an agricultural section, and the chief industries are connected with agricultural products. Its chief industrial establishments are a foundry, a pottery, saw-mill, creamery and cotton-gins. The trade is in manufactured articles, live-stock, cotton and vegetables. It is the seat of a normal college. Pop. 4,500.

**HENDERSONVILLE, N. C.**, town, county-seat of Henderson County, on the Southern Railway, about 21 miles south of Asheville and 100 miles west of Charlotte. It is situated in a mountainous portion of the State, but in the valleys are fertile farm lands. The chief industrial establishments are a furniture factory, a tannery, a canning factory, creamery, hosiery mills and a lumber yard. Apples and vegetables are among the agricultural products shipped to other markets. Hendersonville has a large number of summer guests owing to the healthfulness of the climate and the beauty of the scenery. It is the seat of the Blue Ridge School for Boys, and contains a Carnegie library and hospital. The water-works are the property of the city. Hendersonville is under the commission form of government. Pop. 2,818.

**HENDRICK, Thomas Augustine**, American Roman Catholic bishop: b. Penn Yan,

N. Y., 29 Oct. 1849. He was educated at Saint John's College, Fordham; Seton Hall College, South Orange, N. J., and Saint Joseph's Seminary, Troy, N. Y. He was ordained to the priesthood in 1873 and became successively assistant at Saint Mary's, Rochester, N. Y. (1873-74); rector of Holy Cross Church, Charlotte, N. Y. (1874-77); rector of the church at Union Springs, N. Y. (1877-91); rector at Aurora and Cayuga, N. Y. (1891-95); rector of Saint Bridget's, Rochester (1895-1903). In 1903 he was consecrated bishop of Cebú, P. I. He reorganized his diocese and succeeded in putting an end to the Aglipay schism which was rampant there. He has taken part in numerous congresses of American charitable associations and in 1904 was a delegate of the United Charities of America to the World's Congress of Charitable Associations, London. He also served as vice-president of the Society for the Prevention of Cruelty to Children and from 1900 to 1904 was regent of the University of the State of New York. He is a frequent contributor of articles on charity and charity organization to newspapers and periodicals.

**HENDRICKS, Thomas Andrews**, American politician, 21st Vice-President of the United States: b. near Zanesville, Ohio, 7 Sept. 1819; d. Indianapolis, Ind., 25 Nov. 1885. He was graduated at South Hanover College, Indiana, in 1841; studied law and was admitted to the Indiana bar in 1843. In 1845 he was elected to the legislature, and in 1850 and 1852 to Congress. In 1860 he was the Democratic candidate for governor of Indiana, but was defeated. He was a United States senator 1863-69; and at the Democratic National Convention of 1868 received 132 votes for the Presidential nomination. In the same year he was again defeated for the governorship of Indiana, but in 1872 was elected. In the Democratic National Convention of 1876 he was nominated for the Vice-Presidency, but the ticket, headed by Tilden, was defeated. Hendricks was again nominated for the Vice-Presidency in 1884, however, on the ticket with Cleveland, and on this occasion was elected.

**HENDRIE, Sir John Strathearn**, Canadian statesman: b. Hamilton, Ontario, 15 Aug. 1857. He was educated at Hamilton Grammar School and Upper Canada College. He entered the provincial legislature of Ontario in 1902, was minister without portfolio 1905-13, and in the latter year was appointed lieutenant-governor of the province. He was created K.C.M.G. in 1915.

**HENDRIX, Eugene Russell**, American Methodist bishop: b. Fayette, Mo., 17 May 1847. He was graduated from Wesleyan University, Middletown, Conn., 1867; and the Union Theological Seminary 1869. Appointed bishop of the Methodist Episcopal Church South, in 1886; he has since made official visits to China, Japan, Korea, Mexico and Brazil. He is the possessor of John Wesley's manuscript 'Journal' written in America 1736-37. He has written 'Around the World' (1878); 'Skilled Labor for the Master' (1900); 'Christ's Table Talk' (1908).

**HENGIST**, hēng'gĭst, Saxon founder of the kingdom of Kent in Great Britain: d. about 488. He and his brother Horsa were re-

nowned among the Saxons for their bodily strength and the antiquity of their family, which derived its origin in a direct line from Odin. In 449 the Britons sued for aid from the Saxons against the inroads of the Scots and Picts. Under command of Hengist and Horsa the Saxons landed at the mouth of the Thames, attacked the enemies of the Britons and defeated them near Stamford in 450 A.D. As soon as they had received reinforcements from home they sought occasion for a quarrel, and uniting with the Scots and Picts they attacked the Britons, who were forced to flee or submit to the Saxons. Some fled to Armorica (Haute-Bretagne), to which they gave their name. Hengist, who had lost his brother in the battle near Eglesford (now Aylesford) in 455 A.D., founded the kingdom of Kent. He established his residence in Canterbury. By some of our writers Hengist and Horsa are regarded as mythical personages. Consult Bede, 'History Eccl.' (1896); Nennius, 'Historia Brittonum' (1844).

**HENING'S STATUTES**, the first complete collection of the laws of any American State, including those of its colonial times, those repealed and those dropped in revision. These were the "Statutes at Large of Virginia, 1619-1792," in 13 volumes, published at Richmond 1809-23, by William Waller Hening, clerk of the Court of Chancery; Jefferson is said to have suggested the publication. It is highly valued as a historical source.

**HENLEY, William Ernest**, English poet, critic and journalist: b. Gloucester, 23 Aug. 1849; d. Woking, 12 July 1903. He entered on a journalistic career in London, and in 1877 became first editor of the magazine *London*. He was then editor successively of the *Magazine of Art* (1882-86), of the *Scots*—later the *National Observer*—(1888-93), and of the *New Review* (1893-98). His first publication, 'In Hospital: Rhymes and Rhythms' (1888), was inspired by his own experiences as a patient in Edinburgh Infirmary. Its contents were subsequently included in 'A Book of Verses' (1888). A second volume of poems, 'The Song of the Sword,' appeared in 1892 (2d ed., as 'London Voluntaries,' 1893). Both of these books were incorporated in the collection of his 'Poems' (1898). Later poetical works were 'For England's Sake' (1900); and 'Hawthorn and Lavender and Other Verses' (1901). Henley collaborated with Stevenson four plays, 'Deacon Brodie,' 'Beau Austin' and 'Admiral Guinea' and 'Macaire.' He also edited, either alone or in co-operation with others, the following anthologies and collections: 'Lyra Heroica' (1891), an anthology of English patriotic verse; 'A London Garland: from Five Centuries of English Verse' (1895); 'Book of English Prose' (1896); 'English Lyrics, 1340-1809' (1897); 'The Works of Lord Byron' (1897); 'The Poetry of Wilfrid Blunt' (1896); and 'London Types' (1898), and was editor of a series of 'Tudor Translations.' The 'Centenary Burns' (1896-97) is an important work edited by him with the co-operation of T. F. Henderson. The fourth volume contains an elaborate estimate by Henley of Burns as poet and man, published separately in 1898. His critical work appears at its best in 'Views and Reviews: Literature' (1890), and 'Views and

Reviews: Painting and Sculpture' (1901). Both as poet and critic he was prejudiced and aggressive, but keen, vigorous and often distinguished in style. A paper on Stevenson contributed to the *Pall Mall* in 1901 aroused much unfavorable comment by its arraignment of Balfour's 'Life.'

**HENLEY-ON-THAMES**, England, a historical market-town and municipal borough of Oxfordshire, on the Thames, 35 miles by rail west of London. The town is especially famous for its annual regatta in July, a notable event in the British sporting world. The university boat races are held on the river here, and Americans frequently take part in the various open events. Pop. 6456.

**HENLOPEN**. See CAPE HENLOPEN.

**HENNA**, a shrub (*Lawsonia inermis*) resembling the privet, but of the family *Lythraceæ*. It grows in moist situations throughout the north of Africa, Arabia, Persia and the East Indies, and has acquired celebrity from being used by the inhabitants of those countries to dye the nails of their fingers and the manes, hoofs, etc., of their horses. For this purpose the leaves are dried, powdered and made into a paste with hot water, which imparts a yellow color, requiring renewal every three or four weeks. It is cultivated extensively in Egypt, and the powdered leaves form a large article of export to Persia and Turkey. Henna is supposed to be the *kopher* of the Hebrew, translated *camphire* in the Song of Solomon.

**HENNEPIN**, ěn-pān or hěn'ě-pĭn, Louis, French Franciscan missionary and explorer in North America: b. Ath, Belgium, about 1640; d. Utrecht, Holland, about 1706. He entered a convent, and being sent by his superiors to Calais and Dunkirk, the stories he heard from the sailors inspired him with a desire to visit distant countries. At length he embarked for Canada, and arrived at Quebec in 1675. In 1676 he went to the Indian mission at Fort Frontenac, whence he visited the Five Nations and the Dutch settlement at Albany. In 1678 he was attached to La Salle's expedition, and, in company with the Chevalier de Tonty and the Sieur de la Moote, was ordered to sail from Fort Frontenac to Niagara, and there construct a vessel for navigating the Lakes above the falls. This accomplished, La Salle joined the party, and on 7 Aug. 1679 the adventurers began their voyage on Lake Erie. They passed through Lakes Erie, Huron and Michigan, to the mouth of the Saint Joseph's River, ascended this in canoes to the portage, carried their frail barks several miles by land to the Kankakee and floated down this stream and the Iroquois to the Illinois, on the banks of which they built Fort Crèvecoeur near the present site of Peoria. After a delay of two months at this place, La Salle returned to Fort Frontenac for supplies, charging Father Hennepin with a voyage of discovery to the source of the Mississippi, which had never been explored above the mouth of the Wisconsin. Accompanied by Picard du Gay and Michael Ako, he set out in a canoe 29 Feb. 1680, followed the Illinois to its mouth and ascended the Mississippi to the Falls of Saint Anthony, which he was the first European to see, and which he named in honor of his patron saint. This was on 30 April.

Arriving at the mouth of the Saint Francis' River, in what is now the State of Minnesota, he traveled by land about 180 miles along its banks, naming it in honor of the founder of his order and visited the Sioux Indians, whom he mentions by the names Issati and Nadouessiou. He stayed with them three months, being, according to his own account, held in captivity, and then, meeting a party of Frenchmen who had come into the country by way of Lake Superior, returned with them to Canada, descending the Mississippi to the Wisconsin, and passing up that river and down the Fox, and so through Green Bay to Lake Michigan. From Quebec he sailed for France, where he published in 1683 his 'Description de la Louisiane nouvellement découverte au Sud-Ouest de la Nouvelle-France, etc.' containing the fullest published account of La Salle's first expedition, a history of his second voyage and of Hennepin's own explorations, with a description of the upper Mississippi. Notwithstanding the writer's vanity and fondness for exaggeration, the work is valuable. He put off his clerical dress in Holland about 1697, but to the end of his life seems to have written himself: 'Recollect missionary and apostolic notary.' In 1697, 10 years after La Salle's death, Hennepin published his extraordinary 'Nouvelle découverte d'un très-grand pays situé dans l'Amérique entre le Nouveau Mexique et la Mer Glaciale, etc.' reprinted the next year under the title 'Nouveau voyage dans un pays plus grand que l'Europe, etc.' In this work, which embodies his 'Description de la Louisiane,' written anew and enlarged, he claims to have descended to the mouth of the Mississippi, and to have been the first European who floated on that river. He gives a description of the scenery, Indian tribes and distances along the route, with a minuteness which easily gained him credit for veracity, and explained his long silence on this important point by saying that he feared the enmity of La Salle, who had ordered him to follow a different course, and who prided himself upon his own claims as the first who descended the Mississippi to the Gulf of Mexico. Notwithstanding the utter impossibility of reconciling the dates given in Hennepin's narrative, the story obtained general credence until its falseness was exposed by Jared Sparks. (See 'Life of La Salle,' by Sparks in the 'Library of American Biography'). Consult Saint-Genois, 'Les Voyageurs Belges du XIII au XIX Siècle' (1867); Van Hulet, 'Notice sur le Père Louis Hennepin' (1845); Shea, 'Discovery of the Mississippi' (1852); Parkman, 'La Salle and the Discovery of the Great West'; and especially Winsor, 'Narrative and Critical History of America' (Vol. IV, 1884).

**HENNESSEY, William J.**, Anglo-American artist: b. Thomastown, County Kilkenny, Ireland, 1839. He was brought to New York when 10 years of age, and became a student of the Academy of Design in 1856. He paints in oil and water colors, with a preference for landscape, and draws in black and white as an illustrator. In 1863 he was elected a National Academician, and since 1870 has lived in London, England.

**HENNESSY, John**, American Roman Catholic bishop: b. Ireland, 20 Aug. 1825; d. Dubuque, Iowa, 4 March 1900. He came to the

United States in 1847, and pursued his theological studies in Carondelet Seminary, near Saint Louis. After serving several years as a missionary in Missouri he became professor in Carondelet Seminary in 1854, and its president in 1857. He was afterward pastor in Saint Joseph, Mo.; became bishop of Dubuque in 1866 and archbishop in 1893.

**HENNESSY, John Joseph**, American Roman Catholic bishop: b. County Cork, Ireland, 19 July 1847. He came to America in early life and was graduated at the Christian Brothers' College, Saint Louis, Mo., in 1862. He was ordained priest in 1869; founded the Railroad Men's Benevolent Union 1871; established the Ursuline convent, Arcadia, Mo., 1877; and edited *The Youth's Magazine*, Saint Louis, 1880-86. He was consecrated bishop of Wichita, Kan., in November 1888.

**HENNINGSEN, Charles Frederick**, American military officer: b. in England, of Swedish parents, 1815; d. Washington, D. C., 14 June 1877. He joined the Carlists in Spain in 1834, and later was a follower of Kossuth in the Hungarian Revolution. He went to Nicaragua in 1856, where he distinguished himself in the defense of Granada, and in the victory at Queresma. During the Civil War he served in the Confederate army, becoming a brigadier-general. He directed the construction of the first Minie rifles manufactured in the United States. His publications include 'Eastern Europe'; 'Past and Future of Hungary'; 'Sixty Years Hence'; 'Personal Recollections of Nicaragua'; 'The White Slave,' etc.

**HENRI, hèn'ri**, Robert, American painter: b. Cincinnati, Ohio, 1865. He began his art studies in his native city and became an instructor in the Philadelphia School of Design. He has exhibited in Paris, and his picture 'Snow' was purchased by the French government and hangs in the Luxembourg. While in Paris he gathered round him a group of pupils in his studio, and as a landscape and portrait painter did much to impress younger men with his breadth and vigor of style. While he is a landscape painter of notable attainment, his portraits also are admirable for the power of individualization and the directness which characterizes them. He was elected a member of the National Academy of Design 1906, the Association of American Painters and Sculptors, and the National Institute of Arts and Letters. Among his best-known paintings are 'The Equestrian,' Carnegie Art Institute, Pittsburgh; 'Young Woman in Black,' Art Institute of Chicago; 'Girl with Fan,' Pennsylvania Academy, Philadelphia; 'Laughing Girl,' Brooklyn Institute Museum; 'Spanish Gypsy,' Metropolitan Museum, New York. Other important works are 'The Picador'; 'A Little Gypsy'; portrait of Mrs. W. R. Clarke (1909); 'The Fish-Market Man' (1911); 'La Madrilénita' (1912); 'The Working Man' (1913). In 1914 he exhibited several studies of Irish types. Of these 'Himself' and 'Herself' were shown at the Pennsylvania Academy, where the latter received the medal for the best portrait in the exhibition.

**HENRIETTA, DUCHESS OF ORLEANS**: b. Exeter, 16 June 1644; d. Saint Cloud, France, 30 June 1670. She was the daughter of King

**Charles I.** Her mother fled with her to France, where she was educated a Roman Catholic. Her marriage with the brother of Louis XIV, Philip of France, Duke of Orleans, was celebrated in March 1661. Louis XIV was desirous of detaching her brother, Charles II, from the triple alliance with Holland and Sweden, in order to accomplish his plan of obtaining possession of a part of Holland. She went therefore in 1670 with the court to Flanders, and under pretense of visiting her brother, passed over to Dover, where Charles was awaiting her arrival, and there succeeded in obtaining his signature to the secret treaty of Dover. Shortly after her return she died so suddenly as to excite the suspicion of her being poisoned. Bossuet pronounced her funeral oration.

**HENRIETTA, Maria**, queen of Charles I of England: b. Paris, 25 Nov. 1609; d. Colombes, near Paris, 31 Aug. 1669. She was the youngest child of Henry IV of France. Her marriage ceremony was celebrated by proxy at Paris in 1625. On Henrietta's first arrival in England she enjoyed great popularity with her husband's subjects, but her attachment to the Roman Catholic faith, combined with her hauteur and despotic ideas as to divine right, soon dissipated these favorable prepossessions. Much of Charles' subsequent arbitrary and injudicious procedure may be traced indirectly to the influence of his queen. On the breaking out of the civil war Henrietta proceeded to Holland, where she procured money and troops for the assistance of her husband, and afterward joined him at Oxford. She again returned to the Continent, and took up her abode in France. Consult 'Lives' by Haynes (1912), and Taylor (1905); and Strickland's 'Lives of the Queens of England.'

**HENRIETTA, Tex.**, town, county-seat of Clay County, on the Little Wichita River, and on the Missouri, Kansas and Texas, and the Fort Worth and Denver railroads, about 90 miles northwest of Fort Worth and 128 miles northwest of Dallas. It is situated in an agricultural and stock-raising region and the building-stone quarries in the vicinity add to the industrial wealth of the town. The chief manufactures are flour and lumber. The town has cotton-gins, grain elevators, lumber-yards and stock-yards. The trade is chiefly in live-stock, grain, flour, lumber, cotton and building-stone. Natural gas is plentiful in the vicinity. The water-works are the property of the city. Pop. 2,104.

**HENRY I**, king of England, surnamed **BEAUCLERC**, youngest son of William the Conqueror: b. Selby, Yorkshire, 1068; d. Rouen, France, 1 Dec. 1135. He was hunting with William Rufus in the New Forest when that prince received his mortal wound in 1100, and instantly going to London caused himself to be proclaimed king, to the prejudice of his elder brother Robert, then absent in the Crusade. To reconcile the people to his usurpation Henry issued a charter containing concessions to public liberty, and also performed another popular act by recalling Anselm, archbishop of Canterbury. In November 1100 he married Matilda, daughter of Malcolm III, king of Scotland. This union strengthened his party, when his brother landed an army in 1101, with a view of asserting his claim to the crown. Actual hostilities were pre-

vented by Anselm, who induced Robert to accept a pension; and it was agreed that in the event of the death of either of the brothers without issue, the other should succeed to his dominions. He subsequently invaded Normandy, and in 1106 took Robert prisoner and reduced the whole duchy. His usurpation of Normandy involved him in continual war, but although William, son of Robert, escaped out of custody, and was assisted by the king of France, Henry maintained possession of the duchy. His only son William was drowned in 1120 in returning from Normandy, and Henry was stricken with grief. He married his only daughter, Matilda, to the Emperor Henry V, and when she became a widow married her a second time to Geoffrey Plantagenet, son of the Count of Anjou. Henry was succeeded by Stephen. Consult Davis, 'England under Normans and Angevins' (1905); Freeman, 'History of the Norman Conquest' (1879); and Norgate, 'England under the Angevin Kings' (1887).

**HENRY II**, king of England, the first of the line of the Plantagenets: b. Normandy, 1133; d. Castle of Chinon, near Saumur, France, 6 July 1189. He was the son of Geoffrey, Count of Anjou, and the Empress Matilda, daughter of Henry I. He was invested with the duchy of Normandy, by the consent of his mother, in 1150. The next year he succeeded his father in the possession of Anjou and Maine, and by a marriage with Eleanor of Guienne, just divorced from Louis VII, king of France, annexed that province with Poitou to his other dominions. He succeeded Stephen as king of England in 1154. Although involved with his brother Geoffrey, who attempted to seize Anjou and Maine, and in a temporary dispute with France, he reigned prosperously till the memorable contest with Thomas Becket. Anxious to dominate the clergy, Henry in 1164 summoned a general council of nobility and prelates at Clarendon, which assembly passed the famous constitutions named from that place, the effect of which was to render the Church and ecclesiastical dignitaries subject to the temporal authority. (See **CLARENDON, CONSTITUTIONS OF**). After the murder of Becket, Henry receded from his position and restored the Church to its rights. Before this matter was terminated, Henry, in 1171, undertook an expedition into Ireland, and having left Earl Richard in the post of seneschal of Ireland he returned to England—proceedings so important to the future destinies of both countries having occupied only a few months. Being an indulgent father, Henry had assigned to each of his four sons a provision out of his extensive territories. The eldest son, Henry, was not only declared heir to England, Normandy, Anjou, Maine and Touraine, but actually crowned in his father's lifetime. On paying a visit to the court of his father-in-law, Louis VII of France, the prince was induced by the French monarch to demand of his father the immediate resignation either of the kingdom of England or of the dukedom of Normandy. This request being refused, he withdrew from his father's court and was openly supported in his claim by Louis. Henry's various gallantries, exemplified in the popular and not altogether unfounded legend of fair Rosamond, or Rosamond Clifford, also em-

broiled him with his queen, Eleanor, who incited her other sons, Richard and Geoffrey, to make similar claims. A general invasion of Henry's dominions was in this way concerted, and began in 1173 by an attack on the frontiers of Normandy, but the king presently subdued his opponents and entered into an accommodation with his sons on less favorable terms than they had previously rejected. Henry now employed himself in regulations and improvements which equally manifest his capacity and love of justice. He partitioned England into four judiciary districts, appointed itinerant justices to make regular excursions through them, revived trial by jury, discouraged that by combat, and demolished all the newly-erected castles as shelters of violence and anarchy. The turbulence of his sons still disquieted him; but Henry, the eldest, was cut off by fever in 1183, and three years after the death of the equally restless Geoffrey occurred. Philip Augustus, then king of France, however, continued to foment the differences between Henry and his sons, and Richard was again prompted to rebel. A war followed, the event of which was so unfavorable to Henry, that he was at length obliged to agree that Richard should receive an oath of fealty from all his subjects. He also stipulated to pay a sum of money to the French king, and to grant a pardon to all Richard's adherents. The mortification of Henry at these humiliating terms was aggravated to despair when he saw the name of his favorite son, John, at the head of the list of delinquents whom he was required to pardon. Henry II ranks among the greatest kings of England. His wisdom and love of justice were acknowledged by foreign potentates, who made him arbiter of their differences and regarded him as the first prince of the age. Consult Stubbs, 'The Early Plantagenets' (1876); Green, Mrs. J. R., 'Henry II' (1888); Norgate, 'England Under the Angevin Kings' (1887); Davis, 'England Under Normans and Angevins' (1905).

**HENRY III**, king of England: b. Winchester, 1 Oct. 1207; d. Westminster, 16 Nov. 1272. He was the son of John, whom he succeeded in 1216. As Henry approached to manhood he displayed a character wholly unfit for his station. One of his first false steps was to discard his most faithful and able Minister, Hubert de Burgh. In 1236 Henry married Eleanor of Provence, which increased the dislike which his subjects already felt toward him; for she brought a train of foreigners to the court and encouraged her husband in extravagant courses which forced him to all kinds of oppressive exactions to raise money. He received frequent grants of money from Parliament, but always on condition of confirming the Great Charter, which had been extorted from King John. Henry at length raised the national discontent to such a pitch that the nobles rose in rebellion under Simon de Montfort, the Earl of Leicester, the husband of the king's sister; and in 1258 obliged the king to sign a body of resolutions which threw all the legislative and executive power into the hands of an aristocracy of 24 barons, assisted by a lower house consisting of four knights chosen from each county. By the aid of his son Edward, Henry was gradually restored to authority; on which Leicester, calling in Llewellyn, Prince of Wales, involved

the kingdom in a civil war. The power of the barons was by this means partially restored; but both parties agreed to abide by the award of Louis IX, king of France. This being favorable to the king, Leicester and the barons refused to submit to it, and a battle was fought near Lewes, in which Henry was taken prisoner and the person of Prince Edward also ultimately secured. A convention provided for the future settlement of the kingdom; but in the meantime Leicester ruled without control. To him, however, was owing the first example of a genuine House of Commons in England; for in a Parliament summoned by him in 1265, deputies from boroughs were sent, as well as knights of shires. Prince Edward at length escaped and, assembling an army, defeated Leicester's son. The decisive battle of Evesham (1265) quickly followed, in which Leicester himself was slain. Replaced upon the throne Henry remained as futile as ever. He died in the 64th year of his age, and the 56th of his reign, the longest in English history, except those of George III and Victoria. He was succeeded by his son, Edward I. Consult Davis, 'England Under Normans and Angevins'; Norgate, 'The Minority of Henry III'; Stubbs, 'Constitutional History of England'; Tout's 'History of England, 1216-1397' and 'Lives of Simon de Montfort.'

**HENRY IV**, king of England, first king of the house of Lancaster: b. Bolingbroke, 3 April 1367; d. 19 March 1413. He was the eldest son of John of Gaunt, Duke of Lancaster; fourth son of Edward III by the heiress of Edmund, Earl of Lancaster, second son of Henry III. In the reign of Richard II he was made Earl of Derby and Duke of Hereford, and while bearing the latter title appeared in the Parliament of 1398 and preferred an accusation of treason against Mowbray, Duke of Norfolk. The latter denied the charge and offered to prove his innocence by single combat, which challenge being accepted, the king appointed the lists at Coventry; but on the appearance of the two champions at the appointed time and place, Richard would not suffer them to proceed. Both were banished the kingdom, Norfolk for life and Hereford for 10 years, shortened by favor to four, with the further privilege of immediately entering upon any inheritance which might accrue to him. On the death of John of Gaunt in 1399 he succeeded to the dukedom of Lancaster, and laid claim, according to agreement, to the great estates attached to it; but Richard retained possession of the estates. The duke therefore, disregarding the unfinished term of his exile, landed with a small retinue at Ravenspur in Yorkshire, where he was quickly joined by the earls of Northumberland and Westmoreland, and soon found himself at the head of 60,000 men. Richard falling into the hands of his enemies, was brought to London by the duke, who now began openly to aim at the crown. A resignation was first obtained from Richard, who was then solemnly deposed in Parliament; and Henry unanimously declared lawful king under the title of Henry IV. The death of Richard soon removed a dangerous rival; yet a short time only elapsed before the nobles rebelled against the king of their own creation. The first plot, in 1400, was discovered in time to prevent its

success, but an insurrection in Wales, under Owen Glendower, proved more formidable. That chieftain having captured Mortimer, Earl of March, who was descended from Lionel, Duke of Clarence, the second son of Edward III, and therefore the lineal heir to the crown, Henry would not suffer his relation, the Earl of Northumberland, to treat for his ransom. He thus offended that powerful nobleman, who, with his son, the famous Hotspur, soon after joined Glendower. The king met the insurgents at Shrewsbury, and a furious battle ensued, 21 July 1403, which ended in the death of Percy and the defeat of his party. A new insurrection, headed by the Earl of Nottingham and Scrope, the archbishop of York, broke out in 1405, which was suppressed by the king's third son, Prince John. The archbishop afforded the first example in this kingdom of capital punishment inflicted upon a prelate. The rest of this king's reign was comparatively untroubled. Henry was succeeded by his son of the same name. Consult Wylies, 'Henry IV' (4 vols., 1894-98); Ramsay, 'Lancaster and York' (1892); Oman's 'Political History of England, 1377-1485' (1906); and Stubbs, 'Constitutional History of England.'

**HENRY V**, king of England: b. Monmouth, 19 Aug. 1387; d. Vincennes, France, 31 Aug. 1422. He succeeded his father, Henry IV, in 1413. His dissipated youth, and fondness for joviality and low company, gave his father much uneasiness; but circumstances occurred, even in the midst of his wildness, which showed that better principles were latent in his mind. His conduct when he ascended the throne justified the best expectations. The circumstances of France, torn asunder by the opposing factions of the dukes of Orleans and Burgundy, afforded a tempting opportunity to an ambitious neighbor, and Henry was easily induced to revive the claims of his predecessors upon that country. He accordingly assembled a great fleet and army and landed near Harfleur, 14 Aug. 1415. He took that town after a siege which so much reduced his army that he was advised to return to England by sea. But Henry determined to march on Calais, and on his way was met on the plain of Agincourt by a French army 10 times as numerous as his own. A battle took place there on 25 October, in which the French host was totally defeated, with a comparatively trifling loss on the side of the English. In 1417 the liberal grants of the Commons enabled Henry once more to invade France with 25,000 men. By the famous Treaty of Troyes (21 May 1420), Henry engaged to marry the Princess Catharine and to leave Charles in possession of the crown on condition that it should go to Henry and his heirs at his decease, and be inseparably united to the crown of England. Henry, after espousing Catharine, took possession of Paris and then went over to England to raise recruits for his army. All his great projects seemed about to be realized, when he was attacked by a disease which carried him off at the age of 34, and in the 10th year of his reign. He was succeeded by his son, Henry VI. Henry V, as the gallant, youthful and successful conqueror of France, is a favorite name in English history; but he was inferior in wisdom and solid policy to many of his ancestors. Consult Kingsford, 'Henry

V' (1911), and Oman, 'Political History of England, 1377-1485' (1906).

**HENRY VI**, king of England: b. Windsor, 6 Dec. 1421; d. London, 21 May 1471. He was crowned at Westminster in November 1429 and at Paris in December 1430. As he was not nine months old at the death of his father, Henry V, John, Duke of Bedford, a brother of the late king, was appointed regent of France; and Humphrey, Duke of Gloucester, another brother of the same, protector of the realm of England, with a council at his side appointed by Parliament. A few weeks after Henry's succession, Charles VI of France died, when, according to the provisions of the Treaty of Troyes, Henry was proclaimed king of France. But the French did not quietly submit and a war began, at first favorable to the English, but in the end, after they had been roused to more effectual efforts by the heroism of Joan of Arc (q.v.) (1428-30), resulted in the almost total loss to the English of their possessions in France. In 1453 nothing remained to them in that country but Calais. In April 1445, Henry married Margaret of Anjou, daughter of René of Provence. Two years later the Earl of Suffolk acquired the chief power in the kingdom and was created first marquis and then duke. His government was very unpopular, which caused the people to look to the claim of Richard, Duke of York. The insurrection of Cade followed and the Duke of York was by Parliament declared protector of the kingdom. The York and Lancaster parties were now in such a state that the sword only could decide between them; and that course of civil contention commenced, the first bloodshed in which occurred at Saint Albans in May 1455, and as far as the reign of Henry was concerned, the last in the battle of Tewkesbury in 1471. When the latter took place the king was a prisoner in the Tower, where he soon after died, but whether by a natural or violent death is uncertain. Henry was gentle, pious and well-intentioned, but weak. Eton College reveres Henry as its founder, as does likewise King's College, Cambridge. Consult Gairdner, (ed.), 'The Paston Letters'; Oman, 'Political History of England, 1377-1485' (1906); and Stubbs, 'Constitutional History of England' (Vol. III, 1895); Vickers, 'England in the Later Middle Ages' (New York 1914).

**HENRY VII**, king of England, first sovereign of the house of Tudor: b. Wales, 28 Jan. 1457; d. Richmond, Surry, 22 April 1509. He was the son of Edmund, Earl of Richmond, son of Owen Tudor and Catharine of France, widow of Henry V. His mother, Margaret, was the only child of John, Duke of Somerset, grandson of John of Gaunt. After the battle of Tewkesbury he was carried by his uncle, the Earl of Pembroke, to Brittany, to seek refuge in that court from the jealousy of the victorious house of York. On the usurpation of Richard the young Earl of Richmond was naturally turned to as the representative of the house of Lancaster. In 1485 Richmond landed at Milford Haven, where he was immediately joined by some leaders of rank, but had only 6,000 men when Richard met him at Bosworth, with an army twice as numerous in appearance; but the defection of Lord Stanley with his forces, who joined Richmond during the battle,

obtained for the latter a complete victory. Henry was proclaimed king on the field of battle, and his right was subsequently recognized by Parliament. In 1486 he married Elizabeth, daughter of Edward IV and heiress of the house of York, and thus united the claims of the rival houses of York and Lancaster. The reign of Henry VII was troubled by repeated insurrections. The project of France for annexing the province of Brittany, by marriage with the heiress, induced Henry to declare war, but his measures were so tardy and parsimonious that the annexation was effected. He then raised large sums on the plea of the necessity for hostilities; and landing a numerous army at Calais in 1492, almost immediately accepted a large compensation for peace. The Duchess-dowager of Burgundy, governess of the Low Countries, now advocated the cause of Perkin Warbeck, a youth who gave himself out to be Richard Plantagenet, the younger of the two sons of Edward IV, supposed to have been murdered in the Tower of London, and the justice of his claim has been maintained even by some historians of a recent date. The duchess professed to be satisfied with the proofs of his identity, and acknowledged him as her nephew. He was so far successful as to secure a large following, with which he marched to Taunton; but there his heart failed him and he fled. Captured by Henry he confessed himself an impostor and was sent to the Tower, where he became acquainted with the Earl of Warwick and persuaded him to accompany him in an attempt to escape. They were both retaken and Warwick was recommitted to the Tower and Perkin Warbeck hanged at Tyburn (1499). Soon after the king ordered the Earl of Warwick also to be executed. After a long negotiation he brought about a match between the Infanta Catharine, daughter of Ferdinand of Aragon and of Isabella of Castile, and his eldest son Arthur; and on the death of the latter, in order to retain the dowry of this princess, caused his remaining son Henry to marry the widow by Papal dispensation, an event which, in the sequel, led to a separation from the see of Rome. He married his eldest daughter to James IV, king of Scotland, from which union there ultimately resulted the union of the two crowns. His reign was, upon the whole, beneficial to his country. Being conducted upon pacific principles it put a period to many disorders and gave an opportunity to the nation to flourish by its internal resources. His policy of depressing the feudal nobility, which proportionately exalted the middle ranks, was highly salutary; and it was especially advanced by the statute which allowed the breaking of entails and the alienation of landed estates. It was under the patronage of Henry VII that John Cabot made his voyage of 1497 and discovered the North American continent. Consult Bacon's 'History of Henry VII' (ed. by Lumby, 1881); Gairdner's 'Henry VII' (1889); and 'Lives,' by Pollard (1913-14) and Temperley (1914).

**HENRY VIII**, king of England: b. Greenwich, 28 June 1491; d. Westminster, 28 Jan. 1547. He succeeded his father, Henry VII, in 1509. His disposition for show and magnificence soon squandered the hoards of his predecessor. James IV, king of Scotland, made

an incursion with a numerous body of troops into England, and was completely defeated and slain at the battle of Flodden Field (1513). Henry, however, granted peace to the queen of Scotland, his sister, and established an influence which rendered his kingdom long secure on that side. The aggrandizement of Cardinal Wolsey now began to give a leading feature to the conduct of Henry, that prelate being appointed chancellor in 1515. His favor was now sought by Maximilian I, emperor of Germany, who hoped to secure the support of England against France, and as Wolsey was at first neglected by the French king the German emperor gained his point; but when Maximilian was succeeded by Charles V, hereditary king of Spain as well as emperor of Germany, Francis I, king of France, found it expedient to gain Wolsey, and entered into an amicable correspondence with them. In order to cement this new friendship the two monarchs had an interview near Calais, the magnificence of which gave the place of meeting the denomination of the Field of the Cloth of Gold (1520). Notwithstanding these indications, a prospect of the papacy being artfully held out to the cardinal by the young Emperor Charles, his interest at length gained a preponderance in the English councils. The principles of the Reformation were now making rapid strides. Henry himself wrote a Latin book against the tenets of Luther, which he presented to Pope Leo X, who favored him in return with the title of defender of the faith, a title by which, curiously enough, English sovereigns are still styled. After being married to Catharine for about 18 years, Henry began to feel some scruples as to the validity of the marriage, on the ground that she had previously been his brother's wife, and his scruples were no doubt increased by the fact of his having conceived a passion for Anne Boleyn, one of the queen's maids of honor. He accordingly applied in 1527 to Pope Clement VII for a divorce, and the Pope appointed Cardinals Wolsey and Campeggio to try the case. Wolsey had at first been favorable to the project of a divorce, but when he perceived the desire of Henry to marry Anne Boleyn, fearing that this marriage would result in winning over Henry to the side of the reformers, since Anne Boleyn's friends belonged to that party, he did all in his power to prolong the inquiry, until the commission was at last withdrawn and it was decided by the Pope that the case should be tried at Rome. This procrastination on Wolsey's part led to his own ruin. Henry, disgusted at these delays, eagerly caught at the advice of Thomas Cranmer (q.v.), afterward archbishop of Canterbury, to refer the case to the universities, from whom he got the decision desired. In May 1533 his marriage with Catharine was declared null, and as he had by that time privately married Anne Boleyn, this second marriage was a few days later declared lawful. As these decisions were not recognized by the Pope, an act of Parliament was obtained in the following year (1534), setting aside the authority of the chief pontiff in England, which was followed by another in 1535 declaring Henry the supreme head of the Church. Thus was effected the great revolution by which, in ecclesiastical annals, this reign is so much distinguished. The birth of a daughter by the new queen produced

a bill for regulating the succession, which settled it on the issue of this marriage, and declared the king's daughter by Catharine illegitimate. But although Henry discarded the authority of the Roman Catholic Church, he adhered to its theological tenets. While he executed Bishop Fisher and Sir Thomas More (who had been appointed chancellor after the fall of Wolsey) in 1535, for refusing the oath of supremacy, he displayed an aversion to the principles of the reformers and brought many of them to the stake. Finding that the monks and friars in England were the most direct advocates of the papal authority, he suppressed the monasteries by act of Parliament. The fall of Anne Boleyn was, however, unfavorable for a time to the reformers. Henry then married Jane Seymour, and the birth of Prince Edward in 1537 fulfilled his wish for a male heir, although his joy was abated by the death of the queen. Henry now resolved to marry again, and Thomas Cromwell, a Protestant, who had succeeded More as first minister, recommended Anne of Cleves. The marriage took place in January 1540, and Henry created Cromwell Earl of Essex; but his dislike to his new wife hastened the fall of that minister, who was condemned and executed upon a charge of treason. At the same time Henry procured from the convocation and Parliament a divorce from Anne of Cleves. He then married Catharine Howard, niece to the Duke of Norfolk; but Henry found that his new queen, of whom he was very fond, had proved false, and on further inquiry her conduct before marriage was discovered to have been loose and criminal. She was therefore accused and brought to the block in 1542. In 1543 he married his sixth wife, Catharine Parr, widow of Lord Latimer, a lady of merit, secretly inclined to the Reformation.

Henry was succeeded by his son, Edward VI. The complete union of Wales with England, and the conversion of Ireland into a kingdom, date from the reign of Henry VIII.

Consult *Histories of England* by Lingard (1854-55); Froude (1870); and Green (1879 and 1884); also Brewer, 'History of the Reign of Henry VIII to the Death of Wolsey' (1884); Dixon, 'History of the Church of England from the Abolition of the Roman Jurisdiction' (1884-91); Froude, 'The Divorce of Catharine of Aragon' (1891); Gairdner, 'The English Church in the 16th Century' (1902); Hume, 'The Wives of Henry VIII' (1905), and monographs by Creighton (1888), and Pollard (1902). The 'Letters and Papers, Foreign and Domestic,' for his reign, which are the principal sources, were published in 21 volumes, between 1862 and 1910.

**HENRY I**, king of France: b. 1005; d. Vitri, 4 Aug. 1060. He was the third son of Robert II. He succeeded in 1031. His reign was a continuous series of difficulties with the nobility and with the growing power of the clergy. His younger brother, Robert, led a revolt against him, but this he suppressed with the aid of Duke Robert of Normandy. Consult Lavissee, 'Histoire de France' (Vol. II, 1901).

**HENRY II**, king of France: b. Saint Germain-en-Laye, 31 March 1519; d. 10 July 1559. He succeeded his father, Francis I, 31 March 1547. He severely persecuted the

Huguenots, and was involved in wars with the Emperor Charles V and Philip II of Spain. The Constable de Montmorency was defeated at Saint Quentin (10 Aug. 1557); the Marshal de Thermes at Gravelines (13 June 1558); and the Peace of Cateau-Cambrésis (3 April 1559) lost to France most of the advantages previously gained. Henry was a monarch of slight capability, despite his regal bearing. Consult Williams, H. N., 'Henri II: His Court and Times' (1911).

**HENRY III**, king of France: b. Fontainebleau, 19 Sept. 1551; d. by assassination Saint Cloud, 2 Aug. 1589. He was the third son of Henry II. He fought, as Duke of Anjou, against the Huguenots, was elected king of Poland in 1573 and crowned 15 Feb. 1574, but in June 1574 left Poland and succeeded his brother, Charles IX, as king of France. The Peace of Beaulieu (1576), confirmed by the Edict of Poitiers (1577), granted to the Huguenots so many privileges that the Holy League was formed, seeking openly Catholic supremacy and secretly the elevation of Henry of Guise to the French throne. When all privileges granted to Huguenots were repealed by the Edict of Nemours (1585) war broke out. Henry of Navarre was victor at Coutras, while Henry of Guise drove the king from Paris. The king then caused the murder of Guise and Guise's brother, the cardinal of Lorraine, in consequence of which the doctors of the Sorbonne absolved the people from obedience to him. He then joined cause with Henry of Navarre, with whom he marched against Paris; but in camp at Saint Cloud was stabbed by Jacques Clément, a fanatical Dominican, 1 Aug. 1589. Henry III was the last of the branch of Orléans-Angoulême of the stock of the Valois. Consult Armstrong, 'The French Wars of Religion' (1892), and Freer, 'Henri III: His Court and Times' (1858).

**HENRY IV**, known as HENRY OF NAVARRE, king of France: b. Pau, 13 Dec. 1553; d. 14 May 1610. He was a son of Anthony of Bourbon, Duke of Vendôme, and of Jeanne d'Albret, daughter of Henry, king of Navarre, and herself afterward queen of Navarre. Educated by his mother in the Calvinistic faith, he early joined, at her wish, the Protestant army of France, and served under Admiral Coligny. In 1572 he married Margaret of Valois, sister of Charles IX, and after the massacre of Saint Bartholomew, which took place during the festivities in connection with this marriage, adopted the Roman Catholic creed. For the next four years he was compelled to reside in Paris, but 3 Feb. 1576 succeeded in making his escape, and after retracting, at Tours, the abjuration of Calvinism which he had made at Paris, put himself at the head of the Huguenots and took a leading part in all the subsequent religious wars. He occupied a still more important position when, in 1584, the death of the Duc d'Anjou, brother of the king (Henry III), made him presumptive heir to the Crown as descended from Robert, Count of Clermont, the sixth son of Louis IX. Rejected by the Roman Catholic party and the League as a heretic, Henry found himself obliged to resort to arms to assert his claims. On 20 Oct. 1587 with an inferior force he de-

feated the army of the League at Coutras. In 1589 he became king through the assassination of Henry III (q.v.), but found innumerable difficulties in establishing his claims. His Protestant religion was brought forward by all the competitors to prejudice the Catholics against him. At the head of the opposite party stood the Duke de Mayenne. Philip II of Spain also claimed the French throne and sent aid to the League. Henry IV defeated his enemies in the celebrated engagement of Ivry (14 March 1590). In consequence of this victory Paris was besieged, and Henry IV was upon the point of compelling the citizens to surrender by famine, when the Spanish general, Alexander, Duke of Parma, by a skilful maneuver, obliged him to raise the siege. Convinced that he should never enjoy quiet possession of the French throne without professing the Catholic faith, Henry at length yielded to the wishes of his friends, was instructed in the doctrines of the Roman Church, and professed the Catholic faith, 23 July 1593, in the church of Saint Denys. He was anointed king at Chartres in 1594, and entered the capital amid the acclamations of the people. He quickly brought France entirely into subjection, and concluded the war against Spain in 1598 by the Peace of Vervins, to the advantage of France. The same year was signalized by the granting of the Edict of Nantes, which secured to the Protestants entire religious liberty and freed them from all political disabilities. Henry made use of the tranquillity which followed to restore the internal prosperity of his kingdom, and particularly the wasted finances. In this design he was so successful, with the aid of his prime minister Sully, that the national debt of 350,000,000 livres was diminished by 125,000,000, and 41,000,000 livres were laid up in the treasury. As Henry was riding through the streets of Paris he was stabbed by the fanatic Ravailiac.

The great benefits which Henry IV bestowed upon France entitle him to the designation which he himself assumed at an assembly of the Notables at Rouen in 1596, the Regenerator of France. His benevolent mind, his paternal love for his subjects, his great achievements, his heart, always open to truth, though it exposed his own faults, have preserved his memory in the hearts of the nation. To the end of his life he had to contend against the governors of provinces, Protestant as well as Catholic, who had rendered themselves almost independent under the last kings of the house of Valois. Many of the acts of his internal government show that, while he aimed at restoring the prosperity of the nation by encouraging agriculture, commerce and manufacturing industries, he was determined by all means in his power to strengthen the authority of the Crown. In his foreign policy Henry IV revived the projects of Francis I and Henry II against the house of Austria, and re-established the influence of France in the Catholic states of Italy. He supported Holland in its revolt against Spain; allayed the bitterness of feeling between the Lutherans and the Calvinists, and induced them to form the Evangelical Union. Consult Burton, 'The Fate of Henry of Na-

varre' (1911); Lacombe, 'Henri IV et sa Politique' (1878); Péréfisce, 'Memoirs of Henri IV' (Eng. trans., 1904); Poirson, 'Histoire du règne de Henri IV' (1862-67); Willert, 'Henry of Navarre and the Huguenots in France' (1893).

**HENRY V** (of France). See CHAMBORD, COMTE DE.

**HENRY I**, emperor of Germany: b. about 876; d. Memleben, 2 July 936. He was the son of Otho I, the Illustrious, Duke of Saxony, who had refused the regal dignity offered him in 912. Henry, on the death of his father, became Duke of Saxony and Thuringia. He was chosen king of the Germans by the Franks and Saxons, April 919, at Fritzlär. The surname DER FINKLER or DER VOGLER (the Fowler), sometimes applied to him, did not arise until the 12th century, and is based upon the unauthentic legend that the princes who notified him of election found him at fowling. He subdued Duke Giselbert of Lorraine, and in 924 concluded with the Hungarians a nine-years' treaty of peace, with the condition that he should pay a yearly tribute. This tribute he finally refused (933), whereupon the Hungarians invaded his realm with two large armies which he defeated, the one near Göttingen, the other at Riade (Riethenburg). In 934 he waged a victorious contest against the Danes. He thoroughly reorganized the German defensive military system, built fortified cities and fortified others. Though he did not technically possess the title of emperor, he was the real founder of the mediæval German empire, and is recognized as a wise ruler and skilful military leader.

**HENRY II**, THE LAME, emperor of Germany: b. 6 May 973; d. Grona, near Göttingen, 13 July 1024. He was the last of the Saxon line, a son of Henry the Quarreler of Bavaria, and great-grandson of the Emperor Henry I. He inherited Bavaria on the death of his father in 995. On the death of Otho III in the beginning of 1002 he laid claim to the kingdom, and was crowned at Mainz 7 June. He was for a time busily occupied in wars with Duke Boleslav II of Bohemia, the Margrave Henry of Schweinfurt, and the Margrave Ernest of Austria. In 1004 and 1013 he was obliged to make expeditions to Italy, where Arduin of Ivrea was twice chosen king. Having thoroughly defeated his opponent, he was invested with the imperial insignia at Rome by Pope Benedict VIII, 14 Feb. 1014. His somewhat protracted struggle with Boleslav of Poland ended without any considerable success. At the call of the Pope he fought against the Greeks in lower Italy. For his zeal in the interests of the Church he was canonized by Eugenius III in 1146. Consult Cohn, 'Kaiser Heinrich II' (1867); Hirsch, 'Jahrbücher des deutschen Reichs unter Kaiser Heinrich II' (1874).

**HENRY III**, variously surnamed the OLD, the BLACK, and the PIOUS, emperor of Germany: b. Osterbeck, Netherlands, 28 Oct. 1017; d. Botfeld, 5 Oct. 1056. He was the second of the house of the Salian Franks, son of the Emperor Conrad II, whom he succeeded in the

imperial dignity 1039. He had already been chosen king in 1026. He weakened the power of the nobles by keeping the great fiefs when they became vacant for himself or members of his family, or by bestowing them upon less powerful nobles than had previously possessed them. He also extended the power of the empire by forcing the Duke of Bohemia in 1042, and the king of Hungary in 1044, and again in 1047, to accept their dominions as imperial fiefs. His influence was paramount in Italy, especially in the south, where the Normans in Apulia and Calabria paid homage to him as their feudal chief. On the occasion of his first visit to Italy (1046) he put an end to the contention between Benedict IX, Sylvester III and Gregory VI for the papacy, causing them all to be deposed, and Suitger, bishop of Bamberg, to be elected in their stead with the title of Clement II. His efforts were now directed toward rooting out the evils which were rife among the clergy, but not less toward securing the permanence of the influence of the empire over the See of Rome. Henry III was not only a powerful ruler, but also a patron of arts and sciences. He founded numerous schools in connection with the monasteries and built the cathedrals of Worms, Mainz and Spiers. Consult Steindorff, *‘Jahrbücher des deutschen Reichs unter Heinrich III’* (1874-81).

**HENRY IV**, emperor of Germany: b. 11 Nov. 1050; d. Liège, 7 Aug. 1106. He was the son of Henry III. He was crowned at Aix-la-Chapelle in 1054. His reign was from the first disturbed by contests with his vassals. The Saxons joined with the inhabitants of Thuringia, drove Henry from Saxony (1073), and destroyed many of the castles which he had built to overawe the inhabitants. But some churches having been destroyed by the populace, Henry accused the Saxons to the Pope of sacrilege and thus gave him an opportunity to interfere as umpire. The Saxons offered to make every satisfaction; but Henry suddenly invaded their territory with a powerful army, and attacked them 9 June 1075, at Hohenburg, on the Unstrut, where they suffered a total defeat. He imprisoned nobles and ecclesiastics, and aroused the attention of the papacy. Gregory VII (Hildebrand), who had been elevated to the papal chair some years before without the consent of the imperial court, eagerly seized this opportunity to challenge Henry's usurpation of the power of investing bishops with the spiritual insignia of office, and in December 1075 presented to the king a list of charges and demanded proofs of obedience to the Church. Henry then instigated the bishops, assembled by his order at Worms, to renounce their obedience to the Pope (24 Jan. 1076). Gregory, however, pronounced the sentence of excommunication against him (22 Feb.), and absolved his subjects from their allegiance, and Henry soon found himself deserted. In this state of affairs he was obliged to go to Italy and make his submission to the Pope. He found Gregory at Canossa, not far from Reggio, a strong castle belonging to Matilda, countess of Tuscany, whither he had retired for security. Three days successively, in the depth of win-

ter, Henry appeared in a penitential dress in the court of the castle, before the intercession of Matilda obtained for him an audience of the Pope (28 Jan. 1077), when he was released from the sentence of excommunication only upon submitting to the most humiliating conditions. Some of the Italian princes, who had long been dissatisfied with Gregory and were desirous of deposing him, gathered round Henry, who was not disposed to fulfil the hard conditions imposed upon him, and offered him their assistance. The German princes, however, at the instigation of the Pope, assembled at Forchheim in 1077, and elected Rudolf, Duke of Swabia, king. Henry hastened back to Germany and overcame his rival, who lost his life in battle at Merseburg in 1080. Gregory again excommunicated Henry; but at the councils of Brixen and Mainz in 1080, the Pope was declared deposed by the German bishops as a heretic and a sorcerer, and Guibert, archbishop of Ravenna, set up in his place, with the title of Clement III. In 1081 Henry marched into Italy to take vengeance on Gregory, and appeared at Easter before Rome. He was not able in that year, however, to pursue the siege of the city, which did not fall into his hands till 1084. He was forced by a conspiracy of the majority of the nobles, led by his son, Henry V, to abdicate at Ingelheim 31 Dec. 1105. Consult von Kronan, *‘Jahrbücher des deutschen Reiches unter Heinrich IV and Heinrich V’* (1890-1909).

**HENRY V**, emperor of Germany: b. 8 Jan. 1081; d. Utrecht, 23 May 1125. He was the son and successor of Henry IV. He was crowned emperor in 1111. His reign was continually disturbed by troubles with the papacy. He was excommunicated no less than four times, and finally in the concordat of Worms (23 Sept. 1122) conceded the advantage to the Pope. He also carried on wars with Flanders, Hungary, and Poland, and with various German nobles. He was the last of the Salic or Frankish family of emperors, which was succeeded by the Swabian house. Consult von Kronan, *‘Jahrbücher des deutschen Reichs unter Heinrich IV and Heinrich V’* (1890-1909).

**HENRY VI**, the CRUEL, emperor of Germany: b. 1165; d. Messina, 28 Sept. 1197. He was the son of Frederick I (Barbarossa), was crowned king in 1169, and succeeded his father as emperor in 1190. He was involved in wars in Italy to assure his possessions there. It was during his reign that Richard Cœur de Lion, returning from Palestine, was imprisoned by Leopold of Austria and surrendered to the emperor, who exacted a heavy ransom. Consult Toch, *‘Jahrbücher des deutschen Reichs unter Heinrich VI’* (1867).

**HENRY VII**, OF LUXEMBURG, emperor of Germany: b. 1269; d. Buonconvento, Italy, 24 Aug. 1313. He was son of the Count of Luxembourg, and was chosen king of the Romans, 27 Nov. 1308, and crowned at Aix-la-Chapelle, 6 Jan. 1309. In 1311 he received the iron crown of the Lombards, and 29 June 1312 was crowned emperor at the Lateran. His march into Italy at the head of a Ghibelline army (October 1310) was hailed by Dante, who did homage at some time and place unknown. His sudden

death immediately after reception of the Eucharist led to the unfounded rumor that he had been poisoned.

**HENRY**, prince of Portugal, surnamed the **NAVIGATOR**: b. 4 March 1394; d. 13 Nov. 1460. He was a grandson of old John of Gaunt; nephew of Henry IV of England; and great-grandson of Edward III. His father, King João or John, who formed a close English connection by marrying Philippa of Lancaster, was the first king of the house of Avitz, under which Portugal, for 200 years, rose to its highest prosperity and power. The career of Portugal in exploration and discovery, due to the genius and devotion of Prince Henry, his biographer characterizes as "a phenomenon without example in the world's history, resulting from the thought and perseverance of one man." Prince Henry had become one of the first soldiers of his age when, in 1420, he refused offers of military command, and undertook to direct, at Sagres (the extreme point of land of Europe looking southwest into the Atlantic Sea of Darkness), plans of exploration of the unknown seas of the world lying to the west and south. His idea was to overcome the difficulties of the worst part of that immense world of storms, that lying west of Africa, and thereby get round Africa to the south and sail to India, and China, and the isles beyond India. Every year he sent out two or three caravels; but his great thought and indomitable perseverance had yielded only "twelve years of costly failure and disheartening ridicule," when, in 1434, the first great success was achieved by Gil Eannes, that of sailing beyond Cape Bojador. Prince Henry made his seat at Sagres, one of the most desolate spots in the world, a school of navigation, a resort for explorers and navigators. His contemporary Azurara says of him: "Stout of heart and keen of intellect, he was extraordinarily ambitious of achieving great deeds. His self-discipline was unsurpassed; all his days were spent in hard work, and often he passed the night without sleep; so that by dint of unflagging industry he conquered what seemed to be impossibilities to other men. His household formed a training-school for the young nobility of the country." Consult 'Lives' by Beazley (1895), and Major (1868); Martin, 'The Golden Age of Prince Henry the Navigator' (1911).

**HENRY**, prince of Prussia (**HEINRICH ALBERT WILHELM**) German naval officer: b. Potsdam, 14 Aug. 1862. He is a brother of Emperor William II, and married Princess Irene, daughter of the late Grand Duke Ludwig IV, of Hesse, in 1888. He was educated in the Gymnasium at Kassel (1875-77) and at the Marine Academy (1884-86). He succeeded vice-admiral von Diederichs in command of the German fleet in Chinese waters, in March 1899, became admiral in 1901, chief of the active battleship fleet in 1906. He traveled around the world in 1878-80, and visited the United States in 1882-84, and again in 1902. In January 1902, Emperor William requested that the President's daughter, Alice, should christen the royal yacht then building in the United States. After receiving the consent of President Roosevelt, the emperor informed the President that he had ordered his yacht, the *Hohenzollern*, to be present at the ceremony, and had appointed his

brother, Admiral Prince Henry of Prussia, to represent him on the occasion. The prince arrived in New York city on 23 February and left on 12 March, after receiving many national, municipal and social honors. He traveled in South America in 1914, and at the outbreak of the European War in the same year he held the chief command of the German fleet.

**HENRY**, surnamed **THE LION**, Duke of Saxony and Bavaria: b. Ravensburg, 1129; d. Brunswick, 6 Aug. 1195. He was the son of Henry the Proud and the head of the Guelphs. He greatly enlarged his domains, and so increased in power as finally to become a dangerous rival of the emperor Frederick I, Barbarossa. His refusal to support Frederick was among the chief causes of the latter's defeat at Legnano (29 May 1176). He was summoned to appear at three Diets, and, having failed to attend was placed under the Imperial ban (1180). Later he was allowed to retain Lüneburg and Brunswick upon condition of going for three years into exile. He was finally reconciled with Henry VI.

**HENRY, Alexander**, American traveler: b. New Brunswick, N. J., August 1739; d. Montreal, 4 April 1824. He joined the Canadian expedition under Amherst against the French (1760) and when peace followed he went to Michilimackinac and engaged in the fur trade. After the massacre of the English by the Indians in that place he, being one of the few survivors, remained a captive among the Ojibways at Sault Sainte Marie for 12 months, when he escaped and resumed the fur trade. In the pursuit of this business he traveled between Montreal and the Rocky Mountains, the literary result of which was a remarkable book, 'Travel and Adventures in Canada and the Indian Territories between the years 1760 and 1776,' published at New York in 1809. He interested himself in the copper mines on Lake Superior and for many years made an effort to establish a company for their exploitation. Consult Bain's edition of the 'Travels and Adventures' (Toronto 1901); and Ginnell, 'Trails of the Pathfinders' (1911).

**HENRY, Edward Lamson**, American painter: b. Charleston, N. C., 12 Jan. 1841. He began his artistic studies at the Philadelphia Academy and in 1860 went to Paris where he studied for three years under Saisse and Courbet. In 1869 he was elected a member of the National Academy. He has frequently revisited Europe for the purpose of sketching the scenery, although his specialty is domestic genre and history. In the Albany Historical Society building is one of his most characteristic pictures, which shows his careful grouping of figures, his attention to detail as well as the stiffness of his drawing and his deficiency in the sense of color which recalls Wilkie, whose swing and movement he lacks, though he exhibits some of the humor of the Scottish master. The picture referred to is a crowded canvas of 63 figures with the title 'Initial Excursion of the First Railway Ever Constructed in New York State.' Among his historical pictures the best are 'Battle of Germantown,' owned by William Astor; 'Declaration of Independence,' owned by J. W. Drexel; 'Reception to Lafayette'; 'The Return of the First Congress'; 'City Point,

Grant's Headquarters'; 'In Sight of Home,' and 'Waiting for an Answer.'

**HENRY, Guy Vernon**, American soldier: b. Fort Smith, Indian Territory, 1839; d. Ponce, Porto Rico, 1899. He was graduated at West Point 1861, and went to the front in the Civil War, taking part in four years of the hardest fighting, from Bull Run to Cold Harbor. At 23 he was commissioned colonel of the 40th Massachusetts volunteers. After the Civil War he was transferred to the 3d cavalry, and in 1874 was in Arizona. He continued his Indian campaign, though severely wounded on one occasion, and compelled to be invalided. He served through the outbreak of the Sioux in 1890, and was also on service at Porto Rico during the Spanish-American War, where he died of typhoid fever.

**HENRY, Joseph**, American physicist: b. Albany, N. Y., 17 Dec. 1797; d. Washington, D. C., 13 May 1878. He was educated at the Albany Academy, after graduation undertook the study of chemistry, anatomy and physiology with a view to adopting the medical profession. During the years 1824-25, he contributed occasional scientific papers to the Albany Institute, his especial subjects being chemistry and mechanics, and was appointed assistant engineer on the survey instituted for a road between Lake Erie and the Hudson. In the spring of 1826 he was elected teacher of mathematics and natural philosophy in the Albany Academy and in the latter part of 1827 read a very important paper before the Albany Institute, 'On Some Modifications of the Electro-Magnetic Apparatus.' He made his first public demonstration of his magnetic discoveries in exhibiting before the Institute small electro-magnets wound with silk-covered wire. These magnets had a greatly multiplied lifting power over any that had yet been known. In this lay the essential point of his first discovery, for he was undoubtedly the earliest physicist to adopt insulated or silk-covered wire for the magnetic coil, and to employ spool winding for the limb of the magnet. He demonstrated also for the first time, by a very intelligent experiment, the difference of action in a quantity magnet excited by a quantity battery of a single pair, and an intensity magnet with a long fine wire coil excited by an intensity battery of many elements, having their resistances suitably proportioned. The first of these two forms was not capable of being employed for telegraphic purposes, while the intensity magnets with their attachments could be so applied. The quantity magnets which he exhibited caused a good deal of excitement in the scientific world. Their attractive power was at that time quite unprecedented. One of them had sufficient power to raise as much as 3,500 pounds.

Henry was the first to show that iron could be magnetized at a distance, and to invent a suitable combination of magnet and battery for the production of this result. In 1831 he made this experimental demonstration. He suspended a mile of insulated copper wire round a chamber in the Academy, and so placed a bell at one extremity of it that it was struck by the polarized armature of an intensity battery connected with the other extremity. This was the earliest example of the magnetic telegraph, for the galvanometer or needle had been the principle on which all preceding experiments had been con-

ducted. It was not long after that he invented a machine, and finally constructed it, which is recognized as the first electro-magnetic engine with automatic pole-changer. In 1832 after repeated experiments he discovered how to give greater intensity to a magnetic discharge by the induction of a current on itself in a long spiral or helical wire. These progressive steps in magnetic science gained for him an extended reputation, and soon after the publication of the last experiment in Silliman's 'American Journal of Science' Henry was elected professor of natural philosophy in Princeton College. The discovery of the spiral or helical conductor suggested to him further experiments, and his extended researches and their results were announced by him in a paper published 1834, under the title 'On the Influence of a Spiral Conductor in Increasing the Intensity of Electricity from a Galvanic Arrangement of a Single Pair.' He supplemented these discoveries by many others, and by his experiments produced electrical combinations which were undoubtedly precursors of later relay and receiving magnets, while his demonstration of the conditions and range of induction from electrical currents, and the successive orders of induction in the passage of frictional electricity, as well as his discovery of the oscillatory nature of electricity, paved the way for that great scientific and practical resolution which was to consummate by the genius of Morse and his confrères.

In 1846 Henry was called to a new sphere of activity, in which he exhibited his usual zeal and enthusiasm. The Smithsonian Institution had just come into existence, and during the formative period of the great museum, he was appointed to be its secretary. The office did not so far engross his attention as to make him neglectful of practical work in science. He found time to investigate the acoustics of public buildings, meteorological changes of the atmosphere and methods for telegraphic transmission of meteorological observation from all points of the continent. From 1868 up to his death he was president of the National Academy of Sciences, and of the Philosophical Society of Washington from 1871, when it was first organized.

**HENRY, Matthew**, English Nonconformist clergyman: b. Broadoak, Flintshire, Wales, 18 Oct. 1662; d. Nantwich, Cheshire, 22 June 1714. In 1686, having qualified himself for the ministry, he began to preach; and in the succeeding year he was settled as pastor to a congregation at Chester, and continued to discharge the duties of his office for 25 years, when he removed to Hackney, London, where his clerical labors were still more extended. Besides his greatest work, 'Expositions on the Bible' (1710), he was the author of 'A Discourse on Schism'; 'A Scripture Catechism'; 'Family Hymns,' etc.

**HENRY, O.** Nom de plume of William Sydney Porter (q.v.).

**HENRY, Patrick**, American orator and statesman: b. 29 May 1736, in Hanover County, Va., within a few miles of the birthplace of Henry Clay; d. 6 June 1799, in Charlotte County, Va. His father, John Henry, was a well-educated Scotchman, presiding judge of the Hanover court. He was a cousin of William Robertson, author of the 'History of the Emperor Charles the Fifth.' Another relative

*J. Henry*

of his was Henry Brougham, the radical Scotch writer, who became lord chancellor of England. Of Patrick Henry's mother, "a portly, handsome dame," a pleasing portrait is left us by William Byrd, of Westover, "the genial littérateur of colonial Virginia."

The schools were poor in his neighborhood, and Patrick seems to have profited little by them. From his uncle, the rector of the parish, he gained a rudimentary knowledge of the classics and mathematics. He was a frolicsome and vagrant youth, fond of hunting and frontier life in general. At 18 years of age, and without money or employment, he married Sarah Shelton, a poor girl of the neighborhood. He kept a store and failed; he tried farming, and failed; then he returned to the store, only to fail again. He now turned to law, and spent a few weeks in reading upon that subject. Having received his license, he began to practise in his native county, while he assisted in the tavern kept by his father-in-law.

In 1763 Henry singled himself out as a born orator by his impassioned plea in "The Parsons' Cause." The king had annulled a statute of the Virginia burgesses, which compelled the clergy to accept the depreciated currency of the colony in payment of their annual salaries, in lieu of 16,000 pounds of tobacco as theretofore, a product which was then selling at a high price. Henry startled the court and the countryside by asserting "that a king, by annulling or disallowing acts of so salutary a nature, from being the father of his people, degenerates into a tyrant, and forfeits all right to his subjects' obedience." Henry's utterance on this occasion was in keeping with the bold address, two years previous, of James Otis, who declared that the tyranny lurking in general search warrants had "cost one king of England his head and another his throne."

Henry became a member of the House of Burgesses in May 1765, just at the time of the arrival of the Stamp Act. Unabashed by his rustic appearance and inexperience in legislative matters, he brought forward a series of resolutions to the effect "that the general assembly of this colony have the only sole and exclusive right and power to lay taxes." In the bloody debate which followed he was "opposed by Randolph, Bland, Pendleton, Nicholas, Wythe, and all the old members, whose influence in the House till then had been unbroken," so we learn from Jefferson, then a college student, who was present at the session of the burgesses. In pleading the injustice of the Stamp Act, Henry used the famous words: "Cæsar had his Brutus; Charles the First, his Cromwell; and George the Third ['Treason!'] shouted the Speaker. 'Treason,' 'treason,' echoed others. After a moment's pause, the orator completed the interrupted sentence in a manner that showed no less defiance than adroitness] and George the Third may profit by their example. If this be treason, make the most of it." As the royal governor of Massachusetts wrote the ministry: "The Virginia resolves proved an alarm bell to the disaffected." By his intrepidity, his oratory, and his intuition, at once patriotic and prophetic, Patrick Henry became henceforth the protagonist of the colonial cause, sharing with Otis, Gadsden, and Samuel Adams the high honor of launching the American Revolution.

Henry represented Virginia in the first colo-

nia Congress, which met at Philadelphia 5 Sept. 1774, when he gave final expression to the feeling of nationality: "The distinctions between Virginians, Pennsylvanians, New Yorkers, and New Englanders are no more. I am not a Virginian, but an American." With this speech compare Christopher Gadsden's remark nine years before at the Stamp Act congress in New York: "There ought to be no New England men, no New Yorkers, known on the continent, but all of us Americans."

On 23 March 1775, Henry, as a member of the second Virginia convention, which met in Saint John's Church, Richmond, moved that the colony be armed, and again electrified the patriots with his eloquence in support of this radical measure by the oft-quoted utterance: "Gentlemen may cry peace! peace!—but there is no peace! The war is actually begun! The next gale that sweeps from the North will bring to our ears the clash of resounding arms! Our brethren are already in the field! . . . Is life so dear, or peace so sweet, as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take; but as for me, give me liberty, or give me death!" Col. Edward Carrington, listening at a window in the east end of the church, was so transported by the eloquence of Henry, that he exclaimed, "Let me be buried at this spot," a wish that was respected at his death in 1810. Such was the universal testimony of those present as to the overwhelming effect of Henry's speech at that crisis.

On 5 Aug. 1775, Henry was made commander-in-chief of the Virginia troops. In May of that year he had made a dash against Lord Dunmore, on account of the governor's secret seizure of some powder belonging to the colony. Deeming himself slighted by the Committee of Public Safety, which acted during the interim as the executive of Virginia, Henry, with some heat, threw up his military commission, 28 Feb. 1776.

Fortunate was it for the colonial cause that Henry was again at liberty to exert his forensic powers in the councils of the State. Representing Hanover County in the convention which met at Williamsburg 6 May 1776, he contributed greatly to the constructive work of that celebrated body, notably the motion for a declaration of American independence and the framing of a constitution for Virginia. Among the convention papers in the State Library at Richmond were found three endorsed by the clerk, "Rough Resolutions. Independence." William Wirt Henry, after minute comparison of the handwriting of these, concluded that the first was penned by Patrick Henry; the second by Meriwether Smith; and the third by Edmund Pendleton; and that the resolution actually introduced by Nelson was the one written by Henry. On the other hand, Edmund Randolph, who was a member of the convention, says that the resolution declaring for independence "was drawn by Pendleton, was offered in convention by Nelson, and was advocated on the floor by Henry."

On 29 June 1776, the natal day of the commonwealth of Virginia, Patrick Henry was elected governor, took the oath of office 5 July, and served for three annual terms in succession. As governor he commissioned, on 2 Jan. 1778, Col. George Rogers Clark to enlist seven com-

panies of men for the expedition against the British garrisons in the Northwest Territory. After leaving the executive office, Henry settled in Henry County, on an estate of about 10,000 acres, called Leatherwood, where he lived until he became governor for the fourth time, on 30 Nov. 1784. In the Virginia convention of 1788, which was called to ratify the Constitution of the United States, Henry led the opposition on the ground that such a federal government encroached too far upon the rights of the several States. While the arguments of Madison and the influence of Washington happily prevailed on that critical occasion, Henry was a chief agent in securing the amendments which constitute a bill of rights in the national instrument. His objection to the Constitution was stated concisely in his first speech before the convention: "That this is a consolidated government is demonstrably clear; and the danger of such a government is, to my mind, very striking.

Who authorized them (the framers) to speak the language of *we the people*, instead of *we the States*? States are the characteristics and the soul of a confederation. If the States be not the agents of this compact, it must be one great, consolidated, national government of the people of all the States." Such was his clear discernment of the real nature of the government established by the Constitution of the United States.

S. C. MITCHELL.

**HENRY, Thomas William**, Australian journalist and literary man: b. Sydney, November 1862. He has been continuously in newspaper work since 1878. From 1899 to 1903 he was editor of the *Herald*; after which he became editor of the *Sunday Morning Herald*. His published works include 'Fortunate Days' (1890); 'The Girrel at Birrells' (London 1896); 'A Station Courtship' (1898). Most of his best work is buried in magazines and newspapers. He is considered one of the best editorial writers in Australia.

**HENRY, William Arnon**, American educator: b. Norwalk, Ohio, 16 June 1850. He obtained his early education in the Holbrook Normal School at Lebanon, Ohio; studied at Ohio Wesleyan University from 1867-69, and at Cornell University from 1876-80, receiving the degree of B. S. Agr. He was appointed professor of botany and agriculture in the University of Wisconsin in 1881, professor of agriculture in 1883, director of the agricultural experiment station in 1887, and in 1891 was made Dean of the College of Agriculture, serving as dean and director until June 1907, when he retired owing to ill health, with the title professor emeritus of agriculture. He wrote 'Handbook on Northern Wisconsin' (1895); 'Feeds and Feeding' (1898; 16th ed., 1916).

**HENRY, William Wirt**, American historian and lawyer: b. Red Hill, Va., 14 Feb. 1831; d. 5 Dec. 1900. He was educated at the University of Virginia, and took up the practice of law, later being elected to the legislature for four terms. He preferred, however, historical research to his law practise, and spent much of his time in that pursuit. He was president of the American Historical Association and of the Virginia Historical Society. He is chiefly noted for his 'Life, Correspondence, and Speeches of Patrick Henry' (3 vols., 1890-91).

**HENRY DOCUMENTS**, 26 letters of 1809 between John Henry and several British officials—Sir James H. Craig, governor of British North America, his secretary Ryland, and the English foreign secretary Lord Liverpool, with related papers. Tempted by the hostility of the New England Federalists to the Embargo (q.v.), and the threats of secession by the extremists, Craig sent the adventurer Henry in January 1809 to sound the people as to reunion with Great Britain. Henry remained till June, and sent back the most extravagant reports of the secession feeling, but the British ministry not paying him as he thought fitting, he sold the copies of the letters and other documents to the United States government in February 1812 for \$50,000. Madison used them to hurry forward the War of 1812, by sending them to Congress on March 9 with a special message, in which he accused Great Britain of attempting to dismember the Union by intrigue and annex the North to itself. So far as the New Englanders were concerned, however, the papers contained nothing incriminatory of secession movements.

**HENRY MOUNTAINS**. A group of mountains in the eastern part of Garfield County, Utah, on the west side of the upper part of Grand Canyon of Colorado River. It is about 40 miles long. The principal peaks are mounts Ellen, 11,485 feet, Pennell, 11,330 feet, Hillers, 10,650 feet, Ellsworth, 8,150 feet and Holmes, 7,950 feet. The adjoining area of the High Plateaus ranges in altitude from 4,000 to 6,000 feet. They are noted examples of the form of igneous intrusion known as laccoliths, the mountains consisting of lens-shaped masses of trachyte included in the Cretaceous and Triassic sandstones. Consult Gilbert, G. K., 'Geology of the Henry Mountains' (United States Geological and Geographical Survey of Rocky Mountain Region, Washington 1880).

**HENRY PHIPPS INSTITUTE**, The, for the study, treatment and prevention of tuberculosis, was established in 1903 by Mr. Henry Phipps, of New York, at Third and Pine Streets, Philadelphia. The situation was chosen as being in a section of the city in which tuberculosis was most prevalent, and was made possible by a special law permitting the establishment of the Hospital within the city limits. In February 1910, Mr. Phipps transferred the Institute to the University of Pennsylvania, having previously engaged to erect an appropriate permanent building for its accommodation upon grounds gradually acquired with this in view. The new building, located at Seventh and Lombard streets, was completed in May 1913. It is a beautiful and commodious edifice and embodies the most modern ideas of hospital, sanatorium and laboratory construction. The Institute is the first fully organized and equipped institution of the kind with university connection. An entire reorganization of the plan of work has been made by the University. The work is divided into distinct fields of activity, represented by two corresponding departments, the laboratory or research department, and the clinical and sociological department, each under its special director. An advisory council of 14 members has been selected, composed of the most distinguished men of the country in the lines of work carried on by this Institute, who

visit the institution at least once each year. On account of its connection with the University, the Institute offers facilities for study to the students of the University of Pennsylvania, especially those of the Medical School. Both by visits to the institution and through the publication of the results of its investigations and research, the Institute has proven valuable both to students and physicians throughout the country interested in this special work.

**HENSCHEL**, hĕn'shĕl, SIR George, English composer and concert singer: b. Breslau, 18 Feb. 1850. He began his musical education under the pianist Moscheles, the contrapuntist Richter, and the vocal teacher Gosse in the Conservatory at Leipzig. In 1870 he sang with great success at the Beethoven celebration at Weimar, and toward the end of the same year went to Berlin to complete his studies in musical science and vocalization. He met with a brilliant reception in his professional tour through Cologne, Düsseldorf, and the lower Rhine provinces, and his fame spread over all Germany, Austria, Holland and Russia (1874-77). He was received with immense applause in London, and crossing the Atlantic was appointed musical director in Boston (1883-85); when he returned to London and became teacher of singing in the Royal College of Music (1886-88). He made England his permanent home, and in 1890 was legally naturalized. He was knighted in 1914 by George V. He wrote among his numerous compositions many songs, operas, chamber music and duets, such as 'Wanderlieder'; 'Duette in Kanonform,' 'Serbisches Liederspiel'; 'Stabat Mater' (1894); 'Music to Hamlet' (1892); and the volume 'Personal Recollections of Johannes Brahms,' etc. He married in 1881 Lillian Jane Bailey (d. 1901), a well-known American singer.

**HENSLEY**, Sophia Almon, American lecturer and author: b. Nova Scotia, 31 May 1866. She studied in England and Paris, and moved to New York in 1889. She has been interested in the study of social problems and actively identified with the work of the "Mother's Congress." She has served as president of the Society for the Study of Life in New York City and as vice-president of the New York City Mothers' Club, and lectures frequently. She is author of 'Woman's Love-Letters' and 'Souls.'

**HENSON**, Herbert Hensley, English Anglican clergyman: b. London, 8 Nov. 1863. He graduated at Oxford and elected fellow of All Souls College in that university 1884. He was head of the Oxford House at Bethnal Green, 1887-88, canon of Westminster Abbey and rector of Saint Margaret's 1900-12; and Dean of Durham since 1912. He has attracted wide attention as a fresh and powerful preacher by his utterances on topics of social and political interest, and among his published works may be noted 'Light and Leaven' (1897); 'Cross Bench Views of Current Church Questions' (1902); 'Preaching to the Times' (1903); 'Christ and the Nation' (1908); 'The Liberty of Prophesying' (1909); 'Westminster Sermons' (1910); 'The Creed in the Pulpit' (1912); 'War-Time Sermons' (1915); 'Robertson of Brighton, 1816-53' (1916).

**HENSON**, Josiah, American negro slave and clergyman: b. Port Tobacco, Md., 1787; d. 1883. His early life was one of great hardship, but he finally escaped to Canada (1828), where he became a Methodist clergyman with a charge at Dresden, Bothwell County, Ontario. He also lectured in the United States. Upon the story of his slave career was based the character of Uncle Tom in Harriet Beecher Stowe's 'Uncle Tom's Cabin' (1852).

**HENTY**, George Alfred, English writer of novels and stories for boys: b. Trumpington, Cambridgeshire, 8 Dec. 1832; d. Weymouth, Dorsetshire, 16 Nov. 1902. He was educated at Westminster and Cambridge; he went to the Crimea during the war with Russia, and served there in the purveyor's department of the army. Soon afterward he went to Italy to organize the hospitals of the Italian legion. As special correspondent of the *Standard* newspaper he went through the Austro-Italian, Franco-Prussian and Turco-Servian, Abyssinian, Ashanti campaigns, besides accompanying Garibaldi in the Tyrol. He described two of these campaigns in the works 'The March to Magdala' (1868) and 'The March to Coomassie' (1874). He wrote eight novels, among which are 'A Woman of the Commune' (1895); 'The Queen's Cup' (1897); and 'Colonel Thorn-dyke's Secret' (1898); but he is much more widely known as the author of a large number of stimulating stories of adventure for boys, many of them based on famous historical events. Among these are 'The Young Franc-Tireurs' (1871); 'The Young Buglers,' a tale of the Peninsular War (1879); 'In Times of Peril,' a tale of India (1881); 'Under Drake's Flag' (1882); 'The Lion of the North' (1885), a story of Gustavus Adolphus; 'With Lee in Virginia' (1889); 'By Pike and Dyke' (1889), a story of the Dutch War of Independence; 'In the Irish Brigade' (1900); and 'Out with Garibaldi' (1900); 'With Roberts to Pretoria' (1902).

**HEPATIC**A, a genus of plants, liver-leaf, of the crowfoot family (*Ranunculaceae*), closely related to *Anemone*. The best-known species is *H. hepatica*, found wild throughout eastern North America as well as in Europe in woods, and widely cultivated for its attractive and fragrant star-like blue, white, or purple-red flowers, which open in early spring. It is, indeed, one of the earliest of American spring flowers. Sometimes even under the snow its buds, well wrapped up in a warm down, lie upon the broad, furry, liver-shaped leaves, awaiting the first warmth to induce them to open. In the southern Alleghanias its leaves are dried and steeped into a medicinal tea. A more southern species is *H. acuta*.

**HEPBURN vs. GRISWOLD**, 1869: the great case in which the Supreme Court of the United States decided that the government had no power to make its own notes legal tender; reversed through a change in the constitution of the court in *Knox v. Lee* and *Juilliard v. Greenman*. Mrs. Hepburn of Kentucky had given Henry Griswold a note for 11,250 "dollars," payable 20 Feb. 1862; it was not paid when due, and five days subsequently the government passed the act authorizing \$150,000,000 in notes (see **GREENBACKS**), receivable for public and private debts. In 1864 Griswold brought suit

in the chancery court of Louisville for principal and interest; \$12,270 in greenbacks was tendered in settlement, but refused, on the claim that the act did not extend to debts contracted before its passage. The court decided for Mrs. Hepburn; Griswold carried the case to the Kentucky Court of Appeals, which reversed the decision; Mrs. Hepburn carried it to the Supreme Court, which on account of the far-reaching importance of the case, and at the request of the attorney-general, laid it over till 1868, when it was reargued, and finally decided in the December term 1869. Chief Justice Chase, for five justices against three, decided that the act extended to all debts, contracted as well before as after its passage, and that the question therefore must be whether the government had the power to make anything but coin a legal tender; that it could not do so, under the Constitution, because at the time of its adoption no money but gold and silver was recognized; that as paper money never rose above coin and almost always fell below it, each particle of depreciation was so much abstracted from the value understood by the parties to the contract, and was therefore an unlawful deprivation of private property; that the power of Congress to use "necessary means" to carry out its power of making war did not convey this right, because this was no more a special means of carrying out war powers than any other powers, and would enable it to issue bills of credit and make them legal tender just as much in the post office business or the patent business as the war. The minority admitted that it was so impairing the obligation of contracts, but asserted that Congress was given the power to do so; and this is now law. See LEGAL-TENDER CASES.

**HEPHÆSTUS**, hē-fēs'tus, a god of the ancient Greeks, identified by the Romans with their Vulcanus. He presided over fire, and was the patron of all artists who worked in iron and metals. He was the son of Zeus (Jupiter) and Hera (Juno). Homer says that his mother was so disgusted with the deformities of her son, that she threw him into the sea as soon as born, where he remained for nine years. He afterward returned, but for taking the part of his mother on one occasion against Zeus was thrown down by the latter a second time. He was a whole day in passing from heaven to earth, and fell in the island of Lemnos. He broke his leg by the fall, and ever after remained lame of one foot. He fixed his residence in Lemnos, where he built himself a palace, and raised forges to work metals. The Cyclopes of Sicily were his ministers and attendants; and with him they fabricated not only the thunderbolts of Zeus, but also arms for the gods and the most celebrated heroes. His forges were supposed to be under Mount Ætna, in the island of Sicily, as well as in every part of the earth where there were volcanoes. Aphrodite (Venus) was the wife of Hephæstus. Her infidelity is well known. Her amours with Ares (Mars) were discovered by Phœbus, and exposed to the gods by her own husband. He appears on some monuments with a long beard, disheveled hair, half naked, and a small round cap on his head, while he holds a hammer and pincers in his hand. See GREEK GODS.

**HEPTAMERON**, The. The 'Heptameron' of Marguerite, sister of François I, variously

called Marguerite d'Angoulême, Marguerite de Valois, or Marguerite de Navarre, is a collection of stories modeled on the 'Decameron' of Boccaccio. A company of travelers, five gentlemen and five ladies, on their way home from Caunterets, in the Pyrenees, are overtaken by a sudden storm and flood, and take refuge in a hospitable monastery till the impassable roads may be repaired. To while away the time, after giving the morning to hearing mass and the reading of Holy Writ, they pass the afternoon in telling stories that take us very far from the atmosphere of such edifying exercises. Each person tells a story each day. Apparently it was Marguerite's plan that 10 days should be passed thus, as in the Decameron. But the death of her brother interrupted her labors, and but 72 stories had been finished at her death, bringing the seventh day to an end, but only beginning the eighth; hence the name 'Heptameron.' Love is the invariable theme, but in ever varying guise, from gross appetite to fine and pure devotion. The tone is mainly that of gay and frank sensuality familiar to the Renaissance, but there is not a little fine feeling and delicate sentiment, and we may detect a tendency to look beyond the incident and the situation to the psychology and the moral quality of the actors that foreshadows the later development of fiction. A very interesting feature of the Heptameron is the brief comments of the company after each tale, in which, though quite divergent views of love are represented, we can discern Marguerite's own high ideal of womanly virtue and manly courtesy. The stories were published first in 1558 under the title 'Histoire des amanz fortunez,' but in incomplete form, and, still incomplete, under their present title in 1559. The edition of F. Frank (3 vols., 1879) is considered the best. There are numerous translations in English.

ARTHUR G. CANFIELD.

**HEPTARCHY**, seven Anglo-Saxon kingdoms into which England was at one time or other supposed to be divided, although the kingdoms were founded at different times, and at no one time were they all independent monarchies together. In 827 King Egbert of Wessex united them into one kingdom, and claimed the title king of England. See ENGLAND.

**HEPTASOPHS**, Improved Order of, a benefit society, organized in 1878 as an independent branch of the Order of Heptasophs (q.v.). At the time of secession the Heptasophs had not adopted the benefit system. The constitution and ceremonies are identical with those of the parent order. At the close of 1910 it had 1,102 conclaves, a membership of 74,656, and since its organization had disbursed in benefits nearly \$17,000,000.

**HEPTASOPHS**, Order of, a benevolent society in the United States founded in New Orleans 1852 by Alexander Leonard Saunders and other Freemasons, originally called "The Seven Wise Men." The ritual of its ceremonial is elaborate; the membership of each chapter is seven, or a multiple of that number. In 1872 the adoption of a death benefit system was agitated and the discussion led to the secession in 1878 of the Zeta Conclave of Baltimore, which organized the Improved Order of Heptasophs (q.v.). In 1880 the Order of Hepta-

sophs adopted the benefit system. Members must be white males and profess a belief in the Supreme Being. Their number in 18 States amounts to about 4,000.

**HEPWORTH, George Hughes**, American clergyman, journalist and author: b. Boston, 4 Feb. 1833; d. 7 June 1902. He was brought up a Unitarian and after leaving the Harvard Divinity School held Unitarian pastorates at Nantucket, Boston and New York. He advocated preaching in theatres and conducted theatre meetings in various cities. Being not wholly at ease in the Unitarian denomination, he entered the Congregationalist ministry in 1872. He subsequently quitted the ministry and became attached to the editorial staff of the New York *Herald*. He published 'The Whip; Hoe, and Sword' (1864); 'The Criminal, the Crime, the Penalty' (1865); 'Starboard and Port' (1876), record of a yacht cruise; 'Hiram Golf's Religion'; 'Through Armenia on Horseback' (1899). Consult Ward, 'George H. Hepworth; the Story of his Life' (1903).

**HERA**, hērā or -rē, a mythological goddess of the Greek pantheon, identified by the Romans with their Juno, the sister and wife of Zeus (Jupiter), and daughter of Kronos (Saturn) and Rhea (Cybele). The poets represent Zeus as a faithless husband and Hera as a violent, jealous and vindictive wife. She was worshipped in all Greece, but her principal seats were at Argos and Samos. The companions of Hera were the Graces and Hours. Iris, a personification of the rainbow, which seems to stretch from heaven to earth, was her messenger. Her usual attribute is a royal diadem. The temples built in her honor were called Herææ. The principal one was at Argos, which city was considered to be especially under her protection. She is represented by Homer as taking the part of the Greeks in the Trojan War, being actuated by revenge for the slight passed on her by the Trojan Paris, who gave the golden apple inscribed "To the Fairest" not to her, but to Aphrodite. See GREEK GODS.

**HERACLES**. See HERCULES.

**HERACLITUS**, Greek philosopher: b. Ephesus, who flourished about 513 B.C. He traveled in different countries, particularly in Africa. On his return to Ephesus he was offered the chief magistracy, but refused it. He left a work on nature, in which he treats also of religion and politics. Some fragments only of this work remain. He is considered as belonging generally to the Ionic school of philosophers, though he differed from it in important particulars. He considered fire as the first principle of all things, describing it as an ethereal substance, "self-kindled and self-extinguished," from which the world is evolved (not made) by a natural operation. It is also a rational principle and the source of the human soul. Phenomena exist in a constant state of flux, always tending to assume new forms, and finally returning again to their source.

**HERACLIUS**, hēr-a-kl'ūs, Roman emperor of the East, from 610 to 641: b. Cappadocia, about 575 A.D. He was the son of Heraclius, exarch of Africa, who had gained great renown by his victories over the Persians. The elder Heraclius of the East was applied to by a powerful body of insurgents to claim

the throne for himself. This he declined, but sent his son Heraclius to do so. Heraclius the younger therefore ascended the throne, and though he undoubtedly possessed considerable talents, the Roman empire in the East was tottering to its fall and nothing he was able to do could save it. Before his death Mohammed had carried his victorious arms on every side, and Syria, Palestine, Mesopotamia and Egypt had fallen under the dominion of the caliphs. He was permitted, however, to die in peace and to transmit the succession to his son, who mounted the throne under the title of Constantine III.

**HERALDIC CROSSES**. See CROSSES AND CRUCIFIXES.

**HERALDRY** is the whole group of ceremonial duties discharged by the heralds of a court, an army, a great noble or the like, with the assistance of their pursuivants and under the direction of the Earl Marshal, King-at-Arms, the College of Arms or other chief of the institution. These duties are generally divisible into heraldry proper or the business of regulating ceremonial occasions, such as coronations, marriages among princes, proclamations of important events and the like; and armory, or the art of quasi-science of armorial bearings. In the first of these divisions but little remains of any interest at the present day, for only in Great Britain is the herald of any consequence. There, however, he still has some direction, as at the eventful proclamation of 1 May 1876, when the Queen of Great Britain assumed the title of Empress of India. In the second branch of the subject, the order and marshaling of arms, the Germans are perhaps at the head of modern writers, though the English and Scottish treatises on the subject are more numerous and more widely used. The Germans' thoroughness of investigation has marked their treatment of this subject, which is eminently a branch of mediæval and subsequent history serving to elucidate genealogical research.

Modern heraldry is no older than the tournaments of the Middle Ages. No linking evidences of the science occur during the Dark Ages, although badges and emblems are found on shields and helmets discovered in the ruins of antiquity, while in Biblical times the men of Israel were directed to pitch their tents, every man by his own camp and standard with the ensigns of his father's house. Greek and Roman writers describe devices on shields and helmets; the golden eagle on the shields of the kings of Media; the standards and brilliantly-colored shields borne by the ancient Germans in battle. The office of herald is as ancient as that of priesthood. Spartans, Greeks and Romans had heralds, the Roman officers being divided into three classes: *caduceatores*, heralds of peace; *fetiales*, heralds of war and peace; and *præcones*, judicial criers or messengers. The *caduceator* on a mission carried a wand of laurel or olive (*caduceus*, q.v.), as a symbol of his office and for his security. The *fetiales* are thought to have had a college of 20 members founded by Numa, who formulated the procedure and ceremonies connected with the declaration of war and the making of treaties. The *præcones* were employed to proclaim matters of public interest to the people

at religious ceremonies, in the *comitia*, at public sales, judicial trials, in the senate, on the publication of laws which they read, at funerals, at games, in the army when a general wished to address his men, at executions and at all public meetings. The heralds of the Middle Ages had duties which in part resembled those of the heralds of antiquity. Thus, they carried messages of peace and of defiance, and yet even in the earlier years of feudality their office was an inferior one, they being replaced by ambassadors, diplomats almost in the modern sense, statesmen in whose suite the heralds and pursuivants went to the foreign court. So it was that the chief duty of the herald came to be the care of armories.

The first known tomb or monument with escutcheons in the period of modern history is stated to be the 11th century tomb in the church of Saint Emmeran at Ratisbon, where are the bearings of Varmond, a count of Vasserburg; but this may be a later addition. Another very old specimen and certainly genuine is the shield at Le Mans of Geoffrey Plantagenet, who died in 1150. The use of coats of arms seems to have first become general in the 12th century. Rolls of arms in England are extant in the reigns of Henry III, Edward I and Edward II. Surcoats displayed armorial bearings in the reign of Henry III. The Roll of Caerlaverock, a poem in Norman-French, contains the names and armorial bearings of the knights and barons who attended Edward I at the siege of the Castle of Caerlaverock, Dumfriesshire in 1300 and exhibits heraldry already in a developed form. On coins also, no armorial ensigns are found till the 13th century; but then both coins and the seals of nobles and monasteries display them; the use of arms on the Great Seal of England was introduced by Richard I.

The study of armory became essential when at mediæval tournaments aged knights were appointed, whose duties were to act as arbiters and to pass judgment on coats of arms and the right of knighthood. Whenever a new knight appeared at a tournament, the herald had to *blasen*—that is to blow—the trumpet and proclaim and explain the bearing of his shield or coat of arms. Hence to *blasen* (*blasen*) came to mean, to describe and explain a display of bearings. The heralds were also the chroniclers of the times and were present on all occasions of public ceremony. In France the first herald—*roi-d'armes*—was crowned and consecrated with religious ceremonies, and was called *Montjoie*, from the war-cry of the French royal armies. The heralds were united in associations and their duties formed a branch of science which was communicated only to the members. If any person pretended to the character of a herald, who on examination was found not to belong to the corporation, he was driven away with insults and frequently with violence. The heralds in modern courts are masters of ceremonies. In England there are now three kings at arms; the highest is the *Garber king at arms*; the second, known as *Clarencieux*, is for the southern counties; the third, styled *Norroy*, for the northern provinces. These three kings at arms with six subordinate heralds and four pursuivants form, under the presidency of the Earl Marshal, always the Duke of Norfolk, the herald's college or her-

ald's office, established in 1483. The use of arms by private persons in the British Isles was forbidden by proclamation in the reign of Henry V. All persons who had not borne arms at Agincourt were prohibited from assuming them unless by hereditary descent or with the sanction of the constituted authorities. Periodical circuits called visitations were held afterwards by the provincial heralds to take cognizance of the arms, pedigrees and marriage of such as were entitled to the use of armorial bearings. These visitations continued till about the end of the 17th century; their records, many of which are preserved in the British Museum and elsewhere, contain much genealogical information and are still consulted for evidence of the hereditary right to bear arms.

The practice of *blazoning the arms* is frequently referred to in the poetry of the Troubadours of the 12th and 13th centuries. Those knights who asserted a right to appear at tournaments did so by the blazoning of their arms, and from the Germans this custom was transmitted to the French, for tournaments were held in Germany before they became general in France. The French, however, carried to far greater perfection the tournament, and the blazon of heraldry connected with it, as they did the whole system of chivalry; the French language prevailing at the court of England after the Norman Conquest, pure French expressions came to be preserved in British heraldry. German heraldry, on the contrary, contains almost pure German expressions.

The whole display of any person's arms is called an *achievement*, also spelled *atchievement*. Only the escutcheon, however, is of vital importance. This is the broad surface on which the bearings are *charged*. It is always assumed to be a shield in the case of a man not an ecclesiastic; but churchmen's arms are charged upon an oval or other architectural form, a sort of cartouche, and women's bearings are charged upon a lozenge set vertically. The arms of husband and wife, however, may be charged on a shield divided vertically in the middle, and are then said to be dimidiated or impaled; thus we might say that such an escutcheon bears the arms of Smith impaling the arms of Jones—Smith and Jones standing for the two spouses. It is rare to charge the wife's arms unless she was an heiress, that is to say a lady without brothers, and therefore having the parental arms by right. These rules, however, are those of Great Britain; they differ widely in other countries.

A single escutcheon may be complete with one simple partition. Thus, a horizontal line divides the chief or top of the field at one third of its height from the remainder of the field. If that chief is, say, of gold, while the rest of the field is blue, that by itself makes a very perfect and honorable heraldic blazon. The chief is one of the honorable ordinaries, and others are almost as simple. They are the pale, a vertical stripe in the middle of the shield and one third of its width; the fess, a horizontal stripe; the bend, which goes diagonally from the left hand upper corner to the right hand lower part, ending against the rounded border of the shield; the bend sinister, which is a bend turned the other way (but see below, dexter and sinister); the chevron, which

is a pair of stripes meeting in the middle, forming a figure like the letter A without the cross-bar; the cross, the two arms of which are usually of one quarter the width of the escutcheon; and the saltire, which is a diagonal cross. A shield upon which there is any one of these honorable ordinaries and nothing else, is one of dignity. In general the simpler shields are the older; thus the old family Erskine, with a black pale on a silver field, or the family of Beauchamp with a gold fess on a red field, occupy the most enviable position in having such a plain escutcheon. There are ordinaries of the second rank, such as the quarter or canton, the orle, and besides these there are very many bearings in common use, especially those which are diminutives of the honorable ordinaries. Thus, the pallett is a smaller pale, and the shield of Aragon has four red palletts side by side on a gold ground. These again may be used as charges upon the greater ordinaries. Thus, the escutcheon of Loreyn bears a blue bend sinister on a gold field and the bend itself is charged with three golden six-pointed stars. That also is a simple and presumably ancient armory.

In describing the escutcheon the side on the left of the spectator is called the dexter and that on his right is called the sinister side; that is because the shield, when carried on the arm with the man-at-arms behind it would be to him so disposed. The escutcheon is supposed to be divided into a certain number of imaginary points or divisions for the fixing and placing of the bearings when they are described in words. When there are nine points, the three at the top following each other from the dexter to the sinister side are dexter chief, middle chief and sinister chief, and a similar nomenclature is used throughout. A modern and fuller arrangement is to give eleven points, the honor point interposed between the top horizontal row and the middle one; and the nombril point spaced between the middle row and the lowermost one. A small bearing as a mullet (a five-pointed star) may be located as being in the dexter chief or the like.

The main purpose of armory is to so present simple patches of vivid colors as to be recognized at a great distance. The tinctures used in Great Britain are seven—two metals, or and *argent* (gold and silver); five colors, *gules* (red); *azure* (blue); *sable* (black), *vert* (green), *purpure* (purple); though this last is very rare and green is not very common. There are also two furs, which are represented by curious conventional patterns supposed to represent the patchwork of small skins sewed together which make a garment or the lining of a garment. These furs are ermine and vair, but each has many curious variations known by different names. Thus "ermine" shows black tails on a white field, or in modern times a flowerlike pattern suggested by the real ermine; but erminois has the same pattern in black on a gold field.

Dimidiation and impaling, mentioned above, are varieties of the great general subject of marshaling. The more elaborate form of marshaling is to divide an escutcheon into quarters. Thus, the son of a married pair who

have borne their arms impaled, may divide the escutcheon into four quarters and will put his father's arms on the first and fourth quarters (dexter chief and sinister base) and those of his mother on the second and third quarters. This quartering may be quartered again, and so on indefinitely. Thus, the escutcheon of the Prince of Wales during the reign of Queen Victoria (of him who became King Edward VII) is too elaborate to describe fully here. This is because his bearings as Duke of Rothsay, Lord of the Isles, Duke of Cornwall, Baron Renfrew, and the like were all charged together, so that the number of small subdivisions is remarkable. Now, there are different ways of charging these. Those which his escutcheon must bear are the royal arms of England differenced with the label of the heir apparent, which is a label of three points *argent*, and this escutcheon will bear in the middle a small shield with the arms of Saxony. Even in this the inescutcheon is out of place when we are considering his arms as heir to the Crown. It is held by many that the Prince of Wales should display two shields; the first as simple as possible, with only the quarters for England, Scotland and Ireland; while the second should display all his primary and secondary arms, including those of his wife, who, in the case assumed above, was the Princess Alexandra of Denmark. Again, a system is adopted by which a large shield bears those royal arms upon it, an inescutcheon with the secondary arms of Cornwall, Rothsay, Chester, Dublin, Lordship of the Isles, Carrick, Renfrew, Wales as a principality, and over all a small escutcheon of pretense charged with the arms of Saxony for Saxe-Coburg-Gotha. But even these do not include the arms of the Princess, his wife, which should rightly occupy the sinister side of the shield, while all the achievement described above should be charged upon the dexter side. It is evident, then, that a person whose family has formed many dignified alliances may have an indefinitely great number of quarterings. But let us take the escutcheon of a king of the House of Hanover, as George IV, and we shall find that the four quarters of the shield are charged in this way: the first quarter (dexter chief) in *gules*, bearing three lions *passant guardant*, and the fourth quarter (sinister base) exactly the same. These two quarters are England. The second quarter (sinister chief) is Scotland, a field *or* with a lion *rampant gules*, framed in a *bordure fleur-de-lisée*, also *gules*. The third quarter (dexter base) is Ireland, the Irish harp *or* on a ground *azure*. Upon this shield is set an inescutcheon, divided in a curious way into three parts, for Hanover, and having above it a royal crown. Upon this inescutcheon is still a second inescutcheon, very small, simply *gules* with a bearing *or*, which is supposed to stand for the imperial crown of Charlemagne this in commemoration of the electoral dignity of the sovereign of Hanover, who was called the Elector until after the Napoleonic wars. It is a rule never to place metal upon metal or color upon color. Thus, if your shield is *argent*, any bearing put upon it must be in one of the colors—never in *or*.

But there are several curious exceptions; as that of the Latin Kingdom of Jerusalem (which lasted only from 1099 to 1187, but which is perpetuated by the addition of its bearings to many private shields) was *argent*, a cross potent between four crosslets *or*. This means a large gold cross, at the end of each arm of which is a cross head like the handle of a crutch; and in the little corners left by the cross, four small Greek crosses; all these in gold on a silver ground.

No two persons should bear the same arms at the same time, therefore a distinction is made between the escutcheons of younger children. Even the heir may distinguish his bearings from his father's by a special mark, apart from the quartering described above. The term marks of cadency is used for these differences. Many varying plans have been followed, and one which has been much accepted is the label. This is a band with pendant strips hanging from it, usually three; and this is laid right upon the escutcheon near its head, and crosses it, partly concealing all the bearings. This label will be plain for the eldest son, differenced by a bearing like a crescent for a second son, a mullet for the third son, a martlet for the fourth son, and so on.

The practical functions of the herald developed into blazoning, historifying, passing judgment on, and marshaling coats of arms. Blazoning is the methodical description of a bearing. In the first place the shield is described according to its tinctures, figures and partitions. The other parts of a coat are then blazoned—the helm with its crest which are trumpet, wings and plumes, men and animals, or their members; then the wreath and its tinctures; after which the cornet, cap, etc.; finally the supporters, the mantling, the device or motto and other secondary addenda. To historify in heraldry is to explain the history of a coat of arms, its origin, and the changes it has undergone. If the herald is to explain a bearing historically, he must show that this figure is the proper emblem of the family or country. He derives, for instance, from historical sources the proof that the double-headed eagle of the German Empire was first introduced by Charlemagne (A.D. 802); and he records the privilege given to wear that eagle on a private escutcheon. So he shows that the three leopards (lions passant gardant) in the English arms were first derived in 1127 under Henry I from the Norman house. The marshaling of arms is especially important in the preparation of new escutcheons. In this matter, the herald either follows the orders of the sovereign, or he invents the coat, and makes the charges on the escutcheon according to his own judgment, or he composes a new escutcheon from several coats of arms.

When color is not used, a system of conventional drawing is substituted; thus, *argent* is left white, *or* is white with black dots, *azure* by horizontal black lines on white, *gules* by vertical black lines, *sable* by crossing black lines horizontal and vertical, *vert* by lines from the dexter chief to the sinister base, *purpure* by lines from the sinister chief to the dexter base. The furs have peculiar patterns and surfaces of their own.

The crest is the uppermost part of achievements of arms and is set above the escutcheon. It is called crest from the Latin word *crista*, which signifies a comb or tuft, such as many birds have upon their heads. Crests were anciently marks of honor, because they were worn only by heroes of valor and high rank that they might be the better distinguished in an engagement, and thereby rally their men if dispersed; or else they were of the nature of badges worn by all the followers of a chieftain and serving to identify them. They are at present considered as mere ornaments; and they may be assumed without authority; obviously they should not be used by women. Supporters are figures placed on each side of the shield and perhaps originated from the custom of pages in fantastic dresses guarding the achievements of arms of their masters while the latter were taking part in the exercises of the tournament. The scroll is an ornament usually placed below the shield and supporters, containing a motto or short sentence alluding to the crest, or to the bearing or to the bearer's name. The motto had its origin in the war cries of knights, though in some instances mottoes were borne differing from the war cry of the wearer. The badge does not belong to heraldry, though it may be a part of the heraldic achievement, used separately. The porcupine was the badge of Louis XII of France, and the salamander was chosen by Francis I when he came to the throne, but neither of these was included in the escutcheon or worn as a crest. The reader may consult Palliser, 'Historical Devices, Badges and War Cries' (London 1870). The most recent large and important book on heraldry in English is 'The Art of Heraldry,' by Arthur Charles Fox-Davies, which is based upon the 'Heraldischer Atlas' of H. G. Ströhl. An excellent book for persons who are making a serious study of the matter is Berry's 'Encyclopædia Heraldica,' in three volumes, n. d. (about 1820). The treatise on Heraldry by Woodward and Burnett (2 vols., 1892), is a very full and up-to-date manual. Smaller books are numerous. To name English ones alone Cussan's 'Handbook of Heraldry,' Planché's 'The Pursuivant at Arms,' Worthy's 'Practical Heraldry,' and especially Charles Boutell's two books, 'English Heraldry' (2d ed., 1871), and the very remarkable essay, 'Heraldry, Historical and Popular' (3d ed., 1864), now scarce, but nevertheless the most suggestive book that can be found.

K., *The Heraldic Journal*, recording the armorial bearings and genealogy of American families (Boston 1865-68); Zieber, E., 'Heraldry in America' (Philadelphia 1895); id., 'Rules for the Proper Usage of Heraldry in the U. S. A.'; Woodward, John, 'A Treatise on ecclesiastical Heraldry' (Edinburgh 1894).

**HERAT**, hēr-āt', Afghanistan, a city in the northwest near the Heri-Rud River, 550 miles west of Cabul, 66 miles south of the Russian railway terminal and 290 miles north of New Chaman, the British-Indian railway terminal. It is defended by a strong citadel. The caravansaries, public baths, and mosques are numerous. The trade, almost entirely in the hands of Hindus, is greatly favored by the situation of the town on the great thoroughfare from India westward. Herat was long the capital of the empire founded by Tamerlane, and was once much larger and more splendid than now. Its possession has been repeatedly contested among the peoples of central Asia. Its capture by Persia in 1856 led to a short war between Britain and Persia. As the key to Afghanistan near Persia and Russia, its strategic importance has often made it a scene of great military activity. Pop. 20,000.

**HERAULT DE SEHELLES**, sā'shēl, Marie Jean, French revolutionist: b. Paris, 1760; d. there, 1794. He became imbued with the teachings of Diderot, but, after his election to the Legislative Assembly in 1791, being rather a philosopher than a revolutionist, he at first paid little attention to the radical element there. He soon, however, joined the extreme left, and later on supported Danton in the revolution of August and September 1792. He was a deputy from the department of Seine-et-Oise to the Convention of 1792 and voted for the king's death. He became a member of the committee of public safety, and as such gained the enmity of Robespierre, who claiming that he had betrayed certain secrets to the army of the Rhine, caused him to be arrested and executed. His best writings were published under the title 'Voyage à Montbard' (last ed. 1890).

**HERB PARIS**, a poisonous plant of the lily family (*Paris quadrifolia*), resembling and related to white hellebore (q.v.), the toxic principle of which is a specific alkaloid called paradin.

**HERBARIUM**, a collection of dried plants systematically arranged for study; it is sometimes called *hortus siccus*, "dry garden," and is an indispensable adjunct to the work of the systematic botanist. The most famous public herbaria are those of the Royal Botanic Gar-

dens, Kew, London, the British Museum and the Royal Botanic Gardens, Berlin. Those in Paris, Leyden, Berlin, Brussels and Vienna are also very full and complete.

In the United States there are several large herbaria, namely, the Gray Herbarium of Harvard University, the Herbarium of the New York Botanical Garden, the United States National Herbarium at Washington, that at the Missouri Botanical Garden, Saint Louis, and the herbarium of the Field Museum of Natural History, Chicago. Many universities and colleges also possess large collections of plants. The first named contains a majority of the older types of American plants, and the national herbarium contains the material brought together by the government collectors and many of the most important collections of the early government surveys.

**HERBART**, Johann Friedrich, German philosopher: b. Oldenburg, 4 May 1776; d. Göttingen, 11 Aug. 1841. His career is evidence of the fact that at least some men may live peaceful lives in stormy times. A student at Jena under Fichte, a tutor in Switzerland, a docent at Göttingen in the theory of education, and after that a professor to the end at Göttingen, at Königsberg, and finally at Göttingen again—that is the story of his life. But if he took no part in the revolutionary tumults that afflicted his country, he at least became a leader in her intellectual contests. His metaphysics stands at the opposite pole from that of Hegel. His psychology laid the foundations for modern psychophysics and experimental psychology, while his pedagogics is still the source of much of our best educational theory and practice.

The turning point between Herbart and Hegel lies in the use to be made of the principle of contradiction. Herbart took the orthodox stand that what contradicts itself cannot be truly real or actual, whereas Hegel boldly incorporated the principle of contradiction as a stage in what might be called his dialectic of evolution, which follows the formula, thesis, antithesis, synthesis. The antithesis is the contradiction of the thesis, but only that the two may come together again in a higher synthesis. A familiar illustration is the relation of (1) being, (2) non-being and (3) becoming, in which the second is thought as the contradiction of the first, while the third is conceived as a higher synthesis of the first two, since becoming has elements both of being and of non-being. Herbart, however, rejects such reasoning as insufficient, and demands that philosophy shall accept the validity of the principle of contradiction, and honestly endeavor to remove the contradictions inherent in our everyday thought of the world. Such contradictions are encountered when we consider a thing and its attributes or the ego, which is both subject and object, or when we trace experience back to matter, in which the notions discrete and continuous are seen to be at variance. The effort to remove the contradictions leads Herbart back to a pre-Kantian method of speculation, for he holds himself ready to accept any sort of a presupposition, rational, or irrational, which promises to resolve the difficulty, even though the principle of explanation should forever resist demonstration as to its reality. In other words, we may assume anything to be true

which clears up our thinking. But this is the method of Leibnitz, of Spinoza, and of many others antecedent to the time of Kant (q.v.). The fundamental form in which contradiction appears is that the simple is conceived as manifold. For example, the thing we call water is at the same time thought of as heavy, fluid, colorless, having the quality of quenching both fire and thirst, and as being capable of transformation from a liquid to a solid or to a vapor. The way to overcome this contradiction is to assume a plurality of simple beings, and to explain the manifold as appearance arising from their relations. These simple beings that underlie the phenomenal world are atoms, or monads, or as Herbart prefers to call them, *Reals*. They are conceived to be in mechanical interaction, and to give rise to the manifold we have in experience. Like the atoms of Democritus they are simple and alike in quality, but unlike the monads of Leibnitz they are not points of self-active force, containing an inherent principle of development. Why and how the *Reals* act and interact Herbart does not explain, not even how they get and exercise their one function of *Self-preservation*. The inability to explain these things which we most want to know is the penalty attached to this type of metaphysics. Yet it would be unfair to assume that no good results can come from even such pre-suppositions. The *Reals* are not spatial in the ordinary meaning of that term, for space and time as we know them are themselves phenomenal products, but they may be conceived to be in what Herbart calls *intelligible space*, in which the *Reals* exist in a state of partial or total interpenetration. Here they reciprocally "disturb" one another, a "self-preservation" resulting, which is a "state" of the *Real*. When the *Real* which is "disturbed" happens to be a soul, the disturbance, or the state of self-preservation, becomes an *idea*, which is the primary form of mental life. Psychology is, therefore, the science of these self-pervations of the soul-monad, which is like all *Reals* unknowable, but as Herbart thinks a necessary presupposition of our experience. Psychological life is the reciprocal tension of ideas. Consciousness depends upon the degree of this tension. The lowest degree of strength which an idea can have and still be actual marks the threshold of consciousness. If reduced below this degree it remains as "impulse," and may rise again when freed from "arrest." The soul monad has its seat in the brain and is in intimate interaction with a multitude of other *Reals*. Outwardly originating stimuli are conveyed to the brain by the nerves and reach the soul through the medium of the other *Reals* present. Since the idea is the primary form of mental life, feeling and volition must be explained through an examination of the inhibitory relations of the ideas. Pleasure arises when there is a furthering of mental movement, and pain when there is an arrest. Volition arises from desire, a state of feeling, which has a natural impulse to find satisfaction through action. Since mechanical action and reaction of the *Reals* is the source of ideas, it seems a natural conclusion that there may be a statics and mechanics of mental states. This led to Herbart's attempt to work out the calculus of ideas, thus opening the road for the modern quantitative study of mental phenomena, as seen

in psychophysics and experimental psychology. Herbart claims to have founded psychology anew upon metaphysics, mathematics, and experience. The third of these bases is treated under the term *apperception*, which has important results for education.

Leibnitz, who introduced the term *apperception*, employed it in a double sense. Its first meaning is the original power of the mind to unify experiences originating in sensation; this is the sense in which Kant uses the term. The second meaning is the mental assimilation that takes place when we use knowledge already acquired to interpret new knowledge. It is natural that Herbart should emphasize the latter process, for though he could hardly deny the validity of the first form of *apperception*, yet so slight is the original equipment of the mind — merely the power of preserving itself against the encroachments of other *Reals* — that all the significance of its activity must be found in acquiring experience. This, it may be remarked, is the process most important to teachers, for they can help to supply and order experience, whereas they have no control whatever over the original constitution of the mind. Herbart sees in each new sensation a stimulus to ideas already possessed, an attractive force for the similar, a repelling one for the dissimilar. The new idea therefore at first holds the centre of consciousness, gathering about itself similar ideas, and repelling hostile ones already in consciousness or newly attracted to it by contrast. But this very domination of the new idea is in most cases the cause of its reduction to a subordinate place, for by bringing to consciousness a body of more deeply rooted related ideas, it enables the old to control the new by placing the new in its true relation to older and better ordered experience. In other words, the new is *apperceived* by the old. Herbart's theory, thus briefly stated, has been extended and freed from contradictions, by subsequent writers, notably Lazarus, Steinthal and Wundt (qq.v.).

All knowledge, feeling, desire and will, being explained by the various relations into which ideas may come, there is no room in Herbart's system for transcendental will, hence no ethical imperatives antecedent to those developed by experience. Ethics consequently becomes a branch of aesthetics, and ethical judgment is founded upon pleasurable or painful feelings as the case may be. The mind spontaneously approves some will relations and as spontaneously disapproves others. These basal relations refer to five fundamental aspects of conduct, two relating to the self as such, and the remaining three to the relations of the self to others. The first two are *Inner Freedom* (the feeling that arises from good conscience) and *Efficiency of Will* (the pleasure that is aroused by efficient action). The three other ideas are first *Good Will* (subjective attitude toward others), the second *Justice* (the legal basis of rights), and the third *Equity* (the demand that requital shall be adequate to deed).

Upon the basis of his psychology and ethics as above explained, Herbart built his educational structure. Since there is no source of character but experience, it is to experience, i.e., to organized knowledge or groups of ideas, that we must look for the development of character, which thus has its roots, not in a single department of knowledge as, e.g., that grounded

in sacred writings, but in the whole content of the mind. A man must be ethical all over, not in spots only. For this reason the Herbartians speak fondly and proudly of *educative instruction*, meaning thereby such instruction as shall render all ideas contributory to moral character. But since feeling is the bridge between cognition and volition, this bridge the teacher must induce the pupil to cross if his conduct is to be adequate to his knowledge.

By means of direct interest incited in the pupil for the subject-matter itself, not amusement connected with the subject-matter, as some have erroneously thought, the pupil's permanent attitude of mind toward the circle of thought itself and consequently toward the aspects of life involved will be established. This interest falls naturally into two groups, first that pertaining to knowledge itself, and second that pertaining to intercourse with others. The first group embraces empirical, speculative (causal), and aesthetic interests; the second sympathetic, social and religious interests. This doctrine of interest, so important in modern educational thought, has been brought into harmony with our more spiritualistic systems of philosophy and psychology by Professor John Dewey ('Interest as Related to Will'). The next important topic arises when we ask how the teacher is to lead the pupil to build his circles of thought adequately, and then to have the right mental attitude toward them.

It is a common experience that faulty methods may easily lead to inadequacy of insight; they may still more easily lead to the wrong attitude of mind, as when the student hates a subject and everything connected with it. The first point to consider is *Attention*, which is either spontaneous or forced. With the young where forced attention is painful, it is better to induce spontaneous attention, for here the ideas rise freely, producing liveliness and pleasure. Apperception has two marked stages, that of *absorption*, in which the mind gives itself up to new impressions; and that of *reflection*, in which the newly acquired elements of knowledge find their appropriate place in the systems of the old. To bring about this twofold process of absorption and reflection most effectively and most agreeably to the mind, we must observe at least four prominent stages of method. The first of these is *clearness*, by which is meant the adequate apprehension of the single object or element as such. The second is *association*, which consists in the progress from one absorption to another related one. The third is *system*, or the step in which each part of that which is learned finds its proper place in relation to other parts. Steps two and three may be said to embrace the process of generalization. The fourth stage is what Herbart calls *method*, by which he understands the well-ordered activity of the pupil in the solution of problems and tasks.

Making due allowance for those parts of Herbart's system that are now of historical interest only, it may be seen that many of its elements are still of importance to the world, for they involve the most potent of modern educational processes and aims.

Herbart's chief philosophical works are 'Lehrbuch zur Einleitung in die Philosophie' (1813); 'Lehrbuch zur Psychologie' (1816);

'Psychologie als Wissenschaft, neu gegründet auf Erfahrung, Metaphysik und Mathematik' (1824-25); 'Allgemeine Metaphysik nebst den Anfängen der philosophischen Naturlehre' (1828-29); 'Kurze Encyclopädie der Philosophie, aus practischen Gesichtspunkten entworfen' (1831). The complete works of Herbart have been edited in 12 volumes by G. Hartenstein (Leipzig 1850-52). Herbart's educational works, including the 'Allgemeine Pädagogik' and the 'Umriss Pädagogischer Vorlesungen,' were edited by Dr. Otto Willmann in two volumes (Leipzig 1880). The Psychology is translated and to be found in the International Series, while the 'Allgemeine Pädagogik' and the 'Umriss' are also found in English, the former under the title of the 'Science of Education,' by H. M. and E. Felkin (Boston 1893), and the latter under that of 'Outlines of Educational Doctrine,' trans. by Lange and annotated by De Garmo (New York 1901). The Herbartian School has produced a literature in metaphysics, psychology and education too voluminous for mention here. Consult Adams, J., 'Herbartian Psychology applied to Education' (Boston 1906); De Garmo, C., 'Herbart and the Herbartians' (New York 1895); Gockler, L., 'La Pédagogie de Herbart, Exposé et Discussion' (Paris 1905); Lang, O. H., 'Outlines of Herbart's Pedagogy, with a biographical Introduction' (New York 1894); Wagner, E., 'Die Praxis der Herbartianer; der Ausbau und gegenwärtige Stand der Herbart'schen Pädagogik' (Langensalza 1900).

CHARLES DE GARMO,  
Emeritus Professor of Education, Cornell University; Author of 'Herbart and the Herbartians.'

**HERBELOT**, dër'blô, Barthelemy d', French Orientalist: b. Paris, 4 Dec. 1625; d. there, 8 Dec. 1695. Having gone through a course of study in the university of his native city, he applied himself particularly to the eastern languages, with a view to the elucidation of the Hebrew Scriptures. He visited Italy, and while there commenced his great work, the 'Bibliothèque Orientale.' Recalled to Paris by Colbert, a pension was given him, that he might be at liberty to proceed with his undertaking. It was his first design to have published his collection in Arabic, and types were cast for the purpose of printing it. But the death of Colbert having interrupted this plan, he recomposed the work in the French language, as likely to prove more generally useful. He was appointed to the royal professorship of Syriac in 1692. His book was published in 1697, and after with a supplement at Maestricht (1776-81). The best edition of the 'Oriental Library' is that of The Hague (1777), with the supplements of Galland and Visdelou. Consult Goujet, 'Memoires sur le Collège de France' (Vol. III, Paris 1758); Lefranc, 'Histoire du Collège de France' (ib. 1893).

**HERBERMANN**, Charles George, American editor: b. Saarbeck, Westphalia, 8 Dec. 1840; d. New York, 24 Aug. 1916. He was educated at Saint Francis Xavier College, New York, and was instructor there from 1858 to 1869. From 1869 to 1914 he was professor of the Latin language and literature at the College of the City of New York, serving also as librarian after 1873. From 1905 to 1916 he was editor in chief of 'The Catholic Encyclopedia.' He

delivered a course on German literature at the Catholic Summer School of America in 1896, and lectured frequently on philology and mediæval schools and educators. In 1913 he received the Laetare medal of the University of Notre Dame. His published works include 'Business Life in Ancient Rome' (1880); 'The Sulpicians in the United States' (1916); translations of Torfeson's 'History of Vinland'; 'Life of Bishop Dubois'; 'The Waldseemüller Map of 1507.' He edited Sallust's 'Jugurthine War' (1886); 'Sallust's Catiline' (1891); 'The Unpublished Letters of Charles Carroll of Carrollton'; Thébaud's 'Forty Years in the United States' and 'An English Colony in the United States.' He contributed to 'The Catholic Encyclopedia,' the *American Catholic Quarterly Review*, and the *Catholic World*.

**HERBERT, Edward, LORD HERBERT OF CHERBURY**, English philosopher: b. Eyton-on-Severn, near Wroxeter, 1583; d. London, 20 Aug. 1648. He was a famous soldier and diplomatist in his day, but at the present is remembered as an author and philosopher. At Paris, in 1624, he printed his famous book, 'De Veritate prout Distinguitur a Revelatione, a Verisimili, a Possibili et a Falso,' the object of which was to assert the sufficiency, universality, and perfection of natural religion, and thereby prove the uselessness of revelation. In 1624 he returned from France, and was created an Irish peer; and in 1629 became an English baron with the title of Lord Herbert of Cherbury. In the civil war he at first tried as far as possible to play a neutral part, but afterward sided with the Parliamentary party chiefly with a view, it appears, to save his property. The character of Lord Herbert is strongly marked in his memoirs, which show him to be vain, punctilious and fanciful, but open, generous, brave and disinterested. The 'De Veritate' was followed by works entitled 'De Causis Errorum' (1645); and 'De Religione Gentilium' (1663; Eng. trans. 1709). In 1649 was published his 'Life and Reign of Henry VIII.' The English style of Lord Herbert is strong, manly and free from the quaint pedantry of his age. He was one of the first to attempt a systematic proof of the sufficiency of natural religion. "Herbert's religious doctrine," says Sidney Lee, "starts with the assumption that religion, which is common to the human race, consists merely of the five innate ideas or axioms that there is a God, that He ought to be worshipped, that virtue and piety are essential to worship, that man ought to repent of his sins, and that there are rewards and punishments in a future life. He regards Christianity as on the whole the best religion, because its dogmas are least inconsistent with his five primary articles." His autobiography remained in manuscript till 1764, when it was published by Horace Walpole. There is a recent critical edition by Sidney Lee (1886).

**HERBERT, Edward, LORD HERBERT OF CHERBURY, Autobiography of.** The 'Autobiography' of Lord Herbert of Cherbury is one of the most remarkable in the whole range of self-narrative. In point of time it was among the first important autobiographies in the English language, and it continues to hold its place as one of the most interesting and self-revealing—as one that cannot be passed over by a student who is in any way vitally interested in

biography as a clue to man's nature or as a commentary upon the age in which it was written. It is worth while to know that a work which has afforded so much pleasure to the world lay in obscurity for many years, and was well-nigh lost. It appears that two copies were made, one of which was preserved at Lymore in Montgomeryshire; the other, after more than a century of drifting, was about 1737 handed over to Henry Arthur Herbert, Earl of Powis. Several pages of the Lymore manuscript were torn away or so stained as to be illegible, a loss which the second fortunately supplied. The Earl of Powis presented the originals to Horace Walpole by whom the narrative was first printed at Strawberry Hill in 1764. The 'Autobiography' is chiefly valuable as the record of an important representative of a distinguished family, told with a strict regard for truth, with a humble desire to be of service, and with a naive frankness that attracts while it amuses. The first paragraph is sufficient evidence of what has just been said, and is enough to convince a reader that the entire narrative is worthy of careful attention. Lord Herbert begins by lamenting that his own ancestors had not "set down their lives in writing and left them to posterity" that "their heirs might have benefited themselves by them more than by any else." He wrote with a definite intention of serving his descendants. "I have thought fit," he continues, "to relate to my posterity those passages of my life which I conceive may best declare me and be most useful to them. In the delivery of which I profess to write with all truth and sincerity as scorning ever to deceive or speak false of any; and therefore detesting it much more where I am under obligation of speaking to those near me: and if this be one reason for taking my pen in hand at this time, so as my age is now past three score, it will be fit to recollect my former actions, and examine what has been done well or ill, to the intent that I may reform that which was amiss, and so make my peace with God, as also comfort myself in those things which through God's great grace and favor have been done according to the rules of conscience, virtue, and honor." We may agree with the words of the advertisement to the first printing: "Foibles, passions, perhaps some vanity, surely some wrong-headedness; these he scorned to conceal, for he sought truth, wrote on truth, was truth: he honestly told when he had missed or mistaken it. His descendants, not blind to his faults, but through them conducting the reader to his virtues, desire the world to make this candid observation with them, 'That there must have been a wonderful fund of internal virtue, of strong resolution and manly philosophy, which in an age of such mistaken and barbarous gallantry, of such absurd usages and false glory, could enable Lord Herbert to seek fame better founded, and could make him reflect that there might be a more desirable kind of glory than that of a romantic duelist.'" Lord Herbert brings his narrative down to the publication of *De Veritate*, in 1624, and then abruptly closes. The style, considering the age in which it was written, is straightforward and not unpleasing. Now and then occurs a passage of singular beauty, such as the account of Lord Herbert's observation upon the similitude between birth

and death. In addition to the manner in which the work reveals the individuality of the author, it throws much valuable light upon the customs and spirit of the age. As a reader puts the book aside he will feel that Horace Walpole spoke the truth when he called it "perhaps the most extraordinary account that ever was given seriously by a wise man of himself." The 'Autobiography' should be consulted in the edition of Saunders and Oley (London 1826), and particularly in that of Sidney Lee (ib. 1886).

WALDO H. DUNN.

**HERBERT, George**, English religious poet: b. at the Castle of Montgomery, Wales, 3 April 1593; d. Bemerton, March 1633. His father, Richard Herbert, came of an illustrious Welsh family; his mother, Margaret Newport, also of excellent family, is more remembered for her own noble character. Between her and her poet son was rare sympathy; she guided his life in all things and early destined him to the saintly career in which he came slowly to find his happiness. Upon her husband's death in 1597, the care of her 10 children fell to her. The eldest son was Edward, Baron Herbert of Cherbury (q.v.). The family went to Oxford in 1595, where George Herbert was brought up until 1605, when he entered Westminster School. From the first he distinguished himself, partly by his learning, partly by his daring, which showed itself in his attack in Latin epigrams upon Andrew Melville, the noted Presbyterian. In 1609 he was elected scholar of Trinity College, Cambridge, where three years later he took his degree. In 1614 he became a Fellow of Trinity, and won his Master's Degree in 1616. In 1619 he was elected Public Orator, an office he filled until 1627.

Until this election Herbert had looked toward a worldly career. Pride of family and ambition were strong in him; the influence of his relatives and friends at court was great; he knew his own powers. But all that the court favor bestowed upon him was the lay rectorship of Whitford (1623), a sinecure post which Sir Philip Sidney had held; and shortly afterward the death of his most powerful friends darkened the promise of worldly advancement, and aided his mother's effort to turn him to the Church. In July 1626, while yet a layman, he became prebendary of Layton Ecclesia, in the diocese of Lincoln. With the help of his mother and others, he restored the ruined church building—an act more expressive perhaps of the beauty-loving courtier than of the future parish priest.

His mother had married Sir John Danvers in 1609. Her death in 1627 called forth Dr. Donne's famous funeral sermon and her son's 'Parentalia.' This sorrow marks the beginning of George Herbert's nobler life. Shattered in health, and threatened with consumption, he resigned his oratorship and spent the next three years in London and Essex and Wiltshire. In 1629 he married Jane Danvers, a relative of his stepfather, and the next year he was presented to the living of Bemerton, with which his name is remembered. The short remainder of his life was remarkably active. In these years he wrote most of his poems and the best of them, and also the 'Character of the Country Parson.' He died of consumption. Later

in the same year his famous book of poems, 'The Temple,' was published in Cambridge.

His extreme saintliness took no strange outward form, as did the piety of his friend Nicholas Ferrar, nor did it mar his writing with eccentricities of fervor or mysticism; his genius is entirely sane. In no English poet, religious or secular, do the small common-places of life count for more. In such poems as 'The Elixir,' with its famous praise of 'Drudgery Divine,' he insists on that kind of aspiration which scorns no humble or routine task; and his longest poem, 'The Church Porch'—a series of wise maxims for the familiar discipline of the soul—sums up the moral and religious traditions of the English race, though in his individual way. His genius is for common sense ennobled by lofty faith and passionate devotion. It is this normal quality in him, this quickness to find inspiration along the highway, rather than his frequent reference to ecclesiastical customs and offices, that makes him, as Coleridge said, the representative poet of the English Church.

**Bibliography.**—The best editions are by George Herbert Palmer; Grosart, in the 'Fulter's Worthies Library' and in the Aldine edition; the Pickering edition, with the 'Life' by Isaak Walton. For criticism, consult 'Introductions' to the above, especially to Palmer's edition; also, for a charming study, consult the essay on Lady Danvers in Louise Imogen Guiney, 'A Little English Gallery.'

JOHN ERSKINE,

*Professor of English, Columbia University.*

**HERBERT, Henry William**, "FRANK FORESTER," American author: b. London, England, 7 April 1807; d. New York, 17 May 1858. He was graduated from Caius College, Cambridge, in 1828; removed to the United States in 1831; and until 1839 was instructor in the Greek and Latin languages in a private school of New York. In 1833 he established and until 1836 was editor of the *American Monthly Magazine*, during a portion of that time with Charles Fenno Hoffman (q.v.) as associate. From 1834 he became largely known as the first important American writer on sports and out-of-door subjects. He wrote also on French and English history, and made excellent translations from Dumas and Sue. His volumes include 'Cromwell' (1837); 'Marmaduke Wyvil' (1843); 'The Cavaliers of England' (1852); 'The Chevaliers of France' (1853); 'The Puritans of New England' (1853); 'Field-Sports of the United States and the British Provinces' (1848); 'Sporting Scenes and Characters' (1857); 'Horses and Horsemanship of the United States and British Provinces' (1859).

**HERBERT, Hilary Abner**, American lawyer and politician: b. Laurensville, S. C., 12 March 1834. He was educated at the universities of Alabama and Virginia, studied law and was admitted to the bar. He began practice at Greenville, Ala., but served in the Confederate army as captain and colonel of the 8th Alabama regiment; being disabled at the battle of the Wilderness (1864), he retired from the army, and continued the practice of his profession, first at Greenville, then at Montgomery (1872). He was elected to Congress in 1877, and seven times re-elected; in three Congresses he was chairman of the committee on naval

affairs and hence was prominently connected with the reconstruction of the navy. In March 1895, he was appointed Secretary of the Navy by President Cleveland, an office which he held until 1897. He subsequently practised law in Washington. Both in private and public life, he has always taken a prominent part in the reconciliation of North and South. He has published 'Why the Solid South? or, Reconstruction and Its Results' (1890); 'The Race Problem of the South' (1901); 'The Abolition of the Crusade and Its Consequences' (1912).

**HERBERT, John Rogers**, English historical and portrait painter: b. Maldon, Essex, 23 Jan. 1810; d. London, 17 March 1890. He studied at the Royal Academy, where he exhibited as early as 1830; later went abroad and in 1840 became a Roman Catholic, after which the subjects of his paintings were chiefly religious. In 1841 he was elected one of the masters of the government school of design at Somerset House, and in 1846 became a member of the Academy. His principal works are the frescoes in the peers' robing-room in the House of Lords; 'The Appointed Hour' (1834); 'King Lear Disinheriting Cordelia'; 'Sir Thomas More and his Daughter' in the Vernon collection at the National Gallery; and 'Saint Gregory Teaching His Chant.'

**HERBERT, Sir Michael Henry**, English diplomatist: b. England, 25 June 1857; d. Davos-Platz, Switzerland, 30 Sept. 1903. He went to Paris as attaché in 1879; was *charge d'affaires* at Washington (1888-89); secretary to the British legation at Washington (1892-93); at The Hague (1893-94); at Constantinople (1894-97); at Rome (1897-98); and at Paris (1898-1902). On 4 June 1902 he was appointed British ambassador to the United States, at Washington, in succession to the late Lord Pauncefote, and the following year was compelled by ill health to return to Europe.

**HERBERT, Victor**, American musical director and composer: b. Dublin, Ireland, 1 Feb. 1859. After studying music from his childhood in Germany, he was appointed principal 'cello player in the court orchestra, Stuttgart, from which time he appeared in concerts throughout Europe. In 1886 he took the position of solo 'cellist in the Metropolitan orchestra, New York, and has since been connected as soloist and conductor with the principal orchestras of the United States. Since 1894 he has been bandmaster of the 22d regiment band, New York, was conductor of the Pittsburgh, Pa., orchestra from 1898 to 1904, and since 1904 has conducted Victor Herbert's New York Orchestra. As a composer he has written 'The Captive,' an oratorio; and the comic operas, 'Prince Ananias'; 'The Wizard of the Nile'; 'The Serenade'; 'Cyrano de Bergerac'; 'The Ameer'; 'The Viceroy'; 'The Idol's Eye'; 'The Fortune Teller'; 'The Singing Girl'; 'Babette'; 'Babes in Toyland'; 'It Happened in Nordland'; 'Natoma'; 'Madeleine'; 'The Only Girl,' etc.

**HERBIVORA**, a group of mammals characterized by their herbaceous diet; the grazers or ruminants. The term is no longer in use.

**HERBS, Culinary**, fragrant or aromatic plants used to add flavor to food, especially stews, soups, dressings and salads. They usually

owe these qualities to essential oils, which, being readily soluble or easily volatilized by heat, quickly permeate the mass of food in which they are mixed. The seed of some, as caraway, anise and dill, is employed; the foliage of others, as parsley, sage, thyme, is more frequently used. The former plants are cut and placed loosely upon sheets as soon as the seed reaches maturity; allowed to dry a few days; lightly thrashed and the seed cleaned; still further dried and stored in air-tight packages. The latter are gathered just before the first blossoms open, because they are then richest in flavor. With parsley the leaves are gathered as soon as mature, several cuttings being made in a season. They are then dried upon trays at a temperature below 120 degrees and in freely circulating air until crisp, when they are rubbed to powder and stored as above. Paper or pasteboard packages are bad, because they allow the flavors to escape. Both seeds and leaves may be used in decoction, being covered with vinegar or alcohol in stoppered bottles. Fresh herbs, which are always preferable to dried or decocted, are especially useful in salads; dried and decocted in dressings, stews, etc., and at seasons when fresh ones cannot be obtained. In the United States the species most in demand are parsley, sage, thyme, savory, marjoram, spearmint, dill, fennel, tarragon, balm and basil in nearly the order named. Parsley is beyond question the most popular because of its double use as a garnish and flavoring plant but sage is perhaps more frequently used in the latter capacity. It is most esteemed with pork, goose, duck and similar rich meats. Spearmint is used mainly with roast lamb; tarragon with boiled fish; dill with pickles; and the other kinds mentioned with mild meats such as turkey, chicken, veal, venison, etc. The kind, quantity and mixture used with each sort of food depends upon personal preference.

In general, herbs are of simplest cultivation. They usually prefer rather light, moderately rich, well drained soil and sunny exposures. Since the seeds of many are small or slow to germinate they are frequently started in a greenhouse, hotbed or window, and transplanted to the garden when they are large enough and when conditions are favorable. Clean cultivation and the removal of weeds is essential. The perennial kinds, such as sage, are often propagated by stem cuttings, divisions or layers; tarragon always thus because it does not produce seed; spearmint usually by cuttings of the rootstock. The great majority are grown as annuals, being replaced each spring with fresh plants. Commercially they follow such crops as early cabbage, peas, etc., thus permitting a double use of the same soil annually. They are easily grown for winter use in the borders of benches in the greenhouse or in boxes placed in sunny windows.

**HERCULANEUM**, hĕr-kū-lā'nĕ-ūm, or **HERCULANUM**, Italy, an ancient buried city, about five miles southeast of Naples. Strabo says it was first occupied by Oscans, afterward by Tyrrhenians and Pelasgians, and then by the Samnites. It took part in the social war against the Romans. In the time of Sulla it was a *municipium* and a fortified town. It was situated between Neapolis and Pompeii, on ele-

vated ground between two rivers, and its port was one of the best on the coast. It suffered in 63 A.D. in the same earthquake that nearly destroyed Pompeii. In the greater eruption of Vesuvius in 79 A.D. it was buried under a volcanic tuff formed of sand and ashes, partly consolidated by the agency of water. The site of Herculaneum, though well described, had been long sought in vain, when in 1713 three female statues (now in the Dresden Museum) were found in digging a well at Portici, a village situated on the ancient site. After this discovery further excavation was prohibited by the government, until in 1738 the well was dug deeper, and the theatre of Herculaneum was discovered. In 1750 a long, narrow passage, sloping down into the theatre, was opened, and is still the only way by which travelers descend to examine this structure. The excavations were continued more or less industriously for 50 years; but comparatively little progress was made, as the work was difficult and also dangerous to the houses in the populous villages of Resina and Portici, situated above. As soon as one part was excavated and explored it was filled up with the rubbish from a new digging. The theatre is the only building to be seen underground, and it is encumbered with the supports built to sustain the rock above it. It is a noble edifice, massively built of solid stone, and seated 8,000 persons. Bronze statues of Drusus and Antonia and of the Muses were found in various parts of the building. In a square on the south of the theatre a temple was found which was connected with another temple, to the east of it, by a wide street lined with porticoes. One of these temples, dedicated to the mother of the gods, had been restored by Vespasian after the earthquake of 63 A.D. On the north of the theatre was a basilica 228 feet long and 132 broad, surrounded by a portico of 42 columns, and adorned with paintings. Many beautiful paintings and works of art were removed from these buildings to the museum at Naples. A sumptuous private villa was disinterred, containing a number of statues, and in one of the rooms a quantity of papyrus manuscripts. Some of the statues are excellent as works of art, such as those of Agrippina, Aristides, the Sleeping Faun and the Mercury. Other precious relics discovered here, and now in the museum, are busts of Plato, Demosthenes, Scipio Africanus, Augustus, Seneca, etc., beautiful mosaics, and articles of furniture. New excavations were carried out in 1828-37, and since 1868. The chief discoveries made were those of the forum, a small and elegant temple, a basilica, a dilapidated building supposed to have been an inn, dwelling-houses, tombs, etc. One of the houses discovered at Herculaneum contained a quantity of provisions, dates, chestnuts, large walnuts, dried figs, almonds, prunes, corn, oil, pease, lentils, pies and hams, none of which had been disturbed for 18 centuries, for the doors remained fastened in the same state as they were at the period of the catastrophe which buried the town. The internal arrangement of the house, and the manner in which it was ornamented, proved that it had belonged to a rich family, admirers of the arts; for it contained many

pictures, vases, articles in glass, bronze and terra-cotta. Few skeletons comparatively have been found either in Pompeii or Herculaneum, so that it is probable most of the inhabitants saved themselves by flight. At the door of a villa in Herculaneum were found two, one of which held a key in one hand, and in the other a bag with coins and cameos. Near them were silver and bronze vessels.

Among the most interesting objects discovered here are the papyri above mentioned, over 1,750 of which are now in the Naples Museum. The rolls are of cylindrical form, and much charred. Hardly a third of them have been unrolled. The process presents great difficulties, from the tendency of the MSS. to crumble. One of the works is a treatise by Epicurus on Nature; there are some writings of Philodemus, a Syrian philosopher; but on the whole they are of little value. There have been published 11 volumes of the 'Volumina Herculansia,' containing engraved transcripts of the unrolled papyri (folio, Naples, 1793-1855), and since 1861 several volumes of a continuation of the same.

See also POMPEII.

**HERCULES**, hēr'kū-lēz, called by the Greeks HERAKLES, and also ALCIDES, al-sī'dēz, after his grandfather, Alcæus: a mythological hero of Greece, typified by poets, sculptors, and artists of later ages as a model of human perfection, physical and mental. According to the traditions of the heroic age, he united the finest qualities of mind and heart, as understood at that period, with the highest development of bodily vigor, and under a ceaseless succession of labors and sacrifices, strove perpetually after divine excellence. His indomitable perseverance was crowned with victories which showed the triumph of the divine part of man's nature over the earthly, while his death secured him immortality, a seat among the gods, and the homage of divine honors.

The legends relate that he was the son of Zeus or Jupiter, king of the gods, and of Alcmena the Theban, daughter of Alcæus, son of Perseus. Knowing that the child born on a certain day would rule over the descendants of Perseus, Hera or Juno, wife of Jupiter, consumed with jealousy, contrived to prolong the travail of Alcmena and hasten that of the wife of Sthenelus, another son of Perseus, who gave birth to Eurystheus, subsequently chief of the Persidæ. Hercules was brought up at Tirynthus, or according to Diodorus, at Thebes. Jupiter sought to protect his favorite son in every

manner, and to make him worthy of immortality. On one occasion, while Juno was asleep, he laid the infant on her breast, that he might feed on the milk of the goddess. She awoke and cast the hated babe from her, and the drops that then fell from her are said to have formed the Milky Way. Under the care of Amphitryon, Alcmena's husband, Hercules received the best instruction in all arts. Castor, the son of Tyn-darus, taught him how to fight; Eurystus, archery; Autolycus, driving; Eumolpus, singing; Linus, to play the lyre; and under the centaur Chiron he perfected his training, and became the most valiant and accomplished hero of the age.

In his eighteenth year he slew a huge lion in the neighborhood of Mount Cithæron which had preyed on the flocks of Amphitryon and of the king of Thespiæ. The king, desirous that his 50 daughters might have children by such a hero, entertained him at his court for 50 days, and Hercules became the father of their sons, the Thespiadæ. Hercules next freed his native city from the annual tribute of a hundred oxen, paid to Erginus, king of the Orchomenians. Creon, king of Thebes, rewarded Hercules by giving him his daughter Megara in marriage and intrusting him with the government of his kingdom. Subjected to the power of Eurystheus owing to priority of birth, the latter, acquainted with Hercules' successes and rising power, ordered him to appear at Mycenæ and perform the labors which he was empowered to impose upon him. Hercules refused, and Juno to punish him afflicted him with melancholic madness, during which he killed his own children by Megara, supposing them to be the offspring of Eurystheus. When he recovered he was so horrified by the misfortunes which had proceeded from his disobedience and insanity that he consulted the oracle at Delphi; he was told that he must be subservient to the will of Eurystheus and perform ten labors imposed by the king, after which he would attain immortality. Hercules thereupon went to Mycenæ, where Eurystheus, apprehensive of so powerful an enemy, commanded Hercules to achieve a number of enterprises the most difficult and arduous ever known. The favors of the gods, however, had completely equipped him for their performance; from Minerva he had received a coat of arms and helmet, a sword from Mercury, a horse from Neptune, a shield from Jupiter, a bow and arrows from Apollo, and from Vulcan a golden cuirass and brazen buskin with a celebrated brass club.

The first labor was to destroy the lion which infested the forests of Nemea and Cleonæ near Mycenæ and was invulnerable to mortal arrows. Hercules attacked him with his club, chased him to his den, and after a sharp and fierce struggle choked him to death. He carried the dead beast on his shoulders to Mycenæ, and ever after clothed himself with the skin. The second labor was to destroy the Lernaean hydra, which he accomplished with the assistance of his friend Iolaus, who burnt with a hot iron the root of each head as Hercules crushed it to pieces with his club. The third labor was to catch the hind of Diana, famous for its swiftness, golden horns and brazen feet. The fourth labor was to bring alive to Eurystheus a wild boar which

ravaged the neighborhood of Erymanthus. In this expedition he destroyed the Centaurs, and caught the boar by closely pursuing it in the deep snow. In his fifth labor Hercules was commanded to clean the stables of Augeas, where 3,000 oxen had been kept for many years; this he accomplished in one day by turning the rivers Alpheus and Peneus through the stables, receiving as payment a tenth of the cattle and concealing the fact that he had been commanded to perform the service. The sixth labor was to destroy the carnivorous birds, with brazen wings, beaks and claws, which ravaged the country near Lake Stymphalis in Arcadia. In his seventh labor he brought alive into Peloponnesus the wild bull, a gift of Poseidon to Minos, king of Crete, which had laid waste the island. In his eighth labor he was commissioned to capture the mares of Diomedes, which fed upon human flesh. He killed Diomedes, and gave him to be eaten by his mares, which he brought to Eurystheus. For his ninth labor he was commanded to obtain the girdle of the queen of the Amazons. In his tenth labor he killed the monster Geryon, king of Gades, and brought to Argos his numerous flocks, which fed upon human flesh. Adjudging the second and fifth labors as unlawfully performed, Eurystheus imposed two others. These were: the eleventh, to obtain the golden apples from the garden of the Hesperides; and the twelfth, to bring from hell the three-headed dog Cerberus. Pluto promised him Cerberus on condition that he should use no weapons but force. Eurystheus, pale with fright when Hercules brought the monster to him, ordered its immediate removal. This ended what are generally known as the Twelve Labors of Hercules, and relieved the hero from bondage.

Besides these, Hercules achieved other labors equally great and celebrated, such as his war with Jupiter against the giants, his expedition with the Argonauts to Colchis, the pillage of Troy, the liberation of Prometheus and Theseus, etc. During three years' slavery, imposed by the Delphian oracle for plundering the temple to avenge supposed neglect, Hercules' mistress, Omphale, queen of Lydia, married him. Hercules afterward married Dejanira, daughter of Ceneus, king of Ætolia, and when Iole, daughter of the king of Ecbalia, a princess formerly refused to Hercules, became his captive, Dejanira sent Hercules the tunic given her by the dying centaur Nessus as having the power to recall a husband from unlawful love. The tunic had been infected by the poisoned arrow shot by Hercules at the centaur when he offered violence to Dejanira, after carrying her across the river Evenus. When Hercules put the tunic on, the poison penetrated his system and he suffered untold torments; in remorse Dejanira killed herself. In his agony Hercules had himself conveyed to Mount Ceta and laid on a funeral pyre which at his commands was set on fire. In the midst of a dark cloud, accompanied by lightning and thunder, his immortal spirit was transported to Heaven, where he took his place among the gods, became reconciled to Juno and married her daughter Hebe.

While the myth of Hercules is of Greek origin, counterparts of the legend appear among many nations. Some scholars regard Hercules as a solar hero, and the twelve labors to represent the 12 zodiacal signs. Artists represent him under a variety of forms, as a child, a youth, and man, in his numerous adventures and exploits. The principal ancient statue is the Farnese Hercules at Naples, by the Athenian Glycon. In the Vatican, the Torso di Michelangelo, so called because that artist studied it during several years, is a remarkable fragment of an ancient statue of Hercules. Consult Gayley, 'The Classic Myths' (1911).

**HERCULES**, in astronomy, one of Ptolemy's northern constellations. It is within this constellation that the point toward which the sun, with its accompanying system of planets, is traveling at present is situated. The constellation contains the finest globular cluster of stars in the northern heavens, and the bright double and variable star Ras Algethi.

**HERCULES**, Pillars of, name of the Straits of Gibraltar among the ancients. Hercules is said to have erected a pillar on each side of the strait between Europe and Africa, upon the mountains Calpe and Abyla, as the limits of his wanderings toward the west. The earliest Greek writer by whom the Pillars of Hercules are mentioned is Pindar. On the other hand the Phoenicians called the strait the Pillars of Melkart (q.v.), whom the Greeks knew as Melicertes.

**HERCULES-BEETLE**, a very large South American lamellicorn beetle (*Dynastes hercules*). An enormous horn projects from the prothorax of the male and a smaller one from the head; they act together like a pair of forceps. The length of the male is about six inches but the female is smaller and lacks the horns. Numerous related species are known, of which *D. tityrus*, found in the southern United States, is two and one-half inches long.

**HERCULES' CLUB**, a North American shrub or tree growing to height of 12 feet and sometimes to 40 feet. See **ARALIA**.

**HERDER**, Johann Gottfried von, yō hān gōt frēd fōn hēr dēr, German critic and poet: b. Mohrungen, Prussia, 25 Aug. 1744; d. Weimar, 18 Dec. 1803. He was the son of a poor schoolmaster, but friends procured him an appointment in Frederick's College, where he was at first tutor and at a later period instructor. During this period he became known to Kant, who permitted him to hear all his lectures gratis. His unrelaxing zeal and diligence enabled him to become acquainted with science, theology, philosophy, philology, natural and civil history and politics. In 1764 he was appointed an assistant teacher at the cathedral school of Riga, with which office that of a preacher was connected. In 1769 he went to Paris; he became traveling tutor to the Prince of Holstein-Oldenburg, but in Strassburg he was prevented from proceeding by a disease of the eyes; and here he became acquainted with Goethe, on whom he had a very decided influence. Herder had already published his 'Fragments on the More Modern German Literature,' his 'Critical Woods' (Kritische Wälder), etc., which had gained him a considerable reputation, though he had not published anything of importance

in theology; yet, while in Strassburg, he was invited to become court preacher, superintendent and consistorial councillor at Bückeburg, whither he proceeded in 1771. He soon made himself known as a distinguished theologian, and in 1776 received an invitation to become court preacher, general superintendent and consistorial councillor at Weimar. This appointment was through the influence of Goethe. In 1801 he was made president of the high consistory, a place never before given to a person not a nobleman, and was subsequently made a noble by the Elector of Bavaria. As a theologian Herder contributed to a better understanding of the historical and antiquarian part of the Old Testament. His 'Geist der hebräischen Poesie' is highly valued. He did much for the better appreciation of the classical authors, and his philosophical views of human character are full of instruction. His greatest work is his 'Ideen zur Philosophie der Geschichte der Menschheit' (1785 et seq.). In poetry Herder effected more by his various accomplishments, his vast knowledge and fine taste than by creative power; yet he has produced some charming songs; and his 'Cid,' a collection of Spanish romances into a kind of epic, is one of the most popular poems of Germany.

**HEREDIA**, ā-rā-de'a, José Maria, Spanish-American poet: b. Santiago de Cuba, 31 Dec. 1803; d. Toluca, Mexico, 7 May 1839. He was graduated from the law department of the University of Havana in 1819; for taking part in the attempted revolution of 1823 was banished from Cuba, lived for two years in the United States and in 1825 removed to Mexico, where he held various civil, judicial and journalistic positions. His poetic works have been to some extent rendered into other languages. The 'Ode to Niagara' is well known. Heredia has been considered by many the greatest of Spanish-American poets. One of the best editions is that of Ponce de Leon, 'Obras Poeticas de Don José Maria de Heredia' (1875).

**HEREDITARY MONARCHY**. See **MONARCHY**.

**HEREDITY**. So long as the part played by the male and female in procreation was obscure, as it was to the ancients, it was impossible to arrive at a clear idea concerning the relationship of offspring to parents, but after Spallanzani's discovery that the solid part only of the sperm forms the fertilizing agent, and more especially after Hamm's identification of the spermatozoon, it became possible to study the method of inheritance more directly. At the time when these advances were made the doctrine of praeformation was still generally held and the attempt to harmonize the new discovery of the spermatozoon split the praeformation school into two schools. According to one side, the ovists, the egg contains in miniature a germ in all essential respects, except size, like the parent. The spermatozoon only starts the vital processes but contributes nothing material to the result. Heredity, therefore, *sensu strictu*, could only take place through the female. According to the other side, the spermists, the spermatozoon contained the praeformed germ of the individual, and the egg supplied only the pabulum for its expansion and growth. Both ovists and spermists were logically forced to the further assumption

that each germ contained within itself other germs and these still others, and so, if not *ad infinitum*, still each contained a sufficient number of enclosures to insure the perpetuation of the species as long as its predestined course was to last.

This deadlock was broken with the discovery of the cell (1838-39) and the part it plays in fertilization. Plants and animals have been found to be made up of modifications of a single unit called the cell—a mass of protoplasm usually surrounded by a membrane and containing a central sphere or nucleus. The egg is such a cell—one so simple as compared with its many modifications in the body that the egg is almost an idealized type of the cell. Minute study of the spermatozoon and its origin revealed that it, too, starts as a cell as simple as the egg cell. Fertilization was found to consist of the union of these two cells, one from one parent and one from the other, at least in all animals and plants in which the sexes are separate. By union of the two cells a single cell is produced which through division gives rise to the host of cells of which the new individual is produced. Every cell of the new individual contains all the hereditary elements derived from the two parents. These hereditary elements are now recognized as contained in the cell in certain threads called chromosomes that are the essential elements of the nucleus of the cell. The number of chromosomes is definite for each species of plant or animal. The numerical constancy is maintained by a division that takes place in the ripening of the egg and of the sperm mother cell, for at this time a process occurs that need not be further described here (see below), which leads to a reduction in the number of chromosomes to a single set—one of each kind. By the union of these reduced cells in fertilization the double number of chromosomes is again restored. This demonstration of the duality of the hereditary elements in the fertilized egg with the consequent duality of the same elements in every cell of the adult body is the most important contribution of modern cytology to the theory of heredity.

While these discoveries were being made during the latter part of the last century, discoveries that were destined ultimately to throw a flood of light on how inheritance is brought about, a doctrine was attracting widespread attention, but has never succeeded in being brought into systematic relation with our knowledge concerning the cell.

In 1809 Lamarck had advocated the view that evolution is due in part to the direct influence of the environment, especially in plants, and in part to the inheritance of structural and physiological changes that first take place in the body of animals as a result of use and disuse of its parts. The doctrine involves the idea that in some way the germ cells respond specifically to changes in the body. Darwin accepted Lamarck's view (although Darwin erroneously supposed that Lamarck held a view essentially different from his own) and advanced in 1866 a tentative hypothesis as to how somatic modifications could affect the germ cells. His view was the first attempt to show how such a process, that had been vague—even mysterious, might be made compatible with the teaching in regard to cell structure

and physiology that had at that time made very considerable advances. This is the famous hypothesis of Pangenesis. Darwin suggested that every cell of the body is, at all times, throwing off minute representative particles called gemmules which leave the cell, and, migrating through the fluids of the body, finally reach the germ cells into which they enter, and which in a sense they construct. It was assumed that the gemmules from every part of the body unite in the germ-cells with like particles. These particles determine in some way, not clearly specified by the theory, the nature of the organs or characters of the new individual that develops from the egg.

No evidence whatsoever in favor of the liberation of living units from the body cells, their accumulation in the germ cells and fusion there of like with like gemmules is to be found in the modern work on the germ cells. Moreover, a critical examination, especially in Weismann's hands, of the evidence on which was rested the entire theory of inheritance of acquired characters, has shown that this evidence was in part mythical and in part due to uncritical deductions.

Beginning in 1883 August Weismann in a series of essays that were in part speculative, yet backed by a constant appeal to observation and experiment, attacked the prevailing idea that characteristics acquired by the individual are transmitted to the germ cells and may reappear in the offspring. The germ cells had been shown in many cases to separate themselves at an early stage in the development of the embryo from the rest of the cells, remaining in an unspecialized condition while the remaining cells from which the body of the individual is to be formed were differentiating. The germ cells become later the essential parts of the ovary and testis respectively. In origin, therefore, they are independent of the rest of the body and have never been a constituent part of it. They are protected and nourished by the body, but not otherwise influenced by it. The germ tract is the imperishable stream which throws off in each generation the body cells whose destiny is to maintain the germ cells. All new modifications arise primarily in the germ cells, and first show themselves as characters in the individuals that develop from these germ cells. Evolution is germinal in origin and not somatic as had been earlier taught. This idea of the origin of new characters is held almost universally to-day by biologists. Heredity is due, therefore, to the conservation in the germ plasm of those elements that have appeared in it from time to time—the old as well as the new. The germ plasm is the capital of the race of which the interest only is spent in each generation in producing new individuals.

Darwin held not only that somatically "acquired" characters are transmitted, but also that new characters arise in other ways, in the main through the action of the outer world on the germ cells themselves. To this source he attributed many of the differences shown by individuals of any race or species. Darwin knew that some of these differences were due directly to the environment in which the individual was reared and were not inherited, but others he thought were in the germ stream and hence were transmitted (inherited). Darwin

thought that the latter variations were different from the larger differences that sometimes appear and which were known to the breeder as "sports" (now as "mutations"). The former he believed to furnish the principal material on which natural selection acts to bring about evolution, while the larger and sudden changes or "sports" rarely if ever furnished the materials for evolution. To-day it appears that no such distinction exists and that all variations, whether large or small, that are inherited, arise in the same way, viz., as sudden changes (mutations) in the germ-plasm. Galton, whose studies in heredity, particularly those of human heredity, are based on much the same kind of evidence in regard to variation as that to which Darwin appealed, appreciated more fully the significance of discontinuity in the origin of new characters, but in his treatment of the inheritance of characters he made no sharp distinction between the methods of transmission of "blended" inheritance and "mosaic" inheritance and handled both by the same mathematical method. Nevertheless, Galton's introduction of exact mathematical and quantitative methods has had an important bearing on all recent work. Its later development, especially by Pearson and the school of Biometry, has furnished the Mendelian school with formulae indispensable for testing the validity of much of their data.

Galton reached the conclusion that the two parents of a given individual contribute to it on the average half of its inheritance; the four grandparents collectively one-fourth of its inheritance, the great-grandparents one-eighth, etc. The assumptions on which this theory rests have been shown (see below) to be wrong, for the procedure by which the hereditary elements are sorted out in successive generations is incompatible with such an assumption in individual cases. Individual analyses rather than study of mass phenomena gave the successful method through which the real hereditary mechanism was discovered by Mendel in 1865.

Mendel's two laws of heredity have been shown to hold not only for many plants, but for man and other animals, for birds, amphibia, fish, molluscs, crustacea, insects, etc. It has been found that Mendel's laws apply not only to characteristics of cultivated plants and animals, not only to superficial things such as color, but to the characters of wild animals, to differences that distinguish species, and to the most fundamental attributes of living things. Mendel's law of segregation states that the elements that the two parents contribute to the offspring

constitute pairs, and that the members of each pair separate in the formation of the germ cells in the offspring so that each germ cell contains one member only of each pair. For example, Mendel crossed a race of edible peas having green seeds to one having yellow seeds. All of the offspring seeds were yellow. Yellow dominates green. If plants from these hybrid peas are self-fertilized (or crossed to each other) they produce both yellow and green peas in the ratio of three yellows to one green. These green peas are pure and never produce anything but green peas. The yellow peas, however, were found to be of two kinds, some were pure yellow always producing all yellow descendants, others were hybrids, producing both yellow and green peas in the ratio of three to one. Taken altogether these second generation peas appeared in the proportion of one pure yellow, two hybrid yellows, one pure green. Mendel pointed out that if the original green grandparent contributed an element for green and the yellow grandparent an element for yellow, these contrasted elements form a pair in the hybrid—a pair whose members separate (segregate) from each other when the germ cells (gametes) are produced. In consequence, half of the ovules will contain the element for yellow and half the element for green; likewise half of the pollen grains will contain the element for yellow and half the element for green. Chance meetings of the ovules and pollen, thus:

will give 1 green green; 2 green yellow; 1 yellow yellow.

Mendel's second law deals with cases where more than one pair of characters are involved. It has been found that tall and short races of peas are contrasted characters that segregate in the same way as do yellow and green. If a tall race with yellow peas is crossed to short race with green peas, the segregation of each pair is independent of that of the other, so that one-quarter of the egg cells of such a hybrid contains the elements for tall and yellow; another quarter the elements for tall and green; another quarter the elements for short and yellow, and another quarter for short and green. Similarly in the formation of the pollen of the same four kinds of gametes are produced. Chance meetings of ovules and pollen give 16 combinations as shown in the following diagram.

POLLEN	Ovules			
	Tall Yellow	Tall Green	Short Yellow	Short Green
Tall Yellow.....	Tall yellow Tall yellow	Tall green Tall yellow	Short yellow Tall yellow	Short green Tall yellow
Tall Green.....	Tall yellow Tall green	Tall green Tall green	Short yellow Tall green	Short green Tall green
Short Yellow.....	Tall yellow Short yellow	Tall green Short yellow	Short yellow Short yellow	Short green Short yellow
Short Green.....	Tall yellow Short green	Tall green Short green	Short yellow Short green	Short green Short green

Since yellow dominates green and tall dominates short, there are in this second filial ( $F_2$ ) generation nine tall yellow; three short yellow; three tall green; one short green. Thus, while members of each pair of factors of the hybrid segregate at the time of ripening of the germ cells, the separation is independent for each pair. This is Mendel's second discovery that may be called the law of independent assortment.

Mendel showed that three pairs of characters behave in the same way, i.e., their genes assort independently, and there is reason to suppose that this law holds whenever the genes for the two or more pairs of characters are carried by separate pairs of chromosomes, but, as will be shown below, whenever the genes are carried by the same pair of chromosomes the distribution is controlled by a third law of heredity, viz., the law of linkage.

The elements that are supposed to represent, in a sense, the hereditary characters are commonly called genes and the word Genetics, or the study of behavior of the genes, has come to replace, in the modern work on inheritance, the older term Heredity with its numerous connotations. The Mendelian characters have been spoken of as unit characters, and it is sometimes implied that the gene directly produces each such character. The clearest evidence, however, indicates that the so-called unit character is only one of the many effects which the gene may produce in conjunction always with many, perchance with all of the other genes. Thus, the germ plasma is looked upon as the sum total of the genes whose combined effect is responsible for each character of the body. While the body is built up through the interaction of the materials that the gene produces, yet in the formation of the germ cells the genes act as independent units that collect in pairs, then segregate, those pairs in separate pairs of chromosomes assorting independently; those pairs in the same chromosome pair being linked.

Modern work on the cell has pointed unmistakably to the mechanism by means of which both segregation of the genes and the assortment of the chromosomes takes place. Every cell in the body or immature germ cell contains a double set of chromosomes (except in the male of certain groups, which lacks one of the sex chromosomes); one member of each pair has come from the father and one from the mother. During the maturation process the maternal and the paternal chromosomes mate with each other—like with like. Subsequently at the so-called reduction division one member of each pair goes to one daughter-cell and the other member to the other daughter-cell. If the chromosomes carry the Mendelian genes the maternal and the paternal genes will be segregated when the chromosomes are reduced to produce the gametes; but at the reduction division there is not a separation of all the maternal from all of the paternal chromosomes as a group, but each pair of chromosomes segregates independently of the others, so that the daughter-cells may get any possible assortment of the chromosomes of paternal and maternal origin, but always one or the other member of each pair. This condition fulfills all the requirements of Mendel's second law of free assortment.

But obviously if, as assumed, the chromosome threads are the bearers of the genes and if, as generally held to-day, the thread is a structural element that remains intact even in the resting stages of the cell, then the genes must be inherited in groups corresponding in number to the number of the chromosomes. In a word, all the genes in a given chromosome will be linked together. The most recent evidence shows that this is the case, and that there are as many groups of linked genes as there are kinds of chromosomes. Since 1906 the number of demonstrated cases of linked genes has steadily increased so that it can no longer be questioned that this relation is a characteristic feature of Mendelian inheritance. In one instance, that of the fruit fly, *Drosophila ampelophila*, it has been shown that the 200 known hereditary differences are inherited in four groups corresponding to the four pairs of chromosomes. Thus, Mendel's law of segregation has found its justification in the cytological mechanism of reduction in the germ cells; while his law of free assortment has been confirmed in the method of assortment of the chromosome. Later the discovery of the meaning of linkage phenomena has brought all the fundamental properties of heredity into complete harmony with the chromosomal mechanism. The individuality of the chromosomes that is responsible for linkage has been found, however, not to be absolute, for the members of a pair have been shown to interchange equivalent parts at times, but the interchange has been found to follow a predictable course, and while it complicates the results, in no sense undermines the general principle involved. In some species the interchange (crossing over) takes place only in the female sex (*Drosophila*), in others in the male sex (silkworm moth), while in still others it takes place in both sexes, as in some hermaphroditic plants.

The inheritance of sex has been one of the great biological discoveries of the present century. The factor or factors of sex have been shown to be carried by special chromosomes called the sex chromosomes. In certain great groups (mammals, most insects, etc.) the occurrence of two of these chromosomes, called the X chromosomes, produces a female, the presence of one of them produces a male. Thus the female is XX, the male X. At the reduction division in the female one X is eliminated from the egg so that each egg contains but one X chromosome. In the male there is only one X, this X chromosome goes in the reduction division to only one sperm cell of the two formed, so that two classes of spermatozoa result. At the time of fertilization random meeting of any egg with any spermatozoon will give two classes of individuals, those with two X's (females) and those with one X (males). This mechanism preserves the numerical equality of the sexes. In other groups (birds, moths) the relation is reversed, the male containing two X's, the female one; hence all of the spermatozoa contain one X; half of the eggs contain but one X, the other half none. This mechanism gives the same numerical results but the sex factors are presumably different. In hermaphroditic forms all of the individuals are alike in their chromosomal numbers, and the differentiation of testes in one part and ovaries in another part of the same individual must be

determined by the same kind of relation that determines the differentiation of any of the organs of the body. This is not the result of different chromosomal complexes but of the relation of the protoplasmic parts to each other.

In consequence of the method of distribution of the sex chromosomes a unique type of inheritance called "sex linked inheritance" has been recognized. The sex chromosomes carry many other factors besides the sex factor which follows the distribution of the sex chromosomes. Thus, in man certain kinds of color blindness and hemophilia (bleeding resulting from failure of the blood to coagulate) are inherited as follows: an affected male transmits his characteristics to half of his grandsons but to none of his sons, daughters or granddaughters; but all of his daughters and half of his granddaughters carry his affected X chromosomes, and reproduce their peculiarity in half of their sons. Conversely, an affected female transmits her peculiarity to all of her sons (since each gets her affected X chromosome) but to none of her daughters since the other X chromosome that they receive from their father counteracts the injurious effect of the maternal X chromosome, etc. In birds, where the female is X and the male XX, these relations are just reversed.

The word heredity has come to-day to have a more precise meaning than in the past, because the recurrence of characters in successive generations is now known to come not from the body of the parent, but to be an expression of the factorial composition of the germ plasm. The germ plasm is the heritage of the species or race and changes only through mutation in one or more of its elements or genes. The character of each individual that arises out of this germ plasm is determined by the sum total of the factors contained in the germ, which factors acting on the cytoplasm determine the character of the result in any given environment. Heredity is the name given to express this relation of continuity of the germ plasm material and its consequences in the successive generations that arise from the germ plasm.

THOMAS H. MORGAN,  
Professor Experimental Zoology, Columbia University.

**HEREFORD**, hēr'ē-fōrd, England, a city and parliamentary borough, capital of Herefordshire on the Wye, 144 miles by rail northwest of London. The chief building is the cathedral, built in 1012-56, rebuilt in 1072, and restored in 1863. It is of early Norman architecture, 335 feet long and 174 feet wide, contains many fine monuments, some as ancient as the cathedral, and its accessory features include a lady chapel,

charterhouse, cloisters, an episcopal palace and a library containing valuable MSS., Wyclif's Bible, and a 13th century map of the world. A musical festival of the united choirs of Gloucester, Worcester and Hereford is given in the cathedral triennially. Cider and brewing and the making of excaustic tiles are among the industries. David Garrick was a native. The see dates from 673; the city was incorporated in the reign of King John. Pop. 22,568.

**HERESY** (Gr. *hæresis*) primitively means a choice or election, and in its application to religious belief is used to designate as well the act of choosing for one's self, and maintaining opinions contrary to the authorized teaching, as also the heterodox opinions thus adopted. In the Acts of the Apostles the word seems to be used of a sect or party, apart from the consideration of its character, whether good or bad; but in the Epistles and in the early Christian writers it is almost invariably used in an evil sense, which is the sense uniformly accepted in all subsequent theological literature down to recent times.

Even in the apostolic times heresies had arisen in the Church, and before the Council of Nice the catalogue of sects had already swelled to considerable dimensions.

From the very date of the establishment of Christianity in the Roman empire heresy appears to have been regarded as a crime cognizable by the civil law; and Constantine enacted several severe laws for its repression, which were continued and extended by his successors, and were collected into a single title, 'De Hæreticis,' in the Justinian code. The penalties of heresy ordained by these enactments are very severe, extending to corporal punishment, and even to death; and they all proceed on the distinct assumption that a crime against religion is a crime against the state. These enactments of the Roman law were embodied in the various codes of the European kingdoms; in English law heresy consisted in holding opinions contrary to the faith of Holy Church. By common law the offender was to be tried in the provincial synod by the archbishop and his council, and, after conviction, was to be given up to the king to be dealt with at his pleasure. But the statute 2 Hen. IV, chap. 15 (*De hæretico comburendo*) empowered the diocesan to take cognizance of heresy, and, on conviction, to hand over the criminal directly, and without waiting for the king's writ, to the sheriff or other competent officer. This statute continued practically in force, with certain modifications, till the 29 Charles II chap. 9, since which time heresy is left entirely to the control of ecclesiastical legislation.

The doctrines considered heretical by the Christian Church may be found in the 'Dictionnaire des Hérésies,' by the Abbé Pluquet, with the history, progress, nature, and also the refutations of their errors. From the viewpoint of the Roman Catholic Church all Protestants (including in this term Anglicans) are accounted heretics; the right of private judgment is the keystone of Protestantism. The Protestant churches have themselves judged members who have dissented on doctrinal points heretics, and the Anabaptists were at one time so regarded; but with increasing toleration prosecutions for heresy are becoming very infrequent and are

not regarded as excluding from the fellowship of believers those who thus come under the ban of ecclesiastical censure or disapproval.

**HERETIC**, in ecclesiastical terminology, one who embraces a heresy. It is evident that the word heretic can have only the relative meaning of heterodox. The early Christian Church always made a distinction between heretics who obstinately persisted in their heresy, and heretics merely through error, or who had been born in heresy. The fathers of the Church declare themselves ignorant of the final condition of the latter. Again, peaceable heretics are distinguished from those whose doctrines produce public confusion and disorder.

**HEREWARD**, hēr'ē-ward, a Saxon yeoman who flourished about 1070. He was practically the last to withstand the Normans, holding the Isle of Ely against William the Conqueror 1070-71. After William had succeeded in reaching the refuge of the Saxon patriots, Hereward, scorning to yield, fled to the fastness of the swampy fens to the northward. He was commonly styled **HEREWARD THE WAKE**, and his character and adventures form the theme of Charles Kingsley's popular historical romance, 'Hereward.'

**HERFORD**, Oliver, American humorous author and illustrator: b. England, 1863. He was educated at the Slade School, London, and Julien's, Paris. Among his works are 'Artful Antics'; 'The Bashful Earthquake and Other Fables and Verses' (1898); 'Alphabet of Celebrities' (1899); 'A Child's Primer of Natural History' (1899); 'Wagner for Infants' (1899); 'Overheard in a Garden' (1900); 'Rubaiyat of a Persian Kitten' (1904); 'The Fairy Godmother-in-Law' (1905); 'Peter Pan Alphabet' (1909); 'Kitten's Garden of Verses' (1911); 'The Mythological Zoo' (1914); 'Pen and Inklings' (1917); 'Confessions of a Caricaturist' (1917).

**HERING**, Ewald, German psychologist: b. Altgersdorf, Saxony, 5 Aug. 1834. He studied medicine, and settled at Leipzig as physician in 1860; in 1862 he was lecturer in physiology at the Leipzig University, and in 1865 was professor of physiology and medico-physics in a medical school at Vienna, and in 1870 held the same chair at Prague. Hering is best known for his work in the field of psychophysics, especially for his investigations of visual space perception and for the color theory which he originated. This theory is opposed to the empiristic theory of Helmholtz and is most generally accepted by psychologists at the present time. His writings include 'Die Lehre vom Binocularen Sehen' (1860); 'Zur Lehre vom Lichtsinne' (1872-74); 'Der Raumsinn und die Bewegung des Auges'; 'Das Gedächtniss als eine allgemeine Funktion der organisierten Materie' (1870); 'Grundzüge einer Theorie des Temperatursinnes' (1877); 'Handbuch der Physiologie'; 'Ueber Newtons Gesetz der Farbmischung' (1887); 'Grundzüge der Lehre vom Lichtsinn' (1905-11), and many papers on visual theory.

**HERING**, Rudolph, American hydraulic and sanitary engineer: b. Philadelphia, Pa., 26 Feb. 1847. He was graduated at the Dresden (Germany) Polytechnic School, 1867, and became assistant engineer of Prospect Park,

Brooklyn, N. Y., the following year. He was assistant engineer of Fairmount Park, at Philadelphia, 1869-71, and astronomer at Yellowstone National Park in 1872. After serving as assistant city engineer 1873-80 he opened an office for private practice in engineering and has furnished designs for sewerage and water supply for numerous towns and cities in the United States, Canada and South America. He is member of many professional societies both in Europe and America, and has written many published reports on sewerage and water supply of cities. He was president of the American Public Health Association in 1913-14.

**HERIOT**, hēr'i-ót, George, Scottish philanthropist: b. Edinburgh, 1563; d. London, 12 Feb. 1624. His father was a goldsmith in Edinburgh, and the son followed his father's profession, and was admitted a member of the Incorporation of Goldsmiths in May 1588. In 1597 he was appointed goldsmith to the queen by a charter from James VI and on the accession of the latter to the English crown followed the court to England. From the period of Heriot's settlement in London little is known of his history. He died on 12 Feb. 1624, and was buried at Saint Martin's-in-the-Fields. By his will he left nearly the whole of his fortune toward the founding and erecting of a school for poor boys in Edinburgh, styled in the bequest a "hospital." The foundation of the present structure, known as Heriot's Hospital, was laid in July 1628; and the expense of the erection exceeded £30,000 sterling. From the rise in value of property the yearly revenue of the hospital has very greatly increased; and the governors were empowered in the reign of William IV to establish elementary schools within the city for the gratuitous education of poor children, 16 day schools being ultimately established, besides evening schools. In 1885, however, an entirely new scheme was introduced and a great part of the funds are now devoted to the support of Heriot's Hospital School and the Heriot-Watt College. The former is a day school for boys of 10 and upward, and the Heriot-Watt College is a college giving a thorough technical, commercial and literary education chiefly by evening classes, though there are also day classes. The annual revenue is now about \$150,000.

**HERKIMER**, Nicholas, American military officer: b. about 1715; d. Danube, N. Y., 17 Aug. 1777. He became a lieutenant of militia, served in the French and Indian War, and defended Fort Herkimer in 1758. Promoted brigadier-general of militia in 1776, he directed operations against Sir John Johnson, and when Fort Stanwix was threatened by a combined force of Indians, Tories and regulars, advanced to its relief. He was ambushed by Col. Saint Leger at Oriskany, and one of the most closely fought battles of the Revolutionary War followed. Herkimer having lost a third of his force, was unable to continue, and Saint Leger's army was rendered thoroughly ineffective. Herkimer himself was wounded, and died as the result of an unskilful operation. The town and county of Herkimer, N. Y., were named in his honor.

**HERKIMER**, N. Y., village, county-seat of Herkimer County; on the Mohawk River, the Erie Canal and on the New York Central and

Hudson River Railroad; about 25 miles east of Utica and 68 miles northwest of Albany. The chief manufactures are flour, furniture, mattresses, knit goods, beds, paper, creamery products, leather board, boxes, hardware and cigars. The city owns and operates the electric plant and the waterworks. It is the seat of Folts Mission Institute, has a public library and a hospital. Fort Dayton occupied the northern part of Herkimer and before 1807, when it was incorporated the village was called Fort Dayton. Pop. 7,520.

**HERKOMER**, SIR Hubert von, English painter: b. Waal, Bavaria, 26 May 1849; d. 31 March 1914. His father, a wood carver, went to America in 1851, but returned to Europe and settled in Southampton in 1857. Hubert studied at the school of art in that city, where he assisted in founding a life school for drawing. In 1867 he exhibited in the Dudley Gallery. His first picture exhibited at the Royal Academy, 'After the Toil of the Day' (1873), a German subject, attracted attention; and two years later he gained a great reputation by his famous picture representing 'The Last Muster—Sunday at the Royal Hospital, Chelsea.' Later pictures are 'Eventide: a Scene in Westminster Union' (1878), "a worthy companion of the other realistic yet more heroic study of old age, which the artist made in his Chelsea Pensioners"; 'Missing: a Scene at the Portsmouth Dockyard Gates' (1881), "a masterpiece in its way"; 'On Strike' (1891), his diploma work; 'Back to Life' (1896); 'The Guards' Cheer' (1898), representing a scene in the Diamond Jubilee procession and 'Portrait of Queen Victoria' (1901). Among many portraits painted by him the best known are those of Wagner, Ruskin and Tennyson. His best water-color pictures are 'Im Walde'; 'The Woodcutter's Rest'; 'The Poacher's Fate'; and 'At the Well.' Mr. Herkomer was elected a member of the Royal Academy in 1890, from 1885 till 1895 held the Slade professorship of fine arts at Oxford in succession to Mr. Ruskin and was knighted in 1907. He held a life professorship at Munich, and superintended an art school founded by himself at Bushey in Hertfordshire. At the Royal Academy Summer Exhibition of 1914 the largest canvas exhibited was Herkomer's 'The Managers and Directors of the Firm of Fried, Krupp, Essen, Germany' He was a man of the utmost versatility, and according to the obituary notice in the London *Times* he "could paint, etch, engrave, work in metal, enamel, play the zither and piano, compose music, write plays, and act them," and he paid much attention to cinema work. Consult for an account of his principles 'My School and My Gospel' (1908); also his autobiography 'The Herkomers' (1910).

**HERMANDAD**, ěr-mān-dāth', a confederation of the cities of Aragon, formed to defend themselves against the usurpations and the rapacity of the feudal nobility. This object was most clearly apparent in the brotherhood (Hermandad) formed about the middle of the 13th century in Aragon, and that formed about 1282 in Castile. In 1295, 35 cities of Castile and

Leon formed a joint confederacy for the same object. These fraternities were the model of the later Hermandad of the municipal communities, which was formed in Castile under the reign of Ferdinand and Isabella. It was established in 1486 with the approbation of the king. The city authorities raised a military force and appointed judges in different parts of the kingdom. Neither rank nor station protected the offender against the tranquillity of the country, nor could he find safety even in the churches. The Santa Hermandad (holy brotherhood) which readers of Don Quixote will be acquainted with, had, like the earlier institution, of which it was a continuation, the object of securing internal safety, and seizing disturbers of the peace and highway robbers, but did not act except in case of offenses actually committed. It consisted of a company of armed police officers, who were distributed in the different provinces of the kingdom of Castile, and whose duty it was to provide for the security of the roads outside of the cities. One of their strictest regulations was not to use their power within the cities. They were subject to the council of Castile. The principal divisions of the company had stations at Toledo, at Ciudad Rodrigo, and at Talavera.

**HERMANN**, hēr'mān, Alexander, American conjurer: b. Paris, France, 10 Feb. 1844; d. near Great Valley, N. Y., 17 Dec. 1896. From his brother Carl, Alexander took his earliest lessons in sleight-of-hand and the brothers then traveled in Europe and became widely known as skilled conjurers. Coming to the United States in 1867 they met with great success. The elder presently returned to Europe, but Alexander became a citizen of the United States, made a tour of the world and had few equals in his profession.

**HERMANN**, Friedrich Benedikt Wilhelm von, German economist: b. Bavaria, 1795; d. 1868. He received his education at Erlangen and Würzburg, where he gave special attention to political economy. He was appointed privatdozent at Erlangen in 1823 and two years later became professor of mathematics at the Nuremberg Gymnasium. In 1827 he was named professor extraordinary at the University of Munich. He was elected to the Bavarian Academy of Science in 1835 and also served as inspector of technical instruction in Bavaria. He became one of the advisers of the Minister of the Interior in 1845, and three years later he served as Munich representative in the Frankfort Assembly. Here he led the forces opposed to the threatening leadership of Prussia. In 1855 Hermann was made Councilor of State and for a time was also in charge of the Bureau of Statistics. He published important pamphlets as head of this bureau, and is now regarded as one of the foremost pioneers in the field of statistics. His reputation as an economist is founded on his 'Staatswirtschaftliche Untersuchungen' (1832).

**HERMANN UND DOROTHEA**. Goethe's 'Hermann and Dorothea' is a bright idyll of a small German country town near the right bank of the Rhine, set against the dark background of the French invasion of the Rhenish

Palatinate in 1794. It was written between September 1796 and March 1797, and was to some extent suggested by Voss's 'Luise,' an idyll in hexameters, first published in 1782-84. The story of the well settled burgher's son marrying a poor fugitive was contained in an account of the Salzburg Protestants who, for their religion, in 1731 fled from their old homes into Germany. The inhabitants and conditions of the little town which is the scene of 'Hermann and Dorothea' are pictured in contrast to the turmoil of the French Revolution, for they stand for the foundations on which civilization will always rest. The leading characters represent the standard callings of men—the farmer, the merchant, the apothecary-doctor, the minister, the judge. The hero is the true son of mother earth, given to tilling the soil and harvesting his crops. The life both in family and community is depicted as the fundamental social forms, with some hints of national life. The love story of the young couple is free from wild romance, indeed their love makes them look to the future not with any anticipation of pleasure or extravagance, but with the instinctive conviction that the true blessings of life flow from the performance of necessary tasks. The public spirit of Hermann's father germinates also in the son's character as his burning patriotism protests against the French invasion. But the spirit that permeates the poem as a whole is that of trust in the future and sympathy with mankind. The hexameters of the nine cantos are at times irregular. The serene flow of presentation, the masterly descriptions of landscape and home, the plastic vigor of the main figures, the balance of color, all go to render 'Hermann and Dorothea' a great work of literary art. Consult edition of Goethe's works in 'Deutsche National-Literatur' (Vol. V, pp. 1-99, 1882-98); English translation in German classics and in Harvard classics; von Humboldt, W., 'Ästhetische Versuche: Hermann und Dorothea' (1799); Hehn, V., 'Ueber Goethes Hermann und Dorothea' (1893).

EWALD EISERHARDT.

**HERMANN, Mo.**, a town in Roark Township, the capital of Gasconade County, on the south bank of the Missouri River, here crossed by a bridge, 81 miles west of Saint Louis, and on the Missouri Pacific Railroad. It is in a grape-vine-growing region and manufacturers wine, beer, flour, tools and cigars. Pop. 1,700.

**HERMANNSTADT, or NAGY-SZEBEN, Austria**, the capital of a county in Transylvania. See SZEBEN, NAGY.

**HERMAPHRODITISM**, the occurrence of both kinds of sexual glands in one and the same animal. The differentiation of the sexes begins with the polyps, when for the first time in the animal kingdom we meet with individuals which are male and female. The lower plants and in the animal kingdom the sponges and Hydra (q.v.) are monœcious, that is, sexual cells occur in the same individual. In the more highly specialized animals, the sexual glands exist in different individuals, and the form is said to be bisexual, or dicecious, as opposed to hermaphroditic forms.

**True or Natural Hermaphroditism.**—This is found in many flowering plants, in sponges, most coelenterates, many worms, including the earthworm, many mollusks and in most barnacles, and this appears to be in relation with their more or less fixed mode of life. As a rule testes and ovaries occur in the same animal, but situated in different regions of the body, while in land snails there is a hermaphroditic gland which produces spermatozoa and eggs in the same follicle. Certain animals, or frogs, which are bisexual as adults, pass through an embryonic hermaphroditism. Normal hermaphroditism is very rare in insects and vertebrates; in the latter only two cases are known, that is, a sea-perch (*Serranus scriba*) and the hagfish (*Myxine*).

**Abnormal Hermaphroditism.**—What in man is called hermaphroditism is a misnomer, as it arises from malformation of the external reproductive organs. In insects occurs lateral hermaphroditism in which one-half of the moth or butterfly, for example, is male and the other female. In some of these cases dissection has shown that only male or female sexual glands alone occur in an undeveloped condition. This is called *gynandromorphism*. Abnormal hermaphroditism sometimes occurs in fishes and batrachians where an ovary is found on one side and a testis on the other. It is curious that in a threadworm (*Angiostomum*) and in certain isopod crustacea (*Cymothoidæ*) the reproductive glands are first male, the same gland afterward producing eggs.

**HERMAS, Shepherd of**, the traditional author of an early Christian work, so called because of the character and title of the angel by whom most of the revelations are made. Authorities disagree as to the identity of the author and date. Each theory presents difficulties, but it is quite probable that the authorship is divided, or else that frequent revisions and editions were made before the work reached the form in which it has come down to us. The work includes five 'Visions'; 12 'Mandates' and 10 'Similitudes.' It is interesting chiefly in its bearing on the circumstances in which early Roman Christianity flourished. In doctrine, it is thoroughly Christian, but lays emphasis on the ethical, rather than the dogmatic, points of the religion. It has often been included in earlier editions of the New Testament, but lost prestige in about the 4th century. There are three defective ancient manuscripts of the Hermas in Greek. The best modern edition is by Harnack and Gebhardt (Leipzig 1877). Harmon published a later one with an English translation by Lightfoot (London 1893). K. Lake produced 'Facsimiles of the Other Fragments of the Shepherd' (New York 1907). Consult Spitta, 'Zur Geschichte und Litteratur des Urchristentums' (Vol. II, 241-437, Göttingen 1896); Taylor, 'The Shepherd of Hermas' (New York 1901).

**HERMENEUTICS**, the study of or instruction in, the science and art of interpreting the Scriptures. See EXEGESIS.

**HERMES, hēr'mēs, Georg**, German theologian: b. Dreyerwalde, Westphalia, 22 April

1775; d. Bonn, 26 May 1831. He studied theology at the University of Münster, became a teacher in the gymnasium of that city, and in 1807 professor of dogmatic theology in the university. When the Prussian government established the University of Bonn, Hermes was appointed to the chair of Catholic theology (1819). Here he began to distinguish himself by his attempts to found a speculative, philosophic and dogmatic school in the Church itself, delivering a series of lectures which caused great sensation by aiming at an alliance between Protestants and Catholics. This attempt to base the positive theology of the Church (a doctrine known as Hermesianism) drew around him great numbers of followers. Many of these in time filled chairs of theology and set forth their views in conjunction with their master in a magazine, the *Zeitschrift für Philosophie und katholische Theologie*, published at Cologne from 1832. The method which Hermes advocated insisted that the truth of revelation and of the Catholic Church should first be tested by reason, and that revelation should then be followed. He did not go so far as to declare that all the dogmas in themselves could be proved a priori, but endeavored to found the right of the Church to teach them on the ground of reason. Hermesianism was in fact an ingenious effort to base the doctrines of the Church on Kant's system of philosophy. It aroused powerful opposition, being condemned as heretical by a papal letter of 26 Sept. 1835. Hermes' scholars stoutly defended their orthodoxy, many of them repeatedly appealing to the Pope, on the ground that the Pope had been misinformed by persons who were ignorant of philosophy and theology alike. The Hermesians admitted that the doctrines specified in the papal brief were heterodox, but alleged that these were not the doctrines of Hermes. The chief adherents of the new school were the professors Braun, Elvenich and Achterfeldt. Hermesianism declined rapidly, however, and by 1850 had become a matter of history. Hermes wrote 'Ueber die Wahrheit des Christentums' (1805); 'Einleitung in die christkatholische Theologie' (2 parts, 1819-29); 'Christkatholische Dogmatik' (1834). Consult Braun and Elvenich, 'Acta Romana' (Hanover 1838); Lichtenberger, 'German Theology in the Nineteenth Century' (Edinburgh 1889); Niedner, 'Philosophiæ Hermesii Explicatis' (Leipzig 1838); Werner, 'Geschichte der katholischen Theologie' (Munich 1866), and the biography by Gla in 'Repertorium der katolisch-theologischen Literatur' (Vol. I, Paderborn 1904).

**HERMES**, hēr'méz (called by the Romans *Mercurius*, and identified with their own god of that name), in Greek mythology the son of Zeus and Maia. According to legend his birthplace was in the mountains of Cyllene, Arcadia. Four hours after his birth he invented the lyre, which he made by killing a tortoise and stringing the shell with three or seven strings. He then sang to it the loves of Zeus and his mother, Maia. Having concealed the lyre in his cradle, he was seized with hunger, went in the dark evening to Pieria, and stole 50 oxen from the sacred herd of Apollo which he drove back-

ward and forward to confound their tracks; then walking backward himself, he drove them backward also; and after having killed two of them near the river Alpheus, roasted and sacrificed a part to the gods. He concealed the remainder in a cavern. He also carefully destroyed all traces of them. The next morning Apollo missed his oxen and went in search of them, but he could discover no traces of them until an old man of Pylos told him that he had seen a boy driving a herd of oxen in a very strange manner. Apollo now discovered that Hermes was the thief. He hastened to Maia and accused the infant, who pretended to be asleep and, not terrified by the threat of the god that he would hurl him into Tartarus, steadily maintained his innocence. Apollo, not deceived by the crafty child, carried his complaint to Zeus. Hermes lied even to him. Zeus perceived him to be the offender, but was not angry with him, and smiling at his cunning, ordered him to show the place where the oxen were concealed. To secure him Apollo bound his hands, but his chains fell off, and the cattle appeared bound together by twos. Hermes then began to play upon his newly-invented lyre, at which Apollo begged the instrument of the inventor, learned of him how to play on it and gave him a whip to drive the herd, thenceforth belonging to both in common.

They then concluded a compact with each other; Hermes promised never to steal Apollo's lyre or bow; the latter gave him the *caduceus*. The ancients represent Hermes as the herald and messenger of the gods. He conducts the souls of the departed to the lower world, and is therefore the herald of Pluto and the executor of his commands. His magic wand had the power to close the eyes of mortals, to cause dreams and wake the slumbering. The qualities requisite for a herald he possessed in the highest perfection, and bestowed them on others—grace, dignity and insinuating manners. He was also the symbol of prudence, cunning and fraud, and even of perjury, and was the god of theft and robbery. In the wars of the giants he wore the helmet of Pluto, which rendered him invisible, and slew Hippolytus. When Typhon compelled the gods to fly before him and conceal themselves in Egypt, he metamorphosed himself into an ibis. He is also mentioned by Homer as the patron of eloquence, and still more particularly by Hesiod. Of his inventions Homer makes no mention. Later writers ascribe to him the invention of dice, music, geometry, the interpretation of dreams, measures and weights, the arts of the palæstra, letters, etc. He was also regarded as the patron of public treaties, as the guardian of roads and as the protector of travelers. He was represented in art as a boy in the prime of youth, sometimes with the caduceus, and sometimes with a winged cap, standing, sitting or walking. The artists of later times placed him among the youthful and beardless gods. The most prominent traits of his character are vigor and dexterity. In the representation of Hermes of a later date the relations of corporeal beauty and mental dexterity are wonderfully preserved. Artists made the cock his symbol, on account of its vigilance or love of

fighting (in allusion to gymnastics); the tortoise, on account of his invention of the lyre; the purse, because he was the god of traffic; a ram and a goblet, because he was the director of religious ceremonies and sacrifices; the trunk of a palm-tree, upon which his statues lean, because he was the inventor of arithmetic and writing (upon palm-leaves); the *harpe* or sickle-shaped knife, because he was the slayer of Argus. Consult Lang, Andrew, 'Myth, Ritual and Religion' (1887); and Farnell, 'Cults of the Greek States' (Vol. V, 1909). See GREEK GODS.

**HERMES TRISMEGISTUS**, tris-mē-jis'tūs, the Greek title of the Egyptian moon god, Thoth, one of the most interesting figures in Egyptian mythology. He is represented as Ibis or with the ibis head, and is fully illustrated in the monuments and papyrus rolls from time to time brought to light. He is the god of time and of its divisions; he is the measurer and the god of measurements. He is the conductor of the dead. He is also the god of human intelligence, to whom are attributed all the productions of human art. All the literature of Egypt is attributed to him—all the writings that relate to the different sciences, mathematics, astronomy, medicine, music. These were called by the Greeks the Hermetic Books. Thoth is also credited with the invention of alchemy and magic. The Hermetic art is used to mean alchemy. The secrets of this art were handed on from teacher to pupil orally and in secret and this transmission was termed the Hermetic chain. For these reasons the Greeks identified him with their Hermes, and besides called him Trismegistus, "Thrice great." By later writers, Euhemerists, Neoplatonists (q.v.) and Christians, Thoth was considered a great Egyptian king, a teacher of mankind, who had left books of magic and mystery behind him. Numerous books of such a sort once existed in Egypt. Clement of Alexandria knew of 42, and so-called Hermetic fragments are still extant, in the works of Stobæus, Cyrillus, Suidas and Lactantius. The Hermetic books as we know them belong probably to no earlier date than the 3d or 4th century of our era and are in Greek and Latin. Consult Mead, G. R. S., 'Thrice Greatest Hermes' (1907).

**HERMETIC LITERATURE.** See HERMES TRISMEGISTUS.

**HERMIT** (Gr. *eremites*), a solitary ascetic, who with a view to more complete freedom from the cares, temptations and business of the world took up his abode in a natural cavern or a rudely formed hut in a desert, forest, mountain or other solitary place. Hermits began to appear in the Christian Church in the 3d century. The advocates of asceticism (q.v.) were the first to set the example of retiring from cities to rural districts and villages. But the hermits sought to withdraw altogether from mankind, that they might give themselves up to holy contemplation. The earliest hermit is said to have been Paul of the Thebaid (Egypt), who during the Decian persecution fled to the desert (250); there he lived for the rest of his life, dying, 113 years old, about 342. The fame of his sanctity quickly incited others

to imitate his mode of life. The most famous amongst these successors was Saint Anthony (q.v.). At the time of his death (365) hermit cells existed in considerable numbers in the deserts of Egypt, Syria and Palestine. The fame of their sanctity drew many to visit these hermits partly out of curiosity to get ghostly counsel from them, partly also in the belief that diseases were cured by their blessing. Sometimes they returned for a short time to the midst of their fellow-men to deliver warnings, instruction or encouragement, and were received as if they had been inspired prophets or angels from heaven. But the number of hermits gradually diminished as the cenobite life of convents grew into fashion. Indeed the institution at no time secured the same footing in the Western Church that it did in the Eastern; and perhaps the reason may in part be found in the difference of climate, which renders a manner of life impossible in most parts of Europe that could be pursued in Egypt or Syria. Partial revivals of the practice continued to be made, however, during some centuries, Saint Cuthbert (q.v.) being a case in point. (See MONACHISM). Consult Charles Kingsley's 'Hermits' (1869).

**HERMIT-CRABS**, crabs that shelter themselves in spiral sea-shells, for the protection of the soft-skinned and unsymmetrical abdomen. They are members of the *Macrura* (see DECAPODA), and have very large and generally unequal claws, one being used to close the entrance of the shell into which the hermit can wholly retract himself. The abdominal appendages are practically aborted, with the exception of those at the tip of the tail, which hold firmly to the spire of the inhabited shell. The hermit-crabs belong to three families, namely: *Pagurida*, or common marine hermit-crabs; *Parapagurida*, or deep-sea hermit-crabs; and *Cenobitida*, or terrestrial hermit-crabs. Two species are numerous on the American Atlantic coast running actively about in rock pools and shallows. The little hermit-crab (*Eupagurus longicarpus*) generally inhabits the shells of dog-whelks (*Ilyanassa*), while the larger species (*E. pollicaris*) occupies those of *Lunatia* or sometimes of the wrinkles and conchs. As they grow they must move to larger and larger shells, and the search for new tenements and dangerous change of abodes in the presence of enemies makes the life of one of these animals more than ordinarily exciting. The habits of these and other hermit-crabs are of great interest, generally, and especially on account of the various hydroids, anemones and mollusca which associate with them as commensals. The palm or robber-crab (q.v.) of the East Indies, and the land-crabs of the West Indies, are good examples of terrestrial hermit-crabs. Consult Henderson, J. R., 'Challenger Report on Anomura'; Verrill, 'Invertebrates of Vineyard Sound' (1875); Arnold, 'Sea Beach at Ebb-tide' (1901). See COMMENSALISM; CRAB; CRUSTACEA.

**HERMIT THRUSH.** See THRUSH.

**HERMITAGE.** The. Andrew Jackson's home at Nashville, Tenn., from about 1804, when he removed there from Hunter's Hill. In 1819 the house was built in which he lived till his death in 1845. The Hermitage is now the property of the State of Tennessee.

**HERMITE**, ār-mēt, **Charles**, French mathematician: b. Dieuz, Meurthe, German Lorraine, 24 Dec. 1822; d. Paris, 14 Jan. 1901. He entered the École Polytechnique in 1842, but left it to devote his attention wholly to mathematics. He taught at the École Polytechnique from 1848 to 1876 in various capacities, also acting as lecturer at the École Normale Supérieure from 1862 to 1873. From 1876 to his death he held the chair of higher algebra in the University of Paris. His principal claim to be considered a great and original mathematician rests on his investigations in the line of functions, and his first important work on this theory won for him election to the Academy of Sciences. He proceeded to make discoveries in the theory of algebraic forms and in the theory of numbers. He finally settled the question of the solubility of the quintic equation, and really led the way to Lindemann's further investigations. He became a Grand Officer of the Legion of Honor and a member of the Academy of Sciences in 1892. For a list of his writings consult 'Catalogue of Scientific Papers of the Royal Society of London' (Vols. III and VII); also Mittag-Leffler and Picard in 'Acta Mathematica' (Vols. XXIII and XXIV, Stockholm 1901-02); and Darboux, G., 'Notice historique sur Charles Hermite' (Paris 1905).

**HERMOGONES**, hēr-mōj,ē-nēz, Greek rhetorician, who lived about 170 A.D., a native of Tarsus. At an early age he showed marked ability in forensic and in lecturing, and at the age of 17 was appointed an instructor in oratory by Marcus Aurelius. His 'Manual of Rhetoric,' which was evidently published for the benefit of his pupils, remained for a long time the standard work on the subject. A considerable fragment of this work, dealing with oratorical precepts, has survived and has been published by Walz in 'Rhetores Græci' (Stuttgart 1832-36), and Spengel, 'Rhetores Græci' (1853-56). Hermogones' faculties seem to have suffered from his great precocity and at the age of 25 they snapped under the strain, and he produced no further work.

**HERMON**, Mount, a lofty mountain in Syria, on the border of Palestine, the southernmost peak of the chain of Anti-Libanus. It is about 9,050 feet high. Snow caps the summit throughout the year, but the lower slopes bear rich vegetation, chiefly grapes and fruit. **LITTLE MOUNT HERMON**, bounding the plain of Esdraelon on the east, is 25 miles southeast of Acre, and was called Mount Hermon in the geography of the Middle Ages. The name in Hebrew signifies "forbidden," implying that a sanctuary or holy place was once located there.

**HERMOSILLO**, hār-mō-sēl'yō, Mexico, capital of the state of Sonora, on the river Sonora, about 60 miles from the Gulf of California and 78 by rail north from the port of Guaymas, with which it has a large traffic, being the principal entrepôt for the trade with the interior. Large quantities of fruit are grown in the vicinity, especially grapes, from which much brandy is made.

**HERNÁNDEZ DE CÓRDOBA**, Francisco, Spanish soldier and explorer: b. about 1475; d. Leon, Nicaragua, March 1526. In 1514 he went to Panama with Pedrarias and was

sent by him to take possession of Nicaragua. He founded Granada, Leon and other towns, and discovered the outlet of Lake Nicaragua. He was afterward accused of disloyalty in trying to set up an independent government and was seized by Pedrarias and beheaded.

**HERNÁNDEZ Y GIMENO**, Pablo, Spanish author and priest of the Society of Jesus: b. Rubielos de la Cérda, Teruel, Spain, 9 Oct. 1852. He was educated at the Seminary of Saragossa and at Jesuit scholasticates in France and Spain. In 1872 he entered the Jesuit Order and from 1877 to 1880 was professor of Latin grammar at a Jesuit scholasticate in Chile. From 1880 to 1885 he was professor of science in a Jesuit college in Argentina, and in the latter year returned to Spain. In 1888 he was ordained to the priesthood; taught philosophy at Valencia, 1889-90; scholastic philosophy, 1890-93; and Scripture, 1894, in various scholasticates in Spain. In 1894-96 he was professor of physics, zoology and mathematics in the College of Our Savior, Buenos Aires; in 1896-98 taught theology and canon law in the Seminary of Buenos Aires, and from 1898 to 1903 assisted Rafael Pérez in writing his 'Historia de la Compañía moderna la Argentina y Chile.' For the next seven years he assisted Father Astrain with his 'Historia de la Asistencia de España.' In 1912-13 he was a member of the editorial staff of the periodical *Razón y Fe*. He has written 'Judicio crítico de la educación antigua y la moderna' (1886; 1888); 'El extranamiento de los Jesuitas del Río de la Plata y de las misiones del Paraguay' (1908); 'Los Jesuitas en el Río de la Plata: Historia del Paraguay' (4 vols., 1910-13), a translation of Muriel's 'Historia Paraguajensis.' He edited Cardiel's 'Declaración de la verdad' (1900); 'Organización social de las doctrinas Guaraníes de la Compañía de Jesús' (2 vols., 1913). He is a contributor to *Razón y Fe*, *Revista eclesiástica del Arzobispado de Buenos Aires*; *Amigo del Clero* of Lima; *La Revista eclesiástica* of Santiago, Chile; 'Reseña Histórica de la Misión de Chile-Paraguay, 1836-1914' (1914); and 'El P. Francisco Suárez, S. I.' (1917).

**HERNANI**, by Victor Hugo, is an epoch-marking play in the history of French drama. Finished in September 1829, eagerly accepted by the committee of the Théâtre Français in October, it was found so radical in its departure from French dramatic traditions, both in structure and in versification, that intense opposition to it developed among actors and dramatic journalists, so that its first performance, 25 Feb. 1830, became a sort of pitched battle between the classicists and romanticists, the conservatives and the innovators. Gautier in his 'Histoire du romantisme' has given the classic account of this memorable struggle in which he bore the most conspicuous part. It extended through 45 performances. Almost every line had been at some time applauded or hissed, four parodies had appeared in as many Parisian theatres, before it was withdrawn. Victory rested with the radicals, but rather for the cause than for the drama. 'Hernani' is still occasionally acted, but its merits are lyric rather than dramatic. It has many passages of great strength and some of striking beauty, but it lacks unity of action and is continued beyond

a satisfying conclusion. The time of the play is 1519. It opens and closes at Saragossa. The third act is in the mountains of Aragon, the fourth at Aix-la-Chapelle. The story has no historical basis, though historical incidents and personages are skilfully involved in it. Doña Sol, the heroine, niece of Don Ruy Gomez de Silva, is beloved by him, by Don Carlos, king of Spain, and by Hernani, bandit pretender to the throne. The king favors her marriage with Gomez; she favors Hernani. The three rivals, fanatically devoted to ideals of Castilian honor, spare and protect one another. Gomez even suffers the king to take Doña Sol from his castle on the appointed wedding day rather than give up Hernani, his uninvited guest. Hernani, pledging his own life to his rival's command, enlists him in a conspiracy to defeat the election of Carlos as emperor. Carlos, triumphing, gives Doña Sol to Hernani. Gomez, recalling Hernani to his pledge, bids the bridegroom drink the poison he has prepared. Doña Sol shares it. Gomez kills himself. The play's finest passages are the monologue of the newly-elected Emperor Charles V (Act 4, Sc. 2), the closing love and death scenes (Act 5, Sc. 3 and 6) and the portrait scene at the castle of Gomez (Act 3, Sc. 6). 'Hernani' is edited with English notes by Matzke (1893), Harper (1891) and Perry (1888). Consult Le Roy, 'L'Aube du théâtre romantique' (1904), and for contemporary criticism Biré, 'V. Hugo avant 1830,' pp. 489-508. Translations in Vol. I of 'Dramas by V. Hugo' (Boston 1903), and in 'Dramatic Works of V. Hugo' (London 1913).

BENJAMIN W. WELLS,

*Author of 'Modern French Literature.'*

**HERNDON, William Henry**, American lawyer: b. Greensburg, Ky., 28 Dec. 1818; d. near Springfield, Ill., 18 March 1891. He studied at Illinois College, was admitted to the bar in 1844 and in the same year formed a law partnership with Abraham Lincoln, which continued formally till the latter's death. He was mayor of Springfield, Ill., in 1855. With J. W. Weik, he wrote the well-known 'Herndon's Lincoln; The True Story of a Great Life' (in a new ed. 1891), which is particularly valuable for the study of Lincoln's personality and the details of his early career.

**HERNE, James A. (JAMES AHERNE)**, American actor and playwright; b. Troy, N. Y., 1 Feb. 1840; d. New York, 2 June 1901. He first appeared in a traveling company and later in various rôles and organizations throughout the United States. Later he was actor-manager at San Francisco and in 1878 presented his first play, 'Hearts of Oak,' which won immediate success. 'Drifting Apart' (1885), 'The Minute-Men' (1886) and 'Margaret Fleming' (1890) were less favorably received, although the last was highly ranked by the critics. In 1883-84 Herne wrote his most successful work, 'Shore Acres,' which was first performed as 'The Hawthornes' at Chicago in 1892, and in 1892-93 in Boston under its present title. He himself appeared as 'Uncle Nat' Berry. 'Shore Acres' was followed by 'The Rev. Griffith Davenport' (1899), a dramatization of Helen Gardner's 'An Unofficial Patriot' and 'Sag Harbor' (1900). As both actor and

dramatist Herne was a skilful delineator of types of everyday life.

**HERNIA** (Latin, a rupture, a burst, a descent), a swelling formed by the displacement of a soft part, which protrudes by a natural or accidental opening from the cavity in which it is contained. The three great cavities of the body are subject to these displacements. The brain, the heart, the lungs and most of the abdominal viscera may become totally or partially displaced, and thus give rise to the formation of hernial swellings. Displacements of the brain and of the organs of the chest are, however, extremely rare, and are in general the result or symptom of some accident or disease. They are frequent in war times from gun-shot wounds and from the necessary surgical procedures. Many parts of the abdominal wall may become the seat of hernias, but they most commonly appear in the front lower regions, which, being destitute in great measure of muscular fibres, and being the site of many of the openings leading from the abdomen to the limbs, offer less resistance to the displacement of the viscera. Hernias are most common in the groin, at the navel, more rarely in the vagina, at the interior and upper part of the thigh, and at its lower and posterior part. They have received different names from their positions. All the abdominal viscera, with the exception of the duodenum, the pancreas and the kidneys may form a hernia, but they are not all displaced with the same facility. The omentum and intestinal canal escape easily; the stomach, liver and spleen rarely form hernias. Most of the viscera, when displaced, push the peritoneum forward before them; this membrane thus forms a covering to the hernia, which is called the hernial sac. If the hernia, with its sac, can be entirely replaced, it is said to be reducible; if, from its size or other cause, it cannot be restored to its former place, it is irreducible.

Among the predisposing causes of hernia may be ranked any circumstance which diminishes the resistance of the abdominal walls, whether natural or accidental; such as muscular weakening of those walls by a forced distension, as in pregnancy, by accidents, by lifting heavy weights or by excessive standing. Any prolongation of the viscera which tends to bring them in contact with points at which they may protrude, and articles of dress which push the organs toward the weaker parts of the abdominal wall (as corsets), may also produce hernia. The efficient causes of hernia are all circumstances which may break the equilibrium existing between the abdominal walls and the viscera, which react and mutually press upon each other. The simultaneous contraction of the abdominal muscles and of the diaphragm, which takes place on every violent effort, is one of the chief of these cases. Hence sneezing, coughing, leaping, playing on wind-instruments, etc., may be the direct cause of hernia.

The symptoms of a hernia are the existence of a tumor or swelling at any point of the abdomen, but more particularly in the region of the groin. A reducible hernia is not a very troublesome disease, but may become so by acquiring an increase of size, and by strangulation. A hernia is said to be strangulated when it is not only irreducible, but also subjected to a continual constriction; this constriction may be pro-

duced by different causes, but it is generally a constriction at the opening through which the hernia protrudes. As soon as a patient perceives that he is affected with a hernia he should have recourse to medical advice, for the disease is then in its most favorable state for treatment. The hernia is immediately reduced, and must then be subjected to a constant compression. This is done by means of a truss (q.v.). An irreducible hernia must be supported with great care. All violent exercises and excess in diet must be avoided. Strangulated hernia, presenting greater danger, requires more prompt relief. The object of treatment is to relieve the constriction. If the reduction cannot be effected by other means, an operation will be necessary. This consists in dividing the parts which produce the constriction. The longer this operation is delayed, the more dangerous it will become. After the parts are healed, the opening must be subject to compression, as in the case of a simple hernia. Radical operation for hernia is the most advisable form of treatment. It is safe in the hands of a competent surgeon.

**HERO**, a priestess of Aphrodite at Sestos. The loves of Hero and Leander, a youth of Abydos, on the other side of the Hellespont, are related in a poem by Musæus. No difficulties could discourage Leander. He swam every night across the Hellespont, guided by a torch which shone across the strait from the tower of Hero, and even continued his visits during the winter. On one occasion, however, the guiding light was extinguished and his strength failed him, and the waves carried his body to the foot of the tower, where Hero anxiously awaited him. Overcome with anguish at the sight, she threw herself from the tower and perished.

**HERO OF ALEXANDRIA** (Gr. *Herōn*), Greek mathematician and natural philosopher: fl. perhaps in the 1st century A.D. He seems to have invented a number of machines, among which are "Hero's fountain" and a steam engine on a principle similar to that of Barker's mill (q.v.). He also made some contributions to pure mathematics. Hultsch edited the remaining fragments of his geometrical works in 1864 and Schmidt began in 1899 an edition of his complete extant writings. See **HERO'S FOUNTAIN**.

**HERO AND LEANDER**, one of the world's unforgotten stories of ill-fated love, probably began as a legend of Sestos and Abydos on the Hellespont, in explanation of some immemorial local cult of swimmer, torch and tower. Its literary possibilities may have attracted a poet — perhaps Callimachus — at Alexandria, where many such ætiological legends were versified; and his poem, now lost, seems to have taken the tale to Rome. Leander is the one human example cited by Virgil ('Georgics' iii 258ff.) in proof of the irresistible might of desire. Ovid invents two of the lovers' letters ('Heroides' xviii and xix) tricked out with sentiments, "points," verbal quips, and rhetorical conceits and antitheses in the right Alexandrian vein. There are allusions in Statius ('Thebaid' vi 542ff.) and other ancient authors. It is Musæus ("Grammaticus"), however, an otherwise unknown poet of the 5th or 6th century A.D., who in a poem of 341 Greek hexameters gives the tale

its decisive form for literature. From the lovers' first meeting in the temple of Aphrodite the narrative proceeds through Leander's nightly swimmings of the Hellespont until in a night of storm Hero's torch and Leander's life are extinguished together and Hero perishes at morning upon his corpse. Though tinged with rhetoric, though indeed sharing with Ovid's 'Heroides' several conceits which may point to a common source in the hypothetical Alexandrian version, Musæus's poem has passages of fine imagination and of true pathos: the end especially has been left unlabeled, with something of the old Greek reserve. The Renaissance (editio princeps, 1484, Aldus) assumed the author to be that early semi-mythical Musæus who is associated in legend with Orpheus and Linus. Uncritically accepting as primitive the work of a post-classical grammarian, it proceeded to emphasize the Ovidian or Alexandrian traits of his poem. Marlowe's unfinished 'Hero and Leander' (published 1598 with an ending by Chapman) retains Musæus's scenario, but expands his simple speeches and brief imagery into passionate tirades and long voluptuous descriptions. Chapman, at once more Puritanical and more "conceited," is stodgily concerned for the legality of the lovers' marriage, sermonizes about their passion, adds episodes, allegories, emblems, and other irrelevancies, and ends by metamorphosing the lovers into birds.

Chapman also made a faithful and complete translation of Musæus (1616; reprinted 1858); other English translations are by Sir Robert Stapylton (1647), the Rev. Francis Fawkes (1789), and Sir Edwin Arnold (1888). There are poems and extended allusions by Byron, Keats, Leigh Hunt, Moore, Hood, Rossetti, and Tennyson, a ballad by Schiller, and a five-act tragedy by Grillparzer. Consult Rohde, Erwin, 'Der griechische Roman und seine Vorläufer' (Leipzig 1914); Palmer, Arthur (ed.), 'Ovid's Heroides' (Oxford 1899); Jelinek, M. H., 'Die Sage von Hero und Leander in der Dichtung' (Berlin 1890); Chaballier, Léonce, 'Héro et Léandre' (Paris 1911).

SAMUEL LEE WOLFF.

**HERO OF OUR TIME, A** ('*Geroy nash-ego uremeni*'). Lermontov intended to represent Pechorin, the "hero" of this novel, as a type of cultured men of the thirties, by taking himself as a partial example of that class. His obligation to Pushkin's *Eugeni Onyegin* is expressed in the very name of the chief character, which is derived from the river Pechora, as Pushkin derived his from the river Onyega, wherefore the critic Byelinski said that the two characters did not differ from each other more than did these two rivers. Pechorin is a blasé, but in contradistinction to Onyegin he is filled with ambition and the love of power. He spurns the official career, which alone was then open to men of the upper classes, and directs all his energies to the conquest of women's hearts. In the thirties the critics dwell on the reflective sides of Pechorin, his melancholy, introspection and despair; that is, they saw in him a member of the Byronic crew, so numerous in the literatures of that period. But, in the light of the later, more positive evolution of the intellectuals in Russia, the modern critics point out the fact that Pechorin belongs to the class

of unsuccessful, useless men who made social progress impossible. They look upon him as a literary specimen illustrating certain psychopathological defects common to men of the first half of the 19th century.

The novel contains also a series of positive characters, such as the mountaineers who are untouched by civilization and the simple-minded, faithful Maksim Maksimich and Bela. All these are described with rare accuracy and are totally devoid of melodramatic characterization. It is chiefly the romantic element of the novel in its exotic setting in the Caucasus that has attracted the Western readers to it, hence the considerable number of translations, especially in English, where we have the abbreviated ones by Theresa Pulszky (London 1854), by R. I. Lipmann (London 1887), and by J. H. Wisdom and Marr Murray, 'The Heart of a Russian' (London 1912, and New York 1916); and the anonymous ones, 'Sketches of Russian Life in the Caucasus' (London 1853), and 'A Hero of Our Own Times' (London 1854).

LEO WIENER.

**HEROD**, called **THE GREAT**, king of the Jews: b. about 62 B.C.; d. 4 B.C. He reigned from 37 B.C. until his death. He was the second son of Antipater the Idumean, who, being made procurator of Judea by Julius Cæsar, appointed him to the government of Galilee. He at first embraced the party of Brutus and Cassius, but after their death reconciled himself to Antony, by whose interest he was first named tetrarch and afterward king of Judea. After the battle of Actium Augustus confirmed him in his kingdom. As a politician and commander, his abilities were conspicuous. He rebuilt the temple at Jerusalem with great magnificence and erected a stately theatre and amphitheatre in that city, in which he celebrated games in honor of Augustus, to the great displeasure of the more zealous of the Jews. He also rebuilt Samaria, which he called Sebaste, and adorned it with very sumptuous edifices. He likewise, for his security, constructed many strong fortresses throughout Judea, the principal of which he termed Cæsarea, after the emperor. On his palace, near the temple of Jerusalem, he lavished the most costly materials, and his residence of Herodium, at some distance from the capital, by the beauty of its situation drew around it the population of a great city. Such, indeed, was his magnificence that Augustus said his soul was too great for his kingdom. Herod was the first who shook the foundation of the Jewish government, by dissolving the national council, and appointing the high-priests, and removing them at pleasure, without regard to the laws of succession. His policy, ability and influence with Augustus, however, gave a great temporary splendor to the Jewish nation.

**HEROD**. The tragic figure of Herod the Great is one of the favorite traditions of literature. History tells us that he was ambitious. Josephus in his 'Antiquities of the Jews' (xv), tells of his tragic love for Mariamne, his wife, but makes no reference to the Gospel story of the massacre of the Innocents. In the 5th century Macrobius accepts some features of the biblical narrative and augments them by telling that two of Herod's own children were lost in the massacre. Modern writers, among whom

were Alexander, Hardy, Voltaire and Hebbel have used such strains of the story as pleased them. In the miracles of the Middle Ages Herod was a ranting figure whose excesses explain Hamlet's words "out-Herod's Herod." In writing his version of the Herod story for the first year of the 20th century Stephen Phillips places greatest weight on the great king's infatuation for his wife and fear of losing his kingdom. The victim of Herod's murderous intrigue is in his play the young brother of Mariamne, Aristobulus. By means of this shift in characters the poet was able to combine the two strains of the Herod tradition. The ingenuity the playwright displays in the handling of his situation is equaled by the dramatic skill with which the story is put forth on the stage. The play is vigorous, crisp and poetic. Herod is a bluff and sympathetic figure. The love passages between Herod and Mariamne offer some of the rarest poetry of the modern theatre. They are full of dramatic prescience. Before writing plays in verse for the modern stage Phillips had been benefited by two types of experience. He had made himself a distinguished poet and in the traveling troupe of his cousin F. R. Benson he had secured abundant experience in the practice of the theatre in its more romantic and symbolic orders. Well as it reads Herod is in no sense a closet play. It was written for production. Its single scene, varying only by the change of light from morning to night and the placing and removal of a few stage properties, its effective use of the instruments of sight and sound, bespeak the experienced playwright. It is said that it was the poet's use of the sound of trumpets that decided Tree to accept the play for production. Though Herod is a great stage play it takes but a small place in the history of the modern English theatre. For some years reformers had been press-agenting a return to the poetic drama. George Alexander had in 1899 commissioned Phillips to write a play on the Paola and Francesca theme. Before this play could be produced and while it was in the height of its popularity in its published form Beerbohm Tree accepted and produced at His Majesty's Theatre, 31 Oct. 1900, the same poet's 'Herod.' The play did not have a long run. In 1909 the play was given a creditable production by Faversham at the Lyric Theatre in New York.

THOMAS H. DICKINSON.

**HEROD AGRIPPA I**, king of Judea: d. Cæsarea, 44 A.D. He reigned from 37 A.D. until his death. He was the son of Aristobulus and lived at Rome in extravagance until his debts made him retire to Idumea, but he returned some years after. On the accession of Caligula 37 A.D. he was honored with the title of king, and received the tetrarchies of Philip and Lysanias, and later that of Antipas. Upon the accession of Claudius his rule was extended to include all the dominions of Herod the Great. It was this Herod who, to please the Jews, caused Saint James to be put to death and Saint Peter to be imprisoned. His power and opulence acquired him a great reputation and he really did much for the benefit of the Jews. His death is described in Acts xii, 20-23.

**HEROD AGRIPPA II**, king of Judea: d. 100 A.D. He reigned from 53 A.D. until his death. He was son of Herod Agrippa I. He re-

sided much at Jerusalem, and here, together with his sister, Berenice, heard the defense of Paul, addressed to the Roman governor Festus (Acts xxv, 13-xxvi, 32). A great builder, he improved his capital city of Cæsarea Philippi; renamed by him Neronias. It was in his reign that the Temple was completed. Being driven from Jerusalem in the revolt which proved so fatal to the Jews, he joined Cestius, the Roman commander, and, when Vespasian was sent into the province, met him with a considerable reinforcement. During the siege of Jerusalem he was very serviceable to Titus.

**HEROD ANTIPAS**, tetrarch of Galilee. He reigned from 4 B.C. to 37 A.D. He was son of Herod the Great. This was the Herod who put to death Saint John the Baptist (Mark vi, 14-29), in compliment to his wife, Herodias, and it is he who is the familiar "Herod" of the New Testament narrative. Accused of having been concerned in the conspiracy of Sejanus, and of being in secret league with the king of Parthia, he was stripped of his dominions and sent (39 A.D.) with his wife into exile at Lugunum (Lyons) or, as some say, to Spain, where he died.

**HERODES, Atticus.** See **ATTICUS HERODES**.

**HERODIADE**, *Ārō'dyād*, a tragic opera in five acts by Jules Massenet, based on Flaubert's 'Herodias.' Originally produced at Brussels in 1881, in New Orleans 1892 and in London as 'Salome' in 1904. Though based on the biblical story the plot is different. The scene is laid in Jerusalem, about A.D. 30, and the principal characters are John the Baptist; Herod, king of Galilee; Herodias, his queen; Salome, who does not know that she is the daughter of Herodias; Phanuel, a young Jew; Vitellius, a Roman proconsul, and the High Priest. Salome enters the court of Herod's palace and tells Phanuel that she is seeking John the Prophet, who had saved her life when a child in the desert. Herod is in love with Salome; his wife demands the head of the prophet for having insulted her (Herodias), when John appears and denounces them both. They rush out, terrified; Salome now re-enters and confesses her love to John. Herod's mind is obsessed with thoughts of Salome while Herodias is jealously vigilant. The latter comes to Phanuel crying "Vengeance on the woman who has stolen Herod's love!" She asks Phanuel what had become of her long-lost daughter; pointing from a window he indicates Salome, who is entering the temple. In horror the queen exclaims, "My daughter? Never! She is my rival!" John has meanwhile been thrown into prison and Salome arrives exhausted with grief at the gate. Herod appears and passionately pleads his love; she rejects his advances and declares she loves another. Herod expresses his resolve to find out and kill his rival. John is tried and condemned by the priests; Salome falls at his feet imploring to die with him. Herod now understands, and decrees that both shall die. They are imprisoned together; John admits his love for her but urges her to leave him, which she refuses to do. She is dragged out by priests who convey her to the palace while John is led to his death. An imperial festival is being held in the great hall of the temple when Salome is

brought in. She repeats her desire to die with her lover, appealing to the queen with the words, "If thou wert ever a mother, pity me." Trembling at the word "mother," Herodias appears to relent when the executioner appears and announces that the prophet is dead. With a furious cry Salome rushes to the queen and attempts to stab her, when Herodias cries, "Mercy! I am thy mother!" Horrified, Salome falls back, curses her mother and stabs herself. Some of the finest music of Massenet is to be found in this opera.

**HERODIAS**, a granddaughter of Herod the Great and Mariamne, daughter of Aristobulus and sister of Herod Agrippa I. She was first married to her half-uncle, Herod Philip, whom she abandoned to connect herself with his half-brother, Herod Antipas. It was by her artifice that Antipas was persuaded to order the death of John the Baptist (Matt. xiv, 3-12; Mark vi, 17-29).

**HERODOTUS**, Greek historian, called the "father of history": b. at Halicarnassus in Asia Minor, about 484 B.C. Before writing his history he traveled extensively, visiting the shores of the Hellespont and the Euxine, Scythia, Syria, Palestine, Babylon and Ecubata, Egypt as far as Elephantine and other parts of northern Africa, everywhere investigating the manners, customs and religion of the people, the history of the country, productions of the soil, etc. On returning home he found that Lygdamis had usurped the supreme authority in Halicarnassus and put to death the noblest citizens and Herodotus was forced to seek an asylum in the island of Samos. Having formed a conspiracy with several exiles he returned to Halicarnassus and drove out the usurper, but the nobles who had acted with him immediately formed an aristocracy more oppressive than the government of the banished tyrant, and Herodotus withdrew to the recently founded colony of Thurii, in Italy, where he seems to have spent most of his remaining life. Here, at an advanced age, we are told by Pliny, he wrote his immortal work, a statement strengthened by the fact that events are noticed in the body of the book which occurred so late as 409 B.C., while its abrupt ending proves almost beyond question that he was prevented by death from completing it. The history is divided into nine books, each bearing the name of a Muse, and is written in the Ionic dialect. The object of the historian is to narrate the conflict between the Greeks and Persians, and he traces the enmity of the two races back to mythical times. Passing rapidly over the mythical period he comes to Croesus, king of Lydia, of whom and of his kingdom he gives a comparatively full history. The conquest of Lydia by Cyrus induces him to relate the rise of the Persian monarchy and the subjugation of Asia Minor and Babylon. The history of Cambyses and his Egyptian expedition leads him to introduce the valuable details of the history, geography and manners and customs of Egypt, occupying the second book. The Scythian expedition of Darius causes the historian to treat of the Scythians and the north of Europe; and the subsequent extension of the Persian kingdom affords him opportunity for an account of Cyrene and Libya. In the meantime the revolt of the Ionians breaks out, which eventually brings on the conflict between Greece

and Persia. An account of this outbreak and of the rise of Athens after the expulsion of the Pisistratidæ is followed by what properly constitutes the principal part of the work, and the history of the Persian War now runs on in an uninterrupted stream until the taking of Sestos. There are English translations of his history by G. C. Macaulay (1890); Beloe, Cary, Macan and Rawlinson, the last with important notes and dissertations. The 'Life of Homer,' attributed to Herodotus, and printed at the end of several editions of his works, is now universally believed to be a production of a later date. The best editions of the history of Herodotus are by Wesseling (1763); Schweighäuser (1806); Bähr (1855-61); Stein (1871); and a notable commentary by How and Wells was published in 1912.

**HEROES** (*ἦρωες* plu. *ἦρωες*) were men among the Greeks distinguished for exceptional strength, bravery or achievement. The etymology of the word has not been satisfactorily made out. It may be connected with a root that means "strong," or one that signifies "to guard, protect," either suggestive of soldierly qualities or attributes. (Cf. F. Deneken, in Roscher's 'Lexicon der Mythologie'). Other races cherish the memory of such outstanding figures, and by analogy the term is applied to them also. The heroes, whether of Hellas or elsewhere, belong invariably to an early age, before history records aught of their race; they live in the earliest form of that race's poetry, and draw thence an immortality in succeeding literature. They are often, rightly or wrongly — for there has been much written on the subject, — identified with myths and mythological beings; but their proper sphere is in legend, and as legendary characters they come down to us, except in the classical literatures, where they attain divine dignity analogous to that which the gods themselves enjoy.

**Greek Heroes.**—Among the Greeks in historical times the heroes were half mythological beings who enjoyed a distinct cult of their own. "What god, what hero, or what man (*τίνα θεόν, τίνα ἦρωα, τίνα δ' ἄνδρα*) shall we resound?" asks Pindar in the beginning of the second Olympian ode, thus giving the heroes their hierarchic place between the Olympians and mortals. Hesiod ('Works and Days' 156-170) understands by heroes men of great renown, the fourth of the races of "speech-gifted men" whom the immortals created, and who lived — probably for but a few generations — between the brass age and his own, the iron age. They were the warriors celebrated in epic poetry and perished in the wars before the "seven-gated Thebes" and in the struggle for Helen at Troy; but they now dwell in the Isles of the Blessed beside the streams of Ocean. A former age, says Hesiod, calls them demi-gods (*ἡμιθεοί*). It is not clear what particular period of time is here meant. It has been customary to understand by the former age the age of the heroes themselves, and to see in *ἡμιθεοί* an early belief in hero-cult similar to that well-defined worship of heroes which we find in proto-historic and historic times, at least down to Pausanias, and thence to deduce that heroes are "depotentiated" gods, who sank from mythology and myth to legend, and are related to the chthonic gods in nature and origin.

(F. Deneken, J. Wassner, and others). Rohde combats this view, and thinks the cult-heroes are the glorified souls of the dead, differing even from the Demons, who are real deities of a lower order. The latter, as all the chthonic deities, were always immortal and never succumbed to death, though they were of the underworld. Heroes, on the other hand, he points out, were always conceived to have been once mortals and, what is important, to have gone through death, whence the hero's grave always became the centre of the cult. Ancestor worship, therefore, would seem to be the root whence alone the cult of heroes sprang, though when this was once in full development influence from the cult of the chthonian deities was, of course, to be expected. But confusion between the two cults and the two sets of deities can hardly be shown to have existed in the Greek mind. Hesiod's *ἡμιθεοί* Rohde interprets as merely defining their place between gods and men, and not in any sense indicating their origin. Certainly Homer knows nothing of the later hero-cult. The one striking passage in the 'Iliad' where the heroes are called demi-gods (*ἡμιθεοί*) is known to be an interpolation and probably much later than the older parts of the poem. In the 'Iliad' the heroes are the warriors who fight before Troy, generally kings and sons of kings, but not infrequently participants in the struggle who are of meaner origin. The 'Odyssey' extends the meaning of the term to include wise and venerable old men. To the Homeric heroes life is a serious matter and death a grim affair. True, they are men of great mold and do mighty deeds; but that is because their purpose is lofty. They live and work and battle, however, in the shadow of common human fate, and after death there is for them no "Islands of the Blessed." The very heroes who in Hesiod are made to people these happy realms are in Homer consigned to a gloomy fate, and they prefer any condition of life to the happiest lot possible in the land beyond the tomb. Little of glorified deification is there, indeed, in the greeting of the shade of Achilles to Ulysses in the 'Odyssey' when the latter had the boldness of heart to visit Hades to obtain the counsel of Tiresias (XI, 488).

**Hero-cult and Hero-worship.**—The cult of heroes, except in the case of Hercules, of whom the Greeks themselves were not sure whether he was a god or a hero (Herod. 2, 44, Paus. 2, 10, 1), was always sharply differentiated from that of the higher gods, but had, indeed, much in common with the homage paid to the chthonian gods. The centre of the worship was the grave where the mortal remains of the hero were supposed to be interred. This was generally located in a sacred grove and surmounted by a temple. Altars were erected over the place of sepulture or nearby, where divine honors were paid to the hero, sacrifices made to him, and votive or propitiatory gifts presented. These ritualistic observances, however, generally took place in the evening to mark the distinction from the homage paid to the gods, for whom the morning hours were reserved. Like the designations of the gods, too, the names of heroes became ejaculatory expletives and words of asservation. A survival of ancestor worship, and incidentally an indication of the human origin of

heroes, is seen in the offering of food and drink to them on their special feast days and on other stated occasions. Along with the mortal remains of the heroes, relics of them were cherished and diligently sought out, officially transferred from one place to another, or even stolen from one shrine to be venerated at another. Thus, for instance, was held in esteem the house of Cadmus at Thebes and that of Menelaus at Sparta, the sceptre of Agamemnon at Charoneia, the stone at Salamis on which Telamon sat, and elsewhere the lance of Achilles, the wings of Dædalus, and the skin of the Calydonian boar and a tusk of the Erymanthian boar whose depredations had summoned so many heroes to the hunt. Most heroes were worshipped at places with which they were definitely identified during life, or where at all events their tombs were; but we not infrequently find that a cult was instituted elsewhere for a specific purpose, as to obtain a hero's help in war (Paus. 3, 3, 5f) or to ward off an epidemic or other national evils (Paus. 9, 38, 3). The cult-heroes and their worship were objects of legislative enactments. Porphyry recalls the decree of Draco ordering "gods and indigenous heroes" to be worshipped "publicly conformably to the laws of the country" and "privately according to the ability of each individual." ('De abstinentia,' iv, 22). This is the first recorded law anent the worship of heroes, but its provisions suggest great antiquity for the cult. Later legislators also paid heed to the honors due the heroes. Solon enjoined the greatest respect to their tombs, and Cleisthenes set up statues of the eponymous Attic heroes in the Agora with a view of building up a spirit of pan-Athenianism. Cleisthenes' attempt is not a solitary example of this method of developing national consciousness and civic pride. The chief characters of the older Greek myth and fable, and even historical personages of note, especially statesmen and conquerors, were in the course of time appropriated by one or the other of the Greek cities or communities, or by clans and families, as the eponymous hero and appropriately worshipped. The cult of heroes became so active indeed throughout the whole Greek world that it led, perhaps supported by the equally widespread ancestor worship, to a process of raising distinguished rulers, statesmen, poets, philosophers, and even citizens of lower rank, to the dignity of heroes with all the observances of worship. The dramatists, Æschylus and Sophocles, and the physician, Hippocrates, along with such public personages as the tyrants Gelon of Syracuse and Theron of Agrigentum, and Timesius, founder of Abdera, enjoyed such heroization. Alexander the Great, after his return from the Orient, among other ideas thence imported, made heroic apotheosis an official act, and himself decreed the raising of Hephestion to the status of a hero, whose worship spread rapidly. In some countries the custom became so general that every person, even to slaves, was described as a hero in his epitaph, and at Theos incense was offered to a flute-player during his lifetime.

**Teutonic Heroes.**—Teutonic heroes are best known to-day through the operas of Wagner and popular renderings of the Norse Edda stories. The gods of northern mythology, Odin (Woden, Wotan), Thor (Thunor, the thunder-

god with his hammer), Frey, and the mischievous Loki, together with the genuine legendary hero Siegfried, who like Achilles of old was invulnerable except in one spot, and the Valkyrie Brunhild, or Brynhild, are household words at least in America. The mythical elements of the last two suggest, at first hand, a connection with the Norse gods in origin and nature, which scholarship once maintained and popular feeling still holds to. It has been unmistakably shown, however, that, except for chance influences one way or the other, the Norse gods and the heroes of Teutonic legendary history had independent origin and went independent ways of development. (Cf. especially Mogk in 'Forschungen zur deut. Phil., Festgabe für Rudolf Hildebrand' 1894, p. 1, and Golther in *Germania*, xxxiii, 469, 476). S. Bugge even has pointed out that a number of the Northern gods were really developed during the Viking age out of Christian legends, later, therefore, than the poetic invention of the heroes. Teutonic heroes are usually connected with the migration of nations in the 4th and 5th centuries and the origin of heroic saga is assumed to be indicated by Tacitus who tells us that the deeds of Arminius were sung as late as a hundred years after his death. ('Annals' ii, 88). The historical period of the sagas, it is true, is separated from Tacitus' narrative by quite 400 years, but it is not inept to suppose that other notable characters in the history of the Teutonic nations were in like manner immortalized. The great national awakening that must have come to some of the northern races in their conquest and possession of the fair and opulent Roman provinces brought with it leaders and warriors whose renown could not but eclipse that of their predecessors and draw to themselves the limelight of epic popularity. Among the great historical characters of the period who are thus held to have become the theme of minstrel song and epic saga are Ermanric, the East Goth, who ruled in southern Russia at the end of the 4th century; Theodoric the Great, who founded the East Gothic kingdom in Italy; and Attila, the Hun, who, though not himself a Teuton, was so prominently identified with the migration that poetic fancy appropriated him and made him a powerful and generous Teuton king, surrounded by his loyal retainership. Many other heroes of saga are thought to have historical prototypes in Teutonic kings of the age of migration. Among these the more prominent are: Hagen, the Frank; King Gunther, the Burgundian; Walter of Aquitaine and the Burgundian Princess Hildigund. The 'Beowulf,' the Old English epic, the earliest in composition of all Teutonic poetry, introduces in episodic narratives a host of heroes who are better known to modern readers through the longer stories of the Edda and the 'Nibelungenlied.' A figure who runs through many of the Teutonic legendary histories, and perhaps is the only one who survived to later literature is Wieland—Walter Scott's Wayland the Smith.

**Celtic Heroes.**—The Celts possessed many myths regarding heroic figures, who were either ideal creations, or in the rich fantasy thrown around them tended to become mythical. The three best known are Cuchulainn, Finn (Fionn mac Cumhail) and Arthur. Cuchulainn and Finn belong to Irish legendary history; Arthur, the central character of mediæval romance, is in

legendary history at home in Britain, or more narrowly in Wales, though we first meet him in French works. Cuchulainn is the hero of Ulster and was one of the courtiers around King Conchobar. His wanderings and exploits recall the deeds of Hercules. Finn belongs to Leinster and fights the rest of the Irish, including the men of Ulster. J. A. Macculloch suggests that the hero's identification with Leinster may be due to Leinster annalists of the 11th century rewriting history in the light of later developments and with an eye single to the glory of their own part of the country. Finn has survived to modern literature in the fame of his son Ossian (Oisín), the warrior-bard of Macpherson's poem of that name. Saint Patrick in the legend converts Ossian's son, Oscar, and meets the old Caoilte, the last of the Feinn, or Finn's men, who had survived the last dreadful battle of Gabhra. But the glory of Celtic heroic saga is Arthur, son of Uther Pendragon, king of Britain. Unlike the Teutonic heroes, Arthur and the Knights of the Table Round have but fabulous historical antecedents. Even this they lose, and in later literature become more and more creations of myth and fancy until with Tennyson they become like Excalibur "mystic, wonderful," emblems and types of moral virtues and vices. A Welsh legendary character of the 'Mabinogion,' Peredur, the "Seeker of the Basin," later mediæval romance made into Parzival, the Knight of the Grail, and thus joined to the Arthurian cycle the stories of the mystical Cup of the Last Supper.

**Romance Heroes.**—The countries of western Europe that once formed the Roman Empire gave birth to a class of heroes and a body of legend that had its inception in the wars waged by Christian princes against the growing and ever-threatening menace of Saracen domination. The first clashes between Christian and Moslem came in the 8th century when the stretching south of the Frankish monarchy towards the Pyrenees brought it in contest with the conquering Moorish emirs of Spain. By a confusion of ideas resulting from the ignorance of Westerns regarding things Oriental, the Saracens and Moors were thought to be idolators or pagans, whence in literature the Mohammedans came to be known as Paynims. By a similar misconception Mohammed was contracted into Mahmet (Mahmout) and meant "idol," and Mahmetry (Mahmoutry) came to signify "idolatry." In legend, therefore, the Romance heroes, down to their last descendants in poetry are the champions of Christianity against paganism. The chief historical character of the earlier wars against the Moors of Spain was the Frankish king, Charles Martel, who from the decisive battles of Tours (A.D. 732) to the capture of Narbonne (A.D. 759), dealt the Saracens, who had established a kingdom in France, a series of telling death-blows and drove them forever beyond the Pyrenees. His exploits were in legend transferred to his more famous son, Charlemagne, whose wars were chiefly against the pagan and barbarous people, called Saxons, in the countries north of France. His warfare against the Saracens was not so glorious, and his army on the retreat from Spain was attacked at Roncesvalles in the Pyrenees, where the noblest of the Frankish chieftains, among them Roland, or Orlando, governor of the marches or frontier of Brittany, were

killed. Roland's name became famous in after times and the disaster of Roncesvalles became eventually the most celebrated episode in the whole cycle of romance. It is probably through Roland, therefore, that Charlemagne drew to himself, in the opinion of the early historians and the writers of romance, the more famous exploits of his father and became with his knights once for all the chief heroes of the "chansons de geste." The earliest of these "chansons de geste" is the 'Chanson de Roland.' Like Arthur, Charlemagne's person and character became obliterated in the romances and the chief stories circle around his knights, who are called Peers, as being on a footing of equality among themselves, or Palladins (Lat. *palatinus*, from *palatium*, palace), implying that they were inmates of the palace and intimate associates of the king. The number of the Peers or Palladins is usually 12. Beside Roland they are his friend Oliver; Ogier the Dane; Huon of Bordeaux; Renaud of Montauban; the traitor, Doon of Mayence; Ganelon, treacherously responsible for Roland's death; Archbishop Turpin, as good a specimen of a muscular churchman as Robin Hood's Friar Tuck; William Fierabras; William of Toulouse; William of Orange (the three last probably identical personages); and Vivien, nephew of William of Orange. The later wars against the Saracens in Spain developed for the Spanish people the Cid and Bernardo del Carpio, the latter the Spanish Roland. Curiously too Alexander the Great became a favorite character in the mediæval romances.

Associate Professor of English Language and Literature, Catholic University of America, Washington, D. C.

**HEROES AND HERO-WORSHIP.** In 1837 Carlyle had produced 'The French Revolution' (q.v.), which established his fame, but brought him little money. Good friends rallied to his aid, and helped to set him on his feet by organizing courses of public lectures for him, drumming up an audience and selling guinea tickets. Between 1837 and 1840, Carlyle delivered four such courses; the proceeds tided him over his money difficulties, and put him definitely beyond the reach of want. The final course on 'Heroes' was the greatest success of all, Carlyle's "crowning mercy," as a lecturer. From the notes he had prepared for this course, he wrote out the book, 'Heroes and Hero-Worship,' reproducing the curious effects of the spoken discourses. The book was as successful as the lectures.

To describe 'Heroes' as an introduction to universal history might seem to overweight it; but the survey covers roughly the whole activity of man upon the planet. Carlyle was an historian dowered with a unique style, a penetrating and constructive imagination, and a sense of the picturesque vouchsafed to few. No previous book presented such a series of arresting, original generalizations on history, or such just appreciations of so many diverse careers and personalities. Mahomet, Dante, Shakespeare, Luther, Knox, Johnson, Rousseau, Burns, Cromwell and Napoleon are characterized in unforgettable terms as well as the movements they represented, or conducted. Carlyle's power of appreciation was catholic. For the first time in English, he showed that Mahomet was something more than a sensualist and an impostor. For the first time, he pictured the real Oliver Cromwell. Following up this first pronouncement, with his monumental history of the great Puritan leader, he absolutely reversed English opinion and made possible the statue of the regicide in the Palace Yard at Westminster. Lord Acton says Carlyle invented Oliver Cromwell. On all these representative men, Carlyle had true and weighty things to say which had never been said before.

The book made its influence felt at once on current thinking. In 1849, an acute foreign observer wrote: "The rehabilitation of the hero is to-day of all Carlyle's ideas the most widely spread, and the one which has made head most rapidly. . . . This idea is the basis of Emerson's philosophy, and has inspired all his essays on confidence in oneself, and the power of the individual." Ruskin's determination to *do* something and *be* something has been attributed to his reading of 'Heroes.' It had also a great influence upon the life and character of Phillips Brooks. To aspiring youth with high hopes and lofty ideals it has a special appeal.

ARCHIBALD MACMECHAN.

**HEROIC ACT**, in the Roman Catholic church, the offering to God by a member of the church militant for the souls in purgatory all the meritorious works which he will perform during his lifetime, and all the suffrages which may accrue to his benefit after his death. Its practice is based on the Catholic doctrine of the communion of saints by which the good deeds of one member benefit all other members. The heroicity of the act arises from the willingness of the maker to take upon himself all the dreadful pains of purgatory for the love of his neighbor, its merit arises from the intense charity and altruism which inspires it. The heroic act is not a vow, but is of the nature of an offering to God, and, unlike a vow, is revocable at will, although a vow "never to revoke the Act" is probably binding.

**HEROIN**, hĕr'ō-in, C<sub>17</sub>H<sub>17</sub>NO<sub>2</sub>.(CH<sub>3</sub>CO)<sub>2</sub>, the diacetic ester of morphine. It occurs as a faintly bitter, colorless, odorless, crystalline powder, which is nearly insoluble in water. It is soluble in dilute acids, however, and is precipitated by alkalis. Its hydrochloric dissolves freely in water and in alcohol, but is insoluble in ether. It is a relatively feeble analgesic, and a dangerous habit-forming drug. It is sometimes useful in the treatment of dyspnoea. The dose should be small, as a single dose of two and a half grains has caused alarming symptoms. Heroin was first prominently introduced to the medical world in 1898.

**HEROLD**, ä-röld, Louis Joseph Ferdinand, French musical composer: b. Paris, 28 Jan. 1791; d. Thernes, near Paris, 19 Jan. 1833. A pupil of the Conservatoire, he also studied composition under Catel, Méhul and Cherubini, and in 1812 won the Prix de Rome with the cantata 'Mlle. de la Vallière.' His first opera, 'La Gioventù di Enrico Quinto' (1815) was received by the Neapolitan public with applause. His first serious début as composer for the French stage was with his comic opera 'Les Rosières' (1817). This very successful work was followed in quick succession by numerous others of varying fortune. In 1828 he was elected a member of the Legion of Honor. At last in 1831 appeared his 'Zampa,' and in 1832 his 'Le Pré aux Clercs,' the operas on which his fame chiefly rests, and which have gained a permanent place, the former especially being still produced with acceptance in the principal cities of the Continent. Consult Jouvin, 'Herold sa Vie et ses Œuvres' (1868); and Pougin, A., 'Herold' (ib. 1906).

**HERON**, Matilda, American actress: b. Draperstown, near Londonderry, Ireland, 1 Dec. 1830; d. New York, 7 March 1877. She was brought to the United States as a child, and appeared on the stage for the first time in Philadelphia in 1851 as Bianca in 'Fazio.' Her chief parts, in which she met with great success throughout the United States, were Camille in 'La Dame aux Camélias'; and Ulah in 'De Soto.' She played in all the principal cities of Canada and the United States and appeared in London in 1861. In 1857 she married Robert Stoepel, from whom she was divorced in 1869. After retiring from the stage she taught elocution in New York.

**HERONDAS**, or **HERODAS**, Greek poet, probably flourishing about the latter half of the 3d century B.C. Little positive informa-

tion is obtainable concerning the place of his birth, but it was probably in the island of Cos. Prior to 1891 only a few fragments of his verses had been found, but in that year an Egyptian papyrus was found containing several poems (mimes or mimianibi) and these were published by F. G. Kenyon, thus bringing to light a phase of Greek life and times of which the history has been meagre. Seven of the poems are in comparatively complete form, and, besides giving an insight into Herondas' life and work, they picture the everyday life of the times in extremely realistic terms, though the satirical portions of them are not personal in their nature. In composition the mimes are in choliambic verse or iambic trimeter and are written in the Ionic dialect. Consult Crusius, 'Untersuchungen zu den Mimiamben des Herondas' (Leipzig 1892); Kenyon's 'Classical Texts from Papyri in the British Museum' (London 1891); Sharpley, 'A Realist of the Ægean' (London 1906). See MIME.

**HERONS**, wading birds of the order *Herodii*, forming, with egrets and bitterns, the family *Ardeidae*. The family is characterized by a thin, compressed body; a long, thin neck; a straight, narrow, pointed beak; fully feathered head; longish, slender legs; three toes in front, the two outer united by a membrane, the middle claw pectinate; large, blunt wings; extensive development of powder-down tracts of disintegrating, shaftless feathers; and often by elongated feathers of the top of the head and other parts. Upward of 70 species of herons and their immediate allies are known, of which 14 inhabit North America. The bitterns (q.v.), with 10 tail-quills, form the sub-family *Botaurinae*, the herons and egrets (q.v.), with 12 tail quills, the *Ardeinae*. Egrets are simply small white herons. The great blue heron (*Ardea herodias*) to which *A. cinerea* of Europe is closely related, inhabits all parts of North America and northern South America. It is a large bird with a length of about four and a spread of nearly six feet, and of beautiful slate-blue color, with the long flowing plumes black. It is to be found by the side of streams, lakes and the seashore, usually alone. Fish form the bulk of its food, but it also devours frogs, small reptiles, insects and almost any kind of animal which it can capture. It roams in search of food mostly in the morning and evening. The heronry, or breeding-place, is usually found among high trees, and the same breeding-place is used by successive generations if they are unmolested; frequently several species of herons consort together at a favorite breeding-place. The large nest is made of twigs and sticks, and is lined with rushes, grass and various similar materials. The eggs, usually three or four in a nest, are of a fairly uniform greenish blue color. Many nests are usually found in one heronry, and sometimes the nests are built on the ground or on a cliff. The cry is a sort of "crank, crank," uttered in a hoarse voice. In the North the blue heron is migratory, elsewhere it is resident. The little blue heron (*A. carulea*) is found in the eastern United States from the Middle States southward and in the West Indies and Central America. It is scarcely more than one-half the size of *A. herodias* and exists in two color phases, the one dark slate-blue with purplish

reflections on the head and neck, the other white with traces of blue, especially constant on the unfeathered parts. This species formerly bred with other southern species in great heronries, most of which have been decimated by plume-hunters.

The little green heron or fly-up-the-creek (*Butorides virescens*) ranges throughout temperate North America and somewhat beyond southward, breeding nearly everywhere. Northward it is migratory and is the familiar heron about the streams and ponds of the Middle and New England States, where it usually nests in pairs or small communities and mostly in thick bushes or cedar trees; in other localities it sometimes breeds with larger species in heronries. The pale greenish elliptical eggs are from three to six in number. Its foods consist chiefly of small frogs, minnows and snakes, for which it searches by day as well as by night along the shallows of streams, where its harsh cry of alarm is often the first intimation of its presence. The name refers to the beautiful deep bronze green color of the upper parts.

The night-herons (*Nycticorax nycticorax*, and *N. violaceus*), which are closely related to the *N. grisea* of Europe, are easily distinguished from other herons by the thick, stout beak. The former, known as the black-crowned night-heron or squawk, is common throughout the United States and Canada in summer, and in the winter migrates far into South America, while the latter, or yellow-crowned species, is much less frequent and chiefly confined to the sea-coast of the warm parts of America. The squawk is about two feet long, the young brownish, the adults deep green and blue-gray above with two or three very long filamentous white occipital plumes. The night-herons are more active after dark than any other species, and are seldom seen abroad, except in the dusk or on cloudy days. Many species of herons reside in the warm parts of Africa and Asia, among them being the largest of all, the *A. goliath*. Consult Baird, Brewer and Ridgway, 'Water-birds of North America' (1884); Reichenow, 'Journal of Ornithology' (1877); Job, 'Among the Waterfowl' (1902). See BITTERN; EGRET.

**HEROÖPOLIS**, an ancient Egyptian city found by excavation in the eastern Delta region. Maps made prior to 1880 generally located the city near the present city of Suez, but the excavations of Naville in 1883 under the auspices of the Egypt Exploration Fund tend to show that the city was farther north. Heroöpolis is given in the Septuagint version of the Old Testament as the meeting place of Joseph and Jacob. The Coptic translation is Pethom, very similar to the Hebrew Pithom, or "House of Tum," and for some time it has been known from Egyptian geographical lists that Pithom was situated in the land of Thekut. This name has been identified with Succoth, the second resting place of the Children of Israel in their flight from Egypt. The Naville excavations brought to light the old site of Pithom and Succoth, the excavations being made at Tell el-Mashhutah, 12 miles west of Ismailah. A mile-stone which was recovered then showed the distance between Heroöpolis and Clysma to have been nine miles. This would confirm the view taken by Strabo that the city was at the head of the Red Sea naviga-

tion and was situated on what he called "Heropolitain Gulf," but if his view be correct, then it can only be inferred that the Red Sea extended at that ancient date farther north than it now does and that the place where the Israelites crossed was not where it is generally supposed to be, but considerably farther north.

**HERO'S FOUNTAIN**, a pneumatic apparatus, through which a jet of water is supported by condensed air. A simple mode of constructing it by means of glass tubes and a glass-blower's lamp is shown in the annexed figure. The column of water in the tube *a* compresses the air in *b*; this presses on the surface of the water in *c*, and causes it to gush out at *d*. This principle is made use of in several large installations, notably in northern Michigan, Canada and other mining sections, the water being drawn from a reservoir down a shaft *a*, a large chamber in the rock being excavated to hold the air, similar to the lower bulb. From the rising pipe *b* the air compressed by the water column is tapped for use. In this plan the bulb *c* is unified with the lower bulb and *d* becomes a mere overflow. Air is supplied constantly to the compression chamber by trapping it in the downward moving column *a*.

Hero's Fountain.

**HEROSTRATUS.** See **EROSTRATUS.**

**HERPES**, an acute, non-contagious, inflammatory disease of the true skin, regarded generally as due to a lesion of nerve tissue. It is characterized by an eruption of one or more clusters of vesicles upon a reddened base. Several forms of the disease are recognized by dermatologists, of which the commonest are facial herpes and herpes zoster. Facial herpes constitutes the common fever blister, or cold sore, and is usually seen about the mouth, though it also occurs on other parts of the face. There is often some slight constitutional disturbance preceding the eruption, which first makes its advent known by a sensation of burning or itching in the part, followed by reddish discoloration of the skin and after a few hours by a number of pin-head to pea-sized blisters filled with clear or turbid fluid. After a few days these dry up and form a yellowish crust, which then falls off, leaving a red spot that soon disappears. The usual duration of the disease is about a week and it shows a strong tendency to recur. Herpes often accompanies febrile conditions such as pneumonia and malaria, and a similar lesion is not rare about the genitals. Herpes occurs mostly in those whose skin is irritable or delicate, and is usually the result of some derangement of the mucous membrane of the respiratory, digestive or genito-urinary tract. It sometimes is the unflinching harbinger of the menstrual period. Cold, mental depression, and injury or irritation of the skin are other causes. The disease belongs to the class of the neuroses, and in some instances its presence can be explained only on the basis of nerve disturbance. In most cases no treatment is required, as the

lesions promptly heal of their own accord, but soothing ointments or lotions tend to relieve the irritation. The common domestic remedy is camphor ice. Herpes zoster, or shingles, is a special form remarkable for the fact that the eruption follows the course of certain nerves, and is usually disposed around one side of the body like a half belt. In rare cases it encircles the body. Its onset is preceded by stinging neuralgic pains, and by languor, lassitude, loss of appetite, shiverings, headache, nausea, quickened pulse, etc., after which the eruption appears in irregular patches. The vesicles become enlarged to the size of small peas in 24 to 36 hours, and fresh clusters occur for three or four days, completing the belt-like appearance. As the eruption recedes, by the fifth or sixth day, the vesicles become white and opaque, and the red margins grow livid or purple. Sometimes the vesicles burst, and several of the patches run together, forming irritable sores, discharging a thin serous fluid, which concretes and forms a crust that falls off as the parts beneath heal. The disease occasionally follows injuries to the nerves, and it is common in damp, cold weather of spring or autumn, when it sometimes occurs in epidemics. It is sometimes produced by sudden exposure to cold after violent exercise, and sometimes follows acute affections of the respiratory organs. The treatment consists in attention to any systemic derangement present and in the local use of soothing applications like talcum powder, protective dressings of cotton to prevent rupture of the vesicles, and the administrative of sedatives or even opiates in extreme cases. The duration of shingles is usually from 10 days to three weeks. Most cases run a favorable course and second attacks are rare.

**HERPETOLOGY**, hĕr-pĕ-tōl'ō-jī, the study of reptiles. In its earlier days, included under the term "reptile" were not only those now properly so named, but also the amphibia (q.v.) and some other "creeping things" not in either group. Cuvier's classification, the first approach to a scientific one, put both the true reptiles and the amphibians as correlated groups under *Reptilia*; but their distinction in form was soon perceived. Huxley showed that in their descent, embryology and structural relations, the amphibians were more closely related to the fishes than to the reptiles (lizards, serpents and turtles). He therefore united the two in a superior group *Ichthyopsida*, while he joined the birds to the reptiles in a group of similar rank called *Sauropsida*. But more recently the limits of herpetology have been restricted to truly scientific limits—the chorate class *Reptilia*, a definite group distinguished by the following characters:

Reptiles are cold-blooded, the temperature of the body not differing much from that of the natural surroundings, and rising or falling accordingly; the heart is three-chambered, except in crocodilians, where four chambers first occur in the upward scale of natural creation; mostly venous blood goes from the heart to the anterior viscera, and mixed blood to the posterior region, only the head and anterior regions receiving pure arterial blood; throughout their whole life they breathe with lungs, never with gills; the body is covered with scales, with which subjacent bony plates or

scutes are sometimes associated; the vertebrae are absolutely gastro-centrous (biconcave); the skull articulates by a single condyle with the backbone, and the lower jaw works against the quadrate bone; the great majority are oviparous, while in some the eggs hatch within the mother.

This characterization unites into the one class one order represented by a single living species (the "Tuatera Lizard"), and the existing tortoises and turtles, lizards, snakes and crocodiles and many others now extinct. The group occupies a central position in the vertebrate series. Above it on the scale of organization are the birds and mammals; below it the amphibians and fishes. In respect to their phylogeny Gadow is authority for the statement, "On the other hand, there is not the slightest doubt that they are evolved from some branch of the Stegocephali (q.v.), whilst on the other hand the reptiles, probably through some branch of the Theromorpha, have given rise to the mammals; some other reptilian branch, at present unknown, blossomed out into birds."

The uncertainty arising from the more or less fragmentary testimony of the fossil remains of reptiles of geologic times has necessarily a restraining effect upon the completion of a classification of the reptiles. Moreover, the distortion of skeletons in the processes of fossilizing renders close decisions as to genera and species very difficult. It is customary, therefore, with cautious scientists to halt the differentiation downward at the sub-order, recognizing that in the present state of knowledge of the Reptilia all classification must be tentative. The most recently attempted classification is that of Dr. Samuel Wendell Williston, presented in 1914, and this may be said to be the most that can be done with the data now available. Dr. Williston divides the class Reptilia into 12 orders and three provisional orders, as follows: Cotylosauria, with five sub-orders; Chelonia, with three sub-orders; Theromorpha, with three sub-orders; Therapsida, with three sub-orders; Sauropterygia, with two sub-orders; Proganosauria (provisional); Ichthyosauria; Protosauria (provisional); Squamata, with three sub-orders; Thalattosauria (provisional); Rhynchocephalia, with three sub-orders; Parasuchia, with three sub-orders; Crocodilia, with two sub-orders; Dinosauria, with three sub-orders; Pterosauria, with two sub-orders. The anatomical differences upon which these divisions are established are detailed in Dr. Williston's 'Water Reptiles of the Past and Present' (Chicago 1914). (See REPTILES). Consult Boulenger, E. G., 'Reptiles and Batrachians' (London 1914); Cunningham, J. T., 'Reptiles, Amphibia, Fishes, and the Lower Chordata' (London 1912); Gadow, H., 'Amphibia and Reptiles' (London 1902); Zittel, K. A. von, 'Text-book of Palaeontology' (Eastman's translation, London 1900-02).

**HERRERA**, ár-rá'rá, **Francesco de**, called **EL VIEJO** (the Elder), Spanish painter: b. Seville, 1576; d. Madrid, 1656. He broke with the Italian traditions of Spanish painting and became the founder of the Spanish national school. He also worked in bronze, and it was this probably which gave rise to the charge that he was connected with counterfeiters. He had a disposition so very detestable that his pupils,

of whom Velasquez was one, all left him. The Louvre contains some of his works, among others 'The Israelites Gathering the Quail in the Wilderness.' But the best are at Seville, including the 'Last Judgment,' in the church of San Bernardo; 'Saint Peter,' in the cathedral; and 'Moses Smiting Water from the Rock,' one of four large canvases in the archiepiscopal palace. His frescoes at both Madrid and Seville have quite disappeared.

**HERRERA**, **Francesco de**, called **EL MOZO** (the Younger), Spanish painter: b. Seville, 1622; d. Madrid, 1685. He studied art under his father, Francesco, called **EL VIEJO** (q.v.) (to whom he was very far inferior as a painter), and remained some years at Rome. He was a founder of the Seville Academy (1660), and became its vice-director. Subsequently he was appointed court-painter to Philip IV. In the Seville Museum is his 'Four Doctors of the Church Adoring the Host'; in the Prado Museum, 'Saint Hermenegild.' During his residence in Italy he painted fish with such success that he was known there as 'Lo Spagnuolo dei Pesci.'

**HERRERA**, José Joaquin de, hō-sá' hō-ā-kēn, Mexican military officer: b. Jalapa, 1792; d. Tacubaya, 10 Feb. 1854. He joined the Mexican army in 1809, and in 1821 was promoted brigadier-general. He aided in overthrowing Iturbide, when the latter became emperor, and was successively Minister of War and president of the Supreme Court. President for a brief period in 1845, he again held office in 1848-51. During the war with the United States, he was aide to General Santa Anna.

**HERRERO Y RUBIRA**, **Antonio María**, Spanish writer: b. Borja (Zaragoza), 1714; d. Madrid, 1 July 1767. He was a brother of Luis Herrero y Rubira (q.v.). Graduated as a doctor of theology from the University of Tolosa, he went to Madrid to study medicine. There he began writing on various subjects. Receiving his medical degree, he was appointed by Fernando VI doctor to the general hospitals of the court. Here he continued writing on medical and other subjects. In his special field he acquired a high reputation which led to his being appointed a censor of medical books printed in Spain, and perpetual secretary of the Royal Medico-Matritense Academy. Among his published works are 'Física Moderna' (Madrid 1738); 'Mercurio literario' (Madrid 1738); 'Disertación Meteorologica' (Madrid 1737); 'Impugnación' (Madrid 1738); 'Gaceta Literaria de Madrid' (1740?); 'Diccionario frances y español' (Madrid 1743); 'Vida d Tomás Kan-ñ-Kan Sophi de Persia' (Madrid); 'Milenario Apocolyptico'; 'La lengua española'; 'Los lugares de la Sagrada Escritura.'

**HERRERO Y RUBIRA**, **Luis**, Spanish writer: b. Borja (Zaragoza), 24 Feb. 1716; d. Calanda (Teruel), 1 Feb. 1769. He was a younger brother of Antonio María Herrero y Rubira (q.v.), and like his brother he pursued his literary and ecclesiastical studies in the universities of Huesca and Tolosa (de Francia), graduating from the latter with the degree of doctor of theology and of canonical law in 1734. He became an authority on the

latter and attained a reputation as a writer, among his works being 'La Vida de los siete sabios de Grecia' (Madrid 1738); 'Discurso historico filosofico sobre los terremotos' (Zaragoza 1756); 'Arte de Pintura'; 'Secreta naturæ'; 'Reyes crueles y aborrecidos'; 'Oplica mecanica'; 'Arte de trabajar los vidrios que sirven para los anteojos de larga vista'; 'No siempre quien escucha su neal oye' (comedy); 'Dos loas a San Juan Bautista.'

**HERRERO Y RUBIRA, Sor Luisa del Espiritu Santo**, noted Spanish religious writer, sister of Antonio Maria and Luis Herrero y Rubira (qq.v.): b. Calanda, 1711; d. 24 Aug. 1777. She lived in a religious atmosphere, both her brothers being priests, and her nearest relatives being strongly inclined in the same direction. In the Convent of Concepción de San Roque de Valdealgofa were several of her aunts, and she became a nun in this convent while still almost a child. There she acquired great influence and was twice head of the institution. She was possessed of considerable poetical talent, which, had she had a broader field and more experience of life, might have made her one of the noted poets of Spain. A great student, she acquired a reputation as an authority on ecclesiastical history and sacred writings. Among her works are 'Esposa y esposa'; 'Novenario de Nuestra Señora de Monte Santo' (Valencia 1773); 'Sacro Novenario de Nuestra Señora del Pilar de Zaragoza'; 'Glosa de la Salve'; 'Oraciones a Maria Santisima'; 'Auto Sacramental' (1760); 'Otro Dance al Santisimo y San Miguel'; 'Su's Letrillas para la misa y festividad del Santisimo'; 'Septenario espiritual.'

**HERREROS, Manuel Bretón de**, Spanish poet and dramatist: b. Quel (Logroño), 19 Dec. 1796; d. Madrid, 8 Nov. 1873. He left school to enter the army as a volunteer in 1814, in which he served until 1822. On his retirement from the army he held various offices under the government. In the meantime he gave considerable attention to literature, and in 1824 his comedy, 'A la vejez viruelas,' met with flattering success. Like other dramatic authors of his age, this initial success brought him employment in the way of translations and adaptations of dramatic works from French, some in prose and others in verse. This work included the masterpieces of several noted authors and covered 62 translations and 10 adaptations. 'Los dos sobrinos,' an original comedy, appeared in 1825, and 'A Madrid me vuelvo' in 1828. In all he wrote over 100 original comedies and dramas around which there was perhaps more bitter discussion than around the work of any other Spanish dramatist. So bitter and persistent in their attacks had his enemies become that he was forced to present his dramas under an assumed name. In 1831 he published a volume of poems which had already appeared in the newspapers; and in 1837 he was elected a member of the Royal Spanish Academy of which he soon became perpetual secretary. He was for some time editor of the *Gaceta* (1843-47). He resigned to become head of the Biblioteca Nacional, a position he retained until his death. Bretón de Herreros was one of the

really great dramatists of Spain. He gave life and individuality to the Spanish drama of customs and characters, nearly all of which he drew from the ranks of the middle class, which he knew intimately and which he depicted vividly and true to life. Many of the French dramas which he adapted he revived with his imagination and his dramatic genius, thus making them better than the originals. Among his published works are 'Achoques a los vicios' (1830); 'El Ensayo' (1831); 'El Templo de la Gloria' (1833); 'Un novio para la niña' (1834); 'Elena' (1834); 'El Hombre gordo' (1835); 'La redocción de un periodico' (1836); 'Las improvisaciones' (1837); 'El hombre pacifico' (1838); 'Vellido Dolfos' (1839); 'El Pelo de la dehesa' (1840); 'Don Frutos en Belchite' (1840); 'Cuentas atrasadas' (1841); 'La escuela de las casadas' (1842); 'Estaba de Dios' (1843); 'A lo hecho pecho' (1844); 'Mi dinero y yo' (1845); 'Errar la vocación' (1846); 'Juan Garcia' (1848); 'Quien es ella?' (1849); 'Una ensalada de pollos' (1850); 'Los Poderes' (1851); 'La escuela del matrimonio' (1852); 'La cabra tira al monte' (1853); 'Cosas de Don Juan' (1854); 'Al pie de la litra' (1855); 'La hipocrecia del vicio' (1859); 'Entre dos Amigos' (1860); 'La hermana de leche' (1862); 'Maria y Leonor' (1863); 'Cuando de cincuen ta pases' (1864); 'El abogado de pobres' (1866); 'Los sentidos corporales' (1867). Among the many editions of his works are one by himself, 'Obras Escogidas' (1850-52), and that of Bretón y Orozco (1883); Consult. Marqués de Molins, 'Bretón de Herreros' (Madrid 1883); Le Gentil, 'Le poët Manuel Bretón de los Herreros et la société espagnol de 1830 à 1860' (Paris 1909); Piñeyro, 'El Romanticismo en España' (Madrid 1904).

**HERRESHOFF, hēr'rēs-hōf, John Brown**, American shipbuilder: b. Bristol, R. I., 24 April 1841; d. there, 20 July 1915. During early age he was attacked by infantile glaucoma, which during his youth destroyed his sight, after which he remained totally blind for life. His education was carried on at the schools of his native town, but his real education was gained by contact with the problems of a practical life and surroundings, aided, where his limitations required help, by the constant attentions of a large and devoted family circle. In boyhood Mr. Herreshoff fitted up at his home a well-equipped machine shop and carpenter shop; in the former he laid the foundations of the mechanical skill and knowledge that he turned to such good use later in life, and in his wood-working shop he began building with his own hands small craft which served as a splendid study for the later work which made him so famous. Aided by his father, Mr. Herreshoff began the construction of larger craft at about the age of 20, and in the year 1863 he began naval construction as a business, which he carried on for more than 50 years with success. At first he had as partner, Mr. D. S. Stone, which firm lasted a few years only, then for a short period he was alone in the business, but in 1872 he drew to his side his brother and life coadjutor, Mr. Nathaniel

G. Herreshoff, seven years his junior, and well equipped in construction, engineering and designing. The introduction of steam power as applied to yachts, launches, torpedo boats and craft for trade opened a new and wide field, which they grasped with eagerness and which soon placed them in the mastery of the new field. The early use of the water-tube boiler gave the business a boom, and the performance of the first torpedo boat, *The Lightning*, built for the United States government, was a revelation in the then infancy of high speed craft. In 1879 Mr. Herreshoff and his brother, Mr. Nathaniel G. Herreshoff, incorporated the Herreshoff Manufacturing Company. The introduction of the compound engine in 1880 gave a fresh impetus to the business which was reflected by the construction of numerous steam yachts and torpedo boats and other naval craft for our own and foreign nations. In 1892 the Herreshoff Manufacturing Company took up the practical side of the defense of the Queen's Cup, which had been held at that date for 40 years by the New York Yacht Club, which successfully had held to the old trophy through many attacks from its motherland. The splendid series of defenses lasted about 13 years, in which the names of the *Vigilant*, *Defender*, *Columbia* and *Reliance* are fresh in the memory of all Americans, which, as well as the yet undetermined defense of the *Resolute*, goes to show to what height of perfection the Herreshoff Manufacturing Company have carried the science of naval designing and construction.

**HERRESHOFF, Nathanael Greene**, American naval architect and marine engineer; b. Bristol, R. I., 1848. He was educated in the public schools of Bristol and at the Massachusetts Institute of Technology. He was for nine years with Corliss Steam Engine Company in designing department, and since then with Herreshoff Manufacturing Company, holding office of designer and superintendent, and in 1915 took the office of president after the death of his brother, John B. Herreshoff. He has designed and superintended the construction of many successful steam yachts and torpedo boats, and also many fast sailing yachts, including seven for international racing in defense of the "American Cup."

**HERRICK, Christine Terhune**, American writer; b. Newark, N. J. She is the daughter of Mary Virginia Terhune ("Marion Harland"). She was educated in private schools and by teachers in Rome and Geneva. She married James Frederick Herrick in 1884, who died in 1893. She is well known as a writer on domestic topics, and is a frequent contributor to the *Ladies' Home Journal*, *Woman's Home Companion*, *The Housekeeper*, *Harper's Bazar* and other magazines. She has published 'Liberal Living Upon Narrow Means' (1890); 'Chafing-dish Supper' (1895); 'Cradle and Nursery' (1889); 'First Aid to Young Housekeeper' (1900); 'Housekeeping Made Easy' (1888); 'Little Dinner' (1893); 'What to Eat' (1891); with Marion Harland, 'The National Cook-Book' (1897); 'Cottage Kitchen' (1895); 'In City Tents' (1902); 'The Expert

Maid Servant' (1904); 'Consolidated Library of Modern Cooking and Household Recipes' (1905); 'Sunday Night Suppers' (1907); 'Like Mother Used to Make' (1912); with Marion Harland, 'The Helping Hand Cook-Book' (1912); 'My Boy and I' (1913); 'The A B C of Housekeeping' (1915).

**HERRICK, Francis Hobart**, American biologist and educator; b. Woodstock, Vt., 19 Nov. 1858. He was educated at Dartmouth, Johns Hopkins and the University of Pennsylvania, and was instructor in biology in Adelbert College (1888-91), and since the latter date professor of biology in the same institution. Among his published works are 'The American Lobster' (1895); 'Home Life of Wild Birds' (1902-05); 'Natural History of the American Lobster' (1911); 'Audubon the Naturalist' (1917).

**HERRICK, Myron T.**, capitalist and diplomat; b. Huntington, Lorain County, Ohio, 9 Oct. 1854. His ancestors, of the same line as that of Robert Herrick, the English poet, came to this country from Loughborough, Leicestershire, England, early in the 17th century. His grandfather, Timothy Herrick, one of the pioneers of Lorain County, was a soldier in the War of 1812. At the battle of Sacketts Harbor he was taken prisoner and sent to Canada. When released, he walked to Ohio, and upon locating his land warrant received for services in the war, built a log cabin in the woods and prepared as best he could to receive his family. He then returned to Watertown, N. Y., and brought his family of six children on to Ohio in ox teams. On his mother's side, Mr. Herrick is descended from Jeduthem Cross, who came from England to America and settled in Massachusetts in the early 17th century. Mr. Herrick's father was Timothy R. Herrick, of Wellington, Lorain County, Ohio, a farmer of importance and influence. Myron T. Herrick was educated in a district school, in the high school at Wellington, and later studied at Oberlin College and Ohio Wesleyan University, which latter institution conferred upon him the degree of A.M. Mr. Herrick studied law at Cleveland, Ohio, and was admitted to the bar in 1878. On 30 June 1880 he married Caroline M. Parmely, of Dayton, Ohio. He practised law, in which he was successful, but retired in 1886, becoming actively engaged in banking and manufacturing. In 1894 Mr. Herrick was elected president of the Society for Savings in the City of Cleveland, having been its secretary and treasurer since 1886.

Mr. Herrick filled many positions in the councils of the Republican party, and from 1888 devoted a large part of his time to public service. He served as aide-de-camp on the staff of William McKinley when governor of Ohio. Later when Governor McKinley became President, he tendered to Mr. Herrick the position of Secretary of the Treasury in his first Cabinet, which was declined for business reasons. In President McKinley's second term he offered Mr. Herrick the ambassadorship to Italy, which offer was renewed by President Roosevelt, but was declined in both instances on account of his large business responsibilities. Mr. Herrick was president of the American Bankers Association in 1901. At the Republican

State Convention of 4 June 1903 he was unanimously nominated as Republican candidate for governor and was elected by the largest majority in the history of the State, 113,802 votes, over Tom L. Johnson, his opponent. Mr. Herrick served one term in that office. His record stands among the first as an efficient and successful executive. He was offered the United States Treasury portfolio by President Taft at the beginning of his term, which was declined for business reasons. Later he was offered the ambassadorship to Brazil, which was also declined. In 1912 he accepted the ambassadorship to France, which he had once before declined, and at the outbreak of the World War in 1914, as American Ambassador, took over the German and Austrian embassies. On 2 Sept. 1914, preceding the battle of the Marne, when the French government removed to Bordeaux, Mr. Herrick requested his government to permit him to remain in Paris, as, in his opinion, the American interests were such that they could be better represented in Paris. Upon the departure of the diplomatic corps from the British, Turkish and Japanese embassies and the legations of various other countries, Mr. Herrick took over the representation of these interests. Three years later when Lord Northcliffe visited America, he said in an address, "I had the honor of meeting Ambassador Herrick in almost the earliest stages of the war, when between one and two millions of Germans were marching on Paris, and when Paris, with almost twice the number of inhabitants of Cleveland, was panic stricken and the people were fleeing from that city. It was largely due to the man from Cleveland that that panic did not extend so far as to cause the whole population to leave and allow the Germans to march into Paris. That feat of Ambassador Herrick is one of the most remarkable achievements of any man during the war."

Mr. Herrick formed the American Committee which occupied his residence as a headquarters. This committee rendered a great service in extending financial help to Americans and others who had been traveling in Europe at the outbreak of the war and who found themselves suddenly without funds and in need of advice and help. Mr. Herrick and his wife were largely instrumental in establishing an American ambulance hospital in the Elysée Pasteur at Neuilly, which was equipped and managed by resident Americans in Paris. It was established in 1914, having a capacity of about 1,600 beds, and performed a very great service. When America entered the war it was turned over to the Red Cross. The American Relief Clearing House was organized by Mr. Herrick and his home became its headquarters upon his leaving France. The Clearing House had also a branch in New York City and the admirable service which it has performed is well known to all Americans. Mrs. Herrick remained in Paris with her husband during the early days of the war, ministering to the needs of the stricken people of France, and as a result of her arduous duties in this connection, contracted the disease which resulted in her death on 15 Sept. 1918.

Before war was declared Mr. Herrick's successor had been appointed, and although he had then served nearly two years under a Democratic administration, he remained at his post

at the request of President Wilson until long after the battle of the Marne, returning to America in December 1914. After retiring from office, the French government in recognition of his services, conferred upon him the cross of the Legion of Honor. He was also admitted to membership in the Gens de Lettres. The British government presented him with a piece of old English plate, and in his letter of transmittal the British Ambassador wrote: "His Majesty's Government desires to ask your acceptance of this piece of old English plate which they hope will serve to you and yours as a memorial of the exertions which you so devotedly and generously employed on behalf of the British subjects, both soldiers and civilians, in that time of stress and suffering and as a token of the King's grateful recognition of the same."

Before the war Mr. Herrick had been interested in securing the participation of France in the Panama-Pacific Exposition in San Francisco in 1915. After the declaration of war most of the European countries decided to give up their preparations, but the French government voted to continue with its plans "in compliment to Ambassador Herrick," as they said. Mr. Herrick initiated the rural credit movement in this country, and upon taking up his residence in France, the ambassadors, ministers and councillors of various European countries were directed by their governments to report to him rural conditions and credit systems existing in these countries. In 1913 he reported the results of his investigations to the Department of State, and later published a book on the subject, 'Rural Credits' (New York 1914).

For many years Mr. Herrick was a director of several railroads representing foreign interests. He is interested in many business enterprises which have been uniformly successful. Among them are the National Carbon Company and the Union Carbide Company, which have merged under the name of the Union Carbide and Carbon Company and elected Mr. Herrick chairman of the board; and the Cleveland Hardware Company, in which he has been interested for over 30 years. He is a director in the New York Life Insurance Company, the National Surety Company and the Erie Railroad. Since returning to America, Mr. Herrick has received the honorary degree of LL.D. from Columbia, Harvard, Yale, Princeton and Western Reserve universities and from Miami, Union and Kenyon colleges. He has been presented with a medal by the National Institute of Social Sciences and is a trustee of Carnegie Institution of Washington. Immediately on his return to this country he became actively interested in war relief and is connected with many organizations engaged in this work, having given up the greater part of his time to these activities. Mr. Herrick has one son, Major Parmely W. Herrick, who is in the service of the United States army.

**HERRICK, Robert**, English poet: b. London, August 1591; d. Dean Prior, Devonshire, October 1674. His father, Nicholas Herrick, was a goldsmith; through inheritance and training the son was enabled to transfer to the making of verse the exquisiteness of his father's craft. Shortly after Robert's birth the elder Herrick made his will, and two days later

he died, under circumstances that suggested suicide. To his wife and his seven children he left a small property.

After a few years, perhaps at Westminster School, and a brief apprenticeship to his guardian uncle, William Herrick, also a goldsmith, the poet entered Cambridge University, at first enrolling himself in Saint John's College. Two years later he removed to Trinity Hall, intending to study law. During his residence he seems, from letters to his guardian, to have frequently needed money, and he left the university in debt. He took his degree of B.A. in 1617 and of M.A. in 1620.

Few facts remain of his next years. He went to London and associated with the poets of the time, admirers of Ben Jonson, and he himself wrote verse. The words of two New Year anthems set to music by Henry Lawes were his; through the friendly influence of prominent men at court, he may have been known to the king and queen. By 1627, when he was chaplain of the Duke of Buckingham's expedition to the Isle of Rhé, he must have taken orders. Two years later, shortly after his mother's death, he became vicar of Dean Prior in Devonshire.

So little in Herrick's poetry suggests the priestly character that question has been made why he took orders at all; he himself spoke of his Devonshire years as pure exile from London and the world. Yet the traditions of his career at Dean Prior are entirely pleasant. His parishioners remembered him for his good humor and wit. He wrote his best poems in the little vicarage, whether in celebration of Prudence Baldwin, his housekeeper, or of Tracy, his spaniel, or of the village holiday ceremonies and superstitions, recorded with wonderful sympathy. Nothing more particular remains, save the legend of his keeping a pet pig in the house, and of his hurling a missile at an inattentive congregation—his only practical expression of ill-will toward Devonshire.

In 1647, evicted as a loyalist by Parliament, he returned to London, glad to be free of the quiet country, and set about publishing his poems. They appeared that same year, under the title of 'Hesperides, or The Works Both Humane and Divine of Robert Herrick, Esq.' The sacred poems bear the separate title, 'His Noble Numbers; or, His Pious Pieces, Wherein (amongst other things) he sings the Birth of his Saviour; and sighes for his Saviour's Suffering on the Crosse.' Nothing else is known of Herrick until 1662, when Charles II restored him to his old place at Dean Prior. The parish register records his burial on 15 Oct. 1674.

There is almost no contemporary reference to Herrick's poems, but the frequency with which they were reprinted in collections proves the favor they found. By the end of the century, however, they were forgotten, sharing in the Augustan neglect of Elizabethan and Stuart poetry. A mention of Herrick, with some of his poems, in the *Gentleman's Magazine*, 1796, and Dr. Nathan Drake's essays and quotations in his 'Literary Hours,' two years later, revived his fame.

Herrick's literary master, as he tells us in

more than one fine tribute, was Ben Jonson (q.v.). Campion and the poets of the later songbooks foreshadow him, but it was through Jonson that he derived the tradition of Horace and the Latin epigrammatists, and he remained Latin in spirit, though his own carefully achieved simplicity is often near to Greek restraint. But it is not only in this literary inheritance that he belongs with Jonson; personally, if the Marshall portrait prefixed to 'Hesperides' is faithful, and if the assault upon the drowsy congregation is no fable, he illustrates with Jonson and other Elizabethans, and with Landor in later days, the paradox of violent and robust temperament reacting in fastidious art.

Herrick is first of all an artist; his merit is almost invariably a virtue of expression; he is master of the inevitable phrase. Many of his lyrics have indeed a larger perfection of form, yet he is most often concerned with the single word. His shortest poems, the numerous two-line fragments in which at first sight he would seem to scatter his genius, are frequently mere experiments in diction, usually for the sake of one word that he coins or discovers, easily recognizable for its curious awkwardness or its complete beauty. For among these trial pieces can be found some unhappy ventures, as well as astonishing verbal felicities.

This gift for language, part of the poetical equipment in general, is more marked in Herrick because of its intensity and its narrowness. It is so narrow as to be quite inflexible; far from exhibiting the Elizabethan faculty for adjusting the style to the most varied matter, Herrick subdues to one manner every subject he treats. The lines to his dying brother, the wedding songs for his friends, the epitaph on his housekeeper, and the recipes for country charms, are uttered alike in one voice and in one rigid though lovely tone. And in his choice of subjects he exercises none of the fine selection that distinguishes his diction; his conscientious art is a thing of words only; in his themes he is at once almost the coarsest and the daintiest of English poets. This imperturbable manner, itself exquisite, becomes in the handling of shockingly different themes Herrick's chief limitation; here is felt a certain hardness of character, an ill-proportioned sympathy, or some deep defect of heart. But this impression is partly corrected elsewhere in his work.

The themes of Herrick's secular verse, upon which his fame rests, are given with characteristic confusion in the first poem of his book. He sings of youth and love—a Renaissance motive from which his cheerfulness or his limited sympathy subtracts most of the Renaissance sadness at the passing of beauty. He sings of his own numerous loves in the Horatian manner, leaving his admirers room to ponder whether he ever loved at all. He sings in his kindest vein of fairy lore, and of country holidays; he identifies Renaissance springtime motives in the native village ceremonies around him, and gives to the English May festival something of the significance it had in Provence; and he is the first writer to chronicle at length that old English Christmas spirit which Irving and Dickens recovered. No

poet who writes of such subjects with such delight can be altogether unsympathetic, and in the verses which are frankly about himself there is a frequent note of human pathos that partly disarms criticism of his less felicitous themes.

It is not surprising that his 'Noble Numbers' are little read; in them as in his secular verse he is the technical experimenter, the conscious artist, where conscious art is out of place. But in the 'Christmas Carols,' in the 'Graces for Children,' in the fine though fantastic 'His Saviour's Words Going to the Cross,' in the epigram 'Riches and Poverty,' and in the lines that Swinburne praised, 'Devotion Makes a Deity,' he shows feeling and thoughtfulness not unworthy of England's tradition of devout country parsons. See **HESPERIDES**.

**Bibliography.**—The best editions are those by Grosart, Saintsbury (in 'Aldine Poets') and Pollard, with an introduction by Swinburne, in the 'Muses' Library.' For criticism, consult 'Introductions' to the above; Grosse, E., in 'Seventeenth Century Studies' (London 1898); Aldrich, in 'Ponkapog Papers' (New York 1903); Moorman, F. W., 'Robert Herrick: A Biographical and Critical Study' (New York 1910); and the 'Cambridge History of English Literature' (New York 1907-16).

JOHN ERSKINE,

Professor of English, Columbia University.

**HERRICK, Robert**, American novelist: b. Cambridge, Mass., 26 April 1868. He was graduated at Harvard in 1890, and in 1895 became professor of English at the University of Chicago. His literary style displays much finish, while his studies of character are both keen and discriminating. He contributes regularly signed articles to the *Chicago Tribune*. He has published 'The Man Who Wins' (1895); 'Literary Love Letters and Other Stories' (1896); 'Love's Dilemmas' (1898); 'Composition and Rhetoric' (1899); 'The Web of Life' (1900); 'The Real World' (1901); 'Their Child' (1903); 'The Common Lot' (1904); 'The Memoirs of an American Citizen' (1905); 'Together' (1908); 'A Life for a Life' (1910); 'The Master of the Inn' (1908); 'The Healer' (1911); 'One Woman's Life' (1913); 'His Great Adventure' (1913); 'Clark's Field' (1914); 'The World Decision' (1916); 'The Conscript Mother' (1916).

**HERRICK, Sophie McIlvaine Bledsoe**, American microscopist: b. Gambier, Ohio, 26 March 1837. She was editor of the *Southern Review*, 1875-78, and was connected with the editorial staff of *Scribner's Magazine* and its successor, *The Century*, 1878-1907. She has published 'Wonders of Plant Life under the Microscope' (1883); 'The Earth in Past Ages'; 'Chapters in Plant Life'; 'A Century of Sonnets' (1902).

**HERRING.** The typical fishes of the family *Clupeidae* (q.v.), to which also belong the shad, alewife, sardine (qq.v.) and other food-fishes, the numbers of which consumed make this the most important economically of all families of fishes. The true or sea-herrings belong to the genus *Clupea*. The common herring (*C. harengus*) of both sides of the north Atlantic swims in enormous schools containing countless numbers of individuals packed as

closely as possible over areas of often 6 to 20 square miles. The herring is a migratory fish, but its movements are so complicated that much mystery still clings to them. The most satisfactory conclusions have been arrived at by a German commission appointed to study the natural history of the Baltic, etc., which concluded that the herrings live in the deep water off the coasts which they approach periodically chiefly for the purpose of spawning; that there exist a large number of distinct races, differing in size, form, times of spawning and various other peculiarities, and that each of these races swims in separate schools, which move independently and have different seasons and grounds for spawning. Spawning takes place at various seasons, according to locality, some schools spawning in the late winter, others in the spring and still others during the autumn months. The eggs are small and adhere in masses to seaweeds, stones, etc., on the bottom. Vast numbers are thus deposited in certain favored localities to which haddock and other fishes are attracted for the purpose of devouring them. The number of eggs produced by each fish is not especially large, being from 10,000 to 50,000, but nevertheless the natural productiveness of the herring has been sufficient to overcome inroads caused by the fisheries and the much greater destruction due to the hordes of bluefish, sharks, porpoises, gulls and other enemies which accompany the schools in order to prey upon them. Having only few and small teeth, the herrings cannot capture active living creatures, but, as they swim with quick, nervous movements, water is being continually taken into the mouth and strained through the gill-rakers. By this means great numbers of copepods and other minute forms of life, especially larval crustaceans, annelids and mollusks are retained within the mouth and swallowed.

The herring fishery is of stupendous importance to the countries of northern Europe. This is especially true of the Scandinavian countries, whose hardy fishermen take from the sea annually not less than 1,500,000,000 pounds. Scotland takes from 150,000,000 to 200,000,000 pounds and the other maritime nations usually smaller quantities. The herring is not found in the Mediterranean. On this side of the Atlantic the fishery is much less extensive, but is growing and is no doubt destined to reach a great magnitude, especially in the waters of British America, which furnish each year about 250,000,000 pounds. Although found as far south as North Carolina, the herring has a commercial importance only north of Cape Cod. The New England fisheries are chiefly confined to Maine. Most of the fish is sold fresh, either for food, or, early in the season, for cod bait; the remainder is salted or smoked. A favorite preparation is the partly smoked form of "bloaters." Large quantities of young herrings are packed and sold as sardines. In the prosecution of the American fisheries use is made chiefly of several forms of drift or gill nets and seines; under favorable conditions of great tidal movements, as in the Bay of Fundy, great numbers are captured in weirs.

A closely similar species (*C. pallasii*) is found on the Pacific coast of America, and is the object of a rapidly extending fishery. Of the anadromous river-herrings or alewives

(*Pomolobus*), two species are of great commercial importance on the Atlantic coast of the United States, particularly southward, though the fisheries extend from Maine to Florida. They enter the rivers to spawn about the same time as the shad, with which they are caught chiefly in pound nets and seines. The greater number are smoked.

To the extensive literature of the herring the following references will serve as an introduction: Goode, 'Fishery Industries of the United States' (1884); Smith, 'Alewife Fisheries of the United States' (in Report of United States Fish Commission for 1898); Cunningham, 'Marketable Marine Fishes'; 'Report of the Commission for the Scientific Investigation of the German Seas' (a very important contribution in German); 'Annual Reports' of the United States Commissioner of Fisheries; Samuel, A. M., 'The Herring: Its Effect on the History of Britain' (London 1918).

**HERRING GULL**, the most numerous and widely spread of gulls, common in the breeding season throughout all the northerly parts of the world and migrating southward in winter. The silvery sheen of white and pearl-blue plumage are indicated in its technical name (*Larus argentatus*); and its habit of following schools of fishes and picking them up gives it the name of herring-gull. The same name is often given, however, to several others of the smaller gulls. See GULLS.

**HERRNHUT**, hĕrn'hoot, a small town or village in the kingdom of Saxony, in the circle and 18 miles southeast of Bautzen. It is situated at the foot of Hutberg Mountain, 1,054 feet above the level of the sea. It was founded by Count Zinzendorf 1722, for the use of the Moravian Brethren, and it afterward became the metropolis and centre of that sect of Christians, who, from this town, are often called Herrnhuters. (See UNITED BRETHREN). The town is built with great regularity and distinguished by the order, cleanliness and stillness which prevail in it. It has a great variety of manufactures, principally of linen, calico, tobacco and of articles in gold, tin, leather, etc. The objects of curiosity are the observatory and the burial-ground on a neighboring hill, resembling a garden, and called by the brethren "Garden of Peace." Pop. 1,200.

**HERRON**, Francis Jay, American soldier: b. Pittsburgh, Pa., 17 Feb. 1837; d. New York, 8 Jan. 1902. He was graduated at the Western University of Pennsylvania in 1854, and on the breaking out of the Civil War commanded the Governor's Grays in the First Iowa regiment. In 1861 he was made lieutenant-colonel of the Ninth Iowa regiment. In 1862 he received the commission of brigadier-general of volunteers. Early in 1863 he joined General Grant at Vicksburg and commanded the left wing of the besieging forces as major-general (1862), until the capture of the city. He subsequently captured Yazoo City, with its boats and supplies; commanded the Thirteenth army corps and broke up the traffic along the Rio Grande; assisted President Juarez against Maximilian's forces, and in June 1865 received the surrender of the Confederate forces west of the Mississippi. In 1873 he took up his residence in New York, where he practised law until his death.

**HERRON**, George Davis, American clergyman and social reformer: b. Montezuma, Ind., 21 Jan. 1862. He was educated at Ripon College, Wisconsin, and also studied in Europe. He became pastor of the Congregational church in Lake City, Minn., and while there made an address ("The Message of Jesus to Men of Wealth") before a Minneapolis club, which attracted much attention; he subsequently received a number of calls from important churches, and went as pastor to Burlington, Ia. Here he organized a club for the discussion of social questions, which was largely attended, especially by workmen. In 1893 he accepted the chair of applied Christianity at Iowa College, resigning in 1900 on account of the objection to his teachings; he then organized a religious and socialist movement known as the "social crusade," lectured on "The Economics of the Kingdom of Heaven," and advocated a transformation of the present economic order to one more in harmony with the Christian idea of the brotherhood of man. In 1901 he divorced his wife, and married a second time, an action which aroused much criticism. He was deposed from the Iowa Congregational Council, and has since resided in Italy and is engaged in literary work. He has written 'The Larger Christ' (1891); 'The Call of the Cross' (1892); 'A Plea for the Gospel' (1892); 'The New Redemption' (1893); 'The Christian Society' (1894); 'The Christian State' (1895); 'Social Meaning of Religious Experiences' (1897); 'Between Cæsar and Jesus' (1899); 'Why I am a Socialist' (1900); 'From Revolution to Revolution'; 'The Day of Judgment'; 'Wagner and Parsifal' (1903); 'War and Peace under Socialism'; 'Socialism and Spiritual Expansion'; 'Woodrow Wilson and the World's Peace.'

**HERSCHEL**, hĕr'shĕl, Caroline Lucretia, sister of Sir William Herschel (q.v.), Anglo-German astronomer: b. Hanover, Germany, 16 March 1750; d. there, 9 Jan. 1848. In her 22d year she went to England to reside with her brother, then organist in Bath. When William abandoned his former profession in favor of astronomy she became his helpmate, and when he was appointed private astronomer to George III she discharged efficiently all the duties of an assistant astronomer, for which she was allowed a small salary. Although these duties were very arduous, she yet found time to conduct a series of observations of her own with a small Newtonian telescope her brother had made for her. She devoted special energy to the discovery of comets, and was so successful as to be entitled to claim the priority of discovery of at least five. Several remarkable nebulae and clusters of stars included in her brother's catalogue were described from her original observations. In 1798 her valuable work, 'A Catalogue of Stars taken from Mr. Flamsteed's Observations, with Introductory Remarks by W. Herschel,' was published by the Royal Society. On her brother's death in 1822 she returned to her native country, where she died after an unusually protracted life, distinguished by useful scientific labors. The Royal Society recognized the value of her labors by bestowing upon her in 1828 their gold medal, and some time afterward by conferring upon her the privileges of honorary membership. Consult Herschel, M. C.,

'Memoir and Correspondence of Caroline Herschel' (London 1876); and Clerke, 'The Herschels and Modern Astronomy' (ib. 1895).

**HERSCHEL, Sir John Frederick William**, English astronomer; only son of Sir William Herschel (q.v.): b. Slough, near Windsor, 7 March 1792; d. Collingwood, Kent, 11 May 1871. He was educated at Eton and Cambridge. His first publication was 'A Collection of Examples of the Application of the Calculus to Finite Differences' (1820), but it was not until the death of his father that he devoted his special attention to those astronomical researches which have made the name of Herschel so famous. He limited his first exertions to a re-examination of the nebulae and clusters of stars discovered by his father, and in 1824, with James South, reported to the Royal Society the position and apparent distances of 380 double and triple stars, obtained by more than 10,000 measurements. This memoir attracted the notice of the French Academy, and they voted it their astronomical prize; and two years later the gold medal of the Royal Society was awarded to each of the astronomers. The results of the re-examination were given in 1833 to the Royal Society in the form of a catalogue of stars in order of their right ascension. The catalogue contained observations on 525 nebulae and clusters of stars not noticed by his father, and on a great number of double stars, between 3,000 and 4,000 in all. His 'Treatise on the Theory of Light' appeared in 1827, that on 'Sound' in 1830, and in the same year was published his well-known 'Preliminary Discourse on the Study of Natural Philosophy,' one of the most charmingly written books on science. In 1831 he was created a knight of the Royal Hanoverian Order. In 1833 Herschel published in Lardner's 'Cabinet Cyclopaedia' a 'Treatise on Astronomy,' subsequently enlarged into 'The Outlines of Astronomy,' of which several editions have been published. In the same year he undertook a private expedition to the Cape of Good Hope for the purpose of carrying out in the southern hemisphere observations similar to those he had made in the northern. Four years were spent near Cape Town (1834-37). His great object was to discover whether the distribution of the stars in the southern hemisphere corresponded with the results of his father's labors, prosecuted mainly on the opposite side of the Galactic Circle. That the observations might be strictly comparable they were made by the same method as Sir W. Herschel, and with a telescope of the same optical power. The whole number of stars counted in the telescope amounted to 68,948, included within 2,299 fields of view. By a computation based on the star-gauges in both hemispheres relative to the Milky Way, Sir John found that the stars visible in a reflecting telescope of 18 inches aperture amounted to 5,331,572; and more than this, the number really visible in the telescope was vastly greater, for in some parts of the Milky Way the stars were found to be so crowded in space as to defy all attempts to count them. The results of this vast labor were published in 1847. On Herschel's return to England in 1838 he was received with every public honor, and on the queen's coronation was created a baronet. He was buried in Westminster Abbey.

**HERSCHEL, Sir William**, Anglo-German astronomer: b. Hanover, Germany, 15 Nov. 1738; d. Slough, near Windsor, England, 25 Aug. 1822. He went to England in 1757, and at first was employed in the formation of a military band. Although enthusiastically fond of music, he devoted his leisure hours to mathematics and astronomy; and being dissatisfied with the only telescopes within his reach, he set about constructing one for himself, in which undertaking he succeeded, having in 1774 finished a reflecting instrument of five and one-half feet. Encouraged by his success he proceeded to complete larger telescopes, and from this period gradually withdrew from his musical engagements. Late in 1779 he began a regular survey of the heavens, star by star; with a seven-foot reflector and after 18 months' labor discovered, 13 March 1781, a new primary planet, named by him the *Georgium Sidus*, but now known as *Uranus*. George III gave him a pension, enabling him to devote the rest of his life to astronomy. At Slough, he commenced the erection of a telescope of the dimensions of 40 feet, and completed it in 1787. Its diameter was four and one-half feet, and it weighed 2,118 pounds. With this powerful instrument he continued to prosecute his discoveries, regularly communicating the results to the Royal Society till 1818. He was knighted by George III, and received honorary degrees from Oxford, Edinburgh and Glasgow universities. He was the first president of the Royal Astronomical Society. In 1783 he thought he had discovered a volcanic mountain in the moon and from further observations made with his large instrument in 1787 found he was the victim of an optical illusion. He discovered two of the satellites of Saturn, and the fact that his system of rings revolved and he measured his rotation and that of Vepus, announced to the world that there were binary stars in the heavens, etc. Herschel received much assistance in making and recording observations from his sister Caroline (q.v.), and later his brother, a skilful optical instrument-maker, lent him valuable aid. In 1802 he laid before the Royal Society a catalogue of 5,000 new nebulae, nebulous stars, planetary nebulae and cluster of stars he had discovered. Consult Dreyer, 'Short Account of Sir William Herschel's Life and Works' (London 1912); 'Herschel, his Life and Works,' by Holden (1881); Sime, 'William Herschel and His Work' (New York 1900). His scientific papers were collected and edited in 1912 under the direction of the Royal Astronomical Society and the Royal Society.

**HERSCHEL, Sir William James**, British administrator: b. January 1833; d. 24 Oct. 1917. He was a grandson of the famous discoverer of Uranus, and son of the eminent astronomer and chemist, Sir John Frederick Herschel, who is buried by the side of Isaac Newton in Westminster Abbey. William Herschel was graduated at Oxford and entered the Indian Civil Service in 1853. In 1859, while serving in the Hooghly district, he applied the first tests of the practicability of using finger-print impressions as a means of identification, with the object of circumventing the numerous cases of personation that came before the Bengal courts of justice. Owing to the general state of illiteracy, it was frequently impossible to apply the test of comparing signatures. In a report

to the government Herschel recommended the adoption of the system throughout India, but his advice was not followed till many years later, when he had the satisfaction of seeing his methods applied in all parts of the world. He served as commissioner at Cooch Behar for some years and settled in Oxford on his retirement.

**HERSCHELL, Farrer, Lord**, English lawyer and statesman; b. Brampton, Hampshire, 2 Nov. 1837; d. Washington, D. C., 1 March 1899. He was educated at University College, London, and the University of Bonn. He became a barrister of Lincoln's Inn in 1860; was recorder of Carlisle 1873-80; solicitor-general 1880-85; and Lord High Chancellor in 1886, and again 1892-95. He was a member of the Venezuela and British Guiana boundary arbitration tribunal in 1897, and was subsequently appointed one of the high joint commissioners from Great Britain, on the Anglo-American Commission, designed to settle existing differences between the United States and Canada, of which he became president. During the sitting of the commission in Washington, D. C., in February 1899, he had a severe fall, from the effects of which he died shortly after.

**HERTEL, hër'tel, Albert**, German painter: b. Berlin, 19 April 1843; d. 1912. He studied at the Berlin Academy, where he became professor in 1875, and was made a member in 1901. Among his landscapes are 'Olive Harvest in Capri' (1872); 'Via Flaminia' (1872); 'After the Storm on the Coast of Genoa' (1878); 'Northern Coast Scene with Fishermen Returning' (1883); 'Road Between Rapalla and Santa Margherita' (1892); and 'View in the Roman Campagna' (1896). He also painted decorative subjects.

**HERTEL DE ROUVILLE, är-tél dé roo-vél, Francis**, Canadian soldier: b. Three Rivers, Maurice County, Quebec, 1643; d. 1722. He was captured in 1681 and tortured by the Iroquois, who were so struck by his fortitude that they adopted him into their tribe. He succeeded in making his escape and as one of Frontenac's lieutenants performed, in 1690, some remarkable exploits against the English, from whom he captured Falmouth, now Portland, Me. Twenty-six years after this event Louis XIV tardily rewarded him with a patent of nobility.

**HERTER, Albert**, American artist: b. New York, 2 March 1871. He studied painting at Paris in the studio of Jean Paul Laurens. He has twice visited Japan and the years spent there have strongly influenced the character of his work. He is member of the Society of American Artists, of the Water Color Club and of the Water Color Society.

**HERTFORD COLLEGE**, Oxford, England, a foundation of Oxford University (q.v.), which in its modern form dates from 1874 when Thomas Charles Baring, then a member of Parliament for South Essex, provided an endowment for 15 fellows and 30 scholars, 7 lecturers and dean and bursar. The foundation now consists of a principal, 17 fellows and 40 scholars. In its earlier form the institution dated from 1283 when Elias of Hertford acquired a hall on the site which became known as Hert or Hart Hall. The hall was depend-

ent on Exeter College until 1760 when a charter was granted establishing Hertford as a college. After a struggling existence the charter was declared void from 1805 and the Hertford scholarship endowed by the university in 1834 with part of its property was all that perpetuated the name until, in 1874, the principal and scholars of Magdalen Hall, an offshoot of Magdalen College from 1602, who had occupied the old buildings, reorganized anew and revived the title of Hertford College. The old buildings have undergone restoration and fine modern buildings have been added since 1903.

**HERTLING, Georg F., Count von**, German statesman: b. Darmstadt, 31 Aug. 1843; d. Ruhpolding, Bavaria, 3 Jan. 1919. After completing his studies in philosophy and history at Münster, Munich and Berlin he spent two years in Italy studying the dogmatic history of the Roman Catholic Church, of which he was an uncompromising adherent. In 1867 he settled as tutor of philosophy at the University of Bonn, obtained his professorship in 1880 and two years later was transferred to the chair of philosophy at Munich. For many years he acted as the unofficial representative of Germany at the Vatican, where he conducted numerous important German negotiations with the Pope, dividing his time between occasional university lectures at home and frequent visits to Rome. He sat in the Reichstag from 1875 to 1890 and again from 1896 to 1912, ultimately becoming the leader of the Roman Catholic Centre party. In 1912 he succeeded Count Podewils as Minister-President of Bavaria. Hertling had contributed to the overthrow of Von Bethmann-Hollweg, the Imperial Chancellor, both by the Bavarian opposition to "reform" and by his own influence with the Centre party. In July 1917, without consulting Von Bethmann-Hollweg, the Kaiser offered the chancellorship to Hertling, who refused the post, and it was given to an almost unknown Prussian official, Herr Michaelis (q.v.). The latter, handicapped by the critical position of Germany and his personal incompetence, held office for only three months and a half. On 1 Nov. 1917 Hertling was formally appointed Chancellor and Minister-President of Prussia. Though in his 75th year, he was at first very successful, handling the internal situation with adroitness, bargaining with the emperor and managing the Reichstag so skilfully that he was able to begin with something like a definite pledge from the Reichstag of acquiescent behavior for the duration of the war. He produced as much stability in Germany as would have sufficed if the troops could have carried out their promises and prevented the defection of Germany's allies and the military disaster in the West. If the German offensive in 1918 had succeeded, Hertling would have emerged from the ordeal as the "victorious Chancellor." He carefully kept himself in the background as regarded foreign policy, leaving to Herr von Kühlmann the responsibility as well as most of the odium for the treaties of Brest-Litovsk and Bucharest. Before the end of June 1918 Kühlmann announced the impossibility of ending the war by purely military means and was dropped out of office. Hertling clung on through all the military disasters until the defection of Bulgaria, when he fell and was suc-

ceeded by Prince Max of Baden, the 8th and last German Chancellor. In his last speech to the Reichstag (September 1918), Hertling admitted that the situation was serious but not alarming; he declared that the German people would not beg for mercy and that the hour must come "when our enemies will see reason and make an end of the war."

**HERTZ, Heinrich**, hin'ri:h hërts, German physicist: b. Hamburg, 22 Feb. 1857; d. Bonn, 1 Jan. 1894. He studied at the University of Berlin, and in 1880 became assistant to Helmholtz there. In 1883 he was lecturer on theoretical physics at the University of Kiel; in 1885 was professor of physics at a technical school in Karlsruhe; and in 1889 succeeded Clausius as professor of physics at the University of Bonn. His most important work was his experiments with electricity, by which he proved that electricity can be transmitted in electromagnetic waves with the same rapidity as light, these waves showing the same phenomena of refraction, polarization, etc., as light waves. His first paper describing his electrical discoveries appeared in 1887, and others followed for many years in *Wiedermann's Annalen*. He further developed and attested the truth of Faraday's electromagnetic theory of light. It is by means of the Hertzian waves also that wireless telegraphy (q.v.) is made possible. His 'Ueber die Beziehungen zwischen Licht und Electricität' appeared in 1890, and 'Gesammelte Werke' in 1895. English translations have been published under titles 'Electric Waves,' by D. E. Jones, with a preface by Lord Kelvin (1893), and 'Miscellaneous Papers,' by D. E. Jones and J. A. Schott (1896). Consult Bonfort, H., *Sketch of Heinrich Hertz*, published by the Smithsonian Institution (Washington 1896).

**HERTZ, Henrik**, Danish dramatist and poet: b. Copenhagen, 25 Aug. 1797; d. 25 Feb. 1870. He was of Jewish parents but was converted to Christianity; was educated in the law at the University of Copenhagen, but soon abandoned this profession for the dramatic field. In 1826-27 two plays by him were produced, 'Mr. Burchardt and his Family' and 'Love and Policy.' The comedy 'Flyttedagen' ('Moving Day'), followed in 1828 and in 1830 appeared the comedy 'Amor's Strokes of Genius,' in rhymed verse, a class of composition hitherto unknown in Danish literature. He published anonymously in the same year 'Gengangerbrevene' ('Letters from a Ghost') which he defended J. L. Heiberg. In 1832 appeared the didactic poem 'Nature and Art' and 'Four Poetical Epistles.' These were followed by the comedy, 'A Day on the Island of Als' and, in 1835, by 'The Only Fault.' 'The Savings Bank' (1836) was one of his most successful comedies. Hertz, by this time, had been influenced by the Romantic movement and his full genius was unveiled in the great national drama, 'Vend Dyrings Hus,' which was produced in 1837. The year 1839 saw the less successful historical tragedy, 'Valdemar Atterdag,' but world-wide fame came to the dramatist in 1845, with the appearance of his lyrical drama, 'Kongens Datter' (King René's Daughter), of which translations have appeared in nearly all modern tongues. It was followed in 1848 by the tragedy, 'Ninon,' by the comedy, 'Tonietta' (1849); 'A Sacrifice' (1853); 'The Youngest'

(1854); 'Three Days in Padua' (1869). Hertz's dramatic works have been collected and published (18 vols., Copenhagen 1854-73), and 'Poems' (4 vols., ib. 1851-62). See KING RENÉ'S DAUGHTER.

**HERTZKA, hirts'ka**, Theodor, Austrian political economist: b. Pest, 1845. He was educated at Vienna and Pest; in 1872 became one of the editors of the *Neue Freie Presse*, Vienna, where he remained until 1879, when he founded the *Wiener Allgemeine Zeitung*. He was editor of the latter journal until 1886. In 'Die Gesetze der Handels- und Sozialpolitik' (1880) and 'Das Wesen der Geldes' (1887), he advocated the gold standard and free trade for Austria-Hungary. Later works were 'Gesetze der sozialen Entwicklung' (1886); 'Freiland, ein soziales Zukunftsbild' (1890; 10th ed., 1896); 'Reise nach Freiland' (1893). In these he described a socialistic community in Central Africa. He tried to found such an Utopia, and although many societies were formed to aid it, it failed about 1893.

**HERULI, hër'ü-li**, a Teutonic tribe first heard of in history about the middle of the 3d century, who passed south from the coast of the Baltic and swept with the Goths into the eastern provinces of Rome and founded an empire on the Danube. They appear as reinforcements of Odoacer in his invasion of the western provinces of Rome in 476. Their king, Rudolph, formed an alliance with Theodoric the Great, but they were afterward conquered by the Longobardi. A part of them were driven toward Scandinavia, a part lingered on the borders of the Roman Empire. They did good service to the Byzantine Empire, but after encountering the Vandals in Africa, and the Ostrogoths in Italy, they vanished from history.

**HERVIEU, ar'vyé'**, Paul Ernest, French dramatist and novelist: b. Neuilly, Seine, 2 Nov. 1857; d. 1915. He was educated at the Lycée Condorcet and in 1877 was admitted to the bar. He spent sometime in the office of the president of the council; qualified for the diplomatic service and in 1881 was named secretary of the French legation at Mexico City. He resigned within a few months and began his literary career by contributing essays, novels and stories to French journals and magazines. He was elected to the French Academy in 1900 and was also an officer of the Legion of Honor. His works display his great ability as a character delineator but are at times too severely logical. They include 'Les yeux verts et les yeux bleus' (1886); 'L'Inconnu' (1887); 'Deux plaisanteries' (1888); 'L'Exorcisée' (1891); 'Peints par eux-mêmes' (1893); 'L'Armature' (1895), dramatized 10 years later by Eugène Brieux; and the series of plays: 'Les paroles restent' (1892); 'Les Tenailles' (1895); 'Le loi de l'homme' (1897); 'La course du flambeau' (1901); 'Point de lendemain' (1901); 'L'Enigme' (1901); 'Théroigne et Méricourt' (1902); 'Le Dédale' (1903), produced in New York as 'The Labyrinth'; 'Le réveil' (1905); 'Bagatelles' (1912). See LABYRINTH, THE.

**HERWEGH, her'vek**, Georg, German political and lyrical poet: b. Stuttgart, 31 May 1817; d. Lichtenthal bei Baden-Baden, 7 April 1875. He studied theology at Tübingen, became editor of A. Lewald's periodical *Europa* at

Stuttgart; became embroiled with a military officer at Stuttgart and was obliged to flee to Switzerland, and settled there at Emmishofen in the canton of Thurgau. He there edited jointly with Wirth a periodical called *Die Volkshalle* and published a volume of political lyrics, 'Gedichte eines Lebendigen' ('Poems of a Living Man'); the title is in imitation of Prince Pückler's 'Briefe eines Verstorbenen' ('Letters of One Deceased') in 1841 (at Zürich; 10th ed., Stuttgart 1877). These poems showed considerable revolutionary spirit, yet on his journeys in Prussia (1842), he was favorably received, even by King Frederick William IV, who is said to have remarked "I respect opponents who have principles" and summoned him to an audience. From the city of Königsberg he addressed a strongly provocative letter to the king, resulting in his banishment from Prussia; Zürich also, to which he wished to return, would not receive him. But the king of Württemberg pardoned him for desertion from military service. In the canton of Basle, of which he now became a citizen, he married Emma Siegmund, daughter of a Jewish merchant at Berlin. At Paris, where he lived for a number of years, he wrote the poems in the second volume of 'Gedichte eines Lebendigen' (Zürich 1844) and translated Lamartine's works into German (Stuttgart, 12 vols., 1843-44). He engaged in active revolutionary propaganda at Paris, and in April 1848 invaded Baden at the head of a Franco-German Workers' Legion, accompanied by his wife and A. von Bornstedt. His force was defeated at Dossenbach 27 April by the Württemberg troops, and he fled to Switzerland, aided by his courageous wife. He produced little in the remaining years of his life, except translations of several Shakespearian plays. His works were issued in a complete edition in German with biography and introduction by Hermann Tardel (3 vols., Berlin 1909); 'Neue Gedichte' (posthumous poems, Zürich 1877); Lassalle's, 'Briefe an Herwegh' (Zürich 1896). Consult Walzel, O., 'Vom Geistesleben des 18. und 19. Jahrhunderts' (Leipzig 1911).

JACOB WITTMER HARTMANN.

**HERZEGOVINA**, hěrt-sě-gō-vě'nā, Austria-Hungary. See BOSNIA.

**HERZL**, hěrts'l, Theodor, Hungarian journalist and dramatist: b. Budapest, 2 May 1860; d. Edlach, 3 July 1904. Associated largely with Vienna, where he had won his way as literary journalist and dramatist, he is chiefly known for his labors in behalf of Zionism (q.v.), which gained him international fame. He was deeply stirred by the persecutions of the Jews revived in his day in Rumania and Russia, and was in Paris as correspondent of the Vienna *Neue Freie Presse* during the Dreyfus affair, which further quickened his determination to help solve the modern Jewish problem. In 1896 he issued a pamphlet "Der Juden-Staat," which soon appeared in English and other languages and gave impetus to Zionism, arousing singular enthusiasm chiefly among the masses in Europe and recent emigrants in America. He succeeded in organizing several international congresses at Basel "to establish a publicly and legally assured home in Palestine," and gave his entire time and strength to carry out the plan. He was received by the sultan (1901), the Pope,

the kaiser, and many leaders in Europe. England was ready (1903) to offer land in East Africa for the purpose, on the failure of his scheme to obtain a settlement in the Sinaitic Peninsula, adjoining southern Palestine. His energies, however, had been overtaxed and he died the following year. Of an attractive personality his period of leadership, although brief gave profound impetus to Jewish thought as to present and future conditions. His political Zionism has been hailed as the solution of the Jewish problem and attacked by its opponents as the dissolution of Judaism.

**HESIOD**, Greek poet: b. Ascra, a village of Bœotia, at the foot of Mount Helicon, whence it is called the *Ascraean*. But little is known of Hesiod with certainty. Even the age in which he lived cannot be precisely determined. Herodotus calls him a contemporary of Homer, and says they lived 400 years before himself (about 900 B.C.). In his 'Works and Days' (172) Hesiod says that he belonged to the period immediately following the Trojan War; but there are many reasons for supposing that he lived at a later period. His father emigrated from Cuma to Ascra where the poet was born, and where he spent his early days in rural pursuits. On his father's death, a dispute arose between Hesiod and his brother Perses concerning the father's property, which was decided in favor of the later. Hesiod then went to Orchomenos, where he remained for the rest of his life, and was buried according to tradition. A great number of anecdotes and stories have been handed down concerning his life. Among these is the tradition that there was a contest between Hesiod and Homer in which the former came off victorious. This story owes its origin doubtless to the strife between the Bœotian and Ionic schools of poetry, of which Hesiod and Homer were the respective representatives. Of the numerous works attributed to him three only remain. These are the 'Theogony,' a collection of the oldest fables concerning the birth and achievements of the gods, arranged so as to form a connected whole. It is the most important and difficult of all his works. With it was probably connected the lost 'Catalogues of Women' (or the *Eoiai megalai*), to the fourth book of which the second fragment (the 'Shield of Heracles') must have belonged. This is evidently composed of three distinct parts, only one of which is occupied with the real description of the shield. The third fragment is a didactic poem, 'Works and Days' (*Erga*, or *Erga kai Hemera*). It treats of agriculture, the choice of days, etc., with prudential precepts concerning education, domestic economy, navigation, etc. Other works attributed to him are the epic story of 'Egimius,' the ancestral hero of the Dorians; the epic 'Melampodia,' concerning the prophet Melampus, and 'Exegesis on Miracles.' Fragments of these are to be found in Götting's edition of Hesiod. From a literary standpoint, the Hesiodic poems are far inferior to the Homeric. The former deal with the practical questions of actual labor, the bare genealogical account of the gods and the facts concerning the cosmogony of the universe. They are unimaginative treatises in poetical form, and their purpose, unlike the heroic recitations of the Homeric legends, is purely didactic, informative.

Contemporary as well as succeeding generations held these poems in high esteem as authoritative accounts, and many early scholars zealously wrote commentaries, explanations and criticisms, of which only a few later fragments have survived. Whether or not the Hesiodic works as they have come down to us are the original work of one man, or the elaboration by successive interpreters of a much shorter work, is difficult to determine, though there is much evidence in favor of the latter viewpoint.

**Bibliography.**—The first Greek text was printed at Milan (1493). The first edition with the Greek scholia appeared at Venice (1537), and later at Cologne (1542) and Frankfurt (1591). Other important editions are by Gaisford, T. (in *Poetæ Græcæ Min.*); by Götting-Flach (1878); Paley, F. A. (with Eng. trans., London 1883); and Rzach, A. (1902). The 'Works and Days' has been edited by Van Lennep (1847) and Kirckhof (1889). The best English translations are by Thomas Cooke (London 1728) and A. W. Mair, (1908).

**HESPERIDES** (daughters of Hesperis), the guardians of the gold apples which Ge (the Earth) had given to Hera on her marriage. They were the daughters of Atlas and Hesperis, but their parentage is differently represented by other writers. They were four in number and their names were Agle, Arethusa, Erytheia, Hesperia, or Hesperarethusa. They were assisted in the charge of their garden by the sleepless dragon, Ladon. It was the twelfth labor of Heracles to bring the golden apples of the Hesperides to Eurystheus.

**HESPERIDES**, hēs-pēr'ī-dēz. The book of the collected lyrics of Robert Herrick, beautifully entitled 'Hesperides,' was published in 1633. Included in the volume, in addition to the secular lyrics, which number nearly 1,200, were 271 religious poems, separately entitled 'Noble Numbers.' The two collections comprise practically all of Herrick's characteristic work; it is to the "unbaptized rhymes" rather than to the "pious pieces" that he owes his fame as the most delicate and tuneful of English lyric poets.

The richly varied subject matter of Herrick's art is summed up in an introductory poem, "The Argument of His Book." First in the list stands nature, in its individual objects of grace and beauty, and all the exquisite perceptions of the sense:

Living of brooks, of blossoms, birds and bowers,  
Of April, May, of June and July flowers.

Then come the customs, ceremonies and fairy fancies of the folk; then love and "cleanly wantonness," and finally religion. Herrick is essentially a hedonist, delicately sensitive to beauty in all its myriad forms. He is the literary descendant of the ancient lyrist—of Anacreon, Horace and Catullus; and again of the Elizabethans, especially Ben Jonson, in the roster of whose "sons" he was proud to place himself. The qualities of his poetry are spontaneity, simplicity and a lyric grace which places him above all rivals. The deeper ranges of spiritual and moral experience were foreign to him, and the element of thought is almost entirely absent from his work, save for the ever-recurring idea of the shortness of life and the

speedy decay of youth and beauty, which imparts a wistful melancholy to his verse. He counsels us, like Horace, to pluck the flowers of life while yet we may enjoy them. In his love poems Herrick is never deeply serious. The numerous girls he celebrates are for him like the lilies and violets and morning dews, of a beauty as exquisite and as fleeting. Hence he is almost entirely without the note of sensuality which characterizes the work of many of his contemporaries.

A few of Herrick's lyrics—"To Corinna Going a-Maying," "To Daffodils," "Gather ye Rosebuds," etc.—are universally familiar, but he reaches as high a level in many others. The 'Hesperides' are a perpetual garden of delights, in which men may escape for the moment from "the strange disease of modern life" into a world of sunshine and pure beauty. Consult the 'Works of Robert Herrick' (ed. by Alfred Pollard, The Muses Library); Moorman, F. W., 'Robert Herrick, a Biographical and Critical Study' (1910).

JAMES H. HANFORD.

**HESPERORNIS**, hēs-pē-rōr'nīs, a remarkable extinct form of bird, the remains of which are met with in the Cretaceous deposits of Kansas. As described by Professor Marsh, it possessed small pointed reptilian teeth, which were implanted in a deep continuous groove, somewhat like those of *Ichthyosaurus*. Its brain was small and more reptilian in type than that of any adult bird as yet examined. It appears to have been a large diving-bird, measuring over five feet from the point of the bill to the end of the toes. Its wings were rudimentary, its legs powerful and its feet well adapted for rapid progression in water. The tail was broad, could move up and down, and was probably used as a rudder or swimming-paddle. The long slender jaws were united in front only by cartilage, as in serpents, and had on each side a joint which admitted of some motion, so that "the power of swallowing was doubtless equal to almost any emergency." Consult Lucas, 'Animals of the Past' (1901).

**HESPERUS**, hēs'pē-rūs, among the Greeks the planet Venus, when it appeared as evening star, personified as the divinity that at weddings leads the bride to the arms of her husband. He is called Phosphorus or Lucifer as a morning star, and is styled the son of Eos (Aurora) and Cephalus. He was also known as son or brother of Atlas, and brother of the Hesperidæ.

**HESPERUS PEAK**, an elevation of the La Plata Mountains, in the southwestern part of Colorado. Gold and silver have been mined in the vicinity. This peak is one of a group of high peaks in the vicinity of the State; the height is about 13,135 feet.

**HESSE**, hēs'se, Hermann (also known under the pseudonym HERMANN LAUSCHER), German novelist: b. Calw, Württemberg, 2 July 1877, the son of the editor of a religious journal, Johannes Hesse. He became a mechanic, later a bookseller at Basle, where he simultaneously attended lectures on literature and the history of art. In his choice of petty burgher subjects, as well as in his warmth of language and treatment, Hesse reminds one of the Swiss writers, particularly Gottfried Keller. Since

1905 he has been living at Gaienhofen, near Radolfzell, on Lake Constance. His delicate delineation of moods and milieus perhaps fits him better for the German short story (*Novelle*) than for the longer novel. In him, there are many reminiscences of Adalbert Stifter; his mood of recalling the events of childhood, which seems to be a constant preoccupation with him, yields him material for delightfully intimate treatment in three of his romances, 'Hermann Lauscher,' 'Peter Camenzind,' 'Unterm Rad.' He avoids the narrative of striking or impressive clashes of interest, preferring the more calm and peaceful life of the ordinary citizen. From 'Nachbarn,' a collection of short stories (1908), is taken 'In the old "Sun"' (translated into English in 'The German Classics,' Vol. XIX, New York 1914). His works include 'Romantische Lieder' (1898); 'Eine Stunde hinter Mitternacht' (1899); 'Hinterlassene Schriften und Gedichte Hermann Lauschers' (1908); 'Peter Camenzind,' novel (Berlin 1904; 50th ed., 1909); 'Unterm Rad' (1905); 'Diesselts' (1907); 'Nachbarn' (1908); 'Gertrud' (1908); 'Umwege,' short stories (Berlin 1912). Consult Kuhn, Alfred, 'Hermann Hesse' (Leipzig 1907).

JACOB WITTMER HARTMANN.

**HESSE**, hēs, or **HESSIA** (German, *Hessen*, hēs'sen), Germany, an ancient territory inhabited in the time of the Romans by the Catti or Chatti, an old Germanic tribe. Under the Frankish kings Hesse was governed by counts, the principal of whom were the counts of Gudensberg of the name of Giso. Philip I the Generous, who succeeded to the sovereignty of the whole country in 1509, and who was the earnest and zealous friend of the Reformation, divided his dominions among his four sons. The eldest, William IV, obtained one-half, including the capital, Cassel; Louis IV one-fourth comprising Marburg; Philip II one-eighth, with Rheinfels; and George I also an eighth, with Darmstadt. But Philip dying in 1583, and Louis in 1604, without children, there remained only the main branches of Hesse-Cassel and Hesse-Darmstadt.

**HESSE, Grand Duchy of** (the *Grossherzogtum Hessen*), a state of the German Empire lying between lat. 49° 24' and 50° 51' N. and long. 7° 51' and 9° 39' E. Its capital, Darmstadt, is a city of 87,089 inhabitants according to the latest official census, which gave the total population of the state as 1,282,051. The area is 2,968 square miles. It is divided into two main parts, which are separated by Prussian territory, and 11 smaller outlying parts. The southern main constituent part is divided by the Rhine into the Starkenburg and Rheinhessen (Rhenish Hesse) provinces, and is bounded on the north by Prussia, on the east by Bavaria and Baden, on the south by Baden and on the west by the Bavarian Rheinpfalz and Rheinpreussen. The northern chief division, called Oberhessen (Upper Hesse), lies wholly within Prussia. The outlying members of the state are: Wimpfen a. Berg, Wimpfen i. Tal, Hohenstadt, Helmhof (interpolated in Baden), Steinbach (surrounded by Prussian territory), several afforested districts belonging to the province of Oberhessen but situated in

Prussian territory southwest of that province, etc. A further division is made for administrative purposes, according to which the provinces contain 18 Kreise (circles) and 983 communes. The fact that the members of this state are to such an extent dispersed, and that eight separate parcels of territory belonging to Prussia and Baden are enclosed by Hessian land, finds its explanation in the circumstance that the grand duchy represents the present sum of particular additions made from time to time at the expense of older countries (Katzenelbogen, etc.) and that since 1803 it has secured portions of Kunpfalz and Kurmainz, the bishopric of Worms, the abbey of Seligenstadt, the old imperial cities of Wimpfen, Friedberg and Worms and a part of the old French department of Donnersberg; moreover it now embraces the baronies or principalities of Isenburg, Solms, Schlitz, Erbach, Stolberg, Löwenstein-Wertheim, as well as the domains of the families of Riedesel, Wambolt, Gemmingen and Löw.

**Topography.**—The larger and much more densely populated lower chief division, comprising Starkenburg, with 1,169 square miles, and Rhenish Hesse, 530 square miles, although it is in a measure occupied by the Odenwald in the southeast, and to that extent resembles the rough country of Upper Hesse, has quite different characteristics in the west, the centre and the northeast where it extends into the fruitful valley of the Rhine or clings to the river Main southeast of Frankfurt and Offenbach. Rhenish Hesse includes the fertile and thickly settled country between Krewznach, Worms and Mayence (Mainz). On the other hand the Upper Hesse province, with 1,269 square miles, partakes of the geographical and topographical characteristics described in the article *HESSE-NASSAU* (q.v.). The rivers of the grand duchy belong to the Rhine system, except that the eastern parts of the Vogelsberg declivities send their streams to the Fulda. The principal river, the Rhine, enters the state at the cathedral town of Worms, divides (as we have said) Rhenish Hesse from Starkenburg province, then forms the boundary with Prussia and leaves Hesse at Bingen. Its tributary streams, touching or flowing through Hesse, are the Neckar, which divides Starkenburg province from Baden for a short distance; the Weschnitz; the Main (navigable where it forms the boundary with Prussia); the Mümling and the Lahn, the Salz and the Nahe. Tributary to the Fulda are the Schlitz and the Schwalm. In each of the three provinces there are mineral springs, of which the most widely known are the Sauerquellen at Schwalheim, the (Saline) Bad-Nauheim and Bad-Salzhausen in Upper Hesse. The climate in the southern valleys and plains is mild and well suited to the cultivation of fruits; in the mountainous districts, on the other hand, it is so much harsher, that only hardy crops are grown above a moderate altitude.

**Population.**—The inhabitants (439 per square mile) are by derivation principally West Franks of the Upper or North German race. The ratio of males to females is as 1,000 to 1,006. About two-thirds are Protestants (66.63 per cent, according to an authoritative statement); Roman Catholics, 30.49 per cent; other Christian denominations, 0.67 per cent; Jews,

219 per cent. In the years 1843-67, 1871-75 and 1880-85 large numbers of the inhabitants emigrated to other countries, but that tendency has decreased since 1894 to a very large extent. As the basic principles of the elaborate educational system, instruction is compulsory and the state contributes to the support of elementary schools. Public elementary schools number 979, with 215,709 pupils, 3,469 male and 584 female teachers. Schools of the next higher grade had 27,522 pupils a year or 18 months before the European War began; and at that time there were 11 gymnasia, two progymnasia, three realgymnasia, nine oberrealschulen and the same number of realschulen, an agricultural college, 32 superior Bürgerschulen, with 739 teachers and 12,584 pupils, six higher schools for girls with 3,523 pupils, and 49 private schools with 3,790 pupils; the University of Giessen then having 1,436 under-graduates; the Technical High School at the capital, 1,347. The foregoing enumeration, though not complete, gives a fair idea of the educational system's scope.

**Agriculture and Mining.**—By means of insurance organizations, agricultural societies and institutes for instruction, the important agricultural interests are sustained and promoted by the local government as well as by individuals in private life. The cultivation of fruits is very profitable in all three provinces; especially noteworthy are the vineyards of Rhenish Hesse and some other localities—the wines of those regions figuring largely among exports. Mining plays a larger part in Upper Hesse than in the other two provinces, the chief products being iron, manganese, soft coal or coke, and salt; and in this matter also both the state and private individuals are participants. The quantity of coal produced during the year before the war was 397,520 tons.

**Industrial Activity.**—Complete industrial freedom has been the rule since the adoption of the German regulation of industries; but exceptions are noted in the conduct of certain occupations (those of the apothecary, the tavern-keeper, etc.) which are made dependent upon concessions or licenses. Manufacturing industries in their many varieties support more than 38 per cent of the total population; the principal manufactures being chemicals, leather, cloth, paper, furniture, wagons, railroad cars, musical instruments and machinery.

**Government.**—The sovereign grand duchy, which attained that dignity in 1806, was up to 1918, in accordance with the constitution of 17 Dec. 1820, which had undergone many changes, an "indivisible constitutional monarchy," at the head of which stood the Grand Duke (Grossherzog von Hessen und bei Rhein) who had also the title Königliche Hoheit (royal or regal highness) and was titular head of the Evangelical Church of the duchy as well. His civil list was about \$316,000, and he divided law-giving power with the nobility and representatives of the people in the Landständen, which was composed of first and second houses or chambers. The judiciary (including a high court at the capital and Landgerichte at Darmstadt, Giessen and Mainz) maintained its distinct existence although the head of the department of justice was the Minister of State who was also Minister of the Grand-Ducal House and Foreign Affairs.

**Finance.**—For the year 1915-16 the ordinary revenue and expenditure were estimated to balance at \$22,736,925, leaving a deficit of \$1,143,415, approximately. The public debt, nearly all for railroads, was stated at \$112,215,505, approximately, in 1914.

**HESSE-CASSEL**, hēs-kās'el, or **ELECTORAL HESSE**, Germany, a former electorate and independent member of the Germanic Confederacy, between Rhenish Prussia and Bavaria, containing 4,430 square miles, with about 850,000 inhabitants, mostly Protestants. It was founded by the eldest son of Philip the Generous, the Landgrave William IV, surnamed the Wise (1567-92). For a long period the history of Hesse-Cassel was a narrative of conflicts between the people for political freedom and the Elector for absolute rule. The demands of the people were on several occasions strengthened by appeals to the Elector from the Prussian government. On the outbreak of the German war of 1866, the Elector joined Austria, and his territory was occupied by Prussian troops. On the conclusion of the war Hesse-Cassel was annexed to the Prussian territories, and now forms part of Hesse-Nassau (q.v.). Consult Gräfe, Heinrich, 'Der Verfassungskampf in Kurhessen' (Leipzig 1851); Rommel, Christopher, 'Geschichte van Hessen' (10 vols., Cassel 1820-58); Sybel, H. von, 'Die Begründung des deutschen Reichs durch Wilhelm I' (Munich 1889-94, Eng. trans., New York 1889-94); Wippermann, C. W., 'Kurhessen seit dem Freiheitskriege' (Cassel 1850).

**HESSE-DARMSTADT.** See HESSE, GRAND DUCHY OF.

**HESSE-HOMBURG** (HESSEN-HOMBURG), Germany, former landgraviate comprising the districts of Homburg vor der Höhe and Meisenheim on the right and left bank of the Rhine respectively, with an area of about 106 square miles. It was anciently a part of Hesse-Darmstadt, but became a separate landgraviate in 1768. From 1806 to 1815 it was again an integral part of Hesse-Darmstadt. In the latter year its independence was restored by the Congress of Vienna and its territory increased by the addition of Meisenheim. Baths and springs were opened at Homburg in 1833 and became a principal source of revenue to the state. Gambling also prevailed and was with difficulty kept within bounds until 1872. A liberal constitution was granted in 1848, but appears to have never been in effect. In 1866 on the death without issue of the last Landgrave, Ferdinand, the territory was divided, Meisenheim going to Prussia and the landgraviate to Hesse-Darmstadt. Later in the same year (3 Sept. 1866) it was ceded to Prussia because of its having sided with Austria in the conflict with the former, and became a part of the Prussian province of Hesse-Nassau. Consult Herget, 'Das landgräflche Hans Homburg' (Homburg 1903).

**HESSE-NASSAU**, hēs'nās'ä, or **HESSEN-NASSAU**, hēs'sen-nās'sow, Germany, province of Prussia, which includes the former electorate (Kurfürstentum) of Hesse-Cassel (except some small districts), the greater part of the former duchy of Nassau, that portion of

the former landgraviate of Hesse-Homburg which lies on the right bank of the Rhine, the territory and town of Frankfort-on-the-Main, and some small districts ceded by the grand duchy Hesse and Bavaria. It was formed in 1867-68 out of the foregoing regions, which were annexed by Prussia as a result of the War of 1866. The province is bounded by the Prussian provinces of Westphalia, Hanover, Saxony and the Rhine-province, the principality of Waldeck, the grand duchy of Saxe-Weimar and the kingdom of Bavaria; area, 6,060 English square miles, divided into the two governments (Regierungsbezirke) of Cassel and Wiesbaden. The greater part of this province has a rugged surface, with only small and scattered areas of lowlands or valleys.

**Topography and Climate.**—In the Wiesbaden governmental division the highlands belong to the Rhenish-Westphalian mountain system, a branch of which extends like a peninsula between the new red-sandstone formations of the Cassel governmental division; and in the former division we find the Taunus and Westerwald, with the Feldberg and the Fuchskauten as the highest points. Predominant in the latter division (Regierungsbezirke) are the red-sandstone mountains of the Rhenish system, including the high Rhön with the Wasserkuppe and the Milseburg, etc. In the northern part of the province a great number of mountains, either separated or in relatively small groups, form the Hessian highlands, the altitude of the peaks ranging from 1,235 feet, in the Lahnberge near Marburg, to 2,054 feet in the Knüllgebirge, between the Fulda and the Schwalm, the heights of the Seulingswald between the Werra and the Fulda; north of these the Richelsdörfer Mountains and northeast the Ringgau Mountains; the Bombacher Wald and the Alheimer toward the west, etc. The Söhre, the Meissner and the Kaufunger forest lie farther toward the north; the Lengenbergr, the Reinhardtswald and the Habichtswald extend north and south between the Weser, the Fulda, Diemel and Eder. New red-sandstone constitutes the basis of these mountain-regions; only in rare instances is it covered with shell-lime. Basaltic columnar formations, however, occur in many localities, and in a noteworthy degree are interpolated among Tertiary formations between Cassel and Ziegenhain. The Thuringian Forest occupies a part of Schmalkalden, and in Rinteln are segments of the Weser Mountains; the most conspicuous point in either of these governmental "circles" being the Inselsberg (2,977 feet). As a whole, Hesse-Nassau belongs to the Weser and Rhine river-systems. The navigable larger rivers—in the south the Main and Rhine, and in the north the Werra and the Weser—are to be regarded as border or boundary streams; among those penetrating the territory of the province and more closely identified with it are the Kinzig, the Nidda, the Ohm, the Ems, the Weil, the Aar, the Elbbach, the Dill, the Eder, the Schwalm, the Diemel and (especially important) the Fulda and the Lahn. In the Rhön Mountains and the Westerwald the climate is particularly harsh, these regions being covered with great masses of snow during nearly one-half of the year; on the other hand climatic conditions in low-lying districts are decidedly favorable.

**Population and Education.**—The number of inhabitants according to the last official census was 2,221,021, or 366.5 per square mile. Protestants are about two and one-half times as numerous as Roman Catholics, and there are about 50,000 Jews. The institutions of learning are The University of Marburg, 20 gymnasien or colleges, one progymnasium, four real-gymnasias and an equal number of realprogymnasias, six oberrealschulen, 14 realschulen, one agricultural school, four private schools of the higher-grade, seven normal schools for men and women teachers, three institutions for the deaf and dumb, two for the blind, etc.

**Industries.**—The inhabitants are chiefly employed in farming, cattle-raising, forestry and mining. About 45 to 46 per cent of the total area is devoted to arable fields and gardens; 11.6 per cent to meadow land; 0.2 to vineyards; 39.7 per cent to forest. In this province, which is the forest-region par excellence of Prussia, the principal trees are the beech, oak, fir and pine; forests covering both slopes and crests of the mountains with the exception of the highest parts of the Westerwald and the High Rhön. Although this province is not very well adapted to agriculture, fertile areas are found near such rivers as the Main, the Ems, the Schwalm; moreover, the meadows are utilized very generally for stock-farming. In the neighborhood of Cassel, fruit and garden vegetables are cultivated very profitably; and the same may be said on districts on the Werra, the Rhine, the Lahn and the Main. A pomological institute and nurseries on a grand scale are maintained at Geisenheim. For the cultivation of the vine the hills of Rheingau are famous; and in this province are found those centres or wine-production, Hochheim, Rauenthal, Erbach, Johannisberg, Geisenheim, Assmanshausen and Rudesheim. The mines yield iron ores, coal, copper, manganese and lead. Mineral springs—particularly those of Ems and Wiesbaden, of Niederselters, Geilnau and Fachingen, contributed before the war in an important degree to the prosperity of the province, the waters of many springs being exported; and an important source of income has been the throng of foreigners visiting Wiesbaden and Ems and the well-known baths (Soden, Homburg, Langenschwalbach and Schlungenbad). Manufactures are important only in a few regions, for example: the city of Cassel (machinery, gold and silver ware and instruments of many kinds), Grossalmerode, Eschwege (leather and sole-leather from South American hides), Frankfort-on-the-Main (jewelry, iron and bronze wares, machines and chemicals). Other industrial establishments are those devoted to weaving, the manufacture of paper, etc.

The governmental district of Cassel is divided into 24 "circles," and that of Wiesbaden into 18, the Oberpräsident exercising his authority as the chief representative of the Imperial government at the city of Cassel. In that city are located also the supreme courts (Oberlandesgericht) and one of the three provincial or general courts of justice of the Cassel district, the other two being at Hanau and Marburg. In Frankfort-on-the-Main there is also an Oberlandesgericht and one of five general courts, the other four being at Limburg, Hechingen, Neuwied and Wiesbaden. The province

sends 14 members to the German Reichstag and 26 to the Prussian Chamber of Deputies. The Cassel governmental district belong to the circuit of the 11th army corps; the Wiesbaden district falls within the jurisdiction of the 18th army corps. The most important among the lines of railroad is that from Göttingen to Cassel and Frankfort-on-the-Main.

**HESSEN-DARMSTADT**, hēs'sēn-därm'-stāt. See HESSE, GRAND DUCHY OF.

**HESSEAN FLY**. See WHEAT INSECT PESTS.

**HESSEANS IN THE REVOLUTION**, The. In the 18th century Germany was divided into nearly 300 sovereignties, each maintaining a court and a military force. The possible revenue was often very limited, the burdens were almost intolerable and the princelings were often profligate and cruel; they did not need their forces for home defense, and were glad to make money for themselves by letting out their regiments for hire, though except in one case they remitted no taxes on the people from the receipts. There was also a lingering tradition that soldiering was an honest trade like any other and that it was useful for helping sovereigns to keep order; especially to put down insurrections, which were wicked. This, however, did not apply to rulers hiring out their troops and pocketing the money; and not only the liberal school of writers and public men, but enlightened despots like Frederick the Great, denounced it. But England had not sufficient army for the American War, and wished drilled troops rather than raw recruits and after vainly endeavoring to hire 20,000 Russian soldiers, turned to the German princes, with some of whom she had dynastic relations and all of whom were so eager to sell their wares that two of them offered soldiers for hire immediately after Bunker Hill, without waiting to be asked. Only those which could furnish considerable numbers were worth treating with and all the German auxiliaries were finally hired from six states; about half being from two Hessian states, and by far the largest (more than three times greater than any other) from one. All were indiscriminately termed "Hessians," as all German immigrants were formerly called "Palatines." The first treaty was made with the Duke of Brunswick, 9 Jan. 1776, for 4,300 troops; reinforcements or replacements were sent year by year, till the total had amounted to 5,723, only 2,708 of whom ever returned. The second was with the Landgrave of Hesse-Cassel, 15 Jan. 1776, for 12,805; finally increased to 16,992, of whom 10,492 returned. The contingents from the others, under various treaties, amounted to—Hesse-Hanau, 2,038; Anspach-Baireuth, 2,353; Waldeck, 1,225; Anhalt-Zerbst, 1,152. Total sent to America, 29,867, of whom 17,313 returned; the rest either died or remained as citizens. There were about 20,000 in America at any one time after 1776. These forces cost Great Britain in subsidies and incidentals about £1,770,000; besides the lump sum, it was obliged to replace the dead, and at least in one case count three wounded men as one dead one.

About 18,000 were shipped in 1776; the commander-in-chief was Lieut.-Gen. Philipp von Heister, a veteran of the Seven Years' War. The first division of some 8,000 landed at Staten

Island 15 August; they included a body of chasseurs and grenadiers under Lieut. E. W. F. von Donop, an able and daring officer. They took a leading part in the battles of Long Island and White Plains, and all the operations for capturing New York; and stormed Fort Washington with a loss of 56 killed and 276 wounded. During this time the second division of about 4,000, under Lieut.-Gen. Wilhelm von Knyphausen, joined them. Washington's surprise at Trenton fell on Colonel Rall's brigade of Germans. Rall was a regular officer whose contempt for the ragged Americans surpassed that of the most arrogant Briton, and he refused to take the most elementary precautions; he was mortally wounded. Early in 1777 Heister was superseded by Knyphausen; Howe finding the former intractable and the Landgrave of Hesse laying the blame of Trenton upon him. Meantime the Brunswickers and a Hanau regiment under Baron von Riedesel had made a clearance of Canada; and in 1777 they were joined to the expedition of Burgoyne, in whom Riedesel had no faith. It was from this division that Baum's detachment was sent off to raid Vermont and to meet its fate at Bennington, with Breymann's sent to support it; 365 of Baum's 374 Germans did not return, and 231 of Breymann's were killed, wounded or captured. Riedesel and his remaining men shared in Burgoyne's surrender. Around Philadelphia, at Brandywine and Germantown, Knyphausen's command was of the first importance; and at Red Bank Donop tried to storm the American fort and was mortally wounded, his command losing 82 killed and 229 wounded, besides 60 prisoners. In the three years' occupation of Rhode Island, from the fall of 1776 to that of 1779, about half of the British corps was Hessians; and they liked, and were liked by the inhabitants—when they departed, all persons, but especially women, were prohibited from appearing at the Newport windows, in fear that the soldiers might not wish to go. In the South, at Savannah, Charleston, Pensacola, Baton Rouge, etc., they left many dead; and shared in the bloody drawn battle of Guilford Court House. Finally, at Yorktown, they bore the brunt of the actual fighting, losing 53 killed and 131 wounded.

The Germans did their duty bravely and faithfully, with loyalty to a service they had been sold into to no profit of theirs. Very few deserted, in spite of constant inducements held out to them; a policy which Washington strongly deprecated. Probably one reason was, that they were at once recognizable from their speech. Nor were they in the least inhumane or rapacious; the charge that they were cruel barbarians was a mere political weapon of the time. In a strange country, they would have run the risk of being murdered in reprisal had they been such; but in fact they appear to have been well-meaning men. Of the 29,867 who came over, only 17,313 returned to Germany. Of the 12,554 remaining, 548 were killed; some of the total 1,652 wounded died; some disappeared; but a great number are known to have remained and settled in the country. Grants were given them in Nova Scotia, but many scattered as chance directed. Consult Lowell, 'The Hessians in the Revolution' (1884).

**HESSEITE**. A mineral consisting of silver telluride, Ag<sub>2</sub>Te, containing 63.3 per cent of

silver. Has been mined in La Plata County, Colo., and in California and Oregon.

**HESTIA.** See **VESTA**.

**HESYCHIUS**, hē-sik-i-ūs, the author of a Greek lexicon, which has probably come to us in an abridged form, and which he partly collected from former dictionaries, and partly enlarged by many new words and examples from Homer, the dramatic and lyric poets, the orators, physicians and historians. He was a native of Alexandria, and according to the best authorities flourished about the end of the 4th century after Christ. Of the circumstances of his life nothing is known. His lexicon possesses great value, especially of an antiquarian kind, and is the most useful for the study of the Greek language of all the ancient critical writings that are extant. The best editions of his lexicon are Alberti and Ruhnken's (Leyden 1746-66, 2 vols. folio), and that prepared by Schmidt (Jena, 5 vols., 1867-68; in a smaller form, two parts, 1864; 2d ed., 1867).

**HETÆRA**, hē-tē'ra (Greek *hetaira*, a female companion), the name given by the Greeks to a mistress, as opposed to a lawful wife. But the word had various shades of meaning, from a mistress, who might be a wife in all but the legal qualification of citizenship, down to a harlot. The beauty and accomplishments of many of the hetæræ occasioned their society to be sought by men of the highest eminence, even Plato and Socrates. No shame was attached to associating with them. Aspasia, the mistress of Pericles, is the most renowned of these hetæræ. (See **ASPASIA**). Hetæræ, less intellectually famous, were Lais, whom Aristippus the philosopher loved, Phryne and others. They also became famous for their connection with the works of art. Praxiteles made a marble and gold statue of the latter, and she was also the model for his statues of Aphrodite.

**HETEROGAMY.** See **METAGENESIS**.

**HETEROGENESIS**, hēt'ē-rō-jěn'ē-sis, or **HETEROGENY.** See **METAGENESIS**.

**HETEROPODA**, hēt-ē-rop'ō-da, a group of small, pelagic, pectinibranch mollusks, which dwell together in the open sea, have the foot modified into a swimming organ and are provided with a ventral sucker. The shells are spiral or shaped like that of an argonaut and seem as if composed of thin glass; indeed, the whole animal is beautifully transparent. Heteropods occur in enormous abundance at the surface of the sea in all the warmer parts of the world, and their dead shells sinking to the bottom form a large constituent of the abyssal ooze. They are highly organized, have well-developed eyes and other organs of sense, are bisexual and produce eggs in long cylindrical cords. The young in their development pass through a trochosphere and then a veliger stage. All are predatory, seizing and feeding on the numerous minute forms of life about them. They are most active in the early evening, darting about with twisting motions like worms, usually on their backs. They use the ventral sucking-disc for attaching themselves to any object they may encounter. Three families, containing many species, are known, and their closest affinities are with the petropods.

Consult Kingsley, 'Standard Natural History' (Vol. I, 1885).

**HETEROPTERA.** See **HEMIPTERA**.

**HETH**, Henry, Confederate general: b. Chesterfield County, Va., 16 Dec. 1825; d. Washington, D. C., 27 Sept. 1899. Upon graduating at West Point in 1847 he was appointed second lieutenant, fought in the Mexican War and later against the Indians on the frontier, and became captain in 1855; but on the outbreak of the Civil War entered the service of the Confederacy, being commissioned major 16 March 1861 and colonel of the 45th Virginia Infantry, 17 June 1861. On 6 Jan. 1862 he became brigadier-general, fought through the West Virginia campaign, was assigned to A. P. Hill's division of the Army of Northern Virginia, was wounded at Chancellorsville, and on 24 May 1863 was commissioned major-general. As commander of a division of the Confederate army he rendered efficient service at Gettysburg, where he was again wounded; distinguished himself at Bristoe Station, Spottsylvania, Bethesda Church, Petersburg, Reams' Station and other places; and surrendered at Appomattox, 9 April 1865. After the war he engaged in mining operations for a time, then in the insurance business at Richmond, Va., and later became personal adviser to President Grant in relation to alleged Indian frauds. He wrote 'Memoirs of the War.'

**HETMAN** (Russian, *Ataman*), chief of the Cossacks, formerly elected by that people. He had the power of life and death, and was head of the army in time of war. Mazeppa in 1708 revolted against Russia, taking the side of Charles XII of Sweden, and Peter the Great abolished in consequence the power and authority of the hetman. Catharine II suppressed the office and title in the province of Ukraine; it still exists among the Cossacks of the Don. In Poland the commander-in-chief of the army was styled hetman, and was appointed by the sovereign. The last elective hetman of the Cossacks in Russia was Platort 1812-14. On his death the grand duke, heir to the throne, was made hetman.

**HETTY SORREL**, in George Eliot's 'Adam Bede' (1859), a dairymaid whose unfortunate career, condemnation to death, and final reprieve form an important part of the story.

**HEVELIUS**, Johanne, yō-hān'nēs hā-fā'lē-oos, or hē-vē'lī-ūs, known also as **JOHANNES HEVEL**, Polish astronomer: b. Dantzic, 28 Jan. 1611; d. there, 28 Jan. 1687. After visiting the principal countries of Europe he settled in his native city, and from 1639 till his death applied himself almost exclusively to the study of astronomy. His 'Selenographia,' or description of the moon, published in 1647, was the first of numerous astronomical works of great value and authority on his favorite science. Halley, who visited Hevelius at Dantzic at the request of the Royal Society of London, of which Hevelius had been elected a member in 1664, reported favorably of the correctness of his observations. In 1661 he observed a transit of Mercury, a triumph confined to Gassendi alone of all preceding astronomers. Hevelius ranks

next to Flamsteed among the men of his day as a diligent and accurate observer of the heavens.

**HEWES, hūz, Joseph**, American patriot: a signer of the Declaration of Independence: b. Kingston, N. J., 1730; d. Philadelphia, 10 Nov. 1779. He was educated at Princeton College, and about 1760 he removed to Edenton, North Carolina. He soon became a member of the colonial legislature, and was a delegate to the General Congress at Philadelphia 1774-77 and again in 1779. After taking his seat he was appointed on a committee to "state the rights of the colonies in general, the several instances in which those rights are violated or infringed, and the means most proper to be pursued for obtaining a restoration of them," and aided in the preparation of its report.

**HEWETT, hū'ēt, Waterman Thomas**, American Germanic scholar: b. Miami, Mo., 10 Jan. 1846. He was graduated from Amherst College in 1869, studied in Europe and was professor of German language and literature at Cornell University from 1870 to 1910, when he became professor emeritus. He has resided in Europe since 1913, in Oxford since 1914. He has been general editor of Macmillan's 'German Classics' since 1895, and beside frequent contributions to periodicals has published among other works 'The Friesian Language and Literature' (1879); 'The University of Leiden' (1881); 'University Administration' (1882); 'The Aims and Methods of the Collegiate Study of the Modern Languages' (1884); 'The Present Condition of Instruction in the Modern Languages in American Colleges' (1885); 'The House of Orange' (1885); 'Introduction to the Life and Genius of Goethe' (1886); 'Wilhelm Scherer' (1887); 'The Mutual Relations of Colleges and High Schools' (1887); 'The Revised Constitution of the Netherlands' (1887); 'The Study of Modern European Literature in America' (1887); 'Ministers and Sovereign in Germany' (1888); 'Homes of the German Poets' (1889); 'History of Cornell University' (1894); 'Matthias de Vries and his Contributions to Netherland Philology' (1895); 'University Life in the Middle Ages' (1898); 'Sources of Goethe's Printed Text' (1898); 'The Historical Use of the Relative Pronouns in English Literature' (1904); 'Cornell University: A History' (3 vols., 1905); and editor of 'A German Reader' (1899); Goethe's 'Hermann and Dorothea' (1891); same for colleges and high schools (1907); 'Bibliography of the Writings of Goldwin Smith' (1916).

**HEWIT, hū'it, Nathaniel Augustus**, American Roman Catholic clergyman: b. Fairfield, Conn., 27 Nov. 1820; d. New York, 3 July 1897. He was graduated from Amherst College in 1839 and was for several years in the Episcopal ministry. He became a Roman Catholic in 1846 and joined the Order of Redemptorists. He was later one of the founders of the Congregation of Saint Paul (Paulists), taking the religious name of "AUGUSTINE FRANCIS," and subsequently becoming professor and superior in the Paulist Seminary, New York. He wrote 'Life of Princess Borghese' (1856); 'Problems

of the Age' (1868); 'Light in Darkness' (1871), etc.

**HEWITT, Abram Stevens**, American manufacturer and politician: b. Haverstraw, Rockland County, N. Y., 31 July 1822; d. New York, 18 Jan. 1903. He was graduated from Columbia in 1842 at the head of his class, and in 1843 he was made acting professor of mathematics there; he also began the study of law, and was admitted to the bar in 1845. He did not practise, however, but shortly after went into the iron and steel business with his father-in-law, Edward Cooper. By careful and skilful management he built up the financial success of his firm (Cooper & Hewitt); which was the first to manufacture iron girders and supports for fire-proof buildings and bridges, and also furnished the government with large quantity of material during the Civil War. In dealing with his employees, he was particularly successful, never having any serious trouble; it was his policy to keep the works running and the men employed, at least part of the time during dull seasons, though the business was sometimes carried on at a loss. At the time of his death he was recognized as one of the foremost iron masters in the country, his firm controlling the Trenton Iron Company and the New Jersey Iron and Steel Company. He organized the Cooper Union Institute (q.v.), and as the secretary of the board of trustees largely shaped and controlled its policy for a number of years. He also gave largely to the institution. He was first active in politics at the time of the reorganization of Tammany Hall after the overthrow of the Tweed Ring. He served in Congress 1874-78, and again 1880-86 and was always especially prominent in all matters pertaining to finance, advocating a low tariff and the gold standard. In 1876 he was chairman of the Democratic National Committee, and immediately after the election issued a proclamation to his party stating that Tilden had been elected; later he supported the policy of Tilden which resulted in the appointment of the Electoral Commission (q.v.). In 1886 he was nominated for mayor of New York by Tammany and other Democratic organizations and after a hard campaign won the election over Henry George and Theodore Roosevelt. As mayor he gave the city a most efficient administration, but his independent policy often antagonized the Tammany leaders, especially his strict enforcement of the excise law. He was not renominated by his party, and was defeated as a candidate on an independent ticket in 1888. While mayor he urged in one of his annual messages the need of improvement of the city's rapid transit, and advocated municipal ownership; though his suggestions were not heeded at the time, he continued his interest in the subject, and it was largely due to his efforts that recent improvements in that direction were undertaken; in recognition of his services the Chamber of Commerce presented him with a gold medal in 1901. In February 1903 a number of prominent citizens of New York set on foot a movement to raise a memorial fund of \$500,000 to be presented to Cooper Union as the "Abram S. Hewitt Endowment of the Cooper Union."

eters become naturalized, except in German, to which this measure seems as well adapted as to the Greek. Fischart attempted the German hexameter in the 16th century. In the middle of the 18th century it was used by Klopstock, Uz, and Kleist. Goethe's hexameters are very often as poor as their sense is beautiful. John Henry Voss improved the German hexameter by the excellent translation of Homer and his valuable 'Zeitmessung der deutschen Sprache' (Königsberg 1802). See PROSODY; VERSIFICATION.

**HEXAPLA.** See BIBLE, VERSIONS.

**HEXAPODA**, hēk-sāp'ō-dā, a group name for the six-footed arthropods, or true insects (*Insecta*), excluding spiders, myriapods and other forms often included in the term "insects."

**HEXATEUCH.** See PENTATEUCH.

**HEXOIC ACID**, an organic acid having the formula  $C_6H_{10}O_2$ , or  $C_6H_{11}COOH$ , and occurring in fats, in cheese, among the products of the butyric fermentation of sugar, and in the fruit of *Heracleum sphondylium* and in the flowers of *Satyrium hircinum*. It is best prepared by the fractional distillation of crude fermented butyric acid. It is an oily substance, very clear and mobile, solidifying at about 29° F., and boiling at 400° F. It has specific gravity of 0.95, and is oxidized by nitric acid to acetic and succinic acids. It is also known as "caproic acid," and its salts are sometimes called caproates, and sometimes hexoates.

**HEYSE**, hīzē, Paul, German poet and novelist: b. Berlin, 15 March 1830; d. April 1914. He studied classics in his native city, in 1852 traveled in Switzerland and Italy, and two years later he settled in Munich on the invitation of King Maximilian II of Bavaria, who granted him a pension. He lived mainly in Munich, devoted almost exclusively to literature. He was ennobled in 1910 and was awarded the Nobel prize for literature in 1911. His first work was 'Jungrunnen, Märchen eines fahrenden Schülers' (Tales of a Traveling Scholar) (1850); and to the same year belongs his tragedy 'Francesca da Rimini.' 'Die Brüder' (1852) and 'Urica' (1852), were narrative poems, and formed part of the volume entitled 'Hermen' (1854), later 'Novellen in Versen,' which did much to establish his reputation. Heyse's genius found its most perfect expression in his tales or novelettes (Novellen), and in this department of literature he holds almost a unique place among German writers. His work is almost throughout highly finished and artistic, and shows a rich imagination and great fertility in invention. His tales have been published in more than 20 collections, and a selection appeared in 1890 under the title 'Auswahl fürs Haus.' His early successes in narrative verse were followed by such works as 'Die Braut von Cyperin' (1856); 'Thekla' (1858); 'Rafael' (1863); 'Syritha' (1867); 'Der Salamander' (1879); 'Die Madonna im Olwald' (1879); 'Liebeszauber' (1889). His best plays are those of his third period, and some of them, especially 'Hans Lange' and 'Kolberg,' have been acted with great success. 'Mary of Magdala' was well received in America. Among them are 'Die Hochzeit auf dem Aventin' (1886); 'Gott schütze mich vor meinen Freunden' (1888); 'Hans Lange'

(1866); 'Kolberg' (1868); 'Die Weisheit Salomos' (1887); 'Weltuntergang' (1889); 'Die schlimmen Brüder' (1891); 'Wahrheit?' (1892); and 'Jungfer Justine' (1893). His larger novels, 'Kinder der Welt' (1873); 'Im Paradiese' (1875); 'Merlin' (1892); and 'Über allen Gipfeln' (1895), have met with great success. Among other works are 'Skizzenbuch' (1877); 'Verse aus Italien' (1880); 'Spruchbüchlein' (1885); 'Gedichte' (Poems, 5th ed., 1895); and 'Neue Gedichte und Jugendlieder' (1897). Consult Biese, A. H., 'Deutsche Literaturgeschichte' (Munich 1913); Brandes, Georg, 'Moderne Geister' (Frankfort 1887); Kraus, Otto, 'Paul Heyse's Novellen und Romane' (ib. 1888); Kummer, F., 'Deutsche Literaturgeschichte des 19. Jahrhunderts' (Dresden 1909); Petzet, E., 'Paul Heyse als Lyriker' (ib. 1913). See CHILDREN OF THE WORLD.

**HEYWARD**, hā'ward, Thomas, Jr., American patriot: b. Saint Luke's Parish, S. C., 1746; d. there, 6 March 1809. He was of much prominence in North Carolina during the Revolution, was a delegate to the Continental Congress 1775-78 and one of the signers of the Declaration of Independence. In later years he was a judge in his native State.

**HEYWOOD**, John, English dramatist of the first half of the 16th century. He was a paid musician at the court of Henry VIII, with whom he became a favorite on account of his skill in music. Heywood's dramatic works may be classed as interludes, standing between the miracle-plays and the drama proper. The earliest of them, 'A Merry Play between the Pardoner and the Frere, the Curate and Neybour Pratte,' was written before 1521. Another famous piece is 'The Four P's, an interlude in which figure a Palmer, a Pardoner, a Potycary, and a Pedlar.' His allegory of the 'Spider and the Fly' (1556) fully reveals Heywood's religious proclivities. By spiders, the Protestants are meant; by flies, the Catholics.

**HEYWOOD**, Thomas, English dramatist: b. Lincolnshire; d. c. 1650. He studied at Cambridge and appears to have been writing plays as early as 1596. Of all the old dramatists he was the most prolific. We learn from the preface to 'The English Traveller' that down to 1633 he had "had either an entire hand, or at the least a main finger," in the composition of 220 plays; and he continued for some years after that date to write for the stage. Twenty-four of Heywood's plays have been preserved. The best is 'A Woman kille with Kindnesse' (1607). His work is usually distinguished by naturalness and simplicity; but he wrote at the beginning of his career one absurdly grandiose play, 'The Foure Prentises of London' (1615), which was parodied by Beaumont in 'The Knight of the Burning Pestle.' 'The Rape of Lucrece' (1608) is chiefly noticeable for its songs; 'Love's Maistresse' (1636), dealing with the story of Cupid and Psyche, is fanciful and ingenious; and there is much tenderness in 'A Challenge for Beautie' (1636). 'The Captives, or the Lost Recovered,' an interesting play, acted in 1624, was first published in 1885.

**HEZEKIAH**, hēz-e-kī'a (*Hizkiyah*, generally *Hizkiyahu*, strength of Jehovah), the 12th

king of Judah. At 25 he succeeded Ahaz about 726 B.C. to 698 B.C. He had no sooner mounted the throne than he initiated a system of reform, on the injunctions of Isaiah, and broke up the idolatrous customs into which the people had fallen during the life of his father. He also endeavored to repair the injury done by national defeats and losses. He purged, repaired and reopened the temple with magnificent sacrifices and a splendid ceremonial. So extreme was his indignation against idolatry that he destroyed the brazen serpent which was said to be the one used by Moses in his miraculous healing of the Israelites. With patriotic zeal he assumed the aggressive against the Philistines, and not only rewon the cities lost by his father, but dispossessed them of most of their own. In the 14th year of Hezekiah's reign he had a dangerous illness, which threatened serious complications, and the kingdom was in a difficult crisis, for the king had no heir, Manasseh not being born till long afterward. The greater part of the Scripture records bearing on the reign of Hezekiah is occupied by the two invasions of Sennacherib. Several of the Psalms are supposed to allude to the discomfiture of Sennacherib, for example, xlviii, lxxvi. Hezekiah did not long survive this deliverance, dying after a reign of nearly 29 years. Among the many highly useful works executed by him, the aqueducts of Jerusalem are of especial importance.

**HIAWATHA**, hi-a-wá'ta or -tha, the hero of an American Indian legend known by this name among the Iroquois and among the other tribes. He is mentioned in various works on the aborigines, and in 1855 was immortalized in the poem, 'Hiawatha,' by Longfellow.

**HIAWATHA**, Kan., city, county-seat of Brown County, on the Saint Joseph and Grand Island and the Missouri Pacific railroads, about 70 miles northwest of Kansas City and 55 miles north of Topeka. It is situated in a rich agricultural region and has grain elevators, foundries and a flour mill. Its chief manufactures are flour, foundry products and agricultural implements. Its trade is principally in wheat, corn, fruit, livestock, flour and lumber. It has the Morrill Public Library and an academy in a Carnegie library building. The city owns and operates the waterworks and an electric-light plant. Another electric-light plant is owned by a private corporation. The commission form of government was adopted in 1914. Pop. 2,974.

**HIBBARD**, Freeborn Garretson, American clergyman: b. New Rochelle, N. Y., 22 Feb. 1811; d. 1895. He was the son of the Rev. Billy Hibbard, a clergyman of the Methodist Episcopal Church, well known for his eccentricity and his revivalist preaching. At the age of 18 the son entered the ministry and held various pastorates in New York State until 1856, when he became editor of the *Northern Christian Advocate*. Four years later he was chosen presiding elder of the Geneva district. His principal writings are 'Christian Baptism, its Subjects, and its Import, Mode, Efficacy and Relative Order' (New York 1845); 'Geography and History of Palestine' (1851); 'The Psalms, Chronologically Arranged' (1856); 'The Religion of Childhood, or Children in their Relation to Native Depravity, to the Atonement,

to the Family, and to the Church' (1864); 'Commentary on the Psalm' (1882); the Wheldon series of 'Commentaries on the Old Testament'; 'History of the late East Genesee Conference' (1887), and edited 'Sermons' (1869) and 'Works' (1872).

**HIBBARD**, George, American writer of short stories: b. Buffalo, N. Y., 1858. He was graduated at Harvard in 1880 and was admitted to the bar in 1886. He at one time devoted much time to painting and exhibited at the National Academy of Design in 1887. He has also illustrated his own stories. He has written 'Iduna, and Other Stories' (1891); 'Nowadays' (1893); 'The Governor' (1892), etc. His work is marked by finished style and much insight into character.

**HIBBEN**, John Grier, American university president: b. Peoria, Ill., 19 April 1861. He was graduated at Princeton in 1882. He also studied at Princeton Theological Seminary and at the University of Berlin. He was ordained to the Presbyterian ministry in 1887 and was thereafter pastor at Chambersburg, Pa., until 1891. He then took up the teaching of logic at Princeton, where he was professor from 1897 until 1912. In the latter year he was chosen president of the university. He has published 'Inductive Logic' (1896); 'The Problems of Philosophy' (1898); 'Hegel's Logic' (1902); 'Deductive Logic' (1905); 'The Philosophy of the Enlightenment' (1909); 'A Defence of Prejudice, and other Essays' (1911); 'The Higher Patriotism' (1915), and edited 'Epochs of Philosophy' by authors in the United States and Great Britain (12 vols., 1905).

**HIBERNATION**, the winter sleep of warm-blooded animals. Under this term is also included the torpidity of frogs, toads, reptiles, certain fishes, insects, the horseshoe crab and snails, which is mainly due to prolonged cold. Among the mammals which hibernate are the bear, dormouse, badger, bat and hamster; a number are incomplete hibernators, as the prairie dog, while squirrels fall into a winter sleep during the coldest weather, but may be seen in warm spells in winter. The males of the black and white bear are more or less active during the winter months, while the females are hibernating. The bears and some others, like the skunk, may in the southern portion of their range not hibernate at all. Neither do the hibernators all retire to their holes or dens or under fallen trees at the same date, but the time varies with the temperature, and different degrees of torpidity are exhibited. It also appears that continuous hibernators do not lay in a supply of food, as do intermittent ones like squirrels; yet the Arctic fox is said to store up a supply of dead lemmings, ermines, geese, etc.

Hibernation is like sleep and has been compared with trance. During this period the animal functions are nearly suspended, the excretions are greatly diminished and in the bears the rectum is closed by a resinous plug, called by the Swedes "tappen" and by American hunters "seal." The animal heat is lowered to that or nearly that of the air, the action of the heart being slight; there is an increased muscular irritability and the animal loses from 30 to 40 per cent of weight.

Snakes, lizards, frogs, salamanders and certain fishes hibernate, burying themselves in the earth below the reach of frost, the aquatic forms digging into the mud at the bottom of streams. The few fishes which are known to lie dormant and take no food sink into the mud of streams or of the sea. The horseshoe crab burrows in the mud beyond the reach of oyster dredges in November, remaining in deep water until the middle of spring. Most insects hibernate in the larva or pupa state, a few when adult, as certain moths, butterflies and beetles. Caterpillars hide under moss, the bark of trees, etc., but they freeze solid and may be broken into two pieces like an icicle; they gradually thaw out in spring, but when the changes are sudden, great numbers die. Spiders and snails hibernate under stones, moss, etc., while slugs bury themselves in the mud, and mussels and other mollusks living in streams and lakes descend into the mud.

**Estivation.**—In the tropics there is a corresponding period of torpor during the hot, dry season, when food is scarce and vegetation is taking a rest. Alligators, snakes, certain mammals, as the taurec, insects and land-snails become dormant, the last-named closing the mouth of their shells with a membrane-like substance (epiphragm), leaving a small opening in it for the admission of air in breathing, yet after a prolonged shower they become active. Thus it is seen that heat, dryness and the lack of food operate in causing estivation, while cold and famine appear to be the cause of hibernation; though all species are by no means affected alike. Among the lowest organisms the dormant vitality of resting spores, seeds of plants, winter eggs of sponges, of polyzoa, and the dormancy of certain adult forms, are connected with a lowered temperature, and a resting period is necessary both in plants and animals. The simultaneous shedding of the leaves of deciduous trees is certainly connected with if not caused by cold, and it is undoubtedly true that changes of temperature as well as lack of food, and the need of rest, cause hibernation and summer dormancy.

**HIBERNIA**, the ancient name applied to Ireland (q.v.).

**HIBERNIANS**, The Ancient Order of. This order traces its origin to those ancient orders into which the people of Ireland were divided for many centuries before the coming of Saint Patrick.

**The Military Orders.**—The first of the orders was the military order of the Golden Collar, instituted by Munemen, king of all Ireland about 900 B.C. The custom of dividing society into orders seems to have been a Milesian innovation, as the Milesian kings instituted in succeeding centuries the bardic order, to sing the songs of war and peace; the order of druids, to offer sacrifices and perform all priestly offices; the order of brehens, to arrange and administer the laws and the *ellamhs*, to preserve genealogies and the history of the people. The military orders made the most legible impression on the history of ancient Ireland of any of the divisions of the inhabitants. It was the military orders which were marshalled for the defense of the island when menaced by the Romans. In all foreign

wars they provided the soldiers who crossed the Irish sea to fight the Picts, the sea-roving Danes or the Saxons, or even the Celtic inhabitants of ancient Britain.

It was these military orders which accompanied Daithi, king of all Ireland, in his invasion of Gaul in 420 A.D., when he led the van of the immense multitude of warriors of all the northern nations which drove back the Roman power beyond the Alps. Niall of the Nine Hostages led the military orders in the forays to Britain and Gaul which are so well authenticated because it was on one of them that he brought back the boy Patrick, who afterward Christianized the country. While the Order of the Golden Collar was undoubtedly the first of the national military orders, yet the provincial orders of Munster, Connaught, Ulster and Leinster achieved immense celebrity because of their warlike deeds. The fame of these provincial orders was recounted in poems and songs by bards and ollamh's, and many of the loftiest sentiments ever uttered occur in the recitals of Ossian when recounting the martial prowess of the heroes of these orders. The duels of Finn MacCool and Loda are told in an imagery equal to that of Homer in the immortal narration of Achilles and the siege of Troy. Other old manuscripts tell of Queen Maeve, who led the Knights of Connaught, the Clanna Morna; of the Knights of the Red Branch of Ulster, of the Clanna Deagha of Munster, and of the Feni of Leinster. These orders had rules and vows, and the claim has been made that in Ireland will be found the first trace of standing armies and of the institution of chivalry.

**Influence in Irish History.**—When the people became Christian the military orders seemed to have lost somewhat the old influence. But with the revival of the foreign wars and the first incursions of the Danes, the ancient orders once more took the leadership in society. In the 6th century the knightly orders were consecrated to the service of the Church, receiving the cross as their badge as the defenders of religion. This fact is chronicled in Ashmead's 'Ecclesiastical History of the Irish Church.' Yet even the christianizing of the island did not weaken the strength of the traditions which had raised the old champions of the Knights of the Red Branch, the Feni, the Knights of Munster and Connaught with almost the attributes of deities. The characteristic of all primitive peoples is to worship mighty men, and the feats of Loda, Finn MacCool, Fergus Mac-Roy, and the other leaders were told through the generations, and even to this day are the basis of many of the habits of the Irish people.

The written rules of the ancient orders are believed to have antedated any system of organized military knighthood among mankind. These rules required that the candidate should be of good moral character, in perfect physical health, of an uncorrupted lineage and be able to pass a severe test of body and mind. He entered one of the military schools of the knights, where his education was directed for three years by the most learned teachers of literature and by the most celebrated masters of arms. The Abbe MacGeehegan, Mooney and other historians quote these rules from the original Gaelic manuscripts as evidence of the remarkable attention given to the art of war in pagan

Ireland. It is recorded in numerous tales, songs and genealogies that almost all the kings, bards, sages and statesmen were on the rolls of the ancient orders of knighthood. In the long list it is noticeable that certain families maintained an hereditary leadership in their respective orders. This peculiar fact is not unnatural among a people whose regard for genealogy surpassed that of other nations. Among these families no line of descent is more renowned, nor marked with more legible clearness, than the family of Roderick the Great, which originated with the great champions Conall Kearnach and Lugadh (Loda), whose mighty swords were in the fables and mythology of the pagan Irish analogous to the hammer of Thor and the fury of Ægir among the Norse peoples. These warriors were the founders of the O'Moore family, who were regarded by the Irish people as the hereditary marshals of the ancient orders even after the coming of the Normans. It is upon the traditions which connect this celebrated family with the ancient orders that the descent of the present Ancient Order of Hibernians from the mists of the pre-Christian past through the Middle Ages to modern times is so distinctly defined. Again and again this family appears in history, and almost invariably they are accompanied by a military band easily identified as the successors of the ancient orders. Thus at the siege of Dublin in the 12th century by Roderick O'Connor, the last native king of all Ireland, there was a large body of the Knights of Connaught, degenerate, perhaps, in soldierly skill, but still preserving some trace of individuality. In the 13th, 14th and 15th centuries the Knights of the Red Branch appear in old chronicles, and in the wars against the English during the reign of Queen Elizabeth Rory Oge O'Moore, and his son Owen, carried on the martial fame of their ancestors, the captains of the ancient orders.

In the 17th century the ancient orders were endowed with a national character through their revival and reorganization in the Catholic Confederation of Kilkenny by the popular hero, Rory O'Moore, a nephew of Rory Oge. This Confederation, which attempted to establish the independence of Ireland, conducted a national war against the English for 10 years. Its armies, under Owen Roe O'Neil, Bishop Heber MacMahon and Preston, took the vow of the Confederation, which was substantially the same as the vow of the ancient orders and almost identical with the obligation of the Ancient Order of Hibernians to-day. A nephew of Rory O'Moore, Sir Patrick Sarsfield, was the chief figure in the war against the English under William of Orange, and the Rapparees, an irregular organization of scouts and light cavalry, carried on a desultory warfare until the early years of the 18th century. The Rapparees had signs, passwords and a somewhat loose system of organization which was adopted by their successors, the Whiteboys of the South, who endeavored to redress many grievances regarding land tenure through both civil and forcible means until they were succeeded by the various agrarian societies which expressed the protest of the peasants against intolerable conditions all through the latter part of the 18th and the early part of the 19th centuries. In the North in the latter part of

the 18th century the Defenders were organized to resist the encroachments of the Orangemen, with whom skirmishes and battles were frequent. During the Revolution of 1798 the Defenders aided the Irish patriots, and in the United Irish movement they loyally supported Wolfe Tone and the gifted band of young men who sought to establish an Irish Republic.

**History in America.**—The Defenders and the Whiteboys had a system of intercourse and identification during the troubled times from 1790 to about 1820, and this connection resulted in the Ribbon Confederation, which was both Catholic and agrarian. When the Ribbonmen were legally suppressed and the emigration to England assumed considerable proportions, some Irishmen in Liverpool, to avoid the suspicion of the authorities and for the purpose of aiding their fellow-countrymen, formed the Saint Patrick's Funeral Benefit Society. The name was changed several times, and Saint Patrick's Fraternal Society, Saint Patrick's Friendly Association, etc., are stated to have been the appellations. Branches of the Saint Patrick's Funeral Benefit Society were established in the large industrial cities of England and Scotland, and in 1836 the society crossed the Atlantic. In May of that year a written charter was received in New York city. The organization was established simultaneously in New York city and in the anthracite coal regions of Pennsylvania, where the emigration of Irishmen had been large from the coal-mining counties of England. The headquarters was for a few years in Schuylkill County, Pennsylvania, but greater convenience in transacting both domestic and foreign business resulted in their removal to New York city. In 1851 a charter was granted to the New York Divisions under the name of "The Ancient Order of Hibernians in America." National conventions were held in New York city until 1878 annually, and all the national officers were chosen from New York and vicinity. Since that year national conventions have been held in many other cities, and since 1884 have been held biennially. In 1876 there were bitter labor disturbances in the anthracite coal regions, and in these strikes and feuds a secret organization called the "Molly Maguires" was given an unenviable notoriety through assaults committed by its members upon mine bosses. While the spirit of the ancient order and its precursors has ever been animated with the fraternalism of the trade union, yet the attempt to cast odium upon the ancient order because of the violence of the "Molly Maguires" was peculiarly unjust, as the members of this secret organization were, except in a very few cases, not connected with the Ancient Order of Hibernians. The national convention of the ancient order in 1877 denounced the "Molly Maguires" and disclaimed any sympathy with lawlessness on any pretext.

During all its history in America the Ancient Order of Hibernians accorded most valuable support to every Irish national movement. The Divisions of the A. O. H. were the recruiting field for the Fenian Society, for various associations which forwarded relief to the famine sufferers and to the victims of landlordism in Ireland. Michael Davitt declared that without the co-operation of the Ancient Order the Land League of America would have

failed in its purpose. Almost all the famous Americans of Irish birth or blood have been members of the order, and among these were Gen. Thomas Francis Meagher, Col. Michael Doheny, Gen. Michael Corcoran and Col. John O'Mahony.

**Statistics.**—In 1916 the organization had divisions in 50 States and provinces. Its membership, comprising about 150,000 men and 70,000 women, includes residents of the United States, Canada, Alaska and Hawaii. It has aided multitudes of emigrants to obtain the means of livelihood, and for many years co-operated with the associations which aided Irish settlers to found homes in the West. The A. O. H. had, in 1916, assets of more than \$2,500,000, and its annual payments to charitable purposes, to education and religion, exceed \$2,600,000 annually. For sick and death benefits it pays annually more than \$1,100,000, and during its existence in America has donated nearly \$21,000,000 to works of beneficence. Among the most useful of its gifts is the \$50,000 endowment of the chair of Gaelic and Irish History in the Catholic University, and its contribution of \$40,000 to the Catholic Church Extension Fund and \$40,000 to the San Francisco earthquake sufferers. The Ladies' Auxiliary was founded at the Omaha National Convention in 1894, and has increased until it numbered in 1916 70,000 members, inspired by devotion to home, religion and patriotism, with ideals of noble womanhood, and encouraging education, morality and social uplift with increasing vigor and efficiency. Among the gifts of the Ladies' Auxiliary is its endowment of the chair of Irish Literature in Trinity College, with \$10,000.

JOHN O'DEA,

Secretary, Ancient Order of Hibernians in America.

**HIBISCUS**, hi-bis-küs, a genus of plants of the mallow family (q.v.), distinguished by a calyx surrounded by an involucre and by a fruit of three or more many-seeded carpels united into a capsule. The species are numerous, mostly natives of warm climates, some trees or shrubs, but most of them large herbaceous plants. Many bear very beautiful flowers, much used in the South Sea Islands in wreaths, etc., for personal adornment. The rose-of-Sharon or Althaea (*Hibiscus syriacus*), a native of Syria, has long been in cultivation as an ornamental shrub. Several other species have become favorite hothouse plants. The rose-mallow (*H. moscheutos*) is among the most striking and beautiful of North American wild flowers, conspicuous among the reeds of marshes in late summer with its pink blossoms. The

characteristic mucilaginous and fibrous properties of the Malvaceæ are very strongly developed in this tribe. The fruit of *H. esculentus*, called 'gumbo, okra, etc., is in general use for food in the East and West Indies and the United States. It is an annual plant, with a soft herbaceous stem, three to five feet high, crenate leaves, axillary sulphur-colored flowers, and pyramidal, somewhat podlike capsules. The fruit is used in an unripe state, and is generally much esteemed, but is disliked by some on account of its viscosity. It enters as an important ingredient into the pepper-pot of the West Indies, or is used in soups. It also produces a coarse fibre. The bark of *H. tiliaceus*, a tree 20 feet high, with a very thick bole, abounds in mucilage. This is one of the most abundant trees of the South Sea Islands; and the wood, being light, tough and durable, is used for many purposes. From its fibre the Tahitians manufacture matting. Many other species yield fibres, some coarse, some fine and beautiful, which are used in different countries; but the most important in this respect is *H. cannabinus*, the Deccan hemp of western India (see HEMP). *H. sabdariffa* is very generally cultivated in warm countries, on account of its calyx, which, as the fruit ripens, becomes fleshy, and acquires a very pleasant acidity. It is much used for making tarts and jelly, and a decoction of it, sweetened and fermented, affords a refreshing beverage, well known in the West Indies as sorrel cool drink, the plant being called red sorrel; and in Madras it is used for similar purposes, and is named roselle or rouselle. Musk-seed (*H. abelmoschus*) is cultivated for its seeds, which have a fragrance between that of musk and that of amber. They are much used by perfumers, and are called *graines d'ambrette*. In Egypt and Arabia they are mixed with coffee, and stimulant and stomachic qualities are ascribed to them. The petals of *H. rosa-sinensis* possess astringent properties, and they are also used by the Chinese to stain their eyebrows and their shoes black.

**HICCUP**, or **HICCOUGH**, is a spasmodic affection of the diaphragm caused sympathetically by the irritation of structures supplied by nerves communicating with the phrenic nerve. Though generally a slight and passing inconvenience, its occurrence in the last stages of acute disease is a grave symptom, indicating general collapse of the nervous system. It may last only a few minutes or may continue for weeks without being capable of being subdued by any kind of treatment. Fasting or a stimulant suddenly swallowed is one of the commonest causes of hiccup, which generally passes off of its own accord. Nothing removes it more effectually than some active emotion of the mind suddenly excited. Hiccup is a common attendant of dyspepsia, and is often observed in abdominal diseases when terminating fatally, and is especially a symptom in some forms of hernia. Many remedies have been suggested for it, such as holding the breath as long as possible, tying a belt tightly round the waist and the frequent swallowing of small rounded pieces of ice.

**HICHBORN**, Philip, American naval officer; b. Charlestown, Mass., 1839; d. 1 May 1910. In 1869 he entered the United States navy;

in 1875 was made constructor, and in 1881 a member of the naval advisory board. From 1893 until his retirement 4 March 1901, he was chief constructor, and as such was identified with the reorganization and enlargement of the new United States navy. He attained rear-admiral's rank, and published a valuable report on foreign dockyards.

**HICHENS, Robert Smythe**, English journalist and novelist: b. Speldhurst, Kent, 14 Nov. 1864. He was educated at Clifton College and the Royal College of Music, and after a short career as a musician turned to journalism. In 1893 he visited Egypt for his health, and there conceived the idea which materialized in the 'Imaginative Man' (1895); 'The Green Carnation' (1894), however, epigrammatic and keenly satirical in tone, first brought him into public notice. Later works of his are 'After To-Morrow' (1895); 'New Love' (1895); 'The Folly of Eustace and Other Stories' (1896); 'The Londoners' (1897); 'Byeways' (1897); 'The Prophet of Berkeley Square' (1901); 'The Woman with the Fan' (1904); 'The Garden of Allah' (1905); 'The Call of the Blood' (1906); 'Bella Donna' (1909) and successfully dramatized; 'Barbary Sheep' (1909); 'The Dwellers on the Threshold' (1911); 'The Way of Ambition' (1913); 'The Near East' (1913); 'In the Wilderness' (1917).

**HICKEY PLOT** (1776), a conspiracy of the British officials and Loyalists of New York to end the Revolutionary War by the murder or capture of its leaders and the seizure or destruction of its supplies. The heads and probable devisers of it were Governor Tryon, who had fled from the city but remained on a man-of-war in the harbor, and sent supplies of money for bribery, etc.; and Mayor Mathews. The scheme was to kill or seize the patriot generals, and at all events to deliver Washington alive to Sir William Howe, blow up the magazine and secure the passes to the city. Several hundred New York Loyalists were involved. Two of Washington's guard were bought, but a third pretended to accede and revealed the plot. Mathews, a goldsmith named Forbes and a dozen others were arrested and sent to Connecticut, Mathews carrying the mayoralty flag with him. Thomas Hickey, one of the treacherous guards, was hanged in New York, 27 June 1776, the first military execution in the American army.

**HICKOK, Laurens Perseus**, American metaphysician: b. Danbury, Conn., 29 Dec. 1798; d. Amherst, Mass., 6 May 1888. He was graduated at Union College in 1820, was licensed as a preacher in 1822 and was pastor successively at Newton and Litchfield, Conn., till in 1836 he was elected professor of theology in the Western Reserve College, Ohio, where he remained eight years. He was professor in the Auburn Theological Seminary 1844-52, and then became professor of mental and moral science, and vice-president in Union College. In 1866 he was formally made president of that institution of which, however, he had been in sole charge for eight years previous. His publications include among other works 'Rational Psychology' (1848); 'Moral Science' (1853); 'Empirical Psychology, or the Human Mind as Given in Consciousness' (1854); 'Rational

Cosmology' (New York 1858), in which he attempts to demonstrate a priori the laws of the universe; 'Creator and Creation' (1872); 'Humanity Immortal' (1872); 'Logic of Reason' (1875).

**HICKORY** (formerly **HICKORY TAVERN**), N. C., town in Catawba County, on the Southern and the Carolina and Northwestern railways, near the headwaters of the Catawba River, about 43 miles northwest of Charlotte and 50 miles west of Salisbury. The chief manufactures are flour, foundry products, wagons, lumber, air pumps, hosiery, gloves, carriages, overalls, harness, leather, boots and shoes. It has several private educational institutions: Claremont Female College, opened in 1880; Saint Paul's Lutheran Seminary; Lenoir College, opened in 1891, under the auspices of the Lutheran Church. The commission form of government was adopted in 1913. Pop. 3,716.

**HICKORY**, a group of trees of the walnut, forming the genus *Hicoria*, and exclusively North American. They are large strong trees, 60 to 80 feet high, with close shaggy bark and large pinnately divided leaves, pistillate flowers on a terminal peduncle and staminate flowers in long, drooping aments. The fruit is a thick-shelled nut in a tough green husk. There are about 10 species, all natives of the eastern United States and Canada except a Mexican species. The best known of these are the following: Shag-bark, shell-bark or white hickory (*H. ovata*), leaflets 5 to 7, whose bark scales off in great plates curving outward at both ends, and whose nuts are sweeter and better than those of any other species; the northerly "big shag-bark" or king-nut (*H. laciniosa*), leaflets 7 to 9, with narrower "shags," darker wood and big nuts in husks often three inches long; white-heart, or fragrant hickory, or mocker-nut (*H. alba*), noted for the hardness and toughness of its wood; the pignut or broom hickory (*H. glabra*), leaflets 3 to 7, which represents a group of moisture-loving species whose nuts are thin-husked, elongated and bitter and astringent to the taste.

**Uses of Hickory-wood.**—As timber this wood is of great value for articles requiring great strength with lightness and elasticity; but it is liable to quick decay when exposed to the atmosphere, and for this reason is little used in buildings, and should be painted. It was the most serviceable of all woods to the aboriginal Americans; and the axe, pick and tool handles made from it are exported to all parts of the world. It enters into the manufacture of rakes, cradles and many forms of farm-implements; is largely used in carriage-making, especially for thills, shafts and the parts of racing-sulkies, the lighter American vehicles owing their acknowledged pre-eminence largely to the availability of this wood. The wood of the various species differs in quality, however; that of the pecan is hard and brittle, and the water hickory soft and comparatively light. The wood of the others is exceedingly strong and tenacious, and weighs about 50 pounds to the cubic foot.

**Insect Pests.**—A. S. Packard recorded in

1890 170 species of insects attacking the hickories; and Chittenden declared in 1903 that this number could be easily doubled. Hickory appears to be an especial favorite of borers. Prominent among them are the painted hickory-borer, one of the long-horned beetles (*Cyllene picta*); the hickory twig-girdler (*Oncideres cingulata*), twig-pruner (*Elaphidion villosum*), and hickory-bark beetle (*Scolytus quadrispinosus*). This bark-borer is the most important economic species, and during recent years has been the cause of considerable injury in hickory forests in the State of New York. Consult Packard, 'Insects Injurious to Forest and Shade Trees,' published in 1888 as the fifth report of the United States Entomological Commission.

**HICKS, Elias**, American preacher of the Society of Friends: b. Hempstead, L. I., 19 March 1748; d. Jericho, L. I., 27 Feb. 1830. While a youth he manifested a talent for public speaking, and at 27 was a well-known preacher. For many years he labored zealously in advancing the generally accepted doctrines of the Friends; but having as he believed discovered errors in these tenets, put forth views of his own which he defended with energy and ability. To advance these views he traveled extensively in the United States and in the British provinces, attracting large congregations by his oratory. The result was a schism in the body of Friends, those adhering to the old doctrines being specially termed orthodox, while the followers of Hicks were called after him Hicksites. (See FRIENDS). He was an active abolitionist and with others was instrumental in inducing the State of New York to pass an act which, on 4 July 1827, liberated all slaves within its borders. He was the author of 'Sermons' (1828); 'Observations on Slavery' (1811); 'The Letters of Elias Hicks' (1834); etc. Consult 'Elias Hicks, Journal of his Life and Labors' (1828).

**HICKS, Thomas**, American painter: b. Newton, Pa., 18 Oct. 1823; d. 1890. He studied at the Philadelphia Academy, at the National Academy, New York, and afterward in Paris under Couture. Settling in New York he became one of the favorite portrait painters of his day. His pictures in the rooms of the New York Historical Society form an interesting gallery of historic figures, executed with more than ordinary artistic skill.

**HICKS, Thomas Holliday**, American politician: b. Dorchester County, Md., 2 Sept. 1798; d. Washington, D. C., 13 Feb. 1865. After successively occupying the positions of sheriff, member of the State legislature, member of the State electoral college and member of the governor's council, he was in 1858 elected governor of the State. When war was threatened between North and South, although sympathizing with the South and condemning the North's attitude on the slavery question, he sided with the party of neutrality in Maryland and opposed the secession of that State. When there were rumors of a plot formed by 6,000 men of his State to prevent Lincoln's inauguration and seize the city of Washington he suspended the writ of habeas corpus, and planned

the arrest of suspected persons. He was the only prominent State official who stood by the Federal government, and at the expiration of his term as governor the new legislature passed resolutions thanking him for having saved the State from joining the Confederates. In 1862 he was appointed to the Senate of the United States and served in it till his death.

**HICKS-BEACH, Sir Michael Edward**, first Viscount St. Aldwyn, English statesman: b. London 1837; d. 30 April 1916. He was educated at Eton and Oxford, entered Parliament in 1864, and was Chief Secretary for Ireland in 1874-78, 1886-87, and Secretary of State for the Colonies in 1878-80. In 1885-86 and 1895-1902 he was Chancellor of the Exchequer and leader of the Conservative party in the House of Commons. He was president of the Board of Trade from 1888 to 1892. On the fall of the Gladstone ministry in 1895 he again was Chancellor of the Exchequer 1895-1902. On Lord Salisbury's retirement from public life he also left the government. In the fiscal controversy raised by Chamberlain's tariff reform proposals he warmly defended the established free trade policy; but his loyalty to Mr. Balfour, the new Premier, was shown by his successful efforts to prevent the immediate snapping of party ties on the part of the free-trade Unionists.

**HICKSON, Sydney John**, English zoologist: b. London, 25 June 1859. He was educated at Cambridge and has been professor of zoology at Owens College, Manchester, England, from 1894. He has published 'A Naturalist in North Celebes' (1889); 'The Fauna of the Deep Seas' (1894); 'The Story of Life in the Seas' (1898).

**HIDALGO Y COSTILLA, Miguel**, mē-gēl' ē-dāl'gō ē kōs-tēl'yā, Mexican revolutionist, first leader in the Mexican war of independence: b. state of Guanajuato, 8 May 1753; shot in Chihuahua, Mexico, 27 July 1811. He was a priest, and in earlier life was simply a man of great acquirements, anxious to promote industry in Mexico, and noted for conscientious fulfilment of his ecclesiastical functions. He is said to have introduced the silkworm into Mexico, and did much to promote the culture of the vine. This conflicted with the policy of the Spanish government, which was to discourage all manufactures or agriculture which could interfere with the revenue, and the vines Hidalgo had planted were destroyed. This drove him to rebellion. Possessing much influence among the Indians, he formed the plan of a general insurrection, which was to take place 1 Nov. 1810; but the plot having been disclosed by one of the conspirators, some of his party were arrested, and he was obliged to precipitate his movements. On 10 September having been joined by three officers of the garrison of Guanajuato, he raised the standard of revolt. His eloquence had a remarkable effect on the multitude who heard him, and when after his oration he unfurled a rude copy of the picture of Our Lady of Guadalupe, the patroness of Mexico, the war assumed the character of a crusade. On 29 September with an army of 20,000 men, mostly Indians, he captured Guanajuato. He took Valladolid and several small

places, and soon after was proclaimed generalissimo of the Mexican army, and advanced against Mexico; but finding himself almost without ammunition, was obliged to retreat. During this war the government party declared that the ordinary rules of warfare need not be observed as regarded the insurgents, while the latter retaliated with the most horrible atrocities. On one occasion Hidalgo is said to have massacred 700 prisoners because they were Europeans. After several defeats the insurgents were left at Saltillo under charge of Rayon, while Hidalgo and others went to the United States to obtain arms and military aid. On their way they were captured by a former friend, and finally shot in Chihuahua. He was after his death regarded as a saint by the people, and within a few years the place of his execution was shown to travelers as a holy spot. The town of Goliad, Tex., was named in his honor, the H, as silent in pronunciation, being omitted and the other letters rearranged. At the founding of the town the name of Hidalgo was still proscribed by the Spanish rulers and the transposition of the letters of his name was made in order to avert the attention of the authorities.

**HIDDENITE**, a yellowish-green or emerald-green, transparent variety of spodumene, discovered by W. E. Hidden, in 1880, in Alexander County, N. C. The emerald-green varieties have been used as gems. They resemble the emerald, but show a greater wealth of color on account of their pleochroism.

**HIDES AND LEATHER.** See **LEATHER**; **TANNING**.

**HIERAPOLIS**, hi-er-öp'ô-liz, Phrygia, an ancient city on the Churuk Su, about six miles north of Laodicea. Situated on a high elevation, it was noted chiefly as a religious centre. Here were sulphur springs and a deep cavity called the Plutonium or Charonium, which exuded a vapor considered poisonous to laity. Hierapolis was the seat of the mysteries of the Phrygian goddess Leto, the native goddess of nature, corresponding to Cybele. It is also renowned as the birthplace of Epictetus. Excavations on the site have uncovered ruins of tombs, a theatre, houses and a remarkable bath. Consult Ainsworth, W. F., 'Personal Narrative of the Euphrates Expedition' (1888).

**HIERAPOLIS**, Syria, an ancient town, also known as Bambyce (Gk.) and Mabog (Syrian), situated about 15 miles southwest of the point where the Sajur and the Euphrates meet. It first becomes known as an important station during the time of the Seleucids, and as a seat of the worship of Atargatis (q.v.), described by Lucian in his 'De Dea Syria.' A gorgeously decorated temple housed the shrine. Crassus carried off its treasures in 53 B.C., but under Diocletian it was restored and became the capital of the province of Commagene or Euphratensis. It lost prestige under Justinian, was long a centre of the struggle among the Arabs, Turks and Byzantines and was many times fought for by the Crusaders. It fell into the hands of Saladin in the 12th century, and under the Mongols fell into complete ruin. Arab walls and ruins of the old temple still survive. The Greek name Bambyce has been

preserved in connection with a dress goods manufactured there through the Roman *Bombycina vestis*, in English "Bombazine." Consult Ramsay, W. M., 'Cities and Bishoprics of Phrygia' (Vol. I, 1895).

**HIERARCHY**, hi'ê-râr-ki (From Gr. *hieros*, sacred, and *arche*, government), sacred government or "the administration of sacred things," first used by the pseudo-Dionysius in the 5th century in his work on the Celestial and Ecclesiastical Hierarchies. It is now generally used to signify the body of officials in the Church organically graduated in their ranks and orders from the supreme head to those in the most subordinate position. In the Roman Catholic Church a threefold distinction is recognized: (1) A hierarchy of divine right, which embraces, under the primacy of the popes, bishops, priests and deacons. This hierarchy is held by the Church to be of divine institution. (2) A hierarchy by ecclesiastical right, consisting of the Roman pontiff and the three original divine orders and of the five minor orders (two in the East), subdeacons, acolytes, exorcists, lectors and porters (*ostiarii*). (3) A hierarchy of jurisdiction, which includes all the judicial and administrative authorities, ordinary and delegated, charged with the maintenance of the faith among Christians, its union, its discipline and its general care and supervision. All its powers proceed from the Pope as primate, either expressly or by implication. In this category are ranked cardinals, patriarchs, exarchs, metropolitans and archbishops, and as deriving their powers from these, archpriests, archdeacons, rural-deans, vicars-general, etc. The Anglican Church also recognizes a hierarchical rank in its body, comprising bishops, priests and deacons. The other Protestant bodies practically reject hierarchical government.

**HIERO I**, hi'ê-rô, king of Syracuse in Sicily: d. Catania 467 B.C. He was brother and successor of Gelon. Hiero's reign, though less glorious than the preceding, was marked by a peculiar splendor on account of his generous encouragement of learning. Though some blemishes tarnish the first years of Hiero's reign, he compensated for his first faults by the noble actions which signalized the remainder of his life. A long sickness was the main cause of this alteration. Since he could no longer occupy himself with the cares of royalty, he collected around him a society of learned men, and thus becoming acquainted with the pleasures of learning, he never afterward ceased to value it. His court became the rendezvous of the most distinguished men of his time. The names of Simonides and Pindar appear among those of his most constant companions, and when Æschylus left Greece, he betook himself to Hiero, to close his days in his kingdom. He was several times victor in the Grecian games.

**HIERO II**, king of Syracuse: b. before 306 B.C.; d. 216 B.C. He was the son of Hierocles, a noble Syracusan, who claimed a descent from the family of Gelon. During Hiero's reign began the First Punic War, and he was able, by his adroitness, to preserve the friendship of both Romans and Carthaginians. The glory of Hiero and the prosperity of Syracuse culminated in the period which intervened between the First Punic War and the second; for in that season of peace Hiero enacted wise laws and

was devoted to the happiness of his subjects. His encouragement of agricultural pursuits enriched him and doubled the revenues of the state. He left the crown to his grandson Hieronymus.

**HIEROGLYPHICS.** Hieroglyphics ("sacred carvings") is the term which the Greeks applied to the monumental writing of the ancient Egyptians. It fairly interprets the Egyptian *mdw-ntr*, "speech of the god," though with a different connotation; for to the Egyptian of about 3500 B.C., the date of the earliest surviving hieroglyphs, *written* speech presumably was so marvelous that it seemed necessarily of divine origin, while the Greek who compounded our term 3,000 years later was distinguishing rather between the form of writing which he saw carved on tomb and temple walls and the forms then in use for pen-and-ink documents. The temple inscriptions of that later age were, as we shall see, an artificial product, a sealed book not only to the Greek but to his Egyptian contemporary; and this thought of mystery survives in our common use of the word "hieroglyphs" for any (to us) unintelligible signs. In the field of science the term has been extended beyond the Egyptian which we shall consider here to other systems of picture-writing such as the Hittite in ancient Asia Minor and the Mayan of Yucatan.

**Nature.**—Marks of ownership, messages, memoranda of taxes, accounts and notable personal achievements—all these call for a means of record. So identification marks are scratched on pottery jars, and royal votive offerings of carved stone commemorate their donor's conquests. For such purposes the Egyptian drew upon his environment. Men and women in various expressive attitudes, parts of the body, creatures of the animal world, objects of earth and sky, clothing, tools and weapons are among the fundamentals which could be directly illustrated. In Fig. 1 (from a votive slate palette of 3400 B.C. or earlier)

FIG. 1.

the king, represented by his symbol the falcon, holds in one claw a rope passed through the nose of a human head. The latter grows out of the long, narrow sign which to the native of the long, narrow Nile Valley represented "land." From the "land"-sign sprout six lotus leaves, such as occurred by thousands in the Delta marshes. The composite, thus resolved, indicates that the king has carried off from a hostile land 6,000 human captives. Such symbolism is, of course, not true writing; it is merely the expression of an *idea*, which different readers might phrase differently. But below the

"land"-sign appears a harpoon, followed by a rectangle crossed with wavy lines. The name of the foreign land, then, is similar to the Egyptian name of this harpoon, *wa* (really *w'*; see below); and the framed "water"-lines indicate that it is a lake region. The use of a picture of one object to stand for another concept of similar sound, as the harpoon here represents this geographic name, means that the picture in question has become so associated with one particular word expressive of its idea, that the sound of that word has finally attached itself to the picture. The latter thus acquires *phonetic* value. The taking of this step made it possible to write *abstract* terms as well as the concrete ones which alone could be directly pictured. Word-signs in transferred as well as original meanings resulted, and some pictures attained a wider phonetic usefulness as elements in the writing of longer words. The final step soon followed: illustrations of certain objects whose names contained only one prominent consonant came to stand regularly for single letters, forming the world's earliest alphabet. In contrast with the phonetic signs (word-, consonant group and alphabetic) as a whole are the signs which are not to be read but serve simply as guides to the sense. Of these so-called *determinatives* the "lake" above may be an example.

When we recall the strangeness of Chaucer to modern ears and how we treat Anglo-Saxon as a distinct tongue, it is but natural to assume that the hieroglyphs whose origin has just been traced really represent a whole series of successive languages. This is, in fact, true. The most important historical periods in Egypt, with their linguistic characteristics, are:

A. *Old Kingdom* (Dynasties III-VI, about 3000-2500 B.C.). Earlier labels on boxes, jars or grave markers are now followed by nobles' tomb-inscriptions displaying the same brevity of writing. From royal burials come the most important of all early records, the Pyramid Texts (see below).

B. *Middle Kingdom* (especially the XII. Dynasty, about 2000 B.C.), the classic age. Spellings reach their greatest uniformity and the types of literary composition are most diversified. The folk-speech of this period forms a distinct dialect, just as the common speech of to-day differs from the cultivated literary style.

C. *Empire* (especially the XVIII-XIX. Dynasties, about 1580-1200 B.C.). Tomb and temple inscriptions in hieroglyphic are modeled on classic forms; but from these the folk-language has already diverged so widely that it deserves the distinctive name New Egyptian.

D. *Renaissance* or *Restoration* (XXVI. Dynasty, 663-525 B.C.). Imitation of Old Kingdom writing and ideas. But the hieroglyphs thus reused have passed out of current knowledge. The colloquial language of this age is named after its cursive system of writing, the demotic.

E. *The Graeco-Roman Age* (332 B.C.-4th century A.D.) used for ordinary purposes a later stage of the demotic. But its temple inscriptions were couched in absolutely artificial hieroglyphic systems which exhibit an abundance of new signs and new values.

F. *The Coptic* (3d century A.D. ff.) is the last phase of the old Egyptian tongue, trans-

literated from the demotic into Greek characters when Christianity was introduced into Egypt. Though now a dead language, one dialect is still in official use by the Coptic Church, paralleling Latin in the Roman Catholic.

The Egyptian linguistic principles show kinship with East and North African language-groups and likewise with the Semitic tongues of neighboring Arabia and Palestine. As in the latter, the essence of a word is contained in its *root*, the consonantal framework left after excluding prefixes or affixes, while its particular application depends on these latter or (more commonly) on only the accompanying vowel sounds. The effect is as though *ram*, *arm*, *army*, *reams*, *aroma* and *roomy* in English were all related concepts based on a root *rm*. The context is expected to suggest the proper vocalization. The resultant mental attitude reckons consonants alone as making up the alphabet. The Egyptian alphabetic hieroglyphs (as arranged by modern scientists), with their symbols and English equivalents, are:

	(carrion-kite) , , Hebrew $\aleph$ (Aleph), the smooth breathing in Greek; it may be heard in "I am" or "an hour" if the words are distinctly separated in pronunciation.
	(palm-leaf) <i>y</i> or <i>i</i> ; initially often = Aleph, hence the two elements of the second symbol.
	(fore-arm, palm up) <i>'</i> , Hebrew $\aleph$ (Ayin), a vigorous expulsion of the breath through the contracted glottis.
	(plover) <i>w</i>
	(lower leg and foot) <i>b</i>
	(mat for offerings) <i>p</i>
	(snail?) <i>f</i>
	(owl) <i>m</i>
	(wave of water) <i>n</i>
	(mouth) <i>r</i> and <i>l</i>
	(ground-plan of some building) <i>h</i>
	(twisted fibers) <i>h</i> , fricative, stronger than <i>h</i>
	(placenta) <i>h</i> , the guttural heard in German <i>ack</i> or Scotch <i>loch</i>
	(teats, etc. of some animal) <i>h</i> , a stronger guttural than <i>h</i>
	(bolt of a door) <i>s</i>
	(folded roll of cloth) <i>s</i>

} both pronounced as *s*; what the original distinction in sound may have been is unknown.

	(pool of water surrounded by coping)	<i>i</i> , the <i>sh</i> -sound
	(hill-side)	<i>k</i> or <i>q</i>
	(cup with handle)	<i>k</i>
	(jar-stand)	<i>g</i>
	(loaf of bread)	<i>t</i>
	(tether)	<i>t</i> , the <i>th</i> -sound as in <i>thin</i> ; later confused with <i>t</i> .
	(hand)	<i>d</i> , really a more emphatic <i>t</i> , the Hebrew $\daleth$ (Teth); the Egyptian seems to have had no real <i>d</i> -sound.
	(serpent)	<i>d</i> , etymologically = Hebrew $\daleth$ (Sadhe); later confused with the preceding <i>d</i> . The <i>d</i> , where it has preserved its individuality, has in Coptic a <i>j</i> -sound.

The Egyptian could have written adequately with only these 24 alphabetic characters; but he was too conservative to give up his other hard-won hieroglyphs. All the varieties, phonetic and determinative, thoroughly intermingled, persisted to the end. Thus  is the clas-

sic writing of the adjective *mnh*, "excellent."\* The  pictures an oblong chess-board seen from above, with a group of chessmen upon it in side view, illustrating the Egyptian art principle of faithfulness to known realities rather than to a misshapen modern perspective. It is a phonetic group-sign for *mn*; the same *n* is repeated as a so-called "phonetic complement" by the alphabetic . The alphabetic  is

followed by , a word-sign which will originally have pictured a maul *mnh*, but is found regularly in our transferred meaning instead. The use of the preceding hieroglyphs, which have already stated its phonetic value, is undoubtedly a secondary development intended to

facilitate the reading; otherwise the  here might be considered a "phonetic determinative," i.e., a determinative not of the sense but of the phonetic group. Unquestioned phonetic determinatives of parts of words do, indeed, occur.

The , representing a rolled papyrus document (see below) tied with a cord and sealed with a clay pellet over the knot, is the regular determinative of abstract terms. The supplementing (not supplanting) of pictorial by phonetic signs, as seen in the above example, means that instead of 24 some 600 signs were in common use. Such a system was far more com-

\*To make pronounceable these vowelless writings of Egyptian words, the modern Egyptologist often treats certain consonants as if they were vowels ( $\aleph$  and  $\aleph'$  as *a*, *y* as *i*, *w* as *u*) and then inserts short *e*'s where needed. So *mnh* may be called *mench*.

plicated than our English spelling, and the man who had mastered it in both its monumental and its cursive forms (see below) might well be proud to call himself a scribe. His accomplishment opened for him the pathway to high office.

**Use.**—By the I. Dynasty (about 3400 B.C.) the Egyptian had learned to paint or incise his hieroglyphs on stone and pottery, wood and ivory, and moreover to carve them in relief (see Fig. 1). But the most representative of all Egyptian methods of writing—in common use already by the Old Kingdom—was made possible by the papyrus plant, whose tall stalks flourished in all the swamps and pools. The long strips into which sections of the stalk could be cut lengthwise were glued together side by side and crossed at right angles by another similar layer. When pressed, dried and scraped, a flexible sheet of vegetable fibre, the direct ancestor of our modern paper, was produced. On such papyrus sheets or rolls (for the sheets were usually glued together into strips of the desired length) the Egyptian scribe wrote rapidly with pen and ink as do we, his cultural descendants. But a modern split pen-point would have been ill suited to the soft, unglazed surface of his papyrus; so the Egyptian softened the end of his reed pen, probably by chewing it, until it formed a sort of tuft with which he practically painted his characters. His black ink was of soot suspended in a solution of gum and water; his palette always carried red ink also, similarly made with iron oxide, and regularly used for headings and catch-words. This custom, passing into European manuscripts, survives to-day in printed rubrics. The papyrus was ordinarily held in the unsupported left hand, except when the roll was extremely long and heavy, in which case the scribe might squat and spread it across his knees; the pen met it at a right or slightly acute angle. As the writing-surface was unrolled from the left so as to come under the pen held in the right hand, the lines and columns naturally progressed from right to left, reversing our own method. This same Egyptian technique spread into Asia soon after 1100 B.C., almost contemporary with the appearance of the Phœnician alphabet, from which the Greek, Latin and our modern Western alphabets are descended. Now the Phœnician differs from other Hither Asiatic writing, but agrees with the Egyptian, in technique, in direction of writing, in its lack of vowels and fundamentally in the very principle of alphabetic instead of syllabic signs. So it is quite probable that the letters with which this article is printed are the remote offspring of the hieroglyphs with which it deals.

That the hieroglyphs proper, especially as used on tomb or temple wall, were intended as much to decorate as to inform is evident from the calligraphic grouping of signs as far as possible into squares and from the balancing of inscriptions as well as of scenes. For this purpose the normal order of writing, in which the signs face toward the right, the beginning of the line, is often reversed in one-half of a design. Each of the two units usually then faces toward the centre, reading from there outward. The decorative motive is emphasized in addition by pictorial details common in both

cutting and painting of individual signs, and by the calmness with which scribe as well as stone-cutter can overlook errors in the text which may entirely obscure its sense for modern readers and must often have done so for the ancient. Papyrus documents, on the other hand, needed only to be useful. Thanks to the unusual dryness of the Egyptian climate, vast quantities of these elsewhere perishable records have survived. They include letters, reports of court proceedings, volumes of charms for the benefit of the dead and other volumes of romance to entertain the living. In drawing on papyrus the brush-pen naturally gave to the hieroglyphs a bolder, more cursive form. The resulting *hieratic* system of writing parallels the hieroglyphic for almost 3,000 years, being related to the latter much as modern handwriting is to print. The hieratic of the Old Kingdom was in vertical lines only, like the Chinese. During the Middle Kingdom horizontal lines appear and soon completely displace the vertical. Both styles are found together in Fig. 2, a bit of our earliest historical

FIG. 2. Pages from the Tale of Sinuhe.

novel, the tale of Sinuhe (see below). Of the hieratic forms, though they change from age to age, two general types are distinguishable: the uniform "book-hand" with its signs mostly standing out individually as here illustrated, and the hurried business hand of the clerk or court reporter who often links signs together by the continuous sweep of his pen. By inevitable reaction many single signs or ligatured groups which had diverged widely from their originals were ultimately adopted as new characters into the hieroglyphic, while modified and disguised forms of others totally displaced their unequivocal originals. The process in Egypt was akin to that in early Babylonia, where, however, the rendering of signs by impressed wedges (cuneiform writing) in successive modifications not only effectively obscured the whole body of original pictures but entirely did away with the parent system. By 500 B.C. a new and more compressed business hand, the demotic, which had so lost all resemblance to the original hieroglyphs that whole associated groups of characters were fused into single signs, had developed in Egypt. The hieratic thereupon gained a sanctity which had previously accrued to the no longer understood hieroglyphs. The Greek names *hieratic* ("priestly") and *demotic* ("common, popular") applied to the two cursive systems refer, of course, like the term *hieroglyphic* itself (see above), to this late situation. As the papyrus plant was useful in so many ways that it

could ill be spared to make scratch paper, memoranda and even actual letters and other documents were often scribbled on potsherds or flakes of limestone, which were abundantly available to everyone. These rough substitutes, inscribed in hieratic, demotic or Coptic, are called *ostraka*.

**Decipherment.**—The basis of our knowledge of ancient Egyptian dates back less than 100 years. Whatever the Greeks may once have known about the subject was lost, with one unfortunate exception: the highly fanciful treatise of a certain Horapollon survived to spread a mistaken notion that the hieroglyphs were mystic symbols which pure science must avoid. Yet before 1800 the Dane Zoega had recognized that frames ("cartouches") met with around certain groups of signs indicated kings' names, and had correctly distinguished some monuments as late by their style alone. Then in 1799 Napoleon's expedition to Egypt discovered at Rosetta an inscription dated in 196 B.C., deifying King Ptolemy (V) Epiphanes for numerous benefits conferred upon the priesthood and ordering that this their resolution be displayed beside Ptolemy's statue in all the important temples "in the sacred, the demotic, and the Greek characters." The "Rosetta Stone," now in the British Museum, was evidently one of the stelae here called for; and its Greek text was expected to lead at once to decipherment of its hieroglyphic and demotic versions. The one cartouche preserved in the fragmentary hieroglyphic portion must surely contain the name "Ptolemy," which the Swede Akerblad had in 1802 identified in the demotic. The English scientist Thomas Young proceeded to assign phonetic values to the characters in this name; but study of the text as a whole failed because belief in the symbolic nature of the signs (except as used in such foreign proper names) persisted. Meantime a gifted young Frenchman, Jean François Champollion, born in 1790, had been devoting himself to Egyptian studies since the age of 12. He finally reached the correct conclusion that the hieroglyphs on the Rosetta Stone could not be word-symbols, since they were about three times as numerous as the words of the Greek translation. A few months later, in 1822, he recognized in some newly received copies of inscriptions the Empire royal names Thutmose and Ramses and realized that the signs which he had previously discovered to be phonetic in all Ptolemaic and Roman names were also phonetic in the old language. Rapid progress on the basis of his previous researches could now follow. Before his early death in 1832 Champollion had made a journey through Egypt, and his published notes on the antiquities reveal how fully he had come to understand their language. But his grasp was intuitive rather than grammatical, and much scientific skepticism persisted until his decipherment was fully confirmed by another bilingual inscription, the Decree of Canopus, found in 1866.

Among Champollion's followers should be mentioned especially the German Lepsius and his successor at Berlin, Adolf Erman, the father of Egyptian grammar. Another German, Heinrich Brugsch, composed in the years 1866-80 a seven-volume hieroglyphic-demotic dictionary, much of which, and especially the system of transliteration, is long since obsolete. For not

until the work was almost completed did the wholly consonantal nature of Egyptian writing become clear. The fact that the Greeks had artificially vocalized with *z*, *c*, *y*, and *w* the proper names with which decipherment began is still, indeed, used by some Egyptologists as one evidence for vowels in the Egyptian alphabet. To advance the study of vocabulary as well as grammar, the four learned academies of Germany have been engaged since 1897 in minutely classifying the words and usages of all available Egyptian texts. Specimen pages of the great 'Berlin Dictionary' which is to result were issued in 1916.

**Grammar.**—The classic grammatical system may be briefly outlined. Various types of roots (see above) are distinguished, according as they contain two, three (the usual number), four, or even five consonants (called *radicals*). These may be either strong or weak. The weak consonants (*z*, *y*, *w*) are so called because they combine easily with preceding vowel sounds to lengthen them or form diphthongs with them. Hence *y* and *w* especially are in many cases omitted from the consonantal writing. The weak roots (those containing weak radicals) are distinguished as I *z*, II *w*, III *y*, etc. (with the Roman numeral indicating the position of the radical concerned), or, in the case of *w* and *y*, which show numerous interchanges, simply I, II or III weak. Another variety of root has the last two radicals (most commonly II and III) alike. As the Egyptian, besides omitting weak consonants, never wrote two like consonants together except when a vowel sound came between them, these special types of roots assist in determining at least the position, though not the nature, of the unwritten vowels in several verb forms. The Coptic with its Greek characters shows the vowels used at that late date in the tiny fractions of the old vocabulary and grammatical forms which still survived. Other hints of the vocalization are obtained from Greek transliterations of Egyptian words, and in still fewer cases from the earlier Babylonian and Assyrian.

As in other languages, the verb is the heart of the Egyptian sentence. It follows in some measure the Semitic principle of distinguishing not among present, past and future, but between the finished (*perfect*) and the still progressing (*imperfect*) action or condition, in no matter what field of time they lie. The former corresponds roughly to our past, the latter to our present and future. But the Egyptian-Semitic analogy is very incomplete; so the usual designations of Egyptian tenses are taken directly from the paradigm-verb *sdm*, "to hear." The simplest form is the *sdm*.f ("he hears"), in which only an enclitic pronoun or a noun follows the root as subject of the verb. The conjugation of this tense runs:

<i>sdm</i> .y	I hear	<i>sdm</i> .n	we hear
<i>sdm</i> .k	thou (m.) hearest	<i>sdm</i> .tn	ye hear
<i>sdm</i> .t	thou (f.) hearest		
<i>sdm</i> .f	he hears	<i>sdm</i> .sn	they hear
<i>sdm</i> .s	she hears		

In the earliest texts dual forms also, similar to the plural but with *y* added (*sdm*.ny, "we two hear," etc.), are found. The consonantal modifications in special types of roots (especially the II doubled and III weak) show that

this tense was vocalized in at least three different ways, according to the shade of meaning: emphatic, declarative or optative, and circumstantial or conditional respectively.

Though the *šdm-f* occurs in narrative also, the commonest representative of our past tense is the *n*-form *šdm-n-f* ("he heard"). Other shades of thought are expressed by forms with *yn*, *hr* or *kʒ* in the place of the *n*. For the passive, *tw* is attached just before the subject (e.g., *šdm-kʒ-tw-f*, "may he be heard"). The passive *šdm-n-tw-f* is usually, the passive *šdm-tw-f* sometimes, replaced in the case of noun subjects by a form *šdm-w-f*. A causative conjugation is formed with prefixed *š* (e.g. *š-nfr*, "to make beautiful," from *nfr*, "to be beautiful").

A remnant of an older verbal system, apparently related to the Semitic perfect, uses inflectional endings, takes no suffix-pronouns, and always follows a noun subject (contrary to the *šdm-f* usage). As it occurs chiefly in circumstantial clauses, it has been called the *pseudo-participle*. Both this and the *šdm-f* system are used with auxiliaries to make compound conjugations closely analogous to such English forms as "I am going," "I did go," and "I am to go."

The Egyptian verb is distinguished for one unique development, the *relative-form*, made in the *šdm-f* and *šdm-n-f* tenses by inserting masc. *w* or fem. *t* after the root. The resulting *šdm-w-y*, *šdm-t-n-šn*, etc., mean "(he) whom I hear," "(she) whom they heard," etc., and are used as nouns or adjectives.

The problems involved in translating from Egyptian texts may be realized in some measure

when it is noted that such a form as 

may be read *šdm-k* (*šdm-f* form, with at least three pronunciations and corresponding differences in meaning; or infinitive + suffix, "thy hearing," where "thy" may be either subjective or objective), *šdm-(w)·k* (passive in *w*; "thou art heard"; or masc. relative-form, "[he] whom thou hearest"), or *šdm-k(wy)* (pseudo-participle 1 per. sg., "I being heard"). The context, in conjunction with fairly definite principles of word-order, must be our chief guide amid such perplexities.

The enclitic personal pronouns serve not only as verb subjects but are attached as possessives to nouns (e.g., *pr-y*, "my house"). They enter also into composition to make an emphatic absolute pronoun employed as subject of a nominal sentence (a verbless type whose English equivalent would require an indicative form of the verb "be"). Another, older set of absolute pronouns, from which the weak enclitics were derived, represents our objective case. The demonstrative pronouns in common use vary from age to age, but agree in containing *p* in the masc., *t* in the fem., and *n* in the plural. The definite article "the," non-existent before the Empire, is a weakened demonstrative which even in the Coptic shows the same characteristic letters. There is no indefinite article until the Coptic, which uses a weakened form of the numeral "one." The origins of both "the" and

"a" in Egyptian thus parallel the developments in modern European languages, including English.

Egyptian nouns and adjectives are of but two genders, masculine and feminine. Their distinctive endings are:

masc. sg.	none or <i>w</i>	fem. sg.	<i>t</i>
	dual <i>wy</i>	dual	<i>ty</i>
	pl. <i>w</i>	pl.	<i>wt</i>

As in the verb, the dual was early lost. The prefix *m* (common in Semitic) is used sometimes to make nouns of place and especially of instrument (e.g., *m-šdm-t*, "cosmetic," from the root *šdm*, "to paint the face"). There are two main types of adjective formation. The one, showing the simple verb root, is often indistinguishable from a participle; the other, the *nisbe* (so called from its Arabic counterpart), is made from nouns or prepositions (which were originally nouns) by adding *y* (e.g. *hnsk-t-y*, "curly-haired," from the fem. noun *hnsk-t*, "curl;") *hr-y*, "[he] who or [that] which is upon," from *hr*, "upon" [connected with the noun *hr*, "face"]). The adjective regularly follows its noun. The same close connection may exist between two nouns as between a noun and a suffix-pronoun; thus *pr-f*, "his house," is analogous to *pr-Ymn*, "the house (temple) of Amon." The second noun, *Ymn*, is called a *direct* genitive and is said to be in the *construct* relation with the first. That the vowel sounds are slurred in the first word of such a phrase, whose emphasis naturally falls at the end, is clearly shown by Coptic spellings. Under other circumstances an *indirect* genitive is used, preceded by the declinable adjective *ny*, "of," *nisbe* of the preposition *n*, "to." Modified forms of adjectives and of prepositions furnish the few and heterogeneous adverbs.

**Literature.**—The Egyptian language, whose mechanism has just been noticed, has left an extensive literature, characterized by a concreteness of thought as vivid as the concrete pictures with which it is written. Amid the maze of inscribed records which the dry climate of Egypt has bequeathed us, the field most largely represented is religion. From the Old Kingdom, 4,500 years ago, come the "Pyramid Texts," the earliest large body of literature yet known from any source. A trust in mere massivity of the tomb to preserve royal bodies and so win for them life hereafter was thus early felt inadequate. So during the V. and VI. Dynasties the corridors of five pharaohs' pyramids were inscribed with varying collections of hymns, prayers, rituals, and magic formulæ, in part already hoary with age, calculated to make doubly sure the felicity of the royal dead. Religious texts whose benefits may be shared by all classes are found on the coffins of the Middle Kingdom, and at greater length on long rolls of papyrus (the so-called "Book of the Dead") in the Empire and down through the Restoration. Contrasting with the traditional cults of the living, a monotheism earlier than the Hebrews' speaks (about 1400 B.C.) in the great hymn of its royal founder, the emperor Ikhnaton.

History is represented on the one hand by

fragments of royal annals, annotated royal reliefs and hymns of victory. On the other are memorial records left by expeditions abroad, and the more intimate data derived from autobiographies which nobles and high officials have left carved in their tombs.

The classic age, the Middle Kingdom, is richly productive of philosophy. Satisfaction with the traditional order is evident in a set of maxims, the Wisdom of Ptahhotep, suggestive of the biblical book of Proverbs. But pessimistic tendencies appear in a misanthrope's dialogue with his own soul on the wretchedness of a wronged and unappreciated life. Another writer looks beyond present misery to a messiah who shall establish justice. Eloquence as such is more prominent than the righting of grievous wrongs in a fourth composition, the Laments of the Peasant.

The same fondness for affected language permeates the Middle Kingdom tale of Sinuhe (see Fig. 2), a historical novel depicting the supposed adventures of a fugitive Egyptian courtier of that name in Palestine over five hundred years before the coming of the Hebrews. Even love-songs survive from the late Empire.

Science, represented by mathematics and medicine, was clearly cultivated for practical purposes only; for the mathematical formulæ are very inexact, and the medical prescriptions are in large part based on magic.

**Bibliography.**—A fuller picture of Egyptian literature proper, with translations, may be gained from Breasted, 'Development of Religion and Thought in Ancient Egypt' (New York 1912), and Maspero, 'Popular Stories of Ancient Egypt' (New York 1915). On the technique of the writing, consult Breasted in *The American Journal of Semitic Languages and Literatures* (July 1916, pp. 230-49, ill.). English readers have as yet no handy volume on the subject of hieroglyphics in general, such as Germans enjoy in Erman, 'Die Hieroglyphen' (Berlin 1912).

Secretary, Haskell Oriental Museum, University of Chicago.

**HIERONYMUS.** See JEROME, SAINT.

**HIGGOSOLYMA.** See JERUSALEM.

**HIGGINS, Anthony,** American politician: b. Red Lion Hundred, Del., 1 Oct. 1840; d. New York, 26 June 1912. He was educated at Yale, studied at Harvard Law School and was admitted to the Delaware bar in 1864. From 1869 to 1876 he was United States attorney for Delaware, and becoming interested in politics was chairman of the Republican State Convention in 1868. In 1881 he secured the vote of the Republican members of the Delaware legislature for the United States Senate and in 1884 was defeated as a Republican candidate for Congress. He was United States senator 1889-95. He was counsel for Judge Charles Swayne in his impeachment in 1905.

**HIGGINSON, Ella Rhoads,** American novelist and poet: b. Council Grove, Kan., 1862. She was married to R. C. Higginson and has passed her life mainly in the vicinity of Puget Sound, Wash. She has contributed much to periodicals, and her work, which has a distinctly original flavor, has attracted much at-

tention from its vigorous presentation of life on the upper Pacific slope. She is in charge of the literary department of the Seattle *Sunday Times*, and is a member of the National Geographic Society. Her most noteworthy book is 'Mariella, or Out West,' an extremely strong novel (1902); and other works of hers are 'The Flower that Grew in the Sand' (1896); 'From the Land of the Snow Pearls' (1897); 'A Forest Orchid' (1897); 'When the Birds Go North Again,' poems (1898); 'The Voice of April Land,' poems (1906); 'Alaska, the Great Country' (1908); 'The Takin' In of Old Mis' Lane,' prize short story; 'The Vanishing Race,' poems (1912); 'The Message of Anna Laura Sweet' (1914) and several collections of poems.

**HIGGINSON, Francis,** English clergyman in colonial America: b. 1587; d. Salem, Mass., 6 Aug. 1630. He was educated at Cambridge, England, and subsequently became rector of a parish in Leicester, but becoming gradually a Non-Conformist, was deprived of his benefice, and was employed among his former parishioners as a lecturer. While apprehending a summons to appear before the High Commission Court, he received an invitation from the Massachusetts Company to proceed to their colony, which he accepted. He embarked in May 1629, and it is related by Cotton Mather that as the ship was passing Land's End, he called the passengers about him and exclaimed: "We will not say, as the Separatists were wont to say at their leaving of England, 'Farewell, Babylon; farewell, Rome!' but we will say, Farewell, dear England! farewell, the church of God in England, and all the Christian friends there. We do not go to New England as Separatists, though we cannot but separate from the corruptions of it. But we go to practise the positive part of church reformation, and propagate the gospel in America." He arrived at Salem 29 June, and on 20 July was chosen teacher of the congregation established there. Subsequently Higginson drew up "a confession of faith and church covenant according to Scripture," which on 6 August was assented to by 30 persons, who associated themselves as a church. He wrote 'New England's Plantations, or a Short and True Description of the Commodities and Discommodities of the Country' (1630), and an account of his voyage, printed in Young's 'Chronicles of the First Planters' (1846). Consult Higginson, T. W., 'Life of Francis Higginson' (1891).

**HIGGINSON, Francis John,** American naval officer: b. Boston, 19 July 1843. In 1861 he was graduated at the United States Naval Academy; was promoted through the various grades, becoming rear-admiral on 3 March 1899. In 1861-62 he served on the *Colorado* in the West Gulf blockading squadron; was wounded at Pensacola Harbor, and took part in the bombardments and passage of Forts Jackson and Saint Philip. He was present at the engagements with the Chalmette batteries and at New Orleans. He served on the *Vixen* in 1862 and on the *Powhatan* in 1863-64. Becoming attached to the South Atlantic blockading squadron he participated in the bombardment of Fort Sumter and was on board the *Housa-*

tonic when she was blown up by a torpedo off Charleston. After the war for 30 years he served all over the world in various squadrons and in various capacities at the naval stations and at home. In 1897-98 he commanded the *Massachusetts* and was advanced three numbers in rank for eminent and conspicuous conduct in battle during the Spanish-American War. In 1901-03 he was commander-in-chief of the North Atlantic fleet and from 1903 to 1905 commandant of the Washington navy yard. He was retired 19 July 1905.

**HIGGINSON, Henry Lee**, American banker: b. New York, 18 Nov. 1834. He was educated at Harvard, studied music abroad and served in the Federal army during the Civil War and was brevetted lieutenant-colonel. He has been long connected with the Boston banking and brokerage firm of Lee-Higginson & Co., and has contributed large amounts toward the organization and support of the Boston Symphony Orchestra. He was elected a Fellow of the Harvard Corporation in 1893. He is a member of the Massachusetts Historical Society, and the American Academy of Political and Social Science. His charitable benefactions have been numerous and his activity in the field of social service has earned for him the title of "Boston's first citizen."

**HIGGINSON, Mary Thacher**, American author, wife of T. W. Higginson (q.v.): b. Machias, Me., 27 Nov. 1843. She has written 'Seashore and Prairie' (1876); 'Room for One More' (1879); and 'Such as They Are' (1893), poems written in collaboration with her husband; 'The Playmate Hours,' poems (1904); 'Thomas Wentworth Higginson: The Story of his Life' (1914).

**HIGGINSON, Thomas Wentworth**, American author: b. Cambridge, Mass., 22 Dec. 1823; d. there, 10 May 1911. He was descended from Rev. Francis Higginson (q.v.); was graduated from Harvard in 1841, and from Harvard Divinity School in 1847. He became pastor of a Unitarian church in Newburyport, Mass., in 1847, but resigned in 1850, his anti-slavery views being unacceptable to his congregation. In the year last named he was the unsuccessful "Free Soil" candidate for Congress, and he was pastor of a Free (unsectarian) church at Worcester, Mass., 1852-58. In the interim he had been prominent in anti-slavery agitation, and for his share in the attempted rescue of the fugitive slave Anthony Burns (q.v.), was indicted for murder in 1854 with Wendell Phillips, Theodore Parker and others, but owing to a flaw in the indictment the defendants were discharged. He also aided in the Kansas Free State efforts, and during the Civil War was captain of the 51st Massachusetts regiment of volunteers, becoming colonel in November 1862 of the 1st South Carolina Volunteers, the earliest regiment of freed slaves in the Federal service. He resigned from the army in October 1864, by reason of disability, and thereafter gave his attention to literature, residing at Cambridge, Mass., since 1878. He was almost a life-long and consistent advocate of woman suffrage and of the higher education of woman, and was a member of the Massachusetts legislature 1880-81, serving on the State board of education also, 1881-83. He was a polished, graceful speaker, and frequently appeared on the lecture

platform. He was the Lowell lecturer on American literature in Boston in 1902. As an after-dinner or occasional speaker he was especially happy, his felicitous sentences being almost always illuminated by the play of a very delicate humor. He was president of the Round Table, a social Boston club, and vice-president of the Boston Authors Club, as well as a member of many other organizations, social and literary. He was for a generation a constant contributor to periodicals of the highest class and figured in literature as essayist, novelist, poet and historian. His principal work in fiction is 'Malbone' (1869), in which his first wife is outlined as Aunt Jane. As an essayist he is perhaps seen at his best, the essay form seeming peculiarly adapted to his genius. Among collections of essays by him may be cited 'Outdoor Papers' (1863); 'Atlantic Essays' (1871); 'Women and Men' (1887); 'The New World and the New Book' (1891); and 'Concerning All of Us' (1892). His 'Young Folks' History of the United States' (1875) has been widely popular, and other histories by him are 'Larger History of the United States' (1885); 'English History for Americans' (1893); 'Massachusetts in the Army and Navy, 1861-65' (1895-96). His verse is included in 'The Afternoon Landscape' (1889); 'Such as They Are' (1893). Yet other important works by him are 'The Monarch of Dreams,' a strikingly original sketch (1886); 'Army Life in a Black Regiment' (1869); 'Cheerful Yesterdays' (1898); 'Old Cambridge' (1899); 'Contemporaries' (1899); and lives of Margaret Fuller (1884); Francis Higginson (1891); Henry W. Longfellow (1903); John Greenleaf Whittier (1903); 'History of the United States' (1905). He translated the complete works of Epictetus (1865, revised ed. 1891). With Samuel Longfellow (q.v.) he completed a well-known anthology of seaside verse, 'Thalatta' (1853), and with Mrs. E. H. Bigelow 'American Sonnets' (1890). Several of his works have been translated into French, German, Italian and even modern Greek. He was the friend of very many of the older New England writers and was especially helpful to many of the younger ones, not a few of whom owe him much in the way of kindly criticism or suggestion, the fruit of ripe scholarship.

**HIGH BRIDGE, Engagement at.** See FARMVILLE.

**HIGH CHURCH**, a term applied to a faction in the Church of England. It was applied first to the younger clergy during the latter part of the reign of Elizabeth who asserted that Calvinism was inconsistent with the ancient doctrine and constitution of the primitive Church, and who claimed a divine right for episcopacy. Bishop Andrews was the chief writer of this faction, and Laud became its most active leader. The term now generally refers to those who exalt the authority and jurisdiction of the Church, and attach great value to ecclesiastical dignities and ordinances, being more or less identified with the ritualistic party. See RITUALISM.

**HIGH EXPLOSIVES.** See EXPLOSIVES and related references.

**HIGH-FREQUENCY OSCILLATING CURRENT.** This term is especially applicable to electrical currents, the high-frequency inter-

ruptions of which are obtained by means of condenser discharges in contradistinction to those produced by a disrupted static current, without the interposition of a metallic condenser in series with one or both terminals. The latter differs in several characteristics and is essentially a high potential current, 10,000 to 50,000 volts, with a minimum amperage, usually about .0005. The usual alternating current in commercial use in the United States is that known as 60-cycle: that is, it makes 60 complete journeys—there and back, so to speak—in each second. It has changed its direction, therefore, 120 times in the second. The high-frequency current changes its direction 20,000 times or more per second.

To generate a high-frequency current it is usual to charge two Leyden jar condensers with a high potential current, the source of which may be a static machine or induction coil, shunting the two wires with a spark-gap for the purpose of disrupting the current. The external armatures of the condensers are short-circuited through a solenoid or helix consisting of a few turns of very coarse copper wire (D'Arsonval). The helix may be substituted by a straight copper bar (Sheldon). The helix prolonged to from 50 to 100 turns constitutes the resonator of Oudin. The upper part of the helix resonates in unison with the lower, when properly in tune, as would a tuning-fork resonate with another of the same pitch. The office of the extended helix is to amplify the current.

Another arrangement is after Tesla: The primary of a specially constructed induction coil is energized by an alternating current. The secondary terminals, giving a potential of 15,000 volts, are connected, one to each side of a suitable condenser. From each of these terminals a shunt is taken. One leads to one end of the primary of a Tesla coil; the other, broken by a spark-gap, is connected to the second terminal of the primary. The frequency obtained from the Tesla apparatus is fabulously high—millions a second. The potential may be hundreds of thousands or millions of volts. The amperage is sufficient to light to full candle-power several incandescent lamps. The primary of the induction coil consumes 15 to 25 amperes. For maximum high-frequency effects this type of apparatus seems to be essential. There are many modifications of this apparatus.

At the terminals of a working high-frequency apparatus is seen a beautiful brush discharge or effluve of a peculiar violet color, which will leap to any object brought near it. These brush discharges range from 20 inches upward to 50 inches in length. Interpose a plate glass one-half inch thick (or more), and the effluve will penetrate it. If the object be a vacuum tube it will glow almost as brightly as if nothing intervened. It is an ideal current for igniting Geissler and low-vacuum X-ray tubes; only one terminal need be connected.

One characteristic of the high-frequency oscillating current is its lack of power to excite the motor nerves, and, aside from a slight sensation of warmth, the sensory nerves at the point where the electrode touches the body. The accepted explanation for this fact is, that the nerves respond to certain frequencies of stimulus; for the motor nerves, reaction takes place up to about 5,000 frequencies; if these are

gradually increased muscular contraction diminishes and finally ceases. This theory is in line with reasoning as to the cause for action of the special senses—sight and hearing.

The high-frequency discharge is a rich ozone generator, and, applied to unhealthy granulations and various skin diseases, acts as an oxidizer, antiseptic and disinfectant. Applied to the skin before incision, it will render the site aseptic. In the hands of the expert electric physician the high-frequency current is used to remedy several diseased conditions. The vacuum-tube is employed to increase arterial tension, the D'Arsonval current to decrease it. The former is productive of a powerful tonic effect in cases where the blood pressure is normal, but is dangerous where arterio-sclerosis exists. The vacuum-tube application increases the blood supply to the part under treatment, resulting in an improvement in nutrition at that point. Its application is also marked by an increase of the functions of excretion and secretion. The high-frequency current has been used successfully in renewing the growth of hair where the follicles have not been destroyed, and in many cases has restored the original color to hair which had turned gray. The treatment is also efficacious in corpulency. For a general tonic effect the patient is placed upon an auto-condensation couch or in the centre of an auto-conduction cage. In the treatment of sub-acute and chronic rheumatism, sciatica, neurasthenia, etc., it is most useful. (See ELECTROTHERAPEUTICS). Consult Curtis, T. S., 'High Frequency Apparatus: Its Construction and Practical Application' (New York 1916); Transtrom, H. L., 'Electricity at High Pressures and Frequencies' (Chicago 1913).

JOHN M. GARRATT, M.D.

**HIGH-POTENTIAL SYSTEM.** See ELECTRICAL TERMS.

**HIGH PRIEST,** the head of the Jewish priesthood. In the books of Moses the holder of this dignity is simply designated the priest, the epithet high occurs on one or two occasions, but as a distinctive epithet it appears to have been added subsequently. The formal consecration of Aaron, the brother of Moses, together with his sons, to a hereditary priesthood, is recorded in Ex. xxviii. The high-priesthood continued in the line of Aaron, sometimes in one, and sometimes in another branch of it, until the coming of Christ. After the subjugation of the Jews by the Seleucidæ, the Ptolemies and the Romans, it was often arbitrarily conferred by the foreign masters. The dignity of the priest's office is indicated by the splendor and costliness of his garment, which was among the most beautiful works of ancient art. To the high priest belonged the regulation and superintendence of the worship of God, the declaration of the oracles of Jehovah to the people (he alone being permitted to consult them on important public occasions), and the preservation of the national sanctuary. Although the administration of justice was committed to particular judges, yet to him the last appeal was made in difficult cases, even in temporal affairs, and nothing important in war or peace could be undertaken without his assent.

**HIGH SCHOOLS.** The high school as commonly interpreted is distinctively an American institution. The term is applied to those

schools which ordinarily give a four-year course of study to students who have completed eight years in the elementary school. The course is rarely longer and is sometimes shorter than four years.

These schools grew up in the early history of the United States to supply a distinct need. The state was providing an education for the people in the elementary schools. Those families which were intending to send their children to college sent them to Latin schools which received pupils at the age of 10 or 11 and gave them a course of six years. For entrance to these there was demanded a preliminary education of approximately six years.

To answer the demand of those who did not intend to send their children to college there grew up in the United States private academies which received pupils before they had finished their elementary course of eight years or after such a course had been completed. The academy therefore usually furnished a pre-academic course for the former and the academic course of four years for the latter. Students could go from the academy to a college, but this was not the prime motive of the institution.

The academy was private, charged tuition fees and in a way was intended for people of means. A demand arose for an institution to which pupils could go who had finished the elementary school course, which should be free and prepare its graduates to enter the pursuits of practical life. The English High School of Boston, founded in 1821, was the first of its kind, and gradually, as free elementary schools were established throughout the country, the high schools soon followed. The academies gradually died out.

The high schools were essentially democratic in origin and were not intended to prepare students for college. With the passing of the academy, however, and in view of the fact that, except in the older States along the Atlantic seaboard, the Latin school was unknown, there developed a demand that the high school of the community should offer courses which would prepare students for college. As the principals and the teachers of the high schools were frequently products of the colleges, they lent willing ears to such demands and the high schools came at times to take on the character of college preparatory schools, and their original ends were lost sight of. Even the pioneer of them, the English High School of Boston, felt called upon to offer a special year to prepare its graduates for college.

The studies offered in the high school, too numerous to be mentioned here, came to be grouped into the classical course, which had for its object the preparation of pupils for college, and the literary and scientific courses which aimed to prepare students either to go out into the world of business or to enter technical institutions.

The dominating influence, however, was collegiate and the introduction of business and industrial subjects was gradual, and was often met with active hostility by the teaching force. The students and the teachers in the classical course looked down on the pupils who pursued the business or commercial and manual training courses. The result was that these led a stifled existence. In communities, where the

high school population became large enough, the commercial students were drawn off and placed in a separate commercial high school, others in a manual training or technical or mechanic arts high schools. Once separated from the classical, these new high schools began to develop rapidly into strong institutions. So large did they grow that the colleges, which had hitherto felt that the only kind of preparation which could possibly fit students for collegiate work must be that of the classical high schools, now began to rearrange their entrance requirements so that graduates of not only classical but of the other high schools could enter their walls.

In size high schools now range all the way from institutions housing over 5,000 pupils, as in New York city, to small country institutions of only three or four classes. In a community where only one high school exists it is usual to find the classical, literary, commercial, manual and scientific courses all given in one building. The buildings and equipment of some of the high schools and the courses offered both in the East and West frequently rival and outshine colleges and universities, and so important are they in some communities that they are called the "people's colleges."

State Department of Education, Albany, N. Y.*

**HIGH SEA, The.** All the waters of the ocean, which are not included in the territorial limits of any nation, and over which no nation can rightly claim supervisory or exclusive jurisdiction, are included by the term "high sea." A state's territory extends over its adjacent waters to a line following the sinuosities of the coast at a distance of one marine league, to all harbors, and to the mouths of rivers and to straits and bays, when embraced by headlands not too remote from each other. There is no general rule as to the distance between headlands which determines the character of the waters enclosed by them; but the Bay of Fundy, the mouth of the Amazon and the Strait of Dover, for instance, are unquestionably parts of the high sea, while Chesapeake and Delaware bays would properly be considered territorial waters. The high sea is free to all nations for commerce or fishing or any other lawful use; but this right has been conceded only partially and in comparatively recent times. Powerful maritime nations, ancient and modern, have asserted superiority and exclusive jurisdiction commensurate with their ability to compel obedience from those weaker than themselves. The Phœnicians would permit ships of no other nationality to pass the Pillars of Hercules out into the Atlantic; the Greeks at Byzantium barred others from the Euxine. For nearly 1,000 years, however, the freedom of the high sea was maintained by the Pax Romana; the Romans included even the rivers in the common

liberties—*flumen publica sunt, hoc est populi Romani*—Institutes 2, title 1, sec. 2. But the unsettled conditions following the disintegration of the Roman Empire were not brought to a tolerable state of order until, toward the end of the 12th century, a system of maritime law found general acceptance and was embodied in various compilations of ancient and mediæval maritime usages and customs, in which the Roman idea of the high sea as a common human possession is assumed, though not declared, as a basic principle. This principle was controverted however by claims arising out of the great discoveries made toward the close of the 15th century. Vasco de Gama had doubled the Cape of Good Hope and made the voyage to India; Columbus had opened the way to the western continent. By the famous *bulia* of Pope Alexander VI the worlds thus newly disclosed were partitioned between Spain and Portugal, in whose service the great discoverers had sailed. The grantees, who were then and long after the leading maritime powers, asserted, and enforced, the right to exclude all other nations from the oceans as well as the lands divided between them by the papal grant. More particularly, the Spaniards asserted the Pacific and the Spanish Main to be their own by right of discovery, while the Portuguese, by the same right, insisted upon exercising sole dominion over the Indian Ocean. The circumnavigation of the globe by Francis Drake was in open defiance of the pretensions of both, and Hugo Grotius, in his celebrated treatise *De Mære Liberum*, which appeared in 1609, riddled their preposterous claims.

The plea of Grotius for complete freedom of the seas went unheeded, and the rivalry between the English, Dutch and French as colonizing and maritime powers brought forth jurisdictional claims over the ocean highways scarcely less objectionable than those previously asserted by Portugal and Spain. It was the exaggeration of belligerent rights at the expense of neutrals during the ensuing two centuries of war for maritime and colonial supremacy that caused the most trouble, however. The armed neutrality, established by the North European powers in 1780 under Russian leadership, was the first concerted effort of the weak to protect themselves against the arbitrariness of the strong in naval power. The objects of this concert of lesser naval powers were the limitation of contraband to actual war material, to immunize other neutral property, ships included, from seizure and confiscation on the high sea, and to sustain the right of neutrals to carry on oversea trade in innocent products with all belligerents without interference from either of them. From its very beginning the American government stood out for the greatest possible freedom of high sea commerce; even in time of war, and the principle expressed in the slogan, "free ships make free goods," carried the immunities proposed by the armed neutrality a step further, by extending protection to enemy property when transported in neutral ships. But the American commissioners sent to France in 1793 to secure adherences to this principle were able to obtain only a single treaty embodying the same, that with Prussia, signed by Franklin and his associates at Brussels in 1799. Twenty-five years later a proposal "to abolish private war at sea and

restrict contraband" was simultaneously submitted by this government to all the leading European powers. "Exemption of private property at sea from destruction and the depredations of war is offered to the civilized world by the United States," wrote Secretary Adams to Middleton, the American Minister at Paris on 13 Aug. 1823. The offer was again rejected; this government, however, not only steadfastly maintained its position, but advanced it as time ran on. When the United States were requested to become parties to the Declaration of Paris, the answer was conditionally affirmative. This government would become a signatory if the Declaration should be amended by this addition: "Private property of subjects and citizens of belligerents on the high sea shall be exempt from seizure by public armed vessels of the other belligerents, except it be contraband."—President Pierce, 4th annual message, 1856. Even in the throes of the Civil War this government was prepared to forego the advantage of naval capture of enemy shipping and other property on the sea for the sake of establishing a principle in which it believed. "We must claim for ourselves the rigors which other maritime powers apply to us when we are neutrals. But even to-day, in the midst of this strife, if the other powers, including Great Britain, should agree to abolish naval blockades altogether and forever, and to exempt private property from confiscation in maritime war, we are prepared to consider the proposal."—Secretary Seward to Minister Dayton at Paris, 28 Feb. 1862. The trend of opinion in later years among international jurists seemed to be toward the American idea of complete freedom of high sea commerce in war as well as in peace. The British delegates to the second peace conference at The Hague in 1907 had instructions from Sir Edward Grey, Minister for Foreign Affairs, to agree to the abandonment of high sea captures and the complete abolition of contraband. But the "Convention Relative to Certain Restrictions with Regard to the Exercise of the Right of Capture in Naval War," which was adopted by the conference, left matters practically where they stood. It merely immunized postal correspondence, inshore fishing vessels and small boats operated exclusively in coastal waters. The Declaration of London, formulated and adopted by the maritime conference of 1908, failed of ratification, though it was merely declaratory of prevalent usages and gave undiminished recognition to the right of capture on the high sea. The total disregard of conventions and morals by belligerents in the World War necessitates a complete reformation of the law of the sea, and its enforcement by a super-national authority.

With respect to navigable rivers, flowing to the sea through the territory of more than one nation, the Roman principle, *flumen publica sunt*, has obtained partial recognition. The Rhine was opened to all nations by the Congress of Vienna; the Danube is open, but under control of the International Danubian Commission. Secretary Marcy, in his instructions of 8 Aug. 1853, to Trousdale, United States Minister to Brazil, declared: "The right to peacefully navigate the Amazon River belongs, in international law, to all maritime states." In a report of 18 March 1792, Jefferson insisted

that, "where rivers enter the limits of another society and the rights of the upper inhabitants to descend (or ascend) is obstructed, it is an act of force by a stronger against a weaker nation and condemned by the judgment of mankind." So far as the Mississippi is concerned, controversy has been closed by the inclusion of the entire stream within the territorial limits of the United States. Access to the sea from the Great Lakes has been subjected at various times to various policies; but the Treaty of Washington (8 May 1871) finally declared that "navigation of the Saint Lawrence, ascending or descending, from the 45th parallel of North latitude, shall forever remain free and open for the purpose of commerce to citizens of the United States." Reciprocally, Lake Michigan, which is enclosed entirely by territory of the United States, was made free to British subjects. No laws or police regulations inconsistent with such freedom may be made or enforced in either case; and, by later arrangement, there has been established a perfect equality in the use of all canals and rivers traversed by or contiguous to the boundary and communicating with navigation on the Lakes. Straits giving access to enclosed seas are considered parts of the high sea. The imposition by Denmark of Sound dues at the entrance to the Baltic had been submitted to by commercial nations, because of their antiquity and because of an unwillingness of the great powers to coerce a weak state (see DANISH SOUND DUES). Secretary Buchanan (manuscript instruction of 14 Oct. 1848) pronounced these exactions to be "inconsistent with just principles of international law," and President Pierce (3d annual message, 1855) insisted upon the right of free transit into and from the Baltic. A convention making the Belts and the Sound free to navigation by American vessels was ultimately signed 11 April 1857, and this extended, of course, to the citizens or subjects of all states entitled to the treatment of "most favored nations." The Dardanelles were opened to the free transit by commercial shipping of all nations by the Treaty of Paris, 1856. The great inter-oceanic canals of Suez and Panama have been declared open on terms of equality to the vessels of war and of commerce of all nations. "The government of the United States will not tolerate exclusive claims by any nation whatsoever to the use of the Straits of Magellan and will hold any government responsible that undertakes to obstruct the same by imposts on commerce."—Secretary Evarts, manuscript instructions, Chile, 18 Jan. 1879. Crimes committed on the high sea are under the jurisdiction of the nation whose flag is flown by the vessel on which they occur. Collisions of vessels of different nationality are properly subject to inquiry in any admiralty court which first obtains jurisdiction.

STEPHEN PFEIL.

**HIGH TREASON.** There is a well-known epigram of Sir John Harrington, often quoted for its supposed wit and truth, though it possesses little of either of these qualities, which goes as follows:

Treason never prospers. What's the reason?  
When it doth prosper, none dare call it treason.

To be sure, when an attack on established order has met with success the victors do not

prosecute themselves for treasonable conspiracy. A new polity has come into being, the life of a nation has taken a new point of departure and a new direction, and the former legal sanctions have come to an end. In assuming that an accomplished revolution is nothing more than successful treason, the epigrammatist betrays a shallow way of thinking and an utter lack of appreciation of the fact that the mutability of human institutions is the condition of progress. Indeed, it may be, in the case of an insurrection which has attained the dimension of civil war, that the participants on either side will regard those on the other as enemy combatants, entitled to treatment as such, when made prisoners of war, in accord with the law of nations, and not as common criminals, to be hanged when caught. In the American War of Independence, as well as in the war between the States, the opponents tacitly treated each other as belligerents. The statute of 11 Henry VII, chap. I (1494) distinctly provides that obedience to a king *de facto*, but not *de jure*, shall not expose the adherents of the former to penalty for high treason when the rightful sovereign is re-established in power. On the contrary, however, all systems of law make it treasonable to commit any overt act (*Fr. attentat*) the purpose of which is to destroy or change the existing government; to arm citizens, or incite them to arms, for war against the public authorities; to attack the armed forces of the state, or public property, buildings, fortresses, arsenals, ships, etc., or take possession of the same for use against the state. These and other similar acts, which are specified in the French law of *Lèse Majesté*, are comprised in the English term "levying war," which neither the laws of Great Britain nor the United States more closely define. In strict law, therefore, all those who had taken part in an insurrection that failed would be punishable criminally as traitors, irrespective of the nobility or ignobility of their cause.

Glanville in a brief note on the crime indicates that compassing the death of the sovereign, insurrection or concerting with the external foes of the realm were impeachable (*infamatur*) whether or not a prosecutor appeared to make the accusation. Bracton describes the crime under the title *Laese Majestatis* and his description bears a recognizable likeness to the Roman law of *Majestas*. In his enumeration of the acts constituting treason, Bracton leads off with "The manifestation by action of a will to procure the death of the king; to foment rebellion against him; or to adhere to his external enemies." The resemblance in matter, and in the order of statement, to the Statute of Treason is remarkable; and that this is not accidental is suggested by the fact that the words of the statute, "compassing or imagining the death of our lord the king," might pass for a translation from Bracton. The Statute of Treason (25 Edward III, A.D. 1352) is not only the foundation of the English law on the subject, but contains the major part of it. Disregarding certain provisions for the safety of the king's family and the heir to the throne, the statute declares treason to be

(1) forming and displaying by any overt act an intention to kill the king; (2) levying war against the king; (3) adhering to the king's enemies. As Lord Justice Stephen remarked, it makes no provision for acts of violence against the king's person unless they display an intention to take his life. Nothing is said of attempts to imprison or depose him, or to interfere with his unquestioned prerogatives; nor about disturbances of the peace, however violent, which fail to reach the point of actual levying of war. It fails even to mention attempts or conspiracies to levy war. In enacting the measure Parliament seems to have been less concerned for the security of the state than for the security of persons and its purpose seems to have been to make a definition of treason that would exclude perjuries in office, waste of the king's revenue or counterfeiting or clipping his coin, and similar offenses, which had been so accounted. The crown was secure enough. The Scots were troublesome on the border, but domestic tranquillity seemed assured; the Constitution had been settled and the political institutions of the kingdom had taken practically the form which they have ever since maintained.

The omissions of the statute soon made themselves apparent in the tempestuous reign of Richard II. Acting in its judicial capacity, and overriding the jurisdiction of the courts, the House of Lords, in 1388, impeached the archbishop of York, the Lord Chief Justice, the lord mayor and others for treason, in having led the king to misgovern the country. The traitors were convicted and some of them executed. Ten years later the accusers were in turn impeached by the king's party. The Duke of Gloucester, uncle of the king, who had been the prime mover in the former prosecution, was assassinated, the Earl of Arundel was executed and the Earl of Warwick, who had been sentenced to be hanged, drawn and quartered, was remanded to imprisonment for life. A statute of Richard II, passed two years before his deposition, is described in the repealing act (1 Henry IV, chap. 10) as having left matters in such doubt that "there was no man which did know how he ought to behave himself, to do, speak or say." The War of the Roses, contrary to what might have been expected in that era of depositions and usurpations, passed without changes in the letter of the law. This is not to say, however, that every turn of political fortunes did not bring its score of attainders and executions. In the time of Henry VIII a great variety of new treasons were defined and the heads of many good men, including Thomas More, author of 'Utopia,' fell under the ax. It had become misprision of treason to assert the papal authority, and high treason to refuse to take the oath of abjuration; to will or wish or desire, or by any craft to imagine, any bodily harm to the king or queen or heir to the throne or to deprive either of them of their titles or regal powers; to utter slanders or libels pronouncing the sovereign a heretic, tyrant, infidel or usurper; to question the legality of some of his marriages or to assert the legality of others. These "war measures," which were repealed

immediately on Henry's death, had been intended to fortify him in his opposition to the Pope, and to assure the royal succession in his heirs by making it dangerous to question their legitimacy. One of the first acts of Queen Mary's reign was to restore the statute of Edward III in its integrity by a general repeal of all treason laws subsequently enacted. Since then no permanent additions were made to the statute until the reign of Victoria. A curious law passed in Mary's reign declared it treasonable to "pray that God would shorten the life of the queen." This was re-enacted in the time of Elizabeth and made applicable to her. A statute of Elizabeth making it treason for a priest to grant absolution for disloyalty to the Crown was continued in the reign of James I. By the statute 13 Charles II, chap. 1, it was declared high treason to display, "by writing, preaching or malicious speaking," any intention to depose the king or to do him bodily harm tending to his death, wounding or imprisonment. All of these laws and one or two others not mentioned have expired by limitation or become obsolete.

The meaning of the words of the Statute of Treason had been greatly extended meanwhile by judicial interpretation. In the case of the Earl of Essex the judges advised that it was rebellion when a subject attempts to put himself in such strength that the sovereign will be unable to resist and govern according to his own royal authority and direction; also, that in every rebellion the death of the sovereign must be presumed in law to be the consequence of success, "for the rebel will never suffer that king to live and reign, who might punish or take revenge of his treason or rebellion." Conspiracy to levy war, which might manifest itself in words spoken or printed, though not treasonable according to the letter of the law, was considered an "overt act" for "compassing or imagining" the death of the sovereign, and, therefore, evidence to prove high treason. Like effect has been given to concerting with foreigners or others to invade the kingdom, or to go, or even purpose going abroad, with that end in view. Nor would armed violence have to be carried into England to prove an intent to compass the death of the sovereign; the statute was held to refer not to the natural life of the king but to his political existence. A conspiracy to invade Canada and an insurrection in Ireland were both regarded evidence of an imagining of the king's death. In drawing the line between tumultuous petitioning and levying war the courts have not been consistent. The most authoritative is Lord Mansfield's pronouncement (A.D. 1780) with respect to the Gordon riots: "If this multitude assembled with the intent, by acts of violence, to compel the legislature to repeal a law, it is high treason." But Lord Gordon was acquitted. The trials of Hardy, Horne Tooke and others in 1794 involved interpretations of the meaning of the words "imagining the king's death." The charge was a conspiracy to depose the king and put him to death, and the overt acts alleged were: Consultations to procure a convention to be assembled with intent to subvert the government; the circulation of books

and pamphlets recommending the choice of delegates; consultations concerning the call of the convention; and the provision of arms for treasonable purposes. The purpose of the agitators was to obtain universal suffrage, annual parliaments, and the alleged design to depose the king and set up a republic was not proven. The prosecution failed.

The Constitution of the United States declares that "treason shall consist only in levying war against the United States or adhering to their enemies, giving them aid and comfort." In making this very close definition the founders of the republic were, no doubt, affected by the judicial interpolation of "constructive treason" into the words of the English statute, by the numerous prosecutions and convictions in England for "petty" treason, and the frequency with which the law against the subversion of the state had been invoked as the means of suppressing political agitation and of punishing men merely for their opinion. Therefore, nothing less than a purpose to overthrow the government by armed force, when manifested by an overt act of violence, was to be regarded as levying of war constituting treason. Prior to the Civil War period there were only two important prosecutions for this crime in the United States, and the leaders of the Whisky Rebellion of 1794, though convicted of treason, were afterward pardoned by the President; while Aaron Burr, who had been charged with the design to conquer the southwestern territory of the United States in connection with his hair-brained enterprise against Mexico, was acquitted. The difference between tumultuous assemblies, riots and insurrection is held in this country to be a difference in character, not merely in degree. Disturbances of great violence, extending over large areas, including several States, though practically subverting the public authority for a time and requiring the intervention of Federal troops, have not been regarded as levying of war, a purpose to overthrow the government not being shown. But the seizure of an arsenal by John Brown was deemed sufficient proof of such a purpose. The provision which defines treason as adherence to the enemies of the country, or giving them aid and comfort, allows American legislators greater latitude. This provision becomes active only in times of war; but it is precisely at such times that the safety of the state requires a sharpening of the terms of the law as well as of the methods of its enforcement. The formation of secret societies and conspiracies, the utterance of slanders or libels against the government, opposition to its policies or military measures by agitation, as well as by physical obstruction, or anything that tends to hinder or embarrass the government in the conduct of war, may, in such times, take the aspect and color of treason; and all the things referred to might be so declared, because of the aid and comfort they would possibly give the enemy. A public speech, a published writing, a confidential correspondence, a secret conference would, either of them, be a sufficient overt act. As for intention, the law presumes every person to intend that which follows as a natural consequence of his action.

In practice, however, American war measures against the giving of moral aid or comfort to the enemies of the nation have been in the form of sedition laws. Actual consorting or conspiracy with the enemy would, of course, constitute high treason. The Articles of War, which are part of the statutory law of the United States, declare corresponding with the enemy; relieving the enemy with money, victuals or ammunition; or harboring or protecting an enemy, to be capital crimes. See MILITARY LAW.

STEPHEN PFEIL.

**HIGHBINDERS**, a name given to a secret organization among the Chinese in the United States which has caused much bloodshed in the Chinese quarter of San Francisco, Cal., necessitating intervention on the part of the authorities. The Chinese call these societies "hatchet" societies, and the members "hatchet men." The organization seems to be an offshoot of the Six Companies (q.v.), though some claim that it is merely a revival of one which originated over 200 years ago in China.

**HIGHER CRITICISM**, The. The higher criticism is a science whose aim is the determination of the literary history of books and writings. It sets forth the facts and principles by which we must determine, in the case of any writing, its literary form, its unity, its date, the place of its composition, its authorship, the method of its composition or construction, its integrity and the amount and character of any subsequent editing it has received, so far as these matters can be discovered by the use of such internal evidence as is presented in the writing itself. It is thus the science for ascertaining the literary form and the literary history of any writing by means of internal evidence. These same matters may also be determined, in part or in whole, by external evidence in many cases; that is, by history or tradition. This latter method will not necessarily be either better or worse than the method which employs internal evidence. The greater probability of the result, in every case, will depend upon the amount and the character of the evidence which is attainable. Sometimes external evidence may be more abundant and trustworthy than the internal evidence, and sometimes the reverse may be true.

The science under consideration is termed higher criticism to distinguish it from the related science of lower, or textual, criticism. This latter science has for its object the ascertaining of the history of writings as the work of penmen and printers. It seeks to determine just the words and the letters which the author himself wrote, and what are the changes which his work has suffered in transmission. Since the literary history of a writing is, on the whole, of more importance than the history of the written or printed text, the science of the literary history is justly termed the higher criticism.

The higher criticism is a science which is equally applicable to all literatures. It may be used to determine the literary history of a writing of any age, language or people. But, of late, it has been especially brought into notice in its application to the literature of the Bible. On this account, it is sometimes spoken of as

if it were a science belonging to Biblical study only. But the fact is that Biblical higher criticism is only one department of higher criticism in general.

As employed in Biblical study, higher criticism adopts the following method: (1) it sets forth the principles by which, according to the teachings of general literary criticism, we may correctly determine the literary form, the unity, the date, the place of composition, the authorship, the method of composition or construction, the integrity, the amount and character of subsequent editing, of each of the Biblical books and writings; (2) it then presents the evidential facts to be found in each of the Biblical books and writings, to which these principles will apply; and (3) finally it gives the conclusions which result from the application of these principles to the evidential facts. In practice, however, different schools of Biblical higher critics come to very different conclusions upon the same basis of evidential facts, while using the same principles of criticism. This results from the varying opinions held by these critics in relation to the value and significance of the evidential facts, due to their differing views about the history of Israel, and their philosophical convictions concerning the place of the supernatural in that history. Those critics who refuse to allow the existence of any supernatural element in the history of Israel, and hold that this history was the product of only those forces which shape and determine all human history, so that it was exactly like the history of every other people, cannot put the same value and meaning upon the historical testimony and references to be found in the Biblical books, as those critics must who believe that the history of Israel was, to no inconsiderable extent, a supernatural history, and, therefore, different from the history of every other people. In the case of the Old Testament, for example, some critics hold, because of their philosophical opinions in regard to the supernatural, and the universality of the working of the evolutionary forces of history, that the historical material of the Old Testament, as we now have it, is not to be accepted as the true basis of Old Testament history, and that this history must be constructed out of this material, under the guidance of some philosophical theory. Other critics accept the historical material which is now to be found in the Old Testament, as furnishing in itself the true Old Testament history. Since the evidential facts used in higher criticism receive their value and meaning from their evident relation to a previously determined history, it is clear that each of two so different histories cannot be a basis for the same critical conclusions. But it is to be noted that the determination of the histories is not a work of higher criticism, but is a matter which results from the philosophical opinions held by historians. The consequence of these facts is that the only results which have thus far been reached by Biblical higher criticism, which all schools of critics would accept, seem to be: (1) The existence of different documents in the Pentateuch, which have been used in its compilation, although there is, among critics, quite a little difference of view in relation to the age of these documents and the time of their compilation into

the Pentateuch; (2) the plural authorship of the books of the Old Testament known as the books of Isaiah and Zechariah; and (3) the fact that older sources have been used in the making of the synoptic gospels and the book of Acts. From all that has been said, it will be seen that it is not the duty of higher criticism to assert or deny anything in relation to the inspiration of the Scriptures, or their authority for belief or conduct. With these matters this science has absolutely nothing to do.

SYLVESTER BURNHAM, D.D.,  
*Formerly Dean of the Hamilton Theological Seminary, Colgate University.*

**HIGHER LAW**, a famous phrase used by William H. Seward (q.v.) 11 March 1850, in the United States Senate, on the admission of California as a State, which was held up by the Southern element to force the Congress to admit it as a slave State, or at least to divide it on the line of the Missouri Compromise (q.v.). Seward denied that the principle of compromise applied only to slavery, which was only one of many institutions, and held it equally applicable to the Territories, which were a possession to be enjoyed and administered in common by the States; and declared that the older States had no arbitrary power over them. He went on: "The Constitution regulates our stewardship; the Constitution devotes the domain to union, to justice, to defense, to welfare, to liberty. But there is a higher law than the Constitution, which regulates our authority over the domain, and devotes it to the same noble purposes. The territory is a part . . . of the common heritage of mankind, bestowed upon them by the Creator of the universe. We are his stewards, and must so discharge our trust as to secure in the highest attainable degree their happiness." And to Webster's assertion that it was absurd to re-enact the laws of God, he answered that "there is no human enactment which is just that is not a re-enactment of the law of God." It was his first set speech in the Senate, and at once made him the recognized leader of the radical section. The conservatives denounced it as treasonable, implying that no one was under any obligation to support the Constitution if he believed it in opposition to the law of God, and making the execution of any laws impossible.

**HIGHER PLANE CURVES.** See **CURVES, HIGHER PLANE.**

**HIGHLAND CATTLE,** a variety of small, rough-coated, usually red or black cattle, with upturned horns, kept half wild upon the moors of the Scottish Highlands, and believed to represent in part the cattle of the aboriginal Britons, which are replaced in the south of Great Britain by the short-horned breeds introduced by the Roman conquest. Compare **WHITE CATTLE.**

**HIGHLANDERS,** Scotch, in the United States. After the Jacobite risings in England in 1715 and 1745, in favor of the Old and Young Pretenders, which were zealously supported by the Highlanders (who indeed formed their backbone), the English government exerted itself to drain their strength by colonizing them elsewhere; and many who were in danger of vengeance came to America voluntarily. The chief movement was after 1745, when the government thoroughly reorganized the Highlands, broke up the clans and deported large numbers to the colonies; but after 1715 many, in bands or as individuals, had come over, especially to the Carolinas. Some settled in western South Carolina, as farmers or Indian traders; a considerable body near Fayetteville, N. C., where their descendants still speak Gaelic in preference to English, and have their church ministrations in that language; and a number of different colonies in the future Georgia, where Oglethorpe found them when he came over in 1733 with a patent for a new colony. Especially he won the hearts of a settlement at Darien, under a Captain Mackay. These Highlanders gave him priceless help in his incessant fights with the Spaniards and constant negotiations with the Indians; but they strongly opposed the slave trade or the introduction of slaves into Georgia. Some Highland companies sent to the Mohawk Valley, during the French and Indian War, were disbanded there, and remained as settlers, a recognizable element during the Indian troubles of the early Revolution.

**HIGHWAY SYSTEMS AS RELATED TO SCHOOLS.** See **EDUCATION, RURAL.**

**HILARION, Saint,** a hermit of Palestine, said to have been the first to introduce monasticism into Palestine: b. Tabatha, 291; d. Cyprus, 371. He studied at Alexandria, and then became a hermit under Saint Anthony. Inspired by the example of that hermit, he returned to Palestine and began to live his solitary life in a little hut in the vicinity of Majuma, the port of Gaza. He spent his days weaving baskets of rushes to keep himself alive, and practising the most vigorous asceticism. The wonders he accomplished inspired many others to emulation, and in this way the hermetical life became established in Palestine. In 356 he revisited Egypt, and with his disciple, Hesychnius, lived at Sicily for a time. The story of his great piety and his power of healing so extended his popularity in the island that the crowds who flocked about him soon became unendurable, and he went further into Epidaurus in Dalmatia. He spent his last days at Cyprus, but it is said that his remains were removed to the place of his first isolation by his faithful disciple. The chief source of information concerning Saint Hilarion

is the biography by Jerome based on a eulogistic letter, now disappeared, written by Epiphanius of Salamis. The facts are somewhat obscure and are difficult to establish. Saint Hilarion's day is celebrated on the 21st of October. Consult Migne (Vol. III) for the original source; and also Israel, W., 'Die Vita S. Hilaronis des Hieronymus als Quelle für die Anfänge des Mönchthums kritisch untersucht' (in *Zeitschrift für wissenschaftliche Theologie*, Jena 1880); and Zöckler, O., in 'Neue Jahrbücher für deutsche Theologie' (Vol. III, 1894).

**HILARY, Saint,** bishop of Poitiers: b. Poitiers, 330; d. there, 367. His parents were pagan, and by his own studies he became convinced of the truth of Christianity and accepted baptism. He became bishop of Poitiers some time before 350. His defense of the Nicene creed against the Arians resulted in his banishment to Phrygia. While there he produced his important work, 'De trinitate,' explaining his views on the subject of the trinity, chiefly for the benefit of those bishops who were inclined toward Arianism. He was released before the convocation of bishops at Seleucia, where he devoted his energy and attention to supporting the cause of the Homoiousian party against the Arians. In 361 he was sent back to his diocese, but soon found himself in great disfavor at the court because of his impeachment of Auxentius, bishop of Milan. His visit to Constantinople was the occasion for his great hatred of that monarch, which he expressed in his letter, 'Contra Constantium.' As a Latin author he was in high repute in his time. His day is 13 January. His works were published in Migne, 'Patrologia Latina' ix, x. Consult Harnack, A., 'History of Dogma' (Vol. IV, Boston 1899).

**HILARY OF ARLES (HILARIUS ARELATENSIS), Saint,** bishop of Arles: b. about 403; d. at Arles, about 450. He entered the monastery of his relative, Honoratus, bishop of Arles, and succeeded him in the office. His efforts to extend the primacy of Arles over all of southern Gaul met with opposition on the part of Pope Leo the Great, and he was deposed from his see. His day is celebrated on 5 May. His extant works are preserved in Migne, 'Patrologia Latina' (Vol. I, pp. 1213-92).

**HILDA, Saint,** Anglo-Saxon abbess: b. about 614; d. 680. She was consecrated as a nun by Bishop Aidan, and was successively head of the abbey of Hartlepool and of the famous monastery founded by her in 657 at Whitby, Yorkshire. This continued for several centuries a religious house of great power and influence, in the time of its founder perhaps the strongest in Great Britain. Cædmon (q.v.), the Anglo-Saxon poet, was attached to the monastery during her rule and it was there that the celebrated synod took place in 664 in which the Celtic ritual was condemned. Consult Bede, 'Ecclesiastical History.'

**HILDEBERT OF TOURS,** French ecclesiastic and author: b. Lavardin, about 1055; d. Tours, 1133. According to tradition, he was a pupil of Berengarius and became a teacher at Le Mans, where he was made bishop in 1096. Having antagonized part of his clergy, he was taken prisoner by William II and carried off to England for a year. He was transferred in

1125 to Tours, where he was engaged in constant quarrels with other bishops and with the king of France, Louis VI. He presided over the Synod of Nantes in 1127. His works, consisting of letters, theological discussions, sermons and poems, were first published by Antoine Beaugendre (Paris 1708). Later research has proven these documents to be poorly edited since they include some spurious works. His Latin writings were extremely popular in his century. The poems were collected by Hauréau under the title 'Les mélanges poetiques d'Hildebert de Lavardin' (Paris 1882). Consult Dieudonné, L., 'Hildebert de Lavardin . . . Sa vie et ses lettres' (Paris 1898).

**HILDEBRAND.** See GREGORY VII, POPE.

**HILDEBRAND, Bruno**, German economist: b. Naumburg-an-der-Saale, 1812; d. 1878. He received his education at Breslau and Leipzig universities and in 1839 was appointed professor at the former institution. Two years later he became professor at the University of Marburg. In 1846 he contributed an article to a London journal and its tone giving offense to the authorities Hildebrand was suspended from his chair. He was reinstated in 1849 and in the Frankfurt Assembly sat as a member from Marburg. In 1851 he became a teacher in the Zürich High School and in 1856 was made first chief of the Swiss Bureau of Statistics at Bern. In 1861 he removed to Jena as professor at the university there and chief of the Bureau of Statistics. After 1863 he was editor of the *Jahrbücher für Nationalökonomie und Statistik*. He published 'Nationalökonomie der Gegenwart und Zukunft' (1848); 'Die kurhessische Finanzverwaltung' (1850); 'Statistische Mitteilungen über die volkswirtschaftlichen Zustände Kurhessens' (1853); 'Beiträge zur Statistik des Kantons Bern' (1860).

**HILDEBRANDSLIED**, an Old High German poetic fragment, written about 800 A.D. by two monks of the monastery at Fulda, on the cover pages of a Latin manuscript, now preserved at Kassel. It treats the theme, rather frequent in Aryan (Indo-European) legend, of the unequal combat between an old, and therefore stronger, father, and a younger, weaker son, with the inevitable outcome that the son (Hadubrant) is slain by his father (Hildebrant). (Consult Matthew Arnold, 'Sohrab and Rustum'). It was first printed by J. G. von Eccard in 'Commentarii de rebus Franciæ' (1729) and identified by the Grimm brothers as an alliterative recitative poem; published Kassel 1812 and Göttingen 1830; also by Eduard Sievers (Halle 1872) and in Müller's 'German Classics' (Vol. I, New York 1900). It is 68 lines long. Consult Lachmann, K., in *Philol. Abhandlungen der Berliner Akad.* (1833, pp. 123ff.); Lachmann, K., 'Kleine Schriften' (I, p. 407); Vetter, F., 'Zu Muspilli und germanischer Allitterationspoesie' (Wien 1872); Hermens, 'Über das Hildebrandslied' (Berlin 1877); Wadstein, 'Das Hildebrandslied' (Gothenburg 1903); Th. v. Grienberger, 'Das Hildebrandslied' (Wien 1908).

JACOB WITTMER HARTMANN.

**HILDRETH, Richard**, American historian: b. Deerfield, Mass., 22 June 1807; d. Florence, Italy, 11 July 1865. He was graduated at Harvard in 1826, studied law at Newburyport, entered practice in Boston and abandoned it in

1832 to become editor of the *Boston Atlas*. In this position a series of articles by him in 1837, relative to the separation of Texas from Mexico, did much to stimulate the resistance which that movement encountered in the free States. In 1834 his anti-slavery novel, 'The Slave,' was written. This work was republished and favorably received in England and in 1852 an enlarged American edition appeared under the title of 'The White Slave: Memoir of Archy Moore' (1837). In 1837-38 he was Washington correspondent of the *Boston Atlas* and resumed his editorial post as an advocate of the election of General Harrison, of whom he wrote a campaign biography. He then abandoned journalism, and in 1840 published, under the title of 'Despotism in America,' a volume on the political, economical and social aspects of slavery, to which in the edition of 1854 was appended a chapter on the 'Legal Basis of Slavery.' In 1840-43 he resided in Demerara, British Guiana, and at Georgetown edited two free labor newspapers. Later, for several years, he was a member of the New York *Tribune* staff and in 1861 was appointed United States consul at Trieste. His best-known work is his 'History of the United States' (1849-56), which extends from 1492 to the end of President Monroe's first term. The author sought an authentic presentation of the conspicuous figures of earlier American history. His work is accurate and careful, though with a Federalistic viewpoint; but so uninteresting in manner as to be ill-adapted for continuous reading. Hildreth also wrote 'Theory of Morals' (1844); 'Theory of Politics' (1853); 'Japan as it Was and Is' (1855); and 'Atrocious Judges' (1856).

**HILGARD, hil'gård, Eugene Woldemar**, German-American chemist and geologist: b. Zweibrücken, Bavaria, 5 Jan. 1833; d. Berkeley, Cal., 8 Jan. 1916. He came to the United States in 1836, returned to Europe for purposes of study and was graduated (Ph. D.) at Heidelberg 1853. In 1858 he became State geologist of Mississippi, in 1873 was appointed professor of geology and natural history in the University of Michigan and in 1875 was made professor of agricultural chemistry and director of the agricultural experiment station in the University of California. He became professor emeritus in 1909. He received the Liebig medal from the Munich Academy of Sciences in 1894, and his investigations into the chemistry and physics of soils have done much to promote agricultural science. He was a member of the Northern Transcontinental Survey which in 1880-83 studied the agricultural possibilities of Montana, Oregon and Washington. Much of his work was published in the bulletins of the California Agricultural Experiment Station. He published 'Report on the Geology and Agriculture of Mississippi' (1860); 'Report on the Agricultural Features of the Pacific Slope' (1882); 'Memoir on the Rock-Salt Deposit of Petite Anse, La.' (1872); 'Soils of the Arid and Humid Regions' (1906); 'Agriculture for Schools of the Pacific Slope,' with W. J. V. Osterhout (1909).

**HILL, Ambrose Powell**, American military officer: b. Culpeper County, Va., 9 Nov. 1825; d. 2 April 1865. He was graduated at the United States Military Academy 1847; served

in the Mexican War, but resigned from the army in March 1861, and was made colonel of the 13th Virginia regiment of the Confederate army. Having distinguished himself in service, he was promoted major-general in May 1862, and lieutenant-general 20 May 1863, and placed in command of one of the three corps of the Army of Northern Virginia. He led his corps at Gettysburg and later at Bristow Station and the assault on the Weldon Railroad in 1864. He was killed in the attack on Petersburg, Va.

**HILL, Benjamin Harvey**, American legislator; b. Jasper County, Ga., 14 Sept. 1823; d. 16 Aug. 1882. He was graduated at the State University of Georgia in 1844 and chose law as a career. In 1851 he was elected to the State legislature. He in vain attempted to withstand the secession sentiment of his State, but at last yielded to the movement, and was elected to the Provisional Confederate Congress, and from the assembly promoted to the Confederate Senate. He supported Greeley for the Presidency in 1872, and was defeated for the United States Senate the following year, but after being elected to the House of Representatives in 1875 was given a seat in the United States Senate 1876 and held it for the remainder of his life.

**HILL, Daniel Harvey**, American military officer; b. Hill's Iron Works, York District, S. C., 12 July 1821; d. Charlotte, N. C., 24 Sept. 1889. He was graduated at the United States Military Academy in 1842, and served in the Mexican War; became professor of mathematics and military tactics in Washington College, Va., in 1849, professor of mathematics in Davidson College, N. C., in 1854; and was made president of the North Carolina Military Institute in Charlotte in 1859. At the outbreak of the Civil War he entered the Confederate army as colonel; was promoted to lieutenant-general in 1863, and commanded a corps at the battle of Chickamauga. After the close of the war he resumed his educational work, and in 1877 became president of the Arkansas Industrial University, where he remained until shortly before his death.

**HILL, David Bennett**, American lawyer and politician; b. Havana, N. Y., 29 Aug. 1843; d. 20 Oct. 1910. He entered a law office in Elmira, N. Y., in 1862, and after admission to the bar in 1864 rapidly built up a law practice and was an acknowledged leader of the local bar. He was active in politics, and acquired a leadership there also, through his genius for organization. He was a member of the State assembly 1870-71, and president of the Democratic State Convention in 1877 and 1881. In 1882 he was elected mayor of Elmira and lieutenant-governor in the same year, with Cleveland as governor. In 1885, when Cleveland resigned to take up his duties as president, Hill became governor. He was subsequently twice elected governor, serving till January 1892, when he took his seat in the United States Senate. During his first administration as governor, the legislature was Republican and he was involved in a number of partisan struggles. As senator, he opposed on some issues the policy of President Cleveland; he was also opposed to the income tax clause of the Wilson Tariff Bill. In 1892 he was a prominent can-

didate for the presidency at the Democratic National Convention and at the convention of 1896 was one of the chief leaders of those who favored the gold standard and were opposed to radicalism in the party. In 1894 he was again candidate for governor of New York State, but was defeated by Levi P. Morton. In 1902 he practically dominated the Democratic State Convention and was active throughout the campaign.

**HILL, David Jayne**, American educator and diplomat; b. Plainfield, N. J., 10 June 1850. He was educated at Bucknell University, where he became professor of rhetoric 1877-79, and president 1879-88. He was president of Rochester University, New York, 1888-96, resigning to spend three years in Europe studying international law and diplomacy. He was First Assistant Secretary of State 1898-1903; Minister to Switzerland 1903-05, to the Netherlands 1905-08 and from 1908-11 to Germany. In 1914 he was an unsuccessful candidate for the United States Senate from New York to succeed Elihu Root. He is a member of the Permanent Administrative Council of The Hague Tribunal and was delegate to the Second Peace Conference at The Hague. He has written biographies of 'Washington Irving' (1879); 'William Cullen Bryant' (1879); 'Principles and Fallacies of Socialism' (1885); 'International Justice'; 'A Premier of Finance'; 'Genetic Philosophy' (1893); 'The Life and Work of Hugo Grotius' (1902); 'The Conception and Realization of Neutrality' (1902); 'A History of Diplomacy in the International Development of Europe' (1905), of which three volumes of six have appeared; 'World Organization as Affected by the Nature of the Modern State' (1911; French and German translations); 'The People's Government' (1915); 'The Rebuilding of Europe' (1917).

**HILL, Frank Alpine**, American educator; b. Biddeford, Me., 12 Oct. 1841; d. Brookline, Mass., 12 Sept. 1903. He had been long prominent among New England educators, and after being head-master of high schools in Milford, Chelsea and Cambridge, Mass., became secretary of the Massachusetts State Board of Education in 1894. He was a trustee of the Massachusetts Institute of Technology, of the State Agricultural College at Amherst and of the Boston Museum of Fine Arts, as well as a commissioner of the State School Fund.

**HILL, Frank Pierce**, American librarian; b. Concord, N. H., 22 Aug. 1855. He was graduated from Dartmouth in 1876 and received the degree of LL.D., 1906. In 1881 he became librarian of the Lowell public library, and in 1885 he organized the first free public library in New Jersey at Paterson. He also organized the Salem public library and the Newark library in 1889. At Newark a new building was erected under his administration and the library brought to a high degree of efficiency so that it is recognized as one of the model public libraries. In 1901 he was appointed chief librarian of Brooklyn and under his administration the library has grown from a system of 18 branches with an annual circulation of 944,128 to a system of 31 branches and 13 stations with an annual circulation of 5,875,190 and now ranks as the second largest public library in the United States. During this period 20 buildings were

erected under the gift of Mr. Carnegie and plans made for a magnificent central library building which will cost approximately \$5,000,000. He was secretary American Library Association 1891-95 and president in 1906.

**HILL, Frederic Stanhope**, American sailor and author: b. Boston, 24 Aug. 1829. He went to sea when a boy, and during the Civil War was an officer in the United States navy. He was with Farragut at the capture of New Orleans and Vicksburg, and was also in command on the Texas coast and in the Mississippi squadron. He has written 'Twenty Years at Sea' (1896); 'Story of the Lucky Little Enterprize'; 'Twenty-six Historic Ships' (1903); and has been editor of the Cambridge *Tribune*.

**HILL, George Birkbeck**, English educator and author: b. Tottenham, Middlesex, 7 June 1835; d. Hampstead, London, 27 Feb. 1903. He was a nephew of Sir Rowland Hill (q.v.), was educated at Oxford, and was head-master of Bruce Castle School 1859-76. Since the latter date he had devoted his attention to literature, especially to the literary history of the 18th century. He was an authority on Dr. Johnson and his contemporaries. He was well known in the United States through his 'Harvard College, by an Oxonian' (1894). Other works by him are 'Talks about Autographs' (1896); 'Dr. Johnson: his Friends and his Critics' (1878); 'Life of Sir Rowland Hill' (1880); edited Boswell's 'Life of Johnson' (1881-87); 'Footsteps of Dr. Johnson in Scotland' (1890); 'Memoirs of the Life of Edward Gibbon' (1900); 'Letters of Dante Gabriel Rossetti' (1897); 'Letters written by a Grandfather' (1903); and, posthumously, a volume of 'Letters' (1907).

**HILL, James Jerome**, American railroad promoter and financier: b. near Guelph, Wellington County, Ontario, Canada, 16 Sept. 1838, of Scotch-Irish parentage; d. Saint Paul, Minn., 29 May 1916. Until his father's death, when the boy was in his 15th year, he attended a neighboring academy. After that he was employed in a country store, until in search of larger opportunities he reached Saint Paul, Minn., in 1856, after visiting different parts of the country. As clerk or agent he was employed in the Mississippi River steamboat business for the next 12 years; and in 1870 established the Red River Transportation Company. This gave service between Saint Paul and Winnipeg, and through it Mr. Hill obtained an idea of the immense coming importance of transportation in the Northwest. In 1878, a syndicate of four men, of whom Mr. Hill was one, bought the defaulted bonds of the Saint Paul and Pacific Railroad Company. It had been in the receiver's hands since 1873 and Mr. Hill was one of the few men who believed in its future. In 1879 this property was organized as the Saint Paul, Minneapolis and Manitoba Railway Company and was completed and rapidly extended westward. Mr. Hill was general manager, became vice-president in 1881 and president in 1882. The latter office he held for 25 years. This enterprise contemplated, from an early date, the extension of the line to the Pacific Coast. This was built, through a difficult and unsettled country, by private financing, without the government's assistance. The road was completed to Seattle, on Puget Sound, in 1893.

Between 1881 and 1883 Mr. Hill was interested with other capitalists in building the Canadian Pacific line. His energy and interest were, however, concentrated upon the rounding out and perfecting of his own system. It was extended to Duluth and connected with steamships owned by the railroad and operating on the Great Lakes. By 1890 all the lines of the system were united in the Great Northern Company. Steamships were built to run from Puget Sound ports to Japan and China. Some lands containing iron ore had been bought by Mr. Hill, as a private citizen, in 1889. The ore deposits, being large and valuable, were turned over to a company formed to hold them with others purchased later. The entire property was distributed later among holders of Great Northern stock. The Great Northern and the Northern Pacific together purchased, in 1901, the Chicago, Burlington and Quincy Railroad Company. Together they also built the Spokane, Portland and Seattle line along the north bank of the Columbia River. Connections of the Great Northern thus gave it access to all important markets and ports in the country. Mr. Hill resigned as president in 1907, to become chairman of the board of directors. He was succeeded in his former office by his son, L. W. Hill. From 1912, when he resigned the chairmanship, he held no official place in the company. Both personally and financially he was as closely identified as ever with the great property that was so largely his own creation. Among the diverse interests of Mr. Hill's life, other than railroad work, was agricultural improvement, which he instigated and assisted throughout the Northwest. From the beginning the prosperity of the farm and the prosperity of the railroad were identical to his mind. In addition to that, he believed that the chief interest everywhere rests finally on the foundation of the farm. He gave much of the study and efforts of his best years to ascertaining methods of raising and maintaining soil fertility, and of increasing the quality and quantity of the acre product. His opinion was widely sought on many subjects; and he took a lively interest in art, literature and economic and civic questions. Consult Pyle, Joseph Gilpin, 'The Life of James J. Hill' (2 vols., New York 1917).

**HILL, Octavia**, English housing and social reformer: b. about 1838; d. 13 Aug. 1912. She began work among the London poor under F. D. Maurice (q.v.); and in 1864, supported by Ruskin, began her great work of improving the homes of workmen in the slums of London. Her methods were based upon the principle of teaching the people to help themselves, by inculcating in them right notions of cleanliness, order and self-respect. Her efforts were crowned with success; the houses which were improved yielded a good percentage on the money spent in effecting the improvements; and through her hundreds have been helped to lead more comfortable and better lives. She was a member of the Poor Law Commission of 1905, and was the author of 'Homes of the London Poor' (1875); 'Our Common Land and other Essays' (1878). Consult her 'Life as told in Her Letters' (1913).

**HILL, Robert Thomas**, American geologist: b. Nashville, Tenn., 11 Aug. 1858. He

was graduated from Cornell University in 1866 and was immediately given a position on the United States Geological Survey. He was also a lecturer in the school of economics at the University of Michigan, and professor of geology at the University of Texas for two years, which position he resigned to return to the United States Geological Survey. He has been engaged in geological and geographical explorations in the Southwestern States, Mexico, Central America and the West Indies. His work in the two last-mentioned localities has been the investigation of the origin of the land forms, and the problem of the union of the continents. Among his most valuable contributions to geological science have been the proof of the existence of the lower cretaceous formation in the United States and the announcement of the possibility of artesian wells in Texas. In May 1902 he was sent by the National Geographical Society at the head of the expedition to investigate the volcanic eruption of Mount Pelée in Martinique. His publications include 'On Occurrence of Artesian and Other Underground Waters in Texas, Eastern New Mexico, and Indian Territory' (1892); 'Cuba and Porto Rico with other Islands of the West Indies' (1898); and numerous contributions to the bulletins of the Geological Survey and periodicals.

**HILL, Rowland**, English popular preacher: b. Hawkstone, Shropshire, 23 Aug. 1744; d. London, 11 April 1833. He was ordained in the Anglican Church, but embracing the views of the Calvinistic Methodists, soon began to preach in barns and meeting-houses, and when they were too small or too distant, or not to be procured, in streets, fields and highways. In 1783 he laid the foundation of Surrey Chapel, Blackfriars road, London, where he preached with great success every winter for about 50 years, making summer excursions to the provinces, where his eloquent but eccentric preaching attracted immense crowds. He played a conspicuous part in the religious and philanthropic activities of his time. He published sermons and other theological works, of which the best known are his 'Village Dialogues.' Consult his 'Life' by Sidney (1833); and by Jones (1834).

**HILL, Rowland**, 1st Viscount, English soldier, nephew of Rev. Rowland Hill (q.v.): b. Prees, Shropshire, 11 Aug. 1772; d. near Shrewsbury, England, 10 Dec. 1842. He entered the army in 1790 and served with distinction in the campaigns from Toulon to Waterloo. In 1812 he was made a K.B., and in 1814 was created Baron Hill. At the battle of Waterloo, Lord Hill commanded the right wing of the British. In 1828 he was appointed general commanding-in-chief of the British army. This important office he continued to hold under several successive ministries, and only resigned it a few months before his death. He was made a viscount in 1842. He was often styled "the right arm of Wellington." Consult Sidney's 'Life of Lord Hill' (1845).

**HILL, Sir Rowland**, English postal reformer: b. Kidderminster, 3 Dec. 1795; d. 27 Aug. 1879. He conducted a school near Birmingham in his earlier years on what was known as the Hazelwood method, from the name of the school, the feature of which was a system of self-government by the boys them-

selves. In 1833 he abandoned this work, and shortly after this he was appointed secretary to the commissioners for the colonization of South Australia. He began to interest himself in postal matters, and was amazed to find that in the face of enormously expanding trade, under a high tariff of charges post office receipts were declining, whereas in France, with low rates, they were rapidly increasing. In 1837 he published a pamphlet recommending the adoption of a low and uniform rate of postage throughout Great Britain and Ireland. The scheme was approved by a committee of the House of Commons, and early in 1840 the penny postage system was carried into effect with the assistance of Rowland Hill, who, for this purpose, received an appointment in the Treasury. He applied himself to the work, and in spite of the obstruction of officialdom soon proved the merits of his system. In 1846 he received a public testimonial of the value of upward of £13,000. In 1846, he was made secretary to the Postmaster-General, and in 1854 chief secretary to the Post-office. In 1860 he became K.C.B. Consult his 'Life' and 'History of Penny Postage' (2 vols., 1880); Smyth, 'Sir Rowland Hill: the Story of a Great Reform' (1907).

**HILL, Thomas**, American Unitarian clergyman and mathematician: b. New Brunswick, N. J., 7 Jan. 1818; d. Waltham, Mass., 21 Nov. 1891. Left an orphan at 10 years; at 12 he was apprenticed to the printer of the *Fredonian* newspaper, where he remained four years. He then entered an apothecary's shop, after a year's attendance at school, and served in it several years. He was graduated from Harvard College in 1843; and from the divinity school in 1845, and was settled as pastor at Waltham the same year. He was president of Antioch College, Ohio, 1859-62. He accompanied Agassiz on his expedition to South America and was pastor of the Unitarian church at Portland, Me., 1873-91. He published 'Elementary Treatise on Arithmetic' (1845); 'Geometry and Faith' (1849); 'First Lessons in Geometry' (1855); 'Treatise on Curves' (1855); 'The Natural Sources of Theology' (1875); 'In the Woods and Elsewhere,' verse (1888), etc.

**HILL, Thomas**, American painter: b. Birmingham, England, 11 Sept. 1829; d. 1908. He came to the United States in 1841. Returning to Europe he studied under Paul Mayerheim for several months, but was practically a self-taught artist. He painted the 'Yosemite Valley' which was chromo-lithographed by Prang. He continued to confine himself to the grander aspects of American scenery, and notable among his productions are 'The Home of the Eagle'; and 'Grand Cañon of the Sierras'; 'White Mountain Notch'; 'Donner Lake'; 'Muir Glacier.' He spent most of his life after 1860 in San Francisco.

**HILL, Walter Barnard**, American lawyer and educator: b. Talbotton, Ga., 9 Sept. 1851; d. Athens, Ga., 28 Dec. 1905. He was graduated from the University of Georgia in 1870, and from the law school in 1871, with the degree of A.M. He was admitted to the bar, and practised law in Macon, Ga., from 1871 to 1899. He was a member of the Georgia Bar Association, and was its president in 1888; a member also of the American Bar Association and the chair-

man of the committee on judicial administration. He also was actively interested in educational progress, being trustee of Vanderbilt University at Nashville, Tenn. In 1899 he was appointed chancellor of the University of Georgia; as an educator he strongly approved the work of the Tuskegee and similar institutions for the negro. He wrote articles on legal and educational subjects and compiled the Law Code of Georgia (1873, 1882).

**HILL RIVER.** See HAYES RIVER.

**HILLARD,** hil'ard, **George Stillman,** American author and lawyer: b. Machias, Me., 22 Sept. 1808; d. Boston, 21 Jan. 1879. He was graduated from Harvard in 1828, and from the Harvard Law School four years later. He was a member of the Massachusetts senate in 1850, where his policy as a legislator was warmly commended by Daniel Webster; a member of the Massachusetts Constitutional Convention in 1853; and United States district attorney in 1866-70. Though successful as a lawyer his tastes were largely literary; he was well known as a lecturer; was editor of the *Christian Register* with George Ripley, and associate editor of the *Boston Courier*; wrote 'Six Months in Italy' (1853); 'Life of George Ticknor' (with Mrs. Ticknor); 'Life of George B. McClellan' (1864), and edited a series of school readers which bore his name, and the works of Spenser.

**HILLEBRAND,** Karl, German critic and historian: b. Giessen, 17 Sept. 1829; d. Florence, 19 Oct. 1884. For participation in the insurrection in Baden (1849) he was imprisoned, but escaped to France, where he was graduated at the Sorbonne, and in 1863 became professor of foreign languages at Douai. On the outbreak of the Franco-Prussian War, he removed to Italy and passed the remainder of his life there. He was a remarkable linguist, writing valuable books in French, German, Italian and English. Among these are 'Geschichte Frankreichs v. d. Thonbesteigung Ludwing Philipps bis zum Fall Napoleon III' (1848); 'Des Conditions de la Bonne Comedie' (1863); 'La Prusse Contemporaine' (1867); 'Public Instruction in the United States' (1869); 'Lectures on German Thought during the Last Two Hundred Years' (1880). Consult Homberger, 'Karl Hillebrand' (1884).

**HILLEGAS,** Howard Clemens, American journalist and author: b. Pennsburg, Pa., 30 Dec. 1872. He was graduated from Franklin and Marshall College, Lancaster, Pa., in 1894, and after being connected with several Pennsylvania journals was war correspondent of the *New York World* in South Africa 1899-1900. He has published 'Oom Paul's People' (1899); 'The Boers in War' (1900); 'With the Boer Forces' (1900).

**HILLEL,** Jewish rabbi, who flourished in the time of Herod. He was commonly called Ha-zaken, the elder, to distinguish him from others bearing the same name. Descended from an ancient family of Babylonia, he left his home to study law at Jerusalem. In order to earn a livelihood, he hired out as a day laborer, meanwhile studying diligently; and became an important authority on Jewish teaching and law. He was distinguished for the liberality of his thought and his interpretations of the

Scriptures and rabbinical teachings. Many fine sayings were attributed to him. He was president of the Sanhedrin for many years. By several modern writers, notably Renan, Hillel's influence on Jesus is given great weight. Consult Renan, 'Vie de Jésus' (Paris 1863); Geiger, A., 'Das Judentum und seine Geschichte' (Breslau 1865); Stapfer, E., 'Les Idées religieuses en Palestine à l'époque de Jésus Christ' (Paris 1878).

**HILLERN,** **Wilhelmine von,** German authoress: b. Munich, 11 March 1836. She is the daughter of a well-known novelist, Charlotte Birch-Pfeiffer. She was brought up in Berlin, became an actress at Gotha (1854), and married the prominent jurist von Hillern at Freiburg in Breisgau in 1857. Her husband died 8 Dec. 1882. She has since been living chiefly at Oberammergau and Tutzing. Her principal novels and short stories were produced during the 60's and 70's of the last century. One of them, 'Höher als die Kirche' (1877) is quite well known in America by reason of the fact that it is frequently read as a text by students of elementary German. It is a comparatively insignificant work, however, by no means so important as the novels, 'Ein Arzt der Seele' (Berlin 1869), 'Die Geyer-Wally' (Berlin 1875) and 'Und sie kommt doch' (Berlin 1879).

**HILLHOUSE,** James, American politician: b. Montville, 21 Oct. 1754; d. New Haven, Conn., 29 Dec. 1832. He was graduated in 1773 at Yale, of which institution he was treasurer from 1782. He studied law, and took an active part in the struggle of the Revolution; was a Federalist member of Congress in 1791, and in 1795-1810 a member of the United States Senate. He was also a member of the Hartford Convention of 1815. It was chiefly through his initiative in the planting of trees that New Haven came to obtain the title of "Elm City."

**HILLHOUSE,** James Abraham, American poet: b. New Haven, Conn., 26 Sept. 1789; d. near there, 4 Jan. 1841. He was the son of James Hillhouse (q.v.). He was graduated at Yale College in 1808, entered commerce in New York and published in London his drama of 'Percy's Masque,' reprinted in New York with changes in 1820. In 1822 he removed to a country seat near New Haven, where he passed the remainder of his life. In 1825 he published his second drama, 'Hadad'; and in 1839 a collected edition of his writings appeared under the title of 'Dramas, Discourses, and other Pieces.' His dramatic writings, once greatly praised, now appear grandiose and dull.

**HILLIARD,** hil'yard, **Henry Washington,** American lawyer: b. Fayetteville, N. C., 4 Aug. 1808; d. Atlanta, Ga., 17 Dec. 1892. He was graduated at South Carolina College in 1826, was admitted to the bar in 1829, in 1831-34 was a professor in the University of Alabama (Tuscaloosa), in 1838 was chosen to the Alabama legislature, in 1842-44 was United States chargé d'affaires in Belgium, and in 1845-51 represented an Alabama district in Congress. Though opposed to secession, he became a brigadier-general in the Confederate army. He was United States Minister to Brazil, in 1877-81. He wrote 'Speeches and Addresses' (1855); 'De Vane, a

Story of Plebeians and Patricians' (1865); and 'Politics and Pen Pictures' (1892).

**HILLIS**, hil'is, **Newell Dwight**, American Presbyterian clergyman: b. Magnolia, Iowa, 2 Sept. 1858. He was educated at Iowa College and Lake Forest University, studied theology at McCormick Theological Seminary, entered the ministry of the Presbyterian Church, and held pastorates at Peoria, Ill. (1887-90), and Evanston, Ill. (1890-94). In 1894 he was appointed pastor of the Central Church, Chicago, an independent congregation, and in 1899 of Plymouth Church of Brooklyn. He became known also as lecturer and has published 'The Investment of Influence'; 'A Man's Value to Society'; 'How the Inner Light Failed'; 'Fore-tokens of Immorality'; 'Great Books as Life Teachers'; 'The Influence of Christ in Modern Life'; 'The Quest of John Chapman' (1904); 'The Quest of Happiness' (1902); 'Success Through Self-Help' (1903); 'The Fortune of the Republic' (1906); 'Contagion of Character' (1911); 'Anti-Slavery Epoch' (1911); 'Prophets of a New Era' (1912); 'Story of Phædrus' (1913); 'Lectures and Orations of Henry Ward Beecher' (1913); 'Message of David Irving' (1913); 'Studies of the Great War' (1915).

**HILLSBORO**, Ill., city, county-seat of Montgomery County, on the Cleveland, Cincinnati, Chicago and Saint Louis and the Chicago and Eastern Illinois railroads, about 45 miles south by west of Springfield and 52 miles northwest of East Saint Louis. Its chief manufactures are flour, furniture, glass jars, woolen goods, carriages and wagons and dairy products. There is a coal-mine nearby and there are zinc and lead smelters, a condensed milk plant and a brickyard. It is the commercial centre of an agricultural section of the State. The waterworks are municipally owned. The commission form of government was adopted in 1911. Pop. 3,424.

**HILLSBORO**, Ohio, village, county-seat of Highland County, on the Norfolk and Western and the Baltimore and Ohio Southwestern railroads, about 60 miles southwest of Columbus and 50 miles east by north of Cincinnati. It is in an agricultural and stock-raising region. The chief manufactures are furniture, foundry products, flour, lumber, safes and vaults, chairs, overalls, dairy products and cigars. It is the trade centre for a large part of Highland County. It has a public library containing about 8,000 volumes, and a number of fine public and private buildings. The city owns and operates the waterworks. Pop. 4,296.

**HILLSBORO**, Tex., city, county-seat of Hill County, on the Missouri, Kansas and Texas and the Saint Louis Southwestern railroads, about 52 miles southwest of Dallas and 38 miles north of Waco. It is situated in an agricultural and stock-raising region. Its chief manufactures are cottonseed oil, cotton goods, advertising novelties, hosiery, flour, candy, men's clothing, agricultural implements and lumber. The trade is largely in live stock, cotton, hides, grain, hay and lumber. It has a creamery, cotton-gins, cotton-compresses, planing-mills and hay presses. The government is administered by a mayor and four aldermen. The city owns and operates the waterworks and sewage system. Pop. 6,115.

**HILLSDALE**, Mich., city, county-seat of Hillsdale County, on the Lake Shore and Michigan Southern Railroad, about 88 miles southwest of Detroit and 60 miles west of Toledo, Ohio. The first permanent settlement was made about the year 1840. It is situated in a rich agricultural region in which are raised large quantities of fruit. The chief manufactures are flour, fur garments, screens for doors and windows, wagon-wheels, tables, furnaces, furniture, condensed milk and canned fruits. The trade, in addition to the manufactures, is chiefly in grain, fruits, vegetables and live-stock. Baw Beese Park, outside the city limits, is owned by the city and is a popular summer resort. Hillsdale is the seat of Hillsdale College (q.v.). The electric-light plant and the waterworks are owned and operated by the city. The government is vested in a mayor, elected for one year, and a council. Pop. 5,001.

**HILLSDALE COLLEGE**, a coeducational institution founded in 1855 under the auspices of the Free Baptist Church, in Hillsdale, Mich. Since its establishment it has graduated about 1,300 students. The number of professors and instructors in 1916 was 24, the number of students 457. Special attention is given to the classical and scientific work, but the modern languages are not neglected. Departments of fine arts, music, elocution, home economics, business are flourishing.

**HILL-TIT**, a small, soft-billed, tit-like bird (*Liothrix luteus*) of the Orient, common as a cagebird, and known to dealers as Japanese robin, Pekin robin and Chinese nightingale. Its native home is the Himalayas and eastward into southwest China. It is about the size of the house sparrow. Its colors are rich. The upper parts are olive-green, with a yellow forehead, ring around the eye, and wing-patch. The secondary wing quills are bluish-black. The throat is rich yellow, fading to whitish on the abdomen. Bill red. The male has a brilliant song. This bird is hardy, but requires soft food.

**HILO**, hē'lō, Hawaii, town on Hilo Bay, on the eastern coast of the island, about 38 miles from Mauna Loa, 36 miles from Mauna Kea (the highest peak of the group) and 28 miles from Kilauea. Hilo is the second town in size in the Hawaiian Islands. It has the best harbor belonging to the group. The lighthouse in the harbor can be seen many miles. Large lava-fields are near; on the northwest side of the town and in the vicinity are extensive forests. The craters of Loa and Kilauea, the largest in the world, are visited annually over delightful drives by many tourists who land at Hilo. The inhabitants of the town include many races; but people from the United States who have engaged in business in Hilo are quite prominent. The town has a library, custom house and a courthouse. Hilo has good schools to which attendance is compulsory. The population of the town, which is co-extensive with the district of the same name, is 21,992.

**HILONGOS**, hē-lōng'ōs, Philippines, pueblo of Leyte, on the southwest coast at the mouth of the Salog River, 62 miles southwest of Tacloban. It has a good harbor. Pop. 13,813.

**HILPRECHT**, Herman Volrath, hēr'-mān. fōl'rāt hil'prēt, American Assyriologist:

b. Hohenerleben, Germany, 28 July 1859. He was graduated at Leipzig in 1883 and was curator of the Semitic section of the museum of the University of Pennsylvania, to which he presented the greater part of the 27,000 original cuneiform inscriptions which it contains. He was made professor of Assyrian and comparative Semitic philology in the same institution 1886-1911. In 1888-89 he was Assyriologist and scientific director of the University of Pennsylvania's expedition to Nippur, Babylonia, and editor-in-chief of its publications. In 1882 he studied the Assyrian inscriptions in the British Museum, traveled in Asia Minor and Syria and became an authority on cuneiform inscriptions. He reorganized the Babylonian department of the Imperial Ottoman Museum in Constantinople in 1893-1909. He also made trips to Ceylon, India, China, Japan and Korea 1911-12. Among his works may be mentioned 'Old Babylonian Inscriptions, chiefly from Nippur'; 'History of the Babylonian Expedition of the University of Pennsylvania to Nippur'; 'Recent Researches in Bible Lands'; 'Explorations in Bible Lands during the 19th Century' (1903); 'Ausgrabungen in Assyrien und Babylonien' (1904); 'The So-called Peters-Hilprecht Controversy' (1908); 'The Oldest Version of the Babylonian Deluge Story' (1910), and numerous contributions to scientific journals.

**HILSA**, the common shad of India and Burmah (*Clupea Palasa*) which in spring and summer migrates from the sea to the heads of the rivers to spawn in the shallows. The main body of these fishes ascends the river when the June monsoon begins; but their appearance in particular rivers is often long delayed, and varies with the rapidity of the current and what are regarded as inherited local habits and instinct. This widespread and valuable fish has many names; thus it is "pulla" in the Indus Valley; "sable-fish" in Bengal and "palasah" among the Telings, and is called "nga-tha-louk" by the Burmese.

**HILTON HEAD**, an island, at the mouth of the Broad River, off the southeast coast of South Carolina; a part of Beaufort County. Fort Walker, a Confederate fortification, was erected here during the Civil War. On 5 Nov. 1861, the fort was attacked by a Union fleet, under Commodore Dupont; Commodore Tatnall, with a Confederate flotilla, or "mosquito fleet," assisted Fort Walker, but it was captured by Dupont. The reports gave Union loss 8 killed and 23 wounded; Confederates, 10 killed and 10 wounded.

**HIMALAYA**, him-ā'lā-ya or him-a-lā'ya (from the Sanskrit signifying the abode of snow), a mountain system of Asia lying along the northern frontier of British India. It contains the highest peaks in the world, the principal mass of which is near the southern edge of the central section of the continent between long. 65° and 110° E., and lat. 28° and 37° N. The system extends approximately from northwest to southeast for about 2,000 miles, while its breadth varies from 100 to between 500 and 600 miles. The elevated plateau of Tibet, between the Himalaya proper and its extension, the Kuen-Lun Range, is the widest part of the system. While the term Himalaya is usually confined to the range forming the northern

barrier of India, the Hindu-Kush, on the northwest, and the Karakoram with the Kuen-Lun to the north are not distinct chains as frequently represented, but are all portions of the same connected mountain mass, having very little to distinguish them from the rest of the elevated system to which they belong. The Himalaya is connected on the east with the mountains of China and the Indo-Chinese Peninsula, and on the west with the mountains of Baluchistan and Afghanistan. The Pamir Plateau, described as a "huge boss or knot" north of the Hindu-Kush, connects the Himalayas with the Thian-Shan, another mountain system which extends northeastward for about 1,200 miles. From the Ganges-watered plain of northern India, which has an elevation of about 1,000 feet above the sea, the Himalayas ascend by successive slopes. The transition from this plain to the ascent of the range is marked in the northwest by a belt of dry, porous ground, broken up into numerous ravines. East of this is the "Terai," a belt of sloping marshland covered with forest and jungle, very malarious and crowded with wild animals. Beyond this lies the "Bhabar," a belt of gravelly and sandy nature covered with forests of valuable timber trees. The "duns," "maris" or "dwars," longitudinal valleys partly cultivated and partly yielding forest growth, occupy the space between the Bhabar and the slopes of the Himalayas. The principal passes are the highest in the world and include the Ibi-Gamin pass in Garwhal 20,457 feet, the Mustagh 19,019 feet, the Parangla 18,500 feet, and the highest on which traffic passes, the Kronbrung 18,313 feet and the Dura Ghat 17,750 feet. The greatest elevations of the Himalayan system are Mount Godwin-Austen 28,278 feet in the Karakoram range, and in the Himalayas proper, Mount Everest 29,002 feet, the highest peak in the world, Kunchinjinga 28,146 feet and Dhawalagiri 26,826 feet. On the north the limit of the snow line is 17,400 feet, on the south 15,000 to 16,000 feet. From the southern slope of the central portion of the great chain flow the various streams which unite in the Ganges; from the southern slope of the northwestern portion spring the rivers of the Punjab or "Five Waters," which unite to swell the Indus which rises on the northern slope and flows southwestward to the Arabian Sea; also on the northern slope not far from the source of the Indus springs the Brahmaputra which flows east, southwest and south to the Bay of Bengal; and also from the plateau of Tibet north of the main Himalayan range flow the Salwin, Mekong and other rivers of the Indo-Chinese Peninsula, the Yangtse, Hwang-ho and other rivers of the Chinese Empire. The whole system is of granitic formation associated with gneiss and mica-slate, followed in descending by metamorphic and secondary rocks, until the alluvial deposits are reached. Minerals abound; copper and lead have been mined from ancient times, iron more recently, coal is found at the foot of the mountains, gold in the beds of the mountain torrents, zinc, sulphur, plumbago and salt are also obtained, and there are numerous mineral springs. The vegetation is luxuriant; rhododendrons are in rich profusion, and there are forests of pine, spruce, silver-fir and deodar cedar at varying altitudes. Consult Freshfield, Douglas, 'Round Karchen-

junga' (1903); Waddell, 'Among the Himalayas'; Workman, 'In the Ice World of Himalaya' (1900); 'Call of the Snowy Hispar' (1907); 'Icebound Heights of the Mustagh' (1908).

**HINCKLEY, Thomas**, American colonial governor: b. England, about 1618; d. Barnstable, Mass., 25 April 1706. In 1635 he emigrated to America, and settled in Scituate, but four years later removed to Barnstable. He was deputy governor of Plymouth Colony in 1680 and afterward governor.

**HINCKS, Sir Francis**, Canadian statesman: b. Cork, Ireland, 14 Dec. 1807; d. Montreal, 18 Aug. 1885. He went to Canada in 1831, set up in business at Toronto, and founded in 1838 the *Examiner*. In 1841 he entered the first United Parliament as a Liberal. He first entered the cabinet in 1841 as Inspector-General of Accounts. He undertook the editorship of *Pilot*, Montreal in 1844. From 1851 to 1854 he held the premiership, during which time he passed many important measures. He showed great activity in railway development, and passed the Municipal Loan Fund Act designed to pledge local credit for railway construction; concluded, with Lord Elgin, a treaty of reciprocity with the United States; and was instrumental in introducing the decimal system of coinage. In 1854 his ministry suffered defeat on the clergy reserves question. From 1855-62 he was governor of Barbadoes, from 1862-69, of British Guiana, Minister of Finance 1869-73, and from 1873 editor of the *Montreal Journal of Commerce*. He was created K.C.M.G. in 1869, and was one of the Ontario boundary commissioners in 1878. Among his publications are 'Canada: Its Financial Position and Resources' (1849); 'The Political History of Canada between 1840 and 1855' (1877).

**HIND, hind, John Russell**, English astronomer: b. Nottingham, 12 May 1823; d. Twickenham, 23 Dec. 1895. In 1840 he obtained a situation in the Royal Observatory at Greenwich. He was a member of the commission appointed to determine the exact longitude of Valencia (1844), and on his return was appointed the observer in Bishop's Observatory, Regent's Park. There he calculated the orbits of more than 70 planets and comets, noted several new variable stars and nebulae and discovered 10 minor planets. In 1851 he obtained from the Academy of Sciences at Paris the Lalande medal, and was elected a corresponding member; and in 1852 received the Astronomical Society of London's gold medal, and a pension of \$1,000 a year from the British government. In 1857-91 he was director of the 'Nautical Almanac,' and in 1880 president of the Royal Astronomical Society. He wrote 'The Solar System' (1846); 'Astronomical Vocabulary' (1852); 'The Comets' (1852); 'Elements of Algebra' (1885); 'Introduction to Astronomy' (1871), and other works.

**HIND AND THE PANTHER**, *The*, by Dryden (1687), is an elaborate piece of theological controversy and satire in heroic couplets. The poet, recently converted to Catholicism, represents his new faith as the milk-white immortal hind, the Church of England as the panther, the atheists as the ape, the Baptists as the boar, the Presbyterians as the wolf, the Quakers as the hare and King James as the

lion. His original intention had been to conciliate the Church of England and to persuade it to make common cause with the Catholics against the Dissenters, who are roughly handled in the early part of the poem; but shortly before the completion of the work the king by a declaration for liberty of conscience made a bid for the support of Dissenters against the Established Church, which left the poet in something of a predicament. In the last division of his piece he abandons his conciliatory tone and turns upon the Established clergy in his fable of the doves with bitter and abusive satire, directed with special sharpness at Gilbert Burnet, who is presented as the buzzard. Dryden's eminence, his change of faith, his position as royal apologist, the multitude of his adversaries and the critical posture of public affairs all combined to give to the publication of his carefully barbed and envenomed satire the effect of an attack of hornets. The poem went through three editions in the first year, and provoked numerous replies, notably Prior and Montague's 'The Hind and the Panther transversed to the Story of the Country Mouse and the City Mouse.' In the somewhat confusing and difficult allegory there are fine passages of genuine piety and a sincere plea for tolerance and liberty of conscience. For further commentary consult Johnson, 'Lives of the Poets'; Scott, 'Dryden' (in the Scott-Saintsbury edition of Dryden's works), and W. H. Williams' edition of 'The Hind and the Panther' (1900).

STUART P. SHERMAN.

**HINDENBURG, Paul von Beneckendorff und von**, German Field-Marshal: b. Posen, 1847; cadet, 1864; lieutenant, 1866; wounded at Sadowa; served in the Franco-Prussian War of 1870-71; present at Sedan and the siege of Paris. In 1873 he entered the War Academy at Berlin, and it may be said that he was a "military student" for the next 38 years. As division staff officer at Königsberg in the early 80's he commenced that profound study of the Masurian Lakes districts which was destined many years later to bring him fame; to make him, in fact, the only really successful general (with the exception of von Mackensen), that Germany produced during the first three years of the great war. He was appointed to the general staff in 1886 and lectured on applied tactics at the War Academy till 1893, making the Masurian Lakes region an important item in his lectures. In 1903 he attained the rank of general; spent considerable time in East Prussia, and commanded in succession the two army corps stationed at Königsberg and Allenstein. In every annual manoeuvre he regularly rehearsed the defense of the lake region against a Russian invasion. He often used his intimate knowledge to drive his "opponents" into some marshy spots and kept them for hours up to their waists in mud. He resigned in 1911 at the age of 64; but retirement to him meant only more time to be devoted to his all-absorbing hobby of defending East Prussia. He haunted the wilderness on foot, on horseback, in automobile and even with a field gun borrowed from a local garrison. There was the most serious method in his apparent obsession; by his practical tests he found out where a horse or a gun could stand or be driven through; where mud or

water was deep or shallow, etc. Year after year his investigations were pursued, and every spot was duly and precisely charted. The crisis of his life came about three years before the war, when a business syndicate proposed to reclaim the Masurian Lakes region. The forests were to be cleared and drainage canals cut through. With furious energy von Hindenburg opposed the scheme, went straight to Berlin, interviewed the emperor, and told him that this eastern wilderness was worth a dozen fortresses and many army corps. He carried his point, and the project was abandoned. On the outbreak of the war in 1914 he volunteered his services, though 67 years old. His offer was at first ignored, and it was not till the Russians had overrun East Prussia, shut up the German troops under General von François inside the Königsberg lines, and were throwing advance cavalry in the direction of Danzig, that von Hindenburg was placed in command. With about 150,000 to 160,000 men he inflicted a terrific, crushing defeat upon the Russians under Generals Rennenkampf and Samsonoff at the battle of Tannenberg. He extended his left in a great curve round the Russian right flank and swept southward; performing the same evolution on the Russian left, he drew two-thirds of a circle around the Russians. The retiring Russian batteries sank into the bogs; horses struggled in vain, and as the iron circle closed in whole regiments were driven into the lakes and drowned in the water or choked in the bottomless mires. Von Hindenburg took some 90,000 prisoners and enormous quantities of stores. The kaiser made him a field-marshal and placed him in command of the eastern armies. He led the great drive into Russia and conquered Poland. See WAR, EUROPEAN; TANNENBERG.

**HINDMAN**, hind'man, Thomas Carmichael, American soldier: b. Tennessee, 1818; d. Arkansas, 1868. He studied law, entered practice in Mississippi, fought in the Mexican War as a lieutenant of Mississippi volunteers, and in 1858-61 was a Democratic representative in Congress. Not long after the outbreak of the Civil War he was commissioned brigadier-general, was defeated at Newtonia and Prairie Grove, was promoted major-general at Shiloh and later served in Arkansas.

**HINDUISM** is the name of a religion which is professed to-day by four-fifths of the population of East India, and which embraces within its folds the subtlest philosophic pantheist and the grossest animist. Unlike any other religion extant in the world, it owes its origin to no individual. Hinduism has passed through various stages of development, distinguishable by marked features; but it would be wrong to associate the stages with any process of evolution. The foundation of the faith is a collection of sacred writ, collectively known as the Vedas or Sruti (revelation). The Hindu Scriptures or the Veda has four subdivisions: *Rig*, *Yajush*, *Sāman* and *Atharvan*. Each of the Vedas is further subdivided into *Samhitas* or sacred texts, *Mantras* or hymns and *Upanishads* or philosophic discussions. Besides the *Upanishad*, each Veda has an *Aranyako*, which is principally connected with methods and efficacy of the worship of the Divine Being. The Hindu tradition is that the Veda, which means

"knowledge," is eternal, and like the Divine Being it is ever-existent and part of it. But, the evidence is that all parts of the Veda are not equally old, nor could the authorship be ascribed to a single individual or even a group of individuals. The earliest are the hymns of the Rig Veda, which indicate the purest form of nature worship known to mankind. The grand and striking phenomena of nature are visualized incomparably, and the hymns are dissociated from the mythology usually connected with polytheistic forms of belief. The hymns to Dyapus or the Dawn in the Rig Veda exalts one as no other poetry or any written word does. The idea underlying the hymns was not, however, nature worship. The ancient seers saw the Divine anywhere and everywhere, and they did not consider the world in water-tight compartments. The Divine was in all, and everything was in the Divine.

The deities referred to in the Vedas are *Indra*, the lord of atmospheric region; *Vayu*, the lord of air; *Agui*, the god of fire; *Dyayus*, the lord of dawn; *Varuna*, the lord of water; *Brahaspathi*, the lord of prayer; *Prajapati*, the lord of people; *Visvakarman*, the maker of all. The sage that praises Varuna attributed all creation, all qualities and all power to him, and had no cognizance of the rest of the pantheon. The same sage forgets all but Agui, when he chanted a hymn to him. The underlying thought is that there is only one universal self-existent soul, and that all else are attributes. As the Vedic thought unfolded itself, the universal soul was identified with Brāhma.

But the underlying thought has, of necessity, to suit itself to historic and social conditions. When the first Aryan settlers on the banks of Sindhu wished to chant hymns and devote their entire attention to worship they had to fight and cultivate and provide for their own sustenance. The more they went inside the country, the fiercer was the resistance of the aboriginal tribes, who were called *Rakshasas* and *Pisachas*. The necessity of existence led to the division of the people into castes, which, at the outset, was not intended to be the hide-bound system that it latterly grew up to be. The Brahmin became the priest, the *Khathruja*, the fighter and the ruler, the *Vaisya* the trader, and the *Sudra* the laborer. Caste was defined as *varna*, which is usually foolishly held to denote color by European writers.

On account of the lack of adequate historic material, it is extremely difficult to trace the evolution of Hinduism. Owing, again, to the extraordinarily long period during which the religion has remained a virile force, one can hardly point out any special trait which helped to keep its vigor. If there is any quality above all which distinguishes the religion, it is its catholicism. The Vedic texts, which formed the basis of thought, subscribed themselves to every kind of interpretation put upon them. Throughout the long period of its growth it has assimilated much that should normally be considered alien to it. It found a place for every phase of thought and every grade of life. No special thought, ritual or philosophy was superimposed upon the peoples it came in contact with.

**First Period of Development.**—From the meagre materials that we have, the first period

of the development of Hinduism can be associated with what is known as the sacrificial period. The Vedas were for all practical purposes hymns of worship. They were addressed in beautiful and exalted language to the gods, or the lords of the firmament. Offerings of delicious viands were made to them. Yagnya or sacrificial rites and ceremonies, which at one period was indissolubly connected with elaborate paraphernalia, was the order of the day.

**Second Period.**—The second period in its development may be called the Epic period. In this period the early Aryans extended the range of their conquest. They moved east from the banks of the Indus to the banks of the Ganges, and south to the banks of the Narbudda and the whole country of Deccan. Deeds of valor were committed in the process of conquest. With conquest came hand in hand assimilation, and all the inhabitants in the vast peninsula of the Hindustan found a place in Hinduism. The 'Ramayana' and the 'Mahabharata' are the two great epics of India, which furnish a fund of information about this period—information which is almost encyclopædic in scope. Just as the 'Iliad' and the 'Odyssey' form the mirrors of the epic age of Greece, so the 'Ramayana' and the 'Mahabharata' furnish a history of the life and thought of India in the Epic age. The 'Ramayana' is the story of the abduction of Sita, the queen of Rama, by Ravana, the Rakshasah king of Ceylon, the quest, the conquest of Ceylon and the destruction of Ravana's empire and the recovery of Sita. The 'Mahabharata' is the story of the wrongful possession of Yudishtara's throne by his cousin Duryodhana, the final defeat of the latter and the return of the throne to the rightful owner. These epics have long formed part and parcel of the life of the people of India, and even to-day have more influence on life and thought in that country than the Bible in Christian countries. The stories in the epics are merely threads on which are made to hang treatises on every phase of life, morals, religion, laws and government.

The definitive establishment of the Brahminical hierarchy follows closely the Epic period. There is a void between the close of the Epic period and the rise of the Brahminical era. It is generally believed that during this period there was a struggle between the Brahmins and the Kshatriyas, or the soldier class, for power, and that the former won. The legend of Parasurama is quoted as exemplifying the fall of the Kshatriya. The Dharmasutra, or the Code of Laws of Manu, reproduces on the whole pretty faithfully the state of Hindu society a few centuries before the Christian era. The Brahmins improved their newly acquired vantage ground by investing everything connected with their order with a halo of sanctity, calculated to impress the lay community with feelings of awe. They invested the later religious literature, so imbued with their own aspirations and importance, with the same authority as Sruti or revelation. In their division of castes, and penalties to be inflicted for transgressions of the limits assigned to each, they forged the chain of their own supremacy. But it must be said to their credit that they denied themselves wealth and all means of acquiring wealth. No Brahmin was allowed to be a king. The most rigorous duties were im-

posed on the Brahmin. While the lowest, or Sudra caste, was apparently treated without clemency, the real fact is that the punishment for any infraction was humane. The Brahmin had not to undergo severe physical penalties; but he lost caste. The Sudra may rise to be a member of a higher caste. A Brahmin once fallen is fallen forever, and is ever the object of direct contempt. The three first castes, the Brahmin, Kshatriya and Vaisya were united by a bond of sacramental rites (Sanskaras) traditionally connected from ancient times with certain incidents and stages of the life of the Aryan Hindu, as conception, birth, name-giving, the first taking out of the child to see the sun, the first feeding with boiled rice, the rites of tonsure and hair-cutting, the youth's investiture with the sacrificial thread and his return home on completing his studies, marriage, funeral, etc.

The first three castes were considered the twice-born, because of their right to participate in ceremonials. The Brahmin had to go through four stages in life, i. e., student, householder, anchorite and recluse; while all the twice-born were entitled to do the same. According to the Hindu, there are four sacred "debts" which a man has to discharge in life, i. e., that due to the gods, and of which he acquits himself by daily worship and sacrificial rites, that due to the rishis, or ancient sages, discharged by the daily study of the scripture; that due to his manes, or ancestors, which he discharges by leaving a son; that due to humanity, which demands his continually practising kindness and hospitality. The domestic fire must be continually kept up, and never allowed to be extinguished.

**The Development of Hindu Philosophy.**—The next stage of Hinduism is the development of philosophic thought. At about this time the Aryan Hindus had consolidated their conquests, and had time to devote to speculation. The fundamental thought that union with the Divine is the *summum bonum* of all existence underlies all developments of the religion. In the very early periods, hymns were the means. In the Epic period, the doctrine was prevalent that the union of the human with the divine soul of existence was aided and expedited by penances of various kinds, collectively known as *Yoga*. In the next period, special stress was laid on sacrificial offerings, especially household rites with elaborate ceremonies. Doubt arose in the minds of many as regards the utility of penances or sacrifices. Just as the original hymnmakers of the Vedas speculated on existence in the Upanishad, so the later Hindus began to speculate on existence. At first, there was confusion of thought, because the existence of a universal spirit was not considered incompatible with the doctrine of a personal creator. Having devoted all their time and attention to sacrificial rites, they had failed to bring about a distinct formula of faith. The general drift of thought became pantheistic, although the ancient forms of belief still largely entered into it. Systems of philosophy grew up in the attempt to solve questions of the origin and destiny of man, and his relation to the Supreme Being. The six well-known schools of philosophy are known as the Nyaya, Vaiseshika, Sankhya, Yoga, Mimamsa and Vedanta. They all agree in that

their object was to prescribe rules by which man may be delivered from the bondage of ignorance, and be absorbed in the all-pervading divine soul. Their doctrine of the soul as something eternal and inextinguishable, distinct from mind, senses and body, yet sharing in the merits and demerits of good and bad deeds, the latter of which are caused by ignorance of what is best and highest, is identical. They agree so far as to how ignorance can be gradually eliminated and right apprehension acquired; to this end scriptures must be studied and clearness of mind and heart secured by sacrifices, almsgiving, pilgrimages and prayer. There was no question as regards what is best from an ethical point of view. There has also been no question as to the necessity for the attainment of the Divine. The point of conflict was mainly as regards speculative thought. These systems of philosophy were restricted in their scope, because they all acknowledge that the Veda was the fountain head of all knowledge, and an authority which cannot be questioned. On the other hand, they had a very wide latitude, because it was ever possible to quote some passage or other in the Veda to support any statement. The final result of the development of speculative thought was the enthronement of Brahman, as the be-all and end-all. The idea of a personal deity lost all force and the Great Abstract was the good of all existence, and all existence was in it. The Vedanta philosophy was the culmination of the speculative thought of the Hinduism. See VEDANTA.

Although the new dogma satisfied the aspirations of the most developed speculative minds, the votaries of the religion as a whole could neither comprehend nor take interest in it; an abstract, colorless superentity like Brahman awoke no sympathies in the hearts of those who can have no conception of God except as a personal entity. Even when the primitive symbolic worship of nature as seen in the Hymns of the Vedas had not been touched by philosophic speculation, the mass of the people were drifting away toward the worship of gods of flesh and blood. Different localities became attached to the worship of a particular deity with special attributes. The thoughts and observances of the original inhabitants of the country had also had some influence on the Aryan settlers. The priesthood was loath to give away to the superstitions and deity worship of the common people, and would gladly have raised them to its own level if it could. Attempts made in that direction signally failed. The only way open was for the priesthood to recognize and incorporate into their system some of the most prominent objects of popular devotion, and thereby to establish a kind of catholic creed for the whole community subject to the Brahminical law. The pantheistic thought that had already been highly developed also helped toward that end in view. *Siva* or *Mahadeva* and *Vishnu* were the two popular deities at the time, and they were admitted into the folds of the higher Hindu thought. This was only the beginning. A whole host of gods and goddesses then claimed recognition. Every small community had its local deity, and to refuse recognition would have meant the straying away of that community from the Hindu faith. The Brahmins settled the vexed question without, in any sense, giving up their own Vedantic

faith. As the Brahman was in all, and all was Brahman, what was there to prevent any object being identified with it, so long as there can be no other? What was, after all, in a name? Why should not the Brahman be called *Vishnu*, *Rudra*, *Siva* or *Mahadeva*? Life was meaningless without symbolism; and the local deities were only symbols. The populace, however, did not take the position; that the Brahmins proposed to remedy by gradual education.

The result was that a whole pantheon of gods was created. Imagination was let loose and had a riotous play. Gods and goddesses by the galore peopled the firmament, although however only a handful found deification in the sense that they became objects of worship. New worlds were created, and *Indra* was made the ruler of 330,000,000 divinities. The trinity of Hinduism came into being in *Brahma*, the creator, *Vishnu*, the preserver, and *Siva*, the destroyer. The cosmogony of the world became extraordinarily interesting. The universe, before undiscerned, was made known by the sole, self-existent Brahman. The latter willed to produce from his own substance various lives, which were dormant in, and part of, him, created the waters by meditation. Out of the ultra-universal deluge was created *Brahma*, the creator of all things. *Brahma*, or the creator worship, did not last, because there were no votaries, and the idea was an innovation made to fit in with an artificial cosmogony. With *Vishnu* and *Siva*, however, it was different. The old conception of *Vishnu* as that of kindly protector appealed to the masses. He has been represented as undergoing, for the benefit of mankind, a number of *avatâras*, or incarnations. The object for which *Vishnu* assumes a human form is always to deliver the people from the oppression of some wicked prince or influence, or when the world is overwhelmed in vice and has to be restored to virtue or *Dharma*. *Siva* is the destroyer, also known as *Rudra*, the god of the roaring storm, usually portrayed, in accordance with the element he represents, as a fierce and destructive deity. But he is worshipped, because he is held to symbolize the destruction of sin and the unrealities and illusions of worldly existence, thus leading the soul to its goal. To give even a cursory idea of the various deities in the Hindu pantheon would take volumes. The basis of the pantheon is the *Puranas*, of which the most noted are 18. Besides the *Puranas*, there are commentaries and works which exalt the particular deities of noted votaries. All the deities, however, are either the incarnations or attributes of *Vishnu* or *Siva*.

The Puranic period of Hinduism was contemporaneous with Buddhism. Before the rise of Buddha the religion consisted either of elaborate sacrificial rites or pure philosophic speculation. Buddha found that the masses were ignored, and his teachings were practically protestant Hinduism. The populace saw a new light and went *en masse* to Buddhism, especially as the votaries of the religion included such eminent monarchs as *Asoka*. There was something mellow in the new faith which appealed to popular imagination. The Brahmins found that their hold was being

wrenched from them. They did the best they could, and succeeded in driving Buddhism out of India. They incorporated all that was best in the latter religion into their own faith; in other words, they killed Buddhism by adopting it. In this process, the religion had two new accretions. One is the doctrine of metempsychosis. The doctrine of the transmigration of souls was not altogether new to the seers of the Vedas. But they did not emphasize it. The emphasis laid by Buddha proved a soothing balm to the masses, because they felt that they had always a chance to attain salvation so long as they had a series of lives to achieve it in. The next accretion was that of Divine Mercy. Humanity has ever been noted for its weakness in as much as it is easily tempted away from the right path. But for the Divine guidance and mercy there is little for man to place his hopes on. The exaltation of mercy again appealed to the popular imagination. But Hinduism never accepted the doctrine of vicarious punishment. Every individual soul was meted out its due desserts. There was no reward for virtue or punishment for vice; each act had a certain result which must inevitably follow. But the Divine Mercy held a light, as it were, for the soul not to stray from the right path.

The doctrine of right was also developed during this period. Hinduism considers all life relative, and hence there is no cut and dried line of demarcation between vice and virtue. The code of morals is just the same as in all religions. But in the philosophic discussion of it, the religion holds that as the Divine is in all and is all, the distinction of right and wrong is purely one inevitable in the world of limitations, and is purely subjective.

Hinduism is, in the popular European conception, identified with idolatry. The mistake arises out of not understanding the Hindu mind and the chain of circumstances that brought about the worship of idols. Before the spread of Buddhism there were no idols or temples in India. But votaries of Buddha set up his image in different parts and made obeisance to it. When, however, Buddhism was incorporated into Brahminism, the latter took over the temples and allowed the masses to use idols of their particular deities. The idols were only symbols, a form which makes the worship of the Divine convenient and easy for the average men and women. Later, of course, there was a degeneration in that the masses began to believe that there was special virtue in the idols.

Such in brief are the tenets of Hinduism and the history of that religion up to the date of the Mahomedan conquest of India. Since the 13th century the religion has, for all practical purposes, stagnated. Much that is alien to the faith crept in, and the leaders had to incorporate customs and manners that were repugnant to them. The caste system, which was elastic up to that period, became petrified and fossilized, much to the detriment of the real interests and growth of the country. The Purdah system was then introduced in order to protect the honor of their womankind from the unscrupulous foreign hordes that ravaged

the country from time to time. The schools and universities that flourished in India either degenerated or were closed. The populace had little or no guidance in molding its religious thought, which gradually descended into the grossest mysticism, meaningless rites and unsavory practices. Occasionally reformers like Kabir, Tulsi Das, Ramanuja and Ramananda attempted to correct the evils. Little, however, was done.

The establishment of British rule brought with it a vigorous proselytizing activity on the part of Christian missionaries. The newly acquired knowledge and a wider conception of world affairs put new life into the religious thought of India. Ardent reformers arose by the score and strove for the purification of the religion of their ancestors, and a proper dissemination of religious knowledge both to their own people and the rest of the world. The two most important movements that have achieved some results are the Brahma Samaj and the Arya Samaj. The Brahma Samaj owes its existence to Rajah Ram Mohun Roy, and was vigorously preached by the famous reformer Keshub Chunder Sen. The movement was ambitious and proposed to create a universal faith, although it immediately occupied itself with the purification of the Hindu faith. The movement never had more than a handful of followers; but it had an important effect on orthodox thought and practises, not only in Bengal, which was its birthplace, but also in all parts of India. The Arya Samaj owes its origin to Dayanand Saraswati, in Punjab. He proposed to go back to the faith of his ancestors and would not accept any other text but the Vedas as authority. The movement has succeeded extraordinarily well. It has broken the backbone of the caste system in many parts of the country and has a large number of adherents.

SRINIVAS R. WAGEL.

**HINDUSTAN**, hīn-doo-stān', **HINDOSTAN**, hīn-dō-stān', or **INDOSTAN**, signifying "the land of the (river) Indus," a word of Persian derivation, formerly applied to India (q.v.).

**HINDUSTANI LANGUAGE AND LITERATURE.** Hindustani is the name given to the current vernacular of northern India. In structure it is based originally on a branch of the ancient Sanskrit, descended from a sister dialect and strongly modified by the various forms of Prakrit during the Middle Ages. The name Hindustani itself is derived from modern Persian—Hindi (Indian). Hindustani is split up, however, into some 60 subdialects, and these, while all strongly resembling each other, are shading off one into the other according to geographical boundaries, so that in the eastern region they rather tend toward Bengali and in the southern and western toward Marathi and Gujarati. The territory within which Hindustani is spoken in its various types is the most densely populated in India, for on but 248,000 square miles it is inhabited by 100,000,000 souls. The dialect of Hindustani enjoying a sort of pre-eminence is the Braj Bhāsha, which prevails in the region of Delhi, Agra and Mūttra. Hindustani contains also in varying degree a strong admixture of Arabic, Persian, Turkish and Tartar, as well as many words of Dravidian and Kolarian. When the latter is considerable, Hindustani is termed *Urdū*, meaning in Turkish "camp," "army," and the term itself as well as the facts it stands for go back to the Mongolian and Turanian invasions of the 12th and subsequent centuries. It was Urdū which became the accepted court dialect at Delhi, but a literary form of Urdū, richer in Persian elements, came to be known as *Rekhta*. During the last hundred years, however, by dint of strenuous efforts of grammarians and teachers, Hindustani has been greatly purified and purged of elements not

cognate. Upon this purified Hindustani again has been conferred the appellation of Hindi, or High Hindustani.

As for its makeup Hindustani is an analytical tongue. Like modern Persian and also like other dialects of India it has had its grammar greatly simplified. Tenses, cases, etc., are indicated by means of prepositions, auxiliary verbs, etc. However, there are at least two genders, two numbers, two voices and nine tenses. Many of its constructions resemble analogous English ones closely, as "I am going to see," *main dekhūnga*; "I am seeing," *main dekhto hūn*, etc. Hindi and Hindustani are both written with the characters of the Devanāgarī alphabet, as are Sanskrit and Marathi. But Urdū, faithful to its mixed origin, uses the Perso-Arabic script, with three additional characters to represent specifically Indian sounds.

Hindustani literature is very abundant, although with few exceptions of mediocre quality. Its oldest achievement is the epic of Chand Bardai, the "Prithvirāj Rāsau," dating some 700 years back, in which the long sad story of the last Hindu ruler at Delhi is told. "Hammir Deo," by Sārangdhar, about 1363, describes the heroic fight made against the Sultan Aladdin Khilji, in 1300. The same author also wrote the "Hammir Kāvya" and the "Hammir Rāsau," similar warlike tales in epic form.

"Chattra-Prakās," by Lāl Kabi, is a long chronicle reciting the deeds of Rajah Chattarsāl, who was killed in the battle of Dholpūr, won by Aurangzeb, in 1658. "Padmāwat" another epic, written in 1540, had a Mohammedan, Malik Mohammed, for its author. The poem, written in the purest dialect of Avanti, is based on the loss of his throne of Delhi by Humāyān. The literature of the *Bhagats*, worshippers of Vishnu and adherents of a purified form of Brahmanism, is very extensive and has no doubt exercised much influence on national Hindustani speech. The name, *Bhagats*, means "Children of the God." In the line of fiction, the "Purānas" ("Old Stories") are notable.

WOLF VON SCHIERBRAND,

Author of 'America, Asia and the Pacific'; 'Germany: the Welding of a World Power,' etc.

**HINGHAM**, hīng am, Mass., town in Plymouth County; on Massachusetts Bay, and on the New York, New Haven and Hartford Railroad; about 15 miles southeast of Boston. In

the town are the villages of South Hingham, West Hingham, and Hingham Centre. The first permanent settlement was made in 1633, and it was then called Barecove. In 1635 it was incorporated under its present name. Its chief manufactures are awnings, cordage, woodenware, toys, bootheels, furniture, leatherette and upholstery. The harbor was improved in 1911 by the State and Federal governments. It has a meeting-house which was built in 1681. It contains a public library and is the seat of Derby Academy. Some of the noted people who have lived in Hingham are John A. Andrew, John D. Long, Benjamin Lincoln and James Hall, the famous geologist who for a number of years was State geologist of New York. Joshua Hobart, the Puritan ancestor of the Hobarts of New York State, also lived in Hingham. The government is arranged by town meetings. Pop. 4,965. Consult Cornish, L. C., 'Settlement of Hingham, Mass.' (Hingham 1911); Lincoln, 'History of the Town of Hingham.'

**HINKSON, Katharine Tynan**, Irish novelist and poet: b. Dublin, Ireland, 3 Feb. 1861. She was educated in a convent at Drogheda and since her marriage to H. A. Hinkson in 1893, has lived in Ealing, a suburb of London. She is a voluminous writer both in prose and verse, but as a poet she has won the greater fame. She was one of the originators of what was known as the Irish Literary Revival. Her volumes of verse include 'Shamrocks' (1887); 'Ballads and Lyrics' (1890); 'Cuckoo Songs' (1894); 'Miracle Plays' (1895); 'The Wind in the Trees' (1898); 'Collected Poems' (1901); 'Innocencies' (1905); 'New Poems' (1911); 'Irish Poems' (1913).

**HINMAN, Russell**, American editor of textbooks: b. Cincinnati, 23 Jan. 1853. He was educated at Antioch College, Ohio, went into business as a civil engineer; and later became editor of geographical textbooks for Messrs. Van Antwerp, Bragg & Co. of Cincinnati. Since 1890 he has been in charge of the editorial office of the American Book Co. He has written 'Eclectic Elementary Geography'; 'Eclectic Complete Geography'; 'Eclectic Physical Geography.'

**HINNOM, Valley of**, a ravine near or at Jerusalem, the exact location of which has not been determined. Here children were sacrificed to the god Moloch, and for this reason the valley was deemed accursed. Under the name of Gehenna, Hinnom became synonymous with Hell (q.v.).

**HINOJOSA Y NAVEROS, hé'nó-yó'sa i nā'vér'ós**, Eduardo de, Spanish public official and educator: b. Alhama, Spain, 25 Oct. 1852. He received his education at the universities of Granada and Madrid and from 1875 to 1882 was an assistant in the National Archaeological Museum, Madrid. From 1882 to 1900 he was professor at the Madrid School of Diplomacy, serving meanwhile as civil governor of Madrid in 1897 and in 1900. Since 1900 he has been professor of ancient and mediæval Spanish and American history at the University of Madrid. He is a Senator of the Kingdom and director general of public instruction, member of the Commission on Archives, Libraries and Museums. In 1908 he was elected honorary

president of the Congress of Historical Sciences, Berlin. He is also member of the Royal Academy of Spain, the Royal Historical Academy, the Royal Academy of Moral and Political Sciences, and corresponding member of the Institute of France. He has published 'Historia del derecho español'; 'Estudios sobre la historia del derecho español'; 'El régimen señorial y la cuestión agraria en Cataluña durante la Edad Media'; 'Influencia de los teólogos y juriconsultos españoles,' and contributions to 'The Catholic Encyclopedia.'

**HINOYOSSA, hē-noi-ōs'sā, Alexander d'**, Dutch colonial governor in America; b. and d. Holland. He came to America in 1650 as lieutenant in a small military force sent to accompany 150 immigrants. In 1659 he became director of Nieuer Amstel, a Dutch colony on the eastern bank of the Delaware River. Although, owing to disagreements and illness, this colony was not at first a success, it was greatly developed by Hinoyossa's wise rule. Hinoyossa was for a time involved in a conflict of authority with Director Petrus Stuyvesant of New Amsterdam, who had general superintendence of the commissioners constituting the government of Nieuer Amstel. In 1663 he obtained authority over all the settlements on the Delaware. The Swedish colonists submitted and Stuyvesant relinquished his control. Upon the conquest of New Netherland by England, Hinoyossa returned (1674) to the continent where he fought in the Dutch army against the French invasion by Louis XIV.

**HINTERLAND**, the land behind a coast or river: common in the phrase "doctrine of the hinterland." This doctrine was first advanced by Germany in 1883 by claiming that she had exclusive right to occupy certain territory behind the parts of the African coast over which she already ruled. This territory, it was claimed, extended back without defined limits until it reached the official boundary of territory controlled by another power.

**HINTON, Richard Josiah**, American author: b. London, England, 25 Nov. 1830; d. 20 Dec. 1901. He settled in the United States in 1851; studied topographical engineering at the Columbia School of Mines; and removing to Kansas in 1856 became a supporter of the cause of John Brown. He served in the National army in 1861-65; and was the first white man appointed to raise and lead colored troops. After the war he engaged in newspaper work in Washington, New York and San Francisco. He was the author of 'Life of William H. Seward'; 'Life of Gen. P. H. Sheridan'; 'John Brown,' etc.

**HIP**, that part of the trunk comprised between the abdominal wall and the lower limb, particularly the region over the hip-bone (the crest of the ilium).

**HIP JOINT**, the joint of the upper leg or thigh (femur) where it joins the trunk. It is a ball and socket joint, formed by the sinking of the smooth globular cap into the deep hollow, called acetabulum (vinegar bowl), of the os innominatum. Its movements are controlled by five ligaments: the capsular; the ilio-femoral; the teres; the cotyloid; and the transverse. These movements are more wonderful than even those of the arm, being flexion, exten-

sion, abduction, adduction and rotation inward and outward. It is the most powerful joint in the body and hardest to dislocate.

**HIP JOINT**, Disease of, a disease of the ball and socket of the hip. It is most frequently a type of tuberculosis; comes on in children or young persons, from very slight accidents which have caused an injury to the joint which, becoming infected, then develops the disease; is often traced to a long walk, a sprain in jumping or a fall. In the early stage of the disease the whole of the structures of the joint are inflamed and after proper treatment may be sometimes subdued with no worse consequences than a more or less rigid joint. Usually, however, abscesses form around the joint and often communicate with its interior; and the acetabulum and the head and neck of the thigh-bone become disintegrated, softened and gritty. In a still more advanced stage, dislocation of the head of the thigh-bone commonly occurs, either from the capsular ligament becoming more or less destroyed, and the head of the bone being drawn out of its cavity by the action of the surrounding muscles, or from a fungous mass sprouting up from the bottom of the cavity and pushing the head of the bone before it.

As the disease advances, abscesses occur around the joint. True shortening of the limb now takes place, which at the same time becomes adducted and inverted. From this stage, if the health is pretty good and the lungs are sound the patient may be so fortunate as to recover with an ankylosed (or immovable) hip-joint; but the probability is that exhaustion and hectic will come on and that death will supervene from the wasting influence of the purulent discharges occasioned by the diseased bone. See **TUBERCULOSIS**.

**HIPPARCHUS**, hi-pär'käs, Greek astronomer: b. Nicæa, in Bithynia. He lived about 160-125 B.C.; resided for some time at Rhodes, but afterward went to Alexandria, then the great school of science. A commentary on Aratus is the only work of his extant. He first ascertained the true length of the year, discovered the precession of the equinoxes, determined the revolutions and mean motions of the planets, prepared a catalogue of the fixed stars, etc.

**HIPPARION**, hi-pä'rî-on, a genus of fossil three-toed *Equidæ*. See **HORSE**, **EVOLUTION OF**.

**HIPPELATES**, a genus of midges to whose agency is ascribed the spread in many instances of the southern ophthalmic disease of cattle called pink-eye. See **FLIES**; **PINK-EYE**.

**HIPPOCRATES**, hi-pök'ra-téz, Greek physician, the father of medicine: b. in the island of Cos, 460 B.C.; d. Larissa, Thessaly, 357 B.C. Besides practising and teaching his profession at home, he traveled on the mainland of Greece. His writings, which were early celebrated, became the nucleus of a collection of medical treatises by a number of authors of different places and periods, which were long attributed to him and still bear his name. The best edition is that of Littré (in 10 vols., Paris, 1839-61). He has the great distinction of having been the first to put aside the traditions of early ignorance and superstition and to base the practice of medicine on the study of nature.

He maintained, against the universal religious view, that diseases must be treated as subject to natural laws; and his observations on the natural history of disease, as presented in the living subject, show him to have been a master of clinical research. His accounts of phenomena show great power of graphic description. In treating disease he gave chief attention to diet and regimen, expecting nature to do the larger part. His ideas of the very great influence of climate both on the body and the mind were a profound anticipation of modern knowledge. He reflected in medicine the enlightenment of the great age in Greece of the philosophers and dramatists.

**HIPPODROME** (from the Greek, *Hippos*, a horse and *Dromos*, a race course), the name given by the Greeks to places where races were held. This included both chariot and single horse racing, but the hippodrome later took the form of a circus, other games, such as wrestling, boxing, running, etc., being added, and for a short time after the introduction of Roman customs and manners it became the scene of gladiatorial combats, but as sights of this nature did not find favor in the sight of the Greeks, these combats were eventually eliminated and the main feature of the games, as in the beginning, was the chariot race. To the brutal taste of the Roman populace flowing blood acted as an elixir, but to the more refined Eastern people the amphitheatre was abhorrent. Though numerous amphitheatres were scattered throughout western Europe very few were ever built within the limits of the Eastern empire and then only where the influence and manners of the Romans were most powerful.

The first mention of a hippodrome is made by Homer, but it is believed that the term then applied to any course over which a race of any kind was run and that it did not necessarily have a fixed location. As the chariot-racing became the national game, the proper courses for the holding of such events became necessary, as in these races, though much of the success depended upon the courage and skill of the driver, the loss of life was often great, through collision, the overthrow of the chariot in turning caused by rough grounds, the breaking of an axle, or numerous other accidents. The hippodrome was built for the purpose of avoiding, as much as possible, the possibility of such mishaps, by providing a wide and smooth track, thus leaving plenty of space for the contestants. Of the ancient hippodromes (as distinguished from circus, amphitheatre, etc.), probably the most famous are those of Olympus and of Constantinople, and while the Circus Maximus of Rome may to a great extent have been more of a circus than race course, it was planned after the Greek race courses, was used by the Romans for this purpose and thus may properly be classed with the other two.

The origin of the hippodrome at Olympus tradition gives to Hercules. Of its length and breadth there was until recently no precise information, the overflow of the Alpheus River having washed away the indications of its limits. A Greek manuscript found recently in the old Seraglio in Constantinople gives its dimensions. The total circuit was eight stadia (about 0.95 mile), but the actual course was six stadia. The breadth was 320 feet. Riding races con-

sisted of but one lap (six stadia). The mule chariot race seems to have been about eight and one-half miles.

In general form the hippodrome was an oblong, one end of which was semicircular; on three sides having seats for the populace and on the fourth, where the races were started, seats for the royalty and nobles. The right side, formed by an artificial mound, was a little longer than the left side, which was built on the natural slope of a hill, the base of the fourth side being formed by the portico of Agnaptus, named after its builder. The form of the starting place was not unlike the prow of a ship, each side being 400 feet long and containing stalls for the chariots and their horses. In the arena were two goals around which the chariots passed several times to complete the race; one of these goals having a bronze statue of Hippodameia upon it, the other an altar dedicated to "Taraxippus, the Terror of the Horses." The principal difference between the Greek hippodrome and the Roman circus was in the width of the arena, in the latter only four chariots being able to race at one time; there was also some slight difference in the arrangement of the carceres.

The erection of the hippodrome of Constantinople was due to two Roman emperors, Septimus Severus and Constantine the Great, who each in turn captured Byzantium by storm. About six years after its capture by him (197 A.D.) Severus commenced operations a little to the west of Byzantium, but in that year was called away by a rebellion in the West and never returned to the city. For over a hundred years it remained untouched, until 323, when Constantine, having conquered the city, pushed the work to completion after changing the details in the original plans. On 11 May 330 it was inaugurated.

The external appearance of the hippodrome was imposing for its vastness, its height and even for its beauty. The walls were of brick, laid in arches and faced by a row of Corinthian columns 260 in number and standing 11 feet apart. There were four entrances from the city each flanked with towers, but of the stairways leading to these entrances no description has come down to us.

Some idea of the immensity of this prodigious structure may be given by the fact that its dimensions were 1,400 feet in length by 400 feet in width, covering an area of 535,866 square feet, or 12.3 acres. On the north was a structure containing the apparatus for the games, the servants' and attendants' apartments, the chariots and horses, the arsenal, etc., called by the Romans the *carceres* and by the Greeks *μάγανφ*. This apartment was separated from the arena by pillars with latticed gates, 12 in number. Next to these gates was the little church or oratory, where the rival contestants prayed before the games.

The ground story was 20 feet high. On it rested the palace of the Kathisma or Tribunal, in the centre of which, supported upon 24 marble pillars was the platform in Kathisma proper, on the front of which was the emperor's throne. On either side and a little below the emperor were the seats for courtiers, ambassadors, etc. Far down the western side of the hippodrome and nearly opposite the built column was the gorgeous chamber of the empress, this sup-

ported upon four porphyry pillars and hence called the tetrakion.

The eastern, western and southern portions were occupied by parallel rows of seats, apporportioned to the spectators according to their rank. Behind these rose tier upon tier of benches until nearly half way to the top where was a broad promenade bounding the entire extent of the hippodrome except on the northern side. This promenade was without roof or covering, and, standing nearly 40 feet above the ground, protected by a solid marble railing reaching to the breast, the spectator had a spacious avenue 2,766 feet long. It is estimated that the hippodrome would seat 60,000 persons and have comfortable standing room for 20,000 more, while with a little crowding 100,000 might be accommodated.

The arena was 211 feet wide by 1,190 feet long and was bounded by a narrow walk called the Euripus, paved in tessellated stone. The semi-circular southern portion of the arena, that was included in the curve of the Sphendone, was reserved for the criminals and there too was the place for executions. In the centre of the arena and lying parallel to it was the Spina; a stadium, 607 English feet in length, it marked and governed the beginning, duration and end of each course of a race. At each end of the Spina was a high, narrow framework, surmounted by seven poles, on one group being placed seven fish, on the other seven eggs; one of each was taken down upon the completion of each circuit during the race until the race finished. Toward the southern end of the Spina was the Phiale, a broad basin of running water devoted to the victims of accidents. The space between the northern goal and the carceres was called the Stama, where wrestlers and acrobats performed.

Many additions to the works of art already gathered by Constantine were made during the 700 succeeding years, but in 1203 the hippodrome was sacked by the Franks and Venetians and all were either carried off or destroyed. The most famous of these was the 'Four Golden Steeds,' which was stolen by the Venetians and which in turn was brought to Paris by Napoleon, and is now standing guard over the main entrance of the cathedral of Saint Mark. Among the others are the statues of Hercules, the She-wolf and Hyæna, the Virgin Goddess Diana, the Brazen Ass, the Caledonian Boar, Helen of Troy, the God of Wealth and eight Sphinxes, beside the statues of the early Roman emperors, martyrs, teachers, philosophers, etc. In the early days of the city games were of frequent occurrence, but as time went by they became less and less frequent owing probably to the great cost (it is estimated that a single celebration cost 1,000,000 francs) and at last were celebrated only on 11 May and 25 December, the birthdays of the city and Christ respectively.

It is not known precisely when this hippodrome was entirely destroyed, but as there is no definite reference to any chariot race later than the reign of Isaac Angelus, who was dethroned in 1195, and as the place was sacked in 1203-04 it is probable that it did not survive the beginning of the 13th century.

The Circus Maximus at Rome was for a long time the only structure of its kind in the world, taking its form from the Greek hippo-

drome and furnishing the model for all later *circi*. In the Vallis Murcia, between the Palatine and Aventine hills, wooden seats were first constructed by Tarquinius Priscus (Liv. I, 35); were frequently burned and rebuilt until the time of Julius Cæsar, when the steps were constructed of stone and greatly improved. At that time it probably accommodated about 100,000 people. After its destruction by fire in 31 B.C. Augustus completely restored it, making several magnificent additions. The upper tier of seats on the Aventine side was again destroyed by fire in 36 A.D. but Claudius not only restored these, but greatly enlarged the entire circus. These additions were supplemented by others made during the reigns of Trajan and Constantine until it was estimated that the circus held 385,000 spectators, while the 'Notitia' places the possible number at 485,000.

The general plan of the Circus Maximus compared favorably with the Greek hippodromes, the main difference being in the arena around which Cæsar had constructed a moat 10 feet wide and 10 feet deep to prevent beasts from injuring the spectators, and in the width of the arena as before stated. Before the reign of Augustus the circus was used for gladiatorial fights with wild beasts and other forms of butchery, but after the erection of the amphitheatre of Statilius Taurus the circus was no longer used for such purposes. The popularity of this as of the Greek hippodrome also declined and it gradually decayed, now only a few of the remains standing.

The term hippodrome has also been applied to race tracks in England and on the continent, the most famous of these so-called hippodromes being those at Vincennes, Longchamps, Chantilly in France, Newmarket and Epsom in England, and Curragh in Ireland. The modern hippodrome, or indoor circus, had its beginning in Paris, where the first was constructed in 1845. It was built entirely of wood, the arena was 108 metres long and 104 wide, and it had a seating capacity of 15,000 persons. This was destroyed in 1870 by fire. The word hippodrome was first utilized in this country when Franconi conducted a circus at 23d street and Fifth avenue, New York.

The first hippodrome of the accepted type to be built in America was the New York Hippodrome, which occupies an entire block on Sixth avenue, between 43d and 44th streets. This structure was begun on 1 July 1904 and finished in five months, the opening performance occurring 12 April 1905. The main façade has a length of 200 feet, and the buildings extends 240 feet east on 43d and 44th streets. It is built of brick, marble and steel, and rises to a height of 72 feet on Sixth avenue, and 110 feet in the rear, the total cost being \$1,750,000. It is the largest playhouse in the world, having a seating capacity of 5,200.

In the interior decorations the general scheme of coloring is a Roman red as a background, with all the structural features done in ivory, gold and silver. The carpetings are of the same color, and the wall hangings, draperies and upholstery are executed in a Roman red velvet enriched with heavy gold and silver embroidery and tassels.

The auditorium is about 160 feet long and 160 feet wide in the first story, and the balcony and gallery occupy the building in front of the

stage above the first story. At the rear of the balcony is the mezzanine floor, below the rear seats of the balcony being the wide segmental promenade with main entrances and flights of shallow stairs at each end leading to the street. Behind the promenade the space, 20 to 50 feet wide and 200 feet long, is occupied by smoking rooms, parlors, waiting rooms and cloak rooms. The promenade and lobbies are finished in marble and cæn-stone, relieved by rich illuminations of the ornamented parts in gold and silver. A special feature of the auditorium is the arrangement and construction of cages for animals of the feline kind. Their dens are arranged in a segmental curve in the promenade floor and have plate glass fronts with iron bars behind.

The chief point of interest in the hippodrome centres in the stage and the entirely novel mechanical arrangements for operating the movable platforms, filling and emptying the tank, raising and lowering the stage and handling the scenery. The depth of the stage from the extreme front to the back wall is 110 feet, or 50 feet from the back wall to the proscenium opening and 60 feet from the arch to the front of the stage. This latter part of the stage lying forward of the proscenium arch is known as the "apron." It is large enough to contain two regulation circus rings, each 42 feet in diameter. Beneath the "apron" is built a huge steel and concrete tank, over 14 feet in depth and large enough for the whole "apron" to sink within it. When aquatic performances or naval pageants are given the tank is filled with water and the movable "apron" is submerged below the water to the bottom of the tank.

**Bibliography.**—'Pausanias' (v. 15 § 4; v. 120 § 7 foll.). From results of excavations the best descriptions of the old hippodromes of the world may be had in the following: Curtius, 'Olympia' (Berlin 1852); Gardiner, E. H., 'Greek Athletic Sports and Festivals' (London 1910), and the article 'Hippidromos,' in Daremberg and Saglio 'Dictionnaire des antiquités' (Paris 1897); Grosvenor, 'Hippodrome of Constantinople' (London 1889); Lehndorf, 'Hippodromos' (Berlin 1876); Pollack, 'Hippodromica' (Leipzig 1890); Smith, W., 'Dictionary of Greek and Roman Antiquities' (3d ed., London 1890); Wernicke and Schöne, in *Jahrbuch des archæologischen Instituts* (Berlin 1894). For descriptions of chariot races consult Homer's 'Iliad,' and Livy, and 'Lew' Wallace, 'Ben Hur' (New York 1880). Of the New York Hippodrome probably the best description is contained in the *Scientific American* (Vol. XCII, No. 12; 25 March 1905). For a study of the architectural features of the structures of those times consult Sturgis, 'European Architecture' (New York 1896).

**HIPPOLYTUS**, a saint and martyr of the early church, who flourished early in the 3d century. He was of Greek family, was converted to Christianity and eventually became a presbyter of Rome. His opposition to his bishop Zephyrinus, and to Calixtus, his successor on questions concerning Christology and discipline resulted in a schism. The dissenting party chose Hippolytus as its head, which position he maintained until about 235, when he was banished to Sardinia. Here he died shortly

THE BEAR AND THE CUB

HIPPOPOTAMUS (*Hippopotamus Amphibius*)

afterward. Only fragments of his numerous works remain. Of these, the 'Philosophumena' is the best known, and was first published as a work of Origen's. However, it was soon recognized as a treatise by Hippolytus and first edited as such by Duncker and Schneidewin. In it he states his theological position, dealing especially with heresies and their origins. Hippolytus was also the author of a number of shorter polemical and exegetical treatises. His works are accessible in Migne, 'Patrologia Græca' (Vol. X), and by Bonwetsch and Archelis (Leipzig 1897). Consult Achelis, Hans, 'Hippolytstudien' (Leipzig 1897).

**HIPPOPOTAMUS**, the generic and popular name of a great amphibious ungulate, allied to the swine, of which two species are known. One (*H. amphibius*) is common throughout the greater part of Africa; the other (*H. liberiensis*) is not only smaller, but has other important differences, and is found only in the African west coast rivers, and those flowing into Lake Tchad. The former species has a thick and square head, a very large muzzle, small eyes and ears, thick and heavy body, short legs terminated by four toes, a short tail, two ventral teats, skin about two inches thick on the back and sides, and without hair, except at the extremity of the tail. A curious feature of the skin is the reddish exudation which pours from its pores when the animal is excited or in pain. It is called "bloody sweat," but the blood has no part in it. The incisors and canines of the lower jaw are of great strength and size, the canines or tusks being long and curved forward. These tusks sometimes reach the length of two feet and more, and weigh upward of six pounds. The animal is killed by the natives partly as food, but also on account of the teeth, their hardness being superior to that of ivory, and less liable to turn yellow. The hippopotamus has been found as much as 14 feet long, and nearly five feet high, but usually measures much less. It delights in water, living in lakes, rivers, and estuaries and feeding on water-plants or on the herbage growing near the water, where it can walk as well as swim. It often leaves the water after nightfall, and goes, sometimes long distances, to grassy pastures to feed; regular paths are worn through the reeds, and here the Africans often arrange pits, deadfalls, or other traps for their capture. These animals are quick of sense, timid and anxious to escape danger; but when brought to bay or enraged prove formidable antagonists and often destroy canoes. They are excellent swimmers and divers, and can remain under water eight or ten minutes. The behemoth of Job is considered to be the hippopotamus. Several extinct species are found in Old World Tertiary formations, and modern species formerly inhabited not only Madagascar, but southern Europe and India, where they were contemporary with the men of the Stone Age.

**HIPPURIC** (hipū'rik) **ACID**, an organic acid,  $\text{CH}_2\text{NH}(\text{C}_6\text{H}_5)\text{COOH}$ , existing in the urine of herbivorous animals, and, in small quantities, in that of human beings. It is increased by a vegetable diet, and by the disease called diabetes, and may be caused to appear in the human urine in considerable quantities by the administration of benzoic acid with the food. It is most conveniently prepared by boil-

ing horse urine with milk of lime, filtering, neutralizing with hydrochloric acid, and evaporating to about one eighth of its volume. The concentrated urine is then acidified with hydrochloric acid and allowed to stand, when impure hippuric acid comes down as a yellowish-brown precipitate. To purify the crude product, it is heated to 212° F. with not quite enough water to entirely dissolve it, and chlorine gas is passed through the solution until the unpleasant smell has entirely disappeared. The solution is then filtered while hot, and the crystals which separate upon cooling are isolated and subjected again to the same treatment, the chlorine being passed through the solution, in this second treatment, until the solution is bright yellow. When thus prepared, hippuric acid crystallizes from water in the form of large prismatic plates, belonging to the trimetric system. Its crystals are colorless or white, free from odor and have a slightly bitter taste. Hippuric acid has a specific gravity of about 1.308, and melts at 369° F.; it begins to boil at about 465° F., giving off benzoic acid and benzonitrile. It is insoluble in benzene, carbon disulphid, and cold chloroform, and is but slightly soluble in ether and in cold water. It is very soluble, however, in boiling water, and in hot alcohol. With bases, hippuric acid forms salts that are remarkable for the beauty of their crystalline forms. When boiled with dilute hydrochloric, sulphuric, nitric or oxalic acid, it yields benzoic acid and glycol.

**HIRAM**, a king of Tyre, who assisted David in the building of his palace. Hiram supplied timber and skilled workmen, and when Solomon succeeded to the throne, gave him similar co-operation in the construction of the temple. Great friendship existed between the two kings, Hiram even supplying a navy to Solomon, when the latter was in need of ships. Tyre was strongly fortified during his reign, and Cyprus was vanquished.

**HIRAM COLLEGE**, coeducational institution, founded in 1850, in Hiram, Ohio, under the auspices of the Christian Church. It was first called the Eclectic Institute, but was incorporated as a college in 1870. In 1916 there were in attendance about 266 pupils and 20 instructors. There are about 13,000 volumes in the library. It owns six buildings entirely devoted to college purposes, has women's dormitories, a museum, gymnasium and laboratories.

**HIROSHIMA**, hē-rō-shē'mā, Japan, a town on the island of Hondo, about 160 miles from Kobe, and after Osaka the most important port on the inland sea. It is the capital of the Province of Aki and of the Prefecture of Hiroshima. It is situated opposite the sacred isle of Itakushima, with its celebrated temple. Hiroshima contains several temples and tea houses. It is a centre of the trade in bronze, lacquered ware and other art objects. Pop. 142,763.

**HIRSCH**, hirsh, **Emil Gustav**, American rabbi: b. Luxemburg, 22 May 1852. He studied at the University of Pennsylvania and at Berlin, was rabbi successively in Baltimore, Md. (1877), and Louisville, Ky. (1878-80), and in 1880 was chosen minister of the Sinai congregation of Chicago, Ill. In 1880-87 he was editor of the *Zeitgeist* of Milwaukee, Wis., and

later became editor of the *Reform Advocate* of Chicago. He was appointed professor of rabbinical literature in Chicago University in 1892, and was lecturer at Johns Hopkins in 1902. He appeared as an orator on various patriotic and other occasions, and wrote several monographs on religious and Biblical topics. He was also prominent in Republican State politics, and in 1896 was presidential elector-at-large for Illinois. He was in charge of the Biblical department of the Jewish Encyclopædia in 1903-06, and member of the Board of Commissioners of Public Charities of Illinois since 1906. He translated Einhorn's 'Ritual for Jewish Reform Congregations.'

**HIRSCH, Maurice, BARON DE (BARON MAURICE DE HIRSCH DE GEREUTH)**, Austrian Jewish capitalist and philanthropist: b. Munich, 9 Dec. 1831; d. Ogyalla, Hungary, 21 April 1896. His fortune was computed to be \$200,000,000 and his yearly income at about \$20,000,000. His benefactions equaled nearly \$100,000,000, the most of this sum being directed toward the improvement of the condition of the Jews in all parts of the world. The De Hirsch trust for the United States is a fund of \$2,500,000 for the Americanizing and education of Rumanian and Russian Jews. Other large gifts were those of \$5,000,000 for the endowment of schools in Galicia and of \$50,000,000 to the Jewish colonization association for the establishment of colonies in Argentina. In 1888 he offered to the Russian government \$10,000,000 for schools, with the condition that in the distribution of the amount no discrimination as to race or religion be made. This offer was not accepted. Baron de Hirsch made extensive sums through the construction of railways in Turkey.

**HIRSCH, Samson Raphael**, German Jewish theologian: b. 20 June 1808; d. 31 Dec. 1888. Born in Hamburg of a family devoted to Hebrew studies, and strict conformists, his choice of theology as his vocation was natural and his preparation was thorough. Graduating from Bonn University, his first position (1839) was at Oldenburg and then at Emden (1841). He wrote his 'Neunzehn Briefe über Yudentum' (1826), which was translated into Hebrew (1892) and into English (1899). In 1836 Hirsch issued his 'Horeb,' a Jewish text-book for mature young people, followed by two polemical essays against reform. His standpoint from the beginning was orthodoxy and its defense was his *leit motif*. After preaching in Nicolsburg 1846-51, he was called to Frankfurt, by the orthodox section of the community, where his activity was developed. He organized a school, founded a monthly and wrote many books. He translated the Pentateuch (1867-78) and the Psalms (1882).

**HIRSCHFELD, Georg**, German dramatist and novelist: b. Berlin, 11 Feb. 1873. He belonged to the Naturalistic School and during his early career he was hailed by some as a second Hauptmann. He followed closely in the footsteps of Holz and Schlaf, their influence being clearly evident in his dramatic style. He studied in Munich, and while there his first production, a one-act drama, 'Zu Hause' (1894), was staged, which is a portrayal of life in Berlin, W. The play which first made Hirschfeld well known was 'Die Mütter' (1896), which was

produced for the first time by the Freie Bühne in 1895 in Berlin, where Hirschfeld had now come to reside. It proved a success and was then staged by Brahm in the Deutsches Theatre. This is the work by which Hirschfeld is chiefly known. His later dramas are 'Agnes Jordan' (1898), a variation of the theme of 'Die Mütter'; the romantic drama 'Der Weg Zum Licht' (1902); the servant's comedy 'Pauline,' a counterpart to Hauptmann's 'Biberpelz'; the artist's comedy 'Der junge Goldner,' and one other drama called 'Nebeneinander.' At one time in Hirschfeld's career great things were expected of him as a novelist also. 'Dämon Kleist' was the first of his stories. It was published in *Die Freie Bühne* in 1894. He had the same admiration for the poetic struggles of Kleist that many other literary men had for Byron. Hirschfeld's mystical genius made a better success of the story 'Der Bergsee' (1896). It might be described as the attempt of a naturalist to do homage to symbolistic art. Another story 'Requiem' (1906) completes the list of his novels. His last accessible works are two conventional comedies 'Spätfrühling' and 'Mieze und Maria.' His works are generally characterized by sentimentality and a dreamy poetic longing for beauty and perfection in art. He is still writing and it is impossible as yet to form a definitive judgment of the value of his works. Consult Dr. Adalbert von Hanstein, 'Das Jüngste Deutschland'; Soergel, A., 'Dichtung und Dichter der Zeit.'

WILLIAM F. HAUHART.

**HIRTH, hert, Friedrich**, German-American educator: b. Gräfontonna, Saxe-Coburg, Germany, 16 April 1845. He studied at Leipzig, Berlin, and Greifswald, entered the Chinese customs service in 1870; retired in 1897, and in 1902 was called to the newly created professorship of Chinese in Columbia University. In 1900 he was consulted by Chancellor von Bülow on the Chinese war indemnity question. In the summer of 1902 he was in Petrograd, cataloguing a collection of manuscripts taken at Peking. He made a valuable collection of Chinese porcelains, now in the museum at Gotha, and one of printed books and MSS, now in the Berlin Royal library. Among his publications are 'China and the Roman Orient' (1885); 'Ancient Porcelain' (1888); 'Chinesische Studien' (Vol. I, 1890); and 'Ueber fremde Einflüsse in der Chinesischen Kunst' (1896); 'Scraps from a Collector's Note-Book, Being Notes on Some Chinese Painters of the Present Dynasty, with Appendices on Some Old Masters and Art Historians' (1905); 'Chinese Metallic Mirrors' (1907); 'The Ancient History of China' (1908); 'Chau Ju-Kua' (1911), with W. W. Rockhill; and other monographs on Chinese subjects.

**HIRUDINEA**, bloodsuckers or leeches; formerly classed with flatworms and thought to resemble flukes and tapeworms but really flattened annulate worms (Annelida) with suckers or jaws, and related to the earthworms. Most leeches are carnivorous robbers of the aquatic fauna but some have acquired partial or complete parasitic habits. A few tropical species are land living in Japan, the Philippines, and other eastern regions where they attack travelers or soldiers on the march so violently as to imperil their existence.

**HISCOCK, Frank**, American legislator: b. Pompey, Onondaga County, N. Y., 6 Sept. 1834; d. 18 June 1914. In 1855 he was admitted to the bar, in 1860-63 was district attorney of Onondaga County, and in 1867 a member of the State constitutional convention of New York. He was a Republican representative in Congress in 1879-87, and obtained recognition as a party leader and speaker. In 1887-93 he was United States senator from New York and chairman of the appropriations committees and then returned to professional practice.

**HISPANIA**, his-pá-ni-á. See SPAIN.

**HISSAR**, one of the mailed catfishes of northern South America, noted for its monogamous habits, and the fact the eggs, a few at a time, are voided by the female into a pouch made by the folded membranes of her ventral fins. Here they are fertilized by the male, and then are taken by the faithful pair to a secluded place and deposited. This operation is repeated until about 250 eggs are placed in the nest which is then guarded. The hissar and several other species belong to the genus *Callichthys*.

**HISTOLOGY**, the science of animal and vegetable tissues. It investigates by means of the microscope the various tissues of man, animals and plants in their anatomical relations and compositions. Topographical histology considers the more minute structures of the organs and systems of the body; normal histology deals with the healthy tissues; and pathological histology investigates the changes they undergo in disease. Marie François Xavier Bichat (1771-1802) is generally credited with the foundation of the science of histology. Unfortunately the imperfect condition of the microscope in his time prevented Bichat and his contemporaries from carrying their investigations to the point which Schleiden, Schwann, Johann Müller, Virchow, Von Recklinghausen, Cohnheim, etc., have reached. It has been found that all structures however complex are made up of cells, and that the parts of a body may be resolved into a small number of elementary tissues now grouped as: (1) epithelium, which lines almost all the cavities of the body and is directly or indirectly in communication with the atmosphere; (2) the nervous tissues, which as nerve cells originate and as nervous fibres transmit all nervous impulses; (3) muscle, which produces motion whether voluntary or involuntary; (4) glandular tissue which consists of cells standing in close relation with the blood-vessels which take from the blood certain substances and secrete them; (5) connective substances which support and hold together the more delicate and important structures, especially forming the cartilages and bones. See PLANTS, STRUCTURE OF.

Many tissues have the power of repairing injuries that happen to them. This power is called regeneration, and is found especially in the lower animals, in polyps, worms and in many amphibious creatures and reptiles. In other cases the lesion is supplied by a new growth of connective substance. In diseases the tissues undergo many changes and many of these diseases in the organism are shown also by the changing of color. The science of such changes is generally called pathological histology. It is a comparatively young science

and has been cultivated by Virchow, who was the founder of cellular pathology.

Vegetable histology is that department of botany which deals with microscopic phytotomy or the anatomy of plants, especially investigating the plant cells and plant tissues. It is properly subordinate to morphology and is a distinctively descriptive science. It deals with the question in what relation the cells or forms of tissue stand to the vital activity of plants, what functions they perform, and in what respect they are constituted for the fulfilling of those functions. (Compare CYTOLOGY). Owing to the excessive minuteness of the cells which form the tissues of all plants the investigation relies almost entirely on the microscope, and naturally has made its advance in proportion as the microscope has been made more perfect. Microscopes that are now used magnify at least 1,000 diameters, and the materials used have to be carefully prepared and mounted. Many of them have to be colored with hæmatoxylin, fuchsin, saffranin, and other alcoholic or aqueous dyes. Consult Bailey, F. R., 'Text-Book of Histology' (4th ed., New York 1913); Chamberlain, C. J., 'Methods in Plant Histology' (2d ed., Chicago 1905); Lee, A. B., 'Microtometist's Vade-mecum' (6th ed., Philadelphia 1905); Strasburger, E., 'Handbook of Practical Botany' (7th ed., New York 1911); Delafield and Prudden, 'Handbook of Pathological Anatomy and Histology' (9th ed., New York 1911).

**HISTORICAL DETERMINISM**. See DETERMINISM.

**HISTORICAL GEOLOGY**, that branch of the subject that deals with the orderly treatment of the events of the past, chronologically, and with due regard to cause and effect. It includes Paleontology (q.v.) and Stratigraphy (q.v.). See section on *Stratigraphy* in the article on GEOLOGY. See also PALEOZOIC, CAMBRIAN, CARBONIFEROUS, etc.

**HISTORICAL SCHOOL OF ECONOMICS**. See ECONOMICS.

**HISTORY, ITS RISE AND DEVELOPMENT: A Survey of the Progress of Historical Writing from its Origins to the Present Day.**

#### I. THE NATURE OF HISTORY.

1. **Meaning of the Term.**—The term *History*, in popular usage, has been applied to two somewhat different concepts. It is often used to designate the sum total of human activities, and it is when used in this sense that one often hears the remark at a particularly active or critical period in human events that "now history is being made." A more common usage is that which regards history as the record of the events rather than as the events themselves. In this latter generally accepted connotation given to the term history, two definitions may be offered. In an objective sense history is, to use the words of Professor Robinson, "all we know about everything man has ever done, or thought, or hoped, or felt." Subjectively or psychologically expressed, history may be regarded as a record of all that has occurred within the realm of human consciousness.

In this sense of a record of the activities of the human race, history has been regarded

by some, particularly in earlier periods, as primarily an art—a branch of literature. By a continually increasing number of authorities it has tended, however, in its modern form, to be considered as in the main a genetic social science, which is concerned with reconstructing the past thoughts and activities of humanity. In the present article history will be regarded in the sense of a science rather than as an art. It is the thesis of the writer that history can lay no more claim to being an art than any other branch of social science and that while artistic achievement may be desired in history it is quite subordinate in importance to scientific accuracy and constructive thought. In fact, progress in historical writing may almost be regarded as a development from an art to a science. It is this which constitutes the progress from Livy to Ranke or from Herodotus to Gardiner.

**2. Fallacy of the Term Pre-historic.**—Before the important developments in anthropology and pre-historic archaeology, which have done so much to extend our knowledge of human activities in the distant past, it was the conventional practice to limit the term history to a record of those events which were described or preserved in literary remains. Now, however, when archaeology tells one much more of certain phases of the early life of man than was once known of even more recent periods through literary evidence, it is no longer accurate nor logical to use the term "pre-historic," unless it is employed to designate that vague and hypothetical period in the beginnings of human development of which there exists no positive and tangible record, or unless one is limiting his conception to history as a branch of literature. In the place of the now generally discarded and discredited term "pre-historic" there has been substituted the concept of "pre-literary history," as descriptive of the records of that period of human development where the information is revealed by archaeological rather than literary evidence. In short, it has been agreed that a fundamental fallacy and contradiction is involved in the use of the term "pre-historic" for any period of which there is any considerable record preserved, whether in writing or in the artifacts of daily life. With recent writers "pre-historic" has followed the term "pre-Adamite" into that oblivion of discarded categories which is being continually expanded as an inevitable result of the growth of the knowledge of human activities in both time and space.

It has been deemed inadvisable at this point in the article to discuss the various interpretations of what history means or should be mainly concerned with narrating. It is in great part the task of this whole article to reveal the diverse interpretations of history, and this much debated problem of what history means or has been thought to mean will be shown in its historical mutations and transformations.

## II. THE ESSENTIAL PRELIMINARIES TO THE ORIGIN AND DEVELOPMENT OF HISTORY.

**1. Archaeology as the "Threshold" of History—Pre-literary History.**—Having seen that history in the modern sense of the term goes back to the beginnings of any record of human existence and activities, one must look for the ultimate origin of history in those early

artifacts which were sufficiently distinctive in form and durable in material composition to have been preserved through the ages as evidence of what mankind was accomplishing in the vast expanse of time before the art of writing was mastered. History, thus, may probably be said to have had its real origin in the disputed eolithic period, and the first historical document may be accurately held to have been the first indisputable colith, or if the eolithic period be denied, the first definite paleolith of the river drift period.

Space does not here allow even the briefest résumé of that most interesting story of the early development of mankind as revealed by the artifacts which have been preserved. The thrilling evidences of man's interests and activities in that almost immeasurable period of a quarter of a million years which are revealed by the "coup de poings" of the river drift period, the remarkable flaked flints of the cave period, as well as the engraving on animal bones and the early paintings from such sites as Altamira and Font-de-Gaume and the wonderful products of the bronze and iron ages, are all subjects of the most compelling interest, for the complete treatment of which the reader must be referred to the article on "Archæology." Suffice it to say at this point that these archæological products of the pre-literary period mark the real threshold of history.

Nor can one, in the space, allotted to this article, do more than to refer to the origin in modern times of the science of pre-historic archæology, so inextricably connected with the work of such men as Boucher de Perthes, Sir John Evans, de Mortillet, Rutot, Dechélette, Cartailhac, Breuil, Schmidt, Obermaier, Montelius, Peet, Schliemann and Sir Arthur Evans, and which has rediscovered what is, from the standpoint of the time which elapsed, the greater portion of human history. Even less can be said concerning the work of geologists like Lyell, Le Conte, Winchell, Sollas, Geikie, Penck and Chamberlain; of biologists such as Darwin, Wallace, Huxley and Haeckel; and of anthropologists of the type of Tylor, Aveybury, McLennan, Morgan and their more critical successors, all of whom have reconstructed the prevailing notions of the origin of the human race, of chronology and the eras of human development earlier fixed by Julius Africanus, Eusebius, and Jerome, and have made it possible for the present generation to interpret the real significance of the archæological remains, rather than being compelled to view them in the manner of earlier generations as "thunder stones," or some other object of fancy and superstition.

**2. The Mastery of the Art of Writing.**—Though the non-literary archæological remains of early man are of the utmost aid and importance in reconstructing his modes of life and activity, no extensive or ample record of past events was possible until some progress had been made in the way of being able to give uniform objective and permanent expression to human thought and action, in other words, until the art of writing had been mastered.

The obscure origins of the art of writing must be regarded as dating back to the picture writing which first appears on the implements and the cave walls of the middle and later

paleolithic periods. Before these pictograms, however, could be regarded as real writing, it was necessary that they should pass through three well defined stages of development. In the first place, the pictures had to become conventionalized, so that they always had the same appearance and designated the same object. Next, it was necessary that they should not only refer to a concrete object, but also become the symbols of abstract conceptions. Finally, it was essential that the conventionalized symbols should pass into that stage where they combined a representation of an abstract conception and the sound of the human voice. This last stage itself passed through a number of developments. In the simplest and most elementary form of this "sound writing" each symbol represented an entire word. Some languages, such as the Chinese, have never passed beyond this monosyllabic stage. Normally, however, the symbols usually came to represent not a whole word but a syllable. Sooner or later, the various possible sounds of the human voice were analyzed and came to be represented by separate symbols or letters, and the alphabet thereby came into existence. The first known example of a true alphabet appeared among the Phoenicians about 1000 B.C. Of its origins little is known further than that the Phoenicians borrowed most of these signs from their neighbors in Egypt, Babylonia and Crete. The Phoenician alphabet contained twenty-two consonants and it remained for the Greeks later to perfect the modern alphabet by adding the vowels. There seem to have been at least five independent centres of the origin of writing, namely, Crete, Egypt, Mesopotamia, China and Central America.

Along with the mastery of the art of writing went the provision of materials on which to set down the desired letters and words. Stone columns and walls and even the clay tablets of the Babylonians, whatever their virtues from the standpoint of permanence, were clumsy, awkward and restricted writing materials. The Egyptians solved the difficulty by utilizing the membrane of the papyrus reed. Later, parchment was fashioned from the skin of animals for the use of those peoples where papyrus was not available. Paper, made originally from silk, first appeared among the Chinese about 200 B.C. The Arabs devised a paper made from cotton fibre, about 750 A.D. This was brought into Spain, where flax was substituted for cotton and the modern linen paper came into use about 1250. With the provision of an alphabet and writing materials, historical writing could begin that long course of development which was to bring it from Herodotus and Thucydides to Ranke, Aulard, Gardiner and Osgood. Professor Breasted has well stated the importance of this step in the evolution of civilization in general and of historical writing in particular, "The invention of writing and of a convenient system of records on paper has had a greater influence in uplifting the human race than any other intellectual achievement in the career of man. It was more important than all the battles ever fought and all the constitutions ever devised." Before a true historical perspective could develop, however, it was indispensable that some method of measuring time should be discovered and a scientific system of chronology evolved.

**3. The Development of the Conception of Time and the Provision of a Chronology.**—Indispensable as some method of measuring time was for chronicling the thoughts and actions of man, it was not for this purpose that the calendar was originally developed. As Professor Shotwell has remarked, and Professor Webster has shown in greater detail, it was the deeds of the gods and not of men that the early calendars were designed to fix and record. The methods of measuring time grew up about the need for determining the dates of tabooed or holy days and for fixing and recording the occurrence of unusual natural phenomena which were believed to have some religious significance. In other words, the concept of time was born with the dawn of the consciousness of the repetition of natural processes and phenomena and the necessity of differentiating between days on the basis of their particular virtue or qualities. The perfection of the methods of measuring time has been a gradual process of transition "from luck to mathematics." It was not until long after crude calendars had been provided for these religious uses that they were utilized to fashion a chronology for recording historic events.

The simplest and most primitive type of calendar was the lunar calendar based on the phases of the moon. The basis was the lunar month of 29 and one-half days. From this it was possible to provide roughly for convenient units of measurement, both longer and shorter than the month. The lunar fortnight was a widespread unit of time, and weeks were secured from the quarters of the moon or from a division of the months into three periods of 10 days each, the latter being closest mathematical solution. Twelve lunar months produced a lunar year of 354 days, and to keep the months synchronized with the seasonal divisions, a thirteenth month was interpolated at appropriate intervals. A longer interval was the lunar cycle of about 19 years, which came into use among the Greeks about 750 B.C. Though the lunar calendar provided no exact divisions of time, either long or short, and was continually getting out of adjustment, it was tolerated and retained by all the peoples of antiquity except the Egyptians, who share with the aboriginal inhabitants of Mexico the honor of having first evolved the solar year and the beginnings of the modern calendar. The agricultural life of the dwellers in the Nile valley and the importance of the Sun-God in Egypt tended to increase the importance of the sun at the expense of the moon. Accordingly, as early as 4241 B.C., the earliest fixed date in history, the Egyptians had devised a solar year of 365 days, with 12 months of 30 days each and five feast days at the end of each year. The seven-day week of the modern calendar, cutting through both month and year, was the product of the ingenuity and religious arrangements of the Hebrews. As early as 238 B.C. Alexandrian scientists had devised the quadrennial leap year, and during the Hellenistic period the Hebrew week was adapted to form the planetary week of the modern calendar. In 46 B.C. Julius Caesar prescribed for the Roman world this solar year, but the planetary week did not come into general use in Rome before the 2d century A.D. The final step in perfecting the calendar was taken by the authority of Pope Gregory XIII in 1582.

Eleven days were dropped from the calendar and centennial years were regarded as leap years only when divisible by 400.

The provision of some sort of a crude calendar was an essential prerequisite of systematic history, but the process had to be carried on a step further before the mechanism for measuring and recording time was sufficiently perfected to be of any considerable service to the historian. It was not enough to be able to measure time by the year and its fractions; it was necessary to have some method of identifying successive years, in other words, to provide a chronology. While the Egyptians had an admirable instrument for fashioning a scientific chronology in the astronomical "Sothic cycle" of 1461 years, they made no use of it and never provided a scientific chronology. The earliest Egyptian approximation to a chronology was the annalistic expedient of naming the years by some great event which happened therein. The famous "Palermo Stele" constitutes the earliest remaining record of these year-lists and is supposed, in its original complete form, to have identified the seven hundred years from 3400 B.C. to 2700 B.C. An advance in methodology was made when the years were named from the regnal years of a particular king. The only great list of Egyptian regnal years which has been preserved, even in a fragmentary condition, is the precious "Turin Papyrus," which has to be supplemented by the lists inscribed on the temple walls of the later dynasties. About 275 B.C. Ptolemy Philadelphus commissioned a learned Egyptian priest, Manetho, to collect and translate into Greek all the Egyptian annals and regnal lists. The fragmentary remains of the labors of Manetho have constituted the skeleton upon which modern Egyptologists have reconstructed the chronology of ancient Egypt. The Babylonians never passed beyond the annalistic stage of chronology—namely, the identifying of years by some conspicuous occurrence. A contemporary of Manetho, Berossos, a Babylonian priest at the court of Antiochus II, tried to do for Babylonian chronology what Manetho had done for Egyptian, but to judge from what remains of his work in the fragments of copyists, he seems to have been less successful. A far greater exactness was given to Assyrian chronology by the fact that the years of a given king were identified by the annual appointment of an official, known as a *limmu*. As the name of the contemporary *limmu* was given in the notices of events contained in the clay records, the lists of *limmi*, dating from 892 B.C. to 704 B.C., enable the historian to establish with a high degree of accuracy the Assyrian chronology. In the later period of Assyrian and Babylonian history there developed some conception of an "era," which dated from the reign of Nabonassar, 747 B.C. The Hebrew chronology never developed further than the crude genealogical system of reckoning by generations, the conventional length of which was 40 years. Some vague conception of eras seems also to have arisen, as, for example, the period from Abraham to David, or from David to the "captivity." The classic examples of the Hebrew chronological system are to be found in the opening of the first book of Chronicles and in the first chapter of Matthew. The early Greek historians, in spite of an admirable starting point for the

Greek era in the semi-mythical siege of Troy and an unusually ingenious mechanism for measuring time in the "Cycle of Meton," did no better than their predecessors in creating a chronology. Down to the middle of the 5th century B.C. the only chronological records possessed by the Greeks were the local genealogies and the names of archons, priests and priestesses. The early attempt of Hellanicus of Lesbos, in the latter half of the 5th century B.C., to fashion a chronology from genealogies and name lists has been described by Bury as "an ingenious edifice erected on foundations that had no solidity," but even the attempt had some significance. Neither Herodotus nor Thucydides made any attempt at solving the problem of chronology, and the later Greek historians finished their work with no more satisfactory system of chronology than the clumsy method of reckoning by Olympiac years introduced by Timæus about 300 B.C. The Olympiac "era" was dated from the alleged Olympiac games in 776 B.C. The laudable effort of Eratosthenes, about 80 years after Timæus, to put Greek chronology on the firm basis of astronomical measurements was little utilized or encouraged by the historians, though the astronomical researches of the Alexandrian scientists were of the utmost importance for the future of chronology. The practical minded Romans were the first people of antiquity to devise a rational and reliable system of chronology. They dated their years from the mythical foundation of Rome in 753 B.C. The monstrosities of the Christian chronology introduced by Julius Africanus, Eusebius and Jerome, as well as the real foundations of modern scientific chronology with Scaliger's 'De emendatione temporum' and Dom Clément's 'L'Art de vérifier les dates' will be dealt with later. It is sufficient here to bear in mind the fact that only the Roman chronology enabled an historical writer of antiquity to deal with assurance with anything save contemporary history. This serves in part to explain why the great historical works of Greece were strictly in the field of recent and contemporary history. Now that the development of the indispensable prerequisites of historical writing has been briefly touched upon, attention may be turned to the origins of historical writing in antiquity.

### III. ORIENTAL BEGINNINGS OF HISTORICAL WRITING.

While the climatic conditions have made Egypt a veritable archæological museum, or, as Professor Breasted has termed it, "a vast historical volume," and have made possible the preservation of very valuable and extensive sources of historical information in the remains of the architecture, the engineering feats, the plastic art, and even the inscriptions cut on the stone surfaces of tombs, palaces, temples and monuments, there have been few or no Egyptian historical writings preserved. With the exception of a few fragmentary *annals*, such as the "Palermo Stele" no native Egyptian historical writings have been discovered except the garbled and incomplete work of Manetho referred to above. One may safely agree with Professor Hall that "no real historian is known to us in Pharaonic Egypt, nor is it likely that one will ever be discovered."

While the true historical narrative can scarcely be held to have originated with the Babylonians or Assyrians, they certainly made a closer approximation to this achievement than the Egyptians. The earliest historical writings of the Babylonians, dating back to the third millennium B.C., were the votive inscriptions, giving the names of the kings, their genealogies and a record of the buildings they erected. The great cylinder inscriptions of Gudea (2450 B.C.) are a valuable source for the contemporary manners and customs, while the Code of Hammurabi (2150 B.C.) is probably the most important single document in the history of jurisprudence. In the period following Hammurabi there were important writings of the kings setting forth their achievements, but in an epic rather than a truly historical manner. The second Babylonian kingdom of the 6th century B.C. contributed some important *chronicles* epitomizing some much earlier narratives, which are now preserved only in fragments, and lists of the Babylonian kings. While the Babylonians were concerned mainly with the arts of peace, the Assyrians dealt primarily with the feats of war in their annals and campaign and votive inscriptions. A most important historical document, ascribed by some to Babylonian and by others to Assyrian sources, is the 'Synchronous History,' compiled in the 8th century B.C. This describes the successive boundary disputes between Babylonia and Assyria from 1600 to 800 B.C., with a list of the kings who participated. Finally, from Assyrian sources there are the above mentioned lists of *limmi* or the *eponym canon*, covering the period from 892-704 B.C. The Babylonian counterpart of Manetho's work, Berossos' history of Babylonia in three books, written about 280 B.C., was the first systematic historical narrative produced by a Babylonian or Assyrian scribe. It has, unfortunately, been lost and only survives in scanty references in Josephus, Eusebius and a few other later historians. Whatever its value, its date shows that real historical narrative was not a product of the period of the height of either Babylonian or Assyrian culture.

The honor of having first produced a true historical narrative of considerable scope and high relative veracity must be accorded to the Hebrews of ancient Palestine. The conventional assumption of the Mosaic authorship of the Pentateuch and the synchronous nature of its books, questioned by Hobbes in 1651 and by Spinoza in 1670, was riddled by the French physician, Jean Astruc in 1753, and the German theologian, Karl David Ilgen in 1799. The true nature of the composite authorship of the Pentateuch and the widely divergent dates of the composition of its various books were established as a result of the work of a number of courageous and brilliant scholars, the most prominent of whom were Professor De Wette of Jena, Professor Hupfeld of Halle, Professor George of Berlin, Bishop Colenso of Natal, Professor Kuenen of Leyden, Professor Robertson Smith of Cambridge, Professor Bacon of Yale, and, above all, Professor Julius Wellhausen of Greifswald and Göttingen. Their labors have revealed the fact that the Pentateuch was the work of some five different authors, or groups of authors, writing between 900 and 450 B.C., their diverse writings were consolidated in the Pentateuch, as it is now

arranged, some time before 400 B.C. The oldest, or "Jahvist" source, was written about 900 B.C., the next, or "Elohists," about 725 B.C., the third, or "Deuteronomist," from about 700 to 620 B.C., the fourth, or "Holiness Code," about 575 B.C., and the last, or "Priestly Book," about 450 B.C. Their union, upon the fifth source as a basis, was accomplished some time in the 5th century B.C. The beginnings of the historical narrative among the Hebrews were stimulated by the great expansion of Hebrew prosperity and prestige under Saul, David and Solomon. As Professor Moore has said, "the making of great history has often given a first impulse to the writing of history, and we may well believe that it was so in Israel, and that the beginning of Hebrew historical literature, in the proper sense of the word, was made with Saul and David." This origin of Hebrew historical writing, which marks the earliest appearance of true historical narrative of which any record has been preserved, is to be found in the work of the unknown author of the "Jahvist" sources of the Pentateuch, Joshua, the Books of Samuel and the opening of the first Book of Kings. Of the labors of this writer, who, though he can claim the honor of being the first of the line of true historians, is known only to students by the recently acquired appellation of "J," Professor Breasted makes the following comment, "they are the earliest example of historical writings in prose which we possess among any people, and their nameless author is the earliest historian whom we have found in the early world." The "Jahvist" narrative reaches its highest point in 2 Samuel, ix-xx, which is probably the best example of both Hebrew and Oriental historical writing. Of this passage Edouard Meyer says: "It is astonishing that historical literature of this character should have been possible in Israel at this time. It stands far above everything which we know elsewhere of ancient Oriental historical writing." The remaining historical books of the Old Testament Canon were the Books of Kings, which were written about 575 B.C., and Chronicles—Ezra—Nehemiah, written about 300 B.C. The Books of Kings were the first practical illustration of Polybius', Dionysius of Halicarnassus' and Lord Bolingbroke's view of history as "philosophy teaching by example," for the author sought primarily to convince his people by historical illustrations of the disasters that had come to the Hebrews by deserting their national religion. Chronicles-Ezra-Nehemiah constitute the work of a single author, who by genealogies and narrative surveys the whole of Hebrew history with the aim of glorifying through tremendous exaggerations the splendor of the Hebrew kingdom under David and Solomon, and of re-emphasizing the warning of the author of Kings respecting the penalty of deviation from the true religion. Both Kings and Chronicles-Ezra-Nehemiah are distinctly inferior to "J" from the standpoint of accuracy and lucid narrative. One of the greatest products of Hebrew historiography is a work, which, for some curious reason, has not been included in the Protestant canon of the Bible—the first Book of Maccabees. This narrative, written about 125 B.C. by a devout and vigorous Sadducee and an ardent admirer of the Asmonean house—a sort of a Judean Treitschke—tells the stirring story of Hebrew history from the con-

quest of Palestine by Alexander the Great to the accession of John Hyrcanus. The work centres about the deliverance of Palestine from Syrian domination through the military exploits of Judas Maccabæus and his successors. While fired by the thrills of patriotic pride, the author produced a unique work for his time, in that he explained the victories of the Hebrews as having resulted from the personal ability and courage of the Asmoneans and not from the direct intervention of the Deity in behalf of the Jews. Unfortunately, however, the Christian historians of mediæval Europe took as their Hebrew model not the brilliant secular narrative of First Maccabees, but sought to strengthen their followers' zeal and to terrorize their opponents by imitation of the more conventional Hebrew tales of the miraculous interposition of the Deity in rewarding the faithful and punishing the sinner. The last of the distinguished Hebrew historians was Flavius Josephus (c. 37-105 A.D.). He was the national historian of the Jews and, writing after the destruction of the power of his people in 70 A.D., he tried to compensate for the contemporary distress of the Jewish people by emphasizing the glories of their past. Consequently, he almost outdid the author of Chronicles-Ezra-Nehemiah in his exaggeration of the wealth, population and international prestige of ancient Palestine. His two chief works were the 'War of the Jews' and the 'Antiquities of the Jews.' In his treatment of the Old Testament period his narrative is highly unreliable, but the discussion of the post-Maccabean era is a most valuable source of information, though not wholly free from exaggeration and credulity. He wrote in Greek with a considerable degree of literary skill and he has been referred to as the "Livy of the Jews," but, while the comparison is not without some basis, Josephus did not equal the national historian of Rome in either literary merit or in accuracy of statement. Though the Hebrews brought into being the historical narrative, Hebrew historiography did not affect the general current of the development of historical writing until after the Christians had taken over the sacred books of the Jews and used them as the basis, not only of much of their theology, but also as the foundation of their chronology and their synthesis of the history of the past. It is to the Greeks that attention must be turned in describing the chief source of the origins and development of the type of historical writing which dominated classical antiquity and prevailed to the time of Julius Africanus, Orosius and Eusebius.

#### IV. HISTORICAL WRITING AMONG THE GREEKS.

1. **The Intellectual Setting of the Origins of Greek Historiography.**—The birth of historical writing in Greece required several essential conditions which did not exist before the 6th century B.C., namely, the writing of prose, the critical rejection of the current mythology concerning Greek origins and the stimulation of interest in social origins and institutions. By the middle of the 6th century these indispensable prerequisites of history had come into being in the city of Miletus in Ionia. Cadmus of Miletus, at the beginning of the 6th century, had introduced the practice of writing prose instead of poetry and ranks as one of the earliest of Greek

prose writers or *logographoi*. At the same period there was coming into existence that speculative Ionian philosophy to which the world owes the origin of free thought and critical philosophy. As Professor Bury has said, "Our deepest gratitude is due to the Greeks as the originators of liberty of thought and discussion. Ionia in Asia Minor was the cradle of free speculation. The history of European science and European philosophy begins in Ionia. Here in the 6th and 5th centuries B.C. the earliest philosophers by using their reason sought to penetrate into the origin and structure of the world. They began the work of destroying orthodox views and religious faiths." Finally, the Persian absorption of Ionia tended to break down the provincialism of the Ionian Greeks, through that all-important factor of the contact of cultures, and to arouse their interest in the civilization of the diverse peoples who dwelt in the great empire of which they had recently become a part. The origin of Greek historical literature, then, was a part of that great intellectual movement conventionally known as the rise of the *logographoi* and of the critical Greek philosophy in Ionia. To these more general or cultural explanations of the appearance of the first Greek historical literature, there should be added the personal impulse from the dominating desire of the more prominent citizens of the time to link up their families with a distinguished genealogy. Hesiod had favored the Greek gods by providing them with a respectable ancestry, and a similar service was rendered to the nobles by the *logographoi*.

2. **The Origins of Greek Historiography.**—In view of the foregoing sketch of the intellectual environment of early Greek critical prose, it seems but in the natural course of events that the first Greek historian should have been Hecataeus (born 550 B.C.), a native of Miletus, the birthplace of both Greek prose and Greek critical philosophy. His main significance lies in the fact that he foreshadowed two significant developments of scientific historical method by setting up truth as the ideal of his statements and by assuming a frankly critical attitude toward the conventional Greek creation myths. The opening paragraph of his 'Genealogies' is the first approximation on the part of any writer to a consciousness of the function of historical criticism, "What I write here," he said, "is the account which I considered to be true; for the stories of the Greeks are numerous, and in my opinion ridiculous."

The influences which had produced Hecataeus grew more powerful and the necessary developments between his 'Genealogies' and the 'History' of Herodotus were rapidly consummated. Charon of Lamprus and Dionysius of Miletus compiled histories of Persia during the middle of the 5th century and Scylax of Caryanda produced the first historical biography. In the latter half of the 5th century Antiochus of Syracuse composed the first history devoted to the peoples of Greece, and Hellanicus of Lesbos opened the way for Herodotus by the breadth of his interests. He not only covered the history of Persia and Greece from a broad social point of view, but also was the earliest of the Greek historians to recognize the necessity of a comprehensive system of chronology and to attempt to supply it.

3. **The Systematic Historical Works of Greek Writers.**—The first, and in the estimate of modern exponents of "Kulturgeschichte," the greatest of the systematic Greek historians was Herodotus of Halicarnassus (c. 480–425 B.C.). By his interest in geography and in the civilizations of the East he gave evidence of his Ionic antecedents, while by his dominant concern with the Athenian democracy he gave proof of the transfer of historical attention to Hellenic society. His 'History' was a narrative of Græco-Asiatic relations and contacts from the reign of Cræsus of Lydia (560–546 B.C.) to the defeat of the Persian invasion in 478 B.C. The central theme was the destruction of the forces of Xerxes by the Greeks. But his work was not like that of his great successor, Thucydides, narrowly political and military. It was the story of the struggle of two fundamentally opposed types of civilization, and to prove this antagonism, Herodotus surveyed the foundations of these two cultures to locate the deeper causes of the conflict. It combined, thus, the characteristics of a "Kulturgeschichte" and a "Weltgeschichte," though both were strictly limited in point of time. An ardent admirer of Athenian "democracy" he eulogized Athens and its triumph over autocratic Persian imperialism with the epic fervor of a Bancroft. While recognizing and stating the fundamental principles of historical criticism, he often deserted them, especially in his credulity in accepting the tales he heard on his travels. On the whole, however, modern historical, archaeological and ethnographic research has tended to confirm rather than to discredit his statements, and no subsequent historian has been more keen or sympathetic in his analysis of human nature. As the scope of history has been broadened in recent years through the reassertion of the value and position of "Kulturgeschichte," the slogan has come more and more to be "back to Herodotus" rather than "back to Thucydides," as was long so popular.

As much as subsequent historiography owes to Herodotus with respect to an illustration of the proper scope of history, it is equally indebted to Thucydides (c. 465–396 B.C.) for contributions to the methodology of historical research and to the construction of a coherent historical narrative. His theme, the Peloponnesian War (431–404 B.C.), was as much more narrow and restricted a field than that covered by Herodotus as the American Civil War would be as compared with the evolution of civilization in the 19th century. As his history was in part prepared by Thucydides during the course of the conflict, it was the work of a scholarly and philosophic war correspondent—an antique Hilaire Belloc—rather than of the dispassionate historian reconstructing the events of a distant past from a study of the documents. His sketch of the rise of Greece shows, however, that he had rare power in portraying the past if he had seen fit to utilize it. His greatest contribution to historiography was in the field of criticism and methodology. He set forth with great vigor the thesis that the permanence and enduring fame of an historical work should depend rather upon the accuracy of the statements than upon the entertainment furnished by the narrative. Ranke, at the opening of the 19th century, did not state more effectively than Thucydides had at the close of

the 5th century B.C., that accuracy of data was the foundation of history. The second great historical canon of Thucydides was "relevance" of material, something widely at variance with the long and numerous digressions of Herodotus. To these should be added his ability in the mastery of details and their subordination to the movement of the whole narrative. In these respects Thucydides may rightly be held to have been the founder of scientific and critical history. Finally, while Thucydides has received much credit in this respect which really belongs to Polybius, he was probably the first historian clearly and definitely to state the alleged "pragmatic" value of the writing and study of history. In the opinion of Thucydides, "the accurate knowledge of what has happened will be useful, because, according to human probability, similar things will happen again." Though his writings must not be judged by the canons of Lamprecht's Historical Institute, the Sorbonne or L'École des Chartes, they were not free from major defects. He was unable to grasp the concept of time and to view his facts in their true historical perspective. He narrowed the field of history not only to a consideration merely of contemporary political phenomena, but even to the external military and diplomatic phases of political activity. He missed the vital significance of the deeper social and economic forces in history, a weakness perhaps over-emphasized by Mr. Cornford. It can scarcely be doubted, moreover, that he carried the element of "relevance" too far and omitted as much material that was pertinent as Herodotus had included which was not germane to the subject. Again, he illustrated Carlyle's weakness in his dramatic interpretation of events in terms of great personalities, and he did not possess the latter's ability to portray a personality in its entirety. Lastly, there appeared little or none of Mabillon's profound discussion of the critical use of documents; his sources were carefully concealed in order that the style of the narrative might not suffer. One may agree entirely with Bury that "the work of Thucydides marks the longest and most decisive step that has ever been taken by a single man towards making history what it is to-day," without regarding that statement as an unmixed compliment. Thucydides certainly was influential in bringing historiography under the domination of the "political fetish" and the spell of episodes from which it suffered from classical times to the end of the 19th century, and from which it is only now beginning to escape. It must not be forgotten that, as Lamprecht has insisted, historical accuracy means as much the presentation of the complete analysis of an event, period or movement as it does the mere truth of such facts as are narrated. From the standpoint of this broader and more fundamental view of historical accuracy Thucydides will scarcely rank as superior to Herodotus. The ardent admirers of the former have forgotten that scope and content are quite as important in history as refinement of the methodology of research.

An historian far inferior to Herodotus or Thucydides was Xenophon (c. 430–354 B.C.). His literary ability was of a high order, but his capacity for profound historical analysis was most limited. He was a good memoir

writer and his 'Anabasis' was one of the most absorbing of Greek memoirs. In his 'Hellenica' he attempted to continue the narrative of Thucydides from 411 to 362 B.C. While this work is most valuable as an historical source for the period, it is superficial and owes what historical merit it possesses primarily to its imitation of the method and arrangement of the work of Thucydides. On the whole, it is safe to agree with Bury that he owes his reputation to the fact that an uncritical generation later preserved his writings, while allowing more meritorious works to perish and that "if he had lived in modern days, he would have been a high-class journalist and pamphleteer and would have made his fortune as a war-correspondent." It would not be fair, however, to overlook the remarkable versatility of Xenophon's literary talents, which were exhibited in memoirs, biography, systematic history, constitutional analysis and economic theory.

The last of the major Greek historians was Polybius (c. 198-117 B.C.). From the standpoint of either productivity or profundity he was superior to Thucydides and was fully equal to him with respect to accuracy of statement, but his style being labored and diffuse he has been less popular than his two great predecessors. His 'History' was a vast work in 40 books dealing with the expansion of the Roman Empire to 146 B.C. As Herodotus had mirrored the interest of early Greek historians in the East, and Thucydides had written of Athens at the height of its civilization, so Polybius testified to the decline of Hellas and the shifting of interest to the new empire of the West. His scholarship was equal to that of the great historian of British expansion, but he lacked the latter's power of compression and lucid statement. In the 12th book of his work is found, as a critique of the antiquarian, Timæus, the first great treatise on the methodology of scientific history. Conceived independently of Thucydides, this discussion has scarcely been surpassed, and his impartiality is a model for all historians. Especially noteworthy was his Ritter-like insistence upon the value of a knowledge of topography to the historian. He intended his history to be intensely pragmatic—to be "philosophy teaching by example," but he never allowed the philosopher in him to overcome the historian. Greatly interested in the problem of causation, he went deeper in his analysis of impersonal causes than Thucydides, though his interpretation was ethical rather than economic and social. The following brief quotation from his 12th book admirably epitomizes his views as to the scope, methods and purpose of history. "The science of history is three-fold: first, the dealing with written documents and the arrangement of the material thus obtained; second, topography, the appearance of cities and localities, the description of rivers and harbors, and, speaking generally, the peculiar features of the seas and countries and their relative distances; thirdly, political affairs. . . . The special province of history is, first, to ascertain what the actual words used were; and secondly, to learn why it was that a particular policy or arrangement failed or succeeded. For a bare statement of an occurrence is interesting indeed, but not instructive; but when this is supplemented by a

statement of cause, the study of history becomes fruitful. For it is by applying analogies to our own circumstances that we get the means and basis for calculating the future; and for learning from the past when to act with caution, and when with greater boldness, in the present." All in all, one may agree with Professor Botsford that "a careful reading of this author is the best possible introduction to the spirit and method of history as we of to-day regard it."

**4. Minor Contributions to Greek Historiography.**—Polybius was unique in his age as an historian. Long before he composed his great work Hellenic historiography had begun to decline from the standard set by Thucydides and was brought under the influence of rhetoric in the 4th century. With their tendency to insipid moralizing, the interpolation of florid speeches, and their "passion for panegyrics," the historical works of the rhetorical school, like those of Froissart and Lamartine "exhibited artistic but not historical genius." This capitulation to the popular demand for rhetoric Hermann Peter believes to have been the main cause for the decline and stagnation of Greek history and its Roman imitations. Of the "Rhetoricians" of the 4th century the leader was Isocrates and the chief historians of the school were Ephorus and Theopompus. The work of Ephorus was probably the nearest approach in Greek historiography to a "national history" of Hellas. Of quite a different character was the work of Timæus of Tauromenium who devoted a lifetime of labor to the patient compilation of a vast repository of reliable facts concerning the history of Sicily and Italy. He was the first and the greatest of the antiquarians that flourished in the 3d century and he may be regarded as the prototype of Blondus and Mabillon. Two later ambitious compilations—the 'Weltgeschichte' of Diodorus of Sicily (c. 90-21 B.C.) and the Roman history of his younger contemporary, Dionysius of Halicarnassus, were of a far inferior order, though, perhaps, superior to the work of the "Rhetoricians."

Historical biography among the Greeks was founded by Isocrates, the leader of the "Rhetoricians," and one of the earliest products was the biography of Agesilaus by Xenophon. Subsequent historians devoted considerable space to biography. Plutarch's (c. 50-125 A.D.) polished 'Parallel Lives' have remained at the head of the world's biographical product on account of their compelling interest, if not for their entire historical accuracy. Indeed, it must be remembered that Plutarch was a moralist and wrote his "Lives" not as strictly historical biographies, but in order to furnish concrete illustrations of his ethical principles for the moral edification of his readers.

In the period of the Hellenic revival in Rome a number of Greek historians made contributions to historical writing of widely different merit. Among the less notable productions were the 'Anabasis of Alexander' by Arrian (c. 95-175 A.D.) and the 'History of Rome' by Appian, in the same period. Far superior to these were the incisive 'History of Rome' of Dio Cassius (c. 155-240 A.D.), and the broadly conceived history of the later Roman empire, in its social as well as its political conditions, by Ammianus Marcellinus (c. 330-401 A.D.), the

last of the long and honorable list of Greek historians who, curiously enough, wrote his work in Latin.

#### V. ROMAN HISTORIOGRAPHY.

Rome added no original contributions to historiography. As in all other phases of its culture, Rome here followed the model set up by the Greeks. While there were distinguished Roman historians, none equalled Thucydides or Polybius for careful adherence to critical method and only Livy and Tacitus approached the best of the stylists among Greek historians.

The immediate dependence of the Roman historiography on the Greek is evident from the fact that down to the 2d century B.C. all the Roman historical literature was even written in Greek. These early historical works in Greek were chiefly 'Annals' of which the first and most famous were those of Fabius Pictor (c. 250 B.C.). The first Roman historical literature in Latin was the 'Origines' of Cato the Censor (c. 234-149 B.C.), in which he narrated the history of Rome interpreted according to his notorious bucolic and aristocratic prejudices. The first real historian among the Romans in point of time was that leader of all Romans in ability, Julius Cæsar (100-44 B.C.). Generally accurate and always clear, forceful and direct in his style, Cæsar's apologies for his public career—the 'Commentaries' and the 'Civil War' were the best historical memoirs produced in the ancient world and rank well with those of any period. A more systematic historian was Sallust (c. 86-34 B.C.) the Roman disciple of Thucydides. His chief work, a history of Rome from 78 to 67 B.C. has never been recovered, but from his monographs on the 'Conspiracy of Catiline' and the 'Jugurthine War' one can appreciate his vigorous and graphic style and his power in the analysis of personalities and social forces, but he was not able wholly to conceal his pessimism with regard to the future of the Roman state in the last years of the Republic. The great national history of Rome was that of Livy (59 B.C.-17 A.D.). His work was a massive epic of the growth of the Roman world-state. While he had a general appreciation of the value of accuracy of statement, he subordinated this element to that of perfection of style, and the Greek 'Rhetoricians' rather than Thucydides were his model. The great literary merit of Livy's history, its ministry to the national vanity of the Romans and their cult of modern admirers, and its great popularity with the humanists have given it a position in historiography higher than its purely historical value would warrant. A less successful example of the Roman historical writing of the rhetorical school was the history of Rome under the early empire by Velleius Paterculus in the period of Tiberius. The last of the major Roman historians was Tacitus (c. 55-120 A.D.). Like Polybius, he was a man of action, and, being an ardent admirer of the aristocratic Republic, his view of contemporary Roman society was even more pessimistic than that of Sallust. While he wrote with great vigor, had rare power of portraying personalities and was generally accurate, the subjective moralizing element in his writings, while adding to their literary reputation, greatly reduced their historical value. To him and to Juvenal

is primarily due that notorious and venerable myth of the "moral causes" for the decline of the Roman Empire, which was later revived and elaborated with such deplorable results by Kingsley. In addition to his purely historical works—the 'Annals,' the 'Histories' and the biography of Agricola, dealing with Roman history in the 1st century of the Christian era, the 'Germania' was one of the earliest excursions into the field of descriptive sociology. Being the only extensive source of information regarding the institutions of the Germans of that time, the "Germania" has acquired a great importance in later years. It has been the most controverted historical document in existence, excepting only the Pentateuch and the Synoptic Gospels. Recovered in the period of the humanists and brought before the learned public by Poggio, Enoc of Ascoli, and Conrad Celtis, it has been the centre of historical conflict between the modern Teutonist and Gallican historians, as much as Alsace-Lorraine has been the pivotal point in the political and military rivalry of their respective national States. More than this, the tendency of Tacitus to idealize the early Germans at the expense of the Romans originated that humorous but disastrous perversion of the interpretation of the "invasions" which culminated in the vagaries of Charles Kingsley's "The Roman and the Teuton." The last Roman historian of any repute, unless it be the vague figure that Kornemann has endeavored to reconstruct, was Suetonius (75-160 A.D.), the erudite secretary of Hadrian. His diffuse 'Lives of the Cæsars,' while reliable in its description of public affairs, was one of the earliest examples of historical "muckraking" and "scandal mongering." His chief significance in historiography lies in the fact that he became the model in style and arrangement for the historical biography of the period of humanism. Though the Roman historians were not original and were always more or less under the spell of the Greek "Rhetoricians," Roman historiography was incomparably higher in the sphere of reliability than the type which was to succeed it and was to bring historical writing back under the spell of mythology and religious prejudices from which it had escaped with Hecataeus of Miletus eight centuries earlier.

#### VI. PATRISTIC HISTORIOGRAPHY.

1. **The Christian Synthesis of the History of the Past.**—One of the most effective agencies in allaying suspicion and attracting converts to a movement is the ability to point to a glorious past. The Christians felt this keenly, and, having adopted the sacred books of the Jews as the official record of their antecedents, they were faced with the immediate and pressing necessity of giving to ancient Hebrew history a prestige which it had entirely lacked in the works of pagan historians, who had assigned to the history of the Jewish people only that slender allotment of space and attention to which their inconspicuous political history had entitled them. Therefore, the two world histories, which had already been produced by Diodorus Siculus and Pompeius Trogus, and which were immensely superior to any universal history compiled by Patristic historians, were utterly unsuited to the requirements of Christian

propaganda. Neither was the general Jewish history of Josephus acceptable, for, while it exaggerated tremendously the role of the Jews, it was distinctly antagonistic to the Christians. Therefore, the Christian "literati" set about to produce a synthesis of the past which would give due weight to the alleged glories of Hebrew antiquity and would, at the same time, show why the Jews were no longer worthy of their heritage, which had now passed to the Christians. The first writer to essay the task was Sextus Julius Africanus (c. 180-250) who composed a history of the world in five books bringing the story to 221 A.D. In this he tried to harmonize and synchronize Hebrew and Christian history with that of the four great successive pagan monarchies—the Assyrian, Persian, Macedonian and Roman. This was carried further in the 'Chronicle' of Eusebius (c. 260-340), and Jerome was able to find scriptural sanction for this synthesis in the prophecy contained in the last chapters of Daniel. "That long history," says Professor Burr, "which was now their preamble was the sacred story of the chosen people, with its Jacob's ladder forever linking earth to heaven. The central actor was Jehovah, now the God of all the earth. About that story and its culmination all other history must now fall into place; and from the sacred record—for the record too is sacred—may be learned the plans of the Omnipotent. It was Jerome who now found them in the interpretations and the visions of Daniel—in the image with head of gold and belly of brass, in the four great beasts that came up out of the sea—and from his day on almost to ours the changing empires of earth have been forced to find a place within that scheme. Whatever in non-sacred annals was found in conflict with Holy Writ must be discarded. What was left must be adjusted to its words. Man's career on earth became a fall. Nor might human wit exalt itself: Pythagoras and Plato had learned from Moses; Seneca from Paul." The Christian synthesis received its great philosophic statement and defense in Augustine's 'City of God' (426). It was finally systematized in the grotesque but fiery 'Seven Books of History directed against the Pagans' (417) of Orosius, which was the standard text on universal history until the revival of the appreciation of pagan culture with the advent of "Humanism," when it was riddled by the scholarship of Flavius Blondus (1388-1463) and was superseded by the 'Enneades' of Sabellicus (1436-1506), the humanist attempt at a universal history.

An important part of the Christian synthesis was the synchronizing of the events in the history of the Gentile and Hebrew nations and the establishment of an official Christian chronology. The initial step was taken in this process by Julius Africanus in his 'Chronographia.' In this, the period of the creation was set as having occurred 5499 years before Christ, and subsequent events in world history were dated through an ingenious combination of the various systems of chronology used by the different nations. Eusebius expanded the work of Africanus in his famous 'Chronicle,' in which he epitomized universal history in a set of parallel synoptic and synchronous chronological tables giving the reigns of the rulers of the "four great monarchies" synchronized with the events

of Hebrew history. "In these tables," says President White, "Moses, Joshua and Bacchus, — Deborah, Orpheus and the Amazons, — Abimelech, the Sphinx, and Oedipus, appear together as personages equally real, and their positions in chronology equally ascertained." The chronology of Eusebius was adopted by Jerome in his 'Chronicle,' and in Jerome's version it became the authoritative Christian chronology until it was slightly revised by Scaliger in 1583 and Usher in 1650. It entered systematic church history in the 'Historia Tripartita' of Cassiodorus and was the introduction to every authentic mediæval chronicle.

In this Christian synthesis of world history, aside from the artificiality of its chronology and synchronisms, two characteristics are noteworthy, namely, the absurd relative importance attached to Hebrew history and the serious bias against pagan civilization which made an objective historical narrative absolutely impossible. Of the former tendency Professor Robinson has said, "this theological unity of history was won at a tremendous sacrifice of all secular perspective and accuracy. The Amorites were invested with an importance denied the Carthaginians. Enoch and Lot loomed large in an age which scarcely knew Pericles." It is a curious but incontestable fact that the Jewish nation owes its prominence in world history to these distortions of the early Christian historians. Always on the defensive in the Patristic period, the churchmen were compelled to answer the charge of having been the cause of the calamities which came to the Roman Empire in the 4th and 5th centuries. The calamities could not be denied, and so the only procedure possible was to prove a greater prevalence of misery before the Christian era. This was particularly the task assigned by Augustine to Orosius and performed with great thoroughness in the latter's above mentioned work. Deliberately shutting his eyes to all the cultural contributions of antiquity, he gathered a veritable "historia calamitatum" by combing pagan history to present an unrelieved picture "of all the most signal horrors of war, pestilence and famine, of the fearful devastation of earthquakes and inundations, the destruction wrought by fiery eruptions, by lightning and hail, and the awful misery due to crime." "All the achievements of Egypt, Greece and Rome," says a leading historian, "tended to sink out of sight in the mind of Augustine's disciple, Orosius, only the woes of a devil-worshipping heathendom lingered." When one remembers that this work was almost the sole source of information during the Middle Ages regarding the history of pagan antiquity, it is little wonder that Blondus could remark in the 15th century, that since Orosius there had been no history. Yet, in spite of the external and conscious bias of the "Fathers" against pagan culture, they could not escape the unconscious sources of influence springing out of their environment of paganism. Thus, by a curious irony of fate, it came about that the classical culture they assumed to abhor actually influenced their cosmic and historical philosophy as much, if not more, than the cultural traditions of Judaism. The "Fathers" used the classical languages and were always under the spell of classical rhetoric; many of

them were educated as pagans; their syncretic theology was deeply colored with pagan elements; and their political ideals and practices were so thoroughly modelled after those of the Roman Empire that Professor Burr has very aptly described the origins of the Christian ecclesiastical polity as "the rise of the new Rome." This much is evident from such sources of information as have been preserved. If the great mass of early Christian historical writing which has been lost were available for study it might well be that an even greater amount of infiltration of pagan culture could be detected.

## 2. The Christian Philosophy of History.—

Almost as wide as the break with the classical historiography with respect to the status of pagan culture was the difference in the great emphasis placed on pragmatism and teleology in the Patristic historical literature. To the early Christian historians the "process of history" had a real significance and meaning, it was a part of a greater cosmic process in which God and man were the chief participants. "The Christians were perhaps the first to suspect a real grandeur in history," says Professor Robinson, "for to them it became a divine epic, stretching far back to the creation of man and forward to the final separation of good and evil in a last magnificent and decisive crisis." This Christian philosophy of history, which has been so felicitously termed by Santayana the "Christian Epic," was gradually evolved by the "Fathers" and received its final and decisive systematic expression in Augustine's 'City of God.' This philosophy, drawn more from Persian and Hellenic than from Hebrew sources, considered the historic process as a part—the consequential portion—of a great cosmic struggle between the forces of good and evil. In its earthly and historical significance this conflict was a struggle between the City of God—the community of the elect believers in the Hebrew and Christian God—and the City of Satan—the collective name of the previous and contemporary adherents to paganism. Its final outcome was to issue in the glorious triumph of the former and the utter destruction and discomfiture of the latter. With such a philosophical background it is not difficult to understand that Christian historiography was pragmatic to a degree not dreamed of by either Polybius or Dionysius; it was "philosophy teaching by example" with a real vengeance. With such issues at stake the most insignificant event could not fail to have its vital import. This "epic," which received its philosophical exposition from Augustine, was illustrated from history by Orosius and was given an elegant literary form in the 'Chronica' of Sulpicius Severus (363-423).

**3. Historical Method in the Patristic Period.**—The Christian historians also departed widely from the canons of historical method laid down by Thucydides and Polybius. In addition to their tremendous bias against paganism, which made objectivity out of the question, it was necessary to devise a special method for handling "inspired" documents. To assume towards the Hebrew creation tales the critical attitude that Hecataeus maintained toward the Greek mythology would have been impious and sinful. Therefore, if the obvious content of the

inspired statement was preposterous and unbelievable, some hidden or inner meaning must be found, and, in response to this necessity, allegory and symbolism replaced candor and critical analysis as the foundations of historical method. "Not even Holy Writ," says Professor Burr, "was prized for the poor literal facts of history, but for those deeper meanings, allegorical, moral, anagogical, mystical, to be discerned beneath them." The allegorical method of interpreting the Old Testament had been introduced by the Alexandrian Jew, Philo Judaeus, and appeared in early Christian writings in the Book of Revelations, in "The Epistle of Barnabas" and in "The Shepherd of Hermas." Its main early impulse among the Fathers came from Origen (186-255). According to Origen, says Conybeare, "Whenever we meet with such useless, nay impossible, incidents and precepts as these, we must discard a literal interpretation and consider of what moral interpretation they are capable, with what higher and mysterious meaning they are fraught, what deeper truths they were intended symbolically and in allegory to shadow forth. The divine wisdom has of set purpose contrived these little traps and stumbling blocks in order to cry halt to our slavish historical understanding of the text, by inserting in its midst sundry things that are impossible and unsuitable. The Holy Spirit so waylays us in order that we may be driven by passages which taken in their *prima facie* sense, cannot be true or useful, to search for the ulterior truth, and seek in the Scriptures which we believe to be inspired by God a meaning worthy of him." This allegorizing tendency, which vaulted over criticism, was almost universally accepted by the "Fathers" and received its classical expression in the 'Moralia,' or 'Commentary on the Book of Job,' of Gregory the Great (540-604), and the 'Allegoriae quaedam sacrae Scripturae' of Isadore of Seville (d. 636), which gave in chronological order the allegorical significance of all the persons mentioned in the Old and New Testaments. These became standard mediæval manuals on allegory.

Another element which entered into the historical attitude and methodology of the Patristic period was Neoplatonism. With its thesis of the superiority of the emotions and intuition to reason and intellect and its advocacy of "unbounded credulity," it fitted in admirably with the Patristic mental reactions and became an integral part of the psychic complex of the Patristic and mediæval historians and philosophers. Augustine flirted with it in his youth and it loomed large in his later philosophy. Its great mediæval impulse came mainly from the philosophical and literary activities of Erigena. Along with the allegorizing tendency it served to make quite impossible any sceptical and critical attitude towards the sources of historical knowledge.

Not only were these two standards for the use and interpretation of historical documents erected, but there were also delimited two sharply defined fields of history, the sacred and the profane, the first relating to religious and the latter to secular activities. It is needless to remark that an incomparably greater importance was attached to sacred history and that the working of a miracle was considered much more significant than the making of a constitu-

tion. The "Fathers" were willing to devote the most extended labor to the allegorical explanation of dubious and contradictory statements in scripture, but it is impossible to imagine one gathering and analyzing the contents of 158 constitutions. It is only fair to state, however, that the evident decline of historical scholarship in the Patristic period cannot be wholly assigned to the Christian attitude towards historical data and problems. Though there were the reasons enumerated above why the Christian historiography was bound to be less sound than its pagan counterpart, it cannot be denied that the period of the "Later Roman Empire" was one of general intellectual decline, and the lapse of the ideals of the height of classical culture affected pagan, as well as Christian, writers.

**4. Systematic Ecclesiastical History in the Patristic Period.**—The most creditable performances in the realm of Patristic historiography were achieved in the field of systematic history of the Christian Church. Though the 'Weltanschauung' of the writers marred their perspective and warped their interpretation, the resulting damage to historical scholarship was least in this department. While the anti-pagan bias, the lust for the miraculous, the pious credulity of the writers and the Christian philosophy of history were all in evidence, the very nature of the subject made their operation less disastrous here than in the synthesis of the history of antiquity; attention was centered almost entirely upon ecclesiastical matters and the writers dealt in a large degree with their co-religionists of the immediate past who scarcely received the reverence accorded to personages who had figured in scriptural events—the Church Fathers, like the makers of the American constitution, were not always canonized by their own generation.

The earliest semi-narrative sources of the history of the foundations of Christianity are to be found in the 'Epistles' of the 1st century and in the 'Synoptic Gospels,' written probably in the last quarter of the century. Of the former, the most important, naturally, are those of Paul, the great organizing missionary and theologian of the early Church. Of the Gospels, the earliest and most reliable is the straight-forward narrative of Mark, written about 70 A.D. The 'Acts of the Apostles,' the remaining canonical historical work of the Apostolic period, was written by the author of Luke about 100 A.D. The "Apologists" of the 2d and 3d centuries are also valuable sources of information, though their writings were highly controversial. The first, and the most erudite and scholarly systematic ecclesiastical history of the Patristic period was the work of Eusebius of Caesarea (c. 260-340). His 'History of the Christian Church,' which, in 10 books, brought the story to 324, was a work of massive erudition and relatively high impartiality, but was compiled without literary skill and was most superficial in its analysis of the underlying causes of the great social and religious movements. Though he was not a profound thinker, Eusebius was a real scholar and the literature he examined in the execution of his work was enormous. Many of the most important documents he used were copied *in extenso* in his history; this makes the work a most valuable source book which contains the only extant por-

tions of some highly important early Christian writings. A vast gulf exists between the level of the histories of Eusebius and Orosius.

The 'History' of Eusebius was continued by the historians Socrates, Sozomen and Theodoret in the 5th century. The whole was combined and translated into Latin under the direction of Cassiodorus (477-570) in the 6th century, and the narrative was continued to 518. This product of Cassiodorus and his disciples, known as the 'Historia tripartita,' was the general manual of church history throughout the middle ages. Though confused, incoherent, inaccurate, and annalistic, it was certainly superior to the companion text-book on secular history by Orosius. The greatest defect in the early Church histories was their failure to analyze the deeper forces and the more significant events in the great religious movement which they were describing. This was due in part to the belief that Christianity was being advanced through divine favor and in part to the fact that the writers all succumbed to the temptation to treat primarily of wonders, miracles, martyrs and saints.

Christian biography was founded by Jerome's 'De viris illustribus,' a brief sketch of the lives of all who had contributed to the body of Christian literature, and by the biographies of the earlier saints and hermits. Jerome's work was continued by Gennadius (c. 495), a priest of Marseilles, and by Isadore of Seville in works of the same title. Isadore's compilation was, in turn, supplemented by that of Ildephonsus of Toledo (d. 667), and the process of addition continued through the mediæval period to culminate in the collection of 963 biographies in the 'Liber scriptorum ecclesiasticorum' of Johannes Trithemius (1462-1516), abbot of Sponheim. The astonishing credulity of even the most learned of these early biographers, and their zeal for "miracle-mongering" can best be appreciated by a perusal of such a work as Jerome's 'Life of Paul the First Hermit' or Athanasius' 'Life of Saint Anthony.'

## VII. HISTORICAL LITERATURE IN THE MIDDLE AGES.

### 1. Its Relation to Patristic Antecedents.—

It will be evident from the foregoing discussion that Orosius and Cassiodorus were the standard historical authorities for the Middle Ages and that there was no break with the Patristic philosophy of history or historical methods. "The Middle Ages," says Professor Burr, "did not dissever history and theology. Nay to forbid it there grew to completeness that consummate preserver of the unity of thought, the procedure against heresy. And to the end of that long age of faith history did not escape the paternal eye." The chief representatives of historiography in the Middle Ages, as of other phases of mediæval culture, were churchmen of one sort or another. The same zeal for the miraculous and diabolical and disregard of such non-essential "commonplaces" as the foundation and disruption of states and epoch-making political, economic and social movements still persisted unimpaired. The "Christian Epic" kept its prestige unshattered and almost unchallenged for 14 centuries, disturbed only slightly by the 13th century "revival," the growth of humanism and the controversies of the Reformation period. It never received its first staggering blow until,

in the 18th century, the English and French "Deists" and "Philosophes" revealed its weaknesses and inconsistencies by their penetrating and disconcerting criticism. If anything, in at least the first centuries after the close of the Patristic period, there was a decline in scholarship. The mediæval writers not only retained the Patristic defects but added to them the absence of the great erudition of many of the "Fathers" and the presence of those crudities incident to a recent emergence from barbarism. This assimilation of the Patristic outlook and methodology and its adaptation to mediæval capacities was primarily the work of Rhabanus Maurus (776-856), his pupil and disciple, Waiafrid Strabo (c. 809-849) and John Scotus Eriugena (d. 877). Heinrich von Sybel thus summarizes the outstanding characteristics of mediæval historiography in a manner which brings out clearly its close relation to Patristic historical literature: "This period possessed no idea of historical judgment, no sense of historical reality, no trace of critical reflection. The principle of authority, ruling without limitation in the religious domain, defended all tradition, as well as traditional dogma. Men were everywhere more inclined to believe than to examine, everywhere imagination had the upper hand of reason. No distinction was made between ideal and real, between poetical and historical truth. Heroic poems were considered a true and lofty form of history and history was everywhere displaced by epics, legends or poetical fiction of some kind. A course of slow historical development was traced back to a single great deed, a single personal cause. Almost no one scrupled to give to existing conditions the sanction of venerable age by means of fabricated history or forged documents. The question whether the ascribed derivation was true interested no one; it was enough if the result harmonized with existing rights, dominating interests and prevalent beliefs."

**2. Mediæval Annals and Chronicles.**—An excellent illustration of the primitive nature of mediæval culture is the fact that during the first centuries the main form of historical writings was the 'Annals' which had been common in early Egypt and Babylonia. The mediæval example of this type of historical writing originated in the early Carolingian period as an incident of the mediæval desire to locate the exact occurrence of Easter. The absence of a general knowledge of astronomy and chronology made it necessary for the more learned churchmen to prepare and distribute to monks and priests Easter tables giving the dates upon which Easter would occur for many years in advance. An almost universal practice arose of indicating on the margin opposite each year, the event, which, in the mind of the recorder, seemed to make that year most significant in the history of the locality. Not only were these early annals very scanty in the information they contained, on account of mentioning only one or two conspicuous events which occurred during the year, but they were rendered still less valuable because the mediæval annalist frequently considered most important some insignificant avowed miracle or the transfer of the bones of a saint, information of little or no value to the modern investigator. In time, however, entries were more frequent and the interests of the

annalist grew wider, until the annals became, with such a work as Roger of Hoveden's 'Annals of English History,' in the early 13th century, a valuable record of the development of a nation.

The origin and development of the 'Chronicle' was immediately related to the growth of the annals. The annals were primarily a yearly record set down by a contemporary. The chronicle was more comprehensive. It normally consisted in the summarizing of the history of a considerable period on the basis of one or more sets of annals, preserving the chronological arrangement of the annals. Many of the events transcribed by the chronicler might have occurred before his period and he might combine the records contained in several annals in order to obtain a more complete and comprehensive story. To this compilation of annals was usually added, as an introduction, Jerome's translation of Eusebius' 'Chronicle,' which linked up the local chronicle with the Christian synthesis of world history from the beginning of creation. With the expansion of the basic annals in scope and pertinence, the chronicles became more and more an approximation to a history, until in the 'Anglo Saxon Chronicle,' the 'Chronicle' of Hermann of Reichenau (d. 1054), the 'Universal Chronicle' of Ekkehard of Aurach in the early 12th century, the 'Chronicle' of Otto of Freising (d. 1158) and the 'Greater Chronicle' of Matthew of Paris (d. 1259) this characteristic vehicle of mediæval historiography became one of the most thorough and reliable sources of information available in that age.

The following were the most important of the mediæval annals. For the Carolingian period the 'Greater Annals of Lorsch' and their continuation to 829 in the 'Royal Annals,' the 'Annals of Fulda' and the excellent 'Annals of Saint Bertin' and 'Saint Vaast,' coming down to the beginning of the 10th century, are the most valuable. The most important annals dealing with early French history are those of Flodoard (d. 966). For English mediæval history there is the above mentioned work of Roger of Hoveden coming down to 1201. For mediæval Germany the great annalistic sources are the elegantly written but prejudiced 'Annals of Lambert of Hersfeld,' covering the period to 1077, and the more valuable 'Greater Annals of Cologne,' which come to 1237.

The chronicles dealing with mediæval German history begin with those of Fredegarius the Schoolmaster in the 7th century and of Regino of Prüm in the 10th, and include the authoritative 'Chronicle' of Hermann of Reichenau (d. 1054), Ekkehard of Aurach's 'Universal Chronicle,' compiled at the beginning of the 12th century and the most comprehensive of all mediæval chronicles, the 'Chronicle' of Otto of Freising (d. 1158), the most notable of 12th century historians, and the valuable 'Chronicle' of Arnold of Lübeck (d. 1212). For France the more famous chronicles are the 'Chronicle of Nantes,' coming to 1049, those of Hugh of Flavigny and Sigebert of Gembloux in the 12th century and of William of Nangis at the beginning of the 14th century. The 'Chronicles' of Froissart (1373 ff) are attractive but highly colored and prejudiced and they illustrate to some extent the transition from the mediæval chronicle to the historical

narrative. For England the great mediæval chronicles are the 'Anglo-Saxon Chronicle,' describing events to 1154; Roger of Wendover's 'Flowers of History,' coming down to 1235, and their continuation to 1259 in Matthew of Paris' 'Greater Chronicle.' From Italy is the valuable and voluminous 'Florentine Chronicle' of Giovanni Villani, dealing with events to 1348.

**3. Attempts at Systematic History.**—The efforts to produce something like a systematic historical treatise during the mediæval period varied greatly in their success. Their nature was, on the whole, closely correlated with the changes in the general level of culture. The earliest were usually slovenly and labored in style, sadly inaccurate in grammar and entirely credulous and uncritical in method. In the latter part of the period, however, the level of scholarship was raised, and in the works of such an historian as Otto of Freising, in the middle of the 12th century, one meets for the first time with an author who will compare favorably with the second-rate figures in classical historiography. On the whole, there were few attempts at a general or international history of a period, and the histories chiefly concerned local or national events and movements or the deeds of a conspicuous national monarch.

The following were the more important works dealing with German history from the period of the "Invasions." The first of these, and the earliest product of mediæval historiography, was the 'Ten Books of Frankish History' of Gregory of Tours (540-594), which is the main source of information regarding the origin of the Merovingian dynasty. It was naive, credulous and prejudiced against the Goths, but was an exceedingly straightforward and human document, and was based, to a considerable degree, on Gregory's direct observations. The Lombards found their national historian in Paul the Deacon (725-800), an erudite member of the group of scholars at the court of Charlemagne. His 'History of the Lombards' was greatly superior to Gregory's work with respect to both accuracy and style. The first layman to produce an historical work in the mediæval period was Nithard, whose 'Four Books of History' present an able and lucid narrative of the civil wars among the grandsons of Charlemagne and offer one of the few examples of vivid secular interests on the part of a mediæval historian. The Saxon emperors had as their dynastic historian the monk Widukind, whose 'Deeds of the Saxons' gave an able survey of the reigns of Henry I and Otto the Great. A more penetrating account of the culture of this period is found in the 'Book of Retribution,' the 'History of Otto' and the 'Legatio' of Liutprand of Cremona (d. 973). The finest products of mediæval German historiography from the standpoint of style, accuracy and philosophic grasp were the 'Deeds of the Emperor Frederick the First' and the above mentioned 'Chronicle' of Bishop Otto of Freising (c. 1114-58). While his lack of any scientific canons of criticism, his revival of the Augustine-Orosius philosophy of history in his 'Chronicle' and his bias in favor of his royal patron all combined to prevent his ranking with the greatest historians of classical antiquity, his work illustrates the highest point to which the strictly mediæval German his-

toriography attained. The eminent authority, Wegele, says of the work of Otto: "A writer possessing such extraordinary literary talent as Otto of Freising did not appear again in German history for many a century. However much Lambert of Hersfeld may have excelled him as a polished narrator, Otto more than made up for this by the deep seriousness of his world-philosophy and the loftiness of the viewpoint which he invariably maintained. Whatever anyone may think of his philosophy, he is the only mediæval German historian who was able to grasp in a philosophical manner the march of world-history and who sought to give it a judicious exposition. And he occupies no less conspicuous a position as a narrator of the history of his own times."

For France, alleged historical works began with the prolix and highly prejudiced 'Four Books of History' of Richer, who wrote at the very close of the 10th century and is almost the sole source for the establishment of the Capetian dynasty. An even less reliable and a thoroughly mediæval work with the same title by Raoul Glaber carried the story down for a half century further. Somewhat better was the 'Gesta Dei per Francos' of Guibert of Nogent (1053-1124), which tells the story of the First Crusade, but it is based largely on an earlier Norman narrative and the author is hopelessly confused when he loses his guide. In the 12th century a superior work appeared in the lively and attractive 'Ecclesiastical History' of Ordericus Vitalis (1075-1142). Something like a real history is to be seen in Rigord's (c. 1150-1209) 'Deeds of Philip Augustus,' in the preparation of which the author made some elementary use of the available documents, letters and archives. The 'Conquête de Constantinople,' by Geoffroy de Villehardouin (c. 1160-1213), was one of the more notable historical products of the Middle Ages. It was the first mediæval historical work of any consequence which was written in the vernacular. While it was somewhat of an apology for Villehardouin's policy in the Fourth Crusade, it is much the best extant source for an interpretation of the real spirit of the Crusaders. It was a straightforward account, written in a vigorous and concise style being full of personal touches and throbbing with virile human interests. The 'Chronicles of France, England, Scotland and Spain,' originally written by Froissart (1338-1410), a 14th century Lamartine, about 1375, have been mentioned above. They were the work of a poet and chronicler and were avowedly written to "delight and please" his readers, and in this he succeeded wholly. It is episodic history at its best for literature and near its worst for history, though it is the fullest extant source for the Hundred Years' War. An incomparably superior historical work was the 'Mémoires' of Philippe de Commines (c. 1445-1511), dealing with the period of Louis XI. It was a vigorous narrative exhibiting almost all of the traits of the true historian—a good grasp on the meaning of events, penetrating analysis of motives, a description of contemporary culture and sound generalizations. Especially did Commines emphasize the political and pragmatic value of history and advised all statesmen and diplomats to "study it well, for it holds the master key to all types of frauds, deceits and perjuries."

With this work French history enters on the modern period.

Aside from the above mentioned chroniclers, the avowed mediæval English historians were few. The confused and gloomy description of the invasions by Gildas (c. 516-570) has acquired an undeserved fame because of its being the only available source for that important period. A fine product of the lingering classical culture in the north of Europe is to be found in Bede's (c. 672-735) famous 'Ecclesiastical History of the English Nation.' The work of a real literary artist and scholar, it was a reminiscence of a fast passing culture rather than a promise of a new era in historiography. On the Anglo-Saxon and Norman monarchs a work of interest and merit was 'The History of the Kings of England,' by William of Malmesbury (d. 1142). It is generally agreed that the leading English mediæval historian was Matthew of Paris (d. 1259). His 'Greater Chronicle' dealt with the troubled times in the middle of the 13th century just preceding the beginnings of the English parliamentary system. The cautious English historian and critic, James Gairdner, thus summarizes the characteristics of Matthew of Paris and his historical writings: 'His narrative is plain, straightforward and lucid, with here and there a little bit of graphic description, but it contains nothing that is highly coloured or introduced as a mere embellishment. The whole interest of the history arises simply out of the facts themselves and the truthfulness with which they are depicted. The writer was far too much interested in what he had to tell to adorn it with meretricious graces. He was a politician who felt the moral significance of all that took place in his day, whether in England, at Rome, or in the distant East; and he expresses his judgment without the least reserve, alike on the acts of his own sovereign, of his countrymen, and of the court of Rome. He is, in fact, the most distinctly political historian with whom we have yet had to do. He has, no doubt, his feelings as a monk, resenting the presumption, in some cases, of these new orders of friars, though even here his complaints seem very fair. But his thoughts rise altogether above mere class and party considerations. He is not so much a monk as an English politician, and yet not English exclusively, but cosmopolitan. His merits, even in his own day, as a man of great judgment and impartiality seem to have been renowned over Europe.'

**4. Mediæval Historical Biography.**—The personal prowess of the great political and military figures in the Middle Ages made attractive subjects for historical biography. Often the monarch subsidized or otherwise favored a biographer to ensure a properly flattering record of his deeds. Needless to say, strict impartiality was never observed, and sycophancy often was added to the other defects of mediæval historiography. In addition, the theological coloring of all mediæval thought led the biographer to represent the great secular figures of the period as the chosen agents of Divine Providence in their age. Of these mediæval biographies the most notable were 'The Life of Charlemagne,' by Einhard; 'The Life of Louis the Fat,' by Suger; and Joinville's 'Life of Saint Louis,' one of the polished French historical works written in the vernacular. Here also

belong, almost as much as in the field of systematic history, the works of Otto of Freising and Rigord. Among these mediæval biographers, especially such as Einhard and Joinville, one finds some of the best examples of the rare emergence of secular interests in mediæval historiography.

Several facts stand out from even the foregoing brief survey of mediæval historiography. In the first place, like the most of classical historiography, the historical works of the Middle Ages were for the most part concerned with strictly contemporary history. The treatment of a remote period was almost invariably in the nature of a rude and scanty chronicle of events. In the second place, it is almost impossible to differentiate sharply between chronicles, systematic histories and biographies on account of a common methodology. Thirdly, it is noticeable that the vast majority of the writers were churchmen. Therefore, while the ecclesiastics cannot be too severely criticized for their vitiation of historical methods, it is well to remember that without them mediæval historical literature would have been practically a blank. Fourthly, it will readily be apparent that mediæval history was almost exclusively episodic, there being almost no attempt to analyze the deeper social, economic and intellectual forces in historical development. Finally, one can easily discern that, with the stimulation of intellectual interests during and following the Crusades, there came an increase in the volume of historical output and an improvement in its quality that was a prophecy of a future recovery of the lost historical standards of classical antiquity.

**5. The Arabic Historians of the Middle Ages.**—The contribution of the Arabs to mediæval culture was not insignificant in the field of historiography, but only a few of the more notable Arabic historians can be mentioned in this place. Orosius found his Arabian counterpart in Tabari (846-932), who compiled the first universal history from the Mohammedan point of view. The events of history were adapted to the creation of a 'Mohammedan Epic' justifying the triumph of Islam. History and ethnography were combined in the voluminous works of Mas'udi (d. 966), whose wide travels carried him over most of Asia, Africa and Europe. Not until the publication of the histories dealing with the discoveries of the 16th century was there another work which contained as much descriptive ethnographic material. The ablest contributor to historical biography among the Arabs was Ibn Khallikan (d. 1282), whom experts rank with the best biographers of classical antiquity. The first Arab historian to possess any considerable philosophic grasp upon cause and effect in historical development was Athir (1160-1232). But far and away the ablest and most significant figure in Arab historiography was Ibn Khaldun (1332-1406). His importance lies in the unique feat, for the time, of having been able to rationalize the subject of history and to reflect upon its methods and purpose. At the outset, in his 'Prolegomena to Universal History,' which was the systematic presentation of his theoretical views, he drew a sharp distinction between the conventional annalistic and episodic historical writ-

ing of his time and history as he conceived of it, as the science of the origin and development of civilization. Anticipating Vico and Turgot, he comprehended the nature of the unity and continuity of historical development. In marked contrast with the static or eschatological conceptions of contemporary Christian historiography was his dynamic thesis that the process of historic growth is subject to constant change comparable to the life of the individual organism, and he made clear the co-operation of psychic and environmental factors in this evolution of civilization. Flint makes the following estimate of the significance of his work: "The first writer to treat history as the proper object of a special science was Mohammed Ibn Khaldun. Whether on this account he is to be regarded or not as the founder of the science of history is a question as to which there may well be difference of opinion; but no candid reader of his 'Prolegomena' can fail to admit that his claim to the honor is more valid than that of any other author previous to Vico."

#### VIII. HUMANISM AND HISTORIOGRAPHY.

1. **The Renaissance and Humanism.**—Recent research and a more critical examination of the intellectual currents of European history have profoundly modified the exaggerated opinions of Burckhardt and Symonds with regard to the relation of the so-called "Renaissance" to the development of European thought. It has been shown that, at the best, this period did not mark a direct and conscious advance toward modern concepts, but was distinctly the revival of interest in an antique culture, which was in many fundamental ways opposed to the present-day outlook. This revival indirectly contributed toward the development of modern thought chiefly through its aid in breaking up the ecclesiastical "fixation" of mediæval thought and by bringing to the front again an interest in secular matters. In its broadest sense the literary phase of this movement is now conventionally designated as "Humanism," meaning by this not only a revival of interest in classical literature, but also a renewal of appreciation for the broadly human interests and outlook of pagan culture. It was primarily an emotional and intellectual reaction against the narrow and ascetic attitude of the theologians without constituting any real or conscious revolution in theology.

2. **Characteristics of the Historiography of Humanism.**—Though there were great differences in the quality of the product of the historians of this period, as, for instance, between the works of a Poggio and a Guicciardini, certain fundamental characteristics of the historiography of humanism were sufficiently general and universal to justify enumeration. The reaction of humanism upon historical writing was strictly in accordance with the fundamental aspects of the movement. It meant, in the first place, a search for classical texts and the comparison, criticism and improvement of those recovered. Again, it greatly reduced the element of the miraculous in historical interpretation and lessened the "emotional thrill" of the "Christian Epic." Pagan history was to some extent restored to the position from which it had been excluded by the Christian writers in general, and by Augustine and Orosius in

particular. This was due in part to the admiration of the humanists for classical culture, and in part to the fact, that, for the first time since the passing of Rome, a majority of the leading historians were laymen and practical men of affairs rather than churchmen and theologians. Naturally, also, the classical models of historiography were effective in leading to an improvement in style and, what was more important, to a greater attention to political and social events and forces—it meant the re-secularization of history. A powerful impulse in this latter direction came from the beginnings of modern nationalism in the Italian city-states. Also, the criticism of literary texts produced at least an elementary sense of the value of a critical handling of historical documents. Finally, with the humanists history became more historical. With their centre of interest in the culture of a period long past, historical writing could no longer be limited entirely to contemporary history or to a mere repetition of the threadbare 'Chronicle' of Jerome. In the large, however, humanism meant to historical writing a great literary and cultural improvement but much less of an advance in scientific method—it was a great impulse to history as literature but in no such degree to history as a critical science. The canons of Isocrates, Livy and Tacitus rather than of Thucydides and Polybius, were the guide of humanist historians. Nor did humanism bring to historical writing that freedom from subserviency to vested interests and authority that is commonly supposed. It emancipated it to a large degree from the theological bias, but substituted a secular restraint which was often as damaging to objectivity and accuracy. As Professor Burr has well stated the case, "When the Middle Ages waned, the revived study of the ancients and the rise of a lay republic of letters did not at first, one must confess, greatly advance the freedom of history. The courtier humanist charged with a biography of his princely patron or a history of his dynasty, the humanist chancellor commissioned by the city fathers to write the history of the town, was perhaps less free to find or tell the truth than had been the churchly chronicler unhampered by hereditary lords or local vanity. The audience, too, was humanist, and the tyranny of rhetoric, never wholly dispelled throughout the Middle Ages, now reasserted itself with double power. It was the humanist historian's very function to make the glories of his prince or of his city a vehicle for the display of the Latin style to which he owed his post. And if history, thus again an art, a branch of literature, dared in a field so secular to shun the mention of ecclesiastical miracle and even to forget the great plan of salvation, it was too often to borrow from the ancients a strange varnish of omen and of prodigy." While it bore no causal relation to humanism, it should be remembered that it was during this period that the printing press was invented and introduced into general use. It gave a great stimulus to the "making of books" in the field of history, as in other branches of literary effort. In its largest significance for the future of historical science, the invention of printing can be compared only to the original mastery of the art of writing. It is not too much to say that neither Thucydides, Polybius, Blondus, Mabillon

nor Ranke was as consequential or indispensable in making possible the present status of historiography as the inventor of the art of printing by movable type, be he Coster, Gutenberg or someone yet to be discovered.

3. **The Chief Contributors to the Historiography of Humanism.**—Aside from the scholars whose activity lay solely in the search for classical texts, the first important product of humanist historiography was 'The Twelve Books of Florentine History' by Leonardo Bruni (1369-1444). In this and his later 'Commentaries' are to be found nearly all of the characteristics of the historiography of the humanist school—a moderate adherence to the canons of style of the Greek and Roman Rhetoricians, the opinion that classical rather than contemporary culture was the most promising field for historical inspiration, the elimination of pagan and Christian miracles and legends, and a primary attention to the practical analysis of political events and activities. The standards of Bruni were adopted by his Venetian disciple, Marcantonio Coccio (1436-1506), known as 'Sabellicus,' in the production of the only serious humanist attempt at a world history, his 'Enneades.' Though he took his chronology from Eusebius, he restored to the history of antiquity some degree of proportion in dealing with the various nations by departing from the almost exclusive concern with Hebrew history, which had been the fashion for a millennium. Again, while he in no way foreshadowed Voltaire, that he made some progress toward rationalism and criticism may be seen from his placing the legend of Samson on a parity with that of Hercules. The great gulf between the historiography of the Patristic period and that of humanism can best be appreciated by a comparison of the 'Enneades' with 'The Seven Books of History against the Pagans.' If Bruni was the Herodotus of humanist historiography and Sabellicus its Diodorus, Poggio (1380-1459) was its Ephorus. His 'Eight Books of Florentine History' illustrate in its extreme form the influence of classical rhetoric on humanist historical literature and one may agree with Fueter that "what he gained as a literary artist he lost as an historian."

Of a widely different character from the work of Poggio was that of the most distinguished historical critic of the period, Laurentius Valla (1407-57). Valla's only systematic historical work, 'The History of Ferdinand I of Aragon' was not conspicuously successful. It proved the author to be a "scandal-monger" rather than a historian in the field of narrative, though it may have been a slight methodological advance to have substituted scandals for miracles. His achievement, for which he has received undue fame in the field of criticism, was the final proof of the forgery of the 'Donation of Constantine,' the authenticity of which had already been doubted by Cusanus and Bishop Peacock. As Fueter has clearly shown, Valla acquired fame by virtue of the venerable nature of the document he attacked rather than by the skill or erudition he displayed in its analysis. It was a testimonial to his courage rather than to his critical powers, which could be matched by several other humanists. As Emerton has said, "The most interesting thing about the exposure is the amazing ease of it. It does not

prove the great learning or cleverness of the author, for neither of these was needed. The moment that the bare facts were held up to the world of scholars the whole tissue of absurdities fell to pieces of its own weight." More skill was shown in his 'Duo Tarquintii,' an attack on Livy's treatment of a certain phase of early Roman history. This work also showed that the most highly esteemed of secular authorities was no more immune from critical examination than venerable ecclesiastical documents. Valla's methods were applied by his Venetian contemporary, Bernardo Giustiniani (1408-89), to dissipate the legends connected with the founding of Venice.

Far the greatest historical scholar that Italian humanism produced was Flavio Blondus (1388-1463), the Timaeus of humanism, who devoted his life to a study of the antiquities of ancient Rome and the rise of the mediæval states. His chief work was 'History since the Decline of the Power of the Romans,' in 31 books. The most notable thing about this work, aside from the careful scholarship, was the original attitude that its author displayed in his interpretation of the significance of the mediæval period. "The novel element in the attitude of Blondus," says Professor Burr, "is that instead of thinking of the Middle Ages as the continuous history of a Roman Empire, as mediævals had been wont to do, he left Rome to the past and told the story of the rising peoples who supplanted her." "He contributed more," says Fueter, "to our knowledge of the Middle Ages and of Roman antiquity than all the other humanists combined." It is the best possible illustration of the canons of humanism that its greatest historical scholar and *savant* was never given formal recognition or reward for his great contribution to scholarship, because he did not possess an elegant literary style. In a more fundamental sense, perhaps, his work was given the greatest testimonial possible, in that, of all products of the historical scholarship of the period, it was the most plagiarized for information by later writers. In this way it contributed indirectly to the improvement of historical scholarship. The unpopularity of scholarship for its own sake, as shown by the experience of Blondus, explains why he had but one true Italian disciple, Calchi (1462-1516), the historian of Milan. Blondus was the true precursor of Mabillon and Tillemont.

The humanist Pope, Æneas Sylvius Piccolomini (1405-64), deserves mention in a sketch of humanist historiography more from the nature of his personal career and the influence he exerted on later German writers than from the value of his contributions to systematic history or to the improvement of historical method. His numerous historical works, 'Commentaries on the Council of Basel'; 'The History of Frederick III'; 'The History of Bohemia'; 'The History of Europe'; 'Universal History,' and 'Commentaries,' or his autobiography, were superficial, without deep philosophical grasp, fragmentary and incomplete. Contrary to the usual view, he did not even equal Bruni as an historical critic, to say nothing of Valla and Blondus. On the other hand, he was a man of action in politics to a degree scarcely equalled by Polybius or Tacitus. No contemporary knew more of

European politics and culture than he, and the most valuable aspect of his historical works is the fact that they are full of personal memoirs. As a member of the imperial chancery of Frederick III and through his later ecclesiastical relations with the empire, his interest in German history and culture was greater than that of any of his Italian contemporaries. His significance in the development of historiography rests primarily upon his works on German history and his influence on later German historians. In his history of Frederick III he made large use of Otto of Freising and brought him to the attention of contemporaries. His history of Bohemia was probably the first attempt of a humanist historian to introduce ethnography into historical literature. Finally, his history of Europe and his universal history sought to bring out the interrelation between history and geography. It was in these respects, chiefly, that he influenced later German historians. Fueter says on this point: "Æneas Sylvius was mainly responsible for the later appearance in the works of many German humanist historians of the tendency to introduce into works on history excursions into the origin and growth of law and the relations of geography to historical development, to assume at least a semi-critical attitude toward the legends of racial origins, and to display a boisterous chauvinism in matters touching the question of nationality."

Historical biography among the humanists was founded by Filippo Villani (c.1325-1405) in his survey of the most illustrious citizens of Florence. Always handicapped by the crudeness of their classical model, Suetonius, the biographical products of the period were not as successful as the more systematic historical works. The only notable work was Giorgio Vasari's (1511-1574) 'Lives of the Most Eminent Painters, Sculptors and Architects.' This lacks almost every characteristic of a good historical work, but has become famous because of its subject matter and the scarcity of other sources. It was the first real history of art.

The transition from strictly humanist historiography to the beginnings of modern political and national historical writing in Italy was well illustrated by the works of the Florentine historians, Machiavelli and Guicciardini. The cultural supremacy of Florence at the time, and the intensity of its political life, combined to make it a particularly favorable environment to stimulate the production of works of high value. With Blondus they valued truth more than rhetoric, but they were saved from the former's obscurity and unpopularity by avoiding a labored and pedantic style. With them history became wholly secular and was limited primarily to a straight-forward narrative and analysis of political events. Some attempt also was made to substitute a psychological and material theory of causation for supernaturalism.

Machiavelli (1469-1527) was primarily a political philosopher without any particular emotion for history unless it was utilized in the interests of political theory. It is this tendency which gives his major historical work, 'The History of Florence,' its distinctive characteristics. From the standpoint of style or accuracy it was not superior to some other histories of the period, but is it doubtful if any previous

historian since Polybius, with whom Machiavelli was thoroughly familiar, had exhibited the power of grasping the nature of historical causation or of presenting a clear picture of the process of historical development that Machiavelli displayed in his analysis of the political evolution of the city of Florence. It was as a political thinker and organizer of causal factors that Machiavelli excelled, and not as an objective narrator of political events.

Not at all philosophical, but more truly historical, was Guicciardini (1483-1540). His 'History of Florence' is one of the truly original works in historiography in that the author broke almost completely with both Patristic and humanist historiography and even went beyond the classical historical conventions in one particular, namely, that he eliminated the introduction of direct discourse in his narrative. In his lucid style, free from digressions and irrelevant details, there was no trace of florid rhetoric, and his primary concern with contemporary political history allowed him, in the latter part of the work, to dispense, to some extent, with the annalistic and strictly chronological arrangement of the conventional historical writing of his time. He made no attempt at philosophic analysis, but devoted himself solely to a vigorous and incisive narrative of events and a candid criticism of men and policies. "With the 'Florentine History,'" says Fueter, "there began modern analytical historiography and political ratiocination in history." Most critics contend that with Guicciardini's 'History of Florence' historiography in western Europe had again attained to the level of Thucydides and Polybius. It had, however, no influence on contemporary historiography as it was not published until 1859. From the standpoint of style and arrangement Guicciardini's other major work, 'The History of Italy,' was less original because here he compromised with those rhetorical conventions of humanism which he had so rigorously excluded from his first work. But with respect to its breadth, scope and original mode of approach, the latter work was even more epoch making. For the first time a historian had been able to break with tradition and free himself from primary concern with any particular state or dynasty and to devote his attention to a much broader field—"the history of a geographical unity." This gave him an unprecedented opportunity to study the growth and decline of states, the interaction between states in all the phases of international relations, and the processes of political evolution. In other words, the subject-matter offered rare opportunities for the study of universal history reproduced on a small scale, and, though Guicciardini almost entirely lacked that philosophical insight into social and political processes that distinguished Machiavelli and was thereby prevented from making the first great study of social and political evolution, the very novelty of his program constituted a great advance in historical method. Few will deny that Guicciardini reached the highest level to which post-classical historiography attained until the time of Mabillon, but the great progress that was necessary before modern scientific political history could be reached is best appreciated by a perusal of the rather over severe criticism of Guicciardini by Ranke, the earliest, but by no means the most cautious and scholarly of the

modern school. The modern standards might more quickly have been reached had not the Reformation set back the progress of historical writing by the resurrection of the theological interests and religious bias and controversy which humanism was gradually and peacefully smothering. Not until the theological monopoly had been crushed by the rationalism of the 18th century and secular interests had been reinforced by the commercial revolution and the rise of modern nations could any fundamental advance be achieved.

Outside of Italy, humanism found many distinguished converts, and not the least of them in the field of history. In general, the conventional canons of humanist historiography were faithfully followed, though there were some variations introduced as a result of changing conditions. As the movement was somewhat belated beyond the Alps, it became complicated by the religious conflicts of the Reformation period and took on a concern with ecclesiastical matters which was quite foreign to the Italians of the 15th century. Again, the literary tastes remained less purely classical, and, in the zeal for florid rhetoric and sharp invective, Tacitus, rather than Livy, became the model of many of the northern humanists in the 16th century. As in Italy, so in the north, humanist historical literature gradually evolved into the beginnings of modern political historiography.

The most scholarly product of the historiography of Swiss humanism was the history of Saint-Gall by Joachim von Watt, better known as Vadianus (1484-1551). He is generally rated as a historian superior to Blondus. He not only rivalled Blondus in textual criticism, but also advanced a step further toward Ranke by making some rudimentary progress toward the internal criticism of the tendencies of the authors of the documents. He was able, further, to combine erudition with a clear and vigorous style and good grasp upon the general factors of historical development. Fueter regards his work as the most broadly conceived product of the historiography of humanism on account of the wide scope of the subjects and interests embraced. It was, however, doomed to an even longer period of obscurity than awaited Guicciardini's 'History of Florence,' because it was not published until the third quarter of the 19th century.

In Germany the list of distinguished humanist historians begins with the name of Albert Krantz (1450-1517), who, following Aeneas Sylvius, was one of the first to apply the literary and historical methods of humanism to a study of primitive peoples, in his histories of the early Saxons and Wends. More famous was Johannes Turmair, known as Aventinus (1477-1534). In his 'History of Bavaria' and his 'History of Early Germany' he tried to combine the literary canons of Bruni with the scholarship of Blondus, but fell far short of either, and his bitter Protestant bias prevented any objective treatment of contemporary affairs. Few writers of the period, however, equalled him in his ability to analyze and interpret the manners and customs of a people. Ulrich von Hutten (1488-1523) was more distinguished for his brilliant satire in his campaign against bigotry than for his contributions to historical

literature, but his recovery and publication, with extended comments, of a manifesto of Henry IV against Gregory VII was both a shaft of Protestantism against Rome and a valuable addition to historical knowledge. The only distinguished representative of the erudite and critical tendencies of Blondus among the German humanist historians was Beatus Rhenanus (1486-1547), the friend and disciple of Erasmus. He examined the sources of early German history with the same exact and objective scholarship that Erasmus had applied to the ecclesiastical records and doctrines. While he lacked the ability to organize his work into a coherent exposition of its results, his labors represent the highest level of scholarship to which the historiography of German humanism attained. Of all the publicists who have a place in the historiography of German humanism, Samuel Pufendorf (1632-94) was the leader as a historian. His works included a 'History of Sweden,' a 'History of Frederick William the Great Elector' and 'An Introduction to the History of the Leading Powers and States of Europe.' He had a fine classical style, but exhibited to its fullest extent that fundamental fault still common to publicists when they enter the field of historical literature, namely, a concern only with the few distinguished figures in international relations and with that hitherto most superficial field of political history, the record of international relations when unaccompanied by any attention to internal political or social history. As in the later work of Droysen, one searches in vain in the mass of references to external politics for even the slightest appreciation of those deeper popular movements and forces of which diplomatic history can give only the most scanty and unreliable reflection and information.

A more distinguished scholar and publicist than Pufendorf, but not so noted an historian, was the Dutch writer, Hugo Grotius (1583-1645), the founder of modern international law. His chief historical work was 'The History of the Netherlands.' Though his style, in imitation of Tacitus, was pompous, prolix and involved, he displayed great ability in psychological analysis and in dissecting the problems of military and political history connected with the struggle between Spain and the Netherlands.

That humanist historiography in England was closely related to the origins of that intellectual movement in Italy is to be seen in the fact that the first product of this type of historical literature in England was the scholarly and well-written 'History of England in the Reign of Henry VII' by Polydore Vergil (1470-1535), an Italian ecclesiastic who had made his home in England. His scholarship was not matched in the British Isles until the time of Camden, a century later. England's earliest native humanist historian of note was Sir Thomas More (1478-1535), whose polished style found expression in his 'History of Richard III.' Of all the British historians of this period, it is probable that the truest representative of humanism was the erudite Scot, George Buchanan (1506-82). Few of the best Italians equalled him for the purity of his Latin diction and the vigor and clarity of his narrative, but his 'History of Scotland' was

most uncritical and credulous, utterly lacking in rationalistic tendencies and marred by a narrow chauvinism. Machiavelli and Guicciardini found their English disciple in the philosopher and statesman, Francis Bacon (1561-1626). His 'History of the Reign of King Henry the Seventh' was especially notable for bold criticism, "judicial severity," and the frank expression of the author's opinions. The English representative of the erudite and critical school of Blondus was the court historian, William Camden (1551-1623), an avowed admirer of Polybius. In his 'Annals of English and Irish History in the Reign of Elizabeth' he showed, like his French contemporary De Thou, that the political history of the 16th century could not be wholly divorced from ecclesiastical questions.

The transition from humanism to modern political history in England was illustrated by the works of Lord Clarendon (1609-74) and Bishop Burnet (1643-1715). While the general arrangement of Clarendon's 'History of the Rebellion and Civil Wars in England' resembled the French "memoirs," and though it was most superficial in its analysis of the fundamental social and political causes of the civil wars; it is doubtful if any previous historian, classical or humanist, possessed Clarendon's power of vivid delineation of personalities. Bishop Burnet, in his 'History of the Reformation of the Church of England' and 'History of My Own Time,' was the first historian of party intrigues and parliamentary debates, a subject scarcely available for any previous writer. An ardent Whig and Anglican, he belonged more to the forerunners of modern political history than to the list of disciples of humanism.

Spain contributed three important figures to humanist historical literature in Diego Hurtado de Mendoza (1503-75), Juan de Mariana (1535-1625) and Gerónimo de Zurita (1512-80). While Mendoza wrote his 'History of the War with Granada' in a pompous, archaic and involved style, he equalled Bacon or Guicciardini in his sharp criticisms and acute judgments. Mariana, a Spanish Jesuit, was a writer of quite a different sort. He has been called the Spanish Buchanan by Fueter, and his 'History of Spain' in 30 books resembled the work of the Scot in its excellent style and cautious criticisms of Christian legends. His liberal allotment of space to ecclesiastical matters was a breach with humanist conventions. Much less able in narration, but a far more critical scholar, was Gerónimo de Zurita, the historian of the kingdom of Aragon and the most prominent and faithful disciple of Blondus among the Spanish historians of this period. He was especially significant through the fact that he was one of the first historians to make an extensive and fairly critical use of the diplomatic correspondence in reconstructing the record of political events in the distant past.

The most notable product of the historical scholarship of the French humanists was the work of Joseph Justus Scaliger (1540-1609) in the field of historical chronology. His 'De emendatione temporum' was a bold attempt to put chronology on a scientific basis by revising the "sacred" chronology in the light of the evidence from the history of the "gentile" and

"pagan" nations of antiquity. His 'Thesaurus temporum' was a most notable performance of scholarship, which provided a general history of the development of chronology and included a most valuable reconstruction of the lost 'Chronicle' of Eusebius. Scaliger's publicist contemporary, Jean Bodin (1530-96), in his 'Methodus ad facilem historiarum cognitionem,' produced the first extensive treatise on historical method, with the emphasis on interpretation rather than upon criticism of sources. Especially significant was the emphasis which Bodin placed upon the influence of geographical factors in historical development, thus opening the way for Montesquieu and Ritter. It was, therefore, to a much greater degree a forerunner of the first chapter of Buckle's 'History of England' than of Bernheim's 'Lehrbuch.' A widely different contribution to historiography was contained in the work of Jacques Auguste de Thou (1553-1617), conventionally known as Thuanus. He was probably the most notable French contributor to the systematic historiography of humanism. His 'Historia sui temporis,' designed as a continuation of a work of the same title by the Italian humanist, Paulus Jovus (1483-1552), described the civil and religious wars in France in the latter part of the 16th century according to the spirit of an enlightened and tolerant French Protestant. He introduced into historiography the laudable tendencies displayed by his royal master and friend, Henry IV, in statesmanship. As might be expected in the work of one of the jurists who aided in drafting the 'Edict of Nantes,' he was scarcely fair to the extreme Catholic party, but his message was a lofty and noble plea for mutual religious toleration in the larger interests of France. His work exhibited great powers of extended intellectual labor and uniformly maintained a great dignity of tone. He might have equalled Machiavelli and Guicciardini if he had not reintroduced the theory of the divine determination of political causation, and if he had possessed the constructive literary ability which would have enabled him to organize his work into a coherent narrative. He may be said, however, to have improved upon them in one regard, namely, that he showed how essential a proper consideration of ecclesiastical affairs may be to a thorough understanding of political and constitutional development. The contributions of de Thou's contemporary, Isaac Casaubon, will be discussed in another connection. The finest literary product of the historiography of French humanism was the polished 'Mémoires' of Saint-Simon (1675-1755) dealing with France under the early Bourbons.

#### IX. THE PROTESTANT REFORMATION AND THE COUNTER-REFORMATION IN HISTORIOGRAPHY.

1. Its Effect upon the Subject-matter and the Interpretation of History.—In the same year that Machiavelli received his commission to write his 'History of Florence' Luther burned the papal bull at Wittenberg and the Protestant Reformation was soon in full swing. A rude shock was given to the great impulse of humanism toward the healthy secularization of historical literature, and the centre of historical interests was again forced back into the rut of theological controversies from which

it had been trying to free itself since the days of Augustine and Orosius. Again to quote from Professor Burr, "To the freedom of history there came a sudden check with the great religious reaction we call the Reformation. Once more human affairs sank into insignificance. Less by far than that of the older church did the theology of Luther or Calvin accord reality of worth to human effort. Luther valued history, it is true, but only as a divine lesson; and Melancthon set himself to trace in it the hand of God, adjusting all its teachings to the need of Protestant dogma. Had either Papist or Lutheran brought unity to Christendom, history again must have become the handmaid of theology." Not only were ecclesiastical matters, dealing with both dogma and organization, deemed the all essential sphere of historical investigation, but also universal history was again regarded as purely a great struggle between God and the Devil. Two new "Cities of Satan," however, replaced the pagan "City" of Augustine and Orosius,—the 'Teufels Nest zu Rom,' and the followers of "the crazy Monk of Wittenberg," respectively. The struggle was now limited to Christendom, which became "a house divided against itself."

It is scarcely necessary to point out the fact that this revival of the religious orientation of historical interest was as fatal to the fine objectivity of Guicciardini's type of historical product as it was to the maintenance of the secular point of view of the Florentine school. There was no longer any thought of prosecuting historical studies for the mere love of acquiring information or of enriching the store of knowledge regarding the past, as Blondus had labored for these purposes alone. History again became as violently pragmatic as with Augustine and his disciples. The past was viewed merely as a vast and varied "arsenal" from which the controversialists could bring unlimited supplies of ammunition for the conflict and put their enemies to an inglorious rout. The embryonic canons of criticism which had been in part restored by the best of the humanist historians were lightly ignored, and each party consciously strove to produce the most biased account of past events possible, in order to exhibit their opponents in the most unfavorable light. Sources of information were not valued for their authenticity, but for their potential aid in polemic exercises, and invective replaced the calm historical narrative. Finally, it should be emphasized that since the period of the Reformation there has been little opportunity for a completely free and impartial study of the mediæval period. An epoch, the interpretation of which was so vital to the two great religious groups of Christendom, could scarcely again become a field for calm and dispassionate analysis.

It would be inaccurate, however, to hold that the Reformation gave no impulse to historical investigation. Never in the palmiest days of classical or humanist historical writing was there a more feverish energy exhibited in scanning the records of the past; the great defect was not in the nature of a decline in activity or interest, but in the character of the impulse that led to this vigorous quest for information and the manner of use to which the knowledge was put after it had been acquired.

Protestant historians were "aided by the God of Saint Paul" in the search for evidence that would prove beyond a shadow of doubt that the elaborate ritual and body of dogma of the Roman Catholic Church had been wholly an extra-scriptural and semi-pagan growth, and that the Pope was the real Anti-Christ; and Catholic investigators were "specially guided by the Blessed Virgin" in their counter-demonstration that the Church and all its appurtenances were but the rich and perfect fulfillment of Scripture, and that the Protestants were inviting a most dreadful and certain punishment by their presumptuous and sinful defection from the organization founded by Saint Peter in direct obedience to the words of Christ. The only real contributions made by the controversy were the recovery and publication of important early documents on Church history and the production of telling criticisms by both factions which could be combined a century later by the rationalists to their mutual discomfiture.

**2. The Chief Products of the Controversial Period.**—The first serious contribution of the Protestant camp was 'The Lives of the Popes of Rome' by Robert Barnes (1495-1540), an Anglican Lutheran who had fled to Germany for protection. Composed under Luther's direct supervision, it endeavored to prove the popes responsible for all the disasters of the Middle Ages and praised the virtues of their secular opponents. At last, the methods of Orosius had been turned against the Church itself. Much more important were the voluminous 'Magdeburg Centuries,' a composite work planned and edited by Matthias Vlacich (1520-75), better known by his latinized name of Flacius. He was aided by a number of prominent Protestant scholars, such as Aleman, Copus, Wigand and Judex. The history of the Church and of Christian doctrine was reviewed by centuries down to 1300 in the effort to prove direct historicity in the Lutheran position and to show that the Catholic doctrines and organization had been an exotic and unholy growth away from the purity of Apostolic Christianity. While the authors displayed considerable critical ability in dissecting the papal doctrine and dogmas, they exhibited an equal gullibility in accepting preposterous tales to bolster up their side of the controversy. Its significance lies chiefly in the fact that it founded Church history in its modern phase. Another Protestant polemic appeared about this time in England and met with great popular success. This was 'The Acts and Monuments of the Christian Martyrs,' by the Englishman, John Foxe (1516-87). Beginning with Wycliffe, it traced the record of Protestant martyrs in such a manner as especially to represent the struggle as one between the purity and the perversion of Christianity—between Christ and the Anti-Christ. Protestantism found its Scottish champion in John Knox (1505-72), who wrote his 'History of the Reformation in Scotland' to prove the particular solicitude of the Devil for the welfare of the Catholic cause. In spite of its obvious bias, however, Knox's work was greatly superior to that of the Centurians and Foxe. From the standpoint of literary quality, his history was a work of genius, "displaying a marvelous precision and sureness in the selection and presentation of the significant and striking details." Nor did he fail to condemn

in the most vigorous terms those who adopted Calvinism as a means of gaining selfish material ends or resorted to violence in the name of religion in order to revenge political or personal grievances. A work which can scarcely be regarded as a part of the campaign of theological polemic that is being described, but which calls for some brief notice on account of its great interest and significance for the history of the Reformation, is the "Commentaries on the Political and Religious Conditions in the Reign of Emperor Charles V" by Johannes Philippi (1506-66), more generally known by his latinized name of Sleidanus. The great importance of his work is that it was the first political analysis of the Reformation movement and the Protestant revolt. He was the official constitutional apologist of the Lutheran states of northern Germany, and his task, not unlike that of Jefferson, was to justify at the bar of public opinion the entire legality of the secession of the Protestant princes from the Empire. He, therefore, approached the history of the movement from a political and constitutional rather than a theological point of view. While he limited himself wholly to authentic documents, his work was the product of an advocate; though not a polemic, it was a lawyer's brief carefully selecting and marshalling the evidence to be presented. As might be expected from such circumstances, his "Commentaries" exhibited great power in the organization and concentration of material, an admirable lucidity of expression and a dignified tone, designed to make an appeal to the learned public of Europe. While it contained none of Ranke's religious fervor and in no way anticipated the social studies of Janssen, his work was of the greatest significance as a direct foreshadowing of the now generally accepted thesis of Professor Robinson that the Protestant revolt was far more a political than a religious movement—that it looked more toward the political adjustments of the Peace of Augsburg and the Treaty of Westphalia than to the triumph of the theology of "justification by faith." He anticipated this interpretation, not only through the general mode of his approach to the problem, but also by specific comments upon the underlying political causes of the revolt.

The Catholic counter-blast was initiated by the monumental 'Annales ecclesiastici' of Cardinal Cæsar Baronius (1538-1607), the director of the Vatican library. By the use of an enormous mass of evidence he tried to prove the New Testament origin of Catholic Christianity and to show its logical development from Scriptural foundations. While he was more critical in his use of sources than the authors of the 'Centuries' and introduced more unpublished documents, the work was purely a polemic and marked no advance in historical method. In one way it was decidedly a retrogression. As the most authoritative critic of the historiography of this period has clearly shown, Baronius was mainly responsible for the introduction into historical controversy of the method of shuffling, quibbling and evasion, which has particularly characterized the Jesuit controversialists. He endeavored to avoid meeting dangerous issues by trying to confuse and obscure the vital question through turning the discussion into second-

dary and irrelevant channels. The crudities and errors in the work of Baronius were revealed in the searching criticism of the great humanist scholar, Isaac Casaubon (1559-1614), to whom Baronius' weaknesses due to his inability to handle Greek were readily apparent. He devoted the last years of his life to a refutation of Baronius in his 'Exercitationes in Baronium.' The 'Annales' were later continued with much greater scholarship by Odroricus Raynaldus (1595-1671), a learned Italian ecclesiastic. The second great Catholic champion was the French bishop, Jacques Bénigne Bossuet (1627-1704). In his 'History of the Differences among the Protestant Churches' he endeavored to convince the Protestants of the error of their ways by showing them that there could be no logical end to sectarian divisions once the crucial initial break had been made with ecclesiastical authority. Bossuet's importance lies in the fact that he alone of the controversialists, Protestant or Catholic, was able to get beneath personalities and events and to view the conflict in its deepest philosophical aspects as a struggle between liberty and authority, in which the victory of liberty meant to him indifference, atheism and religious anarchy. In his 'Discourse on Universal History' he appeared as the Orosius of the Counter-Reformation. Though incomparably more able and philosophic than the 'Seven Books against the Pagans,' it was less critical and less historical than the 'Enneades' of Sabellicus. "His 'Discourse,'" says Fueter, "was not an historical work. It was merely a sermon in which the biblical text was supplanted by historical subject-matter carefully edited and prepared in the interest of the Church." It was the last serious attempt at an interpretation of universal history in terms of the old theology. After Voltaire had published his 'Essai sur les Mœurs' in the middle of the next century, no one dared to risk his reputation by a revival of the doctrines of Orosius and Bossuet.

The above-mentioned works of controversy are only the more notable ones selected from the great volume of lesser contributions to the historical literature of the Reformation and Counter-Reformation, but they sufficiently illustrate the general tendencies in method and interpretation. It has not entirely ceased at the present day as one can readily perceive by a comparison of the works of Ranke and Schaff with those of Döllinger and Janssen. While humanists and religious controversialists were writing, a new Europe was being shaped by the effects of the commercial revolution, out of which was to come modern civilization and with it the birth of scientific historiography.

#### X. THE CHIEF INFLUENCES IN THE SHAPING OF MODERN HISTORIOGRAPHY.

1. *The Era of Discoveries and the "Commercial Revolution."*—Inasmuch as history down to very recent times has been regarded as primarily the domain and province of the theologian or *littérateur*, it was but natural that either the Reformation or the Renaissance should be taken as marking the origin of the modern phase of the development of historiography. Now that it has come to be generally conceded that, in its broadest interpretation, history is a branch of social science and related

generically to the whole body of science, it has become necessary to search for the causes which brought modern historical writing into being in the results of that great period of transformation which marks the beginnings of the present social and intellectual order, namely, the "Commercial Revolution." By this term is meant that vast movement of exploration and discovery, which occurred in the three centuries from 1450-1750, and its almost incalculable social and intellectual consequences. The isolation, repetition, stability and provincialism of the old order could not endure in the face of the widespread contact of different cultures—that most potent of all forces in arousing intellectual curiosity and promoting radical changes of every sort.

The reaction of the commercial revolution upon historiography was in no way more notable and far-reaching than in regard to the scope of the historian's interest. The narrowness and superficiality of the field of historical investigation since the canons of Thucydides and Orosius had come to prevail could no longer endure unimpaired; it meant the beginning of the return to the field that Herodotus had to some extent marked out for the historian. Writers to some degree ceased to be absorbed by those most superficial phases of political and ecclesiastical history, which had hitherto claimed all of their attention, and became for the first time interested in the totality of civilization. It meant a much greater impulse to that broadening and secularizing process which had been revived by humanism. Not only were there great stores of knowledge to be obtained from the contact with the older civilizations of the East, but in the natives, historians and philosophers at last found the "natural man," who had hitherto only existed in the mythical period before the "Flood." No greater contrast could be imagined than the vast difference in the type of subjects which interested such an historian as Pufendorf and those with which Oviedo concerned himself. Again, the new range of historical interests offered some opportunity for originality of thought; there were fewer erroneous notions to handicap the writer at the outset. Neither Thucydides, Polybius and Livy, nor Augustine and Aquinas had provided the final authoritative opinion on the marriage customs of Borneo or the kinship system of the Iroquois. The only exception in this respect was the prevalent doctrine of a "state of nature," which had come down from the Stoics and Roman lawyers and now seemed to have practical concrete confirmation.

While the influence of the commercial revolution upon historiography was most effective indirectly, through the intellectual and social changes which it produced, and the reaction of these changes upon historical interests and methods, there were some important immediate and direct results apparent in historical writing among those who dealt with the record of the discoveries. In the first place, there were radical changes in style and exposition. The old arrangement in the form of annals was no longer suitable; what was needed now was a vehicle for comprehensive description and not for chronological narration. The majority of the early historians of the movement of exploration and discovery were practical men of affairs and wrote in a direct and unpretentious

style. Though there was later, with such writers as Herrera, a tendency to lapse into the literal canons of humanism, an important breach had already been made with both the form and the style of the conventional historical literature. The content of historical products was also greatly altered by these writers; political and ecclesiastical intrigues were replaced by a comprehensive account of the manners and customs of a people. This tendency reacted strongly even on those writers who dealt exclusively with European affairs. The 'Chronicle' of Eusebius or the genealogy of reigning monarchs, as the introduction to historical works was generally displaced by a description of the land and its inhabitants. Excepting only the feeble advances of Æneas Sylvius and his numerous German disciples, for the first time since the days of the Ionic historians of the 5th and 6th centuries B.C., ethnography and geography began to make a feeble appearance in historiography. Finally, though the earlier of the members of this school of writers were primarily collectors of descriptive information, they later became speculative, and with Voltaire and Herder there appear attempts at a world history conceived according to the new orientation and possessing some degree of comprehensiveness and grasp of causal forces.

As historiography was completely dominated by the canons of humanism at the beginning of the period of discovery, it was natural that the earliest of the historians of the commercial revolution should be humanists who turned their attention to the new movement. Their style and arrangement of material, however, had to be altered to some extent, and the centre of interest was profoundly changed. The first of these writers was Peter Martyr d'Anghiera (d. 1526), an Italian humanist who devoted himself to a description of the new world which had just been revealed. His 'Decades of the New World' showed a fine power of descriptive composition, which sacrificed humanist conventions when necessary. While exhibiting no profundity and little critical ability, it was a well-proportioned and fairly complete summary of the extant reports regarding the new civilizations. Its great significance lies in the fact that it was the first work by an historian which described the civilization of a people without founding it upon the narrow and cramped basis of political life or religious activities. A more truly historical work and the most objective production of the period was the 'General and Natural History of the Indies' of Gonzalo Fernández de Oviedo (1478-1557), a Spanish naturalist who turned historian—a sort of early Alfred Russell Wallace. He was highly critical in recording his own observations, but was equally credulous in accepting tales told to him by others. His work contained a vast amount of information which was generally reliable. In his direct and matter-of-fact narrative there was nothing of the form of humanism, but his style was slovenly and the organization of material miserable. It was the least artistic and the most scientific work of this early group. At the opposite pole as to accuracy stood the notorious work of the Dominican bishop, Bartholomew de Las Casas (1474-1566)—the "William Lloyd Garrison of the 16th century." He was a biased and pedantic scholastic doctrinaire of a thoroughly mediæval type. His 'History of the

Indies,' idealized the natives without bounds and tremendously exaggerated the cruelty of the conquerors. It was worse than worthless for either history or ethnography and did not even possess the merit of an agreeable style. Infinitely superior was the 'General History of the Indies' of Francisco López de Gómara (1510-c.1560), the ablest historian of this school. He showed an admirable combination of excellent descriptive style with relatively high critical ability. His work would have been the great history of the discoveries had it not been vitiated by personal considerations. He was employed by the family of Cortés and was compelled to devote more space to the history of the conquest of Mexico than to all other events combined, and was also compelled to refrain from candid criticism in this major portion of his work. The great "popular" history of the period of discovery was the 'General History of the West Indies' of Antonio de Herrera (1549-1625), the official historian of Philip II. This work was the best example of the lapse of the early descriptive narrative into the conventions of humanist style. He even adopted the annalistic arrangement and everywhere subordinated subject-matter to external form. This meant that his work was greatly inferior to some of the earlier ones in its descriptive material as well as in critical method. It became the popular authority and did more than any other work to establish the generally accepted ideas concerning the discoveries and the great figures connected with them. Next to the work of Las Casas the least meritorious product of this school was the 'Commentaries on the Incas,' by Garciaso de la Vega (1540-1616), the son of a Spanish adventurer by a native Peruvian mother. He was honest but entirely destitute of critical powers. Adopting the style of the humanists, he constructed an utopian picture of ancient Peru which was exaggerated beyond comparison. His almost worthless picture of the Incas gained great vogue in the 17th and 18th centuries when such idealistic views of native populations were so popular. In passing, there might be mentioned the bumptious and boastful 'General History of Virginia and New England' by Capt. John Smith. The first work to deal with the exploration and settlement of India and the "Far East" by Europeans was the 'Da Asia,' of the Portuguese colonial official and historian, João de Barros (1496-1570). Published in fragmentary form in 1552, it described the Portuguese explorations in Asia. It was, perhaps, the best literary product among the histories of the period of discovery, and, though somewhat apologetic in tone, remained for a long time the chief source of information on the subject. A century and a half later Engelbrecht Kaempfer (1651-1716) provided the first systematic account of the early European contact with Japan. He was a German physician who visited Japan and his manuscript 'History of Japan,' published in 1727, remained the chief popular source of European knowledge regarding that country for a century, and was extensively used by Charlevoix. The French Jesuit, Pierre François Xavier de Charlevoix (1682-1761), not only compiled histories of the Jesuit missionary enterprises in Japan on the basis of the works of Kaempfer and others, but also wrote voluminously of the French ex-

plorations in America from personal observation and first hand contact. His 'Histoire et description générale de la Nouvelle-France' (1744), though prolix and uncritical, was highly interesting and enjoyed a long popularity. The general reaction of the influences growing out of the period of discoveries and the commercial revolution upon this school of historians was best summed up in 'The Philosophical and Political History of the Settlements and Trade of Europeans in the East and West Indies,' by the promoter and pamphleteer, Guillaume Thomas Raynal (1713-96). Published in 1771, it was not only somewhat of a synthetic compilation from earlier works, but also indicated the reaction of the commercial revolution upon European thought by its emphasis upon the significance of commerce in modern history and by its surcharge of 18th century political philosophy concerning the rights of man, liberty and the state of nature. But important as some of these writers may have been in altering the conventions of style and the interests of the historian, the general effect of the commercial revolution upon historiography was less vital in the production of historians of the discoveries than in the alteration of all phases of life in the succeeding centuries which grew more or less directly out of it and indirectly wrought great changes in historical concepts and methods.

**2. The Reaction of the New Scientific Philosophy upon Historiography.**—None of the indirect influences of the commercial revolution upon historical writing were more important and more obvious than its aid in producing that new philosophy of nature of which Bacon and Descartes were the most conspicuous exponents. The results of the explorations of all the major portions of the earth's surface had not only demonstrated the great extent of the habitable portions of the globe, but had also shown that the supposed marvels and terrors in the unexplored regions were but an unfounded myth which quite failed to materialize. At the same time that De Gama, Columbus and Magellan were revealing the extent and nature of the surface of the globe, less picturesque figures were devoting themselves to an exploration of the universe, with results equally disastrous to the older theological traditions. The vast and immeasurable extent of the universe was apprehended to an elementary degree by Copernicus, Galileo and Tycho Brahe. The notion of an orderly arrangement and functioning of the universe was established by the great laws of mechanics, discovered and formulated by Galileo, Kepler and Newton. To these major advances in science should be added the explanation of the now commonplace natural phenomena through the great advances in every field of natural science in the 17th century. The net result of all these notable advances was a serious challenge to the old theological interpretations, based primarily upon the concept of a "God of arbitrariness," who was continually varying or suspending the laws of the universe to punish a recalcitrant prince or to answer the prayer of a faithful bishop.

The general implications of the above scientific discoveries were reduced to a systematic body of philosophical thought by Francis Bacon and René Descartes. Bacon especially emphasized the necessity of following the inductive

method and Descartes attempted a mechanical interpretation of the universe. The new discoveries and the new philosophy tended to produce a rationalistic interpretation of natural and social phenomena which abruptly challenged the older and generally accepted view of miracles and wonders that had been so popular with Christian historians during the mediæval period. The English Deists, such as Cherbury, Blount, Locke, Shaftesbury, Woolston and Hume, forever discredited the doctrine of the miraculous. Finally, with the attacks upon the traditional views of the composition of the Old and New Testaments by Hobbes, Spinoza, Astruc and Reimarus, the philosophy of wonder-working was undermined, not only through the evidence of natural science, but by questioning the authenticity of the Scriptural accounts in which the miracles were recorded. The gradual growth of toleration, especially in England, during the latter part of the 17th century and the opening of the 18th centuries enabled these revolutionary ideas to obtain an adequate expression and a general currency.

It was also inevitable that the new scientific discoveries and the new philosophy of nature should react profoundly upon the contemporary social philosophy. The idea of orderly development and continuity in social as well as natural processes was comprehended by Vico, Hume and Turgot. The older idea of social evolution as a gradual decline or retrogression from a primordial "golden age" was replaced in the writings of Vico, Voltaire, Hume, Turgot, Kant, Godwin and Condorcet by the concept of continual progress from lower stages of civilization. The need for miracles to justify history and the other sciences dealing with human activities was lessened by the growing prevalence of the Deists' doctrine of the inherent and reasonable "decency" of man—a notion widely at variance with the older views of the "Fathers" and of Calvin, which maintained the hopeless depravity of mankind. Finally, the new discoveries and the secularization of natural and social philosophy produced a great extension of the interests of the historian beyond the field of politics and religion. In the writings of Voltaire, Raynal, Montesquieu and Heeren it became apparent that the impulse to a broader and sounder scope of history had begun to affect others than those who described the course of the explorations. Though this healthy tendency toward a wider field of historical investigation and narrative was to some extent checked by the renewed impulse to political history with 18th and 19th century nationalism, it had gained a foothold from which it was not entirely dislodged until it was overwhelmingly reinforced by the expansion of interest in social, economic and intellectual topics after the industrial revolution and its social and intellectual consequences in the 19th century.

The reaction of this philosophy of the new natural science and of the new social philosophy upon historiography appears in the writings of what is conventionally known as the "Rationalistic School" of historians, or the historians of the "Aufklärung." While the writings of this school varied so greatly that it is customary to divide the writers into several groups, there was a fundamental unity of method and interest which makes it possible to summarize the general nature of the rationalistic histori-

ography of the 18th century. Much the most important innovation of this school was their uniform tendency to broaden the field of history, so that it would extend beyond the political intrigues of church or state and embrace the history of commerce, industry, and civilization in its widest aspects. The historians of the discoveries had shown a similar tendency, but their work had been confined to a discussion of the new world and they had not constituted a general European school of historians. With the rationalists, no matter what the period or country dealt with, there was an effort to adopt a broad cultural approach to history and to infuse embryonic sociological principles into historical analysis. Scarcely less important was their attempt to discredit superstition and the theological theories of historical causation, and to substitute for these purely natural causes. Their general theory of historical causation was crude and elementary, being the notorious so-called "catastrophic theory of history," whereby great movements or policies are accounted for as the result of a single personal act or of some isolated natural or political event. Being the first attempt in the history of historiography to provide a purely natural theory of causation, it was bound to be imperfect and unsatisfactory, but it was a great advance over the previous theory of supernatural or miraculous causation. It led, however, to an exaggerated emphasis upon the possibility of abrupt and artificial changes in social and political institutions. The "Romanticists" arose primarily as a reaction against this particular phase of the historical doctrines of the rationalists. Even the political history of the rationalists was given a new and more promising cast. It was no longer limited to the field of political apologetics, but became a truly critical political history as far as its attitude towards policies was concerned. It was not usually written by members of the governing classes nor under their patronage, but by representatives of the new bourgeoisie or third estate, who had little influence in the several European governments at that period. It became an agency of criticism and of agitation for reform but rarely for revolution. It must be remembered, however, that the critical powers of the rationalists were limited almost wholly to their attitude towards the general subject-matter of their history and were not exhibited to any comparable degree in their handling of the sources of information. As research scholars in the use and criticism of printed and manuscript documents they did not even approximate the level of the school of Mabillon.

The founder of the rationalistic school of historians and the master mind of the movement was François Arouet, more commonly known as Voltaire (1594-1778). The two dominating factors in Voltaire's political and historical philosophy were his great admiration for the English civilization of his time and his peerless powers as a critic. An apologist of an enlightened despotism allowing the free development of bourgeois culture and prosperity, he saw in the England of Walpole his political ideal, and his agitation for reform in France was limited wholly to a desire to create in France what he beheld in England. As a critic he has never been equalled in any age, primarily because of the fact that he was utterly

devoid of reverence or respect for any institution and was, thus, wholly free to give full expression to his reactions against every phase of obscurantism. His most finished historical work was the *'Siècle de Louis XIV.'* which Fueter describes as "the first modern historical work." In it he broke wholly with the annalistic, and even with any strict chronological system, and for the first time divided an historical work in accordance with the topical system of arrangement. Again, it was the first time that the civilization of a great European state had been described in its totality. Voltaire's work was no mere skillful compilation; it was an attempt to exhibit the main currents of development in the whole life of a powerful state and a cultured society. As was the case with all the internationally-minded rationalists, there was little of that chauvinism in his work which disfigured the work of the political historians of the following century. Much less thorough, but equally significant was his *'Essai sur les Mœurs,'* generally regarded as the first universal history in the true sense of the term. It was planned as a vast *"Kulturgeschichte"* of all ages and peoples. While Voltaire did not possess the knowledge or the leisure requisite for its execution and the work was ill-proportioned and marred by serious and almost fatal omissions, it was, nevertheless, one of the great landmarks in the development of historiography. It was the real foundation of the history of civilization in its modern sense; it was the first work in which credit was given to the non-Christian contributions, especially of the Arabs, to European civilization; it first put political history in its proper relations to economic and social history in the general development of humanity; and it silenced forever the theological and providential interpretations which had prevailed from Orosius to Bossuet. The most fundamental point in his philosophy of history, the notion of the "genius of a people," was later adopted by the Romantics, with some grotesque exaggerations, in their conception of a "folk-soul."

Voltaire's point of approach found several distinguished representatives in England. There was one important difference, however; among the English writers there was no underlying impulse towards reform. In the case of the English historians of the period there was that same complacent self-satisfaction over the final perfection of English institutions that was evident in the legal works of Blackstone which aroused the fury of Bentham. The best example of this tendency was David Hume (1711-76). His *'History of England from the Invasion of Julius Cæsar to the Revolution of 1688'* gave Englishmen an interpretation of their national history conceived in the spirit of an urbane and dispassionate sceptic. Unlike the work of Voltaire, Hume's history was most superficial in its content and analysis. It was in no way a history of English civilization, and even the political history was superficial and inaccurate. The section on the mediæval period was practically worthless. Its only merit was in its treatment of the Stuart period, for which it provided the first truly historical and analytic interpretation of the great Civil War. His point of view was wholly insular and he was probably the least universal of the rationalist historians. A much abler historian was the

Scotchman, William Robertson (1721-93), the most avowed of Voltaire's English disciples. Of his three major works, *'The History of Scotland'*; *'The History of America'*; and *'The History of the Reign of the Emperor Charles V.'* the latter, especially its introduction, was the most significant in the development of historical writing. Its lack of exhaustive scholarship is revealed by the fact that the author never learned to read German, but he made the best possible use of the sources he employed. He was the first to make clear the major outlines of the constitutional development in the Middle Ages and was one of the earliest to appreciate the cultural contributions of the mediæval Church. He was, however, the most decided of the exponents of the catastrophic theory of historical causation and to him is mainly due the prevalence of the exaggerated notion of the importance of the Crusades in every phase of the later culture and politics of Europe and also the further elaboration of Baronius' notion of the special significance of the year 1000. The member of the English school who has gained the most enduring and general fame was Edward Gibbon (1737-94): Generally estimated by critics as less able than Robertson, he was a classic example of the attainment of great success through ministering to the prevailing sentiments of his time, in the possession of an appealing subject, a fine classic style and the current complacency and mild rationalism. His *'Decline and Fall of the Roman Empire'* dealt with a topic which was charged with an age-old thrill and a compelling interest. Less profound than Voltaire and much less significant for the history of historiography, Gibbon has won a more permanent reputation as a historian on account of causes readily understood. In addition to the more attractive and universally interesting subject with which he dealt, it was also a much more restricted subject, and, possessing abundant means and leisure, Gibbon was able to master most of the then available sources on his topic. The outstanding significance of his work consisted in the fact that it contained the first wholly secular and impartial study of the rise and expansion of Christianity. Possessing a cold and reserved personality he was not bitterly hostile, but divested Christianity of its traditional envelope of unique supernaturalism and treated it as he later dealt with the spread of Mohammedanism. The general outlines of his picture have never been superseded.

In Germany Voltaire found three followers in Schlözer, Schmidt and Spittler. While August Ludwig Schlözer produced a minor attempt at a universal history, his main work was done in the history of Slavonic Europe, where he found his ideal in the enlightened despotism of Catherine II. He had very limited powers of criticism, especially in regard to biblical matters; had no imagination and an unattractive style; but he was far the greatest philologist of the rationalist school. What Voltaire did for France, Hume for England, and Robertson for Scotland, was done for Germany by Michael Ignatz Schmidt (1736-94). His *'History of Germany'* was one of the most finished products of rationalism in historical literature. His style was excellent; he was cautious and accurate in the use of his sources and was free from all chauvinism; he was the first to handle

the German Reformation in an impartial manner; and the scope of his work resembled Voltaire's in being a true history of civilization. The smaller German states and the Christian Church found their rationalist historian in Ludwig Timotheus Spittler (1752-1810). His work was best in dealing with very recent times. He idealized the Middle Ages, and to him is primarily due the origin of that rosy and romantic conception of the mediæval period as one in which the main events were tournaments and the chief figures were the *trouvères*, *troubadours* and *minnesingers*. He was the first writer to handle the whole history of the Church from the rationalist standpoint. His criticism was relatively mild, but he adopted the peculiar attitude of judging the Church from the viewpoint of an instrument for advancing the cause of rationalism.

The discussion of the contributions of the school of Voltaire would not be complete without a brief reference to the work of two writers not technically historians. Though the '*Scienza nuova*' of Vico (1668-1744) undoubtedly contained the first definite anticipation of the modern dynamic theory of progress, he was too pious in his theology to be listed among the colleagues of Voltaire. Such was not the case with Turgot and Condorcet. In his discourse at the Sorbonne in 1750 on '*The Successive Advances of the Human Mind*,' Turgot (1727-81) first set forth clearly the doctrine of continuity in history, the cumulative nature of progress and the causal sequence between the different periods of history—theories later so greatly emphasized by Mr. Freeman. An equally notable work was Condorcet's (1743-94) '*Historical Sketch of the Progress of the Human Mind*,' which contained the best statement of the 18th century doctrine of progress and perfectibility. Less thorough-going echoes of this doctrine were heard from Kant in Germany and Godwin in England.

The rather advanced rationalism of Voltaire and his school could scarcely gain a general acceptance and a sustained success in the 18th century, when it was greatly beyond the general level of contemporary thought. It had also many crudities inseparable from the first courageous attempt to reconstruct history and bring it in harmony with the contemporary progress in scientific thought. It was natural, then, that there should be a reaction against many of its premises and methods, which was in part a recrudescence of obscurantism and in part an effort to correct some of the errors of the school of Voltaire. The stages in this reaction were gradual and clearly marked. It passed through the more moderate and conservative rationalism of Montesquieu to the almost irrational sentimentalism of Rousseau, and ended in the mystic and idealistic vagaries of romanticism. The school of Voltaire did not come to its own until it was revived with greater profundity by Buckle, Lecky, Morley, Stephen and White, as a result of the reaction of 19th century science upon historiography.

While Montesquieu's works as examples of historical criticism and accuracy are almost worthless, his broader attitude toward general methodology was of the utmost significance. He was not at all violent or revolutionary in his political theory, and his literary affinities were with humanism rather than rationalism.

He did, however, present certain phases of thought which were a marked improvement over Voltaire. Accepting Voltaire's unanalyzed doctrine of the "spirit of a people," he tried to show how this was produced by the operation of natural forces, particularly of climate, and first brought out clearly the fundamental proposition that the excellence of social institutions must be judged, not by an arbitrary and absolute standard, but by their relative adaptability to the spirit of the people for whom they serve or are intended to serve. Again, where Voltaire and his followers had dropped only casual reflections, Montesquieu offered a synthesis of the various factors of historical development, which, though crude, marked a considerable methodological advance. Finally, while the school of Voltaire had introduced the treatment of commercial factors in connection with political development, Montesquieu and his followers laid much more stress upon the great influence of commercial activities in the life of the state. The school of Montesquieu most faithfully represented the reaction of the commercial revolution on European historiography.

Being primarily a political philosopher rather than a historian, Montesquieu's disciples were more numerous among the political theorists than among the avowed historians. J. L. Delolme's '*Constitution of England*,' Adam Ferguson's '*History of Civil Society*,' and Joseph Priestly's '*First Principles of Government*' were works that clearly exhibited the principles of Montesquieu in the field of political philosophy. But if Montesquieu had few disciples among historians, he had at least one of the highest order in Arnold Hermann Ludwig Heeren (1760-1842), one of that brilliant group of Göttingen professors of the period. His great work was entitled '*Thoughts Concerning the Politics, Intercourse and Commerce of the Leading Nations of Antiquity*.' Its principles were those of Montesquieu improved by the more scientific analysis of economic life in the works of Adam Smith. With great skill he attempted to reconstruct the commercial life of antiquity and to indicate its hitherto unsuspected influence upon the course of the history of the various nations. Heeren was one of the best writers among historians. Abandoning all attempts at rhetorical flourish, he produced a most thoughtful work written with great clarity and coherence. Edouard Meyer, the greatest of authorities on the history of the ancient nations, has called Heeren the leader of all who have subsequently attempted to deal with this field.

Much less sound was the remaining group of the rationalist school, that which followed the lead of Rousseau and formed the logical transition from rationalism to romanticism. There were a number of important differences between Rousseau and Voltaire in their attitude toward historical and social problems. In the first place, Voltaire was purely intellectual and critical and little moved by sentiment; Rousseau was almost pathologically emotional, sympathetic and sentimental. In the second place, Voltaire was realistic and practical; Rousseau was idealistic and utopian. Finally, Voltaire wrote from the standpoint of the bourgeoisie, praised enlightened despotism, and had little faith in the political ability of the illiterate masses; Rousseau wrote as an ardent exponent

of the release of the masses from despotic political power. Until the period of the French Revolution, Rousseau's views could gain little currency in France for the intellectual circles were controlled by aristocrats, but in Germany he found several enthusiastic disciples.

The most attractive of Rousseau's German disciples in the field of history was the poet-dramatist-historian Friedrich Schiller (1759-1805), whose chief works were the 'History of the Rebellion of the Netherlands against the Spanish Rule' and 'The History of the Thirty Years War.' His works presented a combination of the sentiment and pathos of Rousseau with the native powers of a great dramatist and poet. In his history of the Dutch revolt he found the basis of an epic of deliverance from oppression, while in the description of the Thirty Years' War he saw in Gustavus Adolphus and Wallenstein the central figures for a great historical drama. It scarcely needs to be pointed out that in his grand epic and dramatic themes there was no place for the commonplace description of the elements of culture and civilization. He had great power of clear preliminary analysis of political movements, but once his narrative got under way the poet and dramatist gained complete control over the historian, and his work, like that of Carlyle, was a contribution to great literature rather than to historiography. A much more influential historian among contemporaries, but incomparably inferior in every sense to Schiller, was Johannes Müller (1752-1809). His most famous work was the 'History of the Swiss Confederation.' Though possessing a memory rivalling Macaulay's and a zeal for the study of sources comparable to that of Coulanges, he lacked wholly Macaulay's power of analysis, organization and narrative, and had none of the critical power of Coulanges. Though he read all the available sources, he not only lacked in organizing ability, but was also so devoid of critical powers as to be unable to detect and exclude contradictions in his own narrative. To Rousseau's sentimental devotion to liberty he added a pedantic imitation of classical rhetoric. His Swiss history became an epic of freedom combining the methods of Rousseau and Livy. His 24 books of general history were significant only in that they contributed to the exaggeration of that radically erroneous conception of the general "Gemütlichkeit" of the Middle Ages, which had been given a powerful initial impulse in the work of Spittler. Rather a representative of several of the phases of the rationalistic historiography than a complete disciple of Rousseau was Johann Gottfried Herder (1744-1803). His notable work—'Reflections on the Philosophy of the History of Humanity'—was a composite of many current doctrines. It combined Rousseau's exaggerated enthusiasm for the state of nature and freedom from authority, Voltaire's conception of the reality and permanence of national character, Montesquieu's doctrine of the relation between national character and physical environment, and the theological conception, later expanded by Hegel, of the gradual development of humanity toward a state of freedom. His zeal for the state of nature and the natural man led him to restrict his discussion chiefly to primitive peoples. His particular em-

phasis upon the fixity of national character and the organic unity of national culture put him in direct line with the romanticists. Friedrich Christoph Schlosser (1776-1861) took over Rousseau's conceptions through the intermediary of Kant's "categorical imperative." In his 'History of the Iconoclastic Emperors' and his unfinished 'History of the World,' he anticipated the attitude of Lord Acton and passed judgment on historical events and figures according to the principles of the Kantian precepts of individual morality. His work had a sombre cast, due to his inordinate passion for Dante's 'Divine Comedy,' and his works were full of harsh and hasty criticisms of a purely subjective nature. He was not a critical scholar and he ignored social and economic history. His chief significance lies in the fact that he was one of the first notable historians to lay great emphasis upon the political importance of a national literature.

**3. Romanticism and Historiography.**—Even before Louis XVI had issued the royal edict directing an election of delegates to an "Estates-General," the reaction against the frank and direct rationalism of Voltaire had definitely commenced in the works of the above-mentioned disciples of Rousseau. To the conservative element it seemed that the events of the French Revolution had finally demonstrated the futility of the rationalistic doctrines of catastrophic causation and the possibility of altering social institutions through the application of a few "self-evident dictates of pure reason." Unfortunately, this laudable attempt to correct the artificiality of the dogmas of Voltaire led to a reaction in the opposite direction which was even less valid and progressive than the theories of the rationalists. Romanticism in historiography meant a decided retrogression in the direction of obscurantism, and was an integral part of that reaction in social science which is chiefly identified with the names of Burke, De Bonald, De Maistre and Von Haller. The basic historical premise of the historiography of romanticism was the doctrine of the gradual and unconscious nature of cultural evolution. It proclaimed the unique organic unity and development of all forms of national culture. There was a decided mystic strain in their thinking which maintained that the unconscious creative forces moved and operated in a mysterious manner which defied rationalistic analysis. It was held that all were subject to the operation of these mysterious forces of psychic power, which were later termed by Ranke, the "Zeitgeist." Great emphasis was laid upon tradition and the alleged "ideas" which went to make up this spirit of the age and of the nation. These conceptions naturally led to a dogma of political fatalism which represented the individual or the nation as powerless before the mass of creative spiritual forces. Revolution was represented as particularly wicked, futile and worthy of special condemnation. There grew up that philosophy of political "quietism," which fitted in excellently with the current *laissez-faire* doctrines of the economists and political theorists. Out of this tendency there developed that notorious and specious myth representing the Anglo-Saxon peoples as the perfect examples of political quietism, and, hence, of inherent political capacity, while an equally erroneous doctrine

pictured the French as the typical example of a revolutionary and unstable nation utterly devoid of all political capacity. This fundamental error did more than anything else to mar the accuracy of 19th century political history and philosophy and has not even yet been fully eradicated. Again, the idea of the pure, indigenous and spontaneous nature of national culture led to a narrowing of that cosmopolitan outlook of the rationalists and the centering of attention on purely national history. Further, for each nation the period of particular fertility for historical research was held to be the Middle Ages. This tendency was due in part to the strange misconception that this was the period of the fixing of the several national cultures and in part to the psychic affinity of the romanticists with the mediæval mental reaction to the problems of existence and causation. Language was believed to be the vital mark or criterion of nationality. This doctrine took its deepest root in Germany where language was almost the only bond of nationality, and it led to the great researches in philology associated with the names of Humboldt, Wolf, the brothers Grimm and Lachmann. On account of the fact that the romanticists maintained the hopelessness of any detailed analysis of historical causation, their philosophy of history ran in a "vicious circle." Without giving any scientific explanation of the development of the spirit of a nation, they attributed the peculiarities of national institutions, laws, literature and government to the genius of the nation, and then represented national character as the product of the art, literature, laws and institutions of a people. But in spite of the semi-obscure tendencies and the philosophical crudities of the romanticists, they must be given credit for having done much to correct the vicious catastrophic theory of the rationalists, and for having emphasized the element of unconscious growth in historical development and the vital truth of the organic unity of a cultural complex. It was left for Lamprecht, nearly a century later, to take over what was really valuable in the romantic doctrines and work them over into his famous theory of historical development as a process of transformations and mutations within the collective psychology of both the nation and humanity.

The expressions of romanticism in historiography were many and varied. Its doctrines were employed in the field of the investigation of legal origins by Karl Friedrich Eichhorn (1781-1854), whose 'Political and Legal History of Germany' was devoted primarily to the study of early German law; and, above all, by Friedrich Karl von Savigny (1779-1861) in his 'History of Roman Law in the Middle Ages,' which was the most able and dogmatic defense of the conception of law as a product of the national "genius" of a people. In the field of the history and analysis of religion and literature it received its most notable expression in François Rene Auguste de Chateaubriand's (1768-1848) 'Genius of Christianity'; in Madame de Staël's (1766-1817) 'Literature in Its Relation to Social Institutions'; in Abel François Villemain's (1790-1870) 'Sketch of the Eighteenth Century,' and in the 'History of German Poetry' by Georg Gottfried Gervinus (1805-71). Romanticism entered the

philosophy of history in the works of Friedrich Schlegel (1772-1829), F. W. J. Schelling (1775-1854) and Georg Wilhelm Friedrich Hegel (1771-1831). Schlegel viewed the historical process as the gradual restoration in man of the lost image of God through the operation of a divinely revealed religion. Schelling interpreted historical development as the gradual revelation of God through the operation of the unconscious forces of creative genius. Hegel's 'Philosophy of History' was founded upon his dialectic system of antithesis followed by synthesis, and upon his spiritualistic interpretation of history as "the necessary progress in the consciousness of liberty." Working from these premises he adapted the facts of history in such a way as to portray the successive migrations of the "Weltgeist" from the Orient to Lutheran Germany, bringing with it a continually expanding consciousness and realization of liberty. Hegel's rather grotesque system was purged of its most apparent crudities and applied with much greater learning and accuracy by Ferdinand Christian Baur (1792-1860) to the history of Christianity, and by Edouard Zeller (1814-1908) to the reconstruction of early Greek philosophy. The narrative school of romanticist historians was not only dominated by the general theories enumerated above, but by the literary canons of the historical novels of Walter Scott with their great emphasis upon the element of "local color." This tendency was really anti-historical, in that it aimed primarily to destroy all sense of historical perspective and to portray episodes or periods in the past in such a manner as to make them have the vividness and intimacy of contemporary events. It was a contribution to literature rather than to scientific history. Its only real impulse to improved historical writing lay in the fact that its literary attractiveness awakened an interest in history on a wider scale than ever before, and brought into the field many eminent scholars whose individual contributions to historical knowledge were greater than those of all of the narrative school of romanticists combined. Of this variety of narrative romanticist historical writing the most important products were the 'History of the Conquest of England by the Normans' and the 'Narratives of the Merovingian Period' by Augustin Thierry (1795-1856); the 'History of the Dukes of Burgundy' by Baron de Barante (1782-1866), and the 'History of the Italian States' by Heinrich Leo (1799-1878). A still further intensification of the subjective element in the narrative school was reached in the works of Michelet, Carlyle and Froude, where an attempt was made not only to bring the reader in immediate touch with the setting of the events narrated, but also with the personal impressions and attitudes of the author. The 'History of France' of Jules Michelet (1798-1874) was the greatest product of French historical literature. The author was dominated by a passionate attachment to his country, possessed a marvelous creative imagination and a style notable for its word painting and its power of symbolical presentation, and stood forth as the great historical apologist for French democracy. The best portions are those dealing with the picturesque figures of the Middle Ages and the scenes of the French Revolution. The least attractive

personality of the group and the least worthy as a historian was Thomas Carlyle (1795-1881). In radical contrast to Michelet he was possessed of a sour contempt for the masses and an equally exaggerated interest in the picturesque figures of history. To him history was but the collective biography of the conspicuous figures through the ages, and he was responsible more than any other historian for the conventional disdain of the modern historian for those commonplace things of daily life which have had incomparably greater influence upon social development than the picturesque personalities. Carlyle indulged his prejudices in his 'Letters and Speeches of Cromwell,' his 'History of Frederick the Great' and his 'French Revolution.' While possessing only moderate value as sources of information, on account of the writer's uncontrolled prejudices and his utter lack of critical method, they earned him the undisputed position as "the greatest of English portrait painters." While his name has been adopted to designate chronic inaccuracy in historical investigation, Carlyle's disciple, James Anthony Froude (1818-94), was a much abler historian than his master. His faults were those of one constitutionally rather than carelessly or intentionally inaccurate, as he had a keen appreciation of the value of critical methods and his work was the first extended English history written on the basis of unpublished documents. His 'History of England from the Fall of Woolsey to the Defeat of the Spanish Armada' was an epic of English deliverance from the "slavery of Rome," and his Carlylian attraction for great personalities found ample scope for expression in his portraits of Henry VIII and Burleigh. As a writer he was approached among English historians only by Macaulay. "No other English historian," says Gooch, "has possessed a style so easy, so flowing, so transparent." America found its sole distinguished representative of the school of Carlyle and Froude in John Lothrop Motley (1814-77), who devoted his life to a narration of the struggle of the Netherlands against Spain. Surpassing even Freeman in his passion for liberty, he found a most congenial subject in tracing the successful revolution of the Dutch and the establishment of their republic. For word painting and vivid description of dramatic scenes only Carlyle has equalled him among historians writing in the English tongue. While the conceptions of romanticism gained some dominion over the minds of greater scholars, such as Ranke, they served rather to stimulate the author's interest in history than to vitiate his scholarship. With its emphasis on the doctrine of the "genius of a nation" and its deep emotional basis, romanticism was a powerful influence in stimulating the nationalistic historiography which dominated the historical writing of the 19th century.

**4. Nationality and Historiography.**—The commercial revolution not only was the main factor in arousing historical interest in non-European peoples and a powerful impulse in the development of the new natural science and its accompanying sceptical philosophy, but was also the chief force in bringing to completion the process of shaping the modern national states out of the great feudal monarchies of the later Middle Ages. By its contributions to

the increase of the capital and resources at the disposal of the monarch, and its creation of a loyal middle class, it enabled the kings to provide a hired officialdom and military force, by means of which they could crush the opposition of the feudal nobility and bring to perfection the modern national state. The psychological impulses arising from the welling-up of national pride in the newly fashioned states led to the production of narratives glorifying the national past and to feverish activity in collecting the sources of information which preserved the priceless records of the achievements of the nation from the most remote period. While this movement, in its earliest phases, goes back to the 16th century it took on its modern form after the French Revolution, the Napoleonic Wars and the regeneration of Prussia had contributed so greatly to the creation of an ardent national self-consciousness in most of the European states. Coming at this time, it was reinforced by the then popular tenets of romanticism emphasizing the importance of national character and the imperishable "genius of a people." The nationalistic impulse was refreshed from another source in the middle of the 19th century by the vicious influence of the notorious 'Essai sur l'inégalité des races humaines,' published by Count Joseph Arthur of Gobineau (1816-1882) in 1854. It proclaimed the determining influence of racial differences on the course of historical development, asserted the inherent superiority of the "Aryan" race, and held that racial degeneration was the inevitable result of its mixture with inferior races. His now utterly discredited doctrines gained great vogue among French, English, and especially among nationalistic German, historians and publicists, culminating in the Teutonic rhapsody of Charles Kingsley and Houston Stuart Chamberlain, the Gallic ecstasy of Maurice Barrès and the Saxon pæans of Kipling and Homer Lea. Not only was this doctrine effective in developing a still greater degree of chauvinism upon the part of the governing "races," but it also led to the persecution of minority "races," and the consequent stimulation of their nationalistic sentiments.

Perhaps the earliest state to begin a national history was Germany in the days of humanism and the old empire. The cultured Emperor Maximilian I (1493-1519) followed the example of Charlemagne in gathering to his court at Vienna some of the leading historical scholars of German humanism. Conrad Celtis revived an interest in the 'Germania' of Tacitus. Johannes Spiessheimer (1473-1529), better known as Cuspinian, made a critical study of the historical works of Jordanes and Otto of Freising. Irenicus, Peutinger and Beatus Rhenanus (1486-1547) exhibited the spirit of Blondus in their researches into German antiquities. Their activity was soon smothered, however, in the controversies of the Reformation, and interest in secular and national history waned. A century later Melchior Goldast (1578-1635) produced his famous collection of documents dealing with early and mediæval German history and public law, known as the 'Monarchia romani imperii,' which was the standard German collection until the 'Monumenta' had covered the same period and material in a more thorough fashion. The distin-

guished philosopher G. W. Leibnitz (1646-1716) was ambitious to provide a collection of the sources of German history which would rival those on French history which had been gathered by Duchesne. He was not, however, able to obtain the necessary imperial support and the project had to be abandoned. He merely produced a collection on the history of the Guelphs as a by-product of his history of the dynasty of Brunswick. The great modern collection of the sources of German history, the justly famous 'Monumenta Germaniae Historica,' was a product of the spirit of the War of Liberation and was begun by that greatest of all the German statesmen of his time, Baron vom Stein. Discouraged by the reactionary tendencies of the period following the Congress of Vienna, Stein devoted his energies to the stimulation of popular interest in German history. Failing to obtain government support for a collection of the sources of German history, he raised the funds from the resources of himself and his friends, and with rare good fortune secured an editor of great scholarship and energy in the Hanoverian archivist, G. H. Pertz. Pertz carried the burden of the editorship for a half century, aided by the best of German scholars, most prominent of his colleagues being the constitutional historian, Georg Waitz. This magnificent and colossal compilation includes all the important sources of information regarding German history from the time of the Roman writers on the invasions, and is still in process of execution. It was, perhaps, one of the greatest landmarks in the development of scientific historical writing, as it alone made possible the productivity and accuracy of the succeeding generations of historians.

National history in Germany was not limited to the collection of sources, but received expression in glowing narratives which usually found their theme in the glories of the German imperial past of the mediæval period or in laudatory accounts of the Hohenzollern achievements, which served as the basis of enthusiastic proposals for a Prussian revival of the glories of the empire. Schmidt had written a history of Germany from the rationalist standpoint, but his cosmopolitan outlook made his work quite unsatisfactory to the patriots. Wilken initiated the nationalistic narrative by an account of German prowess in the period of the Crusades. Luden, under the spell of Johannes Müller's views of the mediæval period, produced a 'History of the German People,' in which he aimed to arouse national enthusiasm for the magnificence of mediæval Germany. Voigt contributed an epic dealing with the conversion and conquest of Prussia by the Teutonic knights. Raumer pictured the achievements of the Hohenstaufens, and Stenzel portrayed the deeds of the Franconian emperors with critical skill as well as patriotic edification. Giesebrecht analyzed the formation of the mediæval empire with a display of scholarship not less remarkable than his Teutonic fervor. Though his history of the Reformation was a powerful influence in making Luther the great German national hero, it must be admitted that Ranke and his immediate disciples shared something of the universal outlook of the rationalists, but with the rise of the "Prussian School" nationalistic history became even more chauvinistic and dynastic. Häusser contributed

a voluminous epic on the War of the Liberation in his 'History of Germany, 1786-1815.' Duncker, the historian of antiquity, from his work in editing the state papers of the great Hohenzollerns developed a fervid admiration for the dynasty which convinced him of its fitness to revive the imperial glories of old Germany. The first massive panegyric of Prussianism was the work of Johann Gustav Droysen (1808-84), who deserted his early liberalism to become an almost sycophantic eulogist of the Hohenzollerns. His monumental 'History of Prussian Policy' was marred not only by its grave prejudices in favor of the "mission" of the dynasty he admired, but also by the fact that it was almost wholly limited to the superficial field of Prussian foreign politics with little attention even to domestic policy, to say nothing of its total omission of the deeper social conditions and economic forces. The story was picked up where Droysen had left it by Heinrich von Treitschke (1834-96). His 'History of Germany in the Nineteenth Century' ranks with the histories of Michelet and Macaulay as one of the literary masterpieces of modern historiography. While it was charged with all of the vivid enthusiasm for Prussian leadership which marred the work of Droysen, Treitschke's work at least had the merit of devoting adequate attention to the fundamental cultural forces in national development. Heinrich von Sybel (1817-95), the third of the three leaders of the Prussian school, began his work as a disciple of Ranke by a brilliant work on the First Crusade and by a profound study of the origins of the German kingship, but the stirring political situation in the middle of the century led him away from the poise of his master and he became a thorough advocate of German unity through Prussian military leadership. His 'History of the French Revolution' was a massive polemic against the whole movement, and its central theme was the old romanticist dogma of the political incapacity of the French. From this spectacle of alleged political ineptitude Sybel turned to an account of the events which demonstrated the supreme capacity of his nation in political affairs—the foundation of the German Empire by Bismarck. His voluminous work on 'The Foundation of the German Empire by William I' showed wonderful power in the clear presentation of a mass of political and diplomatic detail, but was fatally disfigured by downright dishonesty in its presentation of Bismarck's foreign policy, from which all the criminal duplicity was carefully excluded. By the time Sybel had finished his work, history in Germany had become too weak a vehicle to serve as a leading instrument for advancing national aspirations. Its place was taken by the literary products of Peters, Tannenberg and the Pan-German expansionists; of Bernhardi and the ultra-militarists; and of Chamberlain and the blatant Teutonists. The complete complicity of the Prussian historians in the production of this state of national exaltation has been clearly revealed by Guiland.

Nearly a century after the beginnings of German national historiography at the court of Maximilian the French began to turn their attention to the analysis and collection of the sources of their national history. This movement may conveniently be dated from the publication of the 'Franco-Gallia' of François Hot-

man in 1574. Other early examples of this tendency were the 'Antiquités gauloises et françoises' of Claude Fauchet (1579); the 'Annales Francorum' of Pierre Pithou (1588); the 'Recherches de la France' of Etienne Pasquier (1611), and the material on the Crusades in the 'Gesta Dei per Francos' of Jacques Bongars (1611-17). The true beginning of the critical collection of sources was marked by the work of André Duchesne (1584-1640) in compiling the 'Historiæ Normannorum scriptores antiqui' (1619) and the 'Historiæ Francorum scriptores coetanei' (1636f.); the 'geneologies' and the 'Gallia christiana' of the brothers Sainte-Marthe (1572-1650, 1655); the critical editions of Villehardouin and Joinville by Charles du Fresne du Cange (1610-88); and the 'Capitularia regnum Francorum' of Etienne Baluze (1630-1718). During the last half of the 17th century and the first half of the 18th this work of collecting sources was carried on almost entirely by the scholarly Benedictine monks of the Congregation of Saint Maur at Saint-Germain-des-Prés in Paris, which was founded between 1618 and 1630 by Doms Martin Tesnière and Grégoire Tardieu, and whose leader in historical scholarship was the great Jean Mabillon (1632-1707). Only a few of their more notable collections can be mentioned here. Dom Thierry Ruinart (1657-1709) prepared critical editions of Gregory of Tours and Fredegarius; Dom Edmond Martène (1654-1739) the 'Thesaurus novus anecdotorum veterum scriptores' and the 'Veterum scriptorum et monumentorum amplissima collectio'; Dom Bernard Montfaucon (1655-1741) 'Les Monuments de la monarchie française'; Dom Martin Bouquet (1685-1754) the famous 'Rerum Gallicarum et Francicarum scriptores,' which is still being continued by modern scholars under the title of the 'Recueil des historiens des Gaules et de la France;' and Dom Antoine Rivet de la Grange (1683-1749), aided by Duclou, Poncet and Colomb, began that unique 'Histoire littéraire de la France' which was completed by the French Institute at the very close of the last century. The Maurists also turned their attention to the history of the French provinces and gathered many valuable collections, the most famous of which was the 'Histoire générale de Languedoc' of Doms Vaisette and Vic (1730-49), recently revised by Molinier. In the latter part of the 18th century the laymen again came to the front, the most notable center of their activity being the Académie des Inscriptions et Belles-lettres, which had been founded by Colbert in 1663. The most valuable product of their labors was the great collection of 'Ordonnances des rois de France' by J. de Laurière, Denis Secousse and L. G. de Brequigny (1714-1794). They also continued the 'Histoire littéraire' and the 'Gallia Christiana.' A further stimulus came when P. C. F. Daunou was appointed national archivist by Napoleon. He brought many foreign archives to Paris and also continued the work on the 'Histoire littéraire' and the other great Benedictine collections. The first monumental collection of sources produced in the 19th century was the voluminous 'Collection de mémoires relatifs à l'histoire de France' by Petitot and Monmerqué in one hundred and thirty volumes (1819-29). What Germany owes

to Stein for the gathering of the sources of German national history, France owes to Guizot, and more, for the latter not only organized the movement for the scientific work in collecting and editing the sources, but also was a historical scholar of the first order who contributed most valuable works from his own pen. Before he left historical writing for the field of political activity he had published a collection of thirty volumes bearing the same title as that of Petitot. In 1834 he organized the Société de l'histoire de France, which was first presided over by Barante and has since included in its membership the most famous historians of France. The 'Ouvrages publiés' of this society have amounted to over three hundred and fifty well edited volumes of source material. Even more important was Guizot's initiative in inducing Louis Philippe to appoint a sub-committee of the ministry of public education which was to devote itself to publishing the hitherto unpublished source material of French history. In the next year their work began to appear in the monumental series of the 'Collection de documents inédits sur l'histoire de France,' of which about three hundred and thirty volumes have thus far been published. The early editorial associates of Guizot in this enterprise were Mignet, Thierry, Guérard and Raynouard. With the foundation of the Société de l'École des Chartes in 1829 the provision of competent editors was henceforth assured through the establishment of the world's greatest historical institute for the training of students in the use of documents — L'École des Chartes. The 'Documents inédits' are the official French counterpart of the German 'Monumenta' and are even more valuable in that they are confined entirely to the presentation of material never before published. The French have also advanced a step beyond any other nation in providing great collections of sources for a study of their history in modern times. This has been due primarily to the fact that no other European state has possessed a national event or movement in modern times at all comparable in picturesque or romantic interest to the French Revolution. Most of the great French collections of sources of modern history relate to some phase of the Revolution. In 1903 the socialist historian and statesman, Jaurès, succeeded in inducing the government to establish a committee of the ministry of public instruction to supervise the publication of the unpublished documents dealing with the economic history of the French Revolution. This work has been carried on by the leading French historians, and the 'Collection de documents inédits sur l'histoire économique de la Révolution Française' has been appearing in successive volumes since 1905. The municipal government of Paris has been publishing the 'Collection de documents relatifs à l'histoire de Paris pendant la Révolution Française' since 1888. In addition to these public collections, many collections of sources dealing with special phases of the Revolution have been made by enterprising scholars, among whom Aulard and his pupils have been most active.

The French also vied with the Germans in the production of nationalistic historical narrative. The publication of Chateaubriand's 'Genius of Christianity' in 1802 gave a lustre

and romantic touch to the French past in the middle ages comparable to the effect produced in Germany by Spittler and Johannes Müller. Fauriel anticipated Coulanges and Jullian in his history of Gaul by contending for the superiority of Celtic to Frankish culture in the formation of mediæval civilization. Michaud described the glories of the French in the period of the Crusades. Raynouard drew a vivid picture of the *troubadours* and proclaimed the supremacy of French among the Romance languages. Hanotaux, Fagniez and Chéruef analyzed with both critical erudition and patriotic pride the centralization of the French monarchy by the great statesmen of the 17th century. Lamartine, in a work which rivalled Carlyle in the field of literature and was equally unscientific as history, set forth with fervid admiration the glories of the French Revolution, and especially the exploits of the Girondists. Mignet, the most scholarly French historian in the first half of the 19th century, made an attack on the Bourbon Restoration by representing the French Revolution as the necessary and inevitable outgrowth of the tendencies of the age and as the dawn of a new and better era in the history of the world. Thiers, while critical of the empire, praised the first consul as the saviour of France and of European civilization. Napoleon was defended in his imperial splendor by Masson, Vandal and Lévy; Vandal representing him as peace-loving and goaded to war by English jealousy, and Lévy presenting a superhuman and faultless personality. Thureau-Dangin, while deploring its popular origin, appeared as the historical apologist of the "July Monarchy." La Gorce dealt with the "Second Empire" as an apologist of monarchy and clericalism, if not of the personality of Napoleon III. Ollivier dwelt with pride upon the liberal tendencies of the last decade of the Empire, and Hanotaux, in one of the finest products of national historiography in France, has described and defended the establishment of the "Third Republic." Nor was France lacking in general histories written from the national point of view. Early in the 19th century Sismondi produced the first detailed and complete history of France. It was written from the standpoint of an ardent liberal who castigated kings and bishops and lauded the liberal tendencies in the communes. But Sismondi was a Genevan and to some extent a representative of the mild rationalism of Rousseau, and his work was not calculated to arouse intense patriotic enthusiasm. Much different, except in its liberalism, was the brilliant work of Michelet, which was not only a great contribution to French literature but to the stimulation of patriotic pride, especially on the part of liberal Frenchmen. Henri Martin's history of France was less brilliantly written than Michelet's, but rested on sounder scholarship and for a half century has remained the popular national history of France on account of its logical arrangement, lucid presentation and its central theme of the progressive growth of French national unity. The great co-operative work edited by Lavisse belongs to the field of erudite and critical rather than nationalistic historiography. French nationalism was greatly stimulated by the sting of the defeat and injustices of 1870. While the scholarly French his-

torians, such as Gorce and Sorel, maintained an impartiality in treating of the war of 1870, which put to shame the fawning apology of Sybel, there was a great outburst of nationalistic ardor on the part of the "super-patriots" among their countrymen. These tendencies found expression, above all, in the fiery speeches, poetry and pamphlets of Paul Déroulède, the chief of the "Ravanchards," and in the brilliant polemics and eulogies of his admirer, that ardent Gallican and head of the League of Patriots, Maurice Barrès, whose study of French history has convinced him that "the French make war as a religious duty. They were the first to formulate the idea of a Holy War. It is not in France that wars are entered upon for the sake of spoil, but as a champion in the cause of God, as a knight upholding justice."

England did not begin any systematic collection of the sources of its national history until the beginning of the 19th century. In the year 1800 the Record Commission was created, but no real historian was connected with its labors until Sir James Mackintosh was appointed in 1825. In 1830 Harris Nicolas called attention to the deplorable condition of the "sources" in England and his criticism led to the creation of a new and more active and critical committee of the Record Commission. A product of this improvement was the edition of the Parliamentary Writs by Palgrave. No systematic activity in the collection of sources began until after the middle of the century. At this time, William Stubbs, the greatest of English mediævalists before Maitland and the Anglicized Russian, Vinogradoff, vigorously criticized the work of the Record Commission. Shortly afterwards, in 1857, Lord Romilly, the Keeper of the Rolls, was able to secure an appropriation from the government to publish the sources of English mediæval history and the general oversight of the project was conferred upon Duffus Hardy, a careful, if not brilliant, scholar. The work of editing these sources has been carried on by a number of English mediævalists, among them Brewer, Gairdner, Canon Robertson, Giles and Dimock, but far the greatest figure was the English Waitz, Bishop William Stubbs (1825-1901). For more than a quarter of a century after 1863 he gave much of his time to this work. This collection, which was finished in 1896 in two hundred and forty-four volumes, is known as the 'Chronicles and Memorials of Great Britain and Ireland during the Middle Ages' ('*Rerum Britannicarum mediæ aevi scriptores*') or, more briefly, as the 'Rolls Series' from the fact of its publication by the Master of the Rolls. It is the official British analogue of the 'Monumenta' and the 'Documents inédits.' Less pretentious collections have been provided by the Camden Society and the Early English Texts Society. There should also be mentioned the great collection of the sources of English legal history provided by the Selden Society, and the publication of the manuscript records of important voyages and explorations by the Hakluyt Society.

The historiography of nationalism has not been less vigorous in England than in Germany or France. Its most conspicuous feature has been the expansion of the "Myth Teutonicus" regarding the political superiority of the Anglo-Saxon

peoples, which was so popular a tenet of romanticism and had been so fervidly expounded by Edmund Burke. It rested primarily upon the assumption that the Teutonic invaders of England had made a clean sweep of the Briton and Celtic inhabitants and had created a purely Germanic England in culture if not in race. The most vigorous and the earliest statement of this view appeared in Kemble's 'The Saxons in England,' which was published in 1849. It not only taught this notion to Englishmen, but was widely read in Germany and served to furnish the German nationalists with a further basis for their convictions regarding the Germanic "mission," which had been drawn from their own mediæval sources. Freeman carried the argument still further in his 'History of the Norman Conquest,' in which he not only accepted the Saxon theory, but, being an ardent lover of liberty like Michelet, espied the real foundations of political liberty in the Germanic folk-moot, and particularly in its English manifestation. This myth, dating back to Thoyras and Montesquieu, so thoroughly punctured by Coulanges, has been one of the most persistent and pernicious sources of error which have come down from a pre-anthropological stage in historical studies. Even the calm and cautious Bishop Stubbs and the charming John Richard Green were also seduced by this fiction of a Teutonic England, which was to be challenged by Seebohm and modified by Maitland and Vinogradoff. The greatest popular emotional impulse toward this Teutonic interpretation came from the notorious work of the poet-historian, Charles Kingsley, on 'The Roman and the Teuton,' which was first published in 1864. Highly entertaining but almost wholly unscientific and non-historical, it did more to pervert the interpretation of early mediæval history than any other book of its time. He idealized the "young and virile" Teutonic "Forest Children" with the ardor of a Las Casas, and set them in marked and flattering contrast with the morally and physically decadent Romans of the "Dying Empire," and rejoiced in the destruction of the latter by the "Human Deluge" from the North. It is a sufficient commentary upon the accuracy of his work to note that the labors of scholarly mediævalists for the last generation have chiefly centered about the rejection of every one of his main theses. The book, however, gained a great popular vogue and no Englishman could read it without desiring to trace his ancestry back to Arminius and Alaric. Passing from the Middle Ages, where the national grandeur of Britain had been laid by the Teuton, the most intensely nationalistic of English historians, James Anthony Froude, described the glories of the English revolt from Rome. Carlyle lauded the virtues of Cromwell and his associates of the Commonwealth period. The Whig apologists, Mackintosh, Hallam, and above all, Macaulay, described the salvation of the world's liberties by the "Glorious Revolution" of 1688. Macaulay's 'History' is the English counterpart of Treitschke and Michelet, and marks the most brilliant of English contributions to historical literature, as well as a valuable, though prejudiced body of historical knowledge. Lecky's study of 18th century England could scarcely be

called nationalistic on account of its impartiality, but Napier praised English prowess in the Peninsular War in a work which was as frank an adulation of war as a process in human society as was Bernhardt's work a half century later. Finally, Seeley, an example of both nationalism and erudition, wrote with restrained pride of the development of the British Empire in his 'Expansion of England' and 'Growth of British Policy.' Not only was Seeley a nationalist, but along with Freeman he was chiefly responsible for turning English historiography into the narrow and unnatural channels of political history. The growth of English national enthusiasm, which accompanied the work of Cecil Rhodes and the Boer War, did not fail to produce its nationalistic literature, which was as far removed from the scholarly grasp of Seeley as was the attitude of Bernhardt from that of Sybel. Bernhardt found his English counterpart in Prof. J. A. Cramb, who detected in England's past wars the governing principle "of that higher power of heroism which transcends reason." Curiously enough, as it had fallen to a renegade Englishman, H. S. Chamberlain, to arrange the apotheosis of "Germania," so it required an American, Homer Lea, to link up the future salvation of the world with the necessity of the universal triumph of "Britannia," through the strengthening and preservation of "the scarlet circle of power that the Saxon has marked around the earth as has no other race before him."

Italy shares the double honor of having been the first nation to provide a complete collection of its sources of national history and of having produced the most indefatigable of all editors in Lodovico Antonio Muratori (1672-1750). From 1723 until his death in 1750 he brought together in the 25 folio volumes of the 'Rerum italicarum scriptores' nearly all of the extant sources of Italian history. So thorough was his work that it has only been deemed necessary in recent years to undertake a new edition of his collection, which has been in progress since 1900 under the supervision of Giosué Carducci and Vittorio Fiorini. It is scarcely to be doubted that the new edition is quite as much a sublimation of patriotic impulses as an enterprise entered upon in the interests of historical scholarship.

While the national narrative history, like the collection of sources, dates back to a more remote period in Italy than in the other states of Europe, it began in its modern phase with Botta's 'History of Italy during the Revolutionary and Napoleonic Wars,' which breathed forth the ardent liberalism which found expression in the politics of the period in the activities of the Carbonari. Coletta condemned the corruption and incapacity of Bourbon absolutism in Naples. Troya and Tosti surveyed the history of mediæval Italy for evidence to support their plea for papal leadership in Italian unity, while D'Azeglio turned to contemporary Italy to prove papal incapacity and to call attention to the promise of leadership in the House of Savoy. More recently Luzio, De-Cæsare and Chiala have dealt with the period of the "Risorgimento" and establishment of national unity, but the Italian enthusiasm over their attainment of national independence and unity has scarcely cooled sufficiently to find his-

tory an effective method of expression; up to the present time it has been recounted chiefly in the patriotic poetry of Giosuè Carducci and Gabriele D'Annunzio.

The first collection of Spanish sources was not the work of Spaniards, but of the itinerant English scholar, Robert Beal (d. 1601), who published his 'Rerum hispanicarum scriptores' in 1579-81. Nearly two centuries later J. A. C. Bertodano produced his extensive collection of sources on diplomatic history (1740-52). The great national collection of sources, however, was not begun until the middle of the 19th century when Pidal, Salvá and others started the 'Colección de documentos inéditos para la historia de España,' which was completed in 112 volumes (1842-95). In addition, the Royal Academy of History at Madrid has been publishing source material since 1851 in the collection entitled 'Memorial histórica español.' Spain found her great national historian in Modesto Lafuente (1806-66). His monumental 'Historia general de España,' which was intended to be a continuation of Mariana, appeared in 30 volumes from 1850-67, and was continued after his death by J. Valera.

The sources of Austrian history were not only collected in the German 'Monumenta,' where the great scholar, Theodor Sickel, rendered valuable editorial assistance, but also in separate national collections, the 'Fontes rerum Austriacarum,' published since 1849 by the Vienna Academy, and the new edition of Böhmer's 'Regesta imperii,' edited by Ficker since 1877 at Innsbruck. The great national narrative history of Austria was Arneht's monumental work on the times of Maria Theresa, while Klopp has recalled the imperial heroes of the Thirty Years' War and conducted an attack on Frederick the Great.

In Bohemia, Czech nationalism did not initiate interest in history as in other European states, but rather history aroused nationalism in the first instance. To the vigorous patriotism of F. Palacky's 'History of Bohemia,' more than to any other source, the modern Czech national spirit owes its origin. The sources of Bohemian history have been collected by the greatest of Bohemian historical scholars, Anton Gindley, and are entitled 'Monumenta Historiæ Bohemica' (1864-90). The Hungarian government has been publishing the 'Monumenta Hungariæ historica' at Budapest since 1857, and Hungary has found in Fessler and his continuators its national historians. Poland has published two large collections of sources, and Lelewel and Szajnocha have reminded the Poles of their ancient splendor and power. The obscurantism of Czarism has prevented the development of historical scholarship in Russia, a loss to Russia which can be appreciated by a survey of the great work of the exile, Vinogradoff. Karamsin's antiquated history presents an apology for the absolutism and Oriental culture of the early czars, while the more recent and scholarly work of Soloviev defends the introduction of Western culture by Peter the Great. Further, it should not be forgotten that both Belgium and Holland are represented by extensive collections of sources and able national historians. Belgian enthusiasm for the collection of sources of national history began with the attainment of independence in 1830.

The great national collection is the 'Collection de chroniques Belges inédites,' published in 111 volumes at Brussels since 1836. The 'Société d'émulation de Bruges,' published between 1839 and 1864 the 56 volumes of the 'Recueil de chroniques, chartes, et autres documents concernant l'histoire et les antiquités de la Flandre occidentale.' In addition Wauters has edited the great collection of communal charters and Gachard has edited the foreign archives of the period since the 15th century. The great Catholic and Belgian counter-blast to Motley's work, as well as to that of Prinsterer, was contained in the work of Lettenhove on the 16th century. He condemned William the Silent and his Protestant supporters and defended the position of Spain and the Catholic party. His somewhat chauvinistic and obscurantist work has been superseded by the admirable critical works of Frédéricq and Pirenne. While Holland has not provided as complete a collection of national sources as Belgium, the Historical Society of Utrecht has been publishing important sources since 1863—the 'Werken uitgegeven door het Historisch Genootschap te Utrecht'—and Prinsterer has edited the voluminous archives of the House of Orange. In 1902 a royal commission of the most eminent Dutch historians was appointed to arrange for the systematic publication of the manuscript sources of the history of Holland. The most enthusiastic Dutch nationalistic narrative history was that by Prinsterer in which Protestantism and the House of Orange received their vindication and eulogy. This has now been rendered obsolete by the scholarly monographs of Fruin, the greatest of Dutch historians, and by the accurate and well-balanced general history of Blok. The Scandinavian nations have not been unproductive in the field of national historiography. The sources have been collected in the following series: the 'Scriptores rerum Danicarum mediæ ævi,' edited by Langebek and his successors; the 'Diplomatarium Norvegicum,' edited by Lange; and the 'Scriptores rerum Suecicarum,' edited by Geijer and his associates. The nationalistic historical narrative was introduced in Denmark by Worsaae; in Norway by Keyser and Munch; and in Sweden by Geijer, Carlson and Fryxell. These works have been succeeded by the more recent and scholarly national histories of Steenstrup on Denmark; Sars on Norway; and Hjärne on Sweden. If there were available space it would be easy to demonstrate the very great, if not determining, influence of the study of the glories of their national past upon the rise of the national aspirations of the Balkan peoples since 1820. The well-known influence of Alexandru Xénopol's 'Histoire des Roumains de la Dacie Trajane' upon Roumanian nationalism is but a typical illustration of the fertility of such an investigation.

Surely, no account of the interrelation of nationality and historiography in modern times would be complete without some reference to the national historiography of Judaism and Zionism. The rise of Jewish nationalism in the last century was intimately related to the general development of nationality in Europe during that period. This stimulated Jewish national spirit, both by the direct influence of imitation and through the persecution of the

Jews, as a result of the growing chauvinism throughout continental Europe after 1870. The relation of this growth of Jewish national sentiment to the remarkable development of the interest of the Jews in their national history is readily apparent. Historical societies were formed in all the leading modern states—the "Société des études juives," founded in 1880; the Historical Commission of the "Union of German-Jewish Congregations," appointed in 1885; "The American Jewish Historical Society," created in 1892; and "The English Jewish Historical Society," founded in 1895. These societies have done valuable work in compiling sources of Jewish history and in arousing interest in its study. Especially to be noted is the 'Regesten zur Geschichte der Juden im fränkischen und deutschen Reiche bis zum Jahre 1273,' published by the German Jewish Historical Commission since 1887. Including an account of the Jewish persecutions in the mediæval period, it has tended to arouse their national resentment at past, as well as present, oppression. The Jews have also been stirred by the work of a great national historian, Heinrich Graetz (1817-91). Isaac M. Jost (1793-1860), in his 'History of the Israelites,' and his 'History of Judaism,' had surveyed the history of the Jews, but he was too liberal, rationalistic and impartial a writer to serve as a truly national historian. Widely different was the work of Graetz, sometimes called the Jewish Treitschke. Conservative and generally orthodox, and fired with a warm enthusiasm for the past and future of his people, Graetz traced in an eloquent manner the history of the Jews from their origins to 1848, laying special stress upon their literary and spiritual development, in other words, upon the elements which contributed the most to the development and persistence of their national culture. Graetz's work was especially in line with the development of "Zionism," for he insisted that the true Messiah was the national spirit of the Jewish people and he discouraged further delay through awaiting the coming of a personal Messiah. In addition to the general history of Graetz, there should be mentioned the many histories dealing in a comprehensive fashion with the history of the Jews in the different European states.

In connection with this brief summary of the reaction of nationalism upon historiography in Europe some passing reference should be made to the growth and accumulation of archival material and its accessibility to students. The development of the national states and their administrative bureaucracies led to a great amount of administrative "red tape" and to the growth of fixed diplomatic correspondence. From these sources a rich storehouse of historical material had accumulated in the national, ecclesiastical and private archives by 1800. Before they could be generally useful to historians, however, the sources in the archives had to be classified and centralized and made public to creditable historians. In the matter of centralization and classification of archival material France has taken the lead, due chiefly to the large number of highly-trained archivists provided by L'École des Chartes. At the present time only England is exceedingly backward among the European states in providing for a systematic arrangement and classification of its

archival material. In the same way that national pride and competition led to the compilation of the great source collections of national history, it forced the several European states at various dates during the 19th century to open the national archives to historical scholars. In addition, the liberal-minded Pope, Leo XIII, opened the Vatican archives in 1881 and secular scholars for the first time had the privilege of examining the treasures that Baronius had made use of. Even at the present time, however, complete freedom is not accorded anywhere in the use of archival material, scholars being excluded from the more recent documents. For instance, the Vatican archives are accessible only to 1815, those of France to 1830, and those of England to 1867. In America, scholars like Gaillard Hunt are laboring to put the archival material of the United States upon the same high plane that it has reached in most European countries.

The United States has never provided a great official collection of the sources of its national history comparable to those prepared by the European countries. This has been due in part to the particularism inherent in the American Federal system and in part to the fact that the American central government has been too much absorbed in the details of routine legislation to be able to concentrate its attention on the furthering of intellectual interests. The true American counterpart of the movement of collecting sources of national history, which was associated in Europe with the names of Pertz, Guizot, Nicolas, Hardy and Stubbs, is to be found in the rather pathetic attempt of Peter Force (1790-1868) to obtain adequate government support for his "American Archives," which were designed to constitute a complete collection of the sources of the history of the United States from the period of discovery to the formation of the constitution. Its psychological and historical affinity with the European movement is clearly indicated by Force's statement of his aims. "The undertaking in which we have embarked is, emphatically, a national one; national in its scope and object, its end and aim." After a painful process of protracted importuning, Force received a Federal appropriation which allowed him to begin publishing his "Archives" in 1837, but the government aid was soon withdrawn and the published material was but an insignificant fraction of what it had been planned to include. Owing to the fact that American historical scholarship was then a generation behind that of Europe, Force was primarily a hard-working antiquarian compiler rather than a scholarly editor like Pertz, Waitz, Mignet, Guérard, Hardy or Stubbs, and the national loss from the cessation of his work was infinitely less than would have been occasioned by a discontinuance of the "Rolls Series," the "Monumenta" or the "Documents Inédits." The collections which have been made have been primarily the result of the enterprise of individuals, publishing companies and the historical societies of the several commonwealths. The process began with the publication of Jared Sparks' writings of Washington between 1834 and 1838. The most ambitious attempt to make a thorough collection was the work of Mr. Hubert Howe Bancroft in the last half of the 19th century, in his gathering of the

sources of the history of the Pacific States. Unfortunately, he did not follow the example of Stein and secure the aid of a Pertz, but trusted to his own untrained guidance the execution of the project, with the result that the work lacked in critical scholarship and careful editing. An incomparably more scholarly work was the co-operative history of the colonization of America, edited by Justin Winsor, but, though this contained much source material, it was primarily a narrative work giving a critical review of the sources rather than including them. Parallel with this movement went the publication of source material by the various commonwealths in the vast collections of colonial records and archives, but in the great majority of cases these collections were prepared by erudite antiquarians rather than by men trained as critical historical editors, and there was no uniformity in the methods employed. Some of these state collections have, however, been of a very high order, the most notable being, perhaps, the extensive series dealing with the exploration and settlement of the middle West by Reuben G. Thwaites of Wisconsin. Another mode of collecting sources was exhibited in the editions of the messages and papers of the presidents and the writings of the chief statesmen by numerous scholars, which have varied widely in quality, reaching the highest level in W. C. Ford's 'Writings of Washington'; Gaillard Hunt's 'Writings of James Madison' and P. L. Ford's 'Writings of Jefferson.' The United States has not been lacking in editorial ability of the highest order, for in Worthington C. Ford, James Franklin Jameson, Paul Leicester Ford and Gaillard Hunt are to be found the equals of Pertz, Waitz, Guizot or Stubbs. The great defect has been the lack of concerted planning and continued and adequate government aid. Promising beginnings in the right direction are to be seen in W. C. Ford's edition of the 'Journals of the Continental Congress' and the scholarly products of the Carnegie Institution under Dr. Jameson's direction. John Bassett Moore has labored with almost Benedictine patience and productivity in the preparation of his monumental series dealing with the documentary history of diplomacy. There also should be mentioned the monumental collection of sources dealing with the history of labor in America which has been prepared by Professor Commons and his associates. Miss Adelaide Hasse has begun an invaluable series of volumes describing and classifying the sources for American economic and social history which are available in the public documents of the various commonwealths. On the whole, however, the United States has been incomparably delinquent in the thorough and scholarly collection of the sources of its national history, and it cannot seek refuge behind any assertion that this has been due to a lack of rabid nationalistic emotions.

If this country has not kept abreast of European development in the editorial aspect of national historiography, it can lay claim to having produced historians enthused with as ardent a patriotism as fired a Treitschke, a Michelet or a Froude. Nationalism in American historiography has, naturally, centred mainly about the romantic period of colonization and the struggle for American independence, and American

historians have surrounded this period with the halo given to the early national history of Germany and France by Johannes Müller and Chateaubriand. The chief figure in the creation of this national epic of migration and deliverance was George Bancroft, whose early years fell in that period of national bumptiousness and florid democracy in the "thirties" and "forties." To Bancroft, the history of the formation of the American Republic was no modest secular achievement of ordinary mortals, but a veritable *Æneid* in which Augustus was replaced by Washington and which exhibited in its succession of scenes "the movement of the divine power which gives unity to the universe, and order and connection to events." His history of the United States through the period of the Federal Constitutional Convention represented the process of colonization as the flight of brave spirits from oppression, characterized the American Revolution as a crusade of wholly virtuous and disinterested patriots in behalf of the liberties of civilized humanity, described the American constitution as the creation of a group of unique mental giants, never before equalled and not to be matched at any later epoch, and regarded their work as even more notable than its makers. The pathetic inaccuracy of all of his major premises can only be appreciated by a careful perusal of the scholarly treatment of the same topics by Beer, Van Tyne, M. C. Tyler, Osgood, Alvord, Andrews, Fisher, Farrand and Beard, and the damage done to proper perspective in American history by his works has been almost incalculable and irreparable. The myth was perpetuated in Palfrey's long Puritan apology and was repeated in a less vigorous form in Mr. Lodge's discussion of the English colonies in America. From his pride in American exploits in behalf of liberty and democracy, Motley was encouraged to study the analogous movement among the Dutch, when they rebelled against Spanish tyranny and established a republic. Francis Parkman, turning from the Anglo-Saxon phobia of Bancroft, first gave full credit to the work of France in colonizing the New World. He found that the record of heroism had not been wholly monopolized by the English and German colonists. While Parkman had turned his attention to the French in the North and West, William H. Prescott found his theme in the conquest and colonization of Central and South America by the Spanish, and in a brilliant description of the splendor of the native American civilizations of Mexico and Peru. Mahan, enthused by the exploits of the small American navy in the wars of the Revolution and 1812, was encouraged to make a study of the influence of naval supremacy upon the history of the past. Few works have been more influential in stimulating the disastrous growth of modern armaments. The period of cementing the national union through the efforts of the Federalists was glorified in the works of Hildreth and John Church Hamilton, and the blessings of the "pure" democracy of the Jacksonian epoch were set forth in the essays and addresses of Bancroft, who believed that he detected the very "voice of God" in the acclaim of Jackson's followers. Roosevelt described the process of American expansion westward with the buoyant and ill-concealed pride of an admirer of the

West and an ardent patriot and national imperialist. Von Holst beheld in the struggle over slavery one more great episode in that eternal conflict between righteousness and iniquity. Professor Burgess saw in the success of the North in the Civil War, not only a justification of his own nationalistic political philosophy, but also a sure manifestation of Teutonic genius in the field of political unification and organization. On the whole, however, by the time that the achievements of the Civil War and Reconstruction periods had come to be subjects for historical analysis the objective scholarship of the critical and erudite school had begun to prevail and the "American epic" passed, to be preserved only in the school texts of succeeding generations. The task of rationalizing the "Bancroftian epic" and adapting it to the prevailing tendencies of the latter part of the 19th century fell to the philosopher-historian, John Fiske (1842-1901). By his amiable Spencerian rationalism and his eulogy of the rise of the middle class he best summed up the prevailing spirit of the educated Americans of his time, and by his lively and attractive style and his primary concern with the period of discovery, colonization and revolution he attracted a following which probably entitled him to the position of the popular national historian of the last generation. He was the prophet of the new era in the interpretation of Anglo-American relations which replaced the Puritan and American epic of Bancroft by an account of the rise and triumph of the middle class in both England and America—"an epic of the English-speaking Peoples." He was as fully convinced as Burgess of the supreme political capacity of the Teutonic branch of the "Aryans." He held that the first instance of self-government in recorded history was to be seen in the Teutonic village-community, which was an "inheritance from pre-historic Aryan antiquity," and he believed that "American history descends in unbroken continuity from the days when stout Arminius in the forests of northern Germany successfully defied the might of imperial Rome." Fiske, however, stressed the element of liberty as the surest criterion of political capacity rather than the aspect of order and authority which found favor with Burgess. England under Gladstone seemed far better adapted than Germany under Bismarck for furnishing an edifying example of the attainment of complete political liberty, and the then popular theory of a wholly Teutonic England was an ethnic argument in favor of such an undertaking. Therefore, instead of conducting the muse of liberty directly from the "German forest primeval" to the Federal Constitutional Convention of 1787, Fiske arranged a detour in her migration to the new world which would guide her to America by the way of the "Glorious Revolution of 1688," in which, as the work of the English "bourgeoisie," "freedom both political and religious was established on so firm a foundation as never again to be shaken, never again with impunity to be threatened, so long as the language of Locke and Milton and Sydney shall remain a living speech on the lips of men." Working hand in hand with George Otto Trevelyan, he tried to show how the American Revolution was but the perfect fulfilment of the spirit of 1688.

He pictured it as the work of Whigs on both sides of the Atlantic in the heroic effort to check and crush the autocratic tendencies of a Tory squirearchy and the unconstitutional tyranny of a "German King," and to preserve for the world the liberties embodied in the Bill of Rights. He dwelt with pride upon the establishment of the American Federal Republic and regarded it as the great contribution of the Western Hemisphere to the solution of political problems, by reconciling the liberty of the New England town-meeting with the existence of large political aggregates. He contemplated with unmixed pleasure the progress of the middle class in its political and economic conquest of the American continent in the 19th century, and, just before his death at the opening of the 20th, he was deeply gratified to see his own country at last assume its part of the "white man's burden" by the retention of the Philippines. Not at all a militarist, he looked upon this as a most significant step in that process of bringing the world under the peaceful dominion of "the two great branches of the English race which have the mission of establishing throughout the larger part of the earth a higher civilization and a more permanent political order than any that has gone before."

Even the more progressive Latin American states have begun to produce extensive collections of the sources of their national history. The 'Documentos para la Historia Argentina,' which have been edited by L. M. Torres and the faculty of philosophy and letters of the National University of Buenos Aires since 1911, is a typical example of this process.

The net result of the growth of nationality and of nationalism upon historiography has been greatly varied and a mixed blessing. Its fortunate results have been, above all, the provision of great collections of source material which would otherwise never have been made available and the training of many excellent historians in the process of the compilation and editing of the sources. The deplorable effects have centered about the creation of a dangerous bias of patriotism, which not only prevented a calm, objective and accurate handling of historical facts, even by highly trained historians, but also contributed in no small degree to the great increase in chauvinism which led to the calamity of 1914. The responsibility of the nationalistic historians in this regard has been well stated by Prof. H. Morse Stephens, probably the most thorough student of this particular subject: "Woe unto us! professional historians, professional historical students, professional teachers of history, if we cannot see written in blood, in the dying civilization of Europe, the dreadful result of exaggerated nationalism as set forth in the patriotic histories of some of the most eloquent historians of the 19th century." It would be fortunate, indeed, if this were all, but for every patriot made by a Treitschke, a Michelet, a Froude or a Bancroft, hundreds have been enthused by the petty chauvinism of the third-rate textbook compilers who have imitated their bias without their literary virtues. The nature and effect of these textbooks upon the past generation has been indicated for this country by Mr. Charles Altschul and for France and Germany by Dr. J. F. Scott. England has not fallen behind any of these nations in this re-

spect. Some optimism for the future may, however, be discovered in the fact that there is an ever greater tendency for the textbook writing to be handed over to reliable and relatively unbiased professional historians.

It should be pointed out in passing that the zeal for collecting historical source material was not limited to the sources of secular history. In the same way that the gathering of the sources of national history was begun by Duchesne in the 17th century, so activity in collecting the sources of ecclesiastical history was initiated at this same period and has been continued to the present time. The first complete collection of the writings of the Church Fathers was gathered and published by Migne in 382 volumes between 1844 and 1864. While, like Bancroft's 'History of the Pacific States,' it was a publisher's rather than a scholar's enterprise, it has been of immense value to students. The failure of Migne to use the best texts in all cases has led to the attempt to produce better collections of Patristic literature. Since 1866 the Vienna Academy has been publishing a carefully edited collection of the writings of the Latin Fathers, and in 1897 the Berlin Academy began to issue an edition of the Greek Fathers. The collection of material dealing with the lives and deeds of the saints, which was begun by Bolland in the middle of the 17th century, is still in progress. A collection of the acts of the Church councils by Labbe and Cossart appeared in the latter half of the 17th century and was continued by Etienne Baluze in 1683. In 1685 Jean Hardouin started a new collection, and in the middle of the 18th century Mansi compiled the largest of all collections of the councils, a new edition of which is now appearing in Paris. At the same time that Mansi was preparing his collection of conciliar material Mainardi published the collection of papal bulls. In the latter half of the 19th century Jaffé and Potthast produced scholarly collections of papal "Regesta" to the year 1304, and Kehr is now engaged in the publication of the latest and most complete compilation of this type of material. On the whole, the collections of source material for the history of the Church are fully equal if not superior to those for the secular history of Europe.

**5. The Rise of Modern Critical Historical Scholarship.**—Professor Gooch, in his scholarly and informing account of the development of historiography in the 19th century, points out that prior to the beginning of the last century historical science labored under four serious handicaps — the catastrophic theory of historical causation and the contempt for the mediæval period, which had characterized the rationalist school; the absence of any extensive collection of original sources; the lack of critical methods in handling historical materials; and the failure to provide for any systematic and competent teaching of the subject-matter or methods of history. It has already been pointed out how the "Romanticists" had corrected the faults of the rationalists by insisting upon the law of continuity in historical development and by looking upon the mediæval period as the most fruitful age for historical research, and it has also been briefly shown how the pride of exuberant nationalism had led to the provision of magnificent collections of source material for

the history of every leading modern nation. It now remains to trace the rise of critical scholarship in the field of history and to show how critical methods were widely disseminated through the development of the professional teacher of history.

It was shown above that the promising rise of critical methods in the use of historical materials as an incident of humanism and exemplified in the work of Blondus, Beatus Rhenanus, Vadianus and Zurita had been checked and smothered in the fierce religious controversies of the period of the Reformation. By the latter part of the 17th century, however, the volume of polemic had tended to decline and it was again possible to assume to some extent an objective attitude and to begin a dispassionate search for truth. This development of scientific historical method passed through two natural and normal stages: first, the development of those auxiliary sciences, such as diplomatic, chronology, palæography, epigraphy and lexicography, which would enable the historian to ascertain the genuineness of a document; and, second, the growth of internal or interpretative criticism, which passes beyond the mere establishment of the authenticity of the document and examines into the degree of the credibility of its author.

The first of the above steps in the growth of modern historical science was primarily the work of those same Benedictine monks of the Congregation of Saint Maur who had been so active in the preliminary period of the collection of the sources of French history. Their priority in this movement seems to have been due to the fact that not being a militant order they did not have to appear as vigorous apologists for Catholicism and that they also had the advantage over lay writers in not being compelled to glorify a particular city, province, family or dynasty. In the quiet libraries of their monastery they brought into existence an indispensable portion of the mechanism of the modern historian. The leader of the historical scholars of the Order was Jean Mabillon (1632–1707), who created the science of diplomatic — or the critical method of determining the authenticity of documents. In 1675 a Jesuit historian, Papebroch, made a sweeping claim that many of the documents upon which the Maurists had relied were worthless. Mabillon devoted the next six years to the preparation of his reply, and in 1681 his opponent was crushed under the erudition of the 'De re diplomatica,' which remained the standard treatise on the subject until it was displaced in the present generation by the volumes of Sickel, Ficher and Giry. The basis of modern palæography and archæology was laid by Dom Bernard Montfaucon (1655–1741) in his 'Palæographia graeca' and his 'L'Antiquité expliquée et représentée en figures.' While a layman, Charles du Fresne Du Cange had founded historical lexicography in his 'Glossarium mediæ et infimæ latinitatis' (1678), the Benedictines left their impress upon this field in the famous revision of Du Cange's work by Dom Carpentier (1768). Finally, in a great co-operative work, begun by Dantine and Durand, and finished in 1790 by Dom Clément, 'L'Art de vérifier les dates,' chronology was at last taken from the hands of Eusebius and Jerome and put on a scientific foundation. Of course, the Benedic-

tines did not limit their efforts wholly to the perfecting of methods of research, but applied these methods in the production of voluminous works and source collections on Church and national history. The advance in scientific method which they brought into existence can scarcely be overestimated. Before this time there had either been no attempt to cite sources or the citations had been hopelessly confused; there had been no general practice of establishing the genuineness of a text; and there had been no hesitancy in altering the text of a document to improve the style. Now documents were searchingly examined as to their authenticity, the text was quoted with exactness, and the citations were invariably included and given with scrupulous accuracy. It is, however, easily possible to overestimate the modernity of the Maurists; they were as near to Timæus as to Ranke or Gardiner. Their critical methods were almost entirely limited to external or textual criticism—to an examination of the genuineness of the document. They were greatly inferior to the school of Voltaire in examining the credibility of contemporary authorities and generally regarded the contents of an authentic primary source as entirely identical with absolute truth. Neither did they possess anything of the romanticist conception of historical development and the continuity and organic nature of cultural evolution. They were nearer to scientific antiquarians than to modern historians. Nor were they sceptical of ecclesiastical tradition. They labored under the pious opinion that the truth would substantiate the contentions of the Church, but in reality provided their rationalist contemporaries and successors with a supply of scholarly information with which to rout the ecclesiastics.

Almost identical in method with the Benedictines was the work of the Jansenist, Louis Sebastian de Tillemont (1637–1698), on the history of the Church and the Roman Empire to 600 A.D. His product was highly objective, being primarily a mosaic pieced together from sources which were selected to harmonize but were not altered. It was one of the earliest of modern historical works to include a critical discussion of the principal sources for each period. His solid work, designed as a pillar of Christian doctrine, was one of the chief sources used by the sceptical Gibbon. A similar example of the new erudite methods was the researches into the history of the Guelfs carried on by the German philosopher, Gottfried Wilhelm Leibnitz (1646–1716) in his 'Annals of the House of Brunswick.' A step was taken towards the development of internal criticism by the great Italian, Muratori (1672–1750), who made a number of advances over his master, Mabillon. He was as critical of miracles as Blondus and departed widely from the Benedictine practice of regarding contemporary sources as infallible. The methods of Mabillon and Muratori were combined with some faint anticipation of the romanticist conception of historical development in Rapin Thoyras' (1661–1735) 'History of England,' which long remained the chief source on the Continent for the history of 17th century England. Finally, in the co-operative 'Universal History' produced by the English scholars, Campbell, Sale, Swinton, Bower and Psalmanazar, the erudite

school published the most scholarly universal history since the humanist attempt in the 'Enneades' of Sabellicus. While thoroughly pious in its approach, it has been called by no less authoritative a critic than Fueter "the first universal history worthy of the name."

While Vadianus, Muratori and Thoyras had shown at least an embryonic power of criticizing the credibility of contemporary or "primary," sources and documents, the real beginning of the searching internal criticism of historical documents must be assigned to the work of the Jesuits. Having been put upon the defensive by the Protestant onslaughts, they were compelled to examine the sources of ecclesiastical history to discover what portion of the old traditions and legends would bear the test of scientific scrutiny. By this means they hoped to eliminate the damaging criticism of the Church by Protestant historians who ridiculed the many crude and obviously false legends connected with the Catholic past. The chief example of this Jesuit criticism was the monumental 'Acta Sanctorum,' begun by the Belgian Jesuits under Bolland's direction in 1643. Here the sources bearing on the lives of the various saints were arranged according to their age and authenticity. A much more healthy spirit of criticism was exhibited by Pierre Bayle (1647–1706) in his 'Historical and Critical Dictionary' and in his criticism of the history of Calvinism by Maimbourg. Bayle took especial delight in pointing out the grave discrepancies between the views and opinions of contemporary authorities and did not hesitate to extend his methods to the examination of "sacred" history. Since the period of humanism the historians of classical antiquity had been regarded with a reverent confidence second only to the "Fathers." Valla had questioned some assertions of Livy, but it was left for Louis de Beaufort (d. 1795) in his 'Dissertation sur l'incertitude des cinq premiers siècles de l'histoire romaine,' to prove that the divergence in the accounts of the period by the great classical authorities indicated that the history of Rome before the third century B.C. rested almost wholly on legendary material. The work of Beaufort marked a break with humanism in attitude and method as well as in style. The most obscure member of this critical school, but perhaps the ablest historian before Niebuhr was Jean Baptiste Dubos (1672–1740). His 'Histoire critique de l'établissement de la monarchie française dans les Gaules' was the first attempt to turn the new critical methods upon the study of institutions. In as objective a spirit as that exhibited by Ranke he examined the documentary sources for the early history of France and anticipated Fauriel and Coulanges in proving that the Merovingians had merely adapted and not displaced Roman culture in Gaul. He also anticipated the romanticists in possessing a grasp upon the conception of the gradual and organic development of civilization which was vastly superior to the catastrophic theory of the contemporary rationalists. In this respect he marked an advance in the direction of Möser. Less critical, but more truly historical was the 'History of Osnabrück' by Justus Möser (1720–94), regarded by many as the first real constitutional history, in that it showed the manner in which political institutions develop out of the deeper social

and economic forces in the life of a state. It was a disciple of Möser, Barthold Georges Niebuhr (1776-1831), who is conventionally regarded as the creator of modern historiography, but if the foregoing discussions have shown anything they have proved that no single personality or school can be regarded as having brought into existence the totality of modern historical science. Niebuhr, a Dane called to the new University of Berlin by Humboldt in 1810, is one of the best examples of this tendency to synthesize the progressive methods of his predecessors. He was influenced by Savigny's romanticism in the study of the evolution of legal and political institutions. He followed Möser in his profound conception of the development of political institutions. Finally, he applied to the sources of early Roman history the critical methods which had been adopted by Wolf in his epoch-making studies of the authorship of the Homeric poems. His 'Roman History' was the first book to combine the best of the newer critical methods with the constructive principles of synthetic institutional history, and it was the chief source of inspiration for the historical work of his greater successors, Leopold von Ranke and Theodor Mommsen.

Von Ranke (1795-1886) first became interested in history through his studies in classical literature, the influence of romanticism and the reading of Niebuhr. His immediate activity as a historian was initiated by his discovery of the wide divergence between the accounts of the events of the 15th century in Italian history as presented by the leading contemporary authorities. This led to the publication in 1824 of his 'History of the Romance and Germanic Peoples, 1494-1535.' Its most significant portion was the appendix, entitled 'Zur Kritik neuerer Geschichtschreiber,' and devoted to an analysis of the sources of information for the period that he had covered. This did for internal and interpretative criticism what Mabilion's treatise on diplomatic had done for external criticism, or the critical study of texts. It was Ranke's great contribution to historical method to have insisted that the historian must not only use strictly contemporary sources of information, but must also make a thorough study of the personality, "tendencies" and activities of the author to determine as far as possible the personal equation in his record of events. There were two more fundamental characteristics in the historical mechanism of Ranke, namely, the conception derived from the romanticists that every nation and age is dominated by a prevalent set of ideas, designated by Ranke, the "Zeitgeist," and the doctrine that the historian must view the past wholly freed from the prejudices of the present and must narrate the events of the past "wie es eigentlich gewesen." His defects have been pointed out by later writers as the failure to exhaust the sources available for any subject upon which he wrote and a primary concern with political events and dominating personalities to the neglect of the more fundamental facts of economic and social, and even of political, life. While he ranged over the entire history of Europe and the world and left an enduring mark upon every field, it was his contributions to historical methods and teaching which were mainly significant for the growth of historiog-

raphy. To historical method he contributed primarily through his formulation of the principles of internal criticism and his insistence upon entire objectivity in the treatment of the past. His influence upon historical scholarship through his teaching was probably greater than through the exemplification of his methods in his written works. That fundamental instrument for the advancement of historical scholarship in the academic world—the Historical Seminar—was founded by Ranke in 1833 and it served to train not only the leading German historians, but historical students from all over the world who came to serve in the historical laboratory which he maintained during the period of half a century. When Ranke became too aged to conduct his seminar with effectiveness, his greatest pupil, George Waitz, adopted the methods of his master at the University of Göttingen, where nearly every leading mediævalist of the last generation received at least a part of his training.

With the work of Ranke the foundations of modern historical scholarship were finally laid. The progress since his time has consisted primarily in a further refinement of critical methods and their general dissemination among a continually growing body of historical scholars. This progressive expansion of scientific historical scholarship has been in part the result of the direct imitation of Ranke's methods by his students and in part the outgrowth in every country of those same preliminary conditions and developments which made the work of Ranke possible.

In Germany the growth of the critical school of historiography was primarily the result of the work of Ranke. Among his pupils were Köpke, Jaffé, Waitz, Giesebrecht and Von Sybel who perpetuated the methods of their master in their own writings and teaching. Waitz probably surpassed Ranke in the thoroughness and exactness of his scholarship. The existence of independent sources of the new scholarship is best seen in the case of Mommsen, who was a product of the same general circumstances that made the work of Ranke possible, and who fully equalled Ranke in the field of scholarship. In the generation since Droysen, Treitschke and Sybel, the works of the younger contributors to German history have shown more perfectly the objectivity of Ranke and have eliminated the errors due to the rabid patriotism of their predecessors. Moriz Ritter has produced the most detailed and scholarly treatment of the Thirty Years' War and the events of the Counter-Reformation. Bernhard Erdmannsdörffer has dealt with great scholarship and candor with the period from the Thirty Years' War to the accession of Frederick the Great and has rejected Droysen's laudatory picture of the early Hohenzollerns and their "mission." R. Koser, in what is probably the most scholarly biographical product of modern critical historiography, has removed from Frederick the Great the halo with which he was adorned by Droysen and Carlyle. The period from Jena to the Revolution of 1848 has been studied by Hans Delbrück, Max Lehmann and F. Meinecke with much greater fairness, poise and scholarship than was exhibited by Treitschke. Erich Marcks and Max Lenz have removed from Bismarck the "Sunday clothes" with which he was dressed by Sybel

and have laid bare his policies and intrigues. Alfred Stern is engaged upon what is by far the most exhaustive and scholarly history of Europe in the 19th century. Further, the influence of the *École des Chartes* in improving the exact methods of handling documents has been evident in the Germanies in the work of such men as Sickel and the foundation of the Vienna Historical Institute in 1854. The general nature of German historical scholarship as exemplified in the adoption of critical methods is best observable in the co-operative work edited by W. Oncken, 'Allgemeine Geschichte in Einzeldarstellungen'; and in the 'Jahrbücher der deutschen Geschichte,' which has been in process of publication by the Historical Commission of the Munich Academy since 1862. The most erudite and complete synthesis of scientific historical methodology ever prepared has been produced by E. Bernheim, though G. Wolf has more recently made a creditable contribution to this field. The discussion of the application of this new critical scholarship to the field of German political history should not cause one to lose sight of the fact that equal progress has been made in the field of Church history since the days of the Centurians. Interest in this subject was revived by Neander in the first half of the 19th century. In the work of Hinschius, Richter and Sohm on the canon law; Hauck's history of the German Church; the labors of Hefele and Hergenröther on the councils; Pastor's history of the Popes of the 'Renaissance'; Harnack's monumental history of Christian dogma, and Kraus' history of Christian art, are to be seen works which rank with the best products of critical political historiography.

The growth of critical historical scholarship in France owed something to German influences and some of the leading French historians, such as Monod, were trained by the German masters, but on the whole the progress of historical scholarship in France has been primarily an indigenous development. To Niebuhr might be compared Fauriel, who was the inspiration of Guizot and his associates. While Guizot never equalled Ranke with respect to exact scholarship or productivity he was far superior to Ranke in analysis and more capable and active as an editor, and his influence in stimulating historical scholarship in France was fully comparable to that exerted by Ranke in Germany. The precise scholarship of Waitz found its first French counterpart in the works of François Mignet, which foreshadowed modern French historiography, not only by their high critical standards, but also by their almost unrivaled powers of causal analysis and their remarkable lucidity in exposition. The perfection of exact historical methods in France was not due to an individual, as in Germany, but to the labors of many scholars and teachers in the greatest of the world's schools for the training of historians in the refined methods of criticism, L'École des Chartes, which began its work in 1829. The names of Delisle, Guérard, Monod, Luchaire, Molinier, Giry and Viollet are indicative of the quality of work produced by the institution. In Aulard, France possesses a scholar whose detailed and masterly knowledge of a brief period of national history can be equalled among the

world's historians only by Gardiner, and the myths surrounding the French Revolution have at last been put to rest. The finest representative collection of French historical scholarship is to be found in the co-operative 'Histoire générale' edited by Lavis and Rambaud and in the 'Histoire de France' edited by Lavis. Space forbids more than a brief enumeration of some of the leading members of this recent generation of French scholars who have made the most notable contributions to historical knowledge. C. Jullian has carried the methods of his master, Coulanges, into a thorough survey of ancient Gaul under the Roman Empire. A. Berthelot has distinguished himself by studies in the later Roman Empire and the beginnings of mediæval Europe. G. Bloch has contributed some striking monographs on the transition from Roman to mediæval civilization. C. Diehl has devoted himself to the period of the revival of the Eastern Empire under Justinian. Feudalism has been analyzed by C. Seignobos and A. Luchaire. Seignobos has also rendered valuable service to modern history and to the general history of civilization, while Luchaire is the peerless authority on France of the 11th, 12th and early 13th centuries. C. Langlois has traced the decline of the Capetians. Town life in the Middle Ages has received the attention of A. Giry, who has also contributed the standard treatise on diplomatic. C. Bémont is easily the leading French student of mediæval England, though Ferdinand Lot has done notable work in early French and English mediæval history. C. Bayet holds the same place with respect to the investigation of the Mediæval Empire and has also done signal work on the Byzantine Empire. A. Coville is the master of the period of the Hundred Years' War. C. Pfister has contributed important monographs to mediæval history, the history of Nancy and the administrative policy of Henry IV. The 15th century has received the attention of C. Petit-Dutaillis. H. Lemonnier is the undisputed authority on the history of France in the 16th century. Hanotaux has analyzed the France of the opening of the 17th century. E. Lavis has also claimed the 17th and holds the first place among French editors of co-operative historical works. H. Vast has surveyed in a brilliant fashion the political history of France in the later 17th and 18th centuries and the era of Napoleon. The 18th century has also profited by the labors of H. Carré and P. Sagnac in the political history of France and Europe, while A. Sorel has mastered the international relations of this century to an unparalleled degree. Aulard's unique work on the French Revolution has been mentioned above. A. Débidour and A. Malet have synthesized the recent scholarship dealing with France in the last century and have done notable work on the history of modern European diplomacy, while H. Mariéjol has covered the history of modern France and Spain, being especially an authority on the early Bourbons. The leading French authority on modern Germany and Austria is G. Blondel, while the similar position with respect to Hungary, Bohemia and Poland must be assigned to E. Denis and L. Leger. A. Rambaud, perhaps the most erudite and versatile figure in French historiography, has earned for himself an enviable position in

many fields. Winning his reputation by a monograph on the Byzantine Empire, he has since become the leading French authority on Slavonic Europe and has contributed brilliant surveys of French civilization and the growth of the French colonial empire. All students of the ecclesiastical and political history of Europe are immensely indebted to the masterly reviews of the relation between the Church and the State throughout the history of France by E. Chénon and Débidour. Renan has found his ablest successor in Émile Faguet whose survey of French thought cannot be matched in any other country. Nor should one forget the contributions of E. Levasseur to economic history; of P. Tannery to the history of science; and of C. Langlois to the subject of historical bibliography and methodology. The contributions of other recent French historians will be mentioned in the treatment of special phases of modern historiography. What Ranke achieved for the improvement of the teaching of history in Germany was accomplished in France by Jean Victor Duruy, Ernest Lavisse, Charles Bémont and Gabriel Monod. Monod, probably the most scholarly and stimulating teacher of history who has yet lived, brought to perfection the seminar method which had been introduced by Duruy. In conclusion, no sketch of French historical scholarship would be complete without proper recognition of the unparalleled ability of French historians to unite careful scholarship with a broad interpretation of historical material, an admirable lucidity of expression and rare powers of synthetic organization.

Even more than was the case with France, critical historical scholarship in England was a native product. Beginning in the work of such men as Freeman, Stubbs, Green, Lecky, Creighton and Seeley, it has reached its highest point in the work of Samuel Rawson Gardiner on the stirring events of the first half of the 17th century. For a thorough mastery of all the available sources for a limited period and the ability to organize these in an intelligible narrative he has but one rival, Aulard, and the objectivity of his work surpasses that of the Frenchman. The English have never, however, provided anything comparable to the *École des Chartes* or the Historical Institute at Vienna for the training of young historians in the most recent methods of exact critical scholarship. The great repertory of the best products of recent English historical scholarship is the co-operative works — the incomplete 'Cambridge Mediæval History,' the 'Cambridge Modern History,' and the less pretentious series edited by Hunt and Oman. Any catalogue of the modern leaders of English critical historical scholarship would certainly include the following names. N. H. Baynes has dealt with the Eastern Roman Empire, a field which has been more extensively cultivated by J. B. Bury, whose thorough and versatile scholarship has also been demonstrated by work on the later Roman Empire, by his critical edition of Gibbon and by his planning of the 'Cambridge Mediæval History.' The mediæval history of both England and continental Europe has profited by the labors of C. W. Oman, who has also distinguished himself in the field of modern history by a comprehensive work on the Peninsular War. H. C. W. Davis, one of the

most brilliant of the younger present-day mediævalists, has contributed notable work on the whole field of mediæval history, but particularly upon the 11th and 12th centuries. T. F. Tout has dealt with England in the 13th and 14th centuries, as well as with the relations between the Church and empire in the Middle Ages, from a broad and well-balanced point of view. J. H. Round has exhibited exceptional scholarship by his studies of English feudalism and mediæval legal institutions. The work of the late F. W. Maitland on the social interpretation of English legal institutions marked the greatest advance in that field since the time of Stubbs. The work of James Bryce on the Mediæval Empire has never been superseded, though H. A. L. Fisher has more recently turned to that subject with both insight and scholarship. Ernest Barker has contributed a number of scholarly monographs on diverse phases of mediæval history. G. M. Trevelyan has dealt with England in both the 14th and the 17th centuries in works which not only exhibit original scholarship, but also the finest mastery of English prose to be found among critical English historians of the present day. The careful scholarship of Richard Lodge has been displayed in the treatment of the transition from the mediæval to the modern period in both England and continental Europe. J. A. Doyle's account of English colonization in America is, perhaps, surpassed only by the American work of Professor Osgood. James Gairdner's calm and scholarly work on the 15th century and the Tudor period has been carried on by A. D. Innes, H. A. L. Fisher and A. F. Pollard, the latter one of the most original and promising writers now engaged in the field of English history. G. W. Prothero has sketched the later 16th century and has secured for himself a position as an historical editor comparable to that held in France by Lavisse. It is a sufficient commentary on the work of C. H. Firth on the history of the middle of the 17th century to observe that the scholarship of Gardiner has not suffered in the work of his continuator. That Lecky's great work on the 18th century did not doom his successors to barren efforts is shown by the works of L. S. Leadam and W. Hunt, C. G. Robertson's narrative on the early Hanoverians, G. O. Trevelyan's survey of the American Revolution and by the biographies of the elder Pitt by Rosebury and Williams, of Burke by Morley, of Fox by Trevelyan and of the younger Pitt by Rose. Stanley Leathes has no English competitor as an authority on the political history of France. F. C. Montague and J. R. M. Macdonald have investigated the history of 18th century France, and H. Morse Stephens contributed the first scholarly synthesis of the French Revolution before he left his native land to win academic distinction in the United States. J. H. Rose is the undisputed English authority on the Napoleonic period, while H. A. L. Fisher has been attracted by Napoleon's administrative reforms. The 19th century has been covered by the works of Spencer Walpole, Herbert Paul, G. Slater and J. A. R. Marriott and by a number of notable biographies, such as those of Francis Place by Graham Wallas, of Cobden and Gladstone by Morley, of Bright by G. M. Trevelyan and of Disraeli by Monypenny and Buckle. The history of the British Empire has

received detailed attention from Egerton, Lucas Innes and H. H. Johnston. European politics and international relations in the last century have been dealt with by W. A. Phillips, G. L. Dickinson and J. A. R. Marriott. In addition, there should be mentioned the exhaustive scholarship of A. W. Ward with respect to all things connected with the political history of modern Germany and the detailed studies of W. H. Dawson on the modern German Empire; the scholarly work of R. N. Bain, R. W. Seton-Watson, D. M. Wallace, F. H. Skrine and W. Miller on Scandinavian, Slavonic and eastern Europe; the studies of Italian unification by Bolton King and G. M. Trevelyan; and the comprehensive work of Martin Hume on modern Spain. Church history has not been neglected in England, the more notable products in this field being the works of H. M. Gwatkin and F. J. Foakes-Jackson on the early Church; of H. B. Workman on the Mediæval Church and the preliminaries of the Reformation; of C. Beard and T. M. Lindsay on the Reformation in general, and of James Gairdner and R. W. Dixon on the Reformation in England; of R. W. Church and F. W. Cornish on the religious movements of the last century; of H. W. Clark on the Non-Conformists; and the monumental co-operative history of Stephens and Hunt on the whole period of English ecclesiastical history. The contributions of Cunningham and Ashley to economic history and of Morley, Stephen, Benn and Merz to intellectual history will be dealt with in another place. Finally, no student of historiography could fail to commend G. P. Gooch for his excellent execution of Lord Acton's long-deferred plan to sketch the development of modern historical writing. Of the teachers of history in England who have done the most to inspire their pupils with the ideals of modern criticism and with an interest in historical investigation Freeman, Seeley, Acton and Maitland have had the widest and most salutary influence.

The beginning of modern critical scholarship in the field of American history dates back only to about the period of the close of the American Civil War. It owed its origin very largely to the influence of Germany. In the first quarter of the 19th century George Bancroft had attended the lectures of Heeren and had later been a friend of Ranke. Not having been an academician, Bancroft had little influence on scientific historical methods in the United States. The real beginning of the systematic introduction of the improved methods of German historical scholarship into the United States began in the year 1857 when Henry Torrey succeeded Sparks at Harvard, Francis Lieber assumed his professorship at Columbia, and Andrew D. White accepted a chair of history at Michigan. All of these men had been trained in Germany and established a direct contact between German and American scholarship. Professor White had also been profoundly influenced by Guizot, and his teaching was never limited to the narrowly episodic and political history which attracted the extreme disciples of Ranke and the Prussian school. A still greater impulse to the sound establishment of historical scholarship in America came when Herbert Baxter Adams instituted the teaching of history in Johns Hopkins University in 1876 immediately after

the conclusion of his studies in Göttingen, Berlin and Heidelberg. To Prof. H. B. Adams was due not only the establishment of the "seminar" method of instruction in America, but also the organization and creation of the first great training school for historians in America. There is scarcely a great American university at the present day which does not have in its department of history one or more men trained in the Johns Hopkins seminar, and the literary products of this seminar were the first conspicuous exemplification in America of the newer critical historical scholarship. Much the greatest personal influence in the introduction of the German methods and ideals was that of Professor John William Burgess, who began his work at Amherst in 1873 after having studied in Göttingen, Leipzig and Berlin and who founded in 1880 the famous faculty of political science at Columbia, which came to rival and later to overshadow Johns Hopkins. Professor Adams, while appreciating the value of the exact German methods, had a healthy confidence in the ability of American scholars to interpret and apply the new methods, but Professor Burgess was convinced that at best Americans could be but lame and halting imitators of Germanic genius and induced most of his students to finish their studies in Germany. As Prof. H. B. Adams has expressed it, "The students of Professor Burgess went to Berlin in shoals. They went in such numbers that they began to be called the 'Burgess School.' They all went to hear Droysen lecture; and came home with trunks full of Droysen's 'Preussische Politik' and of the writings of Leopold von Ranke." In addition to the work of Johns Hopkins and Columbia, Michigan advanced the new methods under Charles K. Adams, and Cornell under President White, Moses Coit Tyler and George Lincoln Burr. About this same time Edward Channing, at Harvard, carried to completion the beginnings in the newer historical scholarship which had been made by Henry Adams in the "seventies." At the present time the new scholarship has permeated the whole American university world and the American students of history need no longer, as Professor Gooch would seem to indicate, seek their training abroad. In the seminars of such scholars as Herbert L. Osgood, William A. Dunning, George Burton Adams, J. F. Jameson, Frederick Jackson Turner, George Lincoln Burr, Edward Channing, Edward G. Bourne, Dana C. Munro and Charles H. Haskins the serious American student has received or may receive training in refined critical methods quite equal in most respects to anything to be obtained abroad. The French influences have to some degree displaced the German in recent years and most American mediævalists finish their training in the *École des Chartes*, a substitute for which scarcely exists in America. A number of American scholars, such as H. B. Adams, E. G. Bourne, B. A. Hinsdale, N. M. Trenholme, F. M. Fling, Henry Johnson, H. E. Bourne, W. H. Mace, J. M. Vincent and F. H. Foster, have made worthy contributions to the systematic elaboration of historical methodology, but nothing has appeared in this field in America that in any way rivals the works of Bernheim or Langlois and Seignobos. Any account of the introduction of the modern methods of historical re-

search in America would be incomplete without some mention of the work of Prof. Albert Bushnell Hart of Harvard. While he has not contributed notably to the further refinement of critical methodology in historiography by his own works, there can be no doubt that he has been easily the leader in promoting the production of scholarly contributions to the field of American history and government, in his capacity as an editor, and in popularizing the more scholarly methods.

The application of the more critical methods to the field of American history has resulted in works worthy to rank with the best European products and has quite reconstructed the earlier notions of American national development. The period of colonization has been examined by Professor Osgood a student of Professor Burgess and Ranke, and his monumental seven volume work on the American Colonies constitutes the highest point to which exact American scholarship has attained, and is worthy to rank with the writings of Gardiner and Aulard. The relation of the colonies to British foreign policy has been recast by Professor Osgood's disciple, George Louis Beer. Professor Alvord, in a scholarly and original work, has for the first time shown the full significance of the problems of British imperial administration west of the Alleghenies for the preliminaries of the American Revolution, and has finally rescued the study of the beginnings of that conflict from the octopus of Boston Harbor. Fisher, Flick, Siebert, Tyler and Van Tyne have at last dealt fairly with the Loyalists. The study of the period of the formation and adoption of the American constitution has finally been secularized through the detailed and critical research of Prof. Max Farrand and the brilliant essay of Professor Beard. Professor McMaster has surveyed the first 70 years of national development with not only scholarship, but a broader and more synthetic approach than has been attained in any other comprehensive American historical work. Much more superficial and narrow in its scope, but equally scholarly is Henry Adams' detailed account of American foreign policy in the administrations of Jefferson and Madison. Professor Turner and his students have applied something of the scholarship of Osgood and the originality and the breadth of interest of McMaster to a study of the colonization of the West, and their work has in many ways superseded the vigorous and interesting survey by Roosevelt. Professor Turner's "school" is the best illustration in America of the combination of exact scholarship with the synthetic tendency in modern historiography. The period of the Civil War and Reconstruction has been dealt with in a calm and temperate fashion by Mr. James Ford Rhodes in a detailed work which for objectivity and scholarship furnishes the only rival to that of Professor Osgood. The same period and the subsequent generation has been covered in an exhaustive manner by Professor Dunning and his students. Dr. E. P. Oberholtzer, a disciple of Professor McMaster, has made a promising beginning in the attempt to present a detailed analysis of the history of the people of the United States since the Civil War, interpreted in the original and comprehensive spirit of his master. The

whole period of national history has been sketched in a careful and dispassionate manner by James Schouler, and Professor Channing is engaged on an ambitious attempt to trace the history of the United States from the period of colonization to the present in a work designed to synthesize the results of the critical studies of the present generation of historical scholars, and which, if completed, bids fair to become the great national history in the better sense of that term. The character of the best American historical scholarship in the first generation of those who had imbibed the newer critical methods is to be discovered in the co-operative 'Narrative and Critical History of America,' edited by Justin Winsor. A much more comprehensive and representative repertoire of American scholarship of a slightly more recent type is to be found in the 'American Nation,' edited by Professor Albert Bushnell Hart. In addition to investigation of the history of their own country, American historians have made important contributions to many other periods and phases of history. Professor Breasted has earned a place among the leaders of modern Egyptology and Rogers, Hilprecht, Jastrow, Olmstead and Goodspeed have done creditable work on the history of Babylonia and Assyria. Professor Ferguson is the world's foremost authority on Hellenistic Athens, Westermann has dealt in an original fashion with the provinces of the Roman imperial system, and Botsford ranged over the whole period of classical antiquity with both insight and the most exacting scholarship. In the field of mediæval history Professor Burr has mastered the Carolingian period and is easily the leading authority in Europe or America on the history of toleration; Larson has investigated the early mediæval history of England and Thompson has dealt with the growth of the French monarchy under Louis VI; Munro had devoted himself particularly to a study of the Crusades; the part played by the Normans in the history of mediæval Europe has been investigated by Haskins with a thoroughness not equalled by any other American or European scholar; few if any English scholars can rival G. B. Adams' knowledge of the constitutional history of mediæval England; Henderson has summarized the results of modern scholarship dealing with mediæval Germany; Emerton has contributed scholarly and detailed manuals covering the entire mediæval period; Lynn Thorndike has recently presented an original synthesis of the best modern scholarship dealing with the Middle Ages, and H. O. Taylor has furnished the best survey of the intellectual history of this period. The original and now generally accepted thesis that the "commercial revolution" rather than the "Renaissance" or the "Reformation" marked the dawn of the modern world has furnished the centre of orientation for the stimulating works of Abbott, Shepherd, E. G. Bourne, Merriman and Cheyney. The French Revolution and the Napoleonic period have profited by the works of H. M. Stephens, Fling, Sloane, H. E. Bourne and Johnston. Thayer has written in an interesting fashion on the history of Italy from the end of the Napoleonic régime to the completion of unification; Henderson, Schevill, Ford and Fay have treated the history of modern Germany; Lybyer has been the only American

historian to devote special attention to the modern history of southeastern Europe; and C. M. Andrews and Hazen have contributed standard political narratives on the history of modern Europe. In Prof. John Bassett Moore the United States has the most productive and authoritative student of the history of international law and diplomacy, and D. J. Hill, J. W. Foster, A. C. Coolidge, C. R. Fish and E. S. Corwin have been some of the other American writers who have contributed to this field. Church history has attracted a large number of American students. H. C. Lea's monographs have entitled him to rank with European scholars like Harnack and Duchesne. G. P. Fisher and Philip Schaff sketched the whole history of the Christian Church. McGiffert won an international reputation by his edition of Eusebius and has since made important contributions to the history of the early Church. The rise of the mediæval Church has received the attention of Ayer and Flick. The period of the "Reformation" has been covered by the monographs of Preserved Smith, Emerson, Faulkner, Jackson and Jacobs. W. Walker has provided a survey of Church history in both Europe and America. David Schaff, S. M. Jackson and W. W. Rockwell have contributed to this field by valuable editorial labors, and Professor Rockwell has been especially active in keeping Americans in touch with the latest developments in European scholarship in this field. The primary attention of European historians to ancient and mediæval history—a lingering effect of humanism and romanticism—has left its impress upon American scholarship and has led to a neglect of modern history. The younger generation of American historians, however, by devoting their energies primarily to modern history, have tended to make a salutary break with tradition and are promising to equal in volume and quality the contributions that their former teachers made to the study of the "Middle Ages."

Historical biography in the United States has tended to take the form of a great number of brief biographies, such as the "American Statesmen Series" and the "Riverside Biographical Series," rather than being limited to a few notable products. Some fine biographies have appeared, however, such as the voluminous documentary biography of Lincoln by Nicolay and Hay, the excellent biographies of Buchanan and Webster by G. T. Curtis, and the more recent ones of Douglas by Allen Johnson, of Andrew Jackson by J. S. Bassett, and of Stephen Girard by J. B. McMaster.

#### XI. THE INDUSTRIAL AND SCIENTIFIC REVOLUTIONS AND THE LEADING TENDENCIES IN MODERN HISTORIOGRAPHY.

**1. The Persistence and Development of Earlier Trends.**—While the major portion of the progress in historiography since Ranke has consisted in rise of new and sounder tendencies there have been important improvements in the earlier and traditional lines of development.

In the first place, while little has been achieved that was not implicit in the methodological system of Ranke, there have been some important improvements in both the critique and the technique of historical methodology since Ranke's time. The fundamental principles of historical criticism have been refined and

systematized in the admirable works of Bernheim and Langlois and Seignobos, so that the beginner may now have at his disposal a more extended discussion of all phases of historical method than Ranke was ever acquainted with. There has also been a great improvement in the mechanical accessories of historical scholarship. Elaborate bibliographies of the historiography of the various countries have been prepared, of which those by Langlois, Molinier, Monod, Dahmann-Waitz and Gross are the more notable. These are supplemented by current lists of the new works which appear, published in the various technical historical journals, and the student is enabled to keep thoroughly abreast of the literature in his field. Remarkably thorough and accurate guides to the vast collections of sources of national and ecclesiastical history which were gathered during the 19th century have been provided, and the modern student may locate in a few minutes in any great library sources which might have occupied any earlier generation in months of fruitless searching. Of this invaluable type of aid the monumental works of Potthast and Chevalier are most worthy of mention. Again, archives, public and private, have been opened more freely to the historical scholar, though he is still excluded from the more recent material. Nor should one neglect to point out the great contribution to efficiency, expedition and accuracy in historical investigation which has come about from the general introduction of card catalogues, filing systems, loose-leaf note books and elaborate schemes for indexing and cross-reference. This important type of innovation and improvement has been chiefly the work of American scholars. As important as the advances in bibliographical and other mechanical aids has been the great extension and improvement of the teaching profession in the department of history. Under the guidance of trained scholars, the members of historical seminars, though of mediocre literary talent may contribute more exact knowledge to the field of history in their dissertations than was contained in many volumes of the older and popular literary history. Finally, historical science has, after two centuries of delay, followed the lead of natural science and become co-operative in the true sense of the word. National historical societies have been formed in all the leading countries, each supporting one or more technical journals. It is also rare now that a single authoritative historian attempts a comprehensive survey of a wide field of history; it has rather come to be the general practice to produce extensive histories on the co-operative plan in order to utilize to the full the ability of specialists. It would seem that historiography can make little more progress in the refinement of critical methodology. It only remains to bring modern history as far as possible under the control of the same exact apparatus of research that has already been provided for mediæval and church history.

A less salutary type of persistence of older tendencies has been the perpetuation of the political fetish of Ranke and his school. A number of causes have accounted for this rather curious survival of a strange distortion of historical interests. In the first place, a great impulse was given to the political orienta-

tion through the students and disciples of Ranke who held steadfastly to the tenets of their master. This was superseded in Germany by the more violent nationalism and political predilection of Droysen, Treitschke, Von Sybel and the others of the Prussian school. The rise of nationalism and political interests in France under the Third Republic kept alive the earlier nationalistic political history that had before been stimulated by the interest in the episodes of the French Revolution and the conquests of Napoleon. In England the universal conviction as to the supreme political capacity of the Anglo-Saxon seemingly imposed a moral obligation upon English historians to concentrate their attention upon the proofs of this superiority. In America the political and episodal historiography was stimulated by the thrills of a great and successful war in behalf of national unity and was perpetuated by the introduction of the tenets of Ranke and Droysen by their returning pupils, who became the leaders and organizers of historical study in this country. Finally, this type of history received a last source of inspiration from the recrudescence of nationalism throughout the world as an inevitable accompaniment of the imperialism or "neo-mercantilism" which developed more or less universally in the period of the "seventies" and the following years. That the adherents of this form of history will gain at least momentary strength and encouragement from the revived importance of nationalism and militarism growing out of the present World War is scarcely to be doubted.

**2. New Developments in the Study and Interpretation of History.**—Important as has been the further development of earlier tendencies in historiography during the 19th century, this has been dwarfed into insignificance by the great advances made in totally new directions or in channels which had been only slightly foreshadowed and anticipated in earlier epochs. The critical political historians provided modern historiography with its accurate methods of research and its vast compilations of primary sources. But, as Professor Shotwell has very aptly said, these scholars were so intensely absorbed in the task of perfecting the methodology of research that they failed to discriminate in the importance of the events which they narrated. It has become the task of an ever-increasing group of progressive historians to promote the synthetic tendency in the hope of giving history a more natural content and a better balanced body of subject-matter. While there can be no doubt that the basis for many of the new developments was laid by the progress of earlier periods in the way of creating the national constitutional state, expanding the European consciousness throughout the world by the commercial revolution, and encroaching upon the field of the mysterious through the great scientific discoveries in the field of natural science during the 17th and 18th centuries, there can be no question that most of the novel elements introduced into the writing and the outlook of the historian in the last century were the product of the vast transformations in social conditions and intellectual interests and attitudes since the first quarter of the 19th century. The chief reason for the great transformation in the historical outlook in the last century has been the fact

that the "Industrial Revolution" and the progress in natural and social science have completely altered not only the material conditions of human life, but also the whole "Weltanschauung" of the civilized world. A more complete reconstruction of the whole mode of life and of the intellectual orientation of civilized peoples has been achieved in the last century than had previously taken place since the beginning of the Christian era, and this great change could not but affect historical concepts viewed as an important branch of intellectual interests.

By the industrial revolution, which was effected between 1750 and 1850, the whole basis of life was profoundly modified and the former ideas and interests quite uprooted and dislocated. The old period of rural stability and repetition was broken up and with the growth of cities the possibilities of invention, imitation and progress were immensely increased. The changes in the centres of population and in the mode of life gave rise to new and strange social problems on a scale hitherto unknown, and demanded the provision of some adequate "science of society" to serve as a guide in their solution. As in the period of the so-called "Renaissance," humanity again loomed larger than the state and social rather than purely political interests forged to the front in historical as in other social sciences.

Not less consequential and epoch-making were the notable advances in natural science in the 19th century which were much more destructive to the traditional philosophy of life than the great discoveries of the 16th and 17th centuries, in that the scientific work of the earlier period centered chiefly in the realm of mechanics and other fields which did not directly concern the problem of the origin and destiny of man, while those of the 19th century had a direct and inevitable bearing upon the interpretation of the derivation and origin of the human race and its relation to the rest of the organic world. Lyell and his fellow geologists revealed the undreamed-of antiquity of the earth and of various forms of animal life. Lawrence, Lamarck, Chambers, Darwin and Wallace, working from both geology and biology, suggested and later proved the gradual and "natural" development of man from the lower varieties of the animal kingdom. The chronology of Africanus, Eusebius and Jerome was discredited for all time through the revelations of pre-historic archaeology in the hands of Boucher de Perthes and Sir John Evans, and the 'Chronicle' of Jerome was replaced by the 'Classification ethnologique' of de Mortillet. "Adam" was reduced, in the new perspective of time, from the originator of the race to a fairly close contemporary of Darwin himself. Man was revealed as the product of natural causes and not of a mysterious creation, in the old and obscurantist sense of the term, and he became, thereby, a legitimate subject for analysis, particularly at the hands of psychology. Along with this progress in natural science went a much further development of critical philosophy and the subjection of scriptural authority and sacred history, already weakened by the established conclusions of scientific investigations, to the same candid and critical investigation which has been accorded to secular history much earlier. The spirit of

Voltaire, Hume and Gibbon had at last permanently come to its own.

It was inevitable that these sweeping alterations in man's outlook upon life should profoundly affect his attitude toward the study of the past, as well as his interests in the present and future. In view of the fact that the industrial revolution was the prime mover in the social transformations of the period it was not surprising that the first vigorous reaction against the conventional political historiography should come through the avenue of a greater emphasis upon the economic factors and the commonplace facts of daily life, the primary importance of which was demonstrated by the historical events of the 19th century. To be sure, the rationalist school had laid considerable stress upon economic influences, Heeren had shown the importance of the commercial activities of antiquity, and Möser had insisted upon the vital relation of economic factors to the development of political organization, but these were only isolated instances of more than the usual contemporary insight and profundity which were almost totally overshadowed and engulfed in the episodic and biographical historiography of romanticism and in the political bias of nationalistic historiography. Economic history, as a general and universal movement of revolt from the narrow political historiography, dates from the publication of Karl Marx's pamphlet entitled, the 'Holy Family,' in 1845, and his joint work with Engels three years later, the 'Communist Manifesto.' While few of the leading figures in modern economic history would defend the economic determinism of Marx, they would at least contend that economic events have an historical significance not second to any other category of facts, and that to pass over them in silence, as did writers like Droysen and Sybel, Stubbs and Freeman, and Burgess and Holst, is to miss much of the significance of any period and inevitably to yield but an imperfect and distorted picture of any epoch. It is important to note that the new economic history was not a break with the exact scholarship of the school of Ranke, but was rather an application of critical scholarship to the recovery of our knowledge of the economic life of the past in its relation to the totality of civilization. In the names of Roscher, Knies, Inama-Sternegg, Nitzsch, Schmoller and Bucher in Germany; of Rogers, Cunningham, Ashley, Gibbins, Hammond and Webb in England; of Levasseur, LePlay, Leroy-Beaulieu, Avenel and Jaurès and his associates in France; of Kovalovsky and Vinogradoff from Russia; and of Bolles, Veblen, Bogart, Coman, Dewey, Clark, Commons, Gay, Callender and Day in America, the student of historiography recognizes scholars worthy to rank with the best disciples of Ranke in the field of critical methodology. In addition to the epoch-making work of the avowed economic historians, this new emphasis upon economic factors in history has filtered into the works of the orthodox school, and few serious historical works are now attempted which do not give at least grudging recognition to the importance of the industrial and commercial life of a people.

Another important new development in historical writing which grew more or less directly out of the effects of the industrial revolution was the origin of sociology and the influence of

the sociological point of view upon historical writing. While there had been sociological tendencies in the writings of earlier publicists and historians, it is generally agreed that the science of sociology had its origin in the necessity of providing a general "science of society" to criticize, evaluate and guide the various reform movements which sprang into existence as a result of the evils of the social and economic transition which accompanied the industrial revolution. Its two great original systematizers were Auguste Comte and Herbert Spencer. The influence of sociology upon history has been varied and profound. One aspect of this influence was evident in Buckle's avowed desire to follow Comte's suggestion of the existence of well defined laws of historical development and to combine this with Quetelet's statistical method of measuring social phenomena, and thus to arrive at an exact science of historical development wholly comparable to the precision reached in natural science. While Buckle's suggestions have been only moderately developed, it has long since been recognized that few valid laws of historical development can be discovered which do not rest upon the firm basis of adequate statistical study. A much more far-reaching reaction of sociology upon historiography has been its influence in broadening the content of history, so as to include all of the important phases of social life and activity. This type of departure from orthodox procedure gained its first great success in the world famous work of John Richard Green. Less popular but equally able were Professor Dill's volumes on the social phases of Roman imperial history. While Green found few immediate followers among his countrymen, who, with the exception of Lecky, for the time being held faithfully to the canons of Freeman, Stubbs and Seeley, the younger generation, led by such scholars as Pollard, Marvin, Zimmern and Slater have organized a powerful movement in favor of a revival of Green's broad social mode of approach to historical problems. Germany has probably been most prolific in the production of historians affected by the sociological movement. In the middle of the last century Riehl and Freytag gathered data for the first comprehensive picture of the social history of Germany, Friedländer described the social life of the Roman Empire, and Buckhardt drew the classic picture of the civilization of the Renaissance. A quarter of a century later Janssen, from a warmly Catholic standpoint, described the social conditions of Germany in the epoch of the Reformation. Erman provided the first reliable and comprehensive account of the civilization of ancient Egypt. The great impulse to social history in Germany, however, came through the labors of the able Leipzig professor, Karl Lamprecht, and his supporters and co-workers Gothein, Steinhausen and Breysig. In France the effect of the new social impulses has been less apparent because the French historians have never been so narrowly political as the German and English schools of history — even such technical and ultra-critical mediævalists as Luchaire, Giry and Monod finding time to discuss social conditions in the mediæval period. Rambaud is probably the nearest French counterpart to Green. The far greater breadth of view in French historiography than in English can best be appreciated by a comparison of

the tables of contents of the 'Histoire générale' and the 'Histoire de France' with those of the 'Cambridge Mediæval History' and the 'Cambridge Modern History.' In Italy, Ferrero has upheld the social point of view in his history of ancient Rome. Worthy and successful imitations of Green's sociological mode of interpretation are to be found also in Blok's 'History of the Dutch People,' and in Kluchevsky's publication of his lectures on the development of the Russian national culture and political organization. Among American historians McMaster has followed most faithfully in the footsteps of Green, and Turner has exhibited a breadth of view not less notable than his exacting scholarship in tracing the colonization of the West. Cheyney's work in the field of English history has always been marked by a broad and well-balanced interpretation. Nor should one forget the promising beginnings in a social interpretation of American history by such writers as W. E. Dodd and Carl Becker, and the application of similar methods to modern European history by Hayes, Lingelbach and others. Professors Breasted and Jastrow have done notable work in reconstructing the civilization of oriental antiquity. Finally, Professor Shotwell of Columbia, while his own written contributions have not been extensive, has rivalled Maitland in stimulating an enthusiastic interest in social history on the part of an ever increasing group of disciples. Another very significant outgrowth of the sociological movement has been its reaction upon the field of constitutional history. While Mōser had anticipated the recent movement in stressing the creative influence of social and economic forces in shaping political forms and institutions, the first great modern school, of constitutional historians, represented in Germany by Waitz and Gneist, in England by Stubbs, and in America by Holst and Burgess, had been content to trace constitutional development in a purely external and formal legalistic manner, or had represented it as a product of the influences of powerful personalities. The spirit of Mōser first reappeared in the uncompleted work of Alexis de Tocqueville on the constitutional developments in 18th century France, which forever discredited the cataclysmic interpretation of the French Revolution by showing how it was the natural and logical culmination of fundamental social and economic forces which had been operating for centuries. A similar mode of approach was evident in the brilliant contributions of Fustel de Coulanges to the constitutional history of France in the early mediæval period. The influence of social and psychic forces in legal and constitutional history was fully recognized in Otto Gierke's monumental work on "Genossenschaftsrecht," perhaps, the most notable German contribution to the newer tendencies in constitutional interpretation, and also in Brunner's monumental history of early Germanic law and Ihering's extensive studies in comparative jurisprudence. What Tocqueville and Coulanges accomplished for France was achieved for English constitutional history by the powerful, original and unbiased mind of Gierke's disciple, Frederick W. Maitland, who for the first time effectively demonstrated the social and economic background of English legal history and made clear the futility of a purely legalistic recon-

struction of constitutional development. Maitland's work in English legal history has been carried on by his friend, Paul Vinogradoff, with a more impressive, if less subtle, scholarship, and with equal productivity. In America a worthy disciple of Maitland has appeared in Prof. Charles A. Beard, who not only shares Maitland's approach to constitutional problems, but rivals him in his disregard of traditional and orthodox opinions.

A direct outgrowth of the industrial revolution which has been of the utmost significance for both historical events and historiography has been the neo-mercantilism or national imperialism which has developed since about 1875 as a result of the need for new markets and investment opportunities which was created by the increase of both commodities and capital through the great revolution in industry between 1800 and 1875. The process has repeated in a much more thorough-going way the commercial revolution of three centuries earlier. European civilization was again brought into contact with different cultures of every conceivable type, and the possession of the scientific knowledge that had been accumulating since 1650 was of the greatest value and assistance in appropriating the new discoveries. The reactions of this movement upon historiography have been nearly as diverse as the civilizations and cultures which have been discovered. Its more unfortunate results have been a perpetuation of ardent national sentiment in historical writing and a stimulation of racial egoism on the part of European and American historians. Its more favorable effects upon historiography, as exhibited in the writings of the more thoughtful historians, have been a broadening of the knowledge of mankind, the enriching of the stores of historical information, an increase of tolerance for cultures different from our own and the great stimulation of the attention of the historian and publicist to the new social, economic and administrative problems created and to their solution in harmony with the principles of enlightenment and humanity. Among the historians and publicists who have given especial attention to these subjects have been Bryce, Douglas, Hobhouse, Hobson, Johnston, Keltie, Kidd, Lewin, Macdonald, Rose and Skrine in England; Bordier, Cordier, Gaffarel, Leroy-Beaulieu, Piquet and Rambaud in France; Meinecke, Meyer, Peters and Zimmermann in Germany; and Blakeslee, Harris, Hornbeck, Jones, Keller, Krehbiel, Latourette, Morris, Reinsch and Shepherd in America. On the whole, the movement has tended to broaden the historical outlook not only with respect to geographical space, but also with regard to the scope of the historian's interests. Especially significant has been the interest that it has aroused in the history of international relations.

A further significant innovation, which was in part a product of the concentration of population due to the industrial revolution and in part an outgrowth of the more scientific approach to the study of social and psychic phenomena, has been the rise of social psychology and its reaction upon history. Voltaire had foreshadowed the psychological interpretation by his doctrine of "the genius of a people," but this concept in the hands of Voltaire was essentially non-historical. He regarded national character as something fixed and immutable,

and he made little attempt to explain its origin. The romanticists had improved somewhat on Voltaire's conception by viewing the development of civilization as the product of obscure psychic or spiritual forces, but they even denied the possibility of discovering or analyzing the nature or operation of this process of psychic causation. Ranke and his school had borrowed from the romanticists the doctrine of the 'Zeitgeist,' but they had been content to describe its varied manifestations in different periods and made no attempt to analyze its content or to account for its origin or mutations. With the growth of cities and the means of communication during the industrial revolution and the resulting increase of social contacts and of the volume of psychic interstimulation, and with the development of modern science with its emphasis upon the amenability of human activities to psychological analysis, there gradually arose a science of collective or social psychology, which first made its appearance in the work of Lewes, Bagehot, Lazarus and Steinhal and was developed by Wundt and Dilthey in Germany; by Fouillée, Guyau, Tarde, Durkheim and Le Bon in France, by Sighele in Italy; by McDougall, Trotter and Wallas in England; and by Giddings, Sumner, Ross, Cooley and Ellwood in America. While this novel development of psychology was at first applied either to abstract or contemporary problems, it soon began to react upon historical interpretations. If the collective psychology was so all-important a factor in recent times it was natural for the original historian to ask the question as to why it had not been of fundamental significance in every age. From a semi-obscurantist view of a "Weltgeist" and a "Zeitgeist," which were either held to be unanalyzable or were left without analysis, the progressive historians turned to an attempt to discover and evaluate the factors which have produced the particular collective psychology of various ages and peoples, and to an effort to account for the transformations of intellectual reactions through the centuries. This line of approach was foreshadowed by Comte's famous formulation of the three stages of the development of psychic reactions. The transition from romanticism to the more scientific collective psychological approach was best exemplified by Taine, who was never quite able to free himself from the obscurantist trends of romanticism. The first and the most distinguished exponent of this newer line of approach to the interpretation of history through the genetic study of the transformation of the collective psychology was the original Leipzig professor, Karl Lamprecht, who not only set forth an elaborate theoretical justification of his methods, but also illustrated them in a monumental survey of German history. Lamprecht's principles have been valiantly defended by some enthusiastic and progressive scholars in every civilized country. While the avowed exponents of the value of an interpretation of history in terms of the changing attitudes of the intellectual classes have as yet been relatively few, the volume of literature which has been produced by them and others which serves to substantiate their thesis has already become considerable. In England Lecky's youthful but brilliant study of the development of rationalism in modern times; John Morley's voluminous

appreciation of the contributions of the French "Philosophes" of the 18th century; Leslie Stephen's masterly sketch of the intellectual history of England in the same period; Poole's study of mediæval thought; the solid contributions of Barker, Figgis and Carlyle to political thought from classical to modern times; the studies in the history of the heroic struggle against obscurantism which have been produced by Bury, McCabe and Robertson; A. W. Benn's survey of English rationalism in the last century; and, above all, J. T. Merz's monumental exposition of the progress of thought and science in 19th century Europe, have been the more notable examples of the growing estimate of the significance of intellectual history. All students of historiography and intellectual history are indebted to the Scotch savant, Robert Flint, for erudite contributions to the history of the philosophy of history. In Germany the more important contributions to this new field have been the massive work of Theodor Gomperz on Greek thought; the brilliant and original contributions of Wilhelm Dilthey and Wilhelm Windelband to the history of philosophy; Adolph Harnack's unique study of the development of Christian dogma; Otto Gierke's great survey of the evolution of certain phases of political theory; and the studies in the history of sociological thought by Paul Barth and Ludwig Stein. France has been creditably represented by the essays of Renan and Émile Faguet; the stimulating studies of the development of human thought from primitive times to the present by L. Lévy-Bruhl; the many brilliant monographs of Émile Durkheim and his school on the most diverse phases of intellectual history; Solomon Reinach's encyclopedic contributions to every department of the history of thought and culture; and the notable works of A. Franck, Faguet and Paul Janet in the field of the history of political theory. In Italy Vico has found a worthy successor in Benedetto Croce, and the Scandinavian nations are ably represented by the labors of Georg Brandes and Harold Höfding. In America this fertile field was first cultivated by John W. Draper, whose once popular works have long since become antiquated. The most widely read American work on intellectual history was Andrew Dickson White's powerful polemic against obscurantism, which probably did more than any other single influence to bring American thought into a proper orientation with the progress of modern science and criticism in every field. Since that time Mr. Henry Osborn Taylor has provided the public with a scholarly survey of the intellectual history of Europe from the period of Roman decadence to Dante. Mr. Henry C. Lea has dealt with several phases of the relation of the mediæval church to intellectual progress. Prof. George L. Burr has devoted his life to an investigation of the history of toleration, the results of which he has forecast in a number of precious articles and monographs. Prof. William A. Dunning has presented the first complete survey of the history of political theory since the publication of the classic work of Janet. Professors W. C. Abbott and W. R. Shepherd have devoted themselves to an investigation of the reaction of the commercial revolution on European thought and culture. McGiffert has sketched the history of

modern religious thought in a brilliant fashion. Finally, Prof. James Harvey Robinson has not only aroused an ardent interest in intellectual history on the part of the large number of enthusiastic students who have attended his stimulating lectures at Columbia University, but is now engaged on what promises to be the first complete summary of the transformations in the intellectual reactions of humanity. In this same field of intellectual history probably belong the valuable researches into the history of natural science in its relation to the progress of civilization which have been carried on by Karl Pearson, Shipley and Whetham in England; Du Bois-Reymond, Mach, Ostwald and Dannemann in Germany; Sarton in Belgium; Tannery and Duhem in France; and Sedgwick, Tyler, Libby, and L. Thorndike in America. Here also belong the contributions to the field of the history of æsthetics which has been cultivated by Symonds, Ruskin, Mahaffy and Murray in England; by Winckelmann, Burckhardt, Gervinus, Gregorovius, Woltmann and Lübke in Germany; by Renan, Sainte-Beuve, Taine and Reinach in France; and by Charles Eliot Norton and Ralph Adams Cram in America. Nor should one forget the many stimulating contributions of such writers as James, Royce, Dewey, Hall and Santayana, in the effort to make the more original and helpful trends in philosophy and psychology the common property of the intellectual classes.

The discussion of the extraordinary development of intellectual history in the last half century furnishes the logical transition from a discussion of those recent trends in historiography which have grown primarily out of the industrial revolution to those which have been a product of the remarkable progress in natural science in the last hundred years. As the industrial revolution was the great event in the economic and social history of the 19th century, so the discovery of the Darwinian theory of evolution was the central fact in the development of natural science in this period. While, as Professor Osborn and others have shown, the idea of evolution is an old one which originated in a certain crude and formal sense, at least, with the same Ionic Greeks that began the writing of prose and of history, its true significance as a fact in science and philosophy began with the publication of Darwin's 'Origin of the Species' in 1859. With the subsequent controversies over the details of the doctrine of natural selection one is not here concerned. Its reaction upon the outlook of the alert and progressive historical student was profound. Spencer worked over the whole field of social science from the evolutionary standpoint and gave it a genetic trend and meaning from which it could never escape. Enterprising biologists and sociologists like Schallmayer and Ammon in Germany, Lapouge in France, Galton in England and Keller in America have attempted to work out a science of social evolution conceived in terms of biological evolution carried over into the social field. Others, among them several distinguished historians, have essayed histories of religion and ethics based upon the new revolutionary conceptions and criteria. In this field the work of Spencer, Lecky, Leslie Stephen, Kidd, Hobhouse, Fiske and Sutherland has been most notable. Finally, an attempt to put the history of law and politics

upon an evolutionary basis was initiated in the suggestive writings of the "organic" school of sociologists and political scientists and of Maine, Bagehot and Ritchie. On the whole, however, the outstanding reaction of the new evolutionary conceptions upon historiography did not consist so much in the various special phases of their application to historical problems which have been mentioned above as in fixing upon the historian's mind the perception of the genetic nature of the social process and in giving him a firm basis upon which to develop a sound theory of progress.

With the general acceptance of the evolutionary hypothesis as to the origin and development of the human race it was inevitable that much greater attention would be given to the influence of the physical environment upon historical development. The general notion of the effect of physical environment upon human types and their behavior was an exceedingly old one which had originated with Hippocrates and had been passed on through the ages by Aristotle, Strabo, Vitruvius, Aquinas, Ibn Khaldun, Bodin and Montesquieu. While their general observations had some rough similarity to the conclusions of modern students, their explanations of environmental causation were most crude, being based primarily upon the doctrine of the alleged planetary influences upon the physiological processes of the human body. The foundations of a scientific study of the relation between geography and history were laid by the monumental studies of Karl Ritter in the first half of the 19th century, which were interpreted to the public in a more popular form by Guyot. Ritter found a worthy successor in Friedrich Ratzel whose profound and voluminous works are conventionally held to have founded the science of anthropogeography. His researches were rivalled in France by those of Élisée Reclus and were interpreted to the English and American world by his pupil, Miss Ellen Semple. In addition to the systematic works of Ratzel and Reclus, many suggestive contributions have been made to special phases of the influence of geography upon history. Metchnikoff has pointed out the significance of the great river systems of the world in the development of the chief historic civilizations. Demolins has dwelt in detail upon the great importance for history of the configuration of the land which has determined the routes which the peoples have travelled in their various dispersals from original seats of culture. Especially noteworthy has been the suggestive, if not entirely convincing, work of Professor Huntington, whose investigations in Asia Minor have enabled him to ascertain the existence of considerable climatic oscillations in the past which throw new light on the hitherto unexplained problems of the shifting of the centres of civilization from Egypt to north-western Europe and of the invasions of Europe by successive waves of Asiatic peoples. The net result of this work of students of anthropogeography has been to compel every self-respecting historian to acquire some knowledge of the geographical setting of a nation before attempting to narrate its history. Historians have not been slow to appreciate the value of these significant studies upon the relation of geography to the development of civilization. Professor George has produced a stimulating

attempt to indicate the general dependence of history, particularly in its military aspects, upon geographical conditions. Professor Myres has sketched in a brilliant fashion the geographic background of the rise of the earliest seats of civilization. The significance of geographical elements in the history of antiquity has been abundantly recognized by Professors Hogarth, Olmstead and Breasted. Ernst Curtius, a disciple of Ritter, for the first time made clear the geographical basis of the history of Greece. Freeman described in great detail the topography of Sicily. Nissen has shown with admirable thoroughness the effect of Italy's topography and situation upon its historical development. The importance of local geographical conditions for the development of national history was made apparent in the case of France by Michelet; with regard to England by Green; for Germany by Riehl; and with respect to the settlement and history of North America by Payne, Shaler, Semple, Hulbert, Brigham and Turner. Finally, Buckle and Hellwald have, with less success, attempted general surveys based upon the conception of the interdependence of nature and the human mind, while Helmolt has presided over the production of the first extensive co-operative history which has made a consistent attempt to emphasize the anthropological and geographical factors in historical development according to the general doctrines of Ratzel. The above bald enumeration of the chief phases of progress in modern anthropo-geography and its contributions to historical interpretation, perhaps, calls for some critical reservations. In no field has there been greater exaggeration of a single set of "causes," or a more persistent flouting of the rules of critical methodology. Particularly have the adherents of this type of interpretation failed to distinguish between a "conditioning" and a "determining" influence. Finally, it is a generally accepted doctrine among all critical students of cultural evolution that environmental influences decrease in importance in proportion as the progress of science and civilization enables man to subdue nature to his own purposes. For these valuable criticisms of too enthusiastic an acceptance of the geographical interpretation students are more indebted to the analytical anthropologists, such as Boas, Wissler, Lowie and Goldenweiser, than to the criticism of historians.

Even more direct and vital in its influence upon historiography was the new science of anthropology, which, in its modern form, was a product of the new evolutionary concepts applied to the study of mankind as a unity. While not ignoring the contributions of earlier students, modern anthropology owed its origin primarily to the researches and writings of Tylor in England, Bastian in Germany and Boas in America. Its purpose, according to Professor Boas, is "to reconstruct the early history of mankind, and, wherever possible, to express, in the form of laws ever-recurring modes of historical happenings." The chief point of contact between anthropology and history is found in the attempt of the former to discover and formulate the laws of cultural evolution. With the controversies between the older school of unilateral evolutionists, represented by Spencer, Aveybury, Morgan and Frazer, the more recent advocates of the doc-

trine of "diffusion," such as F. Graebner, Rivers and Elliott Smith, and the exponents of the so-called theory of "convergent development" of cultural similarities and repetitions, among the most important of whom are Ehrenreich, Boas, Lowie and Goldenweiser, it will be impossible to deal in this place. It will be sufficient to insist upon the fact that no historian can regard himself as competent to attempt any large synthesis of historical material without having thoroughly acquainted himself with these fundamental attempts to bring definite laws of development out of the chaos of historical facts. An attempt to link up cultural anthropology with a dynamic history has recently been made in two thoughtful books by Professor Teggart of the University of California. Dr. Goldenweiser in a recent brilliant article has endeavored to provide a systematic methodological point of departure for scientific history and critical anthropology. Several other significant influences of anthropology in altering the attitude of the historian should be noted. In the first place, nothing could be more destructive of chauvinism or more important for acquiring a proper perspective for the interpretation of historical development than a perusal of the comparative surveys of legal, political, social and religious institutions by such writers as Lippert, Ihering, Tylor, Westermarck, Hobhouse, Durkheim and Sumner. The greatest blow to the venerable myth of the origins of political democracy in the Germanic folk-moot, which it ever sustained, was the discovery that it could be matched among primitive peoples the world over and that it was not the sole possession of the "noblest branch of the Aryans." Again, while the laws of cultural development which have been formulated by anthropology and the breadth or view inseparable from the handling of anthropological data are of the utmost value to all fields of history, anthropology has a particularly close relation to the field of ancient history in that the beginnings of civilization cannot be properly understood and interpreted without a thorough acquaintance with the background of the primitive culture which preceded the dawn of written history. Finally, anthropology, by its study of mankind as a unity in time and space and especially through its basic premise developed by Bastian of the fundamental unity of the human mind, has for the first time provided a firm basis for a rational conception of the real unity of history.

Closely related to the subject of anthropology, and by some considered a branch of that science, is the relatively recent science of prehistoric and proto-historic archaeology. Working in co-operation with geologists and students of paleontology and comparative anatomy the archaeologists, such as Boucher de Perthes, Rutot, Breuil, Boule, Déchelette, Cartailhac, Schmidt, Obermaier, Peet and Munro, have revealed the existence of mankind on the earth during a space of time almost beyond the range of human conception. The origins of the race have been pushed back from the few thousand years comprehended in the exact chronologies of Eusebius, Jerome, Usher and Lightfoot to a vague and uncertain period not less than a quarter of a million years ago. The profound modification in the historical perspective which this epoch-making discovery has necessitated

is obvious. As Professor Robinson has pointed out, Thales and Herodotus can no longer be regarded as among the "ancients," but in the new scale of time must be viewed as our contemporaries. Not only has the discovery of the remoteness of human origins fundamentally altered all previous conceptions of the time element in history, but it has given a new impulse to a dynamic theory of progress, in that it has shown that mankind have advanced further in the few centuries that have elapsed since the dawn of written history than they had in the tens of thousands of years previous to that time, and also because it has demonstrated that the rate of progress seems to be accelerated almost beyond comparison as one approaches extremely recent times. Not only have the archaeologists rendered almost revolutionary services to history in lengthening the historical perspective, but they have also been of the utmost assistance in increasing the historian's knowledge of "lost civilizations" within what are conventionally regarded as "historic" times. Winckler and Garstang have rediscovered the lost Hittite civilization of ancient Syria. Schliemann, Evans and Dörpfeld, among others, have revealed a flourishing Aegean civilization coeval with the civilization of Egypt in the "Pyramid Age" of the third millennium B.C. The progenitors of the historic Greeks no longer appear as the builders of civilization but as barbarous destroyers who ruined a civilization which they were unable to match for five centuries. Equally significant, though less familiar, are the researches of Déchelette, Jullian, Rice Holmes and others in the history and culture of ancient Gaul, which have exhibited an early north European civilization which was in touch with the Aegean civilization at its height and have thrown into high relief the relative savagery and backwardness of Teutonic culture as it appeared in western Europe at the beginning of the Christian era. No adequate history of Europe can any longer ignore the vital importance of this ancient Celtic culture. In this same department should be placed the epoch-making discoveries in philology and archaeology which have allowed scholars to arrive at an accurate and comprehensive knowledge of the civilizations of the ancient East, which had been hitherto known only by allusions in the literature of the Hebrews, Greeks and Romans. About 1825 Champollion deciphered the Rosetta stone, mastered hieroglyphics and laid the foundations of Egyptology. Egyptian chronology and philology were firmly established by Lepsius and Brugsch. Mariette, Maspero and Petrie have led in the excavations that have produced Egyptian archaeology. Meyer has revised Egyptian chronology and Breasted has produced the best synthesis of the history of Egyptian civilization. Erman has provided the only detailed study of the social history of Egypt. What Champollion achieved for Egyptology was accomplished for the history of Babylonia and Assyria by Henry Rawlinson through his reading of the Behistun inscription in the middle of the 19th century. Schrader, Delitzsch and Lagarde perfected Assyriology and Semitic philology; Botta, Layard, Sarzec, Hilprecht and Winckler have supervised the all-important excavations of this region; and Maspero, Meyer, Rogers, Goodspeed and King have pro-

vided the most reliable narratives of Assyrian and Babylonian history, while Jastrow has drawn the best picture of the culture of these ancient nations.

Another most important development in historiography in the last century has been the gradual but sure secularization of "sacred" history and the consequent removal of the last obstacle to the scholarly and objective treatment of every field of history. This progress has been in part a product of the brilliant advances in the critical methods in the last century, and in part has been due to the philosophical destruction of the whole basis of the conception of "sacred" history, which has resulted from the unparalleled discoveries in natural science since 1800. On the whole, it is probable that the latter has been the most important influence because the difference in the skill in handling documents on the part of Mabillon and Wellhausen was infinitely less than the divergence between their "Weltanschauung." The process through which the sources of the Old Testament were discovered and separated has been briefly discussed in an earlier section of this article and need not be repeated here. Upon the basis of this criticism of the sources there has grown up a critical history of the Jewish nation and its religion which had been impossible of attainment since the inclusion of Hebrew history as the corner-stone of the Christian synthesis of the history of antiquity by Eusebius, Jerome and Orosius. A rather lame and halting beginning of a critical and objective history of the Hebrews, upon the basis of the biblical criticism of the early 19th century, was made by the Göttingen professor, Heinrich Ewald, whose 'History of the People of Israel' was published in the years following 1843. The first straightforward and thorough-going critical history of the religious development of the Jews was contained in the 'Religion of Israel,' published by the Leyden professor, Abraham Kuenen, in 1869. Even more advanced was the epoch-making 'History of Israel' of Julius Wellhausen, a professor in Göttingen and the greatest of Old Testament scholars. Wellhausen's work, published originally in 1878, was but a brilliant fragment, and the preparation of a systematic history of Israel in accordance with the advanced views of Wellhausen was the work of the Giessen professor, Bernhard Stade, whose 'History of the People of Israel' was published in 1887. The results of these works from the new critical mode of approach were utterly to destroy the exaggerations regarding the glories of ancient Israel, which had been set forth in Kings and Chronicles-Ezra-Nehe-miah, had been repeated by Josephus, and were thoroughly embodied in Christian tradition. For the first time the history of Palestine was revealed in its proper perspective in the larger history of the ancient East. Not less damaging was the effect of the work of Wellhausen and his associates upon the doctrine of a unique, primordial and revealed monotheism among the Jews. It was clearly shown that monotheism had been a gradual and precarious development out of an original polytheism, and that its maintenance was always difficult and subject to serious lapses. The late origin of the alleged laws of Moses was no less clearly established. The secularizing process was carried

still further by the brilliant Cambridge professor, Robertson Smith, in his 'Religion of the Semites,' which showed the many points of similarity between the religion of the Hebrews and the religious beliefs and practices of the other branches of the Semitic peoples. Finally, Delitzsch, Winckler and Rogers have made clear the profound influence of the Babylonian historical and religious traditions upon the religion of Israel. While the work of the most of these writers was highly technical and intended primarily for scholars, its general significance was popularized through Renan's brilliant and widely-read 'History of the People of Israel.' No less startling has been the result of the invasion of the "sacred" history of the Christian era by the critical methods. Building on the basis of the textual criticism of the sources of the New Testament by such scholars as Strauss, Baur, Loisy and Harnack, and the study of contemporary religions by Renan, Hatch, Cumont, Glover, Dill and others, Percy Gardner, Weizsäcker, Conybeare, Wernle, Harnack, Duchesne and McGiffert have explained with great scholarship and lucidity the syncretic nature of Apostolic and Patristic Christianity, the historic causes for the final success of Christianity, and the nature of the gradual development of Christian dogma and ecclesiastical organization. Henry C. Lea, in a series of massive monographs, which constitute the most notable contribution of America to Church history, has dealt with the most diverse phases of the history of the mediæval Church in a fine objective and secular spirit. Beard and Tröltzsch have traced the rise and development of Protestantism with insight and candor. Three Catholic scholars of the highest rank in the field of scholarship, Döllinger, Huber and Reusch, have made as great contributions to the battle against ecclesiastical obscurantism as any historians from the Protestant or sceptical camps. Döllinger totally demolished the alleged historical foundations of ultra-montanism and infallibility in his work on 'The Pope and the Council.' Huber surveyed the history of the Jesuits with the aim of proving their deadly opposition to the spirit of modern learning and the freedom of thought. Reusch contributed the standard treatise on the history of the Papal Index and threw a flood of light upon the sinister machinery through which the reactionary element in Catholicism has endeavored to perpetuate the credulity of its followers and to exclude the perilous fruits of modern scientific and critical research. The net result of the labors of critical scholars of every religious complexion in the field of "sacred history" has been to destroy entirely the premises of the "Fathers," which led them to mark off a field of historical development which was taboo to critical research, and it has opened every field to the operation of the same degree of patient research and calm and objective narration.

With the growth of modern natural science and the critical attitude in the appropriation and assimilation of knowledge, the effort to formulate some magnificent and systematic philosophical scheme for the organization and presentation of historical development, such as was devised by Augustine and Hegel, has greatly declined. Scepticism of any formal philosophy of history seems to be but a necessary accompaniment of our increasing knowledge of the

infinite complexity of social and historical phenomena, as these attempts to reduce history to such simplicity savor too much of the a priori method, now so thoroughly discredited. To take the place of the older dogmatic philosophy of history there have developed what may be called various "interpretations" of historical data. These at present differ from the older philosophy of history in the absence of any teleological element and in the rejection of the deductive method. They aim solely to emphasize and bring into high relief those factors, which, according to the various schools, seem to have been most influential in producing the civilization of to-day. It is, in short, the attempt to supplement Ranke's aimless search for what occurred in the past by at least a feeble and humble effort to explain how the present order came about. Far from being less scientific than the older program of Ranke, it really constitutes the perfect completion of scientific method in historiography, in the same way that the formulation of the great laws of natural science constitute the logical completion of the task of gathering data by observation and experimentation in the laboratory. The preceding sketch of the development of historiography affords striking corroboration of the thesis of Professor Shotwell that the prevailing types of historical interpretation through the ages faithfully reflect the dominating intellectual interests of the successive eras. The divine epics of the ancient Orient were superseded by the mythological and philosophical interpretations of the thinkers of classical antiquity. With the general acceptance of Christianity, the classical mythology was replaced by that eschatological conception which dominated historical interpretation from Augustine to Bossuet. With the coming of the commercial revolution and its violent shock to the old intellectual order, there arose the critical and rationalistic school of Bacon, Descartes, Voltaire and Hume, which, on account of its being too far in advance of the intellectual orientation of the masses, tended to lapse into the idealism of Kant and Fichte and the romanticism of Burke, Bonald, DeMaistre and Hegel. The growth of nationalism following the French Revolution tended to give temporary precedence to the political mode of interpretation, but the great transformations which constituted the industrial revolution, of necessity doomed so superficial a view to an ephemeral existence. The unprecedented breath and depth of modern knowledge and intellectual interests have produced a number of interpretations of historical development, most of which represent the outgrowth of some one of those outstanding intellectual and social transformations which were reviewed above. There are at present some eight definite schools of historical interpretation among the representatives of the modernized students of historical phenomena, each of which has made an important contribution to our knowledge of historical development. They are in no sense in all cases mutually exclusive, but are rather, to a large degree, supplementary. They may be designated as the personal or "great man" theory; the economic or materialistic; the allied geographical or environmental; the spiritual or idealistic; the scientific; the anthropological; the sociological; and the synthetic or

"collective psychological." It may be pointed out in passing that, in the main, the older type of historian either clings to the outworn theory of political causation, or, with Professor Emerton, holds that historical development is entirely arbitrary and obeys no ascertainable laws. The best known of these schools of historical interpretation, and the only one that the current political historians accord any consideration, is that which found its most noted representatives in Carlyle and Froude, who claimed that the great personalities of history were the main causative factors in the historical development. This view is, of course, closely allied to the catastrophic interpretation of the 18th century rationalists. Perhaps its most distinguished adherents to-day are Prof. Émile Faguet of Paris and Prof. William A. Dunning of Columbia University. The contributions of the economic school of historical interpretation, which was founded by Feurbach and Marx, and has been carried on by a host of later and less dogmatic writers, such as Sumner, Schmoller, Loria, Simons, Ashley, Beard, Bogart and Simkhovitch, are too familiar to call for any additional elaboration. In its best and most generally accepted form, it contends that the prevailing mode and status of the economic processes in society will to a very great degree decide the nature of existing social institutions. In spite of slight exaggerations, no phase of historical interpretation has been more fruitful or epoch-making. Immediately related is the geographical interpretation of history which began with Hippocrates and continued through the writings of Strabo, Vitruvius, Bodin, Montesquieu and Buckle, has been revived and given a more scientific interpretation in the hands of such writers as Karl Ritter, Ratzel, Reclus, Semple, Metchnikoff, Demolins and Huntington. Since the days of Ritter no respectable historian has dared to chronicle the history of a nation without first having acquired a knowledge of its geography. The special phases of this interpretation have been sketched above and need not be repeated at this point. Widely at variance with the economic and geographical interpretation is the somewhat belated offshoot of the idealism of Fichte and Hegel, to be found in the so-called spiritual interpretation of history, which finds its most ardent advocates in Prof. Rudolph Eucken of Germany and Prof. Shailer Matthews of Chicago. Professor Matthews thus defines this view of history: "The spiritual interpretation of history must be found in the discovery of spiritual forces co-operating with geographic and economic to produce a general tendency toward conditions which are truly personal. And these conditions will not be found in generalizations concerning metaphysical entities, but in the activities of worthwhile men finding self-expression in social relations for the ever more complete subjection of physical nature to human welfare." Viewed in this sense, this type of interpretation can be said to have a considerable affinity with the "great man" theory and apparently aims to reconcile this doctrine with the critical and synthetic interpretation, under cover of a common theological orientation. Closely conformable to this mode of interpretation is Prof. E. D. Adams' attempt to connect the historical development of the United

States with a succession of great national ideals, the origins of which are not explained. The attempt to view human progress as directly correlated with the advances in natural science received its first great exposition in the writings of Condorcet and was revived by Comte and Buckle. Aside from the attention given to it by students of the history of science, such as Sarton, Tannery, Libby and Sedgwick, this phase of historical interpretation has been sadly neglected by recent historians, though Prof. F. S. Marvin and Prof. Lynn Thorndike have recently shown its promising potentialities. It has been emphasized incidentally by Professors Lamprecht, Shotwell and Robinson in their synthetic interpretation of history, but it remains the least exploited, and yet, perhaps, the most promising of all the special phases of historical interpretation. Its adherents claim a more fundamental causal importance than can be assigned to the economic interpretation, in that they contend that the prevailing state of scientific knowledge and application will determine the existing modes of economic life and activities. The main tenets of the anthropological interpretation, as well as an enumeration of its chief adherents, have been provided above and may be passed over at this point. The closely related sociological interpretation of history goes back as far as the Arab, Ibn Khaldun; was developed by Vico, Turgot, Ferguson, Condorcet, Comte and Spencer; and has its ablest modern representatives in Professor Giddings of Columbia, Professor Thomas of Chicago and Professor Hobhouse of London. Professor Giddings admirably describes this theory as "an attempt to account for the origin, structure and activities of society by the operation of physical, vital and psychical causes, working together in a process of evolution." As a genetic social science, it works hand in hand with cultural anthropology in the effort to explain the repetitions and uniformities in historical development and to formulate the laws of historical causation. But the latest, most inclusive and most important of all types of historical interpretation, and the one which, perhaps, most perfectly represents the newer history, is the synthetic or "collective psychological." According to this type of historical interpretation no single category of "causes" is sufficient to explain all phases and periods of historical development. Nothing less than the collective psychology of any period can be deemed adequate to determine the historical development of that age, and it is the task of the historian to discover, evaluate and set forth the chief factors which create and shape the collective view of life and determine the nature of the group struggle for existence and improvement. The most eminent leaders of this school of historical interpretation have been Professor Lamprecht of Leipzig; Professors Lévy-Bruhl, Fouillée, Seignobos and Durkheim of Paris; Professor Marvin of London; Professors Robinson and Shotwell of Columbia University, and Professor Veblen of New York. Their general doctrine has gained particular acceptance in France, probably on account of the early and extensive development of social psychology in that country. Even this brief and hasty review of a few of the more conspicuous innovations in the de-

velopment of historiography in the last century will convince the reader that the progress in this field has not been less than in the other branches of human knowledge. It will serve to convey the full significance of Frederic Harrison's statement that Freeman's conception of history as exclusively "past politics" ignored nine-tenths of human history. A synthesis of the various modes of approach to the subject-matter of history must be the ideal of all future historians, but the difficulties inherent in this endeavor will make it hard to be attained. An attempt at a synthetic review of the development of civilization has been essayed by Professor Seignobos. A less complete, but a more stimulating and suggestive outline has been supplied by Professor Marvin. An able and original, if not wholly objective, synthesis of the history of the modern world has been supplied by the detailed manual of Professor Hayes. Prof. W. C. Abbott's recent attempt to indicate the significance of the commercial revolution for the development of modern civilization is probably the best harbinger which has appeared of that synthetic tendency which must characterize the "new history." Professors Robinson and Shotwell have long urged and predicted a larger synthesis of historical material. Whatever success daring individual scholars may achieve in this synthetic movement, it will be apparent that the history of the future must be more and more a co-operative work. The complete mastery of all the newer points of attack will be denied to most individuals and each must contribute through his own speciality. The understanding of this vital fact has contributed more than anything else to a growing spirit of mutual toleration and appreciation among the various "schools" of historians. In much the same way that the truth has been replaced by truth in recent years, so the history of various enthusiasts has been supplanted by a broader and sounder history. Again, in view of the fact that it has now become apparent that the progress of the human race in a cultural sense since 1500 has been greater than the advancement in 50 or more preceding centuries, the supreme importance of modern history has come to be generally recognized, and the primary attention of the previous generation to mediæval history has become a thing of the past. The earnest labors of the mediævalists cannot be deplored for they have furnished the younger generation of historical scholars with not only a sound methodology, but also with the indispensable background for interpreting the origins of the modern age. Out of the labors of the last half century has come a "new history" which will not only furnish a mental discipline for training in the methods of exact scholarship, but will also enable one to know the past and interpret its significance. As Professor Robinson has said: "The 'New History' is escaping from the limitations formerly imposed upon a study of the past. It will come in time consciously to meet our daily needs; it will avail itself of all those discoveries that are being made about mankind by anthropologists; economists, psychologists and sociologists—discoveries which during the last 50 years have served to revolutionize our ideas of the origin, progress and prospects of our race. . . . History must not be regarded as a stationary subject

which can only progress by refining its methods and accumulating, criticizing, and assimilating new material, but it is bound to alter its ideals and aims with the general progress of society and the social sciences, and it will ultimately play an infinitely more important role in our intellectual life than it has hitherto done."

HARRY ELMER BARNES,  
Associate Professor of History, Clark University.

**HISTORY, Ancient.** In the ordinary use of the word, history is a record of past events and conditions as determined by the processes of investigation included in historical method. The history of mankind treats not so much of individuals as of the progress and decline of communities and states with especial reference to morality, religion, intelligence, social organization, economic condition, refinement and taste, government, and the peaceful and military relations of governments to one another (cf. Andrews, 'Institutes of General History,' p. 3). Strictly there are no periods; the life of mankind flows continuously, never wholly changing the direction of its current at any definite time. But for the convenience of study history is more or less arbitrarily divided into periods, during each of which the resultant of changes in the life of mankind, or of a particular part of it, is supposed to be a determinable movement of progress or decline which the historian takes as characteristic of the period.

The familiar division of general history into ancient, mediæval, and modern may be accepted as the most practical, though it is exceedingly difficult to define these long and complex ages. Most obvious is the geographical characteristic. Leaving out of account India and the farther East, which have contributed little to the progress of the rest of the world, ancient history has to do (1) with the fertile

river-valleys adjoining the east end of the Mediterranean; (2) with the Mediterranean basin itself; for the few outlying countries which had a share in ancient history depended upon this area for their civilization. Or taking race and religion as the basis of division, we may define ancient history as the development of pagan, non-Germanic civilization; for with the thorough establishment of Christianity and the coming of the Germans the Middle Age begins. Although ancient history includes many nations and numberless movements of growth and decay, it shows nevertheless remarkable unity. From simple though diverse beginnings the various peoples of the area above defined developed into the one complex political and social organization known as the Roman empire; and when with the wreck of this system the ancient world passed away, there began under new conditions that fresh life of mankind which in its earlier stage we call mediæval and in its more mature growth modern.

History does not concern itself with ultimate origins; it begins with man in the lowest condition in which it actually finds him, and with the help of anthropology, archæology and kindred sciences it traces his improvement from that point upward through the earlier known stages of his existence. For the pre-historic age, which precedes contemporary written records, we are in many cases in a position to ascertain with great distinctness the condition of government, society and culture, although the nature of our sources do not permit us to reconstruct a narrative either of political activities or of personal achievements. Even when the historian reaches the period of contemporary documents and literature, he continues to use all available auxiliary sciences, principally epigraphy, archæology, numismatics, philology and geography. In testing the genuineness and the historical value of sources he makes use of critical principles which are becoming more and more definite and effective with the growth of historical method into a science.

Nowhere has source material accumulated so rapidly in recent years as in the Orient and the region about the Ægean Sea. As a result of continued explorations there our knowledge of human life has been vastly increased, and the beginnings of history have been pushed much farther back into the past. We are now able to study the Egyptians of the paleolithic age (cf. Petrie, 'History of Egypt' (4th ed. i. p. 5 ff), although no date can yet be assigned to that primitive culture, nor have yet been discovered all the links which connect it with the historic age. Beginning with the earliest appearance of written records in the Orient, we may divide ancient history into the following periods. In the chronology of the entire time preceding 1500 B.C. there have been great differences of opinion. This article accepts the system of Eduard Meyer, which has been most widely adopted by scholars.

**I. Dawn of Civilization; Political Unification and the Early Centuries of the Old Kingdom of Egypt; the Sumerian Period in Babylonia; the Later Neolithic Age in the Ægean Country, 4000-3000 B.C.**—Whether mankind first emerged from the Stone Age in the valley of the Nile or in that of the Tigris and Euphrates rivers has long been disputed, but

the evidence now seems to incline decidedly in favor of Egypt. The date of this event, however, has not been closely determined. There can be no doubt that in the fourth millennium B.C. the Egyptians were acquainted with the use of copper tools and weapons. They irrigated their fields, built cities in which they lived under kings, and were acquainted with the elementary practical sciences, such as arithmetic, geometry, surveying and astronomy, as well as with the art of writing (pictographs, hieroglyphs). They had a year of 365 days, which they divided into 12 months.

Gradually the many small principalities along the Nile were united by conquest in a Northern and a Southern kingdom, which were finally joined in one kingdom under Menes about 3300 B.C. The earliest period of united Egypt is designated as the Old Kingdom. Meanwhile tribes of mountaineers, the Sumerians, were invading the lower valley of the Euphrates, evidently from the East. They redeemed these lands from swamps, developed agriculture, created a system of writing (cuneiform), which in time they improved in a phonetic direction, and they discovered the use of copper (Hall, 'Ancient History of the Near East,' p. 30), although for this period no certain written records have been found. They invented also the moon-month calendar and the sexagesimal system of numbers. Briefly, they laid the foundations of Babylonian civilization. As no communication between them and the Egyptians can be discovered, we assume, at least provisionally, that these two peoples made their cultural progress independently of each other. During this period the population of the region about the Ægean Sea were passing through the final millenium of neolithic civilization, best represented in the excavations of Dr. Evans at Cnossus (Hawes, 'Crete the Forerunner of Greece'). The rest of the world was not as yet advanced beyond the neolithic stage.

**II. Continuation of the Old Kingdom of Egypt; Early Semitic Migrations into South-western Asia; the City-States and the Political Unification of Babylonia; the Early Minoan Age in the Ægean country; the Aeneolithic Age in Italy, 3000-2000 B.C.**—In the beginning of this period the capital of Egypt was transferred from Thinis to Memphis, whose Pharaohs of the fourth dynasty (2840-2680 B.C.) constructed as tombs for themselves the great pyramids of Gizeh. For the grandeur and strength of its buildings this age is unique in ancient history. At the same time these immense structures are evidence of a high centralization of power in the hands of the monarchs. A complex system of officials administered the details of governmental business at the capital and in every nook and corner of the kingdom. After the age of the pyramid-builders, however, the central government weakened, and the high officials became feudal lords. It was a period of great economic development, involving a change from copper to bronze. The crafts were highly specialized. Commerce was carried on by river and caravan with the interior of Soudan; a canal was dug which connected the lower Nile with the Red Sea; and royal fleets visited the Phœnician coasts, and occasionally the Ægean islands, for the exchange of products. The people, devoted to agriculture and the indus-

trial arts, were peace-loving, submissive to authority, and intensely religious.

In Asia bands of Semites, issuing from Arabia, overran all Syria. They were the Canaanites of the South, the Amorites of the North, and the Phœnicians along the coast. These larger tribes divided into small city-kingsdoms. Phœnician examples are Sidon and Tyre. Their civilization they obtained from Egypt and even more from Babylonia. About the same time other Semites occupied Accad in the Tigris-Euphrates valley north of the Sumerian country (Sumer, Shinar), and Assur (Assyria) still farther north. Independent city-kingsdoms prevailed among the Sumerians till they were conquered by Sargon, king of Accad (about 2750 B.C.). He extended his empire to Elam on the East and to the Mediterranean on the West. After that date the forces of centralization and of disintegration alternated till the valley of the two rivers was unified under Hammurabi, an Amorite who had gained control of Babylon (about 2000 B.C.). He is especially famous for his code, the earliest body of written law preserved to our day.

In the Ægean region the Early Minoan culture, including the use of copper, followed after a few centuries by bronze, prevailed. A system of picture-writing was in use. For a long time the culture centred in Melos, which radiated its influence upon the neighboring islands, and even farther, upon the Troad in one direction and upon Bœotia and Argolis in the other; but near the close of the period Crete began to occupy the forefront of progress. The use of copper was introduced into Italy about 2500, probably by way of the Danube.

**III. The Middle and New Kingdoms and the Empire of Egypt; Culmination and Decline of Babylonia; Beginnings of the Hebrews; the Middle and Late Minoan Ages; the Bronze Age in Italy and Sicily, 2000-1200 B.C.**—In the beginning of the period Thebes supplanted Memphis as the political centre of Egypt. The most brilliant dynasty was the 12th (about 2000-1788 B.C.). The Pharaohs of this family with a firm hand controlled the feudal lords who since the 6th dynasty had been growing strong over all Egypt, and to whom most of the famous rock-graves of the period belong. The same dynasty conquered Ethiopia (Nubia), carried on a lively trade with Syria, and had commerce with countries as far west as Crete. They built splendid temples, and regulated the waters of the lower Nile by means of a great reservoir in the Fayûm. Their utilitarian works contrast strikingly with the grand though selfish idealism of the pyramid-builders.

After the 12th dynasty Egypt again weakened. While she was in this condition, the Hyksos, who seem to have been Semites from Syria, invaded the Nile Valley, and held parts of the country in subjection a hundred years (1680-1580 B.C.). Less civilized than the natives, they brought Egypt to a lower stage of culture, but gradually their king and leading men were assimilated. Their own contribution was the introduction of the horse and the war-chariot, the use of which gradually extended to the remotest parts of Europe. After their liberation from this foreign yoke, the Egyptians became a conquering people. The 18th dynasty (1580-

1321 B.C.) built up an empire which extended southward through Nubia and northeastward to the Euphrates River. Cyprus and the "Isles of the Great Sea," doubtless the Ægean Islands, sent their gifts, which Pharaoh regarded as tribute.

After Hammurabi, Babylonia suffered from frequent invasions of barbarian tribes. Though her political greatness vanished, her civilization, however impaired by the invasions, continued. In the industries both Egypt and Babylonia had reached a high stage of technical skill. The Egyptians excelled in inlaid work, the Babylonians in the engraving of gems. The architecture was massive, the Babylonian in brick, the Egyptian in stone. The sculpture, too, though lacking grace, showed great strength. The literature was looked upon by after ages as classic. In government we find a centralized monarchy with a bureaucratic administration. In this period the creative energy of the Egyptians had exhausted itself. Life became artificial; wealth, flowing in from conquests, substituted magnificence for taste, and in the end enfeebled the national spirit. On account of the wars the military class came into great prominence; the king, more than before, became the proprietor of the state, and the priests gained control of the material as well as of the spiritual activities of the nation. In Hither Asia, also, artistic and industrial civilization suffered through the decline of Babylonia; for the Assyrian genius was chiefly political and military rather than artistic or intellectual. The family was monogamic, and society was definitely organized in classes. The prime motive power in life was religion, which, manipulated by the priests, was already reducing the activities of man to a system of conventions and thus putting an end to originality.

As the Egyptians lost military power after the 18th dynasty, they were expelled from most of their Asiatic possessions by the Hittites, a people of eastern Asia Minor. They were the first to use iron, obtaining it from the country afterward known as Pontus. In the 13th century we find them supplying Egypt with that metal. Soon afterward their power declined, as they were assailed on the East by the Assyrians, and on the opposite border by many roving tribes from western Asia Minor, from the Ægean Islands, and probably from Europe. One of these peoples from the Minoan area settled on the Mediterranean Coast south of Phœnicia, and are known as the Philistines; others raided the Egyptian Delta (12th century B.C.). Before this date the interior of Syria had come to be occupied by new Semitic tribes from the desert, the Hebrews in the South and the Aramaeans about Damascus in the North. Meanwhile there flourished in the Ægean region the Middle Minoan civilization, centering in Cnossus and Phæstus, Crete, and manifesting itself in great palaces, sumptuous dwellings of nobles, a high development of arts, industries and commerce, polychrome pottery of great variety and brilliancy, a linear script as yet undeciphered, and a bureaucratic administration similar to that of Egypt. In most respects this civilization far outshone the Oriental. The Late Minoan period (1600-1200 B.C.) is one of stagnation and decline, in which the centre of political power shifted from Crete to Tiryns and Mycenæ on the Greek Peninsula.

From about 2000 B.C. Indo-European tribes were entering various parts of the civilized world, including Iran and India in Asia and Greece and Italy in Europe. Everywhere they blended with the natives, and usually gave their language to the people resulting from the amalgamation. In the Greek Peninsula the Hellenic or Greek race was thus formed. From the mainland it gradually colonized the islands and the eastern coasts of the Ægean Sea. About 1400 the cities of Crete were devastated, probably by Hellenic and other raiders. Afterward these sites were occupied by far poorer and less civilized villages. The decline of the Minoans through internal decay and barbarian immigrations brought their period to a close about 1200 B.C. In Italy there prevailed the bronze civilization, including the peculiar Terre-mare settlements in the Po Valley. Sicily and southern Italy were in communication with the Ægean area, whence they received various cultural elements, and probably colonies.

**IV. The Growth and Decline of the Syrian Kingdoms; Rise of the Assyrian Empire; the Greek Middle Age; the Early Iron Age and the Coming of the Etruscans in Italy, 1200-700 B.C.**—As the Minoans declined, the Phœnicians succeeded for a time to their commercial position in the Mediterranean. From what has been said it is clear that they were by no means the earliest mariners. At first Sidon was their leading city, but after a time its place was taken by Tyre. The Phœnicians explored the coasts as far as the Pillars of Hercules (Strait of Gibraltar) and even the adjoining Atlantic seaboard, planting along the way trading stations, some of which like Carthage (founded about 800 B.C.) became flourishing cities. Their civilization, with that of all Syria, was fundamentally Babylonian, affected to some extent by Egyptian commerce and conquest. Their alphabet seems to have been derived by a process of selection from the Minoan script, and was the first purely phonetic system. The Greeks adopted it with modifications, probably about 900 B.C.

The Hebrews under their most famous kings, David (about 1000 B.C.) and Solomon, developed a great political power; but after the death of Solomon they split into two kingdoms, Judah and Israel. Damascus, which David had acquired, again became the capital of an independent Aramæan kingdom. Near the end of the period, however, all Syria excepting Tyre fell under the Assyrian yoke. The people of Damascus (about 730 B.C.) and Israel (722 B.C.) were carried into captivity, and Judah became tributary. Babylon, too, was definitely conquered (728 B.C.). Egypt, again declining, divided into many small principalities, while Ethiopia rose to a power of the first importance. Her king conquered the Nile Valley to its mouth in 728 B.C. But the greatest political event of the period was the rise of the Assyrian Empire. Through persistent warfare carried on by a line of able kings for crushing frequent rebellion as well as for new conquests, the empire reached the height of glory, though not yet its widest extent, under Sargon (722-705 B.C.).

Babylonia was crippled for centuries by the invasion of barbarous Chaldeans, who were Semites from Arabia; and it was not till the following period that the reinvigoration, caused by these virile people, prepared the

lower Euphrates Valley for a new imperial career.

Meantime great progress was made in civilization. The Hebrews, afflicted by Assyria, were purging themselves of polytheism, and under the lead of inspired prophets were learning to look upon Jehovah as the only God, almighty, pure and jealous, who demanded of his worshippers not only ceremonial exactness but clean hearts and spiritual devotion. With the Assyrians, notwithstanding their strong religious nature, political motives were dominant. For strengthening their empire they adopted the plan (1) of recruiting their armies partly from conquered peoples, (2) of transplanting populations from one part of the empire to another, to break up local attachments and weaken the power of resistance, (3) of organizing some of the conquered countries into provinces ruled by Assyrian officials, though many were still left under their native rulers. In government and administration, accordingly, Assyria was at this time the most progressive of Oriental nations. Efficiency, however, was offset by harshness. The transplanting of populations is always attended by extreme suffering, to which the Assyrians lent a deaf ear. They mercilessly exacted tribute; and suppressed rebellions with horrible cruelty. The records teem with royal boastings of tortures inflicted upon conquered enemies.

In this period the centre of interest in the growth of civilization shifts to the Ægean region, where the Hellenic race was gradually emerging from the union of invading Indo-Europeans with native Minoans. Doubtless the latter had more than the former to bestow upon their common progeny, the historical Greeks, particularly in religion, in law and social organization, and in the elements of industry and art. For a long time life was relatively barbarous, represented by the prevailing geometric art; but in the various excavations, especially those of Sparta, Ephesus and Miletus, we can trace the gradual recovery of civilization. Most progressive were the Æolian and Ionian Greeks who had colonized the eastern coast of the Ægean sea and the neighboring islands. It was they who produced the first European literature—the 'Iliad' (q.v.) and the 'Odyssey' (q.v.). Colonists in a strange country, the Ionians drew their subsistence from grazing, agriculture, and war. With a high degree of refinement, mixed with barbarity, they possessed remarkably virile, elastic minds. In contrast with the slavish Orientals, the Greeks, represented by the Ionians, were in spirit free. To them neither nature nor religion was terrible; their gods were intensely human, generally the helpers, never the implacable enemies of man. Combined with this intellectual liberty and boldness was a rare sense of fitness and proportion, manifested in the Homeric poems referred to above. In Greek manhood, virility, freedom, intelligence and taste combined to produce a civilization which was already rapidly advancing beyond that of the Orient. The Ionians in fact soon surpassed the Phœnicians in navigation and in the arts. It is now well known that many utensils, art objects and decorative patterns formerly ascribed to the Phœnicians belong in truth to the Ionians, who were the chief innovators in a material civilization which centred in the Ægean area and extended through commerce to Etruria in one

direction and to the Euphrates in the other. Among the most important constructive agencies in the industrial world was the use of iron, introduced from the Hittite country into Crete in the 13th century B.C., and extended gradually from that island over the Ægean region and to Italy and Sicily. In the 8th century it was known to the Spartans, and probably still earlier to the more progressive people of the coast and islands. Hardened to steel, it added greatly to the efficiency of weapons and of all cutting instruments.

In Italy the Terremare settlements were abandoned (about 1000 B.C.), and the tribes of Indo-Europeans, who had entered the Po Valley a thousand years earlier, began their migrations into the peninsula. As a result the Latins, the Umbrians and the Sabellians took possession of their respective historical countries. Here, as in the Ægean region, with the transition from bronze to iron, civilization fell temporarily to a lower level, from which it gradually rose. The Early Iron (Villanova) Age extended from 1000 to 800 B.C. In this period the famous 'hut urns' make their appearance in Etruria and Latium. Nearly at the latter date occurred the migration of the Etruscans from the Ægean region or its neighborhood into Italy. In culture and in language, which has not yet been deciphered, they bear close resemblances to the decadent Minoans and to the natives of Asia Minor.

**V. The Fall of Assyria and the Rise of the Persian Empire; in Greece Colonial Expansion and the Awakening of a National Consciousness; the Struggle Between Asia and Europe, in which Greece Becomes the Centre of Interest in the World's Politics; in the Central Mediterranean Region the Political Growth of Carthage and Etruria; at Rome the Primitive Kingship and the Beginning of the Republic, 700-479 B.C.**—Early in the period Lydia became a conquering state, and reached the height of its imperial power under Croesus (560-546 B.C.), who ruled nearly all Asia Minor west of the Halys River. Egypt fell under the Assyrian power (664 B.C.); but soon throwing off the yoke, it enjoyed a long period of independence (645-525 B.C.). Before the loss of Egypt the Assyrian empire reached from Thebes on the Nile nearly to the Caspian Sea, and from the Persian Gulf nearly to the Black Sea—the greatest extent of country yet united under one ruler. In Nineveh, their new capital, the kings built magnificent palaces of brick, adorned with representations of their wars in sculptured reliefs. They established libraries, too, of Babylonian learning. But they had already ceased to make political progress, and they failed to give their empire an organic unity, and to inspire the conquered nations with loyalty to the central government. Suddenly the empire was overthrown by a combination of the Babylonians and the Medes, who destroyed Nineveh in 606 B.C. With this event Assyria disappeared from history.

Two empires—the Median and the Babylonian—divided between them the Assyrian domain. The former lay in the north of Hither Asia, the latter in the south. Under Nebuchadnezzar (606-562 B.C.) Babylon became the largest and wealthiest city in the world, a brilliant seat of industry and commerce. He destroyed Jerusalem, carried Judah into captivity (586 B.C.), and conquered Tyre. Of the

other empire the ruling people were the Medes, an Indo-European people, who inhabited the plateau between the Tigris Valley and the Caspian Sea. Their sway extended westward, on the north of Babylonia, to the Halys River, and southward over their Persian kinsmen. Both empires, however, were short-lived; in 550 B.C. Cyrus, an Elamitic prince, at the head of a Persian revolt, established himself master of the Median realm. This event made the empire Persian. After conquering Lydia (546 B.C.) and Babylon (538 B.C.), Cyrus proceeded to subdue the countries to the east and northeast of Persia; so that at his death (529 B.C.) his empire extended from the Ægean Sea to the Indus River, and from the Persian Gulf to the Jaxartes River—an area perhaps five or six times as great as that of the Assyrian empire. His son and successor, Cambyses, added Egypt (525 B.C.), and Darius, the following king (522-485 B.C.), completing an organization begun by Cyrus, divided the empire into 20 satrapies (provinces), each under a governor termed satrap. This magistrate, appointed by the king, exercised full military and civil authority over his province, subject to royal regulations and commands. Though checked by the continual presence of a royal secretary and by the occasional visits of the king's "eye" (inspector), the satrap enjoyed the splendor and nearly all the power of a sovereign. Darius also built roads throughout the empire, distributed the taxes equitably, and established a system of gold and silver coins. He annexed Thrace to his empire, and made an unsuccessful attempt to conquer Greece.

In the beginning of this period the Greeks were extending the sphere of their influence through colonization. About 750 B.C. they had begun to settle in southern Italy and Sicily; and for two centuries the movement of expansion continued, till their settlements extended from Naucratis, Egypt, to the Pillars of Hercules, and from the northern coast of the Black Sea to Libya. With colonial enterprise the industries and commerce kept full pace. They manufactured armor, artistic bronze-ware, and tastefully painted vases. From Lydia they learned the art of weaving and dyeing fine woolsens; from Egypt they derived the elements of astronomy, of surveying, and of the other practical sciences. Great intellectual progress took place; lyric poetry, which flourished in all parts of Greece, shows by its contents that the Greeks were actively thinking on all subjects suggested by their expanding environment. They made a beginning of geography, history and philosophy. Thinking led to religious and moral progress; the Greeks began to exercise self-restraint and moderation in life. Their sympathies widened with their intelligence; they discovered that they were all of one blood, one speech, and one religion, and began to call themselves by the common name of Hellenes. They became aware, too, of the differences between themselves and foreigners, whom they termed "barbarians," and of their own superiority to all other races. Conflicts with foreigners made the Greeks feel that they ought to combine for mutual defense. In the preceding age (1200-700 B.C.) their whole country was divided among a multitude of small city-states, each under an independent king. While in the more progressive parts of the nation in the period

now before us the government was rapidly developing from kingship through aristocracy, oligarchy or timocracy, and tyranny in the direction of democracy, a corresponding movement was going on toward political unity. The city of Sparta, after uniting by conquest Laconia, Messenia, and Cynuria in the strong military state of Lacedæmon, built up the Peloponnesian league with herself as leader. The basis of her superior military organization was the phalanx. Under the fear of Persian invasion this power expanded into an Hellenic league of all the loyal Greek states on the peninsula and on the neighboring islands. In Sicily a similar league grew up under Syracuse for defense against two formidable powers, Etruria and Carthage. The Etruscan dominion extended from the Alps to the vicinity of the present Naples, and probably included the then insignificant city of Rome, which after having been ruled from the earliest times by kings set up a republic in 509 B.C. The Etruscans, now at the height of their development, were equally powerful by land and sea. Even more formidable to the Greeks was Carthage, the greatest Phœnician colony, which united under its leadership all the other Phœnician settlements in the western Mediterranean region. By means of enormous wealth, accumulated through commerce, this city recruited a vast army of mercenaries, with which she hoped to overwhelm the western Greeks.

Checked by the growth of foreign powers, Greek colonial expansion came to an end about 550 B.C. Then the boundary of free Hellas on the east was pushed back by the Lydian and Persian conquests in Asia Minor. A revolt of the Ionians against Darius, in which the insurgents were aided by the mother country, precipitated between Asia and Europe a conflict destined to affect the whole future history of the world. An army sent into Greece by Darius, was beaten back by the Athenians at Marathon in 490 B.C. Ten years afterward, Xerxes, son and successor of Darius, led a vast host into Greece, hoping to overwhelm the free little country by the sheer force of numbers. But his fleet was shattered in the battle of Salamis (480 B.C.) and his army destroyed at Plataea by the forces of the Hellenic league (479 B.C.). Meantime at Himera, Sicily, the despot of Syracuse destroyed the invading mercenary army of Carthage (480 B.C.). The Greeks met with brilliant success both in the East and in the West: those of their race in Asia Minor were liberated; all were relieved from fear of foreigners; Greek civilization was free to develop without the restraint of alien rule; Greece came out of the struggle strong, proud, self-conscious, ready for great achievements in peace and in war.

VI. The Culmination and Decline of Greek Political Power and of Greek Civilization; the Hellenization of the Orient; the Unification of Italy Under Rome, 479-264 B.C.—The splendid naval force which Athens furnished for the war, together with superior statesmanship, placed her at the head of a new league of maritime Greek states, known as the Delian Confederacy (organized 477 B.C.). Rivalry for the headship of Greece between democratic Athens and oligarchic Sparta led to the Peloponnesian War, which involved a great part of the Greek world (431-404 B.C.), and

which ended in the establishment of Spartan supremacy (404-371 B.C.) over eastern Greece, while nearly all western Greece was united under Syracuse. Oppression on the one hand, and on the other the love of the Greeks for city-autonomy, caused the downfall of both political powers. For a short time under Epaminondas (371-362 B.C.) Thebes attempted to take the place of Sparta, but in vain; the Greek state-system,—consisting of leagues and hegemonies of cities,—was rapidly crumbling. Meanwhile Macedon, a territorial state under King Philip, taking advantage of the political disunion and mutual jealousies of the city republics, began to encroach on free Hellas. After defeating the combined forces of Athens and Thebes at Chæronea (338 B.C.) he imposed his protectorate upon the Hellenic state-system. His son Alexander the Great in a series of brilliant campaigns (334-331 B.C.) conquered the Persian Empire, and afterward extended its boundaries to the northeast and the east. His empire was the largest the world had known. Among his improvements was the specialization of administrative functions, financial, judicial and military. When he died, the empire after a long struggle among his generals ultimately divided into three great states,—Egypt, Asia (the Seleucid Empire) and Macedon, including Greece. To regain and preserve their liberty many of the cities of eastern Greece entered into two federal unions, the Ætolian and the Achæan. These institutions, though long known to the Greeks, came into favor too late to save them from the domination—not of Macedon but of Rome. The western Greeks, however, were first to meet their fate.

After adopting a Republican constitution Rome engaged with her neighbors in a long, desperate struggle for existence (509-431 B.C.). Then by securing the headship of Latium (431-406 B.C.) and by the conquest of Veii she became one of the strongest powers in Italy. A series of wars with the Latins, Samnites and Italiot Greeks (343-290 B.C.) gave her control of all Italy south of the Rubicon River. The success of the Romans was due to their improvement on the Greek phalanx, their strict discipline and obedience to authority, their laborious patience in fortifying acquired territory and their liberality in the treatment of conquered peoples. The political system which in this period they gradually built up on the basis of Italian nationality recognized various gradations of rights and obligations among the communities of the system from the tributary subjection of the Gauls to the full Roman citizenship. Though partly federal, the system left to Rome absolute control of foreign and military affairs. At the close of the period (264 B.C.) Rome and Carthage were the great powers of the western Mediterranean; those of the East were Macedon, Egypt and the Seleucid Empire.

The century and a half (479-322 B.C.) following the Græco-Persian War was in some respects the most brilliant in the history of civilization. The tremendous energy roused in Greece by the war displayed itself under the guidance of taste and reason in every field of activity. A wave of independence, overthrowing tyrannies and oligarchies, established popular governments in many cities, and intensified the democracies already existing. In Periclean

Athens, which depended economically upon the labor of slaves and tributes from dependent allies, the citizens enjoyed a more liberal education and a wider range of political and social privileges than have ever fallen to any other community known to history. In close relation with this political and social development architecture, sculpture and literature reached ideal perfection. The 5th century produced the Attic drama (Æschylus, Sophocles, Euripides and Aristophanes), the noblest historical writing (Herodotus and Thucydides), and the inimitable Parthenon and Erechtheum. But the Peloponnesian War exhausted the energy and resources of eastern Greece. The growing refinement and love of peace which characterized the following century is indicated by the fact that the inhabitants of the city-states shirked military service, so that war came largely into the hands of mercenaries drawn from the less cultured territorial states. Thought prevailed over action; and in art strength was to some extent sacrificed to beauty and finish. While poetry declined, oratory and philosophy reached the height of their development in Demosthenes, Plato and Aristotle, who brought classic Greek literature to a close.

Following the conquests of Alexander, commerce, colonization and administrative policy spread Hellenic civilization over the Orient. In the post-classic period (after 322 B.C.) Pergamum and Alexandria became the most famous seats of Hellenistic culture, which was distinguished for painstaking scholarship rather than for creative power. The West, too, was falling under Hellenic influence. Rome adopted from the Greeks not only the phalanx, but also various deities and religious ideas, the alphabet,—either directly or through the Etruscans,—and other rudiments of civilization. From the Etruscans chiefly came the impetus to the building of public works,—temples, sewers, roads, bridges, fortifications,—in which the Romans showed creative genius. But to the end of the period they paid little attention to learning; they were without literature and had few if any schools. A realistic, practical people, they were narrow and unamiable in private and business relations, but excellent warriors and citizens. Duty and Discipline were the great commandments to which the family and society, citizens and soldiers, yielded religious obedience. These heroic virtues were not the least important factor in the creation of their empire.

**VII. The Expansion of the Roman Power over the Mediterranean World; the Growth of Plutocracy and the Decline of the Republic, 264–227 B.C.**—The extension of the power of Rome over the peninsula brought her into collision with Carthage, which had occupied nearly the whole of Sicily and was now threatening southern Italy. Not only did Rome feel bound to protect Italy, but her growing commercial class desired by conquest to extend its opportunities for trade and speculation. The First Punic War (264–241 B.C.) may be compared in character and importance with the war between the United States and Spain, which resulted in the occupation of the Philippine Islands by the former power. To meet the Carthaginians on their own element, Rome built a navy, and thus equipped herself for transmarine conquests. As a result of the

war, Carthage surrendered Sicily to Rome in addition to paying a heavy indemnity. This island became the first Roman province (227 B.C.). Sardinia and Corsica, acquired soon after the war, were organized into a second province. Then by conquering the Gauls in the north of Italy (225–222 B.C.) the Romans extended their sway to the Alps. In the Second Punic War (218–201 B.C.) the Carthaginian Hannibal, one of the most eminent generals of all time, invaded Italy, defeated one Roman army after another, desolated the country and came near wrecking the power of Rome. Her preservation was due to the wisdom of the Senate, to the solidity of Roman character and to the tie of common interests and of kindred blood which bound the Italians together against the alien intruder. This war of defense shows Rome at her best. Peace brought her two provinces in Spain and the destruction of her rival's navy. So greatly superior was now her strength that the conquest of the civilized world had become merely a question of a few years. In another series of successful wars (200–146 B.C.) she acquired Macedon, Greece, Asia Minor and the country about Carthage. Corinth and Carthage were destroyed, and most of the acquired territory was organized into provinces. At this date (146 B.C.) Rome was the only great power in the entire Mediterranean basin. The further growth of her empire consisted mainly in the conversion of protected and dependent countries into provinces and an occasional conquest. To Pompey belongs the subjugation of Syria (65–62 B.C.), which alone remained of the Seleucid Empire, and to Julius Cæsar the more important conquest of Gaul (58–50 B.C.). Egypt, long dependent, became a province in 30 B.C. The Roman Empire, consisting of provinces and dependent allies, now included the whole circuit of the Mediterranean.

Some advantages came to the world from Roman rule: while in the East Græco-Oriental culture continued undisturbed, Latin civilization, which was falling more and more under Hellenic influence, gradually permeated the provinces of the West; throughout the empire the cities retained their own laws and self-administration under the government of their wealthy class; all parts but the frontiers enjoyed lasting peace. The evil effects of the system, however, soon began to outweigh its advantages. To secure a monopoly of commerce for themselves, the Romans restricted trade among the subject communities. Over all the empire they acquired vast estates, which they worked by slave labor, thus destroying everywhere the free peasantry. Their policy of farming the taxes was also unjust and oppressive. The governors, too, with rare exceptions made office a means of amassing fortunes. In these ways the administrative and capitalist classes recklessly exploited the provinces for their own profit. At the same time commercial restrictions and the competition of slave labor were ruining the farmers and business men of Italy, and a worthless, dangerous mob was growing up in the capital.

The early government of Rome by magistrates, Senate and assemblies, although admirably adapted to a small community, proved unequal to its new and complex functions. The assemblies, now becoming corrupt, were in the

hands of magistrates, ministers of the Senate, which as a whole was controlled by a small knot of members, the *curule ex-magistrates*. This inner circle formed in the beginning a nobility of merit; it saved the state from Hannibal and conquered the Mediterranean world. But it soon transformed itself into an hereditary caste, which, monopolizing the domestic and imperial offices, used them as a means of absorbing the wealth of the world. In brief the nobility degenerated into a corrupt, self-seeking plutocracy. As to the general condition of the world at this time it should be noted that the want of competition, such as exists among nations of approximately equal power, or stated positively, the monopolistic greed of Rome, by reducing the vitality of mankind, stopped progress, and decay was already setting in. Thorough reform was needed even to postpone the collapse of ancient civilization.

The Gracchi sacrificed their lives in a vain attempt to regenerate the peasantry and to restore Italy to its old condition of economic health; at the same time they showed the enormous power of the plebeian tribunate for purposes of reform or revolution. Far preferable to government by the corrupt aristocracy or by the mob, which Gaius Gracchus organized, would be the strong rule of one man; and the task of creating in the army a solid foundation for a government of the kind was accomplished by Gaius Marius. After him the governor (*proconsul*) of a military province employed his position as a means of acquiring an army for political use; and the *proconsuls* became rivals for the mastery of Rome. Finally Gaius Julius Cæsar, an aristocrat by birth but a champion of the people, allying himself with the tribunes, overthrew the republic and created a virtual monarchy. This great statesman planned many radical reforms, including the abolition of the pernicious system of tax-farming, the reorganization of the municipalities and the subjection of the provincial governors to a stricter supervision. His enemies, however, did not permit him to live long enough to carry out his reforms; and it is in fact doubtful whether the absolute monarchy which he planned would have proved a blessing. The assassination of the monarch, far from restoring the republic, was followed by a war of succession, in which his grand-nephew Octavius—after 27 B.C. Augustus—won the imperial prize (31 B.C.).

VIII. **The Empire at Its Height, 27 B.C.—180 A.D.**—Instead of recurring to the autocracy of Cæsar, Augustus hit upon a compromise between republic and monarchy (27 B.C.). The Senate through its magistrates and promagistrates was still to govern Rome, Italy and the peaceful provinces, while Augustus as holder of the military authority (*imperator*, hence emperor) was to rule directly the exposed and unquiet provinces and to exercise supervision even over those administered by the Senate; the republic was to continue for Italy, the monarchy was established for the subject countries. In Rome, Augustus held the tribunician power, and was sometimes elected to republican offices; but his chief influence over the home government was exercised not through office but in the capacity of political "boss,"—a position which the Romans dignified with the name of *princeps* (foremost citizen). The prince and the Senate

had not only their separate fields of administration but also separate treasuries and separate sets of officials. Augustus and his successor, Tiberius, strove to maintain what was left of the republic; the Claudian and Flavian princes, by gradual encroachment on the senatorial prerogatives, aimed to convert the principate into a monarchy. As the Senate declined, the officials of the prince, originally his friends and household servants, developed into an imperial bureaucracy. After the tyranny of Domitian the "Good Emperors" (96-180 A.D.), in reconciling the nobility to the principate, laid more firmly the constitutional basis of their power. The government may now be termed a monarchy, although the Senate, with its republican traditions, continued to be a material check upon the powers of the prince.

The emperors made few permanent conquests,—chiefly Britain and the Danubian provinces. Their fundamental task was to extend Latin civilization to the un-Hellenized parts of their dominion. In Africa west of Egypt, notwithstanding the survival of the Phœnician language in private life, Latin civilization took deep root. Spain and southern Gaul became perhaps even more thoroughly Latinized. Northern Gaul was less affected, and Britain still less, by the Romans, while the northern provinces east of Gaul varied greatly in their receptivity of Latin culture. The principal factor in the work of civilization was the city; in most of their European domains the Romans superseded the old tribal organization by the Italian municipal system, which gave the nations the refining and disciplining influence of comfortable homes, useful and artistic public works, schools, courts of justice and local self-government. Each city was a centre from which Latin modes of life and Latin ideas radiated. Imperial rule cured most of the ills of republican administration. Abolishing the farming of direct taxes, it placed their collection in the hands of imperial officials, and distributed them on the basis of a careful census. The governors, now drawing their salaries from Rome, and deprived of their former unlimited opportunity for extortion, were held responsible to the emperor. The armies, placed under strict discipline and controlled by one will, no longer wasted the empire by civil wars. For the vast extent of the frontier the soldiers were few, and the burden of their support was light. The republic had looked upon the provinces as its estates; in the 2d century A.D. the emperor came to regard himself as the parent of the subject peoples, whom he was in duty bound to treat with love as well as with justice. Though oppression was not wholly eradicated, the imperial government was in a high degree efficient, just and humane. The progress of civilization was followed by the extension of the Roman citizenship. The liberal policy of Claudius in bestowing it was continued by his successors, till shortly after the period under discussion all freemen of good standing in the empire became Romans by the edict of Caracalla (212 A.D.).

In this period was tried the experiment of maintaining profound and lasting peace over the large area comprising the interior provinces. Prominent among the results was a material prosperity which had at least the appearance of being very great. Another result

was the development of the "feminine virtues." Men "became chaste, tender-hearted, loyal, religious, capable of infinite endurance in a good cause" (Seeley, 'Roman Imperialism'). They began to regard women as their equals, to treat children and slaves humanely, to show kindness even to animals, and in spite of gladiatorial contests, to abhor bloodshed. Morals, at their lowest ebb in the Rome of Nero, were rapidly purified by the coming in of the best families from the provinces, so that under the Good Emperors morality in the capital reached a high level. The spirit of the age expressed itself not only in the private and social virtues, but also in the Civil Law, which rested upon the principles of justice, kindness and equality among men.

The unimaginative Romans failed to produce a literature of the highest rank. In the late republic lived Lucretius, a poet of real genius, and Cicero, the versatile author of orations, philosophic works and private correspondence. The Augustan Age created the epic and rural poetry of Virgil, the 'Odes' and 'Satires' of Horace on social and moral topics, and Livy's stately history of the republic. The most splendid Latin writers of the age of the Good Emperors were the satirist Juvenal and Tacitus, the historian of the early empire. Among the most famous writers in the Greek language in the first two centuries A.D. were Strabo the geographer, Pausanias, author of a 'Tour of Greece,' Appian, the historian, and Plutarch, the biographer of eminent men. Hellenism continued to be the chief liberalizing and refining force in the empire. Its highest intellectual product from Roman soil was stoicism, which found its best expression in the writings and character of Marcus Aurelius.

**IX. From Limited Monarchy to Despotism; the Reorganization of Diocletian and Constantine; the Barbarian Invasions and the Decline of the Empire, 180-500 A.D.**—Writers generally agree in making the decline begin with the reign of Commodus (180-192 A.D.), though disintegrating forces had long been in operation and though for generations afterward the empire at times, as under Septimius Severus and Diocletian, showed great recuperative power. The century which intervened between the death of Marcus Aurelius and the accession of Diocletian (180-284 A.D.) we may regard as a period of revolution. The happiness of the Roman world under the Good Emperors had been chiefly due to the wisdom of a succession of rulers who were able to secure the good will of the Senate and of the populace of Rome, the subordination of the pretorians and of the army and the respect of surrounding nations. The weak, brutish Commodus allowed these nicely adjusted forces to conflict, and the result was civil war and anarchy. The revolution, sweeping away the influence of pretorians, populace and Senate, almost of Rome itself, brought new principles of government into play. The emperor was to be a despot of the Oriental type,—a God on earth,—who surrounded himself with stately splendor, and governed through a complex bureaucracy. He appointed a colleague, and two Cæsars were named as heirs of the emperors, all four dignitaries being men of eminent military ability. The empire was reorganized in prefectures, dioceses and provinces under appropriate mag-

istrates. These arrangements, chiefly the work of Diocletian (284-305 A.D.), and Constantine (sole emperor 324-337 A.D.), were in the main permanent. In making better use of the resources of the empire for the purposes of defense the new organization brought fresh strength, but rivalry between the emperors again caused civil wars with all their evil consequences. Under Constantine, who removed the capital to Byzantium, thereafter called Constantinople, the two imperial offices were again vested in one person. After that date there were often two or more emperors; and the division of the empire into East and West for administrative purposes acquired a new sanction at the accession of Arcadius and Honorius, sons of Theodosius (395 A.D.). Even then the empire was a unit, ruled by two colleagues; and when in 476 A.D. Romulus "Augustulus" was deposed at Rome and the imperial trappings were sent to Constantinople, people understood merely that the collegial government had once more given way to unity in the imperial office.

Meanwhile from the heart outward through every limb the empire was falling to decay. The most obvious cause was economic. Judged by any modern standard, the empire as a whole was poor. It is true that parts of it, especially in the Orient, were wealthy; but throughout the West were vast undeveloped regions, whose administration and protection formed a perpetual burden on the imperial treasury. The emperors made heroic efforts to improve these territories; but in doing this they exhausted the productive areas. With modern means their task would have been simple; but there were practically no machines in Roman times. Consequently everything had to be done by hand; and under the circumstances it was impossible to produce enough useful materials to make good shortages in the less developed parts of the empire and those losses that were caused by drought and pestilence, in addition to providing the necessities of life for the armies, the hosts of officials and the idle poor in all the cities. In other words, the industries were not sufficiently developed for the maintenance of so vast an empire.

Another cause was the excessive concentration of the people into cities, where the lack of sanitary arrangements, such as now exist, brought about an enormous mortality, where too the relatively high standard of living and the want of remunerative occupations discouraged the rearing of families. Hence the city population had continually to be recruited from the country; and when the rural districts came to be sparsely inhabited, the consequent disappearance of the cities was accompanied by the wreck of ancient civilization. Among the contributory causes was slavery, which long before Marcus Aurelius had been destroying the free population; in his time the plague, and after him foreign and civil wars, continued to waste life, while the burden of taxation, always increasing, made life every day more wretched. The wealth of the empire flowed to the East in exchange for useless luxuries; and for want of gold and silver the coinage was debased; at the same time the cost of living became excessive. Then, too, the growing splendor of the imperial courts added to the burden. With their scant means many found it impossible to support families, and even the slaves grew

fewer. In these conditions most of the lower population, free and slave, became hereditary serfs—*coloni*—bound to the soil and to the payment of fixed dues to their lords. But it was not only the poor who suffered. The municipalities had once enjoyed freedom in local affairs, each governed by a senate, whose members—*decuriones*—were the wealthier men of the community. Gradually the emperors encroached upon the liberty of these cities, till they had converted even the privileges of the senators into intolerable burdens. For as these officials were responsible for the taxes due from their districts, many of them, unable to wring the required amount from the poorer classes, were themselves reduced to poverty. Nevertheless they could in no way shirk their duty, but were held for life by an iron hand to the unenviable task of collecting and of paying oppressive taxes. Artisans and traders, too, were bound strictly to their hereditary vocations, in order that the government might be sure of the dues to which they were subject. In brief, society was forced into a rigid caste-like system, which crushed freedom and made the life of rich and poor, bond and free, almost equally wretched. Under these circumstances, and after ages of governmental brow-beating, the inhabitants of the empire lost their interest in the welfare of the state, of the community, of future generations. As the civilized part of the human race lost love of life and hope for the future, it began rapidly to die out, and those who still lived grew continually more barbarous. As they were unwarlike, the government found it more and more necessary to make up the armies of Germans, who consequently settled in the empire in ever-increasing numbers. Although they readily adopted Roman civilization, their independent spirit, out of harmony with the conditions above described, acted as a new disintegrating force. Another power, which while aiming to make the world over on its own model tended to destroy ancient ideas and institutions,—including the empire itself,—was Christianity. Rome, essentially polytheistic, always tolerated the religions of the nations which she conquered; in the adoption of their gods into her pantheon she found a means of political centralization. Judaism, however, she regarded with disfavor, and attempted to suppress Christianity. These exceptions to her policy of toleration were due to the irreconcilable conflict between monotheism and polytheism and to the leveling tendency of the Christian religion. The apostles of Christ taught that the gods of Rome were demons, that the worship of the emperor was sinful, that all men from the emperor to the slave were equal before God, that the heaping up of wealth was an abomination; in brief their religion seemed to the Romans subversive of all the principles on which the empire rested. But although Christianity and Germanism were disintegrating the empire, they were destined in combination to make the old world new. The estimate of their value as creative agencies belongs to the mediæval period.

In appearance more formidable than internal decay were the hostile nations outside the empire. In the 3d century the Germans, who had long been threatening, began to break through the northern frontier. The Franks flung them-

selves upon Gaul; the Goths occupied Dacia and crossed the Danube to defeat and kill an emperor. In the East, too, a new danger appeared; on the ruins of the old Seleucid power had arisen in the Parthian Empire, which in the 3d century was supplanted by a new, vigorous Persian Empire. The warlike Persian monarchs nearly made good their threat to drive the Romans from Asia.

Early in the 5th century the Germans began to establish their states within the empire—the Visigothic kingdom in Gaul and Spain (415 A.D.), that of the Vandals in Africa and of the Burgundians in the Rhone Valley. About the middle of the century the Angles and Saxons began to overrun Britain; a little later the Franks, who long before had crossed the Rhine, began the conquest of Gaul (486 A.D.); and in 493 A.D. the Ostrogoths conquered Italy. Before the end of the century the western branch of the empire had fallen into the hands of Germanic chiefs, who while vaguely recognizing the emperor at Constantinople as their lord were in reality sovereign kings of the countries they ruled. Here ancient history ends.

**Bibliography.**—For the method of history see Bernheim, 'Lehrbuch der historischen Methode' (4th ed., Leipzig 1903); for an elementary sketch, Botsford, 'History of the Ancient World' (1911); somewhat more detailed, Breasted, 'Ancient Times' (1916), valuable for the Oriental part; by far the best detailed ancient history is Meyer, 'Geschichte des Altertums' (I-V, Stuttgart and Berlin 1884-1902; new edition of I, 1909-10), reaching to the middle of the 4th century B.C.; earlier general histories by Duncker, Oncken and Helmholt are in large part antiquated, so that it is better to be guided by works on special periods or localities; e.g., Myres, 'Dawn of History' (New York 1911); Hogarth, 'The Ancient East' (1914); Hall, 'Ancient History of the Near East' (London 1913); Erman, 'Life in Ancient Egypt' (New York 1894); Breasted, 'History of Egypt' (2d ed., 1909); King, 'History of Babylonia and Assyria' (2 vols. are ready, London 1910, 1915); Rogers, 'History of Babylonia and Assyria' (6th ed., New York 1915); Jastrow, 'Civilization of Babylonia and Assyria' (Philadelphia 1915); Sayce, 'Babylonians and Assyrians: Life and Customs' (New York 1909); Cornill, 'History of the People of Israel' (4th ed., Chicago 1909); Kent, 'History of the Hebrew People' (12th ed., 1912); Smith, 'Historical Geography of the Holy Land' (16th ed., London 1910); Bury, 'History of Greece' (2d ed., New York 1913); Holm, 'History of Greece' (4 vols., New York 1895-98); Grote, 'History of Greece' (12 vols., New York 1846, date of author's first preface); Busolt, 'Griechische Geschichte' (3 vols. of 2d ed. published, Gotha 1893-1904, with best critical apparatus); Beloch, 'Griechische Geschichte' (3 vols., Strassburg I and II, 2d ed., 1912, 1913, the rest, 1st ed., 1897-1904); Botsford and Sihler, 'Hellenic Civilization' (New York 1915); Ferguson, 'Greek Imperialism' (Boston 1913); 'Hellenistic Athens' (New York 1911); Mommsen, 'History of Rome' (5 vols., conformed to the 8th German ed., New York 1895); 'Provinces of the Roman Empire' (2 vols., 1886); Ferrero, 'Greatness and Decline of Rome' (5 vols., New York 1907-09, suggestive but unreli-

able); Heitland, 'Roman Republic' (3 vols., Cambridge 1909, the last volume valuable); Duruy, 'History of Rome' (8 vols., Boston 1883, valuable for the imperial period); Schiller, 'Geschichte der römischen Kaiserzeit' (2 vols., Gotha 1883, the best political history of the imperial period); Seeck, 'Geschichte des Untergangs der antiken Welt' (5 vols. ready, Berlin 1897-1913, a brilliant work marred somewhat by untenable theories); Philippson, 'Das Mittelmeergebiet: seine geographische und kulturelle Eigenart' (Leipzig 1904, valuable for physical environment); Shepherd, 'Atlas of Ancient History' (New York 1913, the best historical atlas); Cunningham, 'Western Civilization in its Economic Aspects' (Cambridge 1898); Webster, 'General History of Commerce' (Boston 1903); Perrot et Chipiez, 'Histoire de l'Art dans l'Antiquité' (8 vols., Paris 1882-1903); for general tendencies, Freeman, 'Chief Periods of European History' (New York 1886). The best encyclopædias for Greece and Rome, containing much information also regarding the Orient, are Daremberg et Saglio, 'Dictionnaire des Antiquités grecques et romaines' (Paris 1873); Pauly-Wissowa, 'Real-Encyclopädie der cl. Altertumswissenschaft' (Stuttgart 1894); the best periodical is *Klio: Beiträge zur alten Geschichte* (Leipzig 1901—); for bibliography past and current, 'Jahresbericht über die Fortschritte der cl. Altertumswissenschaft' including 'Bibliotheca Philol. cl.' (edited by Bursian, Berlin); for bibliographies of special countries see the articles on Egypt, Chaldea, Babylonia, Assyria, Greece and Rome.

GEORGE WILLIS BOTSFORD,  
Late Professor of Ancient History, Columbia  
University.

**HISTORY, Mediæval. Definition.**—Mediæval history may be defined as the middle period between ancient and modern history. Some scholars have wished to do away with the term entirely and to use only two divisions, ancient and modern. In fact, in Oriental history there is no mediæval period. But most students prefer to keep to the threefold division for European history. This is due largely to the fact that the mediæval period can be presented with greater unity than either ancient or modern.

Mediæval history began with the disintegration of the Roman Empire in the 5th century, the ruin of Paganism and the migrations. Without arguing the merits of the various dates which may be assigned for the end of the Middle Ages (q.v.), we shall here discuss the history to about 1500 A.D. During this period of 1,000 years, the most marked characteristic is the dominant influence of the Church. The most important peoples are the Germanic races, who emerged slowly from barbarism, and gradually assimilated some of the features of the Roman civilization. Based upon the ruins of the older rose a new civilization which caused a radical transformation in political, social and religious ideals.

**Contrast Between Romans and Germans.**—The Romans had a highly developed and very complex civilization. From their Greek subjects, they had acquired the knowledge of art, literature, science and philosophy. Under the Roman peace, an active commerce had grown

up throughout the empire, supplying to each province the products of all the others. In law and administration the Romans had reached such excellence that we still imitate them. Moreover, Christianity had become the state religion.

The Germans were barbarians, having the virtues and vices of their savage state, and resembling, in many respects, the North American Indians. But they were a vigorous race, with a great capacity for learning. Some of them had been converted to Christianity before they entered the Roman Empire, but most of them were still pagans.

**Migrations.**—The Roman Empire had for centuries held the barbarians in check, by the prestige of its name, by the payment of tribute or by the policy of exciting dissension among its enemies. This last is well summed up in the Roman proverb, *Divide et impera*, which may be paraphrased, "Cause divisions and strife among those whom you fear and thus rule over them." In the latter part of the 4th century, however, the terrors inspired by the advance of the Huns (q.v.) into Europe, the knowledge of the weakness of the Roman Empire and their own desire for more fertile lands, caused the Visigoths (q.v.) to enter upon their great migration. Their example was followed by other German tribes and the movement continued throughout the 5th and 6th centuries. By the year 600 all the European portion of the Western Empire, except a few positions in Italy, was held by the Germans.

During the period of the migrations there was some destruction of life and property, but the amount of the damage varied; it was great in northern Africa and Britain; slight in Gaul. And nowhere were the conquered inhabitants either exterminated or driven out. The German invaders were relatively few in number, and in many sections they found unoccupied lands sufficient for their needs. The conquerors and the conquered lived in constant contact with one another, and the resultant civilization was partly Roman and partly German. See MIGRATIONS.

**Fusion of the Two Civilizations.**—The 7th and 8th centuries were the period of fusion. By the year 800 the terms *Roman* and *Barbarian* were no longer used. The inhabitants formed a single people, with a civilization much lower than the Roman but much higher than that of the Germans when the latter had entered the empire. In this new composite civilization the Roman influence was greater in language, mechanical arts, business arrangements and municipal, intellectual and ecclesiastical affairs. The German influence was greater in military matters and judicial procedure.

The fusion was practically completed by the time of Charles the Great. He realized clearly the task of the Middle Ages, and did all in his power, on the one hand to retain all that was best of the older German customs, and, on the other hand, to introduce from Italy such Roman customs as his subjects were able to adopt. He did much to foster education, which followed Roman models. By his wars, he brought under his sword most of the German peoples.

**The New Empire.**—In 800, Charles' services received fitting recognition in his election as emperor of the Roman Empire. The idea of

a Roman empire which embraced all Christians had never been lost. After 476, when Romulus Augustulus was deposed, by Odoacer, the people in the West, Germans and Romans alike, had regarded the emperor at Constantinople as the head of the Christian world. Even barbarians like Clovis (q.v.) had been proud to secure recognition and obtain a title from the emperor. The popes had looked to the emperors for support. In the last years of the 8th century the East was ruled over by Irene (q.v.), who was despised both because she was a woman and for her crimes and heresy, so that it seemed to many that the imperial office was vacant. Consequently, Charles was crowned emperor and was considered the successor of Augustus, Trajan and Constantine. Under his strong rule the Western world was governed firmly and the Western nations were held together.

**Disintegration of the Empire.**—After Charles' death, his son was unequal to the task of ruling the empire. Under the combined effects of civil strife and constant invasions by the Northmen, the Mohammedans and the Slavs (q.v.), the central power was weakened and the last Carolingian rulers were unable to protect their subjects. The whole frontier was exposed to attacks and the raids of the enemy even extended far into the interior. In each district the strongest man came to be regarded as the natural leader and protector. Sometimes it was a royal official, holding a fortification; sometimes it was an abbot or a bishop; at other times, a bold adventurer, who usurped authority. In the absence of a strong central government, each leader had to police his land and administer justice. Naturally, he demanded to be paid for his services and exacted tribute from all under his control.

Because of the lack of money, the Carolingians (see CARLOVINGIANS) had always furnished to their counts and other officials estates from which to obtain a living. Under the weak kings, the temporary grants of both land and office became hereditary, with or without the rulers' consent. The rulers, however, soon recognized the necessity of allowing this and sought merely the recognition of their own overlordship. Consequently, they granted the benefices to the heirs and conferred, in addition, the immunity or right of independent jurisdiction. Thus almost all land and power came to be held feudally. See FEUDALISM.

**Feudal Anarchy.**—There was constant warfare as each strong lord sought to obtain greater power or a more independent position. On the other hand, each king tried to increase his own feudal holdings by conquest or marriage. Every vassal was anxious to avoid all the feudal services that he could, and, at the same time, to exact as much as possible from the people subject to him. Commerce was burdened with excessive tolls in each fief and exposed to the depredations of the robber barons. Little attention was paid to maintaining roads and bridges, consequently travel was difficult as well as dangerous. As a whole, the feudal régime tended to isolate each fief and to reduce the peasantry to misery. It is significant that the term "Dark Ages," formerly applied to the whole of the Middle Ages, is often used now for the 9th and 10th centuries.

**The Church.**—The great cohesive and educational force was the Church. Soon after

they entered the Roman Empire, each tribe of Germans had been converted to Christianity; all except the Franks (q.v.) became Arians (q.v.) at first, but gradually this heresy was abandoned. In every barbarian kingdom the bishops were important officials. They often obtained great wealth, and ruled over vast estates. On their possessions, the serfs were treated somewhat better than on the lay fiefs. Monasteries had been founded throughout western Europe, and often these served both as schools and as model farms. Boniface did much to bring the tribes of Germany into direct connection with Rome, and he held frequent Church councils at which the clergy and nobles of a whole district came together. These councils were very important for their effect in unifying the Church and making its work more effective.

From this time the Church gained steadily in power and influence. Charles the Great did much to increase its wealth by enforcing the payment of tithes. He insisted that the clergy should be better educated themselves and should do more for the education of the people. In the 9th century the growing power of the papacy and the weakness of the kings enabled the popes to bring the bishops more directly under their own control. Thus the clergy of western Christendom were brought into intimate association with Rome. Latin was the common language of all churchmen. Their feeling of membership in the Church was frequently stronger than any local attachment. Consequently the more able men were equally at home in every country and the Church had a greater unity than any lay power. This all-pervasive Church was the great unifying element amid the divisions of the feudal period.

**Investiture Struggle.**—After periods of weakness in the first half of the 10th and again in the first half of the 11th century, the Church at Rome was purified and strengthened by the support of the German emperors. About the middle of the 11th century, the strong personalities of Pope Leo IX (q.v.) and of Hildebrand (later Gregory VII) (q.v.) led to a reform movement, and also to an effort to make the popes' power more effective. One feature of this movement was an attempt to secure entire control of appointment to church offices. This brought the papacy into conflict with the kings who considered that they had a right to nominate the bishops in their own kingdoms. The struggle was most acute between the German emperors and the popes, and resulted in the long investiture conflict, which was ended in 1122 by a compromise. See INVESTITURE.

**Roman Empire of the German Nation.**—But the investiture struggle was only a single phase in the relations between the empire and the papacy (q.v.). In order to understand this it is necessary to study the fortunes of the empire after Charles the Great. Under his successors, the emperors had gradually lost their power, so that by the end of the 9th century, the title of emperor had become almost a meaningless designation, either conferred by a Pope on anyone of whom he wished to make use, or else usurped by any ruler who chanced to be temporarily the strongest personality in Italian affairs. This continued to be the fate of the imperial title until Otto the Great (q.v.) was summoned to Italy, because of the discord and

anarchy in the peninsula. In 963 he was crowned emperor, and became the ruler of both Germany and Italy. Under his son and grandson, Otto II and Otto III, "the Roman Empire of the German nation" was a very effective power in controlling both the imperial lands and the papal policy. After the death of Otto III in 1002, the German rulers paid little attention to Italian affairs until 1046, when Henry III was summoned to Rome because of the contest which was being waged between three rivals for the papal office. For 10 years he wielded a power similar to that of the Ottos. But at his death, as the heir was a young child, the reformed and strengthened papacy was able to assert its independence. When Henry reached manhood and desired to regain his father's power, the contest began and took the shape of the already mentioned investiture struggle. After the Concordat of Worms (q.v.) there was little conflict until the accession of Frederick Barbarossa (q.v.), who was determined to be emperor in fact as well as in name.

**Empire and Papacy.**—On the other hand, the papacy was strong and was determined to assert its paramount authority. There ensued a struggle of 100 years between the Hohenstaufen emperors and the popes. In spite of the ability of the rulers and the brilliancy of their reigns, the popes triumphed, largely by means of the assistance of the Lombard cities, which had grown rich and powerful and aimed to be independent of the imperial control. The death of Frederick II in 1250 really marks the end of the mediæval empire as a strong international power, although it continued, under a changed form, to be a factor in European politics for centuries longer, and came to a close only in the 19th century.

**The Crusades.**—The increasing power of the popes was also marked by their desire to extend their authority over the Eastern Church as well as the Western. This was in part the cause of the Crusades, which were the most important manifestation of the strength and influence of the Church. The spirit of asceticism (q.v.) had long been inculcated as the most distinguishing mark of Christianity. The consciousness of their own sins and the teachings of the Church led many to do penance. One of the favorite forms, especially for heinous crimes, was a pilgrimage to some hallowed spot. The most difficult pilgrimage and the one to which greatest sanctity attached was the journey to Jerusalem. In the 11th century, 116 separate pilgrimages to Jerusalem are recorded, and, in some of these expeditions, hundreds and even thousands took part. Thus attention was directed to the Holy Land. Moreover, in spite of the disorders of the feudal régime, the population was increasing, especially in France. The people were hard-pressed to get food, and were anxious for a change of any kind. Consequently, when the Emperor Alexius appealed for aid and Pope Urban II preached the crusade at Clermont thousands took the cross. The movement spread rapidly and affected every country in Europe. Although Jerusalem was in the possession of the Christians for little more than a hundred years, the crusades to the Holy Land, which continued for 200 years, produced great results. In order to understand these, it is

necessary now to take up the Byzantine and Moslem civilizations. See CRUSADES.

**Byzantine Civilization.**—Until 60 years ago, Byzantine history was misunderstood. It was looked upon as the long death struggle of a society in which all progress had ceased, and despotism, tempered by assassination, crushed out all vitality. Gibbon styled the history "a tedious and uniform tale of weakness and misery." It is known now that this was unjust. The most striking fact about the Byzantine Empire is its "constant vitality and power of recuperation." It was repeatedly threatened by invaders, but it repelled them all. At times it lost some of its most fertile provinces, but at other periods it would rise triumphantly and recover lost possessions. Throughout the period between 700 and 1100, Constantinople was the bulwark of Europe, against which the waves of invasions rolled in vain. In addition to being a bulwark, Constantinople was, throughout the Middle Ages, the great storehouse of the Greek and Roman civilizations, where it was preserved until the European nations were sufficiently advanced to profit by it. Constantinople (q.v.) was also the most important commercial centre of the Middle Ages. The city was marvelously wealthy and excited the admiration of every traveler. Most of the Crusaders passed through Constantinople and the Greek lands on their way to Jerusalem; by them the influence of its civilization was widely spread throughout the West. See BYZANTINE EMPIRE.

**Moslem Civilization.**—No less important was the influence of the Mohammedans. After the death of the Prophet in 632, his followers had conquered with wonderful rapidity the greater part of the civilized world. From Persia and India they held all Asia to the Hellespont. Egypt and the whole north coast of Africa, Spain and about one-third of Gaul, were under their sway within a century. Their advance in civilization was equally rapid. The Arabs had great acquisitive ability. In each country they learned the arts and sciences known by the inhabitants, and they carried this knowledge wherever they ruled. The Greek philosophy, which they acquired from the peoples in the lands formerly under Greek sway, the mathematical knowledge of India, the irrigation practised in Egypt, are illustrations of their acquisitions, which enabled them, in the 10th and 11th centuries, to develop a civilization far in advance of any other, with the exception of the Byzantine. From Bagdad to Spain this culture was spread throughout the Mussulman world. In Syria, the Crusaders were in contact with this civilization for two centuries. By their agency and by the association of Christians and Mussulmans in Spain, Sicily and other points, much of the Moslem learning was conveyed to the Christians of western Europe.

**Changes in the 12th and 13th Centuries. Enrichment of Europe.**—In addition to this fructifying intercourse with other civilizations, many elements in their own contributed to cause a rapid advance in the 12th and 13th centuries. Among these may be noted the increase in population, the cultivation of waste lands, the revival of commerce, the general progress along educational lines and the rise of strong kingdoms. But as it is impossible to isolate each factor

and to determine the part which it played, the results will be considered as a whole and the changes which took place in western Europe after 1100 will be described.

The hundreds of thousands of Crusaders had to procure large sums of money for their equipment and journey. Consequently the precious metals which had been hoarded came into circulation as money. Instruments of credit were devised and the money circulated rapidly. Contact with other civilizations gave birth to new tastes and these were gratified by means of a greatly increased commerce which extended to all parts of Europe and even to the extreme East. The merchants became numerous and prospered. Cities increased rapidly in population and new ones were founded. The Italian cities, because of their position, prospered the most of all. The merchants became an important class because of their wealth, and by the end of the 13th century became a political factor which was recognized by their inclusion in the new parliamentary bodies.

**Intellectual Advance.**—The investiture struggle had caused scholars to study history in order to find precedents in support of the imperial or of the papal claims. The contact with other peoples broadened the intellectual horizon of the Western people. The new points of view with which they became acquainted led them to question the traditions which had ruled their lives. The new books, especially the works of Aristotle (q.v.), which fell into their hands, were studied eagerly. The new wealth gave leisure. Students flocked to the centres where teachers were to be found, and gradually universities arose. Roman law was fostered by the emperors; canon law by the Church. Scientific knowledge, especially in medicine, was acquired from the Greek and the Arabic works. Gothic cathedrals of exquisite beauty were built in western Europe. The deeds of the Crusaders furnished new material to literature. The old tales were reworked and given a literary form.

**Growth of Monastic Orders. Temporal Power of the Popes.**—No less marked were the changes in the Church. At the close of the 11th century a great wave of asceticism spread over western Europe. The idea of sacrifice caused thousands to enter monasteries, and many new orders of monks were founded. These orders vied with one another in austerity and asceticism. Their reputation for sanctity and their services to the community brought to them great donations. Their knowledge enabled them to increase their wealth. But this wealth led many to enter the monasteries from unworthy motives, and thus caused a gradual decline in their morals. The wealth of the Church, as a whole, caused many, both monks and laymen, to attack it as having departed from its Christian ideals. Heretics became numerous and had to be repressed by persecutions and the Inquisition. In the 13th century the mendicant orders became prominent, partly as a protest against the wealth of the Church, and partly as an agency to combat heresy. The ideal of service to others for which they stood became dominant in monasticism, and later orders were founded, almost universally, for some special service. See **MONACHISM; ORDERS, RELIGIOUS.**

The papacy, engaged in a struggle with the monarchs, felt the need of temporal power and

strove for it. Innocent III had monarchs as his vassals, and wielded a temporal authority greater than that of any previous Pope. After the popes had triumphed over the Hohenstaufens they seemed to have achieved success. Their struggle with the French king, at the beginning of the 14th century, however, led to defeat and to the "Babylonian captivity" at Avignon. Then ensued the schism and the conciliar period when many felt that the general councils and not the popes should be supreme. Finally the papacy emerged triumphant, but with a changed ideal, laying less stress upon temporal power (q.v.), and more upon control over the conscience of the individual.

**Chivalry. Decadence of the Knights.**—In the 12th century, the clergy and the knights formed the aristocracy. The latter, too, had their period of great splendor. The ideals of chivalry, which became prominent in the 12th century, were inculcated by the Church, and the knights were often likened to the clergy as a class specially set apart by their religious vows. These ideals were also inculcated by the new literature, which glorified not only bravery and loyalty, but also generosity and luxury. The latter led to the ruin of many of the knights. Their income, arising from feudal dues, was relatively fixed. As their tastes expanded and they expended more upon luxuries, they fell into debt. The rate of interest was ruinous and they were unable to pay. Consequently many were compelled to alienate their fiefs; the monarchs and other lords of large fiefs absorbed the lesser fiefs, and there was a tendency for the knights to become retainers of the more wealthy. Their consequence as a class declined in comparison with the growing importance of the merchants. The development of strong infantry forces finally deprived them of their pre-eminence in military matters. See **CHIVALRY.**

**Rise of the Nations.**—The contact with other peoples led to the rise of a national consciousness. In the earlier days, when each feudal castle or village was practically isolated and often at strife with its neighbors, there had been little feeling of common interests. Association with foreigners brought a sense of national feeling in opposition to the foreigners. This is very marked in the armies of the second and third crusades. This movement was coincident with, and one cause of, the growth of the strong monarchies. The merchant class was also an important element in the development of the king's powers. Commerce was heavily burdened with feudal tolls and exposed to depredations by the knights. The merchants sought privileges and protection from the kings. In return they furnished them money, which aided them in extending their power at the expense of that of their nobles. The kings came to depend largely upon the cities for support in all struggles with the nobles. By their wealth the citizens were able to rival the nobles in luxury and ostentation. The sons of the merchants frequented the universities and developed into officials of the kings. More and more the kings came to depend upon the third estate and to withdraw power from the nobles.

**The French Monarchy.**—The development of the monarchical power took different forms in the several countries, but took place about the same time in the leading nations. In France,

the Capetian kings (see **CAPET**) had at first little power. They had only a small territory directly under their control, and consequently only a small income. But by fortunate marriages and by confiscations they enlarged their feudal domains. Several of the kings had long reigns and the evils of a minority or a change of dynasty were avoided. Gradually all the fiefs were brought under the control of the king, and feudal usages were made the basis for the assertion of a really monarchical power. Under Saint Louis (1226-70) and his successors France was centralized and the kings became supreme. The prosperity of France was checked for a time by the Hundred Years' War (1328-1461). This was due in part to a failure of male heirs in the direct line, which enabled the English kings to make a claim to the throne on the ground that they were the most direct heirs. But France finally emerged triumphant and England lost all her territory in France. The kings, supported by the third estate, became practically absolute.

**The English Monarchy.**—In England the Norman Conquest (q.v.) made William supreme lord. Following the Norman feudal usages, he insisted upon an oath from each one of his subjects, and did not allow the intervention of the feudal nobles. In spite of the civil wars of the 12th century, Henry II was able to retain the supreme control. The tyranny and incompetence of John led to a revolt on the part of the barons and the extortion from him of the Great Charter. (See **GREAT BRITAIN—MEDIÆVAL ENGLAND**). The efforts of the kings to evade the provisions of the charter caused the union of the nobles and the third estate, the distinctive feature of the English Constitution as contrasted with that of France or of Germany. The loss of its continental possessions really strengthened England and enabled it to develop a strong government in its own island.

**The German Monarchy.**—Germany was a kingdom made up of great duchies. The king was strong only when he had all these duchies under his immediate control. The imperial title which he held was usually a source of weakness, because of the necessity of maintaining his authority outside of Germany. Those kings who neglected the imperial interests in Italy and Burgundy were strongest at home. Frederick Barbarossa, Henry VI and Frederick II (qq.v.), who attempted to build up strong empires, were compelled, as the price of support from their German subjects, to make constant concessions. Thus they bartered away most of their German lands and royal rights. The towns and cities, in particular, acquired privileges and practical independence in payment for their support in men and money. On the extinction of the Hohenstaufen house, Germany was divided up into many separate entities, varying in size from a duchy to a village or to a knight's fee, all claiming independence of all control except the imperial. The weak emperors of the 14th and 15th centuries were unable to maintain any effective control or order. Each emperor was intent only upon retaining his position and securing such property for his family as he could. Consequently Germany became a prey to internal dissension and division.

**The Other Monarchies.**—The other countries were more backward. In Spain, the Christian kings were engaged in conquering Moslem

territory or else in warring with one another. These movements were going on for several centuries, and culminated just at the close of the Middle Ages. In 1492, the Moors were conquered in Granada, their last stronghold. The two most powerful kingdoms, Castile and Leon, had already been united, and 20 years later the Spanish portion of Navarre was added. In Scandinavia powerful monarchies were growing up. In the eastern portions of Europe new Christian kingdoms had arisen, especially Russia and Hungary, which were destined to play an important rôle in the latter centuries.

**The Period of the Renaissance: Discoveries.**—The last period of the Middle Ages is often spoken of as the Age of the Renaissance (q.v.). The name is to a certain extent a misnomer. But it is sanctioned by general usage, and there are certain factors that may be brought together, which serve to mark the transition from the mediæval to the modern world.

The travel and commerce of the 12th and 13th centuries caused an interest in foreign lands which never abated. In particular, the taste for spices, which had become common, led to attempts to secure these more easily and more cheaply. After the loss of the Christian possessions in Syria, the importation of spices into Europe was burdened with heavy tolls by the Moslem rulers through whose territories they had to be carried. To the men of the 15th century there seemed to be two possible routes by sea to the spice islands, one by sailing around Africa, the other by sailing directly west to India. Attempting the latter led to the discovery of America; attempting the former, to the doubling of the Cape of Good Hope. The result of these discoveries was to make the nations on the ocean the leaders in commerce. The Mediterranean ceased to be the centre of the world's commerce and the Italian cities lost their pre-eminence as commercial centres.

**Inventions: Compass, Printing-press, Gunpowder.**—This exploration was possible only by the use of the compass (q.v.). This had been known in the West by the 12th century; in the East, centuries earlier. But it was perfected as a real aid to navigation only in the 14th century. About the middle of the 15th century came an even more important invention, that of printing (q.v.). This resulted at once in increasing enormously the number of books in existence and in cheapening their cost to one-fifth or less, so that books were readily accessible to a much larger number than before. At about the same time the manufacture of gunpowder was being perfected. Compositions similar to gunpowder (q.v.) had long been known in the East, and the knowledge of the composition of "Greek fire" had been brought to the West. But it came into general use only in the 15th century, and the guns long after that were held by many to be inferior to the cross-bow. But gunpowder, before 1500, was revolutionizing the art of war and rendering the mediæval knight obsolete.

**Classical Literature and Pagan Spirit.**—Contemporary with these discoveries and inventions was the awakening of an interest in classical literature. In the 12th century there had been at some centres an eager study of the Latin classics, but, in the 13th this had been superseded to a great extent by the branches

considered more practical, especially law, mathematics and science. In the 14th and 15th centuries men turned again to the classics, and Greek, which had long been neglected, became a favorite study. Along with the study of the pagan authors developed a new feeling for art, which resulted in the wonderfully natural works of the Renaissance artists. Other sides of this new activity were manifested in the more scholarly spirit of criticism and in scientific study. In fact, with the period of the Renaissance modern history had dawned.

**Bibliography.**—Lavissee et Rambaud, 'Histoire Générale du IV<sup>e</sup> siècle à nos jours' (Paris 1893ff.; the first three volumes form the best general history of the Middle Ages); 'Cambridge Mediæval History' (New York 1911-13, 2 vols. to 800 A.D., published, which supersede all earlier works); Gibbon, 'Decline and Fall of the Roman Empire' (edited by Bury, 7 vols., London and New York 1896-1900); Milman, 'History of Latin Christianity' (9 vols., 1867; formerly a general favorite). Of the many Church histories, two may be mentioned: Alzog, 'Manual of Universal Church History' (3 vols.; a scholarly treatise from a Roman Catholic standpoint); Schaff, 'History of the Christian Church' (4 vols., to Gregory VII; scholarly, from a Protestant standpoint). Three volumes in the 'Periods of European History': Oman, 'Dark Ages'; Tout, 'Empire and Papacy'; Lodge, 'Close of the Middle Ages' (New York 1893-1901), furnish a detailed, but somewhat uninteresting, summary of the political history. Hodgkin, 'Italy and Her Invaders' (8 vols.), and Bury, 'Later Roman Empire' (2 vols.), are useful for the period before 800. Bryce, 'Holy Roman Empire' (new ed., 1904; wonderfully compact and useful); Symonds, 'Renaissance in Italy' (7 vols.); Burckhardt, 'Civilization of the Indian Renaissance'; Voight, 'Wiederbelebung des classischen Alterthums' (2 vols., 3d ed.); these works are to be commended for the period of the Renaissance. For special subjects: Montalembert, 'Monks of the West' (6 vols.); Lea, 'History of the Inquisition' (3 vols.; the masterpiece of a great historian); Oman, 'History of the Art of War' (Vol. II), for military matters; Heyd, 'Histoire du Commerce du Levant' (2 vols.), very important for the commerce; Levasseur, 'Histoire des classes ouvrières avant 1789' (2 vols.), admirable for economic conditions; Gregorovius, 'Rome in the Middle Ages' (8 vols.), scholarly and interesting; Rashdall, 'History of the Universities of Europe in the Middle Ages' (2 vols.), the best treatise on the subject; Saintsbury, 'Flourishing of Romance,' the best brief account of the literature in the 12th and 13th centuries; Munro and Sellery, 'Syllabus of Medieval History' (7th ed., 1913), contains references by topics to about 500 works, mainly in English.

DANA CARLETON MUNRO,

*Professor of History, Princeton University.*

**HISTORY, Modern. General Characteristics.**—When History is divided merely into Ancient and Modern, the term Modern applies to history subsequent to the 8th century A.D. The AMERICANA, however, keeps to the more usual triple division into Ancient, Mediæval and Modern; and with this classification Modern History begins about the year 1500.

At that date, as for several centuries preceding it, the scene of human progress was confined to western Europe, and the actors were the Latin and Teutonic peoples. Except for Poland with its Latin church and borrowed German culture, eastern Europe was outside the pale of civilization. The barbarous northern Slavs seemed doomed to Tartar domination, and the somewhat less barbarous southern Slavs with the neighboring Magyars were enslaved by the Turk. From the devouring victorious march of the Turk even central Europe was in imminent peril.

Even in western Europe, nations, in the proper sense, were not made; and the political map bore faint resemblance to that of to-day. There was one Latin Christendom, binding in feeble union the several geographic units. But most of the units themselves were broken into fragments under local rulers; and these fragments, sometimes of widely separated lands, were recombined, with kaleidoscopic confusion, in loose, shifting aggregates which possessed not even permanent names. Out of this feudal chaos, strong monarchies were just emerging, to organize states, in France, England, Spain, Austria and Bohemia, Sweden and Denmark. Like governments had appeared, too, in Hungary and Poland; and Switzerland and the Netherlands were loosely related to the Austrian monarchy. There was hardly a prophecy of a Germany or an Italy.

The rise of monarchic states is the change that marks the close, *politically*, of the Middle Ages. At the moment it seemed a disaster to many good men, like Dante, who clung to the old ideal of a united Christendom. But since the days of the old Roman Empire, Europe had never known a true union. "Latin Christendom," in its best period of union, had been made up of various layers of society—nobles, burgesses, artisans, priests, peasants; and the horizontal cleavages between these classes had been more fatal to unity of spirit and to progress than the new cleavage into nations was to be. One class had been more foreign to another in the same land than France to England. French noble and German noble were always ready to make common cause against French peasants or German townsfolk. The new monarchies were to change all this. The real mission of each of them, whether the monarchs saw it or not, was to weld all the classes within its land into one people. While this was being done, some old class liberties were lost. But the way was being paved for a new popular freedom, broader and safer than the world had ever known.

Until 1250, for centuries Italy and Germany had been the two centres of interest in Europe. Each had claimed universal empire; and its overreaching claim had left each broken in fragments. Not for centuries was either to attain to this new political form of a united monarchy. Leadership therefore had passed from these two lands to France, Spain and England,—the three countries in which the new movement was most advanced. Germany and Italy were to be, for long, little more than a battleground for these neighbors.

The social and economic conditions of the year 1500 made a dismal picture. Society was hopelessly aristocratic and predominantly militant, and it was crystallized in strata. The

skilled industry of the towns was managed upon the guild system; and agricultural labor, except in England and some other small districts, was carried on by serfs.

But Europe had been astir with dim impulses to change for 400 years,—ever since the Crusades broke the torpor of the Dark Ages and prepared the way for the rise of towns and the Renaissance. Near the close of the 15th century the tendency to progress became more pronounced, and the lines of activity more varied. Louis XI in France, the Tudors in England, Ferdinand and Isabella in Spain, prepared the way for new consolidated political societies, and for new principles of government; the invention of printing made possible the preservation and utilization of the recently rediscovered Greek learning and the rapid dissemination of new ideas; the discoveries of Columbus and Vasco da Gama set free undreamed-of energies among the lands of the Atlantic seaboard, and summoned commercial Europe to a right-about from east to west; the adoption of gunpowder in the wars between Francis I and Charles V marked the passing of the military superiority of the knight in armor, and undermined the citadel of aristocracy in politics; the opening of the Protestant Reformation (1520) shattered the old unity of Christendom, and, together with the Catholic Counter-Reformation, called out new energies in the fields of morals and intellect. Within two generations, the one just before and the one just after the year 1500, there stood revealed not merely a new physical hemisphere and new continents in the old one, but also a new universe of thought and feeling. Europe had passed into a new age.

The four centuries of Modern History have been a period of constant, marvelous, increasingly rapid transformation,—intellectual, political, industrial. The stage itself has widened from a corner of the smallest continent into wellnigh the whole surface of the globe. The actors have multiplied, until they promise in the near future to include all branches of the human race. The drama has become infinitely complex, with the interaction of countless streams of influence. As compared with Ancient or Mediæval History, Modern History deals with a brief time, but with vast spaces, complex relations and accelerated progress. The separate movements that make up the bewildering maze are discussed severally in some detail, under appropriate headings, in the *AMERICANA*. This article attempts only to marshal them in such order as to bring out the essential relations between them.

It is convenient to divide the four centuries of Modern History into the *age of monarchic states* and the *age of nation-states*. The American and French Revolutions make the transition from one to the other, and the most satisfactory dividing date is 1789.

#### FROM THE REFORMATION TO THE FRENCH REVOLUTION.

**Monarchic States.**—The constant warfare of the 16th, 17th and 18th centuries is the simplest thread by which to connect the other movements of the age. Speaking broadly, the contests of the first half of the period, to 1648, are "religious wars," Catholic against Protest-

ant, while after 1648 the struggles grow out of dynastic and commercial rivalries.

The declaration of the war which split Christendom into opposing camps for over a century came in 1520, when Luther burned the Pope's bull. The Diet of Worms at once pronounced against the rash monk the ban of the Empire; and the decree would have been enforced, and Protestantism stifled at its birth, if the young emperor, Charles V, had had a free hand. But Charles had just become involved in strife with Francis I, over the claims of Spain and France in Italy, and he was kept busy with war against France and the Turks until 1544. For a generation, therefore, the new faith was left to spread itself unchecked over Germany and Scandinavia, while during the same period the English Church cut itself off from Rome, and Presbyterian heresy made headway in France and Switzerland. For a time, indeed, Protestantism threatened to conquer even the south of Europe; but the Catholic Counter-Reformation, with equal zeal and superior skill, finally saved the Romance lands to the old faith.

**Religious Wars, 1546-1648.**—Meanwhile, entangled in his strife for European sovereignty, Charles could not strike at Protestants in Germany until 1546. It was then too late. In 1555, after brief struggles, the princes of the Schmalkald League forced upon him the Peace of Augsburg; and, though troubled with incessant bickerings, Germany had no further civil war for 60 years. Just that period, however, was filled with terrible religious contests in the Netherlands and France; and then the age of religious wars closed with another civil war in Germany,—the most destructive in European history, until the World War of 1914. But the century of strife from the opening of the Schmalkald War to the close of the Thirty Years' War (1546-1648) did not materially alter religious frontiers. Catholicism, to be sure, made some conquests with the sword,—Bohemia, South Germany and the southern Netherlands,—but in most of these districts, as in the Latin countries of southern Europe, the Counter-Reformation was making rapid gains before war began.

The close of the period of religious war is marked by the decay of Spain, the continued disruption of the Holy Roman Empire and the rise of France and of the Dutch Republic. To explain these changes it is needful to dwell somewhat further upon the wars.

In 1556-57, after his failure in Germany, Charles V resigned his crowns—the Austrian possessions passing to his brother, and the Spanish to his son, Philip II. Despite the division, Philip was far the most powerful monarch in the world. Each year the gold fleet filled his coffers from the exhaustless wealth of the Americans and in 1580 Portugal with her East India empire fell into his hands. This was the power—supreme in Europe and sole mistress of the New Worlds, east and west—against which the petty, disunited Netherland provinces dared to rebel. Beginning as a political revolt in 1568, the struggle soon became a religious war; and it was waged for more than 40 years with a relentless fury which made it a byword for ferocity even in that brutal age. The 10 southern provinces were finally brought back to Spanish allegiance; but

the northern provinces — Dutch in blood and Protestant in religion — fought on with desperate courage until they won independence. At the same time they preserved political and religious liberty for the world. Midway in the struggle, Elizabeth of England sent some tardy aid. Philip then turned upon England; but the destruction of his "Invincible Armada" in the splendid sea-fight in the Channel not only saved England at home but also paved the way for the English colonization of North America. The war closed in 1609. Spain had sunk into a second-rate power, never again to play an important part in European politics; but the United Provinces, through the stage of the desolating war, had grown prosperous. They drew wealth, not from wasted land, but from the sea, plundering the new possessions of Spain in the East Indies and building there a colonial empire for themselves. For most of the century, in intellectual, commercial and industrial activities, the Dutch held the first place in Europe.

In France the Edict of Nantes (1598) closed the wars of religion by guaranteeing toleration and handing over certain garrisoned towns to the Huguenots as security. During the next half century, under the wise administration of Henry IV and then of Richelieu, the industry of the people restored prosperity with marvelous rapidity. Richelieu crushed the feudal nobles and recaptured from the Huguenots their garrisoned towns. In other respects, however, he kept toward the Protestants the pledges of the Edict of Nantes; and as he warred upon the Protestants within France in order to strengthen the royal power, so he aided the Protestants of Germany in the Thirty Years' War in order to make France supreme in Europe. France had long been in real peril from the Hapsburg powers of Spain and Austria, which ringed her about in hostile embrace; but the failure of Spain against Holland and Richelieu's policy of weakening Austria in the German war removed the peril, and, as Spain declined from the first place in Europe, France stepped into it.

Meantime the Thirty Years' War (1618-48) was desolating central Europe. The princes of North Germany proved timid and incapable; and the cause of Protestantism was saved only by foreign intervention — by Denmark, by Sweden and finally by Catholic France. At the close of the struggle, the first European Congress reorganized Europe. By the Peace of Westphalia, France received most of Alsace and some other Rhine districts. The independence of Switzerland and of the United Provinces was formally recognized; and the second of these two republics ranked as one of the Great Powers. Sweden, already reaching down both west and east shores of the Baltic, secured much of the south shore also, with command of the mouths of the German Oder, Elbe and Weser. On the other hand, the empire lost more than territory. The political rearrangements within that state reduced the imperial Diet to the level of a useless debating society and put an end to whatever shadow had persisted of national unity. From this time until it vanished, a century and a half later, the Holy Roman Empire was a meaningless survival, cumbering the earth. Henceforth the Hapsburg "Emperors" derived their only real importance from their position as hereditary arch-

dukes of Austria; and soon they turned to their proper task of defending Europe against the Turk. To most of Germany the war had brought blasting ruin. Half the population and two-thirds the movable property were swept away. Land tilled for centuries became waste, and men became savages. Not till the middle of the 19th century did large districts again contain as many homesteads and cattle as in 1618; while the low position of the German peasantry, until 1850, was due in great measure to this war.

**American Colonization.**— Before the religious wars closed, the continent of Europe had ceased to be the sole scene of important historical development. American colonization was well advanced and political liberty had received a remarkable development both in England and in English colonies. These topics demand attention before the student enters upon the consideration of the next period of European wars.

Spain made her first settlement upon the American continent at the Pearl Coast in 1513. Then sweeping to north and south, she took swift possession of all South America except Portugal's Brazil, all Central America and Mexico, and of the Floridas and Californias, far up both coasts of North America, while plans were afoot to plant her flag over the rest of that continent. But the ruin of the Armada, together with Spain's decay at home, came in time to leave room for other colonization. France seized upon the mouths of the Mississippi and the Saint Lawrence, the apparent gateways to the continent; and English colonies stretched themselves in patches along the fringe of the North Atlantic coast. The Dutch spent their colonizing energies mainly in the Orient; and, despite some ambitious beginnings, Sweden soon grew too weak to be a serious factor in North America. Thus that continent was left in dispute between Spain, France and England. The contest was to be interwoven with the European wars of the last half of the 17th century and of the 18th century, and the outcome was big with consequence to the world. All European countries except England governed their colonies on despotic plans. The English colonists took to the New World institutions and principles of freedom, and soon gave them a wider development there than had been possible even in the old home. Besides the rights of free speech and jury trial and habeas corpus, each English colony had from the first, or very quickly inaugurated, a representative legislature with full parliamentary privileges and with control over taxation. In several colonies, local government also was conducted on extreme democratic principles. Not until 200 years later did any of these free principles appear in the colonies of any other people — and then only because of their success in the English colonies.

**England in the 17th Century.**— In England itself the 17th century saw an important development in free government. Through the engaged in a critical struggle between the royal claims of "Divine Right" government and the rising spirit of popular government. Except for brief intervals the conflict was parliamentary, not military, but it was constant and stubborn. Much of the time it was confused with ecclesiastical questions, which, to the men of the

time, often seemed the chief issue; and it was fortunate, indeed, that the stern heroism of Puritanism became engaged on the side of political liberty. During this century, too, England was the last remaining battle ground in Europe for free government. In the other large states,—in Spain, France, Austria, in the Scandinavian lands, even in the petty principalities of Italy and Germany,—despotism was triumphant. In England, popular principles not merely maintained themselves against the Stuart attack: they came out of the conflict with increased vitality. The great experiment of a Puritan Commonwealth failed; but after the Stuart Restoration it became apparent that the body of the monarchists themselves were now thoroughly devoted to parliamentary government, and the attempt of the later Stuarts to set up a personal absolutism called forth the "Glorious Revolution" of 1688, which established the supremacy of Parliament over the king.

**Dynastic and Commercial Struggles, 1648–1783.**—We now return to the general development of Europe after 1648. On the Continent the period from the Peace of Westphalia to the French Revolution (1648–1789) is marked (1) by absolutism within the several states and (2) by dynastic interests in their foreign relations,—with incessant selfish war, as the result. The famous phrase ascribed to Louis XIV of France,—“I am the State,”—might have been used appropriately by any monarch of the time outside of England. A few great rulers dominate the period. Indeed the stage is largely filled by three monarchs,—Louis XIV (1643–1715), Peter the Great (1689–1725), and Frederick the Great (1740–86). The influence of Peter was restricted for the most part to Russia, which had thrown off the Tartar yoke a century and a half before, and had been looming an indistinct menace on the East. But the other two monarchs belong to all Europe, and the period divides itself naturally into the Age of Louis XIV and the Age of Frederick II. The chief aim of statesmen was to prevent any one country from becoming too strong for the safety of its neighbors. The Peace of Westphalia had transferred political predominance from the Hapsburgs to the Bourbons. Thus, during the first half of the period France threatened the “balance of power,” and league after league of other powers was organized against her. International morality, however, was low; and commonly rulers were willing to let a strong power rob a weaker one if they could find “compensation” by robbing some other state themselves. In the last wars of Louis XIV, just before and after 1700 (known in American history as King William’s War and Queen Anne’s War), the dynastic interests of European ruling families became merged in a titanic, century-long struggle between France and England for world dominion,—though neither country was yet fully conscious of the import of the strife.

In Europe, France was no longer in peril, as she had been in the period preceding Richelieu; and Louis the Fourteenth’s half-century of war was merely a struggle to enlarge his dominions. For a generation the victories of Turenne dazzled Europe; and France annexed some important strips of territory on the east,

at the expense of Spain and of the decaying empire. But in the closing period, when the Allies also had found great generals, in the English Marlborough and the Austrian Prince Eugene, even success in the field deserted Louis; and to a comprehensive view his failure was profound. Exhausted France was crushed by taxation to pay the interest of the war debt; while, in attacks upon petty provinces in Europe, she had wasted energies and opportunities that might have made her supreme in Asia and America. Within, the economic reforms of the great Colbert were abandoned; and the revocation of the Edict of Nantes (1685) drove into exile more than 200,000 of the best citizens of France. The effect corresponded in a measure to the effect upon Spain of the expulsion of the Moriscos somewhat earlier. The Huguenots had comprised the skilled artisans and the enterprising merchant classes; and their flight added to the terrible economic demoralization and deprived France of all chance at industrial leadership.

To men of the time, however, the failure was partially disguised by the glamor that surrounded the court of the *Grand Monarque*. French literature, brilliant and sparkling, was in its first splendid period; and French intellectual leadership survived for more than a century. Until after 1800, the court of Louis XIV remained the model for every court in Europe; and French thought, French fashions and the French language were the common property of all polite society.

The Treaty of Utrecht (1713), while it left France still one of the three greatest powers, marks her recession from predominance. Spain resigned her territories and claims in Italy and on the Rhine, and, except for her decaying colonies, withdrew finally within her own peninsula. England gained Newfoundland and Nova Scotia from France, and in Europe she secured command of the Mediterranean by the conquest of Gibraltar and Minorca. By the same treaty and by the rearrangements that immediately followed, the old Spanish Netherlands, the duchy of Milan, and the kingdom of Naples and Sicily fell to Austria. The Duke of Savoy (one of the faithful allies against France) acquired Sardinia, with the title of a kingdom for his enlarged state. A little before, in 1701, the Elector of Brandenburg had secured the title of king of Prussia. Thus, out of the wars of Louis, at the beginning of the 18th century, arose the two kingdoms, Prussia and Sardinia, which in the latter part of the 19th century were to make modern Germany and modern Italy against the will of modern France.

About 1700, other important changes took place in the map of Europe. For three centuries, Austria had been one of the chief bulwarks of Christendom against Mohammedanism. In 1683 Vienna had been besieged by the Turks and had been saved only by the arrival of the gallant Sobieski with his Polish chivalry. But thereafter Austria took the offensive. She won back Hungary, and then, step by step, extended her domains down the Danube valley and the Illyrian coast. In the latter part of the reign of Louis XIV, the Austrian Hapsburgs, turning away from the Rhine, definitely adopted a Danubian policy and sought to aggrandize

themselves by seizing Slav territory from Turkey.

This new policy of Austria gave Louis XIV a freer hand on the Rhine than he otherwise would have had, and so helped on the decline of Holland. In 1640 Dutch vessels carried the commerce of the world,—even the greater part of that between England and her colonies. Soon after that date, however, England attacked the Dutch commercial supremacy by navigation laws, and at last by war. Fearful of French conquest, and deserted or timidly defended by Austria, Holland had no choice but to ally herself to her commercial rival. After 1689 in particular (when William of Orange became king of England), Holland followed the lead of England in politics, while that country drew to herself the Dutch carrying trade.

In the north of Europe the former great powers, Sweden and Poland, were declining before the rise of Russia and Prussia. Peter the Great (1689–1725) consolidated the government in Russia, introduced a veneer of Western civilization and started his country on its deliberate march toward distant seas, west, south and east. Peter himself secured the western "window" by seizing from Sweden the south-eastern Baltic provinces. In the middle of the century, the Empress Elizabeth (1741–62) robbed Sweden of the rest of the Baltic coast up through southern Finland. The northern half of Finland remained Sweden's until Alexander I seized it in the Napoleonic wars; but toward the close of the 18th century, under Catherine II, Russia began her advance along the Black Sea at the expense of Turkey. Under the same ruler occurred the Russian gains in the partitions of Poland,—a story which can be understood only in connection with the rise of Prussia.

For three centuries the Hohenzollern Margraves of Brandenburg had been patiently adding scrap by scrap to their realms. Soon after 1600 these dominions lay mainly in three widely separated groups,—Cleves on the Rhine, Brandenburg on the Elbe and East Prussia beyond the Vistula. The object of Hohenzollern politics was to consolidate these provinces by acquiring intermediate territory. Toward the close of the Thirty Years' War, Frederick William, the Great Elector, made important headway in this respect and accomplished still more for his country after the close of that struggle by persistently maintaining peace and fostering industry. It was his son who in 1701 secured the title of king. The second king of Prussia built up a magnificent army and reared a son who was to use it magnificently—and treacherously. Frederick II ascended the throne in 1740 and began his long reign of an unjust but profitable war. The Hapsburg realms had just fallen to a woman, and, disregarding solemn treaties in truly Hohenzollern fashion, Frederick took unscrupulous advantage of the supposed weakness of the Archduchess, Maria Theresa, to seize from Austria the rich province of Silesia by surprise, without even the warning of a declaration of war. The heterogeneous Hapsburg realms seemed about to fall to pieces; and Spain, France, Savoy and Bavaria hurried to join Prussia in dismembering the carcass. But England and Holland threw themselves into the struggle on the Austrian side, and the Treaty of Aix-la-Chapelle (1748)

closed the War of the Austrian Succession without further territorial changes. Frederick kept Silesia, reaching far down into the heart of Germany, and Prussia stood forth as one of the great powers.

The significance of the contest, however, lay in its wide extension into India and America. Indeed, colonial war between England and Spain had already begun before Frederick appeared on the stage, and France must soon have joined Spain in any event. In the New Worlds, too, the peace restored the former boundaries; but the war marks a clear consciousness in England and France that the two were rivals for vast realms outside Europe. The family interests of monarchs as a cause for war were giving place to the commercial interests of English and Dutch merchants as opposed to those of French and Spanish merchants, while back of these selfish motives lay the mighty question, big with consequence to the world, whether French or English political ideas should hold the New World.

In 1756, Austria fortified herself by alliance with Russia, Sweden and even her old enemy France, and prepared to destroy Prussia. Frederick's supreme military genius saved his country for the moment, and the next year England came to his aid. During the brief interval between the European wars, England and France had practically remained at war in America; and now that France had joined Austria, England was constrained to support Prussia. In all the period from 1689 to 1815, no matter what the origin of the wars, England and France soon became the chief factors; and though they were at one time or another on every side of every question, they were never on the same side at the same time.

This Seven Years' War (1756–63), or Great French War, as it is commonly known in America, was literally a world-wide struggle. Red men fought by the Great Lakes of North America, and black men fought in Senegal, while Englishmen and Frenchmen grappled in India as well as in Germany, and their fleets engaged on every sea. The showy battles took place in Germany, and on the whole the European conflict determined the wider results. Pitt, with vision fixed upon a coming British empire, declared that in Germany he would conquer America from France. This he did. England furnished the funds, and her navy swept the seas. Frederick, supported by British subsidies, furnished the generalship and most of the troops for the German battlefields. The striking figures in the struggle are (1) Pitt, the English imperialist and the directing genius of the war; (2) Frederick, the military genius, who won Pitt's victories in Europe; (3) Wolfe, who won French America from the great Montcalm, and (4) Clive, the East India Company's clerk, who laid the basis for England's supremacy in India.

**Changes in the World-Map; the American Revolution.**—The Treaty of Paris (1763) left Europe without change; but in India France lost all except a few unfortified trading posts, while in America, England received Florida from Spain, and Canada and the eastern half of the Mississippi Valley from France. France ceded to Spain the western half of the Mississippi Valley, in compensation for the losses Spain had incurred as her ally; and, except for

her West India Islands, she ceased to be an American power. Spain still held South America and half of North America; but her huge bulk was decaying day by day. Holland, too, with widespread empire, was plainly in decline. England, having dispossessed France in both Asia and America, stood forth as the leading world-power.

The American Revolution, a few years later, did not lessen this pre-eminence; but it had other results of supreme significance. The war came because the American colonies had really become a nation, and because the English government unwisely insisted upon managing American affairs after the Americans were quite able to take care of themselves. English interference in economic matters had long been irksome, and the danger of interference in ecclesiastical matters was feared. England had just relieved the colonies from fear of French conquest. External bonds were gone, and internal ties were dissolving. Then George III and his ministers supplied the necessary jar to effect separation by trying to raise revenue in America by Acts of Parliament. Astute patriots rallied the majority of the Americans by an old English shibboleth; and after a bitter eight-years' conflict (1775-83), the 13 English colonies became the first free American nation.

The Revolution "split the English race and doubled its influence." It paved the way for a more enlightened economic science, since, contrary to all expectations, the trade of free America from the first proved more valuable to England than that of colonial America had been. It reacted upon England, so that, when the great wars were over, both that country and its remaining colonies made new advances in political liberty. It set up the standard of independence for the states of Spanish America in both continents. But its supreme importance lay in the birth into the family of nations of the United States itself, though the full significance of the new nation hardly began to impress Europe for more than two generations.

England's European enemies had seized the opportunity to attack her in a war of revenge. England came out of the contest with glory little tarnished. She had been fighting, not America alone, but France, Spain and Holland, as well; and though she had lost the best part of her old American empire she was not without compensating gains. She seized Dutch colonies at will; she strengthened her grasp upon India; she won back the undisputed sovereignty of the ocean by shattering the navy of France; she rebuffed all assailants from the rock of Gibraltar, the key to the Mediterranean; and in some measure she made good even her American loss by the acquisition of Australia just afterward.

**The Partitions of Poland.**—To return to continental Europe in the closing half of the Age of Frederick the Great:—one more territorial change calls for attention. Poland had fallen into anarchy under its elective, figure-head king and its oligarchic nobles. This anarchy gave the neighboring powers excuse for plunder. Catherine II determined to seize a large part of the country. Frederick II persuaded his old enemy, Austria, to join him in compelling Russia to share her booty. The

First Partition of Poland (1772) pared off a deep rind. The Second and Third Partitions, which "assassinated the kingdom," had not even the pretext of misgovernment in Poland, for the Poles had earnestly taken up the work of reform. These final divisions took place in 1793 and 1795, after the death of Frederick, amid the wars of the French Revolution. Prussia gained large extent of territory, with valuable sea coast; and most important of all, the additions brought the principal Prussian provinces,—formerly scattered,—into a compact body. But Russia gained far the greatest part of the territory, and she now bordered Germany on the east, as France had come to do earlier on the west, after the destruction of the Burgundy of Charles the Bold. The wise policy of the Germans, early and late, would have been to support the buffer states against the greed of Russia and France. Failure to do so has left Germany exposed ever since to direct attack by powerful enemies, and has compelled her to build up artificial frontiers of fortresses and bayonets, and to accept an undue militant character for all her civilization.

**The Beneficent Despots of the 18th Century.**—In foreign relations, the Age of Frederick the Great saw little improvement over that of Louis. In the government within the several states, however, there was a beneficent and significant change. Frederick of Prussia, Catherine of Russia, Charles III of Spain, Leopold of Tuscany, Ferdinand of Naples, Joseph II of Austria, all belonged to a new class of "crowned philosophers" and "benevolent despots" who sat upon the thrones of Europe in the latter half of the 18th century. In Sweden and Portugal, also, great ministers sought to impose a liberal policy upon the monarchs, as Turgot succeeded in doing for a while, even in France. A remarkable school of French writers,—Diderot, Voltaire, Rousseau,—had created a new, enlightened sentiment in the ruling classes, and a new sense of responsibility. Government was no more by the people than before, but despots did try to govern for the people, not for themselves. Sovereigns spoke of themselves no longer as privileged proprietors, but, in Frederick's phrase, as "the first servants of their states." All these rulers planned far-reaching reforms,—the amelioration or abolition of serfdom, the correction of abuses in the Church, the building up of popular education. In Prussia, for a time, much was accomplished. The condition of the peasantry was improved; the administration was rendered economical and efficient; and wealth and comfort began to increase by bounds. But these happy results were secured only by the tireless energy of one of the world's greatest geniuses. On the whole the liberal monarchs made lamentable failures. One man could not lift the weight of a nation. It remained to see what the people could do for themselves. The age of enlightened despots was the prelude to the French Revolution.

#### THE AGE OF NATION STATES.

**The French Revolution, 1789-99.**—In the latter part of the Middle Ages Italy had given the world an intellectual revolution; Germany began Modern History with a religious revolution; and France now introduced the last great division of the Modern period by a political

and social revolution. Pre-eminently among political revolutions, the French Revolution deserves the name. The English Revolution of 1688 swept away temporary interference with ancient principles of English politics. The American Revolution made the Americans politically independent: so far as it brought any social change, it merely hastened slightly a movement, long under way, toward democracy. The French Revolution overturned a society that had been growing up for centuries, cut loose from the past, and started France, with all the world, upon new lines of growth.

But if it destroyed the old, it also built the new. The work of destruction was needlessly horrible and bloody; but as a whole the Revolution was a vast and fruitful reform. The really significant thing is not the temporary mob-rule and bloodshed; the significant thing is the great national awakening which swept away an absurd society, founded on ancient violence and warped by time, to replace it with a simpler social system, based more nearly on equal rights.

The chief institutions of France were: (1) a monarchy, centralized, despotic and irresponsible; but in weak hands, incumbered by complex survivals of ancient local institutions, and hampered by its respect for the good opinion of the privileged classes; (2) an aristocracy, wealthy, privileged, corrupt, skeptical; and (3) an established church, wealthy and often corrupt. Below these spread the masses, a necessary but ugly substructure. Over the Continent, similar conditions held sway. In France the nobles had fewer duties, the peasantry had more completely risen out of serfdom, and more of a middle class had grown up, than in the other large countries of the Continent. Feudal society was more decayed, and industrial society was more advanced. The great European revolution broke through at the weakest spot.

The fundamental cause of the Revolution was the unjust privileges of the favored classes and the crushing burdens of the masses. The evil was no greater than for centuries, but the consciousness of it was greater. The masses had begun to demand reform; and the classes had begun to question the righteousness of their privileges. A revolution "requires not only abuses but also ideas." The combustibles were ready, and so was the match.

Science had upset all old ideas about the world outside man. The telescope had proved that other planets like our earth revolved about the sun, and that myriads of other suns whirled through limitless space; and Newton had shown how this vast universe is bound together by the unvarying "law" of unseen gravitation. The microscope had revealed an undreamed-of world of minute life in air and earth and water; and earth, air, water (and fire) themselves had become new,—since Lavoisier had just resolved them into components and proved that they were not the "elements" the ancients had held them. Such a revolution in the way of looking at the material world prepared men to ask questions about the world of man and society. Tradition and authority had been proved silly in the one field; perhaps they might be wrong in the other. And so the Revolution was really begun by the revolt against the authority of the past among the

dazzling galaxy of French literati led by Voltaire, Montesquieu, Diderot and Rousseau.

The Revolution, however, is conveniently dated from the meeting of the States-General in 1789. The king had summoned that body, hoping to induce the privileged orders to give up their exemptions from taxation, and so relieve the bankrupt treasury. The Third Estate, representing the middle class, and the liberal nobles and clergy had assembled with the determination to secure far-reaching reforms and to establish a "constitution." A sharp contest, with a brief period of anarchy, left power in the hands of these liberal elements, where, despite some attempts at counter-revolution and some danger of mob predominance, it remained for two years. The Constitution fashioned during this period provided for a weak kingship and abolished nobility and all special privileges before the law; but it carefully entrenched middle-class supremacy against democracy by graded property qualifications and a complex system of indirect elections.

Further changes were inevitable; but, if France had been left to herself, they might have come about as quietly as these first ones. Instead, foreign war gave the movement a new character. War was inevitable. Emigrant nobles gathered their forces on the Rhine under the protection of German princes. The emperor, Leopold, brother-in-law of Louis of France, called upon the sovereigns of Europe to recognize the cause of Louis as "the cause of kings," and demanded from France such changes in her government as should protect Europe against the spread of revolution. This presumptuous dictation in their internal affairs roused a tempest of righteous wrath in the French nation; and in 1792 war began between "the cause of kings" and "the cause of peoples." For 23 years Europe was engaged in strife, upon a greater scale than ever before in history.

France was girdled with foes. The empire, Prussia and Sardinia, were at once in arms, Naples and Spain joined the coalition. Sweden and Russia both offered to do so, if needed. Ere long England and Holland were added to the enemies who expected to partition France. Vast armies invaded France; and the French forces were demoralized by treachery of officers and by fear of Royalist plots. If France was to be saved, it could not be done by half-measures, nor with a king in secret alliance with the enemy. Control fell to extremists; and, while the mighty Danton roused and organized the national energies, the frenzied mob, unhindered, answered the victories and boastings of the invaders by the attack on the Tuileries and the Massacres. In September, the Convention established the French Republic with extreme democratic features and with manhood suffrage. Then revolution within revolution transferred power to more and more radical factions. The defeated Girondists raised the provinces against the capital; and for a time Paris and a score of central departments faced the remaining three-fourths of France and united Europe. Out of this crisis, in 1793, grew the great Committee of Public Safety, which ruled France for a year with despotic power. The Revolution now became constructive, and never has the French genius for or-

ganization shown itself more triumphantly. The Committee deliberately adopted a policy of "Terror" to crush plots and dissension and to secure united action. Revolt was stamped out. A million soldiers were sent to the front. The invaders were rolling back in rout, and the ragged but devoted French armies swarmed victoriously across all the frontiers, to sow civil liberty over Europe with fire and sword. France was not again in serious danger from foreign foes until the fall of Napoleon, 20 years later.

Meantime, while the grim, crime-stained men of the Committee in war and tumult were organizing order within and victory abroad, the Convention was laying anew the foundations of French society and advancing the progress of the human race. It adopted the projects of Cambacérès for the codification of French law, and the plans of Condorcet for a system of national education; it accepted Argobast's metric system of weights and measures; it abolished slavery in the French colonies, created provision for the public debt, instituted the first Normal School, the Polytechnic School, the Conservatory, the Institute of France, the National Library and began the improvement of prisons and hospitals, and the reform of youthful criminals. Meantime the peasants had become free landholders, and the whole laboring class was rising rapidly in standard of living.

In 1794 the Jacobins split into factions, and these turned the "Terror" upon one another. The following year a conservative reaction gave the Republic a new constitution, which restored property qualifications and indirect voting. But the new plural executive (the Directory) proved incompetent and corrupt, and kept itself in power only by a series of *coups d'état*. It was assailed by conspiracy, radical and royalist; and France breathed more easily when, in 1799, Bonaparte overthrew it with his troops and set up a firm military despotism, veiled by plebiscites.

**Napoleonic Period, 1800-15.**—For 15 years, as First Consul (1800), Consul for Life (1802) and Emperor of the French (1804-14), Napoleon was sole master of France. He preserved the principle of civil equality and all the economic gains of the Revolution, but political liberty for a time was lost. True, his rule was a denial of the old doctrine of Divine Right: each new usurpation received the sanction of a popular vote, and he boasted that he was chief by will of the people. But every form of constitutional opposition was crushed or muzzled. The legislative chambers existed only to speak when and as he chose; free speech, free press and all security for personal liberty were suppressed by a system of spies and secret police and by arbitrary imprisonment of suspects; local administration was centralized more highly than ever under the old monarchy, "nor did there exist anywhere independent of him authority to light or repair the streets of the meanest village in France."

This all-pervading absolutism was directed by the penetrating intelligence and indomitable energy of the world's most "terrible worker"; and it conferred upon France great and rapid benefits. Order, precision, symmetry were introduced into every branch of the administration. The interrupted work of the Convention was resumed. Education was organized; law

was simplified and codified; the Church was again brought into alliance with the state; industry was fostered, and magnificent public works were carried out. But in all this, Napoleon was merely the last and greatest of the beneficent despots. And in the outcome, his rule fixed more firmly than before in the mind of the nation the dangerous willingness to depend upon an all-directing central power; so that in our own day, after many revolutions, the supremely difficult task of the Third Republic has been to create the spirit of local self-government.

No doubt, in 1800, when Napoleon came into power he sincerely desired peace, in order to reconstruct France. By the brilliant victories of Marengo and Hohenlinden he dissolved the hostile coalition, and a series of treaties, closing with the Treaty of Amiens (1802), gave Europe a breathing spell. But soon Napoleon again desired war. His victories in Italy, as a general of the Directory, had first brought him to the world's notice, and only military glory could keep France from murmuring at his rule. Moreover, he aspired frankly to European empire. On the other hand, the nations felt that there could be no lasting peace with him except by complete submission to his will. In 1803, England and France renewed their strife, and between these powers there was to be no more truce until Napoleon's fall 11 years later. In that time Napoleon fought also three wars with Austria, two with Prussia, two with Russia, a long war with Spain and various minor conflicts. From 1792 to 1802, the unceasing European wars belong to the Revolutionary movement. From 1803 to 1815, they are properly Napoleonic wars, due primarily to the ambition of a great military genius. In the first series, Austria was the chief opponent of the Revolution; in the second series, England was the relentless foe of Napoleon.

Napoleon's insight readily divined his true enemy; but Nelson's great sea fight put an end to all possibility of directly invading England. On the Continent, however, victory followed victory. After Austerlitz (1805), Austria gave up her remaining Italian and Illyrian territory and many of her possessions in Germany. After Jena (1807), humiliated Prussia was reduced half in size, thrust beyond the Elbe and bound to France by a shameful treaty. Less decisive conflict with Russia was followed by the diplomatic victory of Tilsit (1807). Emperor and Tsar entered into friendly alliance. France was to have a free hand in western Europe; Russia was to be permitted to aggrandize herself at the expense of Sweden, Turkey and Asia; and the two were to join in ruining England by enforcing Napoleon's "continental system."

The refusal of Portugal to obey Napoleon's command for the confiscation of English commerce led to the seizure of that state. Then followed a like seizure of Spain, out of which grew the long Peninsular War, which, as Napoleon confessed afterward at Saint Helena, was really the canker that destroyed him. At the time, however, it seemed trivial, and for five years after Tilsit Napoleon was master of the Continent. At its greatest extent the huge bulk of France filled the space from the ocean to the Rhine, including not only France as we

know it, but also Belgium, half of Switzerland and large strips of Germany, while from this central body two outward-curving arms reached toward the east, one along the North Sea to the Danish Peninsula, and the other down the coast of Italy past Rome. The rest of Italy and half the rest of Germany were under Napoleon's protection, ruled as a vassal states by his brothers and generals. Denmark and Switzerland were his willing allies and Prussia and Austria were unwilling ones. Sweden and Russia, though nominally his equals, were allowed that dignity only because they upheld his policy. Only the extremities of the Continent—the islands of Sicily, Sardinia and England, and the mountainous Spanish Peninsula—kept their independence, at the cost of wasting war.

The period was filled with important rearrangements for Europe, territorial, political and social. Many of these were designed in selfishness; but nearly all were to bear good fruit.

In Germany, even the territorial rearrangements paved the way for later national unity. Not only the 1,500 anarchic territories of the "knights," but also the 300 petty, scattered, despotic principalities, ecclesiastical states and oligarchic city-republics (with a few exceptions) were absorbed in larger neighbors; so that the multitudinous, ill-governed states of the vanished "Empire" were consolidated into less than 40. Most of these reorganized states, outside Austria and Prussia, were further combined in the Confederation of the Rhine; and in this Confederation as well as in the German and Italian territory annexed to France, and in the various vassal states over Europe, serfdom and feudalism were abolished and civil equality and the Code Napoleon were introduced. The administration of justice was made cheap and simple, and the old clumsy and corrupt methods of government gave way to order and efficiency.

Most important of all, similar reforms were adopted in Prussia, not from French pressure, but by the influence of the Prussian Minister, Stein, who sought to make his country strong enough to throw off the French yoke and to regenerate Germany. Napoleon's insolence had at last forced part of Germany into a new national patriotism; and that patriotism began to arm itself by borrowing weapons from the arsenal of the Revolution.

Napoleon's "continental system," if embarrassing to England, was ruinous to Europe. Moreover, Tsar Alexander began to suspect Napoleon of intriguing against him in Finland and Turkey; and in 1811 he refused longer to follow Napoleon's commercial policy. Napoleon declared war. The destruction of his Grand Army amid Russian snows was the signal for the rising of the peoples of central Europe in the Wars of Liberation. Napoleon, like a desperate gamester, refused all terms, and finally was crushed and deposed. The Bourbon dynasty was restored to the throne of France, and the powers met in the Congress of Vienna (1814-15) to reconstruct the map of Europe.

**The Congress of Vienna.**—In its desires, that Congress stood for reaction. Says Fyffe, "It complacently set to work to turn back the hands of time to the historic hour at which they stood when the Bastille fell." It ignored peoples, and considered only princes. Its work,

therefore, had to be slowly undone through the next half-century.

Still, its power for restoration was less than its wish; and even its most selfish work contained seeds of progress. Nobody thought of restoring the old ecclesiastical princes, nor of undoing the consolidation of Germany. That country was left in 38 states, and Italy in 12. Austria, which had lost territory in central Europe, received its compensation in Italy, so that its despotic energies were more than ever drawn away into Italian and Danubian questions. Renovated Prussia, in return for Slav lands, which it ceded for the tsar's new kingdom of Poland, received German territory—half of Saxony, the Pomeranian sea coast and German provinces on the Rhine taken from France. Thus, reaching down into the heart of Germany, and with distant isolated districts to defend on the Rhine and on the Niemen, Prussia stood forth the natural champion of Germany against Slav and Gaul. In like manner, Sardinia's gain of Genoa was one more step in the consolidation of Italy. In return for the vast national debt incurred in supporting coalitions against Napoleon, England added still further to her colonial supremacy by holding South Africa, Cyprus, Malta and other important stations. Despite its brief welcome to Napoleon at his return from Elba, France was wisely left with the boundaries she had when the Revolutionary wars began. The most serious disappointment to the liberals was the failure to secure a national union in Germany. Reactionary Austria secured instead the Germanic Confederacy—a loose league under Austrian presidency, with a Diet which was merely a meeting of ambassadors—"a polite and ceremonious means of doing nothing."

It was worth much to Europe merely to recognize that it had common interests which could be arranged by a peaceful congress. Even this gathering of despots was an advance from 18th century politics toward a better international organization. Some of its work, moreover, was distinctly progressive, such as the declaration (secured by England) against the African slave trade, the opening to commerce of the rivers flowing between or through different countries, and especially the neutralization of Switzerland under the protection of the powers.

**The Industrial Revolution.**—Here it is needful to interrupt the political survey to trace a vast economic movement. While France had been giving the world her great social and political revolution with noise and blood, in England an even greater "industrial revolution" had been brought by humble workers busied in homely toil, puzzling day after day over wheels and belts and levers, seeking some way to save time. In the days of Voltaire and George Washington men raised grain and wove cloth and carried spare products to market in the same way in which these things had been done for 4,000 years. The farmer with strenuous toil scratched the soil with a clumsy wooden plow, not unlike those pictured on Egyptian monuments 6,000 years ago. He had no other machine for horses to draw except a rude harrow and a cart. He sowed his grain by hand, cut it with the sickle of Tubal Cain and threshed it with the prehistoric flail. Carpenter's tools differed little in number or style

from a set, 4,000 years old, recently found in Crete. The 17th century had seen the invention of sawmills driven by water (like the still earlier grist mills); but these only cut logs into rough boards; all planing and dressing of lumber was still hand work. Merchandise was still carried on pack horses or mules; and travel was mainly on horseback, though slow six-horse coaches toiled along on a few main roads, at perhaps four miles an hour. No woman had ever cooked by a stove. Household lights were dim, ill-smelling candles or smoky and flaring torches. If a householder carelessly let his hearth fire go out, he borrowed live coals from a neighbor or struck sparks into tinder with flint and steel. If a leg was to be amputated, the agony had to be borne without the merciful aid of anæsthetics. The few cities were still small and mediæval, without water supply, sewerage disposal or regular police protection. London was the only town in Europe that boasted lamp posts.

The first improvements came in agriculture. By the middle of the 18th century English landlords were introducing a scientific crop rotation—which then brought with it a helpful circle of gains—larger crops, more stock, richer soil. The increase in farm products, together with the new interest in agriculture, led, about the beginning of the next century, to the invention of the cast-iron plow, the cradle-scythe and the threshing machine. Even sooner it led to better facilities for transportation,—turnpikes, macadamized roads and lock-canal.

The main change that was to revolutionize working society, however, came not in farming but in cloth manufactures. In the 17th century the primitive distaff for drawing the fibre of flax or wool into thread had been replaced by the wheel, run first by hand, but afterward by the foot of the spinner. But the spinning wheel spun only one thread at a time, and one weaver with his clumsy hand-loom could weave into cloth all the thread eight spinners could supply. In 1761 the English Royal Society for the Encouragement of Manufactures offered a prize for an invention for swifter spinning. Then in swift succession, Hargreaves' "Jenny" (1764), Arkwright's "Water Frame" (1771) and Crompton's "Mule" (1779) enabled one spinner to spin 200 threads at a time. The weavers still using the hand loom older than any records of history could not keep up with this until (1784) Cartwright invented a power loom whose shuttle automatically threw the wool back and forth through the warp. After that, both spinners and weavers needed more raw material. This need was met in America after Whitney's Cotton Gin (1793) made it possible for one slave to clean as much cotton fibre from seed as 300 slaves could clean before. To use the vastly increased supply of cotton there was needed a better motive power for manufacturing machinery, and by 1785 Watt's improvements on the pumping steam-engine had produced an engine that worked swiftly and economically, and which could transmit its power to wheels by an arrangement of shafts and cranks. By 1800 there were more steam-engines in England than water wheels, and the age of steam and iron had begun for that country. Since prehistoric man found ways to make fire and bake pots, and make spindles,

and extract iron from the ore, there had been no change in man's work and life comparable to this tremendous change in the last quarter of the 18th century.

The English inventions were soon known in America, but they came into common use there only when the War of 1812 forced Americans for a time to manufacture all their cloth. In 1800 that country had only four steam-engines, and its four small cotton mills were run by water wheels. From the continent of Europe, too, the new age was shut out for some years by Napoleon's "continental system"; and it did not really establish itself there, even in industrial and progressive France, until about 1830. The problems of the new system had to be met first in England.

With machinery and steam, one worker was soon producing more wealth than hundreds had produced by the old hand processes. Part of the marvelous increase went to the common gain, in lower prices, but to multitudes of the workers the industrial revolution meant not higher life but lower life. This was not the fault of Hargreaves and Watt; the fault lay in the imperfect organization of society. The inventors had swept away the cumbrous and outgrown "Domestic" system of manufactures for an efficient and economical "Factory" system. But the new machinery was costly. Workmen could not own it as they had owned their spinning wheels and looms; nor did they know how to combine so as to own it in groups. And so far-sighted individuals of wealth built huge factories, story on story, filled them with the new machinery, furnished the raw material, paid wages to hired "hands" and took to themselves the bulk of the new wealth. The new factory system became also a capitalist system and a wage system.

At a touch, the factory system had changed magically the face of England—as soon it was to change the face of the civilized world. In 1750 England was still rural, with only five towns of more than 6,000 people; in 1800, it had 100 such towns, and its total population had already nearly doubled. In the next 50 years, it doubled again, and the towns much more than doubled in size and number. And this growth of towns—long without water supply or garbage collection—brought new problems which at first no one saw clearly and with which neither science nor law was then fit to grapple.

And in the new cities appeared two new elements in human society: the capitalist manufacturer, dwelling in his pompous mansion and soon dominating middle-class society; and the capitalless and landless proletariat of pallid factory workers, with nothing to sell but their hands. This new class was at first made up of old workers drawn away from their rural homes,—with garden spots, fresh air and varied industry,—to herd in squalid, indecently crowded tenements, bordering on pestilential alleys, amid destitution, disease, filth and vice. In 1837, one-tenth the people of the great city of Manchester "lived" in cellars.

These destructive tenement conditions were due to general ignorance, to the poverty of the workers and to the careless greed of the employers. Even more disastrous conditions within the factory itself were due directly to capitalistic selfishness. Multitudes of men were clamoring for work, and much factory work

could be done by women and young children. The operatives had not begun to bargain collectively; and the employer fixed wages and hours at will. Accordingly, the "dawn-to-dark" working day was brought from out of doors—where it was endurable because spent in fresh air and in varied activity—into the factory, where it was unendurable because of foul air, poor light, incessant nerve-racking noise of machinery, and because there it crushed women and young children so as to become a menace to the national life. These conditions in England, from 1800 to 1834, are too notorious to need amplification. Even in America as late as 1832 a committee reported that two-fifths of all factory workers were children whose day of toil averaged 14 hours—every day of the year except Sundays and the few holidays—and who had no chance whatever for schooling.

The new society soon begot new social philosophies. The prosperous capitalist class resented all thought of interference in their business by government. Such meddling by the paternalistic governments of the past, they easily proved, had been harmful, even when best intended; and the new science of political economy, founded by Adam Smith, taught remorselessly that the "greatest good of the greatest number" could be secured only by non-interference with the "natural laws" of supply and demand. This *Laissez faire*, or Manchester, doctrine soon became the religion of the town middle-class; but from the first there were raised voices to protest that it united the strong but was merciless and unchristian to the weak. Against the teachings of that "dismal science," such thinkers at once set up an opposing set of doctrines; and before 1850 the utopian socialist dreams of Owen, Fourier and Saint Simon had grown into the scientific socialism of Karl Marx.

Now we may turn back to the course of political history.

**From 1815 to the Revolutions of 1820.**—For more than 30 years after the Congress of Vienna reaction held sway in Europe. The restored princes, who "had learned nothing and forgotten nothing," strove to ignore the progress from 1789 to 1815. In Sardinia, serfdom was restored; in Spain and the Papal States, the Inquisition and other mediæval institutions; in some places, even street lamps were abolished along with other hateful French reforms. Five states,—Russia, Austria, Prussia, England and France,—determined the policy of Europe. The first three were divine-right despotisms; and though the tsar and the king of Prussia played for a time at liberalism, the first disorders enabled Austria to draw them over to her own frankly reactionary program. At first, France and England were not much better than these Eastern powers. Louis XVIII had found it necessary to give France a charter; but in that document itself the theory of divine right was preserved, until the revolutionary changes of 1830. That theory could have no place in England; but even there the government was for many years in the hands of an extreme Tory party. The evil genius of the whole period was the subtle Austrian statesman, Metternich, with his motto, "Government is no more a matter for debate than religion is." The one good thing to be said for Metternich's long su-

premacy is that he permitted no great war; and this was because he felt it necessary to hold the powers in friendly alliance, so as better to arrest progress within the lines drawn at the Congress of Vienna.

However, beneath the tide of reaction, the principles of the Revolution survived. The two positive forces in politics for the 19th century were to be democracy and nationality. The league of princes compelled them to work underground; but before the middle of the century they emerged in three series of revolutions—in 1820, 1830 and 1848.

The revolutions of 1820 started in Spain, to re-establish the Constitution of 1812, which had been adopted first during the war for Independence. Completely successful there for the time, the movement spread swiftly over the southern peninsulas—to Portugal and to the states of North and South Italy, while it stimulated the Greeks rising against the Turks. Metternich found a weapon of repression ready. After Waterloo the four great allies, Russia, Prussia, Austria and England, had agreed to preserve their union against revolutionary France by holding occasional congresses. Metternich now summoned these powers to the Congress of Troppau. Here the despotic masters of Russia, Austria and Prussia signed an agreement to unite in putting down revolution against any established government. England protested and withdrew from the alliance; but her place was taken by France, and the united despots, popularly known as the "Holy Alliance," proceeded to carry out the Troppau program. With overwhelming armies they crushed constitutionalism in Naples and Piedmont, and a little later in Spain. England's fleet preserved the little sea-coast country of Portugal from attack; and the tsar's sympathy for his Greek coreligionists held Metternich from aiding Turkey. Portugal and Greece were the only European lands to reap good from the widespread risings of this period.

**American Progress.**—Greater gain there was, however, outside Europe. The "Holy Alliance," successful in Spain, wished to restore monarchic control over revolted Spanish America. Here they failed. When Napoleon seized Spain (1808), the Spanish colonies, nominally loyal to the old Spanish dynasty, began to taste the sweets of economic and political freedom. They were powerfully influenced, too, by the success of the United States; and soon they began, one after another, to avow independence not only of Napoleon, but also of the mother country. The United States had recognized their independence. England had not done this; but now she interposed her sea-power to shield them against the proposed attack by the "Holy Alliance." England indeed urged the United States to join in a formal alliance to protect Spanish America. The United States chose to act separately, but it did act along the same line; in 1823 President Monroe's message announced that this country would oppose any attempt of the despotic powers to extend their political system to America. Thus was born a group of new nations. For more than 50 years, it is true, the best of the new states manifested anarchic tendencies; but before the close of the 19th century some of them began to make steady and promising progress in government and society. Their constitutions have

been modeled generally upon that of the United States.

Before returning to Europe, brief attention should be given to the progress of the United States itself in the generation following the French Revolution. The Constitution of 1787 saved the 13 States of that time from falling apart into jangling, insignificant units, and gave the world an advanced type of federal government. Jefferson's peaceful "revolution" of 1800 marked the resumption of progress toward democracy and Americanization, which the aristocratic reaction just after the Revolutionary War had interrupted. The Louisiana Purchase (1803) doubled the territory of the country and confirmed its destiny as the home of a mighty continental nation. During the closing Napoleonic struggles, the contemptuous disregard of England for the rights of neutrals, together with the treacheries of Napoleon, involved America in war with England; but, beyond this, except for the enunciation of the Monroe Doctrine, the United States, busied with its marvelous growth at home, had kept free from foreign complications. At the moment of the European revolutions of 1820, the great American republic was entering on the 40 years of anti-slavery debate which preceded the Civil War.

**Revolutions of 1830.**—The year 1830 is one of the notable dates in the 19th century. In America the victory of Jackson had just marked a fresh advance in popular government; and the first labor union movement in America (the backbone of Jacksonian Democracy in the East) was agitating, in some places with successful strikes, for a 10-hour day in place of the dawn-to-dark day, for regulation of child labor so as to permit schooling during part of the year at least, and for a modern free State system of schools in place of the existing "pauper" schools for the poor. In England the First Reform Bill began its two-year struggle in Parliament. On the continent of Europe, revolution struck a new blow at the system of Metternich. This time the movement started in France, where the July Revolution replaced the divine-right Bourbon monarchy with the constitutional, bourgeois monarchy of the Orleanists. Explosions followed over Europe. The Belgians rose against their Dutch masters; the Poles against Russia; Italian risings seemed for a moment to have some chance in the Papal States and the duchies; and, while Russia and Austria were busied in Poland and Italy, liberal gains were secured in several German states. But soon Metternich, his hands free once more, set himself patiently to restore the old order in Germany. France, it is true, was lost to the "Holy Alliance," and joined England in defending liberal Belgium against despotic intervention. But in the final result, France and Belgium were the only European gainers from this period. It was to take the third great "year of revolutions," to sweep away Metternich's shattered system.

To appreciate in any measure the wonderful progress of the remaining two-thirds of the 19th century, it is needful to grasp conditions when the Victorian era began. It was still a small, despotic world, far more remote from the great, progressive world of 1900 than from the world of 1600. Civilization held only two patches on the globe,—western Europe and

eastern North America. In the latter, the real frontier of the United States reached less than one-third the way across the continent, and politics and society were dominated by the slave power. Europe knew "Germany" only as a pious aspiration of revolutionaries, and "Italy" as a "geographical expression." Metternich stood guard over central Europe. On the east hung Russia, an inert mass, in the chains of her millions of serfs. Under the contemptible Orleans monarchy, France was taking breath between spasmodic revolutions. England herself had only begun to stir under the long oligarchic rule of her landlord class. The rest of the globe hardly counted; a fringe of Australia held a convict camp; eastern Canada was a group of jealous, petty provinces, learning to agitate in disorderly fashion for self-government; Spanish America, prostrate in anarchy, gave as yet little hope of the coming renaissance; Japan was to sleep a generation longer; while the two largest continents were undisturbed in their native barbarism, except for England's grasp upon the hem of India and South Africa.

**England in the 19th Century.**—In Europe, England was to lead the van of progress; and in England, almost alone in Europe, reform was to come without revolution. But the England of 1830 was still mediæval. During the great French wars from 1690 to 1815, except for the one development of ministerial government, England had retrograded politically and socially. Her society was marked by extreme inequalities between rich and poor, intensified by cruel class legislation; her government, superficially representative, had really fallen into the hands of a selfish landlord class; her boasted local self-government was intensely aristocratic; her Established Church was aristocratic and uninspirited. In the last half-century along with the industrial revolution had come a marvelous increase of population and growth of city life, calling imperatively for new adjustments; but the great Tory party met all calls for reform with sullen denunciation and repressive legislation which made free speech a crime.

Under the system of rotten and pocket boroughs, more than half the House of Commons were the appointees of less than 200 landlords, while most of the rest represented small fantastic constituencies. Thus, reform necessarily began with Parliament itself. This parliamentary reform was accomplished by three great measures; that of 1832 placed power in the hands of an intelligent middle class, the landed and mercantile interests; 35 years later, the Second Reform Bill (1867) gave power to the skilled artisan class of the towns; the bill of 1884 once more doubled the electorate; and the reform of 1918 made England a democracy with complete manhood and womanhood suffrage, and with abolition of all "plural voting."

The Reform Bill of 1832 was followed at once by social reform, in response to the swelling tide of humanitarianism in literature and society. Legislation swept away negro slavery in the colonies, and the hideous white slavery of women and children in English factories and mines; reformed the barbarous and fantastic criminal code; abolished the worst abuses of the pauperizing poor-law; began the protection of workmen in factories against carelessness or wilful neglect of capitalists; gave

women a few legal rights; adjusted taxation more equitably; swept away the corn laws and introduced the free-trade era; removed the press gang and brought in the penny post; enlarged the self-government of the colonies; and established a wonderfully efficient system of democratic self-government in cities at home. Subsequent political reform, despite the Irish difficulties after 1870, added to the rate of social reform. In particular should be noticed: (1) ballot reform and the elimination of corruption from politics; (2) the adoption of a broad school system; (3) the true democracy established in rural units by the local government bills of 1888 and 1894; (4) the complex industrial legislation; and (5) for dependencies where the nature of the population forbids self-government, the adoption of efficient, unselfish colonial administration, in which England has set an example for all world powers. Even India and Egypt, with their tremendous difficulties, were touched with new life. And the great provinces of the English-speaking colonies, Canada and Australia, were encouraged to organize themselves into two mighty federal states (1867 and 1901) — a movement fitly consummated after the Boer War by the generous establishment of the federal Union of South Africa (1909). Mr. Gladstone's defeat and retirement in 1895 checked internal reform for some 10 years; but by 1906 the Liberals had come into power again, under the vigorous leadership of Asquith and Lloyd George. As early as 1892 a famous Liberal platform had called for Irish Home Rule, Welsh disestablishment, sweeping reforms in taxation, old-age pensions, and, as a necessary step toward any reforms for the "mending or ending" of the lords. This program was now taken up in earnest. In 1911, after successive referendums and a three-year parliamentary struggle, the veto of the Lords was virtually abolished. Then the rest of the "New Castle program" was quickly put into law, along with the most advanced and comprehensive factory acts, workman's compensation acts, and social insurance acts yet known to the world — including insurance against unemployment. By Lloyd George's radical system of taxation, too, the money to wage this "war against poverty" was being drawn largely from that class of wealthy men who receive their wealth without rendering services to society in return. Other countries were moving, too, along like lines. But at the instant of success, all this fair promise of the new 20th century was blighted, in all European lands, by the devastation of the World War.

**Revolutions of '48.**— Meantime, on the Continent, the next great progress after 1830 came with the revolutions of 1848. A general explosion had been preparing; but again the signal was given by France. The Orleans monarchy had become reactionary; and the socialistic February revolution set up the Second Republic. March saw Metternich himself a fugitive, escaping from Vienna in a laundry cart, while thrones were tottering everywhere between Russia and Turkey on one side and England on the other. Even England trembled with a Chartist movement and the threat of an Irish rebellion. The kings of Holland, Spain, Denmark and Sweden made constitutional concessions. In Germany and Italy there were complex move-

ments, working (1) for constitutional liberty and social reform within the several states; (2) for the union of the fragments of the German race into a nation; and (3) for the independence of Italians, Slavs and Hungarians held in subjection by Austria.

The third movement resulted in wars, out of which Austria finally emerged triumphant; and her victorious army was a ready tool to restore absolutism at home. In Germany the undisciplined Liberals had wasted opportunity, Austria dispersed the Frankfort National Assembly, and, after humiliating unready Prussia at Olmütz, restored the old confederation (1850). A year later (1851) the *coup d'état* of Louis Napoleon closed the revolution in France and prepared the way for the Second Empire of the next year.

But there had been great gains. Feudalism and serfdom were gone forever, even from Austria. Sardinia, Prussia and the minor German states kept their new constitutions. Switzerland had become a true federal republic upon the American type. Sardinia, by her sacrifices, and Prussia, in spite of the past mistakes of her timid government, were clearly marked out as the champions of Italy and Germany against Austria. Victor Emmanuel of Sardinia recognized his mission to unite and free Italy; and Prussia, so recently shamed, had statesmen who would see that next time she should be ready.

**From 1850 to 1880.**—The next 30 years saw not only the advance toward democracy in England, the victory of nationality and the abolition of slavery in the United States, the formation of the federal Canadian Dominion, on the American model, and the awakening of Japan under American constraint, but also a new federal German Empire, a united, constitutional Italy, a stable French republic, a constitutional Spain and a constitutional, federal Austria-Hungary. The period was one of "blood and iron." Napoleon III, who had drawn England into the Crimean War (1854) to humiliate Russia, was himself drawn by the statesmanship of Cavour into the Austrian War of 1859 to help free Italy. Within a year after the resulting campaigns in Italy had closed, the American Civil War began; and before it ended, Bismarck had entered upon his trilogy of wars. In 1864 he robbed Denmark of the Schleswig-Holstein duchies, with the great harbor of Kiel for Prussia's projected navy, and so made trial of the new army he was at once to use (1866) in driving Austria out of Germany by the Six Weeks' War. The North German Confederation then formed was expanded into the German Empire by the Franco-Prussian War (1870-71), into which Bismarck next tricked the despairing ambition of the decaying French government. These struggles completed also the unity of Italy. In 1866 Italy recovered Venetia from Austria, and in 1870, when France could no longer interfere, it at last marched its troops into its ancient capital, Rome. Out of the Russian-Turkish War of 1877-78 a new group of Balkan nations was born, mainly Slav in blood, with at least the forms of constitutional government; but in the Treaty of Berlin, the short-sighted selfishness of England's Tory party, led by Disraeli, kept the Turk from being wholly driven out of Europe, and left smouldering the fatal embers of future and vaster con-

flagrations. Even for the vanquished, in the warlike period, reform grew out of war. The Crimean catastrophe struck the chains from Russia's serfs; the shock of defeat in 1859 and 1866 woke Austria to constitutional progress; only when Germany shivered the sham of the Second Empire did France enter upon true republican life; and it was in the ashes of her old social system that our own South found regeneration.

From 1880 to 1914 the Continent of Europe offers a marked contrast to the picture shown by the preceding period. Progress was mainly peaceful, until men began to dream that "blood and iron" were forever out of date. Except Russia, little Montenegro and European Turkey, all the monarchies of Europe had already become "constitutional," more or less after the English model. In none of the monarchies on the Continent, it is true, were the ministers so powerful, or so truly dependent on the people's will, as in England; and in some the formal constitutional monarchy merged into a practical despotism. Political advance consisted during the last period (1) in a growth of "ministerial responsibility"; (2) in a rapid extension of the franchise in almost all countries toward a manhood basis; and (3) soon after 1900, in a swift series of almost bloodless revolutions, which set up constitutional forms in Russia, Turkey, Persia and China, until for a time Siam was the only sovereign state on the globe without a representative assembly. Some of the Oriental revolutions were soon undone in part and in most European countries the actual administration of government remains highly aristocratic. On the other hand, in nearly every European land, the Socialists make a formidable political party with much weight in the national assembly; and nearly everywhere the people are training themselves, in compulsory school systems, for ultimate control.

**International Relations Since 1880. Europe in Africa and Asia.**—International relations since 1880 require brief statement. France, longing to recover her lost provinces from Germany in a war of revenge, drew close to Russia. Bismarck offended Russia by supporting Austria in the Balkans. Italy was angered by the French seizure of Tunis in 1881. Thus new combinations of the powers appeared. In 1882, Germany, Austria and Italy (all old enemies) leagued in the Triple Alliance; while a little later, France and Russia formally adopted a dual alliance. The Continent was thrown into two hostile camps and rested for the next 30 years under a crushingly burdensome armed peace. England, unwilling to join the Triple Alliance, as Bismarck wished, was left in a position her statesmen characterized as one of "splendid isolation." Soon, however, England began to see in Germany a rival in Africa and Asia (below) more to be dreaded than France. Germany's growing commercial activity, too, threatened England's supremacy in trade. Above all, German militarism was intensely repugnant to English democracy. On the other hand, England and France grew to a better understanding of each other, and in 1903 a standing arbitration treaty between them went far to prevent future jealousies. From that time England was properly regarded as allied with the old Dual Alliance — which now became the Triple Entente.

To this alliance the small states of Europe gave their sympathies. On the other hand, Turkey fell away more and more from English influence into a practical dependency of Germany. And while the Dual Alliance grew into the Triple Entente, the old Triple Alliance was partly disrupted. Italy's acquisition of Tripoli (1911) canceled her old grievance against France; and then her ancient bitterness against Austria, because of Austria's retention of the Italian Trentino, began to drive her away from the central European powers.

In the 90's all these European arrangements were threatened by the active appearance, in the field of international politics, of two non-European powers. The Chinese War of 1894 revealed Japan as a modern and powerful state; and the Spanish-American War (1898) made it apparent that the United States had abandoned its exclusively American policy. Moreover, since about 1880, European politics had been merging more completely than ever before in world politics. Rhenish and Danubian questions for a time were dwarfed by mighty African and Asiatic problems. The earlier part of the 19th century, indeed, had been an age of expansion of civilization. The United States had quietly filled its borders from ocean to ocean with a homogeneous population. Russia had spread across northern Asia to the Pacific, and was reaching down in the Trans-Caspian region toward the Persian Gulf. And England had continued annexation of the keys to empire in waste spaces of the earth. These three were the world-powers. Far behind came France, with some important possessions in North Africa and some ancient claims in southeast Asia. Until 1884 Germany had no thought of colonial empire.

But about 1880 a new, conscious greed for colonial territory seized Europe. Africa, some Pacific islands and the helpless Asiatic empires of Persia, Turkey, Siam and China were the only unappropriated lands. There followed a swift, peaceful division of Africa. In 1880, only patches here and there on the coast were European; in 1891, except for the native states of Abyssinia, Liberia and Morocco, the continent was mapped out between European claimants. The three important African powers had come to be England, France and Germany, though Belgium, Spain, Portugal and Italy were also represented. England was far in the lead. Her ambition had been to unite her two main possessions, in the Nile Valley and in South Africa, by acquiring intermediate territory; but the Kongo Free State and German East Africa were thrust between too soon. France came second in extent of territory; but, except for Algeria and Madagascar, her districts were less valuable than those of England or Germany. France would have liked to join her holdings on the east and west of the continent; but she found English territory thrust in between. German ambition was frustrated in similar manner. Until the World War began the three powers had mutually stalemated one another's attempts to dominate Africa.

The occupation of Asia by European states has proceeded more slowly, but has moved with increasing rapidity in recent years. England, Russia, Japan and France have been the chief powers concerned, though Germany has shown

an active disposition to take a hand in any partition.

In 1894, Japan and China engaged in war over the control of Korea. With amazing rapidity, Japan overcame her bulky antagonist; but Russia, backed by France and Germany, stepped in to rob her of the fruits of her victory. Japan, owning not even one modern ship of war, was forced to yield — to spend all energies for the next 10 years in preparing for further conflict. Russia secured from China the right to extend her Siberian railroad through Manchuria, and in 1898 she also obtained the powerful fortress of Port Arthur. Germany and England then compelled China to grant them important districts, which, like the Russian acquisitions, seemed to command the heart of China and to doom that power to partition. In 1900 the Chinese resentment against "western barbarians" culminated in the Boxer massacres. The powers sent armies to rescue their beleaguered embassies at Peking; but, largely through the policy of the United States, no territorial indemnities were demanded. During the campaign, however, Russia occupied Manchuria, and, despite repeated solemn promises, it soon became plain that she meant to keep it. The powers apparently acquiesced; but when Russia in 1903 encroached also upon Korea, Japan foresaw danger to her own independence, and, in 1904, she began war. The struggle was tremendous, beyond all comparison with former wars; but Japanese victory was swift and overwhelming. That victory not only checked Russian aggression in the Orient, it also made plain that an Asiatic power had arisen able and disposed to enforce a Monroe Doctrine for Asia against the Western world. It was only one step more in the same direction when, at the opening of the World War in 1914, Japan captured the German holdings in China, under pledge of restoring them conditionally to China.

**A Summary of Progress.**—Historically measured, the 19th century extends from 1789 to 1914 — from the French Revolution to the World War. That "wonderful century" of progress transformed the world as no previous millennium had ever done. Its three mighty agents have been democracy, humane sentiment and scientific invention. The growth of democracy in politics, and, in less degree, in industry, has been the special theme of the latter part of this article. The gentler spirit of recent society, likewise touched upon, has abolished slavery and serfdom, ameliorated law and given birth to a "war upon poverty," with zealous and intelligent effort to lessen misery and sin. But the most marvelous phase is the scientific advance. Ancient science was the plaything of philosophers: to-day science has become the servant of mankind.

The rate of this form of progress is roughly indicated by the records of the United States Patent Office. From the inauguration of Washington to the War of 1812, patents for new inventions averaged less than 80 a year. From 1812 to 1820 they rose to nearly 200 a year, and in 1830 — the year of a new democracy in politics and industry — the number was 544. Twenty years later the 1,000 mark was passed, and in 1860 the number was nearly 5,000. These inventions mostly saved time or tended to make life more comfortable or more attractive. De-

tailed treatment, with technical features, belongs to special articles such as may be found elsewhere in *THE AMERICANA*. Three groups only will be mentioned briefly here. The remarkable series that underlay the industrial revolution, just before 1800, has been partially surveyed above, and we may now add that America, with its vast spaces and with its rivers for almost its only roads, soon modified the steam engine, one invention of that series, into an engine for locomotion by water, giving the world the steamboat. The next great group belongs to the second quarter of the century. Just after 1830, in both England and America, the steam railway became a success. English friction matches (1837) made the first improvement on prehistoric methods of fire-making, and soon afterward illuminating gas for city streets began to improve public morals. Stern-wheel propellers replaced the old side-wheel arrangement for steamers, and in 1838 the *Great Western* established steam navigation across the Atlantic. In 1839, in France, Daguerre began photography; and still earlier French chemistry had taught the world to can foods. In America, the McCormick reaper (1831), with the quickly following self-binders, mowers and other like machines, made it possible to apply horse power to agriculture in other ways beside preparing the soil; the year 1838 saw the invention of the steam hammer and the successful application of anthracite coal to smelting iron; the anæsthetic value of ether was discovered for the relief of suffering humanity in 1841; the magnetic telegraph, invented in 1835, became a practical working success in 1844; Howe's sewing machine (1846) relieved the overburdened housewife; and the long line of improvements upon it, including machinery for sewing leather, soon revolutionized tailoring and created new industries in clothing factories and shoe manufacturing; and in 1847 the rotary printing press marked the dawn of a new intellectual day. The period of "blood and iron" (1854-78) saw a circle of inventions in Europe and America relating largely to warfare; and then came the third group to be considered here, replacing the age of steam by the age of electricity and transforming the face of the world and all habits of life once more before the eyes of men still under middle age. Here belong electric lights and the electric street railway, telephone and phonograph, wireless telegraphy, automobile and auto truck (with a "horseless age" for city and farm), submarine and aeroplane, along with such a transformation of all earlier machines and processes of production as to make those of 1850 quaint objects for a museum of natural curiosities.

It remains to mention, for this last period, *the new relation of science to medicine*. In the 80's. Pasteur broke the way, proving the germ theory of disease and inventing methods of inoculation against some of the most dreaded forms, like hydrophobia. Devoted disciples followed in his footsteps. During the American occupation of Cuba after the Spanish-American War, Major Walter Reed showed that ordinary malaria and the deadly yellow fever alike were spread by the bite of mosquitoes. In like manner it has been proved that certain fleas, carried by rats, spread the bubonic plague. In 1903 Dr. Charles W. Stiles

proved that the inefficiency and low vitality of the "poor whites" in the southern United States were due to the parasitic hookworm. The special causes of typhoid and tuberculosis have become well known; and the germ that causes infantile paralysis has been discovered. Each such discovery has enabled men to fight disease more successfully. It is not improbable that in the not distant future all deadly contagious disease may be practically banished from the earth. Between 1850 and 1900 the average human life in civilized lands had been lengthened by a fourth, and population has been trebled.

This larger and better life of the 20th century, too, is bound together, for good and for ill, in a *new human solidarity*. The enlarged world of 1900 is more compact than the small world of 1800. Ox-cart and pack-horse have been replaced as carriers by long lines of cars swiftly moving thousands of tons of all kinds of freight across continents. New methods of banking make it possible to transfer credit with magical quickness between distant portions of the earth; and, to say nothing of telegraphy, lines of communication are so organized that it costs no more to send a letter or parcel around the globe than to send it around the nearest street corner. The Minnesota farmer's market is not Minneapolis, but the world. The sheep raiser in Australia, the Kansas farmer, the New York merchant, the London banker, are parts of one industrial organism. All this solidarity means *one more revolution in industry*. The age of small individual enterprise has given way to an era of vast consolidation of capital and management—department stores, mighty corporations, huge trusts, flouring centres like Minneapolis, meat-packing centres like Chicago, money centres like Wall street. And this consolidation has brought incalculable saving of wealth in economy of management and in utilization of old wastes into by-products. The new unity of society, too, has its *moral* side. Any happening of consequence is known within the hour in London, Petrograd, Peking, New York, San Francisco, and, within a day, in almost every hamlet where civilized men live. A world opinion shapes itself, in ordinary times, as promptly as village opinion could be brought to bear upon an individual citizen a century ago.

Even before the horrible catastrophe of the World War, it was plain enough that *all this modern progress had a darker side*. The industrial organization produced wealth with gratifying rapidity, but failed to distribute it equitably. The world had become rich; but multitudes of workers remained ominously poor. Even in the most democratic countries about nine-tenths of the increased wealth was held by one-tenth the population, while at least two-tenths of the people were reduced to a stage of poverty that imperiled both health and decency. The apex of the social pyramid contains real captains of industry, but it contains also pirates and parasites. Service to society has less to do with its revenues than plunder and privilege have. The broad base of the pyramid contains multitudes whose poverty results from physical or mental or moral lack; but it contains other multitudes of willing, hard-working, sober men and women now denied a chance at comfortable and happy life.

And this modern poverty is harder to bear than that of earlier times because it is less necessary. Then there was little wealth to divide. Now the poor man is jostled insultingly by ostentatious affluence and vicious waste. These were the conditions that summoned enlightened thinkers and statesmen to a hopeful "war upon poverty" when the calamitous World War of 1914 set back indefinitely the hand of progress.

For modern society contained other poison more potent even than those industrial ills. All "civilized" nations, on occasion, still showed callous disregard of humane principles and of just dealing in their relations with barbarous and weak states. And among themselves the civilized peoples were still in the imperfect "national" stage,—a stage far advanced upon the city or tribal or class organization of earlier centuries, but insufficient for the new needs of humanity, forbidding all approach to world patriotism, fruitful of international misunderstandings and rivalries and hatreds and of a low and blasphemous international morality which permits a strong power, for its selfish ends, scornfully to tear up the most solemn treaties as "scraps of paper." Semi-civilized peoples are equipped with all the modern engines of destruction. And in particular, in Germany, leader in civilization as she was in some respects, a curiously surviving feudal class had dominated society and had taught insistently and insidiously an intensified Bismarckian philosophy of brute force,—the doctrine that the measure of a people's virtue is its military prowess and that victory in war justifies all means. Thus all modern progress had long been threatened, to the deeply observant, by the brooding menace of annihilating war armed with all the inventions of the new scientific age.

To lessen this peril, the world had recourse to The Hague Congresses of 1899 and 1907 and to a long series of standing arbitration treaties for the judicial settlement of future disputes between nations. This movement held much of promise: but, ominously, all proposals at The Hague meetings for disarmament, or for the limitation of armaments, fell before the opposition of Germany. Between nations armed to the teeth, arbitration treaties backed by no international police it was plain could have little more lasting value than laws have between armed desperadoes in a district without a sheriff.

Still, despite all warnings, the mighty struggle that began in the summer of 1914 amazed the world. The conflagration spread swiftly until the two central powers, Germany and Austria, with their two dependent allies, Turkey and Bulgaria, were encircled by a ring of 10 hostile nations. The various phases of the mighty conflict are treated elsewhere in this work under appropriate headings. (See WAR, EUROPEAN). From the historian's viewpoint, this much is clear: the conclusion of the war must mark the end of one age and the beginning of another. That new age must begin under indescribable handicaps. If ultimately it prove better than the age just gone, it will be only because of some happy outcome from the stern world-wide determination already aroused that some new way shall be found to prevent future wars. A confederation of nations to en-

force arbitration, from the prophetic forecast of poets, has suddenly become the most pressing practical problem of statesmen. This is the ray of hope that breaks from the war clouds over Europe.

**Bibliography.**—Within the space at command, no detailed bibliography is possible. Since the dawn of the scientific study of history, writers have shunned the attempt to cover the complex field of modern history except in co-operative "series." Of such series the most important in English are 'The Cambridge Modern History,' edited by Ward (1903-14, 12 vols.); 'Periods of European History,' edited by Hassall (1890-92, 8 vols., of which the last 5 belong to our period). Hazen's 'Europe Since 1815' (1909); Andrews' 'Historical Development of Modern Europe' (1896); Fyffe's 'Modern Europe to 1878' (1884), and Seignobos' 'Europe Since 1814' (1899) deal with the 19th century. For further references the reader may consult the special bibliographies at the close of the articles on leading countries and movements.

Sometime Professor of History and Head of  
the Department, in the University of Minne-  
sota.

**HISTORY, Great Events of.** The following list gives only those important events which have affected or changed the subsequent history of nations. The cross-reference will refer the student to the special information concerning these epoch-making occurrences, and the following special articles may also be consulted. HISTORY, ANCIENT; MEDIÆVAL; MODERN; WARS OF THE WORLD; PEACE TREATIES; REPUBLICS, HISTORY OF; EXPLORATIONS IN THE 19TH CENTURY; POLAR RESEARCH; JEWISH HISTORY; CRUSADES; CROMWELL; GUNPOWDER; THIRTY YEARS' WAR; SEVEN YEARS' WAR; NAPOLEON; WATERLOO, BATTLE OF; CRIMEA; AMERICA, DISCOVERY AND COLONIZATION OF; DISCOVERIES OF AMERICA TO 1562, SPANISH AND PORTUGUESE; COLONIAL WARS IN AMERICA; UNITED STATES, WARS OF THE: DECLARATION OF INDEPENDENCE; SLAVERY IN THE UNITED STATES; CONFEDERATE STATES OF AMERICA; MONROE DOCTRINE; UNITED STATES—THE AMERICAN REVOLUTION; THE WAR WITH FRANCE; WAR OF 1812; MEXICAN WAR; SLAVERY; CAUSES OF THE CIVIL WAR; RECONSTRUCTION; WAR WITH SPAIN, ETC.; TREATIES OF THE UNITED STATES WITH FOREIGN NATIONS; THE EASTERN QUESTION; THE OREGON QUESTION; EMANCIPATION IN LATIN-AMERICA; PEKIN, SIEGE OF; BOERS; SOUTH AFRICAN WAR; RIEL'S REBELLION; WAR, EUROPEAN, ETC.

## B. C.

- 1277. Exodus of the Children of Israel from Egypt.
- 1111. Mariner's compass (q.v.) discovered.
- 753. Rome (q.v.) founded.
- 603. Geometry and maps (q.v.) first used.
- 551-479. Confucius (q.v.) flourished.
- 538. Fall of Babylon (q.v.).
- 490. Battle of Marathon.
- 336. Accession of Alexander (q.v.); Grecian Empire.
- 63-44. Cæsarian era; Britain invaded; Gaul conquered.

## A. D.

- 33. The crucifixion of Christ (q.v.).
- 451. Battle of Chalons.
- 570-632. Mohammed (q.v.) flourished.
- 800. Charlemagne (q.v.), emperor of the West.
- 967. Egypt conquered by the Turks.
- 1066. Battle of Hastings in England.
- 1095. Crusades (q.v.) in Holy Land begun.
- 1234. Gunpowder (q.v.) first used by Genghis Khan.
- 1453. End of the Roman Empire in the East.

- 1455-85. War of the Roses in England.
- 1492. Columbus discovered America.
- 16th Cent. Period of Reformation (q.v.) in Europe.
- 1588. Destruction of the Spanish Armada.
- 1618-48. Thirty Years' War (q.v.).
- 1619. Beginning of slavery (q.v.) in America.
- 1642. Beginning of the Civil War in England.
- 1627. Barometer and thermometer (qq.v.) devised.
- 1648-52. Civil war of the Fronde in France.
- 1642-1724. Newton (q.v.) discovered gravitation.
- 1713. Peace of Utrecht Ending War of Spanish Succession (q.v.).
- 1741-48. War of the Austrian succession.
- 1756-63. The Seven Years' War (q.v.).
- 1776. Declaration of Independence (q.v.).
- 1789-1802. French Revolution.
- 1804-15. Napoleon (q.v.), emperor of France.
- 1812-14. War of 1812 (q.v.).
- 1815. Battle of Waterloo (q.v.).
- 1819. Electro-magnetism discovered.
- 1821-29. Greek war of independence.
- 1831-39. Belgian war of independence.
- 1845-48. Mexican War (q.v.) with the United States.
- 1853-55. Crimean War.
- 1857-59. Indian mutiny and war.
- 1861-65. Civil War (q.v.) in United States.
- 1863. Battle of Gettysburg (q.v.).
- 1866. Laying of first Atlantic cable.
- 1868-99. Cuban war of independence.
- 1870-71. Franco-Prussian War (q.v.).
- 1877-78. Russo-Turkish War.
- 1883-84. War in the Sudan.
- 1894. War between Japan and China.
- 1895. Roentgen discovery of X-rays (q.v.).
- 1897. War between Turkey and Greece.
- 1898. Spanish-American War began.
- 1898. Hawaii (q.v.) annexed to the United States.
- 1899. Peace conference at The Hague (q.v.).
- 1899-1900. War between England and Boers.
- 1902. First Anglo-Japanese alliance. See ANGLJO-JAPANESE TREATIES.
- 1903. Panama Canal Treaty signed. See PANAMA CANAL.
- 1903. Pacific cable completed. Invention of human flight.
- 1904-05. War between Japan and Russia, terminated 5 Sept. 1905 by Treaty of Portsmouth (q.v.). See MANCHURIA.
- 1905. Second Anglo-Japanese alliance.
- 1906. Earthquake and fire, San Francisco, Cal. See EARTHQUAKE.
- 1908. Restoration of the constitution in Turkey. The American battleship fleet sailed around the world.
- 1909. The North Pole discovered 6 April. Union of South Africa, 31 May.
- 1910. Republic established in Portugal.
- 1911. The Italian-Turkish War began. President Diaz of Mexico expelled. The South Pole discovered 14 December. China proclaimed a republic.
- 1912. Balkan War. Wreck of the *Titanic*, 14 April.
- 1913. Rebellion in Mexico. Peace palace at La Hague dedicated.
- 1914. Great European War began.
- 1915. Wireless communication established between United States and Japan. *Lusitania* sunk by German submarine, 2 May.
- 1916. American troops enter Mexico on punitive expedition against outlaws. *Deutschland*, German commercial submarine crosses and recrosses the Atlantic. *U-53*, German war submarine, enters Newport, R. I., and departing sinks five commercial vessels off Nantucket lightship.
- 1917. United States enters European War.

**HISTORY, Logic of.** The relation of history to the problems of the philosopher has been mostly confined to those questions which are treated in the philosophy of history. The object of this discipline is to interpret the meaning of mankind's historical development and to comprehend the progress of humanity in the setting of a metaphysical system. It is only in recent times that philosophy has recognized clearly the importance of an entirely different relation. If the philosopher studies in the science of logic the ways of thought and the special methods by which the different special sciences are able to reach the truth it must be logical and thus, ultimately, a philosophical task to examine the methods of historical investigation. The special schemes of the historian's technique belong to historical science proper. But as soon as the attitude which the historian has to take toward the world is in

question, we stand before a logical problem which is most nearly connected with the general problem of the meaning of truth. A rich literature devoted to this circle of problems has grown up in late years, partly through the activity of philosophers and psychologists, partly from the interests of historians and economists themselves.

Of course, it is possible to take the skeptical attitude and to deny the existence of a particular problem here. We can say that all science has the same kind of task, and that the logical problems are thus not other for history than for the natural sciences. Yet this attitude may lead to two different standpoints. The first is the most popular one. From that it would appear that history is not a real science at all. It collects a mass of material just as the zoologist collects his specimens; but that kind of treatment which makes zoology a real science, the study of the common characteristics and of the underlying laws, is not in question for the historical material. Instead of this an art enters into play, the art of historical presentation. The works of the great historian are thus in first line works of art parallel to the great epic narratives, with only the difference that the epic poems follow the lines of imagination while the historian reconstructs the facts as they may have happened. Scientifically history would thus stand on the lowest level, as a mere collection of facts without that real scientific treatment which makes the value of the other sciences. The best which can be hoped, then, is that it may be brought to a kind of scientific height by introducing as much as possible the results of other sciences such as physics, biology, anthropology, geo-physics, etc., into the explanation of historical happenings. The influence of climate, of race disposition, of technical inventions, and so forth, then become predominant in the scholarly treatment of historical events. It may be said that this low opinion of the pure scientific character of history has been prevalent throughout the whole history of science.

But those who consider the natural sciences as the only type of real scientific work may be led, and have been led frequently in recent times to still another standpoint. They may say that history has the greatest possibility of being a full-fledged science. The only step it has to take is that from the merely descriptive to the law-seeking attitude. The real task of the historian, they say, would be to find the common features which belong to the growth of every nation and to the political and social, artistic and scientific, economic and religious movement of the different periods and of the different communities. As long as isolated processes are described, history indeed remains on a pre-scientific level, but as soon as we recognize characteristic types of development, we reach general laws like those of the biologist or the chemist. The interest concentrates itself then on the psychological factors which molded the fate of the nations, and especially the life of the masses becomes a true historical agency. That which is unique then becomes insignificant and accidental as compared with the great typical processes which repeat themselves under similar conditions in the most different countries. A kind of natural science of historical nations thus becomes the logical goal.

Those modern movements, however, which have forced the problems of the logic of history to public attention object to both these standpoints because they refuse to admit the first presupposition. They deny that the natural sciences are the only type of a real science. They claim, rather, that this is a prejudice which has been suggested to the world by the overwhelming influence of the Aristotelian logic on the one side, and the impressive triumphs of natural science on the other. They hold that there exists two types of scientific thought in principle commensurable, and that the historical way of thinking is in its importance and in its logical right perfectly co-ordinate with naturalistic thought. Yet here again a variety of standpoints have been taken.

The simplest presentation of this doubleness of logical method is offered by those who hold that the whole separation is to be deduced from the doubleness of the logical attitude. They say that we can take with reference to everything in the universe either the attitude of interest in the general law or the attitude of interest in the particular thing. The one interest can never be substituted for the other. In the one case the particular object is for us only a sample illustration for a general relation. We seek the law which expresses that relation and inhibits therefore the interest in the special chance case which is before us. That is the attitude of the naturalist. On the other hand we may give our whole attention to the particular object before us in its uniqueness, and there is no doubt that our practical interests of life force on us just this attitude. Our earth may be astronomically not more important than any other planet, but our practical interest belongs to this planet alone. Our friends may be to the biologist not more instructive than any other group of organisms, but for our friendship those particular men have their unique position and cannot be replaced by other chance copies. To develop systematically this interest in the particular is the function of the historian, and anything which has its particular existence is possible historical material. Yet it is evident that no science can have the task of describing every particular pebble on the beach. There must be a principle of selection, and this is given in the reference to our values. The men who have relation to that which is valuable in the world, to the development of state and law, of art and science and religion, are to be selected for the historian's account. And this ultimate reference to values binds the particular objects together, while it is evident that the law of natural science brings the facts under a point of view under which they have no special value at all, but are indifferent objects of theoretical observation. The antithesis is thus complete. The naturalist seeks the general, the historian seeks the particular. The naturalist refers everything to the law, the historian everything to the value. Both groups of interest create logically independent systems of knowledge. Their difference is thus in no way a difference of material, as there is nothing in the world which cannot be considered from both points of view. The sun which the astronomer studies in relation to the astronomical laws as a chance case of a general relation which holds for myriads of suns may be at the same time the object of interest for those

who ask about the development of this one particular sun which gives us light. And on the other hand, even the Napoleon of the historian may be brought under the laws of biology from the standpoint of the naturalist.

Others who welcome this sharp separation feel doubtful whether it is really the logical attitude which determines the difference and not the content. They claim that it is not true that natural science has to deal with laws only. Natural science may very well give its attention to particular objects too, and the development of our sun or our earth or our mankind is not history but natural science. The true difference, they say, lies rather in the doubleness of the objectifying and the subjectifying attitude.

The sun and earth are for us all objects, but men and their work can be considered in a double way. We can consider our neighbors as objects, as phenomena which we describe and explain, but we can consider them also as subjects of will which we understand and interpret and appreciate, and this doubleness of attitude reaches over the whole of mankind. Wherever there is will, there the object can be taken as a subject and it is claimed that the work of the naturalist is the study of the world in so far as it is conceived as a system of objects, while the study of the historian is the world in so far as it is conceived as a system of will relations. Only subjects of will would thus be able to enter into history at all. And the task of the historian is to understand the systematic relations between the purposive actions. The naturalist starts from the objects of his perception and seeks their causes and their effects. The historian starts from those will demands which reach him as the political, legal, artistic, scientific, economic, religious demands of his social world, and he seeks to interpret them by connecting them with the purposes of the past. The naturalist explains, while the historian interprets intentions and links the will purposes into a connected unity.

**HISTORY OF ECONOMICS.** See ECONOMIC HISTORY.

**HISTORY OF EDUCATION.** See EDUCATION, HISTORY OF.

**HITCHCOCK, hich'kók, Charles Henry,** American geologist: b. Amherst, Mass., 23 Aug. 1836. He was a son of Edward Hitchcock, geologist (q.v.). He was graduated from Amherst College in 1856, was assistant State geologist of Vermont in 1857-61, State geologist

of Maine 1861-62 and of New Hampshire 1868-78. In 1868 he was appointed professor of geology in Dartmouth College, retaining this position until 1908, when he became professor emeritus. In connection with his survey of New Hampshire, he maintained, during the winter of 1870, a meteorological station on Mount Washington, the earliest high-mountain observatory in the United States. He became known as a compiler of geological maps, and for his investigations regarding the geology of the crystalline schists, ichnology and glacial geology. The location of the terminal glacier in the United States was first suggested by him. His later work has been in connection with the Geological Survey of Vermont, particularly the glacial geology, and with the New Jersey Geological Survey, studying the Triassic footmarks. He claims that the animals that made the tracks were largely "birds with teeth" and not dinosaurs. He was a founder of the Geological Society of America, and in 1883 vice-president of the American Association for the Advancement of Science. His publications include 'Elementary Geology' (1861, with E. Hitchcock); 'Mt. Washington in Winter' (1871); and a 'Report on the Geology of New Hampshire' (1873-78), with folio atlas, his most valuable work; and 'Hawaii and its Volcanoes' (1909; 2d ed., 1911).

**HITCHCOCK, Edward,** American Congregational clergyman and geologist: b. Deerfield, Mass., 24 May 1793; d. Amherst, Mass., 27 Feb. 1864. He was principal of the academy in his native place 1815-18; pastor of the Congregational Church in Conway, Mass., 1821-25; professor of chemistry and natural history in Amherst College 1825-45 and president of Amherst College and professor of natural theology and geology 1845-54. He was appointed State geologist of Massachusetts in 1830, of the First District of New York in 1836 and of Vermont in 1857. In 1850 he was commissioned by the government of his native State to examine the agricultural schools in Europe. His life was in a great measure identified with the history of Amherst College. Connected with it almost from the beginning, in his own presidency he procured for it buildings, apparatus and funds to the amount of \$100,000, doubled the number of students and established it on a solid pecuniary as well as literary and scientific basis. His earliest scientific publications were the 'Geology of the Connecticut Valley' (1823), and a 'Catalogue of the Plants within Twenty Miles of Amherst' (1829). Later works were 'Lectures on Diet, Regimen, and Employment' (1831); 'Lectures on the Peculiar Phenomena of the Four Seasons' (1850); 'Reports on the Geology of Massachusetts' (1833-35-38-41); 'Illustrations of Surface Geology' (1857); 'Elementary Geology,' which passed through 25 editions in America, and one-third of that number in England; 'Religion of Geology and its Connected Sciences' (1851); and 'Reminiscences of Amherst College' (1863). Dr. Hitchcock suggested as well as executed the geological survey of Massachusetts, the first not only in the long series of scientific surveys in the United States, but the first survey of an entire State under the authority of government in the world. He was the first to give a scientific exposition of the fossil footprints of

the Connecticut Valley, and with him ichnology as a science began.

**HITCHCOCK, Ethan Allen**, American soldier: b. Vergennes, Vt., 18 May 1798; d. Sparta, Ga., 5 Aug. 1870. He was a grandson of Ethan Allen (q.v.), and was graduated at West Point in 1817, entering the corps of artillery as a third lieutenant. In 1829 he became the military commandant of the corps of cadets, in which office he continued until 1833. He served in Florida against the Indians, and in the war with Mexico, where he received two brevets, one as colonel and another as brigadier-general. In 1855 he printed for private circulation a pamphlet in support of his opinion that genuine alchemy was not an art for making gold, but that the alchemists were students of man, whose perfection was symbolized by their "philosopher's stone." He subsequently published 'Remarks upon Alchemy and the Alchemists' (1857); 'Swedenborg a Hermetic Philosopher' (1858); 'Notes on the Vita Nuova of Dante' (1866).

**HITCHCOCK, Ethan Allen**, American politician: b. Mobile, Ala., 19 Sept. 1835; d. Washington, D. C., 9 April 1909. Was in mercantile business at Saint Louis, Mo., 1855-60, then went to China to enter a commission house, of which firm he became a partner in 1866. In 1872 he retired from business, in 1874 returned to the United States, and in 1874-97 was president of several manufacturing, mining and railway companies. He was appointed Envoy Extraordinary and Minister Plenipotentiary to Russia in 1897 and in February 1898 Ambassador Extraordinary and Minister Plenipotentiary, the first Ambassador accredited from the United States to the court of Russia. In 1898 he was nominated and confirmed as Secretary of the Interior, and held that position till 4 March 1907.

**HITCHCOCK, James Ripley Wellman**, American art critic: b. Fitchburg, Mass., 3 July 1857. He was graduated at Harvard in 1877, and in 1882-83 made long journeys in the West, Mexico and Northwest as special correspondent of the *New York Tribune*, was art critic of the *Tribune* 1882-90. He was literary adviser to D. Appleton and Company in 1890-1902, and after 1902 to Harper and Brothers. He has written much upon American history, outdoor life and literary topics as well as art. He has lectured extensively upon artistic and literary subjects. He has written 'The Western Art Movement' (1885); 'A Study of George Inness' (1885); 'Madonnas by Old Masters' (1888), the text to photogravures; 'The Future of Etching'; 'Some American Painters in Water Colors'; 'Etching in America'; 'Notable Etchings by American Artists'; 'Thomas De Quincy: a Study'; 'The Louisiana Purchase and the Building of the West' (1904); 'The Lewis and Clark Expedition' (1905). He edited 'The Life of an Artist, by Jules Breton'; 'The Last Words of Thomas Carlyle'; 'The Art of the World Illustrated in the Paintings, Statuary and Architecture of the Columbian Exposition, with an introduction and much other text'; 'The Story of the West Series,' including 'The Story of the Indian'; 'The Story of the Mine'; 'The Story of the Cowboy'; 'The Story of the Railroad'; 'The Story of the Soldier'; and 'The Story of the

Trapper,' with introductions; 'Recollections,' by Richard Henry Stoddard; 'The Trail-Makers, a Library of History and Exploration'; 'Decisive Battles of America,' and other works.

**HITCHCOCK, Roswell Dwight**, American Congregational clergyman: b. East Machias, Me., 15 Aug. 1817; d. Somerset, Mass., 16 June 1887. Graduated from Amherst College in 1836 and from the Andover Theological Seminary in 1838, he also studied at Halle and Berlin (1847), in 1845-52 was pastor of the First Congregational Church at Exeter, N. H., and in 1852-55 professor of revealed religion in Bowdoin College. In 1855 he became professor of church history at the Union Theological Seminary, of which institution he was elected president in 1880. He became president of the Palestine Exploration Society in 1871, and vice-president of the American Geological Society in 1880. An editor of the 'American Theological Review'; he wrote 'The Life, Character, and Writings of Edward Robinson' (1863); 'Complete Analysis of the Holy Bible' (1869); and 'Socialism' (1879), With Eddy and Madge, he compiled 'Carmina Sanctorum' (1885); and 'Eternal Atonement,' a volume of sermons, appeared in 1888.

**HITOTSUBASHI**, Japanese statesman and party leader: b. 1837; d. 1902. Son of Nariaki Daimyo of Mito (q.v.), and naturally a supporter of the Doctrine of Mito (q.v.), he appeared as the leader of the party opposed to the open door in Japan. He is known as Keiki (Ká'kē), the pronunciation of the Chinese characters representing his name, and as Yoshinobu, his real name. The cognomen Hitotsubashi he obtained when he was adopted into the feudal house of that name in 1848. He became guardian of the young Shōgun in 1863, a position that gave him great prominence in the affairs of Japan at a time when the nation was at the parting of the ways. He is known as "the last of the Tycoons," or the last Shōgun. His real title was Yoshinobu Tokugawa, Prince Tokugawa. He was heir of the house of Hitotsubashi, and as such eventually became Shōgun. He came of a long line of illustrious ancestors which had helped to make the history of Japan for over 300 years. Yoshinobu became Shōgun in August 1866, and the following year, notwithstanding his family tradition, he presented a memorial to the emperor advising to call the barons together to discuss the "open door question" and the relation of Japan to foreign countries and civilization. He also took steps to have all the government of the country centred in the emperor. But the Shōgunate party which he represented opposed this and open war broke out between the emperor and the Shōgunates. Yoshinobu, in the difficult position of owing allegiance of a traditional and religious character to the emperor and leadership to his own family and party, decided to follow the will of his famous father, Nariaki (q.v.), and be faithful to the emperor at all cost. In the war the party of the emperor won out and Yoshinobu retired to private life still retaining the favor and confidence of the court by whom he was recognized as Prince Tokugawa. His princely residence was one of the conspicuous objects by the Kioshikawa Gate in Tokio. Con-

sult Okuma, Count Shigenobu, 'Fifty Years of New Japan' (translated into English by Marcus B. Huish, London 1909).

**HITTELL, Theodore Henry**, American historian: b. Marietta, Pa., 5 April 1830. In 1852 he was admitted to the bar at Cincinnati, in 1855 removed to California, in 1855-61 was connected with the *Bulletin and Times* of San Francisco and from 1862 practised law. He was State senator in 1880-82. He wrote a 'History of California,' his chief work; and compiled 'The General Laws of California,' known as 'Hittell's Digest,' and 'Hittell's Codes and Statutes of California'; 'Review of Goethe's Faust'; 'Adventures of James Capen Adams — California Grizzly Bear Hunter.'

**HITTITES**, hit'tis, the name of several peoples mentioned in the Old Testament, and in Egyptian and Assyrian inscriptions. In the Old Testament the name is applied to three more or less distinct groups, namely, the "children of Heth" from whom Abraham purchased a burying-place; a people or group of peoples which inhabited Palestine before the Hebrews and resisted their invasion; a kingdom in north-eastern Syria, with which Solomon formed marriage alliances. The first group dwelt around Hebron in southern Palestine, and the Hittites mentioned in connection with David, of whom the chief was Uriah, may be their descendants. The second group of Hittites dwelt among the mountains of central Palestine, and the third group, united in some sort of empire, had their seat still farther north. Of this Hittite empire we learn more from the Egyptian and Assyrian records than from the Old Testament. The Heta according to the hieroglyphic inscriptions, offered a vigorous resistance in northern Syria to the Egyptian king Thutmosis III (18th dyn.: c. 1560 B.C.), and to his successors of the 19th dynasty, Sethos I, Rameses II and III, c. 1350-1200 B.C. Carchemish, Kadesh and Hamath were among their chief cities. The cuneiform inscriptions contain notices of a people called Hatti who frequently fought with the Assyrians from the time of Tiglath-pileser I (c. 1100 B.C.), till that of Sargon II (721-704 B.C.), after which they are no more heard of. The Hittite monuments and inscriptions which have been found in Carchemish, Hamath and neighboring places, as well as throughout Asia Minor, appear to belong to the Assyrian period.

**HITTORFF, Jacques Ignace**, French architect: b. Cologne, 1792; d. 1867. He studied his profession in Paris under Percier. In 1819-25 he traveled in England, Germany and Italy, making a special study of the Greek ruins of Sicily. He became architect to the king in 1825 and in conjunction with Lepère designed the church of Saint Vincent de Paul, Paris, to which he applied the results of his studies of Greek polychromy. The Place de la Concorde has two fine fountains and other embellishments from his hand, likewise the Bois de Boulogne, the Champs Elysées and other squares and boulevards. He was appointed Surveillant-General du Conseil des Bâtimens in 1864. Among his publications may be mentioned 'Architecture antique de la Sicile' (1830); 'Architecture moderne de la Sicile' (1835); and 'Architecture polychrome chez les Grecs' (1851) — all works of standard and permanent value.

**HITZIG, Ferdinand**, German theologian: b. Hainingen, Baden, 23 June 1807; d. Heidelberg, 22 Jan. 1875. He was educated at Heidelberg, Halle and Göttingen. He went to Zürich in 1833 as professor of theology, where he remained until 1861, when he returned to Heidelberg. He was quite a voluminous writer on the Old Testament, composing commentaries on the Minor Prophets (1838); Jeremiah (1841); Ezekiel (1847); Ecclesiastes (1847); Daniel (1850); Song of Solomon (1855). He made a translation of the Psalms in 1835. His 'Prophet Jesaja übersetzt und ausgelegt' (1834), gave him a high place among Biblical scholars of his day; as also the 'Exegetisches Handbuch zum alten Testament,' which contained many of his commentaries. He also wrote on the New Testament, and his general work 'Geschichte des Volkes Israel' (1870), marked an important advance in Biblical archaeology. Consult Cheyne, 'Founders of Old Testament Criticism' (London 1893), and the biography by H. Steiner (Zürich 1882).

**HIVE-BEE**. See HONEY-BEE; BEEKEEPING.

**HIVES**. See URTICARIA.

**HJÖRLEIFSSON, Einar**, Icelandic novelist and journalist: b. Godhdalir, Skagafjardharsysla, 6 Dec. 1859. He is the best known of the short story writers of his country. He spent the years 1885 to 1895 in Canada, editing the weekly *Heimskringla* at Winnipeg (1886-88) and the weekly *Lögberg* (1888-95). Since 1910 he has been receiving a regular stipend from the government of Iceland for his literary work. His best collection of short stories is probably 'Vestan hafs og austan' ('West of the Sea and East,' 1901), which contains three stories ('Vonir,' 'Litli Hvammur' and 'Ördhugasti hjallinn'), none of which has been translated into English. Those wishing to read specimens of his work should consult *The International* (New York September 1914), and *The American-Scandinavian Review* (New York May 1917).

**HOACTZIN**, hō-äkt'zin or -äk'zin, a singular South American bird (*Opisthocomus cristatus*) of the size of a pheasant. It is brown streaked with white, and the head has a movable crest. It is interesting principally from the extraordinary way in which the fledglings, as soon as they leave the nest (in a tree), scramble about the branches by aid of their wings used like hands, by reason of the fact that they have a temporary claw on both the index and pollex. This is an interesting reminder of primitive methods of progression in birds, reminding one of how the archæoptery utilized its fingers as well as its feet. The food of these birds is mainly leaves and fruit; and a strong musky odor is given off by the adults, so that in British Guiana they are called "stinking pheasants." They nest in trees in companies much after the manner of herons. C. William Beebe has given description and pictures of the hoactzin in his book 'Our Search for a Wilderness' (New York 1910), and in the publications of the American Museum of Natural History.

**HOADLEY, hōd'li, George**, American lawyer: b. New Haven, Conn., 31 July 1826; d. Watkins, N. Y., 27 Aug. 1902. He was graduated at Hudson College, Ohio, in 1844; studied

law at Harvard, was admitted to the bar in 1847 and joined a law firm in Cincinnati of which Salmon P. Chase (q.v.) was the leading member. He was appointed judge of the Superior Court of Cincinnati in 1859, and re-elected in 1864. He took a leading part among the "Barnburners" (q.v.), was a War Democrat, and during the war joined the Republican party. He defeated Foraker in a contest for the governorship of Ohio in 1883, but failed of re-election in a struggle against the same candidate.

**HOADLEY, Benjamin**, English Anglican prelate: b. Westerham, Kent, 14 Nov. 1676; d. Chelsea, 17 April 1761. He was educated at Cambridge; took orders in 1701, and after being settled in London distinguished himself in controversy with Bishop Atterbury and others. A staunch Low-Churchman, he was appointed bishop of Bangor in 1715. During his incumbency he is not known to have visited the diocese. A sermon preached before the king in 1717 gave rise to the "Bangorian Controversy" regarding the divine authority of the king and the Church. He was translated to the see of Hereford in 1721, to Salisbury in 1723 and Winchester in 1734.

**HOANG-HO.** See HWANG.

**HOAR, Ebenezer Rockwood**, American jurist: b. Concord, Mass., 21 Feb. 1816; d. there, 31 Jan. 1895. He was the son of Samuel Hoar (q.v.), was graduated at Harvard (1835), and subsequently admitted to the bar. He rose to be judge of the Court of Common Pleas (1849), judge of the State Supreme Court (1859), and Attorney-General of the United States (1869), and was a member of the Joint High Commission that framed the Treaty of Washington (1873-75).

**HOAR, George Frisbie**, American statesman: b. Concord, Mass., 19 Aug. 1826; d. Worcester, Mass., 30 Sept. 1904. Senator Hoar's paternal and maternal inheritance was very remarkable. His grandfather was an officer in the Revolutionary army and his father, Samuel Hoar, was one of the ablest lawyers and statesmen of his time, a member of Congress from Massachusetts and a man of great learning and force of character. Senator Hoar's mother was a daughter of Roger Sherman, a signer of the Declaration of Independence. He was graduated from Harvard in 1846, studied law there and began his law practice in Worcester, Mass. The young man was early attracted to politics and identified himself with the Free Soil party, and his purpose in 1895—so characteristic of his whole career—is thus stated by himself: "All of us Free Soilers were drawn into politics by a great issue. It was to prevent slavery being extended into the new territory between the Mississippi and the Pacific. We were all ardent advocates of freedom. The party and the movement were new and we were stirred by high ideals. Among the young men who went into the new movement at that time were my brother, Ebenezer Hoar, Erastus Hopkins, Anson Burlingame, Whittier, Lowell, Longfellow and many others that became well known. There were no offices to gain. There was simply a cause to work for. In the campaign of 1850 the Free Soilers did not carry a single State, only a few Congressional districts." He

was a member of the Republican party from the first and in 1852 was elected to the Massachusetts house of representatives; in 1857 to the State senate. In the intervals of service he practised law. In 1860 he was city solicitor. He presided over the Republican conventions in Massachusetts in 1871, 1877, 1882 and 1885; was a delegate to his party's national conventions in 1876, 1880 (the chairman in that year), 1884, 1888, 1892 and 1896. He served in the national House of Representatives for four successive Congresses, 1869-77, elected as a representative of the Worcester district; in 1877 he was elected to the Senate and was re-elected in 1883, 1889, 1895 and 1901, serving his country continuously as a national legislator since 1869, having represented Massachusetts for a longer period in the national Congress than any other representative from that State. In 1876, he was one of the managers on behalf of the House in the Belknap impeachment trial, and was also a member of the Electoral Commission (q.v.), which decided the Hayes-Tilden contest for the Presidency, the other Republican members of that famous body being Senators George T. Edmunds, O. P. Morton and Frederick T. Frelinghuysen, and Representative James A. Garfield. In the Senate he was chairman of the Judiciary Committee, and of the Committee on Privileges and Elections, and a member of other important committees. He was known as the old man eloquent of the Senate, having served in that body for 37 years and taken part in all the great questions that have been before the country during that time. He was a determined opponent of the retention of the Philippines and independent enough to state his views fearlessly in the support of his own theory that the United States should leave the islands to the control of the Filipinos and prevent interference from foreign nations, but his honesty and sincerity were unquestioned and he always retained the confidence of his party and the respect of all. He was a thorough American and believed in the future of his country and placed its welfare above all personal considerations. "The lesson which I have learned in life, which has been impressed upon me daily and more deeply as I grow old," he said in his autobiography, "is the lesson of Good Will and Good Hope. I believe that to-day is better than yesterday, and that to-morrow will be better than to-day. I believe that, in spite of many errors and wrongs, and even crimes, my countrymen of all classes desire what is good, and not what is evil."

Senator Hoar was an idealist, and was not to be turned aside, even by his loyal love of party, from following his sincere convictions. He demanded justice for the negroes and the Indians, openly declared his sympathy for Cuban and Filipino, and as firmly opposed religious intolerance in Massachusetts because his actions were controlled by reasons which he considered were founded in righteousness and truth, and therefore not subject to change.

Senator Hoar was a man of considerable scholarship and took great delight in literary and historical studies. He was a member of several historical and scientific societies, and took much interest in their work. He was president of the American Historical Society, president of the American Antiquarian Society, regent of the Smithsonian Institution in 1880, and trustee

of the Peabody Museum of Archaeology. He received the degree of LL.D. from the College of William and Mary, Amherst, Yale and Harvard. In 1903 he published 'Autobiography of Seventy Years,' which first appeared in *Scribner's Magazine* as a serial. The same year, in a speech in his home city of Worcester, Senator Hoar, as if in anticipation of his approaching dissolution, thus summed up the creed of his career:

"If my life has been worth anything, it has been because I have insisted, to the best of my ability, that these three things—love of God, love of country, and manhood—are the essential and fundamental things, and that race, color, and creed are unessential and accidental."

Although 78 years of age, he was in good health until the death of his beloved wife in 1903; their devotion had led many to predict that neither would long survive the other. Senator Hoar was taken seriously ill in June 1904, but lingered until 30 September, when he died at Worcester, Mass.

His death was the occasion of a remarkable display of panegyric in the press of both Republican and Democratic parties. It possessed the peculiar quality of reconciliation, one party regretting what the other considered his noblest quality. The only flaws in his judgment, said the Republican press, were his disagreements with the party leaders on the Philippine and Panama issues; but to the Democratic press his noble loyalty to the right on these occasions was convincing proof of his lofty statesmanship. The Democratic press regretted his inability to see any good in their party, while to Republican journals this virtue redeemed his errors of judgment on the matters of party policy.

One journal said: "As long as the confidence and affection of all the people are given to such a man, it is foolish and false to assume that the old standards are departing and the old ideals becoming broken. The people still know a man when they see him. Still they respect and honor the statesman who loves the republic better than he does himself, who never falters in his service, to whose fingers gold does not cling, and whose never-forgotten ideal is the people's welfare. While they honor such qualities above all others, pure and able statesmen will continue to come to their service," sentiments which were summarized in Ex-President Cleveland's statement that "Senator Hoar's ability, his high-mindedness, and his freedom from political trickery, furnish an example of a useful life which may well be imitated by all those entrusted by their countrymen with public duties."

**HOAR, Samuel**, American lawyer and legislator: b. Lincoln, Mass., 1778; d. 1856. He was graduated at Harvard in 1802 and three years later entered upon a highly successful career as a lawyer. He served two terms as a State senator and was chosen by the Massachusetts legislature to challenge the constitutionality of certain laws in South Carolina relating to the imprisonment of free negroes. He was subsequently excluded from South Carolina courts by the State legislature.

**HOARHOUND**. See **HOREHOUND**.

**HOBART, Garret Augustus**, American lawyer and politician: b. Long Branch, N. J., 1844; d. Paterson, N. J., 2 Nov. 1899. He was

graduated at Rutgers College, New Jersey, in 1863, and admitted to the bar in 1866. At Paterson, where he made his home till his death, he enjoyed a successful law practice. He became successively city attorney, prosecuting attorney for Passaic County, a member of the State assembly 1873-78, and of the State senate 1879-85. During his several terms he was speaker of the assembly and president of the senate. In 1896 he was nominated at Saint Louis for Vice-President on the ticket with William McKinley, whose intimate friend he was, and was elected to that office. Here he was more than the proverbial figurehead, exercising a strong influence at the capital in favor of sound business methods. In his later years he was known also as a banker and capitalist.

**HOBART, George Vere**, American journalist, playwright and author: b. Cape Breton, N. S., 16 Jan. 1867. He was educated in Nova Scotia, later coming to the United States as a telegraph operator for the United Press. He became editor of the *Cumberland Sunday Scimitar*, later writing for the *Herald, Evening News* and *American* of Baltimore. Since then he has been writing for the Hearst newspapers the humorous sketches, 'John Henry' and 'Dinkelspiel.' He has written 'Many Moods and Many Meters' (1890), and 'Li'l Verses for Li'l Fellers' (1903), both poems; the 'Dinkelspiel' series the 'John Henry' books (1901-04), and the plays, 'After Office Hours,' 'Miss Print,' 'Hodge, Podge & Co.,' 'Sally in Our Alley,' etc.

**HOBART, John Henry**, American Protestant Episcopal bishop: b. Philadelphia, 14 Sept. 1775; d. Auburn, N. Y., 10 Sept. 1830. He was educated at the College of Philadelphia (now the University of Pennsylvania) and the College of New Jersey (now Princeton), and after trying commercial life in his brother-in-law's counting-house, went back to Princeton as a tutor for two years, and was ordained deacon in 1798 and priest in 1801. After brief periods of pastoral service in Pennsylvania, New Jersey and Long Island, he became assistant in Trinity Parish, New York, where he remained until his elevation to the episcopate, combining with his other duties a prominent share in the legislative councils of the Church, as deputy to the General Conventions of 1801 and 1804, and secretary to the House of Deputies in the latter year. In 1811 he was consecrated as bishop-coadjutor in the diocese of New York, and upon the death of Bishop Moore in 1816 succeeded him both in the full charge of the diocese and in the rectorship of Trinity Church. He also gave provisional episcopal care at different times to New Jersey and Connecticut. He was very active in promoting the establishment of the General Theological Seminary, and upon its location in New York became professor of pastoral theology. Hobart College also owed much to him, a debt recognized by the taking of his name, when, in 1852, the original title of Geneva College was changed to Hobart Free College. He wrote or edited a number of theological works, some of which, especially his 'Companion for the Festivals and Fasts' (1805), reached several editions. His 'Apology for Apostolic Order' (1802) is still used as a textbook.

**HOBART**, the capital of Tasmania, and up to 1881 called **HOBART TOWN**, is situated at the foot of Mount Wellington (4,166 feet high), on the Derwent River, 12 miles from its outlet in Storm Bay on the south coast. It has handsome public buildings, including government house, the government offices, Parliament houses, Episcopal and Catholic cathedrals, technical schools, hospitals, library, museum and art gallery. There are important domestic manufactures, and in connection with its considerable shipping interests, a fine harbor with modern accommodations for ships of the largest size. Hobart is connected by rail with Launceston, and has steam communication with Sydney, Melbourne, New Zealand and England. It has several fine parks and drives and is a favorite summer resort. Hobart was settled in 1804 and became a city in 1857. A United States consul resides here. The temperature varies from 42° in winter to 63.1° in summer. Pop. 27,526; with suburbs 39,937.

**HOBART COLLEGE**, located at Geneva, N. Y. In 1825 it was chartered as Geneva College, but in 1852 the name was changed to Hobart Free College, and in 1860 to Hobart College. Bishop Hobart (q.v.) had aided the school by advice and by money. An endowment from Trinity Church, New York, had greatly assisted the institution. The college offers scholarships and prizes to worthy students, and the departments are all well sustained. The courses lead to the degrees of A.B. and B.S. There are about 60,000 volumes in the library. In 1915 the school had 24 professors and instructors and 135 students. The graduates number about 1,700. In 1906 the college received a bequest of a half million dollars from Mr. William Smith of Geneva for the establishment of a co-ordinate college for women. This college, known as William Smith College, was opened in 1908. The faculty of Hobart College with the addition of four women constitutes the faculty of William Smith College. All instruction is, however, given separately in the two institutions. The number of students in William Smith College in 1916 was 107.

**HOBART PASHA**, **AUGUSTUS CHARLES HOBART-HAMPDEN**, third son of the Earl of Buckinghamshire, English sailor: b. Waltham-on-the-Wolds, Leicestershire, 1 April 1822; d. Milan, Italy, 19 June 1886. He entered the English navy as midshipman 1836 and retired as captain at the conclusion of the Crimean War in 1856. During the American Civil War he took the name of "CAPTAIN ROBERTS" and was given command of a blockade runner, an account of which is to be found in his 'Sketches of My Life' published posthumously. In 1867 he entered the sultan's service, reorganized the Turkish navy, and fought the Russians on the Black Sea in the War of 1877-78. He was made pasha (1869) and marshal of the Turkish Empire (1881).

**HOBEMA**, **Meindert**, *min'děrt hōb'ē-mā*, Dutch landscape painter: b. Amsterdam, 1638; d. there, 7 Dec. 1709. He was considered, next to J. Ruysdaal, the best of the Dutch landscape-painters, and as a colorist reckoned even superior to Ruysdaal. The figures in his landscapes are painted mostly by Berchem, Van de Velde,

Lingelbach and J. Van Loo. His paintings consist chiefly of forest scenes, ruins, villages, etc. Some of the most celebrated works of this master are to be found in public or private galleries in France, Germany and Holland. His greatest painting is 'A View in Holland,' with figures painted by Adrien van de Velde.

**HOBBS**, **John Oliver**. See **CRAIGIE**, **PEARL MARY TERESA**.

**HOBBS**, **Thomas**, English moralist, philosopher and political scientist: b. within the borough of Malmsbury, Wiltshire, 5 April 1588; d. Hardwicke, Derbyshire, 4 Dec. 1679. Thomas Hobbes is eminent as writer on the theory of government, on psychology and on metaphysics and as master of a vigorous and picturesque English style. He was born in the year of the Spanish Armada, 1588, and lived to be 91 years old, active to the end in mind and in body. He was the son of a poor English vicar, was educated by his uncle, a prosperous glover, and spent the last five of his student years at Magdalen College, Oxford. The Oxford of that period was given over to a restricted and arid scholasticism, barring out mathematics, for example, as a black art; and Hobbes retained through life a vivid memory of the pedantry and narrowness of the Oxford of his youth. At the end of these student years, in 1608, he was employed by Cavendish, afterward Earl of Devonshire, as tutor to his son; and he remained for the next 20 years in the service of this same great family and throughout his life in close and friendly connection with it. Two years of travel with his pupil on the Continent were followed by 18 years in England—a service terminated only by the death of his former pupil and constant friend, the second Earl. During these years Hobbes devoted himself to classical study, which bore fruit in his vigorous translation of Thucydides, published in 1628. The three succeeding years were spent on the Continent, at first in travel with another English youth, later in the eager study, mainly at Paris, of mathematics and natural science. Hobbes himself tells us with what astonishment and delight he first, in 1628, when he was 40 years old, saw and read Euclid's 'Elements.' In 1631 he became tutor to the third Earl of Devonshire, son of his late patron and first pupil. With him he made, in 1634, a third continental journey, learned to know Galileo during his sojourn in Italy, and was admitted, in Paris, to the fellowship of a group of mathematicians and scientists. He must have been pondering on problems of politics and of psychology in the intervals of his study of physics and geometry, for his next book, which circulated in manuscript as early as 1640, set forth his theory of human nature and of the body politic. The publication even privately of this doctrine brought its author into prominence and strongly influenced the course of his life.

The psychology of Hobbes forms the basis both of his political and of his metaphysical doctrine. He distinguishes the "cognitive (or conceptive)" faculty from the "motive" faculty of the mind, and recognizes five senses, to which he adds "a sixth sense, but internal, . . . commonly called remembrance." He defines the affective consciousness as "motion about the heart," which "when it helpeth is called pleasure

... but when it hindereth the vital motion is called pain." And he ends with a discussion of the passions which reduces will to desire and conceives each emotion from a narrowly individualistic standpoint. "To endeavour," he says, "is appetite" and, in the race of life, "continually to out-go the next before is felicity."

The foundation of the political system of Hobbes is the teaching that men "are by nature equal" and self-seeking; that "many men at the same time have an appetite to the same thing; which yet very often they can neither enjoy in common, nor yet divide"; that consequently "every man is enemy to every other" and that "during the time men live without a common power to keep them all in awe, they seek such a Common Power, as may be able to defend them from invasion of foreigners and are in that condition which is called War." "The only way," Hobbes continues, "to erect such a Common Power, as may be able to defend them from invasion of Foreigners and the injuries of one another . . . is to confer all their power and strength upon one man or upon one Assembly of men, that may reduce all their Wills, by plurality of voices, unto one Will." Hobbes accordingly conceives of a government as formed by a mutual contract of individuals, of whom each seeks simply his own preservation, happiness and security. The contract, he insists, is between each individual "subject" and every other—not at all, between subject and sovereign. It is made, he says, "by covenant of every man with every man . . . as if every man should say, *I authorize* and give up my Right of Governing myself to this Man, or to this Assembly of men, on this condition, that thou give up thy Right to him." Upon this theory, that the covenant of every citizen with every other underlies government, Hobbes bases his well-known doctrine of the absolute right of the sovereign. For, he argues, all the governed "are bound, every man to every man to Own and be reputed Author of all, that he that already is their Sovereign, shall do, and judge fit to be done." In other words "every Subject is Author of every Act the Sovereign doth."

Hobbes asserts unambiguously the subordination of church to state. "The Kingdom of Christ," he declares, "is not of this world; therefore neither can his ministers (unless they be Kings) require obedience in His name." It follows, he teaches, "that every Christian Sovereign [is] the supreme Pastor of his own Subjects"; and that every subject is bound to obey the command of his sovereign with regard not only to the forms of religious worship but to the nature of the doctrines openly professed. Such conformity to the will of even an "infidel sovereign" does not conflict, Hobbes insists, with our duty to God. For God requires of us only faith and obedience to his laws. "And when the Civil Sovereign is an Infidel, every one of his own Subjects that resisteth him sinneth against the Laws of God (for such are the Laws of Nature) and rejecteth the counsel of the Apostles that admonisheth all Christians to obey their Princes. . . . And for their Faith it is internal and invisible; they have the license that *Naaman* had, and need not put themselves into danger for it. But if they do, they ought to expect their

reward in Heaven, and not complain of their Lawful Sovereign; much less make war upon him."

It is not possible, within the limits of this article, to outline the ingenious argument by which Hobbes seeks to foist upon a present generation, the responsibilities of a social contract which a past generation made. Still less is it possible to present an adequate criticism of the conception of Hobbes. Psychologists and sociologists have long since agreed that his psychology and his political theory are alike defective; that societies and governments grow, and are not manufactured; and that sympathy no less than selfishness is a basal instinct. Yet Hobbes' theory of society is still worth studying, not only because it is expressed in such vigorous English, nor even mainly because of the influence it exerted on Rousseau and Spinoza (qq.v.), but primarily because it so ruthlessly depicts society as it would be if men were no more than self-seeking and egoistic.

It is evident that the brilliant attempt of Hobbes to justify the absolute supremacy of the monarch could find little favor in England in the years of the Parliamentary struggle with Charles I. Hobbes, who was morbidly timid, believed that he stood in personal danger and betook himself, a voluntary exile, to Paris where he spent 11 years in the society, on the one hand, of French men of science and letters, and on the other hand, of the English royalists. In 1646 Hobbes became the tutor of the young prince, later Charles II. He published in the meantime an epitome in Latin, 'De Cive,' of his doctrine of government, and afterward the earlier work already referred to. In 1651 he brought out the work by which he is best known, 'Leviathan, Or, The Matter, Form and Power, of a Commonwealth.' This book is the most popular, forcible and detailed discussion of the political theory of Hobbes. It is prefixed by several chapters which are properly psychological, and which embody an egoistic and sensationalistic psychology full of acute introspection and of keen discrimination. The later chapters of 'Leviathan' include suggestions of materialistic doctrine. In spite of its monarchical tendency, 'Leviathan' was violently opposed by the influential clerical party among the English royalists in Paris. Hobbes concluded that he would be safer even in Puritan England, returned accordingly and lived unmolested under the Cromwells. At the Restoration, in 1660, he regained the royal favor and he never afterward lost the protection of his old pupil, Charles II.

The metaphysical doctrine of Hobbes is expounded in two books published a few years after his return to England, 'De Corpore,' which appeared in 1655, and a translation, 'Concerning Body,' published a year later. This teaching is succinctly stated in these words: "The world (I mean . . . the whole mass of things that are), is corporeal, that is body; . . . and that which is not body is no part of the universe." The doctrine of Hobbes is, in other words, frankly materialistic; he teaches that the innumerable realities which go to make up the universe are, one and all, non-spiritual, or material. So-called spirits are, he holds, merely subtle and intangible bodies; and even God, the First Cause of the universe is

body. The philosophy of Hobbes becomes in its detail a system of mechanics or of physics; for, since all reality is physical, laws of space or of motion must be ultimate laws.

The metaphysical doctrine of Hobbes deserves more attention than it often receives, because it is so thoroughgoing and internally consistent a system of materialism. The arguments, implicit rather than explicit, on which Hobbes bases it are none the less, in the view of the writer of this notice, unsound. In brief, Hobbes argues for materialism partly because of the untrustworthiness of consciousness, and partly on the ground that physical motions are admitted to be cause of consciousness. "It is evident," he says, while describing the phenomenon of vision, in the second chapter of 'Human Nature,' "that from all lucid . . . bodies, there is a motion produced to the eye, and through the eye to the optic nerve and so into the brain . . . and thus all vision hath its original from . . . motion." From similar observations he concludes that ideas (or in his own words, apparitions or phantasms) "are nothing really but motion . . ." The reasoning that consciousness because conditioned by motion is, therefore, *identical with* motion is evidently illicit; and it is observable that Hobbes, when he tries to define body, motion and space, really conceives them in terms of ideal reality.

Just before the appearance of the metaphysical works, in 1654, an essay 'Of Liberty and Necessity,' written by Hobbes eight years before in the course of a private discussion with Bishop Bramhall, was published without the knowledge and consent of the author. It was followed in 1656 by a longer and more polemical work, 'The Questions Concerning Liberty, Necessity and Chance, clearly Stated and Debated between Dr. Bramhall . . . and Thomas Hobbes.' The unambiguous teaching of these works is a determinism grounded in psychology, the doctrine "that voluntary actions have all of them necessary causes and are therefore necessitated."

Most of the works which Hobbes published from this time onward are, indeed, controversial in character. Most bitter of them are the books and essays on mathematical subjects, maintaining against Wallis and Ward, Savilian professors in Oxford, the possibility of squaring the circle. The titles of two of these works are an indication of the spirit in which Hobbes wrote them: 'Six Lessons to the Professors of the Mathematics . . . in the chairs set up by . . . Sir Henry Savile in the University of Oxford'; and 'Σεισημαί or Marks of the Absurd Geometry, Rural Language, Scottish Church Politics and Barbarisms of John Wallis.' Hobbes, who was, after all, no trained mathematician, was always worsted in these mathematical contests, but never acknowledged himself defeated.

More serious than the justified criticisms of Ward and Wallis on the mathematics of Hobbes were the attacks upon the orthodoxy and the morality of his teaching. These attacks, and especially the abortive attempt to suppress 'Leviathan' by act of Parliament, caused Hobbes great uneasiness. In the Appendix which he added to his translation of 'Leviathan' into Latin (published 1668) he argued that the teaching of 'Leviathan' is not heretical, and that there remains no English court of heresy; and

he wrote at the same time a very vigorous 'Answer to a Book Published by Dr. Bramhall . . . called 'Catching of the Leviathan,' a book in which the bishop of Derry had maintained "that the Hobbian principles are destructive to Christianity and to all religion." Nobody doubts to-day that these charges are unfounded. Hobbes, it is true, inculcated a materialistic philosophy and an egoistic and necessitarian ethics; but upon these doctrines he himself based both the philosophical conclusion that God exists, and an ethical system which exhorts to justice and social virtues, even while it derives these virtues from purely selfish instincts. It is necessary to suppose that many of the men who decried Hobbes had never read him; and that the epithets "free-liver" and "atheist," which writers of his own and the following century heaped upon him were due, in part at least, to the fact that Hobbes remained throughout his life in some sense under the protection of his former pupil, Charles II. Very unjustly, therefore, he was held responsible for the lax morals of the court. It should be added that from this time onward Hobbes failed to gain from the censor license to publish any work on a political or on an ethical subject. The chief of the works, written at this period but published after the death of Hobbes, is 'Behemoth: The History of the Causes of the Civil Wars of England . . . from the Year 1640 to the Year 1660.'

Hobbes spent the last four years of his life with the family he had so long served, that of the Earl of Devonshire. In these later years he returned to the classical studies of his youth, publishing, when he was 87 years old, 'The Iliads, and Odysseys of Homer, translated out of Greek into English, with a large preface concerning the Virtues of an Heroic Poem.' In his very last year he wrote a sketch, in Latin metre, of his own life. He had feared many things, and death most of all, but he died quietly after a short illness, in 1679. See LEVIATHAN.

**Bibliography.**—The authoritative edition of Hobbes is that of Sir William Molesworth: 'English Works' (in 11 vols.); 'Opera Latina' (in 5 vols., London 1839-45). A recent reprint of the 'Leviathan' is that of Thornton (Oxford 1881). Selections, mainly from the ethical and political writings, are those of E. H. Sneath (1898), and F. J. E. Woodbridge (1903). 'The Metaphysical System of Hobbes,' edited by M. W. Calkins (Chicago 1905), contains the important chapters of 'Concerning Body.' For biography and criticism the reader is referred to G. C. Robertson, 'Hobbes' (1886); Leslie Stephen, 'Hobbes' (1884); and Tönnies, 'Hobbes, Leben und Lehre' (1896). For complete list of the writings of Hobbes and for further references to his critics, one should consult the works just cited and the Bibliography of Benjamin Rand, published as Vol. III, Pt. I of Baldwin's 'Dictionary of Philosophy and Psychology.'

MARY WHITON CALKINS,  
*Professor of Philosophy and Psychology,*  
*Wellesley College.*

**HOBBLE-BUSH**, a viburnum (*V. alnifolium*) of the southern interior of the United States, whose branches often stretch along the ground and root at the other end tripping up the unwary; hence it has such other names as war-

faring-tree, tanglefoot and devil's-shoestrings. The branches are long, flexuous and reddish in color, and the leaves are nearly orbicular and turn to a deep red in the autumn. See *VIBURNUM*.

**HOBKIRK'S HILL**, Battle of, in the Revolution, 25 April 1781. After Guilford Court-house (q.v.), Greene marched toward the British position at Camden under Rawdon and encamped at Hobkirk's Hill, about one and one-half miles north. He had 940 men in line, prudently encamping in order of battle; and some militia just arrived who took no part in the battle. His trains and artillery had not come up, and a renegade drummer boy informing Rawdon of this, the latter took action and making a detour to the right through the woods in front of Greene, drove in Greene's pickets with so sudden an onslaught that the Americans had barely time to form. Greene ordered the First Maryland to charge bayonets and William Washington to take the British in the rear with his cavalry, while Ford and Campbell executed flanking movements on Rawdon's wings. But Ford was killed, one of the First Maryland's captains was shot, the men fell into disorder, and Colonel Gunby ordered the regiment to form on the rear companies instead of moving the latter forward; the retiring men were seized with a panic, the famous veterans broke, and though soon reformed, the position was dangerous and Greene had to retreat. Gunby was court-martialed, but acquitted of anything but grave misjudgment. Greene's loss was 135, besides missing militia; Rawdon's 220 (his own figure) or 258 (Tarleton's). Consult Dawson, 'Battles of the United States' (New York 1858); Carrington, 'Battles of the American Revolution' (New York 1877).

**HOBOKEN**, hō'bō-kēn, N. J., city in Hudson County, on the Hudson River. It is the terminus of the Delaware, Lackawanna and Western, the Lehigh Valley and the West Shore railroads. It is opposite New York city, north of and adjoining Jersey City, and has on the north and west the Palisades. Its area is about one square mile. It has electric railway connections with a number of the cities and towns of the State, and by direct ferries and tunnels with the business district of New York. The principal streets run north and south, nearly parallel with the river. Its long waterfront gives it excellent shipping facilities; and here are located the docks of the ocean steamship lines, the Thingvalla, the Netherlands-American, the Scandinavian-American and the former German-American lines. The land upon which Hoboken is located, as well as much of that adjoining, once formed a part of the territory of New Netherlands. It was early known as Hobocan Hacking, which means "the land of the tobacco-pipe." The tobacco-pipes which were made by the Indians from the stone found in the vicinity gave rise to the name. In 1630 Michael Pauw of Holland purchased from the New Netherlands Company a tract of land a part of which is the site of the present city of Hoboken. The land around was soon cultivated and as New Amsterdam grew in numbers and importance, the gardens across the river became more valuable. John Stevens (q.v.), in 1804, purchased the land upon which the city now stands, and began

the town. The development of steam navigation and steam railroads received an early impetus in Hoboken. John Stevens invented and first employed here the modern type of ferry slip, made of piling. He also invented and put into operation at Hoboken the first steam-propelled ferryboat in 1811. At this time and for some years after the Elysian Fields of Hoboken were much used as pleasure grounds by New Yorkers. At first Hoboken was a part of the town of North Bergen, but on 28 March 1855 it was incorporated as a city. The disastrous fire at the wharves of the North German Lloyd Steamship Company, which occurred in 1900, destroyed considerable of the city property and three steamers. The estimated number of lives lost was 200. The chief manufactures of Hoboken are iron products, machine engines, technical instruments, motor fire engines, castings, elevators, inks, metal tubes, waterproof fabrics, leather, silk, lead-pencils, caskets, wall-paper, beer, ship-building and repairing and chemicals. It has extensive coal yards and large lumber and brick yards. The drainage of the lowlands is under way and by this means a large tract of land will be reclaimed and the sanitary conditions of the city improved. The city is the seat of the Stevens Institute of Technology (q.v.), and of the Sacred Heart Academy. It has Saint Mary's hospital, public and parish schools and several fine church buildings. The municipal income amounts to about \$4,000,000 annually, and the expenditures almost reach the same figure. The government is vested in a mayor, who holds office two years, and a city council. The mayor appoints the school, library, fire and health commissioners, also the assessors. The police commissioners are appointed by the mayor and approved by the council. The council elects the inspectors, the city clerk and his assistants. Pop. 74,994.

**HOBSON**, John Atkinson, English social economist: b. Derby, England, 6 July 1858. He was graduated at Oxford University, and from 1887 to 1897 taught English literature and economics for the University Extension Delegacy, and the London Society for the Extension of University Teaching. He is one of the foremost of economic writers in England and, as a Socialist, advocates the monopolistic control of industries by government, whether municipal or national. Among his works are 'The Physiology of Industry: Being an Exposure of Certain Fallacies in Existing Theories of Economics' (with A. F. Mummery, 1889); 'The Evolution of Modern Capitalism' (1894); 'The Social Problem' (1901); 'Imperialism' (1902); 'Canada To-day' (1906); 'The Industrial System' (1909); 'The Science of Wealth' (1911); 'Gold, Prices and Wages' (1913); 'Work and Wealth' (1914); 'Towards International Government' (1915); 'The New Protectionism' (1916); 'Democracy after the War' (1917).

**HOBSON**, Richmond Pearson, American naval constructor, lecturer and author: b. Greensboro, Ala., 17 Aug. 1870. He was graduated at the Annapolis Naval Academy in 1889 and took a post-graduate course at the Ecole Nationale Supérieure des Mines, and the Ecole d'Application du Génie Maritime in Paris. As midshipman he accompanied the White Squadron in Mediterranean and south Atlantic waters in 1889-90, in 1894-95 was on duty at the Navy

Department, in 1895-96 was stationed at the New York navy yard and in the following year was in charge of construction at Newport News. In 1897-98 he organized and conducted the post-graduate course for officers destined for the construction corps at the United States Naval Academy. Early in 1898 he served as constructor with the fleet, his principal work dealing with stability and fire systems of vessels in action. During the war with Spain he was present in the bombardment of Matanzas and took part in the expedition against San Juan, Porto Rico. He distinguished himself by his heroism in sinking the collier *Merrimac* across the entrance to Santiago Harbor, on the night of 3 June 1898, for the purpose of preventing the exit of Cervera's fleet. While he did not succeed in blocking the entrance to the harbor because the *Merrimac* was disabled by gunfire before reaching the point chosen, and when sunk lay almost parallel with the channel, the exploit brought commendation even from the enemy and Hobson and his comrades became the heroes of the nation. From 3 June to 6 July 1898 he was confined as a prisoner of war in a Spanish fortress, but was well treated. Subsequently he was inspector of Spanish wrecks and had charge of the salvage operations of the Spanish warships beached along the south shore of Cuba in the battle of 3 July 1898. In 1899-1900 Hobson was on duty in the Far East and from 1900 to 1903 had charge of naval construction at several stations. In the latter year he resigned from the navy. In 1904 he was presidential elector-at-large from Alabama. From 1907 to 1915 he was member of Congress from the sixth Alabama district. Mr. Hobson is prominent as lecturer, speaker and writer and as an advocate of American naval supremacy and of American leadership in the international movement for peace. He is also an advocate of nation-wide and world-wide prohibition and was the first to introduce in Congress a prohibition amendment to the Constitution. He is the author of 'A Study of the Situation and Outlook in Europe' (1894); 'The Disappearing Gun Afloat'; 'The Sinking of the Merrimac' (1900); 'America Must be Mistress of the Seas' (1902); 'Why America Should Hold Naval Supremacy' (1903); 'Buck Jones at Annapolis' (1907); 'Diplomacy and the Fleet' (1908); 'Arbitration and Armaments' (1908); 'In Line of Duty' (1909); 'America's War Policy' (1910); 'Fortification of the Panama Canal' (1911); 'The Great Destroyer: Alcohol' (1911); 'Our Country's Destiny' (1913); 'Destroying the Great Destroyer' (1915); 'America and the World War' (1917); 'The Great Reform' (1918).

"HOBSON'S CHOICE," may best be translated, "that or nothing." Tobias Hobson was a carrier and innkeeper at Cambridge, who erected the handsome conduit there and settled "seven lays" of pasture ground toward its maintenance. But the story about him, as told by *The Spectator*, is as follows: "He kept a stable of forty good cattle, always ready and fit for traveling; but when a man came for a horse he was led into the stable, where there was great choice, but was obliged to take the horse that stood nearest to the stable door, so that every customer was alike well served, according to his chance, and every horse ridden with

the same justice." Milton wrote two quibbling epitaphs upon this eccentric character.

**HOCCLEVE**, Thomas, English poet of the 15th century. See OCCLVE, THOMAS.

**HOCHE**, Lazare, lä-zär ôsh, French soldier: b. Montreuil, 25 June 1768; d. Wetzler, 19 Sept. 1797. He took service in the French guards when 16 years old, and at the Revolution joined the popular party. He greatly distinguished himself at the siege of Thionville and the defense of Dunkirk, and shortly afterward, when scarcely 25 years of age, received the command of the army on the Moselle. In 1793 he drove the Austrians out of Alsace, and soon after was arrested by the Jacobins and imprisoned at Paris. In 1794 he was released, and appointed commander of the army destined to quell the rising in the west, and afterward to that in La Vendée. In 1796 he conceived the plan of attacking Britain, and making a descent on Ireland, but expired suddenly while in camp with his army of invasion.

**HOCKEY**, a game of ball known as hurley in Ireland and shinty in Scotland, dating in its present form from about 1883, when a definite code of rules was drawn up by the Wimbledon Club. According to standard rules the game is played between two teams of 11 players each, on a ground 100 yards long by 50 to 60 yards wide. A goal is erected at each end of the field, and consists of two uprights 12 feet apart supporting a horizontal bar 7 feet from the ground. In front of each goal a line 12 feet long is drawn parallel to the goal-line and 15 yards from it; and from each end of this line, with the corresponding goal-post as centre, a segment of a circle is drawn outwards to meet the goal-line. Thus, a kind of semi-circle flattened at the top is drawn in front of each goal, and no goal is scored unless the ball is hit from within this line or striking-circle. The ball used is an ordinary cricket ball painted white; and each player is provided with a stick, curved at the end, without any metal fittings, and not too thick to be passed through a ring two inches in diameter. The players are arranged on the field as in Association football, namely, goal-keeper, two backs, three half-backs, five forwards. The game is started by one player of each side bullying the ball in the centre of the ground, that is, by first striking the ground with his stick and then striking his opponent's stick three times, after which either may strike the ball. When the ball is driven between the goal-posts under the bar by a stroke from within the striking-circle, a goal is scored, and the game is won by the side with a majority of goals scored. The ball may be caught or stopped with any part of the body, but it must not be carried, kicked or knocked on except with the stick; it must be played from right to left only. The goal-keeper is allowed to kick the ball away in defending his goal. Ends are changed at half-time.

**HOCKING**, Joseph, English Non-Conformist clergyman and novelist: b. Saint Stephen's, Cornwall, 1859. He was educated at Owens College, Manchester, and entered the Non-Conformist ministry in 1884. Among his many published books are 'Story of Andrew Fairfax' (1893); 'The Scarlet Woman' (1899); 'The Purple Robe' (1900); 'The Madness of David

Baring' (1900); 'Lest We Forget'; 'O'er Moor and Fen' (1901); 'Greater Love' (1903); 'Esau' (1904); 'The Woman of Babylon' (1906); 'The Trampled Cross' (1907); 'The Jesuit' (1911); 'Spirit of the West' (1913); 'All for a Scrap of Paper' (1914); 'The Day of Judgment' (1915); 'The Path of Glory, Tommy and the Maid of Athens' (1917). He is a brother of S. K. Hocking (q.v.).

**HOCKING, Silas Kitto**, English Methodist clergyman and novelist: b. Saint Stephen's, Cornwall, 24 March 1850. He was ordained a minister in the Methodist Free Church in 1870, and after holding pastorates in Liverpool, Manchester and elsewhere, resigned from the ministry in 1896. He is a prolific writer and several of his books have been much read in America. Among them may be named 'Alec Green' (1878); 'For Light and Liberty' (1890); 'One in Charity' (1893); 'A Son of Reuben' (1894); 'God's Outcast' (1898); 'The Awakening of Anthony Weir' (1901); 'Gripped' (1902); 'A Bonnie Saxon' (1903); 'Smoking Flax' (1904); 'The Flaming Sword' (1906); 'A Modern Pharisee' (1907); 'Yours and Mine' (1909); 'Who Shall Judge' (1910); 'The Third Man' (1911); 'In Self-Defense' (1914); 'His Own Accuser' (1917).

**HOCKING RIVER**, a stream which has its rise in Fairfield County, Ohio, and flows southeast into the Ohio River. The whole length is about 80 miles; it is navigable for about 70 miles. Along the shore, in the upper part of the course, is the Hocking Canal.

**HODGE, Archibald Alexander**, American Presbyterian divine: b. Princeton, N. J., 18 July 1823; d. Princeton, 11 Nov. 1886. He was the son of Charles Hodge (q.v.) and was graduated at Princeton College 1841, where he became assistant professor. In 1847 after graduation in the theological seminary of the same place he went to Allahabad, India, as a missionary. He stayed in Asia for three years and returning home held pastoral charges in Maryland, Virginia and Pennsylvania until 1877, when he became his father's assistant at Princeton Seminary, succeeding in 1878 to the chair of didactic and exegetical theology made vacant by his father's death. He was a trustee of Princeton College and for a time was editor of the *Presbyterian Review*. Among his works the most important are 'Outlines of Theology' (1879); 'The Atonement' (1886); 'Life of Charles Hodge' (1880); 'Manual of Forms, Conformed to the Doctrine and Discipline of the Presbyterian Church' (1883); 'Popular Lectures on Theological Themes' (1887).

**HODGE, Charles**, American Presbyterian theologian: b. Philadelphia, 28 Dec. 1797; d. Princeton, N. J., 19 June 1878. He was educated in Princeton College, graduating in 1815. In 1816-19 he studied in the theological seminary at Princeton, in 1820 was appointed instructor there and two years later made professor of Oriental and biblical literature. In 1840 he was transferred to the chair of didactic and exegetical theology in the seminary, and 12 years afterward appointed to the additional chair of polemical theology. In 1825 he founded the *Biblical Repertory*, afterward was renamed *Biblical Repertory and Princeton Review* and merged in 1872 in the *Presbyterian Quar-*

*terly and American Theological Review*. The semi-centennial anniversary of his connection with Princeton was commemorated there in 1872 by the foundation of the Charles Hodge professorship, with an endowment of \$50,000. At the same time he received a gift of \$15,000. He was moderator of the Presbyterian General Assembly in 1846 and was one of the revisers of the 'Book of Discipline' in 1858. From the foundation till 1872 he was editor of and chief contributor to the *Review*, and two of his works, 'Princeton Theological Essays' (1846-47); and 'Essays and Reviews' (1857), were compiled from his numerous articles in that periodical. Other works are 'Commentary on the Epistle to the Romans' (1855; enlarged 1866); 'Constitutional History of the Presbyterian Church in the United States' (1840-41); 'The Way of Life' (1842); 'Systematic Theology' (1871-72), a comprehensive treatise giving an exposition of Calvinistic theology; and 'What is Darwinism?' (1874). Consult 'The Semi-Centennial Commemoration of the Professorship of Charles Hodge, D.D., LL.D., September 24, 1872' (Philadelphia 1872), and Hodge, A. A., 'Life of Charles Hodge, Professor in the Theological Seminary, Princeton' (New York 1880).

**HODGE, Frederick Webb**, American ethnologist: b. Plymouth, England, 28 Oct. 1864. He was brought to this country at the age of seven years, and was educated at Washington, D. C. In 1884 he received appointment to the United States Geological Survey, in 1886 became secretary of the Southern Archæological Expedition and in 1889 was appointed to the Bureau of Ethnology, Smithsonian Institution. He explored New Mexico and Arizona in 1895, 1897 and 1899; in 1897 scaled the precipitous "Enchanted Mesa" of New Mexico and found traces of former human occupancy. Since 1910 he has been ethnologist in charge of the Bureau of Ethnology, and prepared the 'Handbook of American Indians,' issued by it. He has published 'List of Publications of the Bureau of Ethnology' (1894); 'The First Discovered City of Cibola' (1895); 'Coronado's Route from Culiacan to Quivira' (1899), and contributions on ethnological topics to scientific periodicals and to standard cyclopedias. He is editor of 'Narratives of Cabeza de Vaca and Coronado' (1907); Curtis's 'North American Indian.' He edited the *American Anthropologist* in 1899-1910, and again after 1912. He has written various papers on the Indians of the Southwest.

**HODGES, George**, American Episcopal clergyman: b. Rome, N. Y., 6 Oct. 1856. He was graduated from Hamilton College, Clinton, N. Y., in 1877, and from the Berkeley Divinity School, Middletown, Conn., in 1881. He was assistant rector of Calvary Church, Pittsburgh, Pa., 1881-89, and rector 1889-94, in the year last named becoming dean of the Episcopal Theological School in Cambridge, Mass. He has published among other works 'Christianity Between Sundays' (1892); 'The Heresy of Cain' (1894); 'In the Present World' (1896); 'Faith and Social Service' (1896); 'The Battles of Peace' (1897); 'The Path of Life' (1897); 'William Penn' (1900); 'When the King Came' (1904); 'Holderness' (1907); 'The Garden of Eden' (1909); 'A Child's Guide to the Bible' (1911); 'Saints and

Heroes' (2 vols., 1911-12); 'Training of Children in Religion' (1912); 'Castle of Zion' (1912); 'Moral Training in the School and Home' (1913); 'The Cross and Passion' (1915); 'The Episcopal Church, Its Faith and Order' (1915); 'Henry Codman Potter' (1915); 'Religion in a World at War' (1917). He is one of the most prominent members of the Low Broad Church School in the Episcopal Church.

**HODGKIN, hōj'kin.** Thomas, English historian and banker; b. Tottenham, Middlesex, 29 July 1831; d. 2 March 1913. He was for many years the senior partner in a banking firm at Newcastle-on-Tyne, but after 1874 gave his time to historical writing, to which he applied scientific methods. He has published 'Italy and her Invaders' (1880-99); 'Dynasty of Theodosius' (1889); 'Life of George Fox' (1896); 'Life of Charles the Great' (1897); 'Political History of England to the Norman Conquest' (1906); 'The Trial of Our Faith' (1911).

**HODGKIN'S DISEASE.** See PSEUDOLUCÆMIA.

**HODGKINSON, hōj'kin-sōn, Eaton,** English engineer; b. Anderton, Cheshire, 1789; d. Manchester, 18 June 1861. After a somewhat desultory education he engaged in pursuit of independent investigations in mechanics, which soon brought him fame. His first important work was on strains and the strength of materials, on which subject he read a paper before the Literary and Philosophical Society of Manchester in 1822. He subsequently made researches on the forms of the catenary in suspension bridges and on the strength and best forms of iron beams. He was appointed in 1847 professor of the mechanical principles of engineering at University College, London. He was one of the royal commission appointed in 1847 to inquire into the application of iron in railroad building. He was president of the Literary and Philosophical Society of Manchester in 1848-50. He was a member of the Geological Society, of the Royal Irish Academy, and an honorary member of the Institute of Civil Engineers. He made investigations as to the temperatures of the earth in deep mines. His principal experiments led him to the determination of the "neutral line" in the section of fracture, an important step in the progress of engineering science. Among his many writings is 'Researches on the Strength and Other Properties of Cast Iron' (1846). Consult the 'Life of Eaton Hodgkinson' in 'Memoirs of the Manchester Literary and Philosophical Society' (3d series, No. II, Manchester 1862).

**HODGSON, hōj'sōn, Shadworth Holloway,** English metaphysician; b. Boston, Lincolnshire, 25 Dec. 1832; d. 13 June 1912. He was educated at Rugby and Oxford and is the author of 'Time and Space' (1865); 'Principles of Reform in the Suffrage' (1866); 'The Theory of Practice' (1870); 'The Philosophy of Reflection' (1878); 'The Metaphysic of Experience' (1898), etc.

**HOE, Richard Marsh,** American inventor; b. New York, 12 Sept. 1812; d. Florence, Italy, 7 June 1886. He was the son of Robert Hoe (q.v.). In 1846 with his brother Peter S. he perfected a rotary printing-press which was called "Hoe's lightning press." Subsequently

the two brothers invented the Hoe web-perfecting press, which superseded the rotary press and prints upon both sides of the sheet, and includes apparatus for folding and cutting. This was especially adapted to newspaper printing and made a revolution in that art. The sons of Richard M. Hoe and of Peter S. Hoe conducted the business after the death of the brothers, and added various improvements to the original Hoe printing-press. See PRINTING.

**HOE, Robert,** American inventor; b. Leicestershire, England, 1784; d. 1833. He came to the United States in 1803, was for a time a joiner, and later entered partnership with his brothers-in-law, Matthew and Peter Smith, for the sale of a hand printing-press, the invention of the latter. He took over the business in 1823. He retired in 1832. The original Hoe printing-press was designed and built by him. He is believed to be the earliest American machinist who utilized steam as a motive power in his plant.

**HOE, Robert,** American manufacturer; b. 1839; d. 1909. He is a nephew of Richard M. Hoe (q.v.). He became the head of the Hoe firm, and maintained its high position among establishments of its class. A founder of the Grolier Club of New York, he was also its first president. He was an extensive collector of rare books and manuscripts as well as of silver, miniatures and other art objects, his collections at the time of his death being valued at several million dollars. He published an edition (1880) of Maberley's 'Print Collector,' and wrote 'A Short History of the Printing Press' (New York 1902); 'Bookbinding as a Fine Art' (Grolier Club, id. 1886). Consult biographical sketch by Gilliss in 'New York Genealogical and Biographical Record' (Vol. XII, ib. 1910).

**HOEBER, Arthur,** American artist; b. New York, 23 July 1854; d. Nutley, N. J., 29 April 1915. He studied under Beckwith at the Art Students' League in New York, and under Gérôme at the Ecole des Beaux Arts, exhibited for the first time at the Salon in 1882 and was a contributor to most American exhibitions. He was art critic of the New York Times for three years, associate editor of the *Illustrated American* for one year and later became art critic of the New York *Globe and Commercial Advertiser*. He was also known as a lecturer on art. He was elected an associate of the National Academy. Among his writings are 'Treasures of the Metropolitan Museum of Art' (1892); and 'Painting in the 19th Century in France, Belgium, Spain and Italy.' His Salon picture in 1882 was 'Sur la Grande Route' and in 1885 'Le Pain Quotidien.'

**HÖEGH-GULDBERG, hæg-güld'bërg, Ove,** Danish statesman; b. Horsens 1731; d. 1808. Appointed preceptor of Crown Prince Frederick, son of Christian VII, he conspired against Queen Caroline and Struensee; and on their overthrow rose rapidly in political power. He became Cabinet Secretary in 1773 and three years later, Secretary of State. From 1784-1802 he was governor of Aarhus. Besides some religious works, he wrote an important 'Universal History.'

**HOFER, hō'fër, Andreas,** Tyrolese patriot; b. Sankt Leonhard, 22 Nov. 1767; d. Man-

tua, 20 Feb. 1810. He was landlord of the inn 'Am Sand' at Sankt Leonhard, and hence often known as "Sandwirt." In 1796 he led a rifle company against the French on Lake Garda, and after the Peace of Lunéville was prominent in the organization of the Tyrol militia. In 1809 he led in an insurrection of the Tyrolese for shaking off the yoke of Bavaria, to which their country had been transferred by the Treaty of Presburg. In a short time, with intermittent assistance from the Austrians, he defeated the French and Bavarian troops, and nearly the whole country was liberated. Hofer then carried on the military and civil administration, till the Peace of Vienna was proclaimed. Misled by false reports he commenced hostilities anew, and thus forfeited the protection of the amnesty. He remained concealed for some time, but was at last betrayed to the French, and carried to Mantua, where he was tried by a court-martial and shot. His family was indemnified for the loss of their property by the emperor of Austria in 1819, and his son ennobled. The career of Hofer furnished material for tragedies by Immermann and Auerbach. Consult the studies by Heigel (1874) and Stampfer (1891).

**HOFF, hōf, William Bainbridge**, American naval officer: b. Philadelphia, 1846; d. Washington, D. C., 23 May 1903. He entered the naval service in 1860, and in 1863 was graduated from the Naval Academy. He took part in several naval campaigns during the Civil War, and at the torpedo school and on the United States steamship *Dale* he gave his attention to the instruction of seamen in gunnery. In 1893 he was marine commissioner to Great Britain for the World's Fair at Chicago, and was retired in 1897. He was the author of 'Elementary Naval Tactics'; and 'Avoidance of Collisions at Sea.'
