**HOFFMAN, hōf'man, Charles Fenno**, American poet and novelist: b. New York, 1806; d. Harrisburg, Pa., 7 June 1884. He entered Columbia College, and studied law at Albany, being called to the bar in 1827. In 1830 he became joint editor of a New York journal, and three years later started the *Knickerbocker Magazine*. For many years he edited the *American Monthly Magazine* also. In 1849 his mind began to give way, and from that time till his death he was an inmate of Harrisburg Lunatic Asylum. His first separate publication was 'A Winter in the West' (1835), followed in 1837 by 'Wild Scenes in Forest and Prairie,' and in 1840 by the novel 'Greyslaer: a Romance of the Mohawk,' which met with immediate and remarkable success. An earlier novel, 'Vanderlyn,' appeared in the *American Monthly Magazine* during 1837. Several of his songs have gained great popularity. His published volumes of verse include 'The Vigil of Fafth' (1842); 'The Echo' (1844); 'Lays of the Hudson, and other Poems' (1846); 'Love's Calendar, and other Poems' (1848).

**HOFFMAN, Eugene Augustus**, American Episcopal clergyman: b. New York, 21 March 1829; d. near Plattsburg, N. Y., 17 June 1902. He was educated at Rutgers and Harvard colleges and at the General Theological Seminary. He held successive rectorships at Elizabeth, N. J., Burlington, N. J., Brooklyn, N. Y., and Philadelphia, and in 1879 was appointed dean

of the General Theological Seminary, New York, and with others of his family heavily endowed that institution. Dean Hoffman built Christ Church and rectory at Elizabeth, N. J., and also churches at Woodbridge and Milburn, N. J. He was the author of 'Free Churches' (1858); and 'The Eucharistic Week' (1859 and 1893). Consult Riley, T. M., 'Memorial Biography of E. A. Hoffman' (New York 1904).

**HOFFMAN, Richard**, American pianist and composer: b. Manchester, England, 24 May 1831; d. 17 Aug. 1909. He came to New York in his 16th year. He received early instruction from Rubinstein, Liszt, Thalberg, Döbler and Meyer. After his arrival in America he made a tour of the country as a soloist, and later accompanied Jenny Lind on her tours; he also played with Gottschalk and Von Bülow in New York in 1875. Later he became an important figure in American musical life. He composed music for the piano, songs, anthems, ballads and church music.

**HOFFMANN, August Heinrich**, ow'-goost hīn'rih hōf'mān, usually known as **HOFFMANN VON FALLERSLEBEN**, German poet and philologist: b. Fallersleben, Hanover, 2 April 1798; d. Corvei, 19 Jan. 1874. He studied at Göttingen and Bonn, was appointed in 1823 custodian of the university library at Breslau, and in 1830 became extraordinary, in 1835 ordinary professor of the German language and literature in the university of that city. He resigned his librarianship at Breslau in 1838, and in 1842 was removed from his chair without a pension because of the liberal political views represented in his 'Unpolitische Lieder' (1840-41). He led a wandering life till 1845, when he obtained the right of domicile in Mecklenburg. In 1848 he was granted a pension by the Prussian government, and from 1860 he was librarian to the Duke of Ratibor. Of his original writings the best known are his songs, not a few of which, especially that beginning 'Deutschland, Deutschland über Alles' (1841), have long received emphatic popular approval. For several of them he composed tunes. They were published in several volumes, among these being 'Gedichte' (1827); 'Alemannische Lieder' (1827); 'Hundert Schullieder' (1848); 'Deutsches Volksgesangbuch' (1848); 'Soldatenlieder' (1851); 'Kinderwelt in Liedern,' and 'Alte und Neue Kinderlieder' (1873). A complete edition of his 'Kinderlieder' was prepared by von Donop in 1877. 'Mein Leben' (1868; abridged edition continued to his death, by Gerstenberg, 1892-94), is autobiographical. Consult also the 'Life' by Wagner (1869).

**HOFFMANN, Ernst Theodor Wilhelm**, German novelist: b. Königsberg, 24 Jan. 1776; d. 24 July 1822. In admiration of Mozart he dropped the name Wilhelm and substituted Amadeus. His childhood and youth were joyless and in 1792 he entered the University of Königsberg to prepare for a legal career. He practised for a short time at Königsberg, removing subsequently to Glogau and in 1798 to Berlin. In 1800 he went to Posen but his powers of caricature cost him his place and caused his virtual banishment to Plozk. His leisure moments were spent in musical composition. In 1804 he removed to Warsaw, where he was influenced by the Romantic writers such as

Novalis, Tieck and Wackenroder. During his sojourn in Warsaw he composed the music to Brentano's 'Lustige Musikanten' and to Werner's 'Kreuz an der Ostzee' and the opera 'Liebe und Eifersucht.' Hoffmann's fortunes were impaired when the French invaded Warsaw, and in 1808 he moved to Bamberg as musical director of a theatre there. This institution became bankrupt and Hoffman turned to literature in order to enhance his scanty earnings as composer and teacher of music. His earliest work was a series of musical sketches, 'Phantasiestücke in Callots Manier' (4 vols., 1814). In 1814 he was recalled to Berlin and in 1816 was made councillor of the Court of Appeal. In the latter year appeared his great novel, 'Die Elixiere der Teufels' (q.v.), which laid the foundation of his literary fame. Hoffman's habits of dissipation impaired his health and he died of locomotor ataxia at the age of 46. Other works by him are 'Lebensansichten des Katers Murr' (1820-22), 'Die Serapiensbrüder' (1819) and 'Nachtstücke' (1817). His works were recently published (15 vols., 1905). His musical compositions were edited by E. Istel (1906). Translations of all of his important works have appeared in English. Consult Ellinger, G., 'E. T. A. Hoffmann' (1894); Hitzig, 'Hoffmann's Leben und Nachlass' (Stuttgart 1839); Klinke, O., 'Hoffmann's Leben und Werke vom Standpunkte eines Irrenarztes' (1903); Sakheim, Arthur, 'E. T. A. Hoffmann: Studien zu seiner Persönlichkeit und seinen Werken' (Leipzig 1908); Wolzogen, Hans, 'E. T. A. Hoffmann und R. Wagner' (Berlin 1906).

**HOFMANN, August Wilhelm von**, German chemist: b. Giessen, 8 April 1818; d. Berlin, 5 May 1892. He studied law, obtained the degree of doctor of philosophy, became assistant under Liebig in the Giessen Laboratory, and in 1845 became professor of chemistry in the University of Bonn. The same year he was appointed superintendent of the new Royal College of Chemistry in London, and in 1853 became professor of chemistry in the Royal School of Mines, though still remaining at the head of the College of Chemistry. In 1861 he was elected president of the London Chemical Society, and in 1863 was appointed to the chair of chemistry in the University of Berlin, where he remained till his death. In 1864 he built a laboratory at Bonn and became its director, and in 1868 founded the German Chemical Society. He was judge of several industrial expositions and was a member of many scientific societies, and for his valuable services was ennobled in 1888. A statue of him is in the National Gallery of Berlin. Hofmann's researches contributed much to the development of the color industry and have revolutionized the art of dyeing. He investigated the organic bases of coal-tar and discovered the amines. He discovered a method of transforming acid amides into amines by means of bromine and caustic potash. This method is known as Hofmann's reaction. He also discovered aniline among the products of distilled bituminous coal and methods for the preparation of coloring substances from aniline. Entire departments of organic chemistry have developed from his researches and chemical theory in general has been greatly influenced by his work. He wrote 'A Handbook

of Organic Analysis' (1853); 'Introduction to Modern Chemistry' (1865; and several later editions): this work led to important reforms in methods of teaching chemistry; 'Zur Erinnerung an vorangegangene Freunde' (1889); 'The Life Work of Liebig in Experimental and Philosophic Chemistry' (1876), etc. Consult Volhard and Fischer, 'August Wilhelm von Hofmann: Ein Lebensbild, im Auftrage der deutschen chemischen Gesellschaft' (Berlin 1902).

**HOFMANN, Heinrich**, German painter: b. Darmstadt, 19 March 1824; d. 1902. In his native town he began his studies as a copper-plate engraver, but subsequently under Schadow and Hildebrande turned his attention to painting, to which henceforth he devoted his life. After extensive travels in Europe, which included a residence of four years in Italy in 1854-58, and practising in various German cities, he settled at Dresden in 1862 as professor of painting in the Academy there. The most famous of his pictures are 'The Burial of Christ'; 'King Enzo in Prison'; 'The Betrayal of Christ' in the Darmstadt Gallery; 'The Finding of Christ in the Temple,' in the Dresden Gallery; 'Christ Preaching on the Lake,' in the Berlin National Gallery; 'Venus and Cupid'; 'Romeo and Juliet'; 'Othello and Desdemona'; and 'Christ in Gethsemane.' In 1878-79 he decorated the ceiling of the vestibule of the theatre at Dresden with his 'Apotheosis of the Heroes of the Greek Drama.' All the creations of Hofmann testify to his sense of refined beauty and are rather remarkable for harmonious coloring and delicacy than for originality of design or composition, as he clings to the tradition of the classic period in the ideal character of his conceptions. His works are popular and have been engraved and photographed more extensively perhaps than those of any German painter of his order.

**HOFMANN, Josef**, yó'séf, Polish pianist: b. Cracow, 20 Jan. 1877. He studied with his father, a professor in the Warsaw Conservatory and director of the Warsaw opera, appeared as a pianist in public at the age of six, became known as one of the most notable of musical prodigies, visited the United States in 1887-88, and was there prevented from playing through the action of the Society for the Prevention of Cruelty to Children. After a period of study, two years of which were spent as a pupil of Rubinstein, he made his debut as a virtuoso at Dresden in 1894. His recitals in New York in 1901 showed him to be one of the leading modern pianists. His compositions include some interesting works for the pianoforte. He successfully interprets both the classic, romantic and modern schools. His two handbooks 'Piano Playing' and 'Piano Questions Answered' are very popular and practical works in their field.

**HOFMANNSTHAL, Hugo von**, Austrian poet: b. Vienna, 1 Feb. 1874. He belongs to a circle of neo-romantic poets, headed by Stephan George (q.v.), who represent a reaction against the naturalistic movement. Not much is known of his life and very little knowledge of this sort is necessary for the interpretation of his works, as he and his associates sought the salvation of the poetic art in fleeing from the realities of the present day into the romantic dreamland of the past. Hofmannsthal espe-

cially is an adept in sensing and reproducing the feelings of characters of by-gone civilizations, especially of the Renaissance. He is a child of wealth, lives in Vienna and has made journeys to France and Italy, in which latter country he spends most of his time in Venice. His works have mostly appeared for the first time in costly prints, accessible only to the few. The poets of this group in most cases printed their works privately. They were intended only for a small circulation among the adherents of this movement, as it was held that only they were capable of appreciating them. To understand the aims and theories of this coterie of poets, it is necessary to read their private journal *Blätter für die Kunst*. Hofmannsthal's masters were Keats, D'Annunzio and Swinburne.

His first work, 'Gestern' (1892), was written when he was but 18 years old. It is in dramatic form but largely lyrical in content. A woman deceives her husband and he discovers her deceit. That is the whole content except the delicate, melodious language of the verse, which was to Hofmannsthal everything. In these lyric-epic verses his real talent is shown. This same word-painting, this same perfection of studied and learned beauty is found in all his earlier dramas, of which 'Der Tor und der Tod' (1893); 'Der Tod des Tizian' (1892), and 'Der Abenteurer und die Sängerin' (1899), are the most important. There is lacking all dramatic action, but one is fascinated by the sweet melancholy of the verse of this master-painter of words.

In his later works there is evident more of a tendency to naturalism. This is seen in 'Electra' (1903), a free imitation of Sophocles, 'Das gerettete Venedig' (1904), in which he followed Thomas Otway, and 'Ödipus und die Sphinx' (1905). Here we find a naturalism based upon the brutal instincts of the senses. No dramatic talent is shown. There is only a mixture of pleasing sound of musical words together with a sensuous mysticism. Other works of Hofmannsthal are 'Die Frau im Fenster' (1899); 'Die Hochzeit der Sobeide' (1899); 'Der Kaiser und die Hexe' (1900); 'Das Bergwerk zu Falun' (1900); 'Das kleine Welttheater' (a puppet play, 1903); 'Ödipus der König' (1907); 'Ausgewählte Gedichte' (1903); 'Das Märchen der 672. Nacht und andere Erzählungen' (1905); 'Unterhaltungen über literarische Gegenstände' (1905); 'Prosaische Schriften' (1907); 'Jederman, ein altes Spiel erneuert' (1912); 'Ariadne auf Naxos' (1912), and 'Der Rosenkavalier,' an opera libretto with music by Richard Strauss, performed in New York in 1913. Consult Sulzer-Gebing, Emil, 'Hugo von Hofmannsthal, eine literarische Studie' (Leipzig 1905); Seiberth, Philip, in 'German Classics' (Vol. XVII, New York 1914). See ELECTRA.

WILLIAM F. HAUHART,  
Assistant Professor of German, University of  
Michigan.

**HOG-FEEDING.** See NUTRITION OF FARM ANIMALS.

**HOGAN, John Joseph,** American Roman Catholic bishop: b. Bruff, County Limerick, Ireland, 10 May 1829; d. 21 Feb. 1913. He came to Saint Louis, Mo., in 1848, studied at the Roman Catholic theological seminary there,

was ordained priest in 1852, and built and became pastor of Saint Michael's Church of Saint Louis. In 1868 he was consecrated bishop of Saint Joseph, Mo., and in 1880 was transferred to the see of Kansas City.

**HOGARTH, hō'gärth, David George,** English archæologist: b. Barton-on-Humber, Lincolnshire, 23 May 1862. He was educated at Oxford and has since conducted excavations at Paphos, Alexandria, Fayum and elsewhere in the East. He was director of the British School at Athens 1897-1900, was appointed keeper of the Ashmolean Museum, Oxford, 1909 and has published 'Devia Cypria' (1890); 'Modern and Ancient Roads in Asia Minor' (1892); 'A Wandering Scholar in the Levant' (1896); 'The Nearer East' (1902); 'The Penetration of Arabia' (1904); 'Ionia and the East' (1909); 'Accidents of an Antiquary's Life' (1910); 'The Ancient East' (1914).

**HOGARTH, William,** English painter and engraver: b. London, 10 Nov. 1697; d. there, 25 Oct. 1764. He studied art at Sir James Thornhill's school, James street, Covent Garden. About 1720 he set up for himself, and designed plates for booksellers, the chief of which are the illustrations to Gray's edition of 'Hudibras' (1726). He had ample employment for what are called "conversation pieces," that is, groups of family portraits, united by some common occupation or interest, but never cared greatly for this branch of art. In March 1729 he married clandestinely the daughter of Sir James Thornhill, and shortly afterward began to display his extraordinary faculty for depicting the vices and follies of his time. In 1730-31 he painted 'A Harlot's Progress,' a series of six pictures, like many of his other works, engraved by himself. It was published in April 1732. The 'Harlot's Progress' was followed by other satiric delineations, such as 'A Midnight Modern Conversation' (1734); 'Southwark Fair' (1735); 'A Rake's Progress' (1735); 'The Distrest Poet' (1736); 'The Four Times of the Day,' and the 'Strolling Actresses Dressing in a Barn' (1738). With less success he also produced the large canvases still in Saint Bartholomew's Hospital—the 'Pool of Bethesda' and the 'Good Samaritan,' both executed in 1736; and also painted several portraits. The series of graphic satires was, however, continued by the 'Enraged Musician' (1741) and the famous 'Marriage à la Mode' (his masterpiece), six pictures now in the National Gallery, and engraved by various hands in 1745. 'Industry and Idleness,' 12 plates, followed these in 1747; 'Calais Gate' (1749) came next, and in 1750 the fine plate known familiarly as the 'March to Finchley.' The minor plates of 'Beer Street' and 'Gin Lane' and the set called 'The Progress of Cruelty' belong to 1751. In 1753 Hogarth published his 'Analysis of Beauty,' a treatise containing many shrewd remarks but confused and illiterate in style and the cause of much ridicule. After this he produced (with the aid of Grignion and others) the four prints of the 'Election Series' (1755-58), the 'Cockpit' (1759), etc. In 1762-63 he became involved in a miserable quarrel with Wilkes and Churchill, the result of which, on his side, was the well-known portraits of Wilkes, and of Churchill as a bear ('The Bruiser'). Most of Hogarth's pictures,

which now enjoy a much higher repute for technique than formerly, are preserved in public or private collections in Great Britain. He was entirely uninfluenced by foreign art. His powers of invention and combination were extraordinary; and as a humorist and social satirist with the pencil he has never been surpassed. There can be no doubt also that he genuinely desired to assist by his work in the reformation of manners. Consult the biographies by Sala (1866), and Dobson (1879).

**HOGBACK.** See CUESTA.

**HOGGE, hōg, Moses Drury,** American Presbyterian clergyman: b. Hampden-Sidney, Va., 17 Sept. 1819; d. Richmond, Va., 1899. He was graduated at Hampden-Sidney College and Seminary and was pastor of the Second Presbyterian Church in Richmond, Va. (1845-85). He ran the blockade in a ship from Charleston during the Civil War and secured from England a large number of copies of the Holy Scriptures for distribution among the Confederate soldiers, the British and Foreign Bible Society making a special grant at his request. After the war he was instrumental, especially during the session in 1874 of the Southern Presbyterian Church, in reconciling differences with the Northern Presbyterian Church.

**HOGG, James,** Scottish poet, familiarly known as "THE ETRICK SHEPHERD": b. Etrick, Selkirkshire, 25 Jan. 1770; d. Altrive, on the Yarrow, 21 Nov. 1835. After receiving a very scanty education, he began to earn his bread by daily labor as a shepherd. His early rhymings brought him under the notice of Sir Walter Scott, by whose advice he published a volume of ballads called 'The Mountain Bard.' He then went to Edinburgh, where he published the 'Forest Minstrel' (1810), and started a weekly periodical entitled *The Spy*. The appearance of the 'Queen's Wake' in 1813, with its charming ballad of Kilmeny, established Hogg's reputation as a poet. In 1815 he published 'Pilgrims of the Sun,' followed by 'Mador of the Moor'; the 'Poetic Mirror' (a collection of imitations of living poets); 'Queen Hynde,' and 'Dramatic Tales,' as well as by 'The Brownie of Bodsbeck,' etc. From 1817 he held the farm of Altrive from the Duke of Buccleuch at a merely nominal rent; but his farming schemes never thrived, and he was generally in narrow circumstances.

**HOGNOSE,** a North American colubrine serpent (*Heterodon platyrhinus*), so called because of its upturned pig-like snout. It is usually about two feet long, gray marked with brown bars, but sometimes is so dark that the whole surface appears blackish; it dwells and seeks its prey mainly in the woods and thickets. When alarmed—and it is extremely timid—it hisses violently (whence other rustic names such as "blowing-adder"), and expands and flattens the head and neck by inhaling air and stretching out the ribs, giving itself a most ugly aspect. If these tactics do not succeed in terrifying the enemy sufficiently, the snake begins a series of astonishing contortions and twistings which end in the animal throwing itself upon its back and seeming dead until a chance of escape offers. Two or three other species are known in the South and West, all of which are re-

garded as poisonous by most country people, but are really quite harmless.

**HOGS.** See SWINE.

**HOGSHEAD,** a liquid measure formerly in use in England. Its capacity varied in different cases. For beer it was 54 gallons, for rum 45 to 50 gallons, for brandy 45 to 60 gallons and for different kinds of wine it varied from 46 to 93 gallons. In the United States the measure is still in use, being equivalent to 63 American gallons or 52.485 imperial gallons; for tobacco it varies from 750 pounds in some States to 1,200 pounds in others.

**HOHENLINDEN,** ho-ën-lin'dën, Germany, village of Bavaria, 20 miles east of Munich, celebrated for the victory gained by the French under Moreau over the Austrians under the Archduke John, 3 Dec. 1800. Moreau placed his army on the plain between the Inn and the Isar, thus barring the way to Munich, the objective of the Austrians. When the latter advanced Moreau simply held them in check and sent Richepanse around their flank to attack them in the rear. When Richepanse began his rear attack, Ney was ordered to attack the Austrians in front, who were thus caught and crushed between two forces. The Austrians left 10,000 dead on the field, while the French loss was only about 5,000. The French took nearly 80 pieces of cannon, 200 caissons and more than 10,000 prisoners, with three general officers. The French victory led to the treaty of peace concluded at Lunéville, 9 Feb. 1801.

**HOHENLOHE - SCHILLINGSFÜRST,** hō-ën-lō'é shīl'lings-fürst, Chlodwig Karl Victor, PRINCE VON, German Chancellor: b. Rotenburg-an-der-Fulda, March 1819; d. Ragatz, Switzerland, 6 July 1901. He took courses in law and political science at Heidelberg, Göttingen and Bonn. He entered public life and became in 1866 Prime Minister of Bavaria. In 1874 he was German Ambassador to France and in 1885 became governor-general of Alsace-Lorraine. In 1894 he was appointed Chancellor and resigned in 1900.

**HOHENSTAUFEN,** hō-ën-stow-fën, House of, a German dynasty reigning from 1138 to 1254. After the death of the emperor, Henry V (1125), his two nephews, Frederick II, Duke of Swabia, and Conrad, Duke of Franconia, aspired to the German crown; but were opposed by the directors of the election, the archbishop of Mayence and the papal legate; and Lothaire of Saxony was elected. The circumstance, with the demand made by the new emperor of the restitution of all the possessions acquired by the lords of Hohenstaufen during the preceding reign, produced a fierce war between the emperor and the two brothers. Lothaire preserved himself by a union with Henry the Proud, Duke of Bavaria, to whom he gave his daughter and the duchy of Saxony. The Peace of Mühlhausen (1135), between Lothaire and Conrad, put an end to this Ten Years' War. Conrad renounced his title of king of Italy which he had taken, but received the first rank among the dukes, and both he and his brother regained all their lands. After Lothaire's death (1137) Conrad, Duke of Franconia, of the house of Hohenstaufen, was raised to the throne of Germany, with the title of Conrad III. After

the death of Conrad III (1152) the confidence which was felt in the Hohenstaufen family caused the choice to fall on his nephew, Frederick III of Swabia, called Barbarossa (the Red-beard), who was followed by Henry VI (1190), and he again by Otto IV (1197) and Frederick II (1215-50), all belonging to the same house. After the death of Frederick II his son Conrad was acknowledged as his successor, with the title of Conrad IV, by most of the states of the empire; but Innocent IV laid him under an interdict and declared him to be deprived of all his lands. The conflict between Conrad and the Pope lasted until the latter's death in 1254. The fame of the house of Hohenstaufen is based upon the political greatness to which the Fredericks in particular attained; their success in reducing to order all the states of the empire; the encouragement which they gave to commerce and trade and their efforts to promote the sciences and arts.

**HOHENZOLLERN**, hō'en-tsoi-lörn, Germany, province of Prussia, formed in 1849 by the union of the two principalities of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen. It consists of a narrow irregular strip of country encircled by Württemberg and Baden. Area 441 square miles; pop. (1911) 71,011. The province is traversed by the Danube and the Neckar. Iron, coal, gypsum, peat and rock salt are found in the mountains, and the valleys yield fruit, grain and hops. There are several mineral springs. Cotton spinning, iron founding, agriculture and cattle raising are the principal industries. Sigmaringen is the seat of the Landtag since 1873. The province is represented in the Reichstag by one deputy. The inhabitants are nearly all Roman Catholics, under the jurisdiction of the archdiocese of Freiburg. The princely family of Hohenzollern dates from Thassilo, Count of Zollern, who died about 800 A.D., after having founded a castle near Hechingen, on the Zollern hill in the Swabian Alps. The fine Hohenzollern castle of 14th century architecture, built in the latter half of the 19th century, occupies the site of the ancient family-seat. There have been several lines and branches of the Hohenzollerns, the first separation taking place about 1165, when Frederick IV founded the elder or Swabian and Conrad III the younger or Franconian line. The elder line was subdivided, in 1576, into the branches of Hechingen and Sigmaringen. Frederick VI, the representative of the younger line, in 1415 received from the Emperor Sigismund the investiture of the electorate of Brandenburg, thus founding the reigning dynasty of Prussia. The two branches of the elder line continued unbroken till 1849, when the reigning princes ceded their respective rights and principalities to the king of Prussia, who in 1871 became German Emperor. The main branch of the Hohenzollerns is represented by the former imperial family of Germany. See GERMANY.

**HOHENZOLLERN CANAL**, Germany, running from Berlin to the river Oder, thus connecting the capital with Stettin by water, was opened by Kaiser Wilhelm II on 17 June 1914.

**HOISTING APPARATUS**. See CRANE; DERRICK; ELEVATOR.

**HOJO**. A line of rulers in Japan (1219-1333) who, though historically considered as

usurpers, were the regents and real executives of the country from 1200 to 1333. Descended from Imperial and Taira ancestors, they were men of ability. They made Kamakura their seat of power and virtual capital of the empire and set up and deposed both emperor and shogun at their will. They were finally driven from power by Nitta Yoshisada, in 1333, and Kamakura was burned and left desolate. Their chief claim to honorable fame lies in the energy shown by the regents Tokimune and Yasutoki in driving off the Mongols, when they attempted invasion. This era furnishes the theme of much Japanese fiction and many art motives. To reinforce the national spirit, when the Russian War of 1904-05 was at its height, the Mikado conferred high posthumous honors upon Hojo Yasutoki (1183-1242), for his defeat of the Mongols and the vindication of Japanese Bushido in keeping Japan inviolate. Consult Murdoch and Yamagata, 'History of Japan' (1905); Yamada, 'Ghenko; the Mongol Invasion of Japan' (1916); Griffis, 'The Mikado's Empire' (1912); and, in fiction, Fraser, 'A Stolen Emperor' (1903).

**HOKE, Robert Frederick**, Confederate general: b. Lincoln, N. C., 27 May 1837; d. Raleigh, N. C., 1906. He was educated at the Kentucky Military Institute and at the beginning of the Civil War enlisted in the Confederate army as a private, soon being promoted to the rank of colonel. He took part in the early battles around Richmond, served in North Carolina, on 17 Jan. 1863 was commissioned brigadier-general, and was seriously wounded at Chancellorsville. As a reward for capturing Plymouth, N. C., he was promoted to major-general, 20 April 1864, and assigned to the command of a division of the Army of Northern Virginia. From May to December, 1864, he fought in front of Richmond, serving with distinction at Cold Harbor, where his command bore the brunt of the fighting. For a short time afterward he commanded the district of North Carolina; in 1865 took charge of a division of J. E. Johnston's army; at Bentonville (q.v.) fought his last battle; and surrendered at Durham Station, N. C., 26 April 1865. After the war he engaged in the iron business in North Carolina and later became president of the Seaboard Air Line system. In 1898 President McKinley offered him a commission as major-general of volunteers in the war with Spain but he declined.

**HOKUSAI**, hō-koo-sā'ë. See JAPANESE ART.

**HOLACANTHUS**. See BUTTERFLY-FISH.

**HOLBACH, Paul Heinrich Dietrich**, powl hin'rih det'rih hōl'bāh (Fr. ôl-bāk), BARON von, German philosophical writer: b. Heidelberg, in the Palatinate, 1723; d. Paris, 21 June 1789. He was educated in Paris, where he passed the greater part of his life. He was the centre of a circle of men of wit but of free-thinking principles, using his great fortune, says Rousseau, generously, and appearing to advantage in the learned society which he gathered round his table. He was the author of a great number of works, most of which were anonymous or pseudonymous. The principal work attributed to him, which appeared in 1770 under the name of M. Mirabaud, and excited much attention in the learned world, is the 'Système

de la nature.' He afterward published 'Système social' — a development of the previous work, showing the application of the principles promulgated in it to morals and politics; 'Bons Sens, or Idées naturelles opposées aux Idées surnaturelles'; 'Eléments de la morale universelle,' etc. According to Holbach matter is the only form of existence, and everything is the effect of a blind necessity. Consult Hall, E. V., 'The Friends of Voltaire' (1907).

**HOLBEIN, Hans**, hänts höl- or höl'bîn, THE ELDER, German painter: b. Augsburg, 1460; d. Alsace, 1524. His art training began under the influence of Martin Schongauer, but he quickly launched out into a new style, which left ancient precedents behind. He developed a dramatic energy, a clear and lifelike coloring and pre-eminent distinction of expression which rendered him the acknowledged head of a new school. His figures took the attitude of life. The pictures over the altar in the cathedral at Augsburg, painted in 1493, are good specimens of his best work; in them are portrayed incidents in the life of Virgin Mary. To the same class belong the remains of an altarpiece in the Dominican church at Frankfort-on-Main, representing scenes of the Passion (1501); 16 paintings of the Passion in the Munich Gallery; the portrait of the artist with his two sons, in the gallery at Augsburg. His later pictures show traces of the influence exercised by the Italian Renaissance, and those painted about 1512 and later are vastly superior to his early work. Among them is his 'Fount of Life' (1519), now in the royal gallery at Lisbon; the altarpiece 'Saint Sebastian' (1515), at Augsburg; the altarpiece 'Saint Katharine,' in the same gallery, etc. In such works the bold and devotional conception, delicacy and directness of expression, ease of drawing and splendor of coloring, are beyond praise. Excellent also are some of his preliminary sketches and outlines, and in Basle, Berlin and Copenhagen are collections of his pencil sketches, the most remarkable of which is that at Berlin. Consult Woltmann, 'Holbein und seine Zeit' (1866), and the monograph by A. B. Chamberlain (1905; new ed., 2 vols., London 1913).

**HOLBEIN, Hans**, THE YOUNGER, German painter: b. Augsburg, 1497; d. London, Nov. 1543. He probably received instruction in painting from his father, and about 1515 went to Basle, where he engaged in illustrating books. At Basle he also painted his earliest portraits, and in 1517 went to Lucerne. Here he painted the house of Jacob von Hertenstein, designed windows, and executed other works. Returning to Basle in 1519, he became a burgher in the following year, and during a seven years' residence in that city he executed many works of great importance. In 1526 he went to England. Letters from his friend Erasmus, whose famous 'Praise of Folly' he had illustrated, procured him the patronage of the chancellor, Sir Thomas More, who employed him to delineate the portraits of most of his own personal friends about the court, and introduced him to the notice of Henry VIII, who was a liberal encourager of the fine arts. Among the portraits produced by him during this period are those of More, Archbishop Warham and Bishop Fisher. From 1528 till 1532 he was again in Basle, but in the latter year he returned to England, where he

was destined to spend nearly all the remainder of his life. Holbein painted most of the principal English nobility, whose portraits place him among the world's greatest portrait-painters. Some of his earlier productions, especially his 'Dance of Death,' are also celebrated. In 1538 he completed and published this series. Among the pictures of Holbein's last period are 'The Ambassadors' (1533), and portraits of Hans of Antwerp (1532), English Lady and Gentlemen (1534), Sir Richard Southwell (1538), Duke of Norfolk (1539), Thomas Cromwell, Lady Jane Seymour, Henry VIII (1542, unfinished), and others. Comparatively few of Holbein's pictures are still extant in England, great numbers of them having been destroyed by Puritan fanatics, or sold and dispersed over Europe. Many of them also perished in the great fire in London in 1666. Holbein also excelled in wood-engraving, and before his visit to England had produced a large number of wood-cuts. He was one of the earliest to paint portraits in miniature. Consult Woltmann, 'Holbein und seine Zeit' (1874); Knackfuss, 'Holbein der Jüngere' (1896), and monographs by A. B. Chamberlain (1913), Davies (1903), and Wornum (1867).

**HOLBERG, Ludvig**, lood'vig höl'bërg, BARON, Danish author: b. Bergen, Norway, 3 Dec. 1684; d. Copenhagen, 28 Jan. 1754. He studied at Copenhagen, Oxford and Paris, and after paying a six months' visit to Rome returned to Copenhagen in the end of 1716. In 1718 he was appointed to an ordinary professorship in the university of that city, where after this date he chiefly resided till his death. In 1735 he was unanimously elected rector, and in 1737 treasurer of the university, and in 1747 was raised to the rank of baron. Holberg's numerous productions in various departments of literature as well as the important and salutary influence which he exercised upon his countrymen place him in the front rank of the literary men of his age. He is considered the greatest of Danish authors, and the founder of its literature. He was extremely versatile — now devoted to history, now to poetry and now to the drama; but during his whole life he was a sworn enemy to pedantry, theological disputatiousness and scholastic metaphysics. His works may be divided into four classes — poems, stage pieces, philosophical treatises and historical works. His poems are chiefly of a satirical nature. The most celebrated among them is 'Peder Paars,' a comic heroic poem in 14 cantos, still regarded throughout the Scandinavian countries as a masterpiece, and the hero of which has become the national comic impersonation in Denmark. It has been translated into several languages. Almost equally famous is his 'Nicholas Klimm's Subterraneous Travels,' a satirical romance in prose, originally written in Latin, but translated into seven modern European languages shortly after it appeared, into Danish first by Baggesen (1789). His numerous stage pieces are either comedies or farces, and nearly all characterized by true comic power. In 'Erasmus Montanus' (q.v.), Holberg attacks the pedantry and scholasticism so characteristic of the university life of his day. Among his philosophical writings the most important is his 'Moral Reflections' (1744). His historical works include

'The Political, Ecclesiastical and Geographical Condition of the Danish Monarchy,' a work of great value as a source of reference; 'A General History of the Jews,' and 'A History of Famous Men and Famous Women' (1739-45). Consult 'Lives' by Smith (Copenhagen 1858); and Brandes (1884).

**HOLBORN**, ho-burn, England, a metropolitan borough in central London. Area, 405 acres, the smallest of the boroughs. Here, in Saint Giles in the Fields and Seven Dials, are the lowest strata of London; but Halton Garden, on the other hand, is the centre of the diamond trade. The ancient chapel of Saint Etheldreda, built in the Decorated style, was acquired by the Roman Catholics in 1874, and is now restored for public worship. The City Temple, belonging to the Congregational body, is another important religious edifice. Lincoln's Inn and Gray's Inn, incorporated schools of law, are within the borough. Pop. 49,357. Consult Milton, 'Holborn,' in the 'Fascination of London' series.

**HOLBROOK, John Edwards**, American naturalist: b. Beaufort, S. C., 30 Dec. 1794; d. Norfolk, Mass., 8 Sept. 1871. He was graduated from Brown in 1815, from the medical school of the University of Pennsylvania in 1818, began practice at Charleston, S. C., in 1822, and in 1824 was appointed to the chair of anatomy in the Medical College of South Carolina, a post he held for over 30 years. In the Civil War he was head of the South Carolina examining board of surgeons. His 'American Herpetology, or a Description of Reptiles Inhabiting the United States' (1842), won for him recognition among European scientists. He published but 10 numbers of his 'Ichthyology of South Carolina' (1854 et seq.) when the Civil War compelled its discontinuance.

**HOLCOMB, Silas Alexander**, American jurist: b. in Gibson County, Ind., 25 Aug. 1858. He received a common school training, studied law in Nebraska, was admitted to the bar in 1882, and in 1891 was made judge of the 12th judicial district. He was governor of Nebraska from 1894 to 1898, having been elected by fusion of the Populist and Democratic voters. He was justice of the Supreme Court of Nebraska 1900-06 and chairman of the Board of Commissioners of State Institutions since 1913.

**HOLCOMBE, Chester**, American diplomatist and author: b. Winfield, N. Y., 16 Oct. 1844; d. 25 April 1912. He was graduated at Union College in 1861; and served as interpreter and secretary to the United States legation in China, 1871-85. He was acting Minister in 1875-76, 1878-79 and 1881-82. Becoming an authority on the Chinese and Chinese affairs, in 1896 he acted for the Chinese government in its financial embarrassments, preparing the Chinese and English documents for the government loan of \$100,000,000, and drawing up in both languages the details for the construction of 3,000 miles of railroads in China. In 1902 he lectured at Lowell Institute, Boston. He has published 'Travels in Western China' (1875); 'The Practical Effect of Confucianism upon the Chinese Nation' (1882); 'Catalogue and Handbook of Antique Chinese Porcelains' (1890) 'The Real Chinaman' (1895); 'The Real Chinese Question' (1899); 'China's

Past and Future' (1904); and in Chinese he wrote 'A Mental Arithmetic' (1873); 'Life of Christ' (1875), and a translation of the American Declaration of Independence.

**HOLDEN, Edward Singleton**, American astronomer: b. Saint Louis, Mo., 5 Nov. 1846; d. 16 March 1914. He was graduated at Washington University in 1866, and at the United States Military Academy in 1870; was professor of mathematics at the Naval Academy in 1873-81; and director of the Washburn Observatory (Madison, Wis.) in 1881-85. In 1885-87 he was president of the University of California and in 1888-98 director of the Lick Observatory, on Mount Hamilton, San José, Cal. It was in connection with the Lick Observatory that his most important work was done, and his services to astronomy found recognition in America and from European states. Most of the buildings and instruments at the Lick Observatory were designed by him. He became librarian of the United States Military Academy in 1901. Among his publications are 'Bastion System of Fortification' (1872); 'Index Catalogue of Nebulae' (1877); 'Life of Sir William Herschel' (1881); 'Astronomy' (with S. Newcomb, 1892); 'Mountain Observatories' (1896); 'Essays in Astronomy' (1900); 'Elementary Astronomy' (1900); 'The Sciences' (1903); 'Galileo' (1905).

**HOLDEN, Sir Isaac**, English inventor: b. Hurler, near Paisley, 7 May 1807; d. Keighley, Yorkshire, 13 Aug. 1897. While a worker in a cotton mill in Paisley he fitted himself for the post of a teacher. While conducting an experiment he discovered the lucifer match, previously, however, invented by John Walker of Stockton-on-Tees. Subsequently he was manager, then owner of a wool-combing establishment, and by his mechanical improvements made significant changes in that industry. His shops at Bradford, with branches at Croix and Rheims, eventually became the largest of the kind in the world. He was several times elected to Parliament in the Liberal interest, and was created a baronet in 1903.

**HOLDER, hól'der, Charles Frederick**, American naturalist: b. Lynn, Mass., 5 Aug. 1851; d. 11 Oct. 1915. He studied at the United States Naval Academy, but resigned in 1871; in 1871-75 was assistant curator of the American Museum of Natural History, from that time turned his attention to lecturing and literary work, and became known as a leading writer on popular science. At Pasadena, Cal., whither he removed in 1885, he became president of the board of education, professor of zoology in Throop University and honorary curator of the university museum. Among his publications are 'Marvels of Animal Life' (1880); 'Elements of Zoology' (1885); 'Living Lights' (1887); 'Frozen Dragon' (1888); 'A Strange Company' (1889); 'Around Pasadena' (1889); 'Santa Catalina Island' (1889); 'Louis Agassiz, his Life' (1892); 'Darwin's Life and Work' (1893); 'The Treasure Divers' (1898); 'Along the Florida Reef' (1892); 'Stories of Animal Life' (1900); 'Half-Hours with Nature' (1901); 'The Boy Anglers' (1904); 'Half Hours with the Lower Animals' (1905); 'Life in the Open' (1906); 'Log of a Sea Angler' (1906); 'Big Game at Sea' (1908); 'The Marooners' (1909); 'The

Channel Islands' (1910); 'Distinguished American Scientists' (1911); 'Game Fishes of the World' (1911); 'The Ocean' (1913); 'Angling Adventures Around the World' (1914).

**HOLE, Samuel Reynolds**, English Anglican clergyman: b. Ardwick, Manchester, 5 Dec. 1819; d. Rochester, England, 27 Aug. 1904. He was educated at Oxford, took orders, was ordained in 1845 and was vicar of Caunton, 1845-87. From 1887 he was dean of Rochester Cathedral. He visited the United States on a lecture tour in 1896, where his humorous, anecdotal lectures were very popular. He was a recognized authority on rose culture and wrote 'A Book about Roses,' which has reached its 15th edition; 'The Memories of Dean Hole'; 'More Memories'; 'Addresses to Working Men'; 'A Little Tour in America'; 'Our Gardens'; 'Then and Now,' etc. Consult the Memoir by G. A. B. Dewar prefixed to his 'Letters' (1907).

**HOLE, William**, English painter: b. Salisbury, 7 Nov. 1846. He was destined for the profession of engineering but after a journey to Italy turned his attention to art. He studied at the Edinburgh School of Art, and in 1889 was elected member of the Royal Scottish Academy. His versatility is shown by the excellence of his work in portrait, genre and fresco, while as an engraver he has made many famous plates after such masters as Millet, Constable and Millais. Among his best-known paintings are 'The End of the Forty-five' (1879); and 'News of Flodden' (1886); and a series of 80 water colors, 'The Life of Jesus of Nazareth.' He executed a series of remarkably fine mural paintings illustrative of Scottish history for the National Portrait Gallery, Edinburgh (1900), and another for the municipal buildings in that city (1903).

**HOLGUIN, òl-gèn'**, Cuba, city in the province of Oriente, about 25 miles by rail south by west of Gibara, its port, and 70 miles northwest of the city of Santiago de Cuba. Fertile agricultural lands are in the vicinity; also on the southwest is a hilly section bordering on the interior mountain range. A noted cave is in the vicinity. The trade is chiefly in sugarcane, tobacco, timber, corn and cattle. It was settled in 1720 and became a city in 1751. Pop. 7,592.

**HOLIBUT.** See HALIBUT.

**HOLIDAY**, any day set apart as a religious or national festival. (See FESTIVALS). Certain days are fixed by law as bank-holidays for England and Scotland, and it is enacted that all business transactions which would have been valid on any such holiday shall be held as valid if performed on the day following. Thus, when a bill of exchange becomes due, or notice of dishonor fails to be given, on a bank-holiday, the bill is payable or the notice stands good on the following day. The days fixed for England are Easter Monday, the Monday in Whitsun Week, the first Monday in August and the 26th of December if a week-day. These are in addition to Christmas Day, Good Friday and other holidays previously established. The days fixed as bank-holidays for Scotland are New Year's Day, Good Friday, the first Monday of May,

the first Monday of August and Christmas Day; and if either New Year's Day or Christmas Day falls on a Sunday, the Monday after is held as a holiday. The same act empowers the sovereign to appoint by proclamation a special day to be observed as a bank-holiday, and to alter by order in council any of the days settled by the act.

In the United States there is no national holiday, not even 4 July. The 53d Congress passed an act making Labor Day a public holiday in the District of Columbia, and various States have followed with a similar act. The proclamation of the President designating a day of Thanksgiving makes it a legal holiday only in the District of Columbia and in the Territories. New Year's Day is a legal holiday in all the States and in Porto Rico and Hawaii. Lincoln's birthday (12 Feb.) is a legal holiday in Arkansas, California, Colorado, Connecticut, Delaware, Illinois, Indiana, Iowa, Minnesota, Montana, Nebraska, Nevada, New Jersey, New York, North Dakota, Oregon, Pennsylvania, South Dakota, Washington, West Virginia and Wyoming. Washington's birthday (22 Feb.) is a legal holiday in all the States and in Porto Rico and Hawaii. Decoration Day (30 May) in all the States except Arkansas, Florida, Louisiana, Michigan, Mississippi, North Carolina, South Carolina and Texas. Independence Day (4 July) in all the States and Territories. Labor Day (in general, the first Monday in September) in all the States and in Porto Rico and Hawaii. Election Day and Christmas Day are generally observed as legal holidays in all the States and Territories. There are various States holidays, such as Patriot's Day (19 April) in Maine and Massachusetts, Pioneer's Day (16 Aug.) in Utah, All Saints' Day (1 Nov.) in Louisiana, Admission Day (9 Sept.) in California, and Confederate Memorial Day (10 May) in North and South Carolina. Every Saturday after 12 o'clock noon is a legal holiday in many of the States and cities and in the District of Columbia and the Territories. In Canada eight public holidays are generally observed exclusive of Thanksgiving Day—New Year's Day, Good Friday, Easter Monday, Victoria Day, King's Birthday, Dominion Day and Labour Day; but in the province of Quebec there are others in addition, chiefly Church anniversaries.

**HOLINSHED, hól'inz-héd, Raphael or Ralph**, an English chronicler: d. about 1580. He is only known by his 'Chronicles of Englande, Scotlande, and Irelande,' the first edition of which, known as the "Shakespeare edition," because it is the one the poet is supposed to have used in collecting material for his historical plays, was published in London in 1577. In the preparation of this work Holinshed was assisted by several of the most learned men of the day.

**HOLL, Frank**, English portrait and genre painter, son of Francis Holl, an eminent engraver: b. London, 4 July 1845; d. there, 31 July 1888. He was a very successful student at the Royal Academy, and exhibited constantly from his student days. Among his best-known pictures are 'Faces in the Fire'; 'Fern-Gatherers'; 'No Tidings from the Sea'; 'Leaving Home' and the 'Gifts of the Fairies' In the later portion of his career he devoted himself

to portraiture, in which he greatly excelled, and painted many of the celebrities of the day.

**HOLLAND, Edmund Milton**, American actor: b. New York, 7 Sept. 1848; d. 24 Nov. 1913. He began his professional career at Barnum's Museum in 1866, was later for 13 years a member of Lester Wallack's Company, and as a member of the Madison Square Company from 1882 created the parts of Captain Redwood in 'Jim the Penman,' Colonel Moberley in 'Alabama' and the title rôle in Colonel Carter of Cartersville.' In 1895-97 he starred with his brother Joseph, and later (1901) appeared as Eben Holden in the dramatization of Irving Bacheller's book of that name. In 1903-06 he appeared in 'Raffles' as Captain Bedford. He became a member of the New Theatre Company in 1909, and in 1909-11 appeared successively as Sir Oliver Surface in 'The School for Scandal,' Canon Bonington in 'Don,' Mr. Elkin in 'The Thunderbolt,' Gaffer Tyl in 'The Blue Bird' and Baron Von Haugh in 'Old Heidelberg.' In 1912 he appeared in 'Years of Discretion' as Metz. Consult McKay and Wingate, 'Famous American Actors of To-Day' (New York 1896) and Strang, L. C., 'Famous Actors of the Day in America' (Boston 1900).

**HOLLAND, Henry Richard Vassall Fox**, 3d LORD, English statesman: b. Wiltshire, 21 Nov. 1773; d. 22 Oct. 1840. He succeeded to the peerage by the death of his father when less than one year old. In 1798 he took his place in the House of Lords, and as the nephew of Charles James Fox was at once acknowledged as a Whig leader. In 1806 he was commissioner for settling disputes with the United States; was lord privy seal in 1806-07; and chancellor of the duchy of Lancaster. He made Holland House the resort of the wit, talent and beauty of his day. He was the author of 'Life of Lope de Vega' (1806); 'Three Comedies from the Spanish' (1807); 'Foreign Reminiscences' (1850); 'Memoirs of the Whig Party' (1852).

**HOLLAND, John Philip**, American inventor: b. Liscannor, County Clare, Ireland, 1841; d. 12 Aug. 1914. He was educated at the Christian Brothers' School, Limerick, taught school for 15 years in Ireland and America. As one of the most successful designers in the interesting field of submarine navigation, Holland is well known. His first boat was built in 1875; a second was launched in 1877 and a third in 1881. After a series of severe tests, the Holland boat was ordered by the United States government for the navy in 1900. In 1903 eight of the submarines were put in commission. These have a speed varying from 8.87 to 8 knots, a horsepower of 160 (with one exception), and a displacement in general of 122.55 tons. For some time the inventor was interested in the Holland Submarine Boat Company, but from this he retired to devote his time independently to submarines and flying devices. His later designs called for smaller and more compact vessels, with much less complicated mechanism, power of remaining longer submerged and increased safety in operation. See SUBMARINE NAVIGATION, HISTORY OF.

**HOLLAND, Josiah Gilbert**, American editor and author: b. Belchertown, Mass., 24 July 1819; d. New York, 12 Oct. 1881. He began the

study of medicine in 1840, in 1844 was graduated from the Berkshire Medical College, and entered practice at Springfield, Mass. The years that followed were discouraging, for patients did not come to the young doctor. With true Yankee versatility he turned his hand to anything,—taught district school, was a traveling writing-master and a daguerreotypist. Of his boyish mortification at being a mill hand he has written in 'Arthur Bonnicastle.' He tried editorial work, and started *The Bay State Weekly Courier*, which ran for six months. Subsequently he taught at Richmond, Va., and for 16 months was superintendent of public schools at Vicksburg, Miss. All these varied experiences gave him the knowledge of American life and appreciation of workday struggles which later made the value of his poems, essays and novels. In 1849-66 he was assistant editor of the *Springfield Republican*, and from 1851 also part owner of that journal. It was largely due to his influence that the *Republican* became so widely known and popular a journal. In it his 'Letters to Young People Married and Single: By Timothy Titcomb' first attracted readers by their vivacious style, moral sincerity and good common sense. Later, in book form (1858) they had a great and immediate success. In 1870 Dr. Holland was one of the founders and became editor of *Scribner's Monthly*, later the *Century Magazine* and the editorship of this periodical he retained till his death in 1881. Holland's novels 'Arthur Bonnicastle' (1873); 'Sevenoaks' (1876) and 'Nicholas Minturn' (1877), although showing his quick and sympathetic observation and containing fine passages, have been less popular than his poems. The latter, in their constant appeal to the moral sense, and in their accurate portrayal of the homely and picturesque in New York life, found many admirers. Several of the short lyrics, with 'Bittersweet' (1858); 'Kathrina' (1868) and 'The Mistress of the Manse' (1871), came as messages of an American poet who understood and honored his own people. Consult the 'Life' by Plunkett (1894).

**HOLLAND, Samuel**, cartographer: b. England, 1717; d. 1801. He entered the army at an early age, served on the Continent and attained the rank of captain in 1765. He took part in the expedition against Louisbourg in 1758, and was Wolfe's engineer-in-chief at Quebec. In 1763 he was appointed surveyor-general of Quebec and director of surveys in British North America, and carried through many important surveys.

**HOLLAND, Thomas Erskine**, English jurist: b. Brighton, 17 July 1835. He studied at Oxford, was called to the bar in 1863, in 1874 became a reader in English law at Oxford, and shortly afterward professor of international law 1874-1910. His best-known work is his 'Elements of Jurisprudence' (1880; 11th ed., 1910), now a standard textbook in England and the United States. He wrote further 'An Essay on Composition Deeds' (1864); 'Essays on the Form of the Law' (1870); 'The European Concert in the Eastern Question' (1885); 'Studies in International Law' (1898), and subsequently works bearing on the laws of war and the rights and duties of neutrals.

**HOLLAND, William Jacob**, American zoologist and palaeontologist: b. Jamaica, W. I.,

16 Aug. 1848. He was graduated from Amherst College in 1869, from the Princeton Theological Seminary in 1874, entered the ministry of the Presbyterian Church, and was a pastor at Pittsburgh, Pa., in 1874-91. In 1891-1901 he was chancellor of the Western University of Pennsylvania (Allegheny), and in 1897 was appointed director of the Carnegie Museum at Pittsburgh. In 1887 and 1889 he was naturalist of the United States eclipse expeditions to Japan and West Africa respectively. In 1907-09 he was president of the American Association of Museums. A recognized authority on museum administration and zoology, he wrote numerous scientific papers in learned publications, and 'The Butterfly Book' (1898); 'The Moth Book' (1903); 'To the River Platte and Back' (1913); 'The Butterfly Guide' (1915); also papers on the Tertiary fauna and Jurassic dinosaurs. He has received numerous decorations from foreign governments and honorary degrees from several universities.

**HOLLAND**, a popular designation for the kingdom of the Netherlands, derived from the provinces of North and South Holland, formerly constituting a feudal countship allied to the Holy Roman-German Empire, and from 1806-10 with other parts of the Netherlands, Hanover and Oldenburg, ruled by Louis Bonaparte as the kingdom of Holland. The region is the seat of the hardy and industrious Dutch race and of the Dutch language called by the natives *Nederduitsch*, a dialect of Low German phonology, with evolutionary periods of old, middle and modern, and an interesting historical and varied literature. See NETHERLANDS.

**HOLLAND**, Mich., city in Ottawa County, at the head of Black Lake, which is really an arm of Lake Michigan, and on the Père Marquette Railroad, about 80 miles west of Lansing and 25 miles southwest of Grand Rapids. It has direct communication by steamers with Chicago, Milwaukee and other lake ports. Holland was settled in 1847 by a Dutch colony, and many of its inhabitants are of Dutch descent. In 1867 it was chartered as a city. It is located in an agricultural region, once a lumber section. The manufactures are largely articles made of wood, but the beet-sugar industry is growing in importance. The chief manufacturing establishments are planing-mills, furniture, tub and basket factories, flour-mills, tanneries, wood-working machinery shops, pickling-plants, beet-sugar factory, grain elevators and creameries. The manufacture of launches is also an important industry of Holland. The trade is chiefly in the manufactures, and in grain and vegetables. The city owns and operates the electric-light plant and the waterworks. Holland is the seat of the Western Theological Seminary and of Hope College, both under the auspices of the Reformed Church in America. It has a number of fine public buildings and a free public library. The summer resorts on Black Lake add to the industrial wealth of the city. Pop. 11,650.

**HOLLAND-LINEN**, a fine and close fabric, so called from its first being manufactured in Holland; also a coarser linen fabric, unbleached or dyed brown, used for covering furniture, carpets, etc.

**HOLLANDER**, Jacob Harry, American economist: b. Baltimore, Md., 23 July 1871. He

was educated in the Baltimore schools and graduated from Johns Hopkins University in 1891, receiving his Ph.D. degree in 1894. His ability as economist and financier was soon recognized, and he became associate professor of finance at Johns Hopkins. In 1897 he was appointed secretary of the Bimetallic Commission abroad and was chosen chairman of the Baltimore municipal lighting commission in 1900. In the same year the Secretary of War appointed him special commissioner to revise the laws relating to taxation in Puerto Rico, and while engaged in this service he was made treasurer of Puerto Rico by President McKinley. He devised and put into operation the present revenue system ('Hollander Law') of the island. In 1904 he was special agent on taxation in the Indian Territory for the Department of the Interior. In 1905 he was sent by President Roosevelt to the Dominican Republic as special commissioner to investigate its public debt. Later, as special commissioner plenipotentiary to Santo Domingo (1905-06), and as financial adviser of the Dominican Republic (1908-10), he planned and carried out the readjustment of the public debt of that country. Since 1904 he has been professor of political economy in the Johns Hopkins University. He is the author of various books and monographs on economic and financial subjects, including 'The Cincinnati Southern Railway: A Study in Municipal Activity' (1894); 'The Financial History of Baltimore' (1899); 'Studies in State Taxation' (1900); 'Report on the Debt of Santo Domingo' (1906); 'David Ricardo: A Centenary Estimate' (1910). He edited the 'Letters of David Ricardo to J. R. McCulloch' (1895) and to 'Hutches Trower' (1899).

**HOLLAR**, Wenzel or Wenceslaus, věnt'-zěl or wěn'sés-läs hól'lär, Bohemian engraver: b. Prague, 13 July 1607; d. London, 28 March 1677. He accompanied the Earl of Arundel, English Ambassador to Germany, to London, who employed him to engrave some of the pictures of his collection. Among his numerous works, which are greatly esteemed for their delicate, firm and spirited execution, and which include some 2,740 plates, are the set of 28 plates, entitled, 'Ornatus Muliebris Anglicanus,' representing the dresses of Englishwomen of all ranks and conditions in full-length figures; Holbein's 'Dance of Death,' etc.

**HOLLEBEN**, hól'lá-bén, Theodore von, German diplomat: b. Stettin, Pomerania, 16 Sept. 1838; d. 1913. He was educated at the universities of Heidelberg, Berlin and Göttingen; became an officer in the Body-Guard Hussar Regiment; and took a distinguished part in the Franco-Prussian War. He entered the diplomatic service in 1872; was chargé-d'affaires at Peking, China, 1873-74, and at Tokio, Japan, in 1875; Minister at Buenos Aires in 1876-84; at Tokio 1885-89; and at Washington, D. C., 1892-93. In 1897 he became Ambassador Extraordinary and Plenipotentiary to the United States. At the command of Emperor William he, together with Secretary Hay, of the State Department, had charge of the arrangements for the official reception of the emperor's brother, Admiral Prince Henry, in February 1902. Failing health together with his inability to have President Roosevelt arbitrate the German-Venezuelan dispute caused his resignation,

and in 1903 he was succeeded by Baron Speck von Sternberg. Consult Roosevelt, Theodore, 'An Autobiography' (New York 1913).

**HOLLEY, Alexander Lyman**, American engineer: b. Lakeville, Conn., 20 July 1832; d. Brooklyn, N. Y., 29 Jan. 1882. He was graduated at Brown University in 1853, and became editor of *The Railroad Advocate* in 1856, changing its name to *The American Engineer*. He introduced into the United States in 1865 the Bessemer steel process, erecting the first Bessemer works in the country at Troy, N. Y. He was lecturer on the manufacture of iron and steel at Columbia University 1879-82. Holley secured many patents, the most important probably being that for the detached converter-shell, an improvement in the Bessemer process. He published with Z. Colburn: 'Railway Economy: a Report on European Railways' (1858); 'American and European Railway Practice' (1860); 'A Treatise on Ordnance and Armor' (1865), etc. In 1890 a bronze bust of Holley was placed in Washington Square, New York, by the mechanical engineers of the United States and Europe.

**HOLLEY, Marietta**, American author, known by her pseudonym, "JOSIAH ALLEN'S WIFE": b. near Adams, Jefferson County, N. Y. She began her literary career as a contributor to the *Christian Union*, the *Independent*, *Peterson's Magazine*, and other periodicals; and in 1873 published her first book, 'My Opinions and Betsy Bobbet's,' which in a measure recalled the 'Widow Bedott Papers' of F. M. Whitcher. This was followed by a series of works containing many touches of distinctive and genuine humor; 'Samantha at the Centennial' (1876); 'My Wayward Pardner' (1880); 'Miss Richard's Boy' (1882); 'Sweet Cicely' (1885); 'Samantha at Saratoga' (1887); 'Poems' (1887); 'Samantha Among the Brethren' (1891), considered by many her best volume; 'Samantha Amongst the Colored Folks' (1892); 'Samantha at the World's Fair' (1893); 'Samantha in Europe' (1895); 'Around the World with Josiah Allen's Wife' (1899); 'Samantha at the Saint Louis Exposition' (1904); 'The Borrowed Automobile' (1906); 'Samantha on Children's Rights' (1909); 'Who was to Blame' (1910); 'Samantha on Women's Rights' (1913); 'Josiah Allen on Women's Rights' (1914). Her writings have had a large sale both at home and in foreign countries.

**HOLLIDAYSBURG**, höl'ī-dāz-bërg, Pa., borough, county-seat of Blair County, on the Juniata River, and the Pennsylvania Railroad; about 82 miles east of Pittsburgh and five miles south of Altoona. Rich coal-fields, iron-ore beds, ganister and limestone quarries are in the vicinity. The chief manufactures are foundry products, agricultural and mining implements, nails, silks, cars, furniture and classification yards. Hollidaysburg Female Seminary is a prosperous institution. The famous Ant Hill Woods are in the vicinity. The water-works are municipally owned. Pop. 3,734.

**HOLLINS, George Nichols**, American naval officer: b. Baltimore, Md., 20 Sept. 1799; d. there, 18 Jan. 1878. He entered the navy as midshipman in 1814, and while assigned to the *President*, Commander Decatur, was captured by the English and held prisoner at Bermuda

until the conclusion of peace. He served also in the Algerine War of 1815, later assumed command of an East Indiaman, and in 1844 attained commander's rank. In 1855, on complaint of American residents who claimed they had been injured by the local officials, he bombarded Greytown, Nicaragua. At that time Nicaragua was under English protection, and the property and lives of English residents having been imperiled, international complications with Great Britain arose. Hollins was commissioned commodore in the Confederate navy at the outbreak of the Civil War, attacked the Federal blockading squadron at the passes of the Mississippi River, and was appointed flag-captain of the New Orleans station. He was superseded in 1862.

**HOLLIS-MOSS BILL**, better known as the Federal Farm Loan Act, and the Rural Credits Bill; a bill to provide capital for agricultural development, to create a standard form of investment in farm mortgages and other kindred purposes. It established the Federal Farm Loan Board, to be appointed by the President, and provided for the establishing of 12 Federal Land Banks by the Board in 12 equalized districts and for any needed number of National Farm Loan Associations to be made up of borrowers from the Land Banks. The bill was signed by President Wilson 17 July 1917. The full text of the bill may be found in Senate Document 444, 64th Congress, 1st Session.

**HOLLISTER**, Cal., town, county-seat of San Benito County, on the Southern Pacific Railroad about 80 miles southeast of San Francisco, and 35 miles east by south of Santa Cruz. It is situated in a rich agricultural region, noted for its fruit. The chief industrial interests of the town are connected with farming, dairying, fruit-growing and the shipment of grain and live-stock. Pop. 2,308.

**HOLLOWAY**, höl'ō-wā, Laura Carter, American author: b. Nashville, Tenn., 22 Aug. 1848. She was at one time editor of the *Home Library Magazine* of Chicago, Ill., was for 12 years associate editor of the Brooklyn *Daily Eagle*, and collaborated with Anton Seidl in the preparation of musical terms for the 'Standard Dictionary.' She wrote 'Ladies of the White House' (1870); 'The Mothers of Great Men and Women' (1884); 'The Home in Poetry' (1884); 'Chinese Gordon; (1885); 'The Buddhist Diet Book' (1887), and other volumes.

**HOLLOWAY, Thomas**, English patent medicine proprietor and philanthropist: b. Devonport, 22 Sept. 1800; d. Tittenhurst, 26 Dec. 1883. About 1837 he began to sell his well-known ointment, and soon afterward brought his pills to the notice of the public. He ultimately succeeded in amassing a very large fortune which he partly devoted to benevolent objects. The Royal Holloway College for Women, on the equipment and endowment of which he expended about \$4,000,000, was opened on 30 June 1886. It contains a collection of pictures valued at \$500,000. Near it is a sanatorium founded by him for the mentally afflicted of the lower middle class.

**HOLLS, hölz, George Frederick William**, American lawyer and statesman: b. Zelenople, Pa., 1 July 1857; d. Yonkers, N. Y., 23 July 1903. He was graduated from Columbia in

1878, and from the law school there two years later. He was admitted to the bar and established a large law practice in New York city, becoming senior member of the firm of Holls, Wagner & Burghard; in his later life he visited Europe frequently and became widely known there, especially in Germany where he established a branch of his law firm. He was prominent in philanthropic work, being for years an officer of the Legal Aid Society and a director of the Charity Organization Society. He was also an active member of the Republican party, and much in demand as a campaign speaker, especially as he could address the Germans in their own language. In 1893 he was a delegate-at-large to the New York Constitutional Convention, where he was chairman of the committee on education, a member of the committee on cities and author of several amendments. His frequent visits abroad gave him a wide and intelligent interest in international questions, and at the time of The Hague Conference he was very influential in arousing interest and obtaining a large delegation from the United States. He was secretary of the American delegation at the Conference (1899), was the American member of the committee which drafted the arbitration treaty, and author of the clause on "Special Mediation." He was afterward appointed a member of the permanent international court of arbitration. A few months before his death President Roosevelt asked him to umpire the adjustment of claims between Germany and England and Venezuela, but he declined. He has written 'Sancta Sophia and Troitza' (1888); 'Compulsory Voting' (1891); and 'The Peace Conference at The Hague and Its Bearings on International Law and Policy' (1900).

**HOLLWECK, Josef**, German Catholic clergyman and jurist: b. Pfaffenhofen, Bavaria, 16 Jan. 1854. He received his education at the Royal Gymnasia of Amberg and Eichstätt, at the Episcopal Lyceum, Eichstätt, and at the University of Freiburg. In 1879 he was ordained to the priesthood and for the following six years was engaged, in parish work in his native diocese of Eichstätt. In 1885-90 he was assistant director of the Seminary of Eichstätt, and since 1890 he served as professor of canon law and catechetics of the Episcopal Lyceum there. In 1910 he was made a domestic prelate of His Holiness Pius X. In 1904 he assisted in the work of the new codification of the canon law and was repeatedly called to Rome to assist the Commission of Codification in its work. He has published 'Das kirchliche Bücherverbot' (1897); 'Die kirchlichen Strafgesetze' (1899); 'Die Civilehe des bürgerlichen Gesetzbuches im Lichte des kanonischen Eherechts' (1900); 'Das Testament des Geistlichen' (1901); 'Lehrbuch des Kirchenrechts' (1905); 'Über das Alter der Erstkommunicanten' (1910), and contributions to 'The Catholic Encyclopedia,' and various periodicals.

**HOLLY.** See ILEX.

**HOLLY SPRINGS**, Miss., a point on the Mississippi Central Railroad, about 40 miles southeast of Memphis and about 25 miles south of Grand Junction, on the Memphis and Charleston Railroad, and an important strategic point. After the battle of Iuka, 19 Sept. 1862, and the Confederate defeat at Corinth,

3-4 Oct. 1862, the Confederates fell back to Holly Springs. Early in November General Grant had concentrated an army of 30,000 men in the vicinity of Grand Junction to make a movement along the line of the Mississippi Central Railroad in the direction of the rear of Vicksburg. On 8 November General McPherson, with 10,000 infantry and 1,500 cavalry, advanced from Grand Junction southward and pushed the Confederates under General Pemberton back to Holly Springs. The main body of Grant's army moved forward, and Pemberton, abandoning Holly Springs, fell back to Grenada, Grant following to Oxford, 30 miles beyond Holly Springs. There he arrived 5 December, and arranged with General Sherman a combined movement on Vicksburg. Grant was to move directly south on the line of the railroad and take the place in rear; Sherman to move a force from Memphis, accompanied by a gunboat fleet, to descend the Mississippi and attack in front. A depot of supplies was established at Holly Springs, guarded by Colonel Murphy, with two regiments of Wisconsin infantry and a regiment of Illinois cavalry, and Grant was about to move forward from Oxford, when Gen. Earl Van Dorn, at the head of 3,500 cavalry, dashed into Holly Springs at daylight, 20 December, and attacked Murphy, who had been warned of the impending danger on the 19th, but neglected to take the necessary precautions and was surprised. He made a feeble resistance and surrendered his infantry; the cavalry cut its way out and escaped with the loss of only seven men. Van Dorn took about 1,500 prisoners, destroyed stores to the value of \$1,500,000, and left town in the afternoon. This disaster, in connection with Forrest's raid into West Tennessee, which destroyed Grant's communication, forced him to abandon his movement on Vicksburg and fall back to Grand Junction, leaving Pemberton at liberty to concentrate his forces at Vicksburg against Sherman. Sherman was informed of Grant's failure, but the information reached him after his bloody repulse at Chickasaw Bluff, 27-28 Dec. 1862. Consult 'Official Records' (Vol. XVII); Greene, 'The Mississippi.'

**HOLLYHOCK**, a tall and rather coarse flowering plant (*Althaea rosea*) of the mallow family, said to be a native of China, but now cultivated all over the world as an ornament of gardens. It rises in a single leafy stalk, sometimes to the height of six or eight feet, studded with large single or double flowers, in varieties from white to yellow, scarlet, and purple. Although rather difficult to start and slow of growth, it remains a hardy and easily nurtured perennial of highly effective beauty when suitably placed.

**HOLM, Frits (Vilhelm)**, Danish explorer, journalist and lecturer: b. Charlottenlund, Denmark, 23 July 1881. He was educated at private and government Latin schools. He passed a preliminary examination at the Copenhagen University and received, 1895-1900, an officer's education in the Royal Danish navy, visiting many countries on men-o'-war. Having seen the Paris Exposition of 1900, he went to the Far East and worked in Shanghai and Hankow in journalistic and commercial positions 1901-03, eventually accepting the posts of manager and editorial secretary of *The Japan Daily Ad-*

vertiser in Yokohama. In May 1904, during the Russo-Japanese War, he left Japan and returned to Denmark via the United States, where he visited the Saint Louis World's Fair as special correspondent, completing in nearly four years his first circumnavigation. From September 1905 till February 1907, he worked with the Potentia Press Organization in London under the Earl of Kintore and Sir William Ramsey, frequently visiting the Continent; and in July 1906 he represented The Associated Press at the Interparliamentary Peace Conference in the House of Lords. He is a life-member of the Royal Yacht Club (Copenhagen), of the Imperial Red Cross societies of Russia and Japan (war medals) and of the Kihin Kai (Tokio); a member of the Royal Asiatic Society (London) and other scientific institutions and an officer of the Venezuelan Order of the Libertador. He is the author of numerous articles on Far Eastern and other subjects, and he holds a royal license as sworn interpreter, commanding English, French, German and the three Scandinavian languages, besides knowing something of the romance tongues and Chinese. At the age of 25 he obtained the capital for a scientific expedition into the interior of China. The result of the Holm-Nestorian expedition to Sian-Fu 1907-08, which covered by caravan and water more than 2,500 miles through little-known regions, was the bringing to civilization of a two-ton, 10 feet high monolithic replica of the famous Nestorian Monument of A.D. 781 — since July 1908 as a loan in the Metropolitan Museum, New York. 'The Nestorian Monument' (Chicago 1909) tells about the tablet and the expedition, through which he completed his second circumnavigation. He has lectured, in English and French, in 15 universities and learned institutions in the United States, Canada and Mexico on his exploration work, about which hundreds of illustrated newspaper and magazine articles have appeared.

**HOLM, Saxe**, a pseudonym affixed to a collection of 'Stories' (1st series 1874; 2d 1878), originally published in *Scribner's Monthly* and generally believed to be by Helen Hunt Jackson (q.v.).

**HOLMAN, Frederick Van Voorhies**, American lawyer: b. Baker's Bay, Pacific County, Wash. (then in Oregon), 29 Aug. 1852. He was educated in public and private schools, at the Portland Academy and the University of California. In 1879 he was admitted to the Oregon bar and has since practised at Portland, specializing in corporation, real property, and probate law. He was general counsel and director of the Portland Railway, Light and Power Company, counsel for and director of the Oregon Power Company and other corporations. Since 1903 he has been a regent of the University of Oregon. He has done much for the growth and development of Portland, Ore., and originated and caused to be adopted the name of "The Rose City" for Portland. In 1904-08 he was Democratic National Committeeman for Oregon, and served as delegate to the Democratic National Conventions of 1892, 1904 and 1912. He is a member of the bars of the United States and the Washington State Supreme Courts and in 1909-10 was president of the Oregon Pioneer Association. He published 'Life of Dr. John McLaughlin, Father of

Oregon' (1907), also historical articles, pamphlets, contributions to various magazines.

**HOLMAN, hōl'man, William Steele**, American politician: b. Veraestau, Dearborn County, Ind., 6 Sept. 1822; d. Washington, D. C., 22 April 1897. He studied at Franklin College (Ind.), was admitted to the bar, and began practice at Aurora, Ind. In 1847-49 he was prosecuting attorney, in 1850 a member of the State Constitutional Convention, in 1851-52, of the State legislature. He was a judge of the Court of Common Pleas in 1852-56, in 1856 was elected as a Democratic representative to Congress, where with the exception of eight years he served until his death. His vigilance in opposing unnecessary appropriations and doubtful measures obtained for him the sobriquets of "The Watchdog of the Treasury," and "The Great Objector."

**HOLMAN-HUNT, William**. See HUNT, WILLIAM HOLMAN.

**HOLMES, hōmz, Abiel**, American Unitarian clergyman and annalist: b. Woodstock, Conn., 24 Dec. 1763; d. Cambridge, Mass., 4 June 1837. He was graduated at Yale College in 1783, and became subsequently a tutor in the college, pursuing at the same time his theological studies. In 1785 he was settled over a parish at Midway, Ga., where he remained till 1791. Returning north he became pastor of the first parish in Cambridge, and continued to fill the office till 26 Sept. 1832. Besides publishing a 'Life of President Stiles' in 1798, he was the author also of 'Annals of America' (1805), which gave him a high reputation for care and accuracy. It was republished in England in 1813. He contributed frequently to the collections of the Massachusetts Historical Society, in Vol. XXVII of which will be found a complete list of his publications.

**HOLMÉS, ô-mês', Augusta Mary Anne**, French composer: b. Paris, 1847; d. there, January 1903. She studied composition with Lambert, Klose and César Franck, and began her career as a pianist. Her first work of magnitude was a setting of the psalm 'In Exitu,' sung for the first time in 1873. She later wrote considerable music, including 100 songs, characterized by much grace of expression. In the larger forms her compositions include the well-known symphony 'Hero et Léandre'; three other symphonies, 'Lutèce,' which in 1879 won third prize in an open competition directed by the Paris municipality, 'Les Argonautes' and 'Irlande'; the symphonic poems, 'Les Sept Ivresses,' 'Roland,' 'Pologne,' 'Au Pays Bleu'; an ode of triumph, 'Patrie'; a four-act lyric opera, 'Le Montagne Noire' (Grand Opera 1895), and an allegorical cantata, 'La Vision de la Reine.'

**HOLMES, E(lias) Burton**, American traveler and lecturer: b. Chicago, 8 Jan. 1870. After a secondary education at Chicago he traveled in all the countries of continental Europe, as well as in Japan, Algeria, Tunis, Morocco, Corsica, Greece and Thessaly. Hawaiian Islands, the Yellowstone Park, the Grand Cañon of the Colorado, the Philippines and China. About 1890 he became known as a platform lecturer, giving in popular form the results of his observations. He has traveled and lectured in all countries except Australia, New

Zealand and South Africa. He has published 'The Burton Holmes Travelogues' (12 vols.).

**HOLMES, Charles John**, English landscape painter: b. Stratton, Cornwall, 11 Nov. 1868. He was educated at Saint Edmund's Canterbury, at Eton and at Oxford, where he was classical scholar in 1887. In 1896-1903 he was publisher and manager of the Vale Press; in 1903-09 was editor of the *Burlington Magazine*, and from 1904 to 1910 was Slade professor of fine art at Oxford. His works are in the Art Galleries of Manchester and Johannesburg; in the Ashmolean Museum, Oxford, and the British Museum. In 1909 Mr. Holmes was made keeper and secretary of the National Portrait Gallery and in 1916 was appointed director of the National Gallery, to succeed Sir Charles Holroyd. He has published 'Hokusai' (1898); 'Constable' (1901); 'Pictures and Picture Collecting' (1902); 'Constable and his Influence on Landscape Painting' (1902); 'Notes on the Science of Picture-Making' (1909); 'Notes on the Art of Rembrandt' (1911); 'The Tarn and the Lake' (1913).

**HOLMES, George**, Canadian bishop: b. Westmoreland, England, 1860. He was educated at the Church (Anglican) Missionary College, Islington, and was ordained to the priesthood in 1888. He was consecrated bishop of Moosonee 25 Jan. 1905, and translated to the diocese of Saskatchewan 1909.

**HOLMES, Mary Jane Hawes**, American novelist: b. Brookfield, Mass.; d. Brockport, N. Y., 7 Oct. 1907. She was married to Daniel Holmes, a lawyer of Brockport, N. Y. She published many volumes of domestic fiction which have had an extraordinarily wide circulation but in which the literary element is slight. Among her novels are 'Tempest and Sunshine' (1854) (perhaps the best known of them all); 'Lena Rivers' (1856); 'Marian Gray' (1863); 'Milbank' (1871); 'Queenie Hetherton' (1883).

**HOLMES, Nathaniel**, American jurist and Shakespearean scholar: b. Peterboro, N. H., 2 Jan. 1815; d. Cambridge, Mass., 26 Feb. 1901. He was graduated from Harvard in 1837 and after admission to the bar in 1839 began to practise in Saint Louis. He was judge of the Supreme Court of Missouri 1865-69, and Royall professor of law at Harvard 1868-72. He retired from his profession in 1883 and henceforth devoted himself to study and authorship. He was a strong believer in the Baconian theory of the origin of Shakespeare's plays, which he defends in his work, 'The Authorship of Shakespeare' (1866). In 1888 he published 'Realistic Idealism in Philosophy Itself.'

**HOLMES, Oliver Wendell**, American poet, essayist and physician: b. Cambridge, Mass., 29 Aug. 1809; d. Boston, Mass., 8 Oct. 1894. He was the son of Rev. Abiel Holmes (q.v.), minister of the first parish in Cambridge, and on the maternal side was a descendant of Anne Bradstreet (q.v.) and related to the orator, Wendell Phillips, the poet, Richard Henry Dana, and the theologian, Dr. Channing. He was educated at Phillips Academy, Andover, and at Harvard, and was graduated from the latter in 1829 in a class which contained several who afterward became famous. In the next year he became well known through his poem 'Old Ironsides,' first published in the Boston *Adver-*

*tiser*, and which prevented the breaking up of the famous frigate *Constitution*. He spent a year in the Harvard Law School but soon turned his attention to medicine and after studying in Paris three years returned to America where he received his degree of M.D. in 1836, the same year in which his first volume of poems appeared. He was professor of anatomy and physiology at Dartmouth College 1839-40. He married in the last-named year, and established a practice in Boston, becoming in 1847 professor of anatomy and physiology in the Harvard Medical School, a post which he resigned in 1882, when he was at once made professor emeritus. In 1849, and for several succeeding years, he made his summer home at Pittsfield, Mass., the scene of his novel 'Elsie Venner.' He was one of the first contributors to the *Atlantic Monthly* when it was established in 1857, the opening chapter of his 'Autocrat of the Breakfast Table' appearing in the first issue. It is this work, which has found innumerable readers both at home and abroad, by which he will be longest remembered. These brilliant conversational papers were followed in 1859 by a similar series, 'The Professor at the Breakfast Table,' and these in 1872, by 'The Poet at the Breakfast Table.' Many of his best poems were scattered through these volumes. In 1861 appeared his novel 'Elsie Venner: a Romance of Destiny,' and in 1868 'The Guardian Angel,' a less striking fiction than its predecessor, but like that exhibiting a remarkable series of studies of character. 'A Mortal Antipathy' (1885) was his only other essay in fiction. His volumes of verse, 'Urania' (1846) and 'Astrea' (1850), had made him well known as a poet ere he appeared before the public as the kindly breakfast table autocrat, and he continued to write poetry at frequent intervals for the rest of his life. He was especially happy as the poet of occasions, but much of his verse, witty and sparkling as it is, is ephemeral from its very nature and not destined to endure. In such serious poems, however, as 'The Chambered Nautilus'; 'The Voiceless'; 'The Last Leaf'; 'The Iron Gate'; and one or two hymns, he takes high rank among the poets of his time, while such poems as 'The One Hoss Shay'; 'Evening, By a Tailor,' and 'Parson Turrell's Legacy,' to name no others, are inimitable examples of humorous verse. His later collections of poems comprise 'Songs in Many Keys' (1861); 'Songs of Many Seasons' (1875); 'The Iron Gate' (1880); and 'Before the Curfew' (1887). As a physician and medical lecturer he was very successful, and among his purely professional works may be named 'Lectures on Homeopathy and Its Kindred Delusions' (1842); 'Currents and Counter Currents in Medical Science' (1861); 'Border Lines in some Provinces of Medical Science' (1862); 'Medical Essays,' a reissue of some of his earlier work (1883). Still other volumes by Dr. Holmes are 'Soundings from the Atlantic' (1864), a series of essays originally contributed to the *Atlantic Monthly*, where the bulk of his writing first appeared; 'Mechanism in Thought and Morals' (1871); lives of 'John Lothrop Motley' (1879); and 'Ralph Waldo Emerson' (1884); 'Our Hundred Days in Europe' (1888), a sprightly record of a short visit to England in 1886, on which occasion honorary degrees were conferred upon him by the uni-

**OLIVER WENDELL HOLMES**

versities of Cambridge, Oxford and Edinburgh; and 'Over the Teacups' (1891). His 70th birthday was celebrated by a breakfast given in his honor by the publishers of the *Atlantic Monthly*, and on this occasion the poet read his poem 'The Iron Gate,' which many persons have considered even finer than 'The Chambered Nautilus' which Holmes himself preferred to any other verses of his. At its best Holmes's prose style is thoroughly admirable, characterized as it is by an unerring sense of the value of words and their fitness for conveying a desired impression, and illumined by the interposed play of a delicate fancy and the most sparkling humor. Next to 'The Autocrat' must be ranked 'The Guardian Angel' among his prose works, the same kindly tolerant spirit being dominant in both, and the same shrewd, wholesome perception of character. In much of his earlier poetry, excepting in his lyrics, Holmes uses the formal 10-syllabled iambic pentameter of the 18th century, but in his hands the measure seems at times more flexible than when used by Pope and his school, and it is at all events relieved from solemnity by his ever-present humor. 'Urania' is the best known of his earlier efforts in this manner, and 'The School-boy' (1878) his most notable later one, this latter having been written for the centennial anniversary of Phillips Academy at Andover. Holmes's special characteristic was kindness, which found its expression as well in his verse as in his prose, and in his ordinary living. He could be keenly satirical on occasion but he never became in the least cynical. Of slight physique and charming personality, Holmes endeared himself to all his acquaintances, while his literary fame is secure beside that of Longfellow, Lowell and Whittier. Holmes's gentle, tolerant writing did not a little toward softening the asperities of controversy and liberalizing unconsciously the heart of Puritan New England. Consult Morse, 'Life and Letters of Oliver Wendell Holmes' (1896); and lives by Kennedy (1883); E. E. Brown (1884); Howell, 'Literary Friends and Acquaintances' (1899). See **ELSIE VENN**.

**HOLMES, Oliver Wendell, Jr.**, American jurist: b. Boston, 8 March 1841. He was graduated from Harvard in 1861, and in the same year entered the army as lieutenant of the 20th Massachusetts regiment. He was wounded at the battles of Ball's Bluff, Antietam and the second battle of Fredericksburg and was mustered out of the army in 1864 with the rank of brevet lieutenant-colonel. He then studied at the Harvard Law School and was admitted to the bar in 1866 beginning his practice in Boston. He was editor of the *American Law Review* (1870-73); became professor at the Harvard Law School in 1882 and in the same year justice in the Massachusetts Supreme Court; in 1899 he was appointed chief justice of the same court. His decisions in this position gave him wide fame among lawyers and were characterized by originality and literary finish. In several cases his decisions were in favor of organized labor; his position being that workingmen had a right to combine and to "support their interests by arguments, persuasion, and the bestowal or refusal of those advantages which they otherwise lawfully control, so long as they do no violence or threaten no violence." In August 1902, he was appointed a member of the United

States Supreme Court. He has published 'The Common Law' (1881), lectures delivered before the Lowell Institute, and an important contribution to legal history; and a collection of speeches (1900); a second collection (1913); he also edited the 12th edition of Kent's 'Commentaries' (1873).

**HOLMES, Theophilus Hunter**, American soldier: b. Sampson County, N. C., 1804; d. near Fayetteville, N. C., 21 June 1880. He was graduated from the United States Military Academy in 1829, served in the Florida war, the occupation of Texas and the Mexican War, and at the beginning of the Civil War was major and superintendent of the general recruiting service. On 22 April 1861, he resigned his commission in the United States army, forthwith was appointed brigadier-general in the Confederate forces and organized several North Carolina regiments. He was in command at Aquia Creek, and, promoted major-general, was in command of the trans-Mississippi department from September 1862 to March 1863, was commissioned lieutenant-general, and 3 July 1863 lost heavily in an unsuccessful attack on Helena, Ark.

**HOLMES, William Henry**, American anthropologist and archaeologist: b. near Cadiz, Ohio, 1 Dec. 1846. He was graduated at McNeely Normal College in 1870, and was assistant on the United States Geological Survey 1872-80. During that period he accompanied Dr. F. V. Hayden's explorations in the Rocky Mountain region and superintended the survey of the San Juan territory until the reorganization of the survey in 1880, when he was appointed geologist in charge of the department of illustrations. He had charge of the archaeological explorations of the Bureau of Ethnology in 1889-93, in 1894-98 was professor of archaeological geology at the University of Chicago, from 1898 to 1902 and again after 1910 was curator of the United States National Museum, and was chief of the Bureau of American Ethnology from 1902 to 1909. He was president of the American Anthropological Association, and of the National Society of Fine Arts in 1909. In 1905 he became a member of the National Academy of Sciences. He edited geological publications, including Hayden's 'Atlas of Colorado,' and the 11th and 12th 'Reports of the Geological Survey,' and has published 'Archæological Studies among the Ancient Cities of Mexico' (1895); 'Stone Implements of the Potomac-Chesapeake Tidewater Province' (1897); and papers on aboriginal American art.

**HOLOCAINE**. See **COCAINE**.

**HOLOCEPHALI**, hōl-ō-séf'a-lī, or **CHIMÆROIDEA**, a group of small shark-like fishes of bizarre appearance occurring in the deeper portions of all colder seas, including in all about seven species, five in American waters. They have a cartilaginous skeleton, are of no value as food and are known to fishermen as rat-fish and elephant-fish (q.v.). The name *Chimæra*, given to one genus, emphasizes the strange appearance of these fishes. See **ICHTHYOLOGY**.

**HOLOPHYTES**, hō'lō-fīts. See **FUNGI**.

**HOLOSTEI**, hō-lōs'tē-i, a group of fishes, the bony ganoids, largely fossil, represented by the garpikes. See **ICHTHYOLOGY**.

**HOLOTHURIA**, hōl-ō-thū'ri-a, echinoderms (q.v.) of the class *Holothuroidea*, popularly called "seacucumbers," from their resemblance in shape and rough skin to that vegetable, in which the body is long, cylindrical, somewhat wormlike, less obviously radiated than other echinoderms with a thick muscular body-wall of longitudinal and transverse muscles. The skin is usually thick, tough and imbedded in it are in certain forms calcareous plates, wheels and anchors. The mouth is surrounded with a circle of 10 branched tentacles, adapted both for respiration and for seizing the food, which consists mainly of foraminifera. The intestine is suspended by mesenteries, is very long and slender, thus in *Thyone briareus*, which lives in mud and sand on the coast south of Cape Cod, the intestine in an individual three or four inches long is nearly seven feet in length; it opens at the end of the body, and connects with the "respiratory tree," by which the water is introduced into the interior of the body. Also opening into the cloaca or terminal part of the intestine are the so-called Cuvierian organs, secreting slime on their peritoneal surface. The holothurians possess the power of eviscerating themselves through the cloaca, and these organs then serve as means of snaring an enemy. The destroyed viscera are then regenerated. Unlike other echinoderms the so-called madreporic body is internal. Holothurians move by tubes or ambulacra which are filled with water, and when distended act as suckers to drag the animal over the bottom. These suckers are either arranged in five rows or with three rows on the ventral surface, and two above, the latter serving the function of sense-organs, or they are scattered irregularly over the surface of the body, while in *Caudina arenata* of the New England coast there are no suckers. A tendency to bilateral symmetry is seen in a form *Psolus*, which has a creeping disk and three rows of suckers on the flattened disc-like under side. The nervous system resembles that of the sea-urchins, with its five radial nerve cords prolonged into the radia, and terminating in sensory patches of epithelium. Pigment spots, however, are lacking. There is a celomic nervous system. The blood system consists of a ring around the œsophagus, with branches along the stone canal and above and below the gut. The genital organs are located on the left of the dorsal mesentery, and the genital duct opens below and a little behind the feelers.

The holothurians undergo a metamorphosis, somewhat like that of the starfish; but the transparent larva called "auricularia" is barrel-shaped; what corresponds to the hoops of the barrel being bands of cilia, while the ear-like projections in certain forms give it the name auricularia. Before the larva is fully grown, the body of the young holothurian begins to bud out from near the side of the larval stomach, the calcareous cross-like plates are deposited, and the tentacles begin to grow out. Finally after the larval body is absorbed the young holothurian sinks to the bottom. The degree of metamorphosis is less marked than in other echinoderms, while in two forms development is direct, the young growing in a marsupium or broodpouch. A form (*Cladodactyla crocea*) living in the south seas at the

Falkland Islands, carries its young in a sort of nursery where they are densely packed in two continuous fringes adhering to the dorsal tubes. Holothurians are remarkable from the fact that when captured they eject their intestine, a new one in time being regenerated. The large forms lying about on the coral reefs are known to harbor a small slender fish (*Fierasifer*) which lodges in their cloaca or in the branchial tree. Many of the species are very large, being nearly two feet in length. A common species on the Florida keys and reefs is *Holothuria floridana*; it lives in water only a few inches deep and can be picked up in large numbers; it is fully 15 inches in length and lives on foraminifera. It has been collected, dried and a shipload exported to China, but the trepang or beche-de-mer of commerce is either of two species (*H. edulis*, and *H. tremula*) inhabiting the Pacific Ocean. (See TREPANG). A California species is also dried and exported by the local Chinese.

The class of *Holothuroidea* is divided by Ludwig into two orders: (1) *Actinopoda*, with radial canals, represented by *Holothuria*, *Cucumaria*, *Thyone*, *Psolus*, etc.; and (2) *Paractinopoda*, without radial canals, of which *Synapta* is an example, the common form living in sand at low water on the New England coast being *Leptosynapta girardii*. MacBride, on the other hand, divides the holothurians into six orders. A few forms inhabit great depths. Remains of holothurians have been found fossil; certain calcareous plates attributed to them occurring in the Carboniferous, Lias, Jura and Cretaceous strata. Minute calcareous bodies referable to *Synapta*, etc., have been detected in the Paris Eocene limestones. Consult 'Cambridge Natural History' (Vol. I, London 1909).

**HOLST**, hōlst, Hermann Eduard von, German-American historian: b. Fellin, Livonia, Russia, 19 June 1841; d. Freiburg, Germany, 20 Jan. 1904. He studied history in Dorpat and Heidelberg and in 1865 traveled through France, Italy, etc. His writings were looked upon with suspicion by the Russian authorities and his further stay in that country becoming unsafe, he removed to the United States in 1866. Here he became American correspondent of the *Kölnische Zeitung*, and sub-editor of the 'Deutsch-amerikanischer Conversations-Lexicon.' In 1872 he was appointed extraordinary professor of history in the University of Strassburg and in 1874 ordinary professor at Freiburg-im-Breisgau. In 1876 he undertook, with means furnished by the Baden government, a journey to London for the purpose of study and in 1878-79 a similar journey to North America at the expense of the Prussian Academy of Science. In 1892 he accepted an appointment in the University of Chicago. He has published 'Constitutional and Political History of the United States' (1873); 'The French Revolution Tested by Mirabeau's Career' (1894), etc.

**HOLSTEIN**, hōl'stīn, Germany, a former duchy of Denmark, and member of the Germanic Confederation, since 1866 united to Schleswig-Holstein (q.v.), Prussia.

**HOLSTEIN CATTLE**. See CATTLE.

**HOLSTON**, hōl'stōn, a river which rises in the southwestern part of Virginia, flows

south and southwest into Tennessee and unites with the French Broad River about five miles east of Knoxville. The Holston and the French Broad are the head-streams of the Tennessee River. The course of the Holston is through a mountainous country, noted for its beautiful scenery. It has as tributaries many small mountain streams. It is navigable for about 50 miles for vessels of light draught. Its length is about 200 miles.

**HOLT, Joseph**, American jurist: b. Breckinridge County, Ky., 6 Jan. 1807; d. Washington, D. C., 1 Aug. 1894. He began legal practice at Elizabethtown in 1828, and in 1857 was appointed commissioner of patents. In 1859 he became Postmaster-General and in 1860 Secretary of War. He was made by Lincoln a judge-advocate-general of the army, with colonel's rank, was promoted brigadier, brevetted major-general for distinguished service in the Bureau of Military Justice and was retired in 1875. With the exception of Cass, he was the only member of Buchanan's Cabinet that was not a Confederate sympathizer. Among the courts over which he presided were those before which Fitz-John Porter and Lincoln's assassins were tried.

**HOLTON, Kan.**, city, county-seat of Jackson County, on the Missouri Pacific, the Chicago, Rock Island and Pacific and the Union Pacific railroads, about 28 miles north of Topeka and 30 miles west of Atchison. It was settled in 1859 and received its charter in 1870, and adopted the commission form of government in 1912. It is situated in a section noted for good farms. The chief manufactures are flour, wagons, cigars, bottles, creamery products and planed lumber. There are also a quilting factory, a fruit nursery and a rat-trap factory. Its trade is chiefly in wheat, corn, hay, live-stock and local manufactured products. It is the seat of Campbell College. The waterworks and electric-light plant are the property of the city. Pop. 2,842.

**HÖLTY, Ludwig Heinrich Christoph**, lood'vig hin'rîh krës'tóf hêl'ti, German lyric poet: b. Mariensee, near Hanover, 21 Dec. 1748; d. Hanover, 1 Sept. 1776. In 1769 he went to Göttingen to study theology. Here, falling in with Bürger, Voss, the Stolbergs and other poets of kindred tastes, he became one of the founders of the Göttingen "Hainbund." This league of young enthusiasts was aflame for Klopstock, then considered the greatest German poet for patriotism and for friendship, detested Wieland's sensual poems and his Frenchified manner, read the classics together and wrote poetry in friendly emulation. Hölty's poems reveal a lovable personality. The strain of sentimentality that runs through all his work is not affectation, as it was with so many of the younger poets of that age in which Rousseau had made sentimentality fashionable, but the true expression of his nature. His range was small; but within his limits his work was excellent, and many of his songs have become the common property of the people. Consult Voigts, 'Hölty, ein Roman' (1844); Reute, 'Hölty, Sein Leben und Dichten' (1883).

**HOLUB, ho'loob. Emil**, Austrian explorer: b. Holics, Bohemia, 7 Oct. 1847; d. Vienna, 21 Feb. 1902. At 25 he went to South Africa,

where he practised in Kimberley and elsewhere as a physician. Later he became engaged in African exploration and in recognition of his services as an explorer received from the Austrian emperor the Order of the Iron Crown. He published 'Beiträge zur Ornithologie Südafrikas'; 'Sieben Jahre in Südafrika' (1881); 'The Colonization of Africa'; and 'From Cape Town to the Maskukulumbe.'

**HOLY ALLIANCE**, an international league proposed by Alexander I, emperor of Russia, 26 Sept. 1815, after the defeat of Napoleon at Waterloo had cleared the way for the execution of his desire of establishing a settled peace in Europe. Alexander, Francis of Austria and Frederick William III of Prussia, signed with their own hands, and without the countersign of a minister, the act establishing this alliance, which is said to have been sent to the two latter in the handwriting of the first. It was not wholly published till 2 Feb. 1816, when the text was given in full in the *Frankfort Journal*. It consisted of a declaration, that, in accordance with the precepts of the gospel of Jesus Christ, the principles of justice, charity and peace should be the basis of their internal administration, and of their international relations, and that the happiness and religious welfare of their subjects should be their great object. Their majesties considering themselves as delegated by Providence to govern three branches of the same family, namely, Austria, Russia and Prussia, and regarding their peoples as having no other sovereign than Him to whom alone all power belongs of right, declared that they would lend one another on every occasion and in every place assistance, aid and support. Its real aim was to maintain the power and influence of the existing dynasties. It was also stipulated that the three sovereigns should invite others to become members of the Holy Alliance. In Russia and Germany its principles were not discussed except in a spirit of eulogy, but they were uncompromisingly condemned in Britain by many of her foremost statesmen. On 4 Feb. 1823 both Lansdowne and Brougham openly condemned its doctrines in their places in Parliament. Sir James Mackintosh said of the doctrine of legitimacy, in the sense in which it was used by the Holy Alliance, "Sophistry lent her colors to the most extravagant pretensions of tyranny." The events of 1848 broke up the Holy Alliance. It had previously lost much of its authority from the death of Alexander, and the French Revolution of 1830. By a special article of the treaty the members of the Bonaparte family were declared incapable of occupying any European throne. It was in pursuance of the terms of the Alliance that revolutionary uprisings in Naples, Piedmont and Spain were suppressed by the armed forces of its members in the early part of the 19th century. The threat of the Allies to intervene in the war between Spain and her South American colonies with a view to restoring those colonies to Spain from whom they had separated and declared their independence was the chief cause which led President Monroe in 1823 to send his famous message to Congress proclaiming what later came to be known as the Monroe Doctrine (q.v.).

For the text of the Treaty of the Holy Alli-

ance with a full discussion of its nature and purpose and the historical events which produced it and to which it led, Consult Snow, 'Topics in American Diplomacy' (pp. 237ff. Boston 1894).

**HOLY CROSS, College of the,** an institution in charge of the Fathers of the Society of Jesus, situated at Worcester, Mass. The school was founded in 1843. The college grants the usual degrees given by classical and scientific institutions. It is self-supporting; up to 1916 it had received no State aid nor any endowments. It has established six fellowships. In 1916 there were connected with the school 30 professors and instructors and nearly 600 students. The library contained about 40,000 volumes.

**HOLY CROSS, Mount of the,** a peak of the Rocky Mountains, in Eagle County, in the State of Colorado. The peak is about 75 miles southwest of Denver, and 20 miles north by west of Leadville. It is 14,170 feet high.

**HOLY DAY,** a day set apart in the Catholic Church for the commemoration of some saint or mystery. It is called "of obligation" when attendance at Mass and abstention from servile works are prescribed.

**HOLY GHOST,** in Christian theology, the third person of the Trinity. The doctrine of the Holy Spirit is a distinctively Christian one, but foreshadowings of it are believed by some to be found in the Old Testament. Thus the Spirit of Jehovah is the active divine principle in nature (Gen. i, 2; Ps. civ) and the generator of the higher energies of the human soul (1 Samuel xvi, 13) especially of the prophetic faculty, while the prophets look forward to the Messianic age as the special time for the full manifestation of the Spirit. But it is in the New Testament that we find the bases of the doctrine of the Spirit's personality. The early Christians saw its work in the form of extraordinary gifts, as at the day of Pentecost (Acts ii, 4; x, 44) which inaugurated the new dispensation; for Saint Paul it is the principle of the divine life in the community (Rom. viii, 10), the begetter of all the spiritual graces (Gal. v, 22). But the Spirit's proper personality is most clearly found in the Gospel of John (xiv, 16-26), though it seems to be already implied in Matthew (xxviii, 19). Yet the early Church did not forthwith attain to a complete doctrine; nor was it, in fact, until after the essential divinity of Jesus had received full ecclesiastical sanction that the personality of the Spirit was explicitly recognized, and the doctrine of the Trinity formulated. Rationalistic writers have usually endeavored to reduce the being of the Spirit to the presence of the moral faculty in man, but this is to put the matter lower than the facts warrant. It is better to regard the Spirit as the agency which, proceeding from the Father and the Son, dwells in the church as the witness and power of the life therein. If we realize this energy as implying the presence of God Himself, the divinity and personality would seem to become intelligible and credible. (For the question as to whether the Spirit proceeds from the Father alone, or from the Father and the Son, which ultimately brought about the separation of the Greek and Roman churches, see GREEK

CHURCH; TRINITY). Consult Arnal, J., 'La notion de l'Esprit' (Paris 1908-11); Swete, H. B., 'The Holy Spirit in the New Testament' (New York 1909); De Regnon, T., 'Etudes de théologie positive sur la Sainte Trinité' (2 vols., Paris 1892); Smeaton, 'Doctrine of the Holy Spirit' (Edinburgh 1882).

**HOLY GHOST, Order of,** a former order of Hospitalers, founded by Guy, son of William, Count of Montpellier, in the 12th century for the relief of the poor, the infirm and foundlings. In the 18th century it was united with the order of Saint Lazarus by Clement XIII. Also the name of the principal military order in France instituted in 1578, abolished in 1789, revived at the Restoration and finally abolished in 1830.

**HOLY GHOST FLOWER, or HOLY SPIRIT PLANT.** See DOVE PLANT.

**HOLY LAND,** a name given by Mohammedans to Arabia because it was the birthplace of Mohammed; also by Buddhists to India because it was the country of Sakya Muni. It is a common name of Palestine, because the place where Christ lived when upon earth. See PALESTINE.

**HOLY LIVING AND HOLY DYING.** 'The Rule and Exercises of Holy Living' and 'The Rule and Exercises of Holy Dying,' companion works by the celebrated Anglican divine, Jeremy Taylor, were published in 1650 and 1651 respectively. They are religious treatises designed to give, in the one case, a rule for virtuous conduct in all the circumstances of life, and, in the other, "the means and instruments" of preparing for a blessed death. Besides counsels, meditations and minute instructions, the author gives numerous prayers and devotions, some of them among the most beautiful in English. The practical character of these works, the wisdom, piety and spiritual beauty which inform them, and the universality of their appeal to those who are striving after the Christian life, have given them a wide and permanent popularity. They have won, also, what is denied to most purely devotional works, an assured place in English literature. For their beauty is not of content alone. In style Taylor is perhaps the noblest representative of the wonderful prose writing of the 17th century and particularly of the great tradition of religious and ecclesiastical eloquence which coincided with the reign of Charles I. He employs the magnificent rhetoric of his age without the obscurity and affectation of many of its writers. The sentences are very long, but they are less involved than those of Milton and Sir Thomas Browne, and their complexities are, as critics have pointed out, often a mere matter of punctuation. The vocabulary, too, is comparatively modern, though Taylor is not wholly without the fondness for strange phraseology which was the inheritance of 17th century stylists from the Renaissance. Mason called Taylor "the Shakespeare of English prose," and the term is appropriate to his catholicity of taste, to his subtlety and variety, and above all to the imaginative qualities which make his prose pages glow with poetic beauty. His is a style full of sensuous imagery, brilliant in metaphor, abounding in sonorous cadences. Like the Elizabethans he is delicately sensitive

to the phenomena of nature and makes frequent use of similes and illustrations drawn from the world of eye and ear. "But so have I seen a rose newly springing from the clefts of its hood, and at first it was fair as the morning and full with the dew of heaven as a lamb's fleece; but when a ruder breath had forced open its virgin modesty and dismantled its too youthful and unripe retirements, it began to put on darkness and to decline to softness and the symptoms of a sickly age: it bowed the head and broke its stalk, and at night, having lost some of its leaves and all its beauty, it fell into the portion of weed and outworn faces."

Of the two works 'Holy Living' is on the whole less interesting from the literary point of view. Practical considerations were uppermost in the author's mind. In 'Holy Dying' Taylor, stirred by the memory of a recent sorrow, throws all his powers into the theme and produces a work in which the eternal truisms about death are dignified and ennobled, and made to throb with personal emotion. His view of death is sane and temperate. Avoiding the tendency to dwell morbidly on the hideous images of the sepulchre, he comforts and fortifies the soul until sickness and misfortune and the inevitable end itself come to appear a blessing. The best complete edition of Taylor's writings is that of Reginald Heber, revised by C. P. Eden (1845-52). Reprints of 'Holy Living' and 'Holy Dying' are very common. Consult Edmund Gosse's 'Jeremy Taylor' (in the 'English Men of Letters Series,' 1904), and especially the remarks of Coleridge, 'Literary Remains' (Vol. III, 1836).

J. H. HANFORD.

**HOLY ORDERS**, the several ranks of the ministry of a church; also the power or authority to exercise that ministry.

In the Roman Catholic Church, Holy Orders is one of the sacraments and there are seven orders of the ministry, viz.: priesthood, deaconate, and sub-deaconate: these are the greater or sacred orders; and the four minor orders of lector, acolyte, exorcist, and doorkeeper. Usually the episcopate is classed, not as a separate order, but as the completion and extension of the priesthood. Though every candidate for the priesthood is inducted into the four minor orders and the sub-deaconate and deaconate before he receives priestly ordination, it happens very seldom that a man enters any of those inferior orders intending to remain therein: they are simply steps to the priesthood.

In the Oriental churches, both those in communion with the Roman See—as the Greek Uniate, the Maronite, the United Armenian, etc., and those which are separated from Rome by schism or by heresy, the number of orders is less than in the Latin Church; in all the foregoing churches only four orders or, counting the episcopate as a distinct order, five orders are recognized; those of bishop, priest, deacon and lector: and of these the first three, at least, are held to be of divine institution and sacramental.

By the Anglican Church and the Protestant Episcopal Church of the United States three orders are recognized: those of bishops, priests and deacons but in the 25th of the Articles of Religion those orders are expressly declared to be no sacrament.

The orders of the Oriental churches are generally recognized as valid by the Church of Rome; and when a priest of any of those churches is received into the Roman Catholic Church he is still regarded as a priest: but an Anglican or a Protestant Episcopal Minister enters the Latin Church as a simple layman even though he were in Anglicanism a bishop; for Anglican orders have ever been held by Rome to be invalid.

Generally, the non-episcopal churches, such as the Presbyterian and Lutheran, recognize but one order as having valid scriptural authority, that of the teaching presbyter. Congregationalists and Baptists recognize their pastors as members set apart for the functions of ministry, but not as setting up any essential difference between them and laymen.

**HOLY ROMAN EMPIRE.** The Roman Empire, which Julius Cæsar's nephew Octavianus won for himself at the battle of Actium, B.C. 31, remained for centuries undivided. Even when Constantine the Great transferred the seat of government from Rome to Constantinople, A.D. 326-28, the Roman Empire still continued intact. Not until 364 was it partitioned into an Eastern and a Western realm by Valentinian I. The empire was finally divided in 395 between Arcadius, who took the Eastern, and Honorius, who took the Western provinces. This separation, however, was made for administrative purposes only, and the two realms were still regarded as forming a single empire. In 476 Odoacer brought the Western line to an end by forcing the abdication of Romulus Augustulus. Thenceforward until 800, the emperor reigning at Constantinople was, in theory at least, ruler of the whole Roman Empire.

In 751, with the authorization of Pope Zacharias, Pepin the Short, Mayor of the Palace in Gaul, became king of the Franks in place of the deposed Childeric III, last of the Merovingians, and in 754 the new monarch was anointed and crowned by Pope Stephen II. Pepin's son and successor Charles, known as the Great or Charlemagne, became successively king of the Franks of Neustria (758) and of the Franks of Austrasia (771). He conquered the Saxons (772-803), and, having attacked the Lombards (773-74), he added North Italy to his territories and was recognized as suzerain of Rome. In 797, the Empress Irene having deposed and blinded her son, the Eastern Emperor Constantine VI, the time seemed ripe for the re-establishment of the Western branch of the empire, and the man for the imperial office was at hand. Charlemagne was now unquestioned master of western Europe, and was recognized as Champion of the Faith and Defender of the Holy See. In 800 he entered Rome with his Frankish host, and on Christmas Day of that year he was crowned emperor by Pope Leo III. From that event dates the establishment of the Holy Roman Empire, which, through all the shocks and changes of time, survived until the year 1806. After some negotiations, Charlemagne was in time recognized by the Eastern monarchs as emperor and as ruler of northern Italy except Venice, southern Italy and Sicily remaining subject to Constantinople. Charlemagne was succeeded in 814 by his son Lewis I, the Pious, whom he had crowned as coemperor in the previous year. His line continued to hold

sway until the death of Charles III, the Fat, in 888. After that event, the dominions of Charlemagne fell asunder and the Carolingian empire disappeared. There then succeeded a period of turbulence, during which the empire subsisted but little more than in name. Phantom emperors, like Guido of Spoleto, his son Lambert, Arnulf, Duke of Carinthia, Lewis III, and Berengar, appeared, but, if they reigned, they certainly did not rule.

A great change was effected on the accession of Otto I, the Great, founder of the Saxon line. Crowned king of the East Franks at Aachen in 936, he continued the work of his father, Henry I, the Fowler, and consolidated his kingdom by a series of conquests. On the invitation of the Pope, he descended from the Alps with a powerful army, was acknowledged king of Italy at Pavia, and was crowned emperor at Rome in 962. One of his first acts was to convoke a synod in Saint Peter's, at which Pope John XII was deposed and Leo VIII was elected in his stead. From the latter Pope, Otto received a confirmation of that veto on papal elections which the citizens of Rome had bestowed upon him on the occasion of his coronation. He continued to extend his conquests, and after a wise and glorious reign he transmitted his power and his titles to his son Otto II (973-83) and his grandson Otto III (983-1002). With the latter the direct line of Otto the Great ended, but there was one more Saxon emperor, Henry II, the Saint (1002-24).

The Franconian line of emperors was established by Conrad II, the Salic (1024-39). Under his son and successor, Henry III, the Black (1039-56), the empire attained perhaps its maximum of strength. Henry was powerful in Germany and successful in foreign wars, and he received from a Roman synod the right of nominating the Pope. In the reign of Henry IV (1056-1106), the great struggle for supremacy between the empire and the papacy began. In 1059 Pope Nicholas II, at the instigation of the famous archdeacon Hildebrand, afterward Pope Gregory VII, vested the papal election in the college of cardinals, reserving the rights of the clergy and people of Rome and of the emperor. When Hildebrand as Pope declared it criminal for an ecclesiastic to receive a benefice from a layman, he raised the whole question of feudal investiture of land to the clergy. It had a special bearing on Germany, where a great part of the land and wealth was vested in bishops and abbots, who, under the new ruling, could pass from the control of the emperor to that of the Pope. A war between the secular and the religious powers was thereupon begun. Gregory summoned Henry to Rome for judgment: Henry retaliated by convening a synod which deposed the Pope. The Pope's reply was to excommunicate Henry, who, deserted by his nobles, went as a penitent to Canosa in 1077, and, clad in woolen and standing barefoot on the snow, sued and obtained forgiveness from the successor of the Fisherman. It was a scene well calculated to strike the imagination, and the admission that the spiritual was greater than the temporal power was destined to have momentous consequences. Henry's son, Henry V (1106-25), was as able and determined an opponent of the papal claims as his father. He asserted all the rights over ecclesiastics which had ever been enjoyed by his predecessors, and

it was not until the Concordat of Worms (1122), concluded between Pope Calixtus II and Henry V, that a settlement, greatly diminishing the emperor's powers, was effected. Another blow at the emperor's prerogative came from a different source. On the death of Henry in 1125, the elective principle was established instead of the hereditary. It was by election that Lothar II, of Saxony (1125-38), Conrad III (1138-52), founder of the Swabian or Hohenstaufen line, and Conrad's nephew, Frederick I, Barbarossa (1152-90), succeeded. The reign of the last mentioned was a glorious one, but it was marked by a long struggle with the papacy. There were early bickerings between Frederick and Pope Hadrian IV. On the death of the latter in 1159 there was a disputed papal election, the real Pope being Alexander III, while Barbarossa took the side of the anti-Pope, Victor IV. A fierce contest between Pope and emperor ensued. After the defeat of the imperial army by the allied North Italian cities at Legnano in 1176, Frederick surrendered, and he and Alexander III were reconciled at Venice in 1177. At their meeting, Frederick, it is said, knelt in awe, but the Pope raised him and gave him the kiss of peace. The scene, which has been variously represented, marked the abandonment by the secular power of a contest in which it had now been twice beaten. Frederick led a great German army on the third Crusade, and was drowned in the river Kalykadnus in Cilicia in 1190. He was succeeded by his eldest son, Henry VI (1190-97), who had already as a child been chosen king and crowned at Aachen. Henry endeavored to have the crown pronounced hereditary in his family, but met with so much opposition that he had to be content with procuring the election of his infant son, Frederick II, as king of the Romans. On Henry's death that election was set aside, and a contest for the crown ensued between Otto of Brunswick and Philip of Hohenstaufen, which was not terminated until the murder of Philip in 1208. Otto IV was then formally re-elected emperor and was crowned in 1209. He was, however, excommunicated and declared deposed by Pope Innocent III, and was dethroned by the youthful Frederick II, son of Henry VI. Frederick's whole reign (1212-50) was embittered by a dispute with the papacy, which continued through the reign of his son, Conrad IV (1250-54). Conrad's son, Conradin, the last of the Hohenstaufen house, never reigned. Fighting for his rights, he was defeated as a lad of 15 at Tagliacozzo and beheaded at Naples in 1268.

On the death of Conrad IV there was an interregnum, nominally broken in 1257 by the election of Richard, Earl of Cornwall, and a little later of Alfonso X of Castile, who theoretically were rival emperors, but, while Richard was crowned at Aachen, neither he nor Alfonso was ever crowned as emperor at Rome. During this time conditions in Germany were frightful, and in an attempt to cope with the disorganization, the electors in 1273 chose Rudolf, Count of Hapsburg, founder of the house of Austria, as the occupant of the imperial throne. He, too, was crowned at Aachen, but not at Rome. Dying in 1291, he was succeeded in 1292 by Adolf, Count of Nassau, who was killed in battle (1298) by Rudolf's son,

Albert of Hapsburg, Duke of Austria. Albert was thereupon chosen king of Germany and crowned at Aachen. Pope Boniface VIII refused at first to recognize him, but subsequently, in 1303, became reconciled to him, and invited him to Rome to be crowned, an invitation of which Albert never availed himself. He was killed in 1308 by his nephew John. Henry VII, Count of Luxemburg, was then chosen king, and in 1310 was crowned emperor at Rome by the legates of Pope Clement V, who in 1305 had removed the papal court to Avignon in the then kingdom of Arles. On Henry's death in 1313, a double election took place, Lewis IV, Duke of Bavaria, and Frederick, Duke of Austria, being chosen by different sections of the electors. A civil war followed. Lewis defeated Frederick at Mühldorf in 1322 and took him prisoner. In 1324 Lewis came to an open rupture with Pope John XXII, who excommunicated him. Nothing daunted, however, Lewis marched on Rome (1327), where he was welcomed by the Roman people and was crowned emperor in 1328 by four lay syndics named for that purpose by the people. Lewis soon afterward was obliged to quit Rome and Italy, and on his return to Germany he endeavored to conciliate the Pope, who, however, insisted on absolute submission, but this Lewis was not prepared to give. In 1343 Pope Clement VI set up Charles IV, king of Bohemia, as rival emperor and his selection was confirmed by a majority of the electors. On the death of Lewis in 1347 the electors chose in turn Edward III, king of England, who because of the objection of his Parliament declined the honor; Frederick, Marquis of Meissen, who was bought off by Charles; and Günther of Schwartzburg, who accepted but died soon afterward. Charles was then rechosen and recrowned at Aachen. In 1354 he was crowned king of Italy at Milan and finally emperor at Rome by the cardinal-bishop of Ostia, who was deputed to perform that function by Pope Innocent VI. In 1355 Charles IV gave up to the Pope all the territorial rights over Rome and Italy which his predecessors had claimed and asserted in arms.

In 1356 Charles promulgated the celebrated Golden Bull (*Aurea Bulla*), which settled the composition of the electoral college, the proceedings at elections, and the privileges of the electors. Seven electors were named: the Archbishops of Mainz, Trèves, and Cologne; the King of Bohemia, cupbearer; the Count Palatine of the Rhine, seneschal; the Duke of Saxony, marshal; and the Margrave of Brandenburg, chamberlain.

Charles IV died in 1378, and was succeeded by his son Wenzel, who had been elected and crowned two years earlier. In 1400 Wenzel was pronounced deposed by a majority of the electors, who chose Rupert of Wittelsbach, Count Palatine of the Rhine, in his stead. Wenzel, however, retained his title and his kingdom of Bohemia until 1410-11, when a disputed election took place between Wenzel's brother, Sigismund, king of Hungary, and Jobst, Margrave of Moravia. On the death of Jobst, Sigismund was again chosen in 1414 and crowned at Aachen and in 1431 he was crowned king at Milan and in 1433 emperor at Rome. On his death in 1437, his son-in-law, Albert of Hapsburg, Duke of Austria and king of Hun-

gary and Bohemia, was elected (1438) king of the Romans. He died in 1439 without having received the imperial crown. He was succeeded in 1440 by Frederick III, of Hapsburg, Duke of Styria, who was crowned emperor at Rome in 1452. His was the last imperial coronation that took place there. In 1493 Frederick died and was succeeded by his son Maximilian I of Hapsburg (1493-1519), who had been already elected. On Maximilian's death in 1519 his grandson Charles V (1519-58), king of Spain, was elected emperor and was crowned at Bologna, not at Rome. Charles abdicated in 1555, and on his death in 1558 was succeeded by his brother Ferdinand I (1558-64), who had been already elected. He in turn was succeeded by his son Maximilian II (1564-76), Maximilian by his son Rudolf II (1576-1612), and Rudolf by his brother Matthias (1612-19).

On the death of Matthias his cousin Ferdinand II, of Styria, became emperor and reigned from 1619 to 1637. Ferdinand made a change in the electoral college in 1623 by taking away the electorate from Frederick, Count Palatine, and bestowing it upon Maximilian of Bavaria. The Count Palatine recovered his electoral rights in 1648, thus making eight electors, and a ninth was created in 1692 when the Duke of Brunswick-Lüneburg was given the electorate of Hanover.

The emperors who followed Ferdinand II were Ferdinand III (1637-58), Leopold I (1658-1705), Joseph I (1705-11), Charles VI (1711-40). From the election of Albert II in 1438 to the death of Charles VI in 1740, the empire had remained in the possession of the Hapsburg family. With the decease of the last-named monarch, the male line of the Hapsburgs became extinct, and Charles VII, Elector of Bavaria, was selected to fill the vacant throne (1742-45). When Charles died, Francis I, duke of Lorraine, husband of Maria Theresa, daughter of Charles VI, was elected emperor and crowned at Frankfort, and reigned from 1745 to 1765. In the person of his son, Joseph II (1765-90), already elected in his father's lifetime, the Hapsburg line was restored. Joseph was succeeded by Leopold II, who reigned from 1790 to 1792. On Leopold's death, Francis II, the last of the Holy Roman Emperors, ascended the throne at the fateful period of the French Revolution. In 1804 Napoleon Bonaparte became emperor of the French and regarded himself as the successor of Charlemagne in the empire of the West. In 1805 he overthrew Austria and Russia at Austerlitz and formed the Confederation of the Rhine under the protection of France. By the act establishing the Confederation (17 July 1806), Bavaria, Württemberg, Baden, and 13 other states withdrew from the empire and repudiated its laws, and on 1 August the French ambassador announced to the Diet at Regensburg that Napoleon no longer recognized the existence of the empire. Thereupon Francis II, by a declaration of 6 Aug. 1806, in which he stated that, finding it impossible to carry out the obligations taken at his election, he considered the bonds which attached him to the Germanic body as dissolved, that he released the states of which it consisted from their allegiance, and that he retired to the government of his hereditary dominions under the title of emperor of Austria, resigned the imperial dignity. Thus, in fact, if not perhaps in theory,

the Holy Roman Empire came to an end 1,006 years after it had been established by Pope Leo III and Charlemagne. Consult Bryce, 'The Holy Roman Empire' (London 1864, new ed., New York 1904).

Catholic University of America.*

**HOLY SEPULCHRE**, Jerusalem, the tomb in which the body of Jesus was laid by Joseph of Arimathea the owner of the tomb, and by Nicodemus, "nigh at hand" to Golgotha. As described by John, an eye-witness of the Crucifixion, "in the place where he was crucified there was a garden; and in the garden a new sepulchre, wherein man was never yet laid." Church records state that after the epochal Council of Nice, 325, Constantine the Great entrusted Bishop Macarius with the task of determining the site of the Crucifixion and the Resurrection. Hadrian's temple of Aphrodite covering the site, according to local tradition, was removed by imperial order, and below, a Jewish tomb cut in the rock was identified as the sepulchre. In a cavity 280 feet eastward, three crosses were also discovered, and the cross on which Jesus died was identified from its faith-healing properties. The present buildings of the church of the Holy Sepulchre, which date from the capture of Jerusalem by the Crusaders in 1099, cover both sites. Great controversy and research arose after the 18th century over the authenticity of the sites, but the traditional emplacement is now generally accepted as accurate. Consult Kinglake, A. W., 'Eothen' (London 1844); Lewis, H., 'The Holy Places of Jerusalem' (London 1888); Warren, (Sir) C., 'The Temple and the Tomb' (London 1880); Wilson, (Sir) C. W., 'Golgotha and the Holy Sepulchre' (London 1906).

**HOLY SEPULCHRE, Orders of the.** The four orders under this title most deserving of mention are (1) Canons of the Holy Sepulchre, an organization formed originally in the early 12th century, binding together the clerks of the church of the Holy Sepulchre into a community, under Arnulf, patriarch of Jerusalem. It was transferred to Acre in 1187, and spread to the Occident where its houses offered shelters to pilgrims to the Holy Land. Under Innocent VIII, this order was united with the Knights of Saint John, and its independence was practically extinguished. (2) The Canonesses of the Holy Sepulchre, established by the Marchioness Claudia de Mouty at Charleville. Some houses of the order still exist. (3) Knights of the Holy Sepulchre, or Golden Knights, an order of all the knights who in pilgrimages to Palestine had received the accolade at Jerusalem. It was confirmed by Benedict XIV in 1746; and its rule was formulated by Pius IX in 1847. The costume worn is a white mantle with the red cross of Godfrey de Bouillon. The order comprises three classes: knights, commanders and grand crosses. (4) Fathers of the Holy Sepulchre, the group of Franciscans stationed in Jerusalem to protect the Holy Places. Their chief house is San Salvatore in Jerusalem.

**HOLY WAR, The.** 'The Holy War,' written by John Bunyan about 1684, is an allegory of sufficient excellence to have brought

fame and immortality to any man. Even though in all its imagery and nomenclature it belongs to a by-gone age, doing unpardonable violence to many scriptural texts, and careless of theological accuracy, it still has power to grip with an interest that flows from a seemingly living plot and from the force of dramatic presentation. This masterly piece of literature has been almost obliterated by the brightness of its truly remarkable predecessor, 'The Pilgrim's Progress.' It is however likely that had the order of production and publication been reversed 'The Holy War' would have dropped into second place because it lacks what the 'Progress' has, a hero with a definite and stirring real personality. The theme of 'The Holy War' and in places the treatment and characters remind one of 'Paradise Lost' which without doubt Bunyan had never had knowledge of. Bunyan images man, the soul, or other-than-body man as a "fair and delicate town, a corporation, called Mansoul." "The first founder and builder of it . . . was one Shaddai," the name for deity which the author adopts. "This famous town of Mansoul had set in the walls gates in at which to come, out at which to go . . . Eye-gate, Ear-gate, Mouth-gate, Nose-gate and Feel-gate." The state of Mansoul was at the first perfect in life, loyal and obedient to its king, Shaddai. Diabolus (Devil), originally a servant and prince in Shaddai's government being cast out of office and "down into the horrible pits," because of rebellion, has determined to revenge himself by making war upon Mansoul and capturing it. Approaching the town "under the shape and in the body of a dragon"—Bunyan's interpretation of the Garden-of-Eden serpent—Diabolus "drew up and sat down before Ear-gate" and attacked with subtle arguments made familiar through the Biblical story. "Lord Innocent" and "Captain Resistance" are slain in the encounter by Diabolus' associates, and "Mr. Recorder" (Conscience) is thrown out of office. The town of Mansoul speedily capitulates and is entirely in the possession of Diabolus who thereupon organizes the life of the town according to his own will and scheme, making his mastery more conspicuously complete by defacing the image of Shaddai which "was in the market-place of Mansoul." On hearing the news Shaddai "and his Son retired into the privy chamber" to plan for the recovery of Mansoul. Captains "Conviction," "Judgment" and "Execution" undertake the first campaign. The attacks are all verbal—exhortations to repent, warnings and threats of what Shaddai will do. The attacks fail except in stirring up discord and discontent in Mansoul. Then the king, Shaddai, sends his son, Emmanuel, to "conquer the town of Mansoul." The expedition is successful and Emmanuel enters the town of Mansoul as conqueror, puts Diabolus in chains and proclaims a full pardon for all in Mansoul who have rebelled against the King Shaddai. The life of Mansoul is reorganized and given a new charter with "Free and full forgiveness" and "everlasting comfort and consolation" as the foremost provisions. But the town does not stay conquered. Under the influence of "Mr. Carnal Security" Mansoul backslides and the warfare is renewed. And so the allegory goes on to picture, as only Bunyan can, the fluctuating fortunes of the struggle between the forces of

Shaddai and Diabolus. It is a most vivid and realistic presentation, by personifying the different sentiments and passions and thoughts, of the idea that the soul of man is the battle ground where Good and Evil fight for the mastery.

CHARLES GRAVES.

**HOLY WATER**, in the Greek and Roman Catholic churches, water which has been consecrated by prayers, exorcism and other ceremonies to sprinkle the faithful and things used for the church. The use of holy or lustral water was borrowed from the Jews, and the same symbolism was employed among the Romans. The Roman Catholic Church considers holy water not only symbolical of the purity of the soul, but in certain cases as effectual in exorcism. Before high mass on Sundays the celebrant sprinkles the people with holy water. At the entrance of all churches is kept a font of holy water, in which those going in and out dip the fingers and bless themselves. The consecration of holy water takes place on Holy Saturday before Easter Sunday.

**HOLY WEEK**, or **PASSION WEEK**, is that which immediately precedes Easter. The name Passion Week rather refers to the days following and exclusive of Palm Sunday, since this day, strictly speaking does not commemorate any incident of Christ's passion, but his triumphant entry into Jerusalem. The three chief days of the week are Maundy Thursday (or Holy Thursday), Good Friday and Holy Saturday, the most sacred of all being Good Friday. The observance of Holy Week is of very early origin, and it was known as Great Week, Silent Week, Penitential Week, etc. In the ancient Church of Rome, when any of the ordinary church festivals falls on this week, it is not observed till after Easter. In Rome it used to be observed with much greater solemnity and penitential rigor than now; for the shops are kept open, concerts and other amusements are given, though the theatres are closed. The washing of the feet of poor men is still practised in Roman Catholic churches; and the Pope washes the feet of 13 poor persons, all of whom are priests. In Austria the emperor keeps up the old rite of feet-washing with much ceremony.

**HOLYOAKE**, hōl'yōk, George Jacob, English political reformer: b. Birmingham, 13 April 1817; d. Brighton, 22 Jan. 1906. He early became connected with various advance movements in Birmingham. In 1841 he was one of the lecturers chosen to explain Robert Owen's social theories, and next year was imprisoned on a charge of atheism. He supported the Chartist demands, but did not sympathize with their hostility to the Whigs. He took an important part in the agitation for the repeal of the corn laws, and for the repeal of the so-called "taxes upon knowledge." He was the founder of a purely ethical religion, without theistic element (secularism); and was active as a lecturer and writer in the co-operative movement. His works include 'The Logic of Death'; 'The Logic of Life'; 'The Trial of Theism'; 'Nature and the Origin of Secularism'; 'Thirty-three Years of Co-operation' (1872); 'History of Co-operation in England, Its Literature and Its Advocates' (1875); 'Among the Americans' (1881); 'Self Help

One Hundred Years Ago' (1888); 'The Co-operative Movement of To-day' (1891), a short, useful account of the history of co-operation; 'Sixty Years of an Agitator's Life' (1892), an autobiography; and 'Jubilee History of the Leeds Co-operative Society' (1897).

**HOLYOKE**, hōl'yōk, Mass., city in Hampden County, on the Connecticut River and the New York, New Haven and Hartford, and the Boston and Maine railroads, about 75 miles southwest of Boston and eight miles north of Springfield. Holyoke was settled in the last part of the 17th century by people from Ireland, and for some time it was called Ireland Parish. It was incorporated as a part of West Springfield in 1786; but in 1850 it became a distinct town, with its own government, and it was chartered as a city in 1873. Like the other settlements along the shore of the Connecticut, the inhabitants saw the advantages to be derived from the water power. At first only the small streams flowing into the Connecticut were dammed and used for turning machinery; the main stream itself was the great route whereby trade intercourse was established with settlements along its shores. In 1847 the Hadley Falls Company began to devise ways and means of using the water power of the Connecticut River, which at Holyoke had a fall of about 60 feet. In a few years the dam, 1,000 feet in length, was placed across the river, and the water power thus obtained gave Holyoke great opportunities for the establishment of manufacturing industries, and they have been well utilized. For some years it was noted for the number and magnitude of its paper-mills; but other industries now enrich the city. Its chief manufactures are paper, paper-products, thread, cotton and woolen goods, knit goods, alpaca, silk, automobiles, machinery, bicycles, wire, belting, screws, bricks, furniture and school supplies. Some of the public institutions are the College of Music, public library, House of Province Hospital, City Hospital, two orphanages located outside the city limits, Saint Vincent's for girls and Holy Family for boys. A large percentage of the people are of foreign birth or foreign descent. The law which declares: "No minor who cannot read and write the English language can be employed in any factory or commercial enterprise" is rigidly enforced. Evening schools are provided for those who cannot attend school in the day time. The Holyoke Scientific Society has done special and excellent work in American archaeology. It owns a valuable collection of Indian relics. Some of the places of interest near the city, and which may be reached by the electric railway, are Mount Holyoke (q.v.), Mount Tom (q.v.) and Springfield. In 1896 the city charter was revised, and the government is now vested in a mayor, who is elected annually, and a city council. The annual income of the city reaches over \$3,000,000 and its expenditures are proportionate. The water system, gas and electric-light plants are owned and operated by the city. Pop. 62,852.

**HOLYOKE**, Mount, a narrow ridge of greenstone, the highest point of which is about 1,120 feet above the sea. It is in Hampshire County, Mass., about one mile east of the Connecticut River, five miles southeast of Northampton and eight miles northeast of Holyoke.

On the summit is a hotel, built in 1821. The hotel can be reached by a carriage road which winds to the top, or by a railway which runs up a steep incline.

**HOLYOKE COLLEGE**, Mount. See MOUNT HOLYOKE COLLEGE.

**HOLYROOD**, hō-lī-rood, Palace and Abbey of, Scotland, the ancient royal residence at Edinburgh (q.v.).

**HOLZ**, hōlts, Arno, German poet: b. Rastenburg, East Prussia, 26 April 1863. He came to Berlin early in life, attended the schools and university there, and made it his permanent home. To write verses seems to have been an early passion with him. Geibel, Heine and Eichendorff were his first models. In honor of the 70th birthday of Geibel, he published his first book of poems, 'Gedenkbuch' (1884). Soon after he became interested in some of the more modern lyric poets. But he did not find much satisfaction in them, as he wished to fathom scientifically the basis of art and turned to an extreme form of naturalism under the influence of Zola and other moderns. 'Das Buch der Zeit' (Lieder eines Modernen, 1885), showed this tendency, which he developed into a positive theory in association with Johannes Schlaf. During the years 1887-88 these two men worked together assiduously and produced jointly 'Papa Hamlet' (1889), a collection of novelistic sketches, supposed to have been translated from the Norwegian of Bjørne Holmsen. In these stories the action—in so far as one can speak of action—moves forward with the hands of the clock. In their drama, 'Familie Selicke' (1890) they sacrificed all to their one paramount principle of naturalism.

Holz continued working alone, with much self-confidence, on his theories of art and then tried to put them into practice as a poet, which resulted in the following publications: 'Die Kunst, ihr Wesen und ihre Gesetze' (1891); 'Die Socialaristokraten' (comedy, 1896); 'Phantasm' (poems, 1899); 'Die Revolution der Lyrik' (1899); 'Dafnis, Lieder auf einer alten Laute' (1903-04); 'Traumulus' (Schauspiel, 1904); and 'Ignorabimus' (Tragödie, 1913). Holz must be given an important position among the writers who influenced the trend of literary events in Germany in the last decades of the 19th century. It is only necessary to mention his influence on Hauptmann and Sudermann. No permanent works of art were produced by him and he has been much overrated in this respect by his admirers, but as a stimulating force, as a producer of new ideas on art, he has a secure place in literary history. Consult Strobl, Dr. Karl, 'Arno Holz und die Jüngstdeutsche Bewegung' (1902); Resz, Robert, 'Arno Holz und seine Künstlerische Bedeutung' (Dresden 1913); Lessing, O. E., 'Masters in Modern German Literature' (Dresden 1912).

WILLIAM F. HAUHART.

**HOLZAMER**, hōlts'ām-ēr, Wilhelm, German novelist and short-story writer: b. Nieder-Olm, near Mainz, 28 March 1870; d. Berlin, 28 Aug. 1907. He was the son of an artisan and first prepared himself for the calling of a common school teacher, serving in that capacity at the Realschule of Heppenheim an der Bergstrasse from 1892 to 1896. His literary career began during these years, with the production

of poems and short stories, and a number of monographs on German writers, prepared for newspapers in Germany and in the United States. After 1896 he devoted himself entirely to literary pursuits, retaining his home at Heppenheim until 1902, when Grand Duke Ernst Ludwig of Hessen, whose attention had been called to the poet in so favorable a manner that he was determined to give him an opportunity to develop his talents, called him to Darmstadt to become his private librarian. After occupying this position for a few years, Holzamer left it and settled in Paris as correspondent for a number of German papers, moving to Berlin in 1905, where he fell sick with diphtheria and died in the Elizabeth Hospital. Only one of his short stories has been translated into English ('Cellist Behnke' in *The New Review*, April 1914); it gives an excellent idea of his impressionistic word-painting. Among his works are 'Meine Lieder' (poems, 1892); 'Auf staubigen Strassen' (sketches, 1898); 'Im Dorf und draussen' (short stories, 1901); 'Die Siegesallee' (letters on art, 1902); 'Ellida Solstratten' (novel, 1904); biographies of 'Konrad Ferdinand Meyer' and 'Heinrich Heine' (1905); 'Der Entgleiste' (novel in 2 vols., 1910).

JACOB WITTMER HARTMANN.

**HOLZWARTH TURBINE**. See INTERNAL COMBUSTION ENGINE.

**HOMATROPIN**, hō-māt'rō-pīn. See ATROPINE.

**HOME**, Henry, LORD KAMES, Scottish lawyer and author: b. Kames, Berwickshire, 1696; d. Edinburgh, 27 Dec. 1782. He studied law at Edinburgh, and, called to the bar in 1724, soon acquired reputation by a number of publications on the civil and Scottish law. In 1752 he became a judge of session, and assumed the title of Lord Kames. In addition to legal works he published 'Essays on British Antiquities'; 'Essays on the Principles of Morality and Natural Religion,' in which he advocates the doctrine of philosophical necessity; 'Introduction to the Art of Thinking'; and his best-known work, 'Elements of Criticism,' in which, discarding all arbitrary rules of literary composition, he endeavors to establish a new theory on the principles of human nature. In 1776 he published the 'Gentleman Farmer'; and in 1781 'Loose Thoughts on Education.'

**HOME**, The (Hemmet). In her novel 'The Home' (or 'Family Sorrows and Joys'), written in 1839, Fredrika Bremer produced her masterpiece. Though not as absorbing as 'Grannarne,' which was translated into many languages and made her famous, it is more true to life. Though the plan of construction shows a certain weakness, the characters are drawn with superior skill. The chief character is Elisa Frank, and her relations to her husband, Judge Frank, and her children form the main theme. Fredrika and her own sisters served as models for the daughters whose characters are convincingly described. Petrea, "ready to give away indiscriminately the presents which had been given to her," is the author herself. Tenderness is shown in the description of the death of Henrik (her brother August), while her humor is at its best where Petrea and Jeremiah are described. In 'The Home' we see Fred-

rika Bremer for the first time as the champion of woman's emancipation and advancement. For years afterward, and especially after her return from a visit to America, it became her aim in life to deliver also the Swedish woman from the restrictions in her social position. Long before she wrote 'The Home' the social conditions which confined woman's activities within very narrow limits and left her helpless, unless she was "happily" married, had aroused the author's indignation. Her bitterness increased when Göta Superior Court expressed its narrow-minded opposition to the proposition that women, at the age of 25, should have the legal right to manage their own affairs. Through the study of the writings of Harriet Martineau she had become convinced that reform by law was necessary. 'The Home' has been translated into English by Mary Howitt.

GISLE BOTHNE.

**HOME ECONOMICS.** Home economics is the organized body of knowledge which treats of food, clothing, shelter and household management in their physical, economic and social aspects as related to the life and welfare of the individual, the family and the community.

As a subject for formal instruction and a field for investigation home economics is concerned with living places, the materials used in them, the arts by which they are maintained for families or other groups of people bound together by kinship, affection or necessity, and with the methods by which they can be made to contribute to the length, happiness and productiveness of the individual life. The forms that instruction takes and the lines that investigation follows depend largely on the character and purposes of the educational institution into which the subject is introduced. It takes in one institution the form of applied science, in another that of manual training, while in still others it appears as branches of vocational or normal training or of economics.

Though its subject matter had long received the attention and thought of students and writers, and though a large body of knowledge had accumulated as a result of housekeepers' experience, home economics did not find an established place as a recognized subject for formal instruction until about 1870, when it was introduced into the State agricultural colleges of the United States. In these institutions which were founded for the benefit of regions where the interests of the home and those of the industry that chiefly supports it are very closely allied, it developed rapidly as an applied science side by side with agriculture, and benefited by the same investigational work in the sciences, particularly those that have a bearing on nutrition and diet. It has drawn from these investigations suggestions for the means of improving the methods by which families are fed and clothed and protected from the elements, and has in turn reacted upon them and encouraged further research. By so doing it has added to its own content and its own cultural value, with the result that it is now often given a place in the courses of study of higher institutions of learning from which applied science, as such, is excluded.

As a branch of manual training, home economics first found a place in the elementary

and secondary schools. When the curriculum of these schools was enlarged to include hand training, the particular exercises given to girls were naturally those connected with traditional home industries,—cooking, sewing and cleaning. Even weaving and other handicrafts that had left the home were introduced for the understanding they give of the development of the home as well as for their value in training eye and hand. The rapid development of these subjects in the lower schools and the demand for instructors led to the establishment of teachers' training courses, and promoted serious investigations into the pedagogical value of the subject, and into the question of the forms in which it should be presented in order to meet the changing needs of public schools which represent the only formal education obtained by the vast majority of people. The importance of this pedagogical problem at a time of rapid changes in social and industrial conditions, all of which affected the home, tended to add still further to the subject matter of home economics.

Extension work in household arts for the benefit of those already engaged in home making, and therefore unable to attend school, has for many years been a part of the courses in home economics in agricultural and other colleges. The value of this work was recognized and its possibilities for usefulness greatly increased when in 1914 Congress passed the Smith-Lever Extension Act which made Federal funds available for the promotion of extension work in agriculture and home economics in the various States under certain conditions which include grants of funds from the States co-operating. The general administration of these funds was given to the United States Department of Agriculture, and particularly to the States Relations Service, which co-operates with the various States through their agricultural colleges. At the time of the passage of this act a form of home economics instruction known as home demonstration was already being carried on by the Department of Agriculture. Practical demonstrations of the best methods of canning, cookery and doing other forms of housework were made for the benefit of the housekeepers of a given community. This work, and also education through clubs, classes and lectures, has been greatly enlarged since the passage of the act. Originally limited to rural regions, the work has since been broadened to cover urban districts also.

On still another side the subject has developed as the result of a growing demand for vocational education. The arts by which satisfactory homes are maintained, cooking, sewing, cleaning, etc., have always been followed by women outside of the home as a means of earning a livelihood. The opportunities for such employment have increased as changed conditions of living have called for the establishment of a greater number of hotels, restaurants, boarding-houses, public institutions and other places where food is prepared in large quantities. A vocation which can be followed in maintaining a home and also as a means of livelihood is particularly desirable for women who as a rule spend a comparatively short time in industrial work outside their own homes. This fact has been recognized by the Federal government in the passage of the Smith-Hughes

Act in 1917. This gives Federal aid to vocational education in many subjects, including home economics. Under this form of education according to the provisions of the act, home making and industrial activities which may be the means of earning a livelihood are included within the range of home economics.

Shortly after the passage of the Smith-Lever Extension Act the Nutrition Investigations work of the Department of Agriculture, which since 1892 had been a large contributor to the subject matter of home economics, was expanded into the Office of Home Economics of the States Relations Service. The appropriation for this work is made "to investigate the relative utility and economy of agricultural products for food, clothing and other uses in the home, with special suggestions of plans and methods for the more effective utilization of such products for these purposes." In a general way the Office of Home Economics provides, as a result of laboratory and other technical studies, material for the use of teachers, students and trained workers, as well as a great amount of both popular and more technical literature for general distribution, and also gives attention particularly to subject matter for the instructional work of extension offices of the States Relations Service of the Department. The United States Bureau of Education also deals with home economics, being concerned particularly with methods of teaching in schools of all grades, collegiate, secondary, elementary and normal.

During the progress of the Great War the machinery for teaching home economics was used by government agencies for the purpose of transmitting and interpreting the message of conservation, and the fact that it proved itself useful in the great world crisis without doubt reacted favorably on the subject itself by establishing it in public favor. There can be no doubt that its organization facilitated the carrying out of the programs of the Food and Fuel Administrations and the emergency work of the various permanent departments of the government. In turn its workers were brought into close touch with those who were studying food, clothing and fuel in the light of national and world needs and learned to see home problems in their larger relations.

Although the subject matter of home economics has been formulated in institutions of many different grades and purposes, and although as a field of investigation it has been marked off as the result of the recognition of the large number of social needs, the tendency is not toward further separation into a large number of subjects, but toward formulation into a systematic body of knowledge which can be presented progressively from the lowest schools to the highest. So broadened, it is a subject of universal interest, and deserves a place in general education, since it deals with the natural, social and economic foundations of home life. The tendency is to give to the broad, general, inclusive subject the name home economics, and to apply such terms as household economics, domestic science, cooking, sewing, textiles, etc., to its various branches. This usage is favored by the tendencies in the field of general economics, which though it originally considered little besides the production and the distribution of material wealth

now includes the consumption or use of wealth. Even when the satisfactory consumption of wealth, involving, as it necessarily does, healthful food, clothing and shelter, is looked upon merely as a means of increasing the productiveness of the individual it must include the home-making subjects. There is, however, another tendency in economics which is often described as humanizing. This tendency reflects a tendency in society to recognize the individual's value to himself apart from the value of the material wealth which he is able to create. This naturally directs attention to the importance of leisure in the life of the individual. It tends to emphasize the value of the home as the most satisfactory place for the child during the years of preparation for life, for the adult during periods of recuperation after labor, and for the aged during the period of rest at the close of life. Home economics is, therefore, being recognized as a branch of economics concerned largely with the consumption of wealth and its direction toward the enrichment of the individual life. In this form it includes not only a study of the materials that enter into the construction of the house and those that are used for food, clothing, household equipment, furniture and decorations, but also a consideration of the social and economic forces that affect the homes, put them within the reach of different groups of people, and determine their usefulness.

As a pedagogical subject home economics has been systematically codified in a syllabus of home economics which was prepared by the Department of Agriculture in co-operation with the American Home Economics Association.

The literature of the subject is large and growing rapidly.

**HOME EDUCATION.** See SUPPLEMENTAL EDUCATION.

**HOME RULE,** the domestic control of local affairs in a province, colony, dependency or integral part of an empire. The term has been employed in recent history most especially with regard to Ireland, which became a dependency of England ever since Pope Hadrian, as is averred, handed it over to Henry II of England in 1155, on condition that a certain portion of its revenue should flow into the treasury of the Holy See. Since that time Ireland has been more or less subject to English government. The Irish are a high-spirited and proud nation, and the history of their subjugation has been a bloody one. For many years, however, they had their own Parliament, and managed their own domestic affairs. Then came what is

called the Union. The Irish Parliament was abolished, and Irish constituencies were accorded representation at Westminster to the number of 103. This was in 1801. The Irish Parliament which passed the bill for its own destruction was bribed or cajoled into what the majority of Irishmen of to-day consider a fatal and suicidal act. The first Irishman of note to attempt a remedy for Irish grievances was Daniel O'Connell and his aim, the repeal of the Union, was much more drastic than that of his successors in leadership, who only desire self-government in local affairs, leaving the Imperial Parliament with control over other matters. Catholic emancipation had been won largely through his agitation, seconded by the strong and clear-headed statesmanship of Wellington. In 1834 O'Connell brought forward in the House of Commons his motion for a repeal of the Union. By recent act of Parliament the municipal councils of Ireland had been thrown open to Roman Catholics. O'Connell was elected lord mayor of Dublin, and while his motion for repeal was supported with but 40 votes in Parliament, he carried it by 45 to 15 votes in the municipal chamber at Dublin. This was undoubtedly the earliest step in the movement toward Home Rule, which from that time to the present moment has agitated Ireland. In the town council at Dublin one of the 15 who had voted against O'Connell's motion for the repeal of the union was a brilliant young lawyer named Isaac Butt. Gladstone's measure passed in 1869 for the disestablishment of the Episcopal Church in Ireland was followed by the formation in Dublin in 1870 of the "Home Government Association of Ireland" (later changed to the Irish Home Rule League), with Isaac Butt as one of its founders. Its aim was the establishment of a subordinate parliament in Dublin responsible to an Irish executive. In 1871 Butt was elected member for Limerick, and with him the Home Rule party in the British Parliament was born. From that time Butt brought forward an annual motion in favor of Home Rule, which attracted little public attention in Great Britain; but so effectively was the question agitated in Ireland that at the election of 1874, 60 Home Rulers were returned from that country. With the return of Charles Stewart Parnell in 1875 a new force took the field. He counseled obstructive courses in Parliament with a view to forcing Irish demands on the government—a course that was distasteful to Butt, who, although a true Home Ruler, was conservative in his instincts, and abhorred the obstructionist policy of his younger colleague. Butt died in the spring of 1879, and he was succeeded by William Shaw, who was presently ousted in the leadership by Parnell. With his assumption of the leadership came also a readjustment of the forces behind the Home Rule movement. Butt had received his strength to a considerable extent from the prosperous middle class and Protestant sources, and this was largely withdrawn after 1880. Although Parnell was himself a Protestant, he succeeded, by uniting the Home Rule movement with the agrarian agitation with which the name of the Land League is associated, in winning the support of the "physical force" party, which had hitherto stood aloof, and in obtaining the whole-hearted support of the tenant-farmers.

The period between 1880 and 1885 was an exciting one. Obstruction in Parliament became a fine art; there was continuous political and agrarian agitation in Ireland accompanied by "boycotting" and outrages, these being followed by repressive measures, under which the Irish leader himself suffered imprisonment. In the general election of 1885, the votes of the Irish electors in Great Britain were mainly cast for Conservative candidates, some of whose leaders had indulged in flirtations with the Home Rulers. This election, taken on a widely extended franchise, resulted in a further accession to the strength of the Home Rule or Nationalist party, 85 out of a total Irish representation of 103 being returned, and this party further held the balance of power in the House of Commons. In January 1886 the Nationalists aided the Liberals in overthrowing the Salisbury government, and Mr. Gladstone, after a year in opposition, again resumed the reins. At the general election of 1885 he had appealed for a majority that would make him independent of the Irish vote. That majority had not been accorded him, but he determined to accept the verdict of the Irish people as constitutionally expressed at the polls, announced his conversion to the principle of Home Rule, and immediately thereafter introduced his first Home Rule Bill. In moving the second reading of the measure, he made one of the most powerful and moving speeches in his career. But he had already lost the support of the "Whig" element in his cabinet and in the country, as well as that of Bright and Chamberlain; the second reading was lost by 30 votes, and in the ensuing general election he went down to defeat. The election, however, showed a majority for Home Rule in Ireland, Scotland and Wales; England, the "predominant partner," returned a great majority against it. The appearance of Parnell in 1890-91 as co-respondent in the O'Shea divorce suit was followed by a request from Gladstone—urged thereto by the English Non-Conformists—for his withdrawal from the leadership, by his deposition at the hands of the majority and the formation of a small party of his personal followers, and by his death in October 1891, which however did nothing to heal the divisions within the party. Under these strokes it appeared for a time as if the cause, that united the warring factions were to suffer eclipse. However, in 1892, Gladstone was again returned to power, with a majority of 40 votes. He again brought in a Home Rule measure, which was carried through all its stages in the House of Commons, but rejected summarily by the House of Lords. Shortly thereafter Gladstone retired from political life, and his immediate successor, Lord Rosebery, was not in sympathy with the Irish demands, and accepted the failure of the Home Rulers to convert England, the "predominant partner," as conclusive evidence of defeat. The reunion of the Nationalists under John E. Redmond in 1900 was followed by new activity. The accession of Sir Henry Campbell-Bannerman to power as Prime Minister in December 1905 (following on the long Unionist régime, 1895-1905) was regarded as of happy augury for the success of Home Rule, and on his death in April 1908, he was succeeded in the premiership by Mr. Asquith. The hotly-contested elections of 1910 resulted in drawn battles as between

Liberals and Unionists, and gave the balance of power to the Nationalists and Laborists. Mr. Asquith introduced a Home Rule bill on 11 April 1912 providing for a bicameral Parliament, a Senate of 40 members nominated in the first instance by the British government, and a House of Commons of 164 members, responsible to an Irish executive. Peace and war, treaties, navy and army, trade and navigation, coast defense, coinage, stamps, weights and measures, copyright, religion and freemasonry are subjects reserved for the Imperial Parliament. Ireland was to have 42 representatives in the British House of Commons. (A subsequent amendment provided for election to the Irish House of Commons on a basis of proportional representation, and the Senate after an interval of five years was to be elected by this method). This bill passed the House of Commons on 16 Jan. 1913, and was rejected by the House of Lords on 30 January. The bill was reintroduced in the summer session, passing its third reading in the House of Commons on 17 July. The government refused the Unionist demand that the bill should be the occasion of a reference to the country, and a third time was passed by the House of Commons on 25 May 1914. An amending bill had been introduced by the Premier providing that those counties of Ulster which should by referendum so determine, be excluded from the act for a period of six years. This was a concession made to the demands and threats of the Unionists of Ulster, who, under the leadership of Sir Edward Carson (q.v.), declared themselves unalterably opposed to being forced into allegiance to a Dublin Parliament, and had pledged themselves to armed resistance. Further difficulties were introduced by an undertaking given by the War Secretary to certain army officers that they would not be required to take up arms against Ulster in revolt against Home Rule, which was followed by the repudiation of the pledge by the government and the resignation of Colonel Seely, the War Secretary, and by the assumption of the War Secretaryship by Mr. Asquith. Meantime negotiations to effect a settlement by consent had proved abortive. So matters stood at the declaration of war on Germany on 4 August 1914. Mr. Asquith announced his intention to introduce a suspensory bill postponing the inauguration of Home Rule in Ireland for a twelvemonth or until the conclusion of the war. This measure received the royal assent on 17 September, and the Home Rule Act—under the provisions of the Parliament Act, passed in 1911 with the object of curtailing the powers of rejection up till that time possessed by the House of Lords—automatically became law without further reference to that branch of the legislature.

Following on the serious revolt in Ireland in Easter Week of 1916, an effort was made by the government to bring in Home Rule by consent of the various factions, and Mr. Lloyd George was the minister deputed to undertake these difficult and delicate negotiations. Success seemed to attend his efforts, for a basis of agreement was reached. The 78 members then sitting in the Imperial Parliament for the 26 Home Rule counties were to form the Dublin Parliament, and the 25 members from the six

excluded Ulster counties were to remain at Westminster. Among those who thus accepted seats in the new Parliament were Sir Edward Carson and Mr. J. H. M. Campbell, the attorney-general for Ireland. This temporary settlement was to continue for one year after the war, when the whole question was to be considered at a Great Imperial Conference of all the dominions. On two points, however, the agreement failed to command the assent of the Unionist party. The first point dealt with by the means by which the exclusion of the six Ulster counties was to continue or be brought to an end, the Unionist contention being that only by their full consent could they be brought in. Under the agreement the Irish members were to remain in undiminished numbers at Westminster until a permanent settlement had been carried through and embodied in an act of Parliament. The Unionists found it quite impossible to vote for a proposal which would maintain the Irish members in undiminished numbers after a general election and after a Home Rule government had been set up in Ireland. On these points the proposed settlement broke down, and for their failure to ratify it the government was strongly assailed by Mr. Redmond and the other Irish leaders. The former rule of government from Dublin Castle—abolished after the revolt—was again set up, Mr. Henry Edward Duke, a Unionist member of Parliament, being appointed chief secretary on 31 July, and Lord Wimborne appointed to his former office of Lord Lieutenant on 6 August. See also SINN FEIN MOVEMENT.

In addition to the movement for Irish Home Rule—under the name of "Home Rule all Round"—a similar movement has been inaugurated with the aim of setting up national Parliaments in Scotland and Wales. So far, however, no responsible British government has stood sponsor for them.

**Bibliography.**—There is extensive literature on the subject. The published speeches of the great political leaders in the United Kingdom—Gladstone, Morley, Chamberlain, Balfour, Asquith, Parnell and Redmond should be consulted. 'Gladstone's Life' by Morley is specially valuable, as are also Gladstone, 'Special Aspects of the Irish Question' (1887); McCarthy, 'The Case for Home Rule' (1892); Chamberlain, 'Home Rule and the Irish Question' (1887); Anderson, 'Sidelights on the Home Rule Movement' (1906); O'Donnell, 'History of the Irish Parliamentary Party' (2 vols., 1910); Redmond, 'Home Rule' (1910); 'The Home Rule Bill' (1912); Balfour, 'Against Home Rule: The Case for the Union' (1912); 'Nationality and Home Rule' (1914).

**HOME RULE, Municipal.** See MUNICIPAL GOVERNMENT.

**HOMER** is merely a name for the unknown authorship of the 'Iliad' and the 'Odyssey,' the two noble epics that stand at the beginning of Greek literature. Poems so exquisite cannot really be a beginning either in thought, language or metre. They presuppose a complex evolution of legend and a long apprenticeship to the poetic art. But for our knowledge they are still a beginning. We know that "the

work of Homer is the most admirable product of human poetry" (Sainte-Beuve); that "the 'Iliad' is the most important poetical monument existing" (Matthew Arnold); that "the 'Odyssey' is the only long poem that is never dull" (Lowell); that for the teaching and preaching of English literature Homer ranks with Shakespeare and the Authorized Version (Quiller-Couch). But of Homer himself we know nothing save what we deduce from the poems and infer from their descriptions of the *Aoidos* or bard. The Greeks themselves knew nothing. The eight Greek lives that fill 49 pages of Westermann's 'Vitarum Scriptores' are manifestly late inventions. They are developments of anecdotes, old epigrams and passages in the hymns attributed to "Homer." Hence come the patronymic names Melesigenes and Maeonides, the tale of the seven cities that claimed the honor of his birth, "where living Homer begged his daily bread," the conception of the poet as the blind old bard of Scio's rocky isle (Chios), the legend of his poetical contest with Hesiod and of his suicide because of failure to answer the fisherman's riddle, the tradition of a guild, clan or family of "Homerids" who transmitted the poems to posterity.

All older Greek poetry is reminiscent of Homeric language and phrasing, and there is a sense in which all Greek literature and civilization not to say all European civilization flow from this fountain-head. The earliest mention of Homer's name occurs in the complaint of the philosophic poet, Xenophanes of Colophon, that Homer and Hesiod attributed to the gods actions that would be shameful in men. The historian Herodotus, the first extant prose writer to name and discuss Homer, says that he lived "about four hundred years before my time," i.e., about 850 B.C. This is consonant with the fact that the 'Iliad' and the 'Odyssey' speaking of Achaeans, Danaans and Hellenes practically ignore the historical division of the Greeks into Dorians, Ionians and Æolians and know nothing of the "return of the Heraclidae" and the Ionian colonization of Asia Minor with which the history of Greece begins. Back of this historical Greece the new archaeology and the spade of Schliemann and Dörpfeld have revealed the so-called Mycenaean civilization of Mycenæ, Tiryns, Hissarlik (Troy) and many other sites, and the discoveries of Sir Arthur Evans and others in Crete have carried the hypothetical history of "Ægean" or "Minoan" civilization back to 2000 B.C. These discoveries have added enormously to the interest of the Homeric poems as documents. The civilization portrayed so minutely in the poems and that reconstructed by "Mycenology," though closely related are not identical. Their precise relation is still undetermined. The immense literature of speculation on this subject, including such delightful romances as Professor Murray's 'Rise of the Greek Epic' and Walter Leaf's 'Homer and History,' leave the Homeric problem precisely where Matthew Arnold found it in 1860. "These are questions which have been discussed with learning, with ingenuity, nay with genius . . . but there really exist no data for determining them." The English reader will find all the facts and the German bibliography in Seymour's 'Life in the Homeric Age' (London and New York 1907), and the

most reasonable argumentative discussion of the facts and theories in Andrew Lang's three books, 'Homer and the Epic,' 'The World of Homer,' 'Homer and His Age.' Jebb's little 'Homer' though now somewhat out of date is still an admirable summary. Another type of speculation about Homer combines critical analysis of the poems with the ancient tradition of their collection, arrangement or recitation at a later date than their composition. Passages in Cicero, the Pseudo-Platonic *Hipparchus*, and Diogenes Laertius speak vaguely of some regulation of the order of the "rhapsodes" recitations of Homeric poetry at the Panathenaic festival by Peisistratus or Solon or Hipparchus. The literature of the modern Homeric question beginning with Wolf's famous 'Prolegomena' (1795) interprets this to mean that the 'Iliad' and the 'Odyssey' were late compilations of traditional ballad or epic material, and seeks to confirm this notion by disintegrating analysis of the defects in the plot of the poems and the inconsistencies between their parts. The blown bubble of Wolf's reputation is punctured in Victor Bérard's 'Un mensonge de la science allemande' (Paris 1917). But apart from the personality of Wolf the entire speculative literature of the Homeric question is a gigantic bluff of modern scholasticism. It can be defended only as alchemy or scholasticism are approved, on the ground that the by-products of so great an intellectual effort have been suggestive and interesting. Neither the facts nor the arguments of any one of the 20 or 30 most prominent books of this literature will endure critical scrutiny. This so-called science always breaks down when challenged by a competent scholar who knows the texts, as may be seen, for example, in many articles published in *Classical Philology* in the past 10 years. When Huxley enumerated in a list of the achievements of science the fact that "the unity of authorship of the 'Iliad' was successfully assailed by scientific criticism, he was dogmatizing in dependence on authority about matters which he had not tested and which have now failed to stand the test. There is to-day neither proof nor preponderant probability that the 'Iliad' and the 'Odyssey' are not in the main the work of one supreme prehistoric Greek poet. The 'Odyssey' as we have it is the best constructed long poem in existence, and the 'Iliad' even if we concede the long retarding digression in Books II-XI to be a flaw is at least as well constructed as the 'Æneid' or 'Paradise Lost.' The Homeric poems are doubtless "traditional books." So are Shakespeare's plays, and there is no presumption that Homer followed his sources more closely than Shakespeare followed North's Plutarch or Lodge's Rosalind. The differences between the 'Iliad' and the 'Odyssey' are less than those between the earliest and the latest poems of Tennyson and Goethe. And while it may be true that in Augustan ages great poets come in clusters there is no example in literature of two poems so great and so like by different authors. The wise student of literature, then, will not waste his time on these idle speculations but will endeavor by loving study of the poems themselves to appreciate their unique combination of noble literary art with the charm of an earlier, simpler and more natural humanity. Consult Arnold, Matthew, 'On Translating

Homer'; Pope's Preface to his Translation; Shorey, 'Introduction to edition of Pope's Homer'; Mackail, 'Lectures on Greek Poetry'; Lang, 'Letters to Dead Authors—Homer'; Jebb, 'Lectures on Greek Poetry.' See ILLIAD; ODYSSEY.

PAUL SHOREY,

*Professor of Greek, University of Chicago.*

**HOMER**, Winslow, American painter: b. Boston, 24 Feb. 1836; d. Scarboro, Me., 29 Sept. 1910. He studied in the National Academy of Design, and was also a pupil of Frederic Rondel. He was sent to the front during the Civil War as special artist to *Harper's Weekly*, and on his return to New York exhibited his first important work, 'Prisoner from the Front' (1864), which won him recognition. In 1865 he was elected Academician. Taking up his residence in Scarboro, Me., he painted a series of pictures which indicated a marked development in style, sentiment and power. There was a trace of conventionality at least in the subjects of such pictures as 'Home, Sweet Home,' the series of which he painted between 1864 and 1884. From the latter date he began his portrayal of the fisher population of New England. Dramatic and realistic in the highest degree is the series of seven canvases from the 'Life Line' (1884) to the 'Lookout' (1897). But this artist reached his finest vein in his pure marines, of which the greatest is 'The Maine Coast.'

**HOMESTEAD**, hōm'stēd, Pa., borough in Allegheny County, on the Monongahela River and on the Pittsburgh and Lake Erie, the Pennsylvania and other railroads, about seven miles south of Pittsburgh. It was settled in 1871 and incorporated and chartered in 1880. The chief manufactures are foundry-products, glass, machinery and steel products. It is noted for its large steel plants, which employ over 7,000 men. The government is vested in a mayor, elected for three years, and a council, which appoints the chiefs of police, street and waterworks departments. The borough owns and operates the waterworks. At one time Andrew Carnegie (q.v.) was the principal owner of the Homestead steel works. Pop. 21,256.

There occurred in Homestead a serious strike which began 6 July 1892. Reductions in wages, change in time of signing the schedule and refusal to recognize the Amalgamated Iron and Steel Association, or to hold any conferences with the men, had brought on a general strike to date from a certain time, and enraged the men into burning H. C. Frick, the manager, in effigy; whereupon the works were at once shut down, 1 July, two days ahead of the agreed time, and the men armed themselves and prepared to resist by violence any attempt to supply their places with non-union men. The advisory committee of the union took charge of the town with regular armed companies, and allowed no one to enter the mills without their permission. On 5 July the company announced an intention to make repairs, and appealed to the sheriff for protection; he sent a small squad, who were at once driven from town by the strikers, the latter denying that any damage was intended and offering to be sworn in as deputies themselves. The company then hired a body of 300 Pinkerton detectives, who came up the river in barges; but the strikers broke

through the fence surrounding the mill, entrenched themselves behind a barricade of steel rails and billets, and whenever the Pinkerton men attempted to climb the steep bank (which they began at 4 A.M. of 6 July), shot them down. Next day they procured a 10-pounder brass cannon and bombarded the boat, splintering her wooden sides, but failing to pierce the steel plates within. They then sprayed the boats with oil from a hose, and emptied barrels of it on the river, setting it on fire to float down and fire the boats. The detectives repeatedly ran up flags of truce, which were at once shot down. At length the advisory committee sent delegates to offer a safe-conduct to the detectives, if they would leave their arms and ammunition and quit the town under guard; they were forced to submit, but when leaving under escort, the mob stoned, shot and clubbed them shockingly, one having an eye struck out by a woman in the mob. Seven were killed first and last, and 20 to 30 wounded; and 11 strikers and spectators were killed by their return fire from the boats. The governor (Pattison) refused to use the State power to quell the riot till the 10th, insisting that the local authorities must do their utmost first, and the sheriff must summon the citizens; and the troops did not arrive till the 12th, when the town was put under martial law. A committee of Congress was appointed to investigate the case; and later, a Senate committee in the interest of the strikers was appointed to inquire into the hiring of private armed parties to maintain public order. On 21 July Mr. Frick was shot and stabbed in his office, but recovered. On the 18th a number of strikers were arrested for murder; and retorted by indicting the Carnegie Company, the Pinkerton brothers and five of their men for murder. The advisory committee was also charged with treason and usurpation, in taking military possession of the town. The mills were soon supplied with new men, but the strike was not officially declared "off" till 20 Nov. 1892.

**HOMESTEAD EXEMPTIONS**, homesteads of a certain value or extent which the law provides shall be exempted from sale on execution or by any final court process. Homestead exemptions differ throughout the States. In Alabama "every homestead not exceeding 80 acres and the dwellings and appurtenances thereon" is exempt, if the property is not in any city, town or village; also, any city, town or village lot with its dwellings and appurtenances owned and occupied by a citizen and not exceeding in value \$2,000 is exempt. In Florida the exemption is on half-an-acre city or town lot, and on 160 acres in the country. In Texas, the exemptions are on \$5,000 city or town lots and on 200-acre country lots. In Michigan on \$1,500 urban lots and country lots of not over 40 acres. Exemption, however, does not extend to lawful mortgages, to payment of purchase obligations and contracts, or from sale for public assessments and taxes. See HOMESTEAD AND LAND LAWS.

**HOMESTEAD LAW**. The Homestead Law is a series of enactments beginning with the Act of 20 May 1862, which provides for the disposition of the public lands to homesteaders without requiring any compensation except the mere acts of residence, cultivation and improvement. A person who is the head of a

family or who has reached the age of 21 and who is a citizen of the United States or has declared his intention to become a citizen and who is not the owner of more than 160 acres of land in the United States, may apply for not exceeding 160 acres, and upon residing thereon, cultivating and improving the same for three years in compliance with the law may obtain patent therefor.

There are various modifications of the original law and various extensions by which one may obtain under recent acts 320 acres under what is known as the Enlarged Homestead Law, or as much as 640 acres in Western Nebraska under what is known as the "Kinkaid Act." The details of these acts will be discussed under this title.

In the beginning of the history of the disposition of the public lands the desire of the people seemed to be to secure a large return as rapidly as possible and many sales of large areas were made in the earlier period. This idea was later followed by the policy of encouraging settlement on the public lands and the building of homes. See the article PUBLIC LANDS.

The home-making idea and the disposition of the public lands gained greater and greater strength until in 1852 it became a national political issue. In that year the Free Soil democracy incorporated in its platform for the Presidential campaign this declaration: "That the public lands of the United States belong to the people, and should not be sold to individuals nor granted to corporations, but should be held as a sacred trust for the benefit of the people, and should be granted in limited quantities, free of cost, to landless settlers."

This question held the public attention, was discussed and debated and remained a political issue before the people for 10 years. A homestead bill was passed by the House of Representatives in 1859, but after being voted on by the Senate several times failed to pass. In June 1860, after much discussion in both Houses, a homestead bill was agreed upon and presented to President Buchanan, who on 23 June 1860 vetoed the bill.

The provisions of the bill may be summarized as follows: Any citizen of the United States who is the head of a family, and any person of foreign birth residing in the country who has declared his intention to become a citizen, may enter and settle upon not exceeding 160 acres of public land, and, after residing upon it for five years, shall receive patent for the land. The bill also contained a cession to the States of all public lands within their limits which remain unsold after having been subject to sale for 30 years.

The veto message states that the proposed cessions to the States would involve a present donation to them of 12,229,731 acres and would from time to time transfer to them other large bodies of land. President Buchanan stated a number of objections to the bill. His principal point was that the bill was unconstitutional because it made a donation of the public lands to the States and to individuals, holding that the power given by the Constitution to dispose of the public lands did not include the power to give them away. The President objected because of the injustice to the early settlers who had braved the hardships and dangers of

frontier life and had paid \$1.25 per acre for their lands; also because it would depreciate the value of the land warrants of old soldiers, which were given for their services in fighting the battles of their country. An effort was made in the Senate to pass the bill over the veto, but the necessary two-thirds vote in its favor could not be obtained.

In the political campaign of that year the Free-Homestead Law was an important feature of the discussions of Lincoln and the other candidates. Soon after the opening of the extra session called by President Lincoln to convene 4 July 1861, on account of the troubled conditions in the South, a new homestead bill was introduced in the House of Representatives on 8 July, and it was promptly taken up at the opening of the regular session in December. There was vigorous opposition, and the bill did not pass the House of Representatives till 28 Feb. 1862. The bill was amended in the Senate and passed by that body on 5 May. The two Houses soon after agreed upon a form of bill, and it was finally passed by both Houses on 19 May and approved by President Lincoln on 20 May 1862. The Act as passed differs in only one important particular from the bill which was vetoed, namely, in the omission of the proposed cession of lands to the States.

The Homestead Law has now been on the statute-books for nearly 50 years, substantially as originally enacted. It is regarded as the basis of our land laws and was the most successful of our land policies. The constitutionality of the Act does not seem to have been seriously questioned in the courts.

Under the Homestead Law proper, the applicant is limited to 160 acres and must reside upon the land and make it his home to the exclusion of any other residence during the period of three years. At the end of this time he may make final proof of his residence and of the cultivation and improvement of the land. If this is satisfactory he receives a patent from the United States which conveys to him full title and unrestricted ownership. If a homestead settler dies without having filed application for entry or if having entered he has not submitted final proof, his rights pass to his widow or if there be none then to his heirs or devisees. If all the heirs are minor children and the other parent is dead the right to the patent vests in the children at once.

The laws provide for the commutation of a homestead entry before the completion of the three years' period of residence, after 14 months' continuous residence, and by the payment of \$1.25 per acre, or, where the land is within the limits of certain railroad grants, \$2.50 per acre and upon the proof of substantial improvements and cultivation of not less than one-sixteenth of the area.

Homestead entrymen are not allowed to alienate any part of the land in the homestead entry prior to making proof except for public purposes, but they may mortgage the land for the purpose of securing money for improvement or for any other purpose not inconsistent with good faith. Only one homestead entry is allowed but where the original homestead entry was less than 160 acres an additional entry of such amounts as not to exceed a total of 160 acres will be allowed.

Beginning with the Act of 19 Feb. 1909 several acts were passed providing for enlarged homesteads not exceeding 320 acres of public land in the States of Arizona, California, Colorado, Idaho, Kansas, Montana, Nevada, New Mexico, North Dakota, Oregon, South Dakota, Utah, Washington and Wyoming, applicable, however, only to lands designated by the Secretary of the Interior as non-mineral, non-timbered, non-irrigable and subject to the said acts. The entryman of an enlarged homestead must reside thereon for three years and must cultivate at least one-sixteenth of the area for agricultural crops other than naked grass, beginning with the second year of the entry, and at least one-eighth of the area must be continually cultivated beginning with the third year.

The Kinkaid Act of 28 April 1904 provides for homestead entries not exceeding 640 acres in western Nebraska except for such lands as may be designated by the Secretary of the Interior as irrigable. The general homestead laws will apply but the entryman must expend not less than \$1.25 per acre in permanent improvements. Those who have already made homestead entry may take additional land in the area covered by this Act but the total entered must not exceed 640 acres.

**HOMICIDE**, hōm'ī-sīd, or man-killing, is either justifiable, excusable or felonious. Of the first sort are such cases as arise from unavoidable necessity or accident, without any imputation of blame or negligence in the party killing. Where a crime is punishable capitally according to the laws, the judge is bound to condemn the criminal to death, and the sheriff or other executive officer to carry the sentence into effect in the manner prescribed by the sentence of condemnation. But the judge must have jurisdiction of the offense, and be duly commissioned; and the executive officer must be empowered to carry the sentence into effect, and must perform the execution in the manner prescribed by law, otherwise the execution of the criminal will make the judge or the officer, as the case may be, guilty of criminal homicide. So, too, where an officer of justice is resisted in the execution of his office, in his attempt to arrest a person in a criminal, or, as is maintained, even in a civil case, he is not obliged to give back, but may repel force with force; and if the person resisting is unavoidably killed, the homicide is justifiable, for few men would quietly submit to arrest if, in case of resistance, the officer was obliged to give back. It is, however, laid down as law that if a felony be committed, and the felon attempts to flee from justice, it is the duty of every private citizen to use his best endeavors to prevent an escape, and if in the fresh pursuit the party be killed where he cannot be taken alive, it will be deemed a justifiable homicide. The same rule applies to cases of an attempt on the part of a felon to break away and escape after he has been arrested, and is on the way to jail. So if a party has been indicted for felony and will not permit himself to be arrested, the officer having a warrant for his arrest may lawfully kill him if he cannot be taken alive. But this is to be understood only of officers, and not of private persons. Magistrates and officers authorized to

suppress and disperse mobs are justified by the common law in taking the requisite measures and using the requisite force for this purpose, though it extend to the killing of some of the rioters. The law arms every private citizen in the community with the power of life and death for the prevention of atrocious felonies accompanied with violence and personal danger to others, as in case of an attempt to murder or rob, or commit burglary or arson, the person making the attempt may, by the common law, if he cannot be otherwise prevented, be killed on the spot, and the law will not recognize the act as a crime. In cases of this sort, in order to justify the homicide, it must appear that there were good grounds for a suspicion that the person killed had a felonious intent. A woman is justifiable in killing one who attempts to ravish her, and the husband or father may be justified in killing a man who attempts a rape on his wife or daughter.

The cases already mentioned of justifiable homicide are those in which the public authority and laws are directly concerned. The laws of society, however, leave every individual a portion of that right of personal defense with which he is invested by those of nature. If one may interpose to prevent an atrocious crime against society, where he is not himself in any personal danger, the laws will, a fortiori, permit him to defend himself against attacks upon his own person. Murder is the killing of a person who is under the protection of the laws, with malice prepense, either expressed or implied. Malice is the distinguishing characteristic of murder, and may be either forethought, or expressed, or implied. It is not necessary in order to constitute the crime of murder that the slayer should have the direct intention of killing. If the act be done with a wicked, depraved, malignant spirit, a heart regardless of social duty, and deliberately bent upon mischief, it is characterized by what the law denominates malice though it may not result from any enmity or grudge against the particular victim. So if a man wantonly discharges a gun among a multitude of people, whereby any one is killed, the act will be done with that depravity of disposition which the law considers malice. Murder can be committed only by a free agent, for the crime presupposes a will, motive or disposition on the part of the perpetrator. An idiot or insane person cannot commit this crime. But drunkenness is in general no excuse for homicide, though the act be done under its immediate influence.

The manner of killing is not material. Whether it be by shooting, poison, beating, imprisonment, starvation or exposure to the inclemency of the atmosphere, it will be equally murder. This crime may be committed by mere advice and encouragement. An infant unborn is within the protection of the law, and it is laid down that if, in consequence of poison given or wounds inflicted before the birth of a child which is afterward born alive, it dies soon after its birth, the act is murder. The act of suicide is considered by the law to be murder, and the person making away with himself is accordingly styled a "self-felon." This view is undoubtedly being modified by public opinion.

The lines of distinction between felonious and excusable or justifiable homicide, and between manslaughter and murder, are in many

cases difficult to define with precision. But in general the accused has the advantage of any uncertainty or obscurity that may hang over his case, since the presumptions of law are usually in his favor. The characteristic distinction laid down in law books between murder and manslaughter is the absence of malice in the latter. Sudden provocation may be an excuse for striking another without the intention to give a deadly blow; and though death ensue, the party may not be guilty of murder. One circumstance, showing the degree of malice, or rather showing its presence or absence, is the kind of weapon used in giving a wound on a sudden provocation; and another circumstance of importance is the fact of the weapon's being already in the hand or not, for going to seek a weapon gives time for deliberation. The ground of excuse of homicide, in case of provocation merely, is the supposed sudden passion, some influence of which the law concedes to the frailty of human nature. But the excuse of self-defense goes still further; and where a man is attacked, so that his own life is endangered, or in such way that he may reasonably suppose it to be so, he may repel the attack with mortal weapons. One of the most frequent cases of manslaughter was that occasioned by single combat, and on account of the firm hold which the point of honor had taken of European nations, was long among the most difficult subjects of legislation. (See DUEL). The crime of murder in its most aggravated degree is punished with death in most parts of the civilized world.

**HOMILY** (Greek, *homilia*, intercourse), as an ecclesiastical term, a discourse addressed to an audience on some subject of religion. The homily was so called to distinguish it from the speeches of profane orators. The ancient homily was sometimes simply a conversation, the prelate talking to the people and interrogating them, and they in turn talking to and interrogating him. The difference between the homily and the sermon was the entire absence of oratorical display from the former, and the elucidation of the Scriptural text in natural order, without throwing the exposition into the form of an essay.

The earliest existing examples of the homily proper are those of Origen in the 3d century. In the schools of Alexandria and Antioch this form of discourse was sedulously cultivated, and Clement of Alexandria, Dionysius and Gregory Thaumaturgus are among the names most eminent in this department. Augustine and Gregory the Great were among the Western composers of homilies. Later still Bede, several of the popes and foreign ecclesiastics still adhered to the homiletic form of exposition as the most suitable to impress the truths of Scripture with efficacy on the popular mind.

In the Church of England there were two books of homilies that were long authoritative, and are still sometimes appealed to to settle disputes as to what the Anglican doctrine is in points on which they bear.

**HOMING-PIGEON**, a variety of the common pigeon in which the love of home and power of flight have been developed to make the bird useful and reliable as a bearer of messages; also, a fancy variety characterized

by the possession of certain definite points, but not necessarily useful as a homer. The show carrier-pigeon is a large, long-necked variety, with abnormally developed wattles about the base of the beak and round the eyes, but the true homer is of smaller size and lacks the enormous tuberculated growth.

The training and breeding of homing-pigeons were long almost confined to Belgium, and two main types of the Belgian homer have been distinguished as the Antwerp and the Liège varieties, the former being larger but less graceful in form than the latter. American pigeon fanciers breed mainly from the Antwerp type, and the birds are commonly designated Antwerps.

The training of a homing-pigeon begins when it is about three months old. It may then be taken to a distance of about a mile from its loft in a suitable direction and liberated in order that it may fly back. After an interval of a day or two it should be carried three miles from home in the same direction and set free, and on the third occasion, a few days later still, the distance is usually increased to six miles. This mode of training is continued steadily during the season, the successive distances above those already mentioned being 12, 25, 50, 75, 96, 125, 155 and 200 miles. The intervals of rest must be carefully preserved especially in times when the weather is unfavorable. During the bird's second season it is made to repeat something of its first year's performances and to extend its flight to 250 miles or possibly to a greater distance. During the following three seasons good birds will be at their best, and even for some few years later they may do good work. During the training period and also at other times the housing and feeding of the birds must be carefully attended to.

Velocities of over 30 yards per second have been recorded for various pigeons, but the average velocity is rather less than half that amount. One bird, in 1896, actually covered the distance from Thurso to London, just over 500 miles, within one day, its average velocity being about 24 yards per second. In unfavorable weather the height attained varies from about 320 to rather over 400 feet, but in good weather some birds will reach a height of about 1,000 feet. The distance from Algiers to Paris, fully 1,100 miles, is one of the longest on record as having been traveled by a pigeon.

There has been much discussion regarding the means by which pigeons return to their homes over such long distances. Untrained birds often fail to return, and during training young birds are often lost.

Many instances are recorded of the employment of pigeon messengers by ancient peoples. During the first half of the 19th century pigeons were widely used in Great Britain for the rapid communication of intelligence, and in particular many stockbrokers obtained early information of the state of the markets by this means. The introduction of the electric telegraph, however, soon led to the complete disuse of the pigeon post. The siege of Paris during the Franco-German War of 1870-71 first brought the carrier-pigeon into prominent notice as a valuable means of communication in time of war. During that siege more than 350 birds were sent out of the city in balloons,

and of these some 300 were liberated with messages. Only some 70 returns were made, and these were effected by 57 birds. By the adoption of microphotography the space occupied by a message was so reduced that a single pigeon could carry a very large number of messages without having its movements hampered in the least. One of the pigeons that succeeded in returning to Paris carried no less than 40,000 messages on 18 collodion films which were enclosed in a goose-quill attached to the tail. Since that time the leading Continental powers have established elaborate pigeon systems for use in time of war. During the war with Spain, in 1898, the fleet of vessels that patrolled the Atlantic Coast was supplied with a number of carrier-pigeons' cotes, but happily there was no occasion for testing their effectiveness, though in times of peace messages are frequently successfully carried from war vessels to points on the shore. During the European War carrier-pigeons were extensively used by all the belligerents. Consult books mentioned under PIGEONS.

**HOMINIDÆ**; hō-min'ī-dē, the family to which man was assigned in the earlier systems of animal classification; but many modern zoologists refuse him so great a distinction, making man, zoologically considered, only a species (*Homo sapiens*) of a genus of the family *Simiida*, which also includes the genera of the anthropoid apes. See MAN.

**HOMŒOPATHY** signifies similar affection; passion, suffering or disease. As employed in medicine, and as understood by Hahnemann and physicians of the homœopathic school, homœopathy may be defined as: the treatment of disease by means of its similitum. The cure is undertaken by a medicine capable of producing in a healthy person symptoms similar to those manifested by the patient. The name or type of the disease, the type or class of the drug administered or the size or strength of the dose have no direct relationship to homœopathy. Nevertheless, it does hold important incidental relationship to the classification of drugs, to the facts and principles of dosage, to diagnosis, to pathology and bacteriology and to all other departments of medicine and allied sciences. Under this definition, the experimental application of homœopathy requires that the drug shall cover the *tout ensemble*—or, as Hahnemann expresses it, the "totality" of the symptoms as exhibited by the patient; and not merely one or a few of the dominant or diagnostic symptoms or conditions. Neither does it imply that the homœopathic remedy can overcome any and all the adverse conditions and circumstances under which it may be administered. In its practice, homœopathy recognizes this principle of similarity as between the symptoms of the curative drug and the symptoms appearing in the patient. The symptoms exhibited by the patient are carefully ascertained and studied with reference to their significance and relations, and these furnish the indications upon which the selection of the "similar remedy" is then made with equal care. Whether the object of the prescriber be immediate and complete restoration to health in a curable case or mere alleviation of suffering in a case not curable, the same course is pursued.

In homœopathic practice the finding of the curative remedy is of *first* importance, as a matter of course. But the diagnosis of the case is a most urgent consideration, because it materially aids the physician in his quest for the "totality" of the symptoms, suggests his general management of the case, prompts the sanitary precautions to be taken, guides him in his prognosis, etc. Moreover, it sometimes calls to his mind a group of medicines among which the curative similitum will probably be discovered, and in this indirect way may assist in the medical treatment. Yet it must be distinctly understood that in homœopathic prescribing the final choice of the remedy is always determined, not by the name of the disease, nor even by the symptoms usually present in the disease, but only by those symptoms occurring in the individual patient. Pathology, both structural and functional, is also a subject of careful research in connection with homœopathic practice, as under other systems; but never for the purpose of formulating "theories" of the nature of the disease, on which to base treatment.

In common with all other modern "schools" of physicians, homœopaths hold that whenever the originating or "exciting" cause of the disease can be discovered it should be removed if possible. When the disease does not disappear after removal of the cause which had apparently produced it, homœopathic physicians are convinced that there must be some other contributory cause. In many cases this perpetuating cause is hidden and its nature altogether undiscoverable. They also hold the view that if this latter cause be removed the continuance of the malady is inconceivable. Equally incredible is it that the disease can be actually "cured" so long as the cause remains operative; if it could be, no matter how brilliant might seem the "cure," it would be immediately reproduced, unless meantime the bodily susceptibility to the disease were also removed. The homœopathic profession does not concede a "cure" in any case in which the operative cause remains active, and, therefore, in the view of these practitioners, the word "cure" has a much narrower meaning, and actual cures are accomplished much less frequently than is generally supposed, the majority of such so-called cures being merely recoveries—recoveries facilitated, or perhaps made possible, by the skilful efforts of the medical practitioner—but recoveries merely.

Under this view, that the disease has a central morbid cause, it is impossible that homœopaths can accept the opinion that the malady can be cured by the mere lopping off of one or a few of its principal symptoms, or of its prominent pathological processes or conditions. How, then, do homœopaths explain their ability to reach with their remedies the perpetuating or "maintaining" cause of disease, conceding, as they do, their inability to determine its nature, or even its location? Starting out with the accepted principle that "like causes operating under like conditions produce like effects," the homœopathist assumes the converse of the proposition to be likewise true; namely, that like results appearing under like conditions and circumstances indicate the operation of like causes. When two patients in similar conditions of health manifest similar

morbid symptoms, the phenomenon is, by all pathologists, considered as indicating the operation of causes in corresponding portions of the two organisms, and acting in a similar manner. This view is not peculiar to any medical school, but is held by all physicians alike. To this doctrine the homœopathist adds the belief that it also applies to the effects of drugs, as well as to those of ordinary disease. Therefore, when similar morbid manifestations result, in one case from disease and in the other from the effects of a drug, the symptom-complex indicates a physiological or (pathological) cause operating in a similar part or parts of the organisms involved, and operating in a similar manner in both.

So much as to the *locality* of the cause,—the “seat of the disease,” upon which the “similar” drug acts. What of the *manner* in which it acts? It was long ago shown by Hahnemann and others that the effects of almost any drug upon the human body are of two kinds, primary and secondary, direct action and reaction; and that these two actions are, in a measure, the opposite, one of the other. This view has been advocated by numerous physicians, not always of the homœopathic school. Of late years the phenomenon has attracted more attention from medical writers than formerly, and is generally spoken of as “the dual action of drugs.” To illustrate: a drug may first stimulate and afterward depress a certain organ or function. Another may first depress and then stimulate, and the symptoms will, of course, take their character from the action or reaction of the drug. Some homœopathists are of the opinion that this dual quality of drug action is the proper explanation of the curative potency of the *similimum*. Others, Hahnemann included, explain it on other grounds. Others consider it likely that the different effects of large and small doses—a fact observed by many practitioners—may account for the cures made by the similar remedy. All homœopathists agree, however, that the question turns upon the curative *fact*, and not upon its explanation, and hold that one and all of these explanations may yet prove to be erroneous, yet firmly convinced that the main fact will remain unaffected through all changes in theory and doctrine.

Homœopathy, like any other principle or art, has its own particular field of application and operation. Thus it does not cure directly a mechanical injury to the tissues, or any impairment wrought by chemical means; though it does cure the functional diseases and disorders caused by the irritation of such injuries. The homœopathic remedy acts directly only upon function. It never alters a structure except by first modifying a function. Nor does a drug ever act homœopathically upon a function unless that function be disordered. When a drug acts on a healthy function, or when it causes disorder in a function, such action is never homœopathic, whatever may be the mode of the selection of the drug and whatever the form or quantity in which it is administered. Such, in brief, is an exposition of homœopathic belief and practice, and of its underlying principles and doctrines as taught by Hahnemann and held by the profession as a body. The small dose used by homœopathic prescribers is considered in another part of this article.

Homœopathy as a mode of medical practice is usually said to have originated in 1796, when Dr. Christian Friedrich Samuel Hahnemann published in *Hufeland's Journal*, at Jena, an ‘Essay on a New Principle for Ascertaining the Curative Powers of Drugs.’ In this essay he criticizes the state of the medical art, and especially urges that the chemical properties and powers of drugs are not adapted to the work of curing disease, but that cures must be accomplished by an entirely different property resident in medicinal substances. Having read of cures in medical literature and observed, in his own patients, recoveries occurring under the evident influence of the “similar” remedy, he offers the following theory of the phenomenon: “Every powerful medicinal substance produces in the human body a kind of peculiar disease; the more powerful the medicine, the more peculiar, marked and violent the disease. We should imitate nature, which sometimes cures a chronic disease by superadding another, and employ in the (especially chronic) disease we wish to cure, that medicine which is able to produce another very similar artificial disease, and the former will be cured; *similia similibus*.” Hahnemann further explains his conception of a homœopathic cure in his ‘Organon,’ section 26, in the following language: “A weaker dynamic affection is permanently extinguished in the living organism by a stronger one, if the latter (while differing in kind) is very similar to the former in its manifestation.” This action he designates the “homœopathic law of nature.” The term “homœopathy” or “similar disease,” as representing the new medical practice, may have been suggested, not alone by the fact of cures produced by the similar drug, but also by Hahnemann’s theoretical explanation of the phenomenon.

A correct and adequate conception of homœopathy, of the difficulties necessarily encountered in its propagation and establishment, and of the place it holds and the influence it exerts in the development of therapeutics can be obtained only through knowledge of the conditions of general medicine down to the close of the 18th century. It is essential, therefore, that reference be made to certain points in the progress of medical history from its beginnings, to and including the period of the investigations that resulted in the discovery of homœopathy as a general therapeutic principle. This reference does not need to embrace all the departments of medical science—*anatomy, physiology, pathology, etc.*—but the department relating to treatment, or therapeutics only. It is requisite for us to know and appreciate the mental conception upon which the “art of healing” was established prior to the advent of homœopathy as a system of medical practice.

The earliest efforts of men to alleviate the sufferings caused by illness and mechanical injury were chiefly instinctive. Water, moist earth, the fleshy portions of plants and other cooling substances were employed by men, as well as by the lower animals, to mitigate the pain, heat and discomfort of local inflammation; and other simple expedients were instinctively resorted to for various disordered conditions. In time the number and variety of known remedial agents, as well as the diseases for which they were used, must have been rapidly ex-

tended by experience. And thus began the "empirical method" of treatment—the natural second step in the progress of medicine. Inefficient as were these modes of treatment, they were far more rational than most of those that occupy the pages of medical history for many succeeding centuries. These later methods were based, not on observation and experience, but upon pure assumptions having, as John Stuart Mill expresses it, "no limitations other than those of the imagination." (The construction of medical theories, or philosophical explanations of observed facts, was a still later development). Among the large number of these ancient hypotheses are the following: (1) That disease is a punishment sent by some malevolent deity; (2) that it is due to the influence of a comet, a planetary conjunction, an earthquake or some other celestial or terrestrial phenomenon; (3) that it is caused by abnormal preponderance of some one of the four elements (fire, air, earth and water) of which the human body was said to be composed; (4) that it originates in a disturbance of the bodily states of heat, coldness, moisture and dryness; (5) that it arises from disproportion in the four humors which supply the organism—blood, mucus, black bile and yellow bile; (6) that it is produced by a *materia peccans*, or offending matter, which must needs be expelled; (7) that the body contains multitudes of "invisible pores" through which circulate infinitesimally minute atoms or corpuscles, and that disease has its cause in obstruction or relaxation of these pores; (8) that disease is based upon three possible states of the organism—"strictum," "laxum" or "mixtum"—which must be treated with laxatives, astringents or a combination of both, as might be needed, etc. All these hypotheses, and many others, arose prior to the close of the 2d century A.D. Their absurdity is not more grotesque than that other hypothesis which underlies each and all of them, namely, that a knowledge of the cause or nature of disease necessarily indicates the means and method of its cure; a view not held at present by any homœopathic or other scientific physician. The period between the 2d century and the 15th presents little record of therapeutic art; but with the invention of the printing press came a stronger impetus to all forms of research, medical included. Since that time increasing knowledge of anatomy, chemistry, bacteriology and physiology has led to the elaboration of therapeutic theories based upon certain facts relating to these natural sciences. The advances in anatomy had suggested a mechanical basis for therapeutics; pneumatics, friction of fluids in vessels, the diameters, curvatures and angles of blood-vessels were brought forward to explain the phenomena of disease and to suggest measures for its cure. Physiology and chemistry brought out a renewal of the ancient doctrine of "four elements" and the substitution of the three "alchymistic symbols" represented by mercury, salt and sulphur, whose union is health and their separation disease. The author of this doctrine, Paracelsus, also ascribed to the "vital force" not only power, but also the intelligence, to resist disease and to provide for its cure. About the middle of the 18th century, or near the time at which the discovery of the general principle of similars was made, physiological

hypotheses became largely identified with therapeutics; and the same might be said of chemical theories. Health and disease were the results of a contention between the acids and the alkalis. Haller held to the view that disease was due to change in the "irritability" of the tissues. Cullen revived an old doctrine that disease was caused by "spasm" and "atony" and required to be treated in accordance with that view. Brown, the rival of Cullen, concluded that diseases were either "sthenic" or "asthenic," and required asthenic, or sthenic medication, as the case might be. Before the close of the 18th century the medical profession had acquired knowledge of a number of drugs possessed of "specific" properties for the cure of particular diseased conditions; among them were Peruvian bark for intermittent and other malarial fevers, mercury for syphilitic diseases, sulphur for itch, etc. These specifics exerted their curative effects by virtue of properties not at all understood at that time, and but imperfectly known a century later. These specific cures were limited to comparatively few diseases. For the treatment of the conditions with which the medical practitioner is contending daily which constitutes almost his entire duty, he depended on nothing but fallacious assumptions and hypotheses. Such was the condition of the medical art at the time Hahnemann began his independent researches in therapeutics.

Hahnemann possessed unusual linguistic attainments, which gave him access to the publications not only of Germany, but of England, France, Spain, Italy, Austria, Greece and Arabia. Not only was he a scholar in the field of letters, but he was also a practical expert in chemistry, pharmacy and industrial technology. He made many discoveries in industrial chemistry and introduced scores of improvements in the details of manufacturing chemical products. At the period of his earliest responsible connection with medicine "there was," says Rapou, "complete anarchy in the domain of therapeutics." Hahnemann, unwilling to trust the lives of his patients to the tender mercies of this conglomeration of assumptions, adopted the use of the class of remedies known as specifics, whose effects were easily ascertainable, though their *modus operandi* was altogether unknown. Homœopathy was not an invention, like some of the "systems" of medicine that preceded it; neither was it a sudden discovery. It was an evolution, its development extending over the time from 1790 to 1835, a period of 45 years. The earlier portion of the process is described by Bradford, who in speaking of its beginning says: "We now come to the translation of a very important book (Cullen's '*Materia Medica*'), from which must be dated the discovery of the Law of Similars. He was translating for the booksellers and publishers of Leipzig, and it is not likely that he selected the books which he was to translate. Dr. Cullen was an authority on the subject of the *materia medica* of his day, an experienced lecturer, a talented chemist and a brilliant and popular teacher in Edinburgh. Naturally, the Germans wished to learn of his new and peculiar theories regarding disease, as well as to obtain the use of his '*Materia Medica*,' which at this time was a standard work.

"Hahnemann was the most accomplished translator of medical works of the time, and what more natural than that the task should be given to him. Cullen published the first edition of this book, in London, in 1773. Another edition was issued in 1789, in two volumes, and it was this edition that Hahnemann used in his translation. In this book, Volume II, Cullen devotes about 20 pages to *Cortex Peruvianis* (Peruvian Bark), gives its therapeutical uses in the treatment of intermittent and remittent fevers, advises its use to prevent the chill, and gives minute directions for the safest period of the disease in which to use it. Hahnemann was impressed with the use of this drug, with which he, as a physician, had before been familiar. Something in the manner in which Cullen wrote decided Hahnemann to experiment with it upon himself and to see what effect it would have upon a person in perfect health. The result of this experiment will be given in Hahnemann's own words. In the translation of William Cullen's 'Materia Medica' (Leipzig 1790, page 108 of Vol. II), appears the following foot-note by Hahnemann: 'By combining the strongest bitters and the strongest astringents, one can obtain a compound which, in small doses, possesses much more of both these properties than the bark, and yet no specific for fever will ever come of such a compound. This the author, (Cullen) ought to have accounted for. This perhaps will not be so easily discovered for explaining to us their action in the absence of the Cinchona principle.

"I took, by way of experiment, twice a day, four drachms of good *China*. My feet, finger ends, etc., at first became cold; I grew languid and drowsy; then my heart began to palpitate and my pulse grew hard and small; intolerable anxiety; trembling (but without cold rigor); prostration throughout all my limbs; then pulsation in my head, redness of my cheeks, thirst, and in short, all those symptoms which are characteristic of intermittent fever, made their appearance, one after the other, yet without the peculiar, chilly, shivering rigor.

"Briefly, even those symptoms which are of regular occurrence and especially characteristic—the stupidity of mind, the kind of rigidity in all the limbs, but above all, the numb, disagreeable sensation which seems to have its seat in the periosteum, over every bone in the body—all these made their appearance. This paroxysm lasted two or three hours each time, and recurred if I repeated this dose, not otherwise; I discontinued it and was in health."

"The next note in the German translation is as follows: 'Had he (Cullen) found in bark traces of a power to excite an artificial antagonistic fever, he certainly would not have persisted so obstinately in his mode of explanation.'" ('Life and Letters of Dr. Samuel Hahnemann' by T. L. Bradford, M.D., pp. 35-37).

These experiments seemed to show that Peruvian bark is capable of producing in the healthy human organism a series of symptoms quite closely resembling those of that peculiar form of fever which it is known to cure. Instead, however, of solving any questions in the mind of Hahnemann it only served to suggest several others. Does Peruvian bark then produce the same symptoms that it specifically cures? If so, is this power peculiar to Peru-

vian bark, or is it to be discovered in other drugs? And do all drugs possess the power to cause symptoms similar to those they cure? To obtain light upon these questions occupied his efforts during the six years between the translation of Cullen's 'Materia Medica' and the publication of the 'Essay' above mentioned. To quote from a writer in the British *Homœopathic World* (1875, p. 234): "Drug after drug, specific after specific, was tested on himself and on healthy friends with one unvarying result—each remedy of recognized specific power excited a spurious disease resembling that for which it was considered specific. But many more symptoms than those diagnostic of any one disease resulted from almost every medicine, and aroused a hope in the experimenter's mind of specifically treating a greater number of diseases than had ever been so treated before. Besides discovering many valuable phenomena undreamt of, he verified his discoveries and observations by ransacking the volumes of recorded experiments in materia medica and the whole history of poisoning." The members of his family and his personal and professional friends aided in the work of experimentation, and tests of each medicine were made with different doses, and on many different persons, all the work being conducted under his own supervision.

Dr. Bradford tells us that at the time of Hahnemann's translation of Cullen's 'Materia Medica,' that is, at the beginning of his independent investigations in 1790, he had no preconceived theories or opinions to sustain. This view of his biographer is corroborated by the absence from Hahnemann's writings of even remote reference to any a priori conception or suspicion of a general curative relation between drugs and diseases. Nor does it appear that he then possessed the faintest conception of the magnitude, or of the quality, of the task he was gradually assuming. His original object evidently was to ascertain why Peruvian bark cures intermittent fever, and to learn if the view held by Cullen—that its curative property resides in a combination of bitter (tonic) and astringent qualities—was indeed true. There is no historic evidence that before 1790 the general therapeutic principle of similars had even dawned upon his mind. But we may be quite sure that the logical and philosophical principles that must necessarily govern his researches had been well thought out before the work had very far advanced.

Hahnemann and his disciples claim that in the discovery of homœopathy as a general principle of organic science, and in its conception and development as a system of medicine, assumption, speculation and hypothesis have had no place; but that observation, experimentation and inductive classification constitute the scientific and solid foundation of fact upon which it rests. They assert that all its essential doctrines are susceptible of demonstration, that they have been verified and reverified times without number, and that for the first time in the history of intellectual development the establishment of the homœopathic principle showed that the Baconian method of research is as applicable in the realm of therapeutics as in any other department of scientific investigation. If we look over the records of the processes leading to its discovery, it appears that these

processes were under the guidance of the following principles of scientific philosophy, all of which are distinctly set forth by Hahnemann in his 'Organon': (1) That in the study of disease with a view to its cure, the only safe dependence is upon the manifestations (symptoms) perceptible to the senses, and that no safe conclusions can be drawn from mere theories erected upon these signs and symptoms. The signs and symptoms constitute the only side of the disease that is turned toward the physician, and the totality of these signs furnishes the only true expression or portrait of the disease; (2) that the specifically curative power of a drug resides not in its physical, nor yet in its chemical properties, but in its capacity to produce changes in the functions of the organism; (3) that the dynamic properties of a drug—in other words, its power to specifically cure disease—can be ascertained only by observing the signs and symptoms which it can produce in the organism, and that these specifically curative properties cannot be inferred from the physical or chemical properties of the drug substance; (4) that experiments for the purpose of ascertaining the pathogenetic properties (signs and symptoms) of drugs must be conducted under the precautions necessary in other researches; and the tests must be repeated and varied with a view to eliminating every influence and agency that can vitiate the experiment. The drug experimented with, and the person experimented upon, must both be "standard." That is, the drug must be pure and unmixed with any other substance capable of disguising, modifying, or otherwise affecting its own specific activity, and the person experimented upon (prover) must be possessed of good health, and free from any unhealthful occupation or habit, and from any mental, moral or other influence or agent that modify the pure effects of the drug upon his organism. Also, that the experimentation with the drug must be continued until its whole pathogenetic effect has been elicited; (5) that the observations made from such experiments as those here indicated constitute the only source of a pure and "standard" materia medica, and supply the only material from which general therapeutic principles can be discovered or deduced; (6) that effects observed from the action of a drug upon diseased persons (clinical effects) or those obtained from a combination of drugs (polypharmacy) are not "standard" effects and cannot serve as reliable guides in a search for therapeutic principles.

In the opening sections of the 'Organon,' Hahnemann mentions as among the physician's essential acquirements: (1) Knowledge of disease; (2) knowledge of the dynamic properties of drugs; (3) knowledge of the curative relations between the two. This knowledge he holds essential both to the development of therapeutic science and to enable the physician to prescribe the curative remedy. In order to qualify the physician for his work his knowledge of disease must be composed of facts perceptible to the senses. Our physiological and pathological deductions in reference to a case of disease are more or less uncertain and theoretical. Absolute knowledge of disease is limited to its signs and symptoms, besides which there can be no certain and assured foundation for a science of therapeutics. The knowledge

of drug-properties must be equally certain and substantial. All drugs possess three classes of properties—physical, chemical, and specific or "dynamic." The physical and chemical properties can be ascertained by physical and chemical methods. The specific or dynamic properties, that is, the properties which alone impart the power to accomplish specific cures of disease, can be learned only by observing their power to cause changes in the health of the organism as shown by their capacity to produce signs and symptoms. Here again the signs and symptoms constitute the only sure basis of classification and induction in the construction of a science of therapeutics.

Having possessed himself of so much of such knowledge as was within his reach, Hahnemann then began the investigation of the great and dominating question: Given a knowledge of diseases as expressed by signs and symptoms, and a knowledge of drug properties as expressed by signs and symptoms, can we discover between them any general relation that will guide the physician in his search for the curative drug? In this work of "interrogating nature" he had already been led to infer what her reply might be. His experiment with Peruvian bark had given him a somewhat emphatic hint. Then followed the six years of experiments upon himself, his family and friends; with what result we have already seen. Accompanying and following came the "ransacking of the libraries"—a work for which few men were so well fitted. This literary search resulted in two important discoveries. First, that when two diseases manifesting quite similar symptoms appear in the same organism, they antagonize or annihilate each other. This subject is carefully outlined in the 'Organon' (sections 42-45) and in section 46 the writer cites a score of illustrative instances obtained from the pages of contemporaneous literature, the authority being carefully mentioned in every citation. The second result of this literary search is that it corroborates the view with which Hahnemann set out, namely, that even under the modes of treatment in vogue before his day, undoubted cures frequently resulted from the action of drugs possessed of the power to cause symptoms similar to those of the cases cured. Some of these cases are well worthy of study by these interested in medical subjects. In the earlier editions of the 'Organon' and in the 'Essay on a New Principle for Ascertaining the Curative Powers of Drugs,' these published cures are reported *in extenso*, the literary source being given, together with the name of the physician in each case. In the Dudgeon translation of the fifth German edition the same list occupies 31 pages of the appendix. In practically all of the cases reported, the mere name of the disease is sufficient to suggest the fact of similarity between the symptoms of the malady cured and the symptoms of the drug prescribed. In other cases the symptoms themselves are given with more attention to detail than was customary at that period of medical history. If we sum up the remedies named in the 'Essay,' together with those mentioned in the 'Organon,' we have a total of 63 drugs to which Hahnemann was able to ascribe homœopathic cures occurring in the practice of physicians who had no knowledge of the homœopathic principle. In presenting this

list of cases successfully treated with the similar remedy, Hahnemann had made nearly 500 citations of writers who had no suspicion that any general law of therapeutics was involved in the operation of their prescriptions. The degree of similarity shown between the pathogenetic properties of the drugs administered and the symptoms manifested by the patients seemed, in most cases, to be positive and emphatic, and in some instances striking. In what he has to say regarding the curative effects of opium this fact is graphically shown. He says: "A condition of convulsions without consciousness, resembling the death-agony, alternating with attacks of spasmodic and jerky, sometimes also sobbing and stertorous, respiration, with icy coldness of the face and body, lividity of the feet and hands and feebleness of the pulse (precisely resembling the symptoms of opium observed by Schweikert and others), was at first treated unsuccessfully by Stütz with potash, but afterward cured in a speedy, perfect and permanent manner by opium. According to Vicat, J. C. Grimm and others, opium produces an extreme and almost irresistible tendency to sleep, accompanied by profuse perspiration and delirium. This is the reason why Osthoff was afraid to administer it in an epidemic fever which exhibited similar symptoms, for the system he pursued prohibited the use of it under such circumstances. It was only after having employed in vain all the known remedies and seeing that death was imminent that he resolved to try it at all hazards and behold, it was always efficacious. J. Lind also avowed that opium removes the head troubles, and the burning sensation in the skin and the difficulty of perspiring during the pyrexia; under opium the head becomes free, the burning febrile heat disappears, the skin becomes soft, and its surface is bathed in a profuse perspiration. But Lind was not aware of the circumstance that opium produces very similar morbid symptoms in the healthy. Alston says that opium is a remedy that excites heat, notwithstanding which it certainly diminishes heat where it already exists. De la Guérène administered opium in a case of fever attended with violent headache, tension and hardness of the pulse, dryness of the skin, burning heat, and hence difficult and debilitating perspirations, constantly interrupted by the extreme restlessness of the patient. He was successful in this case because opium possesses the faculty of creating an exactly similar feverish condition in healthy persons, of which he knew nothing, though it is stated by many observers. In a fever where the patients were speechless, eyes open, limbs stiff, pulse small and intermittent, respiration labored, snoring and stertorous and deep somnolence (all of which are symptoms perfectly similar to those which opium excites), this was the only substance which C. L. Hoffman saw produce any good effects. Wirthenson, Sydenham and Marcus have in like manner cured lethargic fevers with opium. C. C. Mathai, in an obstinate case of nervous disease, where the principal symptoms were insensibility and numbness of the arms and legs, after having for a long time treated it with inappropriate remedies, at length effected a cure by opium, which, according to Stütz, Young, and others, causes similar states in an intense degree. Hufeland performed, by the

use of opium, the cure of a case of lethargy of several days' duration. How is it that opium, which, as everyone knows, of all vegetable substances is the one which in its primary action (in small doses) produces the most severe and obstinate constipation, should be one of the most efficient remedies in constipation of the most dangerous character, if not by virtue of the homœopathic therapeutic law, so long unrecognized? The honest Bohn was convinced by experience that opiates were the only remedies in the colic called "miserere"; and the celebrated F. Hoffman, in the most dangerous cases of this nature, placed his sole reliance on opium combined in the anodyne liquor called after his name. Can all the "theories" contained in the 200,000 medical books which cumber the earth furnish us with a rational explanation of this and so many other similar facts? The great German physician and philosopher was careful to credit other medical men with having obtained foregleams of his great discovery. "How near," he says, "was the great truth sometimes of being apprehended!" And again, "There have been physicians here and there across whose minds this truth passed like a flash of lightning without ever giving birth to a suspicion of the homœopathic law of nature."

From Hahnemann's literary and experimental investigations alone, both he and his disciples have unhesitatingly justified their belief in a general curative relation between drugs, as represented by their symptoms, and diseases as represented by their symptoms, and their belief that this curative relation is properly set forth by the word "similarity." The proofs herein presented are considered conclusive, although similar evidence has been constantly accumulating in the writings of medical men of all schools, and in the practice of hundreds and thousands of homœopathic physicians for more than a century.

In Hahnemann's foot-note (Dudgeon's Appendix to the 'Organon,' p. 207) it is shown that he early became aware of the "danger which is to be anticipated from large doses of homœopathic remedies." He says, however, that "it often happens, from various causes which cannot always be discovered, that even very large doses of homœopathic medicines effect a cure, without doing any particular harm." In most instances homœopathic physicians come to regard the small dose as a necessity to homœopathic practice. Thus, a full dose of belladonna, or of opium, administered to a patient already suffering with symptoms like those producible by one of these drugs, might be perilous. Experience also taught them that the curative action of the homœopathic drug could be secured as well or even better through the small dose. The results claimed for these small or minute doses naturally aroused the skepticism of physicians and laymen alike, and became a serious hindrance to the spread of the homœopathic system. The very nature of the homœopathic principle, however, carries with it the necessity for the use of the diminished dose. Homœopathic physicians, when prescribing minute doses of their remedies, are under the necessity of employing great care in securing absolute purity and simplicity in the preparation of their medicines; and this has led to the need of a special phar-

macy for homœopathic prescribers. Another corollary of the homœopathic law of cure is the "single remedy," without which no prescription can be strictly homœopathic. Still another principle follows from the application of this law, namely, that a homœopathic prescription can never be made from the *name* of the disease. The similarity must be traced between the symptoms of the drug and those of the individual patient. This fact is fortunate in that it at once brands the advertised "homœopathic" proprietary medicine as a fraud and a pretense, no matter in what form it may be put upon the market. The spread of homœopathy in the country of its birth, and in other countries of Europe, has been slow. The delay in securing its establishment has been due partly to the cause already mentioned—an unwillingness on the part of both physicians and laymen to accredit the little dose with curative potency. But the chief obstacle to its advancement is to be sought in inimical legislation and the lack of facilities and authority to educate young men and women for homœopathic professional life, and the consequent inability to supply the public need of homœopathic physicians. Homœopathy was introduced into the United States in 1825 by a physician named Hans B. Gram, who, at that time, settled in New York. In this country, with its free institutions and its asserted freedom of opinion, the new medical thought found less antagonism to overcome, although there were many obstacles to be encountered, chiefly of a social and legislative character. The physicians of America, less conservative, perhaps, than those of Europe, were more disposed to inquire into the scientific and practical aspects of homœopathy, with the result that in less than 20 years more than 300 of them were engaged in its practice. These physicians speedily conceived the necessity for having their own students educated under teachers of their own faith and practice, and in 1848 organized and equipped a medical college for this purpose. This school was almost immediately succeeded by others, and these institutions have very largely contributed to the rapid spread of homœopathic practice in all parts of the United States. When Dr. H. B. Gram arrived in New York in 1825, the only homœopathic literature in the English language was Hahnemann's 'Geist der homœopathischen Heilkunst,' a pamphlet of 24 pages, translated by himself and published by J. & J. Harper of New York. At the close of the first quarter-century of the new practice, more than 25,000 pages in the English language had been published by the homœopathic press, and at the end of 50 years the aggregate reached more than 150,000 pages. (Consult 'Transactions of the World's Homœopathic Convention of 1876,' Vol. II, pp. 1020-65). The progress that homœopathy has made in the United States can be best shown by the records of its organization and institutions. The American Institute of Homœopathy, the national society of homœopathic physicians, organized in 1844, now has a membership of over 3,500. There are six other national organizations, formed to promote various departments of medical and surgical interest. State societies are organized in 46 Commonwealths, and at the present rate of increase these bodies will, in a few years, exist

in every State. To these may be added 150 local societies of various kinds. In the United States homœopathic physicians are in charge of 220 hospitals, general and special, 66 other institutions, asylums, homes, etc., and 65 dispensaries, 20 medical colleges and 32 medical journals.

The exact number of physicians practicing homœopathy in the United States cannot be ascertained with accuracy, but it is known to be not less than 12,000, and has been estimated as high as 18,000. The number of people employing these physicians, regularly or irregularly, cannot be less than 15,000,000. Thus has the influence of homœopathy extended during its American career of 75 years. The influence of homœopathy upon public and professional sentiment has been beneficent and pronounced. Laymen and physicians have alike learned from the practice that large quantities of potent and dangerous drugs are not often necessary to determine recovery from disease, and physicians have reached the wise conclusion that cures sometimes occur under the influence of small doses, as well as quantities with larger.

PEMBERTON DUDLEY, M.D.,

*Late Professor of Institutes of Medicine, Hahnemann Medical College, Philadelphia, Pa.*

Revised by ROYAL S. COPELAND, M.D.,  
*Dean New York Homœopathic Medical College and Flower Hospital.*

**HOMOIOUSIAN**, hō-mō-oo'si an (Greek *homo-*, "the same," and *ousia*, "substance") and **HOMIOIOUSIAN** (Greek *homios*, "like," and *ousia*, "substance"). The Council of Nice adopted the word homoiousian to express that the Son was of the same substance with the Father, while the followers of Arius adopted the term homioiousian, as a sort of middle and reconciling theory, to express that the Son, though not of the same, was yet of a similar substance with the Father. The doctrine of Arianism was not only that the Son was subordinate to the Father, but that he was totally unlike him, being a mere created being. See CHRISTIAN DOCTRINE; CREEDS AND CONFESSIONS.

**HOMOPLASY**, hō'mō-plās-i, the effect of the influences of convergence (q.v.), upon homologous structures. The term was proposed by E. Ray Lankester and used at first with a rather broader meaning subsequently restricted and defined by Osborn. See ANALOGY.

**HOMOPTERA**. See HEMIPTERA.

**HOMS**, hōms. See HEMS.

**HONDA, Yoitsu**, Japanese Methodist Episcopal bishop: b. Hirosaki, Hondo, 1848; d. 1912. He studied first at Yokohama where he accepted Christianity, and was baptized in 1872. Joining the Protestant Church, he became a member of the provincial assembly and in 1878 was ordained local elder of the Methodist Episcopal Church. From 1889-90 he attended the Drew Theological Seminary in the United States, and returning to Japan assumed the presidency of the Anglo-Japanese College of the Methodist Episcopal Church. In 1907, he was elected first bishop of the newly-organized Methodist Church of Japan. Reverend Honda was extremely active in Y. M. C. A. work, representing his nation at the World's Student Conferences in Europe several times. He was in the United States in 1910 as delegate to the M. E. Conferences, and the World's Sunday School Convention. Throughout Japanese Christendom he was recognized as an able leader and representative.

**HONDO**, hōn'dō (signifying "chief island"), the largest island of Japan (q.v.), for a long time erroneously known as Nippon or Nippon, the Japanese name for the whole empire.

**HONDURAS**, Central American republic, bounded on the north and northeast by the Gulf of Honduras and the Caribbean Sea; on the southeast and south by Nicaragua; and on the southwest and west by the Gulf of Fonseca, Salvador and Guatemala. Estimated area, 46,250 square miles. The republic, divided into 17 departments and one territory, has as its present capital the city of Tegucigalpa, the only national capital in the new world without a railway. The number of Tegucigalpa's inhabitants was given in 1916 as 40,000. It is situated on an interior plateau about 3,200 feet above sea-level, 12 hours' journey by automobile from the nearest port, Amapala.

Mountain ranges, which rise to heights of 5,000 to 10,000 feet, are massed in the western half of the republic; the Camasca and Tompocente ranges, however, are near the frontier of Nicaragua in the east, and parallel with these and some 200 miles from the frontier is the Juticalpa Range, which stretches from the coast into the interior. Rivers emptying into the Caribbean Sea or Gulf of Honduras are the Patuca and Negro, in the east, and the Ulua in the west. The Choluteca flows southward from the Misoco Mountains near Tegucigalpa, and empties into Fonseca Bay, on the Pacific coast. Large lakes are the Caratasca on the Mosquito coast, and Yojoa, among the western mountains. The chief port on the Pacific is Amapala; other ports of entry are Omoa, Puerto Cortés (on the Gulf of Honduras), La Ceiba, Trujillo and Roatan (on Bay Islands).

**History and Government.**—The first place of debarkation of Christopher Columbus on the American mainland was near the present Cape Honduras, where he landed on Sunday, 14 Aug. 1502. On the following Wednesday Bartholomew Columbus landed at the mouth of the Rio Tinto. They sailed thence along the coast to Cape Gracias á Díos. The conquest of the country was effected by Hernán Cortés, who set out from Mexico City to bring to terms one of his officers, Cristóbal de Olid, who had founded Trunfo de la Cruz in Honduras,

and established an independent government. The march to Honduras occupied six months and Cortés found the natives manageable, but their land "covered with awfully miry swamps," as he wrote to the Spanish monarch 3 Sept. 1526. "I can assure your majesty," he adds, "that even on the tops of the hills our horses, led as they were by hand, and without their riders, sank to their girths in the mire." (Fifth letter of Cortés to the Emperor Charles V). The natives were tractable. Without their assistance it would have been impossible to move about among the dense forests, swamps and mountains, therefore the Spaniards realized that more was to be accomplished by diplomacy than by force. Honduras became, in time, a nation of Spanish-speaking Indians; but like all the other Spanish-American colonies, it suffered from the Spanish policy which regarded the American possessions as the private estates of the Crown and as such to be exploited for the benefit of the sovereign. In 1539 Honduras became a captaincy-general of Guatemala. On its successful revolt from Spanish rule in 1521 it became part of the Mexican Empire; from which it separated in 1823 to join the Central American Confederation. In 1849 Honduras, Salvador and Nicaragua formed a political union which ended in 1863. Three years before the termination of the last effort to form a political union, Honduras was called upon to resist (1860) the landing at Trujillo of a filibustering expedition from the United States led by William Walker. Between 1871 and 1877 the country endured both war and revolution. Comayagua ceased to be the national capital, and the government was established at Tegucigalpa in 1880. General Sierra was elected to the Presidency, 1899-1903; Gen. Manuel Bonilla, 1903-07. Honduras and Salvador were at war with Guatemala for a short time in 1906. In 1910-11 two revolutionary movements occurred, and intervention by the United States became necessary. Señor Dávila resigned the Presidency; General Bonilla, who led an armed revolt against the government, was re-elected for the term 1912-16, but died 31 March 1913. The unexpired term was filled by Francisco Bertrand, who retired from office 28 July 1915 in order to comply with the constitutional provision that no one shall assume the Presidency who has held that office at any time during the six months immediately preceding the inauguration. He was re-elected for the term 1916-20.

The first constitution of Honduras was adopted in 1848, the second in 1865, the third in 1880 and the fourth, under which the country is governed to-day, became operative 1 Jan. 1895. The usual division of authority between legislative, executive and judicial branches is followed; Congress, however, is a single body, the Chamber of Deputies, consisting of 42 members, elected by direct vote for a term of four years at the rate of one deputy for every 10,000 inhabitants. The chamber is renewed by halves every second year, and for each deputy a substitute is elected to take his place whenever necessary. All male literate citizens over 18 years of age; if married, or 21, if unmarried, "are not only entitled but are compelled" by law to vote. The President and Vice-President are elected for a term of four years by direct vote. The President is assisted by a cabinet of six ministers; Minister of Government and

Justice, of Encouragement (Fomento), Public Works and Agriculture, Foreign Relations and Public Instruction, War and Navy, Treasury and Public Credit. The judicial branch includes a Supreme Court (five justices elected by popular vote for four years); municipal courts (judges appointed by Supreme Court), and justices of the peace elected by popular vote. Title III, Art. 10 of the constitution declares that "The Republic of Honduras is a sacred refuge for every person fleeing to its territory," and by Title V, Art. 27 the death penalty is abolished. Military service is compulsory from the ages of 21 to 40. The standing army numbers 2,000, approximately, and the reserve has 54,000 officers and men. Two small vessels are placed in the care of the Minister of War and Navy, for patrol duty along the coasts.

The institutions for secondary education under public control are the National Institute of Tegucigalpa, the National College of Santa Rosa, "La Independencia" of Santa Barbara and "La Fraternidad" of Juticalpa. A school of commerce is annexed to the National Institute. Education is nominally "free and compulsory"; and facilities are actually provided at Ceiba, where schools are supported by the municipal government, and to a limited extent in poorer sections by a small tax or assessment imposed by the national government. The university at Tegucigalpa has faculties of medicine, law, political and natural sciences. A military college also forms part of the university. At Comayagua there is a school of jurisprudence. According to an official statement, "mixed" schools, attended by boys and girls together, will be established in rural districts. Provision for agricultural training has not been made on an adequate scale; the training of teachers is done in five normal schools, one in each of the departments. Freedom of worship is secured by constitutional guaranty. The government does not contribute to the support of any church, but the prevailing religion is Roman Catholicism.

**National Activities.**—Agriculture receives more attention than formerly. The leading product for home consumption is still maize, of which 224,844,500 pounds were raised in 1914-15, chiefly in the departments of Copán, Gracias and Santa Bárbara. Bananas are cultivated for export principally and, although the banana grows wild in nearly all parts of Honduras up to an elevation of 3,000 feet, the industry (at present the most important) of cultivating this fruit for export is confined to the hot lands along the north coast, not extending farther inland than 50 or 75 miles. The shipping-points are Puerto Cortés, La Ceiba and Trujillo, adjoining such lands. From the first mentioned port shipments average about \$1,000,000 in value a year for over 1,000,000 bunches. The annual wheat crop is about 15,000 bushels; coffee, 3,860,000 pounds; rice, 4,000,000 pounds; beans, 14,030,000 pounds, and tobacco, 1,500,000 pounds. Nearly 20,000 acres are devoted to the cultivation of plantains. Coconuts, lemons and oranges are grown for export on a large scale. Sugar-cane is cultivated on 13,263 acres; indigo on about 9,000 acres. The total value of agricultural products annually is about \$3,000,000. Honduras is essentially a cattle country. The number of cattle is estimated at 571,120; horses 68,000;

mules, about 25,000. Large quantities of sarsaparilla are exported to the United States.

Prolonged drought during 1913-14 occasioned short crops and has been a calamity perhaps greater for Honduras than the European War. The total value of the republic's foreign commerce in the fiscal year 1913-14 was \$10,046,261; imports, \$6,624,930, and exports \$3,421,331. Products exported were: Bananas, 6,610,164 bunches; coffee, 1,214,454 pounds; coconuts, 10,366,955; hides, 805,861 pounds; deerskins, 81,791 pounds; gold and silver cyanides, 156,685 pounds. The distribution of foreign trade was: United States; \$5,262,043 imports and \$2,914,157 exports; Great Britain, \$459,762 imports and \$17,896 exports; France, \$141,597 imports and \$5,353 exports; Germany, \$521,837 imports and \$164,607 exports. Straw hats (Panama) are manufactured in the departments of Santa Bárbara and Copán, and cigars are made in different towns. Of the more than 100 factories in the republic aguardiente, soda water, sugar, soap, candles, shoes and ice constitute the principal products. Panama hats and cigars are the only manufactured exports of any great value of the republic.

Gold is found between the south and centre; silver in almost all sections. Lead, copper, salt-peter, iron, coal, zinc, nickel, platinum and antimony are also widely distributed. The value of ores produced annually is approximately \$1,000,000 (20,000 ounces of gold, 1,000,000 ounces of silver and a considerable quantity of copper). Only about 5 per cent of the mines of the country are being worked. Silver, copper and lead ores are exported. The forests from sea-level to an altitude of 1,000 feet contain mahogany, ebony, dyewoods, sarsaparilla and other medicinal plants, cabinet woods and cedar. At an elevation of 1,800 feet are dense and very extensive forests of pine and similar woods.

The unit of the monetary system, which is based on the silver standard, is the peso, divided into 100 centavos and weighing 25 grammes of silver .900 fine, or say 22.500 grammes fine silver. The value of the peso of Honduras fluctuates with the rise and fall of the price of silver in the international market. Thus, it was given as about \$0.42 currency of the United States in April 1916; but \$0.39786, with silver at 55 cents an ounce as a basis, is the value assigned in 'Latin American Monetary Systems and Exchange Conditions' (New York 1915) and in Gonzales, V., 'Modern Foreign Exchange' (New York 1914). In March 1918, the government of Honduras entered into a contract for one year with the Banco Atlántida of La Ceiba, whereby the latter was authorized and empowered to establish agencies in the ports of the republic, the departmental capitals and in other commercial centres for the furthering of commercial affairs and the stabilization of the national currency by the storage of the silver coinage of the country as a reserve to guarantee the paper issue. Principal banks, in 1915, were the Banco de Honduras and the Banco de Comercio at the capital and the Banco Atlántida at Ceiba. The interior debt of the nation, according to the message of the President to Congress in 1915, amounted, on 31 July 1914, to 4,611,464.68 pesos. Honduras has a heavy external debt which consists principally of bonds issued for the construction of the

railway from Puerto Cortés to La Pimienta and the arrears of interest thereon. The British Council for Foreign Bondholders represents the holders of these bonds. The amount of the external debt was given (1 Jan. 1914) as £23,693,969, of which £18,295,399 represented arrears of interest. In other words, a debt of less than \$26,000,000 (in 1870), increased to \$120,000,000, approximately, by 1917. The budget for 1915-16 estimated receipts at 5,929,420 pesos, and the value of the peso at that time was approximately 36.15 cents, currency of the United States.

The National Railway extends from Puerto Cortés to Pimienta, 56 miles. Privately owned lines in the banana regions aggregate about 109 miles. The Ulua River is navigable for a distance of 125 miles, and other streams facilitate, to a limited extent, communication between the north coast and the interior. On that coast, service with Puerto Cortés (and occasionally Ceiba, Trujillo and Tela) is maintained by steamers from New Orleans, New York and Mobile. On the Pacific coast dependence is placed upon the San Francisco-Panama steamship lines. There are 278 post offices. The number of letters (both internal and foreign correspondence) is not more than 1,550,000 in a year. The republic has 4,281 miles of telegraph wire; the capital and some other towns telephone services.

MARRION WILCOX.

**HONDURAS, British, or Belize,** a crown colony in Central America, south of Yucatan, and 660 miles west from Jamaica. It is bounded on the north and northwest by Mexico (Yucatan), on the east by the Caribbean Sea and Gulf of Honduras and on the south and west by Guatemala.

**Area, Physiography, etc.**—Its area is 8,598 square miles, including numerous cays. The coast is generally low and swampy and the interior is largely covered with forests of logwood, pine and mahogany. The Cockscomb Mountains in the southern district rise to the height of 3,700 feet; the northern part contains many lagoons. The climate is hot and moist and, generally speaking, is unhealthy for Europeans. About 50,000 acres are under cultivation and produce fruits, coffee, rubber, etc.

**Commerce.**—The total value of the imports in 1916 was \$2,690,306, a gain of \$561,303 over the previous year, due principally to the increased price of nearly every article invoiced. The United States supplied goods worth \$1,583,650; Great Britain, \$430,345; British colonies, \$30,359; and other countries, \$645,952, consisting chiefly of chicle from Guatemala (\$263,760) and Mexico (\$169,673) in transit to the United States.

The principal articles imported in 1916 from the United States were: flour, \$162,343; boots and shoes, \$119,895; fruits and vegetables, \$73,360; miscellaneous foodstuffs, \$51,970; lard and compounds, \$56,956; hardware and cutlery, \$46,237; drugs and chemicals, \$38,032; condensed milk, \$48,125; wearing apparel, \$69,134; piece goods, cotton and silk, \$107,707. The total exports from the colony in 1916 were valued at \$2,543,622, of which \$1,392,836 went to the United States; more than half of the remainder, \$1,150,786, represented products and manufactures of other countries in transit through the colony. The value of the principal exports to the United States in 1916 was: mahogany, \$473,548; chicle, crude and dried, \$330,045; bananas, \$259,410; coconuts, \$154,290; logwood, \$94,519. Exports to the United States in 1915 totaled \$1,850,000 and to the United Kingdom, \$311,200. Tonnage entered and cleared in 1915 amounted to 803,181 tons, of which 91,370 was British. Registered shipping in 1914 consisted of 298 sailing vessels of 4,531 tons and 53 steamers of 1,981 tons.

**Government, Finances, etc.**—The colony is administered by a governor, who is also commander-in-chief, assisted by an executive council of six members, and a legislative council consisting of five official and seven unofficial members. The chief sources of revenue are the customs duties (\$291,450 in 1914-15); excise, licenses, land-tax, etc., also the sale and letting of Crown lands. The total revenue is about \$550,000 annually. The expenditure, mainly administrative and for the various services, reached \$614,175 in 1915, in which year the public debt was \$972,705. Banking facilities are furnished by a branch of the Royal Bank of Canada. There are six government savings banks, which had, on 31 Dec. 1915, \$104,313 on deposit credited to 932 depositors. United States gold is the standard of currency. The British sovereign and half-sovereign are legal tender for \$4.86 and \$2.43 respectively. There is a paper currency of \$197,825 in government notes and a subsidiary silver coinage of \$158,917 in circulation. There is also a bronze cent piece and a nickel-bronze five-cent piece, whose issues amount to \$5,750 and \$2,500 respectively.

**Post Office, Communications.**—In 1915, 356,000 letters and post-cards, and 166,000 books, newspapers and parcels passed through the post office. The Belize River forms the chief highway from the coast to the western and southwestern parts of the colony. It is navigable for light-draft motor and cargo boats for a distance of more than 100 miles. The rates for both passengers and freight are high, but most of the traffic to and from the interior is carried over this route. There is only one railway in the colony, from Stann Creek to the interior, about 25 miles. It has a gauge of three feet and was built by the government at

a cost of \$826,250. The British Honduras Syndicate has a tram line running eight and three-quarter miles from the Stann Creek pier inland beyond Melinda and another about three miles long connecting the Sennis and the Monkey rivers. The trams are used chiefly for the transportation of bananas. Telegraph and telephone lines connect Belize with Corozal, Consejo and other stations in the north, El Cayo in the west and Punta Gorda in the south. Foreign telegrams are sent from Corozal to Payo Obispo, Yucatan, whence they are transmitted by the Mexican line. The wireless telegraph station at Belize was completed in 1915 and affords communication, through other systems, with the United States. A station of the United States Weather Bureau was established at Belize in November 1916. Steamship communication between Belize and New Orleans is afforded by the regular weekly mail service of the United Fruit Company, which also maintains a fortnightly service to and from New York.

**Education.**—In 1915 there were in operation 54 primary schools, with 5,528 enrolled children, and an average attendance of 1,912; in addition there were 6 primary schools, with 230 in average attendance, which received no government aid. The government spent \$23,300 on primary education in 1915. There are five schools with secondary departments with altogether about 350 pupils. They are under denominational management and none receive aid from the government.

**Population.**—In 1911 there were 20,374 males and 20,084 females, a total of 40,458. The population of the colony at the end of 1916 was estimated at 42,323. The whites number about 650, the rest consisting of negroes, mulattoes and Indians. The birth-rate per 1,000 was 40.1 in 1915, and the death-rate 26.2. Belize, the chief town and seaport, had a population of 10,478 in 1911.

For the origin and early history of the colony, see BELIZE; also CENTRAL AMERICA.

*Editorial Staff of The Americana.*

**HONDURAS**, Gulf of, spacious inlet of the Caribbean Sea, having on the west British Honduras and on the south Guatemala and Honduras. In it several smaller bays of which the Gulf of Amatique, with its inner recess, the bay of Saint Thomas, are spacious and deep. Several large rivers, the Belize, Chamelicon, Dulce, Motagua and Ulua, flow into the gulf. Along the shores are the islands of Turneffe, Manabique, the Bay Islands including Ruatan, Utila and Bonacca and numerous islets and reefs called cays.

**HONE**, hōn, Philip, American merchant: b. New York, 1781; d. there, 4 May 1851. He was a successful auctioneer in New York, es-

tablished there the first savings bank (1816), was mayor in 1826 and one of the founders of the Mercantile Library Association. Prominent in national political affairs, he aided in the formation of the Whig party. His diary, a portion of which, edited by Tuckerman, appeared in 1889, contains important sidelights on the early history of the Whigs. Hone was also at one time naval officer of New York port.

\* **HONE**, William, English bookseller and author: b. Bath, 1780; d. Tottenham, 1842. He was sent to study law, but his preferences led him to undertake the business of bookselling. He was well known in his day for his parodies and satires on religious and political subjects, of which the most notorious were 'Political Litany' (1817); and the 'Political House that Jack Built' (1819). Of greater literary value are 'Ancient Mysteries' (1823); 'Every-Day Book' (1826-27); 'Table Talk' (1827-28); 'The Year Book' (1832). A representative collection of his works is to be found in Tegg, 'Every Day Book, Table Talk and Year Book' (1873); and 'The Three Trials' (1876), containing an account of his acquittal at the trials which he had to undergo for railing against the government. His autobiography, 'Early Life and Conversion of William Hone, by Himself' was edited by his son (London 1841).

**HONE**, a strop or stone for sharpening knives and razors. See WHETSTONE.

**HONESDALE**, hōnz'dāl, Pa., borough county-seat of Wayne County, on the Lackawaxen River; the Erie and the Delaware and Hudson railroads; about 15 miles northeast of Carbondale and 30 miles northeast of Scranton. The first locomotive used in America, the "Stourbridge Lion," made its trial trip from this city. It is situated in a coal-mining region, with good farming land in the valleys. Its manufactures are silk and woolen goods, boots and shoes, machine-shop and foundry products, axes, concrete blocks, paints, electric elevators, green, cut, engraved and decorated glassware, men's clothing and wheels for polishing glass. Large quantities of coal are shipped annually from Honesdale. Pop. 2,945.

**HONESTY**. A flowering herb. See SATINFLOWER.

**HONEY**, a sweet sticky liquid obtained by bees and other insects from flowers (see HONEY-BEE; and FLOWERS AND INSECTS) as food, or taken home to be stored as food for the young. The care with which the honey-bee (q.v.) collects and stores this substance in its hive has led to bee-culture (q.v.). Honey is highly nutritive, especially as a fuel for the energies of the body, as four-fifths of its components are carbohydrates, the remainder being water with a trifle of protein. The saccharine elements are mainly grape-sugar and some fruit-sugar, which are so readily affected by yeast that various fermented drinks are made with honey as their basis, of which the best known are the mead and metheglin in great demand among all Teutonic peoples a thousand years ago, and the equivalents of which are still made in Russia, Abyssinia and elsewhere. Before the general manufacture and use of cane-sugar, honey was largely depended upon for purposes of sweetening, and was put into a great number of cakes and confections now rare or only locally manufactured. Of the place which it took among

the ancients in the household, in ceremonials, worship and for lore a large amount of curious information may be gathered from such books as Beckman's 'History of Invention' (1846); Dutt's 'Materia Medica of the Hindoos' (1877), and similar works, of which lists may be found in Warring's 'Bibliography of Therapeutics' (1868), and in the 'Catalogue of the United States Army Medical Museum.' The importance of honey was, indeed, much greater to the ancients than to us; as might be inferred from its frequent mention in the Bible as a sign of abundance or the resource of the destitute. It has well-recognized medicinal properties, especially as a demulcent against hoarseness, catarrh, etc., in promoting expectoration in disorders of the breast and as an ingredient in cooling and detergent gargles. Its effect is usually laxative also. It is used to sweeten certain medicines; and is sometimes mixed with vinegar in the proportion of two pounds of clarified honey to one pint of the acetic acid, boiled down to a proper consistence over a slow fire, and thus forms the oxymel simple of the shops. It enters into the composition of various sweetmeats, as in the East, such as the genuine Oriental nougat. Its use in confections in the United States was considerably increased as a result of sugar shortage in 1917 and 1918 and the importation has become a considerable business. The properties and the flavor and color of honey vary with the qualities of the flowers from which it is made. Thus in Europe the white Narbonne honey of France is said to owe its peculiar and delicious flavor to the rosemary and other labiate flowers on which the bees feed. The Grecian honey also stands in high estimation. Mount Hymettus in Attica has been famous since classic times for this product; but that yielded by the bees who range the thyme-covered hills of Corinth is said to excel it. Another famous ancient source of supply was Sicily, especially about Mount Hybla; and Corsica is yet celebrated for its honey and wax, which in ancient times were the chief exports of that island. In the eastern United States the early light-colored honey obtained from the blossoms of the white clover is especially esteemed; also that derived from raspberry plantations, bass-wood flowers and the like; while that made later in the summer from buckwheat is in favor among darker varieties. California is an extensive producer of honey from various flowers.

As the aromatic agreeable flavors and healthful qualities of special flowers (fortunately in the majority) are kept and apparent in ordinary good honey, so certain bad qualities are retained and spoil some honey, which thereby becomes deleterious to the human system, acting as a nauseant, a purgative, affecting the nerve-centres or even seriously poisoning those who eat it. This is the case in the United States with honey made from the flowers of the mountain laurel (*Kalmia*) and some other toxic plants. Some persons are unable to eat any kind of honey, without disarrangement of the digestion or nerves, or both; and all should use it in moderation.

The industry of bee-keeping is for the purpose of supplying the market demand for honey. Modern hives are so constructed that the bees build separate combs each filling a box with glass sides, which are taken out and sent to

market as the bees finish them. Another method of marketing is in the form of "strained" honey, the liquid pressed from the comb after warming, through sieves of linen cloth, or by other means. There is no reason why this should not be as good as that left in the comb, if properly prepared and preserved, and it permits of saving the material of the combs for wax (q.v.); but it makes possible adulteration, which is freely taken advantage of. The chief adulterant is commercial glucose, which occasionally is substituted to the extent of three-fourths of the volume, leaving only enough real honey to flavor the mass. As glucose (grape-sugar) is a large constituent of this substance in nature no great harm results (when the glucose is good), beyond the deception; and wholly artificial honey has been largely sold in the past as the product of bees. Consult Simmins, 'A Modern Bee Farm'; *Bee-Keepers' Record*. See BEES.

**HONEY ANT**, a true ant of the family *Formicidae*, and chiefly of the sub-family *Campotoninae*. The honey ant (*Myrmecocystus melliger*) is so called from certain of the wingless individuals becoming so many honey-pots, their abdomens being distended with honey fed to them by the normal workers, including both dwarfs and majors. It occurs from central Colorado (Garden of the Gods) to New Mexico and as far south as the City of Mexico. It erects mounds six or seven inches across and two or three inches in height, of the shape of a truncated cone. In the interior is the "honey chamber" or a rough dome-roofed vault or fissure, the honey-bearers (600 in a large colony) clinging by their feet to the roof. Their yellow bodies are stretched along the ceiling, their swollen, round, amber-colored abdomens of the size of currants hanging down. The "honey" is obtained in the night time by the workers which go in long processions to some distant scrub-oak bearing nectar-producing galls. The workers return with distended abdomens, and feed the honey-bearers with the nectar. C. McCook thinks the honey-bearers are not a distinct caste, but simply workers "with an overgrown abdomen." The honey is thus stored, as bees store their honey, for food in winter or times of famine. A similar habit has been acquired by various related kinds of ants in the dry plains and deserts of Mexico (where these ants are dug up by the people and utilized as a regular food-supply) and in South Africa and central Australia. Consult McCook, 'The Honey Ants of the Garden of the Gods,' etc. (Philadelphia 1882); Wheeler, 'Ants' (New York 1910).

**HONEY-BADGER**, a small mustelid burrowing animal (*Mellivora indica*) of India, which eats insects, frogs, birds' eggs and small animals generally, and is fond of honey. The natives believe it robs graves, but destruction of poultry is its worst sin. It is nearly related to the South African ratel.

**HONEY-BALL**, or **GLOBE-FLOWER**. See BUTON-BUSH.

**HONEY BEAR**, the sun-bear (q.v.).

**HONEY-BEE**. Bees in general are *Hymenoptera*, of the family *Apidae*. Bees are distinguished from wasps and other hymenoptera in the first place by the long, broad, flattened

basal joint of the hind tarsus, which is adapted for carrying pollen to the nest. Bees are also more hairy than others of their order, and some of the hairs are plumose or feathery. The mouth-appendages are long and highly specialized, especially the long flexible proboscis or tongue (hypopharynx). There are no wingless adult forms. While the more primitive genera are solitary, in the more specialized or social kinds, besides the males and females, there are workers, which are, as a rule, sterile females in which the ovaries are undeveloped. Of the bee family there are now known to be about 150 genera and 1,500 species.

**Original Home of the Honey-bee.**—Although the honey-bee (*Apis mellifica*) has followed the white man in his migrations from the Old World to the New, and to Australia, New Zealand, etc., its original birthplace is in southern Asia, probably including the eastern shores of the Mediterranean Sea. Besides *A. mellifica* there are seven or eight other species, all except one southern and eastern Asiatic, including the islands of Timor and Celebes; the exceptional one, (*A. adamsoni*) inhabiting tropical Africa and Madagascar. We know little of the honey-bees of China and Japan.

Like other domestic animals (and the honey-bee is the only domestic insect we possess), this bee is divided into races of which the Ligurian bee (variety *ligustica*), originally inhabiting Italy and adjoining regions, is a well-marked one, and another is the Egyptian honey-bee (variety *fasciata*). There are several subvarieties of the northern form of *A. mellifica* in Germany. The English naturalist Ray, who published before Linné, gave the name *A. domestica* to the northern dark form, our common honey-bee. This dark, northern form is the one which has been carried by the European race to various parts of the world, in some of which it is now wild. It occurs in the West Indies, in North America, including Mexico, in central and southern Africa and in Australia and New Zealand. The variety *ligustica* has also been found at the Cape of Good Hope.

Besides the honey-bee there are other social forms in Central and South America, as well as other tropical countries, including Australia, which store up honey; these are small bees, exceedingly numerous in individuals, which belong to the genera *Melipona* and *Trigona*, and are stingless, though the sting exist in a rudimentary state. *Trigona mosquito* is known to send off swarms and to have but a single queen in a colony. The nests are built in hollow trunks of trees, in banks of clay or earth, and they gather pollen, nectar and resin. On the whole, the honey-bee stands at the head of the hymenopterous series, and, in fact, at the head of the class of insects, though the house-fly is in some respects more extremely specialized.

**Structure of the Honey-bee.**—Besides the males or drones, and the female or queen, the colony consists of workers; these carry on the work of the society, gathering nectar, pollen, building the cells and feeding the young. The colony is permanent, differing in this respect from that of bumblebees, which come to an end each autumn. We will first describe the chief points in the external anatomy of the insect. The body is divided into three regions, the head, thorax and abdomen. The eyes are of two kinds, simple and compound, the male differing

from the queen and the workers in the large compound eye meeting in the middle of the top of the head. The mouth-appendages consist of three pairs,—first the jaws or mandibles; these in the queen and drone are notched, but in the worker the edge is entire and serves for biting, and in comb-building for thinning out wax shreds, also for scooping and molding the wax, while the next pair of appendages, or accessory jaws, are called maxillæ, and are used as a trowel. In the bumblebee the maxillæ are also used for piercing the corolla of flowers like the wistaria and honeysuckle, but those of the honey-bee appear to be too weak for this purpose. They also ensheath the proboscis. The so-called tongue (ligula, lingua or hypopharynx) is the long, slender, hairy appendage adapted for gathering the nectar of flowers. It is an outgrowth of the under lips (labium or fused second maxillæ), is situated in a tube formed by the maxillæ and labial palpi, and can be partially withdrawn into the mentum, or base of the under lip. It can move up and down in the tube thus formed. It is covered by a hairy sheath, and is very elastic, this being due to a rod extending through its centre, enabling it to be used as a lapping tongue. Cheshire states that the rod on the under side has a gutter or trough-like hollow, which forms a false tube by the intercrossing of black hairs. There are also two side-ducts, which extend along to the end of the tongue, where the "spoon" or "bouton" is situated. This is provided with very delicate split hairs, "capable of brushing up the most minute quantity of nectar, which by capillarity is at once transferred by the gathering hairs to two side groove-like furrows at the back of the bouton." The central duct, because of its smaller size and consequent greater capillary attraction, receives the nectar, if insufficient in quantity to fill the side ducts. "But," says Cheshire, "good honey-yielding plants would bring both centre and side into requisition. The nectar is sucked up until it reaches the paraglossæ, which are plate-like in front, but membranous extensions, like small aprons, behind; and by these the nectar reaches the front of the tongue, to be swallowed as before described. The process of gathering the nectar is not exactly either a sucking or a licking process; but, as Cheshire shows, the action is primarily due to capillary attraction.

**Organs of Smell and Taste.**—Bees are guided to flowers chiefly by smell, rather than by the color of the flowers they visit. (See FLOWERS AND INSECTS). The olfactory organs are multitudes of microscopic pits in the antennæ—the organs of smell. The sense of taste is lodged in a minute soft baggy fold on the under side of the upper lip, which is rich in taste-cups; and, besides, there are a few taste-papillæ or cups found by Packard at the base of the paraglossæ and on the base of the labial palpi. These sites of the gustatory organs are situated where the food or nectar will come in contact in passing down the throat into the stomach.

**Formation of Honey and the Honey-Stomach.**—In insects there is the fore stomach (proventriculus) and the true or chyle-stomach. The former is called by apiarians the "honey-sac" or "honey-stomach." "If," says Cheshire, "it be carefully removed from a freshly killed

bee, its calyx-like 'stomach-mouth' may be seen to gape open and shut with a rapid snapping movement." The entrance to the stomach is guarded by four valves, which open to allow the passage of food from the honey-sac to the chyle-stomach. It is closed at will by circular muscles. Thus the bee can carry food for a week's necessities, either using it rapidly in the production of wax, or eking it out if the weather is unfavorable for the gathering of a new store. By means of a complicated mechanism a bee in sucking up, from composite and other flowers, nectar together with much pollen (1) can either eat or drink from the mixed diet she carries, gulping down the pollen in pellets, or swallowing the nectar as her necessities demand; (2) when the collected pollen is driven into the chyle-stomach, the tube-extension prevents the pellets forming into plug-like masses just below, for by its action these pellets are delivered into the midst of the fluids of the stomach to be at once broken up and digested; (3) "while the little gatherer," says Cheshire, "is flying from flower to flower, her stomach-mouth is busy in separating pollen from nectar, so that the latter may be less liable to fermentation and better suited to winter consumption. She, in fact, carries with her, and at once puts into operation, the most ancient, and yet the most perfect and beautiful, of all honey-strainers."

**How the Honey is Made.**—Honey is made of nectar, and is due to a chemical change in the honey-sac. The bee gathers the nectar with its "tongue," swallows it; it then passes into the honey-sac, and is regurgitated as honey. The nectar when gathered is almost entirely pure saccharose, and according to Bertrand, when regurgitated it is found to consist of dextrose and levulose; this change appears to be practically the conversion of cane-sugar into grape-sugar. A little salivary fluid is poured out into the mouth as the bee sucks the nectar, and this effects the chemical change. Cheshire thinks that the salivary fluid is added while the nectar is being sucked, and is passing over the middle parts of the under lip, so that the nectar may be honey when swallowed by the bee.

Many and probably all bees eat the pollen while gathering it. The plumose hairs of bees are of use in collecting the pollen grains which adhere to them, but the exact method of accumulation of the pollen and the mechanism of its conveyance from hair to hair till it reaches the part of the body it must attain in order to be removed for packing in the cells is not fully understood, but the head and front legs scratch up the pollen-grains, and the honey-bee has a pollen-basket on each hind leg, the basal joint of the tarsus being broad and slightly hollow, with nine rows of short hairs to which the pollen-grains adhere.

**Life History and Social Life.**—In founding a new colony the young swarms consist of a queen-bee and a number of workers, a surplus population of the old colony. The swarming is not a nuptial flight, but an act of emigration. After the new swarm has been housed, the workers begin their labors by secreting wax. This is formed in glands on the inside of the ventral plates of the abdominal segments, appearing outside as thin projecting plates, which are removed by the wax-pincers on the hind legs; after being molded by the jaws they form the hexagonal cells in which the young or larvæ

live and the food is stored, and thus the comb is gradually built up. The queen then lays an egg in each cell, and the larvæ (grubs) on hatching are fed by the workers. This they do by eating honey and pollen, which is formed in the digestive organs, into a kind of pap. This pap looks like arrowroot made with water, and the very young grubs partly float in it, besides absorbing it by the mouth. The young grubs, as they increase in size, are weaned from this glandular secretion or pap, pollen, honey and water being added, while the pap or glandular secretion is gradually withdrawn. The queen larvæ, according to Cheshire, is not weaned, but the secretion or pap (the so-called "royal jelly"), which is a rich, highly nitrogenous food, is added unstintingly to the end, and owing to this the queen becomes larger and fertile. When the colony is progressing well and young bees emerge, these act as nurses, the old ones going out of the hive to forage. When the grub is full-sized the worker bees seal up the cell with a cover made of pollen and wax, but pervious to the air. In this cell the grub spins a cocoon in which it pupates, finally biting its way out; the bee developing in three weeks from the time the egg is laid.

The new queen arises from an egg laid in the royal cell, which is large and slipper-shaped. She develops in 16 days. Only one queen is allowed in the hive at one time. The males (drones) arise from unfertilized eggs. The drone cells are a little larger than the ordinary worker cells. A drone is developed in about 24 days. When a swarm leaves the hive the old queen quits with it, but when a second swarm goes off from a hive it is accompanied by a young queen, who is frequently, and perhaps usually, unfertilized.

The young queens will usually mate when five to seven days old, flying from the hive for this purpose. In a day or two after mating the queen generally begins to deposit eggs, and is then ready for use in the hive or to be sent away as an "untested queen."

**Bee-Culture.**—Spring is the best season to start a hive or apiary. In April a good colony situated in the Central States ought to have brood in five or six combs. The Langstroth hive with its modern improvements is the best, and the novice should select those holding 10 to 12 frames in each story.

Swarming is the result of an abundant secretion of honey, and combs crowded with bees and brood, that is, overpopulation. Just before swarming there is a partial cessation of field-work, the workers clustering or loitering about the entrance to the hives. Suddenly those which happen to be in the hive at this time rush forth, accompanied by the old queen, and cluster on some tree or shrub near by. Hiving the new swarm can be done after a little experience and the use of smoke. Swarming may be prevented by giving abundant room for the storage of honey early in the season, before, as Benton says, the bees get fairly into the swarming notion. The honey also should be frequently removed. Also the hives should be well ventilated and shaded in hot weather. To successfully winter bees the colony must have a good queen, and young workers, also good and abundant food. Those colonies having the most honey compactly stored in the brood department and close about the very centre when the last

brood of young bees should emerge, are the ones which will winter best. A good substitute for honey is a syrup made of granulated sugar, to be fed early in autumn. The bees should be kept dry and warm, and there should be no manipulation out of season. (Benton).

**Diseases and Enemies.**—Diarrhœa is due to sour or fermented honey, dampness, and chilling of the bees. Foul-brood is a germ-disease, occasioned by *Bacillus alvei*; it affects both the brood and the adult bees. Of insect enemies the caterpillar of the wax or bee-moth is the most destructive, but with care it can be kept out of well-regulated hives.

**Agency of Bees in Cross-Fertilization of Plants.**—A hive is an essential thing in an orchard, and were it not for the visits of bees the fruit in many cases would not set. Also in hothouses where cucumbers are raised, a small hive of bees is indispensable for fertilizing the flowers. See BEE-KEEPING; FLOWERS AND INSECTS.

**Bibliography.**—Ashmead, 'Classification of the Bees' (in 'Trans. Am. Entom. Society,' Philadelphia 1899); Cheshire, 'Bees and Bee-Keeping' (2 vols., London 1886); Benton, 'The Honey Bee'; Bulletin No. 1, new series, United States Department of Agriculture, Division of Entomology, Washington 1896, contains a list of the best books on bee-keeping; Phillips, 'Bees' (in Farmers' Bulletin 447); 'The Treatment of Bee Diseases' (id. 442); Snodgrass, 'The Anatomy of the Honey Bee' (in Bureau of Entomology, Tech.—Series Bulletin 18); White, 'The Bacteria of the Apiary' (in Bureau of Entomology, Tech.—Series Bulletin 14); 'The Cause of Foul Brood' (Bureau of Entomology Circular 157); 'Sac Brood' (id. 169).

ALPHEUS S. PACKARD,  
Late Professor of Zoology, Brown University.

**HONEY-BIRD, or HONEY-GUIDE.**  
See GUIDE-BIRDS.

**HONEY BLOOM**, one of the American species (*Apocynum androsæmifolium*), the "spreading dogbane" of the family *Apocynaceæ* (q.v.). It grows in fields and thickets all over temperate North America, and has the medicinal qualities characteristic of the family.

**HONEY-BUZZARDS**, a genus (*Pernis*) of Old World hawks, formerly called "perns," which subsist mainly on insects, especially burrowing wasps, and bees, with their young and food-stores, which they dig out of the ground.

**HONEY-CREEPERS**, a group of small warbler-like birds (the family *Certhiidae*) of gay plumage, numerous in the West Indies and neighboring lands, where they are known as "quits," "banana-birds," etc., and are common about gardens and plantations and admired for their agility in searching flowers for small insects, and their cheery notes. They render an important service in the cross-fertilization, of the trees and plants they frequent, by carrying pollen on their feathers from one flower to another. See BIRDS, FERTILIZATION OF FLOWERS BY. Among them are the "banana-birds" (q.v.).

**HONEY-DEW**, the sweet secretion of certain plants and insects. (1) Some trees in warm climates yield from their leaves in very warm, moist weather a saccharine liquid which may fall in drops, or may form a sticky film

over each leaf. This exudation, dried, is one form of manna. (2) Certain minute insects; chiefly plant-lice, leaf-hoppers and related bugs, yield a sweetish secretion, sometimes so copiously as to bedew a whole tree, and even fall in drops, giving the phenomena called weeping trees. The usual cause in this case is the presence of a tree-hopper (*Proconia undata*). Honey-dew in both cases attracts insects in large numbers, who feed upon it or upon the lesser insects gathered to the feast; and these, in turn, attract larger predatory animals, as birds, lizards, etc. Moreover dust sticks to it, closing the pores of the leaves to the injury of the tree; and, still worse, the honey-dew forms a highly favorable culture-ground for the spores of smuts and other pernicious fungi.

**HONEY-EATER, or HONEY-SUCKER**, any of various small and somewhat thrush-like long-billed birds of the family *Meliphagidae*, which inhabit the Australian regions, and seem to feed upon the nectar of flowers. They do so to some extent, but mainly are in search of insects within the corolla, collecting them easily by means of a peculiar tongue, which is divided near the end into a sort of fringe. They also eat soft fruit, and spend much of their time hunting insects on the ground. Well-known examples are the soldier-bird, parson-bird, pimlico, friar-bird and others familiar in Australia and New Zealand.

**HONEY-GUIDES.** See GUIDE-BIRDS.

**HONEY HILL**, Battle of. On the night of 28 Nov. 1864, General Foster, commanding the Federal troops in the Department of the South, left Hilton Head, S. C., with 5,000 infantry, cavalry and artillery, and about 500 sailors and marines, for Boyd's Neck on the south side of Broad River, the object of the movement being to cut the railroad connecting Savannah and Charleston and otherwise co-operate with Sherman, who was marching to the coast. Owing to a thick fog many of the boats lost their way and it was late in the afternoon of the 29th before the troops got ashore. General Hatch was put in command, with orders to push forward and cut the railroad. Hatch marched immediately; the guides and maps proved worthless, and, after marching and countermarching the greater part of the night, he went into bivouac about 2 o'clock on the morning of the 30th. Information of Foster's appearance at Boyd's Neck was carried to General Hardee at Savannah on the evening of the 29th, and next morning at 2 o'clock, the advance of G. W. Smith's Georgia militia arriving at Savannah, Hardee directed Smith to hasten it to Grahamsville Station on the Charleston and Savannah Railroad. The station was reached at 8 A.M., and the men marched out on the road leading to Broad River landing, about three miles, where, on the crest of the north bank of a small stream, a work for light guns had been thrown up and trenches for infantry prepared. These works were about 100 yards from the little stream and upon Honey Hill, 10 or 12 feet above the water level. On the right of the battery of five guns was a dense forest, on the left an open pine wood. The ground in front was open. Preparations were completed by 10 o'clock, at which hour about 1,000 militia filled the trenches on the right and left of the battery. Early in his

**QUEEN STREET, HONGKONG**

Courtesy of the Philadelphia Commercial Museum

march Hatch encountered the Confederate outposts, drove them in and soon after 10 o'clock came under fire of the guns. Hatch attempted a flanking movement, but failed, and made several direct assaults during the day, all of which were repulsed, and at dusk he began his retreat to Boyd's Neck. His loss was 711 killed and wounded and 43 missing. During the action Smith was reinforced by the 47th Georgia, but at no time did he have more than 1,400 men. He lost 8 killed and 42 wounded. Consult 'Official Records' (Vol. XLIV).

**HONEY-LOCUST**, or **HONEY-SHUCKS**. See **LOCUST TREE**.

**HONEY-SWEET**. See **MEADOW-SWEET**.

**HONEYSUCKLE**, a genus of plants, *Lonicera*, belonging to the family *Caprifoliaceae*. About 175 species are native to the northern hemisphere. The genus is represented in the North American flora by different species, among which are *L. sempervirens*, the trumpet honeysuckle; *L. caprifolium*, American woodbine, an introduced species; *L. flava*, yellow honeysuckle, etc. "Coral honeysuckle" is another name in the United States for *L. sempervirens*. It is much valued in the South, where it is native, for its flowers of beautiful color and sweet perfume. In the eastern United States the Japanese honeysuckle has escaped from cultivation. The common honeysuckle, *L. periclymenum*, with distinct leaves and red berries, is indigenous in Europe. There are many other species in America, Europe and Asia, and the name honeysuckle is often given to shrubs with sweet flowers of quite different genera.

**HONGKONG**, hōng-kōng', or **HIANKIANG**, hē'ān-ké'āng (signifying "the place of sweet streams"), an island off the southeast coast of China, forming with Kau-lung on the mainland a British Crown colony and naval station. The island is on the east side of the estuary of the Chu-Kiang or Canton River, 90 miles south of Canton, and is separated from the mainland by the narrow Lyemun Strait. About 10 miles long and from two to five miles broad, the island is of rocky formation, attaining in Victoria Peak a maximum altitude of 1,809 feet. Its area is rather more than 32 square miles. By the Convention of Peking, signed 9 June 1898, China leased to Great Britain for 99 years a portion of her territory, mainly agricultural, together with the waters of Mirs Bay and Deep Bay and the island of Lan-Tao. Its area is 356 square miles, with about 91,000 inhabitants, exclusively Chinese. The area of old Kau-Lung is three square miles. The total area of this colony is 391 square miles.

**Climate**.—The maximum temperature is 93° F. Rainfall is very heavy at certain seasons and the humidity percentage is so great during certain months that the climate is very trying to all except the native Chinese. December is the dry month of the year and is perhaps the most enjoyable month also. The European quarters have modern sanitation systems which ensure the community somewhat against the epidemics so frequent in this quarter of the world.

**Education**.—The government educational institutions comprise Queen's College, average attendance 490 boys, mostly Chinese; the Kau-lung, Peak and Victoria schools, for children

of both sexes of British parentage, average attendance 60, 29 and 47, respectively; the Belilios Girls' School, average attendance 384; eight English schools for Chinese boys, average attendance 1,397; one English school for Indian boys, average attendance 51. There are 39 schools, mainly denominational, which are in receipt of government aid and are subject to government inspection, with an average attendance of 3,500. The net cost of education amounts to about \$235,000 (Hongkong currency) annually. There is a police school and about 360 unaided schools with over 13,000 pupils. In 1906 a technical institute was founded. It is maintained by the local government and has over 500 students. Hongkong University was opened in March 1912, with faculties of arts, medicine and engineering. It has about 200 students at present.

**Industry and Commerce**.—The principal industries of the colony are cotton-spinning, sugar-refining, ship-building and repairing, rope-making, the manufacture of cement, brewing and the manufacture of knitgoods. Deep-sea fishing is growing in importance. The commerce is chiefly with Great Britain (about 50 per cent of both imports and exports), India, Australia and the United States. Hongkong is a free port except as regards the importation of intoxicating liquor and tobacco and there are no official returns of trade, only mercantile estimates, according to which the imports average \$20,000,000 and the exports \$10,000,000. It is the great distributing port for South China and trades in nearly all kinds of goods. Among the principal are opium, sugar and flour, salt, earthenware, oil, amber, cotton and cotton goods, rice, sandalwood, coal, timber, hemp, kerosene, ivory, betel, live stock, granite, vegetables, etc. The tea and silk trade of China is largely controlled by Hongkong interests. In 1917 the colony exported goods to Great Britain valued at \$7,284,035, and imported thence goods to the value of \$15,355,245. Exports to the United States averaged about \$3,000,000, and imports from that country, \$10,000,000. The latter comprise mostly flour, oil and cotton.

In 1916, 24,201 vessels aggregating 11,062,288 tons entered the harbor, and 24,151 vessels of 11,246,173 tons cleared. About 20,000 fishing and other craft frequent the harbor and bays of the colony. The harbor is one of the best in the world, having extensive docking facilities and modern machinery. The only danger is from typhoons, which at times have caused great destruction.

**Communications**.—An electric railroad of nine and one-quarter miles and a cable tramway connect the Peak district with the lower levels of Victoria. There is a railway line to the Chinese frontier connecting with the Canton Railway. It was opened in 1910. The branch line from Fanling to Sha Tau Kok was opened in 1912. There are 17 post offices in the colony, the revenue from which in 1916 amounted to \$216,165, and the expenditure for which amounted to \$167,795. Telegraph lines, including cables, have a length of 254 miles. Telephone wires, excluding military lines, have a length of 8,272 miles. There are military and naval wireless stations and a postal wireless station. Hongkong, as one of the great marts of the world, has steamship connection with all great ports of Europe and America.

**Finance, Money, etc.**—In 1916 the revenue of the colony was \$7,276,940, derived chiefly from land, taxes, licenses, quarry rent, liquor duties and an opium monopoly. The expenditures in the same year amounted to \$5,828,500, a great part of which is devoted to the maintenance of a strong police force. The public debt amounts to about \$7,200,000. The British banking institutions in the colony are the Hongkong and Shanghai Banking Corporation, the Chartered Bank of India, Australia and China, and the Mercantile Bank of India, Ltd. There are also several Chinese and foreign banks.

The currency consists of the notes of the above named banks, and of British, Hongkong and Mexican dollars, besides subsidiary coins. The British dollar is of 416 grains of silver, 900 fine; the Mexican, 417.74, of 902.7 fineness. The circulation of foreign copper coin was prohibited in 1912, and similar action is being taken in regard to foreign silver and nickel coins and bank notes. The Hongkong dollar is of variable value. In 1917 it was worth \$0.525 in American currency.

**History, Government, etc.**—The Crown colony was ceded to Great Britain by China in 1841, the cession was confirmed by the Treaty of Nanking in 1842 and the charter is dated 5 April 1843. It is a military and naval station of first importance. The administration is in the hands of a governor, aided by an executive council, composed of the general officer commanding the troops, the colonial secretary, the attorney-general, the treasurer, the secretary for Chinese affairs, and the director of public works and two unofficial members. There is also a legislative council, presided over by the governor and composed of the commander, the colonial secretary, the attorney-general, treasurer, director of public works, superintendent of police, secretary for Chinese affairs and six unofficial members—four nominated by the Crown (two of whom are Chinese), one by the Chamber of Commerce and one by the justices of the peace. The courts of justice comprise a Supreme Court, a court of summary jurisdiction and a third court or appeal court, a police magistrates' court and a marine magistrates' court. In 1916, 1,418 were committed to jail; the daily average of prisoners in jail in 1916 was 638. The police force numbers 1,215 men, of whom 165 are European, 463 Indians and 587 Chinese.

**Population.**—The population of Hongkong, exclusive of the military and naval establishments, and the new leased territory, was, in 1911, 354,187 Chinese, 8,074 Europeans and Americans, and 3,884 other nationalities, a total of 366,145. The new territories contained 90,594, making a grand total for the colony of 456,739. The total estimated population in 1916 (including the new territories) was 529,000.

**Bibliography.**—Bentham, G., 'Flora Hongkongensis' (Hongkong 1902); Eitel, E. J., 'Europe in China' (London 1895); Ireland, A., 'The Far Eastern Tropics' (ib. 1905); Kyshe, J. W. N., 'History of the Laws and Courts of Hongkong' (ib. 1899); Lucas, C. P., 'Historical Geography of the British Colonies' (2d ed., London 1906); Morse, H. B., 'Currency in China'; 'Oxford Survey of the British Empire' (Vol. II, London 1914); Skertchly, S. J. B., 'Our Island' (Hongkong 1893); 'Twentieth Century Impressions of Hongkong, Shang-

hai and Other Treaty Ports'; 'Annual Report on Hongkong' (London).

**HONOLULU**, Hawaii, capital and principal city of the Hawaiian Islands (now a United States Territory), and commercial metropolis of Polynesia; the business heart of the central Pacific. It is 2,089 miles southwest of San Francisco, in lat. 21° 17' 56" N., long. 157° 51' 48" W. It lies on the southwest side of Oahu (the third island of the group in size and northwest of Hawaii, with a safe harbor formed by a natural breakwater of coral reef, pierced by a broad opening. A fine lighthouse here throws a light visible for 25 miles. With its natural advantages and the absence of rivals, the city occupies a unique position. From its central location it is a common point of touch for the three great trans-Pacific steamship routes—from the United States and British Columbia to New Zealand and Australia, from the same to Japan, China and the Philippines and from South America to Japan and China. Several independent steamship routes also run from it. It has regular communication with San Francisco, Vancouver and Seattle, Peru, Auckland and Sydney, New York and Boston, Yokohama and Hongkong, Liverpool, Glasgow and Bremen, besides other places. The steamship line to Sydney touches at the Fijis; the line to Auckland, at Apia, Samoa. From Honolulu it is 3,850 miles to Auckland, about 4,000 to Sydney and 3,445 to Yokohama. It is the port of foreign trade for the archipelago; about 1,000 vessels and many millions worth of products pass in and out of it annually. There are numerous wharves and warehouses here and a government custom-house. (For the items of the trade, see HAWAII; the great items are sugar and molasses, rice, coffee, hides and wool).

Honolulu lies at the mouth of the valley of Nuuanu, which runs back between two high ridges to a pass between two peaks about 3,000 feet high in the great eastern range of mountains; the view from the brink of the *pali* or precipice at this pass is one of the notable sights of the neighborhood. The climate is mild and equable and many sufferers from lung troubles in the United States seek it for a sanatorium. The extreme range of temperatures is 52° to 88°, average 70°. The rainfall is very irregular, but never slight; from 40 to 60 inches annually. The island is volcanic, the bordering reefs coral; hence the city streets are macadamized with coral and lava, porous rock making good surface drainage. The city is well laid out in American fashion, being indeed a modern American place; the old one-story wooden huts, mingled with grass huts among the trees, have mostly given place to cottages, unpretentious indeed, but neat and comfortable, and making parts of a beautiful and picturesque whole of luxuriant gardens and surroundings of tropical trees, with which also some of the streets are abundantly shaded—the great Norfolk pine, papaya, bread-fruit, mango, and monkey-pod, umbrella-tree, tamarind tree, algaroba, bamboo and koa, date and cocoa palms, candle-nut, royal-palm and poinciana regia, alligator-pear, china-rose bush, blooming all the year round, etc., many with rich and fantastic blossoms, others with great parasitic ferns, besides peach, oleander, banana, guava, orange, citron and others.

Courtesy of the Philadelphia Commercial Museum

## THE HARBOR OF HONOLULU

The flowers are also of great beauty and luxuriance.

The city has nearly 200 acres of public parks. There are all modern appliances and services for civilized work and comfort; several first-class hotels, physicians, lawyers, daily and weekly newspapers, banks and theatres, insurance offices, several hospitals, a public library, etc. There are 32 public schools, including a high school and normal school, with a total attendance of over 5,000 pupils, besides 37 private schools, with an attendance of 2,700 pupils. There are a number of churches, Protestant and Catholic; the city is the seat of a Roman Catholic and an Anglican bishop. It is also the residence of the government officials, and the consular agents of many European powers. It has waterworks owned and operated by the Territorial government and furnishing excellent water, pumped from artesian wells, supplemented by water from the adjoining valleys. Ice is made by machinery. There is an electric street lighting system operated by the government, and an electric street railway system, built and conducted by a chartered company; a telephone system; and there is a submarine cable to San Francisco and wireless telegraph to the neighboring islands and to the United States. Of manufactures the number of different lines is upward of 30, of course chiefly for local needs; the largest branch is foundry and machine-shop manufacture. Next to this is rice-milling. Minor industries are ice, harness, leather, jewelry, soap and shipbuilding.

The chief building is the former royal palace, now the executive building, in the Italian style, finished in 1882. The judiciary and other government buildings are near it. The most interesting place is the museum, with many curious relics of early Hawaiian history, corals and shells and other native curiosities, land and marine. The chief in interest and value is the great feather war-cloak of Kamehameha I, the founder of the monarchy, valued at \$150,000. This was the chief treasure of the former sovereignty and was used as a mantle of state by the sovereigns. It was made of yellow feathers from the *mamo* bird, found only in the mountains, each bird furnishing only two small tufts of feathers for it, one from under each wing. It is four feet long and has a spread at the bottom of 11½ feet. Nine generations were employed in making it.

Honolulu harbor was discovered by Captain Brown in November 1794. The city as a modern foundation dates only from 1816, when John Young, an Englishman, and a faithful counsellor of the king, Kamehameha, advised its fortification. Previously it had been only a native village of huts, of little commercial importance. In 1820 it was made the capital of the archipelago, and afterward became the seat of government. Population about 63,000. Of the population of 52,183 in 1910, 15,618 were Hawaiians, 9,674 Chinese, 12,093 Japanese, 6,147 Portuguese, 4,233 Caucasian-Hawaiians and 9,200 other Caucasians.

**HONORIUS I**, *hō-nō'ri-ūs*, Pope: d. 12 Oct. 638. He was elected Pope in 625. In the hope of allaying a controversy he temporized with the leaders of the Monothelite heresy, which, while recognizing the twofold nature of Christ, declared he had but one will, a doctrine

condemned by the sixth Council of Constantinople. He was anathematized by the council that condemned the heresy. Pope Leo II, in confirming the acts of this council, says that Honorius was condemned for "not extinguishing the flames of incipient heresy." For a full account of the case of Honorius, consult Parson, 'Studies in Church History' (Vol. I).

**HONORIUS II**, Pope: d. 14 Feb. 1130. He was elected Pope in 1124 and was at the time of his election bishop of Velletri. A section of the bishops and cardinals had previously invested Cardinal Thibaut with the papal dignity; but both candidates having resigned Honorius was re-elected.

**HONORIUS III**, Pope: d. 18 March 1227. He became Pope in 1216 on the death of Innocent III. He at once wrote to the king of Jerusalem to assure him of his support; to the bishops of France, to encourage pilgrims, and to the emperor of Constantinople to promise him assistance. John, king of England, had left to his successor, Henry III, the burden of a war with the French Prince Louis, who laid claim to the English throne and had been encouraged in his pretensions by Innocent. Honorius reconciled the barons with Henry, and obliged Louis to renounce his pretensions. He then turned his attention to the Crusades, and crowned Frederick II emperor of Germany, on condition that he would go to Palestine within two years. In France he instigated Philip Augustus and Louis VIII to support the war against the Albigenes. He was succeeded by Gregory IX.

**HONORIUS IV**, Pope: d. 3 April 1287. He was elected Pope in 1285 and supported the French king, Philip the Bold, in the war against Peter of Aragon.

**HONORIUS, Flavius**, Roman emperor, son of Theodosius the Great: b. Constantinople, 9 Sept. 384 A.D.; d. Ravenna, Italy, 26 Aug. 423 A.D. On the death of his father in 395 the empire was divided into two parts, Honorius receiving the western half, with Rome as his capital. The principal events of his reign are the adoption of rigorous measures against paganism in 399; the devastation of northern Italy by Alaric in 400-403; another irruption of barbarians under Rhadagasis 405-06. Both invasions were repelled by his able minister, Stilicho, who, however, fell under the displeasure of his weak and indolent master and was assassinated at Ravenna in 408. Taking advantage of the death of the defender of Rome, Alaric marched upon the city and plundered it in 410.

**HOOCH**, or **HOOGH**, Pieter de, *pè'tèr dè hooch*, or *hög*, Dutch painter: b. Utrecht, 1630; d. Amsterdam, soon after 1677. His early art training was much influenced by Rembrandt. In 1655 he was enrolled in the Painters' Guild of Delft, where he resided, but later removed to Amsterdam. He was the chief representative of Dutch genre painting and his specialty was the delineation of Dutch interiors, with their semi-darkness, suffused by the witchery of sunlight. Sometimes he set out two or more rooms in perspective, the vista of which was drawn and lit up with extraordinary skill.

**HOOD**, Arthur William Acland Hood, BARON, English naval officer: b. Bath, 14 July 1824; d. Glastonbury, 16 Nov. 1901. After

service on the coasts of Spain and of Syria, he was made lieutenant in 1846 and in 1854 commander in recognition of his services with the naval brigade before Sebastopol. Assigned to the China station, he participated in the capture of Canton (December 1857), and in 1858 received the commission of post-captain. In 1862-66 he was in command of the *Pylades* of the North American station, in 1866-69 of the *Excellent* and the Royal Naval College at Portsmouth, and in 1869-74 director of naval ordnance. He was promoted rear-admiral in 1876, was commander-in-chief of the Channel fleet 1879-82, was First Sea Lord of the Admiralty in 1885-89, and became admiral in 1886. In 1892 he was raised to the peerage. His attitude in connection with the development of the British navy was strongly conservative.

**HOOD, Edwin Paxton**, English Congregationalist: b. London, 18 Dec. 1820; d. Paris, 12 June 1885. He prepared himself for the ministry privately and held several pastorates, the last being at Falcon Square Church, Aldersgate street, London. He was exceedingly active in philanthropic work and succeeded in raising huge sums for the benefit of the Royal Hospital for Incurables. Among his best-known publications are 'Lamps, Pitchers and Trumpets: Lectures on the Vocation of the Preacher' (1867); 'The World of Moral and Religious Anecdote' (1870); 'The Throne of Eloquence: Great Preachers, Ancient and Modern' (1885); and biographies of 'John Milton' (1852); 'Andrew Marvell' (1853); 'Swedenborg' (1854); 'William Wadsworth' (1856); 'Isaac Watts' (1875); 'Thomas Carlyle' (1875); 'Oliver Cromwell' (1882); and numerous others.

**HOOD, John Bell**, American soldier: b. Owingsville, Ky., 29 June 1831; d. New Orleans, La., 30 Aug. 1879. He was graduated at West Point in 1853 and bore a commission in the United States army till 1861 when he joined the army of secession. The part he took in the Virginia campaign gained for him the rank of major-general and at Gettysburg his division made a gallant record in its position at the extreme right of the Confederate line. He took part in the battle of Chickamauga on 19-20 Sept. 1863, having come to Tennessee to the support of General Bragg. When General Johnston was endeavoring in the spring of 1864 to impede Sherman's advance on Atlanta, Hood was a lieutenant-general in his army and his corps, on 25 May 1864, was attacked by Hooker at New Hope Church. He succeeded Johnston the following July in the command of the Army of Tennessee, fought the battle of Peach Creek with Sherman 20 July 1864, but was compelled to retire behind the fortifications of Atlanta. After the battle of Jonesboro he retired from Atlanta, which was entered by Sherman. His attack on the forces under Schofield at Franklin being repulsed, he proceeded to Nashville, where he met General Thomas. Thomas advanced from his entrenchments on 15 December, and a two-days' battle ensued. Federal preparation had been carefully and deliberately made. A general attack on the afternoon of 16 December caused the entire Confederate line to give way. Soon Hood's army was in full retreat toward Franklin, the larger part of it "in great confusion," according to Hood's official report. After a nine-days' pursuit by the

Fédérals, the remnant of the Confederates, now largely disintegrated crossed the Tennessee, Hood, at his request, was relieved of his command. Subsequent to the war he was a commission merchant at New Orleans. He wrote 'Advance and Retreat: Personal Experiences in the United States and Confederate States Armies' (1880), and articles for 'Battles and Leaders of the Civil War' (1887). Consult these works; see also NASHVILLE, CAMPAIGN AND BATTLE OF.

**HOOD, Robin**, English outlaw: said to have been b. 1160 and d. 1247. According to the popular account, with his followers, he inhabited Sherwood Forest, in Nottinghamshire, and also the woodlands of Barnsdale in the adjoining West Riding. They supported themselves by levying toll on the wealthy, and more especially on ecclesiastics, and by hunting the deer. The principal members of his band were his lieutenant, Little John, his chaplain, Friar Tuck, William Scadlock, George-a-Greene, Much the miller's son, and Maid Marian. His skill with the long-bow and quarter-staff was celebrated in tradition. What basis of fact there is for the story of Robin Hood is doubtful. Grimm maintained that he was one with the Teutonic god Woden. Other theories suppose him to have been a rebel yeoman in Lancaster's rebellion under Edward II; a Saxon chief who defied the Normans; and a fugitive follower of Sir Simon de Montfort after the battle of Evesham. He figures prominently in Scott's novel 'Ivanhoe,' and in 'The Foresters,' a drama by Tennyson. The earliest known mention of him is in 'The Vision of Piers Plowman,' version B. (about 1377), in which Sloth says he knows "rymes of Robin Hood." 'The Gest of Robin Hood' (assigned to 1400), almost epic in length, consisting of 456 four-line stanzas, is the oldest extant ballad on this theme. Others of the more important ballads are 'Robin Hood and the Monk,' 'Robin Hood and Guy of Gisborne' and 'Robin Hood's Death.' The remaining ballads are, in general, of inferior merit. It seems probable that there were what may be called a Sherwood cycle and a Barnsdale cycle, respectively. Many proverbs and sayings exist in connection with Robin Hood. Consult Child, 'English and Scottish Ballads' (1883); Fricke, 'Die Robin Hood Balladen' (1883) and Ritson, 'Robin Hood' (new ed., 1885).

**HOOD, Samuel**, VISCOUNT, British naval officer: b. Thorncombe, Devonshire, 12 Dec. 1724; d. Bath, Somersetshire, 27 Jan. 1816. He entered the navy in 1740, was promoted lieutenant in 1746, commander in 1754, and post-captain in 1756. While commanding the *Vestal* in 1759 he took the French *Bellona* after a three-hours' fight. From 1767 to 1771 he was commander-in-chief in North America. Having served as commissioner of the Portsmouth dockyard in 1778-80, he was made admiral of the blue in 1780, and almost immediately was sent in command of a squadron to reinforce Rodney on the North American and West Indian stations. He remained on that duty until the signing of the peace, and distinguished himself in several battles. Dispatched in 1781 to blockade Martinique, he was intercepted by De Grasse and the French fleet, against which he fought in April and in July (under Admiral

Graves). Again in the West Indies in 1782, after an absence along the North American coast, he outmaneuvered De Grasse in several minor contests, and later, on 12 April, took an important part in the victory of Dominica, when he led the rear of the British line. In 1784 he was elected to Parliament for Westminster, and in 1788 made a lord of the admiralty. He took command of the British fleet in the Mediterranean in 1793, and occupied Toulon. Hood had a great reputation as a tactician, and a high tribute was paid him by Nelson, who had been one of his subordinate officers. Consult James, 'The Naval History of Great Britain' (1822-24; new ed., 1837).

**HOOD, Thomas**, English poet and humorist: b. London, 23 May 1799; d. there, 3 May 1845. In 1821 he became sub-editor of the *London Magazine*, and from that time appears to have resolved on devoting himself entirely to a literary life. In 1826 he published 'Whims and Oddities.' This was followed by 'National Tales' in prose, and a volume of serious poetry, which, though favorably received, did not obtain much popularity. In 1830 he started the *Comic Annual*, which, during the eight years of its existence, was made the vehicle of many of his most remarkable productions. At the same time his pen was diligently employed on other subjects, and he published the powerful poem called 'Eugene Aram's Dream,' 'Tynney Hall,' a novel, which, though defective in its plan and structure, abounds in fine strokes of wit and humor. His health had begun to fail, and in consequence he lived on the Continent 1835-40. He continued his *Comic Annual* during his residence at Coblenz and Ostend, and in 1838 published *Hood's Own*. His continental experiences also furnished materials for his 'Up the Rhine' (1839), a series of imaginary letters after the manner of Smollett's 'Humphrey Clinker.' The whimsical cuts inserted in the work, as well as its combination of good sense and humor, made it very popular. Shortly after his return, he undertook the editorship of the *New Monthly Magazine*, and continued it until 1843. His principal contribution to it was the famous tragi-comic story in verse of 'Miss Kilmansegg.' His last periodical, entitled *Hood's Magazine*, was commenced in 1844. It contains some of his best productions, though several of them were written after his health had completely given way, and while he was propped up by pillows in bed. Hood is unrivaled as a punster, and seems to have been almost equal master of the comic and the pathetic. In the latter style his 'Song of the Shirt' is universally known, and as a burst of poetry and indignation gave him enduring fame.

**HOOD, Thomas**, generally known as **TOM HOOD**, English miscellaneous writer; son of the preceding: b. at Wanstead, Essex, 19 Jan. 1835; d. Peckham Rye, Surrey, 20 Nov. 1874. He was educated at Oxford with a view to a clerical career, but did not graduate; he edited the *Lisbeard Gazette* in 1858-59, and from 1860 till 1865 was a clerk in the accountant-general's department at the War Office. In 1865 he became editor of the comic paper called *Fun*. His first separate publication was 'Pen and Pencil Pictures' (1857), and among his subsequent works are 'The Daughters of King Daher, and other Poems' (1861); 'Jingles and Jokes for

the Little Folks' (1865); 'Captain Masters's Children' (1865), his best novel; 'A Golden Heart' (1867); 'The Rules of Rhyme: A Practical Guide to English Versification' (1869), a work which has gone through two later editions; 'From Nowhere to the North Pole' (1874). From 1867 he produced *Tom Hood's Comic Annual*. A volume of his 'Favourite Poems,' with a memoir by his sister, Mrs. Broderip, was published in the United States in 1877.

**HOOD, Mount**, a peak of the Cascade Range, in the northern part of Wasco County, in Oregon. The height is usually given as over 11,225 feet, but the latest explorers claim it is nearly 12,000 feet. Mount Hood was at one time an active volcano; the lava is found on the slopes and some distance from its base.

**HOOD RIVER**, Ore., name applied to a valley, town and river in Wasco County. The town is situated on the Columbia River and on the line of the Oregon-Washington Railway and Navigation Company, 66 miles east of Portland and 22 miles below The Dalles, the county-seat. The Hood River strawberry has acquired a reputation almost phenomenal, and is distributed over an immense area of country extending from Denver and Omaha on the south to Winnipeg in the province of Manitoba to the north and east. The apple industry is also rapidly assuming large proportions, grades of superior excellence are produced, and the highest priced Spitzenburgs and Yellow Newton Pippins found in the markets of New York and London were grown in Hood River. The valley proper extends south from the Columbia River to Mount Hood, some 20 miles, and is protected and cradled by the Cascade range of mountains on the west and a high divide putting out from Mount Hood on the east. The amount of land adapted for fruit culture in this unique valley exceeds 50,000 acres. The river itself drains all of the north side of Mount Hood, has a large and constant flow of water, and for the last 10 miles of its course before entering the Columbia has an average fall of over 60 feet per mile, affording 10,000 measured horse power per mile. There are immense forests of fir and cedar about the head-waters of this stream, and one of the largest saw-mills in the State is conveniently situated near its confluence with the Columbia. The climate is a happy mean between the moist section of western Oregon and the semi-arid plains of the Columbia. The scenery is grand in the extreme and yearly attracts the attention of many visitors. The town is pleasantly situated, overlooking the Columbia River, is supplied with electric lights, has a Carnegie library, county hospital, high school, and operates its waterworks, while the telephone is universally present in both town and country. It is, however, the superlative excellence of its fruits that has given Hood River a reputation almost world-wide. The town has saw and planing mills, canneries, evaporators, a vinegar factory, meat-packing plant, cider and syrup factories, machine shops, wagon works and a co-operative creamery. Pop. of town 2,331, valley about 6,000.

**HOODED CROW**, a crow native in northern Europe (*Corvus cornix*), so termed in allusion to markings on the head. Head, wings and fore parts are jet black, the rest of the

bird ash-gray; bill and feet are black. It retires to the southward from its more northerly haunts at the time of the crow migration. In England it is known as the gray, dun or Royston crow. The hooded crow found in India is similar in general appearance, but is a smaller species.

**HOODED SEAL**, a large dark-gray spotted seal of the north Atlantic, closely related to the common harbor seal, and named *Cystophora cristata*. It reaches a length of about 10 feet, and is especially distinguished by a large inflatable sac upon the face, the expansion of which is thought to be a defensive device, calculated to terrify enemies. It is occasionally seen on ice-floes along the Labrador coast.

**HOODED WARBLER**, a fly-catching warbler (*Sylvania mitrata*), common in the southern United States in summer and making its nest in low bushes. It is bright yellow except a solidly black crown, neck and breast, comparable to a hood, leaving the face golden yellow.

**HOODOO**. See MASCOT.

**HOOF**, a toe-nail which is large, envelops the terminal phalange, and is of material assistance in walking, as in the case of horses, cattle and other ruminants, and in the elephant, rhinoceros, etc. It is most highly developed in the horse, where the whole terminal part of the foot is reduced to a single, well-booted toe. In split-hoofed or cloven-hoofed animals there are two toes approximately equal, and booted with hoofs flat on their inner sides and closely appressed. The small non-functional toes hanging behind the hock-joint in most split-hoofed animals are often called "false hoofs." Accidents and diseases affect the hoofs of domestic animals (see FOOT-ROT, etc.), and require careful attention, especially in the case of horses. The soundness of a horse's foot is mainly preserved by permitting it to grow uninjured by the rasp and knife, and kept clean by being washed with cold water; all other applications are injurious and destroy the toughness of the "horn surface." Softness and brittleness of the hoof, which are fruitful sources of cracks and corns, may be remedied by placing the feet for several hours daily in thick woolen swabs, kept cool and moist by frequent applications of cold water, and by encouraging a more healthy growth of horn by occasional mild blisters round the coronary band. Cracks (or sand-cracks) mostly occur among horses much upon the road, cause lameness and constitute unsoundness. When serious and recent, poulticing, thinning away of the crust about the crack and perfect rest are essential. After the earlier heat and tenderness are removed a hot iron should be drawn at right angles to the crack, both above and below, so as to separate the diseased from the sound horn. Waxed thread or fine wire should be wound round the hoof, and a sound growth of horn stimulated by a blister round the coronet.

**HOOF**, Pieter Corneliszoon, pē-tēr kōr-nā-lēs-zōn hōft, Dutch poet and historian: b. Amsterdam, 26 March 1581; d. The Hague, 21 May 1647. He was son of that Cornelius Hooft who did much to procure Elizabeth's recall of the incompetent and tyrannical Leicester in 1587. He traveled through France, Italy

and Germany in 1601, and on his return began with patriotic ardor to improve and purge the speech of his mother country. With this aim in view he translated Tacitus into Dutch, and made that Latin writer the model of his style, as a historian. His historical writings are vivid and comprehensive. His poems are chiefly in the erotic vein. He also produced dramas in the form of pastoral, tragedy and comedy. In his comedies the domestic life of the Netherlands is admirably portrayed. In the castle of Moritz, Prince of Orange, at Muiden, where he lived as high bailiff, he used to gather round him a coterie of brilliant men and women, and this intellectual circle famous as the "Muiderkring" included the poets Huygens, Vondel and Baerle. His principal works are 'Hendrik (IV) de Grote zijn leven en bedrijf' (1626); 'Nederlandsche Historien' (1642); the poems 'Minneliedereren'; 'Afbeeldinglieden van Minne'; the pastoral drama 'Granida' (1605); the tragedies 'Geeraerd van Velzen' (1613); and 'Baeto' (1616); and the comedy 'Warenar.'

**HOOK**, Theodore Edward, English novelist and journalist: b. London, 22 Sept. 1788; d. 24 Aug. 1841. As a mere lad, sometimes in conjunction with his father, and sometimes on his own account, he wrote 13 farces and melodramas. For a time Hook led a life of gaiety in London, and became notorious for practical jokes and similar escapades. In 1812 he through the favor of the Prince Regent, although he was quite unversed in business and even in arithmetic, was appointed accountant-general and treasurer of the island of Mauritius; but, owing to his gross incompetence, a large deficiency in the military chest was discovered, and in 1818 he was sent home under arrest, and although no proceedings were taken against him, the liabilities thus incurred were a millstone round his neck ever after. In 1820 he was appointed editor of *John Bull*, a journal established in order to lampoon Queen Caroline and her supporters, and this paper he conducted till 1841. From this source he obtained at first an income of £2,000 a year. The years 1823-25 were spent in the debtors' prison. At intervals from 1824 to 1828 he published his 'Sayings and Doings' while in 1836 he became editor of the *New Monthly Magazine*. His other principal works are a series of novels, among which may be mentioned 'Love and Pride'; 'Jack Brag'; 'Gurney Married'; He figures in fiction as the Lucien Gay of Disraeli's 'Coningsby,' and as the Mr. Waggs of 'Vanity Fair.' Consult Barham's 'Life and Remains of Hook' (1849).

**HOOKER**, hūk'ēr, Edward, American sailor: b. Farmington, Conn., 1822; d. Brooklyn, N. Y., 1 May 1903. He followed the sea in the merchant service until the outbreak of the Civil War when he joined the United States navy as acting master and served with distinguished bravery. He was commissioned as lieutenant-commander in the regular naval service in 1884 and full commander two years later, when he retired.

**HOOKER**, Isabella Beecher, American philanthropist: b. Litchfield, Conn., 22 Feb. 1822; d. 25 Jan. 1907. She was a daughter of Dr. Lyman Beecher (q.v.) and in 1841 married Joseph Hooker, a lawyer. She made a special

study of the right of women of the United States to vote; was active in various reform movements, and was widely known as a public speaker. She wrote 'Womanhood, Its Sanctities and Fidelities.'

**HOOKER, Joseph**, American soldier: b. Hadley, Mass., 13 Nov. 1814; d. Garden City, N. Y., 31 Oct. 1879. He was graduated at West Point in 1837 and received a commission in the First Artillery. He served in Florida and on the northeast frontier 1837-40 and during the Mexican War was aide to Generals Smith, Harmer, Butler and Pillow. He saw much service in both the northern and southern campaigns and resigned from the army in 1853. From that date to the breaking out of the Civil War he was successively farmer, engineer and militia colonel. In 1861 he went to the front as a brigadier-general of volunteers. In 1862 he was commissioned major-general of volunteers and was present at the battle of Williamsburg, Va., and was subsequently conspicuous in the Peninsular campaign and in the battles of Bristoe Station and Chantilly. He also took part in the Maryland campaign, and in September of 1862 was appointed brigadier-general in the regular army. Two months later he was placed in command of the Fifth corps, and at the battle of Fredericksburg commanded the Third and Fifth corps. In 1863 he was put in command of the Army of the Potomac, but although very successful in refitting and reorganizing his troops, failed to show, as head of an army, those qualities which had characterized him in the field as corps and division commander. At Chancellorsville the defeat of the Federal troops by General Jackson was largely due to Hooker's vacillation and his want of power to cope with the sudden surprise of his right flank by the Confederate general. Public opinion in the North and an increasing lack of confidence in Hooker on the part of President Lincoln led to his resignation from his command and on 28 June 1863 he was succeeded by General Meade. He was then given command of the 11th and 12th corps, later combined in the 20th corps and on 24 Sept. 1863 was dispatched in command of the Army of the Cumberland to reinforce Rosecrans at Chattanooga and distinguished himself on 24 November in the so-called "Battle among the Clouds" on Lookout Mountain. He was brevetted major-general in the regular army in 1865, and a paralytic stroke forced him to retire from active service with that rank in 1868. An equestrian statue of Gen. Joseph Hooker by the sculptor French, was unveiled on Beacon Hill, Boston, 25 June 1903, with imposing ceremonies.

**HOOKER, Sir Joseph Dalton**, English surgeon and botanist: b. Halesworth, Suffolk, 30 June 1817; d. aged 94, Sunnydale, 10 Dec. 1911. His father was Sir William Jackson Hooker, regius professor of botany at Glasgow University, and his mother the daughter of a banker, Dawson Turner, of Great Yarmouth. Educated at the High School and University of Glasgow, he took his M.D. degree in 1839. He was only 21 when he accompanied the famous expedition of Sir James Clark Ross in the *Erebus* and *Terror*, sent out by the government to investigate the phenomena of terrestrial magnetism in the south circumpolar seas. His

official or nominal position was that of assistant-surgeon, but in reality he was the naturalist of the expedition. His researches during this voyage resulted in a series of priceless volumes on the botany of the southern regions, embracing the Antarctic Islands, New Zealand, Tasmania and Fuegia. He succeeded in extending our knowledge of the laws governing the distribution of plants by comparing those he found with the flora of other parts of the world.

Returning home after four years he became botanist to the Geological Survey of Great Britain in 1846, and in 1847 went to India to study the flora of a hitherto unknown region of the Himalayas. Returning in 1851, he published two volumes of 'Himalayan Journals' and other botanical works on India. In 1855 Hooker was appointed assistant director of Kew Gardens under his father, succeeding on the death of the latter to the directorship in 1865, and resigned in 1885. In 1868 he was president of the British Association, and president of the Royal Society 1872-78. He visited Syria and Palestine for botanical study in 1860; the Atlas Mountains in 1871, and the Rockies in 1877. On his return he presented to the Royal Botanical Gardens (Kew) a large collection of seeds and museum specimens, and a herbarium of some thousand species, together with a mass of notes on the distribution of North American trees. He was the recipient of many honors and medals for his eminent services in scientific geography by promoting an accurate knowledge of the floras and economic vegetable products of the colonies and dependencies of the British Empire. In 1907 King Edward conferred the rare distinction of the Order of Merit upon him. Hooker was twice married (in 1851 and 1876), and left six sons and two daughters. A list of his writings forms almost a botanical catalogue, for he wrote thousands of monographs in addition to his larger works. The great 'Index Kewensis' (Oxford 1893-94) was compiled under Hooker's direction at the request and expense of Darwin (d. 1882).

**HOOKER, Richard**, English theologian: b. Heavitree, near Exeter, March 1554; d. Bishopsbourne, 2 Nov. 1600. He was educated at Oxford. In 1581 he took orders, and was shortly after made preacher at Saint Paul's Cross, in London. In 1584 he became rector of Drayton Beauchamp, Buckinghamshire. The following year he was appointed by Archbishop Whitgift Master of the Temple for life. Here he became engaged in a controversy with his colleague, Walter Travers, whose sympathies were strongly Puritanical, and to this controversy we owe his celebrated work 'Of the Laws of Ecclesiastical Polity.' The first four books were printed in 1594. The fifth book of his great work appeared in 1597; the last three in 1600. 'The Ecclesiastical Polity,' written in defense of the Church of England, is no less remarkable for learning and extent of research than for the richness and purity of its style, which entitles its author to be regarded as one of the classics of the Elizabethan Age. Consult Lives by Walton and Keble.

**HOOKER, Thomas**, American colonial clergyman: b. Markfield, Leicestershire, England, probably 7 July 1586; d. Hartford, Conn.,

7 July 1647. After being graduated at Cambridge he took orders, preached in London and was chosen lecturer at Chelmsford in 1626. Having been silenced by Laud for non-conformity, he established a grammar school, and about 1630 went to Holland, where he preached at Delft and Rotterdam. In 1633 he came to New England with Cotton and Stone, and was settled with the latter at Newtown, now Cambridge, being ordained by the brethren of the church. In 1636 he removed with about 100 others to what is now Hartford, Conn., where he and Stone were the first ministers of the church. He was a remarkably animated and able preacher, of commanding presence and earnest zeal, and he has been called the Luther of New England. It was his custom to preach without notes. Some 200 of his sermons were sent to England, where about half of them were published. His most celebrated work, 'A Survey of the Summe of Church Discipline,' written with John Cotton, was published in England (1648). Many of his works have gone through repeated editions. Consult Walker, 'Life of Hooker' (1891).

**HOOKER, SIR William Jackson**, English botanist: b. Norwich, 1785; d. 12 Aug. 1865. He applied himself to the study of botany at an early age, and in search of botanical specimens visited Scotland and the Scottish islands, France, Switzerland and Iceland. His investigations on the British 'Jungermannia and Mosses' drew attention to his attainments, and he was elected to the chair of botany in the University of Glasgow, a position he filled for 20 years. In 1836 he was knighted, and in 1841 was appointed director of the Royal Gardens at Kew, a post which he held up to the time of his death. Under his management these gardens increased their area from 11 acres to 270. They are well laid out, and contain hot-houses and conservatories far superior to anything of the kind on the Continent, and include museums filled with objects derived from the vegetable kingdom, botanical libraries and a most extensive and excellently arranged herbarium. Among his works may be mentioned 'Tour in Iceland' (1811); 'The British Flora'; 'Flora Boreali-Americana'; 'Illustrations of the Genera of Ferns, Icones Plantarum'; 'British Ferns,' etc.

**HOOKER, Mount, Canada**, a peak in the Rocky Mountains, 15,690 feet high, near the eastern boundary of British Columbia.

**HOOKS.** See SHORE LINES.

**HOOKWORM, Anatomy and Life History.** The hookworms or ankylostomes are true roundworms (Nematoda, q.v.) and belong to the order of the strongyles. They are characterized by a well-developed buccal capsule armed with teeth or cutting plates, and in the male a fan-shaped bursa around the posterior end of the body. The anterior end is curved dorsad so that the mouth opens toward the wall of the intestine though the worm, when attached, lies parallel to the lining of the canal.

The hookworms are all dangerous blood-sucking parasites, and give rise to profound and lasting anemias in the host. Many species are known to occur in the higher mammals; two are found in man, often called the Old World and the New World hookworm. The former was discovered in 1843, though the

disease to which it gives rise was recorded in ancient writings and the effects of its presence are recognizable in many regions and races. It is designated scientifically *Ancylostoma duodenale*.

The New World hookworm, *Necator americanus*, was discovered by Stiles in 1902 in the South and has proved to be the most common form in North, Central and South America.

FIG. 1.—*Ancylostoma duodenale* —  $\times 15$  (After Looss). A, Adult male seen from ventral side. B, Adult female seen from right side. a, anus; c, cervical gland; e, excretory pore; i, intestine; o, ovary; p, papilla; s, spicule; t, testes; u, uterus; v, vagina.

Later recognized by Looss among the parasites from pigmies in forests of Central Africa, it is now thought to have been imported into the western continent by the slave trade. The negro seems to be tolerant of its presence but in the white to which it has been abundantly transferred in the regions where the two races are in close contact, it evokes a most serious anemia which results in marked physical and

\* The exact spelling of this name, which has been written in some 20 different ways, following an erroneous orthography employed by the discoverer of the worm, has finally been settled as given here by the International Commission on Zoological Nomenclature.

mental deterioration of the white host. Stiles regards the present condition of the "poor white trash" of the South to be due largely to its attacks. The two hookworms are so much

FIG. 2.—Oral capsule of *Ancylostoma duodenale* from man in Egypt. Viewed from in front (dorsal aspect). On each side two heavy teeth, the inner (upper) one of each set carrying a minute accessory denticle. X 100. (After Looss).

alike in appearance that careful microscopical examination is demanded for their differentiation. Their effects on the host are in general similar though those due to *Necator* are more intense and persistent.

The adult *Ancylostoma duodenale* (Fig. 1) measures in the male 8 to 11 mm. in length by 0.4 to 0.5 in breadth, and in the female 10 to 18 mm. long by 0.5 to 0.6 wide. The most significant region is the anterior end (Fig. 2, A). On looking down into the oral capsule one notes at the anterior ventral margin two pairs of large unciniate teeth turning inwards, and deeper within the capsule two short lateral cutting plates. In *Necator* the corresponding

FIG. 3.—Oral capsule of *Necator americanus* from man, Central Africa; A, lateral aspect; B, dorsal view. The armature consists of cutting plates which completely close the upper part of the oval mouth opening and of lancet-like teeth on the bottom of the capsule. (Compare with Fig. 2). X 240. (After Looss).

region (Fig. 3) shows that the ventral teeth are replaced by broad cutting plates and the deeper lateral plates are lancet shaped. These differences facilitate a diagnosis when the microscope is employed.

The bursa of the male *Ancylostoma duodenale* (Fig. 4, A), is also easily distinguished under suitable circumstances from that of the male *Necator americanus* (Fig. 4, B), as appears from the figures.

The life history of the hookworm is strikingly complex. The eggs are thin shelled and when evacuated in feces are ordinarily in the four-celled stage, i.e., they have started on development but little and hence are readily distinguishable from those of other nematodes

with which they are associated and might be confused (Fig. 6). Development proceeds within the eggshell slowly, the rate varying with the external temperature, until the embryo takes form (Fig. 7) and later a minute larva (Fig. 5, a) is hatched out. This passes its existence free in mud or feces until, after the second molt, the second stage of development lies within the larval skin of the first and in a cyst so that this worm is often spoken of as the encysted stage (Fig. 5, b). In this form known as the infective stage it seeks out water and there awaits an opportunity for gaining entrance into a new host. Eggs or younger larvæ do not cause infection even when introduced into man by chance.

FIG. 4.—A, Bursa of *Ancylostoma duodenale*, seen from the left side. Bursal lobes short, distinctly broader than long, ribs moderately thick. X 60. (After Looss). B, Bursa of *Necator americanus*, seen from the left side. Bursal lobes longer than broad, ribs in general heavier than in *A. duodenale*. X 60. (After Looss).

The distribution of human wastes over the surface of the ground as is prevalent in many regions gives the chance for the young larvæ on hatching out to be dispersed generally in the mud and water of the soil. In those regions where the temperature does not go low enough to kill these larvæ the top layer thus becomes loaded with them in the infective stage. By the contamination of food and water supplies they may gain access directly to the human

alimentary system, and such direct infection does take place though doubted by many after the indirect method of infection had been discovered. It seems likely, however, that the in-

direct method is the more common as it is surely the more difficult to combat.

The facts in the indirect method were determined by Looss in Egypt for the Old World

FIG. 6.—Eggs of A, *Trichostrongylus instabilis* which might be confused with the hookworm; B, *Necator americanus*; C, *Ancylostoma duodenale*. All three X 205. (After Looss).

type and by Claude A. Smith for the New World species in this country. When the larvæ are brought on to the skin in masses of mud and water they essay at once to bore into the tissue. Penetrating the opening of a sweat gland or a hair follicle they reach the more open

inner layers where they enter the lymph spaces and are ultimately carried into the blood stream. Borne by it into the lungs they desert the vessels to enter the air spaces. Here one finds them in the surface mucus, moving out-

ward. They ultimately ascend the trachea to the pharynx and pass over into the esophagus down which they travel to the stomach and intestine, thus completing their migrations. In

the course of their wanderings they undergo two molts during which the structures of the adult are gradually acquired. In the intestine sexual maturity is attained in a short time and the production of eggs completes the cycle.

The hookworm attacks the surface of the intestinal wall, rasping and sucking away the delicate inner cells on which in fact—not on blood—the animal feeds, and laying bare the deeper layers (Fig. 8). To the effects of this severe mechanical injury is added another influence of serious import: the worm produces in large salivary or cervical glands (Fig. 1, c) a secretion of marked hemolytic power which inhibits the coagulation of the blood. As a result the wound continues to bleed for a long time, even after the worm has deserted the spot to which it was attached.

It is evident that environmental conditions play a large part in determining the frequency of the parasite since they favor or hinder its development in the free stage and the coincident infection of man. Since the eggs are killed by a temperature of 34° F. in 24 to 48 hours the parasite never becomes abundant north or south of the subtropical zones. The encysted larvæ will live readily a month or even a year in moist soils but perish rapidly when the earth dries out; consequently moist climates and heavy water-filled soils favor the spread of the parasite whereas dry seasons or absorbent soils bring about its rapid elimination whenever it chances to be introduced. For further data consult Looss, A., 'Records of the Egyptian Government School of Medicine' (Vols. III, IV; 1905, 1911); Smith, Claude A. (in *Journal of the American Medical Association*, Vols. XLI, XLIII; 1903, 1904); Stiles, C. W., Hygienic Laboratory (Washington, D. C., Bulletin 10, 1903).

HENRY B. WAGNER

Professor of Zoology, University of Illinois.

**HOOKWORM DISEASE**, *synonyms*: ankylostomiasis, anchylostomiasis, uncinariasis, dochmiosis, brickmakers' anæmia, miners' anæmia, geophagia or dirt-eating, Egyptian or tropical chlorosis, tunnel-workers' anæmia, tunnel disease (and very improperly), malarial cachexia or anæmia. The disease has also received other names in many other tongues. That this disease existed in Africa and perhaps other countries from time immemorial there can be no reasonable doubt, but it was only within recent times that its cause was discovered. Clinically the malady seems to have been first accurately described by Piso, in 1648, he having observed about that period persons evidently afflicted with the disease in Brazil, though he was ignorant of its causation. Although the affection was unquestionably very common in most tropical countries, and must have been encountered by all practitioners in these regions, nothing further appears to have been written concerning it until just a hundred years later, when it was observed in Guadeloupe, and a short time thereafter in Jamaica. Following this, under the name of "miners' anæmia," it was described in Hungary, and later in Bohemia and France. Subsequently the worm which causes the malady was discovered by Dubini, of Milan, in 1838, who proposed that the parasite be called *ancylostoma* which he first misspelled "agchylostoma," from two Greek

words meaning "bent mouth." Notwithstanding that others had preceded him in finding quite similar and closely related worms in the intestines of various animals, and regardless of the fact that this investigator failed to recognize the vital connection that exists between the presence of these parasites in the alimentary tract of the human being and the profound anæmia that follows, his work was of elementary importance in paving the way for a proper comprehension of this insidious, common and fatal affection.

The connection between these worms and the symptoms that they produce when living in the intestinal tract of the human being was first clearly established by Bilharz, in 1853, and Griesinger, in 1854. In the succeeding years this parasite was discovered in many countries of southern and middle Europe,—being mostly found in laborers in tunnels, mines and brick-making establishments. Previous to this, as early as 1806, "dirt-eating" was described in America by Pitt, and, about a half century later, still more fully by Duncan. Although several cases of the disease of foreign origin had been previously reported, the first recorded cases of the endemic hookworm disease of the United States are those of A. J. Smith, who, in 1901, recognized the eggs of the parasite in a sailor who had lived for some time in America. It is of interest to note that the writer of this article observed and sketched the eggs of what was in all probability this parasite from a patient with amœbic dysentery about 1892, but, misled by the absence of all records of the disease in the new world, failed at the time to identify them. In the meantime the extreme prevalence of hookworm disease in the southern portions of the United States was slowly gaining recognition, and after some years was generally accepted as one of our most common and most serious diseases. Such importance did the subject later assume that the principal efforts of the boards of health of the Southern States have in recent years been directed toward combating this old but newly discovered affection. Some years ago a commission was formed for the eradication of the hookworm, and still more recently, owing to the fact that the malady was found extremely common in the West Indies, in Central and South America, and in other tropical countries, the activities of this commission have been greatly enlarged and its beneficent influences extended to these countries, preventing much suffering, saving many lives, and at the same time preparing the countries affected for the advance of civilization.

The principal pathological change produced by the hookworm consists in a profound anæmia, characterized by a great diminution in the hæmaglobin or coloring matter of the blood. In the young—who are unfortunately the most common sufferers—the alterations of the blood cause a retardation of development in every part of the body, and if the infection persists, as is often the case, the victim is permanently stunted,—being often left for life a dwarf both mentally and physically.

Where the worms attach themselves to the mucous membranes of the gut there is a local lesion, with more or less destruction of the epithelial coating, surrounded often by an area of swelling and redness. In some instances

this process goes on until small ulcers are formed on the inner surface of the intestine. Of course under such circumstances there are found sometimes extensive inflammatory deposits in the mucosa, and even in the submucosa of the wall of the gut. Among the morbid changes produced by the parasite the dermatitis induced by its larvæ as they pass through the skin should not be forgotten. The symptoms produced by the presence of the hookworm in the alimentary canal of the human being may be in a general way inferred from what has been said of the pathological changes brought about by the parasite; naturally, the number of worms present in the intestinal tract—which may be from a very few to several thousand—and the age and size of the individual attacked modify more or less their severity. No greater mistake could be made, however, than to assume that such influences completely control the clinical picture, since individual susceptibility to the malign influences exerted by the parasite largely determines the severity of the resultant symptoms. On the other hand the degree of dermatitis produced is doubtless greatly influenced by the number of the larvæ that pass through the skin, but even here it is more than probable that some individuals react more pronouncedly than others. It is of importance to emphasize the fact that where the individual has a light infection, or where there is a high degree of resistance to the disease-producing power of the parasite, few and insignificant symptoms may occur, and the victim may be only slightly indisposed, or even appear to be in perfect health. This is particularly apt to be the case in the negro. Under such circumstances, however, the matter should not be treated lightly, since such persons act as carriers of the disease, and are a grave menace to their neighbors under certain circumstances. When hookworm larvæ in any considerable numbers attack the skin there is a feeling of irritation and burning, which is quickly followed by swelling, an increase in the uncomfortable symptoms and a severe itching. In from 24-36 hours there form in the affected area small blisters, which, when numerous, are apt to coalesce; in another day the vesicles become pustules, as a result of their watery constituents becoming infected with the germs of suppuration. The tops of the pustules become scabs, and gradually fall off, leaving the raw surface beneath, and in effect forming sores; slowly these heal, so that in from two to three weeks, as a rule, the parts return to a normal condition,—though leaving the surface attacked more or less discolored. The condition described is the so-called "ground itch." In the meantime no general effects are observed in the patient, except that at first the lymph nodes, or "glands," are enlarged and tender in the affected area, and there may be a slight rise in temperature, lasting only a short time. Following this the victim appears to return to a perfectly normal condition,—it being six weeks or two months before he begins to exhibit the symptoms that result from the presence of the worms in the intestine. If the number of worms be sufficient and the patient does not develop sufficient immunity there now begins a gradual decline in strength and general health of the infected individual, accompanied by a certain amount of pallor, which may in extreme

cases become the most prominent objective symptom of the affection. Usually the patient complains of slight tenderness and pains in the upper part of the abdomen, not uncommonly associated with more or less indigestion, and often constipation as well. The victim is often sluggish, and frequently, though by no means always, shows a disposition to avoid exertion of any character, but this is simply the result of a want of physical strength, which by no means warrants the somewhat unflattering characterization of "laziness," which has been so commonly and indiscriminately bestowed on it. Where the disease is severe the patient may in time become so weak that all labor is impossible,—not infrequently accentuated by a shortness of breath that becomes manifest on the slightest exertion. In such cases the feet, legs, face and other parts of the body often become oedematous, and collections of fluids may occur in the abdomen, pleural cavity, the pericardium and other serous sacs. As is the case in other profound anæmias the patient loses little or no flesh. Where conditions such as those just described occur, death may result if the parasites are not expelled. On examination the blood shows interesting but no characteristic changes. In severe cases there is a great and even extraordinary diminution in the red coloring matter of the blood—being sometimes as much as 90 per cent—but strange to say there is no corresponding decrease in the number of the red cells, which are carriers of the coloring matter just mentioned,—in this respect resembling the alterations that occur in the peculiar anæmia of young girls called chlorosis; however, if the disease persists for a long time there is a very gradual falling off in the red cells, but even in such instances the number of these cellular elements rarely go below 50 per cent. In the average case of hookworm disease the number of red cells will be from 3,000,000–4,500,000 to the cu.mm. of blood. There are no marked changes in the white cells,—though there is generally a slight increase in their number; not usually there will be found on examination the normal 6,000 cells to the cu.mm., but much more commonly there are 8, 9, 10 or even as many as 18,000. Differential count usually shows nothing but an increase in the eosinophile cells,—they being generally from 5–8 per cent of the total number. The most striking and wholly pathetic effects of the hookworm are observed in the young. Where the parasite attacks its victims in early youth, and infection constantly recurs during the succeeding years, it would be difficult to imagine that anything could produce more frightful results. In addition to the symptoms already described the wretched victim almost wholly ceases to develop, and usually remains throughout life dwarfed, and a pitiful travesty on humanity. Under such circumstances the sufferer when between 20 and 30 may appear a youth of not more than 8 or 10, without beard, or hair about the pubes, physically weak and incredibly stupid; close inspection shows the skin of the face yellow and wrinkled, with a suggestion of old age, altogether at variance with an otherwise boyish appearance. It is, of course, true that by no means all of the victims of this malady exhibit such terrible effects of the infection, but even where the worms are gotten

rid of comparatively early a failure to develop and a scanty beard are apt to remain throughout life. Notwithstanding the serious character of this malady the prognosis is good if its true nature be discovered, and the proper remedies applied. Recovery almost invariably follows where the parasites are expelled, but convalescence is always slow,—it usually requiring from six to eight months for the sufferer to regain his normal health. The prophylaxis is simple. All that is necessary is for the stools to be passed in a properly constructed water closet, and adequate means taken to prevent the feces being scattered about the premises. Those living in hookworm districts should be instructed as to the danger of children defecating in the horse-lot, in the garden and in other places in the neighborhood of their houses,—a habit very common among the negroes and poor whites in the backwood districts of the South. Likewise the curing of those infected is of the first importance, as so long as they have the disease they are a constant source of danger to those with whom they live. The treatment is also very quick and simple. The day before the treatment is to be given the patient must take no evening meal. It is good practice to give at bed time a dose of some good purgative, such as calomel or castor oil, and if it does not act well before morning a saline laxative should be administered as soon as the patient awakes. After the bowels act well the real treatment for expelling the worms is taken; of such drugs we have several. Perhaps the best and safest is oil of chenopodium, either alone or combined with 10 drops of chloroform with each dose; the medicament is given in two portions, one hour apart; the amount usually prescribed is in the ratio of two drops to each year of life up to 24, after which the quantity is not increased. Another excellent remedy for hookworm is thymol; it is very important to have the drug finely powdered; it should also be administered in two doses at an interval of an hour,—the quantity being about two and a half grains to each year of life of the patient, but is not increased after the 24th year. As this drug is poisonous, and has in a few instances caused death, it should be given with a great deal of care. In using it for the treatment of hookworm disease it should be remembered that the object is to cause it to lie in the intestine in contact with the worms just sufficiently long for it to kill or stupefy them, but to prevent its being absorbed into the circulation of the patient as far as is possible. Therefore we should give nothing that would dissolve the medicament, such solvents are: alcohol and anything containing it; butter and all oils; and, since thymol is slightly soluble in water, fluids and drinks of all kinds in greater quantities than absolutely necessary so long as the drug remains in the patient's intestine. For the foregoing reason it is perhaps as well not to give castor oil in any stage of the treatment where thymol is to be used to expel the worms. In addition to the foregoing beta-naphthol, the oleoresin of the male fern, oil of eucalyptus and several other drugs are sometimes given in the treatment of hookworm, but the results with the two agents first mentioned are so much superior that it is useless to go into details of their administration. Whatever the drug that is used to expel the worms it is well for the

patient to have a suitable laxative some hours after it is given, he should remain in bed during the entire day that the treatment is administered, and should take no food until late in the afternoon. After the worms are expelled nothing but good food is, as a rule, necessary, but it is thought by some that the administration of tonics, especially those containing iron and other supposed blood-builders, is of benefit. The treatment of ground itch consists in keeping the parts cleaned and protected from external injury, together with some antiseptics and soothing ointment.

**HOONOOMAUN**, hoo'noo-mān. See ENTELLUS MONKEY.

**HOOP ASH**. The black or water ash (*Fraxinus nigra*). See ASH.

**HOOPER**, hū'pēr, John, English reformer and martyr: b. Somerseshire, about 1495; d. Gloucester, 9 Feb. 1555. He embraced the principles of the Reformation and in 1539, to avoid the persecution consequent on refusing to sign the new articles of faith put forth by Henry VIII, withdrew to the Continent. On the accession of Edward VI in 1547, he went to London and contributed greatly to the progress of the Reformation. In 1550 he was nominated bishop of Gloucester. On the accession of Mary, in 1553, he was one of the first victims fixed upon, and being imprisoned in the Fleet, was treated with great severity. In 1555 he was required formally to recant his opinions. This he refused to do and was burned at the stake near his own cathedral. His works consist chiefly of a 'Godly Confession and Protestation of the Christian Faith'; 'Lectures on the Creed'; 'Sermon on the Book of Jonah'; 'Annotations on the Thirteenth Chapter of the Romans.'

**HOOPER**, William, American patriot: one of the signers of the Declaration of Independence: b. Boston, Mass., 17 June 1742; d. Hillsboro, N. C., October 1790. He was graduated at Harvard College in 1760, studied law with James Otis in Boston and removed permanently to Wilmington, N. C., in 1767, where he soon rose to professional eminence and was noted for his social qualities and hospitality. He was delegated to the Continental Congress in 1775, and was till his death a leader in the councils of North Carolina.

**HOPESTON**, hoops'tōn, Ill., city in Vermilion County, on the Lake Erie and Western and the Chicago and Eastern Illinois railroads, about 85 miles south of Chicago and 48 miles south by east of Kankakee. It has a Carnegie library, several public parks and is the seat of Greer College, established in 1891. It is situated in an agricultural region and its chief in-

dustries are connected with agricultural products. It has large sweet-corn canning establishments and factories for making the cans and the canning machinery. There are manufactured other canned goods, also horseshoe nails, gas engines and agricultural implements. Grain and hay are shipped to the larger markets. The government, in accordance with the charter of 1877, is vested in a mayor who serves for two years and in a city council. The city owns and operates the waterworks. Pop. 4,698.

**HOOPING-COUGH**, a series of coughs ending in a long-drawn breath, during which a shrill whistling sound, the hoop, is produced. Several fits of coughing succeed one another until some phlegm or mucus is expelled. Vomiting not infrequently follows a fit of coughing. It has recently been discovered that the cause of the complaint is a poison acting as an irritant on the pneumogastric nerve. Hooping-cough is contagious and most commonly attacks children, generally but once in their lives. The first symptoms are a difficulty of breathing and other slight febrile affections, which are succeeded by hoarseness, cough and difficulty of expectoration. After a fortnight or more the cough becomes convulsive and is attended by the hoop. In four or five weeks the expectoration becomes loose and the fits of coughing gradually diminish in frequency and duration. Hooping-cough is seldom fatal to adults, but is most fatal in the first year of childhood. Bronchitis and pneumonia are the most serious complications.

**HOPOE**, hoo'pō, a peculiar bird of the Old World, which takes both its vernacular and scientific name (*Upupa*) from its whooping cry. It is of the group *Coccygomorphæ* (q.v.) and represents a family (*Upupidæ*), many species of which inhabit southern Asia and Africa, while one (*U. epops*) is a well-known migrant in Europe. It is about 12 inches long, is brown above and white beneath, with black, white-barred wings and a very large cinnamon-red black-tipped crest and a long, sharp, curved bill. It seeks its food on the ground, nests in holes in trees, crannies in walls, etc., and has many curious traits and habits which have caused the bird to take a prominent place in the folklore of all countries. The African hoopoes belong to the genus *Irrisor* and are called wood-hoopoes. They have brilliant plumage but no crest. They go about in noisy flocks and have much the appearance and habits of woodpeckers.

**HOORN**, hōrn, or **HOORNE**, hōr'nē, or **HORN**, or **HORNES**, ðrn. COUNT OF (PHILIP II, DE MONTMORENCY-NIVELLE), Flemish soldier and statesman: b. about 1520; d. Brussels, 5 June 1568. His father was a descendant of the French family of Montmorency, and on the mother's side he was related to Lamoral Egmont, with whose fate his own was linked. His mother became a widow when he was about eight, and was married again to John, Count van Horn, one of the wealthiest nobles of the Netherlands, who left his estates to his wife's children on condition that they should assume his name. Philip was thus at the outset of his career one of the most influential of his order, and received from Charles V and Philip II important trusts and distinctions. He accompanied Philip II to Spain, where he is supposed to

have received information of the designs of the Spanish court against the Netherlands and to have communicated them to the Prince of Orange. Returning to the Netherlands he joined Orange and Egmont in resisting the aggressive policy of Philip; yet continued loyal to the Crown. He was, however, suspected by the Spanish court, and upon the arrival of Alva in Brussels was enticed with Egmont to that city, and arrested in September 1567, on a charge of high treason. Ceaseless but vain efforts were made to obtain for him a fair trial, and appeals for clemency on his behalf were made by potentates in all parts of the Continent. He was executed with Egmont in June 1568. Consult 'Cambridge Modern History' (Vol. III, 1905).

**HOOSAC** (hoo'sak) **MOUNTAIN**, the name given to a spur of the Green Mountains which is in the northwestern part of Massachusetts, on the east side of the valley of the Hoosac River; maximum altitude 2,400 feet. The whole length is about 16 miles. The mountain is noted for its beautiful scenery.

**HOOSAC TUNNEL**, in the towns of Adams and Florida, in Berkshire County, in Massachusetts, and piercing the Hoosac Mountain. It is on what is now known as the Boston and Maine Railroad, the route from Boston to Troy, N. Y., by way of Greenfield. From the west entrance of the tunnel to Troy is 54 miles; from the east entrance to Boston, 137 miles. The tunnel is nearly five miles in length, the longest tunnel in the United States and with the exception of the Rogers Pass tunnel in British Columbia the longest on the continent. Before the general introduction of railroads, and, as early as 1825, the project was broached of making a canal across Massachusetts from Boston to the Hudson River. This plan was abandoned when railroads were built across the State. In 1851 the tunnel question had advanced so far that surveys of various routes were made and some experiments were begun. The work of tunneling began in 1856 and was completed in 1873. For so long a tunnel the ventilation is good owing to the shaft, 1,028 feet, sunk near the centre. The width is sufficient for two tracks. The total cost, including 39 miles of adjoining railroad, was about \$13,000,000.

**HOOSICK FALLS**, N. Y., village in Rensselaer County, on the Hoosick River and on the Boston and Maine Railroad, about 28 miles northeast of Albany. The first permanent settlement was made in 1688, and the first charter was received in 1827. The charter has been revised and the last revision was in 1890. The village has excellent water power. The chief manufactures are agricultural implements, paper and paper-making machinery, electric insulators, shirts, cotton and woolen goods and flour. The government of the village is vested in a president who holds office three years, and a board of trustees. The site of the British entrenchments at the battle of Bennington, 6 Aug. 1777, is near here and is now maintained as a State park. The waterworks are the property of the village. Pop. 5,532.

**HOOSIER SCHOOLMASTER**, The. In the conclusion to the 'Hoosier Schoolmaster' Edward Eggleston announces his belief that readers whose taste is not perverted always

want a story to "come out well." Accordingly he so planned this his first and most important romance that the lovers are all happily united, the poor orphans become prosperous and the evil-doers receive just punishment, mitigated somewhat through the generous intervention of those whom they have wronged. The 'Hoosier Schoolmaster' owes its great popularity not so much to the conventional plot as to its happy description of early days in Indiana. It pictures the country school in which custom prescribed a constant warfare between the master and the big boys, the community spelling-school, the different forms of bigoted and illiterate preaching that were offered to the new settlers, the amusing attempts at formality in the proceedings of the courts, and other features of pioneer life as the author had seen them in his career as itinerant missionary and agent for a Bible society. Eggleston's fondness for historical accuracy sometimes led him to sacrifice the artistic unity of his story in order to introduce a detail exactly as it was found in real life, but this defect is less noticeable in the 'Hoosier Schoolmaster' than in some of his later novels. There is a great variety of characters who, while they are drawn pretty much in unshaded black and white, have enough truth to human nature to seem real. A sufficient humor pervades the whole, the action never drags and the book despite its limitations deserves the great vogue it has had since its publication in 1871.

WILLIAM B. CAIRNS.

**HOOSIER STATE**, a popular name for Indiana. The word is said to be a corruption of "husher," formerly a colloquial name for a fighter or a bully.

**HOOVER**, Herbert Clark, American engineer and public official: b. West Branch, Iowa, 10 Aug. 1874. He was graduated at Stanford University, California, in 1895, was assistant on the Arkansas geological survey in 1893 and the United States geological survey of the Sierra Nevada in 1895. In 1896 he was assistant manager of the Carlisle mines, New Mexico, and the Morning Star mines, California. In the following year he went to West Australia as chief of the mining staff of Bewick, Moreing and Company and manager of Hannan's Brown Hill mine. In 1899 he was chief engineer of the Chinese Imperial Bureau of Mines and performed extensive exploration in the interior of China. He took part in the defense of Tientsin during the Boxer disturbances of 1900. From 1900 to 1914 he served successively as general manager, director and partner of various mining companies. In 1915-16 he served as chairman of the American Relief Committee in London and went to Belgium as chairman of the Commission for Relief in Belgium. Under his direction millions of dollars worth of food and clothing were distributed to the needy in devastated Belgium. His efficient record in this position led to his appointment in 1917 by President Wilson as food controller for the United States. See **FOOD PROBLEMS AND THE WAR**.

**HOP-HORNBEAM**. See **IRON-WOOD**.

**HOPATCONG**, hō-păt'kōng, **Lake**, in Morris and Sussex counties, New Jersey, about 33 miles northwest of Jersey City and 25 miles west of Paterson. The lake is 725 feet above

the sea, and eight and one-half miles long and three and one-half miles wide. Its area is 2,443 acres. Its outlet is the Musconetcong River which flows into the Delaware, but it is also the source of supply for the upper level of the Morris Canal, through which some of its waters pass into the Rockaway River. Lake Hopatcong is a favorite summer resort, its beautiful scenery being one attraction. It is surrounded by hills and low mountains, all well wooded, and many of the trees are evergreens.

**HOPE, Anthony.** See HAWKINS, ANTHONY.

**HOPE, Ascott R.** See MONCRIEFF.

**HOPE, Ark.**, city of Hempstead County, 115 miles southwest of Little Rock, on the Saint Louis and San Francisco, the Louisiana and Arkansas, and the Saint Louis, Iron Mountain and Southern railroads. Situated in a cotton and fruit-growing region it has cottonseed-oil mills, compresses, planing and lumber mills, cotton gins, wagon works and box, spoke, stave and handle factories. The waterworks, electric lighting and sewage disposal plants are owned by the city. Pop. 3,639.

**HOPE COLLEGE**, in Holland, Mich., co-educational institution, founded in 1866 by Dutch settlers, and under the auspices of the Reformed Church in America. The Western Theological Seminary was founded in 1869. It maintains a preparatory school. The campus comprises 16 acres. Five courses are given—classical, philosophical, natural science, modern language English and mathematics. The degree of B.A. is conferred. At the close of 1915 there were connected with the school 23 instructors and 400 students. The library contained 21,000 volumes. The income amounts to about \$36,000 annually, and the endowment to \$388,000. The principal buildings are the Carnegie Gymnasium, Graves Library, Van Raalte Memorial Hall, the Ackerman Hoyt Observatory and the Winants Chapel.

**HOPE DIAMOND**, a famous blue diamond weighing 44½ carats, in possession of the family of H. T. Hope, of England, until 1903, when it was sold to an American.

**HOPEDALE**, the name of a community founded by Rev. Adin Ballou, in 1841, at Milford, in Worcester County, Mass. At the beginning there were 28 persons who wished to lead lives in accordance with high ideals of Christianity. They formed themselves into a joint-stock company, purchased a farm of 238 acres, established a settlement, and proceeded to cultivate the soil, and to manufacture their own breadstuffs and clothing. At first a board of trustees were the chief governing power and had entire control of the industries. Later more responsibilities were given to the members, and the industries were, in different ways, apportioned among them. In 1854 there were 200 members; but the community had become a financial failure and dissensions had crept in. In 1856 they were in debt, and as a joint-stock company they disbanded; but continued as a semi-communitistic community until about 1862, when they gave up the industries they had established to private individuals, and formed themselves into Hopedale Parish with their founder as pastor. Consult Ballou, Adin, 'Hopedale Community.'

**HOPKINS, Alphonso Alvah**, American author and lecturer: b. Burlington Flats, N. Y., 27 March 1843. He was for three years professor in the American Temperance University; from 1867-86 was editor of three agricultural papers successively. Since 1868 he has lectured on temperance and other social and political subjects; in 1882 he was the prohibition candidate for governor of New York. He is editor of the *National Advocate*. He has written 'Geraldine, a Romance in Verse,' a popular poem in the style of Owen Meredith's 'Lucille' (1881); 'His Prison Bars' (1878); 'Sinner and Saint' (1880); 'Life of General Clinton B. Fisk' (1888); 'Wealth and Waste' (1896); 'Ballads of Brotherhood' (1900); 'Profit and Loss in Man' (1909); 'The Bugle of Right' (1913).

**HOPKINS, Edward**, American colonial governor: b. England, 1600; d. London, March 1657. He was a prominent merchant of London, and came to Boston in 1637, but soon after removed to Hartford, where he was chosen a magistrate in 1639, and governor of the colony of Connecticut every other year from 1640 to 1654, alternating with Haynes. He afterward went back to England, where he was chosen warden of the English fleet, commissioner of the admiralty and navy and member of Parliament. But he never lost his interest in the colonies, and at his death bequeathed much of his estate to New England, giving £1,000 for the support of grammar schools in Hartford and New Haven, which are still flourishing, and £500 which went to Harvard College and the grammar school at Cambridge.

**HOPKINS, Edward Washburn**, American philologist: b. Northampton, Mass., 8 Sept. 1857. He was graduated from Columbia in 1878, and going to Germany to study took the degree of Ph.D. at the University of Leipzig. He taught at Columbia (1881-85) and at Bryn Mawr (1885-95). In 1895 he became professor of comparative philology and Sanskrit at Yale. He is a member of American Philosophical Society, American Academy of Arts and Sciences, American Oriental Society, German Oriental Society, Royal Asiatic Society, etc. He has written 'Caste in Ancient India' (1881); 'Manu's Lawbook' (1884); 'Religions of India' (1895); 'The Great Epic of India' (1901); 'India Old and New' (1901); 'Epic Mythology' (1915); besides numerous papers on philology and Hindu history. For 10 years he was editor of the *Journal of the American Oriental Society*, of which he became president in 1908.

**HOPKINS, Esek**, first commodore of the American navy: b. Scituate, R. I., 1718; d. North Providence, R. I., 26 Feb. 1802. In November 1775 he received a commission from the Continental Congress as commodore and "commander-in-chief" of the navy, soon after which he put to sea with the first squadron sent out by the colonies. The fleet sailed for the Bahama Islands, and captured the forts at New Providence, and with them 80 cannon and a large quantity of ordnance, stores and ammunition. On his return, when off Block Island, the commodore took the British schooner *Hawke* and the bomb brig *Bolton*. For this act the president of Congress complimented Hopkins officially. Commodore, or Admiral Hopkins, as he

was generally called (even by Washington, who so addressed him in his official letters), performed other remarkable exploits, though he had great difficulties to contend with. His name became a synonym for heroism and for American patriotism. In June 1776, Hopkins was ordered by Congress to appear before the naval committee in Philadelphia to reply to charges which had been preferred against him for not annoying the enemy's ships on the southern coast. He was defended by John Adams, and was acquitted. The unavoidable delays at a later period in getting his ships ready for sea gave another chance for his enemies to complain; and neglecting a citation to appear at Philadelphia, because no specific charges were made against him, and on account of his general disgust at the conduct of his opponents, he was dismissed the service, 2 Jan. 1777. He resided near Providence and exerted during a long life a great political influence in Rhode Island, being often elected to the general assembly of that State. Consult Field, 'Esek Hopkins' (1898).

**HOPKINS, Ezekiel**, bishop of Londonderry: b. Pinne, Devonshire, 3 Dec. 1634; d. Aldermanbury, 19 June 1690. After being graduated at Oxford he became chaplain of Magdalen College in 1656. After conforming to the Church of England he became incumbent of the parish of Saint Mary Woolnoth at London. The great plague drove him to Exeter, where he remained until 1670, when, through the prestige of Lord Robartes, lord lieutenant of Ireland, he obtained the deanery of Raphoe, and in the following year the bishopric of that district. He was appointed bishop of Londonderry in 1681. His office terminated in 1689 with the siege of the town by the Irish supporters of James II. Returning to London, he became rector of Saint Mary, Aldermanbury (1689). His published works include 'Sermons'; 'Expositions of the Decalogue and the Lord's Prayer'; 'Regeneration'; and 'The Vanity of the World.' These have been edited best by Pratt (4 vols., London 1809).

**HOPKINS, John Henry**, American Protestant Episcopal bishop: b. Dublin, Ireland, 30 Jan. 1792; d. Rock Point, near Burlington, Vt., 9 Jan. 1868. At the age of eight, he was brought to America, his father settling in Philadelphia. He became a successful member of the bar in Pittsburgh, where his interest in church work was so earnest that the vestry of Trinity Church unanimously elected him rector of the parish though he was not even a candidate for orders. He accepted the call, was ordained in 1823, and remained in Pittsburgh until 1831, when he went to Trinity Church, Boston, as assistant, and became at the same time professor of systematic divinity in a theological school. He was consecrated bishop of Vermont in 1832 and combined with the episcopate the rectorship of Saint Paul's Church, Burlington. Though at the head of a small diocese, he exerted a widespread influence as a learned theologian and a controversialist of uncompromising bravery and great versatility. He is said to have been the first to suggest the idea out of which grew the important Lambeth Conferences of the entire Anglican Communion, and it is unquestionably to his prudent and charitable efforts that the happy reunion of

the Northern and Southern dioceses after the Civil War was largely due. Besides controversial works, which at the time had great effect, he published 'The Primitive Creed' (1834); 'The Primitive Church' (1835); 'The American Citizen' (1857); and 'The Law of Ritualism' (1866). See 'Life of Bishop Hopkins by One of his Sons' (1873).

**HOPKINS, Johns**, American financier and philanthropist: b. Anne Arundel County, Md., 19 May 1795; d. Baltimore, 24 Dec. 1873. His parents, Quakers, gave him a fair education and the training of a farmer. At 17 he went to Baltimore, there became a grocer, and in 1822 founded the house of Hopkins and Brothers. He built up a trade in Maryland, Virginia and North Carolina, having practically a monopoly in his line. His credit and counsel were highly valued in financial and mercantile affairs. He retired in 1847 with a large fortune, which he employed in banking and railway operations. In 1873 he gave property worth \$4,500,000 to found a free hospital; he presented Baltimore with a public park, and also gave over \$3,000,000 to found the Johns Hopkins University in Baltimore.

**HOPKINS, Lemuel**, American physician and political writer: b. Waterbury, Conn., 19 June 1750; d. Hartford, Conn., 14 April 1801. He practised medicine at Litchfield 1776-84, when he removed to Hartford, where he sustained a high reputation, and had an extensive practice till his death. He was singular in his appearance, manners and opinions; a man of talents and learning, and also a poet. He was associated with Trumbull, Barlow, Alsop, Theodore Dwight and others (called the 'Hartford wits'), in the 'Anarchiad,' 'Echo,' 'Political Greenhouse,' 'Guillotine,' and other similar satirical compositions; and is said to have written for Barlow the beautiful and well known version of the 137th psalm beginning, 'Along the Banks where Babel's Current Flows.'

**HOPKINS, Margaret Sutton Briscoe**, American author: b. Baltimore, 7 Dec. 1864. She married Prof. A. J. Hopkins of Amherst College, and has been engaged in literary work since 1890. She has written under the pen name of 'MARGARET SUTTON BRISCOE' 'Chance to Dream and Other Stories' (1892); 'Links in a Chain' (1893); 'Jimmy and Others' (1898); 'The Sixth Sense and Other Stories' (1899); 'The Change of Heart' (1903); 'The Image of Eve' (1909).

**HOPKINS, Mark**, American college president: b. Stockbridge, Mass., 4 Feb. 1802; d. Williamstown, Mass., 17 June 1887. He was graduated at Williams College, Massachusetts in 1824, and having filled a tutorship in the college two years received in 1828 the degree of M.D., and in the same year commenced the practice of medicine in New York. In 1830 he was recalled to Williams College to fill the chair of moral philosophy and rhetoric, and in 1836 became president of the college, a position which he held till 1872. In addition to his labors as an instructor, he lectured before the Lowell Institute of Boston, the Smithsonian Institution and various scientific and literary associations. Presiding over a college which has been called the cradle of foreign missions, he took an active part in the deliberations of the American Board

of Commissioners for Foreign Missions, of which he was president from 1857. He published 'Lectures on the Evidences of Christianity' (1846); 'Miscellaneous Essays and Discourses' (1847); 'Lectures on Moral Science' (1862); 'The Law of Love and Love as Law' (1869); 'Outline Study of Man' (1873); 'Scriptural Idea of Man' (1883); 'Teachings and Counsels' (1884). Consult Carter, 'Life of Mark Hopkins' (1892).

**HOPKINS, Pauline Bradford Mackie**, American novelist: b. Fairfield, Conn., 6 July 1874. In 1899 she married H. M. Hopkins, who died in 1910; she has been in literary work since 1896. Her works include 'Made-moiselle de Berny, a Story of Valley Forge' (1897); 'Ye Lyttle Salem Maide, a Story of Witchcraft' (1898); 'A Georgian Actress, an Historical Romance' (1900); 'The Washingtonians' (1902); 'The Flight of Rosy Dawn' (1902); 'The Voice of the Desert' (1903); 'The Girl and the Kaiser' (1904); 'The Story of Kate' (1907); and the plays 'Yellow Bird' (1915); 'The Moving House' (1915); and 'The Spell' (1916), with Sarah Jefferis Curry.

**HOPKINS, Samuel**, American Congregational clergyman: b. Waterbury, Conn., 17 Sept. 1721; d. Newport, R. I., 20 Dec. 1803. He was graduated at Yale College in 1741, studied theology under Jonathan Edwards (q.v.), and in 1743 was ordained at Housatonic, now Great Barrington, Mass., where he continued until 1769, when he removed to Newport, R. I., and was pastor there till his death. He possessed almost incredible powers of application, and is said to have been sometimes engaged during 18 hours of the day in his studies. He published 'Dialogue, Showing it to be the Duty and Interest of the American States to Emancipate all their African Slaves' (1776); 'System of Doctrines Contained in Divine Revelation, Explained and Defended' (1793), etc. His theological opinions gave rise to the famous Hopkinsian Controversy. Hopkins differs from orthodox Calvinism in his opposition to the doctrines of original sin and of the atonement; moreover, he put particular stress on the virtue of altruism and unselfishness, even claiming that selfishness, of whatever nature, was inherently and essentially sinful. Consult West, 'Life of Hopkins' (1805); Park, 'Memoir' (1852). Consult also Mrs. Stowe's novel, 'The Minister's Wooing,' in which Hopkins is the central figure.

**HOPKINS, Stephen**, American statesman, a signer of the Declaration of Independence: b. Scituate, R. I., 7 March 1707; d. Providence, 13 July 1785. In 1733 at Providence he was elected a member of the general assembly and in 1739 became chief justice of the Court of Common Pleas. In 1755 he was elected governor of the State and remained in office, with the exception of four years, until 1768. In 1754 he was appointed a member of the board of commissioners assembled at Albany, N. Y., to concert a plan of union for the colonies. In 1765 he was elected chairman of a committee appointed at a special town meeting held in Providence to draft instructions to the general assembly on the Stamp Act. In August 1774 he was, with Samuel Ward, elected to represent the State in the general Congress held at Phila-

delphia and was also chosen in 1775 and 1776. On the naval committee he was placed next after John Hancock, the chairman, and greatly assisted in the formation of a navy. For 50 years he filled some public station; he was for many years chancellor of Brown University. In 1765 he commenced a 'History of the Planting and Growth of Providence,' published in the *Providence Gazette*. In the same year he published 'The Rights of the Colonies Examined,' which was reprinted in London.

**HOPKINSON, Francis**, American jurist, one of the signers of the Declaration of Independence: b. Philadelphia, 21 Sept. 1737; d. there, 9 May 1791. He was graduated at the College of Philadelphia (now the University of Pennsylvania), having been the first student who entered that institution at its opening, and afterward studied law. In 1776 he was sent from New Jersey as one of her representatives in Congress. During the Revolution he distinguished himself by satirical and political writings, which attained such popularity that it has been said that few pens effected more than Hopkinson's in educating the American people for political independence. He also ridiculed in prose and verse most of the social follies of his time. In 1779 he was made judge of the admiralty of Pennsylvania, which office he held for 10 years, until the organization of the Federal government, when it expired. As soon, however, as Washington became President of the United States, he addressed to Hopkinson a letter enclosing a commission as United States district judge for Pennsylvania. He was skilled in painting and music, composing highly popular airs for his own songs. Of his political writings the most prominent were 'The Pretty Story' (1774); 'The Prophecy' (1776); 'The Political Catechism' (1777). The best known of his poems are 'The Battle of the Kegs,' a humorous ballad, and 'The New Roof, a Song for Federal Mechanics.' The 'Miscellaneous Essays and Occasional Writings of Francis Hopkinson' were published in 1792.

**HOPKINSON, Joseph**, American jurist and poet: b. Philadelphia, 12 Nov. 1770; d. there, 15 Jan. 1842. He was son of Francis Hopkinson (q.v.). He was educated at the University of Pennsylvania, studied law and began to practise at Easton, Pa., in 1791, whence he returned to Philadelphia. From 1815 to 1819 he was a member of the House of Representatives from Philadelphia. He opposed the recharter of the United States Bank, and made a noted speech on the Seminole War. At the close of 1819 he retired from Congress, declining a re-election. Having gone to Bordentown to reside, he was elected to the legislature of New Jersey. In 1828 he was appointed judge of the United States court for the eastern district of Pennsylvania, an office which had been filled by his father under Washington. In 1837 he was chairman of the judiciary committee of the convention to revise the constitution of Pennsylvania. He is, however, best known as the author of the national song, 'Hail Columbia,' written in 1798 for the benefit of an actor named Fox.

**HOPKINSVILLE, Ky.**, city and county-seat of Christian County, on the Louisville and

Nashville and the Ohio Valley railroads. Here are Bethel Female and Southern Kentucky colleges, Western Kentucky Insane Asylum and manufactures of tobacco, lime, brick, wagons and carriages, a national bank and the Hopkinsville High School. The city has an assessed property valuation of over \$2,000,000. Pop. 9,419.

**HOPPER, Isaac Tatem**, American philanthropist: b. Deptford, N. J., 3 Dec. 1771; d. New York, 7 May 1852. He was a member of the Society of Friends, and in the division which took place in 1827-28 joined the anti-orthodox or "Hicksite" branch. In 1829-41 he was director of a New York shop for the sale of Hicksite books; in 1841-45 was treasurer and book-agent of the Anti-Slavery Society, and from 1845 devoted his efforts to the work of the New York Prison Association. He was widely known for his interest in benevolent objects, especially negro emancipation and the assistance of discharged prisoners. At Philadelphia he was a founder and the secretary of a society for the employment of the poor, teacher in a colored school and otherwise interested in philanthropic measures. He was an eloquent speaker. Consult the 'Life' by Child (1853).

**HOPPER, (William) De Wolf**, American actor: b. New York, 30 March 1858. He made his first professional appearance in 'Our Boys' (1878) and later appeared with Daniel Frohman's Madison Square Company as Pittacus Green in 'Hazel Kirke' and other plays. He studied vocal music for several years and became a star in comic opera and musical comedy. He was with the Weber and Fields Company for a time and then starred at the head of his own company, playing 'Mr. Pickwick.' He again starred in the revivals of 'Wang'; 'Happyland'; 'The Matinee Idol'; and 'Pinafore.' In 1912 he appeared as Reginald Bunthorne in 'Patience' at the Lyric Theatre, New York, and later as Edward in 'The Pirates of Penzance.' In 1913 he played Ko-Ko in 'The Mikado' and the Lord Chancellor in the star revival of 'Iolanthe' in the same year.

**HOPPIN, James Mason**, American scholar and author: b. Providence, R. I., 17 Jan. 1820; d. 1906. He was graduated from Yale in 1840, studied law at the Harvard Law School (1841-42), theology at the Union and Andover seminaries (1843-45) and the University of Berlin (1847-49), was ordained to the Congregational ministry in 1850 and was pastor at Salem, Mass., in 1850-59. In 1861-79 he was professor of homiletics at Yale, in 1861-63, also pastor of the college church, and from 1879 until his retirement as professor emeritus in 1899 professor of the history of art. His publications include 'Notes of a Theological Student' (1854); 'Old England: Its Art, Scenery and People' (1867); 'The Office and Work of the Christian Ministry' (1869); 'Life of Rear-Admiral Andrew Hull Foote' (1874); 'Homiletics' (1881); 'Pastoral Theology' (1889); 'The Early Renaissance' (1892); 'Greek Art on Greek Soil' (1897); 'The Reading of Shakespeare' (1904).

**HOPS** (*Humulus lupulus*) are the strobiles or catkins of a climbing plant, often met with in the wild state in northern Europe and in

North America. The hop belongs to the nettle family and it is the sole representative of its genus, but is cultivated in many varieties. It is a dioecious plant, that is, the pistillate (female) and staminate (male) inflorescence are borne by different plants. In American and English hop-gardens it is customary to grow a sprinkling of male plants, but these are rigorously excluded on the Continent. In the former case the pistillate inflorescence becomes impregnated and forms seeds, in the latter they do not. In good hops the seeds are scarce, small, shrunken and sterile, that is, incapable of propagating the plant. Many believe that the formation of seed ought to be prevented, as the seeds are useless to the brewer, the main consumer of hops, and besides they only add weight to the hops, and this, indeed, is the chief reason for growing them. Their presence, however, grades the hops to a lower price so that the net result is a loss.

The hop is a perennial herbaceous plant, which produces each year several long, twisting, striated stems, 15 to 30 feet in length, which clamber over hedges, brush, etc., with ease. The leaves are stalked, opposite, generally three lobed (sometimes five- to seven-lobed) and coarsely dentate. They are, like the stem, rough to the touch. The male inflorescence forms a panicle; the flowers enclose five stamens in a small greenish five-parted perianth. At an early stage the female inflorescence is less conspicuous. The strobile or catkin consists of several small acute bracts or leaves at whose base are situated two sessile ovaries, each subtended by a rounded bractlet. These bracts are one-half to three-quarters of an inch long and are attached to the extremity of the stem in such a way as to lap and form a cone.

The ovary and the base of the bracts are covered with a yellowish powder, the "hop-meal" or lupulin, which is the active principle of the plant.

Hops contain hop-oil, hop-resins, acids, hop-tannin, hop-bitter, hop-wax, nitrogenous bodies, carbohydrates and mineral substances. Diastase (an enzyme) has also been found, which is especially valuable in ale brewing. Hop-oil, the principal constituent of the lupulin, present in 0.2 per cent to 0.8 per cent, is obtained by distilling the hops with water. It is colorless and hardly soluble in water. The characteristic agreeable aromatic flavor of the hops depends on this oil. If exposed to air the oil turns to resin, passing to valerianic acid, to which the cheesy odor of old hops can be traced. According to Hayduck, there are three resins in hops, the  $\alpha$ ,  $\beta$  and  $\gamma$ , of which the first two are soft and the latter hard. The preserving, antiseptic effect of hops is due to the two soft resins, as they are distinctly prejudicial to the growth of butyric acid and many other bacteria, but do not have much effect on acetic acid bacteria and sarcina. In old hops valerianic acid, malic acid, citric acid and succinic acid are present. Hop-tannin is chiefly stored in the leaves of the strobile and is a pale brown amorphous powder soluble in dilute alcohol, which through oxidation passes into phlobaphen. The hop-bitter is obtained from the two soft resins, and imparts a pleasant bitter taste to the beer, without which it would be flat and insipid. They are present in the dry hops up to 15 or 17 per cent. Hop-wax is present in con-

siderable proportions in hops, but, since it is insoluble in water and even in 90 per cent alcohol, it has no value in beer. Nitrogenous constituents of hops are about 2 per cent to 4 per cent, which calculated to albumen are 12 per cent to 24 per cent, of which 0.75 per cent to 1.6 per cent are soluble. Bungeer maintains that 30 per cent of the nitrogenous substances are asparagin. Behrens says that trimethylamin and free ammonia are also present. Griess and Harrow have discovered cholin in hops. Brown and Morris have shown the presence of an enzyme similar to diastase, which will saccharify starch, that is, change it into sugar. This enzyme is chiefly accumulated in the seeds. The carbohydrates contained are cellulose, sugar, dextrin. According to Brown and Morris there is present 1.55 per cent dextrose and 2.10 per cent levulose, together 3.65 per cent of inverted sugar. According to Thausing hops contain 5.3 per cent to 15.3 per cent of ash and an average of 7.54 per cent, of which over one-third is potash, one-sixth phosphoric acid, one-sixth silica, and some sodium, lime, magnesia, iron oxide, sulphuric acid and chlorine. The presence of an alkaloid in the seed has been ascertained by Dr. Ernst Hantke, but research on this point is still progressing.

Only a very small amount of hops is used in medicine, being chiefly employed as a stomachic in dyspepsia; a pillow stuffed with hops is said to induce sleep. By far the largest portion of the hops produced is used in the manufacture of various beers, so that here this subject is treated with that idea in view.

For about 1,000 years hops have been added to beer or wort, to give it its pleasant and characteristic flavor and aroma; and their cultivation has progressed as the manufacture of beer became widespread. Germany and England had hop gardens in the 8th and 9th centuries, but the cultivation was not nationalized until the 16th century, and at present hops are a very important agricultural product.

The pistillate plant alone is cultivated on the Continent, especially Germany and Austria, because the hop growers there find that unfertilized pistillate plants produce strobiles richer in aroma, more plenteous in lupulin, and in general better than where the plants were fertilized through the pollen of the staminate plant. In the United States we always find the strobiles containing much seed, while the choice imported Bohemian and Bavarian hops are seedless. The pistillate plant flowers in August, and its strobiles are ready for harvesting during September.

The continental European growers always strive to have early, medium and later hops, so that there the hop-picking begins late in August and lasts through the early part of October. In the United States the picking is usually over in two to three weeks. Much loss can occur by too early picking, while too late harvesting is also detrimental to the value and quality of the product.

Abroad the finest hops are raised in Bohemia, its "Saazer" hops being known throughout the world. Next to this ranks the Bavarian "Spalter hops," and the product of the so-called "Hallertau." As a rule the Bavarian hop is stronger than the Bohemian, but somewhat inferior in quality. Württemberg, Saxony, Baden, Prussia

and Alsace also raise a good quality of hops; and Belgium, northern France and Burgundy cultivate it on a large scale. England's most famous hops are the "Farnhams," the "Golony" and "Grape" varieties. Owing to the high import taxes, Russia is also raising hops. Of all these only the "Saazer" and the "Spalter" are imported to the United States.

The world's production of hops in the year 1913 (the latest normal figures available) amounted to 173,936,914 pounds, about 21,000,000 pounds less than the average, and 50,556,372 pounds less than the preceding year. This deficiency in 1912 was due chiefly to a shortage of 25,000,000 pounds in the Austrian crop, 22,000,000 pounds in the German crop and 13,000,000 pounds in the English crop. This was partly made up by an increase of 13,000,000 pounds in the crop of the United States. The production by countries in 1913 was as follows: United States, 62,898,718 pounds; United Kingdom, 28,631,792 pounds; Germany, 23,408,272 pounds; Austria, 23,314,733 pounds; Russia, 16,973,016 pounds; France, 8,028,492 pounds; Belgium, 7,395,231 pounds; Australia, 2,078,100 pounds; Canada, 1,438,459 pounds.

Although hops may be grown generally throughout the United States, their production is limited to a very few sharply defined areas. Nearly the whole annual crop is grown in Oregon, California, New York and Washington. Small quantities are reported from Wisconsin, Idaho, Massachusetts, Pennsylvania, Michigan, Vermont, Kentucky and Ohio. They do not thrive where the winters are long or severe, and they are dependent in large degree upon the rainfall, a wet season at the time of ripening being disastrous. Hops require bulky nitrogenous manure, and it is the approved practice to manure heavily with stable manure, and to add generous dressings of chemical fertilizers. The crop takes from the soil per acre 129 pounds of nitrogen, 86 pounds of phosphoric acid and 132 pounds of potash. Of these substances 56 pounds of nitrogen, 30 pounds of phosphoric acid and 54 pounds of potash are contained in the hops, and definitely removed from the soil, the remainder being in the stems which can be returned. These figures show that the hop requires twice as much fertilizer as the usual crop of wheat. As the roots run very deep subsoil cultivation is required for the best success.

The hop does not come true from seed, so the commercial crop is grown from cuttings of the "root" (really the underground stem) called "sets." Planting is done as early in the spring as the soil can be had in mellow condition—in January and February in California, in March in Oregon and Washington, in April in New York. The "hills" are placed from 6½ to 7 feet apart both ways; that is, from 1,031 to 889 hills to the acre. Three cuttings are set to the hill to grow—a fourth is sometimes set to ensure three vines, in case one should be lost. The top bud on the cutting should be placed at two inches below the level of the surface or at the level if the plant is to be hilled up. The price of such sets ranges from \$1 per thousand when plentiful to \$10 per thousand when scarce. The field is thoroughly cultivated from the time the plants start into growth until they are well branched out, weeds being scrupulously kept down. The number of

shoots allowed to grow is limited to 9 or 10 to the hill, the other shoots starting being pruned out. The most vigorous ones are left to grow. Some growers cut away the shoots from the top buds (after these have aided the plant to make roots), claiming that a sturdier growth and a larger yield of hops is gained from the deeper buds. The former use of poles has been very largely abandoned in favor of wire trellises. The high trellis is most in favor, the posts being 20 feet high (set two feet into the ground) and six or seven hills apart. A stout wire is carried over the tops of the posts, and to these are fastened strings carried up from pegs set into the ground at each hill. The upper third of each of these strings is of twine strong enough to carry at least 80 pounds. In some hop yards wires are used instead of strings, and are fastened into S-hooks at the top, so as to be readily unhooked and thrown down to the pickers at harvest time. The low trellis has posts eight feet high set every third or fourth hill. As the hop vine will not run horizontally, a good deal of extra labor is required with the low trellis in training the vines by hand along the top wire. Where the pole system is still in vogue it is common practice to set a pole at each hill, and to run twine from a point on each pole five or six feet above the ground across to the tops of the adjacent poles. This is known as the arbor method. To be of first quality hops have to be picked when just ripe. It is customary therefore to grow several varieties with different periods of ripening, stretching over three or four weeks, so as to work the staff of pickers to the best advantage. Hops generally, but not always, acquire a yellowish hue when ripe. A better test is the texture: when the hops give a crisp rustling sound when crushed in the hand they are "ripe." At this time also they give out their characteristic odor. Hops are cured by drying until the 75 per cent of water in the newly gathered hops is reduced to 10 to 14 per cent. This is done in kiln houses where they are submitted to an airblast of from 110° to 140° F. They are then fumed with sulphurous acid gas to improve their color and keeping qualities, and are then cooled and pressed into bales. If not immediately marketed, they are placed in cold storage where they may remain in perfect condition for 15 to 18 months—perhaps longer. Sulphured hops keep well for a time even if not put in cold storage, and when unsulphured seem to preserve their freshness if so stored, but unsulphured hops not stored in the cold will soon deteriorate and become strong and musty.

In California, the hop will yield the first year the fields are planted; in New York no crop is secured until the second year. For winter protection in New York State it is customary to place a large forkful of straw stable manure over each hill.

The cost of producing hops is about 10 to 12 cents per pound. The price they bring varies enormously, from 12 cents up to 50 or 60 cents, and sometimes over \$1 per pound. In times of extreme scarcity the prices have been fabulous.

The hop plant is subject to many diseases, due mostly to parasites, among which are the hop plant-louse (*Phorodon humuli*), the hop-grub (*Gortyna immanis*), the hop-vine snout-moth (*Hypona humuli*), the hop-merchants

(*Polygonia interrogationis*), the zebra caterpillar (*Mamestra picta*), the common woolly bear caterpillar (*Spilonoma virginica*), the saddle-back caterpillar (*Empretia stimulea*), hop-vine leaf-hopper (*Tettigonia confluenta*); various beetles, the "red spider" or spinning mite, and the needle-nosed hop-bug (*Calocoris fulmomaculatus*), which mostly produce red smut, etc., and even destroy entire crops. Fungus pest, blight and mold (black smut), are extremely rare in the United States, although widespread in England and Europe. Within the last few years the hop fields of New York have been devastated by the "powdery mildew" or "blue mould," a fungus imported from Europe. This pest thrives in rainy weather, and if allowed to gain headway quickly ruins the fields. It has been measurably controlled by spraying dry flowers of sulphur, or finely ground sulphur flour among the plants at intervals: (1) before any signs of the mildew appear, about the time of the second tying; (2) when the hops are well up on the poles; (3) when the hops are in full bloom; and two sprayings later if needed. The amount of sulphur used for each spraying is about 50 pounds per acre. Should the pest be very severe, 70 pounds are used. The best remedies for the destruction of the animal parasites is the use of bisulphide of lime or a heavy spraying of soap and tobacco emulsion. Sulphur in any form is a good remedy, and a spray of kerosene soap emulsion, to which a small quantity of flowers of sulphur is added, is generally effective. In extreme cases the affected plants are cut down and burned to prevent a spread of the disease.

The elements also play havoc with the development of the tender hop-vine. High winds will tear the vine from its support; drought will tend to change the color of the light yellow strobile to the objectionable "pole redness"; and too much water will result in a lack of lustre, when the hops are said to be "blind." This is due to the fact that the entire energy of the plant is spent in the formation of leaves, the strobile being imperfectly developed.

Although it is possible to estimate with a fair degree of accuracy the several constituents of hops, it has not been so far found possible to establish any definite relation between the value of the hops and the amounts of hop-oil, resins, tannin, etc., which they contain. Consequently up to the present time, chemistry has not afforded much assistance in this direction. Hence the value of hops is still judged according to its general properties. The color, size and appearance and lustre of the strobile, the quantity and color of the lupulin, the amount of seed, the odor, taste and cleanliness, are the essential points in the valuation of hops.

Fine hops possess a silky lustre which is lacking in inferior grades. The color is greenish yellow, varying with the origin. New York hops have a somewhat paler color of a stronger greenish shade, while the Pacific coast hops have a more pronounced yellowish color. A reddish tint may indicate pole-redness, or, what is worse, that the hops have become overheated in the bale, which implies a darker coloration of the lupulin and deterioration of quality. The form and size of the strobile is also characteristic of the origin. Small strobiles are preferable to big ones, as they contain on an average

more lupulin; and the fewer the seeds the better. The bracts ought to lap over one another and hold firmly together, whereby the lupulin is kept in better. The odor and aroma should be strong, fine, free from any off-smell such as odors of fruit, garlic, etc. Only very slight amounts of stems, foliage or stripped cones should be present, as they impart a coarse taste to the beer. The amount of lupulin present in the strobile is an indicator of the value of the hops, because it contains those resins, volatile oils and bitter substances, which are so essentially valuable to the brewer. In fresh hops, slight pressure will force out the contents of the strobile in a transparent droplet, but in old hops the contents of the lupulin granule will not flow, due to resinification, and the expressed juice is more syrupy, wax-like and opaque. The largest part of the German crop is merely air-dried or sun-dried, and it is claimed that this "natural cure" preserves far more of the essential oils and other active principles than is possible by the artificial hot-air cure used in the United States and England, and that this at least in part accounts for the peculiarities of Spalt hops that command such extraordinary prices. Hops are easily affected by warmth, moisture, air and light, and for this reason must be protected in storage against these influences. For brewing purposes it is almost impossible to pass off a substitute for hops, although lupulin and hop-extract are now manufactured. The lupulin is separated from the strobile, and inasmuch as it contains the essential constituents for which hops are used in brewing, it can be better utilized, although it is impracticable and impossible to replace the entire quantity of hops with lupulin alone because it contains very little tannin, which also is essential. The same remark is applicable to hop-extract. The essential oil of hops is another similar preparation. It consists mainly of myrcene and humulene, which constitute from 80 to 90 per cent of the whole, and small proportions of linalool, linalyl *iso*-nonoate, some ester or geraniol and a diterpene.

In the United States, the culture of hops was introduced as early as 1625 in New Netherlands, and 23 years later in Virginia, but although encouraged by special legislation in 1657, never assumed its present important agricultural rôle until 1800. During the first half of the 19th century Vermont produced seven-eighths of the entire United States crop; and Massachusetts, Vermont and Maine were the chief hop States, but as the quality of the New York hops was far superior, and the quantity three times as great, the former States soon abandoned hop culture. The result was that during 1850-65 a small portion of New York, lying south of the New York Central Railroad between Rochester and Albany, monopolized the hop raising of the United States. Small patches were planted in Wisconsin and Michigan in 1860 and in 1866, when the New York crop was completely destroyed by vermin, Wisconsin hop-growers obtained exorbitant prices for their excellent product, which induced many to plant hops, expecting to realize a fortune in a few years, but the prices speedily declined owing to an overproduction. During 1870 and 1880 New York again was at the head, but at that time fresh competition began to develop on the Pacific Coast. The "Russian River" hops

of California were a marvel; their texture was "fine as silk"; their color "bright golden"; they were "clean picked"; their "content of lupulin" equal to the best German brands, so that hop-culture there advanced quickly to 40,000 bales, the yield of 1902. The hop crop of the United States in 1909 was 40,688,000 pounds, distributed as follows: Oregon, 21,770 acres, 16,583,000 pounds; California, 8,391 acres, 11,995,000 pounds; New York, 12,023 acres, 8,677,000 pounds; Washington, 2,433 acres, 3,433,000 pounds. The acre-yield in the States mentioned was California, 1,400 to 2,200 pounds; Washington, 1,200 to 2,000 pounds; Oregon, 1,000 to 1,600 pounds; New York, 600 to 1,500 pounds. The highest acre-yield recorded was for a locality in Sacramento County, Cal., on a piece of alluvial land four feet deep, where 4,000 pounds to the acre was harvested. The New York hops brought nearly double the price in the market that the Pacific Coast hops commanded, and the imported Bohemian hops brought double the price of the New York hops. New York hops are almost entirely consumed in the United States, while the greater amount of the Pacific Coast hops (especially Oregon) is exported. The English production is scarcely ever sufficient for its needs, so that Great Britain must import some and mostly takes Oregon hops, because they are especially adapted to the English ale brewer's requirements.

DR. ERNST HANTKE

**HOR**, a mountain on which Aaron is said to have died (Num. xx, 22-27, xxxiii, 37-41; Deut. xxxii, 50ff). It is traditionally supposed to have been identical with Jebel Nebr Hârûn, a mountain southwest of Petra.

**HORACE** (QUINTUS HORATIUS FLACCUS), Roman poet of the Augustan Age: b. Venusia, Italy, 8 Dec. 65 B.C.; d. Rome, 27 Nov. 8 B.C. Our information about Horace's life is derived in the main from his own writings, which are supplemented in a few details by a brief biography attributed to Suetonius. He was born at Venusia, a small town in Apulia, near the boundaries of Lucania and Samnium. His father was a freedman, and, according to Horace's own statement, followed the trade of a *coactor*, or collector. He seems to have prospered, for he was able to purchase a small farm. He was not satisfied to send the boy to the local school of Flavius, which was patronized by the aristocracy of Venusia, but moved to Rome to give his son the best possible educational advantages. It is to his credit that he did this, not that Horace might better his position in life, but for the sake of the education itself. At the capital he supplied his son with the means of making a creditable appearance, and he himself accompanied him to and from his classes, giving him moral instruction in a shrewd and homely way by pointing out men who offered examples to be followed or shunned. To this training Horace owed both his habit

of self-examination and his consequent temperance and self-control, and that keen observation of men and things which is one of his marked characteristics. He nowhere makes mention of his mother, who very likely died while he was an infant.

At Rome, Horace pursued the usual grammatical studies under the notorious "flogging Orbilius," and doubtless supplemented them by more advanced work in rhetoric and literature. It is, however, in marked contrast to the fullness of our information about the other details of his life, that we know little or nothing about the masters who influenced him or about the particulars of his education, except that he implies that he attended the classes of several teachers. We may, however, infer something from the results. He certainly acquired a taste for reading, both in the literature of Greece and that of his native land, a habit which he continued to follow throughout his life. Somewhere about 46 B.C., in his 19th year, Horace went to Athens to study philosophy but he does not seem to have been especially attracted by any particular school. In his early life he leaned toward the Epicurean doctrine, but as time went on he turned more and more to that of the Stoics, without, however, committing himself to either sect. The assassination of Cæsar and the arrival of Brutus in Athens in September 44 B.C. put an end to his quiet student life. He joined the army of the liberators, and received a commission as tribune, though he was in no way fitted for the post. At Philippi he fled from the field with the rest of the routed forces, and, as he himself says, "left his shield behind." His humble estate was confiscated, but on his return to Rome in 41, when a general amnesty was granted by Octavian, he in some way secured a position as clerk in the *quæstor's* office, which furnished him the means of livelihood.

Horace freely admits that it was lack of money which first led him to write verse, and it was to his efforts in this line that he owed his advancement. He soon made the acquaintance of Virgil and of Varius, by whom he was introduced to Mæcenas. After a delay of several months, during which the astute statesman doubtless took the young man's measure, his position was established by his admission to the select circle of Mæcenas' literary friends. This honor, as he says with pardonable pride, was due not to high birth, but to his personal character. In 33 he received from his patron a small estate, the famous Sabine farm, situated in the valley of the Digentia, a small stream flowing into the Anio, about 30 miles northeast of Rome. Through Mæcenas he became intimate with the most eminent men of the day, both in literary and in political life, including Augustus. Toward the emperor his attitude was one of dignified independence. He was quick to recognize the advantages of the peaceful and established order of things which Augustus had brought about, and he celebrates it in many of his odes; but he did not hesitate to decline the position of private secretary which the emperor offered him. This he did without giving offense, for Suetonius quotes extracts from letters of Augustus which indicate a cordial and even an intimate friendship. Horace also preserved his independence in his relations with his benefactor, Mæcenas, as appears from several pas-

sages in his works, although he showed a proper gratitude for his many favors.

In the year 35 Horace issued his first book of satires, to which he himself gave the title of 'Sermones,' or familiar talks. On this branch of literature, which the Romans claimed as their own creation, see SATIRE. He took as his model Lucilius, and at first seems to have followed him closely, but he soon found himself out of sympathy with the earlier poet's severity in invective and disregard of form. In the fourth and tenth satires he subjects the work of his predecessor to a thorough criticism, and defines his own ideal of what satire should be. This book was complete in itself, and begins with an essay addressed to Mæcenas. That the reception given to his first effort, which did not lack serious defects, was not wholly favorable, and that Horace had not satisfied himself, is evident from the poet's own words in the introductory essay of the second book, which seems to have appeared in the year 30. This book marks a great advance on the first, from which it differs in its externals in having no formal dedication and in being cast almost wholly in dialogue form, whereas in the first book Horace himself had been the chief speaker. In the following year, urged by Mæcenas, Horace published his first collection of lyrics, some of which doubtless represent his earliest attempts at verse. It was a volume of 17 Epodes, or 'Iambi,' as he himself named them. He chose as his model the Greek iambic poet Archilochus, and followed him closely in form. His work, however, has little of the bitter invective for which the Greek poet was notorious, and Horace shows no little originality both in his choice of themes and in his treatment of them. Six years later Horace, now a man of 42, published the first three books of the Odes, which form a work complete in itself, opening with a dedication to Mæcenas and closing with an epilogue in which he predicts his own immortality. In his choice of metres he followed especially Alcæus and Sappho, from whom he also took many of the subjects of his odes. But he shows the influence of many other Greek poets, as well as considerable independence. Although this work did not wholly escape hostile criticism, it at once placed Horace in the first rank of Roman poets. This position was formally recognized in 17 B.C. through his appointment by Augustus to write the ode, the well-known 'Carmen Sæculare,' which was sung at the celebration of the secular games in that year.

His next work was a return to the field of satire, for the 'Epistles' belong with the 'Sermones' to that branch of literature in the Roman sense of the term. They differ from the 'Sermones' in their greater finish and in their external form. Horace regarded the hexameter as the conventional form for satire, and the poetic epistle represents his third and final choice of form for his essays in that measure. The first book was apparently issued in the year 20. Horace was then a mature man, who had made his mark, and his tone is more assured and his self-appreciation is greater, though without any trace of egotism. The practical philosophy of life seemed to him the thing most worthy of serious consideration, and to teaching this he proposed to devote the rest of his literary work. This book, which consists of

20 letters, of which some are genuine and some fictitious, is also dedicated to Mæcenas. The second book is devoted wholly to literary criticism, a subject which lay within the domain of satire and had already been handled in some of the 'Sermones.' The chronology of the book is somewhat difficult. It was probably published in the year 14. Whether the *Ars Poetica* formed the third letter of the second book or not is uncertain. It has been assigned to various years from 20 to 8 B.C., and if it really belongs to the latter date, it must have been published separately, perhaps after Horace's death, and is the latest of his works. The title which Horace gave it seems to have been 'Epistula ad Pisones,' but it received its present designation at an early period. The second book of epistles begins with a letter addressed to Augustus, who is said by Suetonius to have taken Horace to task for dedicating none of his works to him. In his epistles, Horace had formally renounced lyric poetry. Nevertheless, at the express request of the emperor, he published a fourth book of odes in 13 B.C. This collection, though admirable in form and containing some of Horace's best work, is characterized by certain perfunctoriness and lack of spontaneity. It was not addressed to Mæcenas, and is without a formal dedication. This was however, not due to any diminution of his regard for his patron, but to the fact that the book was published by the special request of Augustus.

Of the remaining years of the poet's life we know very little. Suetonius says that he died 27 Nov. 8 B.C., and there seems to be no ground for rejecting this testimony. No authentic portrait of Horace has come down to us. From his own allusions to his personal appearance, and from a letter of Augustus, quoted by Suetonius, we learn that he was stout and short, with dark eyes and hair, but prematurely gray. He further tells us that he was quick to anger, but easily appeased. He never married, and of all the loves of which he sings, Canara alone seems to be other than imaginary.

It is probably safe to say that Horace has been the most widely read of all Roman writers, not excepting Virgil, and that he has appealed to a more varied circle of readers than any of his countrymen. This statement applies especially to his odes, since it is to them that his popularity with the general public is for the most part due. It has been said that the odes are not poetry of the highest type, and that when they are analyzed and their contents subjected to searching criticism, the sum total of poetic material is scanty. This is unquestionably true, yet it is equally true that their influence and popularity have none the less been great. This is due in part to the personality of the man and the sympathetic feeling which he rouses in his readers on account of his broad humanity; and in part to the fact that the very simplicity of the odes and their ease of comprehension appeal to readers of all classes. As Mackail says, he realized that limited as was his own range of emotions, that of mankind at large was still more so. In some cases, notably in the love poems and the convivial odes, we are conscious that he did not always feel even the emotions which he describes. In spite of all criticism, the one undoubted fact remains, that the odes of Horace

have pleased readers of all epochs and all sorts and conditions of men.

Horace's claim to originality is greater than is usually admitted. In his day the question of imitation of Greek models had ceased to exist, and the question was, rather, which model to choose. In the Augustan Age we find two schools, those who followed the Alexandrine writers, and those who went back for their inspiration to the Greeks of the classical period. Horace belonged to the latter class. His contempt for the followers of Alexandria is outspoken, and so indiscriminating as to include such really great poets as Calvus and Catullus. He certainly knew how to make what he borrowed his own, and many of his odes are so thoroughly national in character that they can have owed little except their external form to Greek sources. In his satires, in spite of his avowed imitation of Lucilius in the beginning, his originality is far greater, and these are in reality his greatest works. While less popular with the general reader, they are of great interest for the light which they throw on Horace's life, personality and habits, as well as for the vivid pictures which they set before us of the complex Roman life. In his daily walks about the city, Horace used his powers of observation, and drew material from all sides and from all classes of society. Above all we can trace in them his own self-improvement and the development of his character, and the gradual growth of that sound judgment and good taste which characterize the work of his mature years. The satires are further characterized by a genial and good-natured humor. Like Dickens, he chose appropriate names for many of his characters—such as *Novius*, or Newman, for the parvenu, though, like those of Dickens, they were not always of his own coinage. The satires also abound in the familiar phrases of every-day life, in puns and plays upon words, in proverbs and homely fables and stories.

Horace's works, as he himself humorously predicted, became school textbooks at an early period. Juvenal implies that this was the case in his day. This fact and his general popularity led to the numerous commentaries on his works, which began to appear as early as the days of Nero, of which those of Porphyrio, of the early part of the 3d century, and the collection falsely attributed to Helenius Acron, have come down to us. The great number of manuscripts which exists testifies to his popularity in the Middle Ages. His fame at that time was, however, much less than that of Virgil, and, though he also was regarded as a magician, it was only at Palestrina and at Venusia that such legends were current. In modern times his influence on French and English satire has been great, as well as on modern poetry in general. See ODES (Horace).

**Bibliography.**—The date of the first edition is uncertain, but is earlier than 1471. Since then the editions of Horace's works, or of parts of them, have been legion. Of these may be mentioned as epoch-making that of Richard Bentley (Cambridge 1711), which has often been reprinted (the reprint at Berlin in 1869 contains a word-index by C. Zangermeister). The standard critical text is that of O. Keller and A. Holder (Leipzig 1864-70, a second edition of the first volume containing the 'Odes,' 'Epodes,' and 'Carmen Sæculare,' appearing

in 1899). A commentary on this edition is furnished by Keller's 'Epilegomena zu Horaz' (Leipzig 1879-80). Of editions with notes may be mentioned J. G. Orelli (4th ed. by W. Hirschfelder and W. Mewes, Berlin 1886-92), containing a complete word-index; A. Kiessling (Berlin, 2d ed., 1890-98); H. Schutz (Berlin 1880-83); these two appear in new editions from time to time; L. Müller, 'Odes' (Leipzig 1900); 'Satires and Epistles' (Leipzig 1891-93); Wickham, E. C., 'Odes and Epodes' (3d ed., Oxford 1896); 'Satires and Epistles' (Oxford 1891); Page, Palmer and Wilkins (London and New York 1896). The edition of the 'Odes and Epodes' by P. Shorey (New York 1896) is of special interest to the general reader on account of its large number of parallel passages from English poetry.

The simplicity and directness of Horace's thought have been a constant temptation to translators, and the number of English versions, particularly of the 'Odes,' is very great. But his care in composition and his inimitable skill in the use of words, his *curiosa felicitas*, as Petronius terms it, make him exceedingly difficult to translate, and, while some brilliant successes have been achieved with single odes, no one has done justice to him as a whole. Many of the attempts which have been made are reviewed in two articles in the *Quarterly Review* (Vol. CIV, 1858, and Vol. CLXXX, 1895). The following may be mentioned: Lord Lytton, 'Odes and Epodes' (London 1869); Cooper, 'Horace's Odes Englished and Imitated by Various Hands' (London 1880); Martin, 'Works of Horace' (Edinburgh 1888); Conington, 'Odes and Epodes' (3d ed., London 1885); 'Satires and Epistles' (London 1892); Gladstone, 'Odes' (New York 1894); Green, 'Odes and Epodes' (London 1904). An edition of Horace's works, in six volumes, containing both text and translations, has recently been issued by the Bibliophile Society of Boston. To give an adequate literary criticism of Horace is nearly as difficult as to translate him, and is out of the question within the limits of a brief article. Consult the various histories of Roman literature, especially that of Mackail (New York 1900); Sellar, 'Roman Poets of the Augustan Age—Horace and the Elegiac Poets' (London 1892); Nettleship, 'Lectures and Essays' (Oxford 1885); Patin, 'Etudes sur la poesie latine' (3d ed., Paris 1883); Tyrrell, 'Latin Poetry' (Boston 1895); Boissier, 'The Country of Horace and Virgil' (London 1896); Lang, 'Letters to Dead Authors' (London 1886).

JOHN C. ROLFE,

Professor of Latin Language and Literature,  
University of Pennsylvania.

**HORACE'S SATIRES AND EPISTLES.** The 'Satires and Epistles' of Horace, each in two books, appeared at irregular intervals from 35 B.C., when the poet was 30 years of age, to almost the close of his life in 8 B.C. They are the products of a mature and well-balanced mind and spirit, and are most fully appreciated by readers of philosophic age. In spite of the dual title, the variety of their subject matter and the length of experience they represent, they form a homogeneous body of literature. Horace himself calls them all *sermones*, which may be translated "discourses,"

"talks," "chats" or *causeries*; thus testifying to their likeness in his mind. There is less personal satire and more formal philosophy and literary criticism in the Epistles than in the Satires; but they are essentially one. The Epistles are only Satires rendered by advancing age and experience more mellow in spirit and more urbane in manner. The same form is employed throughout the four books; they are all in hexameter, the author disclaiming any pretension to verse in the lofty style and professing a natural freedom and simplicity, yet holding to the ideal of urbanity and purity. The content also is homogeneous; the prevailing theme is human life. The Satires and Epistles are most of all a revelation of human nature. First, there is the self-revelation of the author himself. These compositions tell us not only most of what we know of Horace's origin and of his rise from the humblest of positions to a place in the friendship and esteem of the best and greatest men of the age; they have the more important effect of making us intimately acquainted with one of the most sympathetic personalities in the literature of all time. The Horace of the Odes is on the whole the court poet, the exquisite product of the higher culture of Rome and Athens; in the Satires and the Epistles it is the simple, direct and natural Horace of ordinary Italian manners and ideals, who appears only occasionally in the Odes and whom we may call the real Horace, that is everywhere face to face with the reader. No poet establishes so easily and so completely the personal relation with us. There are few expressions of self in all literature so spontaneous, so sincere and unreserved, so complete and so engaging. Horace becomes the reader's familiar and friend—"the friend of my friends and of so many generations of men," as Andrew Lang addresses him. In the second place, the Satires and Epistles are a revelation of the poet's *milieu*. In every composition he is addressing some one of his great number of friends, and in this way holds the mirror up to a wide diversity of character and circumstance in one of the greatest ages in history. The Satires and Epistles are kaleidoscopic with scenes not only from the larger life of the time but also from the daily life of men in the humbler walks of existence. Their pages are golden with the poet's own reasoned contemplation of the facts of life in beautiful and fruitful Italy, and with the homely thought, precept and action of the common man as well. The story of the town mouse and the country mouse find its best telling in Horace.

Again, the Satires and Epistles reveal the reader to himself. This is their greatest charm and their greatest value. They are timeless; they are universal. Their vignettes from nature, their miniatures of the life of men, their tributes to friendship, their homely anecdotes, precepts and aphorisms, their sound common sense, their quiet humor, and, above all, their genial philosophy of life, belong to the common stock of human experience. Even those epistles which are devoted for the most part to literary criticism, far-reaching as their influence upon letters has been, owe their effect hardly more to their exposition of critical principles than to a certain fund of good sense that applies to life in general. In a word,

Horace in the Satires and Epistles is an engaging personality with the gift of art—the man of wide and deep experience in a stirring age who not only looks upon life with understanding and sympathy, but is able to give attractive and effective expression to his thoughts. For keen but genial and charitable contemplation of the human comedy, for kindly humorous and winning expression of the philosophy of life, Horace has no equal. His works, especially the Satires and Epistles, are one of the rare crystallizations of life into art.

The best Satires are I—1, 4, 5, 6, 9; II—1, 6, 8. These and all of the Epistles should be read in connection with the more personal and philosophic Odes, such as I—9, 11, 31, 35; II—2, 3, 6, 10, etc. The verse translations of Theodore Martin and Conington are well known.

GRANT SHOWERMAN.

**HORÆ**, hō'rē, in Greek mythology, goddesses of the seasons. They were generally regarded as attendants of the gods and guardians of the Olympian gates. Their characteristics, however, varied and their number was variously represented as two, three or four. Hesiod names three—Eunomia (good order), Dike (justice) and Eirene (peace), and thus makes prominent their attributes as also guardians of social and political conditions.

**HORATII**, hō-rā'shī-i, three Roman brothers who, in the reign of Tullus Hostilius, engaged the same number of Alban brothers (the Curiatii), in order to decide the contest between the two nations. A sister of the Horatii was betrothed to one of the Curiatii; but both sides forgot their private relations in the service of their country. Two of the Romans soon fell. The contest was unequal, but Horatius saw his antagonist faint with the loss of blood. In order therefore to separate them from one another, he feigned flight, and, while they pursued him as well as their wounds would permit, at unequal distances, he suddenly turned and slew one after the other. He was conducted back to the city amidst the rejoicings of the Romans, adorned with the spoils of the slain. There he saw in the crowd his sister in tears for the death of her betrothed. Angered that her lamentations for her lover should mingle with the rejoicings of the nation on his victory, the brother plunged his dagger into her breast. He was condemned by the duumviri to be scourged to death, but he was later pardoned.

**HORATIUS**, commonly called COCLES (the one-eyed), a Roman hero, who, with the aid of Lartius and Herminius, kept the Tarquins under Lars Porsena from crossing the Sublician Bridge. These three kept the vast array of enemies at bay while the Romans cut the bridge down. When it was about to fall, Cocles sent his companions back, but he himself, when it had fallen, plunged into the Tiber and swam to the Roman shore. He received a reward of as much land "as two strong oxen might plow from morn till night" and a statue was erected in the Comitium. Consult Macaulay, 'Lays of Ancient Rome.'

**HOREB**, hō'rēb, a mountain in the northern part of Arabia, of the same ridge as Mount Sinai, which lies not far distant from it, memorable in the history of Moses. The monks on

Mount Sinai still point out the rock on Horeb from which water issued at the blow of Moses.

**HOREHOUND**, or **HOARHOUND**, so named from the white downy or hoary appearance of the stem and branches, the name given to plants of the mint family of which *marrubium vulgare*, the common or white horehound is the most widely distributed species. It occurs in the northern temperate latitudes of America, Europe, Asia and Africa, and is popularly used for its medicinal properties as a cure for coughs, in the form of an infusion, as a syrup with sugar or as rock candy. It has a pungent aromatic odor, a bitter taste and is stimulant, tonic and laxative. It grows in waste places, on dry chalky or sandy ground and is a perennial with a sturdy root stock, thick stems, one to one and one-half feet high, ovate wrinkled leaves and clustered whorls of white flowers. *Ballota nigra* black or fetid horehound, of the same natural order *Labiata*, resembles white horehound in its medicinal qualities. Water horehound or gypsy wort, *Lycopus*, is a plant of the same order of which several species have been successfully introduced with the white and black horehounds in the United States.

**HORGAN**, Stephen Henry, American editor: b. Norfolk, Va., 2 Feb. 1854. He was educated at Cork, Ireland, the public schools of Nyack, N. Y., and the College of Saint Francis Xavier, New York. In 1874 he was photographer on the *New York Daily Graphic* and from that year to 1907 gave all his time to newspaper illustration; was art manager on several New York dailies, managing editor of the Newark *Monitor*, etc. He invented a process of illustrating the *Daily Graphic* of New York. He was the first to make half-tone illustrations which could be successfully reproduced on news print paper. He published 'Three Color Process Work' (1902); 'Horgan's Half-tone and Photo-Mechanical Processes' (1912); 'About Photo-Engraving' (1914).

**HORICON**, hōr'i-kōn. See LAKE GEORGE.

**HORIZON**. In its most familiar sense the horizon is the line or circle around which earth and sky seem to meet. On the ocean this circle is smooth and easily visible, and is then called the *sea horizon*.

In astronomy the horizon is defined by a plane at right angles to the direction of gravity, extending out indefinitely on all sides, and called the *plane of the horizon*. The circle in which this plane cuts the celestial sphere is called the *astronomical horizon*. All points of it are apparently on a level with the eye of the observer. Owing to the rotundity of the earth

the sea horizon is lower than this astronomical horizon—a narrow strip of sky separating the two. The angular distance between them,  $A E H$ , is called the *dip of the horizon*. The higher the observer is above the ocean, the greater is the dip. To an eye on the surface of the water, the sea horizon and the astronomical horizon coincide, so that there is no dip. The geometrical principle which determines both the dip and the distance of the visible horizon are seen in the figure. The circular arc is here the surface of the ocean. The eye of the observer is situated at the point  $E$ , a short distance above the surface of the water. A tangent drawn from the eye to the surface meets the latter at the visible horizon,  $H$ . Let a horizontal line  $E A$  be drawn from the eye, the angle  $A E H$  is then the geometric dip of the horizon. The geometer will readily see that this is equal to the angle subtended at the centre of the earth between the observer, at  $E$ , and the point  $H$ . Since one minute of arc in the curvature of the earth's surface corresponds to one nautical mile, it follows that, geometrically, the dip of the horizon in minutes is equal to its distance in nautical miles. But, in the actual case, the line of sight is curved in consequence of the refraction of the air. The result of this is that the actual horizon is further than given by the geometric theory, and the dip somewhat smaller. The following table shows the relation between the apparent dip and the height of the eye above the water and the distance of the sea horizon.

Height in Feet	Dip of Horizon	Distance of Horizon Miles
1	1.0	1.3
2	1.4	1.8
3	1.7	2.3
4	2.0	2.6
9	2.9	4.0
16	3.9	5.3
25	4.9	6.6

On board a steamship the eye of an observer on the promenade deck is generally from 15 to 20 feet above the water. It follows that the distance of the horizon is about five miles. A ship farther away than this will have more or less of her hull below the horizon. At double the distance the entire hull will be below the horizon, and only smokepipe and masts visible. As she goes yet further, these also will disappear, as if sinking below the water.

On land the plane of the true horizon is frequently determined by a so-called artificial horizon. This may be either a small rectangular basin containing metallic mercury or else an accurately surfaced plate which is mounted upon three leveling screws and adjusted to the horizontal plane by means of a small level which may be placed in various positions upon it. The first form of artificial horizon is shown in the figure. In use the basin is placed upon an approximately level portion of the ground or other firm support, the mercury is poured into it, and the glass roof is placed over the whole. If a sheet of paper is first laid upon the ground below the basin, this will prevent moisture from accumulating on the inside of the glass plates and so blurring the reflected image. It is evident that if the observer measures the angle between any object in the sky and its image as seen reflected in either form of artificial horizon, the result thus ob-

tained will be twice the altitude. When altitudes are measured at sea, the ray of light from the distant sea horizon passes immediately above the surface of the ocean through many miles of dense and wet air before it enters the telescope. Its change in direction by refraction is therefore very great and very uncertain in amount, so that however carefully the observations may be made, the resulting positions will be uncertain by at least from three to five miles and often by much more. With the arti-

Artificial Horizon.

ficial horizon, however, both the rays of light which fall on the mercury and those which enter the telescope directly pass through our atmosphere at an altitude equal to that of the body observed; the effects of refraction can here usually be determined with a high accuracy. Thus on voyages of exploration, when the ship approaches sufficiently near any island or coast, a sextant party is usually set on shore by boat to determine the position by a land observation. The position of the horizon plane as a fixed plane of reference for large, solidly mounted instruments of astronomy is usually determined by means of the spirit level. See ASTRONOMY, PRACTICAL.

SIMON NEWCOMB.

**HORN**, a tough, flexible, semi-transparent substance derived from the epidermis, which may be developed morbidly as a corn, or naturally, as in the callosities on the legs of a horse; or in connection with important functions, as when it forms the outer sheath of the outgrowths upon the heads of ungulate animals, called "horns," the "shell" of the tortoise, the nails, claws and hoofs of animals, the beak of bird and turtle; and the hairs and feathers of mammals and birds, or their modification into spurs, scales, pines, bristles, whalebone, nasal horns, etc. This epidermal tissue consists largely of keratin, an albuminoid composed mainly of carbon (about one-half), oxygen, nitrogen and sulphur.

The horns of mammals are in effect modifications of the hairy integument covering parts liable to great wear, or needing to be hard and sharp, especially the outgrowths of the skull characteristic of male ruminants. Hollow horns are usually unbranched and persistent, but in the prong horn they are shed annually while the bony cores grow and their vascular coverings persist and give rise to the new horns.

Hollow horns are found usually in both sexes, but in some genera of antelopes only in the male. In the pronghorn the horns of the female are almost hidden in the hair of the head, and are small, short and unbranched. Such horns as these are called hollow or sheath horns, and are very different from antlers (q.v.). Another form of true horn is that on the snout of the rhinoceros (q.v.) where, when more than one appears, the projections stand one behind the other in a median line, and not side by side. This nasal rhinoceros-horn is not a hollow sheath clothing a bony core, but a solid mass of coarse agglutinated hairs arising from the skin and supported by a thickening of the underlying bone.

**Utility of Horn.**—In their natural form, the horn-sheaths of oxen, sheep and antelopes have been put to a great variety of use, as weapons, receptacles, handles and musical instruments—the latter surviving in certain ceremonial usages and in the general term "horn" for a wind instrument. Cleaned and polished it served many additional needs, forming the primitive drinking cups; and it is from this ancient usage that the general name of "horns" has been given to a species of drinking cup, and its spirituous contents. The horns of victims sacrificed to the gods were often gilded by the Romans and suspended in the temples, more especially in those of Apollo and Diana. From the most remote times the altars of the heathen divinities were likewise embellished with horns, and such as fled thither to seek an asylum embraced them. Originally the horns were doubtless symbolical of power and dignity, since they are the principal feature of gracefulness in some animals, and instrument of strength in others. Hence these ornaments were frequently bestowed in imagination and art upon gods, and were actually worn by heroes. In more modern times ox-horns have been used the world over for carrying gunpowder; and museums abound in quaint relics of this kind elaborately ornamented by soldiers and hunters. Small bottles (ink-horns) of this substance were the first receptacles for ink, and are still used in the East, where opium for smoking is usually kept in horn-boxes. Before the general adoption of glass panes in windows thin plates of horn were often used, as they still are in barbarous parts of Asia; lanterns were made of them; and the faces of the mediæval hornbooks were so protected. The material now lends itself to manufacturing into many other articles by reason of its toughness, pliability and capability of being softened by heat and then molded. The heat is applied in the form of hot water; and splitting into thin sheets, or welding pieces together, or molding fragments into various forms, may all be accomplished under combined moisture, heat and pressure. Both the natural horn and the molded substance may be carved, or impressed with a die, polished and dyed. Hence an enormous variety of useful and ornamental articles may be made, and the horns of cattle have commercial value.

**HORN**, a musical instrument, originally formed, as the name denotes, from the horn of an animal. The name includes a large family of wind-instruments, many of which have fallen into disuse. The hunting-horn was long the

chief form extant. The French horn consists of a metallic tube of about 10 feet in length, very narrow at top, bent into rings, and gradually widening toward the end whence the sound issues, called the bell, or in French the *pavillon*. It is blown through a cup-shaped mouth-piece of brass or silver, and the sounds are regulated by the player's lips, the pressure of his breath and by the insertion of the hand in the bell of the instrument. The compass of the instrument is three octaves. Music for the horn is always written in the key of C, an octave higher than it is played, with the key of the composition marked at the beginning of each movement. Great improvements have been made in the instrument by C. J. Sax of Paris, whose saxhorn gives a greater volume of sound than the old instrument. The buglehorn is a tube of 3 feet 10 inches in length bent into small compass. It is usually provided with keys, and has a range of two octaves, and notes commencing with the upper B of the bass clef.

**HORN, Cape.** See CAPE HORN.

**HORN-FLY**, a European fly (*Hæmatobia serata*), since about 1890 became widespread in North America, which have a curious habit of clustering in masses about the base of the horns of cattle. It is closely related to the house-fly and stable-fly, and although annoying does no serious harm to the cattle or their horns.

**HORN REEFS**, off the coast of Jutland, Denmark, where a light ship is stationed. It was in this vicinity that the naval battle of Jutland was fought between the British and German fleets, 31 May to 1 June 1916. That fight is sometimes called the battle of Horn Reef. See WAR, EUROPEAN: BATTLE OF JUTLAND.

**HORNADAY**, William Temple, American naturalist: b. Plainfield, Ind., 1 Dec. 1854. He studied zoology and in 1875-79 visited as a zoological collector South American countries, India, Ceylon, the Malay Peninsula and Islands. In 1882-90 he was chief taxidermist of the United States National Museum, and in 1896 was appointed director of the New York Zoological Park. In 1907-10 he was president of the American Bison Society. He has been active in promoting game preserves and new laws for the protection of wild life generally. He advocated the Bayne law to prohibit the sale of native game; and the new tariff law to prohibit all importations of wild birds' plumage into the United States for millinery purposes. His publications are 'Two Years in the Jungle' (1885); 'Free Rum on the Congo' (1887); 'The Extermination of the American Bison' (1887); 'Taxidermy and Zoological Collecting' (1892); 'The Man who Became a Savage' (1895); 'Guide to the New York Zoological Park' (1899); 'The American Natural History' (1904); 'Camp-Fires in the Canadian Rockies' (1906); 'Camp-Fires on Desert and Lava' (1908); 'Our Vanishing Wild Life' (1913); 'Wild Life Conservation in Theory and Practice' (1914).

**HORNBEAM** (*Carpinus*), a genus of trees of the family *Betulaceæ*, of which the species *C. betulus* is common in Europe, in some places growing to nearly 100 feet in height, although in Great Britain, where it is much planted, it is a small tree. It is also called

horn-beech, hardbeam and yoke-elm. It has staminate flowers in cylindrical catkins; fertile flowers in lax catkins; nuts in pairs. It grows in woods and hedges, often in a damp tenacious soil, and forms a principal part of the ancient forests on the north and east sides of London. The wood is white, tough and hard, and burns like a candle. It is used in turnery for cogs of wheels, etc. The inner bark yields a yellow dye. The American hornbeam (*Carpinus caroliniana*) is a small tree rarely attaining the height of 30 feet, sparingly diffused over the eastern United States. It is also called water-beech, blue beech and ironwood. The wood, fine-grained, tenacious and very compact, is used for handles, as of carpenter's tools, etc., its serviceability being restricted by reason of its inferior size. See IRONWOOD.

**HORNBILL**, a genus (*Buceros*) and of a family (*Bucerotidae*) of birds now placed in the division (*Coraciiformes*), and related to the hoopoes and owls. The species are numerous and are found in Africa, India and throughout the Malayan region as far as New Guinea, are mostly large birds, the largest being more than four feet long, the smallest rather smaller than a magpie. They are bulky birds of heavy, noisy flight; their large bills are surmounted by bony crests or "helmets" of varied shape and sometimes of great size, but rendered light by the presence of numerous air-cells. Their food is principally fruits, but in certain circumstances they become to a great extent omnivorous. Thus a well-known South African ground-hornbill devours snakes, and is highly regarded by the negroes because of its enmity to them, and ability to overcome the largest and deadliest vipers. Several are mainly terrestrial in their habits. The most curious fact regarding these birds is that during the breeding season the female is imprisoned on her nest in a cavity in a tree-trunk, she herself apparently gradually plastering up the entrance by the use of her excrements, until there is left only a small aperture through which the male supplies her and her offspring with food until the young ones are nearly full grown. In captivity the male bird has been observed to disgorge at intervals the lining of his gizzard in the form of a bag, and it is supposed that the food supplied to the female during her term of captivity in the breeding season is enclosed in this structure.

**HORNBLLENDE**, h6rn'bl6nd, or **AMPHIBOLE**, an abundant and widely diffused mineral, remarkable on account of the various forms and chemical compositions that it exhibits, and its diversified colors. Almost numberless varieties of it are recognized, to many of which distinct names have been given. It crystallizes in the monoclinic system, and is brittle, with a hardness of from 5 to 6 and a specific gravity of from 2.9 to 3.4, according to its composition. It has a vitreous or pearly lustre, and its fibrous varieties often have a silky appearance. The variety most commonly known as "hornblende" is usually black or greenish black, and occurs in many rock formations, notably in granites and basalts, and in certain schists and slates. The strongly colored varieties are pleochroic. Common hornblende is a silicate of iron, aluminum, magnesium and calcium. The various hornblende minerals are

now collectively known as the "amphibole group." See AMPHIBOLE.

**HORNBOOK**, an elementary school book in use in England down to the time of George II. It was made up of a single leaf on which was written the alphabet in large and small letters; the Roman numerals, and the Lord's Prayer. The leaf was sometimes set in a frame and sometimes pasted against a piece of sliced transparent horn; hence the name. There was a handle through which a string was inserted whereby the book might be tied around the waist.

**HORNE**, Richard Henry, or **Hengist**, English poet and essayist: b. London, 1 Jan. 1803; d. Margate, 13 March 1884. He was educated at Sandhurst and entered the Mexican navy as midshipman, serving till the close of the Mexican war of independence. He then returned to London to begin a literary career. To his early period belong two tragedies, 'Cosmo de' Medici' (1837), and 'The Death of Marlowe' (1837), both of which contain fine passages. A poem sent to him for criticism by Elizabeth Barrett opened the way to a cordial friendship and a correspondence that extended for seven years. In 1852 Horne removed to Australia, and remained there until 1866; his book, 'Australian Facts and Prospects,' being one outcome of this residence. Again returning to England, he continued literary work until his death. His last publications were tragedies, including 'Judas Iscariot: A Miracle-Play' (1848), and a curious prose tract, 'Sithron the Star-Stricken' (1883), which he pretended to have taken from the Arabian. His best-known work, however, is his epic poem 'Orion' which Poe said might be called "a homily against supineness and apathy in the cause of human progress, and in favor of energetic action for the good of the race."

**HORNED DACE**, **RATTLESNAKE**, **SCREAMER**, **VIPER**, etc. See DACE; RATTLESNAKE.

**HORNED TOAD**, lizards of the family *Iguanida*, popularly called toads from a certain general resemblance in form and manner to those animals. The body and head are broad, thick and flattened, the tail short and the usual attitude a sort of squatting posture with the head elevated. About a dozen species of the genus *Phrynosoma* occur in the arid parts of the southwestern United States and in Mexico. The best known are *P. cornutum* and *P. coronatum*, which, because of the bizarre appearance, quaint ways and tolerance of captivity, are often brought back as souvenirs by visitors to those regions. The scales on the body bear prominent conical spines, and the long horns of the head are supported by bony cores. Their mottled brown and gray colors harmonize well with their natural surroundings. The horned toads love to bask in the sunshine in the hottest weather and to bury themselves in the burning sand. Never very active, they become extremely sluggish in cool or dull weather and hibernate in the winter. They feed on all kinds of insects, for which they search only during the hottest hours of the day, and drink copiously of water when sprinkled in the form of drops. Like many

other lizards, but unlike most of the *Iguanidæ*, they are viviparous.

**HORNED VIPER.** See **VIPER**.

**HORNELL**, hôr'nêl, N. Y., city in Steuben County, on the Canisteo River, and on the Erie and the Pittsburgh, Shawmut and Northern railroads, about 57 miles south of Rochester and 46 miles northwest of Elmira. The first settlement was made in 1790, but it was a part of Canisteo and was called Upper Canisteo until 1820. The present name was given in honor of George Hornell, who had done much for the early development of the town. It was incorporated as a city in 1890. Hornell is situated in a fertile agricultural region, noted for fruit. Its chief manufactures are sash, doors and blinds, railroad supplies, furniture, leather, carriages and wagons, silk, bricks, beer, electrical machinery, tiles, wire-fencings, gloves and agricultural implements. It has a good public high school, Saint Ann's Academy, Saint James Mercy Hospital and a number of fine public and private buildings. The government is vested in a mayor, who holds office two years, and a city council. The subordinate officers are appointed by the mayor subject to confirmation by the council. The water-works are the property of the city. Pop. 14,341.

**HORNER**, William George, English algebraist: b. 1786; d. Bath, 22 Sept. 1837. He was educated at a private school near Bristol, and later taught there, becoming head master in 1806. In 1809 he established a school at Bath, which he conducted until the time of his death. His only work of importance was his discovery of a method of solving numerical equations of any degree, which he first announced in a paper read before the Royal Society in 1819, and afterward published in the 'Philosophical Transactions.' The method is still in use, and is known by Horner's name. See **ALGEBRA**, HISTORY OF THE ELEMENTS OF.

**HORNET**. The true hornet is a European wasp (*Vespa crabro*); but in America the term is applied to almost any form of large stinging wasp, especially such as make papery nests. In some portions of the United States this is considered the only "hornet," but in the vicinity of New York the European hornet also occurs; and southward a somewhat smaller species (*V. carolina*) goes by this name.

**HORNET**, The, the name of two sloop-of-war in the American navy during the War of 1812. The chief was a ship-rigged 18-gun sloop, and did brilliant service. Through December and January 1812-13, under Master-Commandant James Lawrence, she blockaded the 20-gun English sloop *Bonne Citoyenne* in the harbor of Bahia, Brazil, till overmatched by a 74; Lawrence was surprised and was obliged to take refuge in the harbor, but instead of being blockaded, slipped out the next night under the very guns of the man-of-war. After capturing a merchantman, on 24 February, he fell in with the English sloop-of-war *Peacock*, Capt. William Peake, each at this time having 20 guns; they engaged at 5.25 p.m., and in 11 minutes the *Peacock* was a sinking wreck and surrendered. Her captors made every effort to keep her afloat, but in a few minutes she sank, carrying down 13 of her own crew and three of the *Hornet's*. Peake and four

men were killed and three wounded; the *Hornet* had one killed and two wounded, besides two more hurt by an exploding cartridge. "A vessel moored for the purposes of experiment could not have been sunk sooner," said an English paper of the time; "it will not do for our vessels to fight theirs single-handed." On 22 Jan. 1815, under Capt. James Biddle, she encountered off Tristan d'Acumha, in the south Atlantic, the English brig *Penguin*, Capt. James Dickinson, with 19 guns of about the same metal as her own 20; in 22 minutes the *Penguin* surrendered, but on Biddle going forward, two British seamen shot him in the neck (not vitally), and were immediately shot down themselves. The *Penguin* lost her captain and 9 others killed and 38 wounded; the *Hornet*, 1 killed and 11 wounded. The *Penguin* was shot to pieces, and could not be taken away, so she was scuttled; the *Hornet* was almost uninjured. On 28-29 April she had a long chase from the British ship of the line *Cornwallis*, the rear-admiral's flagship, and only escaped by thoroughly dismantling herself.

**HOROLOG**. See **CLOCK**; **CLOCK-WORK**.

**HOROSCOPE**. See **ASTROLOGY**.

**HORROCKS**, hör'òks, Jeremiah, English astronomer: b. Toxteth, near Liverpool, about 1617; d. 3 Jan. 1641. He was educated at Cambridge and was appointed in 1639 to the curacy of Hoole, Lancashire, and in that village made his famous observation (24 Nov. 1639, O. S.) of the transit of Venus, the first on record. Newton, in the 'Principia,' bears honorable testimony to the value of Horrock's astronomical work. The observation of the transit is by no means regarded as his sole astronomical achievement, as he added to our knowledge of the physical cause of celestial motions, deducted the solar parallax, corrected the solar diameter and made tidal observations. Hevelius printed the 'Venus in Sole Visa,' which was first published in Germany (1662); a translation of this work, with memoir by Wharton, appeared in 1859.

**HORSCHOLT**, Theodor, German painter: b. Munich, 1829; d. 1871. He began his early studies in the Munich Academy, and later became a pupil of Albrecht Adam. At first he painted horses, among which is 'The Poacher' (1850), and then turned to military scenes, painting 'The Seizure of Shamyl' and 'Cossacks Returning from a Razzia.'

**HORSE**, in a general sense, a member of the ungulate family *Equidæ*; but in ordinary use the word designates the single domestic species (*Equus caballus*), the wild original of which is unknown. It is not decided, in fact, whether a single species, or more than one, was the source, nor where the domestication of the horse was first effected. The evolution of the species is elsewhere sketched. It is probable that at the dawn of civilization the wild ancestors of our modern horses roamed in bands over the whole extent of grassy uplands stretching from northern Africa to eastern Manchuria; on the steppes of Russia, and wherever in Europe open country might be found; and it is also probable that they were among the first animals which men killed for food and afterward captured and tamed in order to keep a supply of food under control. This act must

have been one of the earliest steps toward community life and civilization. The oldest paintings and carvings left by the ancient inhabitants of the valley of the Euphrates show that saddle-horses were familiar to them; and it is fair to suppose that the supremacy primitively gained by the people of central Asia over other parts of the world was largely due to their use of horses in war, giving them a great advantage over unmounted tribes; but it was not until much later—probably no earlier than 2000 B.C.—that the animal came into use in Arabia and Egypt, where before had been only camels and asses. So far as can be judged, these early Assyrian war-horses were rather small, robust, large-headed and shaggy beasts, much like Przewalsky's horse or the kiang. A very similar animal was domesticated by the men of the Polished Stone Age in Europe, excellent portraits of which were etched by neolithic artists upon pieces of bone, and have come down to us among the contents of graves opened by archaeologists in France, Switzerland and elsewhere. Later, but still in the prehistoric period, Europe was repeatedly invaded by Asiatic hosts who brought with them Eastern horses. These modified, if they did not supersede, the local stock. When Rome conquered the barbarous inhabitants of Europe its horses, which were of Asiatic stock, with perhaps some African mixture, largely superseded those of the conquered tribes, and from the mingling there sprang the big heavy breeds which characterized the Middle Ages, and were intended for strength and weight-carrying, rather than for nimbleness and speed. It was not until near the end of the 17th century that the introduction into France and England of certain sires of Arabian breed—a clean-limbed, small-headed, agile, hardy race, which arose in Arabia and Palestine about 2,000 years ago—began the improvement of British stock, which has reached its highest development in the modern European racehorse, coach and hackney. The normal horse lives to about 18 or 20 years; he is not valued for stud after 20. Occasionally some live to 40 or 50 years. The long intestinal tract seems to operate against longevity. The term horse is applied to males of the *Equus*, as well as to the entire family. A stallion is a mature uncastrated male, also termed a stud-horse; a gelding is a castrated or unsexed male, it being customary to castrate all except those used for breeding. A mare is a female of the horse family. Right after birth the young animal is termed a foal, a little later a colt. The young mare is distinguished as a filly.

The horse owes his speed largely to his long, clean limbs, the advantageous angles made by the leg bones, and to the substitution of a single strong bone for the ulna and radius in other quadrupeds, together with the growth of a strong hoof out of a central toe. The joint corresponding to the knee in man is close to the body, while the horse's wrist-joint is 18 or 20 inches from the ground in a fair-sized animal's foreleg. The horse's hip or thigh joint is entirely imbedded within his muscular hip, and the knee-joint is close up to the body, while the ankle-joint of the hind leg is at the height of a man's knee. By walking and running on his toes, the horse has gained one more joint for leg action. The teeth of the horse

are also peculiar. On each jaw of a mature horse are 6 incisors, 2 canines, 6 premolars and 6 molars; but most mares are minus the incisors. See HORSE, EVOLUTION OF THE, for further peculiarities of teeth and bones.

The best American horses are derived from the English thoroughbreds, though the heavy draft horses mostly show Flemish origin. The light mustang or Indian pony is descended from the early Spanish stock that came to Mexico in 1519 and later; but the great majority of horses in this country come under the title farm horses, and these are fully tabulated by the United States census, together with their half-brothers, the mules.

**Farm Horses.**—In 1850 the census recorded 4,336,000 horses on the farms of the United States; in 1880, 11,201,000; in 1900, 13,537,000; and in 1910, 19,833,000, of the value of \$2,083,000,000, or a little more than \$100 per animal. This figure included the colts, the average value of grown or mature horses being \$112.36. The 1910 census showed 4,209,000 mules on the farms, of the value of \$525,000,000, or \$131.49 each for mature mules. Thus it appears that the humble mule is more valued on the farm than the better bred horse. And this in spite of the fact that a very large proportion of these farm horses have good blood in them from the common use of stallions rated in the stud books, or their near relatives. It is not believed that there has been a rapid increase in American farm horses since 1910. The estimates of 1917 run between 21,000,000 and 22,000,000. In addition to these farm animals there are at least 250,000 blooded horses registered in the stud books of the 19 United States horse-breeding associations, and probably a million city and town horses not enumerated in the census.

Texas is the leading State for breeding farm horses, having 1,870,000 in 1910. But territory and population considered, Illinois is the banner State, having over 1,600,000 in the census year. Other States having over 1,000,000 are Iowa, Missouri, Kansas, Nebraska and Oklahoma. In the South Atlantic States almost half the farms report no horses at all, but this is not due to scarcity of horses, rather to the fact that small tenant farmers are numerous, who use the horses of their landlords.

Horses are commonly denominated as thoroughbreds, coach, hackney, Cleveland bay, several varieties of draft, trotter, pacer, hunter, roadster, saddle, bus, express, farm, pony, mustang, broncho, cayuse, etc. The thoroughbred, from which most of the blooded horses are descended, is fully described farther on, as the progenitor of the American trotter. The hackney or nag is the common English everyday livery horse, what some would call a light coach horse, of no particular breed. The French coach horse is slightly taller and heavier than the hackney type, and there is a registry of blooded horses of this name. The German coach may be a Hanoverian, Oldenburg, East Prussian, etc. He is typically 15 to 16½ hands, stylish and sleek, and may weigh up to 1,500. The Cleveland bay is a coach, obtained by crossing English thoroughbreds with Cleveland mares. They are 16 to 16.2 hands and weigh 1,200 to 1,500. This type makes an excellent farm horse as well as coach and the United States registry increases.

Draft-horses are mainly of Flemish origin,

## HORSES

- 1 Pure Arabian
- 2 Arabian Stallion
- 3 Shetland Pony
- 4 Welsh Mountain Pony

- 5 English Shire Stallion
- 6 Clydedale Gelding
- 7 French Coach Horse
- 8 English Hackney

## HORSES

- 1 English Running Horse
- 2 English Coach Horse
- 3 Morgan Trotting Horse
- 4 Percheron

- 5 Percheron
- 6 Wilkes-Hambletonian Trotting Horse
- 7 American Thoroughbred
- 8 Belgian Stallion

and the Belgian draft animals are highly esteemed in the United States. The standard English draft-horse is the shire, 16 to 17.2 hands, and weighing 1,800 to 2,300 pounds. They have stout legs, a large head, are broad between the eyes, have a neck well arched, full chest, straight back, round body or barrel and large feet, with plenty of hair at the fetlocks. The Clydesdale is not quite as large as the shire, but is more popular in America. They average a little over 16 hands and weigh up to 2,200. Bay and dapple gray are the common colors. The Suffolk or Suffolk punch is an English draft-horse, of 15 to 16½ hands and weighing 1,500 to 1,900. He has slighter legs than either the shire or Percheron and is not much valued on this side of the Atlantic. The Percheron or Percheron-Norman is the handsomest of the draft-horses, and largely imported from France, being used to improve the farm breeds and build up larger animals. They are 16 to 17.2 hands, and weigh 1,700 to 2,200 or more, and are gray, black and white or dappled in color. The Percheron shows his heels in walking and is apt to straddle a bit.

The American trotter, and the pacer, are described under HORSE, TROTTING AND PACING, and HORSE-RACING. The Morgan horse, renowned for his beauty and intelligence, the Hambletonian and the hackney are fully discussed under HORSE, RIDING AND DRIVING. The saddle horse, the hunter, the roadster and the park horse are not breeds of horses, but horses of any breed adapted to those purposes. A typical roadster is 15.1 to 15.3 hands and weighs 950 to 1,150. A good saddle horse has a flat back, weighs 1,000 to 1,100, stands about 15.2 hands and has five gaits: the walk, trot, amble, canter and either a running walk, slow pace or fast trot. He should hold his head up well and appear stylish. The Morgan is a fine type of saddle horse. Any saddle horse that takes hurdles well is called a hunter.

Horses below 15 hands have lesser value. The English call a horse of 14 to 15 hands a hobby; if below 14 hands a Galloway; anything below 13 hands is a pony. The Shetland pony is from 9 to 10.2 hands and weighs 275 to 400 pounds, being valued mainly as a pet, for children's driving. The Indian ponies, descendants of the Spanish mustangs, imported in the 16th century, abound in the Far West, Northwest and in Mexico. They are called mustangs, bronchos and in the Northwest cayuses. They are small, hardy, cheap, and live on almost anything, and will pick up enough to keep them in a new country. The broncho crossed with a thoroughbred makes a good polo pony.

The ordinary cab horse is 15 to 15.2 hands and weighs 1,050 to 1,150. The so-called bus horse is a trifle larger, weighing 1,200 to 1,400. The horses selected for express work are 15.2 to 16 hands and weigh 1,350 to 1,500. For further details of the horse, see articles following.

**HORSE, American Thoroughbred.** The American thoroughbred is the production of pure breeds imported from England; first during the 17th and 18th centuries. They first found their way into the Old Dominion of Virginia, where they founded a tribe of early racehorses, to which are traced to-day many of

the most fashionable pedigrees. From Virginia the thoroughbreds finally found their way into the Carolinas and as far south as Mississippi and Louisiana, and, upon the formation of Tennessee and Kentucky as States, the breeding of thoroughbreds became with them what might be termed an industry.

The early part of the 20th century finds Kentucky in the lead in the production of thoroughbred horses, followed next by California and then by Tennessee. Missouri and Illinois have recently greatly increased their thoroughbred holdings, while both New York and New Jersey produce a goodly number. Many of the other States take rank as fair producers of thoroughbreds, and, in fact, the breed has found its way into every section of the country, even as isolated a State as Oregon annually producing a number of thoroughbred horses.

The requirements of an American thoroughbred horse are that the pedigree contains five uncontaminated crosses, but the average pedigree traces through 16 to 18 crosses, some having as many as 25. Those reaching an origin of a natural Barb source are considered the most fashionable, but many great racehorses have descended from lines unknown to early English or Arabian pedigrees.

Diomed, the winner of the first English Derby, imported to this country in 1799, when he was 20 years old, is classed as the greatest of early importations, and he has left a marked impress upon American pedigrees. The most successful importation of the 19th century was unquestionably Glencoe (imported in 1836) and in later days Leamington ranks the highest. In more recent years, the ranks of the American thoroughbred have been greatly increased by almost unlimited importations from England, France, Australia and other foreign countries, and horses are produced in this country now that are of entirely foreign pedigrees, while there are numerous instances where the first few crosses are strictly foreign lines.

The average height of the early thoroughbred horse was something less than 15 hands, but at this time they average over 15 hands 2 inches and weigh 150 pounds more than they did a half century ago. In individuality, too, the improvement is very marked, the types now being far superior in form to the horses of early times.

In soundness and general service the American thoroughbred has no superior, this being the result of judicious breeding and favorable rearing conditions. The statistics of the American turf (commonly known as Turf Guides) extend over a period of about 40 years, and in this time these records show that the thoroughbred horse has improved some 35 pounds in weight, and also in style and speed. This marked improvement can be attributed to an accepted theory of breeding that like begets like, to intelligent methods of training and to superior riding.

The most favorable condition which has proved so successful in raising the thoroughbred in this country is that he is housed less and has, at all times, access to lands covered by the finest of grasses, which brings his feet constantly into contact with moisture. The frog of the foot, being like a sponge, absorbs this moisture, thus creating a gentle pressure which spreads the hoof. A horse having bad feet naturally favors

them, which has a tendency to make bad ankles and tendons on account of their not being freely used and it is a conceded fact that "no foot, no horse."

In America the horse has been bred more for business than pleasure. The invention of the elliptic spring and the use of American hickory in the production of light vehicles for pleasure and business, together with the development of macadam and asphalt roads, turned the demand from the running to the trotting horse. The first private coach was introduced into New York in 1745; but coaches were scarce until after the Revolutionary War, and not until after 1840, when the light one-horse vehicle came into use, did the changed conditions of travel develop a harness-horse for purposes of business and pleasure. Along with the change in vehicles incident to the evolution of the trotter came as great a change in the style of harness and trappings.

About the beginning of the 19th century there came from the lines of breeding of the thoroughbred, traceable to Flying Childers, Byerly Turk, and the Darley Arabian, Messenger, a gray, stoutly built horse, of wonderful power and stamina, with a slashing open gait, fitted to found a race of trotters. He was foaled in 1780, and became the progenitor of the trotting families in America. In 1793 Justin Morgan was foaled, sired by one believed to be thoroughbred. Three of his sons, Bulrush, Sherman and Woodbury, became noted as the sires of horses of intelligence, courage and speed, and the get of some of them excelled as roadsters and stage horses. From Black Hawk Morgan, sired by Sherman out of a fast trotting English mare, has come the beautiful, useful and courageous line of Morgans. The original horse (240) died in 1856 at the age of 23. In 1849 was foaled Rysdyck's Hambletonian, the founder of the most noted family of trotters, sired by Abdallah, who traced to Messenger by both the sire and dam, out of a dam by Bellfounder, with Messenger crosses on the dam's side. As early as 1876 the interest in breeding and rearing trotters had become so great that fabulous prices were paid for colts, simply on the strength of their breeding. Two fillies, untrained, sold for \$13,000. The three-year-old colt, Steinway, was sold for \$13,000 in 1879. Maud S., bred at Alexander's noted stock farm in Kentucky, was sold to Mr. Bonner for \$21,000 when four years old, with a record of 2.10 $\frac{1}{4}$ , and the title "Queen of the Turf." Smuggler sold for \$40,000, Pocahontas for \$45,000, Goldsmith Maid for \$36,000, Dexter for \$36,000, and so on, until we come to Axtell, who was sold for \$100,000 after he had eclipsed the time of all stallions, and retired to the stud, where his service fee was \$1,000. The stallion, Rysdyck's Hambletonian, was purchased with his dam for \$125, and earned in the stud \$205,750. Thirty-six of his get trotted in 2.30 or better, and the prices for which they could have been sold in their best days amounted to \$325,000. Among them were Sentinel, George Wilkes, Jay Gould and Administrator, all noted sires. Their united progeny was worth many thousands for stud and track uses. Some of his sons, without a 2.30 record, became successful in the stud. Alexander's Abdallah was sold for about \$3,500, but he got Goldsmith Maid, who made

a record of 2.14, and won on the turf close to \$250,000; Almont sired 22 2.30 trotters; Belmont got nine with records better than 2.30. So the descendants of Alexander's Abdallah have been worth to their owners hundreds of thousands of dollars. Volunteer was another who ranked among the most successful of the noted Hambletonian sires, having to his credit 23 2.30 performers. Electioneer, bought by Governor Stanford, proved a noted sire, getting the fastest yearling, 2.36 $\frac{1}{2}$ ; the fastest two-year-old, 2.21; the fastest three-year-old, 2.19 $\frac{1}{2}$ ; and the fastest four-year-old, 2.18 $\frac{1}{4}$ . The bracing climate of Palo Alto, and the methods of handling peculiar to Governor Stanford's breeding farm, aided in these accomplishments. These are but a few of the thousands of good horses that owe success to the Hambletonian blood. The value of trotters has been measured largely by their speed, taken as a measure of ability to win future races, or as evidence of blood lines that will make the animal valuable in the stud. Success in campaigning is undoubted evidence of pluck and stamina; and the breeding and training of the trotter, and his contests on the track, have developed these qualities in so high a degree that no other class can equal him. The evolution of the trotting horse has also shown the value of a training peculiar to America as a factor in breeding.

It is pertinent to notice that in the first years of the last century running races became common in the Middle and Southern States, while a strong sentiment against racing prevailed in the Northern States. In 1820, Pennsylvania, for example, not only forbade racing, but also enacted that no person should "print or cause to be printed, set up or cause to be set up, any advertisement mentioning the time and place for the running, trotting or pacing of any horses, mares, or geldings," etc. A similar law was in the statutes of Connecticut until within 30 years. New York passed an act to prevent horse-racing 19 March 1802, which was amended 30 March 1821, permitting the "training of pacing, trotting and running horses" in Queens County for five years. The sheriff was required to be on hand to witness these "trials of speed," as called in the statute. This amendment was enacted 3 April 1826, without a time limit. In 1825 the New York Trotting Club was organized, with a view of "improving the speed of road horses." This track was probably the first trotting course in the world. The Hunting Park Association was formed in Philadelphia in February 1828, and the next year a trotting club was organized in Baltimore. These facts show a changing public sentiment and the records begin to fall. The keeping of records became an established custom as early as 1829, when the *American Turf Register* began. The English had not then begun to keep records, but the American custom has enabled us to mark the development of speed and establish well-defined breeds during the threescore and more years it has been in use. Wallace's *American Trotting Register* was started in 1871 by J. H. Wallace, New York, since which time the business of breeding trotters has increased, until now it is estimated by good authority that the number of registered standard-bred trotters exceeds 150,000. In the early history of the record many animals were admitted to registry

that are not now classed as standard-bred. The term "standard" indicates to-day ability of one or more ancestors to trot within 2.30.

Before the days of macadam roads and light vehicles, saddle-horses were as common as trotters are to-day. They were of no particular breeding, but traced to the thoroughbred, the Narragansett pacer or the Scottish Galloway. Herbert suggests that they were of Spanish origin, their ancestors coming from Cuba. There is now some slight revival of interest in the saddle-horse as a luxury. From the ideal set up, especially in Kentucky, it is safe to predict that there will soon be an improved breed of American saddle-horses.

Prior to the introduction of railroads Vermont had what Herbert called a distinct breed of cart-horses. He described them as "the models of what draft-horses should be, combining immense power with great quickness, a very respectable turn of speed, fine show, and good action." They had "none of the shagginess of mane, tail and fetlocks which indicates descent from the black horse of Lincolnshire," and none of the curliness of mane and tail which marks the Canadian or Norman blood, and were characterized by short backs, close ribbing up and round barrels. The only other breed of American horses we have to notice is the Conestoga, which before the days of the Pennsylvania Railroad was common on the farms and highways of Pennsylvania. It seems to have descended from the stock brought by emigrants from Flanders, Denmark and Germany. It was a mixture of several breeds, resulting in a large, patient burden bearer, held in high esteem by the Germans of that State. Although we have not originated and permanently established any American breed of draft-horses, the number of heavy horses has greatly increased, and the quality has improved. The increasing heavy business of factories, jobbers, importers and transfer and express companies in our well-paved cities has called for a great number of powerful horses. This demand has led to the importing of heavy horses from France, England, Scotland and Germany. The Vermont cart-horse and Conestoga draft-horse excelled the types of foreign heavy horses, as a rule; and it is to be regretted that our pride in American animals has not led our people to perpetuate and further develop these useful horses. Tens of thousands of dollars have been sent abroad since the fad of importing heavy elephantine horses became common in the Western States. The enterprising importers scoured France, England, Scotland and Germany for the heaviest animals. They imported more than they could sell, and then adopted the plan of leasing stallions for a term of years. Since 1890 there have been many disastrous failures among this class of importers. There were, however, several importers who imported the best type of the draft and heavy coach breeds to be found abroad, establishing breeding farms not excelled in the world. The earliest importer of high-class draft-horses was Edward Harris, of Moorestown, N. J. In 1839 he imported two mares and the stallion Dilligence, who was in many respects similar to the McNitt horse, but heavier and more compactly built, being a little over 15 hands high. The next valuable importation was made by Charles Fullington, of Union

County, Ohio, in the spring of 1851. He bought and brought home from France the famous Louis Napoleon, a "short-legged, closely ribbed, blocky and compact gray, three years old." In 1853 he was sold to A. P. Cushman, of De Witt County, Ill., and after his colts in Union County proved his worth, a company was formed for importing other horses of his type. The author of the 'Percheron-Norman Stud-Book' says of him that he was undoubtedly the best-known and most popular French horse ever brought to America. The first importations west of the Wabash were made in 1868 by W. J. Edwards, of Chicago, in the great stallions Success and French Emperor. The latter went to Iowa as the property of Hon. J. B. Grinnell. Success was sold to the Fletcher Horse Company, of which M. W. Dunham, of Wayne, Ill., was an active member. In 1874 he purchased the entire interest of the company, establishing his celebrated importing and breeding farm at Wayne. Success's colts at the average age of two years and eight months sold at the average price of \$450 per head, and in 1874 alone the sales of his get amounted to \$36,000. The Clydesdale has been the strong rival of the Percheron-Norman; is popular in Canada, and has numerous representatives in the Northwest. The secretary of the American Clydesdale Association, Alexander Galbraith, says: "No importations into the United States appear to have been made until about 1870 and 1872, when John Reber, of Lancaster, Ohio, and the Fullingtons, of Union County, began the work. From that date small importations were made by various parties, the most prominent being the Powell Brothers, of Shadeland, Pa. Importations steadily increased up to 1888. Among the larger breeders in America are Colonel Holloway, of Illinois; N. P. Clarke, of Minnesota, and R. B. Ogilvie, of Wisconsin. These three breeders have among them about 175 brood-mares, and have the very cream of Scotland both in blood and individual merit. As high as \$10,000 has been paid for one Clyde. Many volumes of the 'American Clyde Stud-Book' have been published, containing 10,000 entries." The Shire horse is little esteemed in Canada, but in the American craze for heavy horses he finds admirers. See HORSE-RACING; HORSE, TROTting AND PACING.

MILTON YOUNG,  
Lexington, Ky.

**HORSE, Care and Diseases of the Breeding.**—As *heredity* is the basis of all permanence in breeding and *variation* the condition of advancement, we can, under intelligent selection, environment and control, attain to a constant improvement. In selecting horses for breeding, certain leading principles must guide. These may be shortly stated as: (1) adaptability to the use of the breed; (2) quality, style; (3) strength, endurance; (4) good conformation; (5) good constitution; (6) good pedigree; (7) prepotency; (8) no violent crossing of equally prepotent animals; cross the desirable prepotent animal on a non-prepotent cross-bred animal; (9) a speedy amelioration of a large number is most certainly obtained through a prepotent stallion, which leaves a large number of his offspring every year; (10) sound, vigorous health; the prepotent parent must be at his best, and no non-prepotent one should be bred to him, none that is old, feeble or reduced by

disease, overwork, underfeeding, etc.; the lack of prepotency will not prevent the transmission of the systemic weakness to the offspring; (11) secure an environment calculated to enhance the qualities we seek in the progeny. Systematic exercise that is not exhausting, generous tissue forming, but not fat forming regimen, and pure, dry, genial but bracing air are especially important.

#### Contagion Through Sexual Congress.—

Many maladies may be transmitted during coition, but some are especially liable to be so. Dourine, glanders, genital eczema, contagious acne, horse-pox, mange and contagious abortion are to be specially guarded against. Some, like strangles, influenza and contagious pneumonia, may be transmitted by an animal that has already passed through the disease and acquired immunity. Special care, therefore, or even veterinary supervision of horses devoted to breeding is a desideratum.

**Care of the Pregnant Mare.**—Exercise is a valuable provision too often neglected. Free range on breeding ranches, or, for valuable mares, separate paddocks, secure this, while working mares are better to continue the work, provided it is not unduly straining nor jarring, nor productive of excessive fatigue, exhaustion or debility. This maintains appetite, digestion, assimilation, muscular tone and vigor, favors the development of a stronger, better foal, and keeps the dam fitter for foaling and nursing. Feed well, avoiding what is hard of digestion or liable to cause impaction, indigestion, fermentation, or, above all else, diarrhœa. On good pasture grain may be omitted, unless in the last month of gestation or if the mare is visibly running down. Good, clear, sound oats or barley, or bran mash with some boiled flaxseed may be given, and heating agents like maize, buckwheat or wheat avoided. During gestation violent purgatives and active diuretics are liable to bring on abortion.

**Care of the Foal.**—To avoid danger to both mare and foal in parturition, provide a roomy box-stall with door opening outward, or a paddock. The foal born indoors is always in danger of infection through the raw surface of the navel. The common or box-stall swarming with microbes is more to be dreaded than exposure to stormy outside. When severe weather forbids foaling outdoors, the box should be thoroughly cleansed, disinfected and whitewashed to obviate this danger. Navel infection may cause simple inflammation, swelling and abscess, or the germ may propagate itself through the inactive umbilical vein to the liver, causing infective hepatitis with abscesses or necrosis; or reaching the bowels, it causes infective diarrhœa (white scour); or it may colonize the joints, as infective arthritis (joint ill); or again it may cause pneumonia or multiple abscesses in different organs. The gravity of the resulting disease varies with the infection, and a deadly germ, located in a stable, is liable to attack all foals that come later in the season. Both stable and navel should be disinfected. The foal should be delivered on clean straw, which may be sprinkled with carbolic acid. The navel-string may be severed with an emasculator previously cleaned and boiled or tied with a carbolized new cord painted with tincture of iodine, and, when dry, dusted with tannic acid impregnated with iodine and carbolic acid.

The new-born foal may have the back (flexor) tendons contracted so as to stand over at the knee and fetlock, and in the worst cases the extensor pedis tendon, the opponent of these, is found to be divided across and the muscle wasted and degenerated. A succession of such cases in the same stable suggests infection. Slight cases will recover under splints and bandages, while for more severe ones an aseptic surgical operation may be required. The foal should have the first milk (*colostrum*) to clear away tenacious bowel contents and prepare for healthy function. A mild laxative of raw linseed or olive oil may be requisite in the absence of colostrum. In the absence of the dam's milk the foal may be raised on cow's milk reduced by adding one-third boiled water and sugar to sweeten. After two or three weeks the undiluted cow's milk may be allowed. The cow should be free from tuberculosis.

For the pure bred racer or trotter the foal should have half a pint of oats daily at a month old, to be increased with his growth. Even draft breeds are benefited by such early grain-feeding.

Exercise is essential to the growing foal. The quality of bone, muscle, brain and other parts depends largely on physiological use, and rich blood, active digestion, and assimilation, vigorous health, strength and endurance are incompatible with confinement and inactivity. This may at first be secured by freedom to play in pasture or by careful handling and training by a judicious manager. But to put the two-year-old into a severely contested race, or full training, or to devote the draft colt to regular work, is but to invite disaster. The bones are as yet too soft, they contain too much organic matter and too little mineral, the muscles lack firmness and power of endurance, the whole system is immature and imperfect, and overtaxing exhausts or deranges the functions, and direct injury or impaired development is the natural result.

#### CARE OF THE FEET.

**Overgrown Hoofs.**—With unlimited exercise on firm ground, the unshod foot is sufficiently worn down, but when confined for months indoors or in a limited straw yard overgrowth occurs, especially at the toe, and a dangerously increased strain is thrown on the joints, ligaments and back tendons. Distorted and twisted feet, bruises of the sole by the ingrowing heels and quarters, ringbones, ossified cartilages, sprains of the flexor tendons, and diseases of the fetlock, pastern and coffin joints are common, and irreparable results. The feet exposed to this should be frequently pared and adjusted. Remove excess of toe, reduce and balance the inner and outer sides of the wall, file or cut to the level the incurving heels and quarters and round off the sharp outer edge of the hoof. Dry, imprisoned plates of horn pressing up on the sole must be set free and removed. But do not file the surface of the hoof-wall. This removes nature's protective covering and exposes open horn tubes to exhale moisture, and conduces to dryness, brittleness, shrinking, compression and inflammation of the sensitive parts, atrophy and lameness.

**Defective Growth of Hoof.**—Imperfect growth of hoof may arise from shoeing, pinching, filing, paring, etc., to excess, but also from

compulsory idleness. The circulation inside the hoof is greatly accelerated by the ascent and descent of the foot within the horny box in action, and a free blood supply in a healthy tissue favors growth. Life at pasture on firm ground tends to abundant, strong, tough, durable hoof, while close confinement in a stall makes for a thin, friable, brittle and shrunken horny covering. Constant soaking in water softens the hoof, reducing its tenacity, and tending to flattening of both wall and sole. The Belgian and other horses bred on wet, swampy ground generally show large, flat, pliant and most undesirable hoofs. Such feet are especially liable to thrush, canker, corns, bruises, grease and laminitis. Feet habitually resting on piles of reeking manure in stalls, sheds or yards suffer the additional injury of softening and disintegration from the ammonia gas, and attacks by the swarming putrefying microbes which abound in such material.

Good hoofs, beside use and care, depend on generous living. The fuller growth on the spring and summer grass, forming a permanent ring, illustrates this. Daily washing of the hoof is important, and a subsequent smearing with an ointment of tar and vaseline or oil is useful in preserving the natural moisture and preventing the attacks of microbes.

**Shoeing.**—For good feet shoes may be dispensed with on soft ground or mud roads, but they become necessary on hard roads and for

normal function of the foot is one of the best means of protection against distortions and diseases of the various joints of the limb, it follows that the preservation of sound feet by good shoeing and intelligent care is one of the greatest desiderata in horse management.

#### FEDING AND DIGESTIVE DISORDERS.

The natural food of the horse is *grass* and though charged with excess of water, and at first liable to scour, and always to cause flaccid muscles and lack of energy and endurance, yet a run at pasture, with pure air, normal, easy exercise, and stimulation of stomach, liver, bowels, metabolism and excretion will often improve or arrest infirmities of digestion, assimilation, elimination and even innervation. Heaves (broken wind), chronic bronchitis, various forms of nasal discharges, indigestion, torpid liver, gall stones and kidney affections are examples of maladies which improve at pasture. Dried grass in the form of hay is the standard food of the domesticated horse. This is best from natural pastures with a mixture of grasses to be followed by blue grass, timothy, ryegrass and clover, the latter being the most dangerous as a horse feed. Upland hay is more aromatic and choice than that from low, damp or irrigated meadows, and the first crop is always the best. New hay will sometimes disagree, while the old, though lacking aroma and less palatable, is less likely to cause digestive

	Water	Proteids	Carbohydrates	Fats	Cellulose	Salts
Meadow hay.....	14.59	10.11	40.90	2.34	25.52	6.54
Oats.....	14.3	12.0	60.9	6.0	10.3	3.0
Maize.....	10.6	10.3	70.4	5.0	2.2	1.5

hard-worked animals. Tips, extending back to the broadest part of the foot only, are the least objectionable. Full sized shoes are too often made to pinch, distort, bruise or injure the foot beyond repair; and a poor foot is as injurious to a horse as an unstable foundation to a building. The first consideration is the preparation of the foot, giving due balance to heel and toe, inner side and outer, sole and wall, heel and bars. While removing all overgrown wall and bars, and all sole-plates that have become detached from the tough living horn beneath and now act as foreign bodies, the tough horn itself should not be exposed, nor removed except as a thin margin around the outer edge, where it is smoothed to the same level as the wall, to which it acts as a support, and the bearing surface of which for the shoe it slightly extends. The outer surface of the wall must be spared abrasion by the file, with consequent drying and contracting as already noticed. Shoes should be removed and reset every four weeks at the utmost, to avoid pinching, setting in, bruising and other injuries. Intelligent shoeing, conserving the feet, goes far to obviate diseases of the feet, the most common and harmful of equine diseases. Among these may be specially named corns, bruises, pricks, quittors, sand-cracks, thrush, canker, sidebones, laminitis, navicular disease, contracted hoof, cleft hoof, dry hoof, crooked hoof, loose wall, hollow wall and graveling. As the integrity and easy

disorder. At a year old and over it is brittle, dried, more fibrous and less nutritive. Badly cured hay is always innutritious and often directly poisonous when altered by bacterial ferments, molds and their products. The results are shown in heaves, gastric disorders, liver troubles, brain affections (staggers), kidney and skin diseases. Second crop hay, clover and alfalfa hay are especially dangerous in this sense, the excess of proteids in the last two and especially of foliage, delaying curing and favoring the multiplication of ferments. Oats are the standard grain feed for horses. But like hay they must be well matured on good soil, and well cured. Mustiness brings essentially the same evils as in hay, and newly harvested they are liable to disagree. Kiln-dried oats are to be avoided, also those that have sprouted. The composition of oats and hay shows the excess of proteids, carbohydrates and fats in the first.

Maize is notorious for the deficiency of proteids relatively to the carbohydrates and fat. With a great excess of heat and energy producing constituents and a deficiency of earthy salts it is less calculated to foster growth and development and predisposes rather to fat. It tends more to impactions of the bowels and indigestion, with the resulting skin eruptions, and above all to the destructive recurrent inflammation of the eyes, which ruins so many young horses. Yet it is fed over large areas

as the exclusive grain feed, and such is the adaptability of the living system that the minimum evil results. To obviate the evils it can be fed with cooling, laxative agents as wheat bran, carrots or turnips, or an ounce of Glauber salts may be given daily.

Barley, rye and wheat have been successfully fed to horses, but are not equal to oats in supporting the animal and fitting for hard work.

Beans, peas and other leguminous seeds are fed when a horse is subjected to an extraordinary strain of work or endurance, being especially valuable for the excess of proteids they contain. They should be thoroughly matured and dried as the fully formed and partially ripened seeds of several species contain a narcotic poison.

The relative amount of hay and oats for a horse of 1,000 pounds live weight may be stated as follows: *Cavalry horse*: Oats 12 pounds, hay 14 pounds. *Carriage horse*: Oats 10 pounds, hay 12 pounds. *Draft-horse*: Oats 15 pounds, hays 12 pounds. The horse at rest can live on a mere maintenance ration sufficient to keep up bodily temperature and repair waste. A horse in active work will need about one-half more. For very severe or rapid work about one-third more must be added. For hard work a broad ration-proteids 1, to carbonaceous matter 6, is preferable to a narrow ration-proteids 1, to carbonaceous matter 3. An economical feed can often be made of a number of agents compounded from their known chemical composition, to form such a balanced ration, but mere chemical ingredients are not final, as palatability and adaptability have still to be reckoned with and a given weight of oats is of more value than an equal amount of similar nutritive elements in wheat or barley.

Good judgment and regularity in feeding and watering are essential to success with any feed. Feeding in irregular amounts at varying intervals and with uncertain watering will undo the good effects of a generous ration. The small stomach (16 quarts) cannot admit a large feed of oats and saliva without suffering, and, if overdistended, it becomes paretic or torpid and dangerous fermentation and gaseous distension may ensue. Again, if feeding is delayed the hungry craving and nervous excitement cannot be undone by a generous feed later. Then again, if the perspiring and exhausted animal be allowed to slake his thirst with a bucket of ice-cold water, he may have heart failure, or colic, or gastric congestion with sympathetic skin eruption or laminitis, or inflammation may attack any organ that has been previously weakened.

An excellent appetizing food is molasses. This has been largely neglected because of the mistaken idea that it contained heat producing elements only. But corn carbohydrates furnish energy to the acting muscles and other tissues as fuel does to an engine, and sugar, having no need of digestion, can supply force with less loss than can starch or fat. Not the least of its good qualities is the relish with which it is taken and that it imparts to other less attractive food taken with it. For the horse, otherwise healthy, but debilitated by poor or faulty feeding or overwork, molasses is to be depended on to restore weight and energy alike.

For this purpose it may be given in the amount of two pounds per day, and even in double that amount if subjected to severe work.

**Overdistension of the Stomach.**—Sudden inflation of the stomach with gas, the product of fermentation in unwholesome contents (frosted grass, roots, apples, green potatoes, overripe ryegrass, millet, vetch, etc., irritant plants); from overfeeding (at the cornbin in ripe grain, etc.), from violent exertion on a full stomach, or from a full feed when debilitated from starvation, disease or overwork, is liable to cause death in two hours or a little more. The horse can rarely vomit, or belch gas, the stomach does not absorb and the outlet by the bowels is 100 feet long, so that the organ is usually ruptured with fatal results. Among the other less rapid disorders are catarrhal inflammation of the stomach, intestinal colic, congestion, inflammation, impaction, twisting, invagination, calculi and worms. Of poisons may be named: lead through water, etc.; molds, fungi and bacteria in food (causing gastric, intestinal, hepatic, pulmonary, nervous, cutaneous or kidney diseases); ergot, smut (causing gastric disorder, ulcers of the mouth, abortions, etc.); lupines. *Senecio Jacobaea* (causing cirrhosis of liver); *astragalus*, *oxytropis* (loco, brain disease); *equisetum* (gastric and intestinal catarrh) to which may be added *cicuta*, *conium*, *œnanthe*, *aconite*, *rhus*, *ranunculus*, *larkspur*, *anemone*, *digitalis*, *wild cherry*, *wild onion*, *camas*, *helenium*, *hyacinth*, *clematis*, *thorn apple*, *colchicum*, *belladonna*, *hyoscyamus*, *bitter sweet*, *euphorbium*, *hellebore*, *wild parsnip*, *laurel*, *oleander*, etc.

**Liver Diseases.**—These are notoriously prevalent in hot, damp regions in horses kept in close stables on rich, abundant feeding; in such as have dry feeding and scarcity of water in winter; and in such as have a poorly balanced ration with excess either of proteids or of heating carbohydrates. In damp tropical regions special care is needed as to the site, exposure, ventilation and purity of stables, the dietary, exercise and grooming to obviate liver complaints. Transient fevers, nervous, digestive, skin and kidney disorders often originate from troubles in the liver.

Grooming is most important in the fine breeds of horses in clearing off oil and dandruff, rendering the skin pliant, and favoring secretion, exhalation, cooling and elimination. On the contrary, animals at pasture and exposed to cold and wet find a measure of protection in the sebaceous and thick hairy covering. When, however, drenched with perspiration or rain, and in a warm air, the relaxing effect on the skin and general system is very debilitating, hence clipping may become a necessity to be followed by special precautions against cold. The active friction (massage) of grooming renders circulation active, especially that of the lymph, relieving fatigue, favoring elimination and improving the tone of the muscles and general system. The heels need particular care. Clipped heels are irritated by the stubby hair in the folds back of the pastern often precipitating chaps and grease which would have escaped in the unclipped. The heel is normally protected by the abundance of sebaceous secretion, but when this is rubbed off by dust, clay, sand, etc., the part suffers readily from cold, wet, dried gritty mud or other irritants. Washing

the heels, especially with caustic soap, and leaving them to dry in cold air or draft is hurtful. Prompt drying of the heels will obviate the danger, and, if there is already any swelling, gentle massage with a little vaseline will improve the condition. In obstinate cases the source of the trouble may be sought in disorder of digestion, liver or kidney.

Many disorders of the nervous system, lungs, skin, eye and kidneys are due to constitutional troubles which cannot be dealt with here in general terms. Such diseases are usually manifested by elevated body temperature and accelerated or modified breathing or pulse. The temperature of the healthy, mature horse, at rest in a cool or moderate environment, is 99° to 100° F., respirations 10 to 12 per minute and pulse 35 to 45.

**Contagious Diseases.**—These agree in one fundamental feature that each is due to a microbe, which passes more or less directly from the affected animal to the sound one, thus propagating the disease. The arrest of the epizootic and even its complete and final extinction is merely a question of preventing such transmission and of destroying every infecting germ. This truth is not yet duly appreciated by stock-owners, legislators nor sanitary officers, but when it is fully realized we shall be near the total extinction of most animal plagues to the unspeakable profit of humanity. The *Contagious diseases* may be divided into two classes: (1) Those in which the infection is either confined to solipeds, or mainly propagated by the equidæ, so that its extinction in these would mean the final extinction of the disease, and (2) those which are propagated in other genera as well, so that the extinction of the germ in other species also would be essential to its complete eradication.

To the first class belong strangles (distemper), contagious pneumonia, equine influenza, glanders, tetanus, vesicular exanthema, contagious acne, petechial fever, gastro-enteritis of the new born, South African horse sickness, doufine, surra, Nagana, Mal de Caderea, infectious paraplegia. The first four of these affections are constantly spread in the United States through sales, public stables, stockyards, railroad cars, ships and sale-stables, and no radical measure is taken to destroy the germs in such infected places, or to prevent the infection of all solipeds that pass through them.

In the second class must be included: Horse-pox, contagious abortion, thrush of the mouth, infectious ophthalmia, tuberculosis, rabies, malignant œdema, anthrax and emphysematous anthrax. The first six of these are propagated more by other genera than the horse, so that the burden of the work for their extinction would have to be expended on these other classes. The last three are caused by germs which can live out of the animal body in the soil, and their extinction would involve the drainage and sanitation of the infected soils as well.

**Shipping Fever.**—In the matter of communicable diseases of horses, unfortunately, some one thought the name *shipping fever* as a profitable one to exploit. It embraced not only all contagious and communicable diseases, but all caused by parasites, and all due to exposure, accidents, changes of food and water, to impurities of air and to a thousand other

insanitary conditions. Confining it to contagious diseases affecting the breathing organs alone it would cover glanders, all forms of infectious sore throat, complaints of the nasal passages, of nasal sinuses, of the Eustachian tubes and middle ear, of the tonsils, of the thyroid glands and parathyroids, of the thymus, of the long chain of lymph glands adjoining the nose, mouth and air passages generally, equine influenza, the different kinds of communicable pneumonia,—fibrinous, mycotic, aspergillous, croupous, diphtheritic, verminous, brustseuche, bronchitis, broncho-pneumonia, pleuropneumonia, pleurisy, tuberculosis, etc. The sellers of curative and protective serums had thus to provide the means of contesting the field with scores of anti-serums, each claiming to be the deadly enemy or antidote of one particular brand of the many microbes and microbial poisons (*toxins*) that operate in producing and maintaining the many transmissible affections of the breathing organs. But as they had taken the first step toward assuming to provide the world with an antidote for the whole conflicting group of destructive affections, something that could be blindly used for all alike, they felt obliged to carry out, in form at least, their reckless promise that their product would answer equally well for any disorder that could be classed rightly or wrongly as a shipping fever. They did not dare delay long enough to consider that to produce a *real antidoial serum* for each of the many diseases named they must keep, at their laboratories, a large number of animals suffering from each separate malady, from which they could draw at frequent intervals the fresh, active and trustworthy antidoial products necessary to deal with and control this form of infection, and that the animals under each infection must of necessity be so closely shut in and cared for that by no possible unlucky chance could the infinitesimal infection they carried escape through visitor, instrument, parasite, wind, breath, dust, insect, secretion, fodder, manure, etc., so as to carry infection to anything outside. They did not consider that the laboratory animals must be guarded with similar care after as well as before they have yielded up their protective material. It was formerly supposed that a quarantine of 40 days was sufficient for the death and disposal of any living disease-producing germ, and that the subjects could then be set free to mingle safely with other susceptible animals. But this illusion no longer holds sway. Many germs (glanders, syphilis, tuberculosis, etc.) continue for a lifetime in the bodies of their victims ready to infect others; many others, if frozen, dried or shut up from light, moisture, electricity and air, maintain their vitality and virulence for months and years in the bodies of such victims. But our serum vender is out for commercialism and is not to be hindered by small matters; he has already compressed the many diseases due to trading into one problematic (but utterly indifferentiated) *shipping fever*, he can just as easily offer a polyvalent (multivaluable) serum guaranteed to protect against the whole of the different diseases involved. He can go a step further still: as the Department of Agriculture has been appointed to inspect, supervise and license firms that make prophylactic and curative serums he

can call upon this department to inspect and endorse his polyvalent serum and so secure the requisite guarantee that will procure him a large sale. The buyers of live stock naturally trust to the knowledge of their government and use the commercialized material on a large scale. Only a certain percentage of the horses traded in a district were both susceptible and exposed to a disease existing in that district, so that a large number remained for which the traders could secure certificates that the animals had been treated with this prophylactic and had escaped or survived the prevailing disease. Like the live stock insurance company, trusting to the fact that a given class of animals must increase in numbers or be abandoned, they exacted a premium on each animal that would on the whole more than compensate for the average losses under ordinary conditions and yet leave a handsome surplus for themselves. Prior to the advent of the deadly cattle plagues in Great Britain (Rinderpest and Lung plague) these live stock insurance companies were very prosperous, but after their coming the institutions got into difficulties and were driven to the wall. Their main use was to distribute and average the losses over the whole country. They did little or nothing to remove the causes of the loss. Very nearly a similar experience was had in the would-be immunizations against the deaths from shipping fever in horses. So long as trading was comparatively restricted, the fact that the so-called shipping fever comprehended over a score of different diseases, each with its own specific microbe, its own deadly toxins and its own protective materials, it was easy to get evidence of tens or hundreds of thousands of protective inoculations and of immunizations from the pest. Nothing was easier than to collect these from pest-free areas. But when the demand arose for army horses for the unprecedented war in Europe, the hollowness and falsity of this evidence was quickly revealed. The whole continent was laid under contribution for suitable horses, they were shipped from every available locality in railroad cars to collecting centres, infecting shipping places, stables, sheds, pastures, auction yards, watering and resting places, cars, and finally destination camps and transports; further infection entered through fodder, litter, grain, blankets, combs, brushes and other appliances until each rendezvous of army horses became a veritable pest-house. We cannot leave out the strongly contributing causes attendant on the haste of shipment. The purchases were crowded into cars, good and bad, open and closed, and fresh from the quiet of the fields they were exposed to the terrors of railway travel, the continuous and intermittent explosions of escaping steam, the whirring and plunging of moving wheels, the constant movements and straining to restore the disturbed equilibrium, the jamming against confining walls, and jerking of limiting halters and slings, the attempted or accomplished kicks, blows and bites of neighboring horses, the uncertain steps on bare wet floors. The constancy of this unceasing turmoil and strain, the undeniable imminence of danger, of injury and even of death, throws the nervous horse into a condition of mental excitement and physical fever, which enormously decreases

its capacity of resistance to disease whether from constitutional or microbial enemies. Add to this that the animal, while in the greatest state of excitement, overstrain and exhaustion, aching in overworked muscles, flushed with hurried breathing and circulation, drenched it may be with perspiration, is delayed for many hours in the burning rays of a summer sun from which he cannot protect himself by change of position, or subjected to the rapid motion of 50 miles an hour or more, with no available shelter from the coldest head wind or the chill of rain or snow, and no one can be surprised at the severe illnesses brought on by physical suffering and climatic vicissitudes, altogether apart from microbial invasion. But how much more if the microbial invader is also present, urgently seeking an animal system already below par in which it can begin its deadly work. Some army veterinarians (Turner) are disposed to charge the shipping fever losses mainly, if not altogether, on the unsanitary physical conditions of the shipping, and to seek for the much needed relief in the improvement of these conditions. A large amelioration could unquestionably be secured by this means, but with the fatal drawback of blinding the eyes to the real cause of each of these shipping maladies, the specific microbe, which is the ultimate, essential cause of any one of the pestilential disorders that propagates itself without limit from animal to animal. Moreover, the pestilential microbe readily acquires a greater or lesser virulence and potency according to the conditions in which it exists, so that although we could diminish, or even for a time abolish, the fatality and loss in a given district, yet if we failed to definitely destroy and thoroughly exterminate all of the microbes of each particular disease we would be in a sense but preserving the disease-seed against the time when it could propagate itself anew in a less sanitary environment. We have sad examples of this continually before our eyes in the present mode of dealing with hog cholera, tuberculosis, anthrax, blackleg and a great variety of other plagues. The only rational and universally effective remedy, for the transmissible microbial pest, is one that involves the complete and permanent extinction of all microbes that keep the particular pest going. Anything short of this is a make-shift at best, and must in the end fail to give us a perfect and enduring success. In the obnoxious conglomeration now masquerading under the name of shipping fever the first consideration should be to quarantine all districts wherein anyone of its dangerous list of diseases exists. This should include, not only animals susceptible to the disease in question, but other animals that have in any way come into contact or near proximity, or, secondarily, into relation with the infected or suspected animals endangered through food, litter, manure—solid or liquid—or through coverings, harness or implements used in connection with such animals or their products, and particularly through persons attending to the suspected animals and handling their food, litter, manure or other products. Vermin that live in or visit the premises must be destroyed, and all predatory animals—rats, mice, weasels, skunks, mink, squirrels, woodchucks, buzzards,

eagles, falcons, hawks, vultures, owls, crows, rooks, etc.—must be disposed of. If quarantine is needed at all it must be instant and absolute; any concession or day of grace is but a sacrifice of the most important public right, and the person granting it can only be looked on as a criminal and should be dealt with accordingly, as an enemy of the public, of the live-stock industry and of the first principle of sanitation. The area quarantined must be wide enough to exclude any possibility of the escape of infection. The quarantine of a few more herds on suspicion (precaution) is a very temporary evil at the worst, which will be corrected when the short period of incubation has passed without any infected cases, whereas the omission of but one infected herd and the spread of the germ by shipment, sale or otherwise, would perhaps have become the cause of utterly unnecessary and incalculable losses and might even have placed the resulting outbreak beyond the reach of permanent control. The first wrong step by an official appointed to take effective measures against infection cannot fail to make a second and even worse step easier, and will do much to undermine the confidence and morale of the stockowners generally, to encourage the evil disposed to oppose and circumvent the best extermination measures and to turn an easy success into a failure. A census list of quarantined animals, identified by indelible markings, must be kept, also a record of every death and the mode of disposal of the carcass, also a heavy penalty imposed for every animal missing. No permission to drag out a carcass to be exposed unburied (or unburned) can be permitted or neglected. Thorough sterilization by boiling in water is ideal, as preserving the carcass-values for fertilization, or otherwise, without any possible escape of infection, would be effected. Thorough disinfection of the premises where the animals are shut in and of all products of the animals is quite as essential. The standing rule is safety with conservation. In all self-limiting affections the survivor would recover immune, so that no elaborate nor expensive immunization method need be adopted. An attack of the disease itself followed by recovery gives the subject the most reliable protection. But an animal may have become itself immune and yet may remain a carrier of the disease-germs and prove dangerous to every susceptible subject he may meet, and thus start new outbreaks wherever he may go. Such an immune bearer of a deadly infection may be tested and detected by one of the various laboratory tests (agglutinin, precipitin, complement fixation, antigenetic action, hemolysis, etc.). But any such test is open in this case to the objection of the multiplicity of the germs found in different cases of shipping fever, of the delay and cost of so many different tests made in turn, to the constant temptation to stop short of completing the many successive tests for the diseases involved, when all the materials for the different tests are not at hand and cannot be at once commanded;—this temptation would be especially trying in the case of the many numbers of animals in a polyvalent serum manufactory, where so many animals are needed to be kept under the many diseases necessary to furnish the requisite amount of defensive and immunization

products to protect against the 20 or 30 different affections and microbes to be dealt with in the different forms of shipping fever. All the more is this trying when it is taken into account that the polyvalent serum making is commercialized; that an urgent demand has come through the exigencies of war; and that this must be met at any cost. Need we wonder that when it thus came to a great nation-wide demand and test, under bad sanitary conditions, that the serum proved a dismal failure?

A rigid, inflexible quarantine of a duration covering the length of incubation found in any of the maladies, in the complex shipping fever would be a rational alternative with the unspeakable advantage of being a successful one; it would make an end of the disease (diseases) in the existing areas of prevalence, would purify our markets for horses, the supplies of which would no longer come already-infected, and those that had passed through the disease (diseases) and recovered would come themselves immune from such disease, and such as come to the markets infected would furnish the means of tracing the offending microbe back to its source and of bringing the sellers up for lawbreaking. This would be a telling step toward the extinction of all such plagues in the land.

An important co-operative resort would be the adoption of the auto-therapy referred to in the article on CATTLE AND THEIR DISEASES. The first step in this would be to isolate, quarantine and disinfect all equines, showing any suggestion of any one of those diseases now disguised under the misleading name of shipping fever. Not in foul and infecting railway, market nor shipping yards, but in clean, open pasture if the weather is fine, or in pure, airy buildings, with good exposure in severe weather. This guards owners, shippers, railways, cars, ships, etc., against complicity in spreading infection, and places a wholesome responsibility on every one handling such stock. Any suspicious symptom in stock sent is indicative of complicity. Among disinfectants, freshly made bleaching powder is usually the most available, efficient and cheap with the drawback of injuring the fertilizer, but it may be replaced by others (formalin, carbolic acid, copperas, etc.). Some mild antiseptics (graduated sulphur fumes, eucalyptol, naphthaline, thymol, lime sulphide, etc.) may be used on the respiratory, or digestive mucous membranes, or on the skin. Laxatives (Epsom or Glauber salts) may be used with judgment to counteract constipation, and diuretics (nitrate of potash) to correct suppression of urine. The auto-therapy is sought by the use of the blood serum of insusceptible animals (healthy ox, sheep, swine) taken by the mouth, nose-douche or better subcutaneously, or by the serum of the immunized horse hypodermically, or again the blood serum of an animal already under the disease, after it has been Pasteurized or sterilized by heat (212° F.). This may be used subcutaneo. The serum of the infected has these great advantages of avoiding the blunders and risks that attend on the use of the polyvalent serum which may or may not contain the defensive matters of the particular disease we are now contending with, but which (if really polyvalent) ought to contain those belonging to a large number of other diseases of the shipping fever group and we cannot be

quite sure that it does not contain some of the living germs. By taking the blood from the infected or suspected (exposed) animal before us for treatment, we can get no germ that is not already in its body or in its fellows, and we thus run small risk of inoculating with germs more deadly than they now possess. We thus greatly restrict the complexity of our problem and largely invite good results. By sterilizing, however, at the temperature of boiling water we get rid of all disease germs, leaving no living microbe to propagate itself in the body of the animal we are now dealing with, and thus adding to the force of any disease actually present in its system. Some of the defensive and poisonous bodies present in the infected blood, like alexines, are oftentimes robbed of their potency by the boiling, but a large number of others retain their activity, which is largely antagonistic to the microbe and when used in moderation are beneficial to the case. Those products that are even transiently hurtful or dangerous are the toxins and other poisonous proteids, which in excess and in addition to those already in the system might temporarily aggravate the disease-conditions, but, on the other hand, these are among the desirable elements in stimulating the body cells, especially the white cells of lymph, blood and tissues, to increase the production of the elements that really antagonize the disease-microbes. Even these toxins and proteids therefore must be looked upon as highly important in drawing out from the guardian and defensive body cells that which opposes the attacking microbes and their poisons. In using them indirectly we enlist in our service the native, inherent defensive powers of the body attacked. In the infected (attacked) body of our subject these defensive elements have already been increased, and now, by the guarded use of the poisons of the microbe, we are soliciting a further increase of the protecting and reparatory compounds, where the dead microbes are no longer able to increase their own numbers and poisons. The degree to which this may be pushed will depend on the violence of any attack in hand, the excess of the microbial chemical poisons already present in the animals' system, and the amount of the self-defensive power still remaining in that system. This power it is, in which we must place our trust for recovery, hence the importance of taking our patient in hand at the earliest possible moment after it has become infected. We can judge this condition largely by the morbid symptoms shown, but it is always well to use the clinical thermometer on all the subjects before us and to hasten the treatment for all such as show by a rise of temperature that the system is already under the sway of the disease. We cannot hope that under all circumstances we shall succeed, but we are working in strict accordance with nature's own laws and the sooner we can take the case in hand, and the more judiciously we can check bacteridian increase, and stimulate systemic defense the greater may be our hope of a final success.

**Parasitic Diseases.**—A number of parasites that prey upon solipeds can live indiscriminately in other animals as well. Among these may be named the *Tricophyton* of ringworm; *Aspergillus* of pneumomycosis; *Actinomyces*: different species of wood ticks; *Dermanyssus* of poultry

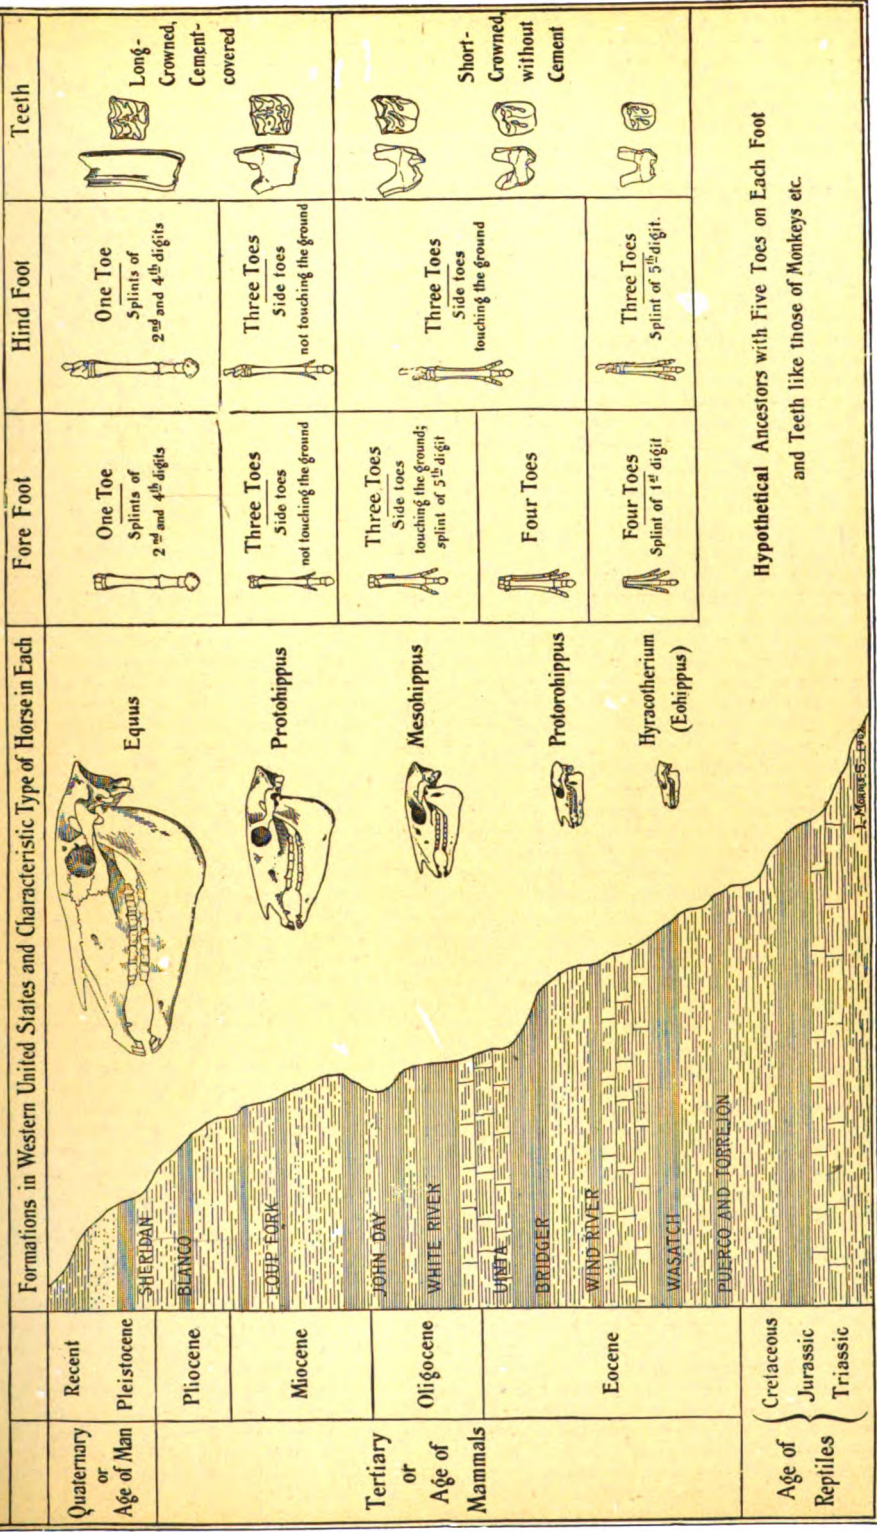

acariasis; *Trombidium Americanum* (and *F. Holosericum*); *Linguatula Denticulata*; *Eustrongylus Gigas*; *Filaria Medinensis*; *Distoma Hepaticum* and *D. Lanceolatum*. By reason of their variety of hosts these would be less easily got rid of. But another list includes the obligate parasites which must live in the soliped at some stage or perish. These accordingly can be extinguished on the same principle as can the microbes of exclusively equine plagues. They include the larvæ of four species of botfly (*Cestrus Equi*, *C. Hæmorrhoidalis*, *C. Pecorum* and *C. Nasalis*); three lice (*Hæmatopinus Marcrocephalus*, *Trichodectes Pilosus* and *Tr. Pubescens*); four mange acari (*Sarcoptes Scabei V. Equi*, *Psoroptes Communis V. Equi*, *Symbiotes Communis V. Equi* and *Demodex Folliculorum V. Equi*); three tapeworms (*Tania Perfoliata*, *T. Mamillana* and *T. Plicata*); two stomach worms (*Spiroptera Microstoma* and *Sp. Megastoma*); five intestinal worms (*Ascaris Megaloccephala*, *Oxyuris Curvala* and *O. Mastigodes*, *Sclerostoma Equinum* and *Sc. Tetracanthum*); one of the serous cavities (*Filaria Papillosa*); one of the lungs (*Strongylus Arnfieldi*); and four of the blood (*Filaria Hæmorrhagica*, *F. Irritans*, *F. Sanguinis Equi* and *F. Reticulata*). For the obligate parasites their extinction on the victim and his removal from the source of a fresh supply means a final extinction of the parasite, as the worm cannot be perpetuated without its host. In the case of worms, which survive as eggs and embryos in damp earth and water, the exclusion of solipeds for a year or two from infested stables and fields, from waters (ponds, lakes, wells, streams) that receive drainage from infested places, and from food derived from such verminous localities, entails the inevitable destruction of these parasites in such habitat outside the body. An essential condition of complete success is that the infested animals must be themselves cleared of the worms, to prevent their colonizing new places with the parasitic, and, in the case of such as are entertained in the blood, or serous cavities or in cysts in the tissues, this takes time to allow of their migrating into the bowels or reaching their limit of life and perishing. The mere use of anthelmintics or vermifuges alone is no radical treatment for these parasites. A veterinary sanitation which is far reaching enough to do away for all time with the class of contagious and parasitic epizootics, is the only one worthy of 20th century knowledge, or which will fulfill the duties of the age.

JAMES LAW,  
Director New York State Veterinary College,  
Cornell University.

**HORSE, Evolution of the.** As a domestic animal the horse is to be found almost everywhere that man can live. He is spread all over the world—from torrid to arctic climates, in all the continents, in remote oceanic islands—he is completely cosmopolitan. But as a wild animal the horse is limited to the Old World, and is found there only in the open arid or desert plains of central Asia and Africa. There are two species in Asia, the Asiatic wild ass (*Equus hemionus*), and the little known Przewalsky's horse (*E. przewalskii*), while in Africa there are the African wild ass (*E. asinus*) and the several species of zebra (*E. zebra*, *E. burchelli*, *E. quagga*). In the Americas and Australia

# THE EVOLUTION OF THE HORSE.

Hypothetical Ancestors with Five Toes on Each Foot  
and Teeth like those of Monkeys etc.

there are no true wild horses, the mustangs and broncos of the Western plains and South America being feral (domesticated animals run wild) and descended from the horses brought over from Europe by the early white settlers. When the Spaniards first explored the New World they found no horses on either continent. The Indians were quite unfamiliar with them and at first regarded the strange animal which the newcomers rode with wonder and terror, like that of the ancient Romans when Pyrrhus and his Greeks brought elephants to fight against them.

The horse is distinguished from all other animals now living by the fact that he has but one toe on each foot. Comparison with other animals shows that this toe is the third or middle digit of the foot. The hoof corresponds to the nail of a man or the claw of a dog or cat, and is broadened out to afford a firm, strong support on which the whole weight of the animal rests. Behind the "cannon-bone" of the foot are two slender little bones, one on each side, called *splint-bones*. These represent the second and fourth digits of other animals, but they do not show on the surface, and there is nothing like a separate toe. So that the horse may be said to be an animal that walks on its middle finger-nail, all the other fingers having disappeared.

The teeth of the horse are almost equally peculiar. The molars are long, square prisms which grow up from the gums as fast as they wear off on the crowns. Their grinding surface exhibits a peculiar and complicated pattern of edges of hard enamel between which are softer spaces composed of dentine and of a material called "cement," much like the dentine in quality but formed in a different way. The dentine is formed on the inside surfaces of the enamel while the tooth is still within the jaw-bone; the cement is deposited on the outside surfaces of the enamel after the tooth has broken through the jaw-bone and before it appears above the gums.

Various other peculiarities distinguish the horse from most other animals; some of these are shared by other hoofed animals. The two long bones of the fore-arm (*radius* and *ulna*) are separate in the greater number of animals, but in the horse, and in many other hoofed animals, they are consolidated into a single bone. The same consolidation is seen in the bones of the lower leg (*tibia* and *fibula*). The lengthening of the foot and stepping on the end of the toe raises the heel in the horse, as in many other animals, to a considerable height above the ground, where it forms the hock joint, bending backward, as the knee bends forward. In these as in various other ways the legs of the horse are especially fitted for swift running over hard and level ground, just as its teeth are for grinding the wiry grasses which grow on the open plain.

The zebra and the ass have the same peculiar structure of teeth and feet as the domestic horse, and differ only in the color of the skin, proportions of various parts of the body, etc.

**Fossil Horses of the Age of Man.**—In the early part of the Age of Man, or Quaternary Period, wild species of horse were to be found on every continent except Australia. Remains of these true native horses have been found buried in strata of this age in all parts of the United

States, in Alaska, in Mexico, in Ecuador, Brazil and Argentina, as well as in Europe, Asia and Africa. All these horses were much like the living species and most of them are included in the genus *Equus*. A complete skeleton of one of them (*Equus scotti*) was found by the American Museum expedition of 1899 in northern Texas. The difference between it and the domestic horse is chiefly in proportions, the skull shorter with deeper jaws, the legs rather short and feet small in proportion to the body. In these characters this fossil horse resembles an overgrown zebra rather than a domestic horse. We know nothing of its coloring. It may have been striped and in this case would have been very zebra-like; but there are some reasons for believing that it was not prominently striped. The bones are petrified, brittle and heavy, the animal matter of the bone having entirely disappeared and having been partly replaced by mineral matter. They are not much changed in color, however, and are so perfectly preserved that they look almost like recent bone.

All the remains of these native horses which have been found in America have been petrified more or less completely; this means that they have been buried for many thousands of years, for petrification is an exceedingly slow process. It serves as an easy method of distinguishing them from bones of the domestic horse, found buried in the earth. These cannot in any case have been buried for more than four or five centuries, and have not had time to petrify. Remains of these fossil horses are found in various parts of the United States, chiefly on the Niobrara River in Nebraska, and in central Oregon. Many separate teeth and bones have been found in the phosphate mines near Charleston, S. C.; other specimens have come from central Florida, from southern Texas, Arizona, Kansas, Louisiana and even from Alaska. They are, in fact, so often found in deposits of rivers and lakes of the latest geological epoch (the Pleistocene) that the formation in the western United States has received the name of *Equus Beds*.

In South America, in strata of the Pleistocene Epoch, there occurs besides several extinct species of the genus *Equus*, the *Hippidium*, a peculiar kind of horse characterized by very short legs and feet, and some peculiarities about the muzzle and the grinding teeth. The legs were hardly as long as those of a cow, while the head was as large as that of a racehorse or other small breed of the domestic horse. All these horses became extinct, both in North and South America. It may have been that they were unable to stand the cold of the winters, probably longer continued and much more severe during the Ice Age than now. It is very probable that man—the early tribes of prehistoric hunters—played a large part in extinguishing the race. The competition with the bison and the antelope which had recently migrated to America, may have made it more difficult than formerly for the American horse to get a living. Or, finally, some unknown disease or prolonged season of drought may have exterminated the race.

In central Asia, two wild races persist to the present day; others were domesticated by man in the earliest times, and their use in Chaldaea and Egypt for draught and riding is depicted in

the ancient mural paintings. In Africa the larger species became extinct in prehistoric times, as in America, but the smaller zebras still survive in the southern part of the continent (one species, the quagga, abundant 50 years ago, is now probably extinct), and the African wild ass is found in the fauna of the northern part. The wild horse of prehistoric Europe, a small race, short-legged and shaggy-haired, was domesticated by man, a fact that is known from the rude drawings scratched on bone or ivory by men of the Neolithic or Polished Stone Age. But the domestic horse now in use is derived chiefly from the Asiatic race, although it is probable that in some breeds there is a considerable strain of this shaggy, short-legged European race, and it is possible also that African races may have been domesticated and to some extent mixed with the Asiatic species. The domesticated ass is a descendant of the African species.

**The Evolution of the Horse.**—The history of the evolution of the horse through the Tertiary Period or Age of Mammals affords the best known illustration in existence of the doctrine of evolution by means of natural selection and the adaptation of a race of animals to its environment. The ancestry of this family has been traced back to nearly the beginning of the Tertiary without a single important break. During this long period of time, estimated at nearly 3,000,000 of years, these animals passed through important changes in all parts of the body, but especially in the teeth and feet, adapting them more and more perfectly to their particular environment, namely, the open plains of a great plateau region with their scanty stunted herbage, which is the natural habitat of the horse. In the series of ancestors of the horse we can trace every step in the evolution of those marked peculiarities of teeth and feet which distinguish the modern horse from an ancestor which so little suggests a horse that, when its remains were first found 40 years ago, the animal was named by the great palæontologist, Richard Owen, the *Hyracotherium* or "Coney-like Beast." Its relation to the horse was not at that time suspected by Professor Owen, and was recognized by scientific men only when several of the intermediate stages between it and its modern descendant had been discovered. On the other hand, this first ancestor of the horse line is very difficult to distinguish from the contemporary ancestors of tapirs and rhinoceroses, and indicates how all the modern quadrupeds have diverged from a single type, each becoming adapted to the needs of its especial mode of life.

The earliest known ancestors of the horse were small animals not larger than the domestic cat, with four complete toes on each forefoot and three on each hindfoot. There is reason to believe that the still more ancient ancestors of this and all other mammals had five toes on each foot. In the forefoot of the earliest known stage we find a splint-bone or small, slender rudiment representing the missing first digit or thumb, which no longer appears on the surface of the foot, while in the hindfoot there is a similar rudiment representing the outer or fifth digit, but no trace is left of the innermost or first digit. The proportions of the skull, the short neck and arched back and the limbs of moderate length, were very little horse-like; re-

calling, on the contrary, some modern carnivorous animals, especially the civets (*Viverridæ*). The teeth were short-crowned and covered with low rounded knobs of enamel, suggesting those of monkeys and of pigs or other omnivorous animals, but not at all like the long-crowned complicated grinders of the horse.

Commencing with the *Hyracotherium*, 12 stages have been recognized from as many successive formations, showing the gradual evolution of the race into the modern form and each stage is characteristic of its particular geological horizon. Some of the stages have been found in several parts of the world, but by far the most complete and best-known series comes from the Tertiary Bad Lands of the Western States. Besides the main line of descent which led into the modern horses, asses and zebras, there were several collateral branches which have left no descendants. Of some stages all parts of the skeleton have been found, of others, only the jaws, or jaws and feet, are known. We can mention only the more important stages.

1. The *Hyracotherium* is the most primitive stage known, but only the skull has been found, so that it has not been determined exactly what the feet were like. The teeth display six rounded knobs or cusps on the upper molars and four on the lower ones, and these are just beginning to show signs of fusing into cross-crests. The premolar teeth have only one main cusp, except the third and fourth premolars (next the molars) in each jaw, which have two and three, respectively. The only specimens which has been found were in the London Clay or Lower Eocene of England and are preserved in the British Museum.

2. The *Eohippus* is much better known. It comes from the Lower Eocene of Wyoming and New Mexico, and is very like the *Hyracotherium* except that the molar teeth have the cusps more clearly fusing into cross-crests, and the last premolar is beginning to look like one of the true molars. The forefoot of this animal has four complete toes and the splint of a fifth. The hindfoot has three complete toes and the splint of another.

3. *Protorohippus*.—In these animals the splint of the first digit in the forefoot and the splint of the fifth digit of the hindfoot have disappeared, but there are still four complete toes in the fore- and three in the hind-foot. The crests on the molars are a little clearer and the last premolar has become almost like the molars, while the next to the last premolar is beginning to become so. A skeleton of *Protorohippus* shows an animal of the size of a small dog, and proportioned much like the breed known as the *whippet*. The *Protorohippus* was found by Dr. J. L. Wortman in 1880 in the Wind River Bad Lands of Wyoming, and was described by Professor Cope and others under the name of the "Four-Toed Horse."

4. Of *Orohippus* we have only parts of jaws and teeth. A specimen of the forefoot is exhibited in the museum of Yale University.

5. *Epihippus* (*Upper Eocene*).—Of this stage of the evolution of the horse only incomplete specimens have been found. The molar teeth have the once round cusps almost completely converted into crescents and crests, while another tooth of the premolar series has become like the molars. The toes are still four in

**HYPOHIPPIUS**

the forefoot and three in the hindfoot, but the central toe in each foot is becoming much larger than the side toes. (This species happens to be somewhat smaller than those found in the Middle Eocene stage, but no doubt there were others of larger size living at the same time). *Palæotherium* and *Paloplotherium* of the Upper Eocene of Europe form a side branch. They were very abundant in Europe, but have not been found in the New World. On each foot they had three toes of nearly equal size, and the teeth show a rather peculiar pattern. One of these animals was thought by Professor Huxley to be a direct ancestor of the horse, but it now is considered to be merely a collateral relative. Some species of *Palæotherium* were of large size, equal to a tapir. They were first described in the year 1804 by the celebrated Baron Cuvier from remains found in the gypsum quarries of Montmartre, Paris.

6. *Mesohippus Oligocene* (*White River Formation*).—In this stage there are three toes on each foot, a splint representing the fifth digit of the forefoot of the Eocene ancestors. The middle toe is now much larger than the side toes, which bear very little of the weight of the animal. Three of the premolars have now become entirely like the molar teeth, the crests on the crown are completely formed and the outside crest in the upper molars has taken the shape of two crescents. In the Middle Oligocene is found *Mesohippus bairdi* about the size of a coyote, while in the Upper Oligocene occurs *Mesohippus intermedius* as large as a sheep. Of both these animals all parts of the skeleton are known.

7. *Anchitherium* (*Lower Miocene*).—This stage has been found both in Europe and in America. It is much like its predecessor, but is larger and has the crests of the teeth somewhat higher and more complete. It probably is not in the direct line of descent of the horses, but is on a side branch.

8. *Parahippus* and *Hypohippus* (*Middle Miocene*).—In *Parahippus* the tooth-crests are much higher, and the transverse ridges on the upper molars are beginning to change shape so as to become a second pair of crescents inside the outer pair. *Hypohippus* is off the direct line of descent; its teeth are like those of *Anchitherium*, by which name it has been generally called, but the animal was much larger, equaling a Shetland pony in size. A complete skeleton of the *Hypohippus* was found near Pawnee Buttes, Colorado, in 1901 by Barnum Brown, of the Whitney expedition. In the forefoot of *Hypohippus* small rudiments still remain representing the first and fifth digits, but there is no splint of the fifth, as in *Mesohippus*. The second and fourth digits still touch the ground, though lightly. The feet of *Parahippus* were much like those of *Hypohippus*, but the side toes were smaller.

9 and 10. *Protohippus* and *Pliohippus* (*Middle and Upper Miocene*).—In this stage the crowns of the upper molars have become much longer, the two pairs of crescents on the upper molars are complete, with two half-separated cusps within the inner pair. And the valleys between the crests have become filled with cement, so that with the wear of the teeth the edges of hard enamel are backed inside by dentine and outside by cement. In this way the surface of the tooth has a series of enamel

ridges always projecting a little above the grinding surface, because the softer material on each side wears down into hollows, yet never breaking off, because they are braced so thoroughly on each side. This is a very efficient instrument for grinding hard grasses. In *Protohippus* and *Pliohippus*, especially in the former, the crowns of the teeth are by no means as long as in the modern horses; they must therefore wear more slowly or wear out at an earlier age. The feet in these two genera have but one toe touching the ground. The side toes (second and fourth digits) are complete, but much more slender than in the earlier stages and are apparently useless, as they cannot reach the ground. In some species of *Pliohippus* they have almost disappeared. The forefoot of *Protohippus* still retains tiny nodules of bone at the back of the "wrist" (sometimes improperly called in the horse the "knee-joint"), which are the remains of the first and fifth digits.

11. *Hipparion* (*Pliocene*).—This genus, probably also a side branch of the genealogical tree of the horse family, is much like *Protohippus*, but larger and with more complication about the tooth pattern. It is common in the European Pliocene beds and has been found in America also. The feet are still three-toed, the side toes as large as those of the older *Protohippus*.

12. *Equus* (*Pleistocene and Recent*).—In this stage, that of the modern horse, the side toes have entirely disappeared and are represented by splints on the fore- and hind-foot. No trace remains on the forefoot of the little nodules which in *Protohippus* represented the first and fifth digits. The crowns of the teeth are much longer than in the last stage, and of the two half-separated inner columns on the upper molars, one has disappeared, the other has increased in size and changed in form. The skull has lengthened and the animal is much larger.

13. *Hippidium* (*Pleistocene. South America*).—The feet are like those of *Equus*, except that they were short and stout. The teeth are like those of *Pliohippus*, from which it is supposed to be descended. The skull is large and long, with very long, slender nasal bones. Casts of the skull and limbs presented by the Museo Nacional of Buenos Aires, Argentine Republic, are exhibited here.

**The Change in Feet and Teeth.**—Along with the disappearance of the side toes in the evolution of the horse there is a considerable increase in the proportionate length of the limbs, and especially of the lower part of the leg and foot. The surfaces of the joints, at first more or less of the ball-and-socket kind, which allows free motion of the limbs in all directions, become keeled and grooved like a pulley-wheel, permitting free motion forward and backward, but limiting the motion in all other directions and increasing considerably the strength of the joint. By this means the foot is made more efficient for locomotion over a smooth regular surface, but less so for traveling over very rough ground, and it becomes of little use for striking or grasping or the varied purposes for which the feet of polydactyl animals are used.

The increased length in the lower leg and foot increases the length of the stride without decreasing its quickness. The heavy muscles

of the leg are chiefly in the upper part, and to increase the length of the lower part changes the centre of gravity of the limb very little. Consequently the leg swings to and fro from the socket nearly as fast as before, since in an ordinary step the action of the leg is like that of a pendulum and the speed of the swing is regulated by the distance of the centre of gravity from the point of attachment, as that of a pendulum is by the height of the bob. To increase the length of lower leg and foot therefore gives the animal greater speed; but it puts an increased strain on the ankles and toe-joints, and these must be strengthened correspondingly by converting them from ball-and-socket joints to "ginglymoid" or pulley joints. Additional strength, likewise at the expense of flexibility, is obtained by the consolidation of the two bones of the fore-arm (*ulna* and *radius*) and of the leg (*tibia* and *fibula*) into one, the shaft of the smaller bone practically disappearing, while its ends become fused solidly to its larger neighbor.

The increase in length of limb renders it necessary for the grazing animal that the head and neck should increase in length in order to enable the mouth to reach the ground. An example of these changes is the modern horse, in which we find the neck and head much elongated when compared with the little *Hyracotherium*, and this elongation has taken place *pari passu* with the elongation of the legs. The reduction and disappearance of the side toes and the concentration of the step on the single central toe serve likewise to increase the speed over smooth ground. The soft yielding surface of the polydactyl foot is able to accommodate itself to a rough irregular surface, but on smooth ground the yielding step entails a certain loss of speed. A somewhat similar case is seen in the pneumatic tire of a bicycle; a "soft" tire accommodates itself to a rough road and makes easier riding, but a "hard" tire is faster, especially on a smooth road. Similarly, the hard, firm step from the single toe allows of more speed over a smooth surface, although it compels the animal to pick its way slowly and with care on rough, irregular ground.

The change in the character of the teeth from "brachydont" or short-crowned to "hypsodont" or long-crowned enables the animal to subsist on the hard, comparatively innutritious grasses of the dry plains, which require much more thorough mastication before they can be of any use as food than do the softer green foods of the swamps and forests.

All these changes in the evolution of the horse are adaptations to a life in a region of the level, smooth and open grassy plains which are now its natural habitat. At first the race was better fitted for a forest life, but it has become more and more completely adapted to live and compete with its enemies or rivals under the conditions which prevail in the high dry plains of the interior of the great continents. The great increase in size, which has occurred in almost all races of animals whose evolution we can trace, is dependent on abundance of food. A large animal, as may be shown on ordinary principles of mechanics, requires more food in proportion to its size than does a small one, in order to keep up a proper amount of activity. On the other hand a large animal is better able than a small one to defend itself against

its enemies and rivals. Consequently, as long as food is abundant, the larger animals have the advantage over their smaller brethren and by the laws of natural selection the race tends to become continually larger until a limit is reached when sufficient food becomes difficult to obtain, the animal being compelled to devote nearly all its time to getting enough to eat.

**Cause of the Evolution.**—The evolution of the horse, adapting it to live on the dry plains, probably went hand in hand with the evolution of the plains themselves. At the commencement of the Age of Mammals the western part of the North American continent was by no means as high above sea-level as now. Great parts of it had but recently emerged, and the Gulf of Mexico still stretched far up the valley of the Mississippi. The climate at that time was probably very moist, warm and tropical, as is shown by the tropical forest trees, found fossil even as far as Greenland. Such a climate, with the low elevation of the land, would favor the growth of dense forests all over the country, and to such conditions of life the animals of the beginning of the Mammalian period must have been adapted. During the Tertiary the continent was steadily rising above the ocean-level, and at the same time other influences were at work to make the climate continually colder and drier. The coming on of a cold, dry climate restricted and thinned the forests and caused the appearance and extension of open, grassy plains. The ancient forest inhabitants were forced either to retreat and disappear with the forests, or to adapt themselves to the new conditions of life. The ancestors of the horse, following the latter course, changed with the changing conditions, and the race became finally as we see it to-day, one of the most highly specialized of animals in its adaptation to its peculiar environment. At the end of the Age of Mammals the continents stood at a higher elevation than at present, and there was a broad land connection between Asia and North America, as well as those now existing. At this time the horse became cosmopolitan, and inhabited the plains of all the great continents, excepting Australia.

It is a question whether the direct ancestry of the modern horse is to be searched for in western America or in the little known interior plains of eastern Asia. It is also unknown why the various species which inhabited North and South America and Europe during the early part of the Age of Man should have become extinct, while those of Asia (horse and wild ass) and of Africa (wild ass and zebra) still survive. Man since his appearance has played an important part in the extermination of the larger animals; but there is nothing to show how far he is responsible for the disappearance of the native American species of horse.

**Parallel Evolution in Other Races.**—It is interesting to observe that while the evolution of the horse was progressing during the Tertiary Period in North America another group of hoofed animals, the *Litopterna*, now extinct, in South America evolved a race adapted to the broad plains of Argentina and Patagonia and singularly like the horse in many ways. These animals likewise lost the lateral toes one after another, and concentrated the step on the central toe; they also changed the form of the joint-surfaces from ball-and-socket to pulley-

wheel joints; they also lengthened the limbs and the neck; and they also lengthened the teeth, and complicated their pattern. Unlike the true horse, they did not form cement on the tooth, so that it was by no means so efficient a grinder. This group of animals native to South America became totally extinct, and were succeeded by the horses, immigrants from North America, which in their turn became extinct before the appearance of civilized man.

Many of the contemporaries of the horse in the northern hemisphere were likewise lengthening the limbs, lightening and strengthening the feet, elongating the tooth-crowns to adapt themselves to the changing conditions around them, but none paralleled the horse evolution quite so closely as did the pseudo-horses of South America. But the camels in America, the deer, antelope, sheep and cattle in the Old World, progressed on much the same lines of evolution, although their adaptation was not to just the same conditions of life.

WILLIAM D. MATTHEW,  
*American Museum of Natural History.*

**HORSE, The French Coach.** The prevailing characteristic of a Frenchman is his devotion to those things that make life pleasant. From an artistic standpoint he leads the world. Pleasure and horses go together. A Frenchman is instinctively a horseman. The French cavalry is without an equal in the world. Since the time of Napoleon the French government has taken charge of the breeding of horses that are best adapted for cavalry uses, and in accomplishing this purpose the government has contributed to the production of a very high-class coach horse. The cavalry horse of France is usually selected after the committee has finished their work of picking out the very best stallions for breeding purposes. Nearly every French coach stallion that stands for public service in France is owned by the French government. The French have been willing to advertise and sell their other breeds of horses, but they have been loath to part with their coach horses. The instinct of self-preservation causes the French government and the French people to keep their French coach horses at home in order to have better horses than can be found in any other country.

The breed of French coach horses has its origin from the same source as the English thoroughbred. On the one hand, the English thoroughbred surpasses in speed, while the French coach horse is superior in all of those qualities that go to make up a high-class carriage horse. Like the Percheron, the French coacher is developed in its highest state of perfection in Normandy, but he comes from the northern part, while the Perche is in the south of Normandy.

The French coach horse is about 16 hands high; his average weight is between 1,200 and 1,300 pounds. His color is as a rule bay, brown or chestnut. His outline is most pleasing. He is a fast trotter, and under the conditions of horse racing in France under saddle over a turf track a distance of 4,000 metres he holds the record. The French method of developing their trotters cultivates a very high, attractive style of action. Not only is the French coacher seen in every French city hauling the most gorgeous equipages over the boulevards surrounding

Paris, but he is to be seen in the best stables throughout all of the capitals of Europe, especially in London. The French coacher supplies the English royalty with their most useful and most attractive carriage horses.

For more than 20 years French coach stallions have been brought to America very sparingly. Where they have been crossed with the best road mares, trotting bred mares, the result has been most satisfactory. High-grade carriage horses that go into our best markets and sell for the highest prices usually have a strain of French coach blood flowing through their veins. A perfect type of the French coach horse when standing or in action is impossible to describe in words. To fully realize his superiority, to appreciate and admire his style and magnificent high action, one must actually see him. Words are inadequate to describe him, and the most perfect picture falls far short of the most perfect horse.

JOHN R. McLAUGHLIN.

**HORSE, Military.** The relative importance of the horse as a factor in the progress of civilization has been somewhat reduced by the introduction of steam and electricity, but mechanical devices such as the bicycle and automobile are not likely to wholly supplant the indispensable ally of man for war purposes. The value of cavalry has not, within the century, been so fully recognized as during the South African campaigns, where the supply of horses reached enormous proportions. The kind of horse for cavalry and artillery use is controlled by the character of service for which he is to be used. Hardy range horses are desirable in a campaign where the question of forage supply is a difficult one, but, if fully armed and equipped men of average size are to be transported and held in readiness for mounted combat with opposing cavalry, then larger and better trained horses are desirable.

The source from which cavalry horses are obtained differs in various countries. Some European nations breed and raise their remounts, while others provide the services of selected stallions gratuitously to breeders, the foals being held subject to purchase by the state. The American plan differs from the European practice and involves only the inspection of such animals as are presented by contractors. This encourages all farmers to breed a fair class of horses, and whenever the requirements of the markets increase the breeding usually increases until prices sometimes fall below a level at which colts can be profitably reared. Only a small percentage of horses raised in the United States are adapted to the requirements of cavalry service. This arises from the preference of the farmer for heavy horses to draw large loads; the cavalry service requires animals of particular conformation and character. The inspection of remounts for soundness and confirmation is a very important duty, demanding technical training and intelligence. It requires judgment, much instruction and long practice to correctly estimate the relative value of various points of the horse and to determine whether the good qualities counterbalance the existing defects. Contractors do not usually present ideal animals, but the market from which they draw is so large that there is no serious difficulty in supplying the remounts

annually required for the United States cavalry.

In European armies horses are accepted at four years of age, and sometimes under that age. It has been found in practice in the United States preferable to buy no horses under six years of age for immediate use in field service. Younger horses may be accepted during peace when there is no likelihood of immediate hard service, but they are subject to influenza or shipper's fever to a degree which often renders them unserviceable for many months. The foreign buyers of our horses in 1914, 1915 and 1916 were not as a rule able to get precisely the class of horses they preferred. Good points in a cavalry horse are not mere matters of beauty, but shapes which, on mechanical principles, are likely to answer required ends. Cavalry horses must have certain qualifications, the most important of which are the possession of sufficient mobility to execute tactical manoeuvres at varying degrees of speed and the ability to stand hard service while carrying weight. The weight of trooper and equipment averages about one-fourth the weight of the horse. Ability to carry flesh under stress of short rations is a commendable quality in a cavalry horse, since it enables him to stand hard work and to avoid a sore back. The requirements demanded in the cavalry horse of the United States are:

"The cavalry horse must be sound and well bred; gentle under the saddle; free from vicious habits; with free and prompt action at the walk, trot and gallop; without blemish or defect; of a kind disposition; with easy mouth and gait, and otherwise to conform to the following description:

"A gelding of uniform and hardy color; in good condition; from 15 $\frac{1}{4}$  to 16 hands high; weight not less than 950 nor more than 1,150 pounds; from four to eight years old; head and ears small; forehead broad; eyes large and prominent; vision perfect in every respect; shoulders long and sloping well back; chest full, broad and deep; fore legs straight and standing well under; barrel large and increasing from girth toward flank; withers elevated; back short and straight; loins and haunches broad and muscular; hocks well bent and under the horse; pasterns slanting and feet small and sound." See also HORSE, RIDING AND DRIVING.

**HORSE, The Percheron.** The Percheron horse is the production of the most patient care and the application of the best scientific principles of breeding. From the dawn of history the French breeders of draft-horses have been most successful, and the horses they have raised have been renowned the world over.

In the 16th, 17th and 18th centuries the same rules of selection in breeding have been applied that prevail to-day. The good horses were permitted to reproduce themselves and multiply. The inferior and unsound ones were never permitted to breed. The result of this most careful selection, based on scientific principles, has given the French the best draft-horse that the world produces.

In a very small portion of Normandy called the "Perche" the highest result has been attained. From this district the Percheron horse has been sent to all parts of the world with such satisfactory results that the word Percheron to-

day means the ideal draft-horse the world over. From the very beginning up until the present time the object of the Percheron breeders has been to produce the kind of horse that would move the greatest weight with the greatest speed.

In making their selections for breeding purposes the Frenchmen have not only picked out stallions and mares that would make the best horses, but comely appearance and pleasing outline have also in a measure been their guide, and as a result the Percheron horse to-day is not only the best draft-horse in the world, but he is one of the most attractive. He is indeed a handsome horse. The prevailing color of the Percheron horse is from black to white, including all of the various gradations from black, dark gray, dapple gray, gray and white.

About 50 years ago the first Percheron stallions were imported from France to America, and those that became most famous came to Ohio. One, called Louis Napoleon, owned in Union County, Ohio, and afterward sold to go to Normal, Ill., both here in Ohio and in his new home in Illinois, was admired by all. In a few years, when his colts began to appear, the reputation of the Percheron breed in America was so well established that hundreds and even thousands of them have been imported to America each year.

During the past 100 years the government in France has maintained a system of supervision over the horse-breeding industry. The government does not own every Percheron stallion, but every Percheron stallion must be approved by the government inspectors and must receive a certificate of approval before he can be used for breeding purposes in France. Many of the best stallions belong to the government. Many of those owned by private individuals receive a subsidy from the government if their owner will offer their services to the public.

On account of the very high tariff laws the French breeders supply nearly all of the horses used in France. The ups and downs of prosperity and depression do not affect the horse-breeding industry in that country. Instinctively the French breeders keep their best stallions and mares, no matter what the foreign demand may be, and as long as they pursue this policy the best Percheron horses will be found in France and the best breed of draft-horses in the world will be the Percheron.

JOHN R. McLAUGHLIN.

**HORSE, Riding and Driving.** In the latter days of this country one can hardly go to even an insignificant town or village without finding that a number of its residents spend time and money in raising, training and driving as good horses as their means will afford. Another striking feature of this country horsemanship is the rivalry and constant vying of each horse-fancier to excel among his fellows, and the interest manifested to-day in buying, selling and "swapping" horseflesh is typical of the American.

The county and State agricultural fairs which now make the exhibition of horses a special feature are largely the outgrowth of this far-reaching interest in horses. Nearly every country fair has, besides trotting and perhaps running races, a department for harness

horses and breeders' competitions. As freight and passenger rates are commonly commuted by the railroads or the fair corporations, these meetings enable the farmer to see the best the country for miles around can produce, raise his standards and teach him the results to be attained by proper breeding.

The horse shows, held annually in many of our large cities, at regular seasons throughout the year, and so arranged that they may not conflict as to dates, invite competitors from all parts of the country, who exhibit what they have with fair prospects of making their expenses from the prize money won. These horse shows are fostered both as sporting and business institutions, and the best horsemen in the country form their directorates and act as judges. These large shows do much to establish the types of animals that meet with favor, and their growth and popularity has cultivated the taste and interest of the general public in horses more than any other factor.

The types of horses highly valued in the large cities and in the country are, of course, similar to a large extent. A good horse is good anywhere. Nevertheless, the requirements of a metropolitan market are much more exacting and extend to the many qualities which we will try to outline in this article. While the country is often satisfied with mere "getting there" qualities in the horse, regardless of how it is done, or perhaps a mere combination of speed and endurance, the standard of a large city calls for certain definite requisites and qualifications—"points"—which are well-nigh indispensable if the horse is to command a good price.

To fill the requirements of the affluent class it is estimated that not more than 5 per cent of the horses throughout the country, including those raised with this object solely in view, can be utilized. Indeed, taste has become so fastidious that the right kind can only be found by diligent search, and prices verge into sums that 10 years ago would have been unbelievable. It must not be thought that the general run of horses in this country, or indeed that the quality of our native bred horses, has deteriorated in the past few years. Such, in the writer's opinion, is not the case. The fact is, that to fill the high requirements of the metropolitan market has become the recognized goal of all horse breeders; and it is now generally understood throughout the country that the market for the inferior horse is limited to those who can afford to pay so little that the breeder is not compensated for his care and outlay in breeding anything but the best. The general introduction of trolleys and the automobile has been an important factor in curtailing the market for horses that are merely "serviceable" and has reduced it to a competitive point that is unprofitable.

The high qualifications for the metropolitan market have reduced the available horses to such a small number that expert buyers search this country and the Dominion of Canada from one end to the other. Buying as cheaply as possible, so thorough has been the scouring of the country that the prices paid would seem fabulous to the seller if the cost alone of raising the horse were taken into consideration. The buyer must also assume the risk and expense of transportation to market.

The "points" for which the breeder is striving are well defined, but the individual may vary so much in combining them that the interesting feature of personal taste remains as the determining factor in selecting horses for personal use.

**Heavy-Harness Horse.**—The term "heavy-harness horse" is a general one. Under it may be classed anything from the 12 hand pony for basket-phaeton or village cart, through the various types suitable for the runabout, gig, brougham, victoria and other vehicles that fashion prescribes for various uses, to the 16-1 hand carriage horse for pulling the capitalist's omnibus.

The importation into this country, since 1883, of English hackneys and the exhibition of them has undoubtedly done much to educate the public to a type of carriage horse. While no disparagement is intended to the standard bred trotting horse, whose origin, indeed, is allied to the hackney—although his later history is somewhat different—the serviceable, short backed, straight-legged and intelligent horse now the standard for metropolitan use is nevertheless nearer the hackney type than the old style American trotter. It should be stated, however, that very few either of the trotters or hackneys of 25 years ago would generally fill the requirements of the harness horse to-day. A type having been once well established, however, horses filling the requirements can be selected from carefully bred trotters as well as from hackneys, and one breed is often mistaken for the other, such is their closeness in resemblance and the result of breeding with particular ends in view. The elements to be taken into consideration in the harness horse are as follows: Conformation, manners, action, speed, color, size and age. Conformation ranks first in point of importance, but manners are an absolute essential also. These two although somewhat variable must be present in any horse required for harness; the others vary considerably according to the type and weight of the vehicle to which the horse is to be harnessed and the purchaser's personal taste.

The elements in the order of their importance from a purely selling point of view are:

1. Conformation as to head and neck. This is probably the first feature the average purchaser will look for. The horse should possess a small head, delicately molded nostrils and a small tapering muzzle. His jaw-bones should be well apart so that when the head is reined in they will not interfere with his breathing. He should have good sized eyes, well separated; a narrow forehead or small eyes being general indications of lack of intelligence, nervousness or a tendency to fright or bad temper. The ears should be small and well apart. The neck should be gently tapering and well cut out in the throat, and the so-called "crest" from which the mane grows should have the slight convexity which indicates strength, maturity and condition. The neck should be set on sloping shoulders, so that the head will be naturally held erect, turning upward from the forward line of the trunk nearly perpendicular. A tapering neck is an indication of breeding and fineness as distinguished from the coarseness of draft blood and the common horse in ordinary use.

2. Conformation as to legs. The general requirements are that all four legs shall be approximately straight and not too long. A moderately short-legged horse is generally preferred, both for looks and service, to one that depends upon long legs for height. The forelegs should be perpendicular when the horse is standing erect, bones flat, but not heavy or coarse. The hind legs, when in a natural position, should be so formed that a plumb line dropped from posterior point of the haunch will be nearly tangent at the point of the hock, the rear line of the leg below the hock being approximately parallel to the plumb line. The thighs should be moderately heavy at the height of the lower line of the trunk. The modern idea is that the horse's buttocks should be round and muscular viewed from behind. The pasterns of all four legs should be springy and long rather than short.

3. In general. The horse should be "close-coupled"; in other words, there should not be too much space between the last rib and the quarter. His trunk should be round and just fleshy enough so that his ribs may be felt—not seen. Standing on level ground the height of his withers and croup should be about the same. The trunk, directly under the withers, should be deep and the chest from the front view broad, giving room for the heart and lungs and an appearance of power. The belly should be well picked up beneath the kidneys with a gentle, convex, upward curve from between the front legs—not enough, however, to produce the waspy effect sometimes seen in horses otherwise well formed. The back should be short, lending to the trunk an appearance of compactness and solidity. The quarters should not fall away back of the kidneys more than an inch or so to the root of the tail. The tail, if set well forward of the posterior line of the horse's haunches, is generally admired, and in this position will be carried at the proper angle naturally.

Under the subject of *manners*, full technical treatment should be sought in various books relating to horse training and breaking. We will endeavor to point out, however, to what extent manners in a harness horse is supplemental to ordinary training; to treat the subject fully being like attempting to describe what a gentleman should do under all circumstances. A few salient points will perhaps give a fair indication of the general subject.

The well-mannered horse should be so trained that when bitted his head is carried almost vertical, and close to his neck, which will be gently curved; the head and neck taken together being straight with the line of direction in which he is traveling. This position is not only graceful but gives the driver the utmost command over him. He should "fill his collar" without urging, but be light mouthed and susceptible to the slightest hint from the reins, voice or whip. He should be afraid of nothing and possess sufficient intelligence so that after first acquaintance with motor vehicles, railroad trains and other startling objects, he will pay no attention to them.

Into this subject, therefore, the question of natural disposition necessarily enters, as without a sensible but willing and high-strung disposition, it is impossible to produce a fashionable carriage horse. The horse should be trained to back and turn for the voice or with the slightest pressure of the reins without mani-

festing any disposition to shake his head or bore upon the bit. Plunging, rearing or trickiness must be absolutely eliminated, so that he is safe for a lady to drive through crowded city streets. He should be broken single, double and tandem, and to the saddle for convenience sake, and should be ready at any moment to serve in any one of these capacities.

All this mannering constitutes a supplemental or post-graduate education, for the horse as delivered from the country is broken, but commonly utterly devoid of manners. To accomplish this a training extending over a period of as much as three months is often necessary even with a horse that would be considered thoroughly broken in the country; and after mannering him as to how he shall carry his head and respond to the driver, it is necessary so perfectly must the horse be trained to suit the metropolitan purchaser, to spend a week or more in thoroughly accustoming him to city pavements and sights. It is almost superfluous to state that many horses cannot be brought to this high state of perfection, but the question of manners enters very largely into the price consideration, and the schooling should be carried on to as high a point as the disposition of the individual will admit.

While *action* is not absolutely indispensable, it is nevertheless the feature that many amateur horsemen will look for first, often neglecting much more important points to secure the flashiness of the high actor. Many dealers say, "Give me action and I can sell anything." Without going to this extreme, it is undoubtedly true that high action will cover many sins, and if a horse will only "get his head up and act" he is apt to be salable. Without action speed seldom attracts the city purchaser, and while it is undeniable that high action, except with careful driving and stable attention, will often cripple a horse on hard pavements who might otherwise go sound for years, the average high-price buyer not only asks for clean, straight action, but verges to the danger point in its height. The expert will seek horses having action both in front and behind as he knows that without both action, little, if any, speed will be produced, the propelling force lying in the power of the thighs. He will look at the horse going, coming and sideways, first to see that the horse neither ~~is~~ in, paddles or interferes in front; second, to see that he keeps his hocks close together as they pass, and consequently does not "straddle" or place his hind legs at the extreme forward stride outside of the line taken by his fore legs, or interfere by brushing either fetlock joint; third, that he does not forge and that his action is even when looked at from the side, each leg advancing at a stride the same distance and height as the corresponding leg on the other side.

The only gait admissible in the heavy harness horse is a trot. Pacing, racking, single-footing or any gait other than a square line trot, by whatever term it may be called, have no place in the metropolitan market. The horse should strike out straight from the shoulder in front, the whole leg straightening at the instant the hoof touches the ground, the hoof striking flat. The straightened foreleg then passes under the body of the horse and is rolled up when it leaves the ground, the hoof nearly touching in extreme cases the point of the elbow joint.

While still "folded" the arm bone reassumes the position for the next forward stride. As indicated above, the action of any single leg and hoof should be in a single longitudinal vertical plane. Some writers have endeavored to demonstrate, by projecting upon a longitudinal vertical plane the arc described by the forward point of the hoof from the time the horse picks up his foot from the ground until he touches it again, that the ideal action thus projected would form a symmetrical arc of an ellipse. While it is conceivable that such may be the case, it is practically impossible to determine slight variations from this ideal, and if the horse acts high, clean and straight without interference or forging he will not generally be open to criticism.

The modern buyer looks more and more nowadays for strong hock action, which means that the horse will cover ground and retain much of his action regardless of the amount of weight behind him.

While *speed* is not a very important element in horses for carriage use, it would be a truism to state that people like to go fast, and of two individuals equal in other respects, the purchaser will prefer the horse that has the most "step." A discriminating dealer will commonly aim to secure horses than can go a mile under ordinary circumstances in three and one-half minutes, and if possible in three minutes. This is, ordinarily, quite fast enough for salability, and the horse that will "road" steadily at 10 to 12 miles an hour and can increase the speed a little for a short spurt fills the market requirements pretty fully.

In *color*, modern fashion prescribes bays, chestnuts and browns, a dark seal brown being perhaps the most popular. Golden chestnuts are also popular, and blood bays are in high favor. Very few purchasers will consider a white or black horse, regardless of any number of other good qualities. Grays, except of the dark dapple variety, are rarely used, except in a cross-matched pair, and then only as a matter of personal fancy. In a road coach four, however, they are approved by the best authorities.

The amount of white on a horse is a matter of personal taste, many people liking white fetlocks and a star, stripe or blaze on a chestnut or bay's head, others preferring solid color. Bays are generally most popular with black points, but in general it may be stated that the horse possessing too much white will not please. One or two white legs, with white extending a short way to the knee or hock, will not be objected to, but it can be stated positively that, except for a leader or wheeler in a road coach team, where a showy effect is desired, there should be no white upon the body of the horse.

A sleek, shiny coat is a recommendation for any horse, as it usually bespeaks condition and breeding.

The question of *size* is one that is a matter of personal taste primarily, and secondly, one of suiting the vehicle to which the horse is to be harnessed. The salable horse for ordinary city use is rarely under 14½ hands, and in the opinion of most judges should not exceed 16¼ hands. For a lady's phaeton a small team with considerable substance and not usually less than 14½ hands in height is required, and for a heavy omnibus sufficient weight and strength are usually secured in the horse whose height does

not exceed 16 hands. The most salable size for horses in general use is about 15-21½ hands. Most buyers will restrict their purchases to horses between 15-1 and 16 hands, unless the animal is very remarkable in other respects, because customers for extremes in size are few in number, and such horses are consequently less readily salable.

A word should be said as to the *age* of the marketable horse. It is pretty well understood that colts suitable for heavy harness do not attain maturity and maximum strength until they reach the age of five or six years, and the ordinary purchaser will prefer the six-year-old horse. From 7 to 10 years the horse is at his best. While some horses hold their good qualities and are serviceable up to an extreme age of perhaps 20 years,—in the city horses rarely stand the strain of travel on hard pavements for many years without showing signs of usage sufficient to render them unsalable, except at small prices.

Horses kept for the show-ring and therefore not subject to usage on hard pavements exemplify the fact that there is little or no advantage *per se* in the young horse. Indeed, the horse may be at his best at the age of 10 years, and many of the blue ribbon winners of the past few years are even somewhat older.

**The Saddle Horse.**—Neglecting the subject of chargers and hunters, the former having but a limited market and being generally subject to army specifications, and the latter constituting too large a subject for discussion in an article of this character, and of more interest abroad, especially in England and Ireland, than in America, we shall say a few words of the saddle horse, presenting as briefly as possible some of the facts which should be borne in mind in supplying the market.

The conformation of the saddle horse will not be found to differ very materially from the carriage horse, and many private owners, who do not feel able or warranted in stabling horses for saddle purposes only, will find a combination horse for saddle and harness use a possibility. A saddle horse is not improved in gait by being harnessed to a vehicle, particularly a heavy one, in fact is impaired thereby, but moderate driving to light vehicles will not incapacitate him wholly for the saddle.

In a "park hack" we should look for somewhat substantial conformation. As in a carriage horse, depth of girth should be sought and the back should be short, all the distance possible, however, separating the forelegs from the hind, the horse having much of his length in his shoulders and quarters. The croup should be long, so that, taken in combination with high and prominent withers and heavy shoulders, the saddle will have a good seat and be prevented from slipping forward. As in the hind legs reside the seat of propelling power the thighs should be long and muscular, and some people prefer the hocks well bent. The pasterns should be somewhat longer and have more spring than in the harness horse.

As in the harness horse, the saddle horse should be about the same width in front as behind. Many will not object, however, to a horse slightly wider behind than in front, as the claim is made that, in a gallop, the hind legs will better pass outside of the forelegs; but,

under no conditions should the horse be wider in front than behind. He should have a moderately long and upright neck and a prominent crest, as this is the muscle that supports his head, and the neck should be arched. With this combination a horse will usually carry his head erect without support from the reins, and the rider will have better control and feel that he has something in front of him.

The manners of a saddle horse is an element worthy of particular notice. Besides the qualities and disposition valuable in a harness horse, primarily he must possess a high degree of intelligence and be absolutely fearless; and he needs a further education to make him "bridle wise." By this term is indicated response to the slightest pressure of the rein on either side of the neck, so that the horse turns readily by the lateral movement of the rein hand. This allows the rider one hand free for use or emergency.

As to gait and action, the horse should have a fast walk, so that when ridden in company he will keep up without breaking into a jog. The trot should be even, springy and regular, so as not to jolt the rider. Extreme action is not a necessary feature, but the horse should possess enough action to be noticeable in company; and high action is not a detriment if unaccompanied by pounding. An easy canter and gallop are necessities, and particularly is this true of the horse intended for long rides or to be used in the country. These gaits should be accomplished with a maximum of forward motion and a minimum of rocking.

Types and sizes of saddle horses vary greatly according to personal taste and the weight to be carried. Some desire a short-legged, thick-set cobby horse for weight-carrying, while those of lighter build may prefer a taller horse of less substance and more speed. Above all things the horse should be free and willing, as no man desires, or will tolerate, a horse needing constant urging.

**Breeding.**—A word or two as to breeding may not be inappropriate, as the requirements of the market are so exacting that every breeder should take them into consideration, in order to produce and raise as large a percentage of marketable horses as possible.

Much has been written upon the subject of horse breeding and genealogy in America, and careful investigation reveals much shallow erudition. The results of recent research have shed sufficient light upon this subject to show that much of the published matter as to the ancestry of the American trotter will not bear close investigation. Heretical as it may seem, the history and origin of the Hambletonian strain of blood, which for years has been held in high esteem among breeders throughout the country, we believe is open to reasonable doubt as to its authenticity. It does not seem unlikely that some of the breeders, in their desire to create a lineage for their horses, drew on their imagination for the breeding of the ancestors. After many years of assumption that the published facts were correct, grave doubt is now cast upon the breeding of some of the original stock. Perhaps, therefore, the less we attempt to demonstrate results by referring to the lineage of the standard bred trotting horse the safer.

Of the other breeds of this country perhaps the best known are the Morgans and Clays, but, generally speaking, such numerous and often

careless crosses have been tolerated that these breeds in anything like purity of blood have mostly disappeared. In the author's opinion, up to a recent date, the breeder in America has sought speed to the detriment of action, even going so far as to make conformation a secondary element.

A word should be said about the hackney. Much confusion has resulted temporarily, and probably only temporarily, from the placing on the market of so-called hackneys, which are such only in conformation and not in the action and speed which are characteristic of the hackney of honest blood. This breed lends itself exceedingly well to the requirements of the heavy harness horse when proper individuals are used in the stud. Although at present there are but few such individuals in this country, the hackney dates back in England to the 18th century. It was originally a cross between the shire or English cart horse, an animal somewhat coarse but of much substance, power and action, and the sleeker thoroughbred of delicate conformation and high strung temperament. So well has this breed been cultivated, to the elimination of the coarser individuals by a few reputable breeders in this country, that it is not difficult for the careful judge to discriminate.

Recently, American breeders have achieved extremely satisfactory results by crossing hackney stallions with clean-limbed, nicely turned trotting-bred mares, and while this cross is one that breeders claim should not be carried beyond one generation for fear of the infusion of cold blood in the offspring, a single cross certainly produces a large percentage of good marketable stock. This cross commonly combines high action and much substance with speed and breedy appearance.

As most scientific breeders now acknowledge, the main fact of all breeding is that it is a matter primarily of individuals, good lineage counting for little in the issue if the breeding stock do not themselves fill all the requirements desired. Not only should care be taken to use proper individuals, but if a slight fault exists in either parent—no horse being absolutely perfect—the other should be selected especially proficient in what the one lacks.

Back of the standard bred trotting horse, Morgan, hackney and French coach horse—another imported breed—stand practically the same Arabian ancestors, and as all are to-day bred with one end in view, the choice of one breed as against the others is a matter of selecting the individual best filling requirements.

If the main purpose be to breed for that market which is the most profitable, that of the heavy harness horse, it seems to the author that, instead of horses becoming standard by performance on the track if they became standard by performance in the show-ring all the qualities desired as well as speed would be more properly conserved. Of course, many practical difficulties, some of which would defeat the very ends sought, stand in the way of such a movement unless it were conducted by the government. A stud book formally conducted by the government and authentically recording the lineage and performance of stock, so that the history of a strain and the results of crosses might be generally published, and read, would be of immense value to the horse breeder

and to the government itself by raising the quality and value of the horses raised both for domestic use and export.

An interesting commentary on the subject of the harness horse and an evolution well worth notice is the gradual elimination of the unreliable small dealer in the metropolis; in fact, the market is fast falling into the hands of the comparatively few reputable dealers who endeavor to conduct their business on broad commercial lines. The purchasing public are beginning to recognize that it is best for their interests to patronize such dealers as can rather afford to take a loss on an unsound or unsafe animal by giving him away than to sell him under a misrepresentation and make a financial gain at the expense of reputation. This fact is not only an assurance that the interest manifested in the horse in our large cities will not decrease, but the business being in good hands that many who have in the past been slow to venture into this field of pleasure and sport can now enter into it as beginners without a long, unsatisfactory and expensive experience as a preliminary. See also HORSE, AMERICAN THOROUGHBRED.

ARTHUR MAN,  
Standard Coach Horse Co., New York.

**HORSE, Trotting and Pacing.** The harness racing horse has two gaits, namely, the trot and the pace. They were both originally the connecting link between the walk and the gallop, but by development and careful training have come to take the place of the latter so far as extreme speed in harness is concerned. The term "diagonal gait" is applied to trotting because the horse employing it raises simultaneously a front and hind foot at opposite sides of the body. In pacing, the front and hind feet on the same side move together, and this is best expressed as the "lateral gait." No one has yet been able to explain why a horse goes at one or other of these gaits when urged from the walk and guided by the rein to keep from the gallop.

The history of harness racing in America is practically contemporaneous with that of the republic of the United States. After the Revolution the development of speed in the horse had its attractions here as in Europe. At first the running gait was the only one considered, but the importation of an English sire called Messenger marked the beginning of a new era. He was brought over in 1788 and landed at Philadelphia. Though descended from stock that inclined to the gallop and practically a thoroughbred, this horse was more inclined to the trot. What is more remarkable, he transmitted this habit or instinct to so marked a degree that he made a great reputation in the New World through the superiority of his progeny over all other breeds. So "Imported Messenger," as he was popularly known, was the patriarch of the American trotter, and nearly all of the immense troop of harness racers in this country to-day trace descent to him. His death in 1808 near Oyster Bay, N. Y., was looked upon as a national calamity, and he was buried with military honors, the funeral being attended by prominent horsemen from all the neighboring States. As this horse was the founder of a notable family and represents a type in some respects separate and distinct from others of the *genus equus* it seems unfortunate that no portrait or drawing of him was ever

made. There is a pen picture which in some measure atones for this, and is worth quoting. It describes Messenger as of a gray color, standing full 15 hands 3 inches in height, with a thin mane and tail, ears larger than most well-bred horses, but erect and lively.

At the time of Messenger's death the limit of speed at the trot was, in round numbers, a mile in three minutes. The saddle was chiefly in vogue for this gait as well as running, but the employment of a vehicle with two wheels followed the building of better roads. According to J. H. Wallace, an authority on the thoroughbred, a chestnut horse trotted at Philadelphia in a sulky 25 Aug. 1810, one mile in 2:48½ for \$600. The horse was 14 years old and barely 15 hands high. There is an earlier feat now accepted as authentic of a horse called Yankee, trotting a mile in 2:59 in 1806 on Harlem Lane, a favorite driving place for New Yorkers. The breeding of these first champions of the sulky remains in obscurity, but it was not long before the descendants of "Imported Messenger" began to do greater things. Topgallant, who is credited with three miles in 8:11 and easily the best trotter of his day, was inbred to Messenger, his sire and dam both being by the potent English stallion. Screwdriver, who went three miles under saddle in 8:02 a year before this, was another of the stars descended from Messenger, as was Dutchman, another long distance trotter, who went his three miles under saddle in 7:32½; but the most famous of the Messenger brood in the nearer generations was Lady Suffolk. She was the first queen of trotters, her reign being a long and undisputed one from 1833 to 1852. She enjoyed the special distinction of being the first trotter to score as fast as 2:30 for a mile in harness. Following Lady Suffolk there were a few lesser lights that improved slightly on her best record, but her real successor as a conqueror of time was Flora Temple. She was foaled in 1845, her turf career beginning in 1852. Five times this wonderful mare reduced the figures that represented the speed limit, her greatest effort being 2:19¾. Then came the mighty Dexter, who reduced the record to 2:17¼. His public career was cut short when Robert Bonner purchased him and took him to New York for his private driving on the road. Goldsmith Maid came out in 1871 and clipped a fraction from Dexter's mark. She was foaled in 1857, made her debut at 10 years and continued to fill engagements in races and against time up to 1877. Rarus managed to improve Goldsmith Maid's record a trifle during a very creditable career. The gelding Saint Julien eclipsed him a year after by a full second. Then a new queen appeared in Maud S., and between this fleet pair was a lively duel for the championship. The figures were improved by fractions of a second until the mare reached 2:10¾ in 1880, which proved too much for the gelding. After his surrender another candidate appeared in Jay Eye See. Meantime Maud S. had got down to 2:10¼, but Jay Eye See enjoyed the distinction of being the first to touch the even 2:10. This was in 1884, and then the mare showed that she was the better horse by compassing the track in 2:09¾, and again in 2:08¾.

The greatest mechanical aid to the harness horse that has yet been devised came into use during 1892. This was the application of the

ball-bearing axle first applied to the bicycle, with the pneumatic tire and a wheel of about 28 inches diameter. Its first public trial was in a race at Worcester, Mass., early in May, where its manifest advantage enabled a slow horse to fairly play with a field of faster competitors. None of the prominent trainers had seen this new contrivance, and it was not until well along in July that they awoke to a full realization of its merits. The writer was privileged to see and try this sulky with its frictionless gear before it had come into general use, and on exploiting it with a conservative opinion that a horse could go at least two seconds faster than if hitched to the high wheel sulky, was informed by Budd Doble, the leading reinsman of that day, that he was the victim of a hoax. Less than three months after this same Doble had driven Nancy Hanks to one of these smooth running machines a mile in 2:04, or nearly five seconds faster than the record of Maud S. This material reduction was only the beginning of a new era in speed, as other trotters at once took advantage of this appliance and earned the championship in turn. Alix only clipped a quarter of a second from the mark set by Nancy Hanks, but she did this after a hard race campaign that took away from her real ability. It was six years before this resolute overworked mare had to surrender the crown, when in 1900 The Abbot trotted in 2:03¾. He had previously won his spurs in several creditable races, but his successor and conqueror, Cresceus, proved to be a much more remarkable representative of his kind. Starting at three years this Hercules among trotters met and defeated older and more seasoned campaigners in his colthood, scoring 2:11¼ in the eighth heat of a winning race. Then each successive season found Cresceus able to add to his laurels until in 1901 he earned the championship twice. His record of 2:02¾ was followed by the famous match against The Abbot at Brighton track, Brooklyn, N. Y., 15 August, when, in the presence of an immense crowd, many of whom came hundreds of miles to see this battle of the giants, Cresceus was the victor. It was no light task at first, as The Abbot forced him to go in 2:03¾, the fastest mile by nearly two seconds ever scored in a trotting race. Besides these feats Cresceus had lowered many other records, including the one for two miles which he placed at 4:17 late in 1902. During the season of 1903 he again battled against time, and after his previous championship record had been several times beaten by Lou Dillon and Major Delmar this stout warrior trotted in 1:59¾ at Wichita, Kan., in October 1903.

Lou Dillon was first trained in the winter of 1902 on the track at Pleasanton, Cal., and on the death of her breeder and owner was brought to Cleveland and sold at auction. The purchaser, C. K. G. Billings, of Chicago, got a rare bargain at \$12,500, and being strictly an amateur he promptly canceled all racing engagements. She then received special training for miles against time, and not only astonished the world by her mile in even time at Boston, but a few days later drew the old-style sulky with high wheels, in 2:05 at Cleveland, clipping three seconds and three-quarters from the record Maud S., made nearly 20 years before. Later on, at Memphis, Lou Dillon added to her fame by another mile in 1:58½ to sulky,

and one to wagon in exactly two minutes. She also defeated Major Delmar in a race for the Memphis gold cup; as a six-year-old her best performance was 2:01 at Memphis, 11 Nov. 1904.

Eight years more breeding and training were required before Lou Dillon's mark was passed. Then the wonderful gelding Uhlan appeared and 8 Oct. 1912, at Lexington, Ky., cut the world's trotting record to 1:58, where it stands to-day. It was demonstrated that Uhlan had considerable reserve speed, for after a number of trials, with a running mate, he accomplished a mile in 1:54½, taking three and a half seconds off his own best speed. This astonishing performance took place at Lexington, 9 Oct. 1913, or just a year and a day after he set the world's record. The 1:54½ does not stand as a trotting record, not having been made under the conditions of record racing. The running mate served as an incentive to develop what speed there was in this phenomenal animal.

The fastest mile trotted in a race is that of Hamburg Belle, at North Randall, Ohio, 25 Aug. 1909, 2:01¼. Uhlan holds the record for a half-mile track, made at Goshen, N. Y., 24 Aug. 1911, 2:02¾. The stallion record is held by The Harvester, made at Columbus, Ohio, 22 Sept. 1910, 2:01. The yearling record is held by Airdale, made at Lexington, Ky., 2 Oct. 1912, 2:15¼. Peter Volo took the two, three and four-year-old records in 1913, 1914 and 1915, the figures being 2:04½, 2:03½ and 2:02. The best two-mile heats recorded stand to the credit of Hamburg Belle, 25 Aug. 1909, 2:01¼ and 2:01¾. The Harvester holds the two-mile trotting record, made at Lexington, Ky., 13 Oct. 1910, 4:15¾. In trotting to wagon against time, Lou Dillon, at Memphis, Tenn., 28 Oct. 1903, made a mile in 2:00, but she was paced by a runner carrying a wind shield. Uhlan trotted a mile to wagon with no shield or artificial aid, at Cleveland, Ohio, 8 Aug. 1911, in the same time, 2:00. At Lexington, Ky., 11 Oct. 1912, Uhlan and Lewis Forest trotted as a team in 2:03¾.

The following table gives the names of all the record makers among the trotters and shows how the figures have been reduced from 2:30 to 1:58:

Lady Suffolk, gr. m. foaled 1833, by Engineer 2d; dam by Don Quixote. Driven by David Bryan, Beacon Course, Hoboken, N. J., 13 Oct. 1845, 2:29½.  
 Pelham, b. g. foaled 1837, pedigree not traced. Driven by William Whelan, Centreville, N. Y., 2 July 1849, 2:28.  
 Highland Maid, b. m. foaled 1847, by Saltram; dam Roxanna, by Hickory. Driven by F. J. Nodine, Centreville, N. Y., 15 June 1853, 2:27.  
 Tacony, ro. g. foaled 1844, by Sportsman; dam not traced. Union Course, N. Y., 14 July 1853, 2:27.  
 Flora Temple, b. m. foaled 1845, by Bogus Hunter; dam Madam Temple, by Terry Horse. Driven by Hiram Woodruff, Union Course, East New York, N. Y., 2 Sept. 1856, 2:24½.  
 Flora Temple. Driven by James D. McMann, Centreville, N. Y., 9 Aug. 1859, 2:23½.  
 Flora Temple. Driven by James D. McMann, Centreville, N. Y., 9 Aug. 1859, 2:22.  
 Flora Temple. Driven by James D. McMann, Cincinnati, Ohio, 7 Oct. 1859, 2:21½.  
 Flora Temple. Driven by James D. McMann, Kalamazoo, Mich., 15 Oct. 1859, 2:19½.  
 Dexter, br. g. foaled 1858, by Hambletonian; dam Clara, by American Star. Driven by Budd Doble, Riverside Park, Boston, Mass., 30 July 1867, 2:19.  
 Dexter. Driven by Budd Doble, Buffalo, N. Y., 14 Aug. 1867, 2:17½.  
 Goldsmith Maid, b. m. foaled 1857, by Alexander's Abdallah; dam Ab. by Abdallah. Driven by Budd Doble, Milwaukee, Wis., 6 Sept. 1871, 2:17.

Goldsmith Maid. Driven by William H. Doble, Mystic Park, Boston, Mass., 9 June 1872, 2:16½.

Occident, br. g. foaled 1863, by Doc; dam Mater Occident, pedigree not traced. Driven by George Tennet, Sacramento, Cal., 17 Sept. 1873, 2:16½.

Goldsmith Maid. Driven by Budd Doble, East Saginaw, Mich., 16 July 1874, 2:16.

Goldsmith Maid. Driven by Budd Doble, Buffalo, N. Y., 7 Aug. 1874, 2:15½.

Goldsmith Maid. Driven by Budd Doble, Rochester, N. Y., 12 Aug. 1874, 2:14½.

Goldsmith Maid. Driven by Budd Doble, Mystic Park, Boston, Mass., 2 Sept. 1874, 2:14.

Rarus, b. g. foaled 1867, by Conklin's Abdallah; dam Nancy Awful, by Telegraph. Driven by John Splan, Buffalo, N. Y., 3 Aug. 1878, 2:13½.

St. Julien, b. g. foaled 1869, by Volunteer; dam Flora, by Harry Clay. Driven by Orrin Hickok, Oakland, Cal., 25 Oct. 1879, 2:12½.

Maud S., ch. m. foaled 1874, by Harold; dam Miss Russell, by Pilot Jr. Driven by W. W. Bair, Rochester, N. Y., 12 Aug. 1880, 2:11½.

St. Julien. Driven by Orrin Hickok, Rochester, N. Y., 12 Aug. 1880, 2:11½.

St. Julien. Driven by Orrin Hickok, Hartford, Conn., 27 Aug. 1880, 2:11½.

Maud S. Driven by W. W. Bair, Chicago Driving Park, Chicago, Ill., 18 Sept. 1880, 2:10½.

Maud S. Driven by W. W. Bair, Homewood Park, Pittsburgh, Pa., 13 July 1881, 2:10½.

Maud S. Driven by W. W. Bair, Rochester, N. Y., 11 Aug. 1881, 2:10½.

Jay Eye See, bl. g. foaled 1878, by Dictator; dam Midnight, by Pilot Jr. Driven by Edwin Bither, Providence, R. I., 1 Aug. 1884, 2:10.

Maud S. Driven by W. W. Bair, Cleveland, Ohio, 2 Aug. 1884, 2:09½.

Maud S. Driven by W. W. Bair, Lexington, Ky., 11 Nov. 1884, 2:09½.

Maud S. Driven by W. W. Bair, Cleveland, Ohio, 30 July 1885, 2:08½.

Sunol b. m. foaled 1886, by Electioneer; dam Waxana, by Gen. Benton. Driven by Charles Marvin, Stockton, Cal., 20 Oct. 1891, 2:08½.

\*Nancy Hanks, br. m. foaled 1886, by Happy Medium; dam Nancy Lee, by Dictator. Driven by Budd Doble, Chicago, Ill., 17 Aug. 1892, 2:07½.

Nancy Hanks. Driven by Budd Doble, Independence, Iowa, 31 Aug. 1892, 2:05½.

Nancy Hanks. Driven by Budd Doble, Terre Haute, Ind., 28 Sept. 1892, 2:04.

Alix, b. m. foaled 1888, by Patronage; dam Atlanta, by Attorney. Driven by Andy McDowell, Galesburg, Ill., 19 Sept. 1894, 2:03½.

The Abbot, b. g. foaled 1893, by Chimes; dam Nettie King, by Mambrino King. Driven by Ed. Geers, Terre Haute, Ind., 25 Sept. 1900, 2:03½.

Cresceus, ch. h. foaled 1894, by Robert McGregor; dam Mabel, by Mambrino Howard. Driven by George H. Ketchum, Cleveland, Ohio, 26 July 1901, 2:02½.

Cresceus. Driven by George H. Ketchum, Columbus, Ohio, 2 Aug. 1901, 2:02½.

Lou Dillon, ch. m. foaled 1898, by Sidney Dillon; dam Lou Milton, by Milton Medium. Driven by Millard P. Sanders, Readville, Mass., 24 Aug. 1903, 2:00.

Lou Dillon. Driven by M. F. Sanders to high wheel sulky, Cleveland, Ohio, 12 Sept. 1903, 2:05.

Cresceus. Driven by George H. Ketchum, Wichita, Kan., 19 Oct. 1903, 1:59½.

Lou Dillon. Driven by M. F. Sanders, Memphis, Tenn., 24 Oct. 1905, 1:58½.

Uhlan. At Lexington, Ky., 8 Oct. 1912, 1:58. The following year Uhlan made a mile with running mate in 1:54½, but this does not stand as a record.

The progress and development of the lateral or pacing gait has kept side by side with trotting. Before Lady Suffolk had opened the door for the 2:30 list, the pacer Dover had gone a mile in 2:28. Dividing the century, since speed in harness for a mile was first considered, into two decades we are able to compare the two gaits and note the progress of each by the following table. The names of pacers are in italics:

1800-1810		
Yankee, b. g.	Harlem, N. Y.	2:59
1810-1820		
Boston Horse, ch. g.	Philadelphia, Pa.	2:48½
Boston Blue, bl. g.	Jamaica, N. Y.	3:00

\* First champion mile to bicycle sulky.

1820-1830			
Topgallant, b. g.	1829—3 miles	8:11	
Bowery Boy	1829—2 miles	5:04½	
1830-1840			
Edwin Forrest, bl. g. (to saddle)	1834	2:31½	
Sally Miller, b. m.	1834	2:37	
Drover, b. g.	1839	2:28	
1840-1850			
Lady Suffolk, gr. m.	1845	2:29½	
Moscow, b. g.	1845	2:30	
Pelham, b. g.	1849	2:28	
James K. Folk, ch. g.	1845	2:27	
1850-1860			
Flora Temple, b. m.	1859	2:19½	
George M. Patchen, b. h.	1859	2:20½	
Ethan Allen, b. h.	1858	2:28	
Pocahontas, ch. m.	1855	2:17½	
Pat, ro. g.	1852	2:18½	
1860-1870			
Dexter, br. g.	1867	2:17½	
Goldsmith Maid, b. m.	1869	2:19	
George Wilkes, br. h.	1868	2:22	
George M. Patchen, b. h.	1860	2:23½	
Ethan Allen, b. h.	1860	2:25½	
Billy Boyce, b. g. (to saddle)	1868	2:14½	
1870-1880			
St. Julien, b. g.	1879	2:12½	
Rarus, b. g.	1878	2:13½	
Goldsmith Maid, b. m.	1874	2:14	
Smuggler, br. h.	1876	2:15½	
Sleepy Tom, ch. g.	1879	2:12½	
Roady Boy, bl. g.	1879	2:13½	
1880-1890			
Maud S., ch. m.	1885	2:08½	
Jay Eye See, bl. g.	1884	2:10	
St. Julien, b. g.	1880	2:11½	
Axtell (3 yrs.), b. h.	1889	2:12	
Malxie Cobb, b. h.	1884	2:13½	
Phalax, b. h.	1884	2:13½	
Johnston, b. g.	1884	2:06½	
Gold Leaf (4 yrs.), ch. m.	1889	2:11½	
Little Brown Jug, b. g.	1881	2:11½	
Brown Hal, br. h.	1889	2:12½	
1890-1915			
Uhlan, g.	1912	1:58	
Lou Dillon, ch. m.	1903	1:58½	
Cresceus, ch. h.	1903	1:59½	
Major Delmar, b. g.	1903	2:00½	
The Harvester, s.	1910	2:01	
Hamburg Belle, m.	1909	2:01½	
Cresceus, ch. h.	1901	2:02½	
The Abbot, b. g.	1900	2:03½	
Alix, b. m.	1894	2:03½	
Nancy Hanks, br. m.	1892	2:04	
Azote, b. g.	1895	2:04½	
Directum, bl. h.	1893	2:05½	
Stamboul, br. h.	1892	2:07½	
Arion, b. h.	1893	2:07½	
Kremlin, b. h.	1892	2:07½	
Martha Wilkes, b. m.	1892	2:08	
*Lou Dillon.	1903	2:05	
*Sunol, b. m.	1891	2:08½	
*Palo Alto, b. h.	1891	2:08½	
*Direct.	1891	2:06	
Dan Patch, br. h.	1906	1:55½	
Directum I.	1915	1:56½	
Prince Alert.	1903	1:57	
Star Pointer, b. h.	1897	1:59½	
John R. Gentry, b. h.	1896	2:00½	
Prince Alert, b. g.	1902	2:00	
Daniel, m.	1903	2:00½	
Joe Patchen, bl. h.	1897	2:01½	
Robert J., b. g.	1894	2:01½	
Mascot, b. g.	1892	2:04	
Hal Pointer, b. g.	1892	2:04½	
Direct, bl. h.	1892	2:05½	

The stallion Dan Patch remains the king of pacers, his half-mile made at Memphis, Tenn., 27 Oct. 1903, and his mile made at Saint Paul, 8 Sept. 1906, in 1:55¼, being unequalled. The greatest pacers in 1915 are William, who as a four-year-old, at Grand Rapids, Mich., 5 Aug. 1914, made a mile in 2:00, and at Cleveland, Ohio, 16 Aug. 1915, beat Directum I in 1:58½, and Directum I, who a month after losing to William made 1:56¾ at Syracuse, N. Y., this being the stallion record for pacers. In 1918 Miss Harris did a mile in 1:58¼.

\* Made to high wheel sulky.

In the matter of breeding, reference has already been made to the fact that the imported horse Messenger, who played so important a part in the generation of harness horses, was of running stock. His descendants that have influenced this type more than any others were Rysdyck's Hambletonian and Mambrino Chief. The former was the son of Abdallah, whose sire Mambrino was by the English Messenger. This same Mambrino was also the grandsire of Mambrino Chief, so that his blood more than that of any of the get of Messenger has been potent in the production of the numerous fast exponents of the two harness gaits. Bellfounder, another English horse, brought over to Boston in 1823, had also much to do in founding the American trotter. His origin seems to be obscure, but he was probably of the type known as the Norfolk roadster, from which the hackney has sprung. The most famous of his progeny in the first generation was the Charles Kent mare, the dam of Rysdyck's Hambletonian. At least 75 per cent of what are called "Standard bred" trotters trace to this sire, and as none of the rest of Abdallah's get amounted to much there is every reason to believe that this daughter of imported Bellfounder had the inherent quality which made the Hambletonian strain so valuable. Every one of the champion trotters that succeeded Flora Temple are descended directly from this horse, Dexter himself being one of his sons.

The records of the running horses will be found under HORSE-RACING.

**HORSE ANT**, a hymenopterous insect of the family *Mutillidæ*. Other common names for the insect are cow ants, cow-killer ants and velvet ants. Structurally, they are similar to the true ants. The males have wings and hairy bodies. The females are wingless, unsocial in their habits and they also sting. They are found frequently in the early stages of their development as parasites in wild bee nests. In New England, certain ants of the genus *Camponotus* are also called horse ants.

**HORSE IN ART AND SYMBOLISM.** In Christian art the horse has been considered as a symbol of courage, intrepidity and generosity. In an opposite sense this animal has been used as an emblem of luxury. The Bible and the Fathers treat of the horse as emblematic of both virtue and vice, as all animals have in their nature both good and bad qualifications. Depictions of a horse found in the Catacombs are symbolic of the fleetness of life's course, and the palm wreath sometimes pictured above the horse's head is declared to convey the idea that the palm of victory is not always to the swift. Fairholt tells us that the horse in ecclesiastical art is an attribute of Saint Martin, Saint Maurice, Saint George and Saint Victor, who are represented on horseback; as also is Saint Leon in pontifical robes, blessing the people. Husebeth informs us that Saint Severus and Saint Quirinus have been depicted with a horse by their side; Saint Elegius (or Eloy), the patron saint of the goldsmiths, has been represented with a horse's leg in his hand, the hoof shod and a hammer in the other hand; this scene is taken from the legend of the saint lifting off, in miraculous manner, the horse's leg and shoeing the hoof, then replacing the leg, when the animal was brought to him as being too unmanageable for any farrier to handle. In

Chinese symbolism the horse is an emblem of wisdom. Ancient art gives us many forms of horse monsters. The hippocamelus was a fabulous creature, half camel, half horse. The hippocampus of the Greeks and Latins was a monster with head and forequarters of a horse to which the tail of a dolphin or some other fish was attached; Pompeii mural decoration displays this creature in paintings as hauling Neptune's marine chariot. The hippocentaur was a fabulous creation with a horse's body and head and bust of a human being, male or female. This hippocentaur, or centaur, is often found armed with bow and arrow, in which case it is termed sagittarius or sagittary. In this form it is the ninth sign in the celestial zodiac and represents August in the constellations. The hippocervus was half horse and half stag. We are told that the hippocervus is a Christian symbol of the pusillanimous man "who throws himself without reflection into uncertain paths and soon falls into despair at having lost himself in them." The hippogryph (or hippogriff) is a fabulous monster depicted as the body of a horse with wings and the head of a griffin; or sometimes it is found with the claws of a lion, some even have a lion's tail. The Greco-Roman artists gave free fancy to this creation as we find them on the wall decorations of Pompeii. The hippogryph is said to have been a symbol of love. The Greeks also had a hippoelectryon which was a hybrid composition of horse and cock. In ornament and composition of the rinceaux of friezes is the hippopot, a monster in form of a man with horses' legs.

CLEMENT W. COUMBE.

**HORSE BOT-FLY**, a bot-fly (*Gastrophilus equi*) parasitic in horses. The adult is about .75 inch long; the wings transparent with dark spots forming an irregular band toward the centre; the body brown and very hairy, the head whitish in front, and the abdomen dark-spotted. The females (males are rarely seen) have an elongated tapering abdomen. The oblong light, yellow eggs are glued, one by one, to the hairs of the forepart of the body, where they are likely to be licked off by the animal. The moisture of the tongue causes the developed larvæ to break through the shell almost instantly, and to be carried into the mouth and thence to the stomach. Many curious facts have been observed in connection with these eggs and their development and may be found fully discussed by Osborn in his 'Insects Affecting Domestic Animals,' issued by the United States Department of Agriculture (1896). Reaching the stomach, the larvæ fasten themselves to its walls by hooks in the posterior end of the body, and great masses sometimes accumulate seriously obstructing the pyloric outlet. They remain there, absorbing nourishment and interfering with digestion through the winter, and on the return of warm weather let go their hold, pass out through the intestines, enter the ground, pupate there for a few days, and then emerge as flies. This pest chiefly affects horses out at pasture, and can be prevented only by removing the eggs, which can easily be seen. The attempt to remove the bots from the stomach by turpentine or other drugs is a dangerous proceeding which should only be attempted under direction of a veterinarian.

**HORSE-CHESTNUT**, or **BUCKEYE**, a tree of the small family *Aesculaceæ* and genus *Aesculus*, represented in Europe by the horse-chestnut (*A. hippocastanum*), now cultivated in many parts of the world, but native to Greece, Turkey and southwestern Asia; and by several indigenous American species known as buckeyes, from the appearance of the fruit. These trees are shapely, have five or more leaflets diverging from the stalk like fingers, and bear white or tinted flowers in large erect panicles, turning the whole tree into the semblance of a big bouquet. The fruit of the horse-chestnut much resembles a huge chestnut, and is prickly when young. In this respect the common or Ohio buckeye (*A. glabra*) agrees with it, but has only five leaflets in each leaf and its flowers are small and not showy. The unpleasant odor exhaled by the bark and leaves in all this genus is especially strong in this species. A more southern species, developed into fine trees in the southern Alleghanies, is the sweet or yellow buckeye (*A. octandra*) which with the red buckeye (*A. pavia*) bears smooth fruit. Though so handsome, rapid in growth, and serviceable as ornamental or shade trees, they are otherwise of little value. The wood is light colored, soft and useful mainly for paper pulp and small articles; it contains a large quantity of saponaceous material, so that country people use the mucilaginous sap as soap. The leaves and roots of the Ohio buckeye are poisonous. The seeds are bitter but are eaten by cattle and sheep, with the preparation of boiling in alkaline water which is necessary in Europe; and from them a flour is made especially adapted to bookbinders and shoemakers' paste, as besides having great tenacity, it will not be attacked by insects. In France starch is produced from horse-chestnut seeds on a large scale. The seeds are also used in the southern United States to impart a flavor of age to raw whisky. The red buckeye has been naturalized in Europe as a park tree. California has a species of its own, Japan another and a third grows on the Himalaya Mountains.

**HORSE-FLY, GAD-FLY, or DEER-FLY**, any species of the family *Tabanidæ*, usually large, robust flies, with a broad head pointed in front and concave behind, with proportionally immense eyes, and fitting closely to the thorax. The legs are long and stout; sometimes hairy, but without stiff bristles. The females are provided with a long, sharp proboscis with which they pierce the skin of animals, and are especially annoying to such short-haired kinds as horses and deer. No poison is injected into the wound, but injurious bacilli may be introduced, causing bad sores. One of the most widely distributed in the United States is the large black *Tabanus americanus*. These flies attach their eggs to grass and sticks in wet places. The larvæ find their way into water or wet earth, and are carnivorous, feeding on other insects, snails, etc. They pass the winter before pupating and emerge as flies in the early summer. To the same family belong many smaller green or yellow species of the woods, more usually called deer-flies.

**HORSE-MACKEREL**. The horse-mackerel tuna or tunny (*Thunnus thynnus*), is the largest member of the mackerel family (*Scombrida*), attaining a length of 10 feet or

more and a weight of 1,000 to 1,500 pounds. It is found in all warm seas, both of the Atlantic and Pacific oceans, and wanders as far north as Newfoundland, appearing on our shores with the menhaden and mackerel. See **TUNNY**.

**HORSE POWER**, the power of an ordinary horse or its equivalent, the force with which a horse acts when drawing. The mode of ascertaining a horse's power is to find what weight he can raise and to what height in a given time, the horse being supposed to pull horizontally. From a variety of experiments it is found that a horse, at an average, can raise 160 pounds weight at a velocity of two and a half miles per hour. The power of a horse exerted in this way is made the standard for estimating the power of a steam-engine or other motor. Thus we speak of an engine of 60 or 80 horse power, each horse power being estimated as equivalent to 33,000 pounds raised one foot high per minute, but this estimate is considered much too high, 17,400 foot-pounds per minute being generally considered nearer the truth. As it matters little, however, what standard be assumed, provided it be uniformly used, that of Watt has been generally adopted. In estimating horse power, it is important to remember the element of time; the shorter the time the greater the power exerted. The general rule for estimating the power of an engine or motor in terms of this unit is to multiply together the pressure in pounds on a square inch of the piston, the area of the piston in inches, the length of the stroke in feet and the number of strokes per minute; the result divided by 33,000 will give the horse power deducting one-tenth for friction. As a horse can exert its full force only for about six hours a day, one-horse power of machinery may be said to equal that of four horses. The difference between an animal and a machine is further illustrated by the fact that any robust man can for a short time put forth more energy than this theoretical horse power; but he cannot maintain it, while the engine can, as long as it is in order and the power is applied. See **ENGINEERING TERMS**; **INTERNAL COMBUSTION ENGINE**.

**HORSE-RACING**, a national pastime, which has been called the sport of kings because it has been one of their amusements since the earliest dawn of civilization. The racing horse is of three distinct types, the running horse, the pacing horse and the trotting horse. For many centuries the running race has been the traditional turf sport in Great Britain and on the Continent, with many varieties, such as flat racing, or racing on level ground; steeple-chasing, or racing over ground not specially prepared for the purpose, and hurdle-racing, in which the horses have to leap over obstacles purposely placed in the way. Trotting is primarily an American institution, the outcome of thoroughbred development. Late in the 19th century horse-racing made a wonderful advance in the United States and easily became the great national pastime of the country.

**Early History**.—Thothmes I, of the 18th Egyptian dynasty, left a papyrus letter telling of his conquest of Mesopotamia, and priding himself upon the acquisition of the racing horse (the Arab) and being the first to introduce him in Africa. Somewhat later the records tell of King Solomon buying horses from Egypt, and

paying as much as \$3,000 for some of them. Among the Greeks it was introduced into the Olympic games in the 33d Olympiad (648 B.C.). From Greece it was introduced into Rome, where it gained a place as one of the games of the circus. The institution of horse-races in England, where the sport has become a great national pastime, belongs to a very remote period. The first regular horse-races, however, did not take place till the reign of James I. The successors of James I down to Queen Anne were all more or less attached to the sport. In the reign of the latter, in 1711, the York Plates were founded, and about that date the passion for betting on the turf began to be general. Under George I, the successor of Queen Anne, horse-racing became more flourishing. The two most celebrated horses of that period were Flying Childers (foaled in 1715) and Eclipse (foaled in 1764), which long had the reputation of being the fleetest horses that ever ran. From the latter are descended many of the first-class thoroughbreds of the present day. None of the English sovereigns was more devoted to horse-racing than George IV. Between 1784 and 1792, while yet Prince of Wales, he gained 185 prizes, including the Derby of 1788. Horse-racing was introduced into France from England during the reign of Louis XIV, and under Louis XV was pursued with the utmost enthusiasm.

**Breeding and Training.**—The training of a running horse begins with its second year, and is a slow process, requiring great care and attention. During the period of training the horse is under the charge of a stable-boy. In the first part of the training the exercise to which the horse is subjected is comparatively gentle, but in the latter part a gallop of half or three-quarters of a mile is taken every other day. Before a race takes place the powers of the horse are put to the test by its being made to run over about half a mile against an older horse, which is weighted to make up for the difference in age. The breeding of thoroughbred horses, that is, of horses which can trace an unbroken pedigree through the best sires and the best dams, is when well conducted a very profitable business. The prices given for stallions are sometimes enormous. In 1900, when the Duke of Westminster's racing stud was sold, the average price reached the high level, and the world's record price of \$187,500 was brought by Flying Fox, which had won the Derby the year before. Before this, Ormonde, another Derby winner, had sold for \$150,000. The large sums now given for the use of stallions in breeding studs are the cause of race-horses being withdrawn much earlier than formerly from the turf, for as soon as they have acquired a reputation the owner of a good race-horse can make much larger sums by hiring it out for breeding purposes than he could by entering it for races. The pedigrees of all thoroughbred horses are registered in the stud-book, so that if any particular animal is omitted in that register the inference is that its pedigree is not without some blemish more or less remote. The effects of a careful system of breeding in improving the quality of horses are very marked. No pure Arabian horse can be compared in point of speed with a thoroughbred. In size and shape, too, the horses of the present day

surpass those of former times, the average height of a thoroughbred now being 15 hands 3 inches, while formerly it seldom reached 15 hands. See also HORSES, AMERICAN THOROUGHBRED.

**Race Meetings.**—In Great Britain the chief race meetings are those of Epsom, Newmarket, Ascot in Berkshire, Doncaster, Goodwood, Liverpool, Manchester and Leicester. Those at Newmarket are the oldest of all, dating from the reign of Charles II. The Ascot races are considered the most fashionable, being largely attended by the aristocracy, and sometimes honored with the presence of royalty. The Goodwood races, which are held in the Duke of Richmond's park in Sussex, are also a favorite rendezvous of the aristocracy. But the most popular meeting throughout the year is the Epsom, which owes its popularity partly to the proximity of Epsom to London and partly also to its being the meeting at which the Derby and the Oaks are run. At the Oaks the ladies are the chief bettors, and the bets are not thousands of pounds, but dozens of Paris gloves. The principal racing meetings in France are those held in spring and autumn at Chantilly and the Bois de Boulogne.

In the United States the season opens at the Bennings track at Washington early in the spring and closes there in the fall. Following Bennings comes the Aqueduct, and Morris Park, Gravesend and Sheepshead, the latter track being the show track of this country, occupying the same position as the Ascot of the English turf, which is also named "The Ladies' Meet." Then follows the Brighton Beach season during July and August. The classic events of England and France are of longer standing but cannot be said to outrank or outinterest the famous Brooklyn Handicap, founded in 1887; the Suburban (1884); or the Futurity (1888); although laws against betting have seriously reduced public attendance at tracks in New York. There are racing parks and tracks in nearly every city in the country, and there are many famous meetings in the West and South, like the Latonia in Kentucky, the Harlem at Washington Park in Chicago, Saratoga and others.

**Racing Rules.**—The conditions under which the most of the races are run are the following: Every horse that takes part in a running race must be entered as a yearling, that is, before the close of the year in which it is foaled, for a horse's age is always reckoned from the first of January of the year in which its birth takes place. On being entered a certain sum is paid by the owner, which is called a forfeit, because it is forfeited if the horse is afterward withdrawn, or in the language of the turf, "scratched." The racing is conducted under association rules, and in England under regulations laid down by the Jockey Club, a body instituted in 1750. The stewards of the Jockey Club have power to grant and to withdraw licenses to racing officials, jockeys and race-courses; to fix the dates on which all meetings shall be held, and to make inquiry into and deal with all matters relating to racing. At every regular race-meeting there must be at least two stewards, with a clerk of course, a handicapper, a stake-holder, a clerk of the scales (since the jockeys of course must be

carefully weighed), a starter and a judge, each of these officials being licensed by the club.

**Handicapping.**—Formerly all running races were what is called weight-for-age races, that is, all the horses entered to compete were of the same age and bore equal weights, or if in certain cases there was an inequality in point of age there was also a fixed difference in the weight carried. But it was found that when races were conducted on this plan the best horses came to be known, and the inferior ones withdrew, not venturing to compete with them, so that the race resulted in a walk-over. Hence arose the practice of handicapping, that is, of adjusting as nearly as possible the weight to be carried to the previously ascertained powers of the horse, so as to reduce the chances of all the horses entered to an exact equality. In England the principal weight-for-age race for two-year-olds is the Middle Park Plate, and for the three-year-olds the principal for both colts and fillies are the Two Thousand Guineas, the Derby and Saint Leger, and for fillies only the One Thousand Guineas and Oaks. The most important handicap races are the Great Northampton Stakes, the City and Suburban and Metropolitan Stakes at Epsom, the Northumberland Plate, the Goodwood Stakes, the Ascot Stakes, the Ebor Handicap (run at York), the Great Yorkshire Stakes (run at Doncaster), the Liverpool Spring, Summer and Autumn Cups, the Cesarewitch, Cambridgeshire and Newmarket Handicaps (run at Newmarket).

**Betting and Book-making.**—The prevalence of the practice of betting in connection with horse-racing is a fact so well known that it is needless to enlarge upon it, although it will be of interest to some to explain in what manner it is conducted. Bettors are divided into two classes—the backers of horses and the bookmakers, or professional bettors, who form the betting ring, and make a living by betting against horses according to a methodical plan. Backers of horses may be again divided into those who have special information about the qualities of the horses which are to engage in a race, which enables them to back a particular horse with a certain amount of confidence; and those who have no such means of information, and accordingly back horses pretty much at random. The former class, if their information is good, have a very fair chance of success in their speculations and the horse that wins any great race usually brings in to his owner vast sums in payment of bets, compared with which the stakes, considerable as they often are, are insignificant; but the latter class are pretty certain in the long run to lose. By the method adopted by the professional bettor the element of chance is as far as possible removed. Instead of backing any particular horse, the professional bettor lays the same sum against every horse that takes the field, or a certain number of them, and in doing so he has usually to give odds, which are greater or less according to the estimate formed of the chance of success which each of the horses has on which the odds are given. In this way while in the event of the race being won (as is usually the case) by any of the horses entered in the betting-book of a professional bettor, the latter has always a certain fixed sum (say \$5,000) to pay, he receives from the backers of the losers sums which vary in proportion to the odds given. Thus, if a

bookmaker is making a \$5,000 book and the odds against some horse is 4 to 1, he will, if that horse wins, have to pay \$5,000, while, if it loses, he will receive \$1,250. If the sum of the amounts to which the horses in a particular race have been backed in some professional bettor's book is \$6,500, and if the odds against the first favorite were 5 to 2 (or \$5,000 to \$2,000), then the total sum received by the bookmaker, in the event of the race being gained by the first favorite, would amount to \$6,500, \$2,000 or \$4,500, so that he would suffer a loss of \$500; while if a horse had won that had long odds against him (say 200 to 1, or \$5,000 to \$25), his total receipts would amount to \$6,475 and his gains to \$1,475. Very frequently the receipts of the bookmaker are augmented by sums paid on account of horses which have been backed and never run at all.

**Americans Abroad.**—In 1855 an American horse had never won a race abroad and an American jockey had never ridden in an English race. The first American to go to England with a stable of thoroughbreds was Richard Ten Broeck, who sailed for England in 1856, taking with him Lexington, Lecompte, the only horse that ever beat Lexington; Pryor and Prioress. Lecompte died of influenza the first year, and Pryor soon followed. It was left for Prioress to retrieve the fortunes of the stable. Her great victory was in the Cesarewitch, a race at two miles, two furlongs and 28 yards. There were 37 starters, the very best horses on the English turf. After one of the most exciting races ever run, Prioress, El Hakim and Queen Bess finished in a dead heat. In the run off, the American horse won by a length in four minutes and 15 seconds. American successes really began in 1878, when Pierre Lorillard and James R. Keene shipped stables to England. The former's Parole won the Newmarket Handicap, defeating the English favorite, Isonomy, a horse that was called the best ever foaled on English soil. The American gelding next took the great Metropolitan, the great Cheshire and the Epsom Gold Cup in quick succession. Iroquois followed Parole, winning four important stakes in 1880, including the Saint Leger. The subsequent invasion of England by W. C. Whitney, Clarence A. Mackay, Richard Croker and others with famous winning horses, and the successes of Sloan, Reiff, Martin and other American jockeys, have brought renown to the American turf. In 1902, American horses ridden by American jockeys took part in 561 races in England, of which they won 85, were second in 80, third in 52 and unplaced 344 times. The stakes and purses won amounted to \$234,120. Since 1903, the Americans have done even better, proportionately, almost every year and their winnings have exceeded \$1,000,000. American horses were second in the Oaks and third in the Derby. In 1907, the Derby was won by a horse owned by an American.

**Trotting.**—The evolution of the trotting horse in America, and the gradual reducing of the one mile record, is a history coincident with the improvement and progress made in breeding. Beginning with the record of Trouble, who trotted a mile in 2.43 in 1826, of Dutchman (2.32) in 1839 and Flora Temple (2.19¾) in 1859, the evolution proceeds to George Wilkes, Dexter, Goldsmith Maid and the others who

followed. In 1818, at a Jockey Club dinner, discussion drifted to the trotter, and a wager was made that no horse could be produced which could trot a mile in three minutes. Boston Blue was named at the post by Maj. William Jones, and the old chronicle says that he "won cleverly and gained great renown." The New York Trotting Club was organized in 1825, for the purpose of improving the speed of road-horses. The initial purses were for races of two-mile and three-mile heats. In 1835 trotting was in almost daily vogue in New York. It was not until 1845 that a mile was trotted in less than 2.30. In 1863, the American trotting horse was an unknown quantity abroad, while since 1903, American trotting stock has been in demand in Europe. Germans, French, Russians and Austrians have bought some of our best bred animals.

The National Trotting Association was formed in 1870 as a result of a meeting of breeders and track owners the previous year. In 1887 the American Trotting Association was formed with headquarters in Chicago, and it works with the National Trotting Association to detect and punish fraud. Some of the ablest men in the country sit on the boards of appeals, and the decisions command respect and are accepted as final. The careers and records of famous trotters like George Wilkes; Dexter; Harrietta; Axtell (2.12); Saint Julien (2.11 $\frac{3}{4}$ ); Sunol (2.10 $\frac{1}{2}$ ); Maud S. (2.08 $\frac{3}{4}$ ); Kremlin (2.07 $\frac{3}{4}$ ); Stamboul (2.07 $\frac{1}{2}$ ); Beuzetta (2.06 $\frac{3}{4}$ ); Directum (2.05 $\frac{1}{2}$ ); Nancy Hanks (2.04); Alix (2.03 $\frac{3}{4}$ ); The Abbot (2.03 $\frac{1}{4}$ ), and the mile of Major Delmar and of Hamburg Belle (2.00 $\frac{1}{4}$ ); Cresceus (1.59 $\frac{1}{4}$ ); Lou Dillon (1.58 $\frac{1}{2}$ ) and Uhlán (1.58), tell the story of the trotting horse in America. See also HORSES, TROTTING AND PACING.

Prominent owners of racing stables in the United States are H. P. Whitney, J. L. Holland, H. G. Bedwell and J. O. Talbott. The best performances on the American running turf are quarter mile, Bob Wade, 4 years, at Butte, 1890, 21 $\frac{1}{4}$ ; three-eighths mile, Atoka, 103 pounds, Butte, 1906, .33 $\frac{1}{2}$ ; half mile, Geraldine, 4 years, 122 pounds, Morris Park, 1889, .46; five-eighths mile, Maid Marian, 4 years, 111 pounds, Morris Park, 1894, .56 $\frac{1}{4}$ ; six furlongs (Futurity), Kingston, 139 pounds, Sheephead Bay, 1891, 1.08; Artful, 2 years, 130 pounds, Morris Park, 1904, 1.08; seven furlongs, Roseben, 5 years, 126 pounds, Belmont Park, 1906, 1.22; one mile, Salvator, 4 years, 110 pounds, against time, Monmouth Park, 1890, 1.35 $\frac{1}{2}$ ; Stromboli, 3 years, 117 pounds, Belmont Park, 1914, 1.36  $\frac{3}{5}$ ; one and a quarter miles, Whisk Broom II, 6 years, 139 pounds, Belmont Park, 1913, 2.00; one and a half miles, Goodrich, 3 years, 102 pounds, Washington Park, Chicago, 1898, 2.30 $\frac{1}{4}$ ; two miles, Everett, 4 years, 107 pounds, Pimlico, Md., 1910, 3.25  $\frac{3}{5}$ . The largest purse won in regular American events was the Futurity of 1904, \$42,880, first place, won by Artful, six furlongs, in 1.11  $\frac{4}{5}$ . The highest purse in the Brighton Handicap is \$21,750, which was offered in both 1904 and 1905, being won by Broomstick and Artful respectively. The Brooklyn Handicap's largest purse was \$19,750, in 1908, when J. R. Keene's Celt won. The Suburban Handicap paid \$19,750 to the winners of 1908, when Keene's Ballot won. The Metropolitan Handicap's largest

purse was \$10,850, in 1906, Grapple being first. The Futurity is now the only race around New York where a large purse is given annually.

The English Derby, which has been run since 1788, over a course of about a mile and a half, shows the following records in recent years:

Year	Owner and winner	Time	Second
1905	Lord Rosebery's Cicero	2.39 3-5	Jardy.
1906	Maj. Loeder's Spearmint	2.36 4-5	Pictou.
1907	Richard Croker's Orby	2.44	Shieve Gallion.
1908	E. Ginistrelli's Signorinetta	2.39 4-5	Primer.
1909	King Edward's Minoru	2.42 2-5	Louviers.
1910	Mr. Fairie's Lemberg	2.35 1-5	Greenback.
1911	J. B. Joel's Sunstar	2.36 4-5	Stedfast.
1912	W. Raphael's Pagalie	2.38 4-5	Jaegar.
1913	A. P. Cunliffe's Aboyeur	2.37 3-5	Louvois.
1914	H. B. Duryea's Dunbar II	2.38	Hapsburg.

For other racing records, see HORSE, TROT-  
TING AND PACING.

**HORSE-RADISH**, a species of watercress (*Radicula armoracia*), native to Europe, but now cultivated everywhere, and naturalized in many parts of the world. Its basal leaves are oblong, finely crenulate and irregular in outline, and its flowers are white and showy. The roots furnish the highly pungent ingredient of a well-known sauce, prepared by grating them, adding vinegar and sealing. They have also some medical use.

**HORSE-RADISH-TREE.** See BEN, OIL OF.

**HORSE-SHOE ROBINSON: a Tale of the Tory Ascendancy**, was published by John Pendleton Kennedy in 1835 with a dedication to Washington Irving, whose 'Bracebridge Hall' Kennedy had already followed in his charming and truthful 'Swallow Barn, or a Sojourn in the Old Dominion' (1832). Cooper, not Irving, however, furnished the model for the later book, with the difference that whereas Cooper relied largely upon invention for his plots, Kennedy took plot as well as topography and costume almost directly from fact. Indeed, he founded the career of Horse-Shoe Robinson upon that of an actual partisan, one Galbraith Robinson, a blacksmith, whom he had met in South Carolina in 1819, and who later approved the record as authentic—"excepting about them women, which I disremember," he said. The love affair thus referred to is, as in most historical romances of the period, pale and conventional, but it is overshadowed by stirring adventures drawn boldly upon a broad canvas. The story opens with Charleston in British hands and carries the account excitingly through all the fratricidal violence of Whigs and Tories to the crucial, decisive battle of King's Mountain, which in 1835 already belonged to the folklore of the Carolinas. Romance as it is, 'Horse-Shoe Robinson' has genuine historical value for its representations of Revolutionary manners in the South. The leading personage, though full of the simple virtues with which the early republic endowed its heroes, just misses greatness by the lack of the touch of genius and poetry which made Leather-Stocking supreme in the class to which,

however, Horse-Shoe Robinson also belongs.

CARL VAN DOREN.

**HORSEFIELD, Thomas**, American naturalist and explorer: b. Bethlehem, Pa., 12 May 1773; d. London, England, 1866. He was graduated in medicine at the University of Pennsylvania, and served as "medical apprentice" in the Pennsylvania Hospital from 1794-99, being the fifth interne in the hospital in the order of appointment. In October 1799 he accepted service as surgeon on the *China*, about to sail for Java. He returned in the latter part of 1800, but in 1801 went again to Java for the purpose of thoroughly exploring the island, and was commissioned as regimental surgeon by the Dutch Colonial government. From 1802 he devoted himself to the thorough examination of the flora, fauna and geology of the island, at first under the auspices of the Dutch government, and, when possession of Java was taken by the English, under the especial patronage of Sir Thomas Stamford Raffles, the lieutenant-governor. A warm friendship, due to kindred tastes, sprang up between Horsefield and his celebrated patron, and, when the English tenure of Java ceased and Sir Stamford Raffles returned to England, Horsefield accompanied him, bringing with him the collections he had made, which were placed in the museum of the East India Company in London, of which he was presently made the curator, a position which he held for nearly 50 years until his death. Horsefield, by his explorations and writings, laid foundations for our knowledge of the natural history of the far East. He contributed while in Java many important papers to the publications of the Batavian Society of Arts and Sciences. In 1824 he gave to the world his great work entitled 'Zoological Researches in Java and the Neighboring Islands,' and from 1838-52 issued in folio parts the 'Plantæ Javanicæ Rariores.' Both works are sumptuously illustrated by colored plates. In 1856-58 he published the 'Catalogue of the Birds in the Museum of the East India Company,' and in 1857-59, with Frederic Moore, the 'Catalogue of the Lepidopterous Insects in the Museum of the East India Company.' Besides these larger works he was the author of a multitude of papers published in the 'Transactions' and 'Proceedings' of societies. To him perhaps more than to any other single naturalist are we indebted for the first correct account of the botany and zoology of the regions with which he became familiar in his early life.

**HORSEFISH.** See MOONFISH.

**HORSEFOOT CRAB, HORSE-SHOE CRAB, or KING CRAB.** This marine animal (*Limulus polyphemus*) was formerly regarded as a crustacean, and is the sole survivor of an extinct group of arthropods intermediate between the trilobites and arachnids. It belongs to the order *Xiphosura*, class *Merostomata*, and phylum *Palæopoda*. By some English authors it is regarded as an arachnid allied to the scorpion. This difference of opinion regarding its affinities is due to the generalized structure of the animal, and to the fact that its nearest allies are extinct.

The body of the horsefoot crab is sometimes two feet in length, and consists of a head and a hind-body or abdomen, the latter ending in

a long spine (telson), which is elevated by the creature in defense. The head is covered by a broad carapace, and is in shape somewhat like a horse's hoof, and in burrowing it acts as a shovel, being bent down at nearly right angles to the hind-body. There are a pair of compound and of simple eyes; the mouth is on the under side, nearly surrounded by six pairs of walking legs, while on the hind-body are six pairs of broad swimming legs. There are no antennæ, jaws, maxillæ or foot-jaws, as in the lobster. The horsefoot crab breathes by means of gills attached to the under side of the last five pairs of abdominal legs, which consist of a pile of about 100 thin broad sacs growing out, one pile on each side, from the base of the legs. The nervous system is peculiar from the nature of the brain, and the œsophageal ring; while the entire system behind the brain is enveloped by the arteries, the latter ending in remarkably fine branches. The heart is large, tubular, the liver very voluminous, and the kidneys are represented by four pairs of excretory red glands, arising from a stolon-like base. The animal is bisexual, the male differing from the female in the second pair of legs ending not in a forceps, but in a sort of hand, with an opposing thumb. The ovaries and testes are voluminous, and the sexual products, eggs and sperm, pass out through a pair of papillæ situated on the under side of the first pair of abdominal legs.

The female lays her large round eggs loosely in the sand between high and low water, spawning in May and June; in about a month they hatch, and the young, after passing late in embryonic life through a trilobite stage, assumes the form of the parent, differing in the short rudimentary caudal spine. It molts frequently, and during the process the front edge of the carapace or head splits open, enabling the animal to draw itself out of the old shell. The recently hatched *Limulus* is strikingly like a trilobite, but while in the latter new segments are added after birth, in *Limulus* no new ones are added. The young horsefoot is about four millimeters in length. Specimens an inch long are about a year old, and it probably requires several years to grow to the length of a foot or more.

*Limulus polyphemus* inhabits the eastern coast of North America from Boothbay, Me., to the West Indies and Honduras, but is most abundant in shallow, retired, sandy or muddy bays on the coast of New Jersey, Virginia and North Carolina. Several other species inhabit the seas of the Eastern Archipelago, China, Philippines and southern Japan. In the United States it is used as a fertilizer, while in the Malayan markets the animals are sold as food.

The *Limuli* date from the Devonian. An allied group, in shape and structure approaching scorpions, is the Eurypterida, one of which (*Stylonurus laccoanus*) of the Devonian of New York and Pennsylvania was about five feet in length, while the British *Pterygotus anglicus* is estimated to have been about six feet in length and two feet across. It is now thought that the scorpions have descended from some merostome, which became adapted for a terrestrial life. See EURYPTERUS.

**HORSEHEADS, N. Y.**, village, in Chemung County, on the Erie and Central New

York, and branches of the Delaware, Lackawanna and Western and the Northern Central railroads, about six miles north of Elmira. It is in a fertile agricultural region. Its chief manufactures are creamery products, bricks, screens, doors, blinds, men's clothing, cigars, cattle-feed, shoes and hardware. Pop. 1,778.

**HORSEMANSHIP.** See RIDING.

**HORSESHOE BEND, Battle of,** in the War of 1812. When Jackson reached Fort Strother after his battles at Emuckfaw (q.v.) and Enotachopco, many of the volunteers returned home, thus forcing him into temporary idleness, but in February 1814 some regulars arrived and, therefore, as others of his volunteers had but a month more to serve, Jackson, on 16 March, dropped about 30 miles down the Coosa River and then started eastward for the Tallapoosa River, in the great loop of which, at Tohopeka, 800 Ocfuskee Indians had erected a fort and there had taken refuge with their women and children. On 28 March, with 3,000 effectives, Jackson camped about six miles from Horseshoe Bend and the next day made the attack. He sent General Coffee to gain the southern bank of the river, encircle the bend and assault from the rear while he attacked in front. Coffee's men attacked and set fire to the Indian huts, whereupon Jackson furiously assailed the breastwork on his side and finally carried it with some loss. The Indians asked no quarter and kept up a hopeless resistance until darkness ended the combat, when they sought refuge in the thickets; but the brush was set afire and as the Indians emerged they were shot. The slaughter was terrible, 557 warriors having fallen in the fort while many were shot swimming across the river so that only 200 are believed to have escaped. The prisoners numbered 304. Jackson's loss was 51 killed and 150 wounded. This battle destroyed the Indian power, and on 9 Aug. 1814, Jackson signed a capitulation and treaty with the Creeks whereby a large portion of their lands was ceded to the government. (See CREEKS). Soon afterward Jackson went to defend New Orleans (q.v.). Consult Adams, Henry, 'United States' (Vol. III, pp. 251-261); 'American State Papers, Indian Affairs' (Vol. I, p. 826); Brackenridge, H. M., 'History of the Late War' (pp. 194-195); Fay, H. A., 'Official Account' (pp. 179-181); Lossing, 'War of 1812' (pp. 779-780); Monette, 'Valley of the Mississippi' (Vol. II, p. 421); Wiley and Rines, 'The United States' (Vol. V, pp. 454-456); biographies of Jackson by Parton (Vol. I, pp. 479-523); Buell (Vol. I, pp. 324-329), and Frost (pp. 231-236).

**HORSESHOE FALLS.** See NIAGARA FALLS.

**HORSESHOE SNAKE,** a large colubrine serpent of Spain and North Africa (*Zamenis hippocrepsis*), so called from a horseshoe-like mark on its nape, and renowned for its fierce disposition, as is characteristic of the genus (rat-snakes) to which it belongs. It is yellowish above, strikingly marked with a variety of blackish lines and spots; the underside is yellow or red. Its usual home is in the burrow of some ground-squirrel or similar animal sought as prey, and it frequently enters the dwellings of men.

**HORSESHOEING.** See HORSE, CARE AND DISEASES OF.

**HORSENS,** Denmark, a seaport in the province of Aarhus, at the head of the Fjord of Horsens, distant from Aarhus by 32 miles southwest. The principal industries are iron-working, shipbuilding, the manufacture of woodenware and lime, and weaving. The chief imports are hay, grains and fertilizers; the exports are meats and dairy products. Pop. about 25,000.

**HORSFORD, Eben Norton,** American chemist: b. Moscow, N. Y., 1818; d. 1893. He received his education in the civil engineering course of the Rensselaer Polytechnic Institute, and in 1839 was employed on the geological survey of New York State. From 1844-46 he studied chemistry under Leibig in Germany, and on his return to the United States received the Rumford professorship in applied science at Harvard. In 1863 he resigned this post to engage in business. Mr. Horsford was known for his antiquarian research, especially in regard to his studies concerning the old Norse settlement which he supposed to be on the Charles River; and for his philanthropy. He endowed the library and a splendidly equipped laboratory at Wellesley College. He published a dictionary of the Iroquois and Algonquin languages; and the 'Discovery of Norumbega' (1892).

**HORSLEY, hörs'li, John Calcott,** English painter: b. London, 29 Jan. 1817; d. 18 Oct. 1903. After studying in the schools of the academy, he made his début in 1836 with 'The Pride of the Village' (Vernon Gallery) at the Royal Academy. He then devoted himself to genre paintings, among which the most famous are 'Malvolio' and 'L'Allegro' and 'Il Penseroso' which he painted for the Prince Consort. The Westminster Hall competition awarded him first prize for his cartoon of 'Saint Augustine Preaching' (1843). In the following year he executed frescoes for the houses of Parliament. He organized the winter exhibits of the "Old Masters" at Burlington House after 1870. His protests against paintings in the nude won for him the nickname in *Punch* of "Mr. J. C. (clothes) Horsley." The Royal Academy elected him member in 1864, of which society he was treasurer from 1882-97, when he retired. Mr. Horsley published his memoirs under the title 'Recollections of a Royal Academician' (New York 1904).

**HORSLEY, Samuel,** English clergyman: b. London, 15 Sept. 1733; d. Brighton, 4 Oct. 1806. He studied law at Trinity College, Cambridge, and then received the living of Newington Butts in Surrey, which his father had held before him. It is in connection with his spirited attacks on Dr. Joseph Priestley's doctrines as set forth in the latter's 'History of the Corruptions of Christianity' and the controversy which followed that Horsley is chiefly known. In 1781 he became archdeacon of Saint Albans and in 1788 was promoted to the see of Saint David's. Subsequently he was bishop of Rochester (1793), and of Saint Asaph's (1802). Besides his controversial works and sermons, he edited the works of Isaac Newton (5 vols., 1779-85); wrote several treatises on mathematics, and also 'On the Prosodies of the Greek and Latin Languages' (1796), and translated

several books of the Bible. Posthumously various collections of his works were made: 'Speeches in Parliament' (1813); 'Collected Theological Works' (6 vols., 1845).

**HORST** (German, the top of a rock), a term applied to a block of the earth's crust lying between two faults and upthrown relative to the adjacent blocks; also applied to the topographic elevation so formed. The opposite of graben (q.v.).

**HORSTMANN, Ignatius F.**, American Roman Catholic prelate: b. Philadelphia, Pa., 16 Dec. 1840; d. Cleveland, Ohio, 13 May 1908. In 1857 he was graduated from the Central High School, and afterward attended Saint Joseph's College, Philadelphia. He went to the Preparatory Seminary of Glen Riddle in 1859, and in 1860 entered the American College, Rome, where, after completing his course, he was ordained priest by Cardinal Patrizzi, 10 June 1865. In 1866 he took in Rome the degree of doctor of theology, and in the same year returned to Philadelphia and accepted the chair of mental philosophy in the diocesan seminary of Saint Charles Borromeo, continuing to hold the same position in the new seminary at Overbrook. In 1877 he became pastor of Saint Mary's Church, Philadelphia, and in 1885 was named chancellor of the archdiocese. On 29 Nov. 1891 Leo XIII appointed him to the vacant see of Cleveland, Ohio, and he was consecrated bishop 25 Feb. 1892.

**HORT, Fenton John Anthony**, British theologian: b. Dublin, 23 April 1828; d. Cambridge, 30 Nov. 1892. He studied at Cambridge, becoming Fellow there in 1852. In the following year he undertook with B. F. Wescott an edition of the Greek New Testament, and founded with others the *Journal of Classical and Sacred Philology*. He received ordination in 1856, and became vicar at Saint Ippolyts, near Cambridge. However, the scholastic life held more attraction for him and he returned to Cambridge, where he rose from examiner to a professorship in 1878. His edition of the New Testament appeared in 1881, a monumental and authoritative work. His 'Introduction to the New Testament in Greek' is a fine scholarly production. Numerous treatises and lectures have been published posthumously, including 'The Way, the Truth, and the Life' (London 1893); 'Judaistic Christianity' (1894); 'Lectures on the Ante Nicene Fathers' (1895); 'Prolegomena to Romans and Ephesians' (1895); 'The Christian Ecclesia' (1897); 'Village Sermons' (1897); 'Village Sermons in Outline' (1900). Consult Hort, A. F., 'Life and Letters of F. J. A. Hort, by his Son' (2 vols., London 1896).

**HORTENSIVS, hōr-těn'shī-ūs, Quintus**, Roman dictator, about 286 B.C. He was chosen to settle the differences between the plebs and the Senate, which had resulted in sedition and their secession to the Janiculum. Hortensius enacted the Lex Hortensia, by which resolutions passed by the plebs were made binding on the whole people, without the Senate's approval.

**HORTENSIVS, Quintus**, who was sur-named HORTALUS, a Roman advocate, and who flourished in the time of Cicero: b. 114 B.C.; d. 50 B.C. At an early age he showed remarkable

ability as an orator, and his skill won for him the successive offices of quaestor (81); aedile (75); praetor (72) and consul (69). The remainder of his life he spent in practise of law and became distinguished in pleading of cases. His oratory was insincere for the most part and very flowery. He opposed Cicero in the cases of Verres, and his failure to win the trial was the turning point of his career. Thenceforth, Cicero occupied the position of leading orator. The works of Hortensius have not been preserved.

**HORTICULTURE**, the art of growing, improving, propagating and utilizing fruits, vegetables and flowers for food and for ornamentation. While horticulture is strictly an art, it is grounded in and supported by many branches of science, all of which play an important part in the success of the work. Although the sciences of plant physiology, chemistry and physics may aid greatly in all branches of horticulture, there have been, are still and will no doubt continue to be men endowed with natural gifts who must be regarded as masters in this field, to whom the sciences as such remain unknown. The degree to which plants may intuitively be molded, shaped and made to respond to the needs of man are little short of marvelous. Science with all its power cannot always accomplish the ends secured by the skilled craftsman who knows plants and loves them, who may work wonders with them himself, but who may be unable to pass this knowledge on to others. While the word horticulture is still retained for a large number of activities, the field has become so extensive that there are now well-recognized groups. No hard and fast lines can be drawn between these groups, but they are generally recognized as more or less distinct and are as follows: (a) Fruit growing, or pomology; (b) Vegetable growing; (c) Flower growing, or floriculture; (d) Landscape art.

**Fruit Growing, or Pomology.**—Fruit growing embraces all those practices having to do with the production, handling and within certain limits the utilization of fruits. Here again it is impracticable to draw any arbitrary lines between products commonly classed as fruits and those classed as vegetables. The tomato is a fruit, but the tomato grower may be either a trucker or a vegetable gardener. He would not be classed as a pomologist or a fruit grower. In America fruit growing embraces the production of fruits like the apple, pear, peach, plum, apricot, quince, orange, lemon, and a considerable number of products from trees, vines, bushes, and even soft wooded plants like the strawberry, banana and papaya. Fruit growing as a whole has been more highly developed commercially in America than in any other country. The last decade has shown progress in the standardization of methods and practices. A striking feature of the past 20 years' development in fruit growing, especially with the apple, has been the demonstration of the fact that the more successful operators are those who live with their trees, who work with them and know them, and that orcharding by proxy through corporations or syndicates is in large measure a failure. In the necessary keen competition that exists in the production of a high-grade fruit like the apple, the limiting

factors are of such a nature that their recognition and control cannot be syndicated or reduced to mathematical formulæ so that an individual may expand his activities indefinitely. An apple grower who owns his orchard of 40 to 60 acres, who knows his trees and lives with them may be highly successful, but if he attempts to expand his activities and oversee several hundred acres, the chances are that he may fail or else become a mediocre grower. In the light of developments during the past 20 years, we may, therefore, look forward to commercial fruit growing as more or less of an industry preëminently suited to individual effort so far as production is concerned. The handling and marketing, however, are matters that lend themselves to organization, but of these points we shall speak later.

The latest available figures indicate that the total value of fruits produced in the United States is somewhere around \$250,000,000 to \$300,000,000 annually. The deciduous tree fruits like the apple, pear, peach, plum, apricot and quince represent at least two-thirds of the total value of all fruits. Quoting the available figures in percentages, deciduous tree fruits represent about 65 per cent of the total value, citrous fruits 10 per cent, grapes 10 per cent, small fruits 14 per cent, miscellaneous fruits (mostly subtropical) 1 per cent. The apple leads in quantity and value of fruits grown. It also leads in distribution and may without question be characterized as the most important fruit in the United States. More than one-half of the farms in the United States, of which there are now nearly 6,500,000, produce apples. The quantity of fruit produced is quite variable, running all the way from 125,000,000 to 225,000,000 bushels a year. The last census figures give the number of bearing trees as 151,322,340 and the yield as 146,122,318 bushels. About 500 different varieties of apples are reported as being offered by nurserymen for planting. Of these, however, 30 to 35 varieties constitute the chief source of this valuable fruit. About one-fourth of all the apples grown in this country are of two varieties—namely, Baldwin and Ben Davis. The principal apple-growing States in the order of quantity produced and value of fruit are New York, Washington, Missouri and Pennsylvania. The great centres of apple production are to be found in southern Maine, southern Vermont, eastern Massachusetts and Connecticut, western New York, western Pennsylvania, the Appalachian region of Virginia, West Virginia and North Carolina, southern and western Missouri, southern Michigan and western Washington and Oregon.

Next to the apple, the peach and nectarine rank in importance in deciduous fruits. Production is variable, ranging from 15,000,000 to 65,000,000 bushels annually. Except in the State of California, the peach, probably more than any other tree fruit, is subject to the vicissitudes of climate. The trees in even the most favored regions are subject to winterkilling. If they survive the winter, the crops may be greatly curtailed or entirely destroyed by late spring frosts. Most of our valuable varieties of peaches owe their parentage to natives of warm climates. The peach, therefore, is prone to respond quickly to a few warm, sunny days,

only to be injured when severe cold follows, as is likely to be the case in many parts of our country. The principal peach producing States are California, Georgia, Mississippi, Texas, New York, Pennsylvania, Ohio, Arkansas and Missouri, in about the order named. The yield of peaches, as given for the last census year (1909), was in round numbers 35,000,000 bushels. The estimated yield for 1915, a banner year, was 64,000,000 bushels. The estimated yield for 1917 was in round numbers 45,000,000 bushels. Certain regions in the States named have become more or less centres of intensive peach production. Such regions are to be found along the southern shore of Lake Ontario in New York State, on the eastern shore of Lake Michigan in the southern Michigan Peninsula, in central and northern Georgia, eastern Texas, western Arkansas and the lower part of the Sacramento Valley in California.

Plums and prunes are pretty widely grown over the whole United States east of the Mississippi River. California, Oregon and Washington, however, are the great centres of production, especially of the prune. The quantity of these fruits produced is between 15,000,000 and 20,000,000 bushels a year, of which California produces at least one-third.

The pear constitutes an important crop. Its production is more stable than the peach and to a certain extent pear growing as an industry may be regarded as less risky than peach growing. The limiting factor in pear growing is fire blight, a disease which destroys many thousands of trees annually, and which has brought about the need of a system of continuous planting in order to keep the orchards intact. The annual production of pears during the last 10 years is close to 11,000,000 bushels. California is the leading pear-growing State, with New York a close second. Oregon and Washington are also large producers of this fruit. The latest available figures, which are estimates for 1916, give the yield of pears in California as 3,124,000 bushels; Washington, 551,000 bushels; Oregon, 555,000 bushels, and New York, 1,675,000 bushels. The estimated yield of pears for the whole of the United States for 1917 is 13,281,000 bushels, valued at \$15,379,000, or an average of \$1.15 per bushel.

The production of cherries may be regarded as a minor fruit industry in this country. California ranks first in quantity produced, with Pennsylvania second. Grape growing is pretty widely disseminated, although the large commercial plantings are centred in certain regions, principally in California and New York. The annual value of the grape output of the country is in round numbers about \$23,000,000. California produces between 70 and 75 per cent of the total crop. The State of New York is second in production, with something like 250,000,000 pounds to her credit. Michigan is third, with 121,000,000 pounds.

Citrus growing, especially the orange and grapefruit, has become one of the most highly organized intensive horticultural industries in this country. The latest estimated figures as to the quantity of oranges produced give 12,282,000 boxes for 1917. The production in 1916 is estimated at 24,433,000 boxes, valued at \$61,463,000. According to the latest census figures (1909), there were produced in

the United States 19,487,000 boxes of oranges, 2,770,000 boxes of lemons and 1,189,000 boxes of grapefruit. About 75 per cent of the oranges were grown in California and 25 per cent in Florida. The grapefruit industry is practically confined to Florida, while lemon growing is confined almost entirely to California.

Of the small fruits produced in the United States, those leading are the strawberry and the raspberry. According to the census figures, the total production of strawberries in the United States was 256,000,000 quarts. Maryland is the leading strawberry producing State, with New Jersey second.

Fruit growing may be commercial or non-commercial, with varying intermediate types involving features of both. Commercial fruit growing has to do with all those matters of location and sites for orchards, securing of young trees, planting, cultivating, pruning, spraying and harvesting of the fruit. In keen competition all of these matters become important, some, of course, more important than others. The successful commercial fruit growers are those who are able by good judgment and foresight to bring about conditions most favorable to the production of the particular fruit in which they are interested. Many men go into the business who are not fitted for it and who do not have the proper conception of the knowledge required to be successful. It is quite remarkable that many men who have been successful in some manufacturing or similar commercial enterprise as a result of long study and experience should become possessed of the idea that they can embark in fruit growing and make a success of it without knowing much about the subject. It must be borne in mind that orcharding is a business that cannot be learned in a month, or a year or a series of years. There are a good many people who can never learn it. There is always room for the right man in this work. Given the right man and one who knows or can learn the methods, and success is assured.

As a business, fruit growing is more profitable than farming, but the risks are greater. The element of risk has its fascination, but unless one is temperamentally suited for this sort of thing, he had better occupy himself with some line of work less hazardous. A big money-making crop of fruit is usually the result of a combination of circumstances and conditions. Some of the conditions are not controllable. A good many of them are controllable. The grower must have patience and nerve, for he may go along for a number of years with nothing but expenses and hard labor to show for his efforts. If in discouragement he relaxes his efforts or his vigilance, if he decides for a year to omit proper fertilization, proper spraying, or cultivation, taking a chance, as it were, when the time comes for the big strike his trees will likely fail him. If the grower, on the other hand, has kept himself keyed up and has done the things he should have done, he may in one year make enough to pay a handsome profit on his own labor and his investments for a considerable period of years.

Within the past decade great progress has been made in the handling and marketing of fruit. Gradually the producers themselves are

assuming control of these matters and are thereby enabled to strengthen their business and increase their profits. Various associations, exchanges and other organizations have been developed for the purpose of standardizing the product, ensuring uniformity, a more equitable distribution, the avoidance of gluts, mutual help in transportation matters, and in the purchase of materials and supplies used in the final disposition of the fruit. Some organizations have entered the selling field so that the growers practically control the product from their own hands directly to the consumer. The citrus growers of California are more highly organized than any other fruit-growing group in the country. During the past 10 years the California Citrus Exchange has worked a revolution in the growing, handling and marketing of the orange crop of that State. The California Citrus Exchange is a leader in this field and has pioneered a way that has proved just and equitable to all concerned.

**Vegetable Growing.**—Vegetable growing may for convenience be considered under three heads: Market gardening, truck farming, home gardening.

Market gardening as a commercial enterprise has developed in this and other countries largely as a concomitant of the growth of large cities. The city must be fed, and as an important part of the food supply consists of fresh vegetables, it was but natural that the production of these vegetables should attract men of energy and foresight, with the result that a very important business has developed. As the cities grew, many of the market gardeners were forced to go further out into the country in order to find land sufficiently cheap to warrant its use for intensive cropping. Not an inconsiderable number of the earlier market gardeners who owned land within the city limits were able to realize handsomely on the land, for the increase in real estate values were rapid and great. The advent of the trolley car, the extension of good roads, the difficulties of securing sufficient quantities of stable manure in the city, especially from the street car companies, the coming of the automobile and the motor truck have all profoundly affected this business. Being an extremely intensive line of work, and as every foot of soil must be used and doubly used, the market gardener can afford to continue cropping his land even when values have reached several thousand dollars per acre. It is not unusual for a good market gardener to take from \$1,000 to \$2,000 worth of produce from an acre of land in the course of a year. This is accomplished, furthermore, without the aid of glass or other forcing equipment or forcing methods. The area handled by market gardeners is relatively small, running from two to three acres to as high as 50 to 60 acres in exceptional cases. It is not uncommon to find men who have brought up their families, educated their children and put away something for the future on three or four acres of land devoted to market gardening. Handled properly, land devoted to market gardening should give a net profit of from \$300 to \$700 a year per acre.

The use of glass in forcing vegetable crops greatly intensifies the work. Some market gardeners use nothing but glass, either as greenhouses or frames or both. The principal

crops forced under glass are lettuce, cucumbers, tomatoes and radishes. A considerable number of other crops are also forced, but the fore-named are the leaders. Handled properly, glass houses may be made to yield a gross return of from 30 to 50 cents per square foot of bed space covered. The average will probably be somewhere from 30 to 40 cents per square foot. There are many acres of glass devoted to this work in the vicinity of our large cities, especially Boston, New York and Chicago. No late figures are available as to the extent of the industry. It would appear from the data at hand that from 60,000,000 to 75,000,000 square feet of glass would fairly represent the extent of this industry. Probably two-thirds of this glass is in well-constructed houses, the remainder being in cold frames and hotbed sash.

Truck growing as an industry is of comparatively recent origin. Little was heard or known of truck growing prior to the Civil War. Improvements in transportation, and especially the wider use of the refrigerator car, and the better organization of marketing and selling agencies have tended to greatly enlarge the scope of this work. Moreover, the people of the country, even in the remote villages, have been educated to the use of fresh vegetables in winter. Improved transportation facilities have made it practicable to deliver these fresh vegetables at nearly all seasons of the year. Truck growing has for its primary object the production of large quantities of certain standard vegetable crops, such as cabbage, kale, spinach, potatoes, sweet potatoes, green beans, tomatoes, eggplant and lettuce. The principal trucking regions are to be found near the seaboard in southern New Jersey, Delaware and Virginia, especially the vicinity of Norfolk, the eastern coast of North Carolina, South Carolina and the coastal plain sections through Georgia and Florida. A large trucking area is also to be found in the Gulf States, especially in southern Alabama, Mississippi, Louisiana and Texas. Considerable development in truck growing has come about in the interior of some of the Southern States, notably Kentucky and Oklahoma. Trucking is also developing considerable importance in the Western States, including parts of New Mexico, Arizona, Nevada and California. No authentic figures as to the extent of truck growing are available since those published in 1909. There have been rapid changes since that time. On the eastern shore of Maryland and Virginia the increase in potato growing has been very great, owing in part to the perfection of an efficient, organized plan of assembling, growing, handling and marketing the product. Reliable estimates would indicate that the increase is over 2,000 per cent since the last census was taken. The increase in the Norfolk, Va., section has also been large, aggregating 40 per cent or more for all truck crops. A striking example of the growth of a special truck industry is found in early Irish-potato growing in Florida. From a small area of something like 1,200 acres planted in 1900, the land devoted to this crop had increased to 16,000 acres in 1915. Florida, with its light, sandy, warm soil, its relatively warm winter climate and its excellent transportation facilities by land and water to the markets of the North is preeminently suited to truck farming. The total area devoted to the vegetable indus-

try in Florida for the census year 1909 was 67,442 acres. In 1915 the estimated area was 99,162 acres, an increase of 47 per cent in six years. On account of the nearly universal demand and the ease of transportation and handling, lettuce constitutes one of the important trucking crops. Florida leads as a lettuce-producing State, the land planted being in the neighborhood of 5,000 acres. An acre of lettuce will yield from 30,000 to 40,000 salable heads, so that the annual output of lettuce from Florida alone is somewhere near 200,000,000 heads.

The production of green vegetables for canneries may be considered as a feature of truck growing. The field requirements for the production of the different crops are similar and the methods followed are for the most part the same. Sweet corn, tomatoes and peas are the principal crops grown. The latest figures indicate the land devoted to these crops for canning as being nearly 450,000 acres. Sweet corn leads with nearly 200,000 acres, tomatoes follow with something like 150,000 acres, and peas show approximately 100,000 acres. From a dozen to 14 different kinds of vegetables are grown in considerable quantities for canning purposes. All of these are grown under the best trucking conditions and in accordance with up-to-date trucking methods.

The home vegetable garden as a feature of horticultural activity has come to be recognized as an important adjunct to our national system of food supply. This is especially true since the great increase in the demand for food as a result of the World War. The home vegetable garden has unquestionably played an important part in producing wholesome and valuable foods for the home. The great interest aroused in this work owing to abnormal conditions is likely to continue even when matters assume their normal state. As countries grow older and more thickly populated, there develops on the part of the people a love for working in the ground. It is found that these activities satisfy a natural craving for creative and productive work, making for contentment, health, happiness and the prolongation of life.

**Floriculture.**—The growing of flowers or ornamental plants as a commercial industry has come to be an important one during the past two decades. The greater part of this work is done under glass and the business now reaches into millions of dollars annually. The great centres of flower production are near the large cities. There are now between 10,000 and 12,000 establishments in this country engaged in floriculture, with an annual output of \$35,000,000 to \$40,000,000. The States leading in the production of flowers are New York, Pennsylvania, Illinois, New Jersey and Massachusetts in the order named. Census figures show 114,655,276 square feet in glass houses in the United States. There is also reported 9,489,556 square feet in sashes and frames. In the earlier days of floriculture in this country the business was general—that is, a miscellaneous assortment of plants for bedding and home adornment were grown, together with plants for cut flowers. Gradually specialization developed, with the result that there are now rose specialists, carnation specialists, violet specialists and other specialists. Rose growing under glass from the standpoint of money in-

vested and annual returns is probably the most important floricultural industry. The growing of the carnation is a close second, with the violet third. Rose growing and carnation growing have developed to a marked degree near certain points. Climate and soil do not seem to have had very much influence in bringing about these centres of industry in the growing of roses and carnations, except that the most successful establishments are to be found in the more northern portions of the country. The changeable climate of the Southern States is not suited for the forcing of these crops under glass. With the violet, however, climate seems to play a more important part in the success of the industry. Somewhat uniformly cold weather during the winter months, accompanied by a maximum of sunlight, gives the best conditions for the production of the violet. The production of bedding plants and ornamentals for outside planting constitutes an important phase of the industry. The forcing of a long list of specialties for the Easter and holiday trade should also be noted. Lilies of various kinds, numerous hard wooded plants, tulips, hyacinths, narcissus, and other bulbous stock are now forced in large quantities. A great deal of the stock is grown abroad and is imported by the florist for purposes of forcing.

A feature of floriculture is the business enterprise shown in the maintenance of beautiful stores and shops in nearly all of our cities. Most of these establishments grow some or nearly all of the flowers and plants they sell. A valuable educational feature of the work of the various flower stores is to be found in the constantly changing beautiful window displays. The florists are well organized nationally and locally. Some of the more important national organizations are "The Society of American Florists and Ornamental Horticulturists," "The American Rose Society" and "The American Carnation Society." The mechanical improvements and developments in the construction of forcing houses have been marked during the past decade. In the early days the houses for the most part were low, relatively small, and constructed of wood in such fashion that plants were subjected to rather unfavorable conditions, especially during the winter months. More recently, iron and steel have come to be used quite generally in the construction of much larger and better lighted houses, all well ventilated and heated. Many of these houses are of large size, sometimes covering acres of ground. The construction of glass houses and the utilization of glass houses for the growing and forcing of plants has advanced more rapidly in this country than in any other country of the world.

**Landscape Art.**—Landscape art or landscape gardening is the development or creation of landscape pictures through the proper and artistic use of plants, roadways, walks, drives, water courses, lakes, etc. In a broad sense the term landscape architecture is sometimes used. This term, however, applies to matters outside the realm of horticulture, hence does not concern us here. Landscape gardening involves not only a knowledge of how to use plants in the development of beautiful and artistic landscape effects, but it also involves broad horticultural knowledge regarding plant growing, propagation, plant habits, hardiness, tenderness,

etc. Landscape gardening may be natural or formal, or it may be of many intermediate forms between these two styles. The tendency in America, as in England, is in the direction of the natural form in landscape work—that is, to make a beautiful natural picture, to bring into our dooryards or into our public or private parks, large or small, a bit of nature as we frequently see it in the woods or in the fields. Formal landscape work has its place, but it is limited. Even in cities where everything is formal, it is coming to be recognized that bits of natural scenery are appreciated by the people. A study of the history of landscape work shows that it has been profoundly influenced by the literature and thought of the people of the time. Japanese landscape designing, for example, is in a measure an expression of the soul of the people. To us much of their work may seem purposeless and meaningless, but probably nowhere in the world has so many meanings been put into an art as in the landscape art of Japan. Plants and flowers are not always necessary for landscape work in Japanese designs. Stones may be used to symbolize such ideas as peace, old age, contentment, etc. Japanese gardening has been introduced here and some fine examples of it are to be found in various parts of the country. Within recent years there has been a great awakening of the public, especially in the older and more thickly populated centres, in home beautification and community effort in civic improvement. The rapid growth of suburban villages, owing to better facilities for transportation, has made practicable an expression of the love for gardening in the adornment of the home lot, the village street and the village community centre. The nature study movement, the home improvement clubs, the civic centre clubs have all contributed to wider interest in landscape work. The advances in educational work in horticulture should be noted. The pedagogical value of horticulture, or a knowledge of plants, how they grow and live, has come to be recognized and is now applied in the elementary and secondary schools in many sections of the country. Horticulture is not taught with the object of turning the minds of the pupils especially toward plants and crops, but the subject is recognized as a means of awakening the mind, developing the observational powers and in other ways aiding in the physical, moral and mental growth of the pupils. The school garden work is gradually assuming an important rôle in educational effort. This is particularly true of rural schools, where theory and practice may be co-ordinated through classroom work with what has come to be called the home project. The pupil gets the basic ideas in the classroom and proceeds to apply them under the direction of the competent teacher in the carrying out of a definite piece of work like the care of an orchard, a vineyard or a garden in his or her own home. Through these activities the proper foundation is laid for broader work in the State agricultural colleges and universities. Nearly all the State universities and agricultural colleges now have well-organized departments of horticulture. A considerable number of the institutions have gone farther and have separated horticulture into the four classes discussed here. In these institutions these classes are recognized as

separate and distinct departments with separate and distinct courses of study. The increasing work of the State agricultural experiment stations has created a demand for trained men in horticulture, consequently the courses at nearly all the institutions are sought by young men and young women who recognize in the work a fine field for professional service as well as one where excellent training in the growing and selling of many horticultural products which the people demand may be secured for practical work on one's own place.

**Bibliography.**—The literature on horticulture is voluminous. The National Department of Agriculture, the State experiment stations and the State agricultural colleges are all turning out numerous bulletins and leaflets each year. There is scarcely a subject in the whole horticultural field that has not already been covered in the series of Farmers' Bulletins issued by the United States Department of Agriculture. The standard horticultural work is Bailey's 'Cyclopedia of Horticulture,' published in six volumes, with 3,639 pages and more than 4,000 illustrations. This valuable work was published 1900-02; new edition 1917. Special works are White, E. A., 'Principles of Floriculture'; Galloway, B. T., 'Commercial Violet Culture'; Wilkinson, A. E., 'The Apple'; Corbett, L. C., 'Garden Farming.'

BEVERLY T. GALLOWAY,

United States Department of Agriculture,  
Washington, D. C.

**HORTON, Robert Forman**, English Congregational clergyman and author: b. London, 18 Sept. 1855. He was educated at New College, Oxford, and in 1879 he was made a Fellow of New College, and lecturer on history. In 1880 he became pastor of Lyndhurst Road Congregational Church, Hampstead. In 1893 he delivered the Lyman Beecher lectures at Yale. His writings include 'History of the Romans' (1885); 'Inspiration and the Bible' (1887); 'The Teaching of Jesus' (1895); 'Women of the Old Testament' (1897); 'The Commandments of Jesus' (1898); 'England's Danger' (1898); 'The Pastoral Epistles' (1901); 'The Trinity' (1901); 'Reunion of English Christendom' (1904); 'Does the Cross Save?' (1905); 'The Law of Spiritual Power' (1906); 'The Holy Spirit' (1907); 'My Belief' (1908); 'Great Issues' (1910); 'The Hero of Heroes' (1911); 'Reconstruction' (1915); 'An Autobiography' (1917).

**HORTON, Samuel Dana**, American publicist: b. Pomeroy, Ohio, 16 Jan. 1844; d. Washington, D. C., 23 Feb. 1895. He was graduated from Harvard in 1864, and from the law school in 1868, and also studied abroad, especially in Berlin 1869 and 1870. He began the practise of law in Cincinnati, moving later to Pomeroy, but devoted himself mainly to the study of monetary questions, spending much time abroad; he was one of the first to advocate the establishment and maintenance of an international ratio between gold and silver. He was a recognized authority on all questions concerning coinage, was a delegate secretary of the American delegation to the international monetary conference at Paris in 1878, and a delegate from the United States at the conference of 1881; in 1889 he was again sent abroad by the President as a special commissioner; shortly

before his death he went to Washington at the request of the administration for a conference concerning the financial situation. His writings include 'Silver and Gold and their Relation to the Problem of Resumption' (Cincinnati 1876); 'The Silver Pound and England's Monetary Policy since the Restoration' (London 1887); 'The History of the Guinea' (London 1887); 'Silver in Europe' (New York 1890). He also assisted in editing the proceedings of the conference of 1878 (Washington 1879) to which there is attached a vast body of documents, etc., collected and selected by him as 'Historical Material for, and Contributions to the Study of Monetary Policy' (in Senate Executive Document No. 58, 45th Congress, 3d Session, Washington 1879). The 'Proceedings of the International Monetary Conference, etc., in Paris, April-July 1881' (Cincinnati 1881) contain a number of addresses, remarks, etc., made by him in his capacity as delegate. Consult Walker, F. A., 'S. D. Horton' (in *Economic Journal*, Vol. V, p. 304, London 1895).

**HORUS**, an Egyptian god or group of gods to all of which the falcon was sacred. The term is supposed to mean "the upper or superior one." Horus was patron of upper Egypt; was worshipped especially at Edfu and in time came to be the type of the king. See EGYPTIAN RELIGION AND SOCIOLOGY.

**HORVÁTH, hór'vát, Michael**, Hungarian clergyman and statesman: b. Szentes 1809; d. 1878. Although he was trained for the priesthood and was ordained (1830), he reacted against this work, and was appointed professor of Hungarian language and literature at Vienna. His learning and sincerity of purpose won for him the appointment of bishop of Csanád (1848), and, when Hungary declared its independence, Horváth became Minister of Public Education and Worship (1848). After the popular government lost its power he spent several years in continental travel, and returned to Hungary in 1867. He sat in Parliament in the Lower House, sympathizing with the Deák following. His historical works are of great importance. They include 'History of the Hungarians to 1823' (3d ed., 8 vols., Budapest 1873); 'Twenty-five Years of Hungarian History, 1823-48' (2d ed., 1868); 'History of the War of Independence in Hungary 1848-49' (2d ed., ib. 1872).

**HORWICH**, England, a town in Lancashire, four miles west-northwest of Bolton. The chief industries are railway works, coal mining, paper and cotton manufacture and stone quarrying. The town owns its water supply. Pop. 16,500.

**HOSANNA, hō-zán'na**, the cry of those who greeted Jesus on his last entry into Jerusalem (Matt. xxi, 9; Mark xi, 9; John xii, 13). The use of the word in different places has led to some disagreement of authorities as to its exact meaning. In Mark xi, 9 and John xii, 13, it stands alone; while in Matt. xxi, 9 and 15 it is followed by *τῷ υἱῷ Δαβὶδ*, "to the son of David"; and in Matt. xxi, 9 and Mark xi, 10 by *ἐν τοῖς ὑψίστοις*, "in the highest." Eminent critics regard it as derived from the Hebrew phrase meaning "save now." On the authority of the use of the word in the early Christian doxological literature (Didaché x, 6), and also on the

interpretations by Clement of Alexandria and Augustine, it is generally assumed that the word was a form of joyous interjection, equivalent to the English "Hail!" Consult Dalman, 'Die Worte Jesu' (Vol. I, Leipzig 1898); and Schmidt, 'The Prophet of Nazareth' (2d ed., New York 1907).

**HOSEA**, hō-zē'ā, the first in order among the minor prophets of the Old Testament, but more probably the third in order of time. Nothing is known of his life, except what can be gathered from the introduction to his prophecies, namely, that he was the son of Beeri, and that his ministry belonged to the reigns of Uzziah, Jotham, Ahaz and Hezekiah, kings of Judah, beginning probably about the end of the reign of Jeroboam II, king of Israel. See **HOSEA**, **BOOK OF**.

**HOSEA**. A Hebrew prophet whose recorded ministry was slightly later than that of Amos, the first "writing prophet." Hosea was evidently, like Elijah, a citizen of the northern kingdom, to whom the king of Samaria was "our King," while Amos came from his home in Judah to preach in Israel. The first three chapters of the book of Hosea have as their historical background the closing years of the prosperous reign of Jeroboam II, which ended about 740 B.C. Chapters iv-xiv carry us into the first years of the period of anarchy that followed Jeroboam's death. The second part of the heading of the book—in the reign of Jeroboam the son of Joash—probably belonged to the original title of chapters i-iii, while the first part of the heading naming a series of Judean kings may have been added by a later editor in the southern kingdom, who knew that Hosea's ministry continued after the death of Jeroboam. Hosea's personal life was a tragedy; his wife, whom he loved with deep devotion, proved to be a wanton who left him for her lovers. At last, deserted of these, she fell into slavery and then her husband bought her back to protect her. Though he could not receive her now into the fellowship of a wife, he himself would marry no other. Out of such bitter experience as this, Hosea learned the great lesson of Divine love which he was the first to frame in human speech.

As a literary whole, the book is clearly divided into two main sections, corresponding to the two different periods of Hosea's ministry. (1) Chapters i-iii, Hosea's love and Gomer's faithlessness, an allegory of Jehovah and Israel, his faithless wife. (2) Chapters iv-xiv, a series of discourses on Israel's guilt and punishment, with glimpses of Jehovah's unchanging love and readiness to restore after purification.

The great question of debate in connection with this book has been the true character of chapters i-iii; do these reflect Hosea's actual experiences or are they pure allegory? The great difficulty in the way of literal interpretation has been that Hosea seems to say that he received Divine command to marry a woman who was a profligate. When it is recognized that the Hebrew prophets are wont to interpret God's guidance in the light of later experience and, in their vivid mode of speech, to style this guidance through experience as the command of God, the difficulty disappears. The succession of names given Gomer's children accords

with the view that it was slowly through the years that the conviction of his wife's character was forced upon Hosea's mind. This interpretation fits, too, with the thought of the latter part of the book that Jehovah had betrothed Israel to himself as a pure bride and that afterward she proved untrue. The prevalent view to-day is accordingly that Hosea married one whom he supposed to be pure. To his first child he gave the name Jezreel as a prediction that Jehu's bloody work in the valley of Jezreel must be avenged upon his dynasty. As time went on and other children were born, he came to know that his wife was indifferent to him and sought other lovers. The names of the later children contain suggestion of their mother's faithlessness. In his own bitter sorrow, Hosea came to see and understand something of the sorrow of Jehovah's heart for a people blind to his loving care, who turned away unto other gods.

In the second part of the book, this blindness, ignorance of God, is the explanation of the complete dissolution of society that followed so quickly upon Jeroboam's death. The king's son reigned but six months and was then struck down by an assassin; a month later the murderer met a similar fate. Drunkenness and all debauchery characterized the upstart monarchs who in their political weakness turned now to Egypt and now to Assyria for support. In the land there was not truth nor knowledge of God; naught but swearing, lying, killing, stealing and adultery. Again and again the prophet returns to the root of the nation's troubles, that they know not Jehovah; their sacrifices are not acceptable because they have forgotten their Maker. In Hosea's time, the licentious symbols and rites of Canaanite Baal worship were still mingled with the worship of Jehovah, whose distinctive character was not understood. Through all that is hopeless in the second section of the book there runs also the deep current of conviction that Jehovah's love is unchangeable and that he cannot give up his people to irreparable doom, despite their sensual blindness. The prophet's thought swings between hope and doom as he contemplates now the brutishness of the people and now the unchanging heart of God. His experience of life has been too deep to permit him to fall into the childish error of supposing that the Divine love can obliterate sin and its effects where there is no answering love and penitence. He knows that there must be long and desolate expiation before there can be any future of hope for his nation. Hosea's ethical teaching corresponds with his conception of God. With him kindness is Jehovah's supreme demand for man's conduct toward man; but again he does not fall into the error of supposing that a sentimental kindness can supersede the claims of justice.

As poet and preacher, Hosea combines deepest insight with compelling emotion and a picturesqueness of speech that has rarely been surpassed in any age or nation. The influence of the rounded hills and broader, more fertile valleys of Samaria are felt in his pages, in contrast to the rugged wilderness reflected in the words of Amos. The luxuriant vine that putteth forth his fruit, the morning cloud and the dew that goeth early away are in pleasing contrast with the fierce and bloody pictures of man's deeds, and yet even these gentler aspects

of nature are made, in the prophet's speech, telling means of presenting man's weak and wanton ways. In his intense emotion, the prophet identifies himself now with God and now with the people in a way that gives dramatic power to his words. Although the opening chapters reflect actual experiences of Hosea and Gomer, they picture also God and Israel in such a manner as to give the elements of a true allegory. Later in the book (chapter xi) the characters change from husband and wife to cherishing father and wayward son; here Hosea gives us the first clear presentation of God as the loving father, but it is the father of the nation, not of the individual. The full revelation of the relation of God to the individual must wait deep and terrible experiences of national failure.

*Professor of Biblical Literature and History,  
Brown University.*

#### HOSIERY AND KNIT GOODS INDUSTRIES IN THE UNITED STATES.

Most of the history of the hosiery industry relates to inventions of knitting machinery. The first knitting machine, invented in 1589 by William Lee, an Englishman, knit a complete course at one operation. His machine had hooked, spring needles, which are still generally used. In Europe nearly all hosiery is knit on machines, the original type of which was patented in England by William Cotton, in 1864. These machines have flat frames and spring needles. The leg is knit on a legger, usually of 18 sections, each section knitting one stocking, and the foot on a footer, usually of 20 sections. The fabric is knit flat, varying in width to fit the slopes of the foot and leg. On the top of ladies' stockings is knit a welt. The toe and heel are closed by a looping machine, the sole and back of the leg by a sewing machine. The product is called full-fashioned hosiery.

A circular machine, invented by Decroix, in France, in 1798, did not come into general use. A latch needle was invented in 1847, by Matthew Townsend, of England, who died in America. Many knitting machine inventions have been made by Americans, and this is true especially as to machines for knitting seamless hosiery. Such a machine was patented, in 1860, by William Goddard, of New York; and im-

proved machines, largely automatic, were introduced, in 1889, by Branson & Son, of Philadelphia. Seamless hosiery is produced by latch needles on small, circular machines, which revolve with great rapidity. The finest quality is knit on machines with  $2\frac{1}{2}$  needles to the inch, making that many stitches per inch. The ribbed part of half-hose and children's socks, full-fashioned or seamless, is knit on a ribbing machine, and then transferred to the machine which completes the knitting process. Sewing machines close the toe and make the welt of seamless hosiery. With seamless machines hosiery is knit which, shaped to some extent by loose or tight tension, does not conform so closely to the ankle and leg as full-fashioned hosiery, but the cost of production is considerably less. One skilled man and a boy attend two full-fashioning leggers or one footer, while one comparatively unskilled operator attends as many as 15 to 20 machines knitting plain seamless hose for ladies. The quantity produced is much greater per operative on seamless machines than on full-fashioning machines. The operatives in mills manufacturing both hosiery and other knit goods are mostly women; operatives on full-fashioning machines are men exclusively, and on seamless machines women.

Inventions have made seamless machines more and more automatic. By 1910 there were in use machines that had five or six self-acting yarn changes, by which it became possible to insert a finer yarn on the top of the foot, in the instep and on the lower part of the leg than in other portions of the fabric, to insert heavy strong yarn in the toe and heel and to reinforce them, also to make horizontal stripes. With these machines silk or artificial silk can be plaited on cotton, and an anti-run back course knit to prevent raveling from garter tears. By a new invention, the welt is knit on seamless hose; by another, seamless half-hose, including the ribbed part, is knit on one machine; by another, perfectly fashioned seamless hosiery, with closed toe, is knit on a machine, which is neither flat nor circular, but more like the former type; all of these being recent American inventions, which, on account of restricted patent rights, are not yet in general use.

While hosiery manufactured in Europe is nearly all full-fashioned, some circular machines for knitting seamless hosiery were exported from America to European countries before the European War began in 1914, some even to Germany, until then the largest hosiery manufacturing country in the world, and some to Japan and China. While the domestic product is mostly seamless, the desire of well-to-do Americans for the best fitting hosiery has led in recent years to a great increase in the domestic production of the full-fashioned kind, especially in silk. The full-fashioned product has been knit on flat machines of the Cotton type, most of which were imported from Germany, the remainder from England. In 1898 or earlier, however, full-fashioned machines of American invention were used in the United States. Such machines are simpler than those made abroad.

About 1850 the Bailey Company, at Cohoes, N. Y., began to use a power knitting machine for underwear, the first in this country. It was a circular spring-needle machine, and produced flat goods, that is, a flat-effect fabric. About

1858, Cooper & Tiffany patented in the United States a spring-needle machine for making ribbed underwear. By 1882 flat underwear had been largely displaced by ribbed underwear. Before that year ribbed underwear was produced by latch-needle machines of Philadelphia make. Spring-needle machines are used for the finer goods, but with latch-needle machines the production is greater at lower cost. To a small extent full-fashioned underwear is made in this country on flat machines of the Cotton type, but practically all is knit on circular machines that make a tubular fabric, which, when laid out, forms a continuous piece of goods of double thickness. After the fabric is cut into parts for garments, shirt cuffs, drawer bottoms and rib tails, knit on flat or circular ribbing machines, are attached by a looping machine, and the parts are seamed by sewing machines.

Fabrics for knit underwear are now knit flat, ribbed, fleeced, balbriggan or mesh. Ribbed underwear is much more generally used than the other kinds. The fleeced fabric is napped by sharp-pointed needles on a napping machine. Balbriggan is made of hard twisted yarn, of Egyptian cotton in the finer goods, and of yarn stained to resemble Egyptian for cheaper varieties. About 1910 there were important changes in the underwear industry. Many people began to wear underwear knit of cotton instead of wool because they believed the former was sufficient protection against cold and more healthful. For summer wear, mesh fabrics began to supplant balbriggans. Sleeveless shirts and knee-length drawers came into vogue. Union suits began to displace two piece suits. The knit underwear industry was affected also by the introduction of underwear made from woven material.

Statistics of manufacturing industries, collected in 1810, show that the value of hosiery produced then in the United States was \$572,742. Hosiery manufacturing then was strictly a household industry, and before 1850 hosiery was chiefly the product of knitting needles plied by hand. Census statistics of the hosiery and other knit goods industries combined, first shown for 1849, appear in the accompanying table.

815; wool, \$2,490,815; merino, \$6,706,102; silk, \$886,248; silk-mixed, \$393,618; all other, \$501,436. Total underwear, \$93,119,085. Bathing suits, \$2,033,889; gloves and mittens, \$10,519,613; hoods, scaris, etc., \$3,456,326; cardigan jackets, sweaters, etc., \$26,195,002; all other products, \$25,490,398.

Hosiery and other knit goods were manufactured in 34 States in 1914, and the value of the product in New York was \$78,299,235; in Pennsylvania, \$64,153,449; in Massachusetts, \$17,419,077; in Wisconsin, \$13,292,305; in North Carolina, Ohio, New Jersey, Tennessee, Illinois, Michigan and Connecticut each, between \$9,000,000 and \$5,000,000. The population of the United States, excluding outlying possessions, increased 21 per cent between 1900 and 1910, while between 1899 and 1909, the domestic production of hosiery and other knit goods increased in value 108.8 per cent. During the five years from 1909 to 1914, the increase in production exceeded 100 per cent in Tennessee, Minnesota and New Jersey, and was between 50 and 100 per cent in California, North Carolina, Wisconsin, Indiana and Georgia.

All imports of hosiery have been of the full-fashioned kind, and, under the Tariff Act of 1913, as well as under previous acts, most importations have been of the cheaper grades of stockings and of children's socks. The importations of cotton hosiery during the fiscal year ended 30 June 1914 amounted to \$2,949,678, or less than 5 per cent of the domestic production in 1914. The imports of underwear have been insignificant as compared with the domestic production; during the fiscal year 1914, the importations of cotton knit underwear amounted to \$341,973, or less than half of 1 per cent of the domestic production in 1914. Imports of woolen and silk hosiery and other knit goods have been very small. Before the war began in 1914, American seamless hosiery was exported to the United Kingdom in considerable quantities, to other European countries in smaller quantities, even to Germany, and to Canada, Mexico and South America. The exports of cotton hosiery and other knit goods increased from \$1,916,325 in the fiscal year 1909

The production of hosiery and knit goods in 1914 was \$258,912,903, in detail as follows: Hose—cotton, \$38,390,194; wool, \$2,548,047; merino, \$1,414,118; silk, \$13,851,251; silk-mixed, \$6,940,959. Half-hose—cotton, \$21,241,280; wool, \$1,327,439; merino, \$3,384,831; silk, \$4,701,969; silk-mixed, \$4,298,502. Total hosiery, \$98,098,590. Shirts and drawers—cotton, \$43,097,937; wool, \$3,448,575; merino, \$9,228,686; silk, \$1,214,609; silk-mixed, \$313,439; all other, \$219,805. Combination suits—cotton, \$25,617,-

to \$2,546,822 in the fiscal year 1914, or over 150 per cent. Since 1914 exports have increased enormously.

Reports by the undersigned on the hosiery and other knit goods industries, published by the Bureau of Foreign and Domestic Commerce, in 1915, contain a bibliography of both industries.

WALTER B. PALMER,

Formerly Special Agent, Bureau of Foreign and Domestic Commerce.

**HOSIUS** (hō'shī-ūs) **OF CORDOVA**, churchman of the 3d century: b. about 257; d. about 358. Sources concerning his life are limited to two letters, one to Emperor Constantine and one to Julius of Rome, and to allusions by contemporaries. He was probably made bishop about 295, holding the office until his death. He held steadfast in his faith and was not shaken by the persecutions under Maximian. It is not certain what part he played at the Synod of Elvira which he attended. For many years, Hosius was the intimate counsellor of Constantine in ecclesiastical matters, and was sent by him to Alexandria in 324 to settle the disagreements between the bishop there and Arius, and also concerning the celebration of the Easter holidays. Subsequently, Hosius attended the Council of Nicæa, at which he exerted great influence, though probably not in any official capacity. There is no doubt that Constantine's signature to the decrees of the council was gained by his religious adviser. The next record of Hosius finds him at the Council of Sardica (343), where, with Athanasius, he formulated the creed of the council. About 10 years later he was invited by the bishops of the court party to join them in condemning Athanasius. This the loyal Hosius refused to do, and accordingly lost prestige in the favor of Constantine. When he refused for the third time to conform to the Arian creed, he was summoned by the emperor to Sirmium, where he was kept practically prisoner for a year, and was finally forced against his will to sign a compromise document formulated by Arian adherents. His signature was widely advertised, and his so-called conversion to Arianism used as a weighty argument by the king's party. After this he was suffered to return to his office at Cordova. His letters are published in Migne, 'Patrologia Latina' (Vol. VIII). Consult Gams, P. B., 'Kirchengeschichte von Spanien' (Vols. II and III, Regensburg 1864-79).

**HOSLEY, Harry Hibbard**, American naval officer: b. about 1855; d. 1908. Upon graduation from the United States Naval Academy (1875) he entered the government naval service and became lieutenant (1889); lieutenant-commander (1899), and commander (1904). It was under his direction that the great dry dock *Dewey*, weighing some 11,000 tons, was hauled from Chesapeake Bay by way of the Mediterranean Sea, the Suez Canal and the Indian Ocean to Olongapo. The time spent in the journey was but seven months and 15 days, and the distance covered 13,080 miles. Hosley's last years were spent as supervisor of New York Harbor.

**HOSMER, hōz'mēr, Harriet G.**, American sculptor: b. Watertown, Mass., 9 Oct. 1830; d. 21 Feb. 1908. She became a modeler in clay, and after receiving a general education studied anatomy in a medical college at Saint Louis. Her first work, a reduced copy of Canova's Napoleon, was followed by an ideal head of Hesper (1852). She went to Rome in 1852 and studied under John Gibson, the English sculptor. About this period she produced ideal busts of Daphne and Medusa, and in 1855 completed her first life-size figure, Cenone. To the same year belongs Puck, which gained her a great reputation in the United States, and the next year she

executed a Will-o'-the-Wisp. The statue of Beatrice Cenci in the public library of Saint Louis was finished in 1857, and her colossal statue of Zenobia in 1859. Her next work was a statue of Benton, the Missouri statesman, a bronze cast of which was erected in Lafayette Park, Saint Louis. Other works are Sleeping Faun, exhibited at Dublin in 1865 and at Paris in 1867; a statue of the queen of Naples as the Heroine of Gaëta; a monument to Abraham Lincoln; and Waking Faun.

**HOSMER, James Kendall**, American librarian, biographer and author: b. Northfield, Mass., 29 Jan. 1834. After serving as a Unitarian minister at Deerfield, Mass., 1860-66, and as a private in the Civil War, he was a professor in Antioch College, Ohio, and the University of Missouri, in 1874-92 was professor of English and German literature in Washington University (Saint Louis, Mo.), and in 1892 became librarian of the public library of Minneapolis. Among his works are 'The Color Guard' (1864), a record of experiences as a private in the Civil War; 'The Thinking Bayonet' (1865), a novel; 'History of German Literature' (1879); 'Life of Samuel Adams' (1885); 'Life of Sir Henry Vane' (1888); 'A Short History of Anglo-Saxon Freedom' (1890); 'How Thankful was Bewitched' (1894); a 'Life of Thomas Hutchinson' (1896); 'A Short History of the Mississippi Valley' (1901); 'The Louisiana Purchase' (1902); 'The Civil War in America' (2 vols., 1912); 'The Last Leaf — Observations during 25 Years in America and Europe' (1912). He edited the *Journal of the Lewis and Clark Expedition* (1904) and for the American Historical Association the *Journal of Winthrop Ames* (1908). He was president of the American Library Association 1902-03.

**HOSPINIAN, Rudolf**, Swiss Reformed writer: b. canton of Zürich 1547; d. Zürich 11 March 1626. He studied at Marburg and Heidelberg and then returned to Zürich to preach and teach. He was head of the Karolinschule which was a part of the Great Minster from 1576-95. In the religious controversies of the time he championed the Reformed Church. His principal antagonists were Belarmine, on the Catholic side, and Hutten on the Lutheran. He was appointed archdeacon of the Great Minster at Zürich in 1588 and pastor of the Fraumünster Church in 1594. His collected works were published by Heideffer (7 vols., Geneva 1681). The most prominent of these was 'Historia Jesuitica' (1619).

**HOSPITALS, Field**. In the United States army, the director of field hospitals is, like the director of ambulance companies, immediately under the division surgeon and is the latter's executive in respect to the field hospitals of the division. His supervision over the field hospitals is similar to that exercised by the director of ambulance companies over those companies. He ordinarily accompanies the field hospital in advance on the march, remains with it in camp and keeps the division surgeon informed of his movements. He should maintain communication with the director of ambulance companies, to enable that officer to make suitable arrangements for the removal of patients from the front, and with the surgeon in charge of the sanitary column from the advance section to

promote the rapid evacuation of patients to the rear.<sup>113</sup>

The personnel of a field hospital at war strength are ordinarily assigned as follows: 1 major (commanding); 5 captains and lieutenants (1 adjutant and quartermaster, 4 ward surgeons); 3 sergeants first class (1 acting first sergeant in general supervision of the hospital and in charge of medical property and records, 1 in charge of transportation and quartermaster property and records, 1 in charge of mess supplies and cooking); 6 sergeants (1 in charge of the dispensary, 1 in charge of operating equipment, 1 in charge of patients' clothing and effects; 3 in charge of wards); 3 acting cooks; 55 privates first class and privates (46 attendants, 1 dispensary assistant, 1 artificer, 4 orderlies, 3 supernumeraries); and of the quartermaster corps, 1 sergeant (wagon master) and 7 privates (drivers).

The function of the field hospitals is to keep in touch with the combatant organizations and to provide shelter and such care and treatment as are practicable for the sick and wounded of the division who are brought in by the ambulance companies until the sanitary service of the line of communications takes charge of them. A field hospital can meet these requirements only when it is relieved so promptly by the sanitary units in the rear that its mobility is not interfered with. Prompt evacuation of the sick and wounded is necessary also to secure for them the facilities for treatment and the comforts which are available on the line of communications.

On the march and in temporary camps, however, the field hospitals are the nightly collecting points for the divisional sick and injured who are unable to continue the march, and provide for the care of such patients until they can be turned over to the medical service of the line of communications or to a local hospital or hospitals. The use of the field hospitals for this purpose should be carefully regulated by the division surgeon.

For service in combat, the locations of the field hospitals and the number to be opened will be determined by the division surgeon acting under the instruction of the division commander. The director of field hospitals will supervise their opening, giving the necessary orders therefor to the commanders of the field hospitals. He will report their opening to the division surgeon. It is desirable that they be centrally located and beyond the zone of conflict, which will usually necessitate placing them three or four miles in rear of the dressing stations.

On receipt of an order to open a field hospital the following departments are established: Dispensary, kitchen, receiving and forwarding, slightly wounded, seriously wounded, operating room and mortuary. All wounded arriving are received at the receiving and forwarding department, which is the administrative office of the hospital.

When no adequate provision is made for the evacuation of the sick and wounded and a field hospital becomes the nucleus around which a camp hospital is developed, it becomes an immobile unit, and, if the troops to which it is attached should move, another field hospital is required to accompany them. If by reason of retreat or otherwise a field hospital is required

to move before it can evacuate its patients, its commanding officer takes action similar to that prescribed for dressing stations in the like contingency.

Field hospital companies form part of the sanitary train and are set up, when conditions so warrant, three or four miles from the battle field. Their position must be one accessible both from the front and rear and where good water is available.

MAJOR EDWARD S. FARROW.

**HOSPITALS, History and Construction.**  
**History.**—Hospitals in the sense of institutions for the care of the ailing poor first occur in history as Christian foundations. Public hospitals are mentioned by no classical writer before the time of Christ, and no trace of one is to be found in the explorations. As Meyer-Steineg points out, Vitruvius, the Greek architectural authority, treats of every kind of public building, but not hospitals. Private hospitals were common enough among the Greeks, and many physicians set aside portions of their buildings for the care of patients. According to ancient Irish traditions (300 B.C.), hospitals of this kind were so common as to be the rule, and there were special Brehon laws regulating their ventilation and other conditions. In India there are some not very definite details with regard to hospitals for men and animals, even before the time of Christ. The only thing resembling our modern hospitals in ancient times were the *valetudinaria* for slaves, and the military lazarettos for wounded soldiers. These latter were supported by government funds. There were a number of health resorts, as at Cos and Epidaurus, but these were for the well-to-do and as in our time, were more frequented by neurotic patients than by the seriously ill.

With the advent of Christianity, there came a new development, and Christ's example in healing the sick made this one of the features of the early history of the Church. Saint Luke was a physician and emphasized this phase of Christ's work in his Gospel. Care for the ailing became a Christian tradition. A portion of the bishop's house in the primitive Church was set aside for the care of those who had no other shelter, and as Harnack notes, at times the bishop was a physician and gave medical attention to the ailing poor in them. Until the end of the persecutions, there could be no public hospitals, but Saint Zoticus is said to have built one at Constantinople during the reign of Constantine. A letter of Julian the Apostate (361) makes it clear that the Christians had many such institutions, for he insists that the old Imperial religion cannot be brought back without charitable institutions similar to those of the Christians, where all, regardless of faith, were cared for. Saint Basil established a hospital at Cæsarea in Cappadocia (369), which shows how seriously the duty of caring for the ill poor was taken. His foundation was outside the city proper and was so extensive that it was called "New Town." There were structures for different classes of the needy,—for children, for the old, and strangers as well as the ill, besides buildings for physicians and nurses, workshops for what we have learned to call reconstruction work, and even industrial schools and an employment bureau. Basil's example was followed very widely throughout

the East. In the West the earliest hospital foundation, according to Saint Jerome, was that of Fabiola at Rome about the end of the 4th century. With it was connected a system of visiting the sick, Fabiola herself organizing it. In the hospital work of Christians there was no distinction of creed, and its open-hearted charity deeply influenced the people of the time.

After this, hospital development continues uninterrupted. The Hôtel Dieu of Paris is said to have been founded in the 7th century, or perhaps the 6th. There is a record of a hospital in Spain at Augusta Emerita (modern Mérida) in 580. This was for the ill, "slave or free, Christian or Jew." Charlemagne (circa 800) decreed that there should be a hospital in connection with every cathedral and monastery.

During the Crusades, the hospitals of the Hospitallers of Saint John of Jerusalem accomplished an immense amount of good for the very large numbers of the Crusaders at long distances from their homes, in the East. Their hospital in Jerusalem is said to have accommodated 2,000 patients and became so famous for its successful effort to meet every need of the patients that according to an old legend, Saladin, the Sultan of the Saracens, went in disguise to the hospital as a patient to see for himself if it could possibly be true that so much was done for the patients there as he had heard. The hospital of Saint Mary Magdalene in Jerusalem was under the female branch of the Hospitallers which had another large hospital in the Holy Land and a number of branches in various parts of Europe to which the wounded and sick were sent to convalesce. These hospitals became famous for what they accomplished in times of emergency, famine, flood and epidemics, so that the institute would remind one in many ways of the Red Cross in the modern time. After some generations, when the Crusades were drawing to a close, the Hospitallers found it necessary to organize a military branch for the protection of pilgrims and of their convalescent patients on their way home. The word Knights was then added to Hospitallers as their title. This did not occur, however, until nearly a century and a half after they began their work. Both the men and women of the Order wore a rather striking costume with a white cross prominently displayed on the breast of it, so that they must have been conspicuous figures on the battlefield or near it, and there are traditions that both men and women in the Order served close to the lines. There was an immense outpouring of charity everywhere in Christian countries at this time, to enable these Orders to do their work, reminding the modern of our own successful organization of war activities. The resulting good example had much to do with the magnificent development of hospitals throughout Europe which occurred almost immediately after the end of the Crusades. With regard to this movement Virchow calls attention to all that the Popes did for hospital encouragement. He has words of highest praise for Pope Innocent III who did so much for the creation of an extensive hospital system in Christendom. The Pope wishing to have a model hospital in Rome, sent for Guy of Montpellier (circa 1200), who, he was told, had organized the greatest hospital of the time in

that city. Guy was commissioned to establish a model hospital in Rome and planned, the Santo Spirito in the Borgo not far from the Vatican which existed until our time. The Pope commended this hospital to bishops when they officially visited Rome, and recommended under conditions in which a recommendation was a virtual command, the establishment of similar institutions in their dioceses. As a result, nearly every town of 5,000 inhabitants or more in France, England, Italy, Spain and Germany came to have its public hospital in the course of the next 200 years. Virchow notes over 150 in Germany. Many of these hospitals were beautiful buildings, and not a few of them in the more populous centres were constructed so as to fulfil the most modern requirements. They were as a rule of single story, rather high, with windows well up in the walls to avoid draughts; with galleries for convalescent patients to sit in the sun and for nurses' observation, running along just below the windows; with tiled floors; with a kitchen in a separate building and surrounded by beautiful gardens. The hospital site was often fixed on a stream of water, sometimes an artificial islet being created which insured flowing water all around the hospital, for coolness and refuse disposal. Some of the hospitals in the cities in the Middle Ages were among the most beautiful of their public buildings architecturally and their interiors were decorated by the great painters and sculptors of the time. Some of these in a lofty spirit of charity gave their services for this purpose. Sometimes artists who had been patients painted pictures for the hospitals out of gratitude for their treatment. A noteworthy example is Saint Jean at Bruges, where Memling's paintings visited at a franc per person still give a revenue of thousands of dollars a year. Wards were often built cruciform with an altar at the crossing where Mass was said every morning which provided religious consolation for the patients' thoughts during the day. The windows were often of beautiful stained glass with figures or Bible stories on them which occupied patients' minds.

Hospitals began to run down with the suppression of the religious houses in many countries after the religious revolt in the 16th century. They became state institutions under paid officials and above all women were replaced by men in control of them. The rule of history is that whenever women are not at least co-ordinate in authority and not mere subordinates in the care of the ailing, the old and children, serious abuses soon creep in. The lowest period of decadence in the history of hospitals came during the later 17th, 18th, and the first half of the 19th century. Jacobsohn, in his 'Essays on the History of Care for the Ailing,' says "it is worthy of remark that attention to the well-being of the sick and improvements in hospitals and institutions generally, had a period of complete and lasting stagnation from the close of the Thirty Years War" (1648). He adds: "The hospitals of cities were like prisons, with bare, undecorated walls and little dark rooms, small windows where no sun could enter, and dismal wards where 50 or 100 patients were crowded together, deprived of all comforts and even of necessaries. In the municipal and state institutions of this period the

beautiful gardens, roomy halls and springs of water of the old cloister hospital of the Middle Ages were not heard of, still less the comforts of their friendly interiors." Garrison in his 'History of Medicine' says that "hospital construction approached perfection in the 15th century, the greatest care being devoted to these structures." He mentions that there were 27 hospitals in Scotland alone by the end of this century. Hospitals for special purposes had begun to be built before the end of the Middle Ages. The earliest of these were for children and particularly for foundlings, and their organization in the 13th century was very complete. The Ospedale degli Innocenti of Florence is still in existence after seven centuries, doing its work. The colony system for defective children had gradually come into existence several centuries before, at Gheel in Belgium and in certain towns of North France. The first special hospitals for the insane were erected in Spain. Pinel, the great French psychiatrist, who struck the manacles from the insane of France (circa 1795), declared Spain to be the country in which lunatics were treated with the most wisdom and the most humanity. Before the end of the Middle Ages, Bedlam or Bethlehem Hospital in London received the insane, for Tyndale uses the word as meaning a mad-house or a madman. On recovering their reason, patients were allowed to go out of this hospital (the open-door system) wearing a badge to indicate that they had been for some time in the asylum. This index of their previous condition made people so kind to them that special provisions had to be made to keep tramps and other "sturdy vagrants" from wearing these badges and abusing the confidence of the public. The first special hospital for eye diseases in America came about 1820. The first nose and throat hospital in the world was organized in New York about 1870. Orthopedic hospitals for the special treatment of crippled children came about the same time.

The modern hospital revival began well after the middle of the 19th century, and indeed did not make itself felt to any serious extent until after Lister's discoveries led to the development of modern surgery. Three things, good hospitals, good nursing, and good surgery, are inseparably bound together. During the period of fine hospital construction in the later Middle Ages, there was an excellent development of surgery and of nursing. Strange as it may seem, for several centuries at this time, serious operations were performed under an anæsthetic and surgeons boasted of getting union by first intention. They used linen soaked in strong wine as primary dressings for their wounds and this acted as an antiseptic. These mediæval surgeons declared that it was not necessary to have pus in wounds, but that on the contrary the presence of pus was an index of negligence of the surgeon. Unfortunately, this teaching went out, to be followed, for some five centuries, by the doctrine of laudable pus. As a result, hospitals became surgically unclean, and infections multiplied to such an extent that surgeons feared to operate. Before Lister's time, a mortality of over 50 per cent of operative cases was not unusual in hospital experience. After Lister, the necessity of absolutely clean hospitals came to be appreciated and hospital construction has

been largely influenced by the necessity of avoiding infection to as great an extent as possible. Practically all the developments in hospital building in recent years are made with an eye single to facilitating such care of patients as will prevent their becoming infected or communicating any infection to other patients or leaving anything after them that might prove a source of danger to subsequent inmates.

**Construction.**—The old-fashioned method of building hospitals came to an end when under the initiative of Dr. John S. Billings, Assistant Surgeon-General and Librarian of the Surgeon General's Library, special studies were made for the erection of the Johns Hopkins Hospital in Baltimore (1875). After this, much less attention was paid to the outside of hospital buildings, and the inside became the subject of intensive study so as to be adapted to various purposes of hospital work. Questions of ventilation, of floor space and of arrangements for the convenience of patients and physicians, with the proper segregation of infectious cases medical and surgical, and the provision of convenient rooms for laboratories and dietetic equipment, were now the main purpose of hospital architects. A new school of hospital architecture arose and America came to be the centre of world attention in hospital construction. Appropriate rooms were supplied for the hospital resident staff who, as late as the 1860's, were often crowded into a single room, four, six, or even eight together, sometimes with no other place for study or relaxation. This sadly interfered with their work and its usefulness for themselves and the patients. With the coming of the trained nurse, fitting quarters had to be provided for her, and training schools gradually added, because it was found that it was through them that hospitals could best secure this valuable adjunct. Once these principles were clear, the erection of hospitals excellently adapted to the needs of modern medicine and surgery went on apace here in America, until now there are altogether some 5,000 hospitals in the country. Many large industrial corporations have met the problem of caring for the injured among their workmen in special hospitals where the nursing and medical and surgical attention is supplied by the employers. Some not using heavy machinery provide a physician and nurse in attendance during the day in special hospital quarters, because it has been shown that in this way the health of working people, particularly women, can be better conserved and absence due to sickness with consequent reduction in commercial efficiency greatly lessened. These hospital quarters are often built with every modern detail and are models of their kind.

The features of modern hospitals that are most important are the reception rooms and the operating rooms. The reception rooms should provide a special apartment for emergency operating and all the patient's outdoor clothes should be removed there, transferred immediately to a sterilizing room and then placed in lockers to be kept until the patient needs them on exit. Except in emergency surgical cases where there is shock, the patient is thoroughly bathed before being dressed in the regular hospital garments and then transferred to the ward. Private patients are taken directly

to their room and cared for on similar principles.

The heart of the modern hospital is the operating room. The supreme idea in the construction of this is cleanliness, though light is a very important secondary consideration. If possible it is built with a northern exposure on the top floor of the hospital both for light and air, as well as that in this situation only those approach it who have business there. It is thus less exposed to the infections that might be brought in from outside. The perfection of artificial light in our day has made the natural lighting problem of ever so much less significance than it was and has facilitated emergency operations at night, even in the receiving ward on the lowest floor, when time is vital. For the sake of surgical cleanliness, the operating room is floored with tile, and the walls for some distance up are made of the same material or of some very hard cement coated with enamel paint that can be thoroughly washed. If there are places for students, these are of limited extent, are made of polished artificial stone or other unabsorbent material with metal railings and usually furnish only standing space. The old surgical amphitheatres built of wood, whose central arenas after a time must have been quite impossible to clean surgically, are a thing of the past. Where they are still used, it is only because of the necessity of teaching large numbers of students and then only for already infected cases. Operating tables have become elaborate apparatus, making it possible to put the patient in any position required, and yet so constructed of polished metal, commonly nicked, that surgical cleanliness is facilitated.

The operating room is connected with a series of rooms for the sterilization and storage of dressings, for the anæsthetizing of patients, which is no longer done in the operating room as before; for the transfer of soiled dressings, and other such material, so as to be sure that the sterilizing room will be saved from all contact with possibly infected matters, and sometimes with temporary rooms for the treatment of shock after the operation, so that patients may not have to be moved far, nor subjected to the almost inevitable draughts of corridors and elevators during removal after the operation, until the reaction has begun. The improvement of the elevator has greatly facilitated hospital work and the ready removal of patients, making the presence of the operating rooms on the top floor in the warmest part of the hospital possible. Wheel carriages of various kinds add to these facilities so that there is very little of that disturbance in moving patients which was almost inevitable under older conditions.

In the operating room itself, all water connections are so arranged that they can be turned off and on either by the foot or knee, so that there is never any need for the surgeon or his assistants to touch any object with the hand when once cleansed for operations. Instrument cases, if placed in operating rooms, are now made entirely of glass and metal, though preferably there is a special instrument room. Tables on which instruments and dressings are placed are made of metal and glass, the metal usually finished with white enamel paint, easily cleaned, revealing the slightest trace of dirt.

As an additional precaution the operating, dressing, and instrument tables are covered with sterilized materials just before the operation. These are changed between all successive operations. All these apparatus are mounted on casters usually of metal or porcelain so as to facilitate necessary movement by simple touch without the necessity of lifting.

The hospital kitchen has grown greatly in importance, and then there are special diet rooms and apparatus for keeping things warm on each floor or with each ward. These are not directly connected with wards, but open out upon the corridor. The development of bathing arrangements in recent years, private baths in connection with many of the private rooms, and a number of baths for ward patients is another important advance of modern times. Corridors of the hospital are usually in slate or tiling with rounded joints to facilitate washing at the angles, though artificial stone floors of various kinds have recently been used for this. These are hard on the feet of nurses, hence the use of compressed cork which is now coming in.

Ventilation is one of the most important requirements for good hospital work. To secure this, patients must have a definite amount of air space. It has been decided by experts that the minimum square feet of floor space and of cubic feet of air for each patient must, according to age, be in accordance with the following table:

MINIMUM SQUARE FEET OF FLOOR SPACE.			
	Adults	Children	Babies
In private rooms.....	90	75	35
In wards.....	80	65	45

MINIMUM CUBIC FEET OF AIR SPACE.			
	Adults	Children	Babies
In private rooms.....	900	675	300
In wards.....	800	600	400

Experience has shown that in wards there should be at least eight feet from centre to centre of beds. If there are two rows of beds in the ward, then the ward must be at least 24 feet wide, for the beds should not be placed nearer than 1½ feet from the wall. The beds themselves should be 6½ feet long, with 8 feet of corridor space between them.

Another feature of the modern hospital in which there has been reversion to old time hospitals is in the arrangement of the gardens. Mediæval hospitals usually had pretty gardens around them which made pleasant vistas from the doorways and windows and restful resorts for convalescent patients. Landscape architects are now asked to design hospital gardens and some of these are very beautiful. Such pleasant surroundings are considered a very important addition to other modes of therapeutics affecting patients' minds very favorably.

JAMES J. WALSH, M.D.

**HOSPITALS, Military.** Military hospitals were organized under the Greeks and Romans but only for their own soldiers. Enemy wounded were neglected, often even deliberately maltreated, sometimes massacred. They often became slaves upon recovery. With Christianity, better conditions prevailed but war always lessened the feelings of humanity. Queen Isabella of Spain is one of the first in history to have insisted that enemy wounded must be cared for like her own soldiers. She organized camp hospitals first in modern time. Early in the 16th century, Camillus of Lellis founded an association for the care of wounded on the battlefield, which wore as a symbol of its special mission a red cross. Later he founded a religious order whose aim was the care of the wounded in battle, and also the plague stricken and others in need at critical times and who visited the sick in their homes. All this pioneer work in the organization of care for wounded soldiers had been lost with the descent of hospitals and nursing which reached its lowest ebb in the mid-19th century. The awful neglect of the wounded in the Crimea (1854) led to Florence Nightingale's work and the reform of hospitals generally. Modern military hospitals have the advantage even when in but temporary quarters, of recent progress in hospital construction and organization. When they are single story barracks, they are thoroughly clean, with abundance of light and air and careful arrangements to prevent contamination of the quarters. The operating room is the heart of the military, as of the civil hospital and is thoroughly equipped. Floors are made of matched boards if not of cement or tile and an abundance of water used for cleansing. Separate rooms for anaesthesia, for sterilizing, for the disposal of septic materials, are provided, so there is as little likelihood of infection within the hospital, as in any good city hospital.

Special care is taken that the hospital shall be free from the visits of flies and in malarial and yellow fever regions, of mosquitos and that the body vermin shall be destroyed without any possibility of transfer to others. These little pests as they were considered, have been proved to be the distributors of disease which caused more deaths than the bullets of the enemy. The situation of the hospital then is usually such that it is out of direct contact with the camp, and separate buildings are provided for infections of various kinds. Excreta and all absorbent materials that had been in contact with infectious cases are incinerated, special provision being made for this. Proper cleanliness requires a large supply of water, nearly 10 gallons a day, for each man. Anything less than 10,000 gallons for 1,500 men is too small an amount. Probably the most important fac-

tor for the saving of human life in modern hospitals has been the introduction of the trained nurse since Miss Nightingale's time. Good nursing, that is faithful care and skilled observation, so that any threatened symptoms will be noted at once, regular, appropriate meals, and thorough personal cleanliness of the patient account quite as much as the modern expert surgical treatment for the lessened mortality of wounded soldiers in war.

In times of peace or in territory not the scene of active military operations hospitals are established at the various camps or posts under the charge of the senior medical officer of the camp or post to take care of the sick. For the care of the more serious, complicated or obscure cases department and general hospitals are organized. General hospitals are under the exclusive control of the surgeon-general except as to matters which concern the administration of military justice. They are staffed by officers of the medical and dental corps, men of the hospital and quartermaster corps, nurses belonging to the army nurse corps, and civilian employees. Permanent general hospitals are established at Hot Springs, Ark., for the treatment of such diseases as are benefited by the waters there, and at Fort Bayard, N. M., for the treatment of pulmonary tuberculosis. Additional general hospitals may be established by the surgeon-general in wartime at such places as he considers most suitable. At points of embarkation where there are no general hospitals, port of embarkation hospitals may be established under the surgeon of the port of embarkation. Special general hospitals may also be organized for the care of prisoners of war.

In time of war and in the zone of operations, the field hospital is that unit of the medical service known by the name of hospital which is nearest the front. Its personnel consists of 1 major in command, 5 junior officers, 3 sergeants, first-class, 6 sergeants, 3 acting cooks and 55 privates or privates, first-class, in addition to 1 sergeant and 7 privates of the quartermaster corps. Its function is to shelter and care for the wounded and sick as they are brought in from the firing line until the sanitary service of the communications can remove them. Field hospitals are attached to divisions, and are used on the march or in temporary camps for the care of the divisional sick or injured until they can be sent to local hospitals or to the rear. In action, the divisional surgeon determines the position of the field hospitals, paying due attention to securing for them a central position, easily accessible, with good water, and if possible with suitable buildings. The field hospitals are opened by order of the division surgeon to the director of field hospitals on his staff as soon as the number of wounded justifies it. Patients are sent as soon as possible from the field hospitals to the evacuation hospitals (two to a division) on the line of communications. The evacuation hospital is manned by a lieutenant-colonel, a major, 14 captains and lieutenants, 8 sergeants, first-class, 20 sergeants, 10 acting cooks and 141 privates first-class and privates. The evacuation hospital replaces the field hospitals and allows them to move on with their divisions. Like a field hospital, an evacuation hospital continually sends to the rear all who can be moved.

They are received by the base hospitals, which are located in buildings, if possible, at the base of the line of communications. They are under the charge of the surgeon of the base group on the line of communications. The establishment of a base hospital consists of a colonel, a major, 18 junior officers, a dental surgeon, 8 sergeants, first-class, 16 sergeants, 14 acting cooks, 115 privates, first-class, and privates, and 46 female nurses. The base hospital is the place where definitive treatment is given to the men from the field and evacuation hospitals. They only send home those who are permanently disabled and those whose recovery will consume a long time, unless their capacity is exceeded. Special hospitals may be formed for other causes, as for contagious diseases. Military hospital organization in foreign countries follow the principles here outlined, though differing somewhat in details. Consult the 'Manual for the Medical Department, United States Army' (Washington 1916); and the corresponding publications of foreign governments. See **AMBULANCE COMPANIES; ARMY ORGANIZATION; HOSPITAL CORPS; HOSPITAL SHIPS; HOSPITAL TRAINS; RED CROSS.**

JAMES J. WALSH, M.D.

**HOSPITAL, Psychopathic.** Psychopathic hospitals (psychiatric clinics, psychiatric institutes) are institutions for the specialized care and investigation of mental disease. They represent the application of general hospital ideals and investigative standards to the problems of disorders of mind. They are institutions for the first care and observation of mental cases, for treatment of the acute and curable cases, for special investigation into the causes, types and treatment of the mentally disordered, for the study of cases in which nervous or mental disease or defect is suspected to be the cause of conduct disorder, and for the instruction of students and physicians.

There are about 60 such institutions in the world, over half of them in German-speaking countries. Some have grown out of general medical clinics, many (especially in Prussia) from the necessities of teaching in insane hospitals, others as specialized institutions, because of elevating the standards of care and study of the insane. Eight such clinics were established in Germany from 1866 to 1882. The first specially constructed institute was that at Halle, opened in 1891 under the direction of Hitzig, who was famous for the discovery of the electrical stimulability of the brain cortex. At the present time there are some 25 such clinics in Germany with capacities from 60 to 300 beds.

Institutes of a somewhat similar type have been opened in practically all the European countries and in Japan. Some of them are administered as departments of general hospitals, others are related to insane hospitals.

There are six institutions of this general type in the United States. The Psychiatric (originally Pathological) Institute of the New York State Commission on Insanity was reorganized with clinical as well as pathological aims in 1902, under Dr. Adolf Meyer. This is almost purely a research and instruction institute, since the patients are derived from among those sent to the Manhattan State Hospital where the institute occupies quarters.

Cases which the institute desires to study are sent to special wards.

The Albany, N. Y., General Hospital opened a ward called Pavilion F, for the observation and treatment of mental cases in 1902. In the same year the Bellevue and Allied Hospitals were established in New York and the psychopathic service was augmented. This service now deals with a great number of patients in the course of a year, chiefly as an observation or detention ward prior to commitment.

In 1906, the State Psychopathic Hospital at the University of Michigan, Ann Arbor, was opened with Dr. A. M. Barrett as director. This hospital comes very close to the European ideal but its bed capacity is somewhat limited and there are certain restrictions on the voluntary admission law which interfere to some extent with its work.

In 1913, the Phipps Psychiatric Clinic at Johns Hopkins University in Baltimore, Md., was opened under the direction of Prof. Adolf Meyer. It approximates closely the ideals of the foreign clinics.

In 1912, the Psychopathic Department of the Boston State Hospital, or as it is commonly called, the Boston Psychopathic Hospital, was opened under the direction of Prof. E. E. Southard, and maintains an active clinical service as well as pathological service for the State Commission on Mental Diseases.

Such institutions are important forces in the modern movement for mental hygiene. They are valuable centres for the mental health of the community. They represent the application of the highest standards to the problems of mental disease and such an institution should be provided for every large city.

LAWSON G. LOWREY, M.D.

**HOSPITAL CORPS, United States Army,** a branch of the United States Military Medical Service, established by the act of 1 March 1887. It consists of sergeants, first class, sergeants, corporals, acting cooks, privates, first class, and privates, and has as its function the performance of all necessary hospital services in camp, garrison and field, including ambulance service. Sergeants, first class, and sergeants are appointed by the Secretary of War upon passing an examination prescribed by the surgeon-general. Acting cooks are promoted by an officer commanding any hospital or sanitary formation from among the privates and privates, first class, employed therein. Enlistments are made by medical officers by the authority of the surgeon-general or department surgeon. Men may also be transferred from other branches of military service. See **AMBULANCE COMPANIES; ARMY MEDICAL CORPS; HOSPITAL, MILITARY.**

**HOSPITAL CORPS, United States Navy,** a branch of the United States navy under the control of the Bureau of Medicine and Surgery which has the duty of performing all necessary medical and hospital service at naval hospitals, naval stations, navy yards and marine barracks, and on vessels of the navy, coast survey and fish commission. It was established by the act of 17 June 1898. It contains chief pharmacists (commissioned warrant officers), pharmacists (warrant officers), hospital stewards (chief petty officers), hospital apprentices, first class (petty officers, third class),

## MILITARY HOSPITALS

2

**DEBARKATION HOSPITAL No. 2 OF THE UNITED STATES ARMY, FOX HILLS, STATEN ISLAND, N. Y.**

For this establishment 6,600 feet of standard gauge railroad track, 10,027 linear feet of macadam and 15,840 feet of cinder roads were constructed in the grounds, and elaborate water, sewer, steam heating, electric light and power systems were installed, making it one of the largest and most complete military hospitals in the world

## MILITARY HOSPITALS

**DEBARCATION HOSPITAL No. 2 OF THE UNITED STATES ARMY, FOX HILLS, STATEN ISLAND, N. Y.**

This establishment occupies an area of 160 acres, of which 90 acres are covered by 87 buildings connected with each other by about 1 1/2 miles of corridors. They were all built and equipped between 24 February and 15 June, 1918, and include: 26 one-story wards; 15 two-story wards; 5 two-story barracks; 2 staff officers' quarters; besides operating pavilion, laboratory, clinic administration building, etc. (See over)

and hospital apprentices (seamen, second class). All enlistments except for the rate of hospital apprentice must be addressed to the surgeon-general. Hospital apprentices may be examined and enlisted at any navy yard or recruiting station. Men in other branches of navy or marine corps service are eligible for transfer to the hospital corps. All promotions are made by examination, and the total number of pharmacists and chief pharmacists together is limited to 25. The hospital corps men on board ship form what is known as the surgeon's division. Schools for hospital corps men are maintained at the training stations at Newport, R. I., and San Francisco, Cal.

**HOSPITAL SHIPS.** By the regulations for the government of the navy of the United States, ships may be designated by the Navy Department as hospital ships. In all matters concerning their use as hospitals, they are assimilated to hospitals on shore, and are under the control of the Bureau of Medicine and Surgery of the United States navy. They are commanded by naval medical officers not below the rank of surgeon. The commander has under him a merchant crew and officers, for the purpose of navigation, and a detail from the hospital corps of the navy, together with such female nurses and junior medical officers as may be required. The ship is considered to be a naval auxiliary, and in all non-medical matters is subject to the inspection, care and supervision of the supervisor of medical auxiliaries. The merchant crew is under the command of its master, who is in full control of its discipline and the navigation of the ship. Hospital ships are for the sole purpose of the care of the sick and wounded of the navy, marine corps and army, and of the shipwrecked or other persons needing medical assistance. They are forbidden to carry any officers or men not sick, disabled or shipwrecked besides their complement, or any contraband of war except the coal and stores needed for upkeep and movement. Strict neutrality is enjoined on all hospital ships, and they carry no guns or ammunition not necessary for the protection of the sick and wounded and the maintenance of order on board. Naval hospital ships fly the Geneva cross at the main instead of the narrow pennant and are painted white, with a horizontal band of green a meter and a half wide. In 1916 the only naval hospital ship of the United States was the *Solace*, of 5,700 tons, with a complement of 59 hospital corps men and 100 in the merchant crew. It was used for hospital purpose with the fleet in time of peace. The army also provides on oversea expeditions hospital ships which are manned by the medical department as far as their medical aspect is concerned, and ships for patients, which are ordinary transports or merchant vessels put into temporary medical use. The medical complement of a hospital ship of 200 beds consists of 1 lieutenant-colonel or major; 4 junior officers; 1 sergeant, first class; 4 sergeants; 5 acting cooks; 30 privates, first class, and privates. When hospital ships are furnished by the American Red Cross, they are likewise commanded by army medical officers. Hospital ships are also used for the conveyance of medical department personnel and supplies.

The second Geneva Convention of 1868 provided that hospital ships, merchantmen having

wounded on board and boats picking up the wounded or shipwrecked should be neutral and immune from attack or capture. They are painted in the manner which has been described for the United States navy if they belong to a government, and with a similar red stripe if they belong to an aid society. They fly the Red Cross flag besides the national ensign, and are not allowed to carry arms. They lose their rights to neutrality if they are used for other than strictly medical purposes.

Civilian hospital ships may be classed under two heads: those that work among the merchant fleet; and those that work primarily among the children of the great cities, giving them the benefit of sea air and a respite from the summer heat during their sickness. The United States coast-guard cutter *Androscoogin* has been fitted out as a hospital ship under a surgeon of the public health service for service among the fishing fleet of the north Atlantic, and the same sort of duty was done by a French ship, the *Saint François d'Assise*. Of the second class, the Boston Floating Hospital and the hospital ship maintained by the Bellevue Hospital of New York city are good examples. The latter ship is used primarily for tuberculous cases, and is in commission throughout the year. See ARMY MEDICAL CORPS; GENEVA CONVENTIONS; HOSPITAL CORPS, UNITED STATES ARMY; HOSPITAL CORPS, UNITED STATES NAVY; RED CROSS SOCIETIES; WAR, EUROPEAN.

**HOSPITAL TRAINS.** See HOSPITALS, MILITARY.

**HOSPITALLERS**, mediæval charitable brotherhoods whose members devoted themselves to tending the sick in hospitals. The name was specially applied to an order of the Knights of Saint John. See ORDERS, RELIGIOUS.

**HOSPODAR**, hōs'pō-dār, a title formerly worn by the governors of Moldavia and Wallachia, signifying, in its simplest derivation, "master." The title was also applied to the princes of Lithuania and Poland, and to the emperor of Russia.

**HOSS**, Elijah Embree, American Methodist Episcopal bishop of the South: b. Washington County, Tenn., 14 April 1849. He was graduated at Emory and Henry College, Virginia, and was ordained in the ministry of the Methodist Episcopal Church South in 1870. He was incumbent of the pastorates at Knoxville, Tenn., San Francisco and Asheville, N. C., successively. From 1876-81 he was president and professor at Martha Washington College, Abingdon, Va., and was connected with Emory and Henry College from 1881-85, first as vice-president and then as president. He was professor of ecclesiastical history at Vanderbilt University from 1885-90, and editor of the *Nashville Christian Advocate* (1890-1902). Since May 1902, he has been a bishop, with residence at Muskogee, Okla.

**HOST**, or **HOSTA SACRA** (sacred host), in the liturgy of the Catholic Church, the body of Christ present in the sacrifice of the Mass under the appearance of bread (see EUCHARIST; TRANSUBSTANTIATION). The Latin word *hostia* denotes that which is offered in sacrifice; hence in the Mass, where the victim is the same who offered himself on the cross, "the cup" is no less the *hostia* than is "the bread"; but usage

has sanctioned the appropriation of the word host to the latter. In the canon of the Mass, the priest, in offering the consecrated elements to God the Father, speaks of both the "bread" and the "cup" as *hostia*; and in the ancient Spanish missal (the Mozarabic) occurs the phrase "this host of bread and wine." But the word *hostia* is also employed to signify specially the bread before consecration; and this usage has its sanction in the Roman liturgy itself and in the rubrics of the Missale Romanum. In the rubric of the *ordo missæ* the altar-bread before consecration is called *hostia*, and after consecration it is called *hostia consecrata*. "Host" in the former sense, that is, the "altar-bread," is, in the Latin Church, a circular wafer made of fine wheaten flour mixed with water only, and it is unleavened. Usually the wafers are stamped either with an image of Christ crucified or with the letters I H S. They are of two sizes, a larøer one which the celebrant himself receives (a host of this size is also reserved for the benediction of the Blessed Sacrament); and a smaller size for administration to those who may communicate at the Mass, or to the sick in their houses. The hosts destined for this use are kept in the pyx (called also *ciborium*), a silver vase gilt inside, and deposited in the tabernacle of the altar. As long as the host is thus reserved in the tabernacle the sanctuary lamp is kept alight before it. The Eastern churches in communion with the see of Rome, except the Maronite and Armenian churches, retain the use of leavened bread in the Eucharist.

**HOST**, a term in pathology, chiefly in plant pathology, designating the organism upon which a parasite is living. In the case of galls, for example, the plant is the host for the parasite (q.v.).

**HOSTAGE** (French, *ôtage*; Latin, *obses*; Low Latin, *obstagnis*), a person or sometimes a thing left as pledge or surety for the performance of the articles or conditions of a treaty. The taking or giving of hostages is now scarcely known in the relations of modern communities, but was formerly almost universal, and many questions in the law of nations arose out of the practice. Writers on international law have discussed how far the rights of conquerors extend over hostages, what circumstances may release them from their obligation and what effect their escape will produce on the treaty proposed by the contracting parties. In modern warfare hostages are not usually interchanged.

**HOSTELRY**. See **HOTEL**.

**HOSTIUS**, hōs'ti-ūs, a Roman epic poet of the 2d century B.C. All that is known concerning his works is that he wrote metrical annals in imitation of Ennius and a poem, 'Bellum Histricum,' on the Istrian War (129 B.C.), celebrating the victory of the consul Gaius Sempronius Tuditanus. The fragments of this work are preserved in Bachrens, 'Fragmentæ Poetarum Romanorum' (1886).

**HOSTRUP**, hōs'trūp, **Jens Christian**, Danish poet and dramatist: b. Copenhagen 1818; d. 1892. He studied at the university in his native city, where he produced a play which was successfully presented by his fellow students, under the title 'Gjenboerne' ('Neigh-

bors,' 1843). He wrote, under the pen name of "Kristrup," numerous plays of a strongly national character, including 'Intrigerne' (1848); 'En Spurv i Tranedands' (1846); 'Eventyr paa Fodreisen' (1850); 'Soldatkøjer' (1849); 'En Nat Mellen Fjeldene' (1852); 'Mester og Lærling.' In 1855 he entered the priesthood and occupied himself with parochial duties. His later works include a series of popular lectures, 'Folkelige Foredrag' (1882); a volume of poems, 'Sange og Digte' (1884); a drama, 'Eva' (1881). A collection of his poems appeared in six volumes (1852-56), and of his comedies, in 1888-89. Consult Klint, 'Jens Christian Hostrup' (Copenhagen 1893).

**HOT AIR ENGINE**. See **ENGINE**.

**HOT-BED**. See **HORTICULTURE**.

**HOT SPRINGS**. See **SPRINGS**.

**HOT SPRINGS**, Alaska, a town on Baker Creek, near the mouth of the Tanana River. On account of its hot springs it is a popular health resort. Truck-farming is extensively carried on. The mines of the district are well known. Pop. about 125.

**HOT SPRINGS**, Ark., city and county-seat of Garland County, and one of the most famous sanatoriums of the United States, in the southeastern centre of the State, 55 miles southwest of Little Rock and 397 miles from Saint Louis, on the Saint Louis, Iron Mountain and Southern, the Chicago, Rock Island and Pacific and other railroads. The location is 600 feet above sea-level and lies principally at the easterly base of the mountain complex known as the Ouachita Range, the nearby peaks of which are oftentimes called the Ozark Range—in a valley between two rocky and heavily wooded ridges called West Mountain and Hot Springs Mountain, 400 feet higher—and in its sheltered situation has a mild and pleasant climate. Lat. 34° N. long. 93° W. Through the valley runs the Hot Springs Creek, starting two miles above; and into this the water from 47 hot mineral springs—originally 73, but many merged artificially or run dry—springing from vents in the gray volcanic tufa near the base of the Hot Springs Mountain on the east. Forty-four are in use or usable; the others rise in the bed of the creek. The former yield 800,000 gallons a day, contain large amounts of calcium and magnesium carbonates, and the presence of lithium, iodides and bromides, etc.; the total mineral matter in solution is between 275 and 280 parts per million and the results, as to the percentage composition of the mineral matter in each hot spring, are very much the same. The waters are prescribed for bathing and drinking and have remarkable curative properties. De Soto, it is said, sought to explore them as the veritable fountain of youth. As many as 150,000 patients and pleasure seekers visit the place annually. The temperature of the springs varies from 97° to 147°. All issue from a space something over a quarter of a mile long and from 200 to 300 feet up the slope, some 10 acres in all. By treaty with the Quapaw Indians in 1818 and by act of Congress in 1832, four sections (2,529 acres) became a reservation, and the springs are in the centre. Dunbar and Hunter of the Lewis and Clark expedition visited the place in 1804 and settlement was made in 1807. After 1832 numerous attempts were

made to enter the lands and title to property involved many years of contention and "shot-gun right." In 1870 Congress authorized suits against the United States in the Court of Claims. In 1876 title was held to be in the United States by the Supreme Court. Justice Field of the Supreme Court in an opinion said: "From the protracted litigation to which it has given rise the Hot Springs Reservation is famous in the history of land titles of the country." And Justice Bradley: "The title to a well-known watering place in the State of Arkansas, called the Hot Springs, has been contested by a number of claimants for nearly half a century." In 1877 Congress created a commission to adjudicate squatter rights, giving right of purchase from the United States and to lay off the town. Under this act the Hot Springs were reserved by the United States to prevent monopoly or injury, and 911 acres are used as permanent parks. The government has expended vast sums in arching the creek, erecting the Army and Navy Hospital (open to soldiers and sailors of the Civil War) and in developing and beautifying a system of parks not yet finished. These parks are covered with forest trees and some are thoroughly fitted up for public enjoyment. Large sums have been spent on boulevards, walks, artificial lakes, landscape gardening and handsome marble hot-water fountains scattered plentifully through the city. The grand entrance to Hot Springs Mountain, from Central avenue, is a noble architectural feature, and the initial point of 15 miles of fine drives around the summits of Hot Springs, North and West Mountains.

With one exception the springs are all enclosed in solid masonry, and the water is conducted by protected pipes into reservoirs near the base of Hot Springs Mountain or to the 23 bathhouses on and off this reservation. The exception is left open and accessible to the public. The government maintains a free bathing establishment for the indigent, at which over 10,000 bathe annually, over 90 per cent being benefited. The prices of baths and fees of attendants are fixed by the Department of the Interior, with severe penalties for deviation. A handsome city has grown up to house the guests and permanent residents. On the slope of Hot Springs Mountain is a fine park of 100 acres, with the most elegant buildings facing it. The creek is covered in and sidewalks and roadways built over it. Several hotels, as the Arlington, Eastman, Majestic, Como, are among the largest and best appointed in the country. The city has a fine courthouse, city hall and opera house. One of the features of the place is the tower on the summit of the mountain, from which four States can be seen and one of the best 18-hole golf courses in the South.

Hot Springs received its city charter in 1879. The city has a mayor and four commissioners, who employ a city manager. Being a pleasure resort, as well as a health resort, it has a large itinerant population. Large quantities of novaculite rock, "Arkansas" and "Ouachita" are quarried in the surrounding mountains, and 5,000 bales of cotton are marketed annually. The country abounds in cold springs, some of which have remarkable curative properties, notably Mountain Valley and Potash-Sulphur, 10 and 17 miles distant

from Hot Springs; these are efficacious in conditions affecting the kidneys and intestinal tract. Pop. 17,238.

GEORGE R. BELDING,  
*Secretary Business Men's League.*

**HOT SPRINGS, N. C.**, a town in Madison County, on the French Broad River, 38 miles northwest of Asheville. The Southern Railway serves the town. It is particularly known as a health resort because of its hot springs and its elevation. Lumbering and mining are the chief industries. Dorland Institute is located here, a mission school for mountaineers. Pop. 450.

**HOT SPRINGS, S. D.**, city, county-seat of Fall River County, on Fall River, the Fremont, E. & M. V. and the B. & M. railroads, about 100 miles south of Deadwood. It is the trade centre for stock, lumber and mining interests. The water power is used for several manufactories, a stucco-mill, board and planing-mills and machine shops. It has thermal and medicinal springs and is the seat of the Black Hills College (M. E.), opened in 1890, the State Soldiers' Home and the National Battle Mountain Sanitarium, erected at a cost of \$2,000,000. Pop. 2,140.

**HOT SPRINGS, Va.**, health resort in Bath County, about 75 miles north of Roanoke, on the Chesapeake and Ohio Railroad. The first settlement in this region was made about 1740. The mineral springs attract numerous visitors, for whose accommodation Hot Springs supplies a number of fine hotels, the most noted of which is the old Homestead Hotel. There is also a fine public library. Pop. 500.

**HOT SPRINGS RESERVATION, or HOT SPRINGS NATIONAL PARK, Arkansas**, the oldest of the 16 national parks of the United States. It now contains an area of 911 acres near the centre of Arkansas, and is visited annually by 125,000 or more persons who are attracted by the fame of the radioactive waters. The authentic history of this place begins with 1804, in which year Dunbar and Hunter of the Lewis and Clark expedition visited the springs, as their report shows. A cabin was built here by Manuel Prudhomme in 1807, and he was joined in the same year by John Purciful and Isaac Cates, who engaged in hunting and trapping. Toward the end of the 20's there were permanent residents; and in 1832 four sections of land were reserved by the government, with the hot springs near the centre. In 1878, however, this land was sold to various claimants, with the exception of that portion which now forms the Hot Springs Reservation, consisting of five units, namely, Hot Springs Mountain, Whittington Lake Reserve Park, and the North, West and Sugar Loaf mountains. The hot water springs issue forth only from the west slope and at the base of Hot Springs Mountain, which embraces 264 acres; the 46 springs, with an average daily flow of 826,000 gallons and an average temperature of 135° F., are confined within an area of 500 by 1,400 feet. The superintendent writes, in his report to the Secretary of the Interior for the fiscal year ended 30 June 1915, that "the trust reposed in the government by the people has been guarded with extreme care. The springs are now the property of the people, free from monopoly and extortion, and within

the reach of all." But in the same year the government was urged—and with good reason—to provide for the erection of a new public bath. Mark Daniels, the general superintendent and landscape engineer, wrote: "Hundreds of thousands of people have been relieved of suffering and as many have had their lives saved by virtue of the medicinal qualities of the waters of Arkansas. It is a great institution and one that fully warrants the hearty support of our Federal government. The bathhouses that are privately owned are many of them luxuriously appointed, and the growing contrast between the people who have money and can afford these bathhouses and the conditions with which the poor are confronted in the free bathhouse is one that arouses righteous anger." Dr. Bertram B. Boltwood, of Yale University, authorized to report to the Secretary of the Interior on the radioactivity of the waters, stated that he reached the following conclusions: 1. The waters of the springs on the Hot Springs Reservation are all radioactive to a marked degree. 2. The radioactivity of the waters is due to dissolved radium emanation (a gas), and not to the presence of salts of radium or other radioactive solids.

The Department of the Interior exercises no direct control or supervision over any matters connected with the city of Hot Springs, which is a municipality (pop. about 16,000) governed under State laws. Adjoining the reservation and well supplied with all modern facilities (hotels, furnished apartments and cottages, etc.), it is built at an elevation of 600 feet above sea-level and the climate is good the year round. It is the county-seat of Garland County, 54 miles from Little Rock, on the Saint Louis, Iron Mountain and Southern, the Chicago, Rock Island and Pacific and the Memphis, Dallas and Gulf railways. See NATIONAL PARKS AND MONUMENTS.

**HOT SULPHUR SPRINGS, Colo.**, borough, chief town and county-seat of Grand County, on the Grand River, near the north-central part of the State, and on the Denver and Salt Lake Railroad, about 65 miles from the Wyoming boundary line and 110 miles northwest of Denver. It was settled in 1873 by W. N. Byers and family, and was incorporated in 1903. It is in a high valley surrounded by mountains. The famous "hot springs" of Grand County are here. The water is highly impregnated with sulphur, and issues from about 25 distinct openings at temperatures of from 110° to 117° F. Many tourists visit the place annually on account of the sublime scenery, climate and the medicinal properties of the springs. Elevation, 7,600 feet. The adjacent valleys furnish pasturage for large herds of cattle. The principal public buildings are the county courthouse, the Congregational church and the public school. There is one bank with a capital of \$5,000; the annual amount of business is \$250,000. The government is vested in a mayor and a council of six members, three of whom are elected each April. Population, 450.

**HOTCHKISS, Benjamin Berkely**, American inventor: b. Watertown, Conn., 1 Oct. 1826; d. Paris, France, 14 Feb. 1885. He was in early life a machinist and turned his attention to the invention of deadly weapons, among them the

Hotchkiss magazine gun and the Hotchkiss machine gun, adapted for use in the fighting-tops of warships. In 1870 he established a factory at Paris. His guns were widely used by navies and armies until supplanted by other devices. He also improved heavy ordnance and projectiles.

**HOTCHPOT**, a legal term for the bringing together of the advancements made to children during the life of a parent and the joining of these advancements with the property left at death. This is done in order that the whole may be equally divided among the children. Blackstone explains the term as follows: "Hotchpot is, in English, a pudding; for in a pudding is not commonly put one thing alone, but one thing with other things." The various States of the United States have enacted laws to cover the provisions of this old English law, the object of which was to provide equality among the children of deceased persons. This law, however, generally only provides for the return of advances and not of gifts. See COLLATION.

**HOTEL, or HOSTELRY**, an inn or public tavern. The palatial hotels that have sprung up since the introduction of railways are too well known to require notice. One point of difference between the European and the American systems is that under the former the charge is for lodging only, while under the American plan it includes both lodging and meals. In former years many American hotels were run on the American plan. In modern times their number has greatly decreased, and they are restricted almost entirely to smaller cities and towns. The modern French word is still used for the house of a rich or distinguished man, or for a public building, such as the *Hôtel de Ville*, the French term for city hall. Recent developments of hotels have resulted in the building of hotels for many special purposes, such as hotels for women, workmen, girls, boys, etc. An extensive literature on the subject of hotels, their architecture, equipment, management, etc., has sprung into being, much of it in the form of special articles in architectural and other class journals. The hotel business itself has its own circle of trade journals of which numerous are published in every civilized country, amongst which are dailies, weeklies and monthlies. Consult Beal, J. H., 'The Law of Innkeepers and Hotels, etc.' (Boston 1906); Guyer, E., 'Das Hotelwesen der Gegenwart' (Zürich 1874); McGovern, J., 'Hospitality; Mine Host from the Time of Babylon to the Age of the Aeroplane' (Chicago 1910); Michel, F., and Fournier, E., 'Histoire des Hôtelleries, etc.' (Paris 1851).

**HÔTEL-DIEU**, *dye*, the name of the principal hospital in most French towns. The Hôtel-Dieu at Paris is one of the oldest in Europe and is said to have been established in 660 A.D. In 1772 it was destroyed and shortly after rebuilt on the same place. In 1868 it was moved from its old location on the south side of the Isle de la Cité to its present place near Notre Dame on the north side of the island. Other interesting ancient Hôtels-Dieu are to be found at Angers (1153); Beaume, Côte d'Or (1443); and at Tonnerre, Yonne (1338).

**HÔTEL DES INVALIDES**, *dä zän'vä-léd'*, an institution in Paris for the maintenance

of wounded veterans of the French army. It was established in 1670 by Louis XIV. It was reorganized in 1811, and under the republic became national property, supported from the annual budget. Three buildings comprise the Invalides: The hôtel, or residence house, a huge edifice, containing also the National Museum of Artillery, a historic military museum, and some of the offices of the Ministry of War; the chapel of Saint Louis, where mass was held for the inmates; and the Dome des Invalides, a royal sepulchral edifice, to which the remains of Napoleon Bonaparte were transferred in 1861. The Hôtel proper can accommodate about 6,000 inhabitants.

**HÔTEL DE VILLE**, *dè vèl*, or *dé vè'*, the town-hall of the French municipalities. Excellent ancient types are to be found at Saint Antonin Compiègne, Orléans and Saint Quentin. The famous Hôtel de Ville at Paris was first erected in the 16th century. It was burned by the Communists in 1871 and was rebuilt between 1873-83. The distinguishing feature of the new building is its fine façade containing sculptured allegorical groups and statues representing the principal cities of France. Excellent statues and pictures ornament the interior.

**HOTELS, LODGING-HOUSES, Regulations** of, the legislation enacted in different States to secure efficient service in buildings in which people are lodged for hire and provided with meals. These regulations vary according to localities, but generally have been directed toward fire prevention, means of exit, limitation of height and the rights of travelers. The legislative regulations are usually to be found posted in a convenient place for guests to consult. See **HOTELS IN AMERICA**.

**HOTELS IN AMERICA.** The public house, or hotel, was established in the early days of the colonies to afford accommodation for those who might be compelled to journey from one place to another. As roads were poor, in those days, and stage transportation was slow, many of these houses were opened along the principal roads, or turnpikes, and the majority of these so-called inns bore such names as "King's," "Queens," "The Red Lion," etc. As public opinion changed, however, and the colonies inaugurated their revolt against the Crown, there was a corresponding change in the names of these hotels which brought them into closer harmony with the spirit of the times. From being mere public houses, wherein beds and food might be obtained by travelers, they became the meeting places of patriots, so it was but natural that the portrait of Washington, or of some other great American, should have taken the place of that of George III, and other royal personages, on the swinging signs before these doors. As time passed and the patriotic spirit rose to greater heights, these inns became the scenes of many events that brought them into the closest relation with the progress of the Revolutionary period and with the formative days which followed the declaration of peace. There was, for example, the City Tavern, in Philadelphia (1775), at which General Washington was frequently a guest; the Bunch of Grapes Tavern, Boston, where he enjoyed that "elegant dinner provided at public expense, while joy and gratitude sat on every countenance and smiled in every eye" (28 March

1776); the True American Inn, at Trenton (1777); Arnold's Tavern, Morristown; Sufferin's Tavern, Smith's Clove, N. Y.; the Buck Tavern, near Philadelphia; Smith's Tavern, Smith's Clove, N. Y. (1779); the tavern at East Chester, N. Y., where he was ill (1780); the Fountain Inn, Baltimore (1781); Day's Tavern, Harlem, where he stopped with Governor Clinton (1783); Fraunces Tavern, New York, where, in the assembly-room, he bade farewell to the men who had followed his fortunes so faithfully; Mann's Hotel, Annapolis, from which he proceeded to Congress on the day when he resigned his commission, and the City Hotel, Alexandria, where he was afterward entertained by the Alexandria Lodge, of which he was a member. The tavern at East Chester, where Washington stayed during his illness, was erected soon after the beginning of the 17th century. At one time Lafayette was entertained in the house, and, for a season, it was practically the seat of the national government, President John Adams having taken refuge at East Chester during the yellow fever epidemic at Philadelphia, then the Federal capital. This tavern now stands within the New York city limits, and the rooms which have the greatest historic interest still preserve the same appearance which they had in those old days.

Among the other taverns of the country which are rich in historic memories, but which were not directly associated with the career of the first President, were the Catamount Tavern, at Bennington, Vt.; George Burns' Coffee-House, in New York, long the lounging place of the British officers, although privately frequented by the Sons of Liberty during the occupation of the city by the British; the Tun Tavern, Philadelphia, the house in which the first Masonic lodge in America was organized; the City Tavern and the Bird in Hand, at Richmond, Va., and the Rose Tree Inn, at Media, Pa.

The first hotels in this country were conducted on the so-called American plan, which provided a fixed price for a day and for each fraction of a day. In those times \$1 a day was considered a "good round price," and taverns were ordinarily so small that one which was provided with 20 rooms was regarded as a most commodious house. The rooms were usually comfortable, however, and were neatly, if plainly, furnished with strongly made furniture. Carpets were rarely found, although hand-woven rag-rugs frequently appeared on the floors. Meals, which were served at fixed hours only, were announced by the ringing of a bell or gong, and all guests were expected to respond as quickly as possible. The table was abundantly supplied with dishes that were both substantial and palatable, the cooking being done by the wife of the landlord, with such assistants as the patronage of the inn might authorize, and while meat dishes predominated, game was so plentiful that its appearance attracted no comment.

At this time in the history of the American public house there were comparatively few inns that made an extra charge for wines. Instead decanters of liquors and of some favorite wine, like Madeira, port or sherry, frequently stood upon the tables, and from these the guests served themselves freely. There were no printed bills of fare in these days, but practically all the food to be served was placed on

the table at one time. Guests helped themselves, some slight assistance being given by the waiter who stood at hand. When Congress met in New York in 1789 the members found accommodations chiefly in the boarding-houses which abounded in the neighborhood of the Battery—on lower Broadway, in Cedar street and in Maiden Lane. It is rather amusing to note that people from other parts of the country complained about the "high prices" that were charged at the taverns and boarding-houses in New York, for that was the time when the "board of the Congressmen was paid out of the common treasury, to which every citizen of the United States contributed his share." In reply to this charge of exorbitant prices it was stated that board in New York "ranges from \$3 to \$7 per week," and one house was cited as furnishing "from 7 to 9 dishes a day, with 4 sorts of liquor."

The most important American taverns in 1795 were located in New York, Philadelphia, Baltimore and Boston. The best New York taverns were Fraunces', opened in 1762, and formerly known as the Queen Catherine, one of the largest inns during the Revolutionary period, as it contained some 30 rooms; the City Hotel, which was erected on the site of the George Burns Coffee House, in 1793, and which was not only the meeting place of the fashionable City Assembly, but was patronized by the so-called "Three Hundred" of that day; Bunker's, the Washington Tavern and the Tontine Coffee House, on Wall street.

The National Hotel, in Washington, which was for many years the home of the most eminent public men of the nation, was opened in 1827. In 1829 the Tremont House was opened in Boston, and for years it was noted as being the grandest hotel in the land, if not the most elegant public house in the world. Prior to that time the principal hotels in Boston had been the Eastern Stage House, Doolittle's City Tavern and the Lamb Tavern.

It was about that time, or, to be exact, in 1830, that Delmonico opened the first high-class restaurant in New York. High as his prices were, when compared to those which prevailed elsewhere, epicures and persons of fashion flocked to his support and the enterprise prospered from the day of its inception. In 1833 the United States Hotel, in New York, was opened; in 1834 the Louisville Hotel, and, in 1835 the Galt House, also at Louisville, all of which immediately became noted as fine houses. The United States Hotel, at Boston, which has since been greatly enlarged and is still standing, was opened in 1835, while, about this time, the old Washington Hotel, at Portland, Me., which had been established since 1823, also took the name of the United States. The Rockingham, at Portsmouth, N. H., once the home of Governor Langdon, was opened in 1834, but, like other hotels of that time it was not particularly commodious in the modern sense of the word. In fact, up to 1836, there were comparatively few hotels in the United States that were capable of accommodating as many as 200 persons. In 1836 the Astor House, in New York, was opened. Built of massive granite, and furnished with all the conveniences of that day, it was a fitting rival to Boston's Tremont House. Barnum's Hotel, at Baltimore, which was opened at about this time,

eclipsed the best houses which had hitherto been built in that city, while the opening of the Saint Charles Hotel, at New Orleans, in the same year, was an event which was heralded from one end of the land to the other. Situated in the centre of the "American" portion of the city, its stately portico, built in the style of a Corinthian temple, made it, next to the Capitol, at Washington, the most imposing structure in the land. It was also one of the best appointed and most commodious houses in America, having accommodations for more than 700 persons. The original buildings were burned in 1851, but it was almost immediately rebuilt, and it continued to enjoy its position as the centre of Southern hotel life until the outbreak of the Civil War. In 1894 the structure was once more burned, but it has since been rebuilt, and still ranks as one of the best hotels in America.

The Charleston Hotel, at Charleston, had the distinction of being the only hotel in the country that had been burned to the ground on the same day on which it was opened. This was in 1839, but as it was rebuilt at once it was again opened in 1840, afterward becoming the favorite resort of Calhoun and other great Southern statesmen. When the Planter's House, at Saint Louis, was opened in 1841, it justly prided itself upon being "the largest hotel west of the mountains." It had 215 well-furnished rooms, a classic ballroom with a floor-space 8,911 square feet more than the celebrated Tremont House, in Boston, while the china and cutlery, all of which was made in England, bore the name of the house. Charles Dickens, who stopped there in 1842, spoke favorably of the hospitality of this hotel in his 'American Notes.' The Massasoit House, at Springfield, Mass., one of the celebrated New England hotels, and the New York Hotel, were both opened in 1848. The Delevan House, at Albany, was opened in 1845. The year 1847 will always be a memorable one in the history of the American hotel, for it marks the date of the opening of the Revere House, Boston, a house which, under the management of Paran Stevens, soon became the pattern which all other hotels in this country sought to imitate.

Up to 1855, the principal hotels in Philadelphia were the Mansion House, the United States, the Washington City and the Girard House, and it was in that year that the Burnett House, at Cincinnati, was opened with 250 bedrooms, besides many drawing-rooms, and especially spacious corridors. The Eagle Hotel, at Richmond, where Lafayette had stopped in 1824, was burned in 1840, and the Exchange and Ballard's were afterward opened. The Clarendon and the Irving House, in New York, were opened about 1850. The first Tremont House, at Chicago, which for some time was the leading hotel in that city, was opened about this time, while the Battle House, at Mobile, the Saint Louis Hotel, at New Orleans, and the Saint Nicholas and the Metropolitan, in New York, were opened about 1852. All were large houses, and were conducted upon an expensive scale, while the two New York houses were particularly conspicuous in having introduced "bridal chambers" and other novelties.

In 1854, the Brevoort and the Everett were opened, on the European plan, in New York; the famous Parker House, in Boston, also on the European plan, was opened in 1855, while

the Fifth Avenue Hotel, in New York, was finished in 1859. It was the first hotel to introduce a passenger elevator.

Willard's Hotel, at Washington, was the focus of many thrilling scenes and events during the Civil War, and among the houses that were opened during the next few years were the Lindell and Southern hotels, at Saint Louis; the Albemarle, Hoffman, Saint James and Grand, in New York, and the Arlington, at Washington. The Gilsey House, which was opened in 1871, in New York, at once took rank as one of the best European-plan hotels, while the Windsor House, in New York, began the successful career that ended so disastrously in the fire of 1899, in 1873. The Brunswick, in Boston, and the Palmer and Grand Pacific, both in Chicago, were opened about this time, while the Palace Hotel, at San Francisco, one of the most famous and palatial houses in the Far West, began to receive guests in 1875.

The last two decades of the 19th century were conspicuous, not only for the sudden increase of new and more splendid hotels, but also for the enlargement and improvement of those already built, in every part of the country, while, in such a brief review of the hotel business, it is impossible to name all the hotels worthy of mention that have been built during the past 25 or 30 years, it may justly be said that the revival of interest in the making of new and better houses extended from the Atlantic to the Pacific, and from our northernmost boundary to the Gulf. Beginning with the Vendome and Young's, at Boston, the list would include the Narragansett, at Providence; the Grand Union, Park Avenue and Murray Hill, in New York; the Lafayette and Stratford, at Philadelphia; the Rennet, at Baltimore; the De Soto, at Savannah; the Kimball, at Atlanta; the Iroquois, at Buffalo; the Hollenden, at Cleveland; the Grand, at Cincinnati; the Cadillac and Russell, at Detroit; Auditorium, Blackstone and LaSalle, at Chicago; Plankinton, at Milwaukee; the Ryan, at Saint Paul; the West, at Minneapolis; the Coates House, at Kansas City; Brown Palace Hotel, at Denver; the Portland, at Portland, Ore., and the Tacoma, at Tacoma. The impetus to the hotel business, which began some 30 years ago, however, has continued up to the present time for the last few years have witnessed the construction of many new and finer hotels than any that had hitherto been built, among them being the Imperial, the Savoy, the Holland, the Waldorf, the New Astor, the Martinique, McAlpin, Knickerbocker, Ritz-Carlton, Plaza, Belmont, Saint Regis, Vanderbilt, Biltmore, Pennsylvania and the Commodore, while one of the most unique experiments in the hotel line was the establishment of the Martha Washington, a hotel exclusively for women, which is successfully operated, also in New York.

The watering-place and summer-resort hotels also represent an important and rapidly increasing branch of the business. At the beginning of the 19th century there were a few inns at places like Saratoga, while a tavern at the White Mountains was built by Crawford in 1803. In 1822, the Catskill Mountain House was opened, and, by 1840, there were good houses at Trenton Falls and Delaware Water Gap. Twenty years later, Newport, Nahant,

the White Mountains, Lake George, Saratoga, Niagara, Cape May, Old Point Comfort, and the Virginia springs, all had good hotel accommodations, but, since that time this branch of the business has grown to such an extent that splendid hotels are now located on almost every available spot on the coast from Maine to Florida, while the Adirondacks, the Catskills and many interior resorts have accommodations for guests that can compare favorably with the best hotels in the country. At such hotels the American plan usually prevails, as it does to a considerable extent throughout the smaller cities and towns. In the large cities, however, the European plan, which fixes a price for the room, and which charges for extra service and for each item on the bill of fare, has become more popular, for while, in some instances, the two plans are combined, it is the European plan that is generally followed by the large hotels. Moreover the charges at the best hotels are about twice as great as they were in 1850.

The year 1914 was a great era of hotel building enterprises. The following year showed a remarkable decrease in the number of new hotels, but was enlivened by the noticeable sumptuousness of the larger erections; these included the mammoth Hotel Traymore, at Atlantic City, N. J.; the Hotel Morrison, Chicago, with 1,600 bedrooms; the fine Hotel Pantlind at Grand Rapids, Mich.; the attractively designed Hotel Muhlbach, Kansas City, Mo.; the Adelphia Hotel, Philadelphia, built of brick and terra-cotta; and the great William Penn Hotel, Pittsburgh, Pa., 20 stories high with 900 rooms.

When compared with the palatial hotels of to-day even the fine houses like the Tremont and the Astor House were primitive in their construction and management. The modern hotel is equipped with running water and set basins in every room; many rooms also have water-closets and baths with exposed plumbing; everywhere there are open grates and steam heat, improved ventilation, elevators for both passengers and baggage, electric bells, telephones and every possible device to prevent fire, or to assure the safe escape of guests in case of a conflagration. Utensils and machinery have also multiplied greatly during the past few years, for the best hotels now run a thoroughly up-to-date laundry, an electric-lighting plant, apparatus for the distilling of water, and the most elaborate cold-storage conveniences, often including an individual ice-making plant, while among the other necessary conveniences of every well-equipped hotel one may mention the reading, writing and music rooms; the coat, package and baggage rooms; the barber shop, with its manicuring, boot-blackening and other accessories; the billiard-room; telephone, telegraph and ticket offices; the book and newsstand; the stenographers and typewriters, and the carriage and messenger services, not to mention a score of other details that are just as imperative a necessity. It is no uncommon thing to-day to find single hotel structures valued at \$3,000,000 or \$5,000,000 equipped with furnishings costing many hundred thousand dollars.

A conservative estimate of the number of hotels in the United States, in a recent year, exclusive of those in process of erection, places the number at over 50,000. Of these about 4,000 are summer or winter resort hotels,

3,000 are family hotels, while the balance are commercial houses. These hotels now give employment to no less than 4,000,000 persons, and the amount of capital invested in the business is undoubtedly in excess of \$6,500,000,000. Consult 'Hotel Red Book: the United States Official Hotel Directory' (New York 1886-1918).

**HOTHAM**, hūth'am, William, British admiral: b. 1736; d. 1813. He received his education at Westminster School and at the Royal Naval Academy, Portsmouth, and entered the navy in 1751. He was assigned to the North American waters, and received his first commission as lieutenant on the *Saint George*, the flagship of Sir Edward Hawke. He rose rapidly in rank, becoming commander of different frigates. In 1759 his ship captured a French frigate, which, pressed into service, made a number of other captures. From 1776-81 he continued to serve in American waters, taking an important part in the Cul de Sac of Saint Lucia in the West Indies in 1778. He was returning with a large fleet of merchantmen when he was attacked by a French force and lost a number of his ships. He assisted in the operations at Gibraltar under Lord Howe (1782), and was appointed rear-admiral (1790) and later vice-admiral. On the retirement of Admiral Hood, Hotham succeeded to the chief command. In 1797 he was created a peer of Ireland, under the title of Baron Hotham of South Dalton.

**HOTMAN**, François, French author and jurist: b. Paris, 23 Aug. 1524; d. Basel, 12 Feb. 1590. At the age of 15 he was sent to the University of Orleans. In 1542 he obtained his doctorate and became a pleader at Paris. In 1546 he became lecturer in Roman law at the University of Paris. He was converted to the Reformed faith soon afterward; went first to Geneva, and then to Lausanne, where, on Calvin's recommendation, he was appointed to the chair of *belles-lettres* and history. In 1555 he lectured on law at Strassburg and in the following year became professor there. His fame extended to foreign countries and he was sought by various rulers, including Elizabeth of England. He was made professor of civil law at Valence in 1564 and three years later was appointed to the chair of jurisprudence at Bourges. Soon afterward he fled to Paris and was for a short time historiographer to the king. On several occasions he was Ambassador of the Huguenots and in 1568 negotiated the Peace of Blois. He returned to Bourges but fled after the massacre of Saint Bartholomew to Geneva, where he was made professor of Roman law. In 1579 he removed to Basel, where, with the exception of short sojourns in Montbéliard and Geneva, he spent the remainder of his life. He wrote numerous works, mostly polemical, including 'De gradibus Cognationis' (1546); 'L'Anti-tribonien, ou discours sur l'étude des lois' (1567); a life of Coligny (1575); 'Brutum fulmen' (1585); 'Franco-Gallia,' his greatest work (1573). Consult Daresté, R., 'Essai sur Hotman' (1850); and Grégoire, E. (in *Nouvelle biographie générale*) (1858).

**HOTTENTOTS**, hōt'en-tots, an African race, the aboriginal occupants of the south end of that continent, near the Cape of Good Hope.

The name now given to the whole race was that of the tribe in the immediate vicinity of the Cape of Good Hope, with which the Dutch settlers first became acquainted. The origin of the name is unknown. They are, when young, of remarkable symmetry; but their faces are ugly, and this ugliness increases with age. The complexion is a pale olive, the cheek-bones project, the chin is narrow and pointed and the face consequently is triangular. The lips are thick, the nose flat, the nostrils wide, the ears large and lobeless, the hair woolly and the beard scanty. The women in early life are often models of proportion, and their gait by no means deficient in grace. Their bloom, however, is transient, for, marrying at 12 or 13, after the first child they lose their grace and proportion, and soon become hideous. Both sexes are distinguished by excessive incurvation of the spine. When the Dutch first settled at the Cape the Hottentots were a numerous nation, and occupied a territory of 100,000 square miles. They had abundance of horned cattle and sheep; and it is supposed that the seven tribes into which they were divided made up together a population of over 100,000. At the present day this race is much degenerated and mixed within the wide territory which formerly belonged to it. They may amount to about 50,000. They are believed to be descendants of an ancient cross between the Bantu negroes (who are Hamitic) and the Bushmen. The cranial capacity is little above that of the Bushmen, and the yellowish, leathery color also shows relationship. They are short in stature (16.3 centimeters), and many of the women have a tendency to be over fat. They are of a happy-go-lucky, friendly disposition, like many of the plantation negroes of the southern United States. In their native state they wore loin-cloths and a cloak of skin (*kaross*). The women added fringed girdles and often a skin cap and were fond of ivory arm-rings. When in full dress they daubed themselves freely with a sooty fat. They raised cattle and lived on the plentiful African game in small villages or kraals. They were not over-fond of work and much given to feasting and dancing. The tribal government was patriarchal, chiefs being hereditary, and kraals having each a *capta*, who was a member of his chief's council. A tax of a portion of the products of the chase belonged to the chief. The councils held court at times, tried cases and disposed of criminals. Murderers were stoned or beaten to death. Adultery was also often punished by death at the hands of the aggrieved husband. Thieves were beaten, starved or banished. Duelling was common, clubs or spears being the weapons. They evidently imbibed some religious ideas from the East, for they were given to ancestor worship, and oriented their huts and graves. Their language possesses much interest, and Hottentot grammars have been published in both English and German. They possess a great fund of myths and legends. The Koras or Korannas (shoe-wearers), south of the Kalahari Desert, still remain a favorable specimen of the Hottentot race. They are taller, stronger and more cleanly than some of the other tribes. Most of them possess cattle; those who do not soon degenerate into Bushmen. On the eastern frontier of the colony

are still some remnants of the Gona or Gonaqua tribe; but they have nowhere preserved their ancient usages and purity of blood, but are much mixed with the Amakosa Kafirs. The Namas, who are the purest type of Hottentots now existing, dwell in Namaqualand, in German Southwest Africa. The Namas are a pastoral people, almost exclusively. Many of them have been Christianized. Consult Stow, 'Native Races of South Africa' (1907); 'South African Natives' (1900).

**HOTTENTOT'S-BREAD.** See ELEPHANT'S-FOOT.

**HÖTZENDORF, COUNT Conrad von,** Austrian field-marshal: b. 1852. He became chief of the Austrian general staff in 1906, and in that capacity made annual visits to the German general staff in Berlin. In March 1917 he was relieved at his own request in order to assume a command in the field. In the following August he was appointed to the chief command of the Austro-Hungarian forces. He had made a special study of mountain warfare, a factor that no doubt contributed materially to the Austro-German victory over the Italians on the Isonzo in the autumn of 1917. Though regarded as a skilful strategist, Count Hötzen-dorf and practically all his generals suffered invariable defeat when unsupported by German officers and troops. It is believed that he was largely instrumental in fanning the flame of Italian animosity against Austria long before the war. He retired in July 1918. One of his sons was killed in the battle of Rawa Russka in Galicia.

**HOUBRAKEN, hou-brä'kën, Jacobus,** Dutch engraver: b. Dordrecht, 25 Dec. 1698; d. 14 Nov. 1780. He was the son of Arnold Houbraken, an artist of some repute. In 1707 he removed to Amsterdam, where he devoted himself to the study of the old Dutch masters. His engravings consist entirely of portraits and genre, his first work being a series for his father's book of biography of Dutch painters. His claim to fame rests chiefly on his illustrations of Cornelis Troost's comedy 'De Ontdekte Schijndeugd.' Consult ver Hull, Alexander, 'Jacobus Houbraken et son œuvre' (Arnheim 1875).

**HOUDAN, hoo'dän,** a breed of domestic fowls, well known and widely cultivated in the United States. They are of medium size, mottled black and white, with black wing bars. The cock has a heavy crest which is divided in the middle of the crown. The hen's crest falls backward. They weigh from six to seven pounds and have five toes. Analogous French breeds are Creveœur and La Fleche.

**HOUDARD, oo'där', George Louis,** French composer and musical historian: b. Neuilly-sur-Seine, 1860. He studied under Hille-macher and Massenet, and devoted his efforts to the study of musical history. In this field he wrote 'L'Art Dit Grégorien d'après la notation neumatique' (1897); 'Le rythme du chant dit Grégorien d'après la notation neumatique'; 'La richesse rythmique musicale de l'antiquité' (1903); 'La cantilène Romaine' (1905); 'La rythmique intuitive' (1906); 'Vademecum de rythmique grégorienne' (1912). Houdard has composed sacred music, of which the best-known work is a 'Requiem.'

**HOUDETOT, oo'd'tō', Elizabeth Fran-çoise Sophie de la Live de Bellegrade, COM-tesse d',** French woman of society: b. 1730; d. 1813. She married, in 1748, Claude Constance César de Houdetot, lieutenant-general of the French army, by whom she became the mother of César Houdetot, governor of Martinique and lieutenant-general under the empire. She was the sister-in-law of Madame d'Épinay. Her liaison with the Marquis of Saint Lambert lasted a number of years. Her fame rests chiefly on Rousseau's descriptions in his 'Confessions' of his unrequited passion for her. She is generally described as plain in appearance, but of sprightly wit and amiable tempera-ment.

**HOUDON, Jean Antoine, zhōn ān-twān oo-dōn,** French sculptor: b. Versailles, 20 March 1741; d. Paris, 15 July 1828. Having gained the first prize for sculpture in the École des Élèves Protégés at Paris in 1761, he went in 1764 to Italy where he studied at the Academy in Rome until the latter part of 1768. There he finished, among other works, the statue of Saint Bruno in the church of Saint Maria degli Angeli. Returning to Paris, he executed admirable busts of Rousseau, Diderot, D'Alembert, Franklin, Turgot, Mirabeau, Gluck, Barlow, Fulton, Jefferson, John Paul Jones, Lafayette, Molière, Napoleon, Voltaire, Washington and many other distinguished men and women; statues of Voltaire and Tourville; the celebrated 'Diana' for the empress of Russia; and other works, which placed him in the first rank of French sculptors. In 1775 he was made a member of the Academy of Painting and Sculpture where he taught for many years. In 1785 he accompanied Franklin to the United States, to prepare the model for the statue of Washington ordered by the State of Virginia, and passed two weeks at Washington's residence at Mount Vernon for that purpose. The statue, bearing the sculptor's legend, '*Fait par Houdon, citoyen Français, 1788,*' now stands in the hall of the capitol of Virginia at Richmond, where there is also one of his marble busts of Lafayette. Among Houdon's later works is the celebrated statue of Cicero ordered by Napoleon I for the Senate chamber. Specimens of his work are in many public buildings in Paris and in many European museums, especially in the Louvre. The Metropolitan Museum of Art, New York; Pennsylvania Academy of Fine Arts, Philadelphia; National Academy of Design, New York; American Philosophical Society, Philadelphia; Girard College, Philadelphia and the collections of B. Altman, H. C. Frick, J. P. Morgan and other art patrons possess valuable examples of his skill. Some of his works have in recent years brought very high prices when sold at auction, a marble bust of one of his little daughters selling in 1912 at Paris for \$90,000. Consult Borgmeyer, C. L., 'Among Sculptures' (in *Fine Arts Journal*, Vol. XXX, p. 199, Chicago 1914); Délerot, E., and Legrelle, A., 'Mémoire sur la Vie et l'œuvre de J. H. Houdon' (in *Mémoires de la Société des Sciences Morales de Seine-et-Oise*, Vol. IV, p. 49, Versailles 1857); Dierks, H., 'Houdons Leben und Werke' (Gotha 1887); Hart, C. H., and Biddle, E., 'Memoirs of the Life and Work of J. A. Houdon' (Philadelphia 1911); Montaiglon, A. de, and Duplessis, G., 'Houdon' (in *Revue Universelle des Arts*, Vols.

I and II, Paris 1855-56); Quincy, Qu. de, 'Notice Historique sur la Vie et les Œuvres de M. Houdon' (Paris 1829); Réau, L., 'L'œuvre de Houdon eu Russie' (in *Gazette des Beaux-Arts*, Periode iv, Vol. XIII, p. 129, Paris 1917); Smouse, F. I., 'Houdon en Amerique' (in *Revue de l'Art*, Vol. XXXV, p. 279, Paris 1914); Taft, L., 'J. A. Houdon' (in *Scribner's Magazine*, Vol. LIII, p. 659, New York 1913); Terrade, A., 'Autour de la Statue de Jean Houdon' (Versailles 1892); Vitry, P., 'Works of Houdon in America' (in *Art in America*, Vol. II, pp. 217 and 368, New York 1914).

**HOUGH, huf, Emerson**, American author: b. Newton, Iowa, 28 June 1857. He was graduated from the State University of Iowa in 1880, traveled extensively in the wild portions of the West, was for several years a writer in Chicago, and there became in 1899 western manager of the New York periodical *Forest and Stream*. His publications are 'The Singing Mouse Stories' (1895); 'The Story of the Cowboy' (1895); 'The Girl at the Half-way House' (1900); 'The Mississippi Bubble' (1902); 'The Way to the West' (1903); 'The Law of the Land' (1904); 'Heart's Desire' (1905); 'The King of Gee Whiz' (1906); 'The Story of the Outlaw' (1906); 'The Way of a Man' (1907); 'Fifty-four Forty or Fight' (1909); 'The Sowing' (1909); 'The Young Alaskans' (1910); 'The Purchase Price' (1911); 'Young Alaskans on the Trail' (1911); 'John Rawn' (1912); 'The Lady and the Pirate' (1913); 'Young Alaskans in the Rockies' (1913); 'The Man Next Door' (1916); 'The Broken Gate' (1917).

**HOUGH, George Washington**, American astronomer: b. Montgomery County, N. Y., 24 Oct. 1836; d. Evanston, Ind., 1 Jan. 1909. He was graduated at Union College in 1856 and received the A.M. degree from Harvard in 1859. In the same year he was appointed assistant astronomer at the Cincinnati Observatory; in 1860 he became assistant astronomer and in 1862 astronomer and director of the Dudley Observatory, Albany, N. Y. In 1879 he became director of the Dearborn Observatory and professor of astronomy at the Chicago University; upon the removal of the Dearborn Observatory to Evanston he accepted a similar position at Northwestern University. He invented several astronomical instruments and discovered more than 600 double stars. He was also the inventor of the recording and printing barometer (q.v.) and of the anometer (q.v.). He belonged to many scientific societies, both in this country and abroad, amongst them being the Royal Astronomical Society of England. He wrote 'Annals of the Dudley Observatory' (Albany 1866-71). Consult Doolittle, E., 'Catalogue and Re-measurement of the 648 Double Stars Discovered by Prof. G. W. Hough' (in *University of Pennsylvania Publications, Series in Astronomy*, Vol. III, part 3, Philadelphia 1907).

**HOUGH, Walter**, American ethnologist: b. Morgantown, W. Va. (Va.), 23 April 1859. He was educated in Monongalia Academy, public schools and West Virginia University, graduating A.B. in 1883. He was granted Ph.D. *pro honoris causa* in 1894; admitted Phi Beta Kappa 1913. After teaching in common schools and at Wyman Institute, Upper Alton, Ill., he

was appointed to the division of ethnology, United States National Museum, January 1886, becoming curator in 1910. For services in connection with the Columbian Exposition of Madrid, 1892-93, he was knighted by Maria Christina, queen regent of Spain. He carried on field work in ethnology and archæology in Arizona and New Mexico, 1896-1907, and published numerous papers on ethnology and Pueblo Indian archæology. He was secretary of the Anthropological Society of Washington, 1901, and president, 1908.

**HOUGH, Warwick**, American jurist: b. Loudoun County, Va., 26 Jan. 1836; d. 28 Oct. 1915. He was graduated from the University of Missouri in 1854, studied law and was admitted to the bar in 1859. In January 1861 he was appointed adjutant-general of Missouri, as such issuing the general order under which the State military organizations went into camp on 3 May. He was for a short time secretary of state in Missouri, resigning in 1863 to enter the Confederate service, and serving on the staffs of General Polk and other Confederate commanders. For a few years after the war he practised law in Memphis, Tenn., but afterward returned to Missouri, establishing himself in Kansas City. He was a judge of the Missouri Supreme Court 1874-84, for two years of that period serving as chief justice of the State. In 1884 he removed to Saint Louis, where he was circuit judge 1901-07, and after leaving the circuit bench, associated with his son, Warwick Massey Hough, continued in the active practice of his profession until his death in his 80th year.

**HOUGHTON, George Hendrick**, American Protestant Episcopal clergyman: b. Deerfield, Mass., 1820; d. 1897. He was graduated at New York University in 1842 and at the General Theological Seminary in 1845. He organized and was rector of the church of the Transfiguration in New York city, which bears the sobriquet "The Little Church Around the Corner." The origin of the name is narrated as follows: A certain actor died and was refused burial services by a prominent city pastor. The reverend referred him to the "little church around the corner" where Dr. Houghton performed the services. Throughout his long pastorate, Dr. Houghton was distinguished for his charitable work.

**HOUGHTON, hō'ton, Henry Oscar**, American publisher: b. Sutton, Vt., 30 April 1823; d. North Andover, Mass., 25 Aug. 1895. He was apprenticed in 1836 to a printer in Burlington, Vt., and in 1842 entered the University of Vermont, where he was graduated in 1846. Going soon after to Boston he became a member of the Cambridge printing firm of Freeman & Bolles which was then changed to Bolles & Houghton in 1849, and founded the "Riverside Press" in 1852, which has since then become one of the biggest and best-known book printing establishments in the United States. In 1864 he formed the book publishing firm of Hurd & Houghton, now the widely known house of Houghton, Mifflin & Co. In 1872 he served as mayor of Cambridge. For many years he was a trustee of Boston University. He was one of the principal figures in the development of printing in the United States during the second half of the 18th cen-

ture, both in regard to quantity and to quality, and was also a strong and sincere supporter of the movement for international copyright. Consult Scudder, H. E., 'Henry Oscar Houghton' (Cambridge 1897).

**HOUGHTON**, how'ton, **Richard Monckton Milnes**, BARON, English poet: b. Fryston Hall, near Pontefract, Yorkshire, 19 June 1809; d. Vichy, France, 11 Aug. 1885. He was educated at Cambridge University and became prominent in Parliament as a moderate Conservative. He was raised to the peerage in 1863. He was long distinguished as the friend of famous authors, notably Tennyson and Swinburne, and himself the author of several volumes of verse and prose, including a 'Life of Keats' (1848). Consult Reid, T. W., 'Life, Letters and Friendship of R. M. Milnes' (London 1910).

**HOUGHTON**, William Stanley, English dramatist: b. Manchester, 1881; d. 1913. After being graduated from the Manchester Grammar School, he worked for a time in the cotton trade. His natural proclivities tended toward the drama, however, and in 1906 he became assistant dramatic critic and reviewer for the *Manchester Guardian*. Among his plays the best are 'The Dear Departed' (1908); 'Independent Means' (1909); 'The Master of the House'; 'The Younger Generation' (1910); 'Hindle Wakes' (1912, also produced in New York in 1913); 'Fancy Free'; 'Phipps'; 'Pearls' (1912) and 'Trust the People' and 'The Perfect Cure' (1913). Most of his plays were produced by the Repertory Players in London and at the Horniman repertory theatre in Manchester. A collection of his one-act plays was published in 1913 under the title 'Five One-Act Plays.'

**HOUGHTON**, Mich., a village and the county-seat of Houghton County, 94 miles northeast of Marquette, on the south bank of Portage Lake, and on the Copper Range, Mineral Range and Duluth, S. S. & A. railroads. Portage Lake is connected with Lake Superior at the south by the Portage River and at the north by a ship-canal by means of which steamers avoid the detour around Keweenaw Point. Houghton is the centre of the rich mineral district in the peninsula of Keweenaw, the total output of which is approximately 150,000,000 pounds. The larger part of the copper export of the region is shipped from this port. There is also considerable lumbering, manufacture and commerce, and the shipping interests are important. The various industries have about 1,000 employees. It is the seat of the Michigan College of Mines, which was founded in 1885 and occupies a fine structure. There are Episcopal, Methodist Episcopal, Catholic and Presbyterian churches. Mention should also be made of the county courthouse. Houghton was first settled in 1851. Its government is by a president and a council of six members elected biennially, three in each year. Pop. 5,113.

**HOULDING**, John Richard ('OLD BOOMERANG'), Australian writer: b. in England and was taken as a child to Australia. He wrote for numerous newspapers and magazines. His published works include 'Adventures of Christopher Cackle'; 'Australian Sketches and Tales from Real Life'; 'Fortunes of the Stubble Family'; 'Investing Uncle Ben's Legacy';

'Adventures of a Young Governess'; 'Roger Larksway's Strange Mission'; 'In the Depth of the Sea'; 'A Flood that Led on to Fortune.'

**HOULT**, Joseph, English shipowner: b. Liverpool, August 1847; d. Penrith, Cumberland, 18 Oct. 1917. He began his business career as a youth at a salary of \$300 a year, and at 21 launched out for himself as a shipbroker. He established the firm of Joseph Hoult & Company, steamship owners, of Liverpool, and built up a very prosperous business. Shortly before his death he made a gift of \$350,000 in War Loan stock, for charitable distribution. He offered a reward of \$2,500 apiece for four German submarines destroyed by any British ship. He sat in Parliament as a Conservative member for the Wirral division of Cheshire from 1900 to 1906.

**HOULTON**, hōl'ton, Me., town and county-seat of Aroostook County, in the eastern part of the State, on the Canadian Pacific and Bangor and Aroostook railroads, 138 miles northeast of Bangor. Houlton is the trade centre for a large agricultural section, abounding in wonderful possibilities and immense agricultural riches. Industries are composed of fertilizer factory, starch factories, woolen mill, long and short lumber mills, carriage factory, foundry and machine works, flour mills, creameries, stave and barrel mills. The water, light and sewerage systems are owned by the town. There are two newspapers, free public library of 10,000 volumes, seven churches, high school and graded schools, also a preparatory school, private; four banks, with deposits of over \$2,000,000. Seat of county buildings. Pop. (1915) 6,729.

**HOUMA**, hoo'ma, La., city, seat of Terrebonne Parish, on the Bayou Terrebonne, the Barataria Canal, and the Southern Pacific Railroad, about 72 miles southwest of New Orleans. It is situated in an agricultural region where the principal crops are rice, sugar-cane and grain. The canning of oysters is one of the important industries; it has a large moss-factory, lumber yards, municipal-owned waterworks and electric-lighting plant. Houma—signifying mound—was the original home of the Houmas Indians. Pop. 5,845.

**HOUND**, a dog that hunts by scent, a definition which excludes the greyhound (q.v.). It is difficult to determine from what stock the English hound has originally sprung, but the old "Southern hound" or talbot was most probably the source of the various hounds now known, among which the bloodhound, foxhound, beagle, harrier, dachshund, turnspit, otterhound and boarhound (now known as Great Dane) are the principal varieties. The mastiff (q.v.) ought also to be included in this group. See Dog.

**HOUNSLOW HEATH**, a region west of the township of Hounslow, London, formerly a resort of highwaymen. A military camp was established on the heath in 1686 by James II, and in the next century extensive barracks were built. Powder-mills now cover part of the territory; the rest is cultivated.

**HOUR-GLASS**, a primitive instrument for measuring time. It consists usually of two hollow bulbs joined one above the other, and having a narrow neck of communication, with

means for placing either bulb in uppermost position. Dry sand is introduced in quantity sufficient nearly to fill one of the bulbs and fine enough to pass freely through the orifice of the connecting neck. The quantity of sand is adjusted to the time which the glass has been constructed to indicate. In the case of an hour-glass the sand in the upper bulb takes an hour to pass into the lower bulb; and so on for any other definite division of time. This instrument is always subject to slight error in its indications of time, owing to the expansion and contraction of the glass by changes of temperature, and by the variations of dryness in the sand. The hour-glass was commonly used in churches during the 16th and 17th centuries to regulate the length of the sermon, and in some places it continued in use down to the beginning of the 19th century.

**HOURIS**, hoo'- or how'riz, the "black-eyed" nymphs of Paradise, whose company, according to the Koran, is to be one of the rewards of the faithful. They are described as most beautiful virgins endowed with perpetual youth. They dwell in beautiful gardens, by flowing streams, have none of the failings but all of the virtues of the sex, and delight in catering to the comfort and pleasures of those good Mohammedans who die in the faith.

**HOURS**, *Book of*, a devotional book for the use of the laity, popular in Catholic countries from the 14th to 16th centuries. It contained an almanac, calendar of the feasts and various devotional selections, litanies, prayers, etc. Some of the ancient books are printed with great care and are beautifully illuminated. Those belonging to royal families were often illustrated by artists according to the taste of the owner. Consult Langlois, 'Essai sur la calligraphie des manuscrits du moyenâge et sur les ornements des premiers livres d'heures imprimés' (Rouen 1841); Soleil, F., 'Les heures gothiques' (ib. 1882); Wordsworth and Littlehales, 'Old Service Books' (London 1890).

**HOURS**, *Canonical*. See **CANONICAL HOURS**.

**HOURWICH**, hoor'wich, **Isaac Aaronovich**, American statistician: b. Vilna, Russia, 26 April 1860. He was graduated at the Classical Gymnasium at Minsk in 1877 and studied medicine at the Saint Petersburg Academy of Medicine and Surgery. The Demidov Juridical Lyceum at Yaroslav awarded him the degree of LL.M. in 1887. Emigrating to the United States, he became Seligman Fellow at Columbia, receiving the degree of Ph.D. in 1893. He is a member of the Russian bar (since 1887), of the Chicago bar (since 1893) and of the New York bar (since 1896). From 1893-95 he was instructor in statistics at the University of Chicago; translator of the bureau of the mint at Washington (1900-02); expert special agent of the Bureau of Census (1902-06); statistician of the public service commission, New York (1908-09); expert special agent on mining, Bureau of the Census, 1909-13. Dr. Hourwich is also prominently connected with various Jewish philanthropies and the municipal reform movement. Among his works are 'Peasant Migration to Siberia' (in Russian, 1887); 'The Economics of the Russian Village' (1893); 'Immigration and Labor' (1912); 'Mooted Questions of Socialism' (in Yiddish, 1917).

**HOUSANTONIC**, hoo-satōn'ik, a river which has its rise in the Berkshire Hills, in the western part of Massachusetts, and flows south, through Connecticut, into Long Island Sound. Its course of about 155 miles is through a hilly, mountainous country, noted for its scenic beauty.

**HOUSE**, **Edward H.**, American author, journalist and musician: b. about 1843; d. Tokio, 18 Dec. 1908. Prominent in promoting friendship between Japan and the United States and in interpreting the men of the two civilizations to each other, reaching the English speaking world through his brilliant writings. Educated at the Chauncy Hall private school, Boston. As correspondent of the *New York Tribune*, he reported to that paper the John Brown episode at Harper's Ferry and was responsible for the incident of John Brown's kissing the negro mother's baby, which has been made the theme of Hovenden's painting and Whittier's poem. He accompanied, to report, the first embassy from Japan in 1860. In 1863, in London, he reported for the *London Times* the prize fight between Heenan and Tom Sayers. There he collaborated with Dion Boucicault in 'Arrah na Pogue' and 'The Colleen Bawn,' and for his friend Charles Reade wrote a chapter in 'Griffith Gaunt.' From 1870 he spent most of his life in Japan—in Tokio as teacher of English in the Imperial University; as editor of the *Tokio Times* (1877-81). He accompanied the Japanese expedition to Formosa in 1874 and wrote an extended account of it in a large pamphlet, besides two revelatory chapters of the modern history of Japan, for Count Okuma, in the pamphlets 'Kagoshima' and 'Shimonoseki' (1875). He held the degree of doctor of music from the University of Oxford and in Japan naturalized orchestral music, being made its imperial orchestra leader. In America, besides numerous contributions to periodicals, his books were 'Japanese Episodes' (1881) and 'Lone Sarto: a Child of Japan' (1888).

**HOUSE**, **Edward Mandell**, universally known as Colonel House, personal representative of President Wilson to European governments during the war: b. Houston, Tex., 26 July 1856. His father, Thomas William House, was an Englishman who settled in Texas and there built a mansion in which he lived with his family the life of an English country squire. A typical Westerner, Colonel House spent his youth in farming, hunting and riding. He was graduated from Hopkins Grammar School, New Haven, Conn., in 1877 and Cornell University in 1881. He made a special study of politics and economics, and though he never sought any public office, he was actively engaged in State and national politics for many years in the Democratic interest. He first came into wider prominence when President Wilson entrusted him with a diplomatic mission to Europe early in 1914, some months before the outbreak of war. Though strong premonitions of war were in the air, he found no belief in a coming conflict either in England or France, but strong military excitement in Germany. In 1915 and 1916 he again represented the President on missions to the governments of the European belligerents, and on 7 Nov. 1917, after the United States had entered the war, Colonel House

arrived in London as chairman of an American mission to the Allies, to attend the deliberations of the Supreme War Council. Since then he had under his supervision the task of preparing materials for the use of the American commissioners at the eventual peace conference. At the Inter-Allied Conference of Premiers and Foreign Ministers held in Paris in November 1917 he presented the views of the American government in relation to the co-ordination of activities and unity of command. In October 1918 Colonel House again visited Europe in connection with the general peace movement and armistice question. Consult Smith, A. D. H., 'The Real Colonel House' (New York 1918).

**HOUSE**, a place of abode of a family or individual. The common expression, "a man's house is his castle," is in most instances true. Except in criminal cases a man can hold his house against all comers. No sheriff can break open his door to arrest him, or seize his goods for debt, except by a writ, affidavit or search-warrant. But the house is no protection where there has been a criminal offense. Breaking into a house with the intent to rob is burglary, and to set fire to a house constitutes arson. A man may defend his house against trespassers and thieves attempting forcible entrance, even to the killing of the intruder, if it can be shown that he has used no greater force than was absolutely necessary. For the house as a structure, see ARCHITECTURE; BUILDING.

**HOUSE ANT.** See RED ANT.

**HOUSE-BOAT**, a combination of boat and house, used largely as pleasure craft on rivers, canals and lakes in Great Britain, the United States and other parts of the world. While palatial house-boats were used by Roman emperors and have been in continuous use in China since early times, the house-boat of modern days first appeared in England about 1860. It was transplanted to this country late in the 19th century, and at first found favor with only a select few; but as soon as its advantages became manifest it began to develop rapidly and advanced to a remarkable state of perfection. A "house-boat" is not a boat with two, three or four decks and a number of staterooms, but a commodious, comfortable craft arranged for the accommodation of a family party, a company of bachelors or any suggestible combination of people. It might be likened to a suite of apartments afloat.

The house-boat in England has been particularly a Thames attraction and is seen to the best advantage at Henley. There are several hundred of these floating houses on the water of the Thames. The price of a house-boat ranges from \$300 to \$25,000. But a comfortable craft, containing saloon, kitchen and four bedrooms may be purchased for \$2,000. The Thames season lasts from June to September and is at its height in July and August. A paper published once a week chronicles the daily movements of each boat. A large house-boat may be hired for the season, including Henley, for \$1,000.

In the United States the house-boat is seen to best advantage on the waters of Florida and during the summer months on the Hudson River, the Saint Lawrence River and Long Island Sound. The American vessels are larger

than the English boats and more expensive. They are constructed on approved plans, and contain every possible comfort and convenience that may be found in the best equipped dwelling or suite of apartments ashore. There are spacious sleeping-rooms, larger than the staterooms on ocean steamers, a cosy sitting-room, a parlor, a library, a reception-room, all the necessary storerooms, a lavatory, a cook's galley and, in fact, everything that a well-ordered household might demand. The properly constructed houseboat has a promenade deck and a high rail encloses it so that children may play about the deck with the utmost freedom and safety. The more pretentious are lighted with gas supplied from a naphtha gas-making machine, or electric light, with the energy supplied by storage batteries.

The great charm of the house-boat is the power that its occupants possess to move it from one place to another. On dry land when a man or a family does not fancy a place he or they move away and leave the house behind. On the house-boat they take their house along with them, and they can go wherever navigable water exists. The boat can be anchored in mid-stream or moored to a pier. No persons can interfere with the privacy of those on board. It is their own floating castle. When they are tired of one place they can go to another, and they have the advantage over their land-living friends that they not only take their house along, but all their belongings, and without the aid of the baggage master.

A typical American house-boat is the *Idler*, owned by a New York gentleman and used about Alexandria Bay, in the Saint Lawrence River. The cabin has a dozen or more windows of goodly size; there is a saloon and opening from it a dining-room. The kitchen, storerooms and quarters for a servant or two are "aft." The promenade deck has hammocks, steamer chairs, camp stools, rugs, tables, books, work baskets and flowers; here the family live, for three-quarters of the time is spent on the boat. Among other well-known house-boats on the Saint Lawrence are the *Nydia*, *Mavis*, *River God*, *Bohemia*, *Amaryllis*, *Merrivale* and *Summerholme*.

On the Mississippi River, Ohio River and other large streams in the Western States the house-boat is utilized for business as well as for pleasure, and floating grocery stores, photograph galleries and dry goods and notion shops are not uncommon. There is on the Mississippi at least one floating theatre built on the house-boat plan, and hundreds of small families have adopted a rudely constructed inexpensive type of boat for permanent residences. Consult Hunt, A. B., 'House Boats and House Boating' (New York 1905).

**HOUSE-BOAT ON THE STYX, A**, a humorous book by John Kendrick Bangs (q.v.) published in 1895. It purports to be an account of the doings and conversations of a company of literary ghosts assembled in a house-boat managed by Charon. Among the ghostly personages represented are Shakespeare, Raleigh, Dr. Johnson and many more of various degrees of renown.

**HOUSE CENTIPEDE**, an insect of the family *Cermatiidae* common in the Southern States of the United States. It is a myriapod,

possessing long legs and antennæ, and is conspicuous for its bright colors. It feeds on lice and smaller insects, and is harmless. Consult Howard and Morlatt, 'Principal Household Insects of the United States' (Washington 1906).

**HOUSE OF CORRECTION**, an institution where disorderly persons are confined, now more commonly known as a reformatory. One of the earliest houses of correction was the Bridewell (q.v.) in London. One of the most modern is the reformatory at Elmira, N. Y., which since 1877 has been a model institution for criminal reform, and its methods an object lesson to other nations. See **ELMIRA REFORMATORY**; **PENOLOGY**.

**HOUSE-CRICKET**. See **GRYLLIDÆ**.

**HOUSE-FINCH**, a familiar garden finch (*Carpodacus frontalis*) of California, grayish, with the head, neck and breast of the male scarlet-carmine. It represents a group of beautiful and interesting Pacific Coast and Mexican finches, also known as linnets and burions.

**HOUSE-FLY**. See **FLIES**.

**HOUSE OF LIFE**, *The*. The manuscript which Rossetti in his love and grief at the death of his wife, buried with her and seven years later caused to be disinterred and published, contained under the general title of *Poems* a section named "Sonnets and Songs, towards a work to be called *The House of Life*." (*The House of Life*), as finally published in 1881, consisted entirely of sonnets, the various pieces in it ranging in their date of composition from 1848 to 1869.

From their appearance at that time until now they have held their position as one of the three or four finest sonnet sequences in English. Of this work as a complete sonnet sequence perhaps the only rivals are Mrs. Browning's 'Sonnets from the Portuguese' and Shakespeare's 'Sonnets.'

'The House of Life' is divided into two parts; the first, in the Elizabethan manner at times but more often after Dante and his circle of poets, deals with the poet's love; the second, in a greater variety of manners, as found in the range of English poetry, deals with many and varied subjects out of his experience. The unique and supreme quality of these poems, as compared with poetry in general, lies in their combination of the mystical and sensuous at once, imagery that is at the same time spiritual and realistic, naive and complex; and in singularly exquisite vividness and poignancy—sometimes strained, exotic, morbid and unregulated—and a passionate love of color and light, of moments, dreams, memories, sound, of seasons and the earth and all beauty, that makes the title, 'The House of Life,' seem perfect and inevitable.

STARK YOUNG.

**HOUSE OF LORDS**. See **PARLIAMENT**.

**HOUSE OF REPRESENTATIVES**, the branch of most State legislatures, and of Congress, which has the more numerous members, elected from smaller districts, and in some cases for shorter terms. Congress—according to the first article of the Constitution—con-

sists of a Senate and House of Representatives. The House represents population; the Senate represents the States. Both represent constituencies and the public equally, and both are not only theoretically but practically equal. The Senate's power of confirming appointments and treaties is fully balanced by the House's power of impeachment, or originating revenue bills, and electing a President if the electors fail of a choice. Nor are the members of either as individuals presumptively superior in power to those of the other. The actual superiority of the Senate is due to the longer terms, which give the older members a parliamentary experience before which the mass of raw members of the House bow; to the seats being the subject of eager competition among the ablest politicians, so that the average public position is higher; and to the lesser membership and smaller number of new bills, which enable it to preserve more independence of the chairman's prerogative than the House. Still, a certain glamour always surrounds the latter as the "popular branch"; partly due to the fact that, owing to its great number and short terms, popular movements are more quickly transformed into legislative action than in the Senate. In this respect alone the idea is correct; a party entrenched in the Senate has often boasted that no matter what the majority of the people wished it could not be dislodged for at least eight years, or the time of two presidential elections, in which anything might happen.

In its formation, the model in the State legislatures was simply to follow the old colonial form of council and assembly—the political theory of "checks and balances" being more potent, however, in defining the distribution of powers than in creating the forms of the houses. The actual form of Congress was a compromise, without which the Union could not have been formed. The large States were averse to being outweighed by the small, and wished for a two-chambered body, with representation in each proportionate to population; the small ones were determined on a single-chambered one, with each State having one vote. The present arrangement was the suggestion of the Connecticut members; a final item of the compromise was that the senators should vote individually and not by States, so that a State should only have its power on condition of keeping its members in place. For the general functions of the House, and its relations present and prospective to the Senate, see **CONGRESS**.

The members of the House, according to the Constitution, must be 25 years of age, seven years citizens of the United States and residents of the States which send them; by act of 25 June 1842 they must be chosen from districts formed of contiguous territory (but see **GERRYMANDER** for the observance of this). This put an end to electing on general ticket, but there is no provision that the representatives shall be residents of their districts, and the people have a perfect right to choose them from any part of the State. What prevents this is not law, but the intense local particularism which, even in State senatorial districts made up of several towns, insists on passing the office around among the towns; at bottom, the American conviction that public office de-

mands no training. The number of members is fixed by Congress after each new census.

A quorum of members is a majority of those actually chosen. The House organizes by having the clerk of the last House call the new members to order, and if a quorum is present he calls the roll for a vote on choice of speaker. The members choose their seats in turn as their numbers are drawn by lot. The principal officers are the speaker, clerk, sergeant-at-arms, doorkeeper, postmaster and chaplain. (For the speaker's powers, see CONGRESS). The sergeant-at-arms is the constable. The symbol of his authority is the mace, made on the pattern ordered by the House 14 April 1789; a Roman device, ebony fasces, of which each rod ends in a spear-head, bound at the ends and in the middle with silver bands, and on the end a globe surmounted by an eagle with outspread wings. The House is governed by Jefferson's 'Manual of Parliamentary Practice,' plus its standing rules and orders and the joint rules of the two houses. Consult Beard, C. A., 'American Government and Politics' (New York 1910); Bryce, J., 'American Commonwealth' (4th ed., New York 1910); McLaughlin, A. C., and Hart, A. B., 'Cyclopedia of American Government' (New York 1914); Reinsch, P. S., 'American Legislatures and Legislative Methods' (New York 1907); Wilson, W., 'Congressional Government' (15th ed., New York 1900).

#### HOUSE OF THE SEVEN GABLES.

A romance written by Nathaniel Hawthorne immediately after the 'Scarlet Letter' (q.v.) and published in 1852. The scene is laid in Salem, the author's native town, which he had quitted for a residence in western Massachusetts when his fellow townsmen became incensed over the personalities in the Introduction to the 'Scarlet Letter.' Something of the resentment shown in this unfortunate sketch is seen in the creation of Judge Pyncheon, the villain of 'The House of the Seven Gables,' who is said to have been drawn after the local politician whom Hawthorne held chiefly responsible for his removal from the Salem custom-house. Other materials in the tale which have a personal or family origin are the inherited curse of the Pyncheons, which was really invoked on an early Hawthorne who was one of the witch-judges, and the account of lost title-deeds to vast estates in Maine, which was one of the traditions in the family of the author's mother. The story involves the aristocratic Pyncheons, who own the house of the seven gables, and their humble fellow-townsmen, the Maules. Between these two families has existed a strange relationship since early colonial times when Matthew Maule pronounced a dying curse on his enemy, a Pyncheon who had brought about his condemnation as a wizard. The reader, however, cares far less for the plot which brings about the removal of the curse than for the treatment of characters and scenes, and the atmosphere which pervades the whole. There is an element of humor which is lacking in the 'Scarlet Letter' and no work of the author shows better his delicacy and subtlety. The portrayal of Hephzibah, the poverty-stricken but proud descendant of the Pyncheons, is masterly in its blending of sympathy and playfulness. While inferior to the 'Scarlet Letter' as a unified work, 'The House of the

Seven Gables' is richer in passages that linger in the reader's memory, and is the romance of Hawthorne most frequently studied in schools and recommended for the reading of young persons.

WILLIAM B. CAIRNS.

**HOUSE SNAKE, or MILK SNAKE,** a variety of *Lampropeltis doliatu*s, the corn-snake (q.v.) of the South, found abundantly in most parts of the northern half of the United States westward to the Rocky Mountains. The dorsal scales are not at all keeled and the ventral plates often exceed 200 in number; the ground-color is gray with three series of rounded black-bordered brown blotches, and the belly checkered with black and white; a length of four feet is sometimes attained. This is a handsome and mild-tempered colubroid snake, very abundant in farming districts, where it frequently enters houses, but probably in search of mice rather than for the purpose of drinking milk, as is popularly believed. It is an expert climber, often ascending porches and vines attached to the walls of houses. Usually the eggs are deposited in a hole dug in a sandy field.

#### HOUSE SPARROW, or ENGLISH SPARROW,

the typical and most familiar sparrow of Europe (*Passer domesticus*), which has now become a cosmopolitan. Its original specific range cannot be determined, as from the first it has attached itself to civilized mankind, clustering about his cabins, settlements and cities, because it was naturally fearless, and still more because human occupations furnished it with an unailing supply of food; and it spread northward and eastward as Roman civilization extended itself into the wilderness. Its hardiness, non-migratory habit and vast fecundity under the stimulation of a constant food-supply, have enabled it everywhere to thrive and to increase in numbers, until now it is probably the most numerous of any sort of land-bird in the world. Certainly it is, as a species, the most widely distributed, yet locally in the sense that it avoids uncultivated or thinly inhabited tracts. When colonies of Europeans, especially British, were formed in various countries, men missed the cheerful little companions of their paternal dooryards, and imported pairs into their new homes in India, Australia, New Zealand and elsewhere, principally from an impulse of sentiment. Meanwhile the bird had made its own way, apparently, across Asia to China and Japan.

This sparrow was introduced into the United States by the deliberate action of gentlemen connected with the Institute in Brooklyn, N. Y., and 50 pairs were set free in that city in the year 1850. Other importations speedily followed, and during the next 10 years colonies were established in Cincinnati, Saint Louis, San Francisco and other interior and western cities, on the theory that they would protect shade-trees from foliage-eating caterpillars. From these centres the adventurous sparrows spread rapidly, chiefly along the highways, "where the droppings of horses furnished an abundant supply of half-digested grain, and along the railways where the grain-cars were continually scattering food." It is now resident in all parts of the continent, as far north as agriculture extends, but is migratory in northern Canada in the time of winter snows. Every-

where it is most numerous in cities, flocking to the rural districts somewhat in autumn, and returning to town or village during the winter.

The natural food of the species consists of seeds, supplemented by buds, fruit and similar fare in season. Caterpillars, ants and other insects are taken, but mainly as food for fledglings. Hence these sparrows have not contributed in a greater degree than do our native fringilline species to the destruction of troublesome "worms." On the contrary they have driven from gardens, villages and city parks, by their numbers and pugnacity, many gentler kinds of native birds that were better insect-catchers. This is true especially with reference to such birds as are willing to make their homes in nesting-boxes within gardens and parks, such as martins, barn-swallows, bluebirds and wrens, which the sparrows attack incessantly, tearing their nests to pieces to get materials for their own, and seizing on their quarters. They are destructive in gardens, also, eating young plants, pecking at all kinds of fruit and plucking off buds and flowers. They make a nuisance of themselves, also, by the construction in shade and ornamental trees, and among vines over porches and walls, of their big, ragged, globular nests, entered by a hole in the side; and often place these unsightly structures on buildings, or amid architectural decorations, and at the same time befall the buildings with their droppings, and disturb the sleeping occupants by their noisy chirping. Moreover the nests and the birds themselves harbor and distribute vermin and disease-germs.

These noxious traits far overbalance any good these foreign sparrows do, and are a heavy cost to pay for the cheer of their presence in the streets of the large cities. In many circumstances repressive action is necessary, and the government not only refuses them the protection of law, but has issued directions for killing them by wholesale; but little can be accomplished toward ridding an estate or a village of the pest except by co-operative and concerted action, steadily continued, and this is hard to obtain.

Much has been written about this subject in ornithological and agricultural literature, including several special treatises, of which the most comprehensive is by W. B. Barrows, entitled 'The English Sparrow in North America,' published by the Department of Agriculture at Washington, in 1889, as Bulletin 1 of the Biological Survey.

ERNEST INGERSOLL.

**HOUSEHOLD GODS.** See LARES; PEN-ATES; VESTA.

**HOUSEHOLD WORDS,** a weekly magazine published by Charles Dickens, founded 30 March 1849. Many of the short stories of Dickens and contemporary authors appeared in its numbers. In 1858 it was discontinued and its patronage absorbed by *All the Year Round*.

**HOUSELEEK,** a genus of plants of the family *Crassulaceæ*. The leaves are of dark green, thick and spiny, growing in rosette-shaped clusters. The flower grows on a slender stalk and is pale-red and star-shaped. The leaves have the property of relieving pain caused by stings, burns, etc. See also *SEDUM*.

**HOUSING PROBLEM.** See TENEMENT HOUSE.

**HOUSMAN, Laurence,** English author and illustrator: b. London, 18 July 1865. He has illustrated 'The Goblin Market'; 'Weird Tales'; 'The Were Wolf'; 'Jump to Glory Jane'; and other books, his work being mostly engraved on wood by his sister Clemence. His publications include 'The Writings of William Blake' (1893); 'A Farm in Fairyland' (1894); 'The House of Joy' (1895); 'Gods and Their Makers' (1897); 'The Field of Clover' (1898); 'The Little Land' (1899); 'The Seven Young Goslings' (1899); 'Love Letters of an English-woman' (1901), which appeared anonymously; 'The Blue Moon' (1904); 'The Cloak of Friendship' (1905); 'Mendicant Rhymes' (1906); 'Selected Poems' (1909); 'Pains and Penalties' (1911); 'John of Jingalo' (1912); 'The Royal Runaway' (1914), and 'Jingalo in Revolt' (1914); 'The Return of Alcestis' (1916).

**HOUSSAYE, oo-sä', Arsène,** French writer: b. Bruyères, 28 March 1815; d. 26 Feb. 1896. His family name was Housset. A few years after his arrival at Paris (1832), he published two interesting romantic novels, 'La couronne de bluets' and 'La pécheresse' (1836). He was a facile writer, producing works of equal merit in various literary forms and on many diverse subjects. They include 'L'histoire de la peinture flamande et hollandaise' (1846); 'Mlle. de la Vallière et Mme. de Montespan' (1860); 'Galerie de portraits du XVIIe siècle' (1844); 'Histoire du quarante et unième fauteuil de l'academie française' (1855), literary criticisms written with satirical poignancy; 'Comédiennes' (1857); 'Symphonie des vingt ans' (poetry, 1867); 'Cent et un sonnets' (1873) and numerous novels. From 1849-59 he was director of the Comédie Française, a post which he secured at the recommendation of Rachel. He was also editor of *L'Artiste* and of *La Presse*.

**HOUSSAYE, Henri, õn-rè oo-sä',** French historian: b. Paris, 24 Feb. 1848; d. 1911. He was educated at the Lycée Napoléon, fought with distinction in the Franco-German War, became an editor of the *Revue des Deux Mondes* and the *Journal des Débats*, and was chosen president of the Société des Gens de Lettres. In 1864 he obtained election to the French Academy, which in 1873 awarded the Thiers prize to his 'Histoire d'Alcibiade.' He published in three parts—'1814,' and '1815' (2 vols.)—a study of Napoleon's downfall, which enjoyed wide sale in France, and is considered one of the best extant works on the subject.

**HOUSTON, hūs'ton, David Franklin,** United States Secretary of Agriculture: b. Monroe, N. C., 17 Feb. 1866. He received his education at Harvard, where he took his M.A. in 1892. From 1887-88, he was tutor in ancient languages at the South Carolina College; and superintendent of city schools at Spartanburg, S. C. (1888-91), when he returned to Harvard to pursue advanced courses in political science. He was appointed associate professor in 1897, full professor of political science (1900-02), and dean of the faculty (1899-1902) of the University of Texas. He then resigned in order to accept the presidency of the Agricultural and Mechanical College of Texas, where he remained for three years; after which he

SAMUEL HOUSTON

returned to the University of Texas in the capacity of president. From 1908-16 he was chancellor of Washington University, Saint Louis, and was appointed in 1913, Secretary of Agriculture in the Cabinet of President Wilson. His published works include 'A Critical Study of Nullification in South Carolina' (1896).

**HOUSTON, Edwin James**, American electrical engineer: b. Alexandria, Va., 1847; d. 1914. He studied at the Central High School, Philadelphia, where he taught later in the departments of physical geography and natural philosophy. From there he was called to the chair of physics at Franklin Institute, and taught the same subject at the Medico-Chirurgical College. His fame rests on his research in regard to electric systems, in which field he was coinventor of the Thomson-Houston system of arc-lighting. He was a member of the United States Electrical Commission and chief electrician of the International Exposition at Philadelphia in 1884. He was president of the American Institute of Electrical Engineers (1893-95). He was the author of 'Elements of Physical Geography' (1878); 'Dictionary of Electrical Word Terms and Phrases' (1889); 'Arc Lighting' (1897); 'Electricity in Every Day Life' (3 vols., 1904); 'Arc Lighting' (revised, 1906); 'Wonder Book of Magnetism' (1908); 'The Land of Drought' (1910); 'Born an Electrician' (1912).

**HOUSTON, Sam**, American soldier and statesman: b. near Lexington, Va., 2 March 1793; d. Huntsville, Tex., 26 July 1863. In 1806, after the death of his father, the family moved to Tennessee. Some years later he left home, crossed the Tennessee River and took up his abode with the Indians, by whom he was kindly received, and with whom he lived after their own fashion for several years. Oolooteka, one of their chiefs, adopted him as his son. In 1811 he returned to his family, and to maintain himself opened a school. In 1813 he enlisted as a common soldier in the United States army, was soon promoted ensign and lieutenant and fought under General Jackson, who from then on became his admirer and friend, against the Indians at the battle of Tallapoosa, in March 1814. There he received a severe wound which gave him considerable trouble throughout his entire life. In November 1817 he was appointed Indian sub-agent to carry out the treaty with the Cherokees just ratified. In the following winter he conducted a delegation of Indians to Washington. On arriving he found that complaints had been made against him to the government on account of the zeal with which he had exerted himself to prevent the unlawful importation of African negroes through Florida, then a Spanish province, into the Southern States. He was acquitted of all blame, but conceiving himself to be ill treated he resigned his commission in the army, and returning to Tennessee settled in Nashville and began the study of law. In 1819 he was elected district attorney, and in 1821 was chosen major-general of militia. In 1823 he was elected to Congress, was re-elected in 1825, and in 1827 was chosen governor of Tennessee.

In January 1829 he married Miss Eliza Allen, member of a prominent Tennessee family. Three months later his wife left him for reasons unknown; he immediately resigned his

office, separated from his family, and deserting civilization, went to Arkansas, where his former Indian friends, the Cherokees, had removed. He was kindly received and for years remained with the Indians. In 1832 he went to Texas and at the outbreak of the Mexican War (q.v.), was elected commander-in-chief of the Texan army.

After the massacre of the Alamo, the Mexican President-general, Santa Anna, was defeated by Houston at the battle of San Jacinto, 21 April 1836. Santa Anna was captured by the Texans and the independence of Texas was achieved. On 23 July a general election for President, Vice-President, and members of Congress of the republic of Texas was ordered to take place on the first Monday of the following September. Houston was solicited to be a candidate, but declined; but as the day of election approached the popular feeling in his favor became so manifest that he had no alternative but to accept. He was elected by a large majority, one of the other candidates being S. F. Austin (q.v.), and was inaugurated 22 Oct. 1836. One of his first acts was to liberate Santa Anna, who had been kept in captivity, and to send him to Washington to confer with the President of the United States. He next opened negotiations with the United States government for the annexation of Texas to the Union, but the measure encountered such strong opposition in the United States that it did not succeed till several years later. Houston was again elected as President of Texas in 1841.

Texas became one of the United States in 1845, and Houston and Rusk were the first senators sent to Washington. Houston was re-elected at the end of his term in 1853, and remained in the Senate till March 1859. Both during his service in the Senate and House of Representatives he distinguished himself by his powerful eloquence. As a senator he was opposed to the Kansas and Nebraska bill, against which he made one of his most elaborate speeches, in which he declared that the repeal of the Missouri Compromise was a flagrant breach of faith, which would involve the country in interminable agitation and difficulty. He was prominently mentioned in 1854 as a presidential candidate of the "Know-Nothing" party. He was elected governor of Texas 1 Aug. 1859, but was deposed for adherence to the Union in 1861. After that he retired to Huntsville, Tex. The city of Houston, Tex. (q.v.), was named in his honor. A statue of Houston by Ney is in the statuary hall of the Capitol at Washington. Consult Anon., 'The Life of Sam Houston, the Hunter, etc.' (Philadelphia 1866); Bradley, G. D., 'Winning the Southwest' (Chicago 1912); Bruce, H., 'Life of General Houston' (New York 1891); Bryan, G. S., 'Sam Houston' (New York 1917); Crane, W. C., 'Life and Select Literary Remains of Sam Houston' (Philadelphia 1884); Dyer, O., 'Great Senators of the United States: 40 Years Ago (1848-49)' (New York 1889); Elliott, S. B., 'Sam Houston' (Boston 1900); Lester, C. E., 'Sam Houston and His Republic' (New York 1846); Sabin, E. L., 'With Sam Houston in Texas' (Philadelphia 1916); United States, House of Representatives, 'Statues of Sam Houston and S. F. Austin, etc.' (in *United States, House Documents, 58th Con-*

*gress, 3d Session, No. 474, Washington 1905*; Williams, A. M., 'Sam Houston and the War of Independence in Texas' (Boston 1893).

**HOUSTON**, Tex., city and county-seat of Harris County, on the Houston Ship Channel and the Houston and Texas Central; Galveston, Harrisburg and San Antonio; Texas and New Orleans; Beaumont, Sour Lake and Western; Houston East and West Texas; International and Great Northern; Trinity and Brazos Valley; San Antonio and Aransas Pass; Gulf, Colorado and Santa Fé; Missouri, Kansas and Texas; Saint Louis, Brownsville and Mexico; Galveston, Houston and Henderson; Texas Transportation Company, Sugarland Railway, and Houston and Brazos Valley railroads, 48 miles northwest of Galveston. It is at the highest point in the State, permanently accessible by water from the Gulf of Mexico.

**Transportation.**—The Houston Ship Channel, formerly known as the Buffalo Bayou, which furnishes an outlet to the sea 50 miles distant, has been navigated from the earliest days of the city's history. The work of widening and deepening it at a total cost of \$4,500,000, was completed in 1914, after considerable delay, and when half of the final appropriation of \$2,500,000 necessary to finish the work, on the offer of the Harris County Navigation District, was accepted by the Federal government. It now admits of the passage of large ocean steamers, and the government stands pledged to maintain it forever. The ship channel has been the greatest factor in the development of the city. Its banks offer excellent sites for industrial enterprises, which can acquire the ownership of their wharves and warehouses, and many large manufacturing plants are already fixed there, including those of the Houston Packing Company, The Texas Company, Bayou City Compress, Density Cotton Yard, International Press, Magnolia Compress and Warehouse Company, Merchants Compress Company, Shippers Compress Company, Standard Compress Company, R. R. Dancy & Co., Merchants and Planters Oil Company, Nelms-Kehoe Cotton Dock Company, Armour Fertilizer Company, Calhoun Pattern, Foundry and Machine Company, Fidelity Chemical Corporation, Houston Lighting and Power Company Houston Gas and Fuel Company, Pritchard Rice Mills, Galena Oil Refinery, Sinclair Oil Refinery, Universal Shipbuilding Company, Midland Bridge Company, Houston-Humble Oil Company Refinery, Pacific Chemical Company, Gulf Refining Company (mixing plant), Peden Iron and Steel Company, Schuhmacher Grocery Company, Farmers Oil Company, Texas Portland Cement Company. Regular steamship service has been established between Houston, Philadelphia and New York City, and also with Tampa, Fla., Tampico, Mexico, and other points, and the completion of the Intercoastal Canal further facilitates transportation. Houston is also the great railroad centre of the Southwest and the headquarters of the larger lines as listed above.

**Industries.**—Being the centre of a rich lumber and agricultural region, it is the distributing point of most of the raw material of the State, and the largest inland port cotton market in the world. Its extensive cotton plants handle over 1,000,000 bales annually, and

over 3,000,000 bales are marketed through Houston. It is the headquarters of 23 oil corporations and 47 lumber corporations, and has important rice mills, cotton-seed oil and sugar refineries, lard factories, fertilizing plants, etc., making a total of 369 factories turning out 283 different articles with an approximate value of \$63,000,000.

**Banks.**—There are six national banks, two State banks and six trust companies, with a combined capital of \$9,000,000. The combined deposits in November 1918 amounted to \$53,210,821.

**Buildings.**—Houston has more skyscrapers than any other city of equal population. Prominent among these are the Texas Oil Company building (costing \$1,000,000), the Union National Bank, the Kress, Mason and Foster buildings. Among the principal edifices are the city hall (with new annex), the city auditorium (costing \$400,000), the Carnegie library and Houston Lyceum, union station, the market, City Hospital, Cotton Exchange, United States government building, South End Junior High School (costing \$325,500) and Rice Institute.

**Bridges and Parks.**—Sixteen bridges span the ship channel and smaller streams of the city, 10 of which are concrete; the largest, the Main street viaduct, was built in 1912, at a cost of \$555,375. The park area of the city is over 800 acres, 409 acres having been donated in 1914 by Mr. G. H. Hermann.

**Education.**—Houston has exceptional educational facilities. It is the seat of the Rice Institute, the largest educational institution in the South, founded by the late William M. Rice in 1892 as a free coeducational institution of liberal and technical learning. The original endowment of \$5,000,000 has been increased to over \$10,500,000, and it was opened for students in 1912. The property covers 100 acres; six of the proposed 33 buildings are completed. The city has, besides, 23 public schools—three of which are high schools for the whites and 12 (one high school) for colored, with a combined building valuation of \$1,415,050 and equipment valuation of \$144,225. Saint Agnes Academy is the most important of several Catholic educational institutions, and there are a number of private schools. There are 34 churches of all denominations for whites, and 29 for colored, besides missions, chapels and numerous charitable institutions.

**Government, etc.**—In 1905 Houston adopted the commission form of government, vested in a mayor and four commissioners, chosen from the city at large every two years. The municipality owns and operates the water-works which are abundantly supplied by artesian wells. The city has a sinking fund of \$1,452,315.94 in 1917. Its total expenses in 1916 amounted to \$3,290,900, of which \$551,380 was expended for schools; \$86,204 for the water department; \$178,068 for the fire department; \$223,592 for the street and bridge department. In 1914 the area of the city was increased from 16 to 32 square miles. The total assessed valuation of lands, improvements and personal property was \$143,000,000.

**History.**—Houston was settled shortly after the battle of San Jacinto, which was fought on 21 April 1836, within a few miles of its location. It was named after Gen. Sam Houston (q.v.), was incorporated in 1837 and until

1840 was the seat of government for the republic of Texas. Pop. 153,192.

JAMES Z. GEORGE,  
General Manager, Houston Chamber of Commerce.

**HOUTMAN**, hout'man, Cornelis, Dutch traveler: b. Gouda, middle of 16th century; d. 1599. He is said to have been the founder of the East Indian trade. He journeyed in a trading vessel to Lisbon in 1593, where he suffered imprisonment. On his release he became interested in the routes to the East and was successful in organizing an expedition of four ships which set forth in 1595. His route led him around the Cape of Good Hope, through the Strait of Sunda to the south coast of Java, and thence returned to his native country, two years later. The importance of this discovery of an accessible route to the Spice Islands resulted in the formation of the Dutch East India Company. Houtman made other voyages over the same passage and was killed by the natives of Achin.

**HOUTMAN**, Frederik, brother of the preceding: b. 1570; d. 1627. He accompanied his brother on his various expeditions as navigator of the fleet. He suffered capture by the natives of Achin in 1598, purchased his freedom and eventually found his way back to Holland in 1601. Two years later he undertook another voyage to the East Indies and was appointed governor of Amboyna in 1605. In 1618 he was given a similar post in the Moluccas and in 1625 received a gold medal from the government in recognition of his services to Dutch trade. Houtman was also a noted linguist, publishing a grammatical dictionary of Malay and Madagascar. An edition of this work as a grammar and dictionary of Malay and Dutch appeared in 1680. The citizens of Gouda erected bronze statues to Frederik and Cornelis Houtman in 1880.

**HOVE**, hōv, England, a municipal borough in Sussex, England, on the English Channel, near Brighton, on the London, Brighton and South Coast Railway. The great seawall of Brighton extends along the Hove front and forms an attractive promenade. There are fine walks, hotels, public buildings, library and municipal baths. The Sussex County cricket ground is stationed here. The municipal borough was incorporated in 1898, the government being vested in a mayor, 10 aldermen and 30 councillors. Pop. 37,000.

**HOVEDEN**, hūv'dēn or hōv'dēn, or **HOWDEN**, Roger of, an English chronicler: b. probably at Howden, Yorkshire; d. about 1201. He served as clerk at the court of Henry II, was itinerant justice for Cumberland, Northumberland and Yorkshire. His fame rests chiefly on his 'Cronica,' a record beginning with the year 732 and ends with 1201. It was edited by Bishop Stubbs (4 vols., 1868-71). A modern translation appeared by Riley at London, 1853, in the 'Bohn Library.'

**HOVELACQUE**, ōv'-lāk, Alexandre Abel, French anthropologist: b. Paris, 1843; d. 1896. He is known chiefly as one of the founders of the Ecole d'Anthropologie, where he was professor of linguistic ethnography, and director in 1890, succeeding Gavarret. He was also active in politics and was elected mayor of Paris in 1888. He published 'Mélanges

des linguistique et d'anthropologie' (1889); 'Les races humaines' (with Emile Picot and Julien Vinson 1882), and 'Précis d'anthropologie' (with G. Hervé, 1887). He was also one of the founders of the *Revue de Linguistique*.

**HOVENDEN**, Thomas, American genre painter: b. Dunmanway, in County Cork, Ireland, 28 Dec. 1840; d. Norristown, Pa., 14 Aug. 1895. He studied at Cork, at the South Kensington art schools and after his emigration to the United States in 1863 at the National Academy of Design, New York. A few years were also spent in France, where he studied under Cabanel at Paris, and devoted much of his time to a study of peasant types in Brittany. On his return to the United States he became a member of the National Academy in 1882. His principal works are 'The Last Moments of John Brown' (Metropolitan Museum); 'Breaking Home Ties,' a popular work, depicting an American farm lad leaving home to seek his fortune in the city; 'News from the Conscript'; 'A Brittany Woman Spinning'; 'Loyalist Peasant Soldier of La Vendée'; 'A Breton Interior' (1793), and 'Jerusalem the Golden.'

**HOVEY**, Alvin Peterson, American soldier: b. near Mount Vernon, Ind., 6 Sept. 1821; d. Indianapolis, 23 Nov. 1891. He taught school by day and at night studied law, and was admitted to the bar in 1843; was appointed successively circuit judge, judge of the Supreme Court and United States district attorney. In 1846, at the outbreak of the Mexican War, he enlisted in the Indiana volunteers, but saw no active service. He was colonel of the 24th regiment of Indiana volunteers, and afterward major-general during the Civil War. He went through the Vicksburg campaign under Grant who thought very highly of him. In 1864 he was made commander of Indiana. He was Minister to Peru; was elected to Congress in 1886, and became governor of Indiana in 1888. Consult Johnson, R. U., and Buel, C. C., 'Battles and Leaders of the Civil War' (4 vols., New York 1884); Walker, C. M., 'Hovey and Chase' (Indianapolis 1888).

**HOVEY**, Charles Mason, American horticulturist: b. Cambridge, Mass., 26 Oct. 1810; d. Boston, 2 Sept. 1887. He was the first to introduce a pistillate strawberry, known as 'The Hovey,' a variety that marks the beginning of strawberry culture in the United States. He edited the *Magazine of Horticulture* for many years, and was the author of 'Fruits of America' (2 vols., 1880).

**HOVEY**, Edmund Otis, American geologist: b. New Haven, Conn., 15 Sept. 1862. He was educated at Yale University, receiving his doctor's degree in 1889. In 1890 he studied at the University of Heidelberg, and on his return to the United States became principal and superintendent of schools at Janesville, Minn. (1884-85); of Elk River, Minn. (1885-86). From 1886-87 he was assistant at the mineralogical laboratory of the Sheffield Scientific School, and served also as principal there from 1891-92. At the Chicago Exposition he had charge of the Missouri mineral exhibit. In 1894 he entered the employ of the geological department of the American Museum of Natural History, serving first as assistant, and finally becoming curator in 1910. He assisted

on the United States Geological Survey in 1890 and in 1901-06. His publications include 'Martinique and St. Vincent' (1902); 'The 1902-03 Eruptions of Mont Pelée, Martinique and the Soufrière, St. Vincent.'

**HOVEY, Richard**, American poet: b. Normal, Ill., 4 May 1864; d. New York, 24 Feb. 1900. He was graduated at Dartmouth 1885, studied theology for a year, but soon went abroad and led a bohemian life, being in turn actor, journalist, dramatist and poet, and finally lecturer on English literature in Barnard College, New York. His verse was of the idealistic school and marked with the influence of Ibsen and Maeterlinck. His works are 'Launcelot and Guenevere'; 'Taliesin: a Masque' (1900); 'Seaward: an Elgy' (1893); 'The Laurel' (1897); 'Along the Trail' (1898). A collected edition of these were published in 1907 (New York). His poems were collected in two volumes: 'Along the Trail' (New York 1898), and 'To the End of the Trail' (edited by Mrs. R. Hovey, New York 1908). Together with Bliss Carman (q.v.) he wrote 'Songs from Vagabondia' (New York 1893); 'More Songs from Vagabondia' (New York 1896), and 'Last Songs from Vagabondia' (New York 1900). He also translated 'The Plays of Maurice Maeterlinck' (2 vols., Chicago 1902). Consult Aide, H., 'Richard Hovey' (in *Nineteenth Century*, Vol. XXXV, p. 240, London 1894); Hale, E. E., Jr., 'Launcelot and Guenevere' (in *Dial*, Vol. XXVI, p. 17, Chicago 1899); Knorr, H., 'Richard Hovey's Promise and Work' (in *Poet-Lore*, Vol. XII, p. 436, Boston 1900); Page, C. H., 'Plays and Poems of Richard Hovey' (in *Bookman*, Vol. VIII, pp. 360 and 449, New York 1898-99); Rittenhouse, J. B., 'Younger American Poets' (New York 1900); Ward, L., 'Richard Hovey' (in *Harvard Monthly*, Vol. XXXI, p. 111, Cambridge 1901).

**HOW, William Walsham**, English prelate: b. Shrewsbury, 13 Dec. 1823; d. 10 Aug. 1897. He received his education at Oxford and became rector of Whittington in Shropshire, where he worked for 30 years. In 1879 he was appointed suffragan bishop of Bedford, and in the following year bishop of Wakefield. He was exceedingly active in church revival work in the East End, founding a philanthropic fund and extending his efforts along social lines. In 1888 he became bishop of Wakefield. Bishop How wrote a number of popular hymns, religious poems and sermons, and also a 'Commentary on the Four Gospels,' 'Manual for the Holy Communion'; 'Private Life and Ministration of a Parish Priest' (1873); 'Commentary upon St. John' (1879), and 'The Papal Claims in the Light of Scriptural History' (1881).

**HOWARD, Blanche Willis**. See TEUFEL, BLANCHE WILLIS HOWARD, BARONESS VON.

**HOWARD, Bronson**, American playwright: b. Detroit, Mich., 7 Oct. 1842; d. 1908. Preparing for college he turned to journalism instead of entering Yale, and from 1867 to 1872 was employed on the New York *Tribune*, *Evening Mail* and other newspapers. In 1864 he had written a dramatic piece called 'Fantine,' which was produced in Detroit, but his first important play was 'Saratoga,' produced by

Augustin Daly in 1870, and the first of a long list of successes, which gave him a foremost position among American playwrights. Among his plays are 'The Banker's Daughter' (1878); 'Young Mrs. Winthrop' (1882); 'The Henrietta' and 'Met by Chance' (1887); 'Shenandoah' (1889); 'Aristocracy' (1892); 'Peter Stuyvesant' (with Brander Matthews), etc.

**HOWARD, George Elliott**, American educator: b. Saratoga, N. Y., 1849. He was graduated at Nebraska University (1876), spent a year at the universities of Munich and Paris, and returned to Nebraska as professor of history (1879-91). He occupied a similar position at Leland Stanford Junior University (1891-1901); was at Cornell, giving a special course in history (1902), and lectured at the University of Chicago (1903-04). In the last-mentioned year he resumed his work at the University of Nebraska as professor of institutional history, and later filled the chair of political science and sociology (1906). From 1885-91 he was secretary of the Nebraska State Historical Society. He has written 'Local Constitutional History of the United States' (1889); 'Development of the King's Peace' (1891); 'History of Matrimonial Institutions, chiefly in England and the United States' (1904); 'Preliminaries of the American Revolution' (1905); 'Social Control and the Function of the Family, in Congress of Arts and Science' (Vol. VII, 1906). He has contributed many articles to encyclopedias on history, social science and institutional history.

**HOWARD, Henry**. See SURREY, EARL OF.

**HOWARD, Jacob Merritt**, American legislator: b. Shaftsbury, Vt., 1805; d. 1871. After studying at Williams College he prepared himself for a legal career and took up practice in Detroit, Mich. In 1838 he was elected to the State legislature, and two years later sat in Congress in the Whig party. He devoted much of his time and interest to the Whig campaigns, and was one of the organizers of the new Republican party. He served as attorney-general of the State for three terms. In 1862 he was appointed United States senator to the vacancy occurring on the death of Senator Bingham, and was re-elected in 1864. He published in translation the 'Secret Memoirs of the Empress Josephine' (1847).

**HOWARD, John**, English philanthropist: b. probably Hackney, 2 Sept. 1726; d. Kherson, Russia, 20 Jan. 1790. From 1742-70 he made repeated journeys to the Continent. In 1756 he became a member of the Royal Society. In 1773 he was appointed high sheriff of Bedfordshire, when the subject of prison discipline came under his notice; and finding many abuses in the management of jails, he resolved to devote his time to investigation of the means of correcting them. With this view he visited most of the English county jails and houses of correction, and in March 1774 laid the result of his inquiries before the House of Commons. This resulted in the passage of a number of bills improving prison conditions in England to a considerable extent. From 1775-80 he again traveled extensively, inspecting prisons in France, the Low Countries, Germany, Switzerland, Austria and Italy. In 1781 and 1782 he made a tour through the northern parts of Europe, including Denmark, Sweden,

Russia and Poland. In 1783 he visited Spain and Portugal, and again surveyed the prisons of his own country. At the same time was published a complete edition of his 'State of the Prisons in England and Wales, etc.,' which had been published first in 1777, but was now enlarged by considerable supplementary matter. A new subject now engaged his attention, namely, the management of lazarettos, and the means of preventing the communication of the plague and other contagious diseases. In 1789 he published 'Account of the Principal Lazarettos in Europe.' In 1789 he proceeded through Germany to Saint Petersburg and Moscow. Prisons and hospitals were everywhere thrown open for his inspection as a friendly monitor and public benefactor. While in Russia he died of camp-fever. A statue by Bacon was erected to his memory in Saint Paul's, London. Consult Aikin, J., 'A View of the Life and Philanthropic Labours of the Late John Howard' (Boston 1794); Anon., 'Anecdotes of the Life and Character of John Howard' (London 1790); Brown, J. B., 'Memoirs of the Public and Private Life of John Howard' (London 1818); Dixon, W. H., 'John Howard and the Prison World of Europe' (New York 1850); Field, J., 'The Life of John Howard, etc.' (London 1850); id., 'John Howard's Correspondence' (London 1855); Guy, W. A., '1773; or John Howard, Sheriff of Bedford' (London 1873); id., 'John Howard's Winter's Journey' (London 1882); Taylor, T., 'Memoirs of John Howard' (London 1836); Stoughton, J., 'Howard, the Philanthropist' (London 1884).

**HOWARD, John Eager**, American soldier: b. Baltimore County, Md., 4 June 1752; d. "Belvedere," near Baltimore, 12 Oct. 1827. He joined the army under Washington at Middlebrook, N. J., in the spring of 1777, and subsequently fought at Germantown and Monmouth. In 1780 he joined the troops in North Carolina under Greene, and in the battle of Cowpens (1781) he displayed great gallantry, and the bayonet charge of the Maryland troops under his command, whereby the enemy were thrown into confusion, turned the fortune of the day and secured victory to the Americans. For his services in this battle he received from Congress a silver medal. He was severely wounded at the battle of Eutaw. In 1787-88 he was a member of the Continental Congress. In 1787 he married Margaret, the daughter of Benjamin Chew (q.v.) of Germantown. In 1788 was elected governor of Maryland, a position which he filled for three years. From 1796 to 1803 he represented Maryland in the United States Senate. He was an unsuccessful candidate for the Vice-Presidency in 1816. Much of his former property in Maryland County is now covered by the streets and houses of Baltimore, in which city his name has been given to streets, parks, etc. In 1904 an equestrian statue by the French sculptor, Frémiet, was erected in his memory by the Municipal Art Society of Baltimore. Consult Anon., 'John Eager Howard' (in *National Portrait Gallery*, Vol. II, New York 1835); Municipal Art Society of Baltimore, 'Frémiet's Howard' (Baltimore 1904); Read, E., 'John Eager Howard' (in *Magazine of American History*, Vol. VII, p. 276, New York 1881).

**HOWARD, John Galen**, American architect: b. Chalmersford, Mass., 8 May 1864. He spent three years at the Massachusetts Institute of Technology; then studied with private architects and finally entered the Ecole des Beaux Arts, Paris, where he remained for three years. Among his designs are the Hotel Renaissance, the Hotel Essex and several Park buildings in New York; the high school at Newark, N. J.; the Majestic Theatre, Boston; the public library, Montclair, N. J., and the Electric Tower at the Pan-American Exposition, Buffalo. Since 1901 he has been professor of architecture and supervising architect at the University of California, and since 1913 director of the School of Architecture. A number of the university buildings, as well as the Greek theatre, were designed by Howard. After the San Francisco earthquake, he became an advisory member of the reconstruction committee; and was later appointed one of the chief architects of the Alaska-Yukon-Pacific Exposition (1909). Since 1912 he has been a member of the board of consulting architects of San Francisco.

**HOWARD, Katharine**, fifth queen of Henry VIII (q.v.): b. about 1520; d. 13 Feb. 1542. She was the daughter of Lord Edmund Howard, a granddaughter of Thomas Howard, second Duke of Norfolk, and a niece of Thomas Howard, third Duke of Norfolk. She was also a cousin of Anne Boleyn, second queen of Henry VIII. Married privately to Henry VIII at Oatlands in July 1540, she was publicly acknowledged as queen soon afterward. In November 1541 she was accused of misconduct previous to her marriage and thrown into prison. Released in December, new evidence was uncovered, apparently showing that she had betrayed the king even after her marriage. She was again imprisoned and beheaded in the Tower. Her story has been dramatized by Alexander Dumas the Elder in 'Catherine Howard,' first played in Paris in 1834 and adapted into English by W. D. Suter (in 'Lacy's Acting Edition of Plays,' Vol. XXXVII, London n. d.); and by the German poet Rudolf von Gottschall, in 'Katharine Howard'; it also forms part of the novel by L. Muehlbach, 'Henry VIII and his Court' (English trans., New York 1864). Consult Brenan, G., and Statham, E. P., 'The House of Howard' (2 vols., London 1907); Fronde, J. A., 'The Reign of Henry VIII' (3 vols., New York 1908); Herbert, H. W., 'Memoirs of Henry VIII, etc.' (New York 1855); Hume, M., 'The Wives of Henry VIII' (London 1905); Reville, A., 'Le Roi Henri VIII et ses Femmes' (in *Revue Politique et Littéraire*, Series V, Vol. VI, p. 805, Paris 1906); Strickland, A., 'Lives of the Queens of England' (Vol. III, London 1877).

**HOWARD, Leland Ossian**, American entomologist: b. Rockford, Ill., 11 June 1857. He studied at Cornell University, and later took graduate work at Georgetown University, District of Columbia. He was assistant entomologist, and later became chief, of the Bureau of Entomology (1894), a position which he still occupies. He was appointed honorary curator of the department of insects in the United States National Museum (1895); and consulting entomologist in the United States Public Health

Service (1904). In 1917 he was made member of the committee on agriculture of the National Council of Defense. From 1900-05, he was a trustee of Cornell University. For many years he was editor of *Insect Life*, and collaborated in the Century and Standard Dictionaries. He lectured also at Swarthmore College and the Post-Graduate School of Georgetown University. Dr. Howard is the author of 'Mosquitoes—How They Live' (1901); 'The Insect Book' (1902); 'The House Fly—Disease Carrier' (1911); 'Mosquitoes of North America' (1912) and also many government publications.

**HOWARD, Oliver Otis**, American general: b. Leeds, Me., 8 Nov. 1830; d. 1909. He was graduated from Bowdoin in 1850, and from West Point in 1854. He was then assigned to the ordnance department of the regular army, served in Florida against the Seminoles and was professor of mathematics at West Point 1857-61. At the outbreak of the Civil War he entered the volunteer service as colonel of the 3d Maine regiment. He was in over 20 important battles; in 1861 he was at the battle of Bull Run, and was afterward made brigadier-general of volunteers; in 1862 he served in the Virginia campaign, and at the battle of Fair Oaks lost his right arm. He commanded at the battles of Antietam and Fredericksburg; in 1863 was appointed to the command of the 11th Army corps and led them at the battles of Chancellorsville and Gettysburg. When the 11th corps was united with the 12th he was given the command of the 4th corps of the Army of the Cumberland, but was shortly afterward transferred to the command of the Army of the Tennessee, which was the right wing of Sherman's army on his "march to the sea." In 1864 he was appointed brigadier-general in the regular army, and in 1865 made commissioner of the Freedmen's Bureau; 1869-73 he was president of Howard University (q.v.), established in Washington for the higher education of the negro. In 1874 he was placed in command of the Department of the Columbia, and there conducted four campaigns against the Indians, including that against the Nez Percés tribe. In 1881 he was superintendent at West Point, and subsequently in command of the Departments of the Platte and of California; in 1886 he was promoted to the rank of major-general and assigned to the Department of the East, where he remained until his retirement in 1894. In 1895 he founded the Lincoln Memorial University, Cumberland Gap, Tenn. He wrote 'Donald's School Days' (1879); 'Chief Joseph, or the Nez Percés in Peace and War' (1881); 'General Zachary Taylor' (1892); 'Isabella of Castile' (1894); 'Fighting for Humanity' (1898), and 'Henry on the War' (1898). Consult 'Autobiography of O. O. Howard' (2d ed., 2 vols., New York 1907).

**HOWARD, Thomas Benton**, United States naval officer: b. Galena, Ill., 10 Aug. 1854. He was graduated at the United States Naval Academy (1873), and saw service at the battle of Manila Bay, where he was navigator of the *Concord*. He rose through successive ranks to rear-admiral (1910). In that year, he was placed in command of the fourth division of the Atlantic fleet; of the third division in 1912, and in 1912-13 was president of the Naval Examining and Retiring Board. He was

retired in 1916; and in 1917 was appointed superintendent of the United States Naval Observatory. For some time Rear-Admiral Howard was instructor in mathematics at Annapolis; later taught applied mathematics and physics and chemistry, and was head of the department of ordnance and gunnery.

**HOWARD, William Schley**, American legislator: b. Kirkwood, Ga., 29 Jan. 1875. He received an academic education, was admitted to the bar in 1895 and has since practised his profession at Decatur, Ga. In 1899 he was elected to the Georgia house of representatives and subsequently was solicitor-general of the Stone Mountain judicial circuit from 1905 to 1910. He was elected to Congress in 1911, and was subsequently re-elected several times. During the Spanish-American War he served in the 3d Georgia Volunteer Infantry.

**HOWARD, Kan.**, city in Elk County, on the Elk River, 76 miles south of Emporia, on the Atchison, Topeka and Santa Fé Railroad. The principal industries are agriculture and stock-raising. The city owns and operates its gas and electric-light plants. Pop. 1,175.

**HOWARD COLLEGE**, a Baptist institution of learning at Birmingham, Ala., founded in 1841. Its faculty numbers 20; the average annual attendance of students is 220. The tuition fees are \$75; living expenses, board, etc., \$150; the productive funds amount to \$97,000; the total income, including tuition and incidental charges, is \$38,024. The college colors are crimson-blue. The library contains over 20,000 volumes.

**HOWARD UNIVERSITY**, a coeducational institution in Washington, D. C., was chartered by the United States government in 1867. It was named for Gen. O. O. Howard, who was head of the Freedmen's Bureau and had much to do with the founding of the university. It has the following departments with the standard courses: College of Arts and Sciences, Teachers College, School of Medicine with its Medical College, Dental College and Pharmaceutical College, School of Law, School of Theology (undenominational), School of Manual Arts and Applied Sciences, Conservatory of Music, Library School, Commercial College and Academy. Total faculty 111, students 1,452 from 35 States and six foreign countries. Annual income for all purposes \$204,000, about one-half of which comes from an appropriation of the United States government. Productive endowment \$309,018; value of grounds \$615,692, buildings \$551,924, academic library \$32,700, law library \$8,000, equipment: medical laboratories \$34,744; academic laboratories \$11,457, manual arts and applied sciences \$22,912, other equipment \$29,707. This university has done a very large work in training teachers, physicians, ministers and other leaders of the colored race in the western hemisphere.

**HOWE, Albion Paris**, American artillery officer: b. Standish, Me., 1818; d. 1897. After receiving training at West Point he was assigned to the 4th Artillery. He returned to West Point in 1843 as mathematical instructor until the outbreak of the Mexican War, where he distinguished himself in active service. He became a captain in 1855, and when the Civil War began was appointed chief of artillery

**ELIAS HOWE**  
Inventor of the Sewing Machine

under General McClellan during the 1861 campaign. He fought in the Peninsular campaign, commanding a light artillery brigade in the Army of the Potomac. In 1862 he was appointed brigadier-general of volunteers and served in Couch's division in the 4th Army corps. From 1864-66 he was in command of the artillery depot at Washington, and at the close of the war (1865), he was brevetted major-general in the regular army. In 1882 he retired from the service.

**HOWE, Andrew Jackson**, American eclectic surgeon and author: b. Paxton, Mass., 14 April 1825; d. Cincinnati, Ohio, 16 Jan. 1892. He was educated at Leicester Academy and Harvard College, from which he graduated in 1853. He then attended medical lectures at Jefferson Medical College, Philadelphia; College of Physicians and Surgeons and the New York Medical College of New York City, and Worcester Medical Institute, graduating from the latter in 1855. He was demonstrator of anatomy in his alma mater in 1855-56; professor of anatomy and surgery in Cincinnati College of Eclectic Medicine and Surgery, 1856-59; demonstrator and professor of anatomy in Eclectic Medical Institute of Cincinnati, 1859-61; professor in same of surgery, from 1861 to 1892. He wrote 'A Treatise on Fractures and Dislocations' (1873); 'Manual of Eye Surgery' (1874); 'Art and Science of Surgery' (1876); 'Operative Gynæcology' (1890); 'Conversations on Animal Life' and 'Miscellaneous Papers,' published in 1894, after his death. He was assistant editor of and a frequent contributor to the *Eclectic Medical Journal*. His chief interest outside of his own profession was the study of comparative anatomy; he left his large collection of preparations and drawings to the Cincinnati Natural History Society of which he was a very active member. His great scholarship and equally great ability as a lecturer and speaker made him a highly successful medical teacher, just as his skill as an operator made him one of the foremost surgeons of his day. He was president of the National Eclectic Medical Association in 1882-83.

**HOWE, Edgar Watson**, American novelist and editor: b. Treaty, Ind., 3 May 1854. At the age of 12 he entered a printing office, and when only 19 was publisher of the *Golden Globe* in Golden, Colo. Ten years later he became proprietor and editor of the Atchison (Kan.) *Daily Globe*. In 1883 appeared 'The Story of a Country Town,' which attracted considerable attention; this was followed by 'The Mystery of the Locks'; 'A Moonlight Boy'; 'A Man Story'; 'An Ante-Mortem Statement'; 'The Confession of John Whitlock'; 'Daily Notes of a Trip Around the World'; 'Travel Letters from New Zealand, Australia and Africa'; 'The Trip to the West Indies'; 'Country Town Sayings'; 'The Hundred Stories of a Country Town'; 'Pagan Psalms,' etc.

**HOWE, Elias, JUNIOR**, American inventor: b. Spencer, Mass., 9 July 1819; d. Brooklyn, N. Y., 3 Oct. 1867. He lived with his father, who was both farmer and miller, till 1836, working upon the farm and in the mill and attending the district school during the winters. He then learned the trade of a machinist, and experimented in inventing a sewing-machine. The

model was completed in 1845 and the patent issued 10 Sept. 1846. A patent was also taken out in England, but from this the inventor realized nothing. After constructing four machines in the United States, he visited England in 1847, where he sold one of his machines with all his English rights for \$1,250 to a corset manufacturer. He returned to Boston after two years entirely destitute, and resumed his trade for the support of his family. From this period until 1854 he was involved in expensive lawsuits, when the principal infringers of his patents acknowledged his rights, and arranged to manufacture sewing-machines under licenses from him from which he finally derived considerable wealth. His patent was renewed in 1860 for seven years. Upon its second expiration in 1867, the inventor refused an offer of another renewal. He served as a private in the 17th Connecticut Volunteers during the Civil War. After the war he founded a sewing-machine plant in Bridgeport, Conn. He was the recipient of the Legion of Honor cross and many medals. Consult Anon., 'Elias Howe' (in *Practical Magazine*, Vol. V, p. 321, London 1875); Gifford, G., 'Argument, etc., for an Extension of E. Howe, Jr.'s Patent, etc.' (New York 1860); Holland, R. S., 'Historic Inventions' (Philadelphia 1911); Hubert, P. G., Jr., 'Inventors' (New York 1893); Iles, G., 'Leading American Inventors' (New York 1912); Koehler, W., 'Die Deutsche Nähmaschinen Industrie' (Munich 1913); Neuburger, A., 'Erfinder und Erfindungen' (Berlin 1913); Roe, A. S.; 'Elias Howe' (in *New England Magazine*, n. s., Vol. XXXI, p. 356, Boston 1904); Talbot, F. A., 'All about Inventions and Discoveries' (New York 1916).

**HOWE, Frederic Clemson**, American lawyer: b. Meadville, Pa., 21 Nov. 1867. He studied at Allegheny College, Pa., and at Johns Hopkins. Later he went to Germany, where he pursued advanced courses at Halle University, and on his return to the United States prepared for the legal profession at the University of Maryland and the New York Law School. From 1894-1909 he practised at Cleveland. In 1911 he became director of the People's Institute in New York city, and three years later became commissioner of immigration, port of New York, which office he still holds. In 1905 was United States commissioner to investigate municipal ownership in Great Britain. He held important offices at Cleveland; sat in the Ohio senate (1906-09); during which time he also was professor of law at the Cleveland College of Law; lecturer on taxation at Western Reserve University, and lecturer on municipal administration and politics at the University of Wisconsin. Dr. Howe is the author of 'Taxation and Taxes in the United States Under the Internal Revenue System 1791-1895'; 'The City—The Hope of Democracy'; 'The British City—The Beginnings of Democracy' (1907); 'Privilege and Democracy in America' (1910); 'Wisconsin: An Experiment in Democracy'; 'European Cities at Work'; 'Socialized Germany' (1915); 'Why War?' (1916); 'The High Cost of Living' (1916).

**HOWE, Henry Marion**, American metallurgist: b. Boston 2 March 1848. He is the son of Julia Ward Howe, and brother of Laura

Elizabeth Richards. He received his education at Harvard, and at the Massachusetts Institute of Technology (1871). He became professor of metallurgy at Columbia University (1897), and after having taught there for a number of years was retired as professor emeritus. Dr. Howe has been the recipient of medals from the Franklin Institute of Philadelphia, from the British Iron and Steel Institute and the gold medal of the Verein zur Beförderung des Gewerbflusses. In 1893 he was elected president of the American Institute of Mining Engineers, and in 1912 president of the International Association for Testing Materials. His publications include 'Copper Smelting' (1885); 'Metallurgy of Steel' (1890-1904); 'Metallurgical Laboratory Notes' (1902); 'Iron, Steel and Other Alloys' (1903-06); 'Metallurgy of Steel and Cast Iron' (1916).

**HOWE, John**, English Puritan divine: b. Loughborough, Leicestershire, 17 May 1630; d. London, 2 April 1705. He was educated at Christ's College, Cambridge, and Magdalen College, Oxford, of which latter he was a Fellow and chaplain. About 1654 he was appointed perpetual curate of Great Torrington, Devonshire; in 1657 Cromwell appointed him as his domestic chaplain. As such he served until Richard Cromwell's deposition in 1659. During his absence from Great Torrington various substitutes acted in his place amongst whom was Increase Mather (q.v.). He was frequently styled "The Platonic Puritan" and is ranked as the greatest of the Puritan clergymen. He was an eloquent preacher and a powerful controversialist, but fortunately free from animosity or theological bitterness. He was a prolific writer. His works were collected and published in various editions (in 2 vols., 1724; in 8 vols., 1822; in 1 vol., 1838; in 3 vols., 1848; in 6 vols., 1862-63). Amongst them have been especially valued 'A Treatise on the Blessedness of the Righteous, etc.' (1668); 'A Treatise of Delighting in God, etc.' (1674); 'The Living Temple of God' (1675); 'A Second Part of the Living Temple of God' (1702). All editions of his works contain a life of the author, of which the most important is that by E. Calamy, prefixed to the edition of 1724. Consult Gordon, A., 'John Howe' (in *Dictionary of National Biography*, Vol. XXVIII, London 1891); Horton, R. F., 'John Howe' (London 1895); Miller, S., 'Works of John Howe' (in *Princeton Biblical Repertory and Theological Review*, n. s. Vol. III, p. 177, Philadelphia 1831); Rogers, H., 'The Life and Character of John Howe, etc.' (London 1836 and 1863).

**HOWE, John Ireland**, American inventor: b. Ridgefield, Conn., 20 July 1793; d. Birmingham, Conn., 10 Sept. 1876. He studied medicine and practised his profession for a number of years. In 1828 he patented a process for making a rubber compound, but was unsuccessful in his attempt to utilize his invention commercially. In 1830 he invented a pin-making machine for which he secured a patent in 1832. After building a more perfect machine in 1833 he secured patents also in France, England, Scotland and Ireland. In 1835 he established the Howe Manufacturing Company, first in New York, and later in Birmingham, Conn., of which he was general manager for some 30 years. His first machines were perfected later

by utilizing the inventions of Fowler and Piper, and soon became the means of revolutionizing the pin manufacture.

**HOWE, Joseph**, Canadian journalist, orator and statesman: b. North West Arm, Halifax, 13 Dec. 1804; d. Halifax, 1 June 1873. He was the son of John Howe, a United Empire Loyalist, the deputy postmaster-general of Nova Scotia and founder of the *Weekly Chronicle*. He learned the art of printing in his father's office, contributed his first poem to the *Acadian Magazine* in 1826, and in 1827 acquired the *Novascotian*, to which he contributed a remarkable series of articles descriptive of rambles in the province and in whose hands it was destined to become the potent instrument of liberal reforms. A trenchant attack on the magistrates of Halifax in 1835 led to his prosecution for libel, when he defended his own case, was triumphantly acquitted and "found himself" as an orator. The following year he was elected to the assembly for Halifax County. In 1833 he visited England, and was influential in the establishment of the mail steam service with Halifax that was the beginning of the Cunard Line. He became a member of the executive council in 1840, and speaker of the assembly in 1841, both of which offices he resigned in 1843 to take up the editorship of the *Morning Chronicle*. He was provincial secretary 1848-54, and in the latter year he was appointed commissioner of the provincial railway board. He undertook a recruiting campaign for the British army in the United States in 1855, and the same year was defeated by Dr. Charles Tupper in Cumberland County. In 1862 he resigned from the assembly on his appointment as fishery commissioner. When in 1864 Confederation became a burning question, Howe threw all the weight of his authority and influence against the scheme, visited England to oppose the passing of the British North America Act, and after Confederation had become an accomplished fact, swept the province in both provincial and federal sections for repeal. After fighting on for a time, he bowed to the inevitable, secured better financial terms in the federal bargain for his native province and accepted office in the Macdonald government, first as president of the council and, 1869-73, Secretary of State for the provinces. His acceptance of office was liable to misconstruction by his opponents and it lost him popularity in his native province to which he returned as lieutenant-governor, but had held office for only a few weeks when he died. His death provoked a revolution of feeling in Nova Scotia and was the occasion of great public sorrow. He had won the battle of self-government; he thought imperially; he had been associated with all the great and far-reaching enterprises of his time. In the greatest crisis of his life, when he turned his back on his past utterances and took the field against Confederation, he was less than true to himself. But in the influence he wielded by his pen, in his powers as an orator to sway the hearts of the people, in his personal magnetism and dynamic force, in his rare combination of statesman's grasp and insight with prophetic vision, he is the most remarkable figure in the public life of any British colony and "stands out like a splash of scarlet on the drab background of Canadian politics." Consult An-

JULIA WARD HOWE

mand's 'Speeches and Letters of Joseph Howe' (Chisholm's ed., 1909), and Longley's 'Joseph Howe.'

**HOWE, Julia Ward**, American author and philanthropist: b. New York, 27 May 1819; d. Middletown, R. I., 17 Oct. 1910. She was carefully educated and in 1843 she married S. G. Howe (q.v.) of Boston and immediately became active in philanthropic work. Their home quickly became a centre of the best intellects of Boston. With her husband she edited the *Boston Commonwealth*, one of the ablest anti-slavery papers, to which she contributed leading articles, essays, poems, etc. At the same time she also wrote for the *New York Tribune* and the *Anti-Slavery Standard*. She also was editor of the *Woman's Journal*. After the Civil War she was active as writer and speaker in social and philanthropic work, particularly in the agitation for woman's suffrage and for prison reform. She was one of the founders and for many years president of the New England Women's Club, the first organization of its kind in America; she was also one of the organizers and for a number of years president of the Association for the Advancement of Women; she was delegate to the World's Prison Reform Congress in London (1872) and at that time founded the Women's Peace Association, being an ardent believer in international peace; and was president of the women's branch of the New Orleans Exposition (1885). She preached occasionally in Unitarian pulpits and was president of the Boston Authors' Club from its foundation in 1899. Her writings include 'Passion Flowers' (1854); 'Words for the Hour' (1856); 'The World's Own' (1857); 'Later Lyrics' (1866); 'A Trip to Cuba' (1860) and 'From the Oak to the Olive' (1868), two books of travel; 'The World's Own' (1855), a drama; 'Sex and Education' (1874); 'Modern Society' (1881); 'Is Polite Society Polite?' (1895); 'Life of Margaret Fuller' (1883); 'From Sunset Ridge' (1898); and 'Reminiscences' (1899). Her best-known poem is 'The Battle Hymn of the Republic' (in 'Later Lyrics'), written early in the Civil War, while she was visiting the camps around Washington. It was set to the music of 'John Brown's Body,' and immediately became popular with the soldiers. As a writer she was best in her lyrical poems, most of which show a strong religious feeling. As a speaker she was successful as much by the strength and clearness of her arguments as by her eloquence. She kept her mental and to a great extent her physical abilities up to within a very short time of her death and throughout the many years of her active life was a strong power for the advancement of women and the improvement of mankind. Consult Adams, E. C., and Foster, W. D., 'Heroines of Modern Progress' (New York 1913); Boston, Mass., City Council, 'Memorial Exercises in Honor of Julia Ward Howe' (Boston 1911); Chapman, J. J., 'Memories and Milestones' (New York 1915); Elliott, M. H., 'The Eleventh Hour in the Life of J. W. Howe' (Boston 1911); Hall, F. H., ed., 'Julia Ward Howe and the Woman Suffrage Movement, etc.' (Boston 1913); id., 'The Story of the Battle Hymn of the Republic' (New York 1916); Higginson, T. W., 'Julia Ward Howe' (in 'Carlyle's Laugh and Other Surprises,' p.

285, Boston 1909); Richards, L. E., and Elliott, M. H., 'Julia Ward Howe' (2 vols., Boston 1915); Stedman, E. C., 'Julia Ward Howe' (in 'Genius and Other Essays,' p. 254, New York 1911); Townsend, H. A., 'Reminiscences of Famous Women' (Buffalo 1916).

**HOWE, Mark Antony de Wolfe**, American editor and author: b. Bristol, R. I., 28 Aug. 1864. He was educated at Lehigh and Harvard universities and on leaving college entered the editorial office of *The Youth's Companion*, Boston. In 1893-95 he was assistant editor of the *Atlantic Monthly*, and from 1899 to 1913 was corresponding editor of *The Youth's Companion*. Since 1913 he has been editor of the *Harvard Alumni Bulletin*. He has published 'Shadows,' verse (1897); 'American Bookmen' (1898); 'The Memory of Lincoln' (edited) (1899); 'Phillips Brooks' (1899); 'Boston: the Place and the People' (1903); 'Life and Letters of George Bancroft' (1908); 'Harmonies, A Book of Verse' (1909); 'Home Letters of General Sherman' (edited) (1909); 'Boston Common: Scenes from Four Centuries' (1910); 'Life and Labors of Bishop Hare, Apostle to the Sioux' (1911); 'Lines of Battle and Other Poems, by Henry Howard Brownell' (edited) (1912); 'Letters of Charles Eliot Norton' (with Sara Norton) (1913); 'The Boston Symphony Orchestra' (1914). He edited the series of 'Beacon Biographies' from 1899 (31 vols.).

**HOWE, Richard, EARL HOWE**, English admiral: b. London, 8 March 1726; d. 5 Aug. 1799. At 14 he shipped as a midshipman on board the *Severn*, in which he sailed with Anson for the Pacific, and passed through the usual gradations of the service under that admiral till 1745, when he obtained the command of the *Baltimore* sloop-of-war, in which he took part in the siege of Fort William during the last Jacobite rebellion. In 1756 he served in the Channel fleet; in 1758 reduced Cherbourg. In 1759 he defeated a French squadron under Conflans, and for two years (1763-65) occupied a seat in the Board of Admiralty. In 1776, as commander-in-chief in North America, he acted against the American forces and against D'Estaing, who commanded a superior French fleet. He sailed to the relief of Gibraltar in 1782 and was successful in spite of the combined fleets of France and Spain, and was rewarded with a British peerage. On the outbreak of war with France in 1793 he took the command of the British fleet, and on 1 June 1794 obtained a decisive victory off Ushant for which he received the thanks of Parliament. He was made admiral of the fleet in 1796. His name is one of the highest among those of the famous naval commanders of Great Britain. He greatly improved the service by the introduction of a new system of tactics and perfected the signaling code. Consult the 'Life' by Barrow (1838).

**HOWE, Robert**, American colonial soldier: b. Brunswick County, N. C., 1732; d. there, 12 Nov. 1785. He was a member of the assembly and of two provincial congresses and took a prominent part in the preparation for the Revolution. At the outbreak of the war he was given a command and aided in driving the British out of Virginia; was promoted to the rank of major-general and commanded in the South. In 1778 he was repulsed by the British

and compelled to evacuate Savannah; though then deprived of command he was afterward acquitted by the court-martial by which he was tried for the loss of the city. In 1780 he commanded at Charleston; in 1783 assisted Washington in putting down a mutiny; and in 1785 was elected to the North Carolina legislature, but died before he took his seat.

**HOWE, Samuel Gridley**, American philanthropist: b. Boston, 10 Nov. 1801; d. there, 9 Jan. 1876. He was graduated from Brown University in 1821, which later gave him the honorary degree of LL.D., and from the Harvard Medical School in 1824. Immediately after completing his studies he joined the Greek army at the time of the war for independence; he created an excellent surgical corps for the Greeks and was also distinguished as a brave commander in battle; at the declaration of peace he established an industrial colony of Greeks on the Isthmus of Corinth. He returned to the United States for a short time and collected a sum of money, supplies of food and clothing which he personally distributed in Greece, keeping thereby many hardships from Greek women and children. He then again returned to America, but becoming interested in the work for the blind, went back to Europe in order to study the schools for the blind there; while in Paris he was chairman of the committee for the relief of the Poles in the time of the Polish uprising; he went to Prussia to distribute the funds collected and was imprisoned by the Prussian authorities for five months. In 1832 he returned to Boston and with the assistance of Colonel Perkins and some other friends founded the Perkins Institution for the Blind, of which he became superintendent; in this position he did much to improve the methods in the instruction of the blind; he gradually built up the Howe Press for printing books in raised type, and as early as 1841-42 an edition of the Holy Bible in eight volumes was prepared under his direction in raised type. He was, though extremely modest in his personal relations, a powerful and convincing speaker and by untiring work and continuous effort did much to induce the legislatures of many States to found schools similar to the Perkins Institution. His greatest success was in the training of Laura Bridgman, a deaf, mute and blind little girl. He also assisted in organizing the Massachusetts School for Idiots. He was active in the anti-slavery cause; was candidate of the Conscience Whig Party for Congress, but was defeated; and was editor of the anti-slavery paper, the *Boston Commonwealth*, assisted by his wife, Julia Ward Howe (q.v.). At the close of the Civil War he joined in the work of the Freedmen's Bureau (q.v.). He was always active in many lines of philanthropic work, organized the Massachusetts State Board of Charities, as chairman of which he served 1864-74, and went to Greece in 1867 with supplies for the Cretans. In 1870 he was one of the commission appointed by President Grant to visit Santo Domingo and report upon the advisability of its annexation. He wrote 'Historical Sketch of Greek Revolution' (1828); 'Reader for the Blind' (1839); 'Appeal to the People of the United States, to Relieve from Starvation the Women and Children of the Greeks of the Island of Crete' (1867). His many reports in his capacity as

chairman and director of several boards and institutions are distinguished by their remarkable clarity and vision, as much as by their thoroughness and humaneness. Consult Elliott, W. H., and Hall, F. M. H., 'Laura Bridgman, etc.' (Boston 1903); Holmes, O. W., 'A Memorial Tribute to S. G. Howe' (in *Atlantic Monthly*, Vol. XXXVII, p. 464, Boston 1876); Howe, J. W., 'Memoir of Dr. S. G. Howe' (Boston 1876); Perkins Institution, Boston, 'Proceedings at the Celebration of the One Hundredth Anniversary of the Birth of S. G. Howe' (Boston 1902); Richards, L. E., ed., 'Letters and Journals of S. G. Howe' (2 vols., Boston 1906-09); Sanborn, F. B., 'Dr. S. G. Howe, the Philanthropist' (New York 1891); Stearns, F. P., 'Chevalier Howe' (in 'Cambridge Sketches,' p. 218, Philadelphia 1905).

**HOWE, Timothy Otis**, American statesman: b. Livermore, Me., 24 Feb. 1816; d. Kenosha, Wis., 25 March 1883. He received a common school education, studied law, was admitted to the bar and sat in the Maine legislature in 1845. He removed in that year to Green Bay, Wis., entered politics, and in 1861 was chosen United States senator, serving till 1879. He declined a Supreme Court judgeship on the death of Salmon Chase, but in 1881, after serving as delegate to the International Monetary Conference at Paris, became Postmaster-General in President Arthur's Cabinet. During his administration of this department, which continued until his death, the postage rate was reduced and various other reforms were instituted.

**HOWE, Sir William**, English general: b. 10 Aug. 1729; d. 12 July 1814. He was educated at Eton and received a commission in the Duke of Cumberland's Light Dragoons in 1746. In 1772 he was promoted major-general, lieutenant-general in 1775 and a full general in 1793. He was a brother of Admiral Lord Richard Howe (q.v.) and was appointed rather against his wishes successor of General Gage in command of the British forces in America. He had previously served under Wolfe at the battle of Quebec. He also took part in the campaign against Havana in 1762. He commanded at the battle of Bunker Hill (1775), in which he lost one-third of his men present in the action; in August 1776 he won the battle of Long Island and in September took New York city. He won the battle of Brandywine in September 1777, in consequence of which Philadelphia was occupied by his army. At his own request he was recalled in 1779, and was succeeded by Sir Henry Clinton, who repulsed Washington at Germantown in the October following. After his return, he represented Nottingham in the House of Commons and held various military commands in England. At his request his conduct of the war, which had been severely criticized, was investigated by a committee of the House before which he spoke at considerable length in his own and his brother's defense. He succeeded to his brother's Irish peerage as fifth viscount in 1799. In 1805 he was appointed governor of Plymouth, which post he held until his death. Consult Howe, Sir W., 'The Narrative of Lieut. Gen. Sir W. Howe in a Committee of the House of Commons, etc.' (London 1780); Stevens, B. F., ed., 'Gen. Sir W. Howe's Orderly Book, 1775-76, etc.' (London 1890); Tower, C., 'Essays Political and His-

torical' (Philadelphia 1914); Wilkin, W. H., 'Some British Soldiers in America' (London 1914).

**HOWELL, Clark**, American journalist and legislator: b. Barnwell County, S. C., 21 Sept. 1863. Graduating from the University of Georgia in 1883, he engaged in journalism, became managing editor in 1889, editor-in-chief in 1897 and eventually general manager and controlling owner of the *Atlanta Constitution*. He was elected a member of the Georgia house of representatives in 1887, and speaker of the house 1890-91. He was a member of and president of the Georgia senate 1900-05; has been a member of the Democratic National Committee from Georgia since 1894; and a member of the board of directors of the Associated Press since 1900.

**HOWELL, John Adams**, American naval officer: b. Bath, N. Y., 16 March 1840; d. 10 Jan. 1918. He was graduated from the United States Naval Academy in 1858, and rose by successive ranks to lieutenant-commander (1865). His rise thereafter was consistent: he became commander (1872); captain (1884); commodore (1895); and rear-admiral (1898). He was in charge of the navy yard at Washington in 1893-96, and of the yard at League Island (1896-98). In 1898 he commanded the European squadron and the Northern Patrol squadron. From 1898-1902, he was president of the Naval Examining and Retiring Board, and retired in the last-mentioned year. Mr. Howell was an inventor of considerable repute, patenting a fly-wheel torpedo, a disappearing gun carriage, an amphibious vehicle and a gyroscopic steering torpedo.

**HOWELL, Mich.**, city, county-seat of Livingston County, on the Pere Marquette and the Ann Arbor railroads, 50 miles northwest of Detroit. It is located in a rich agricultural section of the State. The chief manufactures are flour and condensed milk; and it has manufactures of plows, pumps, condensed milk, flour, etc. Pop. 2,338.

**HOWELLS, William Dean**, American novelist, poet and critic: b. Martin's Ferry, Ohio, 1 March 1837. During his boyhood his father owned and published daily papers in Hamilton and Dayton, Ohio, successively, and he learned the printer's trade and gradually the whole business of conducting a newspaper. In 1851 he was working in Columbus as a compositor; in 1856 he became Columbus correspondent of the *Cincinnati Gazette*; and in 1859 was appointed news editor of the *Ohio State Journal*. At this time he published a small volume of poems, and also some poems in the *Atlantic Monthly*. In 1860, when Lincoln was nominated, Howells wrote his life, and in 1861 was appointed United States consul at Venice, where he remained till 1865. The impressions of his stay there were embodied in 'Venetian Life' (1866), and 'Italian Journeys' (1867). On his return to the United States he was for a time connected with the staff of the *New York Times* and the *Nation*. In 1866 he became assistant editor of the *Atlantic Monthly*, and editor-in-chief in 1872. In 1886-92 he conducted the critical department of *Harper's Monthly* called 'The Editor's Study'; in 1892 was editor of the *Cosmopolitan* for a short time, and since then has been the writer of the

'Editor's Easy Chair' in *Harper's Magazine*. Since 1901 he has received the degree of doctor of letters from Oxford, Yale, Columbia and Princeton universities and LL.D. from Adelbert College, and from its foundation in 1909 has been president of the American Academy of Arts and Letters.

His first novel, 'Their Wedding Journey,' was published in 1871; his other novels include 'A Chance Acquaintance' (1874); 'A Foregone Conclusion' (1875); 'The Lady of the Aroostook' (1879); 'The Undiscovered Country' (1880); 'Doctor Breen's Practice' (1882); 'A Modern Instance' (1882); 'A Woman's Reason' (1883); 'The Rise of Silas Lapham' (1885); 'Indian Summer' (1886); 'The Minister's Charge' (1886); 'April Hopes' (1887); 'A Hazard of New Fortunes' (1889); 'The Shadow of a Dream' (1890); 'An Imperative Duty' (1892); 'The Quality of Mercy' (1892); 'The World of Chance' (1893); 'The Coast of Bohemia' (1893); 'A Traveller from Altruria' (1894); 'The Landlord at Lion's Head' (1897); 'An Open-Eyed Conspiracy' (1898); 'The Story of a Play' (1898); 'Ragged Lady' (1899); and 'Their Silver Wedding Journey' (1900). Howells has also written farces and comedies, including 'The Sleeping-Car' (1883); 'The Mouse-Trap' (1897); 'The Unexpected Guests' (1898); and 'The Albany Depot' (1898), etc., and the following volumes of verse: 'Poems of Two Friends' (1860), with J. J. Piatt; 'No Love Lost, a Romance of Travel' (1868), and 'Poems' (1873). His other works include 'Tuscan Cities' (1885); 'Modern Italian Poets'; 'Essays and Versions' (1887); 'Criticism and Fiction' (1891), and 'Impressions and Experiences' (1896); 'Literary Friends and Acquaintances' (1899), and 'Heroines of Fiction'; 'A Pair of Patient Lovers'; 'The Kentons'; 'Literature and Life'; 'The Flight of Pony Baker' (1902); 'Questionable Shapes' (1903); 'Miss Bellard's Inspiration' (1905); 'London Films' (1905); 'Certain Delightful English Towns' (1906); 'Between the Dark and the Daylight' (1907); 'Through the Eye of the Needle'; 'Fennel and Rue'; 'The Mother and the Father'; 'Seven English Cities'; 'New Leaf Mills' (1913); 'The Seen and Unseen at Stratford-on-Avon' (1914); 'Years of My Youth' (1915); 'The Daughter of the Storage' (1916); 'The Leatherwood God' (1916). He edited 'Choice Autobiographies with Essays' (8 vols.) and 'Library of Universal Adventure.' In 1915 he was awarded the gold medal of the National Institute of Arts and Letters "for distinguished work in fiction."

In American literature Howells is the leader of the realistic school; his novels portray the average, everyday American life; he has a true and sympathetic understanding of the "common people" of the United States, and types of the American "self-made" man appear and reappear in his stories. His latest phase, that in which he seeks to understand and set forth the American social problems,—the meaning of socialism, the relations of labor and capital, and, more broadly, the mystery of poverty and of human suffering,—is typified in a book like 'A Hazard of New Fortunes'; and 'A Traveller from Altruria,' a picture of an ideal commonwealth. The absence of idealism in Howells' writings has been cited as their gravest

defect; but it is by no means true that he entirely excludes the ideal sides of life from treatment. His work is marked by carefulness and thoughtfulness in style and construction, and by fidelity to a high ideal of artistic excellence. His essays, like his novels, have always that indefinable charm which is the enduring note in good literature, and to the charm are added the broad outlook and the deep ethical interest which are typical of the man. See MODERN INSTANCE, A; RISE OF SILAS LAPHAM, THE.

**HOWISON, George Holmes**, American philosopher: b. Montgomery County, Md., 29 Nov. 1834; d. 31 Dec. 1916. He was graduated from Marietta College, Ohio, in 1852, and from Lane Theological Seminary, Cincinnati, in 1855, and after holding various college professorships elsewhere became Mills professor of philosophy at the University of California in 1884 until his retirement in 1909 as professor emeritus. He published 'Treatise on Analytic Geometry' (1869); 'Limits of Evolution' (1901), and he edited and contributed to Royce's 'The Conception of God' (1897).

**HOWISON, Henry Lycurgus**, American rear-admiral: b. Washington, 10 Oct. 1837; d. 31 Dec. 1914. He was graduated from the United States Naval Academy in 1858. He served in various important engagements during the Civil War, becoming lieutenant-commander in 1865. In 1899 he became rear-admiral and was retired 19 Oct. 1899.

**HOWITT, William and Mary**, English authors commonly named together; the one publishing 50 works and the other over 100. **WILLIAM** (b. Heanor, Derbyshire, 18 Dec. 1792; d. Rome, Italy, 3 March 1879), showed such a bias to literature that he published verses at 13. In 1821 he married **MARY BOTHAM** (b. Coleford, Staffordshire, 12 March 1799; d. Rome, 30 Jan. 1888), who wrote both by herself and with her husband. Their first joint work, a volume of poems, 'The Forest Minstrel,' was published in 1823, and 1827 appeared 'The Desolation of Eyam.' The best lines in these are by Mrs. Howitt, Howitt himself having no great poetic gift. In 1871, however, he published a volume entitled 'The Mad War Planet and Other Poems.' William and Mary Howitt settled first in Staffordshire. In 1823 they removed to Nottingham, where they resided till 1837, and in 1840 visited Germany, where they resided for three years. Results of their residence in Germany appeared in 'Student Life of Germany' (1841) and 'Rural and Domestic Life of Germany' (1842), which being translated into German acquired flattering popularity. While at Heidelberg Mrs. Howitt set herself to translate the tales of Frederika Bremer into English, and later the works of Hans Andersen. Their most ambitious work is 'The Literature and Romance of the North' (1852). Howitt's best works are those in which English history and life are treated in connection with English scenery. The earliest of these was the 'Book of the Seasons' (1831), which acquired great popularity; 'Rural Life in England' (1838) was also well received. Still others are 'Visits to Remarkable Places' (1840); 'Homes and Haunts of the British Poets' (1847); 'The Year Book of the Country' (1850), and 'The Northern Heights of London' (1869). With

his wife he published volumes on 'The Ruined Abbeys and Castles of Great Britain.' Mrs. Howitt's books for young people were long popular in the United States, and 'The Pet Lamb' and a few other unpretending verses of hers have become familiar to thousands of juvenile readers. Consult the 'Life' by Margaret Howitt (1889).

**HOWITZER**. See GUNS.

**HOWLAND, Sir William Pearce**, Canadian statesman: b. Pawling, N. Y., 1811; d. 1907. At the age of 19 he emigrated to Upper Canada and settled in York County, where he engaged in business, and later established a wholesale trade at Toronto. His political enthusiasms led him to support the Liberal party, and in 1857 he was elected a member of the Canada legislative assembly. Under the Macdonald-Sicotte administration he was Minister of Finance (1862-63), and under the Macdonald-Dorion, Receiver-General (1863-64). He was appointed Postmaster-General under the coalition government, and again Minister of Finance. With A. T. Galt he represented Canada in the reciprocity negotiations with the United States (1865); and was a delegate at the London conference at which the terms of the British North America Act were adopted. He sat in the first Parliament under the new Dominion (1867); and was also Minister of Inland Revenue. Sir Howland served for one term as lieutenant-governor of Ontario (1868-73), and in 1879 was knighted.

**HOWLEY, Michael Francis**, Newfoundland ecclesiastic: b. Saint John's, Newfoundland, 25 Sept. 1843; d. 15 Oct. 1914. After preliminary studies at Saint Bonaventure's he entered the Propaganda at Rome as a student for the priesthood, and was ordained in 1868. After service in Scotland and at Rome, he returned to his native land, and for the remainder of his life worked with great success in its spiritual interests. He became bishop of Saint George's, West Newfoundland, in 1892—the first Newfoundlanders to attain the dignity of the episcopate—was translated to Saint John's in 1894 and raised to the dignity of archbishop in 1904. Archbishop Howley was not only distinguished as a theological student and thinker, a devoted missionary and able preacher, but also as linguist, poet and antiquary. He contributed largely to the historical study of Newfoundland (q.v.), and is the author of 'The Ecclesiastical History of Newfoundland' (1888).

**HOWORTH, how'érth, Sir Henry Hoyle**, English author and politician: b. Lisbon, Portugal, 1 July 1842. He was a Conservative member of Parliament for South Salford 1886-1900. In recognition of his works on Eastern history and other subjects, he was created K. C. I. E. in 1892. Besides very many scientific memoirs, he published 'History of the Mongols' (2 vols., 1876-78); 'The Mammoth and the Flood' (1887); 'The Glacial Nightmare and the Flood' (1905); 'Saint Gregory the Great' (1912); 'Saint Augustine of Canterbury' (1913); 'The Golden Days of the Early English Church' (1916).

**HOWRAH, how'rā**, India, an independent municipality, opposite Calcutta (q.v.), and its most important suburb. Pop. about 179,000.

**HOWTH**, hōth, Ireland. a seaside town of County Dublin, situated on the side of the Howth promontory, on the north shore of Dublin Bay, nine miles northeast of Dublin, with which it is connected by the Great Northern Railway and by street cars. There is an artificial harbor used chiefly by smaller craft. Interesting old buildings are the picturesque collegiate church, dating from the 13th century, and a very ancient castle with valuable historical relics. Howth is a popular watering place. Pop. about 1,200.

**HOXIE, Vinnie Ream**, American sculptor: b. Madison, Wis., 23 Sept. 1846; d. 20 Nov. 1914. She was educated at Christian College, Columbia, Mo., and going to Washington, D. C., studied art, executed busts of Grant, Sherman and others, and a statue of Lincoln for the National Capitol, while still an art student, having won in competition a \$30,000 prize for the statue of the martyred President. She then went abroad, where she designed medallions of Doré, Liszt, Buchanan, Read and others. Among other works of hers are ideal statues of 'Sappho'; 'The Spirit of the Carnival'; and the statue of Admiral Farragut in Farragut Square, Washington. She was married in 1878 to Maj. R. L. Hoxie of United States Engineers.

**HOY**, one of the Orkney Islands, Scotland, the second in size, in lat. 58° 50' N., long. 3° 20' W. It is about 13½ miles long and from six to eight miles wide. It has an excellent harbor, Long Hope, which is four miles long. A striking feature of the island is its steep red and yellow sandstone cliffs which rise abruptly from the sea to a height of some 1,300 feet. Pop. about 1,200. See ORKNEY ISLANDS.

**HOYLAND NETHER**, England, an urban district in the Hallamshire parliamentary division of the West Riding of Yorkshire. It is about six miles southeast of Barnsley, with which it is connected by the Midland Railway. It has extensive coal mines and manufactures bricks.

**HOYLE, Edmond**, English writer on games: b. 1672; d. London, 29 Aug. 1769. It is said that he was educated for the law, but nothing definite is known of his career except that he was for many years in London a writer on and instructor in games. His 'Short Treatise on Whist' (1742), a compendium of the laws of the game and many rules for play, sold largely and has been the basis of all subsequent manuals of the kind. So generally has his authority been accepted in the game that "according to Hoyle" has attained a proverbial significance.

**HOYT, Arthur Stephen**, American clergyman: b. Meridian, N. Y., 3 June 1851. He was graduated at Hamilton College and the Auburn Theological Seminary. From 1872-75 he was tutor at Robert College, Constantinople, Turkey, and on his return was ordained in the Presbyterian ministry. He was pastor at Oregon, Ill., from 1879-86; when he became professor of English literature and public speaking at Hamilton College. Since 1891 he has been professor of homiletics and sociology at Auburn Theological Seminary. His published works include 'The Work of Preaching' (1906); 'The Preachers' (1909); 'Public Wor-

ship for Non-Liturgical Churches' (1911); 'The Vital Elements of Preaching' (1914).

**HOYT, Henry Martyn**, American lawyer and soldier: b. Kingston, Pa., 8 June 1830; d. Wilkesbarre, Pa., 1 Dec. 1892. He was educated at Wyoming Seminary and Lafayette College and graduated from Williams College in 1849, taught school 1849-52, read law, was admitted to the bar in 1853, practised at Wilkesbarre, at the opening of the Civil War was appointed lieutenant-colonel of 52d Pennsylvania regiment, which he helped to raise, served during the Peninsular campaign in 1862, and was captured in a night attack on Fort Johnson during the siege of Morris Island. Exchanged and mustered out with the grade of brevet brigadier-general; he practised his profession until 1867, and was then appointed additional law-judge of the Lucerne County courts. In 1879-83 he was Republican governor of Pennsylvania. His administration was particularly characterized by a wise financial policy, by means of which the State debt was reduced to \$10,000,000 and refunded at 3 per cent. He published 'The Controversy between Connecticut and Pennsylvania' (Harrisburg 1879); 'Protection versus Free-Trade' (New York 1885). He held honorary degrees from the University of Pennsylvania and Lafayette College. Consult Anon., 'H. M. Hoyt' (in 'A Biographical Album of Prominent Pennsylvanians,' Series I, p. 125, Philadelphia 1888).

**HOYT, John Wesley**, American educator: b. near Worthington, Ohio, 13 Oct. 1832; d. 23 May 1912. He was graduated at Ohio Wesleyan University in 1849, and later studied both medicine and law. He had charge of educational exhibits in several international expositions, and was made chairman of the National Committee to Promote the Establishment of the University of the United States. He was the first president of the University of Wyoming, and was governor of Wyoming 1878-83. He published 'Progress of University Education' (1869); 'Studies in Civil Service' (1878); 'History of University Education' (1903), etc.

**HOZIER, Pierre d'**, SEIGNEUR DE LA GARDE, French genealogist: b. Marseilles, 10 July 1592; d. Paris, 1 Dec. 1660. He acquired a prodigious knowledge of the histories of principal families and of heraldry, and in 1616 began genealogical researches. In 1628 the king honored him with the Order of Saint Michel and pensioned him in the following year. He soon rose to the position of royal histographer and genealogist of France (1634); and in 1641, *juge d'armes* of the kingdom. For several years thereafter he was occupied in tracing the descent of the pages of the king's household. In 1654 he was made Councillor of State. His principal work was in the collection of documents, but he published a number of works also, including 'Receuil armorial des anciennes maisons de Bretagne' (1638); 'Les noms, surnoms, qualitez armes et blasons des chevaliers et officiers de l'ordre du Saint-Esprit' (1634); and the genealogies of the houses of La Rochefoucauld (1654); Bournonville (1657); and Amanzé (1659). His genealogies of the principal families of France which comprised the collection numbered about 150. After his death, they were deposited in the Bibliothèque Nationale. Two sons survived: Louis ROGER,

b. 1634; d. 1708. He succeeded his father as *juge d'armes*, but became blind in 1675 and the office fell to the younger brother, CHARLES RENÉ D', b. 1640; d. 1732. He made a splendid collection of armorial bearings, which was the foundation of the Armorial Général de France. His collection is in the Bibliothèque Nationale, and comprises 34 volumes of text and 35 of colored armorial bearings. The entries number some 60,000. His nephew, LOUIS PIERRE, became his heir and also succeeded to the office of *juge d'armes*. He published an unofficial 'Armorial général, ou registre de la noblesse de France' (1738-68). Other descendants of the family continued in similar work. AMBROSE LOUIS MARIE (b. 1764; d. 1846) was the last *juge d'armes* of France.

**HRABANUS MAURUS.** See RABAMES MAURUS.

**HRDLIČKA**, dlich'ka, Ales, American anthropologist: b. Humpoletz, Bohemia, 30 March 1869. After a preliminary education in Bohemia he emigrated to the United States and undertook studies at the Eclectic College and the Homeopathic College. His work led him to undertake special research among the insane and defectives, from which studies he became interested in physical anthropology. From 1896-99 he was associate in anthropology at the New York State Pathological Institute. He spent some time also in Europe studying at the University of Paris and making extensive investigations in criminal and defective institutions. For many years he has been associated with the American Museum of Natural History, where he conducted expeditions in anthropological research in various parts of the United States, Mexico, Peru, South America, Egypt, the Balkans, Europe, Siberia, Russia and Mongolia. He holds the theory that the American aborigines are of Asiatic origin. Since 1910 he has been curafor of the American Museum, in the department of physical anthropology. Hrdlička is a member of various distinguished American and foreign societies devoted to this subject and was associate editor of the *American Naturalist*. He has written 'Report on Anthropological Work in the State Institution for Feeble-Minded Children, Syracuse, N. Y.' (1898); 'Anthropological Investigations on One Thousand White and Colored Children' (1899); 'The Eskimo Brain' (1901); 'Ancient Man in North America' (1907); 'Tuberculosis Among Indians' (1909); 'Observations on Eskimo' (1910); 'Ancient Man in South America' (1912); 'Anthropological Work in Peru in 1913' (1914).

**HROSWITHA.** See ROSWITHA.

**HSUAN TUNG**, shoo'an' toong', reigning title of Pu-Yi, last of the Manchu dynasty of Chinese kings: b. 11 Feb. 1906. He was the son of Prince Chun, and nephew of the Emperor Kwang-su, whom he succeeded to the throne (1908). Prince Chun was appointed regent by the Empress Dowager Tzu-hsi. But her death a few hours after that of the emperor removed his most conservative opponent. Chun did all in his power to make the régime a liberal one, but was finally compelled to abdicate to the republican forces in 1912. The emperor was retired, thus bringing the Manchu dynasty to a close. He was given a residence and a yearly income of 4,000,000 taels. A re-

actionary movement against the Chinese republic was launched in July 1917, which was successful in restoring Hsuan Tung. A few days later he was forced again to abdicate.

**HUAINA CAPAC**, wā-ē'nā kā'pāk, or **HUAYNA CAPAC**, 11th Peruvian Inca: b. Cuzco, Peru, about 1450; d. Tumibamba, Ecuador, November 1525. He began his reign in 1480, or, according to some authorities, 1491, and made many conquests, even subduing the country as far south as Chile. By his will he divided the empire between two of his sons, Huascar and Atahualpa (q.v.). Consult Markham, 'The Incas of Peru' (1910).

**HUAMANGA**, wā-mān'gā, or **GUAMAN-GA**, gwā-mān'gā, Peru, the former name of Ayacucho (q.v.).

**HUAMBISA**, wām-bē'sā, a tribe of South American Indians, of the Jivaroan linguistic stock, living on the upper Santiago and Marañon rivers, Peru. They are of savage habits, fair of skin and wear beards. In the 16th century they participated in the capture of the Spanish settlement at Sevilla del Oro, when several thousand Spanish women were carried off. Their coloring is accounted for by this admixture. In 1843, they wiped out the inhabitants of Santa Teresa, a town between the Santiago and Marona. They maintain a lofty isolation both from their Indian and white neighbors.

**HUANACO**, hwā-nā'kō, the most numerous and widely distributed of the two species of the genus *Lama* (*L. guanaco*), of the camel family, resident in South America. It is somewhat like a large goat in form, but with a much longer neck, surmounted by a small camel-like head and long, pointed, alert ears, but no weapons. A large male is about four feet tall at the withers, a female somewhat less. The coat is of long, woolly, reddish-gray hair, the improvement of which by selective breeding in domestication has formed the alpaca breed (see ALPACA). It roams the open plains of Argentina and Patagonia, serving as the principal game animal of that region, and furnishing the scattered natives with food, clothing and shelter. In the autumn it gathers into large herds and behaves in general like the antelopes of the similar arid plains of other parts of the world. Consult Darwin, Hudson, Spears and other writers on Patagonia. See LLAMA.

**HUANACO**, a department of Peru, having an area of over 14,000 square miles and 160,000 population. Also its capital, 175 miles north-east of Lima, a bishop's see, and a centre of a country rich in haciendas, and growing coffee, cotton and sugar.

**HUANCVELICA**, wān'ka-vā-lē'ka, Peru (1) a department in the central part, bounded south by Ica, west by Lima, east by Ayacucho and north by Lima and Junin. It is traversed by the Cordillera Occidental, so that there is little agriculture possible. The principal industries are mining of silver and quicksilver. The area is 9,251 square miles. Pop. about 250,000. (2) A city and capital of the department of the same name. It is situated in a ravine of the Andes, at an elevation of 12,500 feet. It was founded in 1572 by Francisco de Toledo. The principal industry is mining. Pop. about 6,500.

**HUANCAYO**, wān-kā'yō, Peru, a town in the department of Junín, on the river Mantaro, situated at an elevation of about 11,000 feet. Pop. about 5,000.

**HUANG-HSING**, or **HWANG-HSING**, kwāng shing', Chinese general and revolutionist: b. near Changsha, Hunan Province, 1875. After studying at native colleges, he was graduated at Tokio University, Japan. His active propaganda against the Manchu dynasty brought upon him the odium of the government and he was forced to flee. He took refuge in Japan where he carried on his efforts in behalf of the revolution. With the funds which had been collected by Dr. Sun Yat-sen, he gathered forces and was second in command in the attacks against the imperial forces at Hankow, Hanyang and Wuchang. Under Dr. Sun's provisional administration Huang-Hsing was made Premier and Minister of Navy and Marine. In 1912 when Yuan Shihkai was elected President, the provisional Premier was appointed commander-in-chief of the Southern army. In this capacity he was instrumental in founding the Southern party or Kuomintang, which incurred the displeasure of President Yuan and resulted in the expulsion of Huang-Hsing from the Peking Assembly. He led an unsuccessful revolt in protest and was forced to retire. He visited the United States in 1914.

**HUÁNUCO**, wā'nū-kō, Peru, city and capital of the department of the same name. It is situated at an elevation of some 6,000 feet, not far from the Hualaga River, about 170 miles northeast of Lima. Founded by Gomez Alvarado in 1539, Huánuco, in the years 1881 to 1883, was almost destroyed by the Chilean riots and massacres. It is the seat of a bishopric and until 1855 was the capital of the department of Junín. The chief industries are the manufacture of cocaine and mining. It is also renowned for its wonderful fruits and sweetmeats. The Inca town of Huánuco Viejo, which was settled by Spaniards in 1535 and is practically abandoned now, is not far distant. Pop. about 7,500.

**HUÁNUCO**, a department of Peru, bounded by Loreto on the north and east, Junín on the south and Ancachs on the west. The Cordillera traverse the department, rising to a great height in the western part. The principal rivers are the Marañon and Huallaga, and there are numerous smaller streams, including the headwaters of the Amazon. The chief industries are mining of gold, silver and quicksilver and the cultivation of coffee, tobacco and sugar-cane. Area 14,024 square miles. Pop. about 150,000.

**HUARAZ**, or **HUARAS**, wā'ras, a city of Peru, capital of the department of Ancachs on the river of the same name, about 60 miles from the coast, with which it is connected by rail, and 190 miles northwest of Lima. It is situated at a considerable elevation, in a fertile valley of the Cordillera Occidental. The climate is mild and the appearance of the town severely plain. The principal buildings are the government quarters, the hospital, school and churches. The chief industries are agriculture, principally wheat-raising, sugar and fruit, cattle-farming and the mining of copper, coal,

gold and silver. There are interesting ruins in the vicinity of the aboriginal Incas.

**HUARTE DE SAN JUAN**, wār'tā dā sān hwān, or **HUARTE Y NAVARRO**, Juan de Dios, Spanish physician and psychologist: b. Lower Navarre, about 1530; d. about 1592. He received his medical education at the University of Huesca and rendered important service in the plague at Baeza (1566). He is known principally for his unique book on phrenology, 'Exámen de ingenios para las ciencias' (1575), which was translated into several European tongues. It is interesting as the first attempt to establish the relation between psychology and physiology and to present new and bold theories of education. Consult Guardia, J. M., 'Ensayo sobre la obra de J. Huarte' (Paris 1855); and 'Biblioteca de autores españoles' (Vol. LXV, Madrid 1873).

**HUASCAR**, wās'kār, Peruvian Inca, son of Huaina Capac (q.v.). See ATAHUALPA.

**HUASCO**, wās'kō, Chile, a port in the province of Atacama. Several steamship lines connect with the port and are served by railways from the interior. The important exports are copper, silver, gold, hay, produce and cattle. Pop. about 2,500.

**HUASTECS**, wās'tēks, a tribe of Indians of the Mayan stock, living in the state of Vera Cruz and San Luis. From the archaic forms of their language, as well as from their legends, it is inferred that this tribe was left behind in a southward migration of the Mayan tribes of Central America.

**HUAYNA CAPAC**. See HUAINA CAPAC.

**HUBAY**, hoo'bō-ī, Jenő, Hungarian violinist: b. Budapest 1858. His master was Joachim at Berlin. He made his début in Hungary at the age of 18, and later went to Paris where he met with splendid success. In 1882 he was head violinist at the Conservatory at Brussels, and four years later succeeded his father, Charles Hubay, as chief professor at the Budapest Conservatory. His compositions include several operas: 'Der Geigenmacher von Cremona' (1893); 'Alienor' (1892); 'A falu rózsá' Hungarian opera; 'Lavothas Liebe' (1906), and 'Anna Karenina' (1915); a symphony, a concerto for the violin and numerous single pieces for the violin.

**HUBBARD**, Elbert, American author: b. Bloomington, Ill., 19 June 1859; d. on the *Lusitania*, 7 May 1915. After working on a farm as a boy, he went to Chicago, where he entered a printing-office and later was employed in a soap factory. In the latter business he rose to be manager and finally partner of the firm; selling out his interest, he devoted himself for a time to study and travel and finally settled at East Aurora, where he established the Roycroft shop, devoted mainly to the artistic printing and binding of books. Hubbard edited the *Philistine*, a "magazine of protest," and wrote 'Little Journeys' (biographical sketches); 'No Enemy but Himself'; 'Message to Garcia' (1898); 'Time and Chance' (1901); 'The Man of Sorrows' (1904); 'Hollyhocks and Golden Glow' (1912).

**HUBBARD**, Joseph Stillman, American astronomer: b. New Haven, Conn., 7 Sept. 1823; d. there, 16 Aug. 1863. He was graduated from Yale in 1843 and in 1844 accepted a call

to Washington from Lieutenant Frémont for the purpose of computing the observations for latitude and longitude made during the latter's transcontinental journey. From 1845 until his death he was stationed at the Washington Observatory as professor of mathematics in the United States navy. He made important investigations regarding comets, was at two different periods editor of the *Astronomical Journal*, and was a member of the National Academy of Sciences, of the National Institute of Washington, of the Connecticut and of the American Academies of Arts and Sciences, and of the American Philosophical Society. The results of his astronomical observations have been published in successive numbers of the *Astronomical Journal*. Consult Gould, B. A., 'Memoir of J. S. Hubbard' (in 'National Academy of Sciences, Biographical Memoirs,' Vol. I, Washington 1877).

**HUBBARD, Leonidas, Jr.**, American journalist, writer and explorer: b. Waldron, Mich., 12 July 1872; d. Labrador, 18 Oct. 1903. He was a teacher in the public school at Angola, Ind., while still in his teens and early in life showed keen interest in writing, exploration and athletics. He was graduated from University of Michigan in 1897. While still at college he did reportorial work in Ann Arbor and later on the Detroit *Evening News*. He came to New York in the summer of 1899 and attached himself to the staff of the *Daily News*, but early in 1902 became associate editor of *Outing*, in which work he was much interested. He conceived the idea of exploring into the wilds of Labrador and 20 June 1903, accompanied by Dillon Wallace, a New York lawyer, and George Elson, a Cree Indian guide, he left New York, going by steamer from Saint Johns, N. B., to Rigolette, a Hudson Bay trading post on the Grand River. From this point Hubbard and his friends traveled by canoe and on foot, mapping correctly for the first time Grand Lake; then penetrating the interior in a westerly and northwesterly direction, mapping the course of the Beaver River from its source to the point where it flows into the southeast bay of Lake Michikamau; and locating and mapping several large lakes in the interior. The party penetrated some 250 miles further into new territory than any previous expedition. Notes on the geology and general observation of the topography of the country were also made. The small party struck unexpected difficulties and an unusual scarcity of game, which combined to hold them back until winter had overtaken them. Hubbard's health gradually weakened and when he had become too weak to continue he insisted that his two companions should keep on without him. By the time help was brought to him he was dead. Wallace, who broke down a few days later, was rescued and brought his friend's body to New York. His wife, Mina Benson Hubbard, undertook in 1905 to complete her late husband's plans and made a successful journey into the interior of Labrador. Among Mr. Hubbard's most noted writings are 'The Moonshiner at Home' (1902); 'Barataria' (1902); 'Going to the Woods' (1903); 'Children of the Bush' (1903); and 'Where Romance Lingers' (1904). He also wrote many short articles on outdoor life which were published in *Outing* from 1900

to 1904. Consult Ellis, M. B. Hubbard, 'A Woman's Way Through Unknown Labrador, etc.' (New York 1908); Wallace, D., 'The Lure of the Labrador Wild' (New York 1905); id., 'Leonidas Hubbard' (in *Outing*, Vol. LIX, p. 189, New York 1911); Whitney, C., 'Hubbard Expeditions into Labrador' (in *Outing*, Vol. XLV, p. 643, New York 1905).

**HUBBARD, Richard William**, American artist: b. Middletown, Conn., 15 Oct. 1810; d. 1888. He was educated at Yale, set up his studio in New York and was elected to the National Academy in 1858. Among his numerous American landscapes are 'Mansfield Mountain at Sunset'; 'Showery Day, Lake George'; 'Glimpse of the Adirondacks'; and 'Lake Cazenovia.'

**HUBBARD, William**, American colonial clergyman and historian: b. Tendring, Essex, England, 1621; d. Ipswich, Mass., 14 Sept. 1704. He came to New England in the *Defence* in 1635, settled with his father at Ipswich, was graduated at Harvard College in 1642, and was ordained about 1656 as minister at Ipswich, where he continued during the remainder of his life. He is the author of 'The Present State of New England, Being a Narrative of the Troubles with the Indians from 1607 to 1677, etc.' the map accompanying which is supposed to be the first executed in America. It was first published in 1677, both in Boston and London, and has gone through some 10 further editions, the latest and most carefully annotated of which was edited by S. G. Drake (2 vols., Roxbury 1865). He left in manuscript a 'General History of New England,' for which the colony paid him £50, and which has been consulted with advantage by Mather, Hutchinson, Holmes and other American historians and annalists. However, it should be used with considerable discretion as it is far from being absolutely correct. It was published by the Massachusetts Historical Society in 1815 and republished in 1848. Consult Caldwell, A., 'William Hubbard and His Parish' (Boston 1885); Deane, C., 'Hubbard's Map of New England' (in *Massachusetts Historical Society Proceedings*, Vol. IV, p. 13, Boston 1887); Green, S. A., 'Hubbard's Map of New England' (ib., Vol. IV, p. 199; Vol. VI, p. 41, Boston 1888 and 1890).

**HUBBARDTON, Vt.**, town in Rutland County, 13 miles from Castleton, its nearest railroad station. It is in an agricultural region, and has but little manufacturing; its raw products are sent direct to the markets. On 7 July 1777 a battle took place here between the Americans under Colonels Francis and Warner, and a British and Hessian force under Generals Riedesel and Fraser, in which the British were successful. The Americans, the rear-guard of General St. Clair's army, who were retreating from Ticonderoga, lost in killed, wounded and prisoner's 324 men; and the British loss was 183 men. A monument in memory of the American soldiers who were killed in this battle occupies a prominent position. Pop. 500.

**HUBER, hoo'ber, Eugen**, Swiss lawyer: b. Stammheim, Canton Zürich, 1849. After several years of private practise, he became lecturer at the University of Bern (1873); and later (1880) professor of civil law at Basel; at Halle (1888); and in 1902 returned to Bern

as professor. He took an active part in the political life of his nation, as a member of the Swiss National Council and as a life member of the Permanent Court of Arbitration at The Hague. His principal contribution to the law of Switzerland has been his codification of the civil law and the standardization of court usage. Since 1907, he has been editor of *Schweizerisches Zivilgesetzbuch*. The most widely known of his legal publications is 'System und Geschichte des schweizerischen Privatrechts' (4 vols., 1886-93).

**HUBER, u'bar', François**, Swiss naturalist: b. Geneva, 1750; d. Lausanne, 1831. His father was a naturalist of some repute and his mother a well-known writer on religious subjects and translator of the *Spectator*. As a boy François received careful training in the sciences; but before he was 15, his eyes began to weaken and he eventually became blind. However, his interest in nature was greatly stimulated by his wife, Marie Aimée Lullin; and with her aid, assisted also by his devoted servant, François Burnens, his research was made possible. His principal investigations were in the life-cycle of the bee, in which study he was the first scientist of distinction. His observations were published as 'Nouvelles Observations sur les abeilles' (Geneva 1792). With Jean Senebier he published also 'Mémoires sur l'influence de l'air, etc., dans la germination' (1800); and 'Mémoires sur l'origine de la cire.' His son, PIERRE, carried on the work of his father and published numerous short papers on entomological subjects, of which the best known is 'Recherches sur les mœurs des fourmis indigènes' (Geneva and Paris 1810, 1861).

**HUBER, Johannes**, German philosopher and theologian: b. Munich, 18 Aug. 1830; d. there, 19 March 1879. He was educated at the University of Munich, became professor of philosophy there in 1859, and was one of the leaders of the Old Catholic party and an active opponent of the Ultramontanes. He vigorously attacked the definition of the dogma of papal infallibility. Among his works were 'Studies' (1867); 'Das Papsttum und der Staat' (1870); 'Der Jesuitenorden' (1873); and 'Zur Philosophie der Astronomie' (1877). Consult Zirmgebl, E., 'Johannes Huber' (Gotha 1881).

**HUBER, Ludwig, Ferdinand**, German author: b. Paris, 14 Sept. 1764; d. Swabia, 24 Dec. 1804. In 1766 he was brought to Leipzig and subsequently received his training in languages and literature in that city. His literary talent soon impressed itself on his contemporaries, and he was admitted to the talented group of writers of the period which included Körner and Schiller. From 1787-92, he was secretary of the Saxon legation at Mainz, where he fell in love with Therese Forster. On the death of Forster, he married the clever Therese. Four years later he assumed the editorship of the *Allgemeine Zeitung*; and was appointed counsellor of education for Swabia (1804) a few months before his death. In addition to his political writings which were contributed largely to *Friedens-präliminarien* and *Klio*, he was the author of numerous plays, of which the one which has endured is 'Das heimliche Gericht.' As a critic he was highly esteemed, his best essays appearing as 'Vermischte Schriften von dem Verfasser des heimlichen Gerichts'

(1793). A collection of his works was published posthumously with a biography by his wife (4 vols., 1807-19).

**HUBER, Victor Aimé**, German publicist and author: b. Stuttgart, 10 March 1800; d. Wernigerode, 19 July 1869. Educated at Würzburg and Göttingen, he became professor of the history of literature and of modern history at Rostock in 1833, of the languages of western Europe at Marburg in 1836, and at Berlin in 1843. He retired in 1850. Huber was one of the most profound of German scholars in the Spanish language and literature. Among his publications were 'Die Geschichte des Cid' (1829); 'Die englischen universitäten' (1839-40); 'Crónica del Cid' (1844); and 'Skizzen aus Spanien' (1825-35).

**HUBERT, Saint**, apostle of Ardennes, the patron of huntsmen; d. about 727. Legend says that he was a keen hunter, and that being once engaged in the chase on Good Friday, in the forest of Ardennes, a stag appeared to him having a shining crucifix between its antlers, and he heard a warning voice. He was converted, entered the church and became bishop of Maestricht and Liège. He worked many miracles, and his body, at first deposited in the church of Saint Peter at Liège, was in 817 conveyed to the Benedictine convent of Andain, in the Ardennes, which received the name Saint Hubert's of Ardennes. The day of the saint is 3 November, and was formerly celebrated at many courts by a solemn chase.

**HUBERT DE BURGH**, English statesman: d. London, 12 May 1243. He held office under Richard Cœur de Lion, and was made castellan of Falaise by King John, with whom he sided in the struggle with the barons, though advising the granting of Magna Charta. In the year of Runnymede (1215) he was made justiciar (chief justice) of England. On 24 Aug. 1217 he won a great victory over a French fleet bringing reinforcements to the army besieging Dover Castle; the Treaty of Lambeth was concluded (11 September) and the enemy evacuated England. After 1219 he was coregent with Langton, archbishop of Canterbury, for Henry III. He vigorously opposed the foreigners who were endeavoring to obtain control of the government, and sought to end the exactions of the clergy. In 1232 he was dismissed, owing largely to his failures in the conflict with the Welsh, and thereafter he had no part in the government.

**HUBERTUSBURG**, hoo-bér'tüs-bürk, Saxony, a château and royal hunting seat, near Wernsdorf, between Oschatz and Grimma. It is known principally as the scene of the signing of the peace which brought the Seven Years' War to a conclusion. It serves at present as an asylum for the insane. Consult Riemer, 'Das Schloss Hubertusburg, sonst und jetzt' (Oschatz 1881).

**HUBLI**, hoo'bli, British India, a town in the Dharwar district of Bombay, 15 miles southeast of the town of Dharwar, and 90 miles northeast of Karwar. The principal trade is in cotton, grain, salt and produce. There is also considerable manufacture of cotton. Several ancient temples belonging to the Jains are here. An English factory was established early in the

17th century, but was plundered by Sivaji, a Mahratta chief, in 1673.

**HÜBNER**, *hup'nér*, Emil, German classicist: b. Düsseldorf, 1834; d. Berlin, 1901. After studying at Berlin and Bonn, he traveled widely on the Continent. On his return to Germany, he became professor at the University of Berlin, where he remained from 1870 until his death. His work consists mainly in researches in Latin epigraphy. His numerous publications in this field include 'De Senatus Populique Romani Actis' (1859); 'Epigraphische Reiseberichte aus Spanien und Portugal' (1861); 'Die Antiken Bildwerke in Madrid' (1862); 'Inscriptiones Hispaniæ Latinæ' (1869, 1892); 'Inscriptiones Hispaniæ Christianæ' (1871, 1900); 'Exempla Scripturæ Epigraphicæ Latinæ' (1885); 'Monumenta Linguae Ibericæ' (1893); 'Über mechanische Copien von Inschriften' (1881); 'Grundriss zu Vorlesungen über die römische Literaturgeschichte' (4th ed., 1878); 'Bibliographie der klassischen Altertumswissenschaft' (1889); 'Römische Herrschaft in Westeuropa' (1890); 'Römische Epigraphik' (1892). He was coeditor of *Hermes* (1866-81), and the *Archäologische Zeitung* (1868-73).

**HÜBNER**, Joseph Alexander, Count, Austrian diplomat: b. Vienna, 26 Nov. 1811; d. there, 30 July 1892. He was educated at Vienna, and, having entered the service of the government, became in 1849 Minister at Paris, and in 1865-68 was Ambassador at Rome. In 1879 he became a member of the Clerical-Conservative wing in the upper house of the Reichsrat. Among his published works are 'Sixte-Quint-D'après des Correspondances Diplomatiques Inédites' (1870, new ed., 1883); 'Ein Spaziergang um die Welt' (1872, 7th ed., 1891); and 'Durch das Britische Reich' (1886; 2d ed., 1891).

**HÜBNER**, Julius, German painter and poet: b. Oels, Silesia, 27 Jan. 1806; d. Losenitz, Saxony, 7 Nov. 1882. He studied at the Berlin Academy, and was also a pupil of Schadow at Berlin and Düsseldorf. In 1841 he became professor in the Dresden Academy of Arts. He was an historical painter of the Düsseldorf School, his works including 'Disputation between Luther and Eck'; 'Charles V and Saint Just,' and 'Last Days of Frederick the Great.'

**HUBNERITE**. A mineral consisting of manganese tungstate,  $MnWO_4$ , containing 76.6 per cent of tungsten trioxide when pure. A source of tungsten, ferrotungsten and sodium tungstate. Mined in places near Diagoon and from quartz veins in granite at Arivaca, Ariz. In Colorado occurs in gold ore at Leadville, and mined in Uncompahgre district and near Silverton and Gladstone. In Idaho mined in Bluewater district. Small quantities occur at several places in Montana. Mined at Ellsworth, Round Mountain, Hub and other places in Nevada and in Victoria district, New Mexico.

**HUC**, *ùk*, Évariste Régis, French Roman Catholic missionary: b. Toulouse, 1 Aug. 1813; d. Paris, 31 March 1860. After studying at Toulouse, he joined the Congregation of Saint Lazarus at Paris and was sent to China in 1839. He was occupied for a time in the southern province, and then set out for the north and succeeded in establishing a settlement not

far from Peking. In 1844, he undertook a journey through Tibet, and had penetrated as far as Thasa (1846) when he, with his companion, Gabet, were returned to China by orders of the Chinese Ambassador. He visited India, Egypt and Palestine, and returned to Europe in 1852. His accounts of his voyages are contained in 'Souvenirs d'un voyage dans la Tartarie, le Thibet et la Chine' (2 vols., Paris 1850, Eng. trans., London 1851); 'L'Empire Chinois' (2 vols., Paris 1854, Eng. trans., London 1855); 'Le Christianisme en Chine, en Tartarie, et au Thibet' (4 vols., Paris 1857-58, Eng. trans., 3 vols., London 1857-58). The historical information contained in these works is still valuable, although it was received by his contemporaries in Europe with incredulity. Consult Henri d'Orléans, 'Le père Huc et ses critiques' (Paris 1893).

**HUCBALD**, or **HUBALD**, Benedictine monk and musician: b. Saint-Amand, near Tournai, about 840; d. there, about 930. Most of his life was spent in the monastery of Saint-Amand, where his uncle Milo conducted a school. He was absent for a number of years, but returned to Saint-Amand in 872, when he succeeded his uncle in his position at the school. Hucbald is noted principally as a composer of music and of treatises on music. There are numerous works which have been ascribed to him, but the most authentic of these is 'Harmonica Institutio,' a system of musical education. 'The Musica Enchiriadis,' long attributed to Hucbald, has been proven to have been of a later period. Consult Müller, 'Hucbald's echte und unechte Schriften über Musik' (Leipzig 1884).

**HUCH**, *hoog'*, Ricarda, German novelist: b. Braunschweig, 18 July 1864. She lost her parents early and was educated by her grandmother, to whom she dedicated her drama 'Evoc' (1892). This is an historical Renaissance drama and has been called an overture to her later works. Being desirous of obtaining a higher education, she entered the University of Zürich, one of the first higher institutions of learning in Europe, admitting women on a par with men. She took the degree Ph.D. in 1891 and then accepted a position as secretary at the city library in Zürich. Later she traveled, especially in Italy, and returned to Germany in 1897. After marrying an Italian dentist, Ceconi, she lived for a time in Vienna and Munich. She has since been divorced from her husband, has married her cousin, Richard Huch, a lawyer, and now resides with him in Braunschweig. Her writings are of three types, poems, novels and stories, and literary criticism. Her poems were published in two collections: 'Sammlung von Gedichten' (1894) and 'Neue Gedichte' (1907). At first she worked under the influence of Conrad Ferdinand Meyer. She loves to comment on life in her poetry and therefore her poems are not always purely lyrical, but they are full of reverence for things beautiful. She does not wish to reproduce everyday life, but to suggest that which is noble, artistic and musical. She has a keen sense for the beautiful in color, tone and smiles. Her chief novel is 'Ludolf Ursleu' (1893). It is the history of the decline of a patrician family of the city of Hamburg. 'Vita Somnium Breve' (1902) is a variation of the same theme.

A third novel, 'Aus der Triumphgasse' (1901), takes us to the slum district of an Italian city. She contrasts the aristocratic-aesthetic view of life of the Romanticists with the social-democratic views of our days. Her writings on literary criticism comprise 'Die Blütezeit der Romantik' (1899); 'Ausbreitung und Verfall der Romantik' (1902), and an essay on Gottfried Keller. They are distinguished by sympathetic interpretation and psychological insight. Recently she has added to this list a book entitled 'Natur und Geist als Wurzeln des Lebens und der Kunst' (1915). Her other literary writings are 'Der Bundesschwur' (1891); the modern fairy tale 'Mondreigen von Schlaraffis' (1896); 'Die Teufeleien' (1897), humorous stories; and 'Haduvig im Kreuzgang,' (1897), a realistic story of dreams and visions; the novel 'Liebe' (1899); and the stories 'Fra Celeste' (1900); 'Von den Königen und der Krone' (1904); and 'Seifenblasen' (1905). Her writings of an historical nature are 'Das Risorgimento' (1908); 'Das Leben des Grafen Federigo Confalonieri' (1910); 'Die Geschichte von Garibaldi' (1906-07); and 'Der Grosse Krieg in Deutschland' (1913), treating of the Thirty Years' War. In these writings she has undertaken to use the novelist's and storyteller's art in delineating important epochs in the world's history and to present with poetical freedom characters which are true to that history. Consult Elfriede Gottlieb, 'Ricarda Huch' (Leipzig 1914); Friedrich Schoenemann, Vol. XVIII of 'The German Classics' (New York 1914).

WILLIAM F. HAUHART,  
Assistant Professor of German, University of Michigan.

**HUCKLEBERRY**, a name of uncertain derivation applied to a variety of shrubs, especially to species of the genus *Gaylussacia*, and also to those belonging to the genus *Vaccinium*. The principal species are found mainly in the northern hemisphere, throughout North America and Europe. In many places in the United States huckleberries are a valuable product, the fields in which they grow are preserved and the berries are secured either for household use or for profitable marketing.

**HUCKLEBERRY FINN**, *The Adventures of*, a story by Samuel L. Clemens ("Mark Twain"), (q.v.), published almost simultaneously in London and New York in 1884, parts of it having been previously published in the *Century Magazine*. It was the first book brought out by the firm of C. L. Webster and Company of which its author was a member. Even previous to its actual publication 40,000 copies had been sold to subscribers. It was illustrated according to the author's own ideas by E. W. Kemble and has gone through many editions. It is a sequel to, and follows the fortunes of, the leading characters of the same author's 'Tom Sawyer.' In this book the author not only preserves to us a valuable record of a rapidly disappearing social order, but throws light upon some questions of moment to the student of history. It is, perhaps, Mark Twain's most notable work of pure fiction and was received with great enthusiasm by many keen critics. At one time it created considerable discussion by the action of a number of librarians who removed it from the shelves of their institutions on account of

some imaginary shortcomings in "Huck's" moral character. Consult Henderson, A., 'Mark Twain' (New York 1911); Johnson, M., 'A bibliography of the Work of Mark Twain, etc.' (New York 1910); Paine, A. B., 'Mark Twain' (3 vols., New York 1912).

**HUCKNALL TORKARD**, England, a town in Nottinghamshire, five miles north of Nottingham, and 132 miles northwest of London, on the Great Central, Great Northern and Midland railways. Near by is Newstead Abbey where Byron lived; and his tomb is in the old town parish church of Saint Mary Magdalene. The principal industries are the manufacture of tobacco and hosiery, and coal mining. Pop. about 16,000.

**HUDDE**, hud'de, **Andreas**, Dutch merchant: b. about 1600; d. 1663. He was a prominent member of the Dutch West India Company and in 1633 was director-general in America. The company awarded him important posts in its newly found territory. He was surveyor of Manhattan (1642); and arbitrator in the disputes between the Dutch and Swedish settlers on the Delaware River, which territory he finally conquered and held for the company. His prestige continued and grew. He was placed in command of Forts Altona and New Göttenburg (1657); was colonial surveyor, and later parish clerk. His records in the Albany archives testify to the quality of his intellect and his education.

**HUDDERSFIELD**, England, municipal, county and parliamentary borough in the West Riding of Yorkshire, on the Colne, 16 miles southwest of Leeds. It is the chief seat of the English cloth and woolen manufacture and also manufactures silk, iron and machinery. Coal-mining and stone-quarrying are also carried on extensively. The borough has good water power and many of the industries are run by it. The town is thoroughly modern, is well built and has spacious streets. It has also fine churches and public buildings. There are here a proprietary college affiliated with the University of London, a technical school and several grammar schools. The municipal government is of a high order and has been a pioneer in several important particulars. The town was the first to own and operate its street railways; it owns its gas, electric and water plants, maintains free public libraries, a slaughter-house, public markets, a hospital, cemeteries and a modern sewage disposal plant. It was the first town to adopt an eight-hour labor day. As far back as 1853 artisan's dwellings were established for married couples and for single women as well as for bachelors. In ancient times known as Odersfelt, Huddersfield has been of importance only from the establishment of the woolen industry in the 18th century. A consulate of the United States is located here. Pop. 107,821.

**HUDIBRAS**. This satirical mock-epic by Samuel Butler, perhaps the wittiest poem ever written in the English language, consists of 11,000 lines of so-called "Hudibrastic" verse (Iambic tetrameter, with burlesque rhymes), and is divided into three parts, each of several cantos. The action, which fills only about 1,800 lines, is constantly interrupted by digressions upon a variety of themes. It is often stated that Hudibras is a kind of rhymed parody of

'Don Quixote,' which is frequently alluded to and is even travestied in several of its minor incidents; but, except for the idea of a crazy knight and his squire setting out to reform the world, Butler owes little to Cervantes, and 'Hudibras' might have been substantially the same had 'Don Quixote' never have been written. The initial suggestion might have come as well from the 'Fairy Queen' or from the 'Morte D'Arthur.' It is probable that Butler named his poem and its protagonist after Spenser's Sir Huddibras ('Fairy Queen,' II, 2), a knight "more huge in strength than wise in works"; though it has been suggested that he derived the name from Hugh de Bras, the patron saint of Devonshire, where he lived for a time in the employ of Sir Henry Rosewell.

The story concerns Sir Hudibras, a religious-mad Presbyterian, and Ralpho, his squire, who set forth to reform social abuses banned by the Puritans. Their fight with the bear-baiters and their defeat; Hudibras in the stocks and his release by his Lady; his oath of flagellation — which he breaks; their rout by the merry-makers; their visit to the astrologer Sidrophel — whom they rob; plots and counter-plots by both Hudibras and Ralpho, each in turn in league with the Lady, are the main incidents of the disconnected story, which breaks off but does not end. The characterization is weak and inconsistent; the characters being in the main mere nicknames for absurdities. Hudibras, perhaps in part a caricature of Sir Samuel Luke, once an employer of Butler's, is a mixture of incongruous traits, knight errant plus Presbyterian magistrate, who, although meant to be ridiculous and cowardly, at times talks good sense and fights right valiantly. Minor characters have been identified with various members of the Puritan party, but such identification is uncertain and unimportant. The character of Sidrophel the astrologer is certainly meant for William Lilly, a notorious impostor of the day. This portrait of the universal and permanent quack is Butler's masterpiece; but the portraits of Shaftsbury and Lilburn are also admirable, and perhaps furnished Dryden with models for his 'Absolom and Achitophel.'

The story itself, with its satire on Puritanism, serves merely as a frame on which Butler hangs his ridicule of the many excesses of contemporary life. A conservative in politics and a rationalist in religion, he was a royalist and an Episcopalian not through sentiment or religious conviction but through hatred of excess and dislike of change. Of strong, well-balanced mind and of eminent good sense, he saw in royalty and in an established church the safety of the state. Satire makes no fine distinctions, and Butler's portrait of Puritanism is of course the grossest and most unfair caricature; but in his burlesque of Puritan habits of mind and speech there was enough truth to render his satire wonderfully telling. He touches upon religion in general apart from Puritanism; upon contemporary science (the researches of the Royal Society he especially ridicules); upon matrimony; upon astrology and kindred superstitions; upon lawyers, with incidental satire on a large variety of political, moral, social and literary themes. The enormous whole forms a "commonplace-book" of satire, for which Butler's prose notebooks furnished the

material, gathered through an entire life of observation and reflection and in parts talked out many a time over a bottle with his friends. 'Hudibras' is utterly devoid of poetry or sentiment. This is amply compensated for by its brilliant and pervasive wit, which, though so often based upon the local, or the temporary, or the recondite as to be unintelligible without the aid of explanatory notes, occasionally attains the universal, and in such passages has become a part of the language. The style of the poem, compounded of its peculiarities of metre, diction and figures of speech, is so original and individual as simply to be termed "Hudibrastic." Butler employs the old iambic tetrameter but gives it a twist of his own by means of astonishing rhymes. He changes the vowel sounds, forces two monosyllabic words to rhyme with a dissyllable, and employs frequent trisyllabic rhymes that are always outrageous but often irresistibly comic. For all this he gained hints from his predecessors, such as Ben Jonson and John Taylor, the "water poet," but he was the first to popularize the practice. Working with the rhyme to make the burlesque effect is Butler's habit of levying upon all fields of knowledge for his illustrations, of alluding even to the most recondite, almost unheard-of things in history, science, pseudo-science, mediæval lore of all kinds. Rabelais and Burton in prose and Cleveland in verse satire had done something of this kind, but Butler is without a peer in the range of his material and in his extravagant use of it.

Although a portion of 'Hudibras' was written before the execution of Charles I, even the first part was not published until 1663; a second followed in 1664, and a third and last in 1678. Thus the satire as an attack upon Puritanism lost utterly any militant value. But few works have ever gained such immediate and universal popularity. It became household property among the royalist reading public, not through whatever of permanent truth it contained, but through its partisanship. No poem in English has ever bred so many imitations. Within the century after its publication appeared at least 23 Hudibrastic satires, many of great length and of intolerable dullness and, oftentimes, of obscenity. Its influence was rife even in America, and it is notable that the only one of these imitations which shows any originality is 'McFingal,' an able political satire by John Trumbull the American, some of whose couplets are often credited to Butler. That 'Hudibras' has practically ceased to be read is not altogether to the credit of the public. True, it is verbose; its political significance has passed; many of its allusions are unintelligible to the average reader; but, on the other hand, much of its satire will remain perennially applicable as long as society contains absurdities and shams, and much of its wit yet sparkles after the lapse of over two centuries.

There are many editions. That edited by Dr. Zachary Grey (Dublin 1744, rep. London 1869) is the standard; Hogarth's illustrations are in the London edition of 1726, reprinted 1775; Grey's notes are used in the three-volume London edition of 1819; the Bohn Library edition (London 1859) contains notes by Grey and Nash. Among other editions are the Aldine 'Poetical Works of Samuel Butler' (London 1893), and that by A. R. Waller

(Cambridge, England, 1905). 'Hudibras' was translated by John Townley into French verse (London 1757) and by D. W. Soltau into German (Riga 1787). Among critical studies are 'Butler's Hudibras, ein echte zeit- und sitten-gemälde,' Rudolph Boxberger (Leipzig 1876), and 'Die Reime von Butler's Hudibras; eine metrische und lautliche Untersuchung,' Bruno Harder (Königsberg 1900).

MARION TUCKER.

**HUDSON, Erasmus Darwin,** American physician: b. Northampton, Mass., 1843; d. New York, 1887. In 1864 he was graduated at the College of the City of New York and three years later at the College of Physicians and Surgeons, New York. He entered Bellevue Hospital as surgeon immediately thereafter, and in 1869-70 was appointed health officer of New York city. Subsequently he was professor of principles and practise of medicine at the Woman's Medical College (1872-82), and from the last-named year until his death was professor of general medicine and diseases of the chest at the New York Polyclinic. His works include 'Report of Pulse and Respiration of Infants' (in Eliot's Obstetric Clinic, 1872); 'Doctors, Hygiene and Therapeutics' (1877); 'Methods of Examining Weak Chests' (1885); 'Limitations of the Diagnosis of Malaria' (1885); 'Home Treatment of Consumptives' (1886); 'Physical Diagnosis of Thoracic Diseases' (1887).

**HUDSON, George,** English railway speculator: b. York, March 1800; d. London, 14 Dec. 1871. He began as a linendraper's apprentice, and soon acquired a considerable fortune in that business. At the age of 27, he fell heir to £30,000. He immediately began to invest in railroads, especially in the North Midland line, and his energy and zeal soon elevated him to the position of director. In 1833 he organized the York Banking Company, and in 1837 became mayor of York. The projection of new railroads now occupied his attention, until, by 1844, he was the owner of more than 1,000 miles of railway and was known as the "railway king." His fortune accumulated rapidly and honors were heaped upon him. Re-election to the mayoralty came twice; and finally, in 1845, he was sent to Parliament. Two years later the crash came; railway property experienced a sudden decline, and Hudson was involved in overwhelming difficulties. Investigations revealed the fact that the money invested had been unscrupulously handled; Hudson spent his last years on the Continent, living on an annuity supplied by his friends.

**HUDSON, Henry,** English navigator. (Some authorities gave his name as Hendrick). The time and place of his birth appear to be lost. We only know that he had earned, perhaps by the time he was 40, sufficient reputation as a bold and skilful navigator to be placed in command of the ship *Half Moon* of Amsterdam. Early in 1609 he made a contract with a party of Dutch merchants to act as captain of their private exploring expedition, and in the written agreement between them he was described as "Henry Hudson, Englishman." This settles the honor of his birth country, though nothing more. At that time the one great commercial demand was for a

shorter and better, all-sea trade route to the Far East. It was known that there was land to the west of Europe and it was believed that a passage could be found through these lands directly westward to the East. It is clear that Hudson believed that the western route was the most promising and, no doubt, he suggested it to his employers, but they evidently had more faith in a sea passage north and then east, round Europe and Asia to China. Thus it happened this English sea captain sailed from the Dutch port of Amsterdam in the small ship *Half Moon* bound for China by the way of the North Cape. The ship's company of Dutch and English was fortunate in having as mate one Robert Juet (perhaps also of England), and the mate could read and write. Juet kept the ship's log, and in this log book on the first page are these words: "On Saturday, the five and twentieth of March, 1609, after the old account (style), we set sayl from Amsterdam, and by the seven and twentieth day we were down at the Texel; and by twelve of the clock we were off the land, it being east of us two leagues off."

Once "off the land" the ship was free to go where the captain pleased and it certainly did not please the crew to face the arctic cold of the attempted voyage round Europe. Solid pack ice and the open mutiny of the crew decided Hudson to turn back and he steered south—and west. It is evident that he felt free to carry out his own plans and reach China by another route. His owners' plans had failed and, while his plan might fail, his success would justify his action. Hudson's decision was almost as bold as that of Columbus for, while he had, no doubt, some knowledge of the lands to the west, he evidently had no conception of the shape or size of North America nor of the width of the Pacific.

The *Half Moon* was a slow sailor, and four months passed before she made the land along the eastern coast of what is now the United States. The log book described the land as "low white sandy ground"—exactly describing all the shore line south of Sandy Hook. The book might also have described parts of Long Island or Cape Cod and it is clear it did not describe the coast of Maine, and it is more than probable the first land mentioned in the book was south of Sandy Hook for, on reaching the land and finding no passage westward, Hudson steered "northeast by north" until, about two weeks later, he came to a great bay. The log book which does not give the name of the month, and which must have been September, says, "And from that lake or bay the land lyeth north by east, and we had a great streame out of the bay." The *Half Moon* had found the "great stream" described by Verrazano, and with the flood tide sailed into New York Bay and headed for the Narrows and, as the log book says, "came to three great rivers." And it continues: "So we stood along to the north-most, thinking to have gone into it." The *Half Moon* was off Manhattan. It was true Verrazano, in 1524, had entered New York Bay and left a record of a high hill and a great bay out of which flowed a large river, but Verrazano had not the courage to pass the Narrows, except in a small boat. Other explorers may have looked into the bay. The *Half Moon* was the first ship to pass up the "great stream" and to Hudson belonged the entire honor of discover-

ing and exploring the river that now bears his name.

The pages of Juet's journal tell nothing of Hudson's own hopes, fears and anticipations. Yet, it is fair to conclude that Juet's enthusiasm over the beauty and value of the great valley was shared by his captain and that the ship's log was, in a sense, a reflex of Hudson's own views. There is no hint of Hudson's belief that he could reach China by this route, yet it is reasonable to suppose he entered New York Bay in the hope that the "great stream" would lead through the land to the Pacific. The great size of the bay and river, and the fact that the tide flowed far into the land, and that for the first few days' sail the water remained salt, no doubt encouraged him to keep on through this most promising opening in the land. Favored by "fairer weather" and a favorable breeze he steered northerly over the wide salt arm of the sea until the apparent strait became a river and the sea water became fresh. At the Highlands all hope of a road to China must have faded away. Still, he would sail on, push through the mountains and see what manner of country lay beyond.

The items of the log book plainly show that Hudson, after passing the Highlands, began to recognize the transcendent importance of his discovery. He had found a new land of surpassing beauty and fertility and everywhere clothed in splendid forests. Hudson clearly recognized the commercial value of his discovery, for the log book enumerates all the potential wealth of the river and valley in fish, game, lumber, fruits, vegetables, grains and peltry. It even mentions the fact that Hudson, while the ship was at anchor somewhere near the present city of Hudson, sent the ship's carpenter ashore to fashion a new fore-arm out of one of the primeval trees—the first bit of lumbering done by white men in the valley. Hudson seems to have decided, after reaching the upper river and sailing to a point opposite the Catskills, that the best way to mollify his owners on his return would be to report as fully as possible the potential wealth he had discovered and he sent a boat up the river to explore the country. The boat party appears to have been absent several days, for they rowed up stream about nine leagues or perhaps beyond Albany, where, as the log book says, the boat found "it bee at an end for shipping to goe in—with but seven foot water and unconstant soundings." Meanwhile Hudson evidently traded with the Indians for peltry, no doubt regarding the furs as something that would demonstrate to his merchant owners the value of his discovery.

Three weeks after the *Half Moon* entered "the great streame" she again passed Sandy Hook and steered away for Amsterdam. There is no record of the return voyage, nor is there any record of Hudson's report to the merchants of Amsterdam, yet it is evident that his story and perhaps the exhibit of peltry created a tremendous sensation in the commercial cities of Holland. Hudson appears not to have cared much about this side of the affair. He seems to have considered his voyage a failure. He had tried to reach China and failed, and wished to sail again, but the merchants seem to have been wholly occupied in fitting out new ships under more commercial captains and would

not listen to him. At last, after some delay, he did secure a second ship and set forth once more to find a sea path through America. He appears to have thought there might be a passage round by the north of America and he steered for Baffin's Bay. Once more he found a great passage leading westward into the land, once more a salt water strait seemed to promise success, but it only led to an inland sea. His miserable crew, ignorant, frightened at the arctic cold and gathering ice, rose in mutiny, and putting their great captain in an open boat, with his son, a boy of seven, and some invalid sailors, set them adrift in the vast waters of Hudson Bay and left them there to perish. Consult Read, 'Historical Inquiry Concerning Henry Hudson'; Janvier, 'Henry Hudson' (1909).

**HUDSON, Henry Norman**, American Shakespearean scholar and Episcopal clergyman: b. Cornwall, Vt., 28 Jan. 1814; d. Cambridge, Mass., 16 Jan. 1886. He served as chaplain in the Civil War, was professor of Shakespeare at Boston University and for a time editor of the *Churchman*. He published 'Lectures on Shakespeare' (1848); 'Campaign with General Butler' (1865); 'Shakespeare, his Life, Art, and Characters' (4th ed., 1883); 'Essays on Education' (1883). He edited the Harvard and the University edition of Shakespeare.

**HUDSON, William Henry**, English educator and critic: b. London, England, 2 May 1862. He was for five years private secretary to Herbert Spencer, and coming to America was assistant librarian of Cornell University, 1890-92. From 1892-1907 he was professor of English literature at Leland Stanford Jr. University; from 1902-03 professional lecturer at the University of Chicago, and later staff lecturer in literature to the extension board of London University. He published 'The Church and the Stage' (1886); 'An Introduction to the Philosophy of Herbert Spencer' (1894); 'Studies in Interpretation' (1896); 'Idle Hours in a Library' (1897); 'The Study of English Literature' (1898); 'The Sphinx and Other Poems' (1900); 'The Meaning and Value of Poetry' (1901); 'Life of Sir Walter Scott' (1901); 'Famous Missions of California' (1901); 'Rousseau and Naturalism in Life and Thought' (1903); numerous volumes on English poets and literature (1910-12); 'The Story of the Renaissance' (1912); 'The Man Napoleon' (1915).

**HUDSON, W. H.**, English naturalist and author. His boyhood was largely spent in Argentina and at school in the British Isles. He published 'The Purple Land,' a romance (1885; new ed., 1916); 'Argentine Ornithology' (collaborating with Dr. P. L. Sclater, F. R. S., 1888-89); 'The Naturalist in La Plata' (1892); 'Birds in a Village' (1893); 'Idle Days in Patagonia' (1893); 'British Birds' (1895); 'Birds in London' (1899); 'Nature in Downland' (1900); 'Birds and Man' (1901); 'El Ombri' (1902); 'Hampshire Days' (1903); and with the publication of 'Green Mansions,' a remarkable romance of Venezuela (1904; new ed., New York 1916), it became known that in this author was, as expressed by John Galsworthy, "a simple narrator who is well-nigh unsurpassed, a stylist who has

few, if any, living equals." His later publications include 'A Crystal Age' (1906; new ed. 1916); 'The Lands End' (1908); 'Afoot in England' (1909); 'A Shepherd's Life' (1910); 'Adventures Among Birds' (1913; new ed. New York 1916); 'Tales of the Pampas' (1916).

**HUDSON, Mass.**, town, Middlesex County, on the Assabet River, and on the Boston and Maine and the Fitchburg railroads, about 17 miles northwest of Worcester. The town is in an agricultural region, but is particularly noted for its manufactures of leather and rubber, gossamer clothing, webbing, goring and boots and shoes, paper and wooden boxes. The town owns and operates the electric-light plant and the waterworks. Pop. 6,743.

**HUDSON, N. Y.**, city, port of entry, county-seat of Columbia County, on the Hudson River, and on the New York Central and Hudson River and the Boston and Albany railroads, about 30 miles south of Albany. Area of the city, one square mile. Hudson was settled in 1783 and was called Claverack Landing; but the year following the name was changed to Hudson. In 1785 it was chartered as a city, and in 1790 it was made a port of entry. From the first it was a trading station of importance and a whaling port. After the Revolution a large foreign trade was established, but the commerce of the city was injured by the destruction of its shipping in the War of 1812. The surrounding country is devoted largely to agriculture, and the city has a number of manufacturing establishments. The chief manufactures are foundry products, machinery, knit goods, car-wheels and creamery products. It has a large sash and blind factory and several small manufacturing establishments. Some of its prominent buildings are the State Volunteer Firemen's Home, the State House of Refuge for Women, an orphanage, hospital and the city public buildings. The city owns and operates the waterworks. The government is vested in a mayor, who holds office for two years, and a city council. Pop. 11,417.

**HUDSON, Ohio**, town in Summit County, on the Pennsylvania Railroad, 20 miles south of Cleveland. This was one of the earliest settled towns on the Ohio Western Reserve, and prior to the Civil War was an abolition stronghold. The Western Reserve College, before its removal to Cleveland, was located here. Pop. 1,021.

**HUDSON, Wis.**, city and county-seat of Saint Croix County, on Lake Saint Croix, an expansion of the Saint Croix River, and on the Chicago, Saint Paul, Minneapolis and Omaha Railroad, 65 miles northwest of Eau Claire and 20 miles east of Saint Paul, Minn. The chief manufactures are railroad cars. The city has a saw-mill, interior finish factory, brewery, large cold-storage plant and ample facilities for shipping the butter, poultry, vegetables and fruits of the surrounding valuable farm lands. It has a large sanatorium, fine courthouse and the Galahad School for Boys. The electric-light plant and the waterworks are owned and operated by the city. Pop. 2,810.

**HUDSON**, the largest river in the State of New York, has its head waters in Hamilton and Essex counties, and flows southwest into Saratoga County, then nearly directly east to

Sandy Hill in Washington County, and from this point south through New York Bay into the Atlantic Ocean. It is fed by several of the Adirondack lakes, a number of small streams, and by Schroon River, Batten Kill, Hoosick, Wappinger and Croton from the east, and the Sacandaga, Mohawk, Wallkill and Esopus Creek from the west. The Mohawk (q.v.), which flows into the Hudson at Cohoes, is the largest tributary; the Rondout enters the Wallkill near the Hudson. The head waters of the Hudson and the sources of several of the streams which flow into the Saint Lawrence are very near each other in the Adirondack Mountains. At Troy, three miles below the mouth of the Mohawk, the Hudson becomes a navigable tidal stream. There is a tidal rise of about one foot at Albany. Above Troy there are a number of rapids and long falls in the river; but below, the navigation is uninterrupted. At one time there were a few obstacles, the largest of which was "Overslaugh," or Castleton Bar, at Castleton. This hindrance to navigation has been almost wholly removed by the Federal and State governments. The Catskill Mountains, on the west side, begin about 25 miles below Albany. Lower down are the Highlands, averaging about 1,100 feet in height, which extend along the shore for a distance of about 20 miles. The Highlands of the Hudson are noted for their beautiful scenery. On the west bank are the famous Palisades (q.v.) about 13 miles long, their southern extremity being near Fort Lee, in New Jersey, and the northern extremity near Piermont, N. Y. This remarkable arrangement of rock rises from near the water's edge, almost perpendicularly, from 350 to 550 feet. Below Verplanck and Stony Point is an expansion in the river, the upper part of which is called Haverstraw Bay and the lower part Tappan Sea. Many small islands in the river serve as foundations for lighthouses, or for the erection of dredging platforms. Iona, on which there is now a naval station, Constitution and Beeren islands have all figured in history. Below Albany the Hudson is more an estuary or fiord than a river, which accounts for the great depth of water. The area drained by the Hudson above where the Mohawk enters is about 30,000 square miles. The river is noted for its beautiful scenery from the source to the mouth. Along the lower part of its course there are many fine residences, as a large part of the country on both banks from New York to Albany is now a residential section. The Hudson is fittingly called the "Rhine of America."

Hudson River was discovered by Verrazano, an Italian navigator, in 1524; but it was explored by Henry Hudson in 1609. The Indian name for the river was Shatemuc, and the first colonists called it North River, as the Delaware was then called South River. The part of the river west of New York city is still called North River; but it was given the name Hudson in honor of its first explorer. The history of the country since its discovery by Europeans occupies an important place in the history of the United States. The almost unbroken waterway from the Atlantic Ocean through what is now the State of New York, to the Saint Lawrence River, made this an important route for missionaries, traders and for the armies in the various wars. From the mouth

of Lake Champlain to Lake George, across the portage from Lake George to the Hudson, and the Hudson to the ocean, was all disputed territory, and the scene of many a contest of the Revolutionary War. See CHAMPLAIN, LAKE; CROWN POINT; HAVERSTRAW; TICONDEROGA.

The river is navigable for ships of the first class for about 117 miles from the ocean. Its whole length is about 300 miles. Before the introduction of railroads, the navigable waters of the Hudson, connecting New York with a large section of country, gave the city great opportunities for development. A canal built along the Mohawk Valley, in 1817-25, connected the Hudson with Lake Erie, and the Champlain Canal completed the water route from the Hudson to Lake Champlain. Later the Erie and the Delaware and Hudson railroads brought the coal of Pennsylvania to the Hudson River for transportation by water to markets in the interior. The New York Central and Hudson River Railroad is on the east side of the river and the West Shore on the west side. In 1807 Robert Fulton made on this river the first successful experiment with steam navigation. The Hudson is now a thoroughfare for an immense amount of freight, and elegant passenger steamers ply daily between New York and Albany. The government has erected and maintains 21 lighthouses and lighted beacons. Navigation ceases in winter because the river is frozen nearly its whole length. The ice crop harvested each winter on that part of the river between Albany and the Highlands is shipped, when navigation opens, chiefly to New York city. Shad fishing is one of the important Hudson River industries. Many of the cities on the Hudson were at first only trading posts or ferry towns, but nearly all have kept pace in development with the rest of the State. The principal cities and towns on the river from north to south are Glens Falls, Sandy Hill, Fort Edward, Mechanicsville, Cohoes, Troy, Albany, Hudson, Catskill, Kingston, Poughkeepsie, Newburgh, West Point, Peekskill, Haverstraw, Ossining, Nyack, Tarrytown and Yonkers. At the mouth of the river are New York and Jersey City, with the suburbs, which are important shipping ports, Hoboken and Weehawken. The only bridge crossing the river between New York and Albany is the one which extends from Poughkeepsie on the east side to Highland on the west. There are 14 public ferries. The use of the water power of the Hudson as an aid in developing electrical power for the mechanical arts is most important. From Mechanicsville the power of the Hudson is transmitted to the General Electric shops of Schenectady. At Spiers Falls, at the foot of Mount McGregor, about 40 miles above Albany, there is a stone dam over 1,800 feet long, 100 feet high and containing 1,800,000 cubic feet of masonry. The Hudson is raised 50 feet above its former river bed, then its waters fall 80 feet, and the power developed is transmitted for electrical machinery to Schenectady, Albany, Troy, Amsterdam and other places. This power development of the waters of the Hudson combined with development of like power of the waters of the Saint Lawrence at Massena keeps the two rivers, as in early years of our country, of vast importance to the State. Many industries are affected by this great new power, not the least of which are the coal-

mining of Pennsylvania and the preservation of the Adirondack forests.

The Hudson occupies an important place in the historical, commercial and mechanical development of the nation, also in its literary and artistic progress. Washington Irving who lived at "Sunny Side" and was laid to rest in Tarrytown, introduced to the world many of the places along the Hudson. Cro' Nest is associated with Joseph Rodman Drake and his poem, 'Culprit Fay'; West Park and the country around have been practice observation ground for the naturalists John Burroughs and Ernest Ingersoll; Cornwall-on-the-Hudson was the home of N. P. Willis and E. P. Roe. Artists who have received inspiration from Hudson's scenery and history have become sufficiently numerous and their works of importance enough to be called "The Hudson School of Painters." Consult Johnson, C., 'The Picturesque Hudson' (New York 1909).

**HUDSON BAY**, Canada, an extensive bay or inland sea extending between lat. 51° and 64° N. and long. 77° and 95° W. Its greatest length north to south is about 800 miles, greatest breadth, 600 miles. It is connected with the Atlantic Ocean by Hudson Strait and with the Arctic Ocean by Fox and other channels. Hudson Bay is navigable in summer from the middle of June to the end of October, being obstructed by drift-ice during the rest of the year. There are many islands, reefs and sand banks. The white whale is found in its waters, and there is a considerable summer fishery, steam whalers frequenting the bay from the middle of June to the end of October. Numerous rivers flow into the bay, the chief being the Nelson and Churchill on the east. The shores on the east are high and bold; those on the west are low and level, and much of the land is favorable for stock and dairy farming, while valuable deposits of iron ore, galena and plumbago exist. With the exception of a few fur trading stations of the Hudson Bay Company on the west and south coast, there are, however, no settlements.

**HUDSON RIVER SCHOOL OF PAINTING.** See AMERICAN ART.

**HUDSON STRAIT.** See HUDSON BAY.

**HUDSON'S BAY COMPANY**, the great fur-trading and later landholding and administrative company of Northwest Canada, incorporated 1670. It originated in the dissatisfaction of two French Protestant employees of the French fur-trading monopoly at Quebec, Groseilliers and Radisson, over its unwillingness to extend the trade to Hudson Bay. After vainly trying to induce Boston merchants and the French court to take up their scheme for so doing, they gained the ear of a company of London merchants and Prince Rupert, cousin of Charles II; brought a load of furs from the bay; and on 2 May 1670 Rupert and 17 associates received from Charles a charter for "The Governor and Company of Merchants-Adventurers trading into Hudson's Bay." It had the monopoly of the right to trade in the bay or on its coasts, and could expel any one entering the territory without its license; could build forts, send out ships of war and privateers and declare war and make peace with any non-Christian people. Its capital was £10,500, divided into 34 shares with an extra one for

Prince Rupert, and in 1676 it imported some £19,000 worth of furs, sending in return £650 worth of goods to the Indians. The profit was high on the petty capital paid in, but the gross amount was not large for a century. In 1748 the trade was carried on with four ships and employed about 120 men in all, including the garrisons at its forts. The furs and other imports amounted to over £30,000, the exported goods to £5,000 and the costs of business over £17,000. The average profit was 40 per cent on capital, but the sum was trivial. Moreover, the company had great losses and tribulations from the French rivalry and assaults, especially in the national wars. The French laid claim to the territory on the strength of a mythical expedition of Jean Bourdon in 1656, and in 1682 and 1686 captured several of the company's forts. The two countries' trading posts shared in the long war ended by the Peace of Ryswick in 1697, captured each other's forts, and the treaty yielded Port Nelson to the French, to the great damage of the company. The War of the Spanish succession inflicted frightful hardships on both sides; the company claimed a loss of over £100,000, hundreds of trappers and employees starved to death and the Indians turned cannibals. The Treaty of Utrecht in 1713 finally resigned all French claim to the Hudson's Bay territory and thence till the cession of French Canada in 1763, the monopoly gave the company an easy life and good profits, though still on a small scale. But when that cession opened up access to Hudson's Bay from both land and sea, the possibilities of trade were incalculably enlarged. Despite the clandestine rivalry of Montreal traders who intercepted their boats, the gross volume of trade increased, and it was not crippled by the ravages of France in 1782, as part of the war begun in 1778, when they captured and partly ruined the massive stone Fort Prince of Wales at the mouth of Churchill River and altogether destroyed property valued by the company at half a million pounds. But a much worse rivalry was at hand, organized and powerful: the Northwest Company (q.v.), started on a co-operative plan in 1784 by an association of Scotch merchants in Montreal. The Declaration of Rights having guaranteed free and open trade to all British subjects, this company invaded its rival's territory, and the trade competition for many years merged into actual war. In 1821 they had done each other so much harm that they consolidated, and Parliament in view of the evils of competition empowered the Crown to issue licenses for the "Indian territories," which was exercised in favor of the new company. Meantime exploration had been steadily enlarging the territory; Samuel Hearne for the old company had reached the Arctic in 1771, Alexander Mackenzie for the new one reached the Pacific in 1793. With the United States, its rivalry for the far Northwest was strenuous and persistent; it planted posts in the Oregon district, repelled settlers and there was much danger of war till the boundary settlement of 1846 quieted the dispute. In 1849 it secured a grant of Vancouver Island. This was the time of its palmiest growth. In 1846 it had 513 employees and 35 officers, in 1856 it had over 3,000 employees and officers together, with 152 posts. Its trade monopoly expired by limitation in 1859, but

there was also a great desire to settle the Northwest Territories, with which the fur-trade and administrative rights of the company were incompatible. The company, liable to be dispossessed by force if it refused to come to terms, agreed in 1869 to transfer its territorial rights to the Dominion of Canada for £300,000 and one-twentieth of the lands set out for settlement by the government for the next 50 years. It retained its posts and its rights of trade. The transfer to Canada, and the survey of lands for settlement, was immediately followed by the Riel rebellion (q.v.). The company, despite its lapse of administrative powers, remains the most potent influence for law and order in the unsettled parts, through its relations with the Indians. Consult Bryce, 'History of the Hudson's Bay Company' (1900); Willson, 'The Great Company' (1900); Cawston and Keane, 'Early Chartered Companies' (1896). For the Northwest Company, consult Irving, 'Astoria.'

**HUÉ**, hoo-ā, French Indo-China, the capital of Annam, on the river Truong, 10 miles from its mouth in the Gulf of Tonking. It is surrounded by Vaubanian fortified walls, five miles in circumference, the internal city being built on a rectangular plan with wide and straight streets. The chief building is the royal palace, containing a famous museum of ancient Annamite art, mainly in gold and jade jewelry. Hué is the seat of a French political resident, and at Thuan-an, the port at the river mouth, there is a French garrison. Pop. 60,600, of whom less than 400 are Europeans.

**HUE AND CRY.** (1) Formerly, the common-law process of pursuing criminals with loud outcry, in which all persons were bound to join and assist in the capture. (2) In recent usage, a proclamation for the finding of stolen goods or for the capture of a criminal; hence, any outcry or clamor of pursuit or the like. (3) In England, an official gazette for the information of the authorities as to criminals, crimes committed, etc. Under the process of hue and cry (definition 1) no proof was required of the guilt of the accused, and he had no right of appeal, but all statutes relating thereto were repealed in England in 1887 by the Sheriffs Act, which provided simply that every person in a county, at the command of the sheriff, must be ready to arrest a felon or be fined on failure to comply.

**HUELLEN**, wā'lān, Chilean hero: b. about 1540; d. 1603. He attained the command of the native forces in Araucania and was for a time successful in repelling the invading Spaniards, whose methods of warfare he copied. He defeated the enemy at Valdivia, near Concepción, and near Bio-Bio, but died during the siege of Osbornó.

**HUELVA**, wāl'va, Spain. (1) A maritime province in the southwest, bounded on the north by Badajos; on the east by Seville; south by the Gulf of Cadiz, and west by Portugal. The Sierra de Aracena cross the province in a southwesterly direction. The chief rivers are the Guadalquivir and the Gudiana, the Odiel and the Tinto, and several other tributaries of the main streams. The principal industries are the manufacture of bricks, pottery, soap, candles, flour, brandy and some agriculture. Mining, however, is the leading occupation, the

minerals produced in greatest quantity being copper, manganese and iron. Area, 3,913 square miles. Pop. (est.) 340,560. (2) A city, capital of the province mentioned above. It is situated on the left bank of the Odiel River, about 10 miles from the Atlantic Ocean, and serves as a railroad centre. Originally a Carthaginian trading post, it fell into the hands of the Romans who colonized it. An interesting Roman aqueduct in good repair still survives. Other noteworthy features are the monastery of Santa Maria la Rabida near by, in which Columbus resided after his failure to interest King John of Portugal in his adventurous schemes; the colossal statue of Columbus, erected in 1892 to commemorate his sailing from the port there on his voyage of discovery, and several fine churches. The principal industry is the mining of copper and other minerals at the Rio Tinto mines. To facilitate exportation, excellent modern piers have been constructed at great effort and cost. There are also machine shops, shipyards and considerable trade in grain, fish, olives, grapes and cork. Pop. 34,492.

**HUEPPE**, hüp'pé, Ferdinand, German hygienist: b. Heddesdorf, Rhine Province, 24 Aug. 1852. He studied at the Friedrich Wilhelms Institut of Berlin and in 1890 became professor of hygiene in Prague University (Germany). His researches in bacteriology and disinfection have been extensive and important. He wrote 'Die Methoden der Bakterienforschung' (1885); 'Naturwissenschaftliche Einführung in die Bakteriologie' (1896); 'Handbuch der Hygiene' (1899); 'Wohrung und Gesundheit' (1912); 'Sport und Reizmittel' (1913), and other works.

**HUERCAL-OVERA**, war'kal ô-vá'ra, Spain, a town in the southeastern part, in the province of Almería, on the Lorca-Baza Railway, 16 miles from the Mediterranean coast. It is finely built, the chief edifice being the church. The rich silver, lead and copper mines of the Sierra de Almagrera in the neighborhood supply the town with considerable trade. Agriculture is carried on extensively in the vicinity. Pop. about 17,500.

**HUERTA**, wár'ta, Vicente Antonio García de la, Spanish poet and literary critic: b. Zafra in Estremadura, 1734; d. Madrid, 1787. After studying at Salamanca, he went to Madrid, where he occupied the position of head librarian of the Royal Library. His first literary work of distinction was the tragedy 'Raquel,' which made its first appearance in 1778. He was a staunch upholder of the ancient traditions of Spanish literature and wrote with considerable force and skill. His principal works were his two volumes of poems, 'Obras poeticas' (1778-79), which were printed in 'Biblioteca de autores españoles' (Vol. LXI, Madrid 1869). He was also editor of 'Teatro español' (17 vols., Madrid 1784-85), a collection of old Spanish dramatists.

**HUERTA**, Victoriano, Mexican military officer and president: b. Colotlán, Jalisco, 23 Dec. 1854; d. El Paso, Tex., 13 Jan. 1916. He was a full-blooded Indian and prided himself on his ancestry. At the age of 17 he was made secretary to General Guerra and soon afterward was admitted to the military aca-

demy of Chapultepec. After graduation there he was attached to the topographical bureau of which he was chief for several years. He conducted many surveys throughout the country and as a result had a wider knowledge of Mexican topography than any of his countrymen. For his part in suppressing revolts of the Yaquis and Mayas, Huerta was promoted to the rank of brigadier-general. Huerta was greatly trusted by Porfirio Diaz, and when the latter deemed it advisable to resign the presidency and leave Mexico, it was Huerta who safely conducted the Diaz party to the port of Vera Cruz, where they embarked for Europe. During the Madero regime, Huerta was dispatched to suppress the insurgents led by Pascual Orozco. Felix Diaz, nephew of ex-president Porfirio Diaz, instigated a revolt against the Madero government in February 1913, within the capital city, where a violent conflict was waged for 10 days. Huerta, now a general of division, conducted the defense for the Maderistas. By the latter it was charged that he did not use his best efforts to suppress Diaz. At the end of the street battle Madero and his vice-president, José Pino-Suarez, were seized, and on 18 Feb. 1913 Huerta proclaimed himself provisional president of Mexico. Four days later Madero and Suarez were murdered while being transferred from one prison to another. The circumstances surrounding the murders have never been cleared up, but the general belief is that Huerta was at least a party to the deed, if not the prime instigator, and the world doubted him when he disclaimed responsibility. Public opinion in the United States was aroused and demands were made for intervention. President Taft, however, being about to leave office, wished to leave his successor full freedom of action and President Wilson discounted intervention but firmly refused to recognize Huerta as president of Mexico although several European nations, including Great Britain, had done so.

Huerta's regime was troubled from within. Three more or less independent revolutions were in full blast during 1913, led severally by Carranza, Villa and Zapata. The United States ambassador was recalled and John Lind, ex-governor of Minnesota, was sent as personal envoy of President Wilson to demand of Huerta that he permit a regular presidential election at which he would not be a candidate. Huerta refused and when the Congress set about investigating his autocratic action he caused the arrest of the members hostile to him, and, after dissolving the chamber, assumed full dictatorial powers. In April 1914 some members of the crew of the United States ship *Dolphin* were arrested at Tampico while seeking gasoline supplies on shore. Upon explanation of their errand by Admiral Mayo they were released but the admiral demanded an apology and a salute to the American flag. Huerta refused compliance with this demand and on 21 April Vera Cruz was bombarded by American warships, and landing parties of marines and sailors took the city after a sharp and decisive conflict with the Mexican forces. At this juncture Argentina, Brazil and Chile offered their services as mediators, but the subsequent "A. B. C." conference at Niagara was barren of result. Failure of recognition

by the United States government greatly weakened Huerta's hold in Mexico; he resigned on 15 July; and within a short time set out for Spain. He left the latter country on 3 March 1916 and within a few weeks arrived in New York and established his family at Forest Hills, L. I. Soon afterward he set out for the southwest, but on 27 June was arrested at Newman, N. M., on the charge of fomenting a revolution against Mexico, a country then friendly to the United States. Huerta was released under bond, but on 3 July was rearrested at El Paso, just as he was preparing to enter Mexico. Thereafter until a few days before his death he was under guard at Fort Bliss. Many stories were circulated that German money was being used to put Huerta back in control in Mexico, but none of these was proved as he died before his trial, from acute sclerosis of the liver, aggravated by his hard-drinking habits.

**HUESCA**, wá'ska, Spain. (1) A province of northern Spain, formed in 1833 of districts once belonging to Aragon; bounded on the north by France, west and southwest by Saragossa, southeast by Lérida and northwest by Navarre. The Pyrenees traverse the northern part, reaching an altitude at Monte Perdido of 10,997 feet. The principal rivers are the Aragon in the northwest; the Gallego in the west; the Noguera Ribagorzana in the east, and the Cinca in the centre. Agriculture and cattle raising are the chief industries. The forests are abundant and there is considerable mining of lead, copper, iron, salt, cobalt, limestone and granite. Some manufactures of soap, leather, pottery and cloth are also carried on. The chief towns are Huesca, the capital, Jaca, Barbastro and Fraga. Area, 5,848 square miles. Pop. (est.) 249,265. (2) A city, capital of the province of the same name, on the river Isuela, 45 miles northeast of Saragossa, with which it is connected by rail. It is a very old town, as its many winding streets, mediæval houses and ancient walls testify. The important buildings are the splendid Gothic cathedral dating from the 15th century; the church of San Pedro, in the Romanesque style, dating from the 12th century; and the former university edifice, occupied by a secondary school since 1845, when the university took up its headquarters at Saragossa. Huesca is the seat of a bishop and the episcopal palace is another fine structure. Manufactures of cloth, pottery, bricks and leather are carried on and there is important trade in wine and produce. Under the name of Osca it was an important town in Roman days. Sertorius founded a school there for native chiefs. It was later the scene of the death of Sertorius at the hands of Perpenna (72 B.C.). Under the Moors it was strongly fortified in the 8th century, but in the 11th it was regained by Pedro I of Aragon and became the capital of Aragon. In the following century, with the removal of the capital to Saragossa, it began to decline in prestige.

**HUÉSCAR**, wá'skär, Spain, a city in the province of Granada, 75 miles northeast of the city of the same name. The principal manufactures are flour, paper, linen and woollens. Pop. about 9,000.

**HUET**, u-ä', Pierre Daniel, French Roman Catholic scholar: b. Caen, 1630; d. Paris, 1721.

After studying at the Jesuit school at Caen, he went to Paris in 1651. In the following year his friend and teacher, Samuel Bochart, was invited to the court of Queen Christina at Stockholm, whither Huet accompanied him. Here he conceived the plan for his edition and translation of Origen which appeared in 1668. By indefatigable efforts he mastered many scientific studies, and gained also a most comprehensive knowledge of languages and literature. In 1670 he was appointed assistant tutor to the Dauphin and in this capacity contributed largely to preparation of the Delphine classics. In 1676 he took holy orders, and two years later he was given the abbey of Aulnay. His famous 'Demonstratio evangelica' was published in 1679. As abbot, he published 'Alnetanæ Quæstiones de Concordia Rationis et Fidei' (1690); 'Censura philosophiæ Cartesianæ' (Paris 1689), and also his 'Nouveau mémoire pour servir à l'histoire du Cartésianisme' (1692), and his discussion with Boileau on the Sublime. In 1685 he was created bishop of Soissons, which office, however, he never filled, being transferred to Avranches in 1692. After serving as abbot of Fontenay for a short period, he withdrew to the Jesuits' House at Paris, where he spent his last days. Huet was conceded to be one of the most versatile and brilliant minds of his period. He left a huge library which eventually became incorporated in the royal library. A collection of his works was published in 1712, and 'Huetania,' a volume containing many of his essays and miscellaneous writings, was edited by the abbot of Olivet (1722). In his 'Commentarius de rebus ad eum pertinentibus' was found his autobiography, since translated into French, and into English by J. Aiken (2 vols., London 1819). Consult de Gournay, F. A., 'Huet, Evêque d'Avranches, sa vie et ses œuvres' (Paris 1854); Trochon, 'Huet, Evêque d'Avranches' (ib. 1877).

**HUFELAND**, hoo'fē-länt, Christoph Wilhelm, German physician: b. Langensalza, 12 Aug. 1762; d. Berlin, 25 Aug. 1836. His father was court physician to the Grand Duchess of Weimar, at which city the younger Hufeland received his preliminary education. Later (1780) he studied at Jena and at Göttingen, becoming professor of medicine at the former institution in 1793. In the same year he succeeded his father as court physician at Weimar. Five years later he established himself at Berlin. He was professor of therapeutics and pathology at the university from 1810, became councillor of state in the same year and was prominent in state medical affairs. His reputation was unequalled in his time. Of his many excellent medical writings, the most widely known are his 'Makrobiotik' ('The Art of Prolonging Life') which was translated into a number of European tongues; 'System der praktischen Heilkunde,' a practical work; 'Über die Ursachen, Erkenntnis und Heilart der Skrofelkrankheit' (1795); 'Guter Rath an Mütter über die wichtigsten Punkte der physischen Erziehung der Kinder' (1799); 'Enchiridion Medicum' (1836). His autobiography was published in 1863.

**HUFELAND**, Gottlieb, German political economist and lawyer: b. Dantzig, 19 Oct. 1760; d. Halle, 25 Feb. 1817. He received his

education at Leipzig, Göttingen, and finally at Jena, where he was appointed extraordinary professor of law in 1788 and full professor in 1793. His expositions of the Kantian ideas of legislation won him considerable reputation and attracted many students to his lectures. In 1830, Hufeland became professor of law at Würzburg, but remained only a short time, and then accepted a call to Lanshut. From 1808-12 he was burgomaster at Dantzig. In 1813 he returned to Landshut, where he remained for three years and left to resume work at Halle. His legal works include 'Versuch über den Grundsatz Naturrechts' (1785); 'Lehrbuch des Naturrechts' (1790); 'Lehrbuch der Geschichte und Encyclopädie aller in Deutschland geltenden positiven Rechte' (1790); 'Institutionen des gesammten positiven Recht' (1798); and his greatest work 'Neue Grundlegung der Staatswirthschaftskunst' (2 vols., 1807-13).

**HUFFCUT, Ernest William**, American lawyer and educator: b. Kent, Conn., 1860; d. 1907. He studied law at Cornell University, being graduated in 1888. He then established a practice in Minneapolis, Minn. (1888-90), which he abandoned for the chair of law at Indiana University (1890-92). From 1892-93 he taught at Northwestern University, and from the last-mentioned year was dean of the Cornell Law School. He was appointed legal adviser to Governor Hughes at the beginning of his first term (1907), but shortly afterward he suffered a nervous breakdown and committed suicide. His publications include 'American Cases on Contract' (1884; 3d ed., 1913); 'Cases on the Law of Agency' (1896, with Woodruff), and 'Elements of Business Law' (1905), which is still a standard textbook on the subject.

**HUG, hoog, Johann Leonhard**, Roman Catholic scholar: b. Constance, 1 June 1765; d. Freiburg, 11 March 1846. After studying at Freiburg he was ordained in 1789. Two years later he received the appointment of professor of Oriental languages and of the Old Testament and New Testament exegesis (from 1792) at Freiburg. Here he remained for the rest of his life, except for short sojourns at other universities where he participated in the organizing of new courses; and for travel on the Continent in pursuance of his literary labors. He attained great eminence as a political scholar, his works including 'Erfindung der Buchstattschrift' (1801); 'De Antiquitate Codicis Vaticanæ Commentatio' (1810); 'Das hohe Lied' (1813); 'De Pentateuchi Versione Alexandrina Commentatio' (1818); 'Gutachten über das Leben Jesu, kritisch bearbeitet von D. Fr. Strauss' (1835), and his most widely-known 'Einleitung in die Schriften des Neuen Testaments' (1808), which was translated into English and French. It is an important contribution to the history of Bible versions. Consult Werner, K., 'Geschichte der Kathologischen Theologie in Deutschland' (Munich 1867).

**HUGER, ū-jè, Francis Kinloch**, American soldier: b. Charleston, S. C., September 1773; d. there, 14 Feb. 1855. He was a nephew of I. Huger (q.v.). His father, Maj. Benjamin Huger, was killed before the lines of Charleston in 1779. He studied medicine in London and Vienna where he became acquainted with Dr. Eric Bollman whom he joined in an attempt to rescue Lafayette (q.v.) from the dun-

geons of Olmütz, his father having been the first to receive that general on his arrival in Georgetown in 1777. The enterprise resulted in their imprisonment for eight months. After his liberation he went to Philadelphia where he continued his medical studies at the University of Pennsylvania from which he received the degree of M.D. in 1797. A bronze tablet was erected in the Medical Hall of this institution in his memory in 1909. Huger became a captain in the United States army in 1798, was a colonel in the War of 1812 and served in both branches of the legislature of his State. Consult Headley, P. C., 'Life of General Lafayette' (New York 1855); Lafayette, M. J., Marquis de, 'Memoirs, Correspondence and Manuscripts of General Lafayette' (3 vols., London 1837); Quincy, J., 'Figures of the Past' (Boston 1883); University of Pennsylvania, 'Memorial to F. K. Huger, etc.' (Philadelphia 1909); Varnhagen von Ense, K. A., 'Denkwürdigkeiten und Vernichte Schriften' (Vol. IV, Leipzig 1843).

**HUGER, Isaac**, American general: b. Limerick Plantation, S. C., 19 March 1742; d. Charleston, S. C., 17 Oct. 1797. He was one of five patriot brothers active in the Revolution, beginning his military service as lieutenant-colonel in 1775, after having participated in 1760 in the expedition against the Cherokees. Promoted to the rank of brigadier-general in 1779, he took a conspicuous part in the engagements connected with the siege of Savannah in 1779, commanded a force of cavalry at the siege of Charleston in 1780 which was surprised and dispersed by Tarleton, and commanded the Virginia brigade which formed the right wing in the battles of Guilford Courthouse and Hobkirk's Hill in 1781. He was wounded in 1779 at Stono Ferry and again in 1781 at Guilford, but recovered and served until the end of the war.

**HUGGINS, hūg'inz, Sir William**, English astronomer: b. London, 7 Feb. 1824; d. there, 12 May 1910. He was educated at City of London School, and in 1856 erected an observatory at Tulse Hill, in northeastern Surrey. When in 1859 Professor Kirchoff of the University of Heidelberg announced the true interpretation of the dark Fraunhofer lines in the solar spectrum, Huggins at once saw the possibility of using his practical knowledge of chemistry and physics in the service of astronomy. With W. A. Miller, professor of chemistry at King's College, London, he at once set about the task of constructing a star-spectroscope. The two then began the observation of stellar spectra. A full statement of their results was read before the Royal Society in 1864, the essence of the statement being, in Huggins' own words, that the chemistry of the solar system prevails, essentially at least, wherever a star twinkles. In August 1864 Huggins directed his star-spectroscope toward a planetary nebula in Draco and found its spectrum to be a monochromatic one, thus proving that the nebula consists of a luminous gas. In 1868 he was able to announce to the Royal Society the results of his first measurements of the motion of stars in the line of sight. He began his observations of comet spectra with that of Winnecke's comet in 1868, and in 1868-69 made spectroscopic observations of the solar prominences. About 1876 he resumed his

abandoned efforts to photograph stellar spectra, using the gelatine dry plate process then recently introduced, and this time he was completely successful. His photographs of the invisible ultra-violet portions of stellar spectra have proved extremely valuable, providing, for example, the only reliable data for determining the relative ages of the stars. He was awarded successively the Royal, Rumford and Copley medals of the Royal Society; was president of the Royal Astronomical Society 1876-78 and of the Royal Society 1900-06, was created K.C.B. in 1897, and was (1902) one of the original recipients of the Order of Merit. In his wife (née Margaret Murray) whom he married in 1875, he had a valued coadjutor, and with her published in 1900 a valuable 'Atlas of Representative Stellar Spectra.'

**HUGH**, hū, Saint, of AVALON, bishop of Lincoln: b. about 1140; d. London, 16 Nov. 1200. When Hugh was a young child, about eight years old, his father, Lord of Avalon, retired with him to the monastery at Villard-Benoitt near Grenoble. Here he received his early training; and when he became 19, undertook the duties of deacon. In 1160 Hugh became attracted to the Carthusian order, and joined their ranks at the Grande Chartreuse. He was appointed procurator of that order, and in this capacity gave evidence of that fine administrative ability and tact which induced Henry II to request him to undertake the establishment of a Carthusian monastery at Witham, Somerset. His great success in this work secured his elevation to the bishopric of Lincoln at the favor of the same monarch. However, in spite of the king's patronage, Hugh remained fearless and independent, often opposing his ruler on matters which seemed to him worthy of his championship. He attended rigidly to his ecclesiastical duties, avoiding participation in secular affairs. His benevolence and kindness endeared him to the people of his see, and made him an object of universal respect and admiration. On his return from a visit to his native monastery, he became ill and died. He was buried in Lincoln Cathedral, and his tomb became a shrine for pilgrims. Hugh was canonized on 17 Feb. 1220. His day in the Roman Catholic calendar is 17 November. His 'Life' in Latin, doubtless written by Adam, the bishop's chaplain, was edited by Dimock (London 1864; Eng. trans. by Perry, ib. 1879). Consult 'Vie de Saint Hugues, évêque de Lincoln (1140-1200) par un religieux de la Grande Chartreuse' (Montreuil 1890; Eng. trans. by H. Thurston, London 1898).

**HUGH**, king of Provence and Italy: flourished in the 10th century; d. 947. The son of Lothair, Count of Arles, he was chosen ruler of Provence to succeed Louis the Blind (923). He was also given the crown of Italy by the revolted subjects of Rudolph. His reign was occupied with attempts to maintain his position. Revolts and insurrections were rampant throughout the kingdom and Hugh himself was driven out of Italy by Berengar.

**HUGH CAPET**, king of France, founder of the Capetian dynasty. See **CAPET**.

**HUGH OF LINCOLN**, Saint, a child who is the central figure of a popular mediæval story. He was a boy of 10 when he was found murdered on the premises of a Jew.

Another version makes Hugh guilty of having thrown a ball through the window of the house of a Jew who murdered the boy for his crime. The name of the murderer was revealed to the mother by the child himself, who spoke to her from the well into which his body had been thrown. The belief that Jews were wont to kill Christian children at Passover time was current throughout the Middle Ages, and many Jews were made to suffer bitter persecution because of this superstition. The story of Hugh is treated in Chaucer's 'Prioress's Tale' and by Marlowe in the 'Jew of Malta.'

**HUGHENDEN**, hū'en-dén, England, a parish of Buckinghamshire, two miles north of High Wycombe. It is known principally for Hughenden Manor, where Benjamin Disraeli, Earl of Beaconsfield, lived, and for the parish church in which the Earl and his wife are buried. Pop. 2,150.

**HUGHES**, Ball, American sculptor: b. London, 19 Jan. 1806; d. Boston, Mass., 5 March 1868. He early exhibited a decided taste for modeling and at 12 years of age made out of wax candle ends a bas-relief copy of a picture representing the wisdom of Solomon, which was afterward cast in silver. He was then placed in the studio of Edward Hodges Bailey, where he remained seven years. At this time he successfully competed for the prize awarded by the Royal Academy, winning the large silver medal for the best copy in bas-relief of the Apollo Belvedere; also the silver medal from the Society of Arts and Sciences for a copy of the Barberini faun, the large silver medal for the best original model from life and a gold medal for an original composition, "Pandora brought by Mercury to Epimetheus." He emigrated in 1829 to New York, where his first work of importance was a marble statue of Hamilton, for the Merchants' Exchange, which was destroyed by fire in 1835. He also made a life-size statue of Bishop Hobart for the vestry of Trinity Church. Soon afterward he moved to Dorchester, Mass. Among later works of his are the bronze statue of Bowditch at Mount Auburn Cemetery, a bust of Washington Irving and a statuette of General Warren at Bunker Hill. A plaster figure, 'Little Nell,' and a group, 'Uncle Toby and Widow Wadman,' are in the Boston Athenæum.

**HUGHES**, Charles Evans, American jurist: b. Glens Falls, N. Y., 11 April 1862. He attended the public schools and Madison, now Colgate, University, 1876-78, and was graduated from Brown University in 1881; he then taught Greek and Latin in the Delaware Academy, Delhi, N. Y., studying law at the same time. In 1882 he went to New York city, where he continued to study law. He received honorary degrees of LL.D. from Brown in 1906, from Columbia, Knox and Lafayette in 1907, from Union and Colgate in 1908, from George Washington University, Washington, D. C., in 1909, from Williams, Harvard and Pennsylvania in 1910, and from Yale in 1915. He studied law in the office of Gen. Stewart L. Woodford and in the Columbia Law School, from which he was graduated with the degree of LL.B. in 1884; he was admitted to the bar the same year and practised in New York city. He won the prize

fellowship at Columbia Law School and was a Fellow 1884-87; he was a member of the firm of Carter, Hughes & Cravath, 1887-91; professor of law at Cornell University, 1891-93; special lecturer, 1893-95, and also a special lecturer at the New York Law School, 1893-1900. He returned to his old law practice in New York as a member of his old firm, which became Carter, Hughes & Dwight, and in 1904, on the death of Mr. Carter, the firm became Hughes, Rounds & Schurman. In 1905 he was made counsel for the legislative committee, headed by Senator Stevens, appointed by the New York State legislature to investigate the Consolidated Gas Company and the price of New York city gas, and he framed the 80-cent gas and the assault proof bills, which became laws. In the same year, while in Europe, he was recalled to act as attorney for the Armstrong legislative insurance committee, and drew up a set of insurance laws which were adopted and which have meant the effective stoppage of waste and theft which had run into millions of dollars annually. In 1906 he was appointed special assistant to United States Attorney-General William Henry Moody, in the investigation of the coal trust; in the same year he was nominated for governor of New York State on the Republican ticket and was the only Republican candidate elected on the ticket, defeating William Randolph Hearst, the Democratic nominee, and was re-elected in 1908. In 1908 Governor Hughes was regarded as a possible candidate for President of the United States as successor to Theodore Roosevelt, the delegates from New York giving him a complimentary vote in the convention. On 25 April 1910 he was appointed by President Taft an associate justice of the United States Supreme Court. He was sworn in 10 Oct. 1910, and was succeeded as governor by Lieut.-Gov. Horace White, who served the remaining three months of the term. As governor he gave to New York State one of the most efficient administrations in its history. He carried many of his measures against the strong opposition of the legislature and other political forces, by gaining for them popular opinion through speeches made throughout the State. The most important amongst them were: Creation of State Probation Commission, Public Service Commissions, State Highway Commission, New Apportionment Act, Anti-Race Track Gambling Act, Direct Primary Law. During his administration the State also celebrated in a worthy manner the tercentenary of the discovery of Lake Champlain and of the Hudson River. He resigned from the United States Supreme Court after having been nominated on 10 June 1916 by the Republican National Convention for the presidency. After his defeat by President Wilson in November of that year he returned to the practise of his profession. After the entrance of the United States into the World War, he was appointed chairman of the New York District Board of Exemption. In the spring of 1918 President Wilson placed in his hands the investigation of supposed irregularities in connection with the building of airplanes for the United States army and navy, and he submitted his findings to the President October 1918. He is a member of the American, New

York State and New York city bar associations, a Fellow of Brown University, a trustee of Chicago University and of the Rockefeller Foundation, and president of the Legal Aid Society. His speeches have been published as 'Addresses of C. E. Hughes' (revised ed., New York 1916); his messages, etc., as governor of New York have been collected as 'Public Papers of C. E. Hughes, Governor, 1907-10' (Albany 1908-10). He has also published 'Conditions of Progress in Democratic Government' (Yale Lectures on the Responsibilities of Citizenship, New Haven 1910). Consult Ransom, W. H., 'Charles E. Hughes, etc.' (New York 1916).

**HUGHES, David Edward**, English-American inventor: b. London, 16 May 1831; d. there, 22 Jan. 1900. When very young came with his parents to the United States, of which he became a citizen. He was educated at Saint Joseph's College, Bardstown, Ky., where he was appointed professor of music (1850) and later of natural philosophy. In 1855 he patented his first important invention, that of the well-known printing telegraph which bears his name. It was at once adopted in America, and by 1876 by practically every European country. In 1877 he settled in London. In 1878 Hughes announced to the Royal Society his invention of the microphone, an ingenious instrument which not only transmits sound, but so magnifies faint sounds as to make them distinctly audible. The microphone is now in universal use in the telephone. Another important invention, that of the induction balance, was completed by Hughes in 1879, and in 1880 he was elected a Fellow of the Royal Society, which awarded him its gold medal in 1885. He was a member and at times an officer of the Society of Telegraph Engineers (now Institution of Electrical Engineers), and a manager and vice-president of the Royal Institution. In his later years he experimented along the lines which some years later led to the discoveries of Hertz, Branly and Marconi, resulting in wireless telegraphy. He left a large fortune which was divided among four London hospitals and a number of scientific bodies. A list of his scientific papers will be found in Royal Society of London, Catalogue of Scientific Papers. Consult Anon., 'D. E. Hughes' (in *Nature*, Vol. LXI, p. 325, London 1900).

**HUGHES, Edwin Holt**, American Methodist Episcopal bishop: b. Moundsville, W. Va., 7 Dec. 1866. After studying at the Ohio Wesleyan University and the theological department of Boston University, he became pastor at Newton Centre, Mass. (1892-96) and at Malden, Mass. (1896-1903). In the last-mentioned year he was appointed president of De Pauw University, Greencastle, Ind., which position he occupied for five years, when he was called to the bishopric, with his residence at San Francisco. He was elected president of the State Teachers' Association of Indiana for the year 1904. His publications include 'Letters on Evangelism' (New York 1906); 'Thanksgiving Sermons' (1909); 'The Teaching of Citizenship' (1909); 'A Boy's Religion' (1914); 'The Bible and Life' (1914); Hauréau, J. B., 'Les Œuvres de Hugues de Saint Victor' (Paris 1886); Harnack, 'Dogma' (Vol. VI).

**HUGHES, Hugh Price**, English Wesleyan clergyman: b. Carmarthen, 8 Feb. 1847; d. London, 17 Nov. 1902. He was educated at University College, London, and the Wesleyan Theological College, Richmond; was appointed to Dover in 1869 and was afterward at Brighton; Stoke-Newington; Mostyn Road, London; Oxford; Brixton Hill; and the West London Mission. From 1885 he was editor of the *Methodist Times*, and he was also at one time president of the national council of Evangelical free churches. He was prominently identified with reform work in London and with the Anti-gambling League. He was a powerful preacher, possessing great personal magnetism, and politically a radical. Among his writings are 'Social Christianity' (London 1889); 'The Atheist Shoemaker' (London 1889); 'The Philanthropy of God' (London 1890); 'Ethical Christianity' (London 1892); 'Essential Christianity' (London 1894); and 'The Morning Lands of History: A Visit to Greece, Palestine and Egypt' (London 1901). Consult Hughes, D. P., 'The Life of Hugh Price Hughes' (London 1904); Mantle, T. G., 'Life of H. P. Hughes' (London 1903); Robinson, J. A., and others, 'Hugh Price Hughes As We Knew Him' (London 1902); Stead, W. T., 'H. P. Hughes and His Work' (in *Review of Reviews*, Vol. IV, p. 279, New York 1891-92).

**HUGHES, John**, American Roman Catholic prelate: b. Annaloghan, County Tyrone, Ireland, 24 June 1797; d. New York, 3 Jan. 1864. His parents were poor but made sacrifices to give him the opportunity of acquiring an elementary education; and by his own efforts he continued his studies so that when he came with his parents to America in 1817 he was prepared for college. However, for lack of means he had to defer entering any school, and instead began work as a day laborer, in which occupation he continued for three years, but at 23 entered the Roman Catholic Theological Seminary, Mount Saint Mary's, Emmitsburg, Md. As a student, his remarkable power of reasoning and his ability in argument attracted attention. He was ordained priest in 1826, and for a time was stationed at Bedford, Pa., from which he was transferred to Philadelphia. Here he had charge of Saint Joseph's parish and later Saint Mary's parish. In 1838 he was consecrated titular bishop of Basileopolis and appointed coadjutor to the bishop of New York. In 1842, after the death of Bishop Du Bois, he was made bishop of New York. In 1850 the diocese of New York became an archdiocese and on 19 July 1850 he was raised to the dignity of first archbishop of New York, which office he held until his death. He was an active and effective worker. As a speaker or writer he was ever ready to defend the Church which he represented. He was a resourceful controversialist, a powerful preacher, and, even though he was one of the most ardent supporters of the Pope and a faithful son of Ireland, he became a strong and sincere believer in the truth and desirability of American freedom and of American institutions. He established Saint John's Orphan Asylum in Philadelphia and a number of charitable and educational institutions in New York. The "school question" was to him all important. One of his first

undertakings was to establish a theological seminary at La Fargeville in Jefferson County, N. Y.; the distance from New York caused the abandonment of this plan, and Saint John's College (q.v.) was founded at Fordham instead. In 1858 he laid the corner stone of Saint Patrick's Cathedral. In 1861, being a bold and strong supporter of the Union cause during the Civil War, he was sent by the United States government to Europe, to present the cause of the Union and counteract any adverse sentiment which might exist against the attitude of the North. His diplomatic mission was most successful in France, Italy and Ireland. After his return, though in feeble health, he promptly responded to official appeals to use his influence toward the breaking up of the Draft Riots (q.v.) in New York city. His remains were at first buried in Old Saint Patrick's, Mott street, but in 1883 were transferred to the new cathedral, whose founder he was, where they were laid to rest under the sanctuary. Of his controversial speeches the following were published: 'A Discussion of the Question, "Is the Roman Religion . . . Inimical to Civil or Religious Liberty?"' (Philadelphia 1836); 'Controversy between Rev. Messrs. Hughes and Breckenridge' (Philadelphia n.d.); 'The Controversy between Senator Brooks and John, Archbishop of New York, etc.' (New York 1855); his sermons, speeches, etc. were collected by L. Kehoe, 'Complete Works of John Hughes, Archbishop' (2 vols., New York 1866). Consult Brann, H. A., 'The Most Rev. John Hughes, First Archbishop of New York' (New York 1892); Farley, J. M., 'History of Saint Patrick's Cathedral' (New York 1908); Hassard, J. R. G., 'Life of the Most Rev. John Hughes' (New York 1866); Meehan, T. F., 'Archbishop Hughes and the Draft Riots' (in *United States Catholic Historical Society, Historical Records and Studies*, Vol. I, part 2, p. 171, New York 1900); Shea, J. G., 'History of the Catholic Church in the United States' (4 vols., Akron 1886-92); Smith, J. T., 'The Catholic Church in New York' (2 vols., New York 1905).

**HUGHES, Rupert**, American novelist: b. Lancaster, Mo., 31 Jan. 1872. He received his education at Adelbert College (Western Reserve University) and took graduate work at Yale, where he received his M.A. in 1899. He was assistant editor of *Godey's Magazine*, *Current Literature* and *The Criterion*; and then served for four years in London and New York on the staff of the 'Encyclopedia Britannica.' His published works include a number of books for children, also 'The Musical Guide' (1903); 'Love Affairs of Great Musicians' (1903); 'Songs by Thirty Americans' (1904); 'The Gift-Wife' (1910); 'Excuse Me' (1911); 'The Lady Who Smoked Cigars' (1913); 'What Will People Say?' (1914); 'Music Lovers' Cyclopedia' (1914); 'Empty Pockets' (1915); 'Clipped Wings' (1916); 'The Thirteenth Commandment' (1916); 'In a Little Town' (1917); 'We Can't Have Everything' (1917); 'The Unpardonable Sin' (1918); and a number of successful plays, the most well known of which are 'The Wooden Wedding' (1902); 'Alexander the Great' (1903-04). In 1918, he was commissioned a captain in the National Army.

**HUGHES, SIR Sam**, Canadian soldier and statesman: b. Darlington, County Durham, Ontario, 8 Jan. 1853. He completed his education at Toronto University; was lecturer in English language, literature and history at Toronto Collegiate Institute, and resigned in 1885; proprietor and editor of the *Lindsay Warbler*, 1885-97; has been member of the Canadian House of Commons since 1892; and was appointed Minister of Militia and Defense 1911. The outbreak of the European War imposed on him the task of organizing a huge volunteer force; to this task he bent himself with characteristic energy, and in the first 20 months of the war an army of 320,000 was raised for overseas service. Sir Sam served in the Fenian raid of 1870 and in the South African War 1899-1900. He was created K.C.B. in 1915.

**HUGHES, Thomas**, English author: b. Uffington, Berkshire, 20 Oct. 1823; d. Brighton, Sussex, 22 March 1896. He was educated at Rugby and Oxford, later studied law at Lincoln's Inn, was called to the bar of the Inner Temple in 1848, and began practice at once. In 1869 he was appointed queen's counsel, in 1882 County Court judge. Throughout his long public career, as advanced Liberal in Parliament (1865-74), as president of the Working Men's College in London, as a champion of the co-operative movement, as founder with Canon Kingsley and Frederick Maurice of the Christian Socialists and as creator of Rugby, a socialistic community in the mountains of Tennessee (1880), he tried most earnestly to exercise a helpful influence upon English working-people. He early essayed journalism, writing many sketches for the London *Spectator*, chiefly accounts of traveling experiences. These sketches served as his apprenticeship in writing, and afterward were collected in book form with the title 'Vacation Rambles' (1895). But authorship was a secondary interest until 'Tom Brown's School Days,' first appearing in 1856, made him famous. This work is largely a presentation of the influence of Dr. Thomas Arnold (q.v.) in the great public school. 'The Scouring of the White Horse' (1858), a spirited account of a vacation trip, had a respectful although less cordial reception. The great success of the first story led him to continue his hero's career with 'Tom Brown at Oxford' (1861), first published serially in *Macmillan's Magazine*. At the time of the American Civil War, Hughes was a decided abolitionist, and thus established a friendship with James Russell Lowell. Among other works of his are 'Alfred the Great' (1869); 'Life of Livingston'; 'Memoir of a Brother'; 'Macmillan the Publisher' (1882); 'Life of Bishop Fraser' (1887); 'Vacation Rambles' (1895).

**HUGLI, or HOOGHLY**, hoog'li, British India, (1) a district in Bengal in the Burdwan division along the river Hugli (q.v.). The principal railway is the East Indian. Transport is carried along the Hugli, the Damodar and Rupnarayan rivers; and the Eden Canal irrigates the country between. The chief occupations are the manufacture of brass and bell metal. Flour mills, a bone-crushing mill and brick and tile works are also active industries. Area, 1,190 square miles; pop. 1,060,000. (2) A town, capital of the district of the same

name, on the west bank of the Hugli, 24 miles north of Calcutta, with which it is connected by rail. With Chinusra, an old Dutch settlement, it forms one municipality. Hugli was founded by the Portuguese in 1537, who established a fort at Gholghat, which formed the nucleus of the present city. The principal buildings are the mosque, Hooghly College, a Mohammedan college, several high schools and a hospital. The manufactures consist of jute-bagging, bags and oil. Pop. about 25,000.

**HUGLI, or HOOGHLY**, British India, a channel which connects the Ganges with the Bay of Bengal. The group of rivers known as the Nadia rivers, i.e., the Jalangi, the Bhagirathi and the Churni form the Hugli by their confluence. The Hugli itself measures 125 miles and its estuary 35 miles. Its importance is due to the fact that it is the most navigable of the channels of the Ganges. The peculiarities of the tide in the river make it an object of physiographical interest. The tide in the dry season is felt about 17 miles above Calcutta; while during the southwest monsoon it is subject to a bore seven feet high and ascends rapidly at the rate of 22 miles an hour. The shoals at the mouth of the river demand constant dredging. It is navigable as far as Calcutta to boats drawing 26 feet of water. Above Calcutta the constant silting has rendered it unnavigable.

**HUGO, Gustav von**, German jurist: b. Lörrbach, Baden, 1764; d. Göttingen, 15 Sept. 1844. He studied law at Göttingen for three years and in 1786 was appointed tutor to the Prince of Anhalt-Dessau (1786). Two years later, he was called to the chair of law at Göttingen, becoming professor ordinary in 1792. His principal contribution to the study of law is in his application of the historical method to the great unsifted mass of legal matter which had been handed down by Roman legislators. His name ranks with Savigny and Haubold as one of the founders of this method. His important writings in this field are 'Lehrbuch eines civilistischen Kursus' (7 vols., 1792-1821); and 'Civilistisches Magazin' (1790-1837), together with its supplement 'Beiträge zur civilistischen Bücherkenntnis der letzten vierzig Jahre' (1823-45). Consult Eysenhardt, 'Zur Erinnerung an Gustav Hugo' (Berlin 1845).

**HUGO, hū'gō** (Fr. ū'gō), Victor Marie, French poet and novelist: b. Besançon, 26 Feb. 1802; d. Paris, 22 May 1885. Major Hugo, his father, having entered the service of Joseph Bonaparte, king of Italy and afterward of Spain, Victor's earlier years were partly spent in these countries. At the age of 12 he was already writing verses of considerable promise, and in 1823 his first novel, 'Han d'Islande,' appeared, followed in 1825 by 'Bug Jargal.' In 1828 a complete edition of his 'Odes et Ballades' appeared. In these productions Hugo's anti-classical tendencies in style and treatment of his subject had been very visible, but the appearance of his drama, 'Cromwell' (1827), with its celebrated preface, gave the watchword to the anti-classical or romantic school. 'Cromwell' was too long for representation, and it was only in 1830 that 'Hernani,' over which the great contest between Classicists and Romanticists took place,

was brought on the stage. Other dramas followed—'Marion Delorme' (1831); 'Le Roi s'amuse' (1832); 'Lucrece Borgia' (1833); 'Marie Tudor' (1833); 'Angelo' (1835); 'Ruy Blas' (1838); 'Les Burgraves' (1843). During those years he had also published a novel, 'Notre Dame de Paris' (1830), and several volumes of poetry, 'Les Feuilles d'Automne' (1831); 'Les Chants du Crépuscule' (1835); 'Les Voix intérieures' (1837); 'Les Rayons et les Ombres' (1840). The poetry of this period has a melody and grace superior perhaps to any that he afterward wrote, but wants that deep and original sense of life characteristic of his later poems. During the same period he also wrote critical essays on Mirabeau, Voltaire, and a number of articles for the *Revue de Paris*. In 1841, after having been four times previously rejected, he was elected a member of the French Academy; made shortly afterward a tour in the Rhineland, of which he wrote a brilliant and interesting account in 'Le Rhin' (1842). In 1845 he was made a peer of France by Louis Philippe. The Revolution of 1848 threw Hugo into the thick of the political struggle. At first his votes were decidedly Conservative, but afterward whether from suspicion of Napoleon's designs or from other reasons, he became one of the chiefs of the Democratic party. After the *coup d'état*, 2 Dec. 1851, he was one of those who kept up the struggle in the streets against Napoleon to the last. He then fled to Brussels, where he published the first of his bitter satires on the founder of the Second Empire, 'Napoléon le Petit.' In August 1852 he went to live in Jersey, but finally settled in Guernsey, where he bought an estate called Hauteville House. In the following year (1853) the famous volume 'Les Châtiments,' a wonderful mixture of satirical invective, lyrical passion and pathos, appeared. It was in the comparative solitude and quietness of the Channel Islands that he wrote most of the great works of his later years. 'Les Contemplations' (1856); 'La Légende des Siècles,' 1st series (1859); 'Chansons des Rues et des Bois' (1865), and his celebrated series of social novels, 'Les Misérables' (1862); 'Les Travailleurs de la Mer' (1866) and 'L'Homme qui Rit' (1869). In 1870, after the fall of the empire, Victor Hugo returned to Paris, where he spent his remaining years in occasional attendances at the Senate, and in adding to the already long list of his literary works. Among these latest productions may be cited, 'Quatre-Vingt-Treize' (1873); 'L'Art d'être Grand-père' (1877); 'L'Histoire d'un Crime' (1877); 'Le Pape' (1878); 'La Pitié Suprême' (1879); 'Religions et Religion' (1880); 'Les Quatre Vents de l'Esprit' (1881); 'La Légende des Siècles' (last series, 1883); 'Torquemada' (1882). If not the greatest writer that France has produced, certainly he is her greatest poet. But he had grave defects and limitations, the chief being an entire want of humor, a too frequent straining after effect through the abnormal and bizarre, an overweening belief in his own infallibility and an ever-present conviction that he was a sage, all of whose sayings might be regarded as priceless teachings, to be eagerly caught up by a listening world. His death was the occasion of an imposing public funeral in the Pantheon, preceded by his body lying in state and guarded for several days under the

Arc de Triomphe. Posthumous works include 'Le Théâtre en liberté'; 'La fin de Satan'; and 'Toute la lyre.' An edition of his complete works in 40 volumes appeared at Paris in 1886. The house in which Victor Hugo lived, on the Place des Vosges was transferred to the city of Paris, and now forms a Victor Hugo Museum, full of interesting relics of the poet. (See HERNANI; LES CHÂTIMENTS; MISÉRABLES, LES; NOTRE DAME DE PARIS; RUY BLAS). Consult Swinburne, 'Study of Victor Hugo' (1886); Barbot, 'Victor Hugo et son Temps' (1882); Mabileau, 'Victor Hugo' (1893); Nichol, 'Victor Hugo, a Sketch of his Life and Work' (1894); Dupuy, 'Victor Hugo, l'Homme et le Poète' (1887); Baire, 'Victor Hugo après 1852' (1894); Stapfer, 'Victor Hugo et la grande poésie lyrique en France' (1901); Claretie, 'Victor Hugo, souvenirs intimes' (1902); Mack, 'Romance of Victor Hugo and Juliette Drouet' (1905).

**HUGO**, Okla., city and county-seat of Choctaw County, 125 miles northeast of Dallas, Tex., served by the Saint Louis and San Francisco Railroad. Situated on the Kiamichi River, Hugo is a manufacturing city. The chief industries are in railroad repair shops; manufacture of cotton and its by-products; saw and planing mills, and creosote factories. The government is under a mayor and alderman. The municipality owns the waterworks. Pop. about 4,700.

**HUGO OF SAINT VICTOR**, a monk of the 12th century: b. either Saxony or Flanders, about 1097; d. Saint Victor's at Paris, probably on 11 Feb. 1141. He was doubtless of Saxon origin, and impelled by a desire for learning, came to France with his uncle, Archdeacon Hugo of Halberstadt. He entered the monastery of Saint Victor at Paris, and rose eventually to be the head of the school there. His contemporaries held Hugo in high esteem for his brilliance as a scholar and teacher, and his erudite writings. These include several mystical treatises; an encyclopedic survey of the field of knowledge: 'Eruditio didascalica'; and his distinguished work on theology, 'De sacramentis christianæ fidei,' in which he opposes the scepticism of other critics and insists on adherence to the best dogma of the Church. The subjective mysticism of his point of view accounts in some degree for his decline in popularity with later scholastics. However, his influence on the 12th century religious thought surpassed that of any other contemporary theologian. His works were first published at Paris (1518), and were reprinted several times.

**HUGO VAN DER GOES**, hu'go van der goos, Dutch painter: b. Goes, Zealand, date uncertain; d. 1482. Very little is known concerning the early period of his life. It is probable that his artistic education was obtained in Holland. He resided at Ghent and in 1467 was admitted to the painters' guild of that city. He was employed by the city authorities in public decoration in 1468-69 and in 1473-75 was dean of the painters' guild there. Subsequently he retired to a monastery near Brussels, where he remained until his death. There survive copies of an oil decoration by Hugo for the home of a wealthy citizen of Ghent. The Novak Gallery of Prague has the best copy. His greatest surviving work, how-

ever, is the Portinari altarpiece, now in the Uffizi Gallery. It represents the Madonna and Child with shepherds, angels, etc. Other works of Hugo are panels in the Vienna Gallery, of which one represents the 'Fall of Man'; in others are 'The Sorrows of Christ' and 'Saint Genevieve.' In the townhall of Bruges is Hugo's 'Death of the Virgin.' Consult Voll, 'Die altniederländische Malerei' (Leipzig 1906); and Wanters, 'Hugues van der Goes' (Brussels 1872).

**HUGUENOT** (hū'gē-nō) **SOCIETY OF AMERICA**, The, a patriotic society, founded in New York city 1883, for the purpose of perpetuating Huguenot history by collecting relevant documents and libraries; and also by public commemoration. The membership is limited to descendants of Huguenot families which emigrated from France prior to the Edict of Toleration (1787); and also to historians and authors who have done important work in Huguenot history. The society has headquarters at New York and branches in other States of the East. Its publications are under the title 'Collections of the Huguenot Society of America.' A celebration of the tercentenary of the Edict of Nantes was held in 1898; an account of the exercises appearing in a memorial volume in 1900.

**HUGUENOTS**, hū'gē-nōts, a term of unknown origin, believed to be a diminutive of the personal name Hugo, applied to the Protestants of France during the religious struggles of the 16th and 17th centuries. During the early part of the 16th century the doctrine of Calvin, notwithstanding the opposition of Francis I, spread widely in France. Under his successor Henry II, 1547-59, the Protestant party grew strong, and under Francis II became a political force headed by the Bourbon family, especially the King of Navarre and the Prince of Condé. At the head of the Catholic party stood the Guises. The contest between the two parties was as much political as religious. The result was that a Huguenot conspiracy headed by Prince Louis of Condé was formed for the purpose of compelling the king to dismiss the Guises and accept the Prince of Condé as regent of the realm. But the plot was betrayed, and many of the Huguenots were executed or imprisoned. In 1560 Francis died, and during the minority of the next king, Charles IX, it was the policy of the queen mother, Catherine de Medici, to encourage the Protestants in the free exercise of their religion in order to curb the Guises. In 1562 an accidental conflict between the followers of the Duke of Guise and some Protestants at a church meeting precipitated a series of religious wars which desolated France almost to the end of the century. Catherine, however, began to fear that Protestantism might become a permanent power in the country, and suddenly making an alliance with the Guises, with their help she projected and carried out the massacre of Saint Bartholomew's (q.v.), 24 Aug. 1572. The Protestants fled to their fortified towns and carried on a war with varying success. On the death of Charles IX, Henry III, a feeble sovereign, found himself compelled to unite with the King of Navarre, head of the house of Bourbon and heir-apparent of the French Crown, against the ambitious Guises, who openly aimed at the throne, and had ex-

cited the people against him to such a degree that he was on the point of losing the crown. After the assassination of Henry III the King of Navarre was obliged to maintain a severe struggle for the vacant throne; and not until he had, by the advice of Sully, embraced the Catholic religion (1593), did he enjoy quiet possession of the kingdom as Henry IV. Five years afterward he secured to the Huguenots their civil rights by the Edict of Nantes (q.v.) which confirmed to them the free exercise of their religion, and gave them equal claims with the Catholics to all offices and dignities. They were also left in possession of the fortresses which had been ceded to them for their security. This edict afforded them the means of forming a kind of republic within the kingdom, which Richelieu, who regarded it as a serious obstacle to the growth of the royal power, resolved to crush. The war raged from 1624 to 1629, when Rochelle, after an obstinate defense, fell before the royal troops; the Huguenots had to surrender all their strongholds, although they were still allowed freedom of conscience under the ministers of Richelieu and Mazarin. But under Louis XIV a new persecution of the Protestants commenced. They were deprived of their civil rights, and bodies of dragoons were sent into the southern provinces to compel the Protestant inhabitants to abjure their faith. The Edict of Nantes was revoked in 1685, and by this act about 50,000 Protestant subjects were driven out of France to other countries. (See HUGUENOTS IN AMERICA). In the reign of Louis XV a new edict was issued repressive of Protestantism, but so many voices were raised in favor of toleration that it had to be revoked. The Code Napoléon and later enactments place Protestants in France on an equality with their Catholic compatriots. Consult Browning, 'History of the Huguenots' (1840); Félice, 'Histoire des Protestants de France' (1874); Baird, 'The Huguenots' (New York); Thompson, 'The Wars of Religion in France' (1909).

**HUGUENOTS**, The, a dramatic opera in five acts by Giacomo Meyerbeer, libretto by Augustin Scribe and Deschamps. This is regarded as the best of Meyerbeer's operatic compositions, the music being intensely dramatic, with brilliant orchestration and fine themes. The subject is the persecution of the Protestants by the Catholics in France in 1572. The opening scene represents the interior of the castle of the Count of Nevers, where the Catholic noblemen receive Raoul de Nangis, a Huguenot, recently promoted captain. During the toasts at the banquet each member of the party is called on to give the name of his lady love, when Raoul informs the company that he once rescued a beautiful girl who in her sedan chair was molested by students. She had thanked him for his gallantry and, though he did not know her name, he had lost his heart to her. Marcel, an old retainer of Raoul and a Protestant, warns his master of the danger he is courting by drinking with the noblemen. A lady is announced, and Raoul recognizes her as his unknown charmer. She turns out to be Valentine, daughter of St. Bris, betrothed to the Count of Nevers. She has come to beg the Count to release her from her promise, to which he reluctantly agrees. A page brings a note to Raoul, in which he is commanded to

attend a lady, unknown to him. The others, however, recognize the seal of Queen Margaret of Valois; regarding Raoul as an important person, they endeavor to win his friendship. The second act shows Raoul in the presence of the Queen, who is striving to reconcile the warring religious factions. With this object she desires Raoul the Protestant to marry Valentine, her maid of honor and a Catholic. The girl had told her mistress of her meeting with the dashing cavalier and of her love for him. Raoul, as yet not knowing that he is speaking to the Queen, willingly vows to be Margaret's knight and promises St. Bris to wed his daughter. When, however, he finds that that daughter is his unknown lady, about whom he entertained certain doubts, he revokes his promise and makes an enemy of the offended father. On behalf of Raoul, Marcel later carries a challenge to St. Bris, who accepts it, but a fanatical noble named Maurevert advises St. Bris to crush his enemy by other means. Notwithstanding her disappointment with Raoul, Valentine determines to save him and tells Marcel to warn his master not to meet his opponent alone. In the presence of four witnesses the duel takes place, during which a quarrel breaks out between Catholic and Protestant citizens. The Queen intervenes and listens to the mutual recriminations, not knowing which side to believe, when Valentine enters to bear witness. Raoul now learns the object of her interview with Nevers—to regain her freedom. But too late, for her father has again promised her to Nevers, who arrives on the scene accompanied by wedding guests. In the fourth and fifth acts the dreadful Saint Bartholomew's night is shown. Raoul takes a last farewell of Valentine in her room when her father breaks in with a party of Catholics. Raoul hides and hears the details of the great conspiracy to destroy the Protestants, to begin with the murder of their leader, the great Coligny. While all the assembled Catholics agree to the plot, Nevers alone declines to soil his honor by murder, but is willing to fight in honest battle. Raoul resolves to warn his brethren; despite Valentine's entreaties he rushes forth. At the end the Queen and her husband, Henry of Navarre, are seated in the hall surrounded by courtiers when Raoul rushes in pale and blood-stained, describes the horrors being perpetrated outside and implores the royal help. It is too late. Valentine and Raoul meet again; she implores him to accept her faith and thus save his life. He remains firm, however; nothing can move him. Then Valentine decides to remain. She accepts his creed and they meet death together.

**HUGUENOTS IN AMERICA.** The French Protestant settlements in the New World divide themselves into two classes: those of choice (or at least with time and opportunity to make choice) and those of necessity. The former extend from the middle of the 16th century down to the capture of New York by the English in 1664; the latter comprise all those dating from the increasing severity of repression that heralded the Dragonnades and the Revocation of the Edict of Nantes to the end. The former were deliberately organized colonizations, of the same stamp as the English and from the same motives; the latter were the desperate and generally hurried resource of

crowds of ruined exiles. The former were complete failures, and were soon suppressed, absorbed or exterminated; the latter sought only life and livelihood and welcomed absorption. The former include the abortive attempts in Brazil and Florida, the earliest settlements in Acadia and Canada, the first settlement of New York and the settlement of some of the West Indies; the latter include the feeble attempts at settlements in New England, the flood of accessions to the French element in New York, the founding of New Rochelle, the migrations to Pennsylvania, Delaware and Maryland, the promising but aborted attempt in Virginia and, greatest of all, the tide of immigrants that created South Carolina.

The first attempt at creating a New-World Huguenot asylum and magazine of supplies was undertaken in 1555; Nicholas Durand de Ville-gagnon pretended to undertake it for Coligny, and settled a colony in Rio Janeiro Harbor. But it was half Catholics; Villegagnon was a scamp, persecuted and scattered the Protestants and finally deserted the colony; and the Portuguese killed the remnant in 1567. A more honest attempt was made by Jean de Ribault in 1562, at Port Royal, S. C., but failed. In 1564 René de Laudonnière founded a colony on the Saint John's in Florida, at Fort Caroline; but the next year Pedro Menendez de Avillés butchered the entire settlement. Saint Bartholomew and the religious wars intervened; and no further efforts were made till after the accession of Henry of Navarre, who had imbibed the ardor for colonization from Coligny. In 1664, under his commission, Sieur de Monts planted a settlement to be on the basis of perfect religious equality, the first in the New World—at Port Royal, N. S.; French mercantile jealousy had the commission revoked and it perished; but two years later it was refounded by Poutrincourt, and De Monts and Champlain founded Quebec. In 1613 Sir Samuel Argall (q.v.) destroyed Port Royal, but the French stayed and bands of Protestants came to reinforce them at intervals. A small settlement was made on Newfoundland, but was broken up by the government except for a few who would turn Catholics. The founding of New Amsterdam, usually supposed to be by the Dutch, was in fact by Huguenots under Dutch auspices. The Huguenots—largely French-speaking Walloons—who had crowded into the Netherlands to escape persecutions, had tried to gain permission to found settlements in the English colonies; rebuffed in this, they engaged with the Dutch, and the first shipload of emigrants that came to the future New York were entirely Huguenot, Peter Minuit himself being a Walloon. French families had been there already for years, the first white child born on Manhattan Island being French. For three generations the French element continued to be a highly important factor in the city, and composed much of the business aristocracy; even after the English occupation, all official documents were printed in both Dutch and French as well as English. Of the first shipload of emigrants, a number went up the Hudson and founded Fort Orange (Albany). In 1660 a number of Walloon and Vaudois exiles, who had taken refuge in the Lower Palatinate, settled near Kingston, N. Y.; later, the Vaudois founded New Paltz in the Wallkill Valley. In 1677 a French town

was founded at Hackensack, but the fast increasing Dutch soon swamped it. Small French groups settled in various parts of New Jersey.

Of the second class, the refugee emigration—100 scattered and hurried in general to found separate French settlements—the first beginning from the north was at Boston. From 1660 on, small numbers had come from the Channel Islands and Rochelle, but after the Dragonnades 200 or 300 families came over, including some of the most notable names in Boston history. A settlement at Oxford, Mass., was made in 1687, primarily to convert the Nipmuck Indians, but that tribe joined hands with the Canadian tribes in league with the French and inflicted such horrors on them—one whole summer besieging them in their blockhouse—that the settlement broke up in despair, many of them taking refuge in Milford, Conn. Many small groups settled in Rhode Island; the largest had a miserable history, being defrauded by a New England company organized expressly to sell to innocent foreigners a tract of land to which it had no title. In Connecticut, Hartford and Milford received the greatest number. In New York the arrivals strengthened the French element, but soon melted into the general mass. In Pennsylvania, Delaware and Maryland, many hundreds settled, but as scattered members of the population, and left no outward trace. In Virginia, whose southern climate was congenial to them, the Huguenots had settled in considerable numbers for many years, but in 1690 William III sent over some 300 Huguenots who had followed him from Holland and they made a settlement named Monacantown, from an extinct Indian tribe. In 1700, after long negotiations, four shiploads more came over under Marquis de La Muce; about half of them settled at Jamestown, Va., and in South and North Carolina, the rest at Monacantown. Several hundred more came over at different times and the settlement seemed to have struck enduring roots; but furious religious dissensions broke it in two, and the pastor led part of them to the Trent in North Carolina, whence in fear of Indian massacre they finally went to South Carolina, the Canaan of the Huguenots, settling at Jamestown. This South Carolina French immigration, due to the latitude and soil fitting their habits, began in 1670 in small numbers. In 1680 the city of Charleston was founded, largely under French auspices; the same year Charles II sent over about 90 Huguenots to produce wine, oil and silk. After the Revocation the great tide began to flow in; in 1687 there were four wholly or largely French settlements—Jamestown on the Santee, the "Orange Quarter" on the Cooper, Saint John's Berkeley and Charleston. In 1732 a band of 360 French-Swiss Protestants settled Purysburg on the Savannah; and in 1764 the last French colony was founded—New Bordeaux in Abbeville County. In the intervals there was a steady stream, very large for many years after 1685. Some of the greatest names in Southern history are French, and the entire character and action of the State have been deeply molded by this fiery, impulsive, gallant strain. It is pitiful to record that after all the sacrifice and courage of these exiles, religious persecution forced them to close their churches. All but members of the Church of England were disfranchised in 1706, and the Huguenots were bribed into sub-

mission by government support of the churches and having the liturgy translated into French.

The Huguenot settlements in the West Indies—Saint Christopher, Martinique, Guadeloupe and some smaller ones—belong in origin to the former group, that of voluntary colonization; their later history and the flight from them belong to the latter. They were colonized by a trading company under Richelieu's patronage from 1626 on; there was nominal prohibition of public worship, but actually the law was a dead letter, as there would have been no trade but for the Huguenots; the Walloon Synod of Holland supplied ministers and the life was one of prosperity and content. Then as the Revocation approached, atrocious penal laws were passed, but still not enforced. The Revocation changed everything into a scene of misery. The first result was the using of the islands as a penal settlement for the Huguenots of France; they were sold into service, sometimes of the worst character, and the horrors of the passage rivaled the worst of the slave-trade. Then the governor-general was ordered to extirpate heresy at all hazard and threatened a dragonnade if the inhabitants did not recant. The effect was a general flight; next a stern order from the governor-general to stop or he would carry out the government orders in all their severity, which produced a still greater stampede, assisted by the Catholics themselves. In a few months the islands were half depopulated and their trade nearly ruined. The king then modified his orders; the flight ceased and a few returned; but most of the refugees remained in the English colonies or Bermuda. Several score at least removed to New York, and some of them founded New Rochelle; a few to New England, and the Southern colonies naturally received the largest quota. This immigration had an important effect on the United States trade with the West Indies, as the Huguenot merchants, from their familiarity with the region and their family ties, took the lead and greatly developed it.

The "dead-line" of the French churches in America, the test of that element's separate existence, is about the middle of the 18th century; beyond that, according to Baird, few existed and fewer kept their language. French instinct was to blend, and of course it was much the best that it should do so. The element was absorbed soon and utterly, but its blood and its ideas have been very valuable to the United States. Consult Baird, 'History of the Huguenot Emigration to America' (1885); 'Collections of the Huguenot Society of America.'

**HUIA**, a New Zealand bird (*Heteralocha acutirostris*), one of the starling family. It is about the size of a thrush, is greenish black in color, with a white tail band and red wattles at the gape. The bill of the male is much shorter than that of the female, the latter being long and curved like that of a snipe. It feeds on timber beetles. The bird is fast becoming extinct, being sought after as a cage-bird by the whites and by the natives for its tail feathers. It is now protected by law in an effort to save it.

**HUICHOL** (wě'chōl) **INDIANS**. See **INDIANS, AMERICAN**.

**HUILA**, wě'la, Colombia, a department situated between the central and western Cordil-

leras. The principal river is the Magdalena, which traverses it in a northward direction. Cacao, rice, coffee, sugar-cane, tobacco and corn are cultivated. There is also some stock raising and gold mining; and manufactures of straw hats, cigarettes and woollens are carried on. The capital is Neiva. The country on the whole is not developed. Pop. about 160,000.

**HULL, Charles Henry**, American historian and political scientist: b. Ithaca, N. Y., 29 Sept. 1864. He received his education at Cornell University and subsequently spent several years in Germany at Göttingen, Berlin and Halle, where he took his Ph.D. in 1892. He became assistant librarian at Cornell (1886-90), and then held an instructorship in political science there (1892-93). He was appointed professor of American history in 1901, which office he has since occupied, combining with his professorial duties from 1908-13, the office of dean of the College of Arts and Sciences. He has published 'The Economic Writings of Sir William Petty.'

**HULL, Cordell**, American congressman: b. Overton County (now Pickett), Tenn., 2 Oct. 1871. He studied law at Lebanon Law School where he was graduated in 1891. From 1893-97, he was a member of the Tennessee house of representatives; judge of the 5th judicial circuit of Tennessee 1903-07; and was elected a member of the 60th and 65th United States Congresses (1907-19). He rendered distinguished service in the Spanish-American War as captain of the 4th Tennessee regiment.

**HULL, Edward**, Irish geologist: b. Antrim, 21 May 1829. As a member of the Geological Survey of Great Britain for 20 years, he geologically mapped a large portion of the central counties of England. From 1869-90 he was professor of geology at the Royal College of Science, Dublin; and in 1883 commanded an expedition under the auspices of the Palestine Exploration Society to Arabia Petraea and Palestine. Among his important works are 'The Coal-Fields of Great Britain' (1865); 'Building and Ornamental Stones' (1872); 'A Text-Book of Physiography' (1888); 'Mount Seir, Sinai and Southern Palestine' (1885); 'Volcanoes, Past and Present' (1892); 'Our Coal Resources at the Close of the 19th Century' (1897); 'Reminiscences of a Strenuous Life' (1910); 'Monograph on the Sub-oceanic Physiography of the North Atlantic Ocean' (1912).

**HULL, Isaac**, American commodore: b. Derby, Conn., 9 March 1773; d. Philadelphia, 13 Feb. 1843. He commenced his career in the merchant service, and was commissioned as lieutenant in the navy at the commencement of hostilities with France in 1798. In 1800, when first lieutenant of the *Constitution*, he cut out a French privateer from under a strong battery in the harbor of Port Plate, San Domingo. During the war with Tripoli (1802-05) Hull served with distinction in the squadrons of Commodores Preble and Barron, in command of the schooner *Nautilus* and brig *Argus*, participating in the several attacks on the city of Tripoli in July, August and September 1804, and subsequently co-operating with General Eaton in the capture of the city of Derne. In May 1804 he was promoted to the rank of master commandant, and in April 1806 to that of captain.

At the opening of the War of 1812 between the United States and Great Britain he was in command of the frigate *Constitution*, and in July of that year, while cruising off New York, fell in with a British squadron, which chased the *Constitution* closely for nearly three days and nights. The wind was light and baffling, but Hull handled his vessel with superior seamanship and finally escaped without injury; at one time he resorted to a novel and successful expedient; the boats were lowered, and all the spare rope on board was bent to a kedge anchor which was carried out nearly a mile ahead and let go. The ship was warped up to this kedge, which was weighed while another was carried out. In this way she left her pursuers before they discovered the manner in which it was done. After this remarkable escape, Hull went into Boston for a few days, whence he sailed 3 August, and 19 August met the English frigate *Guerrière*, which after a short conflict he reduced to a complete wreck and forced the English to surrender. (See *CONSTITUTION, THE*). As this was the first naval action of the war, it was regarded as a very important one; Captain Hull was enthusiastically received, and Congress at its next session presented him with a gold medal. After the war his principal services were in command of the navy yards at Boston and Washington, of the squadrons in the Pacific and Mediterranean, and as a member of the board of navy commissioners.

**HULL, William**, American soldier: b. Derby, Conn., 24 June 1753; d. Newton, Mass., 29 Nov. 1825. He was graduated at Yale College in 1772, then taught school and studied theology for one year, but finally studied law at Litchfield, Conn., and was admitted to the bar in 1775. He entered the army of the Revolution at Cambridge in 1775 as captain of a Connecticut company of volunteers; was promoted to the rank of major in the 8th Massachusetts regiment in 1777, and to that of lieutenant-colonel in 1779. He was in the battles at White Plains, Trenton, Princeton, Stillwater, Saratoga, Monmouth and Stony Point and in all the battles fought against Burgoyne. His services throughout the war received the approbation of his superior officers, and neither his courage nor patriotism was ever doubted. After the English evacuation he accompanied Washington to New York and was made lieutenant-colonel of the one regiment which then made up the entire peace establishment of the United States army. He was sent to Canada as a commissioner in 1784, and again in 1793, after which he returned to the practice of law at Newton, Mass. After a trip to Europe in 1798 he was appointed judge of the Court of Common Pleas and later was elected to the Massachusetts senate where he served until 1805. In 1798 he was also made major-general of the Massachusetts militia. He was governor of Michigan Territory from 1805 till 1812, when he was appointed as brigadier-general to the command of the northwestern army. He marched his troops to Detroit, heard of the declaration of war, and of the fall of Michilimackinac, which let loose the Indians of the Northwest upon him, crossed into Canada, but found his communications cut off, recrossed, and on the arrival of General Brock surrendered to that officer the post of Detroit and the territory. For this he was tried two years after by a court-martial, and

sentenced to be shot. The execution of the sentence was remitted by the President in consideration of his age and Revolutionary services. Historians are now agreed that the difficulties which surrounded General Hull were so great that we need not ascribe his surrender either to treason or to cowardice. He published 'Defence of Brigadier-General W. Hull, etc.' (Boston 1814); 'Memoirs of the Campaign of the North Western Army of the United States, 1812' (Boston 1824). Consult Campbell, M., 'Revolutionary Services and Civil Life of General W. Hull' (New York 1848); Clarke, J. F., 'History of the Campaign of 1812' (New York 1848); Clarke, S. C., 'General W. Hull's Surrender at Detroit, 1812' (in *Magazine of American History*, Vol. XXVII, p. 343, New York 1892); id., 'General W. Hull' (in *New England Historical and Genealogical Register*, Vol. XLVII, pp. 141 and 305, Boston 1893); Forbes, J. G., ed., 'Report of the Trial of Brid.-Gen. W. Hull, etc.' (New York 1814); Foster, J., 'The capitulation, or a History of the Expedition Conducted by William Hull' (Chillicothe 1812); Lossing, B. J., 'Hull's Surrender of Detroit' (Philadelphia 1875); Summer, W. H., 'General W. Hull' (in *New England Historical and Genealogical Register*, Vol. IX, p. 41; Vol. XI, p. 167; Boston 1855 and 1857); Snelling, J., 'Remarks on Hull's Memoirs of the Campaign of 1812' (Detroit 1825).

**HULL**, Canada, town and county-seat of Ottawa County, Quebec, on the Ottawa River, at the junction of the Gatineau River, opposite the city of Ottawa, and on the Canadian Pacific Railway. It is connected with its important neighbor by a fine suspension bridge spanning the Chaudière Falls. Iron mining is carried on in the neighborhood, and the falls afford immense water power. Lumbering is the chief industry of the district; and Hull has vast lumber yards, saw- and planing-mills, and manufactories of pulp, paper, matches, pails, woodenware, woollens, axes, etc. The total annual value of its manufactures is over \$7,258,000. It has several churches, a college, a convent, many fine residences, and French and English newspapers. The population is chiefly French Canadian. The town has been rebuilt since its almost total destruction by fire, 26 April 1900. Pop. 18,222.

**HULL**, officially **KINGSTON-UPON-HULL**, England, a city, river port, municipal and parliamentary borough, and self-contained county, situated in the East Riding of York, on the north shore of the estuary of the Humber, where it is joined by the Hull, 34 miles east-southeast of York. Its total area in land and water is 9,042 acres. The buildings of note are the town-hall, the exchange, the corn exchange, market-hall, postoffice, the custom-house, Trinity House, dock offices, public rooms, royal institution (containing the rooms of the Philosophical Society, etc.), art gallery, technical schools, central library, Hymers College, grammar-school, the jail, royal infirmary, borough asylum, hospitals, crematorium and dispensary. The city possesses three well-laid-out public parks. The industries are varied. There are several ship-building yards, iron-foundries, machine-shops and steam flour-mills; the other principal branches of industry include

seed-crushing, color-making, paper-making, canvas, rope and cable-making, tobacco manufacturing and oil boiling. Hull ranks as the sixth port in the kingdom, and has extensive ship accommodation, docks, quays, etc. The principal exports are coal, coke and manufactured fuel (in 1914, 3,056,368 tons valued at \$10,133,265), machinery, metal goods and woollen and cotton goods; imports—timber, corn, iron, wool, flax, hemp, tallow, hides, pitch, tar, resin, bones, etc. The total net tonnage of ocean-going vessels entering and leaving the port in 1914 was 6,760,000. The name of Kingston-upon-Hull was given by Edward I, who erected a fortress, and constituted it a chartered town and port. When Edward III invaded France in 1359 Hull contributed 16 ships and 470 mariners. During the Civil War Hull was besieged unsuccessfully by the Royalists twice. Pop. 277,991 of which 136,006 are males.

**HULL HOUSE**. See SOCIAL AND UNIVERSITY SETTLEMENTS.

**HULLAH**, John Pyke, English musical composer: b. Worcester, 27 June 1812; d. London, 21 Feb. 1884. In 1833 he entered the Royal Academy of Music. His first important composition, an opera entitled 'The Village Coquettes,' of which the words were by Charles Dickens, was successfully produced at Saint James' Theatre in 1836. Early in 1841 he opened classes in Exeter Hall for the instruction in vocal music of schoolmasters and the general public, and from 1849 to 1860 continued them in Saint Martin's Hall, built for him by his friends and supporters. His classes were remarkably successful despite much adverse criticism of his method of teaching. In 1858 he succeeded Horsley as organist at the Charterhouse, and in 1872 received the appointment of musical inspector of training schools for the United Kingdom. He conducted the Philharmonic concerts at Edinburgh 1866-67, and those of the Royal Academy of Music 1870-73. He also held professorships in King's College, Queen's College and Bedford College. Hullah's best-known compositions are songs, of which several, such as 'The Sands of Dee,' 'Three Fishers,' 'The Storm,' and 'O that We Two Were Maying,' have become very popular. He issued many excellent collections of songs and other musical pieces, among which are 'Part Music,' in three series (1842-45); 'Vocal Scores' (1846 onward); 'School Songs' (1851); 'Sea Songs'; 'Singer's Library of Concerted Music' (1859); and 'Song Book' (1866). Dr. Hullah was the author of the following among other works on the history and theory of music: 'Grammar of Vocal Music' (1843); 'On Vocal Music' (1849); 'Grammar of Musical Harmony' (1852); 'The History of Modern Music' (1862); 'Grammar of Counterpoint' (1864); 'Music in the House' (1877). Consult the 'Life' by his wife (1886).

**HULLIN**, u'lân', Pierre Augustin, French general: b. Geneva, 1758; d. 1841. He learned the trade of watchmaking and went to Paris to practise. When the Revolution broke out, Hullin was one of the leaders of the attack on the Bastille. However, he was unwilling to go to the extremes to which his fellow revolutionists reverted during the Terror, and was consequently imprisoned by them. When released, he joined the Italian army and was made adjutant.

tant-general to Napoleon I. In 1802 he was given command of a division and two years later was head of the military court which pronounced judgment on the Duke d'Enghien (1804). Napoleon held him in high esteem, distinguishing him with the rank of count in 1809. In 1812 he was made governor of Paris. When the power of Napoleon declined, Hullin made several unsuccessful efforts to maintain his position, and although he was restored to the governorship of Paris during the Hundred Days (q.v.), he was later banished. After a few years at Brussels and Hamburg, he returned to France in 1819.

**HUMACAO**, oo'ma-kā'ō, Porto Rico, city and capital of the province of the same name, on the Humacao River, about five miles from the coast. It is beautifully situated in a mountainous district. The chief public buildings are the schools and library. The original settlement at Humacao was made in 1793, and it became incorporated as a city in 1894. Pop. 6,500.

**HUMAITA**, oo-mā-ē'tā, Paraguay, town and fort, on the Paraguay River, near the mouth of the Paraná River, in the southwestern part of the republic. A situation of strategic importance during the war of the "Triple Alliance," it withstood a siege for a whole year, the attacking forces being Argentine and Brazil soldiers. In 1868 it surrendered and the fortifications were destroyed. It is surrounded by a fertile agricultural country. There is but little local manufacturing; but there is an extensive trade in coffee, sugar, cotton, tobacco, hides and live stock. Pop. 4,000.

**HUMAN EMBRYOLOGY.** See **EMBRYOLOGY**, **HUMAN**.

**HUMANE ASSOCIATION**, American, a consolidation of various societies, formed at Cleveland, Ohio, in 1877, becoming a national organization for the prevention of cruelty to animals and children. The initial work of the Society was to regulate the abuses in cattle-transportation by the railroads, and to secure the passage of State laws looking to this end. It offered a prize of \$5,000 for the best model of a cattle car that would make possible the feeding, watering and resting of cattle in transit, and many improved cattle cars were brought into use. Prizes for essays on vivisection, its abuses and their remedy were also offered for competition in 1900 among colleges and medical students. Since 1913 the societies represented in the Association number over 300 with an aggregate membership of 141,000, and since that year have published the *National Humane Review*.

**HUMANE SOCIETY**, Royal, formed in London, in 1774, for the purpose of resuscitating those who had been immersed in water and were apparently drowned. The headquarters is on the Serpentine in Hyde Park and numerous stations are maintained in different parts of the metropolitan area. At the present time it distributes rewards, consisting of medals, clasps, testimonials and sums of money to those who save or attempt to save life from drowning. Also "all cases of exceptional bravery in rescuing or attempting to rescue persons from asphyxia in mines, wells, blast-furnaces, or in sewers where foul gas may endanger life, are recognizable by the society." It likewise

gives prizes for swimming to the pupils of public schools and of training-ships.

**HUMANISM.** (1) That phase of the Renaissance which consisted in a renewed study of the so-called humanities—the Latin and Greek classics. Like the entire movement of the Renaissance, Humanism had its source in Italy, which had at all times maintained a continuous (through often a slender) tradition of its ancient greatness. Furthermore, Italy was the nearest of the civilized western countries to the Empire of the East, and so it was to Italy that the Byzantine scholars fled when their country fell under Turkish dominion. Much before this, however, the Italian scholars had begun to set a high price on the remains of ancient learning. Petrarch (1304-74), and Boccaccio (1313-75) (qq.v.) were both more highly esteemed by their contemporaries for their Latin writings than for their compositions in the vernacular, and both spent much effort in the discovery and preservation of classical works. Boccaccio indeed was familiar with Greek as well as with Latin.

The definitive introduction of Greek into Italy, however, took place in 1391, when Michael Chrysoloras, being on his way through Florence on a mission from the emperor of Byzantium, was induced to settle there and teach Greek. After him came Johannes Bessarion, Theodorus Gaza, Johannes Argyropoulos and Demetrius Chalcondylas, who had left the Byzantine Empire on account of the menace of the Turks or on account of the fall of Constantinople in 1453. These men had as pupils Piero and Lorenzo de Medici, Pitian, Reuchlin, Linacre, Grocyn, Latimer and many other scholars from both sides of the Alps. The recovery of manuscripts became the passion of monarchs and popes. Nicolas V, Leo X, Cosimo and Lorenzo de Medici, Alphonso the Magnanimous of Naples, Guarino Veronese and Poggio Bracciolini stand out among the many ardent bibliophiles of this age. Under the de Medicis the revival of learning came to be associated with a revival of Platonism and a new academy was organized, the most distinguished head of which, Marsilio Ficino (1433-99), tried to unite Platonism and Christianity. Aristotle too was read in the original, and many disputes arose between the advocates of the Catholic or Arabic traditions and those who interpreted the works of Aristotle in their own fashion.

Humanism received a great impetus from the invention of printing. Aldus Manutius (q.v.; 1450-1515), the greatest of Italian printers, produced editions of 28 Greek and Latin classics. Aldus associated himself with a large number of scholars, who co-operated with him in his work. For him publishing was not merely a business, but a propaganda for the dispersion of knowledge.

The revival of learning ended in Italy with the conquest of the Italian cities by the ruffianly soldiers of Charles V in 1527-30, after the strength of the country had been sapped by the dissipation and profligacy which followed the upsetting of the old religious sanctions by the influence of ancient philosophy. This failed to impose its own standards of righteousness on a people given over to the splendid luxury which accompanied the rebirth of art. Human-

ism might well have perished had it not been that it had already taken root in a more northern soil. Among the pioneers of humanism beyond the Alps were Agricola (1443-85), Johann Reuchlin (1455-1532), and Melancthon (1497-1560). Between these men and their obscurantist reactionary opponents there was waged a continual strife. Italian humanism turned its energies primarily to literature and art; German humanism to theology, education and social betterment, thus forming the prelude to the Reformation.

Like the humanism of all northern countries, that of France had Italian origin, and may be said to have received its first great impulse from the invasion of Naples by Charles VIII in 1494. It owed much, however, to the influence of perhaps the greatest of all the scholars of the Renaissance, the Dutchman Desiderius Erasmus (1467-1536). Erasmus also played an important part in British humanism. Humanism in England was foreshadowed by Chaucer, who was at once a literary debtor and a disciple of Petrarch and Boccaccio. In the reign of Henry V, Humphrey, Duke of Gloucester, was a patron of learning in the Italian sense, and gathered around him a coterie of English and Italian scholars. However, British humanism first became definitely established by Thomas Linacre (1460-1524), William Grocyn (1446-1519), and William Latimer. These three friends made secure the hold which humanism had already obtained on Oxford, so that British humanism became able to meet that of Italy on even terms. Through Colet (1467-1515), the pupil of Linacre and Grocyn, the humanistic movement led to the foundation of the great schools of England. Sir Thomas More (1478-1535), another pupil of Linacre and Grocyn, did much to break down the opposition to Greek at Oxford. More was also an ardent Platonist, as is shown by his famous book, the 'Utopia,' which was patterned after the 'Republic' of Plato. Greek was established at Cambridge through the efforts of Erasmus and John Fisher (1469-1535), bishop of Rochester. The humanism established in England by these men spread throughout society, and paved the way for the great Elizabethan period of literature and culture. See RENAISSANCE for further details and for bibliography.

(2) The word 'humanism' is often used for that theory of education which claims that a study of the classics is the best means for a well-rounded and broad culture. It often takes the form of a protest against the scrappiness of a training based on a too exclusive devotion to natural science.

(3) 'Humanism' is sometimes used to designate that type of philosophical view which makes man the measure of all things. Its chief contemporary exponent is F. C. S. Schiller of Oxford.

**Bibliography.**—Consult Jebb, R. C., 'Humanism in Education' (New York 1899); Schiller, F. C. S., 'Humanism' (New York 1903); Mackenzie, J. S., 'Lectures on Humanism' (New York 1907).

**HUMANISTS**, a class of scholars which arose about the 14th century in Italy and was prominent throughout Europe in the 15th and 16th centuries. See HUMANISM.

**HUMANITARIAN CULT**, The, a society founded at New York, 5 Nov. 1914, by Misha Appelbaum. Its object is to develop between individuals a proper sense of responsibility, to create a correct understanding of the essence of true religion and to develop the spirit of helping mankind from a sense of love, rather than merely from a sense of duty. It is absolutely non-sectarian; has no officers, incurs no expenses and levies no dues. Collections and contributions are not permitted. The society is non-partisan in politics but is interested in securing legislation for improving the condition of the masses. The only qualification necessary for membership is a desire to be just human and be of some assistance to one's fellow-man. Its relief work is undertaken voluntarily by the members, who give the unfortunates kindness and sympathy as well as material aid. The society aims to abolish all philanthropic institutions, charity societies and foundations, by the establishment in every municipality of departments of welfare. A section of the cult is devoted to the abolition of capital punishment, and it has done good work in creating public sentiment in favor of abolishing the death penalty in New York State. The movement has spread to other States. Meetings and concerts are held at frequent intervals in Carnegie Hall, New York. Its propaganda is also furthered by the *Humanitarian Magazine* (New York). The cult has now a total membership of 123,012.

**HUMANITARIANS**, a term applied to the various classes of anti-Trinitarians, who regard Christ as a mere man. The earliest known author of the purely humanitarian theory is Theodotus of Byzantium, who lived in the 2d century. A contemporary of his, Artemon, taught the same doctrine, and asserted that such had been the universal belief of Christians up till the beginning of the 3d century. See UNITARIANISM.

**HUMAYUN**, Mogul emperor of Delhi: b. 1508; d. 1556. He was the son of Baber, whom he succeeded in 1530. His reign was occupied with 10 years of warfare in the effort to maintain his possessions; but he was finally driven from India. Taking refuge at the court of Persia, he devoted his energies to plans for his restoration. With his son, the famous Akbar, he returned and reconquered Delhi in 1555. He died shortly afterward and was succeeded by his son. A splendid mausoleum was erected for him at Delhi.

**HUMBER**, the estuary of the Ouse and Trent rivers between Yorkshire and Lincolnshire. Its length is 38 miles, and its width varies from one to seven miles. It is important as a shipping route, having the city of Hull on its north shore and Great Grimsby on the south. The presence of shoals makes careful buoying necessary. The Humber is connected by canals with South Yorkshire and Trent. Historically, the river is known as the point of entrance for the Norse invasions in the 9th and 10th centuries. The tidal bore sometimes occurs on the Humber and the shore-line is constantly shifting.

**HUMBERT I**, RANIERI CARLO EMANUELE GIOVANNI MARIA FERDINANDO EUGENIO, king of Italy: b. Turin, 14 March 1844; d. Monza, near Milan, 29 July 1900. He was eldest son of Vic-

tor Emmanuel II and Queen Marie Adelaide, daughter of the Archduke Regnier of Austria. He received a most careful education, entered the army, took part as a youth in the war of independence, and in 1866 was in command of a division at Custoza. On 22 April 1868 he married his cousin, Princess Margherita of Savoy, daughter of the Duke of Genoa. On the death of his father he succeeded to the throne of Italy, 9 Jan. 1878, as Humbert I. During his reign he carefully regarded constitutional limitations, and directing his choice of prime ministers according to parliamentary conditions selected but one, Rudini, from the Conservatives. In 1891 was concluded the "Triple Alliance" with Germany and Austria, a compact which necessitated the maintenance of a large army, and navy, and the oppressive taxation of an already burdened country. Humbert believed in colonial expansion, which he inaugurated by the occupation of Massowah, on the Red Sea. The Italian troops suffered reverses in 1887 and 1888, when they were defeated by the Mahdi, and 1 March 1896 when they lost the battle of Adowa to the Abyssinians. Humbert's attitude toward the Vatican was one of firmness, respecting all guarantees to the Pope, but insisting on the permanence of the Italian possession of Rome. His private munificence—it is said that he expended not less than \$500,000 yearly in benefactions—and his personal interest and courage in the rescue work after the earthquake at Ischia (28 July 1883), and in visits to Busca and Naples during the cholera epidemic (1884), made him greatly respected by the Italians, to whom he was known as "Humbert the Good." He was thoroughly a soldier and eager in the interests of the army. Two unsuccessful attempts were made upon his life, one at Naples, 17 Nov. 1878, by Passanante, a fanatic, and another near Rome, 22 April 1897, by Acciarito, an anarchist. On 29 July 1900 he was shot and killed at Monza, near Milan, by the anarchist Bresci. See ITALY—HISTORY.

**HUMBERT SWINDLE**, The, one of the most daring and extensive frauds on record, perpetrated for 20 years by a Mme. Humbert of Paris with the aid of her husband and various accomplices. It was alleged by Mme. Humbert that a certain Robert Henry Crawford, American millionaire, had left to her his fortune of \$20,000,000. A subsequent will divided the estate between her younger sister, Marie Daurignac, and Henry and Robert Crawford, nephews of the testator, while a third document bound the heirs to the preservation of the title deeds and securities, and placed these in the keeping of M. and Mme. Humbert until Marie should attain her majority. Without examination the alleged title deeds and securities were deposited and sealed in a safe by the authorities. On this wholly fictitious basis Mme. Humbert netted about \$10,000,000, while the amount of notes in the form of original loans and renewals equaled \$140,000,000. The fraud was discovered, and the Humberts disappeared in May 1902; they were arrested in Madrid in December and brought to Paris for trial. They were found guilty of forgery and swindling, and were sentenced 22 Aug. 1903 to five years' solitary imprisonment, but were released 13 Sept. 1906.

**HUMBLE-BEE**. See BUMBLEBEE.

**HUMBOLDT**, hüm'bôlt (Ger. hoom'bôlt), Friedrich Heinrich Alexander, BARON VON, German traveler and naturalist: b. Berlin, 14 Sept. 1769; d. there, 6 May 1859. His father was chamberlain to the king of Prussia. He studied at the universities of Frankfort-on-the-Oder, Berlin and Göttingen, and in 1790 traveled along the Rhine to Holland, France and England. This journey gave rise to his 'Observations on the Basalt on the Rhine,' published in 1793. In 1791 he studied mining and botany at the mining school in Freiberg, where his acquirements, his attractive and instructive conversation, his wit and goodness of heart gained him universal esteem and affection. In 1792 he was appointed assessor in the mining and smelting department, and soon afterward removed to Bayreuth as overseer of the mines in Franconia. Here he introduced many improvements, among which was the establishment of the mining school at Steben; he likewise made valuable galvanic experiments, the results of which were published in 1796, in two volumes. But in 1797 he gave up this office from a desire to travel. Owing to the disturbed state of the Continent, however, it was not easy for him to carry out his project. For some time he resided in various parts of Germany, particularly at Jena, where he became intimately acquainted with Goethe and Schiller. In 1797 he went, in company with his brother Karl Wilhelm, a Prussian minister of state, to Paris, where he became acquainted with Aimé Bonpland, a pupil of the medical school and botanic garden in Paris. He then went to Madrid, and having obtained permission from the Crown to travel through the Spanish colonies in America, immediately sent for his friend Bonpland, and sailed with him from Corunna. They landed at Teneriffe, where they ascended to the crater in Pico, in order to analyze the atmospheric air, and to make geological observations. In July they arrived at Cumana in South America. For five years they were occupied incessantly in traveling through tracts of the earth rich in all that could interest the scientific observer, and till then never scientifically described. They explored the regions of South America watered by the Orinoco and the upper part of the Rio Negro, fully tracing the connection between the Orinoco and the Amazon; then returned to the coast and sailed for Cuba, where they remained some months. Leaving Cuba in 1801, they returned to the South American continent, sailed up the Magdalena as far as they could, pursued their route by land to Popayan and Quito, and thence as far south as Lima, crossing the Andes no fewer than five times in the course of their journey, and, besides other mountain ascents, climbing Chimborazo (23 June 1802) to an elevation of 19,300 feet, being the highest point of the Andes then reached by man; from Lima they sailed to Guayaquil, and thence to Acapulco, Mexico (January 1803). Some months were spent in examining the City of Mexico and the surrounding country, and in a visit to the United States; and in January 1804, they set sail for Europe, taking Cuba again on their way. On 3 Aug. 1804, they arrived at Bordeaux, bringing with them, as the result of their labors, an immense mass of fresh knowledge in geography, geology, climatology, meteorology, botany, zoology and every branch of natural science, as well as in eth-

nology and political statistics. Humboldt selected Paris as his residence, no other city offering so many aids to scientific study, or having so many distinguished savants, and remained there till March 1805, arranging his collections and manuscripts, and experimenting with Gay-Lussac, in the laboratory of the polytechnical school, on the chemical elements of the atmosphere. He was accompanied by Gay-Lussac, who exerted a lasting influence on his chemical studies, in a visit to Rome and Naples, and also by Von Buch on his return through Switzerland to Berlin, where, after an absence of nine years, he arrived in November 1805. As the condition of Germany made it impracticable to publish there his large scientific works, he was permitted by King Frederick William III, as one of the eight foreign members of the French Academy of Sciences, to remain in Paris, which was his residence, excepting brief periods of absence, from 1808 to 1827. There appeared his 'Voyage aux Régions équinoxiales du Nouveau Continent' (with Atlas, 1809-25; German edition, Stuttgart 1825-32; new edition, edited by Hauff, 4 vols., 1859-60). When in 1810 his elder brother resigned the direction of educational affairs in Prussia to become Ambassador at Vienna, the former post was urged upon Humboldt by Hardenberg; but he declined it, preferring his independence. He had also already decided upon a second scientific expedition, through Upper India, the region of the Himalaya and Tibet, in preparation for which he was diligently learning the Persian language. The political events between the Peace of Paris and the Congress of Aix-la-Chapelle gave him occasion for several excursions. He went to England in the suite of the king of Prussia in 1814; again in company with Arago, when his brother was appointed Ambassador to London; and again in 1818 with Valenciennes from Paris to London, and from London to Aix-la-Chapelle, where the king and Hardenberg wished to have him near them during the Congress. He also accompanied the king to the Congress of Verona, and thence to Rome and Naples; and in 1827, at the solicitation of the monarch, gave up his residence in Paris, and returned by way of London and Hamburg to Berlin, where in the following winter he delivered a series of public lectures on the cosmos. Under the patronage of the Tsar Nicholas he undertook in 1829 an expedition to northern Asia, to explore the Ural and Altai mountains, the Chinese Dsougaria and the Caspian Sea. In this expedition he was accompanied by Ehrenberg and Gustav Rose. Their course lay through Moscow, Kazan and the ruins of Old Bulghari to Ekaterinburg, the gold mines of the Ural, the platinum mines of Nijni Taghilsk, Bogoslovsk, Verhoturye and Tobolsk, to Barnaul, Schlangenbergl and Ustkamengorsk, in the Altai region, and thence to the Chinese frontier. From the snow-covered Altai Mountains the travelers turned toward the southern part of the Ural Range, and traversed the great steppe of Ischim, passed through Petropavlovsk, Omsk, Miask, the salt lake of Ilmen, Zlatousk, Taganay, Orenburg, Uralsk (the principal seat of the Uralian Cossacks), Saratov Dubovka, Tzaritzin and the Moravian settlement of Sarepta, to Astrakhan and the Caspian Sea. They visited the Kalmuck chief Sered Jaab, and returned by Voronesh, Tula and Moscow. The

entire journey of over 10,000 miles was made in nine months; its results are given in Rose's 'Mineralogisch-geognostische Reise nach dem Ural, Altai und dem Kasjischen Meere' (1837-42); and Humboldt's 'Asie Centrale, Recherches sur les Chaines de Montagnes et la Climatologie comparée.' It extended the knowledge of telluric magnetism, since in consequence of it the Russian Imperial Academy established a series of magnetic and meteorological stations from Saint Petersburg to Peking, which was followed, on Humboldt's application to the Duke of Sussex, by the establishment of similar stations in the southern hemisphere by the British government. The convulsions of 1830 gave a more political direction to Humboldt's activity for several years. On the news of the French Revolution, and the accession of Louis Philippe, he was selected to convey to Paris the Prussian recognition of the new monarch, and to send political advices to Berlin. The latter office fell to him again in 1834-35, and he was called upon to fulfil it five times in the 12 following years, residing four or five months in Paris on each mission. To this period belongs the publication of his 'Examen critique de la Géographie du Nouveau Continent' (1835-38). He accompanied the king of Prussia in visits to Denmark, England, etc. (1841-45), and resided for several months in Paris in 1847-48, from which time he lived in Prussia, usually in Berlin, occupying a high position at the court until his death. His last great work, 'Cosmos' (1845-58), has been unanimously recognized as one of the most valuable contributions to science ever published. It explains the physical universe according to its dependencies and relations, grasps nature as a whole, moved and animated by internal forces, and by a comprehensive description shows the unity which prevails amid its variety. It has been translated into all languages in which a book of science is required, and has been without an equal in giving an impulse to natural studies. Consult Bruhns, 'Alexander von Humboldt, eine Wissenschaftliche Biographie' (English trans., 1873); Klenke, 'Alexander von Humboldt, ein biographisches Denkmal' (1859).

**HUMBOLDT, Karl Wilhelm, BARON VON,** German statesman and philologist, brother of the preceding: b. Potsdam, 22 June 1767; d. Tegel near Spandau, 8 April 1835. He studied law at Berlin, at Frankfort-on-the-Oder and at Göttingen, and at the same time devoted equal attention to antiquities, æsthetics and the philosophy of Kant. In 1789-90 he lived in Erfurt and Weimar, where a friendship commenced with Schiller continued without interruption till the poet's death. A valuable memorial of his friendship with Schiller is the correspondence between them ('Briefwechsel zwischen Schiller und Wilhelm von Humboldt,' 1830). In 1790 he became Prussian Councillor of Legation at Berlin, resigning in the following year. From 1794-97 he was one of the Schiller circle at Jena. In 1801, at the request of the Prussian government, he accepted the situation of ministerial resident at Rome. From 1806-08 he was here Minister Plenipotentiary, but, having been called from Rome to fill the office of Minister of the Interior in connection with ecclesiastical and educational matters, had a most important share in the educational progress which Prussia has since made; more especially

FRIEDRICH HEINRICH ALEXANDER VON HUMBOLDT

is the erection of the Berlin University to be ascribed to him. In 1809 he was appointed Privy Councillor of State, and in this office was in charge of public worship and education. He exchanged this situation in 1810 for that of Extraordinary Ambassador and Minister Plenipotentiary to Vienna. He took an active part during the armistice of 1813 in the peace congress at Prague; in 1814 at the Congress of Chatillon, and the conclusion of the first Paris peace; in 1815 at the Congress of Vienna; and in 1816 at Frankfort-on-the-Main, in all matters connected with the German Diet. He was afterward appointed Ambassador to London, and in 1818 attended the Congress of Aix-la-Chapelle. In 1819 he was an active member of the Prussian Ministry of the Interior, but sent in his resignation the same year, in favor of a freer and more constitutional system. It was not until 1830 that Humboldt was recalled to the Council of State. His publications include the elegiac poem 'Rom' (1808); the important work in philological research in the Basque language 'Prüfung der Untersuchungen über die Urbewohner Hispaniens vermittelt der baskischen Sprache' (1821); also 'Über die Kawisprache auf der Insel Java' (3 vols., 1836-40); 'Ideen zu einem Versuch, die Grenzen der Wirksamkeit des Staates zu bestimmen' (ed. by Cauer in Reclam's 'Universalsbibliothek' 1851). Humboldt's philological studies were the first in this field to be based on history, philosophy and the various anthropological sciences. His collected works appeared in seven volumes (Berlin 1841-52). Consult Haym, R., 'Wilhelm von Humboldt, Lebensbild und Charakteristik' (Berlin 1856); Gebhardt, 'Wilhelm von Humboldt als Staatsmann' (2 vols., Stuttgart 1896-99); and Kittel, 'Wilhelm von Humboldts geschichtliche Weltanschauung' (Leipzig 1901).

**HUMBOLDT, Kan.**, a city in Allen County, 60 miles southeast of Emporia, on the Neosho River. The Missouri, Kansas and Texas and the Atchison, Topeka and Santa Fe railroads connect with the town. The chief occupations are the mining of oil, and the manufacture of tile, bricks, cement and flour. Oil refining and agriculture are also carried on. The city owns its waterworks. Pop. 2,600.

**HUMBOLDT, Tenn.**, a city in Gibson County, 85 miles east of Memphis. It is situated on the Forked Deer River and is served by the Mobile and Ohio and the Louisville and Nashville railroads. It is a shipping centre for the surrounding region which grows cotton and fruit. There are marble and granite works, cotton mills, brickyards, canning factory and cotton gins. The municipality operates its own waterworks and electric-light plant. Pop. 3,500.

**HUMBOLDT**, a river which has its rise in Elko County, Nevada, in the northeast corner of the State, and flows west and southwest, a distance of about 350 miles into Humboldt Lake, in the eastern part of the State. The stream is narrow, the waters saline and the whole course is through a barren region, destitute of large trees and but few shrubs, except a few clusters of willows. The fields are covered with sage brush. The only east and west pass through the mountains of Nevada, which rise to a height of 11,000 feet above sea-level, is the valley of the Humboldt. The

Central Pacific Railroad, in its course through the State, follows this river. Humboldt Lake has no outlet; but the waters evaporate so rapidly that sometimes its bed is dry, but when the water is high it overflows the banks. A dam built a few years ago prevents the overflow from falling in Carson Sink.

**HUME, David**, Scottish historian and metaphysician; b. Edinburgh, 26 April 1711; d. there, 26 Aug. 1776. He appears to have entered the University of Edinburgh at 12 and to have left at 14 or 15 without taking a degree. He began the study of law, but abandoned it first for commerce and then in order to devote himself to the "pursuits of philosophy and learning." These he carried on in France, largely at the Jesuit school of La Flèche. His first work, the 'Treatise of Human Nature,' was published partly in 1739 and partly in 1740; the books entitled 'Of the Understanding' and 'Of the Passions' appearing in the former, and that entitled 'Of Morals' in the latter year.

The 'Treatise of Human Nature' is the final and most complete exposition of the fundamental principles of the old school of empirical philosophy,—the school to which belonged Bacon, Locke and Berkeley. According to Hume, the contents of the mind are embraced in the term "perceptions." Perceptions consist of sensuous impressions and ideas. Ideas are merely faded-out sensuous impressions. Knowledge is the cognition of the relation between perceptions. There is no necessary connection between cause and effect. The idea of cause depends on the habit of the mind which expects the event that usually follows another. Mind—and it is precisely this point that Hume transcends Berkeley—is but an isolated series or succession of impressions and ideas. As knowledge is dependent on experience derived through the senses, and as the senses frequently deceive, one can have no absolute knowledge of things, but only of one's impression of them. Or rather, there are no things apart from experience, but merely chains of experiences which constitute the things. Hence, to give the conclusion later arrived at in the famous 'Essay on Miracles,' a miracle even if genuine is incapable of proof.

The 'Treatise of Human Nature' is clear, forcible and untechnical. Its most striking characteristics are its spontaneity and individuality. Hume owed little to academic training, and wrote his earlier works at a distance from centres of learning, without access to large libraries. The literary beauties of the 'Treatise,' however, are marred by its structural defects. It is a series of brilliant fragments rather than a well-rounded whole, and is concerned more with criticism of metaphysical opinions from the point of view of Hume's theory of knowledge than with the construction of a complete system of philosophy, yet this lack of system-making can scarcely be held up against a man whose chief contribution to philosophy was of the nature of a destructive criticism of the old notions of substance. The 'Treatise' failed to excite the interest and antagonism which Hume confidently expected. He therefore turned his activity in the direction of political investigation.

In 1741 appeared the first volume of 'Essays, Moral and Political,' the second volume coming out in the following year. These, with some

additions and omissions, were republished in 1748 under the expanded title, 'Essays, Moral, Political and Literary,' which has been retained in the many subsequent editions. In 1744 Hume failed to receive an appointment to the chair of ethics and pneumatic philosophy at Edinburgh on account of the reputation for unorthodoxy, which the 'Treatise' has engendered. Hume's essays are models of their kind, full of sparkle, interest and animation. Hume accompanied General Sinclair in 1746 and 1747 in his expedition against France and in a military embassy to Vienna and Turin. He now published a recasting of his 'Treatise upon Human Nature,' under the title 'An Enquiry Concerning the Human Understanding' (1747). In 1752 he published his 'Political Discourses' which were well received, having the previous year published his 'Enquiry Concerning the Principles of Morals.' The posthumous 'Dialogues on Religion' belong to the same period. That year he obtained the appointment of librarian of the Advocates' Library at Edinburgh, and began to write his 'History of England,' of which the first volume appeared in 1754. It was, like most of the succeeding volumes, severely attacked both for its religious and political tendencies; but, in spite of adverse criticism, after its completion in 1762 was recognized as a standard work. Its merits are chiefly clearness and force of narrative and philosophical breadth of view in the judgment of men and event. In 1757 came 'Four Dissertations: the Natural History of Religion; of the Passions; of Tragedy; of the Standard of Taste.' In 1763 he accepted an invitation from the Earl of Hertford, then proceeding as Ambassador to Paris, to accompany him, and was enthusiastically received by Parisian circles in his character of philosopher and historian. After the departure of Lord Hertford, he remained as *chargé-d'affaires*, and returned to England in 1766, bringing with him Rousseau, for whom he procured a pension and a retreat in Derbyshire. But the morbid sensitivity of Rousseau brought about a disagreement which put an end to the friendship. In 1767 Hume was appointed Under-Secretary of State, a post which he held till 1769.

Hume's philosophical fame rests primarily on the fearless and unrelenting way in which he carried to their logical conclusion the implicit assumptions of the Empiricist school of Great Britain and, for the matter of that, of the entire philosophy of the Enlightenment. Among the most important heirlooms handed down to the Enlightenment from the Schoolmen was the notion of substance.

The Aristotelian logic made every proposition essentially the attribution or denial of some predicate to some subject. As a natural and even necessary consequent of this, the Middle Ages and the Enlightenment viewed every relation under the aspect of a subject-predicate relation. The tendency, moreover, was to regard certain entities, not merely as in the situation of subjects, but as subjects in their very essence, and others as essentially predicates. Locke already saw that if every fact is a predication of an attribute to a subject, and if such a predication, as he thought, consists in the modification of the subject by the predicate, the unmodified subject or substance is not susceptible to any cognition in the least analogous

to that which we have of the modified subject. Berkeley took the next step, saw that an unknowable substratum is useless for explanatory purposes and ousted substance from the material world. However, he retained the old substantial notion of unity essentially unmodified in his explanation of the unity of consciousness—the soul. It was left to Hume to expel substance from its last hiding-place, and to view mind and matter alike as mere aggregates of impressions and ideas in essence no more mental than material.

It is important to note that Hume, no less than his predecessors, retained the opinion that unity is essentially of a substantial character. For this reason he interpreted his reputation of the substantial character of consciousness as a refutation of all intrinsic unity whatever which consciousness might possess. This led to his associationism: he believed that ideas group themselves together according to the principles of "resemblance contiguity in time or place, and cause and effect." Owing to his inability to understand relations as apart from substance, and owing, moreover, to the imperfect development of the notions of infinite and infinitesimal which characterized all his predecessors and contemporaries, he was forced to view time and space as mere aggregates formed by the juxtaposition of a finite number of *minima divisibilia*. Cause comes to be merely an idea produced in the mind by the constant concomitance of two states and their resulting association.

Hume left the universe of his philosophy in danger of falling to pieces from sheer lack of any principle of cohesion—indeed, of any principle at all. It is space and time are aggregations without arrangement; his cause in coexistence without connection. It is this destruction of the unity of the older systems which has given Hume a reputation for scepticism. Hume's chief work is destructive, yet by this very destruction he showed the necessity and prepared the way for a theory of the universe which should not found its unity on the insecure basis of substance. The first definite step toward this theory was taken by Kant, whom Hume "wakened from his slumber."

In ethics Hume is a utilitarian. He believes that pleasure and pain are the only springs of action, and that utility to the race is the end of all good action. While he emphasizes the share played by intuition in all ethical matters, he does not deny all efficacy to reason. He is a rigid determinist. Consult Burton, J. H., 'Life and Correspondence of David Hume' (Edinburgh 1840); Gizycki, Georg von, 'Die Ethik David Humes' (Breslau 1878); Hume, D., 'My Own Life' (London 1777); Huxley, T. H., 'David Hume' (London 1879); Hyslop, J. H., 'The Ethics of Hume' (Boston 1893); Jodl, 'David Humes Lehre von der Erkenntnis' (Halle 1871); Knight, W., 'Hume' (Edinburgh 1886); Orr, J., 'David Hume and his Influence on Philosophy and Theology' (New York 1903); Seth, A., 'English Philosophers and Schools of Philosophy' (London 1912).

HUME, Fergus, English novelist: b. 24 July 1862. He was educated at the University of Otago, New Zealand, became a barrister, and in 1888 removed to London. His first long work, 'The Mystery of a Hansom Cab,' published in Melbourne (1887), and later in London, achieved a phenomenal circulation. Later

**DAVID HUME**

publications are 'The Piccadilly Puzzle' (1889); 'Miss Mephistopheles' (1890); 'A Creature of Night' (1891); 'An Island of Fantasy' (1894); 'The Bishop's Secret' (1900); 'The Turnpike House' (1902); 'The Mandarin's Fan' (1904); 'Jonah's Luck' (1906).

**HUME, Joseph**, English politician: b. Montrose, Forfarshire, 22 Jan. 1777; d. Norfolk, 20 Feb. 1855. He studied medicine at Aberdeen, Edinburgh and London, and in 1796 became a member of the College of Surgeons of Edinburgh. In the following year he became assistant surgeon in the sea-service of the East India Company, and after several years of service was transferred to the land company. Having mastered Hindustan and Persian, he was employed by the government in political duties. He acted in the capacity of surgeon and interpreter in the Mahratta War and filled several high posts during that time. Returning to England in 1808, he spent several years in travel and study, and then began to take an active interest in politics. He represented Weymouth in Parliament from 1812, re-entering in 1818, and remained there until his death, for 36 years being a leader of the Radical party. He published a translation in blank verse of the 'Inferno' of Dante (1812). Hansard's 'Parliamentary Debates' are the best record of his incessant political activity. His letters were published by Cornwall Lewis (1894).

**HUME, Martin Andrew Sharp**, English historian: b. London, 8 Dec. 1847; d. 1 July 1910. He was educated in Madrid; became a major in the British army and was attached to the Turkish army 1878-79. He was editor of Spanish State Papers in the Public Record Office and examiner of Spanish in the University of London. He was a distinguished authority on Spanish history and literature and was the author of numerous books on the Spain of Philip II, and Elizabethan England.

**HUMIDITY.** See CLIMATE; METEOROLOGY.

**HUMMEL, Johann Nyomuck**, Austro-Hungarian composer and pianist: b. Pressburg, 14 Nov. 1778; d. Weimar, 17 Oct. 1837. His father became music-director in one of the theatres of Vienna, and removed his family there when the boy was seven years old. In Vienna he attracted the notice of Mozart, who took him into his own family and taught him for more than two years. The boy's talent seems to have made a great impression on all the musicians with whom he came in contact, and the list of his teachers takes in most of the masters of the day, including Haydn. So great was his success and appreciation that he was at one time considered to be a rival to the great Beethoven. When he was only nine years old his father took him on a two years' concert tour through Germany, Denmark, Scotland, England and Holland, in all of which countries he was greatly admired as a pianist. In 1791-92 he lived in London, where his first composition, 'Variations for the Piano,' was published. He returned then to Vienna and studied composition, etc., under Albrechtsberger, Salieri and others. From about 1803-11 he was in the service of Prince Nicholas Esterhazy. He justly ranks among the best pianists of the time, and his chief importance in music is due to his efforts to introduce correct and scientific fingering in piano playing. He trav-

eled and taught music in Vienna from 1811-16. In the latter year he accepted a call as royal orchestra leader at Stuttgart, where he remained until 1820. In the same capacity he went then to Weimar, where he remained until his death, except for a trip to Paris and London in 1830, and to Dresden, Vienna and Italy in 1834. While his compositions number among the hundreds, only comparatively few have survived the test of time. Among these should be mentioned 'Septett' (Op. 74); some of his masses (Op. 77 and 80); various 'Rondo' (Op. 11, 49, 120); 'Variation' (Op. 57); and a number of lesser pieces for the piano. A complete list of his compositions may be found in Eitner, 'Quellen-Lexikon der Musiker und Musikgelehrten' (Vol. V, Leipzig 1901); and in Grove, 'Dictionary of Music and Musicians' (Vol. II, New York 1911). His important book on piano-playing, 'Ausführliche Theoretisch-Praktische Anweisung zum Pianofortespiele, etc.' (3 parts, Vienna 1828), has been published also in English, French and Italian editions. Consult Neumann, W., 'Die Componisten der Neueren Zeit' (Heft 99-102, Cassel 1857).

**HUMMING-BIRDS**, a family of small birds, the *Trochilidae*, closely allied to the swifts, peculiar to America and almost exclusively tropical. They are distinguished by small size, iridescent plumage, long slender bill and the peculiar form of the tongue, which consists of a double tube tapering and separating at the tip into two externally lacerated sheaths, which contain the extensile portion. "The horns of the hyoid apparatus are greatly elongated, and pass round and over the back of the head, meeting near the top, and thence stretching in an ample groove to terminate in front of the eyes. This arrangement, analogous to that found in woodpeckers, allows the tongue to be suddenly protruded to a considerable distance, and withdrawn again in an instant." This is a modification of parts adapted to food-getting habits, and is accompanied by others equally characteristic. Humming-birds feed almost entirely upon minute living insects, especially those that gather about flowers and loiter in the corollas, feeding upon the nectar; or dwell on the leaves and bark of plants and trees. Such honey as may be taken with them seems to be gratefully accepted, but the birds do not seek for, nor "suck" the nectar from flowers, as has been popularly supposed. They will dart from a perch and capture an insect like a flycatcher, but ordinarily they obtain them by poising upon their wings about leaves and in front of tree-trunks, picking up morsels, not with the mandibles, but with the tongue; and still more frequently by searching flowers. As it is in the deep, tubular, sweet corollas of trumpet-creepers, orchids and similar great blossoms of tropical shrubs and vines that insects most abound so there does the humming-bird find its richest hunting-ground; and the long curved beaks of most species have been developed in the constant effort to penetrate to the nectarous depths of these deep blossoms; in truth, the head and half the tiny body may often be pushed into the flower, and in so doing gather and dispense pollen from flower to flower, so that humming-birds are important if not exclusive agents in the cross-fertilization of certain large flowered plants. (See FLOWERS, FERTILIZATION OF

BY BIRDS). This method of obtaining food requires the power of sustaining themselves in the air in a fixed position while they explore leaves or blossoms, since no perch is available for their feet, which are small and weak at best. Hence humming-birds have developed lightness of body coupled with extraordinary muscularity and extent of wings, which in most species reach far beyond the root of the tail. These long narrow wings are operated by pectoral muscles that proportionately exceed in size those of any other bird,—even those of the chimney-swifts; and these huge muscles actuate remarkable short wing-bones, so that extreme rapidity of movement is possible, but it is accompanied by a loss of that power secured by the relatively longer alar bones of other birds. By this apparatus the humming-birds are able to beat the air with a rapidity which enables them to stand still, or to dart and dodge in pursuit of some agile insect, or in escaping danger, with a speed which defies human sight to trace; the moving wings at such times, indeed, appear only as a misty halo about the body of the bird, and make a loud humming noise. Most species have very long bills—frequently exceeding, and sometimes twice as long as the head; but some have short, awl-like beaks, with which they pierce the base of such flowers as are too deep for them.

A characteristic of humming-birds is that flashing beauty of plumage which long ago led to calling them the gems of the air, and is due mainly to the quality of the feathers, upon the surface of which are small scales that reflect the light in prismatic hues, giving an iridescent or metallic sheen to certain parts, especially the throat (gorget), comparable only to the shards of some beetles. Such brilliance, however, belongs only to the males, the females being uniformly more plainly dressed, though still highly colored. In many species, also, the males are further adorned with fanciful crests, mustaches, tufts, pendants of the chin and throat, "puffs" upon the legs, and especially with ornamental developments of the tail-feathers; and these they seem to take great delight in displaying for the admiration of the female, and the exasperation of rivals. They are extremely pugnacious, especially in the nuptial season, when constant and bitter fighting occurs, and their courage is so great that neither sex has any hesitation in attacking any bird that offends them or comes too near the nest,—even hawks and crows often flee ignominiously before the impetuous onslaughts of these little furies. On the other hand no bird is more fearless of man. The nests of humming-birds are small cups of downy materials, sometimes resting upon the limb of a tree (as is the method with the common ruby-throat of the eastern United States; sometimes fastened in a crotch of a bush or of large leaves; or fastened to the tip of a pendant leaf, or in a bunch of hanging moss or foliage. The materials are adapted to the place in color and appearance, and further concealment is gained by coating the structure with lichens, or bits of bark, or with cone-scales, as is the habit of the familiar Calliope hummer of California, which nests in pine trees. The eggs of all species are only two in number and purely white.

The family is exclusively American, and is represented from Labrador and southern

Alaska to Patagonia; but the more vagrant species are few, and withdraw in winter toward the equator. About 125 genera with some 500 species are recognized by ornithologists. Nineteenths of them belong to the Amazon and Orinoco valleys, or to the lowlands of Central America; yet some species habitually spend the summer on high mountains. The variety decreases northward, but nearly 20 species reach the boundary of the United States and several are regularly present in summer west of the great plains as far north as southern Alaska. One species wanders over the whole country, and is abundant in the Eastern States. This is the ruby-throat (*Trochilus colubris*). It is about three and one-half inches long. The whole upper part, sides under the wings, tail coverts and two middle feathers of the tail are rich golden green; the tail is forked, and, as well as the wings, of a deep brownish purple; the bill and eyes black; but what constitutes their chief ornament is the splendor of the feathers on the throat of the male, which are ruby-red, and gleam like a great jewel. The females and immature young lack this gorget.

The Anna humming-bird (*Calypte anna*), with crown and throat glittering purplish-pink; the broad-tailed (*Selasphorus platycercus*), green, with pink throat; the rufous (*S. rufus*), back reddish brown, gorget red; Allen's (*S. alleni*), crown and back green, tail rusty; and the calliope (*Stellula calliope*), very small, green above, throat purplish-pink, mixed with white; are more or less common and widespread summer visitors to the Pacific slope.

**Bibliography.**—Jardine, 'Naturalists' Library' (Vols. I and II, Edinburgh 1833); Lesson, 'Histoire Naturelle des Colubris' (1830); Gould, 'Monograph of the Trochilidae' (5 vols., 1850-95); Mulsant and Verreaux, 'Histoire Naturelle des Oiseaux-Mouches ou Colubris' (4 vols., 1876); Ridgway, 'The Humming-birds' (Am. Rept. United States National Museum for 1890, Washington 1892).

ERNEST INGERSOLL.

**HUMOR**, a fluid of the living body, of which Hippocrates enumerated four, namely, blood, phlegm, yellow bile and black bile. These were considered to be the principal seats of disease in man. In modern medicine humor is a term generally applied to the thinner fluids, whether natural or morbid, limpid, serous or sanious, such as the humors of the eye or the watery matter in a blister of the skin caused by heat, etc.

**HUMORESKE**, hu'mō-rĕsk'. The word first came into prominence when applied by Schumann to short musical compositions, free and whimsical in form and strikingly original in harmony and rhythm. The popular "Humoreskes" of Grieg and Dvorák have made the term a familiar one.

**HUMPBACK SALMON**, Whitefish, etc., several kinds of fishes are said to be "hump-backed" because of an unusually raised dorsal outline. The humpback salmon of the Pacific coast is a commonly known but little valued species (*Oncorhynchus gorbuscha*), whose flesh is styled in market "pink" salmon. (See SALMON). The common whitefish (q.v.) is known locally as humpback or bowback; and the curious razor-backed sucker (*Xyrauchen cypho*), is locally called the humpback.

HUMMINGBIRDS

of the United States and Canada, and the more vagrant species withdraw in winter toward the south. There are 125 genera with some 1,000 species recognized by ornithologists. No species is native to the Amazon basin, but nearly 20 species occur in the lowlands of Central and South America. Some species probably spend the winter in the mountains of the Andes.

The most common species is the yellow-green flycatcher, which is very present in summer weather, and occurs as far north as southern Alaska. The blue flycatcher wanders over the whole of the continent, and is most abundant in the eastern States. The blue flycatcher (*Trochilus colubinus*) is a small bird, one and one-half inches long. It has a blue head and back, and the sides under the wings, and the middle feathers of the tail are blue. The rest is green; the tail is forked, and the wings are of a deep brown color. The head and eyes black; but what gives it its most brilliant ornament is the splendid blue patch on the throat of the male, which is as bright as the green like a great jewel. The blue flycatcher migrates young to the Colorado mountains. The yellow-green flycatcher (*Colaptes auratus*) is a small bird, one and one-half inches long. It has a yellow-green head and back, and the sides under the wings, and the middle feathers of the tail are yellow-green. The rest is green; the tail is forked, and the wings are of a deep brown color. # HUMMINGBIRDS

1. Double-crested (*T. cornutus*). 2. Ruby-throat (*Trochilus colubris*). 3. White-collared (*T. melivorus*). 4. Tufted-neck (*T. ornatus*). 5. Delande's (*T. delandii*). 6. Cora's (*T. cora*). 7. Golden-green (*T. prasina*). 8. Vieillot's (*T. chalybeus*). 9. Evening (*T. vesper*). 10. Avocet-billed (*T. avocetta*). 11. Curve-billed (*T. curvirostris*). 12. Harlequin (*T. multicolor*). 13. Natterer's (*T. scutatus*).

**HUMPBAC WHALE**, one of the baleen whales or rorquals (q.v.) of the genus *Megaptera*, characterized by a low hump in place of the inconspicuous dorsal fin and a tuberculous head. The genus is world-wide, and an undetermined number of species exist, of which the best known is the northern *M. longimanus*, the specific name referring to the elongated pectoral fin, with which the animal beats the water, itself and often its playmates. These whales reach 50 or 60 feet in length, and go about in small schools. See **WHALE**.

**HUMPERDINCK**, Engelbert, ɛng'ɛl-bɛrt hoom'pɛr-dink, German composer: b. Siegburg, near Bonn, 1 Sept. 1854; after studying music at Cologne and elsewhere he taught in the conservatories of Barcelona and Cologne, and was musical adviser to a publishing firm in Mainz. Wagner asked him to assist in the production of the latter's only symphony; and he prepared and coached the first cast of 'Parsifal' at Baireuth (1882). He subsequently became famous as the author of the phenomenally successful children's musical fairy play, 'Hänsel und Gretel' (1894); followed by 'Schneemädchen' (The Snow Maiden), 'The Royal Children' and other operas, with incidental music to fairy plays and dramas, distinguished by appealing melody, harmony and orchestration.

**HUMPHREY**, hūm'fri, Charles Frederic; American soldier: b. New York, 2 Sept. 1844. He served in the 5th Artillery in the Civil War, became first lieutenant of the 4th Artillery in 1868, was transferred to the quartermaster's department in 1879 as assistant quartermaster with captain's rank; distinguished "for gallant service in action against the Indians" when on 11 July 1877 he recovered abandoned guns. In 1897 he attained the post of deputy quartermaster-general with grade of lieutenant-colonel. In 1898 he entered the volunteer service, participated in the Cuban expedition and was promoted brigadier-general of volunteers. In 1899-1900 he was chief quartermaster of the division of Cuba; in 1900 of the United States China relief expedition. In 1903 he was appointed quartermaster-general, United States army, with rank of brigadier-general, retiring 1 July 1907 after over 44 years of service.

**HUMPHREY**, Heman, American Congregational clergyman and college president: b. West Simsbury, Conn., 26 March 1779; d. Pittsfield, Mass., 3 April 1861. He was graduated from Yale in 1805, was pastor of the Congregational church at Fairfield, Conn., 1807-17, and of that at Pittsfield, Mass., 1817-23, while from 1823 to 1845 he was president of Amherst College. He published several works, including a popular 'Tour in France, Great Britain, and Belgium,' but is best known by a famous pamphlet called the "first temperance tract" and entitled 'Parallel Between Intemperance and the Slave Trade.' Consult Tyler, W. S., 'History of Amherst College' (Springfield 1873).

**HUMPHREY GAS PUMP**. See **INTERNAL COMBUSTION ENGINE**.

**HUMPHREYS**, Alexander Crombie, American mechanical engineer and educator: b. Edinburgh, Scotland, 20 March 1851. His family settled in Boston in 1859 and he was

educated by his father, an English classical scholar. He passed preliminary examinations for entrance to the United States Naval Academy, but disbarred by youth began to work in 1866, and by 1872 had reached a point of responsibility, when he was made secretary and shortly afterward superintendent of the Bayonne and Greenville Gas-Light Company. While in this position he studied and was graduated from Stevens Institute of Technology in 1881, shortly after being appointed chief engineer of the Pintsch Lighting Company of New York. From 1885 to 1892 he was general superintendent of the United Gas Improvement Company of Philadelphia, rebuilding and reorganizing the gas and electric properties and reducing the management to a system of high efficiency. He became senior member of the firm of Humphreys & Miller of New York city; president of the Buffalo Gas Company; and president of the faculty (since 1902) and of the trustees (since 1907) of the Stevens Institute of Technology. He received the degrees of Sc.D., University of Pennsylvania 1903; LL.D., Columbia 1903; New York University 1906; Princeton 1907. He is a member and official of numerous learned and scientific societies and the author of a great number of papers on engineering education and the economics of gas engineering, including 'Business Features of Engineering Education' (1905).

**HUMPHREYS**, Andrew Atkinson, American soldier: b. Philadelphia, Pa., 2 Nov. 1810; d. Washington, D. C., 27 Dec. 1883. He was a grandson of Joshua Humphreys (q.v.) and was graduated at West Point 1831, receiving a commission in the artillery. He took part in the Seminole War. Resigning in 1836 he was associated with Maj. Hartman Bache as a civil engineer in government work. He reentered the army in 1838, joining the newly-founded corps of topographical engineers, was detailed in 1844 to the Coast Survey office and was engaged in several government surveys, especially in connection with the Mississippi River delta. In 1854 he was detailed to the supervision of the surveys of railroad routes to the Pacific. In 1856 he became a member of the Lighthouse Board. In the Civil War he was chief topographical engineer to the Army of the Potomac. In 1862 he was made brigadier-general and commanded the 5th corps of the Army of the Potomac at the battles of Fredericksburg and Chancellorsville. He commanded a division in the battle of Gettysburg and earned promotion to a major-generalship in the volunteer forces. He then became chief of staff of General Meade. He commanded the 2d corps of the Army of the Potomac in the campaign which closed with Lee's surrender. After his services at Sailor's Creek, he was brevetted major-general in the regular army and was subsequently placed in command of the engineer corps with the regular rank of brigadier-general. Throughout his career during the Civil War he displayed the greatest courage and wisdom and was one of the most successful commanding officers on the Union side. These characteristics, combined with great administrative ability and untiring industry, made him equally successful as commander of the engineer corps. He was retired at his own request in 1879.

He held the honorary degree of LL.D. from Harvard and was a member of the American Philosophical Society, National Academy of Sciences and of numerous other domestic and foreign scientific bodies. He wrote 'Preliminary Report Concerning Explorations and Surveys principally in Nevada and Arizona' (Washington 1872); with H. L. Abbott, 'Report upon the Physics and Hydraulics of the Mississippi River, etc.' (Washington 1876); 'The Virginia Campaigns of 1864 and 1865' (New York 1882); 'From Gettysburg to the Rapidan' (New York 1882); 'Historical Sketch of the Corps of Engineers' in *Occasional Papers No. 16* (United States Army, Engineer School, Washington 1904). Consult Abbott, H. M., 'A. A. Humphreys' (in *Science*, Vol. III, p. 476, New York 1884); De Peyster, J. W., 'A. A. Humphreys' (in *United Service*, Vol. X, p. 254, Philadelphia 1884); Humphreys, H. H., 'Major-General A. A. Humphreys' United States Volunteers at Fredericksburg and Farmville, Va.' (Chicago 1896); McClellan, C., 'General A. A. Humphreys at Malvern Hill and Fredericksburg, Va.' (Saint Paul 1888); Wilson, J. H., 'Major-General A. A. Humphreys' (in *Military Historical Society of Massachusetts, Papers*, Vol. X, p. 69, Boston 1895).

**HUMPHREYS, David**, American writer and diplomat: b. Derby, Conn., 10 July 1752; d. New Haven, 21 Feb. 1818. He was educated at Yale and graduated in 1771; after teaching for a few years he entered the army at the beginning of the Revolutionary War, serving as aide-de-camp to Generals Parsons and Putnam and in 1780 became a colonel and aide-de-camp to General Washington, who became his sincere friend and patron. In 1784 he went to Europe as secretary of the commission for negotiating treaties of commerce with foreign powers consisting of Jefferson, Franklin and Adams; in 1786 was elected to the legislature of Connecticut and was soon associated with the "Hartford Wits," Hopkins, Trumbull and Barlow, in the composition of the 'Anarchiad,' a satirical poem of political conditions existing at that time. After Washington's first election he acted, more or less unofficially, as his private secretary. In 1789 he was appointed one of the three "commissioners for treating with Indians south of the Ohio." In the following year he was sent to England, Portugal and Spain on a confidential diplomatic mission. He was Minister to Portugal 1791-97, Minister Plenipotentiary to Spain in 1797-1802. During his service in the diplomatic corps of the United States he concluded treaties with Tripoli and Algeria. On his return he imported from Spain 100 merino sheep, the first introduced into the United States, and engaged in the manufacture of woollens. In 1806 he erected a woolen mill in Derby, one of the first in this country and destined to become one of the most successful. That part of Derby which he developed industrially became known from then on as Humphreysville. He held command of the Connecticut militia in the War of 1812, and also served in the State legislature 1812-14. He held honorary degrees from Brown University and Dartmouth College, and was a Fellow of the Royal Society of London. Throughout his entire life he displayed great

interest in and considerable ability for writing. Amongst his works the best known are 'A Poem Addressed to the Armies of the United States of America' (New Haven 1780); 'The Glory of America' (New Haven 1783); 'A Poem on the Happiness of America' (London 1786); 'An Essay on the Life of the Hon. Major-General Israel Putnam' (Hartford 1788); 'A Poem on Industry' (Philadelphia 1794); 'The Yankey in England, a Drama in Five Acts' (1815); 'A Discourse on the Agriculture of the State of Connecticut, etc.' (New Haven 1818). Various collections of his writings were published: 'Poems' (Philadelphia 1789); 'The Miscellaneous Works of Colonel Humphreys' (New York 1790); 'The Miscellaneous Works of David Humphreys' (New York 1804). Consult Cutting, N., 'Journal of an Embassy to Algiers, 1793, under Col. David Humphreys' (in *Dawson's Historical Magazine*, Vol. IV, pp. 262, 296, 359, New York 1860); Humphreys, F. W., 'Life and Times of David Humphreys, etc.' (2 vols., New York 1917); Marble, A. R., 'David Humphreys and his Services to American Freedom and Industry' (in *New England Magazine*, n. s. Vol. XXIX p. 690, Boston 1903-04); Orcutt, S., and Beardsley, A., 'History of the Old Town of Derby, Conn., 1642-1880' (Springfield, Mass., 1880); Swift, L., 'Our Literary Diplomats' (in *Book Buyer*, Vol. XX, p. 369, New York 1900).

**HUMPHREYS, Frank Landon**, American Protestant Episcopal clergyman and author: b. Auburn, N. Y., 16 June 1858. He was educated at Columbia and Oxford universities and attained the degrees of A.M., Mus.Doc., S.T.D. and LL.D. He was precentor and minister in charge of the cathedral of the Incarnation, Garden City, L. I., 1885-90, canon in the cathedral of Saint John the Divine, New York, 1900-06; chaplain of the Naval Order of United States Society of 1812 from 1895; historian of the Society of Colonial Wars; president of the Society of the Cincinnati in New Jersey; and vice-president of the Morristown Electric Light Company. Among his writings are 'The Evolution of Church Music' (1896); 'Clerical Education' (1896); 'The Mystery of the Passion' (1898); 'Men of Understanding' (1897); 'Christmas Carols and Caroling' (1900); 'Beloved of Washington—Life of Col. David Humphreys' (1904); and 'What we owe to France' (1915).

**HUMPHREYS, Joshua**, American shipbuilder: b. Haverford, Pa., 17 June 1751; d. there, 12 Jan. 1838. He came of Welsh Quaker stock, his grandfather, Daniel Humphreys, settling near Philadelphia in 1682. In 1765 he was apprenticed to a Philadelphia shipbuilder and, before reaching his majority, opened a shipyard of his own. He was the first builder of war vessels for the American colonists and is therefore often called the "father of the American navy." As a result of his activities in behalf of the Revolution he was disowned by the Quakers. He was the first naval constructor of the United States navy. Among the ships constructed by him were the *Chesapeake*, *Congress*, *United States*, *President*, *Constellation* and the famous *Constitution*. Of these the *Constitution* is now at the Boston navy yard, the *Constellation* at Newport and

the *President*, captured in 1814, during the war with England, at London. Consult Humphreys, H. H., 'Who built the First United States Navy?' (in *Pennsylvania Magazine of History and Biography*, Vol. XL, p. 385, Philadelphia 1916).

**HUMPHREYS, Milton Wylie**, American university professor and scholar; b. Greenbrier County, Va. (now W. Va.), 15 Sept. 1844. He served with distinction as a gunner in the Confederate army from 1862-65. After the Civil War he resumed his studies and took his master's degree at Washington and Lee University in 1869. In 1874 he received his Ph.D. at the University of Leipzig. He held the professorship of Greek at Vanderbilt University (1875-83); of classical languages at the University of Texas (1883-87), and then became professor of Greek at the University of Virginia, where he remained until his retirement in September 1912. Dr. Humphreys has been the chief American editor of the *Revue des Revues* (Paris 1878-88) and has edited independently the 'Clouds' of Aristophanes (1885); 'Antigone' of Sophocles (1891); and Demosthenes' 'On the Crown' (1913). He has contributed many erudite papers to both American and foreign journals.

**HUMPHREYS, William Jackson**, American physicist; b. Gap Mills, Monroe County, W. Va., 3 Feb. 1862. He received his education at Washington and Lee University and then pursued an engineering course at the University of Virginia; later specializing in physics and chemistry at Johns Hopkins. From 1889-93, he was professor of physics and mathematics at the Miller School, Virginia; from 1893-94 occupied the chair of physics and chemistry at Washington College, Maryland; and was instructor in physics at the University of Virginia (1897-1905). Since the last-named year he has been professor of meteorological physics of the United States Weather Bureau and occupied the same chair at George Washington University since 1911. Dr. Humphreys was director of the Research Station at Mount Weather, Va. (1905-08) and was a prominent member of the eclipse expedition to Sumatra under the auspices of the United States Naval Observatory. He has written numerous papers on electric phenomena.

**HUMPHRY CLINKER**. 'Humphry Clinker,' the last of Smollett's novels, was published in 1771, just before the author's death. It is the story of a Welsh gentleman named Matthew Bramble, a crusty bachelor who, suffering from gout and imaginary diseases, makes a tour of England and Scotland in order to be amused and to drink the waters at famous wells. He visits Bristol, Bath, London, Harrogate, Scarborough, Edinburgh, Glasgow and the Scottish lakes. Of his party are his sister Tabitha, a mature spinster, with her maid Winifred Jenkins and her dog Chowder; his nephew Jeremiah Melford, a student fresh from Oxford, and his sentimental niece Lydia Melford. The novel takes its name from a footman picked up on the way between Bath and London, a shabby country lad who proves to have many accomplishments and the innate qualities of a gentleman. He becomes a Methodist preacher and converts the women of the company to the new doctrine of grace

without works. The novel, written primarily to describe the sights and misadventures of a journey through the British Isles, has a sort of plot. Tabitha and Lydia both get husbands; and Humphry Clinker, made happy by the discovery that, though his mother was but a barmaid, his father was Matthew Bramble, is married to Winifred Jenkins. All return to Brambleton Hall in time for a Christmas dinner.

Thackeray rightly thought 'Humphry Clinker' the most laughable novel ever written. The farcical comedy, naturally rising out of the situation, is enhanced by a very clever use of letters which the travelers send to their friends at home, descriptive of the same incidents from the very different points of view of a hypochondriac, an aged spinster, a young woman in love, a young man of the world and a vivacious servant-maid. To Lydia, for example, the journey is a continuous round of delight; while nothing except Scotland gives the slightest pleasure to her uncle. All the scenes are based upon the direct observation of the author, who makes Matthew Bramble the mouthpiece of his own sardonic humor. In this gentleman more than anywhere else, Smollett embodied his own personality. He was generous, irritable, keenly intelligent, but thoroughly disillusioned. Perhaps the most amusing character is Lismahago, a soldier of fortune, who has been scalped and otherwise mutilated in Indian wars in America. To Tabitha he is "the prettiest gentleman" she has ever seen, and she marries him. With others besides Thackeray 'Humphry Clinker' has been a favorite. Lismahago, after undergoing a sea-change, reappears in Scott's *Dalgetty*; and from Smollett, Dickens learned the art of caricature. From the one passed to the other the humor to be derived from comic misspellings, unexpected turns of phrases and whimsical exaggeration. These characteristics in their extreme form appear in the letters of Winifred Jenkins, who writes from London to Mary Jones at Brambleton Hall: "I have seen the park, and the paleass of Saint Gimses, and the king's and the queen's magisterial pursing, and the sweet young princes and the hillyfents, and the pye-bald ass, and all the rest of the royal family."

WILBUR L. CROSS.

**HUMUS**, a term applied in the generic sense to the decomposed organic matter which makes up a certain percentage of soil matter. The carbon, nitrogen, oxygen and hydrogen are carried off in the process of decomposition in the form of water, carbon dioxide and ammonia, etc. The matter which remains is called humus. Chemical investigations of the compounds of which humus is composed have been unable to determine their exact nature and relations. However, the amount of humus in soil is an important factor in determining the degree of its fertility. See *SOIL*.

**HUN, Henry**, American physician; b. Albany, N. Y., 1854. He received his education at the Sheffield Scientific School at Yale, where he was graduated in 1874. From 1874-75 he was assistant in physics there, and was graduated from the Harvard Medical School in 1879. He became professor of nervous diseases at the Albany Medical College (Union

University) and established a wide practice in that locality. Dr. Hun was president of the Association of American Physicians (1910) and president of the American Neurological Association (1913-14). He is author of 'Guide for American Medical Students in Europe' (1883); and 'Differential Diagnosis of the Diseases of the Nervous System' (1913).

**HUNAN**, hoo'nán, China, an inland province, bounded on the north by Hupeh, on the east by Kiangsi, on the south by Kwangsi and Kwangtung and on the west by Kweichau and Szechuan. The country is hilly, with considerable elevation in the south, southeast and along the western border. The chief rivers are the Siang, which rises in the Nan-shan and flows north into the Tung-t'ing Lake; the Tsze, which is only navigable for small boats; and the Yuen, which rises in the southeastern part of Kweichau and empties into Tung-t'ing Lake. The irrigation afforded by these streams and their tributaries makes the soil exceedingly fertile. It produces tea, hemp, rice and tobacco in large quantities. A considerable yield of lumber is produced annually. The coal mines cover a large part of the area of the southeastern part. Antimony ore, copper, tin and some precious metals are also mined. The chief cities are Siangtan, on the Siang River (Pop. about 400,000); Yochau, the "treaty port," which is an important transportation point, having steamer connection with Hankau (Pop. 20,000); and Changte (Pop. 150,000), on the Yuen River. The capital is Changsha, on the Siang River, about 60 miles above Yochau. It is a fine city noted for its educational institutions, its wealth and culture. (Pop. 250,000). The people of Hunan are of an independent, healthy type; and for many years were entirely hostile to foreign intrusion. This spirit has been greatly minimized, however, in recent years. The most important railway is the Changsha-Chuchau, about 35 miles long, which is a branch of the Canton-Hankau line; but transportation is carried on principally by water. The area of Hunan is 83,330 square miles, and the population is estimated at 20,580,000.

**HUNDRED**, (1) in England and Ireland, a division of a county, or the body of residents and landholders therein. (2) In the United States, a political division similar to that in England and still surviving in Delaware. Hundreds in England were of varying sizes, but it is supposed to-day that originally they consisted of 100 families. Each hundred was presided over by a court, known as the Hundred Court. Until very recent times a hundred was held liable in England for damages resulting from various offenses, as rioting. Most of the hundred courts have been abolished, their jurisdiction having been acquired by the County Courts, but a few are in existence to-day.

**HUNDRED DAYS** (Fr. *Cent Jours*), the name applied to the period between 20 March 1815 and 28 June 1815—the time which intervened between Napoleon's return to Paris from Elba, and the restoration of Louis XVIII. The term became popular through its use by the Comte de Chambrol, prefect of Paris, in his speech of welcome to Louis. For the events of the Hundred Days, see NAPOLEON; FRANCE, *History*.

**HUNDRED YEARS' WAR**, the name given to the prolonged struggle between France and England which began in 1337 and ended in 1453. Among the chief of the immediate causes of the war was Edward III's claim to the French throne, but the keen rivalry of the two nations rendered conflict inevitable. It lasted during the reigns of five English kings, Edward III, Richard II, Henry IV, Henry V and Henry VI, and of five French kings, Philip VI, John II, Charles V, Charles VI and Charles VII, ending in the expulsion of the English from France. The most important events were: Defeat of French fleet at Sluys (1340); defeat of French at Crécy (1346); siege and capture of Calais (1347); defeat of English at Saint Omer (1352); defeat of French at Guines (1352); defeat of French and capture of John II at Poitiers (1356); Treaty of Brétigny (1360); defeat of English at Pontvallain (1370); defeat of English at Chizé (1373); truce of Bruges (1375); defeat of French at Agincourt (1415); Treaty of Troyes (1415); defeat of French at Verneuil (1424); siege of Orleans (1428); capture of Meaux and Paris (1429); defeat of English at Patay (1429); capture of Joan of Arc at Compiègne (1430); Joan of Arc burned at Rouen (1430); loss by English of Paris (1436), Nemours (1437), Meaux (1439), Mons (1448), Rouen (1449), Cherbourg (1450), Bordeaux (1453); defeat of English at Formigny (1450) and Castillon (1453); truce of Tours (1444). Besides the English and French kings mentioned, many of the most famous Frenchmen and Englishmen of the 14th and 15th centuries were active participants in these struggles: Edward, the Black Prince; Bertrand du Guesclin; Joan of Arc; John, Duke of Bedford; Arthur, Earl of Richmond; Dunois, Talbot, etc. Some of these events form the historical background for Shakespeare's 'Henry V' and 'Henry VI.'

**HUNEEUS, Jorge.** See HUNNEUS, GEORGE.

**HUNEKER, James Gibbons,** American musical and dramatic critic; b. Philadelphia, 31 Jan. 1860. In Paris he was a pupil of Barili, Ritter and Dontreleau, and subsequently became an instructor in piano at the National Conservatory of New York. He was musical and dramatic critic of the *New York Recorder* in 1891-95, and of the *Morning Advertiser* in 1895-97. Subsequently he was musical editor, and from 1902 dramatic editor of the *New York Sun*. Among early writings which attracted wide attention are 'Mezzotints in Modern Music,' essays (1899); 'Chopin, as Man and Musician' (1900); an interesting study; 'Melomaniacs' (1902), clever but often extravagant stories satirizing the musical profession. His later works include 'Overtones' (1904); 'Iconoclasts' (1905); 'Visionaries' (1905); 'Egoists: A Book of Supermen' (1909); 'Franz Liszt' (1911); 'The Pathos of Distance' (1913); 'Ivory Apes and Peacocks' (1915); 'New Cosmopolis' (1915); 'Unicorns' (1917).

**HUNG HSIU-CH'UAN,** Chinese rebel; b. Hua, Kungtung, 1812; d. 1864. After a youth spent in desultory studies, including the doctrines of Christianity, he took up the occupation of a fortune-teller; and ere long joined the Society of God, organized by Chu Chiu-t'ao, of which he rose to be the head, one of his chief associates being Yang Hsiu-ch'ing. In 1836 he started, on the borders of Kuangtung and Kuangsi, a sect of professing Christians, and set to work to collect followers, styling himself the Brother of Christ. In July 1850 he headed a rising in the district of Kuei-p'ing, and made his way, plundering and ravaging, as far as Yung-an. He then adopted the term "Heavenly Dynasty of Perfect Peace" (*Tai ping Kwoh*), styling himself the Heavenly King; and working his way northward in 1853, he captured Wu-ch'ang and all the other cities on the Yang-tsze down to An-ch'ing. On 11 March 1853 he took Nanking; and with that city as his headquarters he succeeded in capturing over 600 other cities in no less than 16 out of the 18 provinces. There he remained until 1864, when the Imperial forces under Tsêng Kuo-fan closed around him and the fall of the city was imminent. On 30 June, seeing that all was lost, he took poison, his body being subsequently found and burned. On 19 July Nanking was taken by assault, and one of the greatest rebellions the world has ever seen was at an end. From the fact that the T'ai-p'ings ceased to shave the head and wear a queue according to the Manchu fashion, they also came to be known as the Long-haired Rebels. Consult Brine, 'The Taiping Rebellion' (London 1862); and

Lin-Li, 'Ti-ping Tien-Kwoh: History of the Taiping Revolution' (2 vols., London 1866).

**HUNGARY** (in Hungarian, *Magyarország*, "Land of the Magyars"); Germ., *Ungarn*; Fr., *La Hongrie*; Ital., *Ungheria*; Turk., *Magyaristan*; Latin, *Hungaria*: A country in the middle of the southern half of Europe, lying in the basin of the Danube. Until the break-up of the Austrian Empire in October 1918, the then kingdom of Hungary included Croatia-Slavonia, Dalmatia, Transylvania and the territory of Fiume (qq.v.). Hungary proper has an area of 109,188 square miles, with a population of 18,142,200 (1910 census). In form it resembles a semicircle, and except for a small portion of the western side, it is separated by natural boundaries on three sides from the neighboring territories. Encircled from the east round the north to the northwest by the long chain of the Carpathian Mountains for more than 1,000 miles, Hungary is bounded on the west by the river March and some offsets of the Noric Alps; on the southwest by the Drave; on the south and southeast by the Danube and the Transylvanian Alps — a continuation of the Carpathian range. Thus Hungary proper may be considered as a large basin surrounded by mountains on every side except the south; but even here the natural boundaries of this geographical basin are completed at no great distance from the frontier by the highlands of Croatia, Bosnia and Serbia, that meet those of Wallachia and Transylvania at the "Iron Gates," a pass formed by the abrupt divisions of the mountains on either side of the Danube, through which that river flows in whirling rapids. The immense curve of the Carpathians starts from the gate of the Danube near Pressburg, sweeps round one-half of the country from west, through north and east, to south, here it again reaches the Danube at the Iron Gates near Orsova. The only portion of the frontier not clearly outlined by nature is that marching with the Rumanian border, a line which, after negotiation with Rumania in 1887, was defined by the statute of 1888.

The mountains of Hungary belong to a dual system, the Carpathians being the greater and the Transylvania Alps the lesser range. The first group is the source of a multitude of streams which flow toward the south, forming long fertile valleys; the second group, less wild, but scarcely less beautiful, is rich in woodland scenery and is intersected by numerous passes. Between the Carpathians and the Alps lie the great Hungarian plains — the small and the greater Alföld. From Budapest (the capital) to the borders of Transylvania, from Tokay to Belgrade, stretches one vast alluvial plain, marshy in some places, parched in others, here and there loamy, but on the whole of extraordinary fertility. The Carpathian range is divided into three principal sections forming the northwestern, the northeastern and the southeastern highlands. The best known of the mountains is the High Tatra (*Magas Tatra*) in the north, which rises up in enormous proportions without any foothills at all to a height of 6,000 feet above the plain. On its southern slopes a series of watering places has been created, which attract numerous visitors both in summer and winter. The loftiest peaks are those of Lomnicz, over 8,600 feet high, and

Gerlachfalva (now called Ferencz József), 8,737 feet—the highest mountain in Hungary. The most extensive members of the Carpathian system are the southeastern highlands, abounding in wondrously beautiful spots and forming a grand natural fortress through which there run but few passes. The Vereczke Pass, in the northeastern frontier range, is famous in history as that by which the Magyars entered the country in 898 A.D. All the mountains of Hungary do not belong to the Carpathian system, for three branches of the Alps enter Hungarian territory on the west. One of these stretches along the shores of the Adriatic; a second extends east between the Save and the Drave; while the third flanks the long frontier line of the country between the Drave and the Danube, and after being intersected by the valleys of rivers and being reduced in many places to low-lying hills, ends at the Danube near Budapest in a low mountain range of over 2,000 feet in height, named the Bakony Wald. This branch of the Alps stretching towards the east, near Visegrád faces the spurs of the Carpathians, which also extends right down to the Danube where the mighty stream is enclosed by wooded mountains, constituting a magnificent panorama.

The Little Hungarian Plain (Kis-Alföld) lies in the western part of the country upon the islands and both sides of the Danube from Pressburg (Pozsony) to Gran (Esztergom); it is exceedingly fertile and has an area of about 5,000 square miles. Coming through the passes of the Danube at Vác from the small plain, we reach the Great Hungarian Plain, lying in the centre of the land and bounded by the Carpathians on one side and the lower Danube on the other, occupying some 30,000 square miles. Its greatest length is traversed by the river Tisza (Theiss). The undulating surface is covered with salt marshes, sand-dunes and rows of mounds. During recent years much of the monotony of the territory has been lessened by cultivation; great pastures and luxuriant meadows have been broken by fine forests and orchards; broad roads and railways intersect the former lonely tracts, and the immense pasture-grounds are filled with cattle, horses, sheep and swine. The villages are large and populous, but are generally long distances apart.

**Hydrography.**—The Danube (Duna) is the principal waterway of Hungary, and most of the rivers belong to it. Only two streams rising in the High Tatra flow to the Vistula. Traversing the country for nearly 600 miles, the Danube contains several large islands, the principal ones being Csallóköz and Szigetköz between Pressburg and Komorn; above Budapest lies the island of Szent Endre and below that of Csepel. The Danube is navigable by steamships from Vienna to the Black Sea. Tributary streams of the Danube on the left side are the Morva, Vág, Garam, Ipoly, Tisza and Temes; on the right the Lajta (or Leitha), Rába, Kapos, Drave and Save. The Mura flows into the Drave. The Tisza rises and ends in the country. Four silver stripes in the Hungarian coat-of-arms represent the Danube, the Tisza, the Save and the Drave. The two largest lakes in Hungary are the Balaton or Plattensee and the Fertő or Neusiedler See. Both lie in that part of the country which ex-

tends along the right bank of the Danube, the Pannonia of the Romans. Balaton is 46 miles long from N.E. to S.W., has an area of 230 square miles and stands 420 feet above sea-level. Its banks are flanked by watering-places and the surrounding hills covered with rich vineyards. Fertő Lake has an area of 110 square miles and its surface—which is not permanent—is 370 feet above sea-level. Although many canals have been projected in Hungary, there are few in actual existence; the Ferencz Canal between the Danube and the Tisza, and the canal at the Iron Gates, both old constructions, are still the most important.

**Climate.**—Though the whole territory of Hungary is situated within 44° and 49° (latitude) North, i.e., within the temperate zone, yet there are great divergencies between the various parts of the country in respect of mean, minimum and maximum temperature. The winter is in general very cold, especially in the great plain and in the inner basin of Transylvania; the summer is hotter than in western Europe in the same latitude. The average temperature ranges between 42° and 58° F. The average monthly temperature in January falls to 40° and 42° F. In January the temperature is highest in the western half of the country and lowers gradually toward the east. In July, on the other hand, it is highest where Hungarian territory approaches the Adriatic, and in the district between the southern frontier and the centre of the country on both banks of the Tisza. The climate is very variable in the highlands, but snow does not lie in summer, except in some hollows of the High Tatra. The rainfall varies considerably in different parts. At the foot of the northwestern Carpathians the annual average is 59 inches; in the mountainous Karst district near the Adriatic the average is about 79 inches; whereas in the Small Hungarian Lowlands it is only 20 inches and in the Great Hungarian Lowlands about 25 inches. Spring is the cloudy season; in the summer the *délibáb*, or Fata Morgana, rises about noon on warm, tranquil days and spreads like a shimmering sea over the heated plain. Despite its climatic variability Hungary is one of the healthiest countries in Europe.

**Natural Resources.**—While most of the soil of Hungary is productive, more than half is arable land. The Carpathians present many varied physical features of geological structure. The wild granite rocks of the Tatra exhibit scenes of savage grandeur and stand out in sharp contrast to the broad flat sandstone ridges of the Carpathian Waldgebirge. The whole region of the north Hungarian mountains between the upper part of the Tisza and the Danube is noted for its mineral wealth, which has been worked from very early times. The northern counties of Szepes (Zips) and Gömör, to the southeast of the Tatra, abound in iron ores. Kassau (Kaschau), to the east, is the largest town in northern Hungary and the centre of a district containing metals and the only opal mines in Europe. To the southwest, in the basin of the Gran, lie Schemnitz and Kremnitz, noted for the production of the precious metals, especially silver. Lignite is mined among Tertiary rocks in several of the valleys. Salt abounds in the valley of the upper Tisza. The mountains of Transylvania produce gold; varying quantities of silver,

copper, mercury, zinc, nickel and lead are also found, and much salt. Other parts yield coal, petroleum, cobalt, antimony, sulphur, soda, salpêtre, alum, vitriol, arsenic, marble, peat and remarkably fine chalcedony. The alluvial and diluvial deposits in the plains form excellent soil for wheat, rye, barley and maize, of which large quantities are exported. Most of the mountainous districts are covered with forests; the woods occupy 30 per cent of their area, as against from 1 to 5 per cent of the plains. There is a valuable export trade in timber, principally oak, poplar and acacia. Fruit trees are widely cultivated and much fruit is exported, while the wine production is of great magnitude. The most celebrated wine is made in the Tokay district, and that which goes by the name of Carlowitz is well known. Vineyards cover more than 30,000 square miles. The great moors and forests provide ample game for the sportsman, the bear, wolf, lynx, wild cat and boar still roam, as well as stags and chamois. The vulture and the eagle soar above. The Danube and the Tisza abound in wild fowl, and the plains are plentifully stocked with hares and partridges. No other European country rivals Hungary in the wild and profuse luxuriance of fauna and flora. Vines, maize, almonds, figs, olives and apples flourish in abundance. Hungary is also endowed with a wealth of medicinal waters. Cold mineral and thermal springs are to be found almost everywhere. Budapest is rich in medicinal springs, and a whole series of hot springs containing lime and sulphur rise out of the volcanic hills on the right bank of the Danube. Sulphuric hot springs of remarkable healing properties for the treatment of rheumatism, gout and diseases of the bones are plentiful. There are 38 important watering places with hot springs in the country and 52 climatic health resorts. The famous medicinal water called Húnyadi János is exported to all parts of the world.

**Ethnography and Population.**—Like Austria and Russia, Hungary is a polyglot country of many races whose unity is merely political. Exact statistics are not obtainable, since for many years the census returns have been deliberately falsified for "Magyar State" reasons—to prove that the Magyars are the predominant race in numbers as well as in political power. Competent observers estimate that, in Hungary proper—excluding Croatia-Slavonia, the new Jugo-Slav state—there are about 8,500,000 Magyars, or over 1,500,000 less than the official figures show. Some authorities even place the number of Magyars as low as seven to eight millions. Of these classified as "Magyars" there are nearly 1,000,000 professing and a large number of baptized Jews. Against this total there are more than 2,000,000 Germans, including the numerous colonies on the Austrian border, the Swabians of the south and the Saxons of Transylvania; more than 2,000,000 Slovaks, inhabiting chiefly the northwestern counties; between three and four million Rumanes, living between the Tisza and the eastern Carpathians; some 500,000 Ruthenes or little Russians, who inhabit the northeastern counties; some 600,000 Serbs and Croats in the central southern counties; 100,000 Slovenes along the borders of Styria and Carinthia; and some 200,000 other non-Magyars, including about 90,000 gypsies, who speak a language of their own. Taking the

population of Hungary proper at 18,000,000, the Magyars are thus in a minority, which becomes more marked when the former (till 1918) crown-land of Croatia-Slavonia are added, with its population of 2,600,000 Southern Slavs. In 1868 Croatian was recognized by law as the official language of these crown-lands; it has since proved to be the mother-tongue of over 60 per cent of the inhabitants. The last census returns (1910) for Hungary show that there were 11,820,416 persons speaking the Hungarian language, or 64.7 per cent. Obviously, a great number would naturally speak the official language of the country without being of Magyar birth. The census also showed 278,130 foreign residents of whom 235,475 were Austrians; 8,655, Germans; 10,612, Italians; 5,640, from Bosnia and Herzegovina; 1,055, French; 2,389, Russians; 998, Swiss; 1,042, British; 1,674, Turks, and 10,590 of other nationalities. The town population of Hungary was close to 4,000,000. In 1913, the last normal year before the war, there were 751,517 births and 500,875 deaths; the rate of illegitimacy was 9.2 of the total number of births. Marriages, 195,030. The infant death rate is remarkably high. The Magyars (pron. mād'yār), who are the dominant race, are located for the most part in the centre of the country. They are high-spirited, proud, warlike and generous; according to travelers they are more sincere than their Serbian and Wallachian (Rumanian) neighbors. Their general deportment is serious; and in many respects they resemble the Turks, who followed them out of Asia, and belong to the same great family of mankind. The Magyar costume is remarkable for its picturesque elegance. Most of the Hungarian nobles are Magyars; and it is by this section of the population that the constitutional form of government and municipal institutions have been mainly, if not wholly, upheld. The Slovaks are among the people apparently the earliest settled in Hungary; they inhabit the northwest, and are similar in race, customs and language to the adjacent Moravians, to whose extensive empire they belonged before the Magyar conquest. The Ruthenians or Rusniaks dwell beneath the north and northeastern Carpathians. The Rumanians (Wallachians) occupy a tolerably wide tract of country on both sides of the west and north boundaries of Transylvania. They are behind the Slovaks, and, indeed, nearly all the other races of Hungary, in education and civilization. They appear to be the descendants of Italian colonists, placed in Dacia during the Roman dominion there, and have been accordingly called *Daco-Romans*—an epithet to which their classic features, easy manners, language and antique costume seem to give them a claim. They call themselves *Romouni*; and speak a dialect of Latin. The Croats people nearly all Slavonia and Croatia, and stretch into seven of the counties of Hungary proper as far as the county of Pesth. The Wends (Vandals) inhabit two counties of Hungary proper as far as the county Theresianopol, and a few other parts of the Banat; the Montenegrins a part of the county Temes; and the Armenians portions of three of the eastern counties. The Germans appear, in the first instance, to have emigrated into the country during or before the 7th century, subsequently to which many successive immigrations took place, especially under Geysa,

king of Hungary, who ascended the throne 1141 A.D. and who established large numbers of German colonists from Franconia, Thuringia and Alsace in several of the northern counties, and in Transylvania. They speedily became dispersed in detached settlements over all Hungary; and early in the 13th century Pesh was described as a "large and rich German town." In the 18th century other Teutonic immigrants, with some French refugees, settled in the kingdom. They people the greater part of the western frontier, from Pressburg and around the shores of Lake Neusiedler south nearly to the limit of Croatia; elsewhere they are most numerous in the county of Zips, the mining districts, the Banat, and especially in the towns, where they compose the bulk of the trading population. Class animosity is exceedingly strong among the mixture of races. The Magyar peasant never forgets the dominance of his race and treats the peasants of other nationalities with more or less good-natured insolence. He especially despises Jews and gypsies.

According to the last census Budapest, the capital, a magnificent double city, also called Pest-Ofen or Buda-Pest, and situated on both sides of the Danube, had a population of 880,371. The only other town with a population of over 100,000 was Szeged, 118,328. The towns of Transylvania present a striking contrast to the cities of the plains. They are full of picturesque reminiscences of the Middle Ages. Some of the true Hungarian cities spread over the Alföld have enormous areas with small populations. Debreczen, for instance, is larger than New York city in area and has only 93,000 inhabitants. Country life is monotonous and dull; the ablest men are attracted to the cities, and little is left to the villagers beyond "the call to work at dawn and the church bells in the evening." There was no absolute ownership of land except in the hands of the crown; so long as a member of a family lived, the property remained in his hands, otherwise it devolved upon the king, who could vest it only in a noble family.

**Emigration.**—As most of the peasantry live in grinding poverty, large numbers who are able to do so emigrate to other countries, principally to the United States. In 1911 the United States admitted 19,996 Magyars, 18,982 Croats and Slavonians, and 21,415 Slovaks; in 1912 there were 23,599 Magyars, 24,366 Croats and Slavonians and 25,281 Slovaks; in the year before the war broke out the numbers rose to 30,610 Magyars, 42,499 Croats and Slavonians and 27,234 Slovaks. For the year ending June 1917, after the United States had been three months at war, only 112 immigrants were admitted from Hungary.

**Agriculture, Live Stock and Trade.**—Almost the only industry in Hungary is agriculture, which provides a living for nearly 70 per cent of the population. Directly or indirectly agriculture supports nearly three-fourths of the inhabitants. Of the total area of arable land no less than 82.09 per cent is farmed by the proprietors, and only 17.91 by tenants. Stock-breeding was the chief industry for centuries, but agriculture has become increasingly important during the last 70 years. The great plains are dotted with agricultural villages separated by long solitary tracts. The principal products of Hungarian agriculture are wheat,

rye, barley, oats, maize, potatoes, clover and lucerne, rape-seed, peas, lentils, hemp, flax, tobacco, sugar-beet, vegetables and rice. Nearly all the corn is consumed in Hungary and Austria; only the finest flour is exported. The great pride of Hungarian agriculture, however, is Hungarian wine, for which one of the best foreign markets is, strange to say, Bordeaux. The industry is so disfigured by a wide system of adulteration that a bottle of genuine Hungarian wine, it is admitted by natives, rarely leaves the country. A kind of brandy called Slivovitz is prepared from plums. Horses, cattle, sheep, hogs, game (in the north bears), poultry, fish (among which the sturgeon and salmon are the principal), bees and silkworms are among the productions of the animal kingdom. Long hours and small pay mark the lives of agricultural laborers, causing much discontent and friction. Government intervention and numerous acts of Parliament have vainly endeavored to check the flow of emigration by improving the lot of the workers.

The principal artisans are tanners, furriers, manufacturers of *tschism* (cordovan boots), lace-makers, harness-makers, makers of wooden wares, of straw-plait work, etc. There are few extensive manufactures in Hungary. There are numerous iron and steel works, some iron-foundries, tinplate and wire works; also potteries, glass manufactures, sugar-refineries and beet-root sugar works, soap-works, tallow, stearine and wax-candle works; soda, saltpetre and potash works and brandy distilleries. Trade is almost exclusively in the hands of the Germans, Greeks and Jews. Internal commerce is promoted by the railways and rivers, the Temes and Francis canals (the former 75, the latter 60½ miles long), the fairs (which amount to 2,000), and the complete absence of tolls. The railways have a total length of about 13,400 miles, 11,665 miles being run by the state, and the remainder by private companies. The total length of navigable rivers and canals is 3,736 miles, of which 2,177 miles are navigable for steamers. The Danube is the most important highway of traffic. Before the war Hungary possessed about 540 merchant ships, steam and sail.

**Government.**—The Hungarian constitution and the system of central government obtaining in Hungary under the old régime which ended in 1918 are dealt with in the article AUSTRIA. Of that famous constitution it may be said that the practical application of its principles was not in strict accordance with its written provisions. Although, on paper, Magyars and non-Magyars were on terms of equality before the law and nominally fully represented in the legislature, the fact was that the representatives rather represented the Magyar upper classes than the subject nationalities or the masses of the people. Only a quarter of the men qualified to vote were permitted to exercise that power, being disfranchised by various questionable means besides property qualifications. As the Germans in Austria, so the Magyars in Hungary were in the minority, hence the manipulation of the census returns referred to under *Population*. The Dual Settlement after the Austrian defeat at Sadowa had the effect of making the German minority supreme in Austria and the Magyar minority supreme in Hungary, a circumstance, by the way, which ren-

dered both minorities dependent upon Prussian support as against the Slav majorities. The remarkable disparity between population and the numbers of the 413 deputies for Hungary alone in the last election preceding the war is shown by the returns of 1910: Magyars, Independents and other parties, 404; Socialists, 1; Rumanians, 5; Slovaks, 3; Serbs, none. About 400 of these were Magyars; the remaining 13 represented nearly 10,000,000 non-Magyars, out of a total population of, roughly, 18,000,000. Elections were invariably accompanied by bloodshed, violence and terrorism. For the 1910 elections no fewer than 202 battalions of infantry were mobilized, besides 126 squadrons of cavalry, while a large number of troops were brought in from Austria. The price of "maintaining order" was estimated at nearly \$4,000,000 (*Dancer's Armeezzeitung*, 6 June 1910). Troops and gendarmes prevented many thousands of qualified voters from entering polling booths in the country districts. During one election 32 men were killed and 70 wounded. An electoral reform bill in 1918 enfranchised every male Hungarian over 24 possessing any one of the following qualifications: Two years' service in the war; non-commissioned rank; passed primary education; payment of annual tax (\$2); having a licensed profession or trade; permanently employed; being a former elector. The ability to read and write is attached to each qualification. On 1 Nov. 1918 Count Karolyi announced that following a revolution in Budapest a Hungarian National Council had taken over the government. The king-emperor formally abdicated on 11 Nov. 1918. Thus ended nearly 400 years of revolt against Hapsburg rule.

**Local Government** in Hungary was administered since 1876 by committees partly elected by the county or district and partly appointed by the crown. A more bureaucratic system was introduced in 1891. The local assemblies are now half composed of landed proprietors and half of those chosen by parliamentary electors, presided over by the appointed lord-lieutenant. There is no popular representation in the true sense in these county assemblies. The land-owners and those elected under the very limited parliamentary franchise hold all the power, while the working classes and subject races have none whatever. So far from being—as it was often held up to be—the land of ideal local government, "Hungary is becoming the happy hunting ground of the *petite bourgeoisie*, which, with its strong Jewish element, is replacing the decaying gentry of former days."

**Law and Justice.**—The Minister of Justice stands at the head of judicial affairs and exercises only administrative control. His functions, prescribed by law, relate to the supervision of judges, legal redress in international law, extradition, the execution of punishments, pardons, dispensation in divorce cases, and especially the preparation of bills. The judges were appointed by the king; they were perfectly independent and irremovable. As courts of first instance there are—in Hungary proper—385 district courts with single judges and 67 county courts with collegiate judgeships. Altogether there are over 2,000 judges of first instance. As superior courts there were the 11 "Royal Tables" (Courts of Appeal) and the Curia (High Court of Justice) in Budapest, the

first composed of 200 judges, the latter of 92. Civil procedure is regulated by the Consolidation Acts of 1868 and 1881; summary procedure was codified in 1893. The Criminal Code of 1896 closely resembles the English model.

**Religion.**—The creeds of the Hungarian peoples are as various as the races: Roman Catholic, Greek Catholic, Old Catholic, Greek Oriental or Orthodox, Evangelical, Unitarian, Evangelical Brotherhood, Baptist, Gregorian—Armenian, Jewish and Mohammedan. All are recognized and each sect independently administers its own affairs; on the whole this principle is loyally respected. The education act of 1907 somewhat restricted that autonomy in regard to the Church schools. The latest statistics, which include Croatia-Slavonia, now separated from Hungary, give the religions as follows:

Roman Catholics.....	10,888,138
Greek Catholics.....	2,025,506
Evangelical.....	3,961,472
Greek Orthodox.....	2,987,163
Unitarians.....	74,296
Jews.....	932,458
Others.....	17,452
Total.....	<u>20,886,487</u>

It is somewhat remarkable that the true Magyars, in spite of having become Christians, still preserve to this day the original pagan expression, *The God of the Hungarians*.

**Education.**—Since 1868 all children between the ages of 6 and 12 are supposed to attend day schools. Children that are educated privately or at home must pass a public examination at the end of the year. Three years (12 to 15) must be spent in continuation schools. In 1910 there were over 9,000,000 who could neither read nor write—nearly half the population, while 1,775,000 could only read. Continuation schools for technical instruction in agriculture gradually took the place of general continuation courses all over the country and give both theoretical and practical instruction, the latter on model farms and gardens attached to the schools, which are separately for boys and girls. Since 1907 Magyar is the language used in all continuation schools. About 2,754,000 children attend elementary day schools, to the upkeep of which the local authorities defray 71 per cent of the cost; the state contributes the rest. Higher education is provided by secondary schools wherein pupils are prepared for college and university. There are two kinds of secondary schools—the *gymnasia* or classical schools, which attach most importance to the humanities, to the classical languages, history and literature; and the *realschulen*, which, by putting modern languages, mathematics and natural science in the foreground, prepare their pupils for the higher grades of technical science. The latest figures show 192 *gymnasia* with 66,863 pupils and 43 *realschulen* with 14,938 pupils. The Magyar element predominates in all the higher schools. In a few of these the German, Italian, Serbian or Rumanian languages are used. In Hungary proper there are some 60 institutions of university status; 2 universities of sciences, 1 of technical sciences, 10 law academies and 47 theological colleges. The state maintains 5 universities: Budapest, Kolozsvár, Agram, Pressburg and Debreczen. All but one comprise the four faculties

of medicine, law, philosophy and theology. Women are admitted to the universities as ordinary students. The theological colleges are thus distributed: Roman Catholic, 29; Greek Catholic, 4; Greek Oriental, 4; Protestant, 9; Jewish, 1. A large number of Hungarian students go abroad to study at foreign universities. Before the war Hungary possessed over 1,000 institutions for instruction in agriculture, commerce, industries, technology, mining, art, music and military training. The Hungarian National Museum (founded 1802) in Budapest contains a library of over 1,500,000 volumes and a rich collection of antiquities, natural history and ethnographical exhibits, and the oldest monuments of Hungarian life, language, literature and history. Among other museums, that of Fine Arts contains numerous old masters and the works of modern painters.

**Language.**—Hungarian (properly Magyar) is a branch of the Ural-Altai family of languages to which belong the Samoyede, Mongolian, Tungusian, Turco-Tartaric and Finno-Ugric languages. It is classed in the Ugric branch of the northern division of the Turanian group and is most closely allied to the Ostiak, Vogulic and Mordvinic, and is also akin to the Turkish. Together with Finnish and Turkish it is one of the three non-Aryan languages that have taken root in Europe. The language of the Huns (from whom the name of Hungary is derived) is not known; neither do we know when they first appeared in Europe. They were conquered by the invading Magyars toward the end of the 9th century. Magyar differs from all the cultivated languages of Europe in internal structure and external form and is difficult to learn. Its origin has been the subject of much speculation; philologists have sought its cradle in the Hebrew, Turkish and Slavonic tongues. An Hungarian monk in the 13th century found a tribe called the Baskirs on the banks of the Kama in eastern Russia who spoke Magyar. An Hungarian astronomer visited the extreme northern coast of Norway in 1769 to observe the transit of Venus when he found that he was able to understand the Laplanders, which led him to write a book entitled 'Demonstratio Idioma Ungarorum et Lapponum idem esse,' a work that proved the origin of Magyar. But Leibnitz, who died half-a-century before, had already propounded a theory that the Finns, Lapps and Hungarians were related.

At the dawn of the 19th century Latin was the language of the scholar and the native tongue was held in disfavor. At that time the language of the people was inadequate to express the new ideas. A national movement began to stimulate literature, invent new words, and to substitute Magyar for Latin as the literary and political language of the country. By 1830 some 7,000 new words had been coined and added to the language; others have been added since, while not a few were borrowed from German and Slavonic languages.

Magyar is written in Latin letters (no *W*); by a system of accents, umlauts and combinations, 15 vowels and 26 consonantal characters represent every sound in the language with invariable fidelity. As in the other Turanian languages the root is never obscured in words, whatever changes they undergo. Determining or modifying syllables are placed at the end,

and have a double form, always taking a different vowel when attached to a sharp-vowel root from what they have when attached to a flat-vowel root—a general characteristic of the Turanian languages. These suffixes represent the case-endings of nouns and the conjugations of verbs in other languages, and are very numerous. Hungarian has no diphthongs nor gutturals. At the beginning of a syllable the Hungarian never allows more than one consonant; in foreign words which begin with two consonants, the consonants are made to go with different syllables by putting a vowel before them (for example, of *schola* they make *iskola*), or a vowel is put between (as from *král* they make *király*). It also has no distinction of sex whatever. No vowel is mute. Family names are considered as adjectives, from which they mostly originated, and hence are put before the baptismal name; for instance, Bátori Gábor (Gabriel Bátori), as if it were the Batorish Gabor, the Gabor of the Batori family. The perfect proportion between vowels and consonants, the accurate shadowing and full articulation which every syllable requires, and the fixed succession of vowels, give to the language a character of masculine harmony. The tonic accent or stress is always on the first syllable.

The preference given to Latin over the national language, not only in the Church, but in judicial proceedings, legal documents and parliamentary debates prevailed until 1844. The use of a dead language in common life, as well as in all scientific subjects, could neither be advantageous to the general improvement of the people nor to the national literature. Though with the introduction of Christianity into Hungary the Latin language acquired the ascendancy in the Church, in schools, in public affairs, parliament and courts, yet Magyar was used in commerce, in the streets and in camp, and even the resolutions of the diet were first drawn up in it and then translated into Latin. After a struggle which had continued almost without interruption since 1790, the Magyar language was raised (1844) to the position to which it was entitled as that of a dominant nation.

**Literature.**—It is said that nationality is to the Hungarians a question of more absorbing interest than religion, and the truth of this assertion is reflected in almost every phase of their literature. Already their earliest poetical myths reveal the influence of national politics. Though the Magyars under Arpád conquered the Huns and their territory, they nevertheless adopted the Hun king, Attila, as their own ancestor and a national hero. Their own legends and traditions are interwoven with those of the Huns and form part of 'The Legend of the Occupation of the Fatherland,' the second great cycle of primitive Hungarian poetry. After its conversion to Christianity (about the year 1000) under king Saint Stephen, churches, monasteries and schools sprang up in Hungary, but the earliest written memorial of the language dates from the beginning of the 13th century, in the shape of a short funeral address. Of the two mighty forces that dominated the literature of Christendom during the Middle Ages—religion and the spirit of chivalry—only one, religion, is represented in the relics of Hungarian literature that have survived. Traditional sagas and prose legends inscribed

on parchment still exist to bear witness to a high standard of literary culture at Hungarian courts and among the nobles and ecclesiastics during the 14th and 15th centuries. Earlier manuscript books exist containing legends of Saint Francis of Assisi; other documents retail legends clustering around the national saints, the Arpád kings, and especially Stephen.

In 1465 Janus Pannonius wrote an Hungarian grammar, which is lost. The 16th century was favorable to Hungarian literature, through the religious disputes in the country, the sacred, martial and popular songs, as well as by the histories written and published for the people, and the multiplied translations of the Bible. Among writers of ballads or metrical tales belonging to the 16th century may be mentioned Tinódi, Kákonyi, Tzanádi, Valkai, Tserényi, Szegedi, Illesfalvi, Fazekas, Balassa, etc. A higher aim was manifested by the epic poems of Count Niklas Zrinyi (1652), Ladislaus Lisszti (1653), Christopher Paskó (1663), Count Stephen Koháry (1699), and in particular the numerous and excellent productions of Stephen von Gyöngyösi (1664-1734), as well as the lyric poems of Rimai, Balassa, Benitzky, etc. In 1653 an encyclopædia of all the sciences, and in 1656 a work on logic, were drawn up in the Hungarian language by John Tere (Apáztai). A large number of grammars and dictionaries were printed from the 16th century to the 18th. But the hopes of the further development of Hungarian literature were not realized; a Latin period again succeeded, from 1700 to 1780, during which time numerous and finished works were composed in Latin by Hungarian writers. In 1721 a Latin newspaper was established, and the state calendar, which commenced in 1726, was regularly published in Latin. In 1781 the first Hungarian newspaper was printed in Pressburg.

After Joseph II died (1790) several laws were passed in favor of the Hungarian language. Several periodicals were established, Hungarian theatres erected in Buda and Pesth, many works were written both in poetry and prose. The modern period of Hungarian literature may be said to date from the time of Joseph II. The epic poem of Arpád was written by Andrew Horváth, and published at Pesth in 1830. The brothers Alexander and Charles Kisfaludy acquired a great and deserved reputation as poets and dramatists, and did much toward developing the national language and literature. The latter (who died in 1830) may be looked upon as the founder of the modern drama in Hungary. The most celebrated works of the former are his lyrical masterpiece, 'Himfy Szerelmei' (Himfy's Love, 1802), his 'Regék a Magyar előidőből' (Tales of the Early Hungarian Times), and his historical tragedies, which were partly modeled on those of Schiller. The development of the Hungarian literature owes much to the influence of the periodical press, which spread abroad a taste for literature at the same time as it intensified the sentiment of nationality among the people. In this department the name of Kossuth deserves honorable mention. Previous to the troubles of 1848-49, which checked for a time the national growth of the literature, almost every species of composition was successfully practised. Works on politics and narratives of travel were written by Eötvös, Széchenyi,

Szalay, Szemere, etc.; on history by Stephen and Michael Horváth, Szalay and Jaszay; on philology by Fogarassy and Bloch; works on the exact sciences, however, were confined to translations from the German, French and English. Novels and romances were written by Baron Jósika, Eötvös, Kemény, Kuthy, Nagy, Pálffy, etc., which, though of no great originality, showed considerable artistic skill, and helped to diffuse a more correct style. The dramatic pieces of Eötvös, Obernyik, Vörösmarty, and the prolific Szigligeti—who for a long time had almost the exclusive possession of the national stage—have greater value and originality. It is in poetry, strictly so called, however, that modern Hungarian literature shines. Many of the poems (songs, ballads, etc.) of Czuczor, Vörösmarty, Bajza, Garay, Bachot, Szász, Erdélyi, Kerény and others, are among the finest things that modern literature has produced. In this field the palm must be awarded to Alexander Petöfi, who completely freed Hungarian poetry from its dependence on foreign models and subjects, and inspired it with a life drawn fresh from nature and national feeling; and who, in artistic skill and masterly handling of his mother tongue, ranks as a model. Tompa, Hiador, Lisznyai and others, have copied him with more or less success. The collection of ancient Hungarian national poetry, compiled and edited by John Erdélyi, at the instance of the Kisfaludy Society (three vols., Pesth 1845-47), contributed greatly toward bringing back the modern poetry to nature and originality, and to impress upon it the stamp of nationality. The ill success of the revolutionary struggle seemed for a time to have dealt a heavy blow to the progress of Hungarian literature, the most gifted writers having either fallen in battle (as Petöfi), or been imprisoned or banished. Time, however, opened the prisons and brought back the exiles; to the writers already mentioned others were added, and an active literary life again began. The greatest recent Hungarian poet is John Arany, who surpasses even Petöfi in artistic feeling, and whose national epic, 'Toldi,' is looked upon as a masterpiece. Baron Jósika holds the first place among the novelists; Jokai, Kuthy, Bérczy, Pálffy, Miksrath and Dobzsa are also favorite fiction writers. Narratives of travel have been written by Count Andrassy, Ladislaus Magyar, Vámbéry, etc.; on politics by Esengery, Szalay, Pákh and Eötvös. National history has attracted much attention; and besides the works of Szalay and Horváth, we should mention Teleki's 'Age of Hunyad,' Jászay's 'Hungary after the Battle of Mohács,' Salomon's 'The Rule of the Turks in Hungary,' etc. Many excellent translations of modern foreign works have been made, some of which, such as Esengery's translation of Macaulay's 'History of England,' and Somssich's translation of Guizot's 'Histoire de la Révolution d'Angleterre,' rival the originals in style. The best works on Hungarian literature are those of Toldy, Emil Reich and F. Riedl.

**Music.**—From the earliest stages of his known existence the Magyar appears to have had a special love for music and dancing, which found their place in every ceremonial, whether it was religion, war, rejoicings, sacrifices or funerals. Accompanying themselves on the lute, their minstrels sang the heroic deeds of

fallen warriors. The Hun minstrels before them both sang and fought in battle. Chroniclers of the 10th century mention Hungarian hymns, dirges and martial songs. From this period, too, dates the well-known slow-moving national dance, called the "Hun step." From very ancient times, lutes, violins, pipes, horns and tambourines were used by the Magyars. None of the melodies of those days survive. The first priests being Italians, they taught Latin songs; later, when natives (Magyars) became ordained, they composed hymns in their own tongue—subject to approval by the Holy Synod. Early in the 12th century Andreas Vásárhelyi wrote a song to the Virgin as Patroness of Hungary. Two Hungarian master-singers of European fame were Andreas Klinsor, who took part in the competition held at the Wartburg, near Eisenach, in 1208, and George Szlatkoni, a minor bishop at Saint Stephen's in Vienna and choirmaster to the Emperor Maximilian I. Foreign musicians—instrumentalists, singers, tutors and composers were attached to the Hungarian court under most of the kings. Church organs existed in Hungary in the days of Hunyadi. But the true missionaries of Magyar music were the wandering gypsies, first heard of—as musicians—in the 14th century. It was they who spread those weird, melancholy yet wild melodies over Europe just as their descendants may be found performing them (or something like them) all over Hungary at the present day. They enlivened the humble peasants on the village green and the haughty nobles in their castles. Michael Barna, the "Hungarian Orpheus," and Czinka Panna were distinguished musicians of the 18th century, while John Bihary composed those three fine dances, "Coronation," "Palatine" and "Primate." He had the honor of counting Beethoven in his audience, and his orchestra frequently played at the court balls in Vienna. They were all Hungarian gypsies, of the type that is now well known in London, Paris and New York as in their own country. A prominent part of the national music is the great collection of war songs, the composers of which can be numbered by the hundred. With the spread of the Reformation in Hungary the national music received a powerful impetus both sacred and secular. Huguenot hymns by Gaudimel (17th century) became naturalized on Hungarian soil. The lives of Thököly and Rákóczy represent the most brilliant period of Magyar folk-songs, the so-called *Kurutz* songs, of exquisite rhythm, from which nearly all the later songs, dances and melodies originated. Handel and Bach were babes when the *Kurutz* were sung and played. The great Liszt—himself a Hungarian—has placed it on record that "there is no other music from which European musicians can learn so much rhythmic originality as the Hungarian." In addition to the innumerable "hallgató magyar" melodies, mainly played in public performances, Hungarian music includes a number of pretty dances, for the ballroom and the cottage, the former called the *Palace Dance* and *Slow Hungarian*, and the latter the *Dumping tune* and *Dance tune*. The *Verbunkos* is a recruiting dance, said to be unique. Other varieties are the *Wedding Dance*, *Coquettish*, *Drum Dance*, *Arm Dance*, *Tent Dance*, *Round Dance*, *Wreath*

*Dance* and the celebrated *Csárdás* (châr'dash) or *Tavern Dance*. Three prominent dance composers of the 19th century are John Lavota, Anton Csermák and Mark Rozsavölgyi. An early opera composer was Sigismund Cousser (d. 1730); his works include 'Erindo' (1693), 'Porus' (1694), 'Pyramus and Thisbe' (1694), 'Scipio in Africa.' He was choirmaster in Dublin Cathedral for some years. Special mention must be made of John Francisci (b. 1691) as a brilliant organist.

A new era opened for music in Hungary at the dawn of the 19th century when the old clavichord developed into the forerunner of the modern pianoforte. Hungarian noblemen installed these instruments in their homes, with the result that many famous pianists settled in Hungary to engage in teaching. As former pupils of Haydn, Beethoven and Mozart, these tutors introduced the works of their great masters to the Hungarian aristocrats, among whom, it may be presumed, were some excellent players, for Beethoven dedicated several of his sonatas to Hungarian ladies. With the spread of music several Hungarian textbooks on piano instruction were issued, and a Hungarian (Stephen Gadi) wrote the first 'School for the Piano' (Buda 1809), followed by others. Nepomuk Hummel (1778-1837) left over 100 compositions. The greatest genius of Hungarian music was Franz Liszt (q.v.), the greatest pianist of the century, the creator of the *Rhapsody* and the *Symphonic Poem*. His contemporary, Franz Erkel (1810-60) was the creator of the Hungarian Opera, who reintroduced into his works long-forgotten native instruments with striking originality. Charles Goldmark (b. 1832) stands high as a composer of symphonies and operas: *Queen of Sheba* (1873), *Sakuntala* (1860) and other dramatic works.

In more recent years the Hungarian school of music and musicians has spread throughout the artistic world. Not only in composition of grand and light opera, ballet and chamber music and in prominent vocalists, but also in the domain of instrumentalists—on the violin, such masters as Joachim, and the large number of piano virtuosos who attract large audiences in American and European cities, has the Hungarian nation attained a position second to none. In 1819 and 1833 the first Hungarian conservatoires were founded at Kolozsvár and Arad; another in Budapest, followed by more in Debreczen, Kassa, Szeged and Szabadka. The National Hungarian Academy of Music (1875) had Liszt and Erkel as its first directors. Musical and choral societies are spread throughout the country, and historical concerts of the highest merit are periodically given in the academy of Science.

**History.**—The nations which occupied parts of Hungary before its conquest by the Magyars were the Dacians, Bastarnæ, Illyrians, Pannonians, Samatians, Vandals, Bulgarians, Jazyges, Alans, Huns, Marcomanni, Longobards, etc. The Romans held the southwest part of the country under the name of Pannonia, while the southeast belonged to their province of Dacia. Various Slavic tribes, together with Wallachians, Bulgarians and Germans, were the chief occupants at the time of the Magyar invasion. The Magyars, called

Hungari by the Latin writers, a warlike people of Turanian race, had made various migrations and long dwelt in the vicinity of the Caucasian Mountains, and afterward in the region between the Don and the Dniester, before they approached and crossed the Carpathians (about 887) under the lead of Almos, one of their seven chiefs (*vesér*), and elected head (*fejedelem*) or duke. Árpád, the son of Almos, conquered the whole of Hungary and Transylvania, organized the government, and also made various expeditions beyond the limits of these countries. These incursions were extended under his son Zoltán (907-46) and grandson Taksony (946-72), as far as the German Ocean, the south of France and Italy, and the Black Sea. These formidable enemies were first defeated by Henry I the German emperor, at Mersburg in 933; they then invaded Franconia in 937, and Saxony in 938, were defeated at Stederburg, and also on the river Ohre. Their last incursion into Bavaria (954 and 955) terminated with their complete overthrow on the Lech, where Otho I, king of the Germans, conquered them. They gradually learned from the Slavonians and Germans whom they conquered, and from the prisoners whom they had taken in their incursions, the arts of peace, agriculture and manufactures. The hospitality of Geysa (972-97), and the religious zeal of Sarolta his wife, did much to attract strangers from different countries and of all classes into Hungary. The Hungarians violently opposed the introduction of Christianity and Geysa was obliged to leave the extension of it to his son Stephen (997-1038), who finally prevailed by the assistance of Latin monks and German knights. King Stephen granted a constitution, the principal features of which were never lost, but the unsettled state of the succession to the crown, and the consequent interference of neighboring princes and of the Roman court in the domestic concerns of Hungary, long retarded the prosperity of the country. The religious zeal and bravery of Saint Ladislaus (1077-95), and the energy and prudence of Coloman (1095-1114), shine amid the darkness of this period.

The introduction of German colonists from Flanders and Alsace into Zips and Transylvania by Geysa II (1141-61) had an important influence on those districts. In 1186 Hungary became connected with France by the second marriage of Béla with Margaret, sister to Henry, king of France, and widow of Henry, king of England, who introduced French elegance at the Hungarian court. The reforms of Béla IV (1235-70) were interrupted by the invasions of the Mongols (1241), and the kingdom was in a most deplorable condition. After one year of pillage they left the land a desert. With Andrew III (1290-1301) the male line of the Árpád dynasty became extinct, and the royal dignity became purely elective. Charles Robert of Anjou, by his mother a descendant of the extinct dynasty, was the first elected (1309). The reign of his descendant Sigismund (1387-1437) is interesting from the invasion by the Turks (1391) and the war with the Hussites. The Turks routed the army of Sigismund, reinforced by the flower of Western chivalry, in 1396. From their first appearance the Turks constantly disturbed the tranquillity of Hun-

gary which served as a bulwark to the rest of Europe. The death of Ladislaus I in the unfortunate battle of Varna (1444) is to be regretted, as the plan of the hero John Huniades, for driving the Turks from Europe, failed through the coldness of the Christian courts and the intrigues of his enemies.

Matthias Corvinus (1458-90), son of Huniades, held the reins of government with a firm hand, and gained the love and confidence of the nation, notwithstanding the severe measures which he was often compelled to adopt.

During the reigns of Ladislaus II (1490-1516) and Louis II (1516-26) the ambition and rapacity of the optimates, headed by Stephen Zapolya, and afterward by his son John excited domestic troubles and caused an insurrection of the peasants, which was only suppressed by the severest measures (1514), while they destroyed the foreign influence of the kingdom. The battle of Mohács (1526), in which Louis II lost his life, and which for 160 years made a great part of Hungary a Turkish province, was the natural consequence of this state of things. The rest of the country was in dispute between the rivals Ferdinand of Austria and John Zapolya. The contest was decided by the Protestants, who, fearing the persecution of Zapolya, declared for Ferdinand, who thus became the first Hapsburg king of Hungary, a connection that endured through the reigns of 16 monarchs till 1918. Zapolya was compelled to rest satisfied with the possession of Transylvania and some counties of Upper Hungary; but this division of the kingdom caused continual disputes with the descendants of Zapolya, instigated by the Turks and the French, and gave rise to civil commotions, which were quieted by the treaties of Vienna with Stephen Botskay (1606), of Nikelsburg with Gabriel Bethlen (1622), and of Lintz with George Rakoczy (1645). Deliverance from the Turk came when, in 1683, Kara Mustapha besieged Vienna and John Sobieski, king of Poland, and Duke Charles of Lorraine relieved the city and routed the Turkish army. After the expulsion of the Turks Leopold I finally succeeded so far that he took Buda (1686), and by the Peace of Carlowitz (1699) recovered the rest of Hungary (except the Banat) and Transylvania. Joseph I became king in 1705. With England, Holland and Savoy he fought against Louis XIV under the Duke of Marlborough and Prince Eugene. Joseph inherited from his father the long struggle of the Magyars against Austrian encroachment on their liberties. Persecution of the Protestants led to revolt in Hungary, which Joseph suppressed. He granted a general amnesty, observed the constitution and made peace with his people in the year of his death (1711), ending 200 years of continuous war.

The Congress of Passarowitz (1718) restored the Banat to Hungary, and the Peace of Belgrade (1739) terminated hostilities with the Porte for a long time. Charles VI (1711-40) by the Pragmatic Sanction secured the inheritance of the Hungarian crown to the female descendants of the house of Hapsburg, and improved the administration of the kingdom by giving the royal chancery and the vice-regal office an organization better suited to the age. He also formed a standing army for Hungary,

and established the military contribution for its support. Joseph II (1780-90), one of the greatest sovereigns of his age, was influenced by the best intentions in the changes which he undertook in the Hungarian constitution; but his zeal made him forget the necessity of proceeding gradually in such reforms, and the nation, far from entering into his views, opposed them.

The subsequent history of Hungary—the adoption of the Magyar language in its Diet; the resistance against the encroachments of Austria; the heroic struggles for independence, and the noble work of Bathyanı, Deák, Kossuth and Klauzal along these lines; the disastrous war of 1848 and the reduction of Hungary to the position of an Austrian crownland; its rehabilitation to independence in 1867 and the constitution of the former dual Austro-Hungarian Empire, are described under AUSTRIA.

**HUNGARY AND THE WAR.** It is too early yet to weigh—with even approximate accuracy—the influence and responsibility of Hungary in provoking the war and abetting the designs of Austria and Germany. Two circumstances, however, seem to be clearly revealed: Whereas Austria was drawn or pushed into the war without the consent of Parliament or people, in Hungary, on the other hand, the war was popularly declared—by Magyars—to be a Hungarian war, and the fact, that it had spread to such gigantic proportions was regarded with rather a feeling of national pride. Vienna, during the first months of the conflict, was apathetic and anxious; Budapest was enthusiastic and confidently jubilant. The long tradition of Austria's "facility for defeat" weighed heavily upon her people; neither doubt nor misgiving clouded the Hungarian vision. The one-sided Dual Compromise of 1867 had invested Hungary—or rather the Magyar gentry—with two-thirds of the power in the monarchy and left Austria with the burden of defraying two-thirds of the costs. Though the foreign relations of the empire were exclusively in the hands of the Austro-Hungarian Minister in the Reichsrath in Vienna, his policy not infrequently was dictated from Budapest or Berlin. (See Aehrenthal; Berchtold). Nearly every important official in the Foreign Office is a Hungarian. Vienna was nominally the capital of the empire, but Hungary was practically an independent country in which the ruling classes, as we have already pointed out, stood in the minority. Yet it would have been no very difficult task for the Magyars, by genuine constitutional government and a policy of conciliation, to build up a powerful and united state. The Slav races under their control would have accepted Magyar leadership the more willingly as they themselves had formerly been oppressed by Austria as severely as the Magyars had been. The few prominent Hungarian statesmen, such as Deák and Eötvös, who had endeavored in the past to secure political justice for the non-Magyars were overruled. Since 1875 the "Magyar State" idea developed into a ruthless policy of "Magyarization," in pursuance of which coercive measures were employed to crush out the national sentiments and languages of the greater part of the population. Newspapers and banks fell into the

hands of Magyarized Jews who became the most ardent promoters of the cause. All non-Hungarian place-names and, by persuasion, the surnames of prominent persons underwent the process. Thus, Pressburg became Pozsony; Vienna, Bécs (bátsch); Klausenburg, Kolozs; Hermannstadt, Szeben. The real name of Munkácsy the painter was Lieb; that of Vambéry, Bamberger; Toldi the author was originally Schebel; Petöfi the poet was a Slav, Petrovitch; Komlóssy was Kleinkind, and the ethnologist Hunfalvy was Hundsdorfer, etc. Letters from Austria bearing German place-names were returned "not known," though every child in the town knew the two names. Austrian postal authorities retaliated by returning letters addressed "Bécs" (Vienna) with the inscription, "place not known." The inevitable consequences of the Magyarization policy was that the Croats, Serbs and Dalmatians looked toward Serbia for deliverance; Rumanes turned their hopes to Rumania, Ruthenes to Russia and the Slovaks to their kinsmen of Bohemia and Moravia. The races of Austria were free to use their national languages, and since 1907 enjoyed universal suffrage. Under Hungarian dominion the Magyar language alone was recognized, while the constitutional suffrage became a dead letter. (See *Government*). Koloman Tisza (1830-1902) inaugurated and pursued the Magyarization policy during his 15 years of the premiership; it was continued by his son Stephen (Count) Tisza, who became the most dominant personality in the empire. He was murdered a few days before the end of the war, in the progress of which he, and not the Austrian Foreign Minister, attended the German war councils. His policy bore retributive fruit early in the war in the defection of Austro-Hungarian Slav regiments. It brought about the Czecho-Slovak and Yugoslav risings, their fighting on the Allied side, their eventual recognition as belligerents and independent states by the Allies, and, finally, the collapse of the empire followed shortly after by the surrender of Germany. See AUSTRIA; CROATIA-SLAVONIA; CZECHO-SLOVAKS; JUGOSLAVS; SLAVS; TISZA; TRANSYLVANIA; WAR, EUROPEAN.

HENRI F. KLEIN,

*Editorial Staff of The Americana.*

**HUNGERFORD**, Margaret Hamilton Wolfe Argles ("THE DUCHESS"), Irish novelist: b. Ross, Ireland, about 1855; d. Bandon, County Cork, 24 Jan. 1897. She was the daughter of a vicar choral of Cork Cathedral and the death of her first husband, Edward Argles, left her with a young family to support, whereupon she took to writing novels, using the pseudonym "THE DUCHESS." Later she was married to T. H. Hungerford. Her more than 30 novels were widely popular both in America and England and without possessing a large amount of literary value are cleverly written, entertaining fictions. Among them may be cited 'Phyllis' (1877); 'Molly Bawn' (1878); 'Airy Fairy Lillian' (1879); 'Beauty's Daughters' (1880); 'Mrs. Geoffrey' (1881); 'Portia' (1882); 'O Tender Dolores' (1885); 'Green Pastures and Gray Grief' (1886); 'A Modern Circe' (1887); 'The Duchess' (1887); 'Undercurrents' (1888); 'Hon. Mrs. Vereker'

(1888). Consult Taisin, A., 'Best Sellers of Yesterday' (in *Bookman*, Vol. XXXVIII, p. 645, New York 1914).

**HUNKERS** (supposedly from Dutch *hokk*, "post" or "station"; "stick-in-the-muds"), in American politics, at present a contemptuous nickname, like "moss-backs," for the unprogressive elements of a party, which detest change. Originally, a name given about 1844 to the section of the New York State Democrats which opposed new issues: the points for which it then stood, however, had become party tenets from about 1835. Thence till 1840 the Hunker faction was in opposition to the Locofoco wing (q.v.) which opposed bank charters; but was obliged to yield in 1838. From 1840 to 1846 they opposed the Radicals, who wished a revised State constitution, elective judges and cessation of State canal building. Thence till 1852 they opposed the Barnburners (q.v.), who, at first separately and then in alliance with the Free-Soil party (q.v.) fought the National Democratic party for recognition of its State power. After the election of Pierce in 1852, it divided into "hards" and "softs"; the first under Daniel S. Dickinson opposed the administration, the second under William L. Marcy supported it. The former made up the bulk of the "War Democrats" after 1861. Besides those named, Horatio Seymour is the best remembered Hunker leader; while the opposition has the familiar names of Martin Van Buren, Silas Wright and John A. Dix, besides others remembered by the older generation.

**HUNNERIC**, a king of the Vandals in Africa, who flourished in the 5th century; d. 484. He succeeded his father, Genseric, in 477. In 435 he was sent to Italy as a hostage. He married a daughter of Theodoric, king of the Visigoths. When she was suspected of an attempt against the life of his father, Hunneric caused her ears and nose to be cut off and sent her home. He later married Eudocia, daughter of Valentinian III, emperor of Rome.

**HUNNEUS**, ún-ná'ús, **George**, Chilean statesman: b. Santiago, Chile, 1831; d. 1889. He was graduated at the university of his native town in 1857, and became professor of political economy and jurisprudence at the same institution the following year. Montt, President of Chile, drove him out of the country on account of his forceful eloquence and his liberal opinions, which he found carried into actuality in the government of the United States, where he spent his time of banishment. He was recalled to his native land in 1861, was elected to the House of Representatives and became its speaker. He was also appointed Secretary of Public Instruction and became rector of Santiago University, while holding from time to time high positions in the Chilean administration. His collected works, chief of which is 'La Constitución ante el Congreso' (1879), were edited by his sons and published by the government as 'Obras' (4 vols., Santiago 1890-91).

**HUNS**, a people who make their appearance in authentic history about 375 A.D. Ethnologists identify them with a Mongolian people of northern Asia, who invaded the Chinese Empire about 200 B.C., and after various migrations entered Europe. They appear afterward

to have sided with the Goths of Mœsia against the Romans, and sometimes in alliance with the emperors, who purchased their services, and sometimes in hostility with them, they continued to extend their dominion along the Danube until the time of Attila (434), their greatest leader, whose reign constitutes the best-known period of their history. See **ATTILA**.

**HUNT, Gaillard**, American historian and author: b. New Orleans, 8 Sept. 1862. He studied at Emerson Institute, Washington, and in 1893 represented the State Department at the World's Fair at Chicago. From 1900-09 he was chief of the Bureau of Citizenship; and after 1909 was chief of the Division of Manuscripts in the Library of Congress. He attained great prominence on matters of citizenship, being appointed a member of the Naturalization Commission (1905); a member of the Citizenship Board (1906), and adviser to the Department of State on citizenship matters (1915 and 1917). In 1913 he lectured on nationality at the Graduate School of Political Sciences at George Washington University, and on materials for history at Johns Hopkins. Dr. Hunt is the author of 'The Seal of the United States' (1892), revised as 'History of the Seal of the United States' (1909); 'The Department of State of the United States' (1892), revised and enlarged as 'The Department of State of the United States, Its History and Functions' (1914); 'The American Passport' (1898); 'Life of James Madison' (1902); 'John C. Calhoun' (in 'American Crisis Biographies,' 1907); 'Disunion Sentiment in Congress in 1794' (1905); 'Life in America One Hundred Years Ago' (1914). He is editor of 'Fragments of Revolutionary History' (1891); 'The Writings of James Madison' (8 vols.); 'The First Forty Years of Washington Society' (1906); 'The Journals of the Continental Congress in Succession to Worthington C. Ford' (1909); 'James Madison's Journal of Debates in the Constitutional Convention' (1917).

**HUNT, Helen**. See **JACKSON, HELEN FISKE HUNT**.

**HUNT, Henry**, English politician and reformer: b. Widdington Farm, Upavon, Wiltshire, 6 Nov. 1773; d. 15 Feb. 1835. He received some training for the ministry, but abandoned this for farming. After his acquaintance with John Horne Tooke he adopted those radical views which made his career a particularly stormy one. He suffered imprisonment for duelling in 1800, and for attacking a gamekeeper in 1810. Again, he was a speaker at a meeting held in Saint Peter's field, Manchester, which ended in a riot; and he was imprisoned for two and a half years. His following continued to increase rapidly. In 1830 he sat in Parliament for Preston, but failed of re-election in 1833. His term was occupied with the forwarding of radical reforms, such as women's rights, universal suffrage and the repeal of the corn laws. Hunt was extremely vigorous and blatant in his speeches, and gained considerable reputation as an orator. He retired from politics in 1833. He wrote 'Memoirs of Henry Hunt, written by himself in His Majesty's Jail' (London 1820). Consult Huish, R., 'Life of Hunt' (1836).

**HUNT, Henry Jackson**, American soldier: b. Detroit, Mich., 14 Sept. 1819; d. Washington, D. C., 11 Feb. 1899. He was graduated from West Point in 1839, receiving a commission in the artillery. He saw service in the Canadian Rebellion 1837-38; afterward in the Mexican War. In General Scott's advance on the City of Mexico he distinguished himself as officer of the artillery at Contreras (18 Aug. 1847) and Churubusco (20 Aug. 1847) and subsequently received the brevet rank of major for gallantry. In 1856 he was placed on the board engaged in revising the system of light artillery tactics. At the outbreak of the Civil War he was stationed at Fort Pickens, Fla., 1861, and the same year commanded the artillery at the battle of Bull Run, and in the defense of Washington. He subsequently organized and commanded the reserve artillery of the Army of the Potomac. As commander of artillery he was present at the battle of Malvern Hill (1 July 1862) and he also took part in the battle of South Mountain. He was brevetted brigadier-general of volunteers in 1862, and was present at the battles of Antietam, Fredericksburg, Chancellorsville, Gettysburg, served in the Wilderness campaign and at the end of the war retired from his position with the rank of brigadier-general in the United States army. In 1866 he received the commission of colonel in the reorganized army, and in 1883 became governor of the National Soldiers' Home at Washington. Among his writings are 'Instruction for Field Artillery' (1860) and 'The Battle of Gettysburg' (in 'Battles and Leaders of the Civil War' (New York 1887).

**HUNT, (James Henry) Leigh**, English journalist, essayist and critic: b. Southgate, Middlesex, England, 19 Oct. 1784; d. Putney, near London, 28 Aug. 1859. He was the youngest of a large family of children, and was descended on the one side from Tory cavaliers of West Indian adoption, and on the other from American Quakers of Irish extraction. From his father, an improvident and engaging clergyman of convivial habits and of lax doctrines, Hunt seems to have inherited his optimism of temperament, his liberal views and his courage of conviction; from his mother, a passionate love of nature and of books. From birth a delicate child, he early developed hypochondriacal tendencies that never left him. The years from 1791 to 1799 were spent at Christ's Hospital, and were his only formal preparation for a literary life. In 1801 his father published 'Juvenilia,' a collection of Hunt's poems written from the age of 12 to 17. They show wide reading and some fluency in versification, but are mostly poor imitations. From 1803 to 1805 he worked in his brother Stephen's law office and, at the same time, began his long career as a journalist with contributions to *The Traveller*, *The News* and other papers. His theatrical criticisms were reprinted separately in 1807.

His next position was in the office of the Secretary of War, resigned in 1808 in order to start his political journal, *The Examiner*, in its far-reaching effects the most significant step of his career. With his brother John as publisher, he continued editor until 1821. *The Examiner* was a departure from the standards of contemporary journalism in its combination

of the news-giving quality of the daily sheets with the essay style of the weeklies (Fox-Bourne, 'English Newspapers'). Discussion of politics was its chief object. The liberal policy and boldness of attack of the editor caused one charge of libel by the Tory government to follow closely upon the heels of another. The third resulted in prosecution and conviction for applying to the Prince Regent, afterward George IV, the phrase "a fat Adonis of fifty." The two brothers were sentenced to imprisonment of two years, dating from 15 Feb. 1813, in separate prisons, and a fine of £1,000 to be divided between them. They rejected offers from the government to remit the punishment on condition that *The Examiner* should change its attitude, and served the full sentence. Hunts finances, which up to this time had been good, became greatly involved during his incarceration. Not until 1844 was he free from want. His health suffered greatly from the long confinement. *The Reflector* (1810-12) had much the same political and literary character as *The Examiner*. The chief measures for which Hunt labored through these journals were Catholic emancipation, reform of Parliamentary representation, liberty of the press, reduction and equalization of taxes, greater discretion in increasing the public debt, education of the poor and amelioration of their sufferings, cessation of child labor, abolition of the slave trade, reform of military discipline and of prison conditions and of criminal and civil laws. After Hunt's release from prison he was never again so active in political matters.

In 1809 Hunt married Marianne Kent. She was an invalid the greater part of her life; consequently, the "hugger-mugger" condition of domestic affairs which so greatly distressed the Carlyles. Curiously enough, Hunt was allowed to continue *The Examiner* while in prison. During that time he republished from *The Reflector* his 'Feast of the Poets,' a wholesale satire on contemporary poets in the manner of Suckling's 'Session of the Poets.' It antagonized the literary world, as *The Examiner* had done the political, and played a large part in creating the antagonism of *Blackwood's* and the *Quarterly* toward Hunt, which resulted in the creation and the long and bitter persecution of the so-called Cockney School. The 'Descent of Liberty' appeared in 1815. The 'Story of Rimini' (1816), also written in prison, was the most important of Hunt's poems up to that time, and brought him into immediate notoriety. For its influence on his contemporaries, particularly Keats, in the use of idiomatic language, and in the revival of the free, heroic couplet, it is the most important of Hunt's poems. It was at once denounced as most pernicious and immoral by the *Quarterly* and *Blackwood's*. 'Foliage' (1818) contains some of Hunt's best epistles and sonnets. 'Hero and Leander' and 'Bacchus and Ariadne' appeared jointly in 1819, and a translation of Tasso's 'Amyntas' in 1820. His prose style of this period reached its best expression in *The Indicator*, in essays of the occasional and personal type. They are distinguished by a unique charm and tenderness, by delicate humor and keen observation.

During Hunt's imprisonment he had made the acquaintance of Byron, Shelley, Moore and

Lamb. The friendship with Keats probably did not begin until the winter of 1816. In the case of Shelley it was the beginning of a wonderful friendship that involved personal sympathy and public defense with his pen on the part of Hunt, and much financial aid on the part of Shelley. It was through the latter that Byron, in 1821, invited Hunt to Italy to undertake the management of *The Liberal*, an ultra-political-literary journal, suddenly abandoned after a few months of unsuccessful running. The failure of the project led to Byron's desertion of Hunt and his family in a foreign land, and Hunt's revenge in 1828 in the shape of 'Lord Byron and Some of his Contemporaries,' an error which Hunt later greatly deplored. During the stay in Italy he edited the *Literary Examiner*, wrote 'Ultra Crepidarius,' a satire on William Gifford, translated the 'Bacchus in Tuscany' of Redi, and contributed the 'Wishing-Papers' to *The Examiner*. He returned to England in 1825 in great poverty. From this time on his work consisted of editing numerous magazines: *The Companion* (1828), *Chat of the Week* (1830), *The Tailor* (1830-32), *Leigh Hunt's London Magazine* (1834-35), *Monthly Repository* (1837-38), *Leigh Hunt's Journal* (1850-51), unsuccessful because of the great impracticability of the schemes and the monotony of one chief contributor; of contributing to an incredible number of other magazines; of publishing reprints from previously edited journals and collected editions of his "poetical works"; of selections from other writers made with running comment or introductory essays, as 'Imagination and Fancy' (1844), 'Wit and Humor' (1846), 'Stories from the Italian Poets' (1846), of guidebooks, as 'The Town' (1848), and 'The Old Court Suburb' (1855). His only novel, 'Sir Ralph Esher,' appeared in 1832. 'The Legend of Florence' was produced at Covent Garden in 1840. His 'Autobiography' was published in 1850, and in a revised form in 1859; the 'Correspondence' posthumously in 1862.

Hunt's best prose work is to be found in his 'Autobiography' and in his essays of the kind already mentioned as having appeared first in *The Indicator*. Carlyle said of the former, "except it be Boswell's of Johnson, I do not know where we have such a picture drawn of a human life as in these volumes." Though less of a poet than an essayist, some of his short-poems are exquisite, notably the famous 'Abou Ben Adhem,' 'Mohammed,' 'Jaffar,' 'The Nile,' 'On a Lock of Milton's Hair,' 'Paganini' and others. As a translator, some of his work is admirable. Hunt's powers of criticism and of selection will not be fully recognized until scattered notes and buried prefaces are collected. He had an inborn love of poetry and all beautiful things. His insight was most remarkable of all in the appreciation of his contemporaries. His personal quality was as rare as his opportunity. He had a personal ascendancy, a strange fascination born of the sympathy and chivalry, the sweetness and joyousness of his nature. Barry Cornwall said that he was "compact of all the spicy winds that blow."

**Bibliography.**—Hunt's works have never been collected and as a whole are difficult of access. His poems and essays, except in small selections and cheap editions, are out of print.

The best edition of the former is that edited by S. Adams Lee (Boston 1857); of the latter *The Indicator and Companion* (2 vols., London 1834). Scribner publishes in a uniform edition some of the most popular of his works. Consult also Johnson, R. B., 'Leigh Hunt' (1896); Monkhouse, Cosmo, 'Life of Leigh Hunt' (1893); Clarke, 'Recollections of Writers' (1878); Trelawney, 'Recollections of the Last Days of Shelley and Byron' (1858). Frequent references to Hunt are to be found in the writings of Byron, Shelley, Keats, Carlyle, Dickens, Lamb, William Hazlitt and Alexander Ireland. Excellent bibliographies of Hunt's works are to be found in Ireland's 'Lists of the Writings of William Hazlitt and Leigh Hunt' (1868); Monkhouse's 'Life of Leigh Hunt' mentioned above, and R. B. Johnson's 'Essays and Poems of Leigh Hunt' (Temple Library 1891).

BARNETTE MILLER,

*Instructor in English in Vassar College.*

**HUNT, John**, English clergyman and missionary: b. Balderton, Nottinghamshire, 1812; d. Fiji Islands 1848. He studied theology at the Wesleyan Theological Institution at Hoxton, and was sent in 1838 to the Fiji Islands. Here he won many converts to Christianity and established numerous missions. His works, which were published posthumously, include 'Entire Sanctification: Its Nature, the Way of Attainment and Motives of Its Pursuit' (1853); 'Memoir of Rev. W. Cross, Missionary to the Friendly and Feejee Islands' (1848); 'Wesley and Wesleyanism' (London 1858). Consult Rowe, G. S., 'The Life of John Hunt, Missionary to the Cannibals' (London 1859).

**HUNT, Richard Morris**, American architect: b. Brattleboro, Vt., 31 Oct. 1828; d. Newport, R. I., 31 July 1895. He began the study of architecture in Europe at an early age, attended the *École des Beaux-Arts* in Paris, traveled in Germany, Italy, Asia Minor and Egypt, and under his former teacher, Lefuel, was clerk of the works on the buildings that were erected to connect the Tuileries with the Louvre. In 1855 he returned to the United States and proceeded to signalize himself by a remarkable series of noble architectural creations, such as the Capitol extension at Washington; the Lenox Library, New York; the Yorktown Monument, Virginia; Presbyterian Hospital, New York; Tribune building, New York; Fogg Museum, Cambridge, etc. He also designed the pedestal for Bartholdi's colossal statue of 'Liberty Enlightening the World' on Bedloe's Island, New York Harbor. He was also chiefly instrumental in the artistic success of the World's Fair at Chicago for which he designed the administration building. Some of the finest private houses in the country were built by him on a truly palatial scale of magnificence, such as those of W. K. Vanderbilt, E. T. Gerry, H. G. Marquand, J. J. Astor, Ogden Mills, etc., in New York; the country house of George Vanderbilt at Biltmore, N. C.; the so-called "Marble House" and the "Breakers" at Newport, and many other residences at the Rhode Island resort. He was one of the founders and president of the Institute of Architects; an associate of the *Académie des Beaux-Arts*; member of the Royal Institute of British Architects and holder of its gold medal; a chevalier of the Legion of Honor, and a mem-

ber of numerous other domestic and foreign societies. In 1892 he was made an associate member of the Institute of France. He held the honorary degree of LL.D. from Harvard. There are two monuments to his memory in New York city: a fountain by D. C. French on Fifth avenue opposite the residence of H. C. Frick and a life-sized statue on top of the W. K. Vanderbilt residence. Through his artistic and structural faculty he exercised a profound influence over American architecture. Consult Anon., 'A Reminiscence and an Appreciation' (in *Architectural Record*, Vol. XXXIX, p. 295, New York 1916); id., 'The Richard M. Hunt Memorial' (in *Engineering Record*, Vol. XXXVIII, p. 493, New York 1898); Cortisoz, R., 'R. M. Hunt' (in 'Art and Common Sense,' New York 1913); Schuyler, M., 'Works of R. M. Hunt' (in *Architectural Record*, Vol. V, p. 97, New York 1896); Van Brunt, H., 'R. M. Hunt' (in *American Architect*, Vol. L, p. 53, Boston 1895).

**HUNT, Theodore Whitefield**, American Presbyterian clergyman and educator: b. Metuchen, N. J., 19 Feb. 1844. He was graduated from Princeton 1865 and from Princeton Theological Seminary 1869; was instructor in English at Princeton 1868-71 and professor of English there from 1873. He published 'The Principles of Written Discourse' (1884); 'English Prose and Prose Writers' (1887); 'Studies in Literature and Style' (1890); 'Ethical Teachings in Old English Literature' (1894); 'American Meditative Lyrics' (1896); 'English Meditative Lyrics' (1899); 'Literature—Its Principles and Problems' (1906); 'English Literary Miscellany' (1914).

**HUNT, Thomas Sterry**, American chemist, mineralogist and geologist: b. Norwich, Conn., 5 Sept. 1826; d. New York, 12 Feb. 1892. In 1845 he became an assistant to the elder Silliman at Yale College; was chemist and mineralogist to the Canadian Geological Survey 1847-52, professor of chemistry at Laval University, Quebec, 1856-62, and at McGill University 1862-68, and professor of geology in the Massachusetts Institute of Technology 1872-78. In 1859 he invented the green ink with which greenbacks (q.v.) are printed. He was made an officer of the Legion of Honor in 1867; Fellow of the Royal Society in 1859, and was president of the Royal Society of Canada in 1884. He was also a member of the National Academy of Sciences; a member and president of the American Association for the Advancement of Science; a member of the American Institute of Mining Engineers, and of the American Chemical Society. One of the organizers of the first Geological Congress he became its secretary, and acted as vice-president of the Geological Congresses at Paris (1878), Bologna (1881) and London (1888). Among his published books are 'Chemical and Geological Essays' (Boston 1875); 'Coal and Iron in Southern Ohio, etc.' (Boston 1881); 'Mineral Physiology and Physiography' (Boston 1886); 'New Basis for Chemistry' (New York 1887; Paris 1889); 'Systematic Mineralogy' (New York 1891). Some 400 papers of varying length, published in scientific journals of the United States, Canada, England, France and Germany, attest to his remarkable industry. Consult Douglas, J. B., 'T. S. Hunt' (in

*American Philosophical Society, Proceeding, Memorial* Vol. I, p. 63, Philadelphia 1900); Frazer, P., 'T. S. Hunt' (in *American Geologist*, Vol. XI, Minneapolis 1893); Laflamme, J. C. K., 'Le Docteur T. S. Hunt' (Quebec 1892).

**HUNT, William Henry**, English water-color painter: b. London, 28 March 1790; d. 10 Feb. 1864. Born of poor parents and crippled in childhood, Hunt became the pupil of John Varley, the landscape painter. He exhibited three paintings in oil in 1807; but later painted exclusively in water-color, becoming an associate of the Water-Color Society in 1824 and full member three years later. He painted genre and still life with great delicacy and variety of color, so that Ruskin in his criticism has these words of praise for him: "He was, take him for all in all, the finest painter of still life that ever existed." His humor, accuracy and technical expertness made his genre scenes particularly popular. Of these the best known are 'Boy and Goat'; 'The Card Players'; 'Too Hot'; 'Plums, Primroses and Birds' Nests.' Hunt ranks high in the group of founders of the English school of water-color painters. He lived for the best part of his life at Hastings.

**HUNT, William Henry**, American lawyer: b. New Orleans, La., 5 Nov. 1857. He was educated at Yale; became attorney-general of Montana in 1884; and held various public offices there after Montana became a State. He was for a time United States agent before the Chilean Claims Commission, but resigned that post in 1900 to become secretary of Porto Rico, and from 1901 to 1904 was governor of the island. He then became United States district judge for Montana; from 1910-11 was associate judge of the United States Court of Customs Appeal, and from 1911-14 served as associate judge of the United States Commerce Court.

**HUNT, William Holman**, English painter of religious subjects: b. London, 2 April 1827; d. there, 7 Sept. 1910. He studied at the Royal Academy in 1845, and next year exhibited his first picture, 'Hark!' representing a child holding a watch to her ear. His early years as an artist were spent in great poverty. About 1848 Hunt, D. G. Rossetti and J. E. Millais formed the Pre-Raphaelite Brotherhood, afterward enlarged by the admission of other painters and writers, and which attained a position of great influence through the eloquent support of Ruskin. Each of the three founders exhibited in 1849 a picture painted in strict accordance with the principles of the Brotherhood. Hunt's picture represented 'Rienzi Vowing to Obtain Justice for the Death of His Younger Brother,' and was exhibited at the Royal Academy. The exhibition of 1854 included two of his greatest pictures, one of them the well-known 'Light of the World,' now in Keble College, Oxford, and a life-size copy in Saint Paul's, London. Both it and 'The Awakening Conscience' are characterized by the careful draughtsmanship and attention to detail which form notable features of the best Pre-Raphaelite work, but their full meaning is far from clear to the average spectator. In 1854 Hunt went to Palestine in order to obtain a living acquaintance with the scenes

of the Biblical stories, and the first fruits of his study of Eastern life was 'The Scapegoat' (1856), one of his most original and most poetical works; but much finer is his 'Finding of the Saviour in the Temple,' exhibited in 1860. Among subsequent works of Hunt's are 'A Street Scene in Cairo—the Lantern-Maker's Courtship' (1861); 'Portrait of D. G. Rossetti' (1850); 'Fairlight Downs' (1858); 'The After-Glow in Egypt' (1865), "that modern masterpiece of technical art"; 'Isabella, or the Pot of Basil' (1868), based on the well-known story from Boccaccio utilized by Keats, and in respect of coloring the finest of the artist's works; 'The Shadow of Death' (1873), showing a prevision of the Crucifixion in the carpenter shop where Jesus is working beside His mother; 'The Triumph of the Innocents' (1885), one of his masterpieces; 'Christ among the Doctors' (1860). In 1857 he received only one vote when put up as an associate of the Royal Academy and afterward set his face against academic honors; but he was awarded the coveted Order of Merit in 1905. His talents were consecrated to the depiction of sacred subjects, which are chosen with great attention to detail. Consult his 'Pre-Raphaelitism and the Pre-Raphaelite Brotherhood' (2 vols. 1905); the biographies or studies by Coleridge (1908); Farrar and Meynell (1893); Stephens, F. G., 'William Holman Hunt and His Works' (1905); and Bayliss, 'Five Great Painters of the Victorian Era' (1902).

**HUNT, William Morris**, American painter: b. Brattleboro, Vt., 31 March 1824; d. Isles of Shoals, 8 Sept. 1879. In 1840 he entered Harvard University, but ill health obliged his removal before completion of the course. He traveled in Europe, studied at Paris under Couture and subsequently came under the influence of Jean Francois Millet. Hunt introduced the Barbizon School to America after his return home in 1855. Settling in Boston, he was very successful as an art teacher; painted several pictures reminiscent of his French travels and in general turned American aspirants in art toward France. His best works are 'Sheep-Shearing at Barbizon'; 'The Fortune-Teller'; 'The Prodigal Son'; 'The Farmer's Return'; 'Girl with Kitten'; 'Girl Reading'; 'Marguerite'; 'Hurdy-Gurdy Boy.' He is well represented in the Boston Museum. The Metropolitan Museum, New York, contains his 'Girl at a Fountain'; 'A Landscape'; 'The Bathers' and other examples. Among his portraits are those of Chief Justice Shaw, Mrs. F. G. Ward, Mrs. Charles Francis Adams, Mrs. F. W. Long, William H. Gardiner, William M. Evarts, Horace Gray. The Albany capitol contained colossal decorations by Hunt which were later either covered or removed. He published 'Talks about Art' (London 1878). Consult Knowlton, H. M., 'The Art Life of William Morris Hunt' (Boston 1899); and Isham, Samuel, 'History of American Painting' (New York 1903).

**HUNTER, David**, American soldier: b. Washington, D. C., 21 July 1802; d. there, 2 Feb. 1886. He was graduated at West Point in 1822, became captain in 1833, and resigning from the army in 1836 settled in Chicago. He, however, re-entered the army in 1842 as paymaster with the rank of major, and in May 1861 was

appointed brigadier-general of volunteers, and a few months later major-general. He recruited and organized in South Carolina the first negro regiment in the Union army. In 1863 his manumission of the slaves in Florida, Georgia and South Dakota was annulled by the President. He defeated the Confederates at Piedmont, 5 June 1864, and was chairman of the military commission which tried the conspirators engaged in the assassination of President Lincoln. He was brevetted major-general in the regulars 1865, and retired in 1866.

**HUNTER, Edward**, American soldier: b. Gardiner, Me., November 1839. He was graduated from West Point in 1865, and was commissioned second lieutenant in the 12th Infantry, and a few months later, first lieutenant. He served as aide-de-camp to General Getty at Santa Fe, N. M., in the operations against the Arapahoe and Cheyenne Indians. In 1870 he was transferred to the 1st Cavalry; and for subsequent meritorious services in California, Nevada, Washington and Montana was commissioned captain. In 1888 he became major and was appointed judge-advocate in the division of the Pacific and the Department of California (1889-95). He was made lieutenant-colonel and deputy judge-advocate in the Department of Dakota (1895-98). In the last-named year he accompanied General Brooke as judge-advocate in Porto Rico. He occupied a similar office in the Department of the East a few years later, and was officially retired in 1903.

**HUNTER, George Leland**, American author and expert on interior decorating: b. Bel-lingham, Mass., 8 May 1867. He was graduated at Harvard in 1889, and devoted many years to the study of furniture and textiles. His publications include 'Tapestries, their Origin, History and Renaissance' (1912); 'Home Furnishings' (1913); 'The House That Jack Built' (1914); 'Italian Furniture and Interiors' (1917); 'Decorative Textiles' (1918). Mr. Hunter was also decorative art editor of the 'New International Encyclopedia,' and has organized exhibits of tapestries at various museums.

**HUNTER, John**, British surgeon and physiologist: b. Long Calderwood, Lanarkshire, 13 Feb. 1728; d. London, 16 Oct. 1793. He was a younger brother of William Hunter (q.v.). In 1749 and 1750 he studied surgical pathology at Chelsea Hospital, London, and already began to make original observations; which his subsequent experience confirmed. In 1754 he was entered as a surgeon pupil at Saint Georges Hospital; and in 1754 or 1755 he was admitted to a partnership in his brother's school of anatomy, and continued to lecture there till 1759. He served as staff-surgeon in France and Portugal 1760-63, and then returned to London and commenced practice as a surgeon. In 1767 he was elected a member of the Royal Society, and in 1768 was appointed surgeon to Saint George's Hospital. His investigations at this time extended over every branch of natural history, particularly pathology, comparative anatomy and physiology, to which he devoted his entire leisure time. In 1790 he was appointed inspector-general of hospitals and surgeon-general to the army. Hunter left at his death a museum which he had built for himself, and filled with

upward of 10,000 preparations illustrative of the departments of science to which his attention had been devoted. It was afterward purchased by government and presented to the Royal College of Surgeons. His leading works are the 'Natural History of the Human Teeth' (1771); 'Treatise on the Venereal Disease' (1786); 'Observations on Certain Parts of the Animal Economy' (1786); 'Treatise on the Blood, Inflammation and Gun-shot Wounds' (1794). The complete works, edited by Palmer, were published in 1838.

**HUNTER, Peter**, Canadian administrator and soldier: b. Scotland, 1746; d. Quebec, 1805. He served in the Revolutionary War and rose to the rank of lieutenant-general and commander-in-chief of the forces in British North America (1799). In this capacity he was also appointed successor to Gen. John Graves Simcoe as lieutenant-governor of Upper Canada. His administration was severely criticized because of his neglect of civil and preference for military duties. Reforms instituted by him were improvements in the system of representation and the trade agreements between the United States and Upper Canada. Later critics have given more favorable estimates of Hunter, laying emphasis on his fair-mindedness and capability in face of the great difficulties involved in the administration of a poorly organized and not wholly responsible government.

**HUNTER, Robert**, British colonial governor of New York and Jamaica: d. 1734. He was of an Ayreshire family, and entered the military service. He fought at Blenheim and became colonel of dragoons. In 1707 he was made lieutenant-governor of Virginia, but was captured by the French en route and was held prisoner until his captors found it expedient to exchange him for the bishop of Quebec. Three years later he returned to America with a group of German Protestants who had sought escape from persecution in England. Colonel Hunter remained as governor of New York for nine years, during which time he was continuously occupied with dissensions with the colonial assemblies. He returned to England in 1719, and remained a short while, when he was sent out as governor of Jamaica and major-general of the troops stationed there. He fulfilled these commissions very ably.

**HUNTER, Robert Mercer Taliaferro**, American statesman: b. Essex County, Va., 21 April 1809; d. 18 July 1887. He was graduated at the University of Virginia, and, choosing the law for his profession, commenced practice in 1830. He soon began to take an active part in politics, and at 24 was elected to the house of delegates, where he remained until 1837, when he was elected to Congress. In the discussions growing out of the commercial convulsion of that year, he at once took his stand on the side of the administration in favor of the independent treasury bill, and in his first speech developed those principles of free trade to which he consistently adhered throughout his public career. In the succeeding Congress he was elected to the speakership; and at the close of his term of service, the usual vote of thanks was passed without a dissenting voice, in a House of Representatives strongly marked by partisan bitterness. At the election in the spring of 1843 for members of the 28th Congress,

Hunter was defeated by a small majority, mainly on account of his adherence to that clause of the independent treasury scheme requiring all dues to the government to be paid in specie. At the next Congressional election in 1845, he was successful. In 1846 Hunter, in common with other southern representatives, resisted the application of the Wilmot Proviso. He voted for all the measures necessary to prosecute the war to a just and honorable conclusion, but altogether opposed the project, favored by some, of incorporating the whole of the Mexican states into our political system. He represented Virginia in the Senate, 1847-61. He was active in framing the Tariff Act of 1857, and after leaving the Senate became the Confederate Secretary of State. At a later period he was a Confederate senator, and in 1865 commissioner of peace. He became treasurer of Virginia in 1877, and retired from public life in 1880. Consult the memoir by M. T. Hunter (1903).

**HUNTER, William**, British anatomist: b. Long Calderwood, 23 May 1718; d. London, 30 March 1783. After studying at Glasgow University 1732-37, and subsequently medicine at Edinburgh, he went to London in 1741, and in 1746 received the appointment of lecturer on anatomy to a society of naval surgeons. In 1747 he became a member of the College of Surgeons and practised surgery and midwifery, but at length confined himself entirely to the latter, and was appointed accoucheur to the British Lying-in Hospital. In the first volume of 'Observations and Inquiries,' published by the Medical Society in 1757, appeared Hunter's 'History of an Aneurism of the Aorta.' In 1762 he published 'Medical Commentaries,' and in 1764 was appointed physician-extraordinary to the queen. In 1768, on the establishment of the Royal Academy of Arts, he was appointed professor of anatomy. The most elaborate of his publications, the 'Anatomy of the Human Gravid Uterus,' appeared in 1774. In 1770 he purchased and completed a house and theatre, in which he constituted a splendid museum. At first he only contemplated a collection of preparations in human and comparative anatomy, but added a collection of shells, corals and other objects of natural history, paintings and ancient coins and medals. He bequeathed the whole of his splendid museum, valued at £150,000, to the University of Glasgow, with the sum of £8,000 in cash to be expended in an appropriate building for its reception, and a further sum of £500 per annum to bear the charges of its preservation.

**HUNTER, Sir William Wilson**, English statistician and author: b. Glasgow, 15 July 1840; d. 1900. He was educated at the University of Glasgow and foreign universities and appointed to the Bengal Civil Service in 1862. As director-general of statistics he made a statistical survey of India, the results of which are embodied in the well-known *Imperial Gazetteer of India* (1881; 1885-87). He also published 'Annals of Rural Bengal' (1868; 5th ed., 1872), continued in 'Orissa' (1872); 'The Life of the Marquess of Dalhousie' (1890); 'A Dictionary of the Non-Aryan Languages of India and High Asia' (1868); 'Brief History of the Indian Peoples' (1880; enlarged ed. as 'The Indian Empire' (1895), which has been

translated into five languages, and was editor of the series of biographies known as 'The Rulers of India.' He was knighted in 1887.

**HUNTER-BLAIR, Oswald** (SIR DAVID HUNTER-BLAIR, 5TH BARONET), Scottish clergyman: b. Dunksey, Scotland, 30 Sept. 1853. He was educated at Eton and at Magdalen College, Oxford. Entering the army he was commissioned in the Prince Regent's Royal Ayrshire Militia, becoming captain in 1876. He was converted to Roman Catholicism in 1875 and three years later became a member of the Benedictines. He was ordained to the priesthood in 1886, and from 1890 to 1895 was rector of the Abbey School at Fort Augustus. In 1896 he succeeded to the baronetcy on the death of his father. From 1899 to 1909 he was master of Hunter-Blair's Hall, Oxford, and since 1913 has been abbot of Saint Benedict's Abbey, Fort Augustus, Scotland. He was a private chamberlain to the late Leo XIII and spent some time in Brazil employed in educational research for his order. He published 'Jerusalem of To-day'; 'Catholics at the National Universities'; 'Oxford as It Is'; 'History of the Catholic Church in Scotland,' a translation of the 'Geschichte der katholischen Kirche in Schottland' of Bellesheim; 'Holy Rule of St. Benedict,' and contributions to the *Tablet*, the *Weekly Register*, the *New Era*, the *Glasgow Observer* and 'The Catholic Encyclopedia.'

**HUNTER COLLEGE.** See NORMAL COLLEGE.

**HUNTING**, the pursuing of wild animals as a sport. Hunting for the market is termed pot-hunting. Among sportsmen certain conventionalities obtain, and the hunter who does not observe these unwritten rules is stigmatized as unsportsmanlike.

Within comparatively recent years the indiscriminate slaughter of wild game has moved the devotees of the sport of hunting to insist upon such regulations, statutory or self-imposed, as shall protect game birds and animals from extinction, and afford them a "sporting chance" to escape an unskilful hunter. In the extension of this idea many sportsmen of the higher type deliberately reduce their chances of killing the game by substituting the rifle with its one missile for the shotgun with its widely scattering scores of deadly pellets. What may be called the "new thought" among American sportsmen is well expressed in the "Sportsman's Platform," adopted by "The Camp-Fire Club of America" in 1909 as an official code of hunting ethics. It may be epitomized by "planks" 12 and 13, which declare: "The killing of an animal means the end of its most interesting period. When the country is fine, pursuit is more interesting than possession. The best hunter is the man who finds the most game, kills the least, and leaves behind him no wounded animals."

The complete disappearance from the United States of several kinds of game birds and animals which formerly were abundant and the depletion of other species to almost the point of extinction has united the sportsmen of the country in an effort to check the further ravages of the pot-hunter and those who find their pleasure in wholesale slaughter. As one instance of the danger of unrestrained "gun-

ning" in areas where game is plentiful the following figures taken from a report of the State Game Commission of Louisiana for the season 1909-10 are enlightening. While it is stated that the record can be regarded as only approximate, it shows the killing of 3,176,000 wild ducks, 1,140,750 quail and 1,402,474 other game birds; 5,470 deer, 690,270 squirrels and rabbits and 1,971,922 other fur-bearing animals—a total for one season for that State alone of 8,386,876 game birds and animals. Most of the "hunters" who bagged this game were hired men sent into the State by wholesale dealers in game in distant markets.

With such incentives to action to prevent the total destruction of the wild life of the country sportsmen have worked actively to have suitable game laws passed in the several States, urging especially the protection of closed seasons for appropriate terms of years, in order to give vanishing species a chance to multiply again to such numbers that a surplus could be spared without danger of extinction. A lack of uniformity in the State laws, however, has been a serious obstacle to the success of a country-wide plan. Within recent years the Department of Agriculture in the exercise of its authority over migratory birds has aided to a considerable degree the preservation of several species which were subjected to indiscriminate slaughter both while going north to their nesting places and on the return trip to their winter habitat. There have been established also by Presidential executive orders a number of bird refuges which have served to stem the tide of unreasoning destruction. But much remains to be accomplished, and the struggle is still on between those who would save the game, and with it the sport of hunting, and those who would heedlessly and selfishly destroy both the game and the sport.

Dr. William T. Hornaday, the well-known hunter-naturalist, designates as the principal remaining game areas in North America: the Arctic prairies north of the tree limits; the Alaska-Yukon region; the northern extensions of the Canadian provinces, Ontario and Quebec; Labrador and Newfoundland; British Columbia, and the Sierra Madre of Mexico. In 1912 the hunting grounds in and near the United States and southern Canada where big game may still be found in numbers which permitted hunting without danger of extermination were:

The Maine Woods — for white-tailed deer.  
New Brunswick — for moose, caribou, deer and black bear.

The Adirondacks — for white-tailed deer.

The Pennsylvania Mountains — for deer and black bear.

Northern Minnesota — for deer and moose.

Northern Michigan and Wisconsin — for white-tailed deer.

Northwestern Wyoming — for elk, deer, grizzly bear and black bear.

Western and Southwestern Montana — for elk, mule deer and white-tailed deer.

Northwestern Montana — for mule deer and white-tailed deer.

Wyoming east of the Yellowstone Park — for elk, deer and two species of bear.

Woods of Northern Ontario and Northern Quebec — for moose and deer.

Southern British Columbia — for mountain goat, mountain sheep, deer and grizzly bear.

Northern British Columbia — for moose, elk, bighorn sheep, grizzly bear and black bear, mule deer and white-tailed deer.

Northwestern Alberta — for grizzly bear, bighorn sheep and mountain goat.

The hunting of large game, as bear, deer, tigers, lions, leopards, etc., will be found treated under the titles by which they are described. In Europe the various modes of shooting game are known as open shooting, covert shooting, river and pond shooting and salt-water wild fowl shooting. See DEER STALKING; FOX HUNTING; GAME LAWS; GAME PRESERVES, ETC.

**HUNTING LEOPARD.** See CHEETA.

**HUNTINGDON, Selina Hastings,** COUNTESS OF, English Methodist leader: b. 24 Aug. 1707; d. 17 June 1791. She was married in 1728 to the Earl of Huntington and on his death in 1746 became very devout, appointing the famous George Whitefield (q.v.) her private chaplain. Adopting the principles of the Methodists, she was long considered, owing to her rank and fortune, as the head of the Calvinistic Methodists, her followers being known as the "Countess of Huntington's Connection." She founded a college at Trevecca in Wales for the education of ministers, built some 64 chapels and contributed liberally to their endowment and to the support of the clergy. Consult New, A. H., 'The Coronet and the

Cross, or Memorials of Selina, Countess of Huntingdon' (London 1857); Tytler, S., 'Countess of Huntingdon and Her Circle' (London 1907).

**HUNTINGDON**, England, a municipal borough, capital of Huntingdonshire, situated on the Ouse, 59 miles north of London, and served by the Great Northern, Great Eastern and Midland railways. The town was originally settled by the Saxons, and was the seat of a royal castle built in the 10th century. It was chartered in 1189. It is connected by bridge with Godmanchester. Huntingdon is famous principally as the birthplace of Oliver Cromwell, whose birth is registered in the books of the old parish church of Saint John. His house is still standing. Pop. 4,000. Consult Griffith, Edward, 'A Collection of Ancient Records relating to the Borough of Huntingdon' (1827).

**HUNTINGDON**, Pa., borough, county-seat of Huntingdon County, on the Juniata River, and on the Pennsylvania Railroad, about 200 miles west of Philadelphia. Where Huntingdon is located was once a famous council ground for the Indians of the central part of Pennsylvania, now marked by the "Standing Stone Monument" erected at the centenary celebration. It was first settled by white people in 1760 and was chartered in 1796. The country around is a fertile agricultural region, with valuable mineral deposits and quite extensive forests. The chief manufactures are boilers, machinery, radiators, sewer-pipe, flour, furniture, stationery, knit goods and stoves and there is an important trade in grain and fruits. Huntingdon is the seat of the State Industrial School and of Juniata College, an institution opened in 1876 under the auspices of the German Baptist Brethren. The original charter is still in force and provides for a chief burgess, who holds office three years, and a council. Pop. 6,861.

**HUNTINGDONSHIRE**, England, an east-midland county, bounded on the east by Cambridgeshire, on the west and north by Northamptonshire and on the south by Bedfordshire. Area, 366 square miles, of fertile rolling valley. The chief streams are the Ouse and the Nene; the Kym joins the Ouse at Saint Neots. Agriculture is the principal occupation of the county, about nine-tenths of the entire area being under cultivation, or used for pasturage. Wheat, barley, beans, peas, fodder, cabbage and mangold are raised, and there is also considerable truck-farming, bee-cultivation and cattle raising; and some dairy-farming. The manufactures consist of paper and parchment, brick tile and ale. Railways traversing the country are the Great Northern, the Great Eastern and the London and North-Western. The chief cities are Godmanchester (Pop. 2,000); the capital, Huntingdon (Pop. 4,250) and Saint Ives (Pop. 3,000). The county is rich in historical remains, some of which date back to Roman times. Huntingdonshire was settled by an East Anglian tribe in the early 6th century and has shared in the vicissitudes of the struggles between the Anglians and Mercians; the Danes and the Saxons. Pop. 56,000.

**HUNTINGTON**, Archer Milton, American author: b. New York, 10 March 1870. He

received his education in New York and in Spain, and became deeply interested in Spanish archæology. Dr. Huntington is known chiefly in the United States as the founder and first president of the Hispanic Society of America. Under his auspices, the society became a flourishing organization; for, besides endowing it heavily, he gave it a building, splendid collections and library. Yale awarded him the degree of honorary A.M. in 1897, and Harvard in 1904; Columbia, the degree of Litt.D. in 1907. Besides numerous criticisms and magazine articles, he is the author of 'A Note Book in Northern Spain' (1898), and 'Sonnets' (1908); and editor of 'Lady Aulnoy's Travels into Spain' (1899); 'The Poem of the Cid' (3 vols., text, translation and notes, 1897) and numerous Spanish textbooks.

**HUNTINGTON**, Collis Potter, American capitalist: b. Harwinton, Conn., 22 Oct. 1821; d. Pine Knot Camp, near Lake Raquette, N. Y., 13 Aug. 1900. He worked on his father's farm, until his 14th year. In his 16th year he procured credit in New York for \$3,000 worth of clocks and traded them through the South and West. He then, together with one of his brothers, set up as a general merchant at Oneonta, N. Y., where he prospered immediately. He shipped goods to California in 1848; followed them in person in 1849 by way of the Isthmus where he was detained for three months on account of the overcrowded conditions. During this time he used his small capital to such good purpose that he increased it from \$1,200 to some \$5,000. He then took ship to California and began to make his fortune in the hardware business, soon becoming associated with Mark Hopkins (q.v.). In 1860 he matured a plan for a transcontinental railroad in conjunction with Leland Stanford, Charles Crocker and Mark Hopkins. The Central Pacific was finished in 1869. This was the crowning achievement of his life and at his death the railroad system known as the Southern Pacific, of whose managing board he was president, comprised 26 corporations, with more than 9,000 miles of tracks and 5,000 miles of steamship line. Another achievement was the upbuilding of the Chesapeake and Ohio Railroad and the accompanying marvelous development of Newport News, Va. He was one of the largest landholders in the country and his fortune was estimated at \$35,000,000. He built a granite church, to the memory of his mother, in his native town; gave C. W. Peale's portrait of Washington to the New York Metropolitan Museum; a library and reading-room to Westchester, N. Y.; materially aided in building and equipping Hampton (Va.) Normal Agricultural Institute; and gave \$50,000 for the endowment of Tuskegee (Ala.) Normal and Industrial Institute. He was one of the foremost art collectors of his time, leaving a magnificent collection of paintings, valued at \$3,000,000 to the New York Metropolitan Museum, the bequest to become operative after the death of his wife and adopted son. Consult Anon., 'C. P. Huntington' (in *Review of Reviews*, Vol. XXII, p. 325, New York 1900).

**HUNTINGTON**, Daniel, American painter: b. New York, 14 Oct. 1816; d. there, 18 April 1906. He was educated at Hamilton College, where he made the acquaintance of Charles

L. Elliott, from whom he received a decided bias for his art. In 1835 he entered the studio of Professor Morse, president of the National Academy of Design and soon after produced the 'Bar-room Politician'; 'A Toper Asleep,' besides some landscapes and portraits. In 1839 he went to Europe and in Florence painted the 'Sibyl' and the 'Florentine Girl.' Removing to Rome soon after, he painted the 'Shepherd Boy of the Campagna,' and 'Early Christian Prisoners,' both of which were purchased by New York collectors. In 1845 he returned to New York. He became a member of the National Academy in 1840 and was its president in 1862 and 1869, and continuously from 1877 to 1891. He devoted himself mainly to portraits and among portraits by him of well-known people are those of Presidents Lincoln and Van Buren and of Sir Charles Eastlake. His noted 'Mercy's Dream' is now in the Corcoran Gallery at Washington.

**HUNTINGTON, Ellsworth,** American explorer and author: b. Galesburg, Ill., 16 Sept. 1876. After receiving his B.A. from Beloit College, he became president's assistant and instructor at Euphrates College, Harput, Turkey (1897-1901). His first tour of exploration was along the canons of the Euphrates River in 1901. Returning to the United States, he was research assistant at the Carnegie Institution, Washington; and from 1903-04 was a conspicuous member of the Pumpelly expedition to Russian Turkestan. From 1905-06, he traversed Chinese Turkestan with the Barrett expedition. He taught at Yale University subsequently, becoming assistant professor (1910-15), and research associate since 1917. Other noteworthy explorations conducted by Huntington were to the Syrian Desert, Palestine and Asia Minor (1909); and for investigations of climatic conditions in the United States, Mexico and Central America (1910-13). He received his degree of M.A. from Harvard (1903) and his Ph.D. from Yale (1909). Dr. Huntington is associate editor of the *Bulletin* of the American Geographical Society and the *Journal of Race Development*. Various geographical and ethnological societies have distinguished him by medals and election to their membership. He is author of 'Explorations in Turkestan' (1905); 'The Pulse of Asia' (1907); 'Palestine and its Transformation' (1911); 'Asia—a Geography Reader' (1912); 'The Climatic Factor as Illustrated in Arid America' (1914); 'Civilization and Climate' (1915); 'Human Geography' (1917).

**HUNTINGTON, Frederic Dan,** American Protestant Episcopal bishop: b. Hadley, Mass., 28 May 1819; d. Hadley, Mass., 11 July 1904. He was graduated at Amherst in 1839, and studied three years in the divinity school of Cambridge. In 1842 he was ordained pastor of the South Congregational (Unitarian) Church in Boston, which he left in 1855 after a highly successful pastorate to become the first occupant of the college pulpit and Plummer professor of Christian morals at Harvard. During these years he was also a highly successful lecturer on the lyceum platform, a form of popular education then at its height. He spoke on philosophical, historical and theological subjects and his eloquence was as impressive there as in the pulpit or the classroom.

From 1847-51 he edited the *Christian Register* and from 1845-59 the *Monthly Religious Magazine*. In 1860 he resigned and took orders in the Episcopal Church, founding Emmanuel Church, Boston, and serving as its rector 1861-69. In April 1869 he was consecrated bishop of Central New York with residence at Syracuse. He has published 'Sermons for the People' (1856); 'Christian Believing and Living' (1859); 'Divine Aspects of Human Society' (1859); 'Helps to a Holy Lent' (1872); 'New Helps to a Holy Lent' (1876); 'Fitness of Christianity to Man: Bohlen Lectures' (1877); 'Christ in the Christian Year' (2 vols., 1878); 'Forty Days with the Master' (1892), etc. Consult Huntington, A. S., 'Memoir and Letters of F. D. Huntington' (Boston 1906).

**HUNTINGTON, Lucius Seth,** Canadian statesman: b. Compton, province of Quebec, 1827; d. New York, 1886. He was elected to the Canadian Parliament in 1861 and was solicitor-general for Canada East 1863-64. In 1873 he moved in the House of Commons for inquiry into the alleged corrupt practices in connection with the proposed transcontinental railway, afterward called the "Pacific Scandal." He held office in the Mackenzie administration from 1874-78 and retired from public life in 1882. He was the author of a novel on English and American political life, 'Professor Conant.'

**HUNTINGTON, Margaret Evans,** American educator: b. Utica, N. Y., 9 Jan. 1842. In 1869 she was graduated at Lawrence University and subsequently studied at Berlin, Paris, Heidelberg and Oxford. In 1874 she began her connection with Carleton College as professor of English literature and dean of the women's department. After 1879 she served as president of the Minnesota Congregational Board of Missions and from 1885 to 1899 of the Minnesota Federation of Womens' Clubs. She was also chairman of the Minnesota Public Library Commission and was the first woman member of the American Board of Commissioners for Foreign Missions of the Congregational Church. In 1908 she was elected honorary vice-president for life of the General Federation of Womens' Clubs. In 1914 she married the Rev. George Huntington. She has published several addresses and the volume entitled 'Woman as Citizen.'

**HUNTINGTON, Samuel,** American jurist: one of the signers of the Declaration of Independence: b. Windham, Conn., 3 July 1731; d. Norwich, Conn., 5 Jan. 1796. Although at first intended for a farmer and merchant he managed to study law and soon became a successful lawyer at Norwich, Conn. From 1765-74 he was king's attorney; from 1775-83 associate justice of the Superior Court of Connecticut, of which he became chief justice in 1784. In 1764 he began service in the general assembly, advancing in 1775 to the senate or governor's council. In spite of this long service as an officer of the Crown, his sympathies were strongly on the side of the colonists and, in January 1776, he entered the Continental Congress as a delegate from his native State. In September 1779 he succeeded John Jay as president of Congress and discharged the functions of that office until July 1781 when he resumed his seat on the Connecticut bench. He served again in Congress from May to June,

1783, and in the succeeding year was appointed chief justice of the Superior Court of Connecticut. In 1785 he was elected lieutenant-governor of Connecticut and in 1786 he succeeded Roger Griswold as governor, to which office he was annually re-elected until his death. Consult Huntington, S., 'S. Huntington' (in *Connecticut Magazine*, Vol. VI, p. 247, Hartford 1900).

**HUNTINGTON, William Edwards**, American university president: b. Hillsboro, Ill., 30 July 1844. He served in the Civil War as private in the 40th, and first lieutenant in the 49th Wisconsin Infantry. After the war, he studied at Wisconsin University, and prepared himself for the ministry, being ordained in the Methodist Episcopal Church in 1868. He held pastorates at Nahant, Mass. (1870-71); Roslindale (1872-74); Newton (1875-76); Cambridge (1877-79); Boston (1880-82). He received the degree of Ph.D. at Boston University in 1881, and in the following year became dean of the College of Liberal Arts. From 1904-11 he was president of that university, and dean of the graduate department (1911-17).

**HUNTINGTON, William Reed**, American Episcopal clergyman: b. Lowell, Mass., 20 Sept. 1838; d. 1909. After graduation from Harvard in 1859 he took orders in the Episcopal Church, was assistant at Emmanuel Church, Boston, 1861-62, rector of All Saints, Worcester, Mass., 1862-63, and from 1883 until his death was rector of Grace Church, New York. He was prominent in the councils of the Episcopal Church, an acknowledged leader of the Broad Church school of thought and author among other works of 'A National Church' (1898); 'Sonnets and a Dream' (1904).

**HUNTINGTON, Ind.**, city, county-seat of Huntington County, on the Little River, and on the Chicago and Elkhart, the Wabash, C., B., & C. railroads, and the Fort Wayne-Northern Indiana Traction Line, about 26 miles southwest of Fort Wayne and 70 miles southeast of South Bend. It was settled in 1834, incorporated as a town in 1848 and received its charter in 1873. Its chief manufactures are boots and shoes, pianos, lime, cedar chests, furnaces, rubber specialties and railroad cranes. It has railroad shops and wood-working factories. The trade, in addition to the manufactures, is from crushed stone, lime-kilns near by and agricultural products. It is the seat of the United Brethren College. The public library has over 30,000 volumes. The city owns and operates the electric-light plant and the water-works. A commercial association of over 500 members is maintained. Pop. 15,106.

**HUNTINGTON, N. Y.**, town in Suffolk County on Long Island. It is on Long Island Sound and on the Long Island Railroad. Huntington originally included the village of Babylon and other adjoining places. As first laid out, the area was 150 square miles. The first settlement was made in 1653, and the first deed of land given to actual settlers was made on 2 April 1653, on behalf of the Matinecock tribe of Indians, and conveying to the whites six square miles between Cold Spring and Northport. The consideration paid was six coats, six kettles, six hatchets, six "howes," six shirts, 10 knives, six fathoms of wampum, 30 "muxes," and 30 needles. Additional lands were pur-

chased in 1656-58. The early settlers were nearly all Puritans from England. The inhabitants of Huntington were among the first of the colonists to protest against "taxation without representation." From the first agriculture was the chief occupation; but trade with the West Indies began at an early date. In 1675 Thomas Fleet was listed as owning 40 vessels. Whales were often caught along the south coast. Nathan Hale (q.v.) was captured in Huntington. The place of capture is marked by a boulder, a shaft and a drinking fountain. The town celebrated its 250th anniversary on 4 July 1903. Large market gardens are in parts of the town, but much of it is a favorite residential suburb of New York. Pop. 15,357.

**HUNTINGTON, W. Va.**, city and capital of Cabell County, on the Guyandotte Valley, the Chesapeake and Ohio and the Baltimore and Ohio railroads, and on the Ohio River, 300 miles southwest of Pittsburgh, and 160 miles northeast of Cincinnati. The city, named after the late Collis P. Huntington, was founded and incorporated in 1871. It is an important commercial and industrial centre and among its industrial establishments are the car manufacturing shops of the Chesapeake and Ohio Railroad, foundry and machine shops, lumber and planing mills, manufactures of woodwork, glass, stoves, bricks, pottery, ice, bottling and meat-packing establishments. The city is regularly laid out, has 64 miles of paved streets, water 99 plus pure, complete modern sewer system, average temperature 54.5. "Five Cent Gas" for manufacturing purposes—domestic 15 cents. Nine banks. The city is noted for its educational establishments, which includes Marshall College (the State Normal School), Saint Edward's College, numerous graded schools and a high school with a building that cost \$300,000. Commission form of government. Pop. 43,571.

**HUNTINGTON'S DISEASE**, hereditary chorea, a comparatively rare disease, commencing in middle life, was first described by Dr. George Huntington of New York in 1872. At times it is hard to distinguish from locomotor ataxia (q.v.). The offspring of adults thus affected are likely to have congenital or hereditary chorea.

**HUNTSVILLE, Ala.**, city and county-seat of Madison County, on the Nashville, Chattanooga and Saint Louis and the Southern railroads, 96 miles due north of Birmingham, 97 miles due west of Chattanooga, 125 miles south of Nashville and 210 miles east of Memphis. The city is located in the heart of the famous Tennessee Valley, and is surrounded by a large and fertile agricultural cotton, fruit and stock-raising country, making it an important commercial centre. As a cotton manufacturing point, its spindles lead the South, and is second only to Lowell, Mass. Its nine cotton mills have 203,000 spindles, with 4,374 looms, the annual product of which amounts to \$8,500,000 in sheet cloth, knitted goods, khaki cloth, drilling and printing cloth. These mills own 1,246 acres of land and have 34½ acres of floor space, support and maintain three Y. M. C. A. buildings, four libraries and trained nurses for the benefit of the employes. Besides these, Huntsville has machine and foundry shops, cottonseed-oil mills, hoop and heading factory, fibre and planing mills, brick plants, sanitary

dairy, mattress factory, broom factory, canning factory, wholesale grocery stores, wholesale seed store, wholesale millinery store, flour mills, bonded warehouses, private warehouses, carriage works, wholesale and retail lumber yards, cottonseed and fertilizer plants; one of the largest nurseries in the world, and one of the largest nursery sections in the United States. The annual pay-roll is \$2,018,100. The government of the city is by commission, this being one of the first cities of the State to adopt this form. The city has paved streets, gas and electric plants, electric car lines, paid fire department and municipal waterworks, with a daily capacity of 24,000,000 gallons. The city is well supplied with a number of private schools, and an excellent public city school with new modern building erected at a cost of \$25,000. Four miles north of the city is located the Alabama Agricultural and Mechanical College for Negroes. There are 11 churches, a city infirmary and other notable buildings, including Elks' home and theatre cost \$110,000, Y. M. C. A. cost \$75,000 and four banks.

The first settler here was John Hunt, a Virginian and a soldier of the Revolution, who came to the "Big Spring" in 1805, built his cabin, the first, nearby and in 1806 went back to Tennessee and brought his family, having lived in that State before coming to Alabama. In 1811 the town was incorporated by the Territorial legislature as Huntsville. The first State constitutional convention was held here 5 July 1819. The first legislature sat here and assembled on the first Monday in August 1820, and this was the first capital of Alabama. Pop. (1910) 7,611, but the city corporate limits have not been extended in 50 years; estimated population including suburbs and mill district is about 20,000.

**HUNTSVILLE**, Canada, a town in Muskoka County, about 150 miles north of Toronto on the Grand Trunk Railway. The waterworks and electric light plant are owned by the municipality. The chief manufactures are lumber, leather and machinery. Huntsville is also a well-known summer resort, attracting numerous visitors. Pop. about 2,500.

**HUNTSVILLE**, Mo., city and county-seat of Randolph County, on the Wabash Railroad, 150 miles northwest of Saint Louis and 122 miles northeast of Kansas City. It is situated in an agricultural and coal-mining region. Its principal industrial establishments are flour mills, machinery shops, rake and stacker factory. Its trade is chiefly in agricultural and mining implements, live stock and farm products. Pop. 2,247.

**HUNTSVILLE**, Tex., city, county-seat of Walker County, on the International and Great Northern Railroad, about 200 miles southeast of Austin and 72 miles north of Houston. The first settlement was made about 1835. It is in a fertile agricultural region in which cotton, one of the large crops, is the staple of trade. The chief manufactures are cotton goods, cottonseed oil, cigars, steam-engines, foundry products, agricultural implements, furniture, ice, corn-meal, and wagons. Here are the home and grave of Gen. Sam Houston, and the grave of H. Yokum, the first historian of

Texas, which are of historic interest; the main State Penitentiary, and the Sam Houston State Normal School are located in this city. Pop. 2,072.

**HUNYADY**, János, Hungarian statesman and soldier: b. about 1387; d. 11 Aug. 1456. Little is known of his early life, but while still a youth he entered the service of Sigismund. His prowess was recognized by that monarch and by his successor, Albert II. He was made royal councillor and received gifts of large estates. In 1438 he was made ban of Szöreny, on the border of Transylvania, a difficult post which necessitated constant vigilance to repel the Turkish incursions then at their high tide. During the civil war in which Hungary was engaged after Albert's death in 1439, Hunyady supported Ladislas III of Poland, defeated the Turks in several battles and in 1443 secured from them favorable terms of peace. After the battle of Varna, Hunyady was made regent during the minority of Ladislas Posthumus. He lost the decision over the Turks at Kossovo in 1448, was imprisoned by the Serbians for a short time when he was ransomed by the Magyars. In 1456 he successfully defended Belgrade against the hosts of Islam. The plague broke out soon after the Turks raised the siege and Hunyady fell a victim to its ravages. To Hunyady is due the repulse of the Turk and the saving of Western civilization. He was also a great military genius; was the first to raise a regular army in the modern sense; and the first to make general use of tactics and strategy. Consult Teleki, J., 'The Age of the Hunyadis in Hungary' (Perth 1857); Vambery, A., 'Story of Hungary' (New York 1894), de Chassin, J., 'Jean de Hunyad' (Paris 1859).

**HUON PINE** (*Dacrydium Franklinii*), a timber tree of Tasmania, of the order *Coniferae*. It grows in swampy land, chiefly along the upper Huon River, and attains a height of 75 to 100 feet. It is exceedingly valuable as timber, being used extensively in ship building, because of its close-grained quality.

**HUPA**, hoo'pa, an Indian tribe of Athabascan stock, inhabiting the Hupa Valley Reservation, California. Their original settlement was also in this locality, along the lower part of the Trinity River. They number about 650. Consult Goddard, P. E., 'Life and Culture of the Hupa' (University of California Publications, Vol. I, 1903).

**HUPEH**, hu'pā, China, a province in the central part, bounded on the north by Honan, east by Ngan-hui, south by Hunan and west by Shensi and Szech'uen. Irrigation and means of transportation are supplied by the Yang-tse River which traverses the southern part, and the Han, which, after many windings, joins the Yangtze Kiang at Hankow. Agriculture is extensively carried on, the principal products being cotton, wheat, tea, tobacco, beans and rape seed. The country is a level, marshy plain, with some mountains of the Ta-pa-shan and Fu-miu groups in the north. The principal ports are Hankau, Ichang and Shashi, and the capital is Wuchang on the Yang-tse, opposite Hankow. Hanyang on the Han has extensive iron and steel works, utilizing the products of the great coal fields and iron mines of the

province. Area, 71,410 square miles. Pop. (estimated) 21,260,000.

**HURA**, hū'ra, a genus of euphorbiaceous plants of which the best known is *Hura crepitans*, common in the West Indies and in the American tropics. The stalk contains a milky juice; the leaves are acuminate, thick and heart-shaped. The seeds are contained in a tough, large, woody capsule, shaped like an apple flattened at the ends, and are embedded in carpels, of which there are from 12 to 15, surrounding a common axis. From the use of the hollowed fruit as a sandbox, the plant became known as the "sandbox tree."

**HURLBUT**, Jesse Lyman, American Methodist Episcopal clergyman; b. New York City, 1843. After studying at Wesleyan University, he held successive pastorates at Newark, Montclair, Paterson, Bloomfield and other towns in New Jersey. He rendered important service in the Sunday school work of his community, was secretary of the Epworth League, and with Dr. J. H. Vincent was active in the superintendency of the Chautauqua Literary and Scientific Circle. From 1909-14 he was district superintendent of the Newark district. His publications include 'Manual of Biblical Geography' (1882); 'Outlines in Old Testament History' (1890); 'Our Church' (1902); 'Story of the Bible' (1905); 'Outline Studies in the New Testament' (1906); 'Teacher Training Lessons' (1908); 'Organizing and Building up the Sunday School' (1909); 'Traveling in the Holy Land Through the Stereoscope' (1913); 'The Superintendent's Helper' (1915); 'Story of the Bible for Boys and Girls' (1917); 'Story of the Christian Church' (1918).

**HURLEY**, Wis., town, capital of Iron County, on the Montreal River, at the State boundary, opposite Ironwood, Mich., 49 miles by rail east by south of Ashland, on the Chicago and North Western, the Milwaukee, Lake Shore and Western and the Wisconsin Central railroads. It is in a rich iron mining district and has saw-mills and considerable lumbering interests. Pop. 3,000.

**HURLING**, an ancient field sport, to which the modern game of hockey owes its origin. A field 150 × 84 yards is required, marked across at 21, 50 and 75 yards from either end. The goals at the ends are indicated by posts, 21 feet apart, connected by a crossbar at a height of eight feet. Twenty-one feet from each goal post is a point post, 16 feet high. The implements for the game are the ball, made with a cork centre, bound with wool and cased in leather, five inches in diameter and weighing seven ounces; and the hurley stick, similar to a short ice-hockey stick, held in the left hand. Teams are composed of 17 players. The object of the game is, as in hockey, to drive the ball between the opponent's goal posts. The ball, or "slitter" may be caught by the hand, but must be played with the stick. In a locked play, the ball may be moved with the foot. The game is played in Ireland, where it had great vogue formerly.

**HURON**, hū'rōn, an Indian tribe. See WYANDOT; INDIANS, AMERICAN.

**HURON**, S. D., city and county-seat of Beadle County, on the Chicago and Northwestern and Great Northern railroads; also on

the proposed line of the Duluth, Huron and Southern Railroad. Located at the centre of population for the State. Huron is surrounded by rich, fertile farms producing corn, alfalfa, hogs and cattle, also some dairy products and small grain. The city is a distributing point of considerable importance, being the division point of the Chicago and Northwestern roads going in all four directions, and is the home of the State Fair. Huron College, one of South Dakota's leading colleges, having \$500,000 endowment, is also located here. Huron has commission form of government. Pop. 6,112.

**HURON, Lake**, one of the Great Lakes on the boundary between the United States and Canada. Canada is on the north and east, Canada and Michigan on the south and Michigan on the west. It receives the waters of Lake Superior through the Saint Mary's River, and the waters of Lake Michigan through Straits of Mackinac, and discharges its waters through Saint Clair River into Lake Saint Clair (q.v.). Its general direction is northwest and southeast. It length is about 250 miles, its average width about 155 miles and its area 22,322 square miles. This area includes Georgian Bay and North Channel. It is 581 feet above the sea, the same as Lake Michigan, 21 feet below the level of Lake Superior. The depth of the waters beyond the land shelf is from 200 to 750 feet; and along the coast, from 20 to 60 feet. The waters of the whole lake are remarkably clear, and in the northern part cold. In summer the temperature of the surface varies from 52° to 58° and of the bottom from 42° to 52°.

The chief arm of the lake on the east coast is Georgian Bay, which indents Ontario; and on the west, Saginaw Bay, in Michigan. Other indentations on the west coast are Thunder, Presque Isle and Hammond bays. A number of short streams flow into the lake from Michigan, the largest of which are Thunder Bay, Au Sable and Black rivers. The lake receives from Canada a large amount of water from lakes Nipissing, Simcoe, Muskoka, and several other small bodies which discharge their waters through short rivers into Georgian Bay.

There are no large islands in the main body of the lake, but on the north and northeast shores are a number of small islands, composed chiefly of glacial deposits and limestone. Grand Manitoulin and Cockburn islands, together with several small islands, belong to Canada. Drummond, Mackinac and Bois Blanc islands belong to the United States. The long group of islands in the northeast are separated from the mainland of Ontario by North Channel. The greater part of the shore line is low and at one time the country on the west was well wooded. Regular terraces showing different water levels, deposits of fine sand and clay containing freshwater shells, extend inland fully 20 miles and at heights above the lake to 100 and 200 feet. These wide beaches show that at one time this lake, as the other lakes, must have been much larger than at present. The area of the whole basin of the lake, including the surface of the water, is about 74,000 square miles. Some picturesque cliffs along the southeastern coast rise to a height from 80 to 150 feet. The harbors are nearly all protected by breakwaters. The chief ports on the west coast are Cheboygan, Alpena, Tawas City, Bay City (at the head of Saginaw Bay) and Sandbeach. Mackinaw and

Saint Ignace, at the entrance to the Straits of Mackinac, are important ports. A railroad line from Detroit to Mackinaw is almost parallel with the west coast. There is an abundance of fish in this lake; one kind, the whitefish, is most important.

Violent storms, to which the lake is subject, make navigation dangerous. During the summer months, from the first of May to December, there are but few storms. Lake Huron as a factor in commercial enterprises is most important; it is one of the great waterways of the world, and the shipping on its waters is growing in amount and importance. The great bulk of the iron ore from the Lake Superior district is now brought to the Cleveland and Pittsburgh districts; the wheat and flour from the Northwest comes east, and nearly all are carried over Lake Huron; and a large proportion of the products of the East which are sent to the Northward pass over this same lake. The Saint Mary's Falls Canal, "The Sault or 'Soo' Canal," has been the means of greatly increasing the travel and traffic on Lake Huron.

As early as the 17th century this lake was crossed by the French missionary, Père Marquette, who, in 1668, established a mission at Sault Sainte Marie, Saint Mary's Falls. In 1673 he was in charge of the mission at Mackinaw, from which place, on 17 May 1673, he departed with Joliet and others in search of the "Big River." For amount of shipping and tonnage see GREAT LAKES. Consult Morton, E. P., 'Lake Huron and the Country of the Algonquins' (Chicago 1913).

**HURONIAN SERIES**, the name first given by Sir William Logan to a series of strata lying in the vicinity of Lake Huron. They are very thick and consists chiefly of quartzite with great masses of greenish chloritic schist, sometimes containing pebbles derived from the Laurentian rocks. No organic remains have yet been found in them, and limestones are subordinate. They lie unconformably on the Laurentian. As the term is now used, the Huronian makes up the lower part of the Algonkian system and is divided into Lower, Middle and Upper Huronian. The latter is also called Animikean. The Middle Huronian contains the important iron ores of the Marquette Range in Michigan, and the Upper Huronian is the ore horizon of the Mesabi Range in Minnesota. The Lower Huronian conglomerates of Ontario are believed by many to be of glacial origin, as indicated by striated boulders within the main mass of the rock. If so, it is the earliest record we have of glaciation during the great geologic past. See GEOLOGY.

**HURRICANE.** See CYCLONE; STORMS; TORNADO; TYPHOONS.

**HURRICANE CLIFFS.** See GRAND WASH CLIFFS.

**HURST**, *herst*, Hal, English artist: b. London, 26 Aug. 1865. He started on his artistic career by drawing eviction scenes in Ireland. He emigrated to the United States, and joined the staff of the Philadelphia *Press*; afterward at New York, Paris and London he contributed to various journals and periodicals. He became a painter, studying at the Art League in New York and under Julian at Paris. Among his paintings are 'The Siren' (1896); 'The Cap-

ture' (1898); and 'The First Court of King Edward VII.'

**HURST, John Fletcher**, American Methodist bishop: b. near Salem, Md., 17 Aug. 1834; d. Washington, D. C., 4 May 1903. He was graduated from Dickinson College, Carlisle, Pa., in 1854, studied theology at Halle and Heidelberg, Germany, and after holding pastorates in New Jersey and Staten Island became bishop in 1880, and chancellor of the American University 1891-1902. He was one of the leading men in his denomination and of much prominence as a writer. Among his many works may be cited 'Literature of Theology'; 'History of Rationalism' (1865); 'Martyr to the Tract Cause' (1873); 'Life and Literature in the Fatherland' (1874); 'Outline of Church History' (1875); 'Our Theological Century' (1876); 'Bibliotheca Theologia' (1883); 'Short Histories of the Church' (1888-90); 'Short History of the Christian Church'; 'Indika: the Country and People of India and Ceylon' (1891); 'History of the Christian Church' (1897); 'History of Methodism' (1904). Consult the 'Life,' by Osborn (1905).

**HUS, John.** See HUSS, JOHN.

**HUSBAND AND WIFE.** The legislation of the past 50 or 60 years, beginning with the Married Woman's Property Acts of the 40's in the last century, have profoundly affected the rights and obligations of the parties to a marital contract, with respect to each other as well as with respect to the world at large. But the new legislation has been of the greatest diversity in character so that it is impossible to make a statement of the law that will exactly fit every locality. Moreover, the general rule that a statute does not abrogate the common law, unless such is clearly and irrefragably the intent thereof, makes a knowledge of the antecedent legal rules essential to an understanding of those which have superseded them in whole or in part. It is the duty of husband and wife to adhere to the marriage contract and cohabit; the husband having the right to determine the place of domicile. If he changes the same the wife must go with him; though in this country the husband is obliged to show a reasonable cause for removing to another abode in order to obligate the wife to follow him. The unreasonable refusal of the wife to follow would be an act of desertion. It is the duty of spouses by mutual forbearance to make a living together tolerable. Blackstone would find few subscribers nowadays to his dictum that a husband may correct his wife by subjecting her to restraint and even to "moderate" corporeal punishment. Such restraint and chastisement would have to be very moderate to satisfy modern ideas of ethical or legal propriety. On the other hand, if a wife is a woman of bad temper and provokes her husband's ill-usage, she will not be permitted by law to separate herself from his bed and board; "her remedy in such case is by bettering her own manners." (Warring v. Warring, Haggard Consistorial Reports). If the husband drives his wife from his house by "conduct so abominable that no decent woman would live under the same roof with him," her departure would not be desertion. Incontinence, of course, would justify the innocent party in leaving the guilty one, and no legal right would be forfeited in consequence of such departure.

Either spouse has a cause of action against any one who entices away or estranges the affections of the other. In England either the husband or the wife may bring suit against the other for a restitution of conjugal rights; actions of this character have not obtained judicial favor in this country, however.

At common law the husband was responsible for the torts of his wife even when committed before marriage. In theory of the law the husband stood in the position of a universal successor; having succeeded, on marriage, to all the rights of his wife, whether to things in possession or choses in action, he was assumed to have succeeded as well to her obligations, whether *ex delicto* or *ex contractu*. So the husband alone could proceed to recover damages for an injury suffered by his wife and was solely responsible for her torts during coverture. If the wife slandered another lady or horsewhipped a blackguard, the husband had to pay the damages. When a husband thus liable died, the right of action died with him and could not be pursued against the surviving widow or the husband's estate. Even for misdemeanors of a wife, not punishable by imprisonment, the husband alone could be held and prosecuted—and would be compelled to pay the fine. At the present time, and in nearly all jurisdictions, the husband's liability for the torts and misdemeanors of his wife is more narrowly circumscribed, and is limited to those committed in his presence; the presumption of law being that he coerced or commanded the wife to do what she did, or, at least, that he encouraged or connived in the wrong. The husband, however, can defend himself by showing the wrong to have been done by the wife against his will. As to higher crimes the complicity of the husband was also presumed from his presence. The suggestion, however, to absolve the wife from punishment for a felony committed presumptively under coercion from, or at the command of, the husband never found favor. When a married woman commits treason no presumption of coercive influence over her was deducible from her husband's participation in the crime, because the peculiar dangerousness of this offense to the state required from all persons connected with the act the fullest responsibility for their own part therein. Where a man and wife are charged with keeping a brothel, coercive influence from the husband will not be presumed, because in such a case "the wife probably would be the chief manager, and to hold her guiltless would be absurd." The presumption of the guilt of the husband from his presence at the commission of a criminal act by the wife could always be rebutted, while, nowadays, his partnership in crime would have to be proven like that of any other accomplice. It was a general rule of the common law that husband and wife could not bear witness against one another in any action, civil or criminal. The rule was mandatory, not merely a rule of privilege—and was grounded on public policy, which would not be served by the disruption of conjugal relations and the disturbance of domestic tranquillity. From this rule an exception was again made in trials for high treason, in which either party to the marital contract could become a competent witness against the other; and where the testimony of the wife was of necessity required, as in the

case of personal violence or cruel treatment charged against the husband, she would be a competent witness to prove the facts. In civil actions a wife might testify against her husband to anything she had done in the capacity of his agent. Modern legislation has brushed most of these disabilities and distinctions aside; and husbands and wives are permitted, and may be compelled, to testify against each other in nearly all kinds of legal proceedings. They are not competent witnesses in suits for divorce on the ground of adultery, nor in actions for criminal conversation, except to prove the fact of marriage. They are permitted but cannot be compelled to testify against each other in criminal actions; and they will neither be compelled nor permitted to disclose anything communicated in the confidence of the marital relation. A husband or wife giving harbor, aid and comfort to a spouse who has committed a crime does not thereby become an accessory after the fact. The duty of the husband to protect implies his right to defend the wife from personal injury; and a battery committed by either in defense of the other is not actionable.

It is the duty of the husband to support and maintain the wife as long as she lives with him. And from this duty the husband is not relieved, though the wife have independent means quite adequate to her needs. The obligation of the husband is to provide "necessaries," and to obtain these the wife may contract debts which the husband by law is bound to pay. For more than 200 years the principal laid down in the leading case of *Manby v. Scott*—namely, that a husband is not bound by his wife's contracts, unless she acts by his authority—has controlled the decisions of the courts. The wife in the case had lived apart 20 years and returned; the husband had refused to receive her and forbidden tradesmen to trust her. The long separation countervailed any presumption of an authority conferred on the wife to contract even for necessaries. Such authority will be presumed to have been given only when the relations apparently are normal and the parties live together as husband and wife. But the fact of cohabitation as man and wife will not raise a presumption of the husband's assent to the purchase by the wife of non-essentials. This is illustrated by the triumphs over the Philistines of the gentleman who figured as defendant in the actions of *Montagu v. Benedict*, and *Seaton v. Benedict*, reported with much humor in Shirley's 'Leading Cases in Common Law.' Mrs. Benedict, who appears to have been a woman of extravagant tastes, contracted a substantial debt with the plaintiff, Montagu, for jewelry. In due course the jeweler presented a substantial bill, which Mr. Benedict declined to pay; and the court held that, "tradesmen, who are about to trust a married woman for what are not necessaries, ought in common prudence to inquire if she has her husband's consent for the order." Mrs. Benedict continued to "walk on primrose path" and by the way dropped in at Seaton's millinery establishment, whence she took, with the gladly-given consent of the proprietress, large quantities of fine laces, scarves, gloves, etc., on the credit of her husband. The latter had always liberally furnished his wife with apparel or, what amounts to the same thing, with money to buy what she required, and he knew nothing of her

clandestine dealings with Seaton. This person, confident in the correctness of her assumption that "a lady's needs" and "necessaries" were terms of identical meaning, brought suit when Benedict refused to pay the bill; but she met with a judicial rebuff, which gained nothing in sweetness from this judicial gloss to the decision: "It may be hard on a fashionable milliner, that she is precluded from supplying a lady without previous inquiry into her authority; the court, however, cannot inquire into these little delicacies, but must lay down a law that shall protect the husband from the extravagances of his wife." The rule deducible from these and many other cases is: When husband and wife are living together there is a presumption that the wife has the husband's authority to enter into contracts, binding on the latter, in relation to all domestic matters ordinarily entrusted to the woman of the house, and to obtain on the husband's credit the things necessary to the conduct of the household. The term "necessaries" means a reasonable supply of such goods and services as are suitable in kind, sufficient in quantity and required in fact, for the use of the husband, the wife, the children and other members of the household, according to the conditions in which they live. When the wife is living apart from the husband without his consent the presumption is the other way about—namely, that she has no authority to pledge his credit; and, when the separation is due to the woman's fault, the presumption of "no authority" is conclusive. When the separation is by mutual consent the wife goes forth with implied authority to contract for necessaries in the name of the husband. But this implication is not absolute and may be repelled by a variety of circumstances. For instance, if the husband make her an allowance which is sufficient, or accepted by her as sufficient; probably, also, if she have money of her own to live on, or if she be capable of earning it. For the wife's authority to bind the husband for necessaries is a mere question of agency, and an agency can hardly be assumed when the wife is living alone on her own income, or supported by her own earnings. The husband's liability to pay for necessaries cannot be evaded by a public, or even by personal notice not to extend credit, unless it can be shown also that the wife was adequately provided for by the husband. The latter must supply the wife's needs or pay. A married woman will not be permitted to suffer deprivation if there be a husband living capable of supplying her wants; and third parties may sell necessaries to her on credit—or lend her money to buy the same—and hold the husband responsible, though the latter have forbidden the wife to contract and the creditor have notice of the inhibition. (As to the effect of a divorce or judicial separation, see *DIVORCE*). A married woman living with her husband cannot be sued for debts contracted for necessaries. She incurs no liability even when the necessaries are contracted for after the death of the husband in foreign parts, the fact of his demise being unknown.

In theory of the common law the personality of a woman, on her marriage, was merged in that of the husband. The twain had become one person with the husband as head. With respect to legal rights in property this merger

was complete. The husband, on marriage, acquired absolute title of the wife's personal property, not held in trust; it became his as completely as if he had bought it, and could never again become hers, unless he gave it to her by will. In the event of the husband dying, without having made a will, the wife's personal property did not revert to her but went to his estate. Choses in action also passed to the husband, who alone could sue for a recovery. Unless the personal property of the wife was reduced to his possession during his lifetime, however, it remained her own, and would not pass to the husband's executors or administrators, nor become chargeable with the payment of his debts or legacies. On the death of the wife, however, the surviving husband was entitled to the administration of personal property that had remained in her possession, and he was unaccountable therefor to her next of kin. A gift or sale of personal property from the wife to the husband, or vice-versa, was a nullity, of course. The wife, in such case, would merely have transferred to the husband that which was already his; while he would immediately and again become the legal owner of the thing that had just been transferred to the wife. The wife, during coverture, gained nothing from her marriage so far as the personal property of the husband was concerned. In case of his death intestate, the wife surviving, she was entitled to one-third of his personal estate if there were children, or to one-half if there were none; but this right could be defeated by the testamentary disposition of the husband. Besides an absolute right to the personal property of the wife the husband, on marriage, obtained an usufructuary interest in all of the wife's real estate during the period of their joint lives; he was entitled to collect and use the rents and profits thereof. On the death of the wife, and if there had been any living children born of her husband, the latter became entitled to the possession, and the enjoyment of the income, for life of all his wife's real property (estate by curtesy) even though no child of the marriage survived. By no act of the wife could the husband's estate by curtesy be diminished or destroyed. A wife by her marriage acquired a right of dower. This was a life interest, to the extent of one-third of its value, in all real estate owned by the husband at the time of the marriage or acquired by him subsequently, whether by purchase, gift, inheritance or process of law. The right of dower could not be defeated by a conveyance of the property by the husband during the period of coverture nor by his will; and it attached to all real property owned by the husband at any time during his married life. The right of dower could be terminated only by a release from the wife; or the acceptance by her, in lieu of dower, of a provision made for her during his life, or by his will, out of the husband's individual estate. Dower could be admeasured, on the basis of its cash value as an annuity, and the owner of the right could thus be satisfied by a payment in gross. Conveyances of real estate from husband to wife and vice-versa, if direct and without intervention of a trustee, are void in law; though it has been held also that the effect of such a conveyance would be to create a joint estate for life, the surviving party taking the whole property on the death of the other.

While the common law rigorously adhered to the theory of the unipersonality of husband and wife, in equity the separate existence of the wife was abundantly acknowledged. She might own separate property, real as well as personal, free of any control on the part of her husband. Her right to the sole use and possession during coverture of property owned by her while single was usually effectuated by an ante-nuptial settlement; but property could also pass to her after marriage, for her sole and separate use, from any person and in any manner, by will, deed or gift—and it would be more absolutely her property than her husband's property was his. Sometimes the legal title to a married woman's separate estate was held by trustees, but the beneficiary of the "use" could dispense with her trustees' advice, manage the property as she pleased or convey or otherwise dispose of it without their knowledge or consent. Often "uses" were created without the formality of vesting the legal title in a trustee; and a single woman contemplating matrimony might convert her legal estate into a "use," and have the sole and separate management of the same after marriage. And this might be done on the very eve of the wedding, the only condition being that it was done with the knowledge and consent of the prospective husband. If done clandestinely it would be in fraud of his expectations, and the arrangement would be annulled by a court of equity. The rule of law that conveyances between husband and wife were nullities was disregarded in equity, and a husband's grants and gifts of either personal or real property to his wife for her separate use were validated. The legal disabilities of a married woman were considered non-existent in equity with respect to her separate estate. She was presumed to be clothed with all powers necessary to the management and protection of her property; she could sue and be sued without her husband joining or being joined in the action, and she could even enforce rights in opposition to him. In law a married woman could make no valid contract except for necessities; in equity, and in respect to her separate property, a married woman's right of contract was not limited by any legal disability flowing from coverture.

The legal status of married women before the emancipatory legislation of the past half century was not quite as degraded as has sometimes been represented. The statutory changes are, to a large extent, matters of form. Under the statutes passed in the United States and in England, it is true, the husband, on marriage, acquires no rights whatever in the personal property owned by the wife at the time of marriage or acquired by her in any manner thereafter. It remains her separate property. But, as we have seen, even before the passage of this legislation both personal and real property could be owned separately by a married woman if she or her grantors and devisors took the precaution of converting it into a "use." Under the new law a man, on marriage, acquires no right in his wife's real estate during her lifetime; but he still has a life estate by curtesy which vests on the wife's death. Women, as before, acquire a right of dower in their husband's real estate when they marry; in this respect, as with respect to estates by curtesy,

the law has not been altered. The wife, by her marriage, now acquires as little as she did under the old law with regard to the husband's personal property. If the husband dies intestate she gets one-third or one-half, or whatever share thereof the statutes of the State of her domicile may award her; if he chooses to make a will in favor of anybody else, even his "affinity," the widow has no remedy at law nor in equity. There is little comfort in the reflection that she fares neither better nor worse than her sisters of a by-gone age. The husband's right to administer a deceased wife's personal property and convert it to his own use may be defeated by a will. Moreover, there are statutes of distribution fixing the rights of the next of kin of an intestate wife. The American statutes uniformly permit married women to hold separate property and conduct business as "if they were unmarried." This, undoubtedly, marks a great advance over former conditions. Neither the common law nor equity recognized the right of a wife to her separate earnings. The husband was entitled to the wife's personal services and to the fruits thereof, and in theory this is still the case. It is so also in fact, except with respect to a wife's earnings in a business or profession separately conducted or practised by her, or where it is clearly intended that the earnings of the wife are on, and for, her own account. The right of a husband to recover damages for injuries suffered by his wife is based on the real or assumed loss of her services as the result of the injuries. Formerly she was incapable in law from prosecuting an action for tort. This disability has been removed, though in some jurisdictions the action must be brought jointly with the husband as her "next friend." In other localities husband and wife may each sue independently and recover damages for the same injury. The right now accorded to married women to conduct business in their own names and keep the earnings thereof is most valuable, pecuniarily as well as morally; it gives them a degree of independence far beyond that attainable in the marriage-settlement stage of civilization. The separate property held by married women in form of equitable "uses," after all, was merely a device for the idle rich. The New York Court of Appeals years ago regretted that the statutes, which granted married women the right "to hold separate property and conduct business as if unmarried," was not associated by the legislature with "the correlative rule that they have also capacity to contract debts as if unmarried." A married woman is still exempt from prosecution for any debt, unless it be contracted with respect to or for the benefit of her separate property, or in the conduct of her separate business. She would not be responsible for necessities consumed in her household, though her earnings in business amount to 10 times those of her husband and her house were being conducted on a scale of living commensurate with her income rather than his. If she were dishonest enough to do so, she could repudiate her liability without fear of the law; the husband being still solely responsible for the supply of "necessaries." In the New York case above referred to a woman, known to have means, contracted in her own name for a large

bill of goods, which she received and delivered to her husband to be used by the latter in his business. An action against her was dismissed, because the debt was not contracted by the wife in a business separately conducted by her, and her separate estate was not shown to have benefited by the transaction. This defect of the law has been remedied in many places. The English Married Woman's Property Act of 1870 laid down the more equitable rule, that the wife's separate estate is answerable for all debts contracted by her except as her husband's agent. To sum up the law, neither husband nor wife have any rights in the personal property of either that cannot be defeated at the caprice of the other; their interest in each other's real property is, an estate by curtesy to the husband if he survive, and a right of dower to the wife if she survive. Beyond this the wife has the right to be supported, which may be enforced either by the decree of an equity court for her separate maintenance, by actions in debt against the husband for necessities, or by a quarter sessions court in a criminal proceeding for desertion. There remains to be mentioned the widow's right to her "paraphernalia." This consists of clothing, bedding, furniture, jewelry and trinkets suitable to her condition; and this property forms a part of the husband's estate only in so far as it is chargeable for the payment of his debts if there is insufficient other property to pay the same. As against next of kin the paraphernalia belongs to the widowed wife.

STEPHEN PFEIL.

**HUSBANDRY, Patrons of.** See GRANGERS.

**HUSH MONEY**, a term used in English law, signifying a sum of money or its equivalent, given or offered to another in order to induce him to refrain from giving evidence or prosecuting an offense. Such a contract is not considered a penal offense at common law, but is illegal and cannot be enforced. The offense comes under the crime of compounding a felony and the punishment is imprisonment.

**HUSHI**, hoo'shë, Rumania, capital of the department of Falciu, near the Russian frontier, about 10 miles west of the Pruth, and 40 miles southeast of Jassy. An episcopal see, Hushi has an interesting 15th century cathedral and a theological seminary. There is active trade in cattle. Hushi was the seat of the Treaty of Pruth between Russia and Turkey in 1711. Pop. 15,500.

**HUSI.** See HUSHI.

**HUSKISSON**, hüs'ki-sön, **William**, English statesman and financier: b. Birch-Moreton, Worcestershire, 11 March 1770; d. 15 Sept. 1830. He was sent to Paris in 1783 to study medicine. In 1789 he became an enthusiastic sympathizer with the French Revolution, was present at the taking of the Bastille and joined the Club of 1789, instituted the following year. He made a speech at the club against the proposed creation of paper money, and withdrew from it when the assembly decreed the issue of assignats. His views of the Revolution afterward underwent a change. In 1790 he was appointed secretary to the British Ambassador; and when the Ambassador was recalled in 1792 he returned to England, and in 1795 he became Under-Secretary

for War and the Colonies. In 1796 he was elected member of Parliament for Morpeth. He resigned in 1801, and returned in 1804. In Pitt's administration formed in this year he became Secretary of the Treasury, and during the Whig ministry that succeeded Pitt's death was an active member of the opposition. In 1807 he resumed his post as Secretary of the Treasury, which he resigned in 1809. In 1823 he was elected Member of Parliament for Liverpool, and appointed president of the Board of Trade and treasurer of the navy. From 1827 to 1828 he was Secretary of State for the Colonies. He was killed at the opening of the Liverpool and Manchester Railway, 15 Sept. 1830. He seldom spoke in Parliament except on commercial or financial subjects, on which he was an authority as also on subjects affecting India. He was a strong supporter of Catholic emancipation, and he anticipated Peel in his advocacy of a free-trade policy. Lord Melbourne regarded him as the greatest practical statesman he had known. A collective edition of his speeches and a memoir appeared in 1831.

**HUSS**, or **HUS**, **John**, Bohemian religious heresiarch: b. Husinec, Southern Bohemia, about 1369; d. Constance, Switzerland, 6 July 1415. He studied at the University of Prague and in 1398 began to lecture on theology and philosophy. In 1401 he was made dean of the faculty of philosophy, and was made rector of the university (1400). Since 1391 he had been acquainted with the writings of Wiclif, and his denunciations of the indulgences, of masses for the dead, of auricular confession, etc., alarmed Archbishop Stynko of Prague, who had 200 volumes of Wiclif's writings burned (1410) in the archiepiscopal palace, and the preaching of his doctrines in Bohemia prohibited. Huss appealed to the Pope, John XXIII, who summoned him to appear at Bologna. Huss refused to appear and was in consequence excommunicated, and Prague threatened with an interdict as long as Huss should remain in it. Wenceslas, the king, alarmed by this menace, thought to bring about peace; and at his demand, Huss made an orthodox profession of faith in 1411. But the quarrel broke out again when Huss and his friend Jerome publicly condemned the papal indulgences granted for the crusade against Ladislas of Naples. Huss was again excommunicated and Prague interdicted. He now retired to Husinec to the protection of his feudal lord and here he wrote his books 'On the Six Errors' and 'On the Church,' in which he attacks transubstantiation, the belief in the papal primacy and the saints, the efficacy of the absolution of a vicious priest, unconditional obedience to earthly rulers, and makes the Scriptures the only rule in matters of religion. In the meantime the Council of Constance had convened in 1413. Huss was summoned to this council to render an account of his doctrines. The Emperor Sigismund granted him a safe conduct to the council. After several examinations of his doctrines, and his persistent refusal to retract the points which were regarded as heretical, he was sentenced to death and burned 6 July 1415. The Hussite War followed. See HUSSITES. The best editions of his works are by K. J. Erben (1865-68); F. Palacky (1869) and by W. Flojshaus (1904). Con-

sult also Neander, J. A. W., 'Allgemeine Geschichte der christlichen Religion und Kirche' (Eng. trans. by J. Torrey, 1850-58); von Lechler, G., 'Wiclif und die Vorgeschichte der Reformation' (Eng. trans. by P. Lorimer, 1878); the 'Acta' of the Council of Constance (in P-Labbe, 'Concilia,' Vol. XVI, 1731). Good biographical material is contained in Denis, F., 'Huss et la guerre des Hussites' (1878); Lützwow, F. H. H., 'Life and Times of Master John Hus' (New York 1909); Lea, H. C., 'History of the Inquisition' (Vol. VIII, New York 1888); Creighton, M., 'History of the Papacy' (1897).

**HUSSARS**, *huz-zärz'*, light cavalry troops, originally raised by Matthias Corvinus in 1458 to fight against the Turks. Of the several possible origins suggested for the word, the most generally accepted is that it is derived from the Magyar word "husz," meaning "twenty," the troops having been raised by selecting every twentieth man in the community. The effectiveness of these light-mounted troops recommended their adoption by other European armies; and they became part of the British cavalry in 1805. The peculiar uniform of the Hungarian hussar with its characteristic loose coat, hanging from the left shoulder, was adopted with considerable modification by the other European light cavalry.

**HUSSEIN KAMIL PASHA**, *hüs-sän kä'mel*, first sultan of Egypt: b. Cairo, 20 Dec. 1853; d. there, 9 Oct. 1917. He was the second son of the Khedive Ismail and brother of the late Khedive Tewfik (d. 1892). The latter was succeeded by his son, Abbas Hilmi (q.v.), who reigned till 18 Dec. 1914, when the British government deposed him for having "adhered to the King's enemies," namely, intriguing with Turkey and Germany. A British protectorate was proclaimed over Egypt and Hussein Kamil became sultan. After attending native schools he was sent to Paris in 1867 to complete his education. There he was the guest of the Emperor Napoleon III and the playmate of the ill-fated Prince Imperial, who was killed in the Zulu War, 1879. He accompanied his exiled father to Naples, but was permitted to return to Egypt in 1883. Fully appreciating the benefit of the British occupation to his country, he became strongly pro-British in sentiments and was a friend and adviser to Cromer, Gorst and Kitchener. Two attempts were made to assassinate him in 1915; in November a court-martial in Constantinople sentenced him to death for alleged treachery. He had gained a wide experience in administrative positions, personally attended to all public affairs and freely gave advice to all who sought it. He was twice married and had one son and four daughters. His youngest brother, Prince Ahmed Fuad (q.v.), succeeded him.

**HUSSEIN NAZIM PASHA**, Turkish general: b. Constantinople, 1848; d. 1913. After a preliminary education at native schools, he was sent to the military school at Saint Cyr, Paris. By successive steps he became chief of the Turkish staff during the war with Russia. His sympathies were completely with the revolutionary element in Turkey and this brought him into conflict with the government repeatedly. He was thrown into prison for a five-year sentence, but managed to escape, and,

joining the Young Turks, took an active part in planning the Revolution of 1908. His skill recommended him to the royal party and in 1909 he was appointed Minister of War under Kiamil Pasha. Under threat by the Young Turks he was forced to withdraw. He subsequently served as Vali at Bagdad, where he proved himself a capable and efficient governor; was made chief of the army council in 1911 and Minister of War under Mukhtar Pasha. During the Balkan War he distinguished himself by the vigor and brilliance of his moves. His early adherents, the Young Turks, assassinated him in 1913.

**HUSSITES**, followers of the Bohemian reformer and martyr John Huss (q.v.), who to avenge his death on the treacherous Emperor Sigismund and the clergy involved the empire in one of the most terrible wars of history (1420-34). Instead of suppressing the teachings of Huss, the *auto-da-fé* of Constance was the slogan of union for multitudes of all classes, including a league of 450 Bohemian nobles. Their symbol was the chalice, the withdrawal of which in the celebration of the Lord's Supper had been a cause of contention. The wavering and temporizing King Wenceslas was compelled in 1417 to grant the use of many churches for the celebration of the sacrament in both forms. After his death, 13 Aug. 1419, the inquisitorial violence of the cardinal legate, John Dominico, kindled the fire of insurrection. The people could not overthrow the claims of the hated Emperor Sigismund to the vacant throne and, bent upon the extirpation of so-called heresy, faithless in treaties, but unequal to contend with the activity of the Hussites and the genius of their generals Ziska and Procopius, for 15 years Sigismund saw his kingdom in a state of utter anarchy. The Hussites comprised three parties (a) Calixtines or Utraquists (q.v.); b. Orphans; and (c) Taborites. Overtures tending to conciliation were made by the Council of Basel in 1431 which were listened to by the Calixtines who were desirous of peace. On 20 Nov. 1433 the compromise or compact of Prague was made, which, however, was not accepted by all parties and hostilities recommenced, but ended by a complete victory of the Calixtines and Catholics under Meinhard of Neuhaus, at Bömischbrod, 30 May 1434. The Orphans and Taborites deprived of political influence and religious freedom finally merged in the fraternity of Bohemian and Moravian Brethren (q.v.), which arose in 1457. Consult Berger, W., 'Johannes Hus und König Sigmund' (1871); Denis, E., 'Huss et la guerre des Hussites' (Paris 1878); Krummel, L., 'Geschichte der böhmischen Reformation' (Gotha 1866); ib., 'Utratisquen und Taboriten' (Gotha 1871); Lötzone, Count, 'The Life and Times of John Hus' (London 1909).

**HUSTING**, the name applied to an ancient court held in the city of London. It was the County Court and listened to pleas of land, common pleas and appeals from sheriffs. The court in its original sense no longer exists, although a hustings court is sometimes held for registering gifts to the municipality. In its present sense, the word denotes the place where members of Parliament used to be nominated, before the Ballot Act of 1872 rejected

the form of nominating openly. From this it has come to be applied to any electioneering platform. In the United States a hustings court existed in many towns in Virginia which were settled during the 18th century. The establishment of such a court is recorded in the charters of Norfolk and of Richmond.

**HUTCHESON, Francis**, Irish philosopher: b. Drumalig, Ireland, 8 Aug. 1694; d. Glasgow, 8 Aug. 1746. He was educated at the University of Glasgow, taught in Dublin 1717-29, and in 1729 became professor of philosophy at Glasgow. In 1725 the first edition of his celebrated 'Inquiry into the Ideas of Beauty and Virtue' appeared without his name. In 1728 he published his 'Treatise on the Passions,' often reprinted and admired even by those who dispute the soundness of its philosophy. In 1775 was published from his MSS. a 'System of Moral Philosophy.' The philosophy of Hutcheson is based primarily on that of Locke. His particular theory of conscience as a distinct sense was attacked by Richard Price in a celebrated work, 'Principal Questions and Difficulties in Morals.' The views of Hutcheson and Price are reviewed in Jouffroy's 'Cours de droit naturel.' Hutcheson was a writer of considerable originality who stimulated the spirit of inquiry in Scotland and is justly regarded as the precursor of Reid and the founder of the Scottish school in philosophy. An admirable résumé of his works is contained in Cousin's 'Philosophie Ecossaise.' Consult Albee, 'History of English Utilitarianism' (1902); Scott, 'Francis Hutcheson' (1901).

**HUTCHINS, Harry Burns**, American university president: b. Lisbon, N. H., 8 April 1847. He received his education at the University of Michigan, where he subsequently became assistant professor of history and rhetoric (1872-76), Jay professor of law (1884-87). He then was called to the chair of law at Cornell University, remaining until 1894. In the following year he resumed his connection with the University of Michigan, serving as professor of law, dean of the law department (1895-1910), acting president (1897-98), and from October to June 1910, on which latter date he became president. Dr. Hutchins received the degree of LL.D. from the University of Wisconsin (1897), Wesleyan (1916) and Notre Dame (1917). He is also a member of the advisory board of the *Michigan Law Review* and has revised and annotated, under appointment from the Supreme Court, five volumes of 'Michigan Supreme Court Reports.' He also edited the American edition of Williams' book on 'Real Property,' was consulting editor of 'American and English Encyclopedia of Law and Procedure,' and contributor of the biography of Thomas M. Cooley to the 'Great American Lawyers' series. He was appointed a member of the international commission created by the treaty between the United States and Uruguay for the advancement of peace.

**HUTCHINS, Thomas**, American geographer: b. Monmouth, N. J., 1730; d. Pittsburgh, Pa., 28 April 1789. In early life he enlisted in the English army and saw active service in the French and Indian War. He was in England in 1779 and was arrested in London

and thrown into prison as an advocate of American independence. He escaped to France, from which country he sailed to America, joined the Continental army and was appointed geographer-general by General Greene. Among his published works are 'Topographical Description of Virginia, Pennsylvania, Maryland and North Carolina' (1778); 'History, Narrative and Topographical Description of Louisiana and Western Florida' (1784).

**HUTCHINSON, Anne**, American religious leader, the founder of the Antinomian party in the New England colonies: b. Lincolnshire, England, about 1590; d. Westchester County, N. Y., August 1643. She was the daughter of a Lincolnshire clergyman. In England she was interested in the preaching of John Cotton and her brother-in-law, John Wheelwright, and it was her desire to enjoy the ministry of the former which induced her to follow him to New England. She arrived in Boston with her husband 18 Sept. 1634, was admitted a member of the Boston church 2 November and rapidly acquired esteem and influence. She instituted meetings of the women of the church to discuss sermons and doctrines, in which, with a ready wit, bold spirit and imposing familiarity with the Scripture, she gave prominence to peculiar speculations which even on her voyage had attracted the attention and caused the displeasure of her fellow passengers. Such were the tenets that the person of the Holy Spirit dwells in every believer and that the inward revelations of the Spirit, the conscious judgments of the mind, are of paramount authority. She had been two years in the country before the strife between her supporters and her opponents broke out into public action. Among her partisans were the young governor, Vane, Cotton, Wheelwright and the whole Boston church with the exception of five members, one of whom was the associate pastor, Wilson, while the country clergy and churches were generally united against her. "The dispute," says Bancroft, "infused its spirit into everything; it interfered with the levy of troops for the Pequot War; it influenced the respect shown to the magistrates, the distribution of town lots, the assessment of rates; and at last the continued existence of the two opposing parties was considered inconsistent with the public peace." The peculiar tenets of Mrs. Hutchinson were among the 82 opinions condemned as erroneous by the ecclesiastical synod at Newtown 30 Aug. 1637; and in November she was summoned before the general court and after a trial of two days sentenced, with some of her associates, to banishment from the territory of Massachusetts, but was allowed to remain during the winter at a private house in Roxbury. She joined the larger number of her friends, who, led by John Clarke and William Coddington, had been welcomed by Roger Williams to his vicinity, and had obtained through his influence from the chief of the Narragansetts the island of Aquidneck, subsequently called Rhode Island. There a body politic was formed on democratic principles, in which no one was to be "accounted a delinquent for doctrine." The church in Boston, from which she had been excommunicated, vainly sent a deputation of "four men of a lovely and winning spirit" to the island with the hope of

reclaiming her. After the death of her husband in 1642 she removed with her surviving family into the territory of the Dutch, probably from apprehensions that Rhode Island might not be a safe place of refuge from the encroachments of Massachusetts. The precise locality where she settled has been a matter of dispute, but according to the latest authorities it was near Hell Gate, Westchester County, N. Y. The Indians and the Dutch were then at war and in an invasion of the settlement by the former her house was attacked and set on fire and herself and all her family, excepting one child who was carried captive, perished either by the flames or by the weapons of the savages. Consult the biography by Jared Sparks in the 'Library of American Biography,' (Vol. XVI, 1845).

**HUTCHINSON, Horatio Gordon**, English golfer: b. 16 May 1859. He was educated at Charterhouse School, London, and graduated with classical honors in the University of Oxford. He was golf champion in England 1886-87. He has published 'Hints on Golf'; 'Golf' (in Badminton Library); 'Creatures of Circumstance'; 'Peter Steele the Cricketer'; 'My Wife's Politics'; 'Cricketing Laws and Stories'; 'The Book of Golf and Golfers' (1899); 'Little Lady Mary' (1900); 'Dreams and Their Meanings'; 'A Friend of Nelson' (1902); 'Bert Edward, the Golf Caddie' (1903); 'Glencairly Castle' (1904); 'Amelia and the Doctor' (1906); 'A Saga of the Sunbeam' (1910); 'The Faun and the Philosopher' (1915); 'From Doubt to Faith' (1916).

**HUTCHINSON, John**, Puritan English soldier: b. Nottinghamshire, 1615; d. Sandown castle, Kent, 11 Sept. 1664. While a student of law, being of a religious turn of mind, he devoted much time also to the study of divinity, from which his attention was soon diverted by the serious political questions which agitated the kingdom. A careful investigation of the matters at issue between the king and the Parliament satisfied him of the justice of the latter's cause and after the commencement of the Civil War he declared for the Parliament and was appointed governor of Nottingham castle, which he held until the close of the war. He afterward represented Nottingham in Parliament, and as a member of the high court of judiciary appointed for the trial of the king concurred in the sentence pronounced on him. The subsequent course of Cromwell, however, met with the disapproval of Hutchinson. At the restoration he was comprehended in the general act of amnesty, but was subsequently arrested on a suspicion of treasonable conspiracy and after a detention of 10 months in the Tower was removed to Sandown castle, where he died of fever.

**HUTCHINSON, John**, English philosopher, founder of a mystical school of philosophy and theology: b. Spennithorne, Yorkshire, 1674; d. 28 Aug. 1737. In 1724 appeared the first part of his 'Moses' Principia,' in which he disputed the Newtonian theory of gravitation. In the second part (1727) he continued his criticisms of Newton and maintained on Biblical authority the doctrine of a *plenium* in opposition to that of a *vacuum*. From this time one or more volumes, containing a sort of cabalistic interpretation of the Hebrew Scrip-

tures, appeared annually. His leading idea is that the Scriptures contain the elements of all rational philosophy as well as of general religion. The Hebrew language has not only its literal but its typical sense, every root of it being significant of hidden meanings. With this elastic principle of exegesis he deduces a system from which the occult powers of attraction, gravitation, magnetism and electricity are excluded, but according to which the whole mechanism of the heavens is the result of the agency of fire, light and spirit, the three material elements which were set to work in the beginning and which typify the three persons of the Trinity.

**HUTCHINSON, Thomas**, American colonial governor: b. Boston, 9 Sept. 1711; d. Brompton, near London, 3 June 1780. He was the son of a merchant of Boston who was long a member of the council, and graduated at Harvard College in 1727. He represented Boston for 10 years in the general court, of which he was for three years speaker; became judge of probate in 1752, was a councillor from 1749 to 1766, lieutenant-governor from 1758 to 1771, and appointed chief justice in 1760, thus holding four high offices at one time. In the disputes which led to the Revolution he sided with the British government; but he favored a moderate policy. His brother-in-law, Andrew Oliver, was appointed distributor of stamps under the law which was to go into effect 1 Nov. 1765, but was compelled by mobs to resign the office before that time. The mansion of Hutchinson was also twice attacked in consequence of a report that he had written letters in favor of the act, and on the second occasion (26 August), when the rioters were maddened by liquor, his house was sacked, the furniture burned in bonfires in the street and many manuscripts relating to the history of the province, which he had been 30 years in collecting and which could not be replaced, were lost. The inhabitants of the town on the following day in public meeting voted their abhorrence of the proceedings; but though many of the actors were well known, no one was punished. He, however, received compensation for his losses. When in 1769 Governor Bernard was transferred to Virginia, the government of Massachusetts fell to Hutchinson. The popular excitement had already been increased by the arrival of the British troops, and after the so-called Boston massacre a committee of citizens, headed by Samuel Adams, obliged him to consent to the removal of the regiments. The popular indignation against Hutchinson became so great that he at last obtained leave of absence and sailed for England, 1 June 1773. The Privy Council investigated his official acts, and decided in favor of "his honor, integrity, and conduct," which decision was approved by the king. He was rewarded with a pension. He published 'History of the Colony of Massachusetts Bay, from the First Settlement Thereof, in 1628, until the Year 1750' (2 vols., 1760-67; Vol. III, 1828); 'Brief State of the Claim of the Colonies' (1764); 'Collection of Original Papers Relative to the History of the Colony of Massachusetts Bay' (1869). His diary and letters appeared (1883-86). The sober judgment of later times has reversed the prejudiced accusations of his American contemporaries,

and he is now seen to have been a conscientious man, zealous in the performance of duty but sorely perplexed between the claims of loyalty to the king and his natural inclinations in favor of the colony. Consult Hosmer, 'Life of Thomas Hutchinson' (1896); Fiske, 'Historical Essays' (Vol. I, 1902).

**HUTCHINSON**, Kan., city and county-seat of Reno County, on the Arkansas River, and on the Atchison, Topeka and Santa Fe, the Chicago, Rock Island and Pacific, the Hutchinson and Southern and the Missouri Pacific railroads, 40 miles west of Wichita. The city, founded in 1871, has one of the largest salt interests in the world, producing about 6,000 barrels per day. It is also an important meat packing and shipping centre; and has manufactures of lumber, machinery, boilers, etc., and the railroad shops of the Hutchinson and Southern Railroad. It has a public library, high school, State reformatory, electric lights, a national bank and an assessed property valuation of \$1,500,000. The commission form of government has been in operation since 1909. Pop. 19,500.

**HUTIA**, a West Indian rodent. See **RODENTIA**.

**HUTSON**, Charles Woodward, American educator and author: b. McPhersonville, S. C., 23 Sept. 1840. He was graduated from South Carolina College in 1860; served in the Confederate army 1861-65; was professor of Greek in Louisiana State University, 1869-73; of modern languages in the University of Mississippi 1881-89, and of English and history in the Texas Agricultural and Mechanical College 1893-1908. South Carolina University, his alma mater, conferred on him the LL.D. degree in 1911. He has published 'Out of a Besieged City' (1887); 'The Beginning of Civilization' (1888); 'The Story of Beryl' (1888); 'French Literature' (1889); 'The Story of Language' (1897); two articles in 'The South in The Building of The Nation' (1909), and edited Lafcadio Hearn's 'Fantastics' (1914).

**HUTTEN**, hoot'tèn, Philip von, German adventurer; cousin of Ulrich von Hutten (q.v.): b. Birkenfeld, about 1490; d. Venezuela, 1546. In 1528 the Emperor Charles V made a grant of the province of Venezuela to the Welsers, a firm of Augsburg merchants; and Hutten sailed with one of the companies sent out by them. He accompanied the viceroy, Georg Hohemut, in a journey (1536-38), in which they reached the headwaters of the Rio Japura, near the equator. In 1541 he set out in search of the Golden City. After several years of wandering, harassed by the natives and weakened by hunger and fever, he and his followers came on a large city, the capital of the Omaguas, in the country north of the Amazons, where they were routed by the Indians, and Hutten himself severely wounded. He led those of his followers who survived back to Coro in 1546, where Juan de Caravajal had in the meantime usurped the office of viceroy; and by him Hutten and his lieutenant, Bartel Welsler, were seized and beheaded. Eight years later the Welsers' grant was taken from them, and the German rule in Venezuela was concluded. Hutten left an account of his journeyings, which was published under the title 'Zeitung aus Indien'

(1765). Consult Von Langegg, 'El Dorado' (1888).

**HUTTEN**, Ulrich von, ool'rin fôn, German knight, distinguished for his poems and satires, and for the influence which his writings exercised upon the Reformation: b. Steckelberg on the Main, 21 April 1488; d. Ufnau, an island in the lake of Zürich, 23 Aug. 1523. His father placed him at Fulda in order to educate him for a monk. The monastic school there was one of the most famous in all Germany, and he received an excellent education. Here he lost his faith and, the declared enemy of Christianity, fled to Erfurt in 1504, where he became intimately acquainted with several scholars and poets. In 1511 he went to Wittenberg, where he published a work on versification. Ulrich, Duke of Würtemberg, murdered a cousin of Hutten and Hutten gave free course to his indignation in poems, letters and addresses, which made him known throughout Germany. He distinguished himself no less in the Reuchlinian controversy with the Dominican Hogstraeten in Cologne. Hutten severely criticized the monastic life, and was so much the enemy of the clergy, that by his edition of Laurentius Valla, 'De falso credita et ementita Donacione Constantini,' he declared war upon the Church and prepared the way for Luther. In 1518 he entered the service of Albert, archbishop of Mayence, and made several official journeys to Paris. He also accompanied the archbishop to the Diet at Augsburg, where Luther held his well-known discussion with Cajetan; and Hutten, in a Demosthenic oration, urged the German princes to a war against the Turks. He took the field with the Swabian League in 1519 against his hereditary enemy, Ulrich of Würtemberg, and then retired to the solitude of his paternal castle of Steckelberg, to engage anew in the controversy with the monks. Here he published work after work, violently assailing the Church, the clergy and the state. Leaving Steckelberg in 1522 he went first to Basel and thence to Zürich, where he died. He was a savage and violent controversialist, and was unsparing in the vehemence of his invective. Consult 'Life' by Jordan (1910); and Sturges' translation of Strauss' 'Life' in German.

**HUTTON**, hut'n, Charles, English mathematician: b. Newcastle-upon-Tyne, 14 Aug. 1737; d. 27 Jan. 1823. The destruction of the old bridge at Newcastle having attracted his attention to the subject of the construction and properties of arches, he was led to the production of a small work on the 'Principles of Bridges' (1772), which laid the foundation of his future fame. He was in 1773 appointed professor of mathematics at Woolwich Academy, elected a Fellow of the Royal Society in 1774 and in 1785 published his 'Mathematical Tables,' preceded by an introduction, tracing the progress and improvement of logarithms from the date of their discovery. In 1778 he had gained the Copley medal for investigations on ballistics. At the request of the Royal Society, he carried out investigations concerning the density and mass of the earth. From 1779 to 1783 he was foreign secretary of the Royal Society. On account of ill health he resigned his chair in 1807, receiving a pension of £500 a year. From 1774 to 1817 he edited

the *Ladies Diary*. Later works were 'Tracts, Mathematical and Philosophical' (1786); 'Elements of Conic Sections'; 'Mathematical and Philosophical Dictionary' (1795-96); 'Course of Mathematics' (1798-1811).

**HUTTON, Edward**, English author: b. London, 12 April 1875. He became deeply interested in the literature and art of Italy, and spent several years traveling through that country and through Spain on foot. He is the author of a number of well-known books relating to his studies there. Among these may be mentioned 'Frederic Uvedale: A Romance' (1901); 'Italy and the Italians' (1902); 'Studies in the Lives of the Saints' (1902); 'The Cities of Umbria' (1905); 'The Cities of Spain' (1906); 'Sigismondo Malatesta' (1906); 'Florence and Northern Tuscany' (1907); 'County Walks about Florence' (1908); 'In Unknown Tuscany' (1909); 'Giovanni Boccaccio' (1909); 'Rome' (1909); 'Siena and Southern Tuscany' (1910); 'Venice and Venetia' (1911); 'Highways and Byways in Somerset' (1912); 'The Cities of Lombardy' (1912); 'Ravenna' (1913); 'England of My Heart' (1914); 'Naples and Southern Italy' (1914); 'Attila and the Huns' (1915); 'Highways and Byways in Wiltshire' (1917). He edited also two extremely important works: Dennistoun's 'Dukes of Urbino' (3 vols., 1908); and Crowe and Cavalcaselle's 'History of Painting in Italy' (3 vols., 1908-09).

**HUTTON, Frederick Remsen**, American mechanical engineer, educator and author: b. New York, 28 May 1853. He graduated at Columbia University in 1873; was professor of mechanical engineering there from 1877 to 1907; and has been professor emeritus since 1907. He received the honorary degrees of Sc.D. from Columbia in 1904 and Rutgers College in 1914. He was secretary of the American Society of Mechanical Engineers 1883 to 1906, president 1907, honorary secretary from 1907; consulting engineer department of water, gas and electricity, New York city, 1911; consulting engineer and chairman Technical Committee of Automobile Club of America since 1911; general secretary National Highways Association; secretary Engineering Foundation 1915. A contributor to the leading encyclopedias he is also the author of 'Machine Tools' (United States Census 1880); 'Mechanical Engineering of Power Plants' (1897); 'Heat and Heat Engines' (1899); 'The Gas Engine' (1904).

**HUTTON, James**, Scottish geologist: b. Edinburgh, 3 June 1726; d. there, 26 March 1797. He studied medicine at Paris and Leyden, but on his return (1754) devoted himself to agricultural pursuits and to chemistry, from which he was led to mineralogy and geology. In 1768 he removed to Edinburgh, and there spent his time in scientific investigations. He was the first great British geologist, and the 'originator of the modern explanation of the earth's crust by means of changes still in progress.' He published 'A Theory of the Earth' (1795) and 'A Theory of Rain' (1784); 'Dissertations in Natural Philosophy' (1792); 'Considerations on the Nature of Coal and Culm' (1777), and other works. See HUTTONIAN THEORY.

**HUTTON, Lawrence**, American editor and critic: b. New York, 8 Aug. 1843; d. Princeton, N. J., 10 June 1904. He was privately educated, for some time devoted himself to the study of literature and to foreign travel, in the early 70's became a dramatic critic, and began contributions to periodicals of many sorts. From 1886 to 1898 he was literary editor of *Harper's Magazine* and subsequently he became lecturer in English literature at Princeton University. He was a well-known collector, possessing among various things a famous series of death-masks of historical personages. He was also an organizer and founder of the Authors' Club and of the American Copyright League. Among his numerous writings were 'Plays and Players' (1875); 'Literary Landmarks' of famous cities (1885-1904), etc. Consult Wood, 'Lawrence and Eleanor Hutton: Their Books of Association' (1905).

**HUTTON, Maurice**, Canadian educationist: b. Manchester, England, 1856. He was educated at Magdalen College School and Worcester College, Oxford, and was a Fellow of Merton College, Oxford, 1879-86. In 1880 he was appointed lecturer on classics and ancient history in Firth College, Sheffield, was professor of classics in University College, Toronto (1880-87), and from the latter year has held the chair of Greek in that university, and became principal in 1901. He has published several translations from the classics and articles on Herodotus and Thucydides.

**HUTTON, Richard Holt**, English essayist and journalist: b. Leeds, 2 June 1826; d. Twickenham, 7 Sept. 1897. The son of a Unitarian clergyman, he was educated at University College, London, and in Germany, for the Unitarian ministry, but, coming under the influence of F. D. Maurice, he entered the Anglican Church. In 1861 he became editor of the *Spectator* which owed its prominence largely to him. Through this journal he exercised great influence on the thought, political and religious of his time. During the American Civil War he incurred great hostility and ventured the fortunes of his paper by a strenuous advocacy of the cause of the North. Up till the time of the Home Rule split (1886), he supported the Liberal party. Hutton's best work is in the critical 'Essays, Theological and Literary' (1871); 'Essays on Some Modern Guides of English Thought' (1887); in the biography of Sir Walter Scott in the 'English Men of Letters' (1878); and 'Aspects of Religious and Scientific Thought' (1899). Consult Hogben, 'R. H. Hutton of the Spectator' (1900).

**HUTTONIAN THEORY**, a view of geological processes first published by James Hutton (q.v.) in 1788, in his 'Theory of the Earth,' and developed in 1795. He was the first to distinguish between cosmogony and geology, believing the latter to be in no way concerned with "questions as to the origin of things." His view was that the upraised land of the globe must be worn away by atmospheric influences and the debris be finally deposited in the bed in the sea, where it is consolidated under great pressure; it is then forced upward by subterranean heat, acting with an expansive power, and thereby split and cracked, the fissures at the same time filling with molten mineral matter; and so the process goes on. Hut-

ton was the precursor of Sir Charles Lyell, whose views were essentially the same, and who procured for them large acceptance among geologists. See UNIFORMITARIANISM.

**HUXLEY, Thomas Henry**, English biologist; b. Ealing, Middlesex, England, 4 May 1825; d. Eastbourne, Sussex, 29 June 1895. When he was 12 or 13, he wished to become a mechanical engineer; but a medical brother-in-law (Dr. Salt) took him in hand, and he commenced at this early age the study of medicine. Eventually he went to Charing Cross Hospital, and passed the first M.B. examination of the University of London. Stern necessity compelled him, as soon as his medical course was over, to seek at once, even before he was of age, some post or employment. At the suggestion of a fellow-student, Huxley in 1846 applied for admission to the medical service of the navy, was admitted and was in attendance at the naval hospital at Haslar. The next year he was appointed assistant-surgeon of the *Rattlesnake*, which was sent on an exploring and surveying cruise in the seas on the east and northeast of Australia. The voyage lasted four years and gave Huxley an opportunity of gaining an almost unrivaled knowledge of marine zoology. Various papers on this subject were contributed by him to the Linnæan and the Royal Society (one of them gaining a medal from the latter body, of which he was elected a member in 1851), and a further result of his investigations was the important work published in 1859, entitled 'The Oceanic Hydrozoa.' He suggested the homology between the germinal layers of a vertebrate embryo and the two layers of a medusa.

The *Rattlesnake* returned to England at the end of the year 1850 and Huxley found that the scientific papers he had sent home had already made him famous. By the aid of those who valued the promise given by his published work, he was allowed by the Admiralty for three years to draw pay as a navy surgeon while devoting himself to the working up of the results of his observations when at sea. In 1854 he was appointed lecturer or professor of natural history in the Royal School of Mines, a post long combined with that of naturalist to the Geological Survey. In 1855 he was appointed Fullerian professor of physiology to the Royal Institution, and delivered four courses of lectures in as many years; while he was also an examiner for seven years to the University of London. The posts of Croonian lecturer to the Royal Society and Hunterian professor in the College of Surgeons were likewise filled by him.

There is no doubt that Huxley was fortunate to obtain at 28 a post, worth nearly a thousand a year, in London, and unburdened with any excessive duties. He had to give during winter (October to end of February) a course of lectures on five days of the week, and attend in his study at the Museum in Jermyn street, but had not the cares of a laboratory. He carried out his researches alone, and consequently was able to arrange the employment of his day in his own way. He wrote largely for the press upon such topics as belonged to his branch of science; lectured frequently in other places besides Jermyn street; and took an active and important part in various government commissions, to which his official position rendered it

proper that he should be appointed. His lectures to workingmen, in 1860, on the 'Relation of Man to the Lower Animals,' gave rise to much discussion, and led him to treat the subject in his 'Evidence as to Man's Place in Nature' (1863). By this time the Darwinian theory had given rise to much excited controversy, and Huxley's thorough-going Darwinism brought many a bitter attack upon him. In 1862 he was appointed by government to assist in inquiring into the effects of the acts regarding trawling for herring; and his labors and advice had much influence in determining the course of fishery legislation and administration. In 1870 his name became more prominent than ever on the publication of his collection of papers entitled 'Lay Sermons, Essays and Reviews,' which met with fierce denunciation in many quarters. In this year he presided over the Liverpool meeting of the British Association, and was also elected a member of the first London school board. In 1872 he was elected lord rector of Aberdeen University; in 1875-76 lectured on natural history in Edinburgh University.

In 1883 Huxley received the crowning honor of his life, being elected president of the Royal Society. But ill health soon compelled him to give up his official work. In 1885 he retired from his professorship, from his fishery post and from the presidency of the Royal Society, and confined himself to such work as he could perform in his study at Eastbourne (where in 1890 he built himself a house), or in the Engadine, where he usually spent the summer.

He produced between 1885 and his death in 1895 a large series of brilliant and interesting essays, especially on the relation of science to Hebrew and Christian tradition, and on the evolution of theology and of ethics. During this period he was president of the Marine Biological Association, in the founding of which he took an active part, and in 1892 was made a member of the Privy Council.

In 1888 Huxley received the Copley medal of the Royal Society, and in 1894 the Darwin medal. Huxley was one of the first scientists of his time; his chief and most valuable work was in the direction of the popularization of science, particularly of the Darwinian theory. He was also active along lines of social and political reform, and in the development and organization of scientific education. He wrote, besides the books already mentioned, 'Elementary Physiology' (1866); 'Anatomy of Vertebrated Animals' (1871); 'Critiques and Addresses' (1873); 'Elementary Biology' (with Dr. H. N. Martin, 1875); 'American Addresses' (delivered at New York in 1876 on the fossil horses, 1877); 'Physiography' (1877); 'Hume' (1878); 'The Crayfish: An Introduction to the Study of Zoology' (1880); 'Collected Essays' (1893-94). Between 1898 and 1902 there appeared four volumes of his 'Scientific Memoirs,' under the editorship of Sir Michael Foster and Prof. E. Ray Lankester. An authorized edition of his lesser works was published at New York between 1897 and 1900 in eight volumes. Consult Cadman, S. P., 'Charles Darwin and Other English Thinkers' (Boston 1911); Clodd, Edward, 'Thomas Henry Huxley' (New York 1902); Davis, J. R. A., 'Thomas H. Huxley'

C., 'Thomas Henry Huxley: A Sketch of his Life and Works' (ib. 1900); Osborn, H. F., 'Huxley and Education' (New York 1910).

**HUY**, ū'ē, Belgium, a town on the right bank of the Meuse, at its confluence with the Hoyoux. It is in the province of Liège and 18 miles from the city of Liège. Interesting features are the old citadel, built in the rock wall, dating from 1822, topped by the ancient cathedral of Notre Dame with a 13th-century gateway. Huy had many educational institutions, including a theological seminary and teachers' institute. The ruins of the abbey of Nemouster founded by Peter the Hermit on his return from the first Crusade are to be found in the suburbs. The principal occupation of the vicinity is the cultivation of grapes, and the distilling of wine. There is some manufacture of paper and cloth, and some tin mining. Because of its strategical position, Huy has been a battle ground and has changed hands many times. In 1703, it was captured by Marlborough and Coehoorn; and during the European War fell into the hands of the Germans in 1914, after a stubborn resistance. See WAR, EUROPEAN.

**HUYGENS**, hoi-gēns or hī'gēnz, Christian, Dutch mathematician, astronomer and physicist: b. The Hague, 1629; d. there, 8 June 1695. He studied at Leyden, and at Breda, where he went through a course of civil law from 1646-48. He settled in Paris at the invitation of the minister, Solbert, was elected to the Academy and was given rooms at the Royal Library. He returned to Holland when the Edict of Nantes was revoked, and remained there till his death. Among his most important contributions to science are his investigations on gravitational acceleration and the oscillations of the pendulum, which he was the first to apply to clocks, and his 'System of Saturn,' in which he first proved that the ring completely surrounds the planet, discovered the fourth satellite, and determined the inclination of its plane to that of the ecliptic. He perfected the telescope and invented the micrometer. In 1690 he published important treatises on light and on weight. His 'Traité de la lumière' was an exposition of the undulation theory, but in consequence of the prevalence of the Newtonian theory was long neglected till later researches established its credit. Huygens discovered the polarization of light, which he could not explain because he thought the vibrations of light longitudinal rather than transverse. He also investigated the theory of probabilities. Huygens also wrote 'Theoremata de Quadratura Hyperbolis, Ellipsis, et Circuli, ex Dato Portionum Gravitatis Centro' (1651); 'De Circuli Magnitudine Inventa' (Leyden 1654); 'De Ratiocinatione in Ludo Alexæ' (1656); 'Horologium Oscillatorium, sive de Motu Pendulorum' (1673). His works have been published in 10 volumes by the Koninklijke Akademie van den Wetenskapen (The Hague 1888-1905). Consult Bosscha, 'Christian Huygens' (tr. into German, Leipzig 1895); Harting, P., 'Christian

Huygens in Zijn Leven en Werken Geschetzt' (Groningen 1868).

**HUYGENS**, Constantijn, Dutch writer: b. The Hague, 1596; d. 1687. From his early youth he received special training in diplomacy. He was educated at the universities of Leyden, London and Oxford. In 1620 he was special diplomatic envoy to Venice and the following year to London. King James I conferred knighthood on him in 1622. In 1625 he was appointed private secretary to the Stadtholder and five years later became a member of the Privy Council. His works include 'Batava Tempe' (1623); 'Costelick Mal' (1624); 'Otia, Ledige uren' (1625); 'Dagherwerck' (1637); 'Hofwijck.' In 1658 his poems appeared in a collected edition entitled 'Korenbloemen,' and the year following appeared the drama 'Tryntje Cornelis.' Consult the autobiographical 'Cluyswerck' (Amsterdam 1841) and 'De Vita Propria' (ib. 1817); Dumesnil, A. J., 'Histoire des plus célèbres amateurs étrangers' (Paris 1860); Jorissen, 'Constantijn Huygens' (Amsterdam 1871).

**HUYGENS' PRINCIPLE.** See LIGHT.

**HUYSUM**, hoi'sum, Jan Van, Dutch painter: b. Amsterdam, 1682; d. there, 8 Feb. 1749. His father was Justus van Huysum, a landscape painter and decorator of no mean skill. From him he acquired the art of painting formal landscapes, imaginative, and fine in coloring, but lifeless and studied in composition. No motion stirred the trees of his scenes, nor did any animation brighten the faces of the figures of his paintings. Later he abandoned landscape painting for still life reproductions and proved himself a consummate master in the art. His backgrounds are generally light, against which he projects gay bouquets of flowers and fruits, often introducing butterflies, insects, birds' nests, etc. His work is characterized by a remarkable perfection of detail and coloring, rarely surpassed. Later critics have found fault with this heightened perfection and have deplored the absence of breadth of treatment and insight. The works of Huysum are best seen at the Louvre; the galleries of Berlin, Amsterdam, Petrograd, The Hague, Copenhagen, Vienna; and in private collections in England.

**HWANG** or **HOANG-HO**, hwāng'hō, or **YELLOW RIVER**, China, a large river which rises in the mountains of North Tibet, in the Koko-Nor territory, about lat. 34° 30' N. and long. 97° 30' E. It derives its name from the vast quantities of yellow mud continually carried down by its waters. After a winding course, north, east and south, of about 2,600 miles, it flows since 1853 into the Gulf of Pe-chi-li; prior to that year its outlet was in the Yellow Sea. It is a turbulent, turbid and impracticable stream, but little used for navigation, and subject to disastrous floods is known as 'China's' sorrow. The misery which followed the flood of 1898 was the chief cause of the Boxer Rebellion. To prevent inundation and the former frequent changes in its bed and outlet, great expense is incurred maintaining artificial embankments.

**HYACINTH.** (1) A genus (*Hyacinthus*) of lilies with corolla-like, bell-shaped, six-cleft perianth, six stamens fixed in the tube of the

perianth, and dry capsular fruit. The Oriental hyacinth (*H. orientalis*), one of the chief favorites of florists, is a native of Asia Minor, Syria and Persia. It is now naturalized in some parts of the south of Europe. It has broad linear leaves, and a scape with a raceme of many flowers pointing in all directions. The flowers in cultivation exhibit great variety of color, chiefly blue, purple and white. They are very beautiful and very fragrant. The fragrance is strongest about or after 11 o'clock at night. Among cultivated hyacinths are many with double flowers. The hyacinth has been cultivated from a remote period. It was introduced into Europe, probably by the Dutch, about the beginning of the 16th century. The grape-hyacinth is a somewhat different plant of the genus *Muscari*, of which *M. racemosum* is common in gardens. (2) See ZIRCON.

**HYACINTHE**, Père, pār ē-ā-sānt. See LOYSON, CHARLES.

**HYACINTHUS**, in Greek mythology, the youngest son of King Amyclæ of Amyclæ, who was killed by Apollo. The story is told as follows: Apollo, attracted by the beauty of the young prince, fell in love with him. One day while he was teaching the lad to throw the discus, Boreas (or Zephyrus), who was jealous, lifted the discus so that it struck and killed Hyacinthus. His death was greatly mourned by Apollo, who admitted him with his sister Polybœa to the immortals. A flower called the hyacinth grew up out of the blood of the boy, and on its petals were inscribed the word "AI," the sound of mourning. The incident was commemorated by the Spartans by the feast of Hyacinthia, which was one of the most strictly observed of Laconian celebrations. Amyclæ, the scene of the event, was held highly sacred, for here was the tomb of Hyacinthus, on which stood a shrine to Apollo. Allegorically, the myth is generally interpreted as the slaying of the Spring by Summer. Consult Frazer, J. G., 'Adonis, Attis, Osiris' (in the 'Golden Bough,' Pt. IV, Book II, Chap. 7, London 1906).

**HYADES**, hī'a-dēz, in Greek mythology, the daughters of Atlas and Æthra. They lived at Dodona, where they cared for Zeus and nursed the infant Bacchus. As a reward they were translated to the stars. Another tradition makes them sisters of the Pleiades. Their brother Hyas having been killed, they mourned so for him that Zeus changed them into stars. Their rising and setting ushered in the rainy season in April and November. The Romans translated the name into "Suculæ" (little pigs), deriving the word from *sūs*, sow. The Hyades were associated with the fertilizing principle of rain and moisture.

**HYENODON**, hī-en'ō-dōn, a genus of primitive carnivorous mammals (*creodonts*), fossil in the Upper Eocene and Lower Miocene rocks of Europe, Africa and the western United States, of which several species are known by well-preserved skeletons. The skull was relatively very large and long, with great canines and strong, hyena-like molars, but the brain-cavity was very small. The feet were fully five-toed, had powerful claws, and the animal, which must have somewhat resembled a small, cat-like bear, was partly plantigrade. Species

of this family (*Hyænodontidæ*) were the last of the creodonts, surviving to the Middle Oligocene (Oreodon zone).

**HYALITE**. A variety of opal (hydrous silica) which occurs in clear globular or botryoidal forms resembling drops of melted glass. Used as a gem. Occurs in Arizona and Georgia and a large deposit of banded hyalite in Beaver County, Utah, is being utilized to some extent.

**HYAMS, Henry Michael**, American lawyer and politician: b. Charleston, S. C., 1805; d. New Orleans, 1875. In 1828 he went to New Orleans, studied law, and after 15 years of country practice in Alexandria, La., resumed his residence in New Orleans, where his investments in landed property made him wealthy. In politics he was originally an old line Whig, but on the outbreak of Know-Nothingism joined the Democratic party. In 1855 he was elected to the State senate; in 1859 he was chosen lieutenant-governor, the first member of the Jewish race to hold such an honor in the United States. He was devoted to the Southern cause, sent his sons to fight in the Confederate army and after the war found his large fortune vanished. Prepared to begin life anew, he resumed the practice of law until his death.

**HYATT, Alpheus**, American naturalist: b. Washington, D. C., 5 April 1838; d. Cambridge, Mass., 15 Jan. 1902. He was graduated from the Lawrence Scientific School at Harvard in 1862, then entered the army and served during the war in the 47th Massachusetts regiment, being promoted to the rank of captain. After leaving the army, he resumed his studies under the instruction of Agassiz, and later studied abroad. In 1867 he went to Salem, where he was one of the founders of the Peabody Academy of Sciences and one of the curators of the Essex Institute. In 1870 he was made custodian of the collections of the Boston Society of Natural History, becoming curator in 1881. He was also professor of biology and zoology from 1877 to 1902 at Boston University; was organizer and manager of the Teacher's School of Science (1870-1902); had charge of a summer laboratory of marine zoology founded by the Women's Educational Society at Annisquam, which was later moved to Woods Hole where its work was greatly expanded with Hyatt as president of the board of trustees; he was also for 18 years professor of zoology and palæontology at the Massachusetts Institute of Technology. In his later life he had charge of invertebrate fossils in the Museum of Comparative Zoology at Cambridge. He was a member of the American Academy of Arts and Sciences, of the American Philosophical Society, of the Geological Society of London, of the National Academy of Sciences and of the American Society of Naturalists. He was one of the founders of the last mentioned society and its first president (1883); he was also one of the founders and, from 1868-71, editor of the *American Naturalist*. He held the honorary degree of LL.D. from Brown University. His most distinctive work was the investigation of the development of the fossil *Cephalopods* and of the fossil and semi-fossil *Planorbis* on Steinheim Lake, Germany, from which investigations he deduced laws of growth very important to the evolutionary theory. He was also especially

successful as a teacher of science teachers. His interests were broad and he was a member of that remarkable coterie of intellects which adorned Boston in the latter part of the 19th century, including Longfellow, Emerson, Holmes, James and others. His works include 'Observations on Polyzoa' (1866); 'Fossil Cephalopods of the Museum of Comparative Zoology' (1872); 'Revision of North American Porifera' (1875-77), the only work on North American commercial sponges; 'Genesis of Tertiary Species of Planorbis at Steinheim' (1880); 'Genera of Fossil Cephalopoda' (1883); 'Larval Theory of the Origin of Cellular Tissue' (1884); 'Genesis of the Aretidae' (1889); 'Carboniferous Cephalopods' (1891-93); 'Bioplastology and the Related Branches of Biologic Research' (1893); 'Phylogeny of an Acquired Characteristic' (1894); 'Pseudocerabites of the Cretaceous' (1903); 'The Triassic Cephalopod Genera of America' (1905). All of these were published in scientific journals or as part of official scientific reports, as were also many other shorter papers on similar subjects. A full bibliography will be found attached to the memoir by W. K. Brooks, 'Alpheus Hyatt' (in *National Academy of Sciences, Biographical Memoirs*, Vol. VI, p. 311, Washington 1909). Consult also Anon., 'Memorial of Professor A. Hyatt' (in Boston Society of Natural History, Proceedings, Vol. XXX, p. 413, Boston 1902); Jackson, R. T., 'A. Hyatt and his Principles of Research' (in *American Naturalist*, Vol. XLVII, p. 195, Lancaster 1913); Mayer, A. G., 'Alpheus Hyatt' (in *Popular Science Monthly*, Vol. LXXVIII, p. 129, New York 1911); Packard, A. S., 'Alpheus Hyatt' (in American Academy of Arts and Sciences, Proceedings, Vol. XXXVIII, p. 715, Boston 1903); Zirngibel, F., 'Teachers' School of Science' (in *Popular Science Monthly*, Vol. LV, p. 451, New York 1899).

**HYATT, Anna Vaughn**, American sculptor. b. Cambridge, Mass., 10 March 1876. After a preliminary education at private schools, she studied at the Art Students' League, New York, and later under Henry Kitson, H. A. McNeil and Gutzon Borglum. Her works consist mainly of small bronzes of animals, which are executed with rare spirit and delicacy. They have appeared at various exhibits and a number are owned by the Metropolitan Museum. Her larger pieces include a lion at Dayton, Ohio; a memorial statue at Lancaster, N. H.; 'Joan of Arc,' New York city. Miss Hyatt has been awarded honorable mention at the Paris Salon (1910); silver medal at the San Francisco Exposition (1915); Rodin gold medal at Philadelphia (1917), and was appointed curator of sculpture in the French Museum of Art in the United States.

**HYBLA**, hi-blā, the name of several ancient cities in Sicily, of which the best known are Hybla Major, identified with Hybla Megara, a seaport near Syracuse; and Hybla Minor, or Galeatis, near Mount Ætna, where the city of Paterno now stands. Hyblæan honey, celebrated in Roman poetry, is generally supposed to have come from the former city.

**HYBRIDITY**, the crossing of two individuals of distinct species. The result of the intercrossing of species is a hybrid, for exam-

ple, the mule, which is the result of breeding the horse with the ass. As the mule is invariably sterile, the infertility has always been supposed to be a test of species. But this is not an invariable rule, as not a few so-called "good" species have been crossed with one another. It may be set down as a general proposition that the difficulty of crossing increases the more distant the systematic relationship of the species experimented with. Also these difficulties are, says Hertwig, by no means directly proportional to the systematic divergence of the species.

Nature tends to keep species separate, in the higher animals, as well as among insects, etc.; mating is usually prevented by the structure of the parts concerned with sexual union; also the principle of preferential mating comes into play among mammals as well as insects, as often between males and females, even of closely allied species or varieties. When there are no structural differences there may exist an aversion which prevents any union of the sexes.

**Artificial Hybridization.**—Many experiments have recently been made on the lower marine animals in which the eggs are fertilized in the sea without sexual union, by placing the eggs of starfish and sea-urchins, etc., in a watch-glass and adding the sperm of the males, thus securing artificial fertilization. In this way hybrids have been obtained from species belonging to quite different genera, while it has been found that in some cases closely related species will not cross. For example, among the sea-urchins the spermatozoa of *Strongylocentrotus lividus* readily fertilize the eggs of a species of Echinus, but only rarely those of the more closely allied *Sphærechinus granularis*. Hybrids have been obtained from different genera of fishes, as those between the salmon and brown trout. It appears that salmon eggs have been fertilized by trout sperm, but not trout eggs by salmon sperm. According to Hertwig eggs have been fertilized by sperm belonging to species of different families, orders and possibly classes. For example, the eggs of a flounder (*Pleuronectes platessa*) and of *Labrus rupestris* have been fertilized by the sperm of the cod; frog's eggs (*Rana arvalis*) by sperm of a triton, and even, it is said, the eggs of a starfish by milt from a sea-urchin; in such cases, however, the hybrids die during or at the close of segmentation of the yolk.

**Fertility of Hybrids.**—While the mule and many other hybrids are sterile, there are some known exceptions. Hybrids of hares and rabbits have continued fruitful for generations, and also hybrids obtained from the wild buck and she-goat, from the Chinese goose (*Anser cygnoides*) and the common goose (*A. domesticus*); from *Salmo salvelinus* and *S. fontinalis*; *Cyprinus carpio* and *Crassius vulgaris*, as well as between the two silkworm moths, *Philosamia cynthia* and *P. ricini*, the Arrhindy worm. In this country Caton has hybridized the common Virginian deer with the Ceylon deer and the Acapulco deer, and states that the hybrids seemed perfectly healthy and prolific. Ewart states that the Indian buffalo and the American bison produce fertile hybrids with the European wild ox.

In the human species it is a well-established fact that marriages between remote varieties or races tend to sterility, while crossing between

allied races are fertile, and such unions are most beneficial. Thus the most mixed white races are the most fertile and vigorous. Ewart thinks that as there are no definite limits between species and varieties, there can be "no fundamental difference between a hybrid and a cross, nor yet any *a priori* reason why any given hybrid should be sterile, or any given cross fertile." He also states that sterility has in some cases been slowly acquired, in others abruptly, but how it has been acquired is not known.

As the result of breeding thousands of moths Standfuss states that in no case observed by him has the female of a true hybrid been shown to be fertile. On the other hand, the occurrence of undoubted cases of fertility in male hybrids has been proved by crossing the male hybrids with the females of both parent species.

**Ewart's Experiments with Crossing the Zebra and Horse, and the Wild Ass and Horse.**—A Burchell's zebra stallion, "Matopo," became the father of nine zebra hybrids by mares of various sizes and breeds. The hybrids exhibited a curious blending of characters, which seemed to have been derived partly from their actual and partly from their remote ancestors; some of the hybrids strongly suggest their zebra sire, others their respective dams, "but even the most zebra-like in form are utterly unlike their sire in their markings."

He succeeded in securing a male wild ass (kiang) from central Asia and a couple of Mongolian pony mares, one a yellow dun and the other a chestnut. The wild ass was mated with the dun Mongol mare, a brownish-yellow Exmoor pony and a bay Shetland-Welsh pony. The kiang hybrid in its long legs, slender joints and speed took after its kiang parent. The mane and tail "are exactly what one would expect in a mule." This kiang hybrid also differs from the wild horse (Przewalsky's horse) in not neighing like a horse. The result is to prove that the wild horse is not a kiang-pony male, but a "good" species. Also in accordance with Mendel's law (see under HEREDITY) the kiang proved to be dominant, the Exmoor pony recessive. It is generally held that an old species is prepotent over a more recent variety.

**Hybridity in Plants.**—The method of hybridizing hermaphroditic flowers is to cut away their stamens before they are ripe and then enclose the flower in a paper bag. After the stigma has ripened the pollen is placed on it, the bag is again tied over the flower and not removed until the seed begins to form. Great advantages and improvements in agriculture have resulted from hybridizing plants, chief among which are many new varieties of cultivated plants, increased size and vigor, hardiness, or adaptation to warmer climates, and increased resistance to disease, as well as increase in odor of flowers and the quality and flavor of fruits.

**Sterility in Hybrids.**—Thus far the cause of infertility in animals is unknown, but botanists attribute the frequent sterility of plants to the imperfect formation of the pollen. Standfuss' experiments with moths agree with Focke's statement as to the great variability of the offspring resulting from the crossing of a plant hybrid with one of the parent species. In plants, as discovered by Mendel, the proportion of the pure races is constantly increasing in the successive generations descended from a hybrid.

Malformations and sports are much more frequent, especially in the floral organs in hybrids, than in individuals of a pure descent. Double flowers appear to be formed especially easily in hybrids. Recent experiments and results in the study of hybridity show how intimately the subject bears on heredity (q.v.) and the origin of species.

**HYBRIDS IN PLANTS.** A hybrid may be defined as a cross between two parents belonging to different varieties or different species. In a few cases, two different genera have been crossed. Thus, it is evident that the term, hybrid, is used whenever the two parents do not belong to the same species or variety. Consequently, a hybrid differs from the result of ordinary fertilization only in the fact that the two parents are not so closely related. When hybrids are produced artificially, the pollen from one parent is placed upon the stigma of the other parent, great care being taken to exclude all other pollen. When the parents are dioecious—the male bearing only anthers with pollen, and the female only ovaries tipped with stigmas—it is easy to exclude other pollen by placing a paper bag over the female flowers. When the anthers and ovaries are on the same plant, but in different flowers—as in corn, where the tassel bears the anthers and the silk is tipped with the stigmas—there is little difficulty in making a cross. The tassel of the plant to be used as the female parent is cut off before it ripens any pollen; a tassel from the male parent is shaken over the silks of the female until the silks are well dusted with pollen; a paper bag is then placed over the silks. It is an interesting fact that in corn, the male parent determines whether the content of the grain is to become starch or sugar, i.e., whether there is to be "sweet corn" or "field corn"; so that sweet corn may be raised on a plant grown from field corn seed, and vice-versa. When the two parents, anthers (male) and

ovaries (female), are in the same flower, as in lilies and most flowers, the anthers of the flower to be used as the female parent must be removed before they ripen their pollen, lest "close fertilization" might result. The stigma is then dusted with pollen from the male parent, and a paper bag is applied. While numerous hybrids occur in nature, artificial hybridization is of immense importance, economically, in developing new forms better suited to local conditions, since desirable features of different "races," "strains" or varieties, as various degrees of close relationship are denominated, may be combined by judicious crossing.

The term, graft hybrid, has become fixed in the literature of the subject. As the name implies, it is a hybrid secured by grafting. Such hybrids have been known for nearly 100 years; but they have more recently come into prominence through the researches of Winkler, who succeeded in grafting the nightshade (*Solanum nigrum*) upon the tomato (*Solanum lycopersicum*). The resulting form had some leaves like those of the nightshade and some like those of the tomato and still others showed mixed characters; altogether, the "hybrid" was so bizarre that it was called a *chimera*. It is now believed that such chimeras are not the result of any blending of characters but that they are built up of pure cells of the two "parents," so that the *chimera* may be regarded as a mosaic built up of two kinds of blocks, the cells representing the blocks. Consult Winkler, H., 'Untersuchungen uber Propfbastarde' (Jena 1912). A review, with references, may be found in the *Botanical Gazette* (Vol. LI, 1911, p. 147).

CHARLES J. CHAMBERLAIN.

**HYDASPES.** See JHELAM.

**HYDATHODES**, hí'dá'thódz, special surface organs or glands on plant leaves exuding water when there is excess pressure in the moisture channels, due to diminished transpiration. They are of great variety and widely distributed, especially in the tropics where the roots of plants absorb abundantly under humid atmospherical conditions. Some hydathodes both secrete and excrete moisture.

**HYDATID**, hí'dá-tíd. See BLADDERWORM; TAPEWORM.

**HYDE, Anne, DUCHESS OF YORK**, eldest daughter of the Duke of Clarendon, and first wife of James II of England: b. 1637; d. 1671. At the age of 17 she became maid of honor to the Princess of Orange, and while visiting in Paris in the retinue of the Princess made the acquaintance of James who was then Duke of York. Despite the disapproval of both families, the young couple were married in September 1660. Slander and threats were used to dissolve the match, but Anne maintained a dignified aloofness to all interference. In 1667 she became a Roman Catholic, converting her husband shortly after. She was the mother of queens Mary and Anne.

**HYDE, Douglas**, Irish author and historian: b. Frenchpark, County Roscommon, 1860. After receiving his bachelor's degree from Trinity College, Dublin, in 1884 and his LL.D. three years later, he became interim professor of modern languages at the State University of New Brunswick (1891). Hyde's chief title to fame rests on his splendid studies of Irish lit-

erature and his collections of Irish folklore. He is a prominent figure in the Irish national revival. He was president of the Irish National Literary Society (1894-95), and was one of the prime organizers and first president of the Gaelic League, resigning from that office in 1915. In Ireland he is popularly known by the Gaelic pseudonym of "An Craoibhin Aoibhinn" (sweet little branch). In 1906 he visited the United States in order to raise funds for the support of the league, and was successful in collecting some \$55,000. He was president of the Irish Texts Society; examiner in Celtic to the Royal University of Ireland; assistant editor of the New Irish Library; a member of the Royal Commission on Irish University Education; and a member of the senate and professor of modern Irish in the National University of Ireland (1909). Hyde's most monumental work is his 'Literary History of Ireland' (1899), a fine piece of pioneer scholarship. His other writings are in varied literary forms: lyrics; essays, folktales, plays and history. He writes with equal fluency and skill both in Gaelic and English. His numerous works include 'Leabhar Sgeulúigheachta' (1899); 'Beside the Fire' (1890); 'Cois na teicadh' (1891); 'Love Songs of Connacht' (1894); 'Three Sorrows of Story Telling' (1895); 'Story of Early Irish Literature' (1897); 'An Sgeuluidhe Gaodhalach' (1898-1901; translated into French, 1901); 'Mediæval Tales from the Irish' (Vol. I of Irish Texts Society, 1899); 'Ubhla den Chraoibh' (Irish poems, 1900); 'Casadh an tsugáin' (a play in Irish, 1901); 'Sgéalta' (1902); 'Fílidheacht Ghaedhalach' (1903); 'Raftery's Poems' (1904); 'The Bursting of the Bubble,' 'An Pósadh,' 'An Cleamhnas,' 'King James,' 'The Tinker and the Fairy' (Irish plays, 1905); 'The Religious Songs of Connacht' (1906); 'Sgeuluidhe Fíor na Seachtmhaine' (1909); 'Maistin an Bheurla' (a play, 1913); 'Legends of Saints and Sinners from the Irish' (1915). Many of his poems reproduce the exact metre of the original Gaelic verse, and are replete with quaint conceits which show a sympathetic and scholarly handling of the translations. Dr. Hyde has kept aloof from the political and religious embroilments which have torn the Irish nationalists, preferring always to keep the main problem above party interest.

**HYDE, Edward.** See CLARENDON, EDWARD HYDE, EARL OF.

**HYDE, Edward.** See CORNBURY, EDWARD HYDE, LORD.

**HYDE, Edward**, British colonial governor in America: b. England, about 1650; d. North Carolina, 8 Aug. 1712. In 1710 he arrived as governor of the Albemarle district of North Carolina province. The provincial governor, by whom he was to be commissioned, was dead, and Thomas Carey, formerly a deputy governor, had undertaken an armed insurrection. Hyde, at the request of the better class of the population, took office as governor and, assisted by Spotswood, governor of Virginia, crushed the revolt. Not long after massacres by the North Carolina Indians compelled him to seek aid from Virginia and South Carolina.

**HYDE, Helen**, American artist: b. Lima, N. Y. After a preliminary course at the Wellesley School, Philadelphia, she studied

under Emil Carlsen at the San Francisco Art Institute. Later she continued her work under Frank Skarbina, Berlin; Raphael Collin, Paris, and Kano Tomonobu, Tokio. Miss Hyde's best work is in studies of women and children, executed chiefly by wood cut and etching. Particularly charming are her wood cuts and water colors of Japanese women and children, the fruit of 14 years of work in Japan. On her return to the United States, she made a series of cuts of Mexican subjects, which are preserved in the Congressional Library at Washington. Others are to be seen at the New York Public Library and the Art Museum at San Francisco. Miss Hyde is a member of various American, European and Asiatic art and etching societies.

**HYDE, William Dewitt**, American college president: b. Winchendon, Mass., 23 Sept. 1858; d. 29 June 1917. He was graduated from Phillips Exeter Academy in 1875, from Harvard in 1879, and studied theology at Union and Andover. After completing his theological studies he was pastor for a time at Paterson, N. J. In 1885 he became president of Bowdoin College; at that time he was the youngest college president in the United States, and was not widely known. He soon gained a high reputation as a scholar and an able executive, the college growing largely in numbers and resources during his administration. His clear, logical and brilliant contributions to American literature include 'Practical Ethics' (1892); 'Social Theology' (1895); 'Practical Idealism' (1897); 'The Evolution of a College Student' (1898); 'God's Education of Man' (1899); 'The Art of Optimism' (1900); 'Jesus' Way' (1902); 'The College Man and the College Woman' (1906); 'Self Measurement' (1908); 'Sin and its Forgiveness' (1909); 'The Five Great Philosophies of Life' (1911); 'The Gospel of Good Will' (1915).

**HYDE**, England, a town and municipal borough in Cheshire, on the Tame River, about eight miles east of Manchester on the Great Central Railway. The principal industry is cotton manufacture. There are also important iron works, and factories for machinery, hats and margarine. Coal-mining is extensively carried on in the district. Its greatest increase of population has taken place within the last century, due to the increase in the number of factories and the development of the collieries. The old manor hall once owned by the ancient family of Hyde dates from the reign of King John. Hyde received its charter as a municipal borough in 1881, and is governed by a mayor, six aldermen and 18 councillors. The municipality owns its waterworks, sewage plant, markets and cemetery. There are also a library, public baths and a hospital. Area, 3,081 acres. Pop. 33,500.

**HYDE PARK**, London, a park in the West End, adjoining Kensington Gardens. It derived its name from having been the manor of the Hyde belonging to the abbey of Westminster, and contains nearly 400 acres. It was opened to the public shortly after the Restoration in 1660, and abounds with fine trees and pleasing scenery. The sheet of water called the Serpentine River was made between 1730 and 1733 by order of Queen Caroline. It is much frequented in summer for bathing, and during

frosts for skating. The park is the regular meeting place for public speech on popular questions by independent orators. Attractive features of the park are the fashionable drive, bridge path, promenade of Rotten Row, the Ladies' Mile, Marble Arch and the statue of Achilles by Westmacott, cast from the cannon trophies of Waterloo, in honor of the Duke of Wellington.

**HYDE PARK**, Mass., a former town in Norfolk County, on the Neponset River, and on the New York, New Haven and Hartford Railroad, southwest of, but since 1912 incorporated with, Boston. The town enclosed four villages and was incorporated in 1868. Rubber goods, paper, morocco, cotton and woolen goods, curled hair, chemicals, dyestuffs, looms and machinery are manufactured within its boundaries. It is a residential suburb for many Boston business men. It has good schools and a well-equipped free library. Pop. 15,507.

**HYDE PARK**, Vt., village in the town of Hyde Park, county-seat of Lamoille County, on the Lamoille River and on the Boston and Maine Railroad, about 31 miles northeast of Burlington and 23 miles north of Montpelier. Stone quarries nearby are worked and flour, lumber, dairy products and leather are manufactured. Pop. about 500.

**HYDER ALI**, hi'dér ä'lë, Indian Mohammedan prince: b. Bangalore, about 1728; d. Chittore, 7 Dec. 1782. Of humble origin and unable to read or write, his bravery at a siege in 1749 attracted the notice of the Rajah of Mysore; deposing Kandih Rao, he was chosen Rajah of Mysore in 1762, and he so greatly extended his dominions, that in 1766 they contained 84,000 square miles, and afforded an immense revenue. His reign was passed in wars with the English and with the Mahrattas. A treaty which he made with the East India Company in 1769 for the mutual retrocession of all conquests, was violated in 1780, and, forming an alliance with the Mahrattas, he obtained the services of French officers, invaded the Carnatic and took Arcot on 31 October of the same year. He was finally defeated by Sir Eyre Coote, 1 June 1781. He was succeeded by his son Tipoo Saib (q.v.). Consult Bowring, 'Haidar Ali' (in the 'Rulers of India' series, 1893).

**HYDERABAD**, hi-dér-a-bäd', or **HAI-DARABAD**, hi-da-rah-bäd', India. (1) One of the largest native states occupying the greater part of the Deccan plateau of southern India, in possession of the Nizam, a Mohammedan prince, and frequently called the Nizam's Dominions. It is bounded north by Berar, northeast by the Central Provinces, southeast by Madras and west by Bombay. Area, 82,698 square miles; pop. about 13,374,676. The chief rivers are the Godavari in the north and the Kistnah in the south. The soil generally is fertile but poorly cultivated; the principal crops are rice, wheat, maize, sugar-cane, tobacco, cotton and fruits. Indigo is manufactured, and the forests yield valuable timber; there are coal and iron deposits, and diamonds and other gems are found. The ruler belongs to the dynasty founded by Asaf Jah, a distinguished soldier, whom the Emperor Aurungzebe made viceroy of the Deccan in 1713 with the title of Nizam or Regulator.

(2) **HYDERABAD**, the capital, is on the Musi River, at an elevation of 1,672 feet above the sea, about 400 miles in a direct line southeast of Bombay, with which it is connected by rail. It is wall-girt, and its chief buildings are the extensive nondescript palace of the Nizam, the handsome British Residency, the Charshinar, or Four Minarets, built about 1590 as a Mohammedan college, but now used for warehouses, and the Jumma Musjid or cathedral mosque, a reproduction of that at Mecca. Pop. about 500,623. (3) **HYDERABAD**, the capital of a district of Sindh, British India, on the east bank of the Indus, is a well-fortified town connected by rail with Karachi, 105 miles to the southwest. Pop. 76,000.

**HYDRA**, hī'dra, a monster well known in Greek fable. She was the offspring of Echidna and Typhon, and inhabited the marshes of Lerna, not far from Argos. She had many heads, which were endowed with the faculty of renewing themselves endlessly. Thus, although many heroes tried to slay the hydra, Hercules alone succeeded by a clever trick. As fast as he severed her heads, Iolaus, his companion, burned the roots with a flaming brand. The central head which was immortal was buried underneath a huge rock by the hero who then dipped his arrows in the poisonous blood of the hydra. With these weapons he slew the gorgon, Medusa. According to Preller, the hydra-myth is the allegorical interpretation of the damp ground of Lerna, with its numerous springs which exuded a poisonous vapor. The slaying of the hydra by Hercules signifies the purification and draining of the marsh.

**HYDRA**, a minute fresh-water polyp, living on the stems and underside of submerged leaves. The body is a club or vase-shaped sac, the mouth at the upper end surrounded by a crown of from five to eight long tentacles armed with lasso or netting cells buried in the skin. The hydra feeds on minute crustacea, etc., which become paralyzed when swimming in contact with the arms of the hydra, thus being easily drawn by the creature into its stomach. The body is very retractile, and the hydra can slowly move from one place to another, by detaching the end of the body. The sexual cells are, during the reproduction season, developed in the skin, appearing as circular swellings, one (male) just below the tentacles, the other mass, corresponding to the ovary of higher animals, farther down the body. The hydra is famous from its power of regenerating parts of its body. Trembley in 1744 experimented upon this animal; he cut them in two, also into slices, and found that each bit became a new hydra, finally he turned one inside out, the stomach-lining becoming the skin, this experiment having recently been successfully repeated. This is due to the lack of differentiation in the tissues and organs of the body, there being no distinct nervous, or circulatory system, the hydra being the most generalized member of its class, except the Protohydra, which has no tentacles. See **HYDROZOA**.

**HYDRA**, Greece, an island five miles off the east coast of Morea. Its length is 11 miles, and its breadth three miles, at its widest point. The island is rocky, with steep cliffs descending to the sea. Hydra, the main town, was in former times an important seaport, but has

greatly declined. Silk, cotton, leather goods and ships are manufactured, and there is still some trade. Hydra is the seat of a bishopric. Pop. about 6,000.

**HYDRANGEA**, hī-drān'jē-ā, a genus of shrubby plants of the family *Hydrangeaceæ*, with about 35 species indigenous to eastern Asia and temperate America. They have large simple leaves and very large cymes of flowers, the outer ones often infertile. *H. arborescens* grows on the Alleghanies, and in other parts of the United States. *H. radiata*, a more ornamental shrub, occurs in the region of the southern Alleghanies. *H. quercifolia*, distinguished by its lobate leaves, inhabits the States bordering the Gulf of Mexico. The best-known species is *H. opuloides*, a common greenhouse plant. *H. paniculata*, a hardy species, is one of the commonest cultivated shrubs. Both the last are natives of China and Japan.

**HYDRANTS**. See VALVES AND HYDRANTS.

**HYDRANTIS**, a genus of plants of the *Ranunculaceæ* family, having two species, *H. canadensis*, popularly known as orangeroot, yellowroot and golden seal, and a Japanese variety of which little is known. The rhizome and rootlets are used as a bitter stomachic tonic and a tonic to the uterus in various diseases. In poisonous doses it stops the heart-action.

**HYDRATE**, in chemistry, a compound containing one or more molecules of the radical "hydroxyl" (OH). In these compounds, the water may be considered as playing the part of an acid, and the compounds themselves are entirely analogous to salts. Thus water, H<sub>2</sub>O, combines with sodium oxide, Na<sub>2</sub>O, according to the equation Na<sub>2</sub>O + H<sub>2</sub>O = 2 NaOH; the reaction being accompanied by the liberation of considerable heat. The sodium hydrate (NaOH) that is produced is quite a different substance from the simple oxide, Na<sub>2</sub>O, and it cannot be resolved into Na<sub>2</sub>O and water by the action of heat alone. In organic chemistry hydrates are met with very frequently. The large and exceedingly important class of substances collectively known as the alcohols, for example, are hydrates of organic radicals. See **ALCOHOL**.

The word "hydrate" is also used in a less definite manner, to signify any compound which contains water, or from which water can be expelled by the action of heat. Thus salts or minerals which are associated with water of crystallization are said to be "hydrated." When an aqueous solution of a salt, containing an excess of the salt in the free state, is cooled until it freezes, a mechanical mixture of ice and of the precipitated salt is obtained, which is known as a "cryohydrate," although it is not a definite chemical compound.

**HYDRAULIC** (hī-drā'illc) **CEMENT**. See **CEMENT**.

**HYDRAULIC CRANE**, a type of crane in which the motive power is water under hydraulic pressure. There are two general styles of hydraulic cranes: direct-acting and indirect-acting. In the former class the lifting mechanism is applied directly to the load; in the latter the power works upon a system of pulleys and chains, for the purpose of increasing the speed of operation, or of multiplying the working force. The mechanical action of the hydraulic

crane is the same as in the hydraulic press (q.v.).

The direct-acting cranes are of two distinct designs; those in which the lifting mechanism is contained within the post of the crane, and those where the lifting cylinder with its piston and ram is suspended from the crane-head, as in the Armstrong crane. The indirect mechanisms are generally placed horizontally in a pit under the base of the crane, the operating chains passing up through the post and thus to the crane-head. Provision is generally made also for revolving the crane by the hydraulic power.

The hydraulic crane has a decided mechanical advantage in conditions where a very great force is to be exerted through a comparatively short lift. In the Armstrong crane, however, lifts of 40 feet are attained with remarkable speed. It is economical as compared with other forms of cranes, because when the crane is idle no power is being used to keep up the momentum of the driving machinery, as with steam and electric cranes. Moreover, the hydraulic crane has but very few moving parts, and there is therefore a minimum of wear and great durability. It is, besides, capable of instantaneous control, impossible in any form of geared cranes. In the direct-acting hydraulic cranes the efficiency is close to 90 per cent.

In designing a hydraulic crane the formula commonly in use is that for each pound of pressure per square inch on the lifting piston a "head" of 2.31 feet is required in the water-supply—whence the required head of water will be the total lifting power desired divided by the area in square inches of the lifting piston, multiplied by 2.31. As a matter of practice the pressure of the water used is not often due directly to a head of falling water, but to water from hydraulic accumulators which is under the pressure of weights and sustained by high-pressure pumps. The water pressures commonly in use vary from 400 pounds to 1,200 or even 1,500 pounds per square inch, that most frequently found being about 700 pounds. There are, however, a number of cranes known as low-pressure cranes in which the working pressure is 70 pounds per square inch, or even lower. These cranes are usually run by direct gravity water pressure from an elevated tank in a nearby tower, supplying a water main with hydrants, the crane itself being movable and arranged to be coupled to the nearest hydrant.

Hydraulic cranes, especially if of the low-pressure type, are susceptible to damage by frost, and in order to reduce the freezing point of the water with which they are operated to a temperature at least as low as the weather conditions may produce, various substances have been added to the water. Glycerine has had the preference, but its cost has been almost prohibitive. Alcohol has been used, but the most economical substances have been cheap, non-corrosive salts. The cylinders, pipes and valves are covered with non-conducting coatings, and the exhaust of the compressor-pumps has been utilized to impart some warmth to the water. In high-pressure cranes the danger of freezing is very much less. Consult Boettcher, A., 'Cranes' (London 1908); Collyer, F., 'Hydraulic, Steam and Hand Power Lifting and Pressing Machinery' (London 1892).

**HYDRAULIC ELEVATORS.** See **ELEVATORS.**

**HYDRAULIC ENGINE,** an engine which is driven by the power or pressure of water seeking a lower level. The simplest form of engine utilizing water power is the water-wheel. The overshot wheel acts partly by the impact of the stream flowing in the sluice, partly by the weight of the water in the buckets; the breast wheel gets its power almost wholly from the rush of the water, but to a small degree by the weight of water in the curved buckets; the undershot wheel is acted upon purely by the force of the moving stream, and thus is the more purely hydraulic of the three. (See **WATERWHEELS**). The turbine wheels are highly developed hydraulic engines. They utilize the power of falling water in one of three ways: as axial turbines, in which the water is supplied and discharged in a current parallel to the axis; as outward flow turbines, in which the water enters and is discharged in currents radiating away from the axis; as inward flow turbines, in which the water enters and is discharged in currents converging radically toward the axis. (See **TURBINES**). The well-known hydraulic ram (q.v.) is another simple form of hydraulic engine, but is wasteful of power even in the most improved forms.

The rotary forms of hydraulic engines such as the turbines, Pelton wheels, etc., have proved difficult of adaptation to many forms of work on account of the high speed at which they run, and the necessity of gearing them down to the usable speed, which renders them less flexible. But a more potent objection is that they vary extremely in efficiency under varying speeds. These difficulties led to the invention of the reciprocating hydraulic engine, which has been found dependable and very steady in operation, although it must run always at the same speed, using the same power, no matter what its load: it is therefore of commendable efficiency (about 65 per cent) only when running under a full load. The reciprocating engine which has found most favor is the Brotherhood hydraulic engine, or modifications of it. This engine has three cylinders set at angles of 120 degrees with each other, the three piston rods working on the same crankpin. Each cylinder has a single port which becomes alternately an inlet and an outlet, the cylinders being all the time full of water, that on one side of the piston having a greater pressure than that on the other. The opening and closing of the ports and of the inlet and outlet valves is accomplished by a rotary valve mechanism carried by the crank shaft. The piston speed of these engines is about 30 feet per minute for all sizes, and they are built up to 30 horse power. They are built for use with water pressures (in pipes) ranging from 60 pounds per square inch up to 1,000 pounds per square inch. Another type of reciprocating engine is the Riggs hydraulic engine. In this, the crankpin is fixed, and the cylinders, fastened 120 degrees apart upon a disc, revolve with the disc around. Consult Butler, E., 'Modern Pumping and Hydraulic Machinery' (London 1913); Dunkerley, S., 'Hydraulics' (Vol. 1, 'Hydraulic Machinery,' London 1907); Gelpke, V., and Van Cleve, A. H., 'Hydraulic Turbines' (New York 1911); Gibson, A. H., 'Hydraulics and Its Applications' (New York 1915).

**HYDRAULIC ENGINEERING**, that branch of civil engineering which deals with the application to the use and convenience of man of the natural laws governing water and other liquids. In practice it is closely connected with and utilizes the details of other branches, such as mechanical, electrical, mining and the almost infinite subdivisions of engineering. During recent years the range of uses of water has rapidly expanded and the hydraulic engineer is being called upon to solve more and more intricate problems growing out of the increasing density of population and multiplication of industries. In the practice of his profession, especially in relation to the larger problems, he must have available the results of meteorological observations,—of the occurrence of water in the form of rain or snow,—and obtain data as to variations in precipitation which takes place from day to day and from year to year and of the resulting stream flow. He must consider the topography of the country and the possibility of building storage reservoirs to conserve the supply; he must be prepared to discuss the questions of river control, of erosion and sedimentation; and of the use of water in domestic and municipal supplies, also in the production of power in manufacturing and for other purposes created by the ever-growing needs of a civilized community. In earlier years when the sparse population was occupied mainly in agricultural pursuits and the industries were few, there was usually enough water and to spare, especially in the humid areas of Europe and America. No great difficulty was found in procuring ample drinking water and there was little interference of one community with another through pollution by discharging sewage or manufacturing wastes into the streams. With the rapid change from a rural to an urban population and with the growth of manufacturing centres, the question of obtaining adequate supplies has become more pressing; joined with this have been conflicts between the diverse interests of manufacturing, power production and navigation.

**Operations.**—The operations of hydraulic engineering may be classified according to the uses to which the water is put. First is that for drinking, for domestic and municipal supply. Mankind under ordinary conditions can exist only a few days without water and to retain good health the water must be of a high degree of purity. It is obvious therefore that the procuring of water for immediate consumption, for cooking and related purposes, must take precedence. Second in importance is the use of water in the production of food, including in this the watering of live stock and the artificial application of water to agricultural soils or irrigation in arid or drought-stricken regions. Correlated with irrigation is drainage or the removing of an excess of water from farm lands. The third class of uses of water is that of disposing of the sewage or the waste from centres of population and manufacturing establishments. Wherever adequate supplies of water have been provided for municipal purposes there arises at once the need of disposing of an equal quantity of sewage or industrial effluents. The importance of this has not always been recognized and the public health has been needlessly sacrificed because of neglect

of this important detail of hydraulic engineering. A fourth use and one in which the hydraulic engineer has made the most rapid progress during the past quarter of a century has been in connection with water-power development and employment of water in manufacturing, including the production of steam. For years following the development of the steam engine the water powers of the country gradually fell into disuse; but with the improvement of methods of generating and transmitting electricity the hydraulic engineer is called upon to co-operate with the electrician in developing hydro-electric power, often at remote points. At the same time the necessity of procuring an ample supply of pure water for certain manufacturing purposes as well as for the steam engine has become more pressing and requires that the hydraulic engineer co-operate with the chemist in obtaining the desired quality as well as quantity. In the fifth group of uses are the details of transportation by water or navigation. The rapid development of the steam locomotive put out of use the canal boat and caused the abandonment of inland waterways in very much the same way as the stationary steam engine overshadowed the water powers. Similarly there is now a revival of interest in navigation of inland waters. The hydraulic engineer is again called upon to take up questions of improvement of rivers, particularly of the deepening and maintenance of channels. Closely joined with these are the problems of flood protection or prevention. With the increase of industries upon the flood plains of the rivers, the annual losses have been becoming greater and greater and reach into millions or tens of millions of dollars. For instance in the State of Kansas the flood losses for a little over a decade have been estimated at over \$50,000,000 and at Pittsburgh, Pa., for 10 years they have amounted to over \$12,000,000.

**Wide Range.**—Hydraulic engineering in its practical application thus calls into play almost the entire range of civil engineering activities and requires co-operation at one time or another with the chemist, physicist, electrician, topographer, geologist, meteorologist and with other students of natural phenomena. Its distinguishing feature is that fundamentally it deals with water in its various phases and has for its special province the practical application of the three distinct sets of laws or principles, namely, (a) hydrostatics, which relates to liquids at rest and has application in particular to the pressure of water against a dam or other restraining body; (b) hydraulics which considers liquid in motion, as, for example, the action which takes place through an orifice in the dam or restraining wall; and (c) hydrodynamics or hydro-mechanics, which discusses the effect of a stream in motion issuing, for example, from an orifice and acting upon a water wheel or other mechanical device.

Historically hydraulic engineering is among the most ancient of the recorded activities of men. The Egyptian engineers are known to have largely controlled the flow of the Nile and to have built canals and reservoirs whose magnitude caused them to be mistaken for works of nature. Almost innumerable works for storage and distribution of water to agricultural lands have been built in India and

Mesopotamia. Aqueducts, the remains of which still exist, were built by the Romans and other people of antiquity. Although a high degree of mechanical skill was developed in distributing the water supply to houses, baths and fountains, the principles of water measurement were not understood until within comparatively recent times. There is now a steady advance in experimentation to discover the laws which govern the movements of water under varying conditions, such as the form and character of material composing the channels or orifices along or through which the movements occur. The fundamental formula now accepted is that suggested by Chezy in 1775,  $v = c \sqrt{rs}$ , in which  $v$  represents the mean velocity of the fluid,  $r$  represents the hydraulic radius and  $s$  the slope of the surface. The value of  $c$  is determined by experiments. Kütter, a German scientist in 1868, from the results of data then available developed the formula, expressed in feet per second,

$$c = \frac{41.6 + \frac{.00281}{s} + \frac{1.811}{n}}{1 + \left\{ 41.6 + \frac{.00281}{s} \right\} \frac{n}{\sqrt{r}}}$$

The factor  $n$  termed the coefficient of roughness varies with the nature of the channel and its degree of smoothness. The values of  $n$  for channels of various types are as follows:

- 0.010 Planed lumber or plaster.
- 0.012 Smooth cement lined section.
- 0.015 Smooth brick or vitrified surface.
- 0.017 Rubble.
- 0.20 Firm trimmed soil.
- 0.225 Canals in good condition.
- 0.25 Canals in average condition.
- 0.275 Canals below average condition.
- 0.030 Canals in defective condition or rivers.
- 0.035 Very defective channels.

**Municipal Supply.**—At the present time the greatest activity in hydraulic engineering is in connection with procuring water, suitable in quality as well as quantity, for municipalities or similar communities. It is no longer considered advisable to take water directly from the flowing streams because of the widespread pollution of these due to increase of population. In most localities the treatment of the water by filtration must be undertaken, necessitating extensive works. The ideal condition for obtaining water for drinking and related purposes is from some elevated watershed which can be protected from intrusion and where the erosion of the soil may be prevented by the maintenance of forests or other suitable vegetation. Such conditions are found, for example, in the water supply of Portland, Ore., which obtains its water from a national forest. These favorable surroundings, however, are rare and in case of large cities such as New York and Boston it has been necessary to purchase large areas of land near the head water of small streams and build storage reservoirs, in some cases removing towns and factories in order to secure the necessary land and to ensure the purity of the supply. Among the more notable works are those of the city of Los Angeles, Cal., which brings its water supply from Owens Valley, a distance of upwards of 240 miles. As

contrasted with this is the abundant supply of the city of Chicago, pumped from Lake Michigan, being obtained through tunnels extending out for several miles under the margin of the lake to avoid the pollution. This city discharges its sewage inland through the Illinois River which empties into the Mississippi near the intake of the Saint Louis waterworks, which utilizes, after filtration, the muddy and polluted waters received from the vast drainage area above.

There has been steady progress in the art of supplying water to towns during the past century and now the questions which the hydraulic engineer is required to consider in the design and construction of any waterworks embrace a great variety of subjects. It is necessary to consider:

1. The quantity of water likely to be needed. There is not yet any consensus of opinion among engineers on this point, the estimates varying from 100 to 150 gallons per day for each resident of the district to be supplied, at the expiration of 20 years from the inauguration of the supply. The prospective population is estimated from the records of past growth of the district and the growth of districts of similar character of occupation.

2. The possible sources whence the required quantity of water can be obtained, including the legal as well as physical limitations to its continued use.

3. The quantity of the water obtainable from each source, as regards its chemical constituents, in order to judge of its economical as well as its sanitary value. It sometimes happens that a water otherwise acceptable is so hard or contains in solution such quantities of various chemicals that the amount of soap required for washing with it is greatly in excess of that required by another water more difficult to procure, so much so that the cost to individual consumers for its constant use will be greater than the cost to the community of the introduction of the other supply.

4. The character of the water biologically; the number and nature of the organisms which are found in it. This is most important from the sanitary point of view. The identification of certain organisms as pathogenic or disease-producing marks a decided advance in sanitary science and is of great interest to the hydraulic engineer. It is found that the removal of the injurious organisms from water can be effected by filtration, and it now is considered to be the engineer's function to design or construct works for filtration through sand or other material which experiment proves to be adapted to the purpose.

5. The quantity of water obtainable from each source which appears generally suitable, the area of the watershed, the amount of annual rainfall upon it, the distribution of the rainfall through the year, the geological and topographical features of the surface, the wind movement and the range of temperature of the air, with especial reference to the probable evaporation losses, must all be taken into consideration. Whenever the minimum rate of daily run-off from the watershed exceeds the maximum daily consumption to be provided for, reservoirs must be constructed to retain the stream-water in times of excessive flow, and deliver the excess gradually as required.

6. The location of reservoirs requires a thorough acquaintance with the topography of the district, and their construction demands a high order of both theoretic and practical acquaintance with the action of water on various materials and with the form and method of their use. The construction of dams of earth, concrete and masonry has been the subject of careful study within the last few years, and the general principles have been fairly well established. There still remains a number of unsettled problems due largely to the progress of the mechanical arts and the introduction of new modes of construction, particularly of concrete and steel.

7. The means of conveying the water from the source to the point where it is to be used must be studied. The conditions of this problem are unlike those which are encountered in rivers, or in canals for either irrigation or navigation. A nearly uniform quantity of water must be continuously carried a long distance at as great a velocity as is consistent with safety and economy. It must be protected from loss by evaporation and by leakage of the channels, and kept free from pollution on its route. These conditions are best fulfilled by an enclosed conduit or pipe of masonry or metal, with a smooth interior surface. The relations between different values of  $n$ , which can be obtained by using different classes of material and of construction, and values of  $c$ , obtained by using different grades and alignments, have been for many years the subject of carefully conducted experiments by scientists. It is the function of the hydraulic engineer to apply to the special case he has in hand the use of the materials which are available and the mode of construction practicable in the case, in accordance with the latest results of scientific research. Up to the present time the best form and material for large conduits seem to be masonry or concrete, of horseshoe form, with smoothly plastered interior surface; or steel-plate circular pipes, with as few irregularities caused by rivet-heads as possible, sometimes lined with cement mortar and encased in concrete.

8. On reaching the point of distribution an entirely different set of conditions is encountered. The water heretofore concentrated in large masses has to be distributed over a wide area in a great number of small pipes in which orifices are opened and shut at irregular intervals of time; these pipes, moreover, are under a great head of water producing a pressure of 50 to 100 pounds per square inch, with consequently a high velocity of efflux from any orifice. The problem to be solved is so to arrange the connections and sizes of these pipes that, under the ordinary conditions of use, the pressure in the pipes will not be materially altered at any time, and a constant supply may be kept up in the entire system. As illustrating the magnitude and complication of the distributing system in a large city, the conditions existing in the city of Chicago may be cited. There were there, in 1916, in an area of 128,000 acres, 2,600 miles of pipes for the delivery of water, with 275,000 taps or orifices from which water is drawn at irregular intervals, 20,000 of these being controlled by meter. The development of such a system as this involves the exercise of not only theoretical knowledge of the prin-

ciples governing the flow of water under all conditions, but also a thorough acquaintance with materials of construction and the methods of using them to produce the best results at the least expenditure.

**Irrigation and Drainage.**—Next in importance to municipal and domestic supply are the hydraulic engineering problems connected with the obtaining of an adequate quantity of water or the proper regulation of it to enable the production of food. Throughout the western two-fifths of the United States, on much of the best agricultural lands, the rainfall is insufficient in quantity, or so irregularly distributed throughout the year, that valuable crops cannot be produced with certainty without an artificial application of water. In the Mississippi Valley and to a certain extent in most of the States of the Union there are vast tracts of otherwise fertile lands which have an excess of water to a degree such that crops cannot be profitably raised. Here the hydraulic engineer is called upon to solve the problems of drainage. In many respects these are similar to those of irrigation and are intimately connected with it as the object to be attained is the maintaining of the moisture in the soil within relatively narrow limits, for ordinary soils not dropping below 8 per cent of the volume nor rising above 15 per cent. There are also similar problems of providing adequate supply of water for cattle and other domestic animals used largely for food.

For the production of crops by irrigation or for relieving the lands of an excess of water by drainage, quantities of water must be handled which are relatively very large when compared with those needed for city supply. For example, a 160-acre farm will require for its irrigation or may need for drainage the handling of a volume of water as large as would be needed for domestic or general supplies if the area were covered with dwelling-houses or factories. When it is considered that an ordinary American city of say 100,000 persons covers an area of about 10,000 acres, while an irrigation or drainage project may include 100,000 acres or more, some conception may be had of the relative magnitude of the works needed for the two purposes. Although for irrigation or drainage there must be constructed works of large capacity, yet it is not practicable to pay for these works an amount comparable with the expenditures which may properly be incurred by a municipality. For farming purposes a cost of irrigation exceeding, say, \$50 per acre or for drainage \$20 per acre may be practically prohibitive, but for municipal supply the cost of providing water for a similar densely populated area may properly run into thousands of dollars. Thus the hydraulic engineer while encountering similar problems of quantity and quality of water, adequacy of supply and difficulties of storage and distribution, must keep down the cost of these irrigation or drainage works to a small fraction of that which is feasible in considering questions of municipal supply.

Extensive studies must be made by the hydraulic engineer and detailed maps prepared to show the topography of the country from which water may be obtained for irrigation and to which it may be carried. This mapping should be accompanied by measurements not only of

the rainfall, wind movement and other meteorological phenomena, but especially of the flow of various streams at typical points on their course. Usually problems of flood conservation or water storage are involved, these being on a larger scale than those in connection with municipal supply. The result of these measurements of rainfall and run-off should be available for a considerable period of time, as the fluctuations during five consecutive years, particularly in the arid region, may not fully reveal the ordinary conditions. Ten years are better, but it appears from study of data now available that the engineer cannot assume to have complete knowledge of the climatic fluctuations from observations extending for a shorter period than half a century. Of course, it is impossible to wait that length of time before preparing plans for works, but when utilizing data which extends over a short period, a large factor of safety, especially with reference to extreme drought and flood, should be employed.

The United States government has recognized the necessity of furnishing data of this kind and has instituted through its Weather Bureau and Geological Survey series of observations of climatic factors and steam flow, which enable the hydraulic engineer to make his estimates with a fair degree of accuracy.

Rapid advances have been made throughout the United States, especially in the western or arid portions since 1900 in the construction of large storage reservoirs and distributing canals for bringing water to agricultural lands; so that in 1919 about 15,000,000 acres are under irrigation out of possibly 40,000,000 acres in all which may be watered. Also in other parts of the country drainage works have been provided for say 10,000,000 acres out of 70,000,000 acres needing such treatment to relieve the low lands of an excess of moisture. Large works have been and are being built in arid countries, notably in Egypt, India, South Africa and Australia by the British engineers. In other dry lands, notably in Spain and Italy, there has been a gradual development and in many cases restoration and enlargement of great works built centuries ago.

**Disposal of Waste.**—With the rapidly increasing density of population, the question of disposal of sewage from towns and cities is offering more and more intricate problems to the hydraulic engineer. In this he must call to his assistance the bacteriologist and chemist. Closely connected with the sewage problem is that of disposing of manufacturing or industrial wastes, especially where the custom has grown up of discharging these into the sewers or natural streams. Water is the universal carrier and solvent and of necessity must be largely employed in removing noxious materials.

The opinion has been advanced that the streams of the country should be preserved in their original purity and that each city or manufacturing establishment should be required to dispose of its sewage or waste in some other way than by using water as a carrier. Practically, however, it has been found that the natural streams must be used to a continually increasing degree in removing sewage, preferably of course after its more or less complete purification. The hydraulic engineer and his advisers are becoming expert in reducing the

amount of pollution and in maintaining a high degree of purity in the effluent which escapes from the sewage or waste treatment works, and which flows away in the natural stream channels so that it will not be injurious to health or offensive to the senses.

**Manufacturing.**—The next large use of water with which the hydraulic engineer is concerned is in connection with manufacturing — this coming fourth in the scale of importance to human life, following after drinking water, food production and sewage or waste disposal. The problems in many respects are similar to those just enumerated as they are concerned with the provision of an adequate quantity and quality. In manufacturing water may be needed either for direct consumption or simply in washing or cooling. Included under this head is the use also of water for steam purposes in which case it must be free from mineral substances which would encrust the boiler or cause other deleterious action. For each purpose of manufacture there are certain requirements of purity, such, for example, in paper making where freedom from soluble matter is essential and where the hydraulic engineer and chemist must work together.

**Water Power.**—Next in importance after manufacturing is the employment of water in the production of power. As compared with other uses, the quality of water—its mineral contents or freedom from bacteriological life—is insignificant. What are required for power production are large volumes with steady flow and an adequate fall. The use of water for power is ordinarily compatible with its later employment for irrigation or in manufacturing — so that development of water power often goes hand in hand with the upbuilding of municipal supplies, irrigation works or other industries.

Through the United States the smaller water powers were sought and developed about a century ago but with the introduction of the steam engine these water powers were abandoned to a large extent and the cities which had originally been located near the water power gradually came to depend more and more upon the use of steam, while other cities built at more convenient railroad points have surpassed them in size and in manufacturing capacity. The immobility of water power and the former impracticability of transmitting power to any considerable distance from the water fall resulted in stagnation or even abandonment of the use of the water in power production. The situation was changed, however, by the invention of methods of electrical transmission of power. Since 1900 there has been a notable revival of interest in water-power development. Hydraulic engineers are being called upon to a greater extent than in the past to utilize the larger and more inaccessible streams of the country. Similar conditions prevail throughout the world and in localities such as in Norway and Sweden the water falls are now being developed and utilized by electrical transmission, the cheap power making possible the manufacture of certain chemicals, particularly the fixation of nitrogen from the air to form the basis of agricultural fertilizers.

In this branch of his work the hydraulic engineer enters largely into the field of hydro-mechanics as above defined, since he must study

the mechanical effects which may be produced by utilizing the force exerted by water in motion to generate power. In hydraulic works, distinctively so called, the effort is constantly made to diminish the mechanical effect of the moving water so as to avoid injury to surfaces and substances unprepared to resist it. In hydrodynamic works the effort is made to concentrate all the power obtainable from the moving water and transmit it to machines which do effective work.

In the present state of hydraulic science more attention is being paid than ever before to the obtaining of closely accurate results of experiments conducted by skilled observers, in which the aid of electricity is used to register all phenomena in a manner never possible heretofore. Great as the advantages have been during the last 25 or 30 years, equal or greater progress in the elucidation and practical application of principles may be expected within the next quarter of a century.

**Navigation.**—The least in present importance to mankind but the first in historic development of industries is the use of water in inland navigation. Railroads have increased to such an extent that the use of the rivers and lakes for transporting persons and products, while still important, is relatively far less so than in former years. Civilization can expand and succeed if there is an adequate supply of water for the purposes before mentioned, even if navigation is not employed, as goods can be transported by rail with a high degree of economy. Up to the first half of the 19th century, however, water transportation was of prime importance as communication by land was slow and in places almost impracticable. On the other hand the relatively sparse population and undeveloped condition of industries offered few hydraulic problems. It thus resulted that in the Constitution of the United States, while the rights of navigation are protected, there is practically no provision made for other uses of water. What are now found to be the more pressing needs of communities in regard to water supply required for domestic and municipal purposes, for irrigation, for disposal of wastes, for manufacturing or for power purposes—have come forward prominently since the Constitution was adopted. Particularly with reference to interstate waters there is much uncertainty in Federal and State laws, hampering the work of the engineer.

Navigation upon the ocean is, of course, of vital importance to the nations of the world and hydraulic engineering works having to do with harbors are being built of rapidly increasing magnitude as the size of the ships increase, but with respect to the inland passages and rivers there has been rapid decline of their use in navigation, such that, outside of the operations of the corps of engineers of the United States army, few advances have been made. There are indications, however, that a change is about to take place and that with the development of different types of barge and of modified power boats, the rivers upon which navigation has practically ceased will be more generally employed and there will be a larger demand for works for their regulation and control for purposes of navigation.

As a notable exception in the general decline of interest in inland navigation should be cited

the expenditures being made in enlarging and changing the alignment of the Erie Canal from the vicinity of Buffalo, N. Y., east to Albany and the connecting canal to Lake Champlain. Over \$100,000,000 was appropriated by the legislature of New York State for changing the old waterway into a barge canal capable of navigation by boats drawing nine feet of water. Later appropriations have been made and notable hydraulic works executed. There have also been large expenditures made by the Federal government for the improvement of the channels connecting the Great Lakes. On these the conditions are more nearly comparable to ocean navigation; the freight traffic, principally of iron ore, coal and grain on Sault Sainte Marie and Detroit River surpasses that of the Suez Canal.

**Harbors.**—An interesting and important branch of hydraulic engineering is that which deals with larger masses of water than any of those so far considered. Along the sea-coasts of all countries there are places where the conformation of the shore and the nature of the contiguous lands render the creation of harbors desirable, but where the tidal waves and littoral currents come in conflict in such a way as to make the approach from the sea dangerous to vessels. To lessen the destructive effects of the great masses of water in motion, impelled by either the wind or the tidal currents, breakwaters or piers of stone projecting from the shore are built with good results. The massiveness which such structures are required to possess may be judged from the fact that it has been learned that the foundation for a breakwater must extend out to where there is from 18 to 20 feet of water at low tide; that the height of the waves by which it is likely to be assailed may be from 10 to 20 feet; and that the impact of the wave on the opposing structure may be as high as 6,000 pounds to the square foot. In the open sea it is not likely that waves as high as this are formed, or that the force exerted by them is nearly as great, but the problem of the form and resisting power of the hull of ships has to be considered from the standpoint of the dynamic effect of the water which is impelled by the wind and waves against the hull, as well as the resistance offered by the water to the passage of the hull through it.

**Floods.**—Each stream in a state of nature fluctuates in accordance with the rapid changes of weather and alternates between high and low water, having usually a spring flood due to increased temperature, the melting of snow and frequent rains. The factors which combine to produce floods vary in intensity from year to year; occasionally the combination of extraordinary rains on frozen ground or with rapidly melting snow produces flood of exceptional violence. During their geological history the streams during high water periods have built up flood plains by deposits from the muddy waters. Such lands are of exceptional fertility and their level character has invited settlement. The tendency has been not merely to cultivate these lands but to build manufacturing establishments, railroads and towns upon the level surface. During periods of low water or even of ordinary flood there is no difficulty, but at times of high flood, the bridges, factories and other buildings along the bank interfere

with the free flow. The river of necessity at such times spreads out and endeavors to take possession of its ancient flood plain, with consequent destruction to property or even life. The immediate answer to questions, which are presented to the hydraulic engineer by these flood conditions, is to remove from the river channel and the flood plain the obstructions placed there by man and to erect permanent buildings only on higher ground, saving the low land for such agricultural purposes as will not be seriously injured by the occasional floods. This, however, has often become impracticable and it is necessary to consider other solutions for the many flood problems. In attacking these there are two lines of effort: First, flood prevention; second, flood protection.

In flood prevention the remedy is to be sought by careful surveys and examinations on the drainage basin to discover possible reservoir sites and by storing the flood water in suitable basins, enlarging the natural ponds or lakes or making artificial reservoirs where the floods may be restrained for a period of days or weeks, the excess being let out slowly in accordance with the capacity of the channel to receive it. There are not many localities where adequate reservoir capacities have been provided by nature or where dams can be erected creating a reservoir at a cost commensurate with the immediate benefits. Investigations have been made, however, and it is evident that in the future many reservoirs will be constructed to reduce the flood crest.

In flood protection the object sought is to build near the points of danger large dykes or walls, shutting off the river from its ancient flood plain, and confining it in a relatively narrow channel. This is the most immediate and direct method of solving the difficulties for any particular locality, but of course does not assist other threatened points as in the case of reservoirs or similar works built for flood prevention. In fact the protection of one area may jeopardize another by increasing the flood heights. The combination of flood protection by reservoirs and of flood prevention by dykes offers many interesting problems and is the subject of continued study by engineers in many parts of the world.

**River Regulation.**—All these hydraulic engineering problems of (a) domestic and municipal supply, (b) irrigation and drainage, (c) disposal of sewage and waste, (d) manufacturing, (e) water power, (f) navigation, (g) flood protection and prevention, may be considered as part of the general hydraulic engineering problem of river regulation. As a rule each of these items has come up as a separate matter to be handled by the hydraulic engineer within certain territorial limits or restrictions of funds available. The artificial restriction of property lines, or of State or other boundaries, have usually prevented any broad consideration of the subject, but it is obvious that for the full development of any country each river system must be considered as a whole and examined, beginning at its head waters, with the intent of utilizing all possible storage reservoirs for holding water for municipal supply, irrigation, water power or flood prevention—considering in this connection also the forest cover and cultural conditions of the drainage area. There should be studied also the

requirements of disposing of sewage and manufacturing waste, the employment of water for manufacturing and water power and finally in its lower courses its use for navigation. Regulation in the interest of the commonwealth demands broad consideration of all such problems by qualified hydraulic engineers and requires a broad control, usually by national authorities, because of the fact that the larger river systems are independent of artificially drawn State lines.

In river regulation in general and in the individual problems a wide field is thus offered to the engineer. The capacity and arrangement of storage reservoirs must be proportioned to the fluctuations of the natural flow of the stream. The channels for the conveyance of the water must be proportioned for the various proposed uses and with reference to the materials of which they are composed. When used for irrigation a low velocity of flow is desirable to avoid abrasions of the banks, and the sizes of the channel are proportioned to convey definite quantities of water steadily. In other cases the channels must be maintained in such manner as to carry constantly varying quantities of water at different speeds of current, and the banks must be fortified against injury from sudden fluctuations of level in the water surface and from abrasion by floating material or accretion by deposit.

The construction of levees or embankments along the banks of a river and parallel to its current is the earliest and simplest of the methods of river improvement; but it is only within the last half century that this has been reduced to a science, and the most effective and economical methods of design and construction formulated. If the stream improved is of sufficient size to be navigable, the conditions of the problem are again changed. The course of the channel in places may have to be altered to avoid rapids of too steep descent for passage of boats, and a sufficient depth of water must be maintained at all times and in all places for boats of definite dimensions and draft. Where such artificial channels are necessary it is important that they should be so proportioned that the passage of the largest boat at the maximum permissible speed should not create a wave which would injure the banks or retard the progress of the boat.

The problem of the resistance of the water to a vessel passing through it enters into the consideration of navigation, especially of canals and inland waters. The more rapidly a vessel passes through a small channel the greater is the work to be done in the displacement of the bulk of water occupied by the hull. The displaced water is prevented from flowing off by the adjacent banks and shallow bottom, and the pressure required to propel the boat is so increased that it is found that a greater velocity than three miles per hour is not economical. All such factors must be listed for consideration in the general plans for improvement of inland waters.

From the above review of hydraulic engineering it is to be noted that it is a profession which has numerous ramifications and underlies the health, comfort and prosperity of the human race to a greater and greater degree as population and industry increase. Each year is showing notable advances in methods and results of work. The literature on the subject

is already voluminous and each month shows some notable contribution either in the proceedings of engineering and scientific societies or in textbooks or treatises on one or another of its many details. See HYDRAULICS; HYDROSTATICS; HYDRODYNAMICS; HYDRO-ELECTRIC DEVELOPMENT.

FREDERICK H. NEWELL,  
*Professor of Civil Engineering, University of Illinois.*

**HYDRAULIC MACHINERY**, machinery which is operated by water pressure, either natural or transmitted: natural, as in a pipe leading down from an elevated reservoir; transmitted, when the pressure is produced by an engine, such as a pump or a hydraulic ram. The more powerful hydraulic machines are worked through an "accumulator," which acts as a governor. This device substitutes a uniformly acting weight for the fitful variation of impulse inseparable from pumps and natural sources. It consists essentially of a piston held down by heavy weights, acting in a cylinder into which the water supply is led below the piston. The water under pressure pours into the cylinder, lifting the piston and its weights. If the impulse is much greater than the weight, the pressure in the cylinder does not change, but the piston is driven higher. The machine is operated by water taken from the cylinder at the constant pressure represented by the weight. The smaller the area of the piston in proportion to the weight the greater the pressure per square inch available to run the machinery.

Hydraulic machines include metal working machinery like presses for corrugating and stamping, punches, shears, riveters, bending machines, etc.; many kinds of cranes, lifts and elevators; hay and goods presses; jacks, pumps, capstans, and winches; railway switches and turntables; drydocks; gun brakes to take up the recoil of guns when fired, and gun lifts to raise disappearing guns to the firing position; door-closing mechanism for closing safety doors in bulkheads on shipboard; grain elevators and dredges; and similar power applications. (See HYDRAULICS; HYDRAULIC ENGINE; HYDRODYNAMICS). Consult Butler, E., 'Modern Pumping and Hydraulic Machinery' (London 1913); Dunkerley, S., 'Hydraulics' (2 vols., London 1907); Gibson, A. H., 'Hydraulics and Its Applications' (New York 1915); Merriam, M., 'Treatise on Hydraulics' (New York 1916); Robinson, H., 'Hydraulic Power and Hydraulic Machinery' (London 1912); Slocum, S. E., 'Elements of Hydraulics' (New York 1917).

**HYDRAULIC MINING.** See GOLD MINING.

**HYDRAULIC PRESS.** The action of the hydraulic press depends on two facts concerning water: (1) that it is incompressible; (2) that when confined it will transmit equally in all directions any pressure to which it is subjected. The hydraulic press by which these facts are put to economic use consists essentially of two connected cylinders, one of large diameter and the other of small diameter. Each is fitted with a piston. The smaller cylinder is operated as a pump, the larger one as a reservoir. Any pressure per square inch put upon the pump piston is transmitted to the res-

ervoir piston per square inch. Thus, if the pump piston has an area of two square inches, and the reservoir piston an area of sixty square inches, a pressure of 80 pounds on the pump piston rod will exert a pressure of 2,400 pounds on the reservoir piston rod. As applied industrially, the hydraulic press carries a platen, or platform, on the upper end of the reservoir piston rod—generally a plunger of large diameter. A massive frame work extends from the base of the reservoir cylinder up and overhead, and upon this is fastened a fixed platen opposite the moving platen. The material to be pressed is placed on the movable platen below and is forced up against the upper platen by pumping water with the pump cylinder into the reservoir cylinder below its piston. The efficiency of the hydraulic press is very high—above 90 per cent; that is, less than 10 per cent of the power put into the machine is absorbed by the friction developed in operating it.

The principle of the hydraulic press is made use of in the portable hydraulic jack, used in raising heavy vehicles, and even great buildings, bridges, etc. The hydraulic cranes used for lifting heavy castings and machines, such as locomotives, is a development of the hydraulic press. Perhaps the most common application of the hydraulic press is in the gaining of oil from oil-seeds and oil-nuts. These require the immense pressures long continued which the hydraulic press supplies. Another use is in forcing into place the metal hoops on large and strong barrels. A very interesting application of the hydraulic press is in the making of lead and tin pipes. These metals become plastic under the tremendous pressures exerted, and flow out of the prepared orifices in the same way that macaroni is forced from the machine in which it is made by a very moderate pressure upon the soft dough. By an ingenious device lead pipe lined with tin is as readily produced as the plain lead pipe. The hydraulic press is also used to coat electric cables with lead, the cable passing through the core stem which preserves the hollow when lead pipe is made. Still another application of major importance is the use by engineers of the hydraulic press in tunneling, the shield through which the excavations are made being forced forward into the new excavation by six (usually) hydraulic presses butting against false work in the completed part of the tunnel.

**HYDRAULIC RAM**, an automatic machine generally employed to lift water from a low level to a higher one, but also to supply compressed air for motor purposes. The hydraulic ram operates by the momentum of a body of falling water. It consists essentially of a large pipe sloping downhill, the lower end rounding upward and being fitted with a heavy drop valve; and a small pipe reaching uphill to the point where the water is to be delivered. Back a few inches from the lower extremity of the pipe is attached an air-chamber connecting with the body of the pipe by an ordinary lift valve. The exit valve or "pulse valve," as it is called, having dropped by gravity below its seat, the water in the drive pipe flowing down from the reservoir out of the exit gathers increasing velocity, and therefore momentum, until it is strong enough to lift the exit valve to its seat and close it. The column of water in the drive pipe being thus suddenly halted

exerts a pressure all about it equal to its momentum at the moment it was stopped. This pressure operating on the valve into the air chamber opens it and a part of the water rushes into the air chamber, compressing the air within, until the pressure of the compressed air balances the pressure of the checked stream in the drive pipe. The force which closed the exit valve being thus greatly reduced, that valve drops down again from its seat, and the stream of water begins flowing again from the exit. This cycle is continuously repeated. The lift pipe is connected with the lower part of the air-chamber just above the inlet valve. When the latter closes in the balancing of the air pressure, the water entering the lift pipe is forced upward until its weight balances the air pressure. As but a small proportion of the water running in the drive pipe enters the air-chamber, the lift pipe is always much smaller in diameter than the drive pipe.

It is evident that the pulse valve must be designed or regulated to suit the momentum of the water with which it is to operate: if it is too heavy it will not close at all, and the ram will not work; if too light, it will close before the stream in the drive pipe has attained its full force, and the result will be that so little water will enter the air-chamber that there will be practically no air pressure developed to lift the water in the lift pipe. The newer types of rams have a balanced lever with a sliding weight connected with the exit valve so that it may be adjusted with great delicacy to the available water power. The efficiency of the hydraulic ram depends upon the momentum of the flow of water in the drive pipe—that is, to its velocity multiplied by its mass. The velocity being dependent on the vertical fall or head of water available, greater power at the ram is gained by increasing the mass of water moving in the drive pipe, by making it larger in diameter or longer. This will mean that more water will flow into the air-chamber when the current is halted, and thus the air be compressed to a greater degree, and consequently a higher or larger lift of water attained in the lift pipe. The formulas in common use by engineers for calculating the diameter and length of the drive pipe for any given conditions are as follows:

Diameter of drive pipe  $=\sqrt{1.63 \times M}$  where  $M$  is the volume of water continuously available in cubic feet.

Length of drive pipe  $=H+h+\frac{h}{H} \times 2$  where  $H$  is the fall (perpendicularly) of the drive pipe, and  $h$  the height to which the water is to be carried in the lift pipe.

One of the difficulties to be guarded against in the operation of the hydraulic ram is the gradual absorption of the air in the air-chamber by the water continually flowing through. Water under pressure dissolves a considerable quantity of air, and this has to be replaced, or the air cushion would become too small to be effective. An attachment to keep a sufficient supply of air always in the air-chamber is a low standpipe connected with the drive pipe at its base and to the air-chamber from its top, with suitable valves to take air from outside at low pressures, and force it into the air-chamber at high pressures.

The more common use of the hydraulic ram is to supply water from a lower level to a country house or dairy upon an elevation near by. It is also used by builders to get a water supply on the upper floors of new buildings where the water service fails. In the boring of the Mont Cenis tunnel the engineers used hydraulic rams to compress air to drive the rock drills employed, the compressed air being taken from the top of the air-chamber direct. The water power operating the rams was the natural drainage of the tunnel.

The pumping ram is designed to raise a water supply separate from that which operates the machine, so that water that is not fit to drink may be used to deliver a supply of wholesome water through the lift pipe. In this form of ram the momentum of the checked flow of water in the drive pipe expends its force upon a large area piston of a pump working in the lift pipe.

An industrial application of the principle of the hydraulic ram is made in the machine known as the "hydraulic ram accumulator," a device for storing water under great pressure, in some cases reaching 1,000 pounds per square inch. Consult Bradley, F. A., 'Pumping and Water Power' (London 1912); Clarke, J. W., 'Hydraulic Rams' (London 1907); Hutton, W., 'Country Plumbing Practice' (New York 1914); Kennedy, R., 'Modern Engines' (London 1912).

**HYDRAULIC TRANSMISSION.** The fact that water confined within an unyielding encasement transmits equally in all directions any pressure put upon it gives rise to the principle of hydraulic transmission—the transference of power by means of a column of water under pressure. In the industrial application of this idea the column of water is held in a pipe, which may be vertical, horizontal, inclined or in any combination of these positions: wherever the water reaches, the pressure under which it has been placed is available as power at any point of the pipe line. In large cities this principle is made use of for supplying many power users from central stations by means of water pipes laid in the streets. London has the largest development of this form of power transmission, having upwards of 150 miles of pressure mains, some of them seven inches in diameter, carrying water under 750 pounds to the square inch. At Glasgow and Manchester the pressure carried is 1,120 pounds to the square inch. Many other British cities have similar hydraulic power service. The pressure upon the water is supplied by steam pumps at the central stations. The steam is used expansively in high and low pressure cylinders working directly upon single-acting pumps of small diameter. The action is a direct reversal of the hydraulic press (q.v.). The water from the pumps is forced into storage cylinders known as hydraulic accumulators. These cylinders are fitted with pistons which are weighted with loads per square inch equal to the pressure the confined water is to carry. The water from the pumps enters at the bottom of the accumulator at a little higher pressure than is represented by the weight, and lifts the piston with its load, thus storing power in proportion to the amount of the confined water. In the case of the London service the pres-

sure in the steam cylinders is 80 pounds to the square inch, and in the accumulators 800 pounds to the square inch—the areas of the steam cylinders to the pump cylinders being as 10 to 1. The high pressure power is used generally through Pelton wheels. The cost of hydraulic power in London is equivalent to about five cents per horse power per hour—from 30 to 60 per cent less than the cost of electric power.

The natural gravity pressure of water in pipe lines leading from elevated reservoirs is equally available for power, and is usually passed through an accumulator to render the pressure uniform. Each 32 feet of elevation contributes about 14 pounds pressure to the square inch.

**HYDRAULICS**, that branch of engineering science which deals with liquids (especially water) in motion, the regulation of the flow of liquids, and utilization of the momentum, pressure, weight, etc., as when confined in pipes and channels, for the operation of machinery, or doing useful work.

Water being the most common liquid, and having considerable weight (62⅓ pounds to the cubic foot), is excellently adapted to do work by its gravity. When allowed to run it acquires momentum, a quality available for the convenient use of the designer of hydraulic mechanisms. Being of very slight elasticity, that is, practically incompressible, it can be used when confined with great advantage, as we note in the hydraulic press and similar machines. Flowing as it does in streams, in almost every locality, it is comparatively easy to direct it for the service of man.

The density of water is apparent from the fact that it supports heavily laden ships, and from the tremendous power with which large waves driven at great velocity by high winds beat upon a shore or breakwater, exerting a pressure in the case of a 30-foot wave of 7,000 pounds per square foot. This density will be better appreciated after studying this table showing

**THE DENSITY OF WATER.**

Temperature		Weight per cubic foot	Comparative density
Fahr.	Cent.		
32°	0°	62.417	.999884
37.4	3	62.424	1.000004
41	5	62.423	1.000003
50	10	62.409	.999760
59	15	62.373	.999173
68	20	62.316	.998272
104	40	61.947	.992366
167	75	60.863	.974999
212	100	59.844	.958666

Sea water will weigh about one and a half pounds more than fresh water, on which the above table is based. Ice loses weight, or expands on freezing, weighing 57.28 pounds to the cubic foot. A cubic foot of water equals 7.48 United States gallons; a liter of water equals 0.264 United States gallons.

The volume and speed of flowing water in a stream constitutes its theoretical utility. To calculate the horse power available in a stream, it is first necessary to know its cross section. If it can be determined that the average depth is five feet and the average width 50 feet, then the cross section is 250 square feet. If the water flows three miles an hour, that is 264

feet a minute or 4.4 feet per second. Since 33,000 pounds raised one foot in a minute is the horse power equivalent, it is obvious that this gives a basis for figuring the horse power. If a dam is built, there will be normally 250×264 cubic feet of water weighing 62⅓ pounds per foot coming over the dam every minute, that is, 4,114,000 pounds, a potential of nearly 125 horse power. This water to be utilized may be conveyed by a level mill race to a point where it can fall over an overshot waterwheel, and thus be made to yield from 70 to 90 per cent of its potential horse power, depending upon the mechanical efficiency of the wheel. If the same water were taken from the bottom of the dam to operate a turbine wheel a higher efficiency would be gained. Such a large volume of water as that supposed—1,000 cubic feet per second would suffice to run several ordinary wheels.

The actual horse power developed will be considerably less than the theoretical, owing to friction and imperfect machinery. About 75 per cent of the theoretical is generally considered as available for use in practice. Since no stream flows uniformly, and since the power will be used intermittently, it is obviously necessary to provide a large storage reservoir for the power plant if the approximate value of the power is to be obtained. The engineer must therefore calculate how large a dam he needs and can build in that locality, and what it will cost, and how high this dam should be.

If the water in a stream is to be led away in a pipe, it is necessary to figure the carrying capacity of the pipe, for which the following table is useful:

**VELOCITIES OF WATER THROUGH PIPES.**

Diameter of pipe in inches	(In feet per second)				
	Gallons flowing per minute				
	100	200	300	400	500 1000
3.....	4.54	9.08	13.62	.....	.....
4.....	2.55	5.11	7.76	10.21	12.17
5.....	1.63	3.27	4.90	6.54	8.17
6.....	1.14	2.27	3.40	4.54	5.67
7.....	0.83	1.67	2.50	3.34	4.17
8.....	0.64	1.28	1.92	2.55	3.19
9.....	0.50	1.01	1.51	2.02	2.52
10.....	.....	0.82	1.23	1.63	2.04
15.....	.....	.....	0.55	0.73	1.09
20.....	.....	.....	.....	0.40	0.62
30.....	.....	.....	.....	.....	0.45

The above figures are to be taken as approximate, because in each actual case there will be differences of friction, depending on the roughness of the interior of the pipe.

Water moving through a pipe at a certain velocity acquires momentum—that is the velocity multiplied by its weight. When water is suddenly stopped in a pipe it delivers a blow that is called water-hammer, or more properly water-hammering. In a large or long pipe with rapid flow this momentum may be strong enough to rupture the pipe, hence it is extremely dangerous to shut off suddenly the flow in a large pipe. A similar effect is produced in pipes carrying great head. In one reported instance the sudden closing of an automatically balanced valve in a short 42 inch pipe, under a head of 25 feet, caused a hammer equivalent to a head of 250 feet, and sprung the rivets, causing a leak in a ¼-inch steel casing. In another instance, with a 24-inch pipe, a valve was closed by hand in 20 seconds, and the pressure, measured 2,100 feet away, was found to

oscillate a number of times between the extremes of 40 and 65 pounds.

It is obvious that the first use of water for mechanical purposes involved leading the water from a stream or other source, for use at another place. A primitive mechanism for raising water from a stream was the *noria*, consisting of a large upright framework like a wheel, placed over a stream or river so that the flow of the current turned it around on its axis. To the periphery of the wheel were attached hinged buckets, which were often earthen jars tied on the frame, and which were partly filled as they dipped in the stream, and being carried to the top were emptied by a tripping device into a trough, which led the water away on the higher level.

When men began to use machinery, as for grinding wheat, a better mechanism than the *noria* was necessary, and they learned to dam a stream and secure a fall of water to drive the wheel, which was provided with cross boards, so as to give the water a surface to push against. When the water struck the wheel on top, pushing with both its weight and velocity, it was an overshot wheel; if it passed under it was an undershot wheel; if the water struck the wheel just below the level of the shaft it was a breast wheel; when the wheel was mounted on its side rotating on an upright shaft, with spiral or curved flanges for buckets, it was a tub-wheel, which form is the progenitor of the turbine. Overshot and undershot wheels were used for hundreds of years to drive flour mills, and a few are still in use, but such wheels are very wasteful of water, as compared with modern constructions.

**Flow of Water Through Orifices.**—A large and important section of the science of hydraulics is that which treats of the study of the flow of water through orifices of varying shapes and sizes and under varying heads. From these studies has come the knowledge which guides the mechanic in the proper formation of a nozzle suitable to the economical and efficient delivery of a certain amount of water under the pressure of any given head. Experiments in this direction are carried on by passing the water through an opening in a thin plate. Careful measurements of the spouting jet give a very close idea of its natural form. In this way the observed contraction of the jet just after issuing from the opening has led to the use by water-supply engineers of an entrance tube, or "mouthpiece" of modified funnel-shape placed within the reservoir, in the case of the supply pipe leading out of a reservoir. Outside of this mouthpiece the pipe is gradually expanded into an elongated funnel or "adjustage." The effect of these modifications has been to increase the velocity and consequently the discharge from the reservoir into the pipe to, in some cases, twice the volume to be theoretically expected from the existing head of water in the reservoir.

Another economic result from the study of the jet from an orifice is in the formation of hose nozzles for fire service, where the aim is to produce a jet of the largest possible volume and velocity with the smallest amount of friction.

**Flow of Water in Channels.**—In the practical applications of hydraulics, water is conveyed to a place where it is to do work, in open

channels or in pipes. In the case of the former the velocity or speed of the current depends solely on the grade of the bottom of the channel. The water simply "runs down hill," and the steeper the grade the swifter the current. The material in which the channel is formed will control the grade it is possible to give the canal or ditch, as too high a velocity for the water will tend to destroy the channel. So where the channel is simply cut in the natural earth the grade is perforce made safe for the material. A water velocity of three inches per second will carry off fine clay; at six inches per second, ordinary soil will be carried away; at one foot per second, coarse sand will run off; at two feet per second, gravel washes away; at six feet per second, large stones will be rolled along. It is customary, therefore, to line a channel with some enduring material, such as concrete, or even masonry if it is to be permanent. The flow of water in these channels will obviously be affected by the friction at the bottom and sides of the channel. This is technically known as the "wetted perimeter" and is measured on the cross-section of the stream. All along these edges of the flowing body of water the stream is held back, the normal speed of the current being found only toward the centre and near the surface. The action of wind may serve to retard or advance the surface velocity. So it becomes a matter of considerable intricacy to determine just how much water will be delivered and at what velocity, by a given stream flowing down a given grade. A great number of formulas have been proposed by different engineers to aid in making such calculations, and these are to be found in the technical textbooks on hydraulics.

**Flow of Water in Pipes.**—When the flowing stream of water is completely enclosed, as in a pipe, it is evident that no attention need be paid to the grade. The pipe may stand vertical if so desired. The difference in level vertically between the intake of water at the upper end of the pipe and the point of discharge is called the "head." It is expressed in feet, but in practice it is translated into pressure—the pressure equivalent to the weight of a column of water having the area of the pipe and a height equal to the head.

The friction set up by the perimeter of a pipe filled with running water is very considerable, and as soon as the lower end of the pipe is opened and the water is allowed to flow the pressure corresponding to the head disappears by a large percentage. This is called technically "loss of head." Its effect is to cut down the velocity of the stream in the pipe, and hence, to reduce the theoretical discharge very materially. Several "laws" have been deduced from a number of experiments made under these conditions. They are:

- (1) The loss of head from friction is directly proportional to the length of the pipe.
- (2) It is inversely proportional to the diameter of the pipe.
- (3) It increases nearly as the square of the actual velocity of the stream in the pipe.
- (4) It increases with the interior roughness of the pipe.

Another source of loss of head is to be found in every bend of the pipe. This is greater as the velocity is large, and is very small when the current is very slow.

From the first two laws above quoted it is seen that the discharge of water from a pipe

must depend upon the proportion of the length to the diameter. Hydraulic engineers are accustomed to classify pipes as "short" and "long." A short pipe is one whose length is less than 500 times its diameter; a long pipe is one whose length is more than 500 times its diameter. In a short pipe the loss of velocity due to friction is so small as to be negligible in practical work. In a long pipe, on the contrary, particularly if of very small proportional diameter, the friction is sometimes great enough practically to nullify the velocity and reduce the discharge to a mere trickle. As an example it may be stated that experiment has proved that one pipe of 24 inches diameter (452 square inches in area) will discharge as much water as 32 pipes of 6 inches in diameter (904 square inches in combined area). That is, the advantage of half of the area of the smaller pipes was lost by the friction of the larger perimeter surface. This matter assumes great importance in designing water-supply systems for cities, where the apportionment of the large mains and the small supply pipes must be directed to conserving the "head" or force of the flow against its too great diminution by "long-pipe" friction.

**Hydraulic Gradient.**—Another phenomenon which presents itself in the problem of the water-supply engineer is what is known as the "hydraulic gradient." This is a grade line assumed under the influence of the varying pressure by a body of water flowing in a pipe toward a lower level. It is ascertained experimentally by inserting in such a pipe a series of vertical tubes freely open to the atmosphere, and reaching upward to the level of the water in the supply reservoir. If the water in the pipe were not flowing, it is evident that in all the tubes the water would stand at the same level—that of the water in the reservoir. Upon allowing the water to flow, however, the water in the upright tubes falls, not to a uniform level, but to a graded line. In the tube nearest the reservoir it falls least; in the tube farthest from the reservoir it falls most. A line connecting the points at which the water stands in all of the tubes is the hydraulic gradient for that particular pipe.

The hydraulic gradient will vary according to the diameter of the pipe, its length, the grades on which it is laid, the roughnesses of its interior, its expansions or contractions in diameter and the distances from the reservoir at which they occur, and the number and sharpness of the bends placed in the system. The application of the principle of the hydraulic gradient in water-supply work appears when it becomes necessary or desirable to carry a supply pipe over a hill, which, though it be on a lower level than the water in the reservoir, may be above the line of the hydraulic gradient. In this case a siphon must be formed, otherwise the water supply will be cut off from the hill and the pipe line beyond it. See SIPHON.

**Hydraulic Power.**—Reference has already been made to the potential power for work by water stored at a height above the level where it is to be used. This power is exercised only in case the water is allowed to move. The power developed is that of the weight of the water used multiplied by the speed or velocity at which it moves; this product being termed its "momentum." From the previous discus-

sions it is seen that in making use of moving water a much greater power can be secured by confining it in pipes than by conducting it in open channels. In the latter case, while the weight of the water used may be the same, the velocity factor in the momentum is quite small, whereas in a pipe it may be very large if the grade of the pipe is steep. So that a small quantity of water operating under a great head may be made to do much more work than a large quantity with practically no head at all, as in the case of an open channel. For this reason the open water water-wheels are much less efficient with the same volume of water than the enclosed Pelton and turbine wheels operated by pipe lines.

**The Turbine Wheel.**—An overshot wheel is unscientific, because it carries a small part of the water beyond its lowest point, back on to the rising side of the wheel, where its weight is opposed to the forward movement; the undershot wheel gets the push of the water during only a small part of its revolution, and also carries up waste water. The best construction aims to throw the water quick and hard into the wheel and get it out again without dragging on the wheel. The theoretically best construction has been found in the turbine wheel, which is fundamentally a wheel rotating on its sides, on a perpendicular or upright axis, and taking in water at the sides, from gates in a stationary case, which admit the water at a desirable angle so that it strikes the curved blades of the runner or running wheel, gives them a quick thrust and falls through, delivering usually at the centre. It should be here noted that in English and Continental usage all water wheels are called turbines, while in American usage the word turbine is reserved for the style of water wheel just described, having spiraled flanges and runners. The turbine has been built in many forms, in the endeavor to secure the most power from the flowing water. The style which has become most common is the impulse or action turbine, having stationary gates with curved guides that direct the flow of water. Immediately below is the runner, having flanges curved but substantially at right angles to the fixed guides, so that the water delivers a push to the runner, and falls down, perhaps to a second, third or fourth runner. This developed type is now commonly called the Francis turbine, after an engineer who developed it about 1850. The reaction turbine has spiral-shaped flanges positioned to receive the water axially and deliver it tangentially.

The turbine is now almost universally adopted for all water powers of low head, that is under 300 feet head. It should be understood that "head" signifies the height of the source of water above the point where it enters the turbine or other water wheel. This head gives a pressure the equivalent of the weight of a column of water of that height, or slightly less, owing to the friction of the tube or container.

**Impulse or Pelton Wheels.**—The impulse or direct-action wheel, after going through evolutionary development as overshot, undershot, breast wheel, etc., has settled into the form known as the Pelton wheel as the best type. It is in almost universal use for high heads of 500 feet and over and in hydraulic street service. It is named after L. A. Pelton,

because he did more than any other man to perfect the dividing wedge principle, which serves to direct the water to the best advantage, securing the highest efficiency deemed possible with a direct-impulse wheel. The Pelton is a wheel in its simplest form, usually rotating on a horizontal axis, having buckets bolted to its periphery, against which the impelling water is directed from one or more nozzles. The buckets are like twin hollowed hemispheres or half-globes that are pushed together so that they divide by a straight line and sharp edge. The jet from the nozzle is aimed directly at this dividing ridge, which separates the water and gives it a direction that tends to throw it out of the hemispherical twin buckets as soon as it has done its work. The impulse wheel for utilizing high heads of water was first introduced by the California miners of 1850, and gradually improved, Pelton doing his work about 1878 to 1880. In modern practice the construction has improved. See HYDRO-ELECTRIC DEVELOPMENT.

The Pelton wheel is not quite as efficient theoretically as a turbine, wasting from 5 to 7 per cent more water; a Francis turbine will deliver more water for the same diameter than a Pelton. But the turbines are more complicated and more costly, and not so well adapted to receive the enormous pressures to which Peltons are subjected under a high head. For many years a three-foot Pelton wheel was run at the California and Consolidated Virginia mine in Nevada, under a 2,100-foot head with a little half-inch stream of water, making 1,150 revolutions per minute, or the equivalent of 240 miles an hour, and delivering 100 horse power. They are built in sizes up to 10,000 or more horse power, and use from one to four nozzles distributed around the periphery, the tendency being to employ one nozzle. Some of the larger nozzles deliver a stream of 9 or 10 inches diameter. This flow is regulated by a central "needle" which can be advanced to partially close the aperture of the nozzle. Deflectors are also employed to turn aside the flow of water should the "load" be suddenly reduced. Both turbines and Peltons are now commonly coupled directly to dynamos for generating electricity, that the power may be sent out on wires, or the current used for electric lighting, etc.

**Pumps.**—To comprehend the action of pumps the reader must understand that water always seeks the lowest possible level. If a garden hose is nearly filled with water and the two ends are held up, it may be demonstrated that the level of the water in one end is the same as the other end; this crude device is sometimes used in making grades for drains. It must also be borne in mind that water is under atmospheric pressure. The air weighs 14.7 pounds per square inch (at sea-level), and if the lower end of a pipe of one inch cross section be placed in water, and the air be pumped out or otherwise removed from the pipe, the water, being relieved of 14.7 pounds pressure, at once rises in the pipe until the column of water in the pipe equals the weight of the atmosphere removed, which in theory is about 32 feet, or in practice a little less.

The hand pump is made in almost an infinite variety of forms and styles. The common

suction pump (see Fig. 1) has a pipe whose lower end rests in the water; the pump proper is a barrel A of larger diameter than the water pipe. A piston B with valves CC is reciprocated in this pump barrel A, by moving the pump handle up and down. As the piston moves upward the valves CC are automatically closed, and the valve D opens, when the tendency to create a vacuum below sucks up the water, which may thus be raised to a height not exceeding 32 feet. In other words the up-stroke of the piston causes the water below to rise because of the atmospheric pressure. To force water higher than 32 feet with a piston movement, the force-pump is employed. This has a solid piston, moving up and down in a cylinder, but the valves are both in the lower part of the cylinder, as shown in Fig. 2. When the piston is rising, as illustrated, the lower

FIG. 1.—Suction Pump.

FIG. 2.—Force Pump.

valve A opens and water is drawn into the pump barrel, the valve B being closed. When the piston reaches the top and starts its return downward stroke, the pressure closes the valve A and opens the valve B, and the water in the cylinder or pump barrel is forced into the pipe leading upward which may extend to a considerable height. As described, the action of the force-pump is intermittent, but it may be made to deliver water continuously by attaching an air-chamber to the eduction pipe. The air in this chamber is compressed while the piston is forcing water up the eduction pipe, and on the return movement of the piston, its pressure being removed for an instant, the compressed air acts as a spring and pushes up some water. The force-pump, it is apparent, raises the water as far as the pump barrel on the same principle as the suction pump, atmospheric pressure being the raising force in both cases, but above that point the action of the force-pump is that of the downward force exerted

by the pump handle on the confined water in the pump barrel, so that it is free to raise more water on every stroke regardless of its perhaps having already raised a column of water 32 feet up to the barrel.

The force-pump barrel is usually set in a horizontal position, with the pump handle vertical, so that the man pumping can throw his weight against it in much more effective fashion than in an up-and-down stroke.

A lift pump is one that raises the water bodily by lifting or scooping it up; it may employ a piston in a tube, but the common device is an endless chain with circular buckets fixed a few inches apart, these buckets being shaped like washers and fitting loosely the bore of the pipe through which the chain is raised. The chain is hung at the top over a driving windlass; the lower end dips in the water; the turning of the windlass by a crank draws one side of the chain up through the pipe, and the washer-like buckets draw up the water between them. The old-fashioned ship-pump was the simplest sort of lift pump, consisting of a pipe running from the deck nearly to the bottom of the ship's hold. In this pipe was let down a rod, having a handle at the top and dish-shaped leather buckets near the lower end. By working the handle up and down the sailor who manned the pump lifted water in a continuous stream. With such a pump it was necessary for the sailor to make the downward movement rapidly, so as not to lose the water raised, while reaching down for more.

A centrifugal pump of the form also called a rotary pump is one having a short cylindrical case, in which turns a rotary piston having several radial arms that embrace sectors of the cylindrical space, so that water may be admitted at one side and passed out at the other side. Tesla's pump might also be called centrifugal, since it receives the water axially in a wheel, and throws it out at the periphery; its fundamental characteristic, however, is capillary attraction or skin friction. By placing several discs about three-sixteenths of an inch apart and rotating them in unison the water is picked up by the side friction of the discs, and then when the disc spaces are full, it is thrown out by centrifugal force. A centripetal pump is one having a rotating mechanism that picks up the water at the periphery and delivers it at the axis, a sort of reversed turbine.

Steam pumps are made in numerous forms, some being simple force-pumps operated by a steam-engine. A common direct-acting steam pump has large gears mounted in a water-tight case, and meshing closely so that their rotation withdraws the air from a water pipe, creates a partial vacuum and raises the water. The propeller pump, or spiral pump, also called Archimedes pump, employs an inclined tube, within which a broad-bladed screw turns, the edges of the blades filling the tube. When the lower end is placed in water, and the tube placed at an angle of about 30 degrees, rotation of the screw picks up the water by the advancement of the blades and carries it to the top.

The vacuum pump utilizes a closed vessel, to which steam is admitted and a little cold water then turned in to condense the steam. This condensation forms a partial vacuum, and because of atmospheric pressure the water rises and fills the steam chamber. The pulsometer

is of this type. It consists essentially of a double chamber, having a ball-valve at top and clack-valves at bottom. Steam is admitted to one of the chambers and presses out the water contained there. Condensation then taking place a vacuum is formed, and the ball falls over and closes the opening through which the steam entered and water flows up through the clack-valves and again fills the chamber. The steam in the meantime acts upon the water contained in the adjoining chamber. Condensation then taking place there, the ball falls back to that side, and the operations go on alternately, the result being a steady stream of water sucked into one chamber after another, and then forced out and upward by the steam pressure. The water is drawn into the machine from the centre.

A hydraulic or hydrostatic pump is simply the pump of a hydraulic press, crane, punch, etc. The principle of the hydraulic press and hydraulic ram are described under those titles. The hydraulic crane and hydraulic punch are simply a crane or a punching press having one or more hydraulic cylinders with large diameter pistons which are moved with great force by means of water pumped in through a small aperture. The pressure of water varies with the degree of surface. If a stream of water of one square inch cross section be forced into a large cylinder under a pressure of 100 pounds, the pressure of the water will move a piston of 500 square inches surface sliding in the large cylinder, with a push of 50,000 pounds, less the friction involved, which is slight. The larger piston of course will move at one five-hundredth of the speed of the smaller pumping piston.

**Hydraulic Mining.**—This term is applied to that system of mining in which heavy streams of water are played on a bank of earth or gravel to wear it away. The streams are thrown by "giants," which are simply huge nozzles by which the water is delivered from some high head, giving great pressure. Where plenty of water is to be had there is no such cheap way of opening up a hillside for the miner as the hydraulic system. The giant streams bring down the gravel rapidly and in just the right condition for easy panning of the gold or other valuable metal content. But this system ruins the locality for agricultural purposes, because all the soil is buried beneath deep beds of gravel, and so hydraulic mining is in disfavor with all other interests, and in some States is prohibited by law. The "miner's inch," originally a measure of water for the placer miner, and now also a unit of measure for water used in irrigation in the arid regions of the West and Southwest, has interest as a hydraulic flow through an orifice and subject to the laws governing such flows. It is adjudged to be that amount of water which will flow through an inch-square opening in an inch board, all the edges being sharp, under a head of six inches (sometimes seven inches) above the upper edge of the opening. The amount of water which actually passes under such conditions is 1.52 cubic feet per minute. It varies, however, in different localities. In Arizona, Idaho, Nevada and Utah the customary miner's inch is a deliverance of 1.2 cubic feet per minute. In California and Montana it is fixed by law at 1.5 cubic feet per minute.

**Dams and Canals.**—The hydraulic engineer is called upon to design and construct dams under ever varying conditions. Most modern river dams are made of concrete, or part concrete and part stone; the concrete is often reinforced. It is common to curve the dam up stream so as to form an arch, thus greatly increasing the strength of the dam, as its resistance may be considerably more than its weight. The up-stream side of a dam is usually sloped, and if the dam is of rubble or riprap, is faced with timber or concrete; the down-stream side of a dam may approach the perpendicular. Every dam requires a waste weir with gates to let out the surplus water in time of flood or emergency. Insufficient dams have occasionally burst, flooding the valley below, as at Johnstown, Pa., but these calamities have served to inform engineers more fully as to conditions, and there is every reason to place confidence in modern dams. See IRRIGATION; WATER SUPPLY.

Canal engineering is a part of hydraulics, and has reached its highest development in the building of the Panama Canal (q.v.). The principle of a canal lock is simple. Where there is a change of level of the water in a canal a lock is formed by building two dams having great gates and located a few hundred feet apart. The space between these dams is termed the lock. When a vessel is to pass, say from the lower to the higher level, the water within the lock is let out by means of small gates until the water of the interior of the lock is at the lowest level, the upper gates of course being kept closed. The large lower gates are then opened wide and the vessel is floated in to the lock; then the lower gates are shut, and small gates in the upper end of the lock are opened, so that water flows in until the lock is filled to the upper level, when the upper large gates are opened, and the vessel floated up and out of the lock. To pass a vessel down through a canal lock the operation described is reversed. Water is lost from the upper level at every such passage, but in designing a canal the engineers find streams to supply water to keep the upper levels full.

**Wave Motors.**—One of the most interesting fields of hydraulic study is connected with wave motors. In theory the waves on the ocean constitute a tremendous power, which it ought to be easy to harness for man's use; in practice the wave motor has never been able to compete with the steam-engine. The wave motor has been constructed in hundreds of ways, and the files of the Patent Office are flooded with designs, most of them ingenious, and very many of which have been built and tried out; but though the machines develop immense power at times, they accomplish little at low tide and in very calm weather, while in storms they are apt to be broken to pieces by the tremendous exercise of surplus power. It remains for some inventor of the future to make the wave motor commercially practicable.

**HYDRAZINE**, or **DIAMIDOGEN**, a substance having the formula  $N_2H_4$  (or  $H_2N.NH_2$ ), obtained (together with oxalic acid,  $H_2C_2O_4$ ) by heating an aqueous solution of the complicated substance known as triazoacetic acid  $(C_6H_5N_3)(COOH)_2$ . It is a gas with a peculiar penetrating odor, but the properties of the pure substance are imperfectly known, on account of the avidity with which it combines with water to form the hydrate,  $N_2H_4.H_2O$ , and the consequent difficulty of isolating it. Hydrazine hydrate is a powerful base, combining with acids to produce numerous definite crystalline salts. Among these the sulphate,  $N_2H_4.H_2SO_4$ , and the two hydrochlorides,  $N_2H_4.2HCl$  and  $N_2H_4.HCl$ , are important. The hydrate may be prepared by boiling the sulphate with a solution of caustic soda. It is a fuming liquid, somewhat oily in appearance, and boiling at 245° F. The hydrate reduces cold ammoniacal solutions of silver nitrate and also reduces Fehling's solution. It attacks glass, cork and india rubber, but may be kept in silver vessels.

The substances derived from hydrazine by replacing one or more of its hydrogen atoms by compound radicals are also called "hydrazines." If only one hydrogen atom is replaced the hydrazine is said to be "primary." If two hydrogen atoms are replaced, the hydrazine is said to be "secondary." The radical which replaces the hydrogen may belong to the fatty series, or to the aromatic series. One or more of the hydrogen atoms may also be replaced by a metal, such as sodium. The most important of the organic hydrazines is phenylhydrazine, in which one of the hydrogen atoms is replaced by the aromatic radical phenyl,  $C_6H_5$ . This substance, which has the formula  $(C_6H_5)HN.NH_2$ , is a colorless, oily liquid, which solidifies a mass of tabular monoclinic crystals on cooling to 73° F. It mixes with alcohol, ether, benzene and chloroform, but hardly at all with water. It reduces Fehling's solution in the cold, and is very poisonous. A secondary hydrazine is "symmetrical" when the two substituted radicals are attached to different nitrogen atoms; it is "unsymmetrical" if they are attached to the same nitrogen atom. Thus  $(C_6H_5)HN.NH(C_6H_5)$  is the symmetrical secondary hydrazine of phenyl ( $C_6H_5$ ) and ethyl ( $C_2H_5$ ), while  $(C_6H_5)(C_2H_5)N.NH_2$  is the unsymmetrical secondary hydrazine of the same radicals.

**HYDRAZONES.** See COAL-TAR COLORS.

**HYDRIÆ.** See VASES.

**HYDRIDE**, a chemical substance formed when hydrogen combines with a metal, or some simple or compound metallic base, or with a compound radical acting as a base. Formerly the term had the same meaning as hydrate, and this must be borne in mind when studying the older works on chemistry.

**HYDRIODIC ACID**, or **HYDROGEN IODIDE** is an acid composed of hydrogen in

combination with iodine, and having the formula HI. Hydriodic acid is analogous to the more familiar hydrochloric acid, both in its chemical structure and in its general properties. It may be prepared by the direct union of hydrogen and iodine at a red heat. A more convenient method, however, consists in passing sulphuretted hydrogen gas ( $H_2S$ ) into water in which a little pulverized iodine is suspended. The reaction is  $H_2S + 2I = 2HI + S$ . The action is slow owing to the deposition of sulphur which encases the iodine particles and prevents their free solution. The larger the amount of hydriodic acid formed, the faster the operation progresses. Fresh supplies of iodine are added from time to time, and the liberated sulphur is finally removed by agitation and filtration, the sulphuretted hydrogen remaining in solution being also removed by the application of gentle heat. In another method the iodine is dissolved in carbon bisulphide, and the solution covered with a stratum of water. When sulphuretted hydrogen is passed into this mixture, the hydriodic acid as it forms is dissolved in the water, and the sulphur set free is dissolved in the carbon bisulphide. The aqueous solution is boiled to expel the sulphuretted hydrogen it may have taken up and the hydriodic acid remains in a pure state in the solution. The aqueous solution so prepared possesses strongly acid properties, and combines with bases to form salts called iodides. The pure acid is a colorless gas, with an odor similar to that of hydrochloric acid gas. It has a density about 63 times as great as that of hydrogen, and at a temperature of 32° F. it condenses to a liquid when subjected to a pressure of four atmospheres; the liquid so obtained freezing to a solid mass at about 67° F. below zero. The specific heat of the gas, at ordinary temperatures, is about 0.055 (at constant pressure), and the ratio of its specific heat at constant pressure to its specific heat at constant volume is 1.397. It dissolves freely in water, the specific gravity of a saturated aqueous solution, at 32° F., being about 2.00. The aqueous solution is colorless when pure, but it is slowly decomposed by sunlight, becoming dark from the liberation of iodine. It is also decomposed by sulphuric and nitric acids and by chlorine and bromine, which set the iodine free. In medicine hydriodic acid is administered as a syrup.

**HYDRIODIC ETHER** (more correctly known as ethyliodide), a heavy, colorless liquid with a sharp, pungent taste and a penetrating ethereal odor, obtained by acting upon pure ethyl alcohol ( $C_2H_5.OH$ ) by iodine, in presence of red phosphorus. The proportion is 1 part of red phosphorus (or equal parts of red and yellow phosphorus), 5 parts of alcohol and 10 parts of iodine added slowly. After 24 hours the hydriodic ether is distilled off, and washed with a solution of sodium hydrate and water, and dried over calcium chloride. In large quantities it is prepared by adding sulphuric ether slowly to a warm, concentrated aqueous solution of potassium iodide, or by the action of hydriodic acid upon sulphuric ether. Hydriodic ether has the formula  $C_2H_5.I$ , boils at 162° F. (under ordinary atmospheric pressure), and has a specific gravity of about 1.946. When not quite pure it becomes brownish upon exposure to light, from the liberation of iodine. In chemistry, hydriodic

ether (or ethyl iodide) is largely used as a fundamental substance in the preparation of the various other compounds of ethyl.

**HYDRO-ECONOMICS.** The science that investigates the conditions and laws affecting the occurrence and use of water as a material means of satisfying human needs and desires, and that takes into consideration also the proper balance between cost and benefits to be derived in each particular case from the practical application of these laws. Water for drinking purposes next to air is the most important substance necessary for the support of life. It must be had at short intervals in suitable quantities and qualities for the daily needs of mankind and for all animals and plants; thus to the extent to which these are used as a food, it is vital also in food production. The regulation of its supply for watering live stock and for irrigation in producing crops is an essential for the welfare and the increase of population. As a correlative, the reduction of excess of water by drainage is equally important. Related to these is the conveyance away from human habitations and centres of population of waste products through sewage systems and the economic disposal of manufacturing effluents or waste in running water, where this can be properly done.

The data for the study of hydro-economics necessarily fall into several groups of subjects, primarily those relating to the properties—physical and chemical—of water as a substance, next to its occurrence in nature, these facts being included within the science of meteorology. Following these are the measurements of its volume included within hydrology and the mapping of large bodies of waters, rivers, lakes and oceans, known as hydrography. All of these data are needed in the consideration of the largest development and use of water for human needs, *first*, as above stated in the direct support of life involving questions of domestic and municipal supply; *second*, in the production of food directly through water needed for domestic animals and for the irrigation of crops or the relief of the excess from the tilled fields by means of drainage; *third*, in relative importance come questions of conveyance of waste from towns and factories; *fourth*, the employment of water in the industries in the production of power directly by water wheels, included in the science of hydraulics, or in steam production, this being within the range of thermo-dynamics. The *fifth* use of water is that of transportation of persons and goods, included under the head of navigation. This latter use, under modern conditions and due largely to the rapid development of railroads, has declined in relative importance. From the standpoint of Federal law, however, navigation has priority over other uses, the Constitution of the United States providing, in Section 8, that Congress shall have the power "to regulate commerce with foreign nations, and among the several States, and with the Indian tribes."

Under a very broad interpretation of this provision, Congress has undertaken the regulation not only of the interstate but of many intrastate streams and has authorized the building of extensive levees and related works for the protection of agricultural lands from overflow. It has also made appropriations for the

purchase and protection of forests at the headwaters of streams whose lower reaches may be navigated—the tendency being to enter upon the development and use of the water resources of the country under Federal auspices as far as practicable under a liberal interpretation of Federal power conferred by this clause of the Constitution.

As proprietor or guardian of the vast area of public lands in the western part of the United States, Congress has made appropriation of the funds resulting from the disposal of portions of these lands to be used in the storage and distribution of water occurring in the arid and semi-arid States and under the terms of the Newlands or Reclamation Act, 17 June 1902, has provided for the irrigation of extensive tracts, the Reclamation Service being created for this purpose. It has expended over \$100,000,000 in building large works such as the Roosevelt Dam in Arizona, the Arrowrock Dam, 350 feet high, the highest in the world, in Idaho, and other great structures, including tunnels, canals and subsidiary works, such as roads, railroads, electric transmission lines and minor manufacturing plants, all for the purpose directly or indirectly of conserving and utilizing the natural resources of the country.

The science of hydro-economics may thus be said to bring together for practical application many of the subjects which form portions of physics, chemistry, meteorology, hydrology, hydrography and hydraulics and to combine these in the building of waterworks, sewers and disposal works for towns and cities. Also for irrigation and drainage systems, for power plants—electrical or otherwise,—for steam production, for flood prevention, by forest growth, reservoirs or other means, also for flood protection by levees or dikes, and finally for navigation including the character and size of channels and related details, boats, barges and terminal facilities. The constitutional and legal phases introduced by Federal, State or municipal laws and the interpretation by the courts of the common law regarding riparian rights as well as statutory enactment have a part.

FREDERICK H. NEWELL,

*Professor of Civil Engineering, University of Illinois.*

**HYDRO-ELECTRIC DEVELOPMENT**, the term by which the engineering profession has come to designate the production of water power and its electrical distribution for use as power, light and heat. About 1890 it was recognized by some that a change in motive power was imminent, and that gradually the steam-engine and boiler depending on coal would be replaced by water wheels, utilizing the largely wasted forces of the rivers, streams

and waterfalls, and converting these into electricity, to be sent out at high pressure, over hundreds of miles of wires, and thus distributed to lighting plants and electric motors for use where needed. Gradually capital was interested, and power sites have been acquired, and now there has come to be competition for the remaining good water powers, and the public has even been alarmed at the suggestion of monopoly of the important natural resource represented by the potential power of its flowing waters.

The Niagara Falls power plants settled the question of economical utilization of water power on a large scale. The latent power of the great waterfall was utilized in 1877 in a small way, and in 1886 the Niagara Falls Power Company was chartered to utilize the power on a large scale. It took them 10 years to get going, and the leading engineers of the world were consulted as to the best mechanical means of using the tremendous head and mighty volume of descending water. The difficulty of the problem lay in the fact that there was so much power that ordinary machinery was likely to be broken up by the mighty force it was desired to harness. But the cataract yielded to man's genius just as has the harnessed lightning. A side channel was dug by the Falls, and a pit sunk so as to allow of using a head of 136 feet, and at the foot of these were placed turbines, with shafts running up to the top of the pit, and directly connected to dynamos, each of 5,000 horse power, far the largest that had then been constructed. To support the weight of this great 136-foot steel shaft, carrying the heavy dynamo and turbine, and whirl it around at a peripheral speed far exceeding that of the fastest railway train, without wearing itself out with friction was indeed a problem. No known bearing would stand such tremendous friction, therefore a new form of bearing had to be devised; and the form decided on was highly admirable. As constructed the heavy column and revolving machinery rest on the flowing water itself. The water comes down the interior of the columnar pipe, strikes the lower surface, rebounds or reacts against the blades of the turbine, causing it to rotate and at the same time lifting or supporting it in an almost frictionless manner. Thus was solved the problem of using the turbine wheel for comparatively high heads of water to gain very large power for a single unit machine.

One other important invention was needed to make the utilization of great water power complete, and that was means for sending out a great voltage of electricity to a long distance. This was accomplished by Nikola Tesla, in his notable discovery of the rotating magnetic field. He reversed the arrangement of the dynamo as constructed before his time, making the core stationary, and arranging the magnetic field to revolve around it. This made possible a dynamo for high service, and with the development of improved methods of insulation and minor details, the mechanism for long-distance power, light and heat transportation was complete.

It is true that before 1891 two fair-sized hydro-electric plants had been established, one sending electricity 13 miles from Oregon City to Portland, Ore., and the other 29 miles from Pomona to San Bernardino, Cal., but these

were single phase currents, of not more than 10,000 voltage, adapted to running street cars and electric lights, but not for miscellaneous purposes, for which a polyphase current is requisite. It should be understood that an alternating current generator can be constructed to generate two or more currents alternating at the same rate but not at the same time. One current will be just stopping and changing its direction when the other current is flowing with full force; the next instant the first current will come up to its full strength, and the second current will stop and reverse. Three as well as two alternating currents can be combined and transmitted in this way to a distance, and this system is called three-phase or poly-phase transmission. A polyphase current applied to an alternating current motor produces a balanced rotation of the armature very much as three or more cranks on an engine-shaft balance each other. One current in the motor will be doing its maximum work while another is at or approaching zero, just as in the engine one crank is exerting its maximum push as another is at or approaching its dead centre. Three-phase transmission was first successfully accomplished in 1891 at Frankfort, Germany, and is now universal.

The transformer is an important adjunct in an electrical transmission system. It is based on the principle of the induction coil (q.v.). The essential parts are a core of laminated sheet iron wound with two coils of copper wire, one coil consisting of numerous turns of fine wire and the other coil of a few turns of coarse wire. If the fine wire coil is connected to the line a much lower pressure current can be drawn from the coarse wire or secondary coil; if the connections are reversed and the fine wire coil is used for a secondary, a current of much increased pressure is generated. Thus the transformer is used, as its name implies, to "step up" or "step down" the pressure. The relative number of turns in the primary and secondary coils determines the ratio of the steps obtained.

To distribute hydro-electric power economically, it has been found best to first create a very high potential for the alternating current, and to send this out to a station, where there are transformers, and it can be stepped down for use, and by means of rotary converters can be changed into direct current when desired. It is not many years since it was considered an achievement to send out 40,000 volts on a wire, but now 150,000 voltage is used, and still higher pressures are contemplated.

To develop the water power, a stream has to be dammed, a reservoir formed to maintain a flow of water and a power-house with water wheels must be installed. The head or fall of water determines the sort of water wheel to be employed. All heads under 300 feet are now classed as low heads, and all over about 700 as high heads; the wheel accepted for low heads is the turbine, and for high heads the impulse or Pelton wheel. For intermediate heights of head, conditions have to determine which form of wheel is best. For a fuller description of water wheels see HYDRAULICS.

Water-power plants are usually supplied with two sorts of dams, storage reservoirs and diverting dams. These are now mostly constructed of masonry and concrete. Conduits

for conveying the water are made of both wood and steel; the wood may be rectangular or box-shaped, or of circular cross-section, made like a continuous barrel with staves and steel bands. These wood stave pipes are exceedingly strong, and will carry a 200 foot head, and last for years. But for greater pressure and durability steel pipe is requisite. Lap-welded galvanized sheet steel is the favorite material, and it is made of a tensile strength of 50,000 to 65,000 pounds per square inch of section. It is lapped and triple-riveted for carrying heavy pressures. Such steel pipes are often three to five feet in diameter, and have been made up to seven feet. When of considerable length the construction has to allow for contraction and expansion of the metal with changes in temperature. One engineer reported that a long section of metal pipe "crawled"—that is, expanded and moved its position lengthwise—seven inches between the extremes of heat and cold of a single 24 hours.

Where the water is not under pressure, as in a tail-race, it may be carried in an open channel, and such are frequently built of concrete. It is often necessary to tunnel through the rock to find a proper outlet. To use a high head of water a power station must occupy a low site, which means standing in a valley. After using the water here the next problem is to get rid of it, which means leading it to some lower locality where it can flow away. To find such lower level it is sometimes necessary to tunnel for miles.

Complete statistics of the extent of hydro-electric power development are lacking. The United States census of 1910, covering returns made by manufacturing establishments in 1909, shows only a very small percentage of water power in use, and it is known to be far larger than the official figures show. To illustrate: In 1869 the census reported a total of 2,346,000 horse power used in manufacturing, of which 1,130,000 or nearly a half was water power. In 1889 the total power recorded as used in manufacturing was only 10,000,000 horse power, of which 1,454,000, or 14.4 per cent, was water power, and nearly all the rest steam power. This was the date at which hydro-electric development really began, yet 20 years later, in 1909, in spite of the tremendous development of plants, as recorded farther on, the increase of water power is given at only a little more than 1 per cent a year. The steam power is credited in 1909 with 14,199,000 horse power, electric power is credited with 1,749,000 horse power and the water wheels get credit for only 1,823,000, or less than 10 per cent of the total. This despite the known development of tremendous horse power at Niagara, Big Creek, Tallulah River, Las Plumas, Butte, Keokuk, etc. It is true than the census figures quoted do not include the use for mines and quarries, which is reported separately at the insignificant figure of 97,460 water power, as against 255,699 electric and 4,608,000 steam horse power. This 1909 census does credit New England with 27.9 per cent of her horse power as being derived from water, but only allows 5 to 8 per cent for far Western States.

It would appear that the reason why the census does not show the extent of the hydro-electric development is that the method of gathering returns from manufacturers did not

cover the situation. Probably a very large part of the power credited as electric is hydro-electric, and another large part escapes enumeration under the head of manufacturing or mining, because it is utilized by street railways and lighting companies whose reports do not always indicate the source of their supply. Hence the census figure of 1,823,000 total water power used in manufacturing in 1909 probably represents less than half of the total use, and at the present time it is a fair estimate that the total hydro-electric horse power in use in the United States for all purposes is 5,000,000 and the capacity of these plants is fully 9,000,000 horse power.

A description of a few of the hydro-electric power and transmission plants will afford some idea of the actual accomplishments in this field. The Pacific Light and Power Company of Big Creek, Cal., has utilized a small stream for a phenomenal power development. The creek drops 4,000 feet in six miles and by two installations the engineers utilized 3,680 feet of this head. The equipment includes three large concrete storage reservoirs that will hold 4,500,000,000 cubic feet of water. From these the water flows first through a 10,360 foot tunnel, and 425 feet of standpipe, arriving at Power Station No. 1 with 1,900 feet effective head. Here are installed two 17,500 k-v-a generators and four 10,000 horse power Pelton water-wheels, each of one nozzle. The tail water from this plant runs off through another long tunnel and pipe, and delivers at Power Station No. 2, with 1,780 feet effective head. Here there is another installation of a total of 35,000 k-v-a generators and 40,000 horse power water-wheels. These two stations have an ultimate capacity of double the power they are now supplying. The dynamos send out the power over a line of 240 miles, made of steel aluminum wires, carried on steel towers, at the enormous pressure of 150,000 volts.

The Pacific Gas and Electric Company, with headquarters at Denver, Cal., have 150 miles of transmission line operated at 110,000 volts, 380 miles at 20,000 volts and many miles of minor lines at 11,000 volts. In 1913 they were equipped with generators for 25,000 kilowatts, but a capacity of 50,000. They use 12,500 k-v-a generators, each driven by two 8,500 horse power Pelton wheels of single nozzle type. They now have in all 11 hydro-electric stations, and their highest head is 1,345 feet. The Sierra and Santa Fe Power Company, at Stanislaus, Cal., in 1907-08 built a plant which is running at 34,000 kilowatts, the capacity may be increased any time to 75,000 kilowatts, which is the equivalent of about 100,000 horse power. The plant includes four 8,500-kilowatt generators, and eight 6,000 horse-power single-nozzle Pelton wheels.

The Tallulah River plant of the Georgia Railway and Power Company, which supplies Atlanta and vicinity, is one of the most notable in the South. The electric current is sent 90 miles to Atlanta and 50 and 80 miles in other directions, at as high as 110,000 volts. The storage reservoir has a billion and a quarter feet capacity, and there is a large diversion dam. A tunnel of 6,670 feet carries the water to the six penstocks, each of which serves a 10,000-kilowatt Francis turbine of 514 revolutions per minute. A large medium-head plant is that

of the Great Western Power Company at Las Plumas, Cal., which was completed about 1910, and supplied with five 10,000-kilowatt generators, each driven by 18,000 horse-power, vertical shaft, single-runner turbines. The head here is 465 feet, and the water is carried 15,168 feet through a pressure tunnel. An illustration of large power obtained from a low head is seen in the plant of the Mississippi Power Company, at Keokuk, Iowa, which sells power in Saint Louis at the low rate of \$18 per horse power. In 1913 the plant was developed for 112,500 kilowatts, but there is an ultimate capacity of 225,000 kilowatts. They use 7,500-kilowatt generators and 10,000 horse-power Francis turbines, employing 32 feet head. The Alabama Power Company's installation at Coosa Lock, in 1914 totaled 52,000 kilowatts, with 78,000 ultimately available. They use 17,500 horse power single-runner turbines, direct-connected to 13,500 k-v-a generators, and have 68 feet head of water. The No. 3 plant of the Niagara Falls Hydraulic Power and Manufacturing Company uses generators to a total of 130,000 k-v-a, and has 13 10,000 horse-power turbines running under 210 feet head. The power projects now under way at Niagara indicate an increased development on the American side of at least 600,000 horse power, and as much on the Canadian side.

The great trunk line railways of the country are most of them planning for a greater or less electrification of their lines, and naturally will avail themselves of water powers along their routes wherever they can be used economically. Much of the water that is dammed for irrigation or transported for city supply can be used en route for supplying power without loss, and this is already being done, and is sure to become a common practice.

CHARLES H. COCHRANE,

*Author of 'Modern Industrial Progress.'*

#### HYDRO-THERMAL METAMORPHISM. See METAMORPHISM.

**HYDROBROMIC ACID**, or **HYDROGEN BROMIDE**, a compound having the formula  $\text{HBr}$ , and analogous in its general properties to hydrochloric and hydriodic acids. Hydrogen and bromine do not combine directly, even in strong sunlight; but when hydrogen that is charged with bromine vapor is burned, hydrobromic acid and water are formed. Hydrogen and bromine may also be made to combine by electric sparks, or by passing the mixed gases through a hot tube, or over hot platinum. The most convenient way of preparing the acid, however, is by the action of bromine upon water, in the presence of phosphorus, the reaction being  $4\text{H}_2\text{O} + 5\text{Br} + \text{P} = 5\text{HBr} + \text{H}_3\text{PO}_4$ . Phosphoric acid, it will be seen, is formed at the same time; but the two are easily separated by heat. Pure hydrobromic acid, when free from water, is a colorless gas of pungent odor, having a density about 39.1 times as great as that of hydrogen. Under ordinary atmospheric pressure it condenses into a liquid at  $99^\circ$  below zero F., and at a slightly lower temperature it crystallizes. It dissolves freely in water, a saturated solution, at  $32^\circ$  F., having a specific gravity of 1.78, and containing 82 per cent of hydrobromic acid, by weight. A concentrated aqueous solution of hydrobromic acid fumes strongly in the air, but does not decompose.

When heated, the gaseous fumes are evolved until the solution contains about 47 per cent of the acid, when it boils continuously at 126°. Hydrobromic acid is a powerful acid, forming, with metallic bases and with organic radicals, definite salts called "bromides." Hydrobromic acid is used in medicine in the treatment of the ear, and the bromides of the alkalis are extensively used as sedatives. Bromide of silver is also used in large quantities in photography, in the manufacture of sensitive dry-plates.

**HYDROCARBON GASES.** See LIQUEFIED AND COMPRESSED GASES.

**HYDROCARBONS**, the simplest of organic compounds, consisting solely of carbon and hydrogen. They are exceedingly numerous, and many of them occur in nature, both in petroleum, asphaltum and similar minerals of organic origin, and in the essential oils of plants. They are produced economically in the dry distillation of wood and peat, and are components of illuminating gas and the oils of coal tar. The hydrocarbons can be broadly divided into two general classes: (1) saturated hydrocarbons; (2) unsaturated hydrocarbons; — according to the way in which the carbon atoms that they contain are connected to one another. The first class contains only the single-linked carbon atoms; the second class comprises those in which pairs of carbon atoms are united in doubles or threes. The first class includes only the paraffines.

In the fatty series, the atoms are all connected in open chains, while in the aromatic series the carbon atoms are connected with one another in such a manner as to form closed rings. (See FATTY COMPOUNDS and AROMATIC COMPOUNDS). As a class, the hydrocarbons are insoluble in water; they cannot be saponified; and they are neutral, and do not combine with acids to form salts.

The classification of the hydrocarbons is as yet incomplete; but the greater number of those that are known can be included in one or another of the following groups:

1. The *Paraffins*, having the general formula  $C_n H_{2n+2}$ . The lowest member of this series is methane, or marsh gas,  $CH_4$ , and many other members of the series are known, each containing one carbon atom and two hydrogen atoms more than its immediate predecessor. See PARAFFINS.

2. The *Olefines*, also known as Alkylenes, or Alkenes, having the general formula  $C_n H_{2n}$ . Ethylene,  $C_2H_4$ , is the simplest member of this series, which includes also propylene; the butylenes; amylenes; hexylenes; heptylenes, etc.

3. The *Acetylenes*, or Alkines, and the *Allylenes* or Diolefines, having the general formula  $C_n H_{2n-2}$ . Acetylene gas,  $C_2H_2$ , is the simplest representative of this series, which includes also allene; divinyl, erythrene or pyrrolylene; piperylene; isoprene, diallyl, conylene, etc.

The foregoing all belong to the fatty subdivision. At a red heat three molecules of acetylene unite to form one molecule of benzene, thus linking the aliphatic or fatty series with the aromatic series. The latter class embraces:

4. The *Benzene* series, having the general formula  $C_n H_{2n-6}$ , known also as the cyclic hydrocarbons, and the terpenes.

5. The *Terpenes*, or alicyclic compounds, a class of substances having the general formula  $C_{10}H_{16}$ , and including pinene, camphene, fenchene, sylvestrene, carvestrene, terpinolene, terpinene, etc.

The known hydrocarbons having any one general formula may be ranged in a series, whose members exhibit a sort of regular progression in their properties. For example, the first eight members of the normal paraffin group may be arranged as follows:

		Boiling Point.
Methane	$CH_4$	(Gaseous)
Ethane	$C_2H_6$	"
Propane	$C_3H_8$	"
Butane	$C_4H_{10}$	34° F.
Pentane	$C_5H_{12}$	100° F.
Hexane	$C_6H_{14}$	160° F.
Heptane	$C_7H_{16}$	209° F.
Octane	$C_8H_{18}$	258° F.

A series of this sort is said to be "homologous."

The paraffins are said to be "normal" when they contain but two methyl groups ( $CH_3$ ). Thus normal propane,  $C_3H_8$ , has the constitutional formula  $CH_3.CH_2.CH_3$ ; and it is not possible to arrange its atoms in any other way. In proceeding from this hydrocarbon to the next in the same series (that is, butane,  $C_4H_{10}$ ) we may substitute the methyl group,  $CH_3$ , for a hydrogen atom in the  $CH_2$  of the propane, or for a hydrogen atom in one of the  $CH_3$  groups. Hence we may have either of the two following constitutional formulas for the hydrocarbon butane:

or

The latter compound, which contains only two  $CH_3$  groups, is called "normal butane"; while the former, which contains three such groups, is known as "isobutane." Two butanes, each having the empirical formula  $C_4H_{10}$ , are therefore possible, and both are actually known. When we pass to the higher members of the paraffin group we find that a far greater number of isomeric forms can exist, according to the way in which the new  $CH_3$  group is introduced, in generating the new hydrocarbon from the one next below it in the general series. Thus octane,  $C_8H_{18}$ , can exist in 18 different isomeric forms, and tridecane,  $C_{13}H_{28}$ , in no less than 802.

The saturated hydrocarbons are of the greatest value in the arts, comprising a series of solvents (as naphtha, benzol, etc.) for fats, oils and resins, the mineral oils used for lighting and lubrication, motor fuels, vaseline, paraffin wax, the essential oils from which are derived perfumes and flavorings, the camphors, etc. Consult Norris, J. F., 'Principles of Organic Chemistry' (New York 1912); Plimmer, R. H. A., 'Practical Organic and Bio-Chemistry' (London 1915); Pond, F. J., 'Heusler's Chemistry of the Terpenes' (Philadelphia 1902); Spielmann, P. E., 'Richter's Organic Chemistry' (Vol. I, London 1915).

**HYDROCELE**, hi'drō-sēl, a collection of serous fluid forming tumors around the testicle or spermatic cord. During the fetal life the testicle pushes the peritoneum before it as it

descends from the abdomen into the scrotum. Along the spermatic cord the sac is usually obliterated, but if it is not it may become distended with fluid. The pouch of the peritoneum normally remains alongside of the testicle, and is called the tunica vaginalis. Distensions of these pouches may be congenital, but ordinarily they begin after maturity and probably are due to some fault in the blood-vessels, allowing the escape of the serum. Symptoms are due to the weight of the tumor, and the only danger lies in the possibility of the injury and rupture of the sac. Aspiration of the fluid, followed by the injection of a few drops of carbolic acid, may accomplish a cure, but partial removal of the sac may be necessary.

**HYDROCEPHALUS**, a dropsical effusion of fluids into the interior of the skull, occupying one or more of the ventricles of the brain or the submeningeal space, or both. The symptoms of acute meningitis are such that the older authors called this disease acute hydrocephalus, but there may be very little fluid exudation in meningitis, and when present it is not often clear and watery. The causes of chronic hydrocephalus are various. A low-grade inflammation may give rise to chronic hydrocephalus, just as chronic peritonitis is accompanied by fluid in the belly, but the usual cause of chronic hydrocephalus is some obstruction to the venous circulation. It is regarded as certain that arrest of development of the brain-substance, pressure upon the veins of Galen by masses of tubercle or cancer, and in fact any condition which obstructs the venous circulation in the brain, may lead to hydrocephalic effusion, just as pressure on the veins of the leg may produce dropsy of the feet. It is probable also that in arrest of brain development the increase of the normal subarachnoid fluid is a conservative process, serving to keep full the space between the brain and the cranium. The large majority of cases are congenital, and hydrocephalus must be set down as a disease (or symptom) belonging to infantile life; but cases occasionally occur in mature life or in old age. Dean Swift, after three years of illness, died with hydrocephalus, the result, doubtless, of organic brain disease. The prognosis of chronic hydrocephalus is very grave. The child may live for many years, but, with rare exceptions, becomes idiotic, and in some cases is epileptic. The head becomes distended, the fontanels remain open, supernumary bones form in the courses of the cranial sutures, and in some cases quarts of fluid are effused, consisting of water, with earthy salts and a little albumin; while in acute hydrocephalus there is sometimes much albumin present, with some pus-corpuses or a little blood. When the disease is detected early, mercurial inunctions, with the administration of the iodides, may possibly afford benefit. Treatment by systematic compression or by tapping the skull has been tried in many cases, but the most common result has been the speedy death of the patient, although in a few instances it would appear that more or less advantage has been obtained by these means. The term spurious hydrocephalus is sometimes applied to cholera infantum, infantile typhoid or other enteric disease, the general symptoms of which may simulate those of acute meningitis.

**HYDROCHARIDÆÆ**, hī-drō-kā-rid'ē-æ, monocotyledonous floating or submerged aquatic plants of the series Helobieæ. About 50 widely distributed species are known, divided into 15 genera; 12 fresh water, occurring in temperate zones, and three marine occurring in tropical or sub-tropical zones. *Vallisneria* (q.v.), or eel-grass, and *Elodea canadensis*, or water-thyme, are well-known American types; *Hydrocharis Morsusranæ*, or frog-bit, and *Stratiotes aloides*, or water-soldier, are well-known European types. The tropical marine types are *Thalassia*, *Enhalus* and *Halophila*, submerged plants found chiefly in the Pacific and Indian oceans.

**HYDROCHLORIC ACID**, or **HYDROGEN CHLORIDE**, an important compound of hydrogen and chlorine, which under the names "spirit of salt" and "muriatic acid," has been known in aqueous solution from very early times. It has the chemical formula HCl, and may be formed by exposing a mixture of equal volumes of hydrogen and chlorine to diffuse daylight, the combination taking place quietly under these circumstances, but explosively under the influence of direct sunlight. A more convenient and usual method of preparing hydrochloric acid is by treating common salt ("sodium chloride," NaCl) with strong sulphuric acid (H<sub>2</sub>SO<sub>4</sub>). The reaction is as follows: NaCl + H<sub>2</sub>SO<sub>4</sub> = HNaSO<sub>4</sub> + HCl. Pure hydrochloric acid is a colorless gas, 1,259 times as heavy as an equal volume of air at the same temperature and pressure, and with the molecular weight 36.457. By weight hydrochloric acid consists of 2.74 per cent of hydrogen and 97.26 per cent of chlorine. At a temperature of 50° F. it condenses, under a pressure of 40 atmospheres, to a colorless liquid, which boils, under ordinary atmospheric pressure, at 171° F. below zero, and solidifies at a temperature about 6° below the boiling point. The specific heat of the gas at constant pressure (compared with water) is about 0.19; and the ratio of its specific heat at constant pressure to its specific heat at constant volume, at ordinary temperatures, is 1.389. Hydrochloric acid gas was first prepared, in an approximately pure state, by Priestley, in 1774; but it was believed to be an oxide of a new element (provisionally called "murium") until Davy, in 1810, showed that it is a compound of hydrogen and chlorine.

Hydrochloric acid gas is exceedingly soluble in water. If a dry glass flask, which is completely filled with the dry gaseous acid, be brought mouth downward under water, and the stopper is then removed, solution takes place with such extreme rapidity that the water is often drawn into the flask suddenly enough to break it. By passing a stream of the gaseous acid into water, an aqueous solution may be prepared which has a specific gravity, when saturated, of 1.2257 at 32° F., and contains 45 per cent by weight of the acid. The commercial acid is commonly known, to the present day, as "muriatic acid." Large quantities of it are obtained as a by-product in the manufacture of sodium carbonate by the action of sulphuric acid upon common salt. The hydrochloric acid gas liberated in this process is passed up through stone towers packed with hard coke over which trickles water, which greedily absorbs the gas. The acid solution which collects at the bottom

of the tower, if too weak for concentration, is taken to the top and again allowed to seep down and gather a larger content of gas. The acid thus obtained is not pure but contains sulphuric acid, ferric chloride, arsenic and free chlorine and sulphurous acid gases. These impurities give it a yellowish tinge. The pure acid (in aqueous solution) is obtained by removing the arsenic with stannous chloride and then distilling; or by digesting the diluted acid solution with bright copper strips and distilling with ferrous chloride. Aqueous hydrochloric acid is largely used in the laboratory and also in the arts, in the manufacture of a great variety of substances.

Hydrochloric acid combines with metallic bases to form salts which are known as "chlorides." Common salt (chloride of sodium, NaCl) is the most familiar and the most abundant example, in nature, of this class of substances. The chlorides of silver, gold, mercury, barium, aluminum, platinum and ammonia are also important and are described under MERCURY, ALUMINUM, etc. The largest use of hydrochloric acid is in the manufacture of chlorine (q.v.) and chlorides of the metals. It is also used extensively in the arts, as well as in the manufacture of agricultural fertilizers, coal tar colors, etc.

**HYDROCYANIC ACID, or PRUSSIC ACID**, an exceedingly poisonous substance, discovered by Scheele in 1782. It has the chemical formula HCN, and may be formed by passing a series of electric sparks through a mixture of nitrogen and acetylene (q.v.). The reaction in this case is  $2N + C_2H_2 = 2HCN$ . The pure acid is more conveniently prepared by passing sulphuretted hydrogen gas,  $H_2S$ , over dry mercuric cyanide,  $Hg(CN)_2$ , hydrocyanic acid and mercuric sulphide being formed, according to the equation  $Hg(CN)_2 + H_2S = 2HCN + HgS$ . As thus prepared, hydrocyanic acid is a volatile liquid, boiling at  $80^\circ F.$  and freezing at  $5^\circ F.$ , and possessing a peculiar smell of bitter almonds. It is inflammable, producing by its combustion carbon dioxide. It is so intensely poisonous that a single drop of the anhydrous acid produces instant death when swallowed, and its vapor, even when mixed with considerable quantities of air, is also exceedingly poisonous. It mixes readily with water, ether and alcohol. Although it is called an acid, and forms salts that are known as "cyanides," it is very weak in its acid properties. It does not redden litmus paper, and its salts are readily decomposed by other acids. Hydrocyanic acid is formo-nitrile, and like the nitriles is hydrolysed rapidly by boiling alkalis and slowly by mineral acids. In the presence of oxygen the cyanides dissolve all metals but lead and platinum.

Hydrocyanic acid is found in nature in the glucosides of plants, typically in amygdalin, the glucoside of bitter almonds, to which it gives its characteristic odor and taste. In dhurrin, the glucoside of sorghum, it is so plentiful that cattle have been poisoned by eating the green plant too freely. The method usually employed in the manufacture of hydrocyanic acid is to run a solution of sodium cyanide in about twice its weight of water slowly into a small excess of cold 60 per cent sulphuric acid. The resulting vapor of hydrocyanic acid is almost anhydrous, and it is completely dried over cal-

cium chloride. It is kept at a temperature of  $85^\circ F.$ , and finally condensed to liquid form in an ice-cooled receiver. Hydrocyanic acid may be synthesized by passing dry ammonia over wood charcoal heated to  $1,300^\circ$  to  $1,800^\circ$ . At  $2,000^\circ$  it is liable to a reverse action, the forming hydrocyanic acid being decomposed as it forms.

Among the more important compounds of hydrocyanic acid are potassium cyanide and mercuric cyanide. Potassium cyanide, KCN, may be formed by passing nitrogen gas over a white-hot mixture of charcoal and potassium carbonate, the reaction being:

It is more conveniently prepared, however, by strongly heating potassium ferrocyanide (see below), which breaks up into potassium cyanide, carbide of iron and free nitrogen. Potassium cyanide is a white salt, soluble in water and in alcohol and exceedingly poisonous. It is much used in electroplating as a solvent for gold and silver, and also in the extraction of gold from certain ores by the process known as "cyaniding." It melts without decomposition, and in the molten state it is a powerful reducing agent. For this reason it is often used as a flux in welding and in other metallurgical operations. It is used in solution to dissolve unaffected silver salts in the tintype process in photography.

Mercuric cyanide, which is also very poisonous, is used in medicine, and is prepared by dissolving mercuric oxide in an aqueous solution of hydrocyanic acid.

Allied to hydrocyanic acid are two other acids, known respectively as "ferrocyanic acid,"  $H_4Fe_2(C_6N_6)_4$ , and "ferricyanic acid,"  $H_4Fe_3(C_6N_6)_4$ , which are not of any importance in the arts in the free state, but whose potassium salts are much used. Potassium ferrocyanide, or yellow prussiate of potash,  $K_4Fe_2(C_6N_6)_4 \cdot 6H_2O$ , is prepared on a large scale by heating a mixture of nitrogenous organic matter and caustic potash, and treating the mass with freshly prepared ferrous carbonate. Crude cyanide of potassium is formed in the first instance, and this combines with the ferrous carbonate to form the yellow prussiate of potash and potassium carbonate, from which the yellow prussiate may be obtained in large crystals, by evaporation. When pure, the yellow prussiate is not poisonous. It is used, in the arts, as a source of Prussian blue, and also for the manufacture of potassium cyanide, which is liberated when the yellow prussiate is strongly heated.

Potassium ferricyanide, or red prussiate of potash,  $K_3Fe_3(C_6N_6)_4$ , is prepared by passing chlorine gas through a solution of the yellow prussiate, two molecules of potassium being thereby abstracted from it, with the formation of potassium chloride as a secondary product. The red prussiate is used in the manufacture of sensitive paper for making blue-prints.

**HYDRODICTYON**, a genus of the family *Chlorophyceæ* or green algæ. Each individual plant consists of a long cylindrical cell, attached to others at the ends, forming a mesh in polygonal shape. The plant is freely moving, and its greatest length is one foot. It is familiarly known as "water nets."

**HYDRODYNAMICS** (ὕδωρ, water; δύναμις, force), or **HYDROMECHANICS**, is that part of Dynamics which treats of the motion or rest of fluids under the action of forces. A perfect fluid is defined as a body whose parts are perfectly free to move under the action of the smallest forces, or otherwise, as a body such that the reactions between any two portions of it are normal to the surface separating them. If there is any tangential drag tending to prevent the one portion of the substance from slipping past the other, the fluid is said to be *viscous*. A perfect fluid is an abstraction, like the material particle or the rigid body, but many of the ordinary fluids, like water, alcohol, air and other gases, are so slightly viscous that for many purposes they may be considered as perfect. The normal reaction, which alone we suppose to be present, is called the *pressure*, and is measured by the limit of the ratio of the force exerted on an element of surface to the area of the element, when both diminish without limit. The usual gravitational unit of pressure is the pound-weight per square inch, the usual scientific, absolute unit (see **MECHANICS**), is the dyne per square centimeter. The pressure of the atmosphere may be considered as equal to 1,000,000 dynes per square centimeter.

The fundamental theorem of hydrodynamics is that the pressure on an element of surface is independent of the direction of the normal to the surface. This may be proved by considering the equilibrium of a small tetrahedron, *ABCD*, Fig. 1, and resolving the forces on its

FIG. 1.

faces in the direction *BD*. The pressure being normal, the forces on *ABD*, *BCD* have no component along *BD*, while if the pressures on *ABC*, *ACD*, and the areas of those sides are respectively  $p_1, p_2, S_1, S_2$ , their normals  $n_1, n_2$ , we have for equilibrium  $p_1 S_1 \cos(n_1, BD) = p_2 S_2 \cos(n_2, BD)$ . But  $S_1 \cos(n_1, BD), S_2 \cos(n_2, BD)$  are the projections of the areas on a plane perpendicular to *BD*, which are equal, therefore  $p_1 = p_2$ . If there are other forces applied to the fluid besides the pressure, such, for instance, as its weight, these will be proportional to the volume of the tetrahedron, and when its size is diminished indefinitely, the volume vanishes to the third order of small quantities, and may thus be neglected in comparison with the area, which is of the second order, so that the result is not affected.

**Hydrostatics.**—We will first consider hydrostatics, or that part of our subject which deals with fluids at rest. Suppose that the fluid is subject to the action of forces whose components along the co-ordinate axes are equal to *X, Y, Z* per unit of mass. These we call *bodily forces*. Now consider the equilibrium of an infinitesimal rectangular parallelo-

iped, Fig. 2, whose edges, parallel to the co-ordinate axes, have lengths *dx, dy, dz*. Suppose that the mean value of the pressure on the side *ABCD*, which is at a distance *x* from the origin, is  $p$ , then the *X*-component of the force

FIG. 2.

on this side is  $p dy dz$ . On the side *EFGH*, which lies at a distance *dx* farther from the origin, the mean pressure will be  $p + \frac{\partial p}{\partial x} dx$ , and the component on the face *EFGH*, acting on the parallelepiped, being in the opposite direction will be  $-\left(p + \frac{\partial p}{\partial x} dx\right) dy dz$ . Now if

the density of the fluid is  $\rho$ , the amount of matter in the parallelepiped, being the product of the density and volume, will be  $\rho dx dy dz$ , and the force exerted upon it in the *X*-direction will be  $X \rho dx dy dz$ . We must therefore have for equilibrium

$$p dy dz - \left(p + \frac{\partial p}{\partial x} dx\right) dy dz + \rho X dx dy dz = 0,$$

and passing to the limit by decreasing the dimensions,  $p$  will be the pressure at any point, and dividing by  $dx dy dz$ , we have

$$\rho X = \frac{\partial p}{\partial x}$$

In a similar manner we have

$$\rho Y = \frac{\partial p}{\partial y},$$

$$\rho Z = \frac{\partial p}{\partial z}.$$

Thus the fluid can be in equilibrium only under the influence of bodily forces such that the components of the bodily forces, multiplied by the density, are the derivatives of the same functions of the co-ordinates. Now there is in general a physical relation between the pressure of a fluid and the density at any point. If we put

$$P = \int \frac{dp}{\rho}, \quad \frac{dP}{dp} = \frac{1}{\rho},$$

we have

$$\frac{\partial P}{\partial x} = \frac{dP}{dp} \frac{\partial p}{\partial x} = \frac{1}{\rho} \frac{\partial p}{\partial x}, \quad \frac{\partial P}{\partial y} = \frac{dP}{dp} \frac{\partial p}{\partial y} = \frac{1}{\rho} \frac{\partial p}{\partial y},$$

$$\frac{\partial P}{\partial z} = \frac{dP}{dp} \frac{\partial p}{\partial z} = \frac{1}{\rho} \frac{\partial p}{\partial z}.$$

and our equations (1) become

$$(2) \quad X = \frac{\partial P}{\partial x}, \quad Y = \frac{\partial P}{\partial y}, \quad Z = \frac{\partial P}{\partial z}.$$

Now this is the condition that the bodily forces are *conservative*. (See MECHANICS). In that case the potential energy for unit mass is called the *potential* of the forces, and will be denoted by  $V$ . Thus we shall have  $P = -V$

+ const., and  $dV = -dP = -\frac{d\rho}{\rho}$ . If two fluids of different densities are in contact, we have at their common surface

$$-d\rho = \rho_1 dV = \rho_2 dV,$$

so that

$$(\rho_1 - \rho_2) dV = 0,$$

and since  $\rho_1 - \rho_2$  is not zero we must have  $dV = 0, d\rho = 0$ . Consequently the surface of separation is a surface of constant potential and constant pressure. In the case of gravity we have, if the  $Z$ -axis is measured vertically upward,  $V = gz$ , so that the surfaces of constant  $V$  are horizontal planes, and a surface where water is in contact with the atmosphere must be a horizontal plane, or level surface, the pressure being the constant atmospheric pressure. If we suppose the fluid to be incompressible, we have  $\rho$  constant,  $P = p/\rho$ ,

$$(3) \quad \frac{p}{\rho} = -V + \text{const.} = -gz + \text{const.},$$

$$(4) \quad p = -\rho gz + \text{const.},$$

so that, if we neglect the atmospheric pressure, and count the depth from the plane  $z=0$ , we have the fundamental theorem for heavy liquids, namely, that the pressure is proportional to the depth. This may be proved experimentally by placing a well-fitting plate

FIG. 3.

under a tube, Fig. 3, communicating with a vessel of any shape, and holding the plate up by a wire hung from a balance, while water is poured in above. The weight required to hold the plate up is found to be independent of the shape of the vessel, and to depend only on the depth and the area of the plate. The vase and plate may also be immersed in liquid, while, instead of liquid within, weights are placed on the plate; the weight supported will then be proportional to the depth.

Consider now a gas, or compressible fluid, satisfying the law of Boyle and Mariotte,

$$p = \rho a.$$

Accordingly,

$$(5) \quad P = \int \frac{d\rho}{\rho} = \int \frac{a d\rho}{\rho} = a \log \rho + \text{const.},$$

and

$$(6) \quad V = gz = c - a \log \rho,$$

$$(7) \quad \rho = \rho_0 e^{-\frac{gz}{a}}.$$

Thus as we ascend to heights in arithmetical progression the density decreases in geometrical progression, becoming zero at an infinite height. From equation (7) the barometric formula is obtained by which heights are found from barometer readings. The law of Boyle assumes constant temperature. It is, however, more likely that the temperature varies in accordance with what is called convective equilibrium, so that if a portion of air is hotter than the stratum in which it lies it will rise, and, cooling and expanding, will eventually find a layer of the same density and temperature as its own. The principles of thermodynamics give us the relation between pressure and temperature when the rarefaction is adiabatic, that is, when no heat is lost or gained by the air,

$$p = b\rho^\kappa$$

where  $\kappa$  is a constant for the gas, whose value is about 1.4. We then have

$$(8) \quad V = gz = - \int b\kappa\rho^{\kappa-2} d\rho = c - \frac{b\kappa\rho^{\kappa-1}}{\kappa-1}$$

Since  $\kappa > 1$ ,  $\rho$  diminishes as  $z$  increases, and is equal to zero when  $gz = c$ , so that on this hypothesis the atmospheric has an upper limit.

Let us now consider the equilibrium of a solid body floating in a liquid. If we consider the body removed and the space that it occupied filled with water, since this water is in equilibrium, its weight is borne up by the pressure of the surrounding water, the effect of which is accordingly to apply to each portion of the water in question an upward force just equal to its weight. Now just the same forces must be the resultant of the pressures on the solid when it is substituted for the displaced water, so that it is borne up by a force equal to the weight of the displaced water. This is the Principle of Archimedes. Since the resultant of the weight of all the displaced water is a single force applied at its centre of mass, the resultant upward thrust on the floating body is applied at a point coinciding with the centre of mass of the displaced water. This point is called the *centre of buoyancy* of the body. If the body is to be in equilibrium, according to the principles of statics of a rigid body, its weight must be equal to that of the displaced body, and its centre of mass and centre of buoyancy must be in the same vertical line. If the first condition is satisfied, but not the second, the body will float, but will be subject to a turning couple.

Suppose the body floats without being wholly immersed. A plane which cuts off from the body a volume equal to the volume of water having an equal weight is called a *plane of flotation*, and if we draw all such planes they will envelope a surface called the *surface of flotation*. For every plane of flotation there will be a centre of buoyancy, and the locus of all these points is called the *surface of buoyancy*. Suppose the floating body is displaced from its position of equilibrium by rotation through a small angle  $\delta\theta$  about an axis  $OX$  through  $O$ , Fig. 4, and let  $WL, W'L'$  be the original and final planes of flotation. By turning the figure until either is horizontal both positions of the body may be shown. Let  $B$  be the original centre of buoyancy,  $G$  the centre

of mass of the floating body. Then if  $B$  were the centre of buoyancy in the second position, the body would be acted on by the couple of which either arm would be the weight

FIG. 4.

$W = mg$ , and the arm the horizontal projection of  $BG$ ,  $b \sin \theta$ , where  $b = BG$ . The moment of the couple tending to further displace the body will then be  $W b \sin \theta$ . But this is not the only couple, for the immersed part is not the same as before, the volume of the wedge  $EOE'$  having become immersed, giving rise to an upward thrust, and the wedge  $DOD'$  having emerged and lost its buoyancy, both these causes giving rise to a turning moment in the same direction, and opposite to that previously found. Since the volume under water is to be the same in both positions, the volume of the wedges of immersion and emersion must be equal. Since the wedges are infinitely thin, the thickness at any point  $x, y$  in the plane of flotation is  $z = y \delta \theta$ . The condition for equality of volumes is then

$$(9) \quad \iint x dx dy = \delta \theta \iint y dx dy = 0,$$

the integral being taken over the plane of flotation. This will be the case if the axis passes through the centre of mass of the area of flotation. The thrust on any element of volume  $d\tau = x dx dy$  being  $g \rho d\tau$ , the moment about the  $X$ -axis will be

$$(10) \quad L' = \iiint g \rho y d\tau = g \rho \delta \theta \iint y^2 dx dy = g \rho \delta \theta S \kappa_x^2,$$

where  $\kappa_x$  is the square root of the mean of the squares of the distances of the elements from the  $X$ -axis, or the so-called radius of gyration of the area of flotation about the  $X$ -axis, and  $S$  is the area of flotation. In like manner the moment about the  $Y$ -axis is

$$(11) \quad M' = - \iiint g \rho x d\tau = - g \rho \delta \theta \iint x y dx dy.$$

There are always two axes at right angles to each other, called *principal axes*, for which the integral above vanishes, and for such an axis a displacement about it gives rise only to a couple about that axis. Subtracting this couple  $L'$  from the one previously found we obtain for the magnitude of the *righting couple*

$$(12) \quad L = g \delta \theta (\rho S \kappa_x^2 - mb).$$

It is evident that in moving the point of application of the thrust from the centre of mass of one wedge to that of the other, the

centre of buoyancy will be moved in a parallel direction, so that, in the limit, this direction being that of the plane of flotation, the line  $BB'$  will be parallel to that plane, or the tangent to the surface of buoyancy is parallel to the corresponding plane of flotation. It is also evident that the body is under the same forces that it would be if the surface of buoyancy were material and rested on a horizontal plane, for the reaction would be vertical and equal to the weight of the body.

If  $B'$  be the new centre of buoyancy, and we draw verticals from  $B$  and  $B'$ , they will be normals to the surface of buoyancy and will intersect at  $M$ , the centre of curvature of the section of the surface of buoyancy. This point is called the *metacentre*, and its distance  $h_z$  above  $G$  the *metacentric height*. Evidently for stable equilibrium, or a positive righting couple,  $M$  must be above  $G$ . The arm of the couple being the horizontal projection of  $MG$  is equal to  $h_z \sin \theta$  and we have  $L = m g h_z \sin \theta$ . Inserting this in equation (12) we obtain for the metacentric height

$$(13) \quad m h_z = \rho S \kappa_x^2 - mb,$$

and dividing by  $m$  and writing  $V = m / \rho$  for the volume of displaced liquid,

$$(14) \quad h_z = \frac{S \kappa_x^2}{V} - b.$$

The equilibrium is stable or unstable according as this is positive or negative.

For the displacement about the  $Y$ -axis we have in like manner a couple proportional to the angle of displacement, with a new metacentric height,

$$(15) \quad h_y = \frac{S \kappa_y^2}{V} - b,$$

where  $\kappa_y$  is the radius of gyration about the  $Y$ -axis. It is evident that the metacentric height is greater for a displacement about the shorter principal axis of the plane of flotation. Thus it is easier to roll a ship than to tip it endwise. The above theorems concerning the surfaces of flotation and buoyancy are due to Dupin.

If the floating body is totally submerged, like a submarine boat, only the first moment  $m g b \delta \theta$  comes into play,  $S$  being zero, and the centre of buoyancy becomes the metacentre. The stability is in this case only secured by placing the centre of gravity low.

HYDROKINEMATICS.—We will now consider the motions possible to a fluid, without regard to the forces causing them. Let the velocity

FIG. 5.

at a point be the vector  $q$ , with components  $v, w$ , and let us consider the quantity of fluid entering or leaving any closed surface in the unit of time. The amount of fluid which crosses the element of surface  $dS$ , Fig. 5, with a velocity  $q$  would in unit time, if  $q$  were

constant, fill a prism on the base  $dS$  with a slant height  $q$ . If  $n$  is the normal to  $dS$ , the volume of this prism is  $dSq \cos(qn)$ , and the mass of fluid in it  $dS \rho q \cos(qn)$ , or using the formula for the projection of  $q$  on  $n$  (see MECHANICS, equation (12)),

$dS \rho q_n = dS \rho \{ u \cos(nx) + v \cos(ny) + w \cos(nz) \}$ . Consequently if we consider any closed surface, whose outward normal is  $n$ , we have for the whole outflow in unit time the surface integral

$$(16) \quad \Phi = \iint \rho q_n dS = \iint \rho \{ u \cos(nx) + v \cos(ny) + w \cos(nz) \} dS.$$

But we may find a different expression for the same quantity, by considering the elements of volume. Consider the parallelepiped of Fig. 2, and let  $u$  be the mean velocity on

the side  $ABCD$ ,  $u + \frac{\partial u}{\partial x} dx$  on the opposite side  $EFGH$ . Then the inflow on the first side will be  $\rho u dy dz$ ; while the outflow through the second will be  $\left\{ \rho u + \frac{\partial(\rho u)}{\partial x} dx \right\} dy dz$ . The total

outflow will thus be  $\frac{\partial(\rho u)}{\partial x} dx dy dz$ .

In a similar manner we find the outflow through the two remaining pairs of sides to depend on the other two components. From the whole surface we accordingly have the outflow

$$\left\{ \frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} \right\} dx dy dz,$$

and for the outflow per unit volume we have

$$(17) \quad \frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z}.$$

On account of this kinematical interpretation, if we have any vector  $F$ , whose components  $X, Y, Z$  are functions of the co-ordinates of a point, the expression

$$(18) \quad \frac{\partial X}{\partial x} + \frac{\partial Y}{\partial y} + \frac{\partial Z}{\partial z}$$

is called the *divergence* of the vector, and will be abbreviated  $\text{div } F$ . Summing up the outflow for all the elements of volume, inside the surface  $S$ , it is evident that the volume integral thus found must be equal to the surface integral  $\Phi$ . Thus we have

$$(19) \quad \iiint \rho \{ u \cos(nx) + v \cos(ny) + w \cos(nz) \} dS = \iiint \left\{ \frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} \right\} dx dy dz.$$

This may be taken as a kinematical proof of the *Divergence Theorem*, due to Gauss and Green, in which, for any vector function which is continuous and has a definite value at every point in the volume within  $S$ ,

$$(20) \quad \iint \{ X \cos(nx) + Y \cos(ny) + Z \cos(nz) \} dS = \iiint \left\{ \frac{\partial X}{\partial x} + \frac{\partial Y}{\partial y} + \frac{\partial Z}{\partial z} \right\} dx dy dz,$$

or in more abbreviated notation,

$$(20) \quad \iint F_n dS = \iiint \text{div } F \cdot dr.$$

The surface-integral in (20) is called the *flux* of the vector  $F$  through the surface  $S$ . If we have any continuously distributed vector-function  $F$ , that is, one whose components  $X, Y, Z$  are continuous functions of the point  $x, y, z$ , we may draw curves having the property that at every point on a curve its tangent has the direction of the vector  $F$ . The differential equations of these curves are

$$\frac{dx}{X} = \frac{dy}{Y} = \frac{dz}{Z} = \frac{ds}{F},$$

and the curves are called *lines* of the vector  $F$ . For instance, lines of the vector  $q$  are called *lines of flow*. If we draw all the lines of the vector passing through a closed contour, we shall obtain a tubular surface called a *tube* of the vector, Fig. 6.

If the fluid is incompressible, as much fluid must flow out from as into any volume, so

FIG. 6.

that the total outflow is zero. The density is then constant, and we have, dividing (17) by  $\rho$ ,

$$(21) \quad \text{div } q = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0.$$

A vector whose divergence is zero is said to be *solenoidal* ( $\sigma\omega\lambda\eta\nu$ , a tube), for its tubes have the property that the flux across a cap, or portion of a surface bounded by the tube, is the same wherever the surface be drawn. Analytically, applying the divergence theorem to the portion of space bounded by a portion of such a tube and two caps forming ends, since along the sides of the tube the normal component vanishes, that portion of the flux in (20) is zero. Accordingly the flux through both ends is zero, or the flux out through one is equal to that in through the other. Or, looking in the direction of the vector-lines, the flux across any cap is the same. If we consider a tube of infinitesimal cross-section, and  $S$  is the area of a right section, since the flux is  $FS$ , which is constant for the tube, the magnitude of the vector  $F$  is inversely proportional to the area of the cross-section.

If the liquid is not incompressible the total outward flux is equal to the time-rate of decrease of the mass inside the surface,  $S$ , so that, the mass in an element of volume  $d\tau = dx dy dz$  being  $\rho d\tau$ , we have

$$(22) \quad -\frac{\partial m}{\partial t} = -\frac{\partial}{\partial t} \iiint \rho d\tau = \iiint \rho q_n dS = \iiint \text{div}(\rho q) d\tau.$$

Now since the volume over which we inte-

grate is independent of the time, we may differentiate under the integral sign; also, both integrals being taken over the same volume, we may combine them into one,

$$(23) \quad \iiint \left\{ \frac{\partial \rho}{\partial t} + \text{div}(\rho q) \right\} d\tau = 0.$$

This equality holding for any volume whatever, the integrand must vanish, so that we have

$$(24) \quad \frac{\partial \rho}{\partial t} + \frac{\partial(\rho u)}{\partial x} + \frac{\partial(\rho v)}{\partial y} + \frac{\partial(\rho w)}{\partial z} = 0.$$

This is the so-called *equation of continuity*, the term arising from the continuity of existence of mass, none being created or destroyed, but being conveyed without change from place to place.

Besides the surface- and volume-integrals dealt with above, we need to consider certain line-integrals. If we resolve the vector  $q$  along the direction of the tangent to a curve running from  $A$  to  $B$ , and multiply by the length of the arc  $ds$ , and integrate from  $A$  to  $B$  along the curve, the line-integral

$$(25) \quad \int q ds = \int (u dx + v dy + w dz)$$

is called the *circulation* along the curve. If we describe the curve in the reverse direction, the integral changes sign. If the curve is a closed one, we shall prove the line-integral to be equal to a certain surface-integral over any surface  $S$  which has the contour in question as a boundary. Suppose first the contour is a plane curve and the surface is a plane. Let us divide the area up into infinitesimal rectangles by lines parallel to the axes of  $X$  and  $Y$ , Fig. 7. If we then find the circulation around each of the rectangles in the same direction, we shall have gone around all the

FIG. 7.

sides common to two adjacent rectangles twice in opposite directions, so that those parts of the circulation will have destroyed each other, and there will remain only those parts which belong to the original contour. Accordingly the integral around the contour is equal to the sum of all these around the infinitesimal rectangular contours. Consider one of these,  $ABCD$ , Fig. 8. Along  $AC$  the

FIG. 8.

tangential component is  $u$ , and the contribution to the integral  $u dx$ . Along  $BD$  the value of  $u$  is  $u + \frac{\partial u}{\partial y} dy$ , and since we are going in the opposite direction the contribution to the integral is  $-(u + \frac{\partial u}{\partial y} dy) dx$ . Along  $AB$  the tangential component is  $v$ , and, since we are

moving from  $B$  to  $A$ , the contribution to the integral is  $-v dy$ . Along  $CD$  the tangential component is  $v + \frac{\partial v}{\partial x} dx$  and the contribution

$(v + \frac{\partial v}{\partial x} dx) dy$ . Adding these four we have

$$\left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) dx dy,$$

and summing for all the rectangles,

$$(26) \quad \int q ds = \iint \left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) dx dy,$$

which is a particular case of our theorem.

If the contour is not a plane curve, so that the surface  $S$  is not plane, let us by drawing a series of planes parallel to one of the co-ordinate planes divide it into infinitesimal strips, Fig. 9, and then by drawing planes alternately

FIG. 9.

parallel to the two other co-ordinate planes divide each strip into infinitesimal triangles each having one side parallel to each co-ordinate plane. As before, the sum of the circulations around all the triangles is equal to the circulation around the contour. Let us consider one of these triangles,  $BCD$ , Fig. 10, and let  $A$

FIG. 10.

be the point from which lines drawn parallel to the co-ordinate axes will pass through  $B, C, D$ . Again, circulation around  $BCD$  is equivalent to the sum of the circulations around the triangles  $ABC, ACD, ADB$ , the projections of  $BCD$  parallel to the co-ordinate planes. Let the areas of these four triangles be respectively  $dS, dS_x = dS \cos(n_x), dS_y = dS \cos(n_y), dS_z = dS \cos(n_z)$ ,  $n$  being the normal to  $S$ . Then we have, applying (26) to the three contours,

$$\int q ds = \left( \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z} \right) dS_x,$$

$ABCA$

$$\int q ds = \left( \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x} \right) dS_y,$$

$ACDA$

$$\int q ds = \left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) dS_z,$$

$ADBA$

and consequently

$$\int_{BCDB} q_n ds = \left\{ \left( \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z} \right) \cos(\pi x) + \left( \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x} \right) \cos(\pi y) + \left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) \cos(\pi z) \right\} dS.$$

Summing up for all the infinitesimal triangles, we find the surface-integral over the surface  $S$  to be equal to the circulation around the contour.

$$(27) \int (u dx + v dy + w dz) = \iint \left\{ \left( \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z} \right) \cos(\pi x) + \left( \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x} \right) \cos(\pi y) + \left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right) \cos(\pi z) \right\} dS.$$

This is known as Stokes's theorem.

If we define a vector  $\omega$  with the components  $\xi, \eta, \zeta$ ,

$$(28) \begin{aligned} 2\xi &= \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z}, \\ 2\eta &= \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x}, \\ 2\zeta &= \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y}. \end{aligned}$$

we have the integrand in the surface-integral in (27),

$2[\xi \cos(\pi x) + \eta \cos(\pi y) + \zeta \cos(\pi z)] = 2\omega_n$ , as the component of  $2\omega$  normal to the surface  $S$ . The vector  $2$  is called the *curl* of  $q$ , for the reason that if the lines of the vector "curl" about in any region, so that the tangential component along a closed curve always has the same sign, the surface-integral, and hence the curl, cannot vanish. We may write Stokes's theorem in the abbreviated form

$$(27) \int q_n ds = \iint (\text{curl } q)_n dS.$$

As an example of the kinematical significance of the curl, let us consider a portion of fluid which revolves like a rigid body about the  $Z$ -axis. We then have  $u = -ay, v = ax$ , where  $a$  is a constant representing the angular velocity. We thus have

$$2\zeta = \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} = 2a.$$

Or applying Stokes's theorem to a circle with centre on the axis of rotation, since  $q = ar$ ,

FIG. 11.

the line-integral is  $2\pi r \cdot q = 2\pi r^2 a$ , which is equal to the area of the circle multiplied by  $2a$ , which must represent the curl. Thus we find that the curl of the velocity is twice the angular velocity with which an element of fluid is revolving. On this account the vector  $\omega$  has received the name of *vorticity*, and fluid moving so that  $\omega$  is not zero is said

to move vortically. As the difference between vortical and non-vortical motion is very important, we may illustrate it as follows: It is possible that fluid may circulate in a region either vortically or non-vortically. Suppose that the fluid is filled with short straws repre-

FIG. 12.

sented by the short lines in Figs. 11 and 12; if, as the fluid moves about, these all remain parallel to their original direction, the flow is non-vortical, Fig. 11; if they turn, the flow is vortical, Fig. 12. Thus it is impossible to tell by merely looking at a diagram of stream-lines whether the flow is vortical or not.

FIG. 1

It will be shown later that the divergence and curl of a vector function are characteristic of it, and that if they are known everywhere the complete nature of the vector is known. They are quite independent of each other, as is illustrated in Fig. 13, which shows re-

gions where the divergence and curl are zero or not, independently.

*Non-vortical Motion.*—Let us first examine non-vortical motion, that is, where  $\text{curl } q = 0$  everywhere. If we connect  $A$  and  $B$  by any two curves  $ACB$ ,  $ADB$ , the circulation around the closed path  $ACBDA$  will be zero, hence the circulation from  $A$  to  $B$  will be the same by either path. Thus the circulation does not depend on the path, but only on the position of its ends, so that we have

$$(29) \quad \int_A^B q_s ds = \phi_B - \phi_A,$$

which necessitates

$$q_s ds = u dx + v dy + w dz = d\phi \\ = \frac{\partial \phi}{\partial x} dx + \frac{\partial \phi}{\partial y} dy + \frac{\partial \phi}{\partial z} dz,$$

and therefore

$$(30) \quad u = \frac{\partial \phi}{\partial x}, \quad v = \frac{\partial \phi}{\partial y}, \quad w = \frac{\partial \phi}{\partial z}.$$

The function  $\phi$  is called the *velocity-potential*. The direction of the velocity  $q$  is everywhere normal to the equipotential surfaces  $\phi = \text{const.}$ , for if we move along the equipotential we have

$$d\phi = u dx + v dy + w dz = 0,$$

which is the condition that the vectors  $u$ ,  $v$ ,  $w$ , the velocity, and  $dx$ ,  $dy$ ,  $dz$ , the displacement, are perpendicular. According to the relation  $q_s ds = d\phi$ , we have the component of

velocity in any direction  $q_s = \frac{\partial \phi}{\partial s}$ , equal to the

space-rate of variation of potential in that direction; and since the velocity itself is equal to the rate of change of  $\phi$  in the direction of the normal to the surface  $\phi = \text{const.}$ , a vector related to a function  $\phi$  by the relations (30) is called the *gradient* of the function. A vector which is thus derived from a potential function is called a *lamellar* vector.

As an example of lamellar flow, let us take the case in which the velocity is directed radially outwards from a given point  $a$ ,  $b$ ,  $c$  with a value depending on the distance  $r = \sqrt{(x-a)^2 + (y-b)^2 + (z-c)^2}$  from that point,  $q = f(r)$ . The equipotential surfaces are concentric spheres, and we easily find the potential to be  $\phi = \int f(r) dr$ . For, since the direction

cosines of  $r$  are  $\cos(rx) = \frac{x-a}{r}$ ,  $\cos(ry) = \frac{y-b}{r}$ ,

$\cos(rz) = \frac{z-c}{r}$ , we have the components of the velocity,

$$(30) \quad u = f(r) \frac{x-a}{r} = \frac{d\phi}{dr} \frac{\partial r}{\partial x} = \frac{\partial \phi}{\partial x}, \\ v = f(r) \frac{y-b}{r} = \frac{d\phi}{dr} \frac{\partial r}{\partial y} = \frac{\partial \phi}{\partial y}, \\ w = f(r) \frac{z-c}{r} = \frac{d\phi}{dr} \frac{\partial r}{\partial z} = \frac{\partial \phi}{\partial z}.$$

The flux out through any of the concentric spheres is  $M = 4\pi r^2 q$ , so that if the fluid is incompressible we must have

$$(31) \quad q = \frac{M}{4\pi r^2}, \quad \phi = -\frac{M}{4\pi r},$$

where  $M$  is constant. The vector  $q$  is then solenoidal as well as lamellar, and the equation of continuity becomes

$$(32) \quad \text{div } q = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 \phi}{\partial z^2} = 0.$$

This equation for  $\phi$  is known as Laplace's equation, and the sum of the three partial derivatives of second order, which will be abbreviated as  $\Delta \phi$ , is called the *Laplacian* of  $q$ . Obviously the above flow cannot extend as far as  $r=0$ , for there the velocity would be infinite. Suppose that in a small region of volume  $\tau$  at the centre liquid is being created just fast enough to supply the outflow, so that the volume  $M$  is created per unit of time. Such a region is called a *source*, and the whole system of flow is called a *squirt*. The quantity  $M$  is called the *strength* of the source, and the strength per unit of volume  $M/\tau = \sigma$  the *source-density*. If we have several sources, and add their potentials, the resultant velocity will be obtained as the gradient of the sum. Thus a complicated vector-field may be represented by its potential function. The sources may be continuously distributed through a portion of space, then  $\sigma$ , the source-density, will be a function of the position of the point, and the total strength will be

$$(33) \quad M = \iiint \sigma d\tau,$$

while the total potential will be

$$(34) \quad \phi = -\frac{1}{4\pi} \iiint \frac{\sigma d\tau}{r},$$

where  $r$  represents the distance from the element  $d\tau$  to the point where  $\phi$  is calculated. The total flux through any closed surface will be

$$(35) \quad \iint q_n dS = \iint \frac{\partial \phi}{\partial n} dS = \iint (\text{grad } \phi)_n dS,$$

or by the divergence theorem,

$$(36) \quad \iint q_n dS = \iiint \text{div } q d\tau = \iiint \Delta \phi d\tau \\ = \iint (\text{grad } \phi)_n dS.$$

Since this flux must be equal to the strength of all the sources within the surface of integration, we must have

$$(37) \quad \iiint \Delta \phi d\tau = \iiint \sigma d\tau.$$

Now as this equality holds for any volume whatsoever, the integrands must be equal; accordingly we have

$$(38) \quad \Delta \phi = \sigma,$$

as a consequence of equation (34). The equation (38) is called Poisson's equation. We may also prove the converse, namely, that if  $\sigma$  is given as a function of the point, the integral of equation (38) is given by (34). This is done by means of Green's theorem.

In the divergence theorem (20) let us put for the vector  $F$  the value  $U \cdot \text{grad } V$ , where  $U$  and  $V$  are two functions, both of which, with their derivatives, are finite, singly-

valued, and continuous in the region of integration. Then we have

$$\begin{aligned}
 X &= U \frac{\partial V}{\partial x}, \quad Y = U \frac{\partial V}{\partial y}, \quad Z = U \frac{\partial V}{\partial z}, \\
 \frac{\partial X}{\partial x} + \frac{\partial Y}{\partial y} + \frac{\partial Z}{\partial z} &= U \Delta V + \frac{\partial U \partial V}{\partial x \partial x} + \frac{\partial U \partial V}{\partial y \partial y} + \frac{\partial U \partial V}{\partial z \partial z}, \\
 (39) \quad \iint F_n dS &= \iint U (\text{grad } V)_n dS \\
 &= \iint U \frac{\partial V}{\partial n} dS \\
 &= \iiint \left\{ U \Delta V + \frac{\partial U \partial V}{\partial x \partial x} + \frac{\partial U \partial V}{\partial y \partial y} + \frac{\partial U \partial V}{\partial z \partial z} \right\} d\tau.
 \end{aligned}$$

Interchanging the functions  $U$  and  $V$  and subtracting from (39), we have

$$\begin{aligned}
 (40) \quad \iint \left\{ U \frac{\partial V}{\partial n} - V \frac{\partial U}{\partial n} \right\} dS \\
 = \iiint \left\{ U \Delta V - V \Delta U \right\} d\tau.
 \end{aligned}$$

The equations (39) and (40) are known as Green's Theorem. Let us apply it to two functions, one of which,  $U$ , is the reciprocal distance from a fixed point  $P$ ,  $U = 1/r$ . Let us apply the theorem to the whole extent of space, bounded by the infinite sphere, with the exception of a portion bounded by a small sphere with centre at  $P$ , which we exclude, on account of the infinite value of  $U$  at  $P$ . We must thus take the surface-integrals over the large and small spheres, the normals being in each case drawn away from the volume considered, or out in the first case, in in the second. Since the direction of the normal coincides with that of the radius of the sphere,

$$\frac{\partial(1/r)}{\partial n} = \pm \frac{\partial(1/r)}{\partial r} = \pm \frac{1}{r^2},$$

in the two cases respectively while  $dS = r^2 d\omega$ , where  $d\omega$  is the element of area of a sphere of radius unity, cut out by a cone of vertex  $P$ , having as base the element  $dS$ . Accordingly on either sphere.

$$(41) \quad \iint V \frac{\partial(1/r)}{\partial n} dS = \mp \iint V d\omega,$$

and if  $V$  vanishes at  $r = \infty$ , the integral over the infinite sphere vanishes. If we now let the radius of the small sphere diminish without limit, the value of  $V$  to be taken is the value at  $P$ , so that

$$(42) \quad - \iint V \frac{\partial(1/r)}{\partial n} dS = -V_P \iint d\omega = -4\pi V_P.$$

On the other hand the surface-integral

$$\iint \frac{1}{r} \frac{\partial V}{\partial n} dS = r \iint \frac{\partial V}{\partial n} d\omega,$$

over the spheres vanishes for  $r = \infty$ , on account of the vanishing of  $\frac{\partial V}{\partial n}$  to the second order,

and for the small sphere in the limit, on account of the factor  $r$ . As for the volume-integrals we have seen in (31), (32), that any multiple of  $1/r$  satisfies Laplace's equation, hence  $\Delta(1/r) = 0$ , so that finally

$$(43) \quad V_P = -\frac{1}{4\pi} \iint \frac{\partial V}{\partial n} dS,$$

the integral being taken over all space. But this is the required theorem, the converse of (38).

Solutions of Laplace's equation can be found for the case of uniplanar flow, where the velocity is parallel to a given plane, and independent of the co-ordinate perpendicular thereto. A plane diagram then represents the flow. If the given plane is that of  $X, Y$ , Laplace's equation becomes

$$(44) \quad \frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = 0.$$

An infinite number of solutions are furnished us by the method of functions of a complex variable  $z = x + iy$ , where  $i$  is the imaginary defined by  $i^2 = -1$ .

If now we take any function  $w = f(z)$  of the combination  $z = x + iy$ , on arranging it in powers of  $x, iy$ , all even powers of  $i$  will be real, all odd ones real multiples of  $i$ ; accordingly  $w$  will be of the form  $\phi + i\psi$ , where  $\phi, \psi$  are real functions of the two real variables  $x, y$ . Differentiating partially,

$$\frac{\partial w}{\partial x} = f'(z) \frac{\partial z}{\partial x} = f'(z), \quad \frac{\partial w}{\partial y} = f'(z) \frac{\partial z}{\partial y} = if'(z) = i \frac{\partial w}{\partial x},$$

$$\frac{\partial w}{\partial y} = \frac{\partial \phi}{\partial y} + i \frac{\partial \psi}{\partial y} = i \frac{\partial w}{\partial x} = i \left( \frac{\partial \phi}{\partial x} - \frac{\partial \psi}{\partial x} \right),$$

and equating real and imaginary parts,

$$(45) \quad \frac{\partial \phi}{\partial x} = \frac{\partial \psi}{\partial y}, \quad \frac{\partial \phi}{\partial y} = -\frac{\partial \psi}{\partial x}.$$

Differentiating the first equation by  $x$ , the second by  $y$ , and adding, we have

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \psi}{\partial y^2} = 0,$$

and similarly

$$\frac{\partial^2 \psi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} = 0.$$

Thus either function  $\phi$  or  $\psi$  derived from any function of a complex variable gives us a case of uniplanar flow of an incompressible fluid. From the equations (45) we obtain by cross-multiplication

$$(46) \quad \frac{\partial \phi}{\partial x} \frac{\partial \psi}{\partial x} + \frac{\partial \phi}{\partial y} \frac{\partial \psi}{\partial y} = 0,$$

which is the condition that the normals to the family of curves  $\phi = \text{const.}$  and those of the family  $\psi = \text{const.}$  intersect each other at right angles. Such families are called orthogonal. For instance, the function

$$(47) \quad w = \frac{1}{z} = \frac{1}{x + iy} = \frac{x - iy}{x^2 + y^2}$$

gives

$$(48) \quad \phi = \frac{x}{x^2 + y^2}, \quad \psi = \frac{-y}{x^2 + y^2},$$

and the curves

$$\frac{x}{x^2 + y^2} = \text{const.}, \quad \frac{y}{x^2 + y^2} = \text{const.}$$

are a set of circles tangent to the  $Y$ -axis and the  $X$ -axis, respectively, the two sets intersecting each other at right angles.

The flux across any cylindrical surface whose generator has the length unity parallel to

the  $Z$ -axis, and which intersects the  $XY$ -plane in a curve from  $A$  to  $B$ , is, if  $\rho = 1$ ,

$$(49) \quad \Phi_{AB} = \int_A^B q_n ds = \int_A^B \frac{\partial \phi}{\partial n} ds \\ = \int_A^B \left\{ \frac{\partial \phi}{\partial x} \cos(nx) + \frac{\partial \phi}{\partial y} \cos(ny) \right\} ds.$$

But if the normal lies on the right as we go along the curve, Fig. 14,

$$\cos(nx) ds = dy, \quad \cos(ny) ds = -dx.$$

Using these values and equations (45), we have for the flux

$$(50) \quad \Phi_{AB} = \int_A^B \frac{\partial \psi}{\partial x} dx + \frac{\partial \psi}{\partial y} dy = \psi_B - \psi_A,$$

so that the quantity of liquid crossing the surface does not depend on the curve joining

FIG. 14.

$AB$ , but is the same for one as for another, as must be the case if the liquid is incompressible. The function  $\psi$  is called the *flux-function*, and since if  $\psi_B = \psi_A$ , no liquid crosses, it is evident that the curves  $\psi = \text{const.}$  are stream-lines. It is evident from equations (45) that either of the two functions  $\phi, \psi$  may be taken for the velocity-potential, the other being taken for the flux-function. Functions satisfying equations (45) are called *conjugate functions*, and the two states of flow just described are called conjugate. In the case just investigated, the two conjugate flows happened to be identical; this is not generally the case.

For instance, consider the functions  $w = \log z$ , and introducing polar co-ordinates  $r, \theta$ ,

$$(51) \quad w = \log z = \log(x + iy) \\ = \log \{ r(\cos \theta + i \sin \theta) \} = \log \{ r e^{i\theta} \} = \log r + i\theta.$$

Thus we may put

$$(52) \quad \phi = \log r, \quad \psi = \theta,$$

obtaining a radial flow, or uniplanar squirt, with circular equipotentials, or

$$(53) \quad \phi = \theta, \quad \psi = \log r,$$

obtaining a circular flow with radial equipotentials.

**Vortical Motion.**—Let us now free ourselves from the restriction that the curl of the velocity vanishes. There will then be no velocity-potential in regions where there is curl. Lines whose tangent has everywhere the direction of the vector  $\omega$ , the vorticity, are called *vortex-lines*, and tubes generated by such lines vortex-tubes, tubes of infinitesimal cross-section being termed vortex-filaments. The fluid within such a tube is called a vortex. Since the curl of any vector is solenoidal, as is seen by differentiating the equations (28) to find the divergence, the vorticity is a solenoidal vector and its tubes have the solenoidal property that the vorticity in any filament is inversely

proportional to the area of the cross-section of the filament. The product  $S\omega$ , which is constant for the filament, is called the strength of the filament. Consequently the vorticity cannot vanish at any point on a tube, nor can the cross-section. The vortex-tubes must accordingly be closed, or end at a free surface of the liquid, as do those vortices formed by an oar at the surface of water.

The properties of vortex-motion were first investigated in an important paper by Helmholtz in 1858. Following him we shall now show that any continuous flow vanishing at infinity may be represented as the sum of a lamellar and a solenoidal part, and that the solenoidal part may be represented as the curl of another vector. Suppose that  $\phi$  be the potential of the lamellar part,  $Q$  the vector with components  $U, V, W$ , whose curl represents the solenoidal part. Then we assume

$$(54) \quad u = \frac{\partial \phi}{\partial x} + \frac{\partial W}{\partial y} - \frac{\partial V}{\partial z}, \\ v = \frac{\partial \phi}{\partial y} + \frac{\partial U}{\partial z} - \frac{\partial W}{\partial x}, \\ w = \frac{\partial \phi}{\partial z} + \frac{\partial V}{\partial x} - \frac{\partial U}{\partial y}.$$

Finding the divergence of  $q$  we have

$$(55) \quad \text{div } q = \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = \Delta \phi,$$

since the divergence of the curl vanishes. But by (43) we have

$$\phi = -\frac{1}{4\pi} \iiint \frac{\Delta \phi}{r} dr = -\frac{1}{4\pi} \iiint \frac{\text{div } q}{r} dr.$$

Since  $q$  represents a continuous flow,  $\text{div } q$  is finite. Accordingly we find that the lamellar part of the flow is completely determined by the distribution of its divergence.

Secondly, find the curl of  $q$ .

$$(56) \quad 2\xi = \frac{\partial w}{\partial y} - \frac{\partial v}{\partial z} = \frac{\partial}{\partial y} \left\{ \frac{\partial \phi}{\partial z} + \frac{\partial V}{\partial x} - \frac{\partial U}{\partial y} \right\} \\ - \frac{\partial}{\partial z} \left\{ \frac{\partial \phi}{\partial y} + \frac{\partial U}{\partial z} - \frac{\partial W}{\partial x} \right\} \\ = -\Delta U + \frac{\partial}{\partial x} \left\{ \frac{\partial U}{\partial x} + \frac{\partial V}{\partial y} + \frac{\partial W}{\partial z} \right\}$$

Since the vector  $Q$  is as yet undetermined except as to its curl, let us assume it to be solenoidal, which will make the divergence in (56) vanish, giving

$$(57) \quad 2\xi = -\Delta U, \quad 2\eta = -\Delta V, \quad 2\zeta = -\Delta W.$$

As before, we find the integrals of these equations to be

$$(58) \quad U = \frac{1}{2\pi} \iiint \frac{\xi}{r} dz, \quad V = \frac{1}{2\pi} \iiint \frac{\eta}{r} dv, \\ W = \frac{1}{2\pi} \iiint \frac{\zeta}{r} dr.$$

The integrals are to be taken over all space, but as any part of space where the vorticity vanishes will contribute nothing to the integrals, we may suppose them restricted to the vortices. Thus we see that the solenoidal part of the flow  $q$ , which is due to the vortices, is completely determined by the distribution of curl  $q$ . Thus the statement is justified that a continuous vector-function is completely determined by its divergence and curl. Kinetically we may say that any flow is the

resultant of squirts and vortices. The vector  $Q$ , whose components are formed in the manner of potentials from the components of  $2\omega$ , is called the *vector-potential* of  $2\omega$ .

Thus the velocity due to a vortex is the curl of the vector-potential of twice the vorticity. We may find this velocity by differentiation. Let us distinguish the point of integration from the point for which the potentials are calculated and by which we differentiate, by attaching an accent to the co-ordinates of the former. We have

$$(59) \quad u = \frac{\partial W}{\partial y} - \frac{\partial V}{\partial z}$$

$$= \frac{1}{2\pi} \left[ \frac{\partial}{\partial y} \iint \frac{\eta'}{r} d\tau' - \frac{\partial}{\partial z} \iint \frac{\eta'}{r} d\tau' \right]$$

$$= \frac{1}{2\pi} \iint \left\{ \zeta' \frac{\partial}{\partial y} \left( \frac{1}{r} \right) - \eta' \frac{\partial}{\partial z} \left( \frac{1}{r} \right) \right\} d\tau'$$

Thus the portions of velocity contributed by the element of the vortex  $d\tau'$  are

$$du = \frac{1}{2\pi r^3} \{ \zeta'(y' - y) - \eta'(z' - z) \} d\tau',$$

$$(60) \quad dv = \frac{1}{2\pi r^3} \{ \xi'(z' - z) - \zeta'(x' - x) \} d\tau',$$

$$dw = \frac{1}{2\pi r^3} \{ \eta'(x' - x) - \xi'(y' - y) \} d\tau'.$$

These are immediately seen to be, aside from the factor  $1/2\pi r^3$ , the projections of the parallelogram whose sides are the vectors  $\omega'$  and  $r$  the vector from  $x', y', z'$  to  $x, y, z$ . If  $dq$  be the magnitude of the resultant, we accordingly obtain

$$(61) \quad dq = \frac{\omega' \sin(\omega'r)}{2\pi r^3} d\tau',$$

the direction of  $dq$  being perpendicular to both  $\omega'$  and  $r$ , as shown by (60).

Let us take for the element of volume  $d\tau'$  a length  $ds$  of a vortex-filament of cross-section  $S$ . Then  $d\tau' = Sds$ , and since  $S\omega' = \kappa$ , the strength of the filament

$$(62) \quad dq = \frac{\kappa ds \sin(\omega r)}{2\pi r^3}.$$

The velocity is connected with the vorticity in the same way that the magnetic field due to an electric current is connected with the current-density, equation (62) giving us the magnetic field produced by a current of strength  $\kappa/2\pi$ .

**HYDRODYNAMICS.**—We now arrive at the subject of Hydrodynamics proper, in which we take account of the forces that are capable of producing the states of flow that have been previously described. Suppose that the co-ordinates of a particle are  $x, y, z$ , then  $u = \frac{dx}{dt}$ ,

$v = \frac{dy}{dt}$ ,  $w = \frac{dz}{dt}$ . The principles of dynamics tell us that the product of the mass by the acceleration of any particle is equal to the resultant of all the forces applied to it. Taking the mass contained in the element of volume  $d\tau$ , and the resultant of the bodily forces and pressures, as found under the treatment of hydrostatics,

$$(63) \quad \rho d\tau \frac{d^2x}{dt^2} = \rho d\tau \frac{du}{dt} = \left( \rho X - \frac{\partial p}{\partial x} \right) d\tau,$$

from which we obtain the equation with two similar ones,

$$(64) \quad \frac{du}{dt} = X - \frac{1}{\rho} \frac{\partial p}{\partial x}, \quad \frac{dv}{dt} = Y - \frac{1}{\rho} \frac{\partial p}{\partial y},$$

$$\frac{dw}{dt} = Z - \frac{1}{\rho} \frac{\partial p}{\partial z}.$$

By the derivative  $\frac{du}{dt}$  is meant the rate of change of velocity of a particular particle as it moves about. If we have any function  $F$  of the position of a particular particle, we may write its derivative

$$(65) \quad \frac{dF}{dt} = \frac{\partial F}{\partial t} + \frac{\partial F}{\partial x} \frac{dx}{dt} + \frac{\partial F}{\partial y} \frac{dy}{dt} + \frac{\partial F}{\partial z} \frac{dz}{dt},$$

where  $\partial F/\partial t$  would be the rate of change of the function if the particle were at rest. The derivatives  $\frac{dx}{dt}$ ,  $\frac{dy}{dt}$ ,  $\frac{dz}{dt}$  are the velocity-components  $u, v, w$ . Accordingly we have

$$(66) \quad \frac{dF}{dt} = \frac{\partial F}{\partial t} + u \frac{\partial F}{\partial x} + v \frac{\partial F}{\partial y} + w \frac{\partial F}{\partial z}.$$

We call this mode of differentiation *particle differentiation*.

Introducing this terminology, our equations of motion become

$$(67) \quad \frac{\partial u}{\partial t} + u \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + w \frac{\partial u}{\partial z} = X - \frac{1}{\rho} \frac{\partial p}{\partial x},$$

$$\frac{\partial v}{\partial t} + u \frac{\partial v}{\partial x} + v \frac{\partial v}{\partial y} + w \frac{\partial v}{\partial z} = Y - \frac{1}{\rho} \frac{\partial p}{\partial y},$$

$$\frac{\partial w}{\partial t} + u \frac{\partial w}{\partial x} + v \frac{\partial w}{\partial y} + w \frac{\partial w}{\partial z} = Z - \frac{1}{\rho} \frac{\partial p}{\partial z}.$$

These equations are due to Euler. These three equations, with the equation of continuity (24), and the physical relation between  $\rho$  and  $p$  furnish five equations for the determination of the five variables  $u, v, w, \rho, p$ , as functions of  $x, y, z, t$ .

Subtracting from both sides of the first of equations (67) the quantity

$$\frac{\partial}{\partial x} \left( \frac{q^2}{2} \right) = \frac{1}{2} \frac{\partial}{\partial x} \{ u^2 + v^2 + w^2 \} = u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x} + w \frac{\partial w}{\partial x}$$

we obtain

$$(68) \quad \frac{\partial u}{\partial t} + w \left( \frac{\partial u}{\partial z} - \frac{\partial w}{\partial x} \right) - v \left( \frac{\partial v}{\partial x} - \frac{\partial u}{\partial y} \right)$$

$$= X - \frac{\partial P}{\partial x} - \frac{\partial}{\partial x} \left( \frac{q^2}{2} \right).$$

If the bodily forces are conservative and derived from a potential  $V$ , the right-hand member is the derivative of the quantity  $-(V + P + q^2/2) = U$ , and inserting the values of  $\xi, \eta, \zeta$ ,

$$(69) \quad \frac{\partial u}{\partial t} + 2(\omega\eta - v\zeta) - \frac{\partial U}{\partial x},$$

$$\frac{\partial v}{\partial t} + 2(\omega\xi - w\zeta) - \frac{\partial U}{\partial y},$$

$$\frac{\partial w}{\partial t} + 2(v\xi - \omega\eta) - \frac{\partial U}{\partial z}.$$

If the motion is *steady*, that is, independent of  $t$ , the time-derivatives vanish. Then multiplying the equations (69) by  $dx, dy, dz$  respectively, adding and integrating along any curve, we obtain on the right the difference between the terminal values of  $V + P + q^2/2$ .

If the curve is either a stream- or vortex-line, that is, if  $dx, dy, dz$  are proportional either to  $u, v, w$ , or to  $\xi, \eta, \zeta$ , the sum on the left will also vanish, so that along a stream-line or a vortex-line we have  $V + P + q^2/2 = \text{const}$ . If the motion is non-vortical, the left-hand side of (69) vanishes, so that the above sum is constant throughout the fluid. In this case

$$(70) \quad V + P + \frac{1}{2}q^2 = \text{const.},$$

this result being called Daniel Bernoulli's theorem.

If the fluid is incompressible,  $P = p/\rho$ , and if there are no bodily forces  $V = 0$ , so that (70) becomes

$$(71) \quad \frac{p}{\rho} + \frac{1}{2}q^2 = \text{const.}$$

Accordingly where the velocity is small the pressure is large and vice-versa. By constricting the tube the velocity is made large and the pressure small. This is the principle of jet exhaust-pumps, like that of Bunsen, the air being sucked in at the narrow part of the jet. The same principle is used in the Venturi water-meter. The horizontal main being reduced in diameter in a certain portion and the difference of pressure at a point in that portion and in the main observed, the velocity is computed. If the pressure at the two cross-sections  $S_1$  and  $S_2$  is  $p_1, p_2$ , we have

$$(72) \quad p_1 - p_2 = \frac{\rho}{2}(q_2^2 - q_1^2).$$

But since the flow is solenoidal,  $S_1q_1 = S_2q_2$ . Combining with (72),

$$(73) \quad p_1 - p_2 = \frac{1}{2}\rho q_1^2 \left\{ \left( \frac{S_1}{S_2} \right)^2 - 1 \right\},$$

which determines  $q_1$  in terms of the pressure-difference. The efflux in unit time is  $\rho q_1 S_1$ .

For the adiabatic expansion of a gas,

$$(74) \quad P = \frac{b\kappa\rho}{\kappa-1} = \frac{b\kappa}{\kappa-1} \left( \frac{p}{b} \right)^{\frac{\kappa-1}{\kappa}}.$$

We may use Bernoulli's theorem to calculate the efflux of gas from a reservoir. If we consider a point in the reservoir where the pressure is  $p$ , so far from the orifice that the air may be considered at rest and if the velocity at the orifice is  $q$  and the atmospheric pressure  $p_0$ , we have

$$(75) \quad q^2 = 2b \frac{1}{\kappa} \frac{\kappa}{\kappa-1} \left\{ p^{\frac{\kappa-1}{\kappa}} - p_0^{\frac{\kappa-1}{\kappa}} \right\},$$

which is the usual formula for the efflux of gases.

If the external force be gravity,  $V = gz$ , and we have for an incompressible fluid,

$$(76) \quad \frac{p}{\rho} + gz + \frac{1}{2}q^2 = \text{const.}$$

If we again consider efflux from a reservoir whose upper free surface  $z = z_1$  is so large that  $q$  is negligible, the pressure being that of the atmosphere, the same above and at the orifice where  $z = z_2$ , the velocity of efflux is given by

$$(77) \quad \frac{p_0}{\rho} + gz_1 = \frac{p_0}{\rho} + gz_2 + \frac{1}{2}q^2, \\ q^2 = 2g(z_1 - z_2),$$

or the velocity of efflux is that acquired by a body falling freely from a height equal to that

of the free surface above the orifice. This is the theorem of Torricelli, one of the oldest on hydrodynamics.

**Wave-motion.**—The case of uniplanar waves may be dealt with by the method of the complex variable. We shall find that the waves travel with constant velocity  $a$  and that it will simplify the problem if we impose upon the whole fluid a horizontal velocity equal and opposite to that of the waves. The waves then stand still and the motion is *steady*, as in the case of waves about an obstruction in a running river.

Let us consider waves in deep water. At a great depth the vertical motion will disappear, so that

$$u = -a, \quad v = 0, \quad \phi = -ax.$$

The function

$$w = -ax + Ae^{-ikz} = -a(x + iy) + Ae^{-ik(x + iy)}$$

gives

$$\phi + i\psi = -a(x + iy) + Aekv(\cos kx - i \sin kx). \\ (78) \quad \phi = -ax + Aekv \cos kx, \\ \psi = -ay - Aekv \sin kx.$$

When  $y = -\infty$  this makes  $\phi = -ax$  as required. The free surface of the water being composed of stream-lines is represented by one of the lines  $\psi = \text{const}$ , and if we take the origin in the surface its equation is

$$(79) \quad ay + Aekv \sin kx = 0,$$

which shows that  $y$  is a periodic function of  $x$  with the wave-length  $\lambda = 2\pi/k$ . The longer the wave-length, that is the smaller  $k$ , the more nearly does the exponential reduce to unity and the profile to a curve of sines. The velocity is given by

$$(80) \quad u = \frac{\partial\phi}{\partial x} = \frac{\partial\psi}{\partial y} = -a - Aekv \sin kx, \\ v = \frac{\partial\psi}{\partial y} = -\frac{\partial\phi}{\partial x} = Aekv \cos kx,$$

$$(81) \quad q^2 = u^2 + v^2 = a^2 + A^2k^2e^{2ky} + 2Aekv \sin kx.$$

So far we have merely kinematics. The dynamical relation required is that for steady motion,

$$(82) \quad \frac{p}{\rho} + gy + \frac{1}{2}q^2 = C.$$

At the surface putting  $p = 0$  and making use of (79),

$$gy + \frac{1}{2} \{ a^2 + A^2k^2e^{2ky} - 2a^2ky \} = C.$$

Since the surface passes through the origin, putting  $y = 0$ ,

$$(83) \quad C = \frac{1}{2}(a^2 + A^2k^2). \\ (g - a^2k)y + \frac{1}{2}A^2k^2(e^{2ky} - 1) = 0.$$

This equation can be only approximately fulfilled, but if the height of the waves is so small in comparison with the wave-length that the square of  $2ky$  may be neglected, developing the exponential gives

$$(g - a^2k + A^2k^2)y = 0,$$

giving the relation between the velocity and the wave-length.

$$(84) \quad g - a^2k + A^2k^2 = 0.$$

If  $ky$  is small, the equation of the profile (79) is approximately

$$(85) \quad y = -\frac{A}{a} \sin kx,$$

so that the height of the waves above the

origin is  $B = A/a$ , inserting which in (84) gives

$$(86) \quad a^2 \left\{ \frac{2\pi}{\lambda} \left( 1 - \frac{4\pi^2 B^2}{\lambda^2} \right) \right\} = g.$$

For long waves we accordingly have  $a^2 = g\lambda/2\pi$ , or the velocity of long waves in deep water is equal to the velocity acquired by a body in falling freely from a height equal to one-half the radius of a circle whose circumference is the wave-length.

In order to study the motions of the individual particles of water let us now impress upon the motion given by (80) a uniform velocity  $a$  in the  $X$ -direction. Equations (80) now give the motion with respect to axes traveling with the waves, so that in order to obtain the motion with respect to fixed axes we have to add  $a$  to the  $u$  of (80) and replace  $x$  by  $x - at$ , obtaining

$$(87) \quad u = -Akekv \sin k(x - at), \\ v = -Akekv \cos k(x - at).$$

If the displacement of a particle which when at rest was at  $x, y$  is  $\xi, \eta$ , the above values are  $\frac{d\xi}{dt}, \frac{d\eta}{dt}$  and if we neglect the small change of velocity from  $x, y$  to  $x + \xi, y + \eta$ , we may integrate with respect to the time.

$$(88) \quad \xi = -Bekv \cos k(x - at), \\ \eta = -Bekv \sin k(x - at).$$

Thus each particle performs a uniform revolution in a vertical circle of radius  $Bekv$  in the time  $T = \frac{2\pi}{ka} = \frac{\lambda}{a}$ . The rapidity of decrease of

the motion as we go below the surface is seen by the fact that at a depth  $y = -\lambda$  the amplitude has diminished in the ratio  $e^{-2\pi} = .001867$ . The form of the wave-profile is shown in Fig. 15, the crests being farther above the

FIG. 15.

level than the troughs are below it. As the height increases the waves become sharper at the crest.

**Vortex-motion.**—Let us consider the change in circulation along a line that always contains the same particles. We have

$$(89) \quad \frac{d\phi_{AB}}{dt} = \frac{d}{dt} \int_A^B (u dx + v dy + w ds) \\ = \int_A^B \left\{ \frac{du}{dt} dx + u \frac{d}{dt}(dx) + \frac{dv}{dt} dy + v \frac{d}{dt}(dy) \right. \\ \left. + \frac{dw}{dt} ds + w \frac{d}{dt}(ds) \right\}.$$

Now consider an element  $ds$  which at a time later by  $dt$  has moved to a position  $ds'$ , Fig. 16. Since one end has moved in the  $X$ -direction a distance  $u dt$  and the other a distance

$$\left\{ u + \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz \right\} dt$$

the new value of its  $X$ -projection is

$$dx' = x + dx + \left\{ u + \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz \right\} dt \\ - (x + u dt),$$

from which we obtain the derivatives

$$\frac{d}{dt}(dx) = \frac{dx' - dx}{dt} = \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz, \\ (90) \quad \frac{d}{dt}(dy) = \frac{dy' - dy}{dt} = \frac{\partial v}{\partial x} dx + \frac{\partial v}{\partial y} dy + \frac{\partial v}{\partial z} dz, \\ \frac{d}{dt}(dz) = \frac{dz' - dz}{dt} = \frac{\partial w}{\partial x} dx + \frac{\partial w}{\partial y} dy + \frac{\partial w}{\partial z} dz.$$

FIG. 16.

But the equations of motion (67) are, in abbreviated form,

$$(91) \quad \frac{du}{dt} = \frac{\partial(U + q/2)}{\partial x}, \quad \frac{\partial v}{\partial t} = \frac{\partial(U + q/2)}{\partial y}, \\ \frac{\partial w}{\partial t} = \frac{\partial(U + q/2)}{\partial z},$$

where  $U = -(V + P + q/2)$ . Accordingly

$$(92) \quad \frac{d\phi_{AB}}{dt} = \int_A^B \left\{ \frac{\partial(U + q/2)}{\partial x} dx + \frac{\partial(U + q/2)}{\partial y} dy \right. \\ \left. + \frac{\partial(U + q/2)}{\partial z} dz + \left( u \frac{\partial u}{\partial x} + v \frac{\partial v}{\partial x} + w \frac{\partial w}{\partial x} \right) dx \right. \\ \left. + \left( u \frac{\partial u}{\partial y} + v \frac{\partial v}{\partial y} + w \frac{\partial w}{\partial y} \right) dy + \left( u \frac{\partial u}{\partial z} + \right. \right. \\ \left. \left. v \frac{\partial v}{\partial z} + w \frac{\partial w}{\partial z} \right) dz \right\} \\ = \int_A^B \frac{\partial(U + q)}{\partial x} dx + \frac{\partial(U + q)}{\partial y} dy \\ + \frac{\partial(U + q)}{\partial z} dz$$

$$= (U + q) \int_A^B,$$

which vanishes for a closed curve. Therefore if the bodily forces are conservative, the circulation around any closed curve moving with the fluid is independent of the time. If the circulation around a closed path is zero at one time, it remains zero, so that if the velocity-potential once exists, it always exists. This theorem is due to Lagrange.

From the equations (69), whose right-hand members are derivatives of the same quantity  $U$ , this quantity may be eliminated by differentiation. Differentiating the last equation by  $y$ , the second by  $x$ , and subtracting,

$$\frac{1}{2} \frac{\partial}{\partial x} \left( \frac{\partial w}{\partial y} - \frac{\partial v}{\partial x} \right) + \xi \frac{\partial v}{\partial y} + v \frac{\partial \xi}{\partial y} - \eta \frac{\partial u}{\partial y} - u \frac{\partial \eta}{\partial y} - \zeta \frac{\partial u}{\partial z} \\ - u \frac{\partial \zeta}{\partial x} + \xi \frac{\partial w}{\partial x} + w \frac{\partial \xi}{\partial x} = 0,$$

or otherwise,

$$(93) \frac{\partial \xi}{\partial t} + u \frac{\partial \xi}{\partial x} + v \frac{\partial \xi}{\partial y} + w \frac{\partial \xi}{\partial z} = u \left\{ \frac{\partial \xi}{\partial x} + \frac{\partial \eta}{\partial y} + \frac{\partial \zeta}{\partial z} \right\} - \xi \left\{ \frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} \right\} + \xi \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + \zeta \frac{\partial u}{\partial z}.$$

On the right the coefficient of  $u$ , being the divergence of the vorticity, is zero, while that of  $\xi$  is by the equation of continuity equal to  $\frac{1}{\rho} \frac{d\rho}{dt}$ , so that equation (93) becomes

$$\frac{d\xi}{dt} = \frac{\xi}{\rho} \frac{d\rho}{dt} + \xi \frac{\partial u}{\partial x} + v \frac{\partial u}{\partial y} + \zeta \frac{\partial u}{\partial z},$$

which may be written, with its two companions,

$$(94) \quad \begin{aligned} \frac{d}{dt} \left( \frac{\xi}{\rho} \right) &= \frac{\xi}{\rho} \frac{\partial u}{\partial x} + \frac{\eta}{\rho} \frac{\partial u}{\partial y} + \frac{\zeta}{\rho} \frac{\partial u}{\partial z}, \\ \frac{d}{dt} \left( \frac{\eta}{\rho} \right) &= \frac{\xi}{\rho} \frac{\partial v}{\partial x} + \frac{\eta}{\rho} \frac{\partial v}{\partial y} + \frac{\zeta}{\rho} \frac{\partial v}{\partial z}, \\ \frac{d}{dt} \left( \frac{\zeta}{\rho} \right) &= \frac{\xi}{\rho} \frac{\partial w}{\partial x} + \frac{\eta}{\rho} \frac{\partial w}{\partial y} + \frac{\zeta}{\rho} \frac{\partial w}{\partial z}. \end{aligned}$$

Thus the time derivatives of  $\frac{\xi}{\rho}$ ,  $\frac{\eta}{\rho}$ ,  $\frac{\zeta}{\rho}$  for a given

particle are homogeneous linear functions of those quantities. By continued differentiation with respect to  $t$  and the substitution of the derivatives from these equations, we see that all the time-derivatives are homogeneous linear functions of the quantities themselves. Thus if at any time these quantities are zero, all their derivatives are zero, and developing by Taylor's theorem, we find that the function remains zero for all times. Thus if a particle is once not vortically revolving, it never can acquire such rotation under conservative forces.

Let us now consider two points  $A$  and  $B$  lying on the same vortex-line at a distance apart  $ds = \epsilon \frac{\omega}{\rho}$ , where  $\epsilon$  is a small constant.

Since the particles lie on the vortex-line we have

$$(95) \quad \frac{dx}{\xi} = \frac{dy}{\eta} = \frac{dz}{\zeta} = \frac{ds}{\omega} = \frac{\epsilon}{\rho}.$$

For the difference of velocity at  $A$  and  $B$  we have

$$(96) \quad \begin{aligned} u_B - u_A &= \frac{\partial u}{\partial x} dx + \frac{\partial u}{\partial y} dy + \frac{\partial u}{\partial z} dz \\ &= \epsilon \left\{ \frac{\xi}{\rho} \frac{\partial u}{\partial x} + \frac{\eta}{\rho} \frac{\partial u}{\partial y} + \frac{\zeta}{\rho} \frac{\partial u}{\partial z} \right\}, \end{aligned}$$

or, by equations (94),

$$(97) \quad u_B - u_A = \epsilon \frac{d}{dt} \left( \frac{\xi}{\rho} \right).$$

Now at an instant later by  $dt$ , when the particles are at  $A'$  and  $B'$

$$dx' = dx + (u_B - u_A)dt = \epsilon \left[ \frac{\xi}{\rho} + \frac{d}{dt} \left( \frac{\xi}{\rho} \right) dt \right],$$

$$(98) \quad dy' = dy + (v_B - v_A)dt = \epsilon \left[ \frac{\eta}{\rho} + \frac{d}{dt} \left( \frac{\eta}{\rho} \right) dt \right],$$

$$dz' = dz + (w_B - w_A)dt = \epsilon \left[ \frac{\zeta}{\rho} + \frac{d}{dt} \left( \frac{\zeta}{\rho} \right) dt \right].$$

Therefore the projections of the arc  $ds'$  in the new position are proportional to the new

values of the components of  $\omega/\rho$ , as they originally were, so that the particles still lie on a vortex-line. Accordingly a vortex-line is always composed of the same particles of fluid. Also, since the components of  $ds$  have changed so as to be always proportional to the components of  $\omega/\rho$ , if the liquid is incompressible the rotation is proportional to the distance between the particles. And whether  $\rho$  vary or not, if  $S$  is the cross-section of a vortex-filament, since the mass  $\rho S ds$  of a length  $ds$  remains constant, so does  $S\omega$ , the strength of the filament. Accordingly the strength of a vortex-filament is constant, not only at all points in the filament, but at all times, consequently a vortex existing in a perfect fluid is indestructible, however it may move. It is from this remarkable property of vortices discovered by Helmholtz that Lord Kelvin was led to imagine atoms as consisting of vortices in a perfect fluid.

From the kinematical properties of flow due to vortex-motion (62), we see that the velocity at every point of a circular vortex-ring, Fig. 17, due to all the elements of the vortex,

FIG. 17.

is in the same direction perpendicular to the plane of the ring, and in the direction in which the inside of the ring is turning; the ring therefore advances with a constant velocity, as if it were rolling in a tube which it just fits. We may verify this by an experiment due to Professor Tait, where smoke is suddenly forced out through a circular hole in a box provided with an elastic back. The smoky air rolling on the edge of the hole is endowed (by the friction, a *non-conservative* force) with a vortical rotation, and issues as a vortex-ring, which advances with approximately constant velocity for a considerable distance. That it consists always of the same air is seen by the smoke which it carries with it. Such a ring, on striking an edge or obstacle, is not destroyed or cut. Similar experiments can be performed with the rings formed by letting drops of ink fall into water. The loss of velocity finally obtaining in all these cases is due to the viscosity, that is, to non-conservative forces. The treatment of viscosity is beyond the scope of this article.

**HYDROFLUOSILICIC** (hi'drō-floo'ō-sī-lis'ik) ACID. See FLUORINE.

**HYDROGEN** (Greek, "producing water," in reference to the fact that in burning in air or oxygen, hydrogen forms water-vapor), a

gaseous element, discovered by Cavendish in 1766. It was at first called "inflammable air," the present name being due to Lavoisier. Hydrogen is the lightest known substance, and it also has the smallest known atomic weight. The atomic weight of hydrogen is often taken as unity in stating the relative atomic weights of the different elements (see ATOMIC THEORY), but it is now more usual to assume the atomic weight of oxygen to be precisely 16, which amounts to making the atomic weight of hydrogen 1.0076. According to Regnault's experiments, hydrogen has a density equal to 0.06926 of that of an equal volume of air, at the same temperature and pressure. In absolute measure, the mass of a cubic centimetre of hydrogen, at the freezing point of water and under a pressure of 76 centimetres of mercury at Paris, is 0.00008957 gram, or 0.08957 milligram. Hydrogen has the chemical symbol H, and is one of the most abundant elements known. It occurs in the free state in volcanic gases, and in the sun and in many of the fixed stars. Free hydrogen is also present in the earth's atmosphere in exceedingly small amount. Water (or hydrogen monoxide) is its commonest and most abundant compound, and it is an essential constituent of nearly all organic tissues. Hydrogen may be prepared very easily by many methods. One of the most convenient of these consists in acting upon metallic zinc with dilute sulphuric acid, the reaction in this case being:  $Zn + H_2SO_4 = ZnSO_4 + 2H$ . Hydrogen is chemically inert toward most of the elements, at ordinary temperatures, but it combines with chlorine when exposed to light,—quietly in diffused daylight, and explosively under the direct action of sunlight. At elevated temperatures it combines with other elements also, and it burns in air (or oxygen) with the development of an intense heat, but with very little light; water being produced as the result of the combustion. Hydrogen has been both liquefied and solidified. Its critical temperature is estimated, by Dewar, to be about 402° F. below zero, and the same authority gives 15 atmospheres as the critical pressure. See CRITICAL POINT, and GASES, LIQUEFACTION OF.

Hydrogen combines with oxygen in two proportions. The monoxide, or common water,  $H_2O$ , is formed, as already noted, when hydrogen is burned in air or in oxygen. It is also formed in many of the double decompositions that occur in chemistry, as when metallic oxides or hydrates are dissolved in acids. Sodium hydrate, for example, combines with sulphuric acid according to the equation  $2NaOH + H_2SO_4 = Na_2SO_4 + 2H_2O$ , sodium sulphate and water being formed.

Hydrogen peroxide (or dioxide),  $H_2O_2$ , may be prepared by acting upon barium dioxide,  $BaO_2$ , with dilute sulphuric acid; the reaction being:  $BaO_2 + H_2SO_4 = BaSO_4 + H_2O_2$ . The barium sulphate that is formed at the same time is a heavy, insoluble substance, which is easily removed from the solution by filtration, or by settling and subsequent decantation. The aqueous solution of the peroxide may then be concentrated by evaporation over strong sulphuric acid, under the receiver of an air pump. When the water has all evaporated, the pure peroxide remaining behind has a specific gravity of 1.452, and is a colorless, oily liquid, devoid of odor,

but having a disagreeable metallic taste. The peroxide does not freeze, even when cooled to 0° F. At 70° F. it slowly gives off half its oxygen, passing into water. At 212° F. this change takes place very rapidly. Owing to the facility with which hydrogen peroxide gives off oxygen, it is used quite largely as a bleaching agent, and also, in surgery, as a disinfectant in the treatment of wounds.

When hydrogen is passed through boiling sulphur, combination takes place, with the formation of hydrogen sulphide, or sulphuretted hydrogen,  $H_2S$ . This compound is more conveniently prepared, however, by treating sulphide of iron,  $FeS$ , with dilute sulphuric acid, ferrous sulphate ( $FeSO_4$ ) being formed at the same time. The reaction is:  $FeS + H_2SO_4 = FeSO_4 + H_2S$ . Sulphuretted hydrogen is a gas, devoid of color, but possessing an overpowering odor, suggestive of rotten eggs. It burns with a bluish flame and is poisonous when inhaled in any considerable quantity, even though largely diluted with air. Under ordinary atmospheric pressure, sulphuretted hydrogen gas condenses, at 80° F. below zero, to a colorless liquid, which freezes to an ice-like solid upon being further cooled to 121° F. below zero. Liquefaction may also be induced at the ordinary temperature of the air by the application of a pressure of from 17 to 20 atmospheres. Sulphuretted hydrogen is an invaluable reagent in the chemical laboratory, where it is greatly used for separating the metals into groups, in inorganic analysis. See CHEMICAL ANALYSIS.

With carbon, hydrogen forms a large number of compounds which are collectively known as hydrocarbons (q.v.). With carbon and oxygen, and with carbon, oxygen and nitrogen, hydrogen forms compounds past enumeration. For further information concerning these, consult any treatise on organic chemistry, and also, in this encyclopædia, the articles COMPRESSED GASES; FATTY COMPOUNDS; and AROMATIC COMPOUNDS.

**HYDROGRAPHIC OFFICE, United States,** an institution established by Act of Congress in 1866 for the improvement of the means for navigating safely the vessels of the navy and mercantile marine. It is attached to the Bureau of Navigation of the Department of the Navy, and prepares the instructions for and receives the results of the ocean and coast surveys which the naval service is authorized to perform. The accumulations of this office, in the form of charts, sailing directions, and nautical tables for the use of mariners in the practice of navigation and nautical astronomy, have resulted from original naval surveys, from geographical and cartographical data gathered from the reports of commanding officers of vessels in the general naval service, from information collected from mariners of all nationalities by the branch hydrographic offices operating in sixteen of the principal ports of the United States, and from the hydrographical information that comes into the custody of the Department of the Navy through the prosecution of surveys by foreign governments. These publi-

cations relate to all parts of the navigable waters of the globe and form an important asset in the operation of American shipping.

At regular intervals there have also been constructed world-charts showing the lines of equal declination and inclination of the magnetic needle and the intensity of the earth's magnetic force, which have been supplemented by publications of the results of the analytical treatment and the discussion of magnetic observations made at a great number of places in all parts of the world, and also charts showing the telegraphic connections of the world, and showing the tracks for full-powered steamers with the shortest distances in nautical miles. These charts, as well as those issued for purely navigational purposes, are, in nearly all cases, constructed upon the Mercator projection. The exceptions include the circumpolar charts showing the frigid zones and the great circle sailing charts of the several oceans.

A pamphlet of notices to mariners is issued each week, giving information to enable mariners to amend the publications that are extant from the hydrographic office, by means of descriptions of newly discovered dangers to navigation and recently installed or altered lights, beacons and buoys.

The opportunities that surround the seafarer for observing the processes of nature have been made of avail by the hydrographic office in collecting observations in relation to the physical geography of the sea, which, when collated and digested, are of benefit to the material interests of commerce and navigation. For such a field observers are necessary in numbers that come only at the call of nations; and, in order that no man may feel that he has labored in vain, it is necessary to give back to each, to his own profit, the results of the united experience of all. This is the purpose of the pilot charts — to give timely expression, in a graphical form easily comprehended by navigators, of those conditions and facts of experience which, on being taken account of in navigation, will tend to safeguard the lives of seamen and accelerate transit from place to place. These charts are published monthly for the North Atlantic, Indian, and North Pacific oceans, and at quarter-yearly intervals for the South Atlantic and South Pacific oceans. They show the regions of storm, fog and floating masses of ice, the set and rate of ocean currents, the average direction and force of the winds to be expected, the trade-wind limits, the best passage routes, the normal isobaric and thermal lines over the ocean, the variation of the compass and its change with time and locality, and the positions in which derelict vessels and floating obstructions to navigation are reported to exist.

GEORGE W. LITTLEHALES,  
*United States Hydrographic Office.*

**HYDROGRAPHIC SURVEYING.** See SURVEYING.

**HYDROGRAPHY.** Hydrography has been viewed by past generations of writers as comprehending all those branches of science which pertain to the waters of the earth's surface. In the present generation, however, the description and knowledge of the oceans is embraced in oceanography; the description of the river systems, their function as agents for the

sculpture of the land, and the conditions under which their courses are modified, and the description of the lakes, and the processes of their creation and extinction are viewed as subjects of physical geography; the treatment of rivers from the point of view of their manner of flow, their floods, and their employment as sources of power is designated as river hydraulics; and the motions and oscillations of lakes and other bodies of fresh water, including their physical, chemical, meteorological and biological description, constitute the science of limnology. Hydrography, in its definite application, comprehends those operations and investigations which relate to the representation and charting of the depths, shoals and shore lines of oceans, lakes, rivers, harbors and other bodies of water, mainly in the interests of navigation and for the purpose of indicating the hidden dangers to be avoided and the channels where safety is to be sought in the guidance of shipping. It is not only necessary to designate the exact position and extent of dangers to navigation, but also to indicate the undulations and characteristics of the bottom which, being charted, frequently enable the navigator, by casts of the lead or sounding-plummet, to recognize his position, or the course he is following, and which, at night, are often the only guides to an anchorage.

**History.**—There came a time in the history of the world when commerce was pushed into the sea. There was an age in which, by two world-old high roads stretching across Persia, the slow caravans passed and repassed bearing silks and spices and merchandise from Central Asia and India to Syria and the West. Then came the sweeping hordes from the northeast to interpose a barbaric wedge which practically shut the main gates of the Eastern trade; and Europe began to find the way to India and China in ships. Long before the rise of Greek civilization, and long before the oldest Greek and Hebrew records, Phœnician navigators, having emigrated from the shores of the Erythræan Sea or Indian Ocean, were making voyages over the Mediterranean Sea and through the Pillars of Hercules or the Strait of Gibraltar into the Atlantic Ocean. And, after the Phœnicians, the Carthagenians, animated by the same spirit of commercial enterprise, continued to conduct voyages which might rival those of much later centuries. These experiences must necessarily have produced some knowledge of the configuration of the coasts with which the Phœnicians and Carthagenians were familiar and of the depths of the bordering waters, but this knowledge, whatever its extent, was not transmitted to us, and it remained to later centuries to provide those foundations of knowledge upon which the superstructure of hydrography has been raised.

Although the Greeks must be regarded as the founders of scientific geography, they are not known to have undertaken voyages of discovery before the 4th century B.C., when they sent an expedition to the North Sea under the direction of the illustrious astronomer and mathematician, Pytheas, who, at that distant period, had determined the latitude of Marseilles with such exactitude that 20 centuries afterward Gassendi found it correct to within a few seconds. There is no doubt that, before this voyage, the chart of the seas to the west

of Europe was almost a blank, and that, down to the time of Strabo, it retained the form given to it by Pytheas. Hydrography is also indebted to the solicitude shown for the sciences by the Ptolemies, the successors of Alexander in Egypt. Timosthenes, a native of Phodes, who was admiral of the Egyptian fleet under Ptolemy Philadelphus, drew up a treatise "Concerning Ports" which may be regarded as the precursor of the modern sailing directions issued by the hydrographic offices of the maritime nations. Although the Romans carried their arms throughout nearly all the world known to the ancients, including in their rule a great extent of coast bordering on the Atlantic, they never organized any voyages of discovery into this outer sea, after the manner of the Carthagenians and Greeks. It was near the beginning of the Christian era when the celebrated Grecian geographer, Strabo, suggested that besides the world known to the Greeks and Romans, other continents or other worlds might yet be discovered inhabited by different races of men. Strabo does not appear to have been acquainted with Hippalus, an Egyptian navigator, living about the same time, who proved the regular alternations in the direction of the monsoons of the Indian Ocean, and profited by the discovery to open up a route across the high seas between the shores of the Red Sea and India. Coast routes, followed up to this time, were abandoned, and a fresh impetus was given to voyages in oriental waters. Nevertheless, 150 years afterward, Ptolemy, whose great authority gave his views a scientific stamp, rejected the hypothesis of an ocean extending to the east of the Asiatic continent and regarded these great land masses as extending indefinitely toward the north and east. His maps, in which he accomplished so great an advance in projection by latitude and longitude, show also that he shared the view of many of his predecessors in representing the Indian Ocean as a sea enclosed by an extension of Africa eastward to China. This Southern Ethiopia remained on maps down to the time of the second voyage of Captain Cook. Two principal views prevailed among the ancients regarding the distribution of coasts and seas. The school that may be called Homeric—to which Eratosthenes and Strabo belonged—considered the three continents of the Old World as forming a single island surrounded by the ocean. On the other hand, the adherents of what may be called the Ptolemaic school—to which Hipparchus belonged—did not admit the extension of the sea around the known world. They considered the Atlantic and Indian oceans to be great enclosed seas like the Mediterranean; they held that the extreme points of the known lands toward the east and the west approached so nearly to each other that a ship, parting from the west, might easily reach the eastern extremity, which they regarded as greatly extended. This error was perpetuated, thanks to the influence of Ptolemy, and led directly, 14 centuries afterward, to the discovery of the New World by Columbus. When the barbarians invaded and overran Europe in the 4th and 5th centuries, the maps and other scientific works of ancient civilization were destroyed or lost sight of for centuries afterward. In the Middle Ages, the Arabs extended their voyages as far as China in the

East, and, in the West, they were acquainted with the whole of southern Europe and of northern Africa. It is to their intercourse in the 10th and 11th centuries that the knowledge leading to the introduction of the mariner's compass is believed to have been conveyed from China to Europe. The ancients, who made so many excellent circumnavigations of the Mediterranean, never constructed general or coast charts. The marine compass-charts of the Middle Ages therefore demonstrate a great progress in knowledge in relation to coast charts which were based on rounds of angles taken from successive positions by means of the compass. The compass-charts, or *poriw-lani*, a name applied both to the charts and the accompanying sailing directions, made their appearance in Italy in the 13th century. The most remarkable of these compass-charts is known as the Catalan chart. It is a map of the world in six sheets, dated 1375, and is at once a planisphere and a marine chart. It indicates in particular the new islands discovered in the Atlantic Ocean, and shows much progress in the representation of the Indian Seas. It is on this chart that India appears for the first time as a peninsula, and the Indian Ocean is no longer an inclosed sea as had been previously represented.

The compass shows the mariner his course, but not how far he may have been drifted from it by wind or current. It is the province of nautical astronomy to tell him from time to time his exact position by latitude and longitude. Nautical astronomy was greatly advanced by Prince Henry the Navigator, a prince of Portugal, who founded an observatory and school at Sagres in 1420, employed the best Italian mapmakers and pilots, and inspired the heroic age of Portuguese and Spanish exploration, which took its course toward the Atlantic because Europe, whose face was turned toward Asia up to the time of the closing of the routes to the East through the capture of Constantinople by the Turks in 1453, now began to transfer the centre of her civilization and commercial activity to the Great Western Ocean. The great works of the ancient geographers were rescued from the expiring Byzantine Empire and reproduced in the West, and, after the lapse of a thousand years, maps were once more constructed on the principles of latitude and longitude initiated by Ptolemy. It was into such a state of the progress of knowledge of the coasts of the world that the generation of Columbus, Gama, and Magellan was introduced—the generation that gave America, the route to India, and the circumnavigation of the globe. The revolution that had been effected in the map of the world between the sailing of Columbus and the year 1600 may be realized by comparison of Behaim's famous globe of 1492—the year of the sailing of Columbus—with Hakluyt's map of 1599. Behaim's globe had no America, and the Indian Ocean was inclosed to the south by an eastern extension of South Africa: it was essentially the same as Ptolemy's of 13 centuries earlier. But, Hakluyt's map, a century later, shows the modern world, except for the omission of Australia which had only recently been reached by the Dutch in those voyages from their East Indies' colonies as a result of which its western coast was explored

and represented in the map by Ortelius, in 1570, as New Holland.

In the 16th century the art of drawing up sea charts found its greatest cultivation among the Spaniards and Portuguese. The governments of Spain and Portugal endeavored to have charts constructed with the greatest possible accuracy. Portugal created a commission, of which Martin Behaim was a member, for the greater development of this science. In Spain, Amerigo Vespucci was appointed Chief Pilot in 1508, and soon became the head of a hydrographic bureau for the execution of charts and kindred purposes. It was ordered at this time "that henceforth all navigators sailing towards known or unknown parts of India, who should discover new regions, islands, harbors or bays, affording some interest for the general chart, should, on their return to Europe, report the same to the Chief Pilot." Such was the importance attached to the proper construction of these charts, that foreigners were summoned to correct or complete these documents. It was for this purpose that the celebrated English navigator, Sebastian Cabot, repaired to Spain in 1512.

In the course of his voyages, Cabot carefully observed the changes in the variation of the compass, and he was instrumental in bringing it to pass that, after the early part of the 16th century, care was taken to introduce this datum when drawing charts. Charts were further improved toward the middle of the 16th century by the use of the Mercator projection, which has rendered signal services to navigation, and by a more accurate outline of the sea coasts and a more precise representation of the position of each of the points: the progress thus made was in direct relation to the improvement of the methods of determining latitude and longitude, and the improvement of nautical instruments. The soundings which could be ascertained with the appliances then in existence soon were noted in charts at important points of the coasts, and hydrographic signs, resembling those at present in use, began to be employed to show reefs and rocky bottom by means of crosses, and sand banks and shallows by means of masses of dots. The period which opens with the voyages of Captain Cook, in the second half of the 18th century, marks the beginning of the more precise observations in hydrography. After these voyages, the chart of the Pacific, until then almost a blank, differed but little from that of the present, in general superficial outlines; and the reduction of Australia approximately to the proportions now accepted, and its separation from New Zealand and from the *Terra Australis Incognita* were among his great achievements. It was reserved to the United States Exploring Expedition under Charles Wilkes to discover the Antarctic Continent in the first days of the year 1840, and to chart 1,500 miles of its coastline; and also to contribute extensively to the records of geography and terrestrial physics with which the splendid set of sea voyages by our own and all other maritime countries have stocked the hydrographic offices established by the various nations during the last one hundred years or so.

By the labors of these institutions, new details have been introduced for determining position, based upon astronomical and geodetic

observations; the survey of coastlines is no longer made by the compass, but by trigonometrical measurement; the meteorological element is introduced in the graphical representation of the seas, hydrographic signs guide the seaman, reliable soundings inform him of the depth of water in the approach to nearly every coast, the currents are delineated, and the local tides are indicated.

**Modern Practice.**—The two branches of surveying on which hydrography is most dependent, and which it is most convenient to have precede it, and on which its accuracy largely depends, are triangulation and topography. The triangulation fixes the position of the trigonometrical points on land by means of which the location of the soundings is determined. The topography provides the delineation of the shore, locates the rocks that show above water, and the limits of dry shores and banks. These data are placed in their proper relative position on an outline map whose scale will depend upon the minuteness with which the submerged features are to be mapped, and this in turn will largely depend upon the characteristics of the area and its importance to navigation or other commercial purpose. A scale of 1-10,000 (which means that 10,000 feet on the surface of the earth are represented by one foot on the projection) is well adapted for the survey of most harbors. The points determined by triangulation are plotted on the outline map or projection in their proper geographic positions. These points consist of prominent objects, such as church spires, chimneys, conspicuous rocks or trees and specially built signals, all of which are of a suitable kind to be observed from a boat or vessel while sounding. When a sufficient number of these signals or other objects have been located and a tide gauge or tide staff has been erected at some suitable point in the vicinity of the work, the next step in the hydrographic survey is making the soundings for the depth of water. Power launches and ships are now more often used than rowboats in running sounding lines. The lines of soundings are run in accordance with such a plan as will best develop the contour of the bottom and its characteristic features; generally a rectangular system of lines is used, and where the two systems of lines cross each other the soundings must agree within prescribed limits varying with the depth of water. When beginning a line of soundings, two observers, with sextant in hand, the recorder, with a watch or clock and record book, and the leadsman, with his sounding line, take their respective positions. The observers measure with their sextants the two angles between three shore signals and read the angles measured; the leadsman gets a cast of the lead and announces the depth of water in feet or fathoms and feet, and the recorder records all these with the time the boat begins to move. The boat does not stop again until the end of the line is reached. The position of the boat is determined by the observation of pairs of angles at equal intervals of time (two to four minutes), or when there is a change in the direction of the line, or a change of speed of the boat or sudden change in depth of water, and at the end of the line. Where the depths are changing rapidly the soundings are taken by the leadsman as frequently as possible, and the

time of each sounding may be noted to seconds; but where the bottom is comparatively level the soundings are preferably taken at equal intervals of time. The pairs of angles taken for position of the sounding boat are plotted on the projection or outline map by means of a three-arm protractor, thus each sounding is laid down in its proper position. When practicable the lines of soundings are run on ranges — that is, with the boat in the same straight line with two fixed objects on shore.

While the boat has been running the lines of soundings, the water has not remained at the same level owing to the rise or fall of the tide; and, therefore, the tides must be observed by means of a staff or self-registering tide gauge while the sounding is in progress, so that the depths can be reduced to a common plane of reference. Each sounding must therefore be corrected for the stage of the tide at the time it was taken. The plane of reference usually adopted is that of "mean low water," which is, roughly speaking, the mean reading of all the low waters observed on the tide staff for as long a period as practicable, but usually not less than one lunar month. The reading of mean low water on the tide staff being known and the observations of the height of the tide having been made at sufficiently frequent intervals while the soundings were in progress, the tidal corrections may be readily applied to the measured soundings. In order to preserve the plane of reference permanent tidal bench marks are established on shore and the plane of reference is referred to them by leveling. In deep-sea sounding, offshore it is not necessary to apply the tidal reduction to the soundings.

The successive positions of the sounding boat being plotted, and the number and time intervals of the soundings being shown in the record, intermediate soundings are spaced accordingly between the positions. The result is practically the same as though the boat's position had been instrumentally ascertained at each sounding. Up to depths of about 20 fathoms the soundings can readily be made by the hand line; for greater depths machine sounding appliances are used. Down to about 85 fathoms, these appliances are designed to be used while the sounding vessel is under way; at greater depths, including deep-sea work, the vessel is stopped while the sounding is made. When sounding in the deep offshore waters, piano wire is used on the drum of the sounding machine, and spherical or pear-shaped shot weighing about 60 pounds is used as a sinker and is attached to the wire by a device which automatically detaches it on reaching the bottom. The wire is then reeled in by means of the reeling engine and a new sinker attached for the next sounding. The depth of water is measured by noting the length of wire run out, and, as a check, this is again noted in reeling in. In addition to ascertaining the depth of the ocean, a mechanical device is also attached to the end of the sounding wire by means of which a specimen of the materials of the ocean bottom is secured and brought up in deep-sea sounding. While the vessel remains in sight of land the method of determining position in running the sounding line is similar to that explained in relation to sounding boats and launches in inshore and harbor hydrography, but when out of sight of land the position is ob-

tained by radio-direction plotting or by astronomical observations and dead reckoning.

Hydrographic surveys with the lead line, while developing the slopes of the bottom, do not with certainty reveal all of the hidden dangers to navigation that lie in the pathway of ships. In regions like the coast of Maine and in Alaska, where there are isolated rocks and ledges on the bottom, or in the tropical regions fringed with coral reefs and dotted with coral heads, the work must be supplemented by examination with special appliances. Owing to the extension of commerce and its increasing demands, bringing into use ever larger and deeper draft vessels, much special examination is now required. To meet these requirements and in order to be certain that an area is free of obstructions to navigation to a specified depth, the water area is swept over by an appliance known as a wire drag, which is essentially a large wire rope (lengths up to 12,000 feet have been used), supported at intervals by specially designed buoys so arranged that the wire can be maintained at any required depth irrespective of the changes in the stage of the tide. This apparatus is towed through the water by two or three launches, and, if no obstruction is encountered, it is certain that no dangers exist at a less depth of water than that at which the drag was set. One of the best features of the wire drag is the rapidity with which an area can be examined. The length of drag now commonly used is 3,000 feet or over, except when used in channels of less width than this. The average speed of the drag through the water is about a mile and a half per hour, and the area that can be covered in a day depends largely upon local conditions, such as natural or artificial obstructions. Great accuracy is required of the hydrographer, even where the water is so deep that there is no possible danger of the largest ship afloat touching bottom, because the hydrography shown on a mariner's chart has a twofold object: First, to point out to the navigator the invisible dangers which he must avoid; and second, to reveal the configuration of the bottom and also its physical characteristics so truly that by the use of his sounding appliances he may fix his position in relation to those dangers, or, when offshore or the coast line is invisible, determine his distance from land.

Marine hydrography also embraces the observation and reduction of the tides and the tidal currents. Tidal phenomena present themselves to the observer under two aspects — as an alternate rising and falling of the surface of the sea and as a recurrent inflow and outflow of the waters. In common and general usage, the name tide is applied both to the vertical and the horizontal movements, but, in the strict sense, its meaning is confined to the changes of elevation, while the recurrent streams are properly distinguished as tidal currents. While the rise or fall of the tide in a given period may be practically uniform in amount and nearly simultaneous at widely separated points within an extensive area, the currents which accompany the change will vary widely within the same region, being modified by every outline of the shore and by every irregularity of the bottom. Moreover, the time at which the tidal current changes its direction, as from flood to ebb, or the reverse, does

not generally coincide with the time at which the tide begins to fall or to rise.

The basis of fact derived from the observation of the tides in hydrographic surveying provides for the prediction of their occurrence, and, accordingly, on account of the vital importance of tidal knowledge in navigation, the United States issues an annual volume of tide tables in which the predicted times and heights of every high and low tide throughout the year are stated for 70 of the principal parts of the world, along with provision, by means of tidal differences, for affording like information in relation to more than 3,000 other ports in all parts of the world. **HYDROID**, a class of cœlenterate animals. See HYDROZOA.

**HYDROLITE**. See Gmelinite.

**HYDROLOGY**, hi-drōl'-o-gē. Although etymologically hydrology covers the entire science of water, its properties, phenomena, laws and distribution, the application of the term usually is restricted to investigation and description of water in or on the earth, that is, underground waters and stream flow or the increment of water from rainfall. Water that comes to the earth from the atmosphere in the form of rain or snow is in large part gathered into streams or lakes while a smaller part passes underground. Some of it evaporates so rapidly that it does not add to the increment and there is also considerable loss by evaporation from all water bodies and from ground water brought to the surface by vegetation and capillary action. Many factors influence the volume and movement of surface waters and the passage of waters underground. Stream flow depends on conditions of precipitation, light showers often yielding no flow and heavy storms resulting in floods. The most important factors are climate, vegetation, topography, the works of man and various geologic conditions, especially those affecting the absorption of surface water by soils and rocks. The passage of water into the ground is controlled by the texture of surface materials and of the rocks below, and in large measure by the configuration of the land and conditions of rainfall or snow melting. Much underground water comes again to the surface in the general seepage on slopes and also in springs which often draw from deep sources, and the water in the ground is depleted by vegetation and capillary action. The science of underground water is sometimes designated hydrogeology because it is a branch of geology. Extensive investigations of underground waters have been made by geologists in various parts of the world with most important economic results. The basis of the work is geologic because the water is mostly contained in sand, sandstones and various other rocks which occur in succession among the strata constituting the earth's crust. The water-bearing beds are carried to great depths by downward dips of monoclines or basins. Locally they are cut by faults and igneous masses and generally they are affected by variations in texture both of themselves and of adjoining strata. The "head" controlled by height of intake is an important factor in delimiting the area in which artesian flows may

be expected. Mineral or saline components affect the quality of the water and variations in texture and thickness of the beds control the volume of water available. The study of most problems of hydrology relating to artesian water and their prospects require the determination of geologic conditions in wide areas, for the evidence is often many miles away from the place where the water is desired. The rate of movement of water through various rocks and sands and the capacity of these materials for water have been studied extensively by King, Slichter and others. For many years a branch of the United States Geological Survey has been devoted to studies of problems of hydrology. The function of this work is to investigate water supply from wells and streams for domestic use, manufacturing and irrigation and consideration is also given to water powers and methods of pumping and storing water. The determination of volume of water in surface streams is an important branch of hydrology. Ordinarily streams are gaged by current meters taking the velocity on a measured cross section but on many rivers vertical gages are set and observations are made of the height of the water while in some cases water stage recorders are used which give a continuous record. Volume of flow is calculated from these records by a rating table computed from observations made at various stages of flow. The amount of water flowing in a stream, termed the discharge or run off, is expressed either in rate of flow or volume of increment. Rate of flow is given in second feet (cubic feet per second) but some records are given in miner's inches or in second feet per square mile. A miner's inch is the discharge through an orifice one inch square under a head which varies locally and is defined by State laws. In California the miner's inch is .187 gallons a second or .0248 second feet; in Colorado it is .195 gallons or about 5 per cent more. A second foot is 7.48 United States gallons a second, 1,98347 acre-feet a day. One acre-foot is 325,851 United States gallons, (43,560 cubic feet) the amount covering an acre one foot deep. It is equal to 50 miner's inches in Idaho, Kansas, Nebraska, New Mexico, North Dakota and South Dakota, 40 miner's inches in Arizona, California, Montana and Oregon and 38.4 miner's inches in Colorado. A second foot falling 8.81 feet is equal to one horse power. The United States Geological Survey alone and in co-operation with various state surveys maintains many stations, where volume of stream flow is determined as often as may be necessary to indicate the total yearly flow and its variations from year to year. By this means in the last 25 years or more there has been ascertained the amount of water available for various purposes including water power in all the principal streams of the country. Similar observations have been made in Canada for the past 10 years. The methods have been largely developed by engineers in the water resource branch of the United States Geological Survey and they are generally accepted as standard. Records of rainfall such as those systematically obtained by the weather bureau of the United States Department of Agriculture throughout the country afford important hydrologic data, for their averages show the amount of precipitation that may be expected in various areas.

The determination of rates of evaporation throw light on the prospects for water storage. See GEOLOGY; IRRIGATION; PHYSIOGRAPHY; RIVERS; ARTESIAN WELLS.

Geologist, United States Geological Survey.

**HYDROMETAMORPHISM.** See METAMORPHISM.

**HYDROMETER**, an instrument for determining specific gravity, as of fluids, by flotation. For determining the specific gravity of a liquid, the instrument is floated in the liquid itself. When a solid body floats in a liquid, and displaces a quantity of the liquid, it is supported by the same upward pressure that for-

liquids are inversely proportional to the densities of the liquids. On each of these principles a form of hydrometer is founded. One is called the constant weight hydrometer, the other the

FIG. 1.—Forms of Hydrometer.

constant volume hydrometer. The first, usually made of glass, is shown in Fig. 1. It has a large hollow bulb, and below that a smaller bulb, weighted with mercury, to make the instrument float upright and it is surmounted by a cylindrical glass stem which is graduated, the

FIG. 2.—Nicholson's Hydrometer.

merly supported the liquid which it displaces. The weight of the solid body is thus equal to the weight of the liquid that it displaces. Hence the depth to which the same solid body is immersed in a liquid is greater as the density of the liquid is greater. This makes it possible to test the strength or purity of various solutions. And, likewise, the weights required to immerse a given body equally deep in various

divisions being usually marked on or within the stem. The depth to which the hydrometer sinks in the liquid gives the density.

Of constant volume hydrometers, Nicholson's hydrometer, the best known, possibly, is adapted for determining the specific gravities not only of fluids, but of solids also. It is shown in Fig. 2. It consists of a hollow cylinder of metal, surmounted with a very fine

metallic stem, to the top of which there is attached a plate or pan for weights. From the bottom of the metallic cylinder hangs a cup or basket. The whole instrument is weighted so as to float upright. On the fine metallic stem there is a marked point; and by putting weights on the upper pan the hydrometer is always made to sink precisely to the point. If the weight of the instrument itself is known, and also the standard weight, or weight required to sink it to the marked point in distilled water, the calculation of the specific gravity of any liquid from an observation with the instrument is very easy. To determine the specific gravity of solids, the instrument is placed in distilled water and the solid body is put on the upper pan. Weights are then added till the hydrometer sinks to the marked point. But the standard weight of the instrument being known, it is plain that the difference between it and the weights that must be added on the upper pan to the weight of the body whose specific gravity is to be determined must be the weight in air of that body. The body is now transferred to the basket below the instrument, and the weight of the solid in water is similarly determined. From these data the specific gravity of the solid is calculated. Hydrometers are variously named from their use, as areometer, one for determining the density of fluids; lactometer or galactometer, one for measuring the density of milk, and usually having a scale graduated from 1.000 to 1.029; incorrectly called creameter, as it does not correctly measure the cream; sacharometer, one for determining sugar contents; salinometer, one for testing saline solution, as the brine in a marine boiler; urinometer, one for detecting the presence of sugar, etc., in urine; volumeter, one for determining the specific gravity of a solid by measuring its volume in a liquid. Alcoholometers are commonly graduated to show pure alcohol as 200 and proof spirit (50 per cent alcohol) as 100. The chemical hydrometer is simply a balance in which equal volumes of liquid are weighed, or in the case of testing a solid, it is weighed in air and in distilled water of tested temperature. A simpler device for the same purpose, commonly called a specific gravity bottle or pycnometer, is a measuring flask which permits easy comparison with the known weight of a similar measure of water. In all these devices temperature is a modifying condition, because fluids increase in volume with heat, and therefore it is customary to have one or more thermometers permanently attached to the apparatus. See SPECIFIC GRAVITY.

**HYDROPATHY**, a name for the treatment of diseases by the use of water. This name is now largely superseded by the term hydrotherapy (q.v.).

**HYDROPHANE** or "**MAGIC STONE**," a porous dehydrated opal, which is opaque when dry but becomes translucent in water.

**HYDROPHILIDÆ**, hī'drō-fil'i-dī, a family of beetles inhabiting submerged vegetation in stagnant waters. They are of the scavenger variety, the larvæ being carnivorous and the adults feeding on decaying vegetable matter. Some forms are found in moist earth or dung heaps, feeding on lesser animal forms. The body is black and elliptical, with a white sheen

on the ventral surface imparted by a film of air which covers it. The antennæ are thick and club-shaped. About 150 species are found in the United States, of which one of the most common is *Hydrophilus triangularis*.

**HYDROPHOBIA** (from Greek words meaning "fear of water"), an acute or subacute infectious disease, particularly of canine animals. It is usually communicated by a bite of the afflicted animal, and the contagion, the exact nature of which is still under discussion, is resident for the most part in the saliva, although it has been found in the peripheral nerves, the pancreas and the suprarenal gland. It is frequently communicated to man, although the dog, wolf, fox, deer, cat, cow and skunk are the animals most frequently affected; it has been known to occur also in the horse, pig, birds and other animals. Nine-tenths of all the cases are contracted through the bites of rabid dogs. Hydrophobia may be produced, however, by wounds occurring during the dissection of rabid animals; it is said to have been caused by eating the flesh of animals that have died of the disease; and the milk of sucklings, animal and human, is thought to contain the virus. This poison has been found to be active in a dog 44 days buried, and in a rabbit buried 21 days.

In dogs the disease is comparatively common. In 1900 D. E. Salmon, chief of the United States Bureau of Animal Industry, determined that the disease was prevalent throughout the United States, and largely on the increase. The chief symptoms in dogs may be divided into two classes. Dogs suffer from furious rabies, and from dumb rabies. In the former Pasteur thought that the brain was involved; in the latter, the spinal cord. The furious form of the disease shows (1) a period of melancholy or depression; (2) a period of irritation; (3) a period of paralysis. The first varies from a few hours to two days. During this period the anxious and restless dog may also be cross. He hides from his master, obeys sullenly and changes his position frequently. His appetite may not be at first affected, but it soon fails; he may lick everything in sight, or bite everything within reach, swallowing all sorts of foreign bodies. The period of irritation usually persists three or four days, during which the dog is spasmodically mad; restlessness increases, and the animal has an irresistible impulse to run away. During the running spells dogs may bite at everything in sight; at such times they usually seem fearless, and rarely avoid other dogs or people. If caged, they tear and chew on the bars, even breaking their teeth or fracturing their jaws. The bark is modified into a peculiar howl. During the third or paralytic period the dog is subdued and more sullen; the lower jaw becomes paralyzed and hangs down, saliva dripping from the mouth; the gait is staggering; from the fourth to the eighth day after the onset he dies of paralysis or exhaustion.

In dumb rabies the characteristic second stage may be entirely absent. The most persistent feature of dumb rabies is the dropped lower jaw, the paralysis of the jaw in the later stages preventing the dog from biting. Veterinarians see many cases of dumb rabies in dogs brought to them by owners who think that the trouble is caused by a bone in the throat. Beware of a dog that becomes listless and dull and hides

away; is always on the go, prowling about and restless; one that is sullen and walks with his head down like a bear. A dog that scrapes incessantly and tears things up, and one that suddenly becomes excessively fond of its master, desiring to lick his hands and face, should be watched and guarded. A dog that has trouble in swallowing, that seems to have a bone in his throat, or, having wandered away from home, returns covered with dirt, exhausted and miserable, should be put under lock and key.

So far as the water-test is concerned, it is nonsense. The mad dog is often very fond of water; he is thirsty and rushes into water, thrusts his head into it; but he may have great difficulty in swallowing it, the act of swallowing usually bringing about severe convulsions.

In man the disease may go through somewhat similar stages, but the course is greatly modified; males are more likely to be affected than females, the difference in dress and exposure accounting for this; and two-fifths of the subjects are below the age of 15. Bites on the face, neck and hands are thought to be the most liable to develop the disease, and punctured wounds are more dangerous than lacerated wounds because of the difficulty in cleansing them. In man the period of incubation varies widely, from 20 to 60 days is the usual range, but six months may represent an extreme limit. In exceptional instances the period of incubation seems to have been greatly prolonged. The pathological changes recently discovered are found to be extremely characteristic, so that it is now even possible to diagnose rabies in a dog within a reasonable time after his death.

In all cases of suspected hydrophobia it is best not to kill the dog; but if, by accident or design, the death is accomplished the body should at once be sent to the health board authorities for a confirmation of the diagnosis. The characteristic changes, as described by Nélis in 1900, consist in minute alterations in the spinal ganglion cells, especially in a proliferation of the endothelial cells of the ganglionic cell-capsule. These changes are considered characteristic of this disease and are not known to occur in any other affection. The general treatment is both prophylactic and remedial. All stray dogs should be destroyed; or, if they have bitten anyone, they should be imprisoned and watched. It is best to have dogs muzzled or held in leash. In Germany muzzling has entirely eradicated hydrophobia. London in 1889 had 176 cases of hydrophobia. Muzzling was made compulsory, and in 1890 the number of cases of rabies had fallen to 44; in 1891 to 28; and in 1892 to 3. The muzzling was then allowed to lapse, owing partly to the sentimental agitation of many so-called lovers of dumb animals, and the cases of rabies increased, 25 persons dying of the disease in five years, while 174 patients were sent for treatment to the Pasteur Institute.

The direct treatment of the wound causing rabies is important. The poison seems to diffuse slowly, so that, if a ligature is promptly placed about the limb on the body side of the wound, a suction-cup or direct sucking may extract all of the virus. In the non-abraded mouth the virus is not very poisonous. If the wound is deep it is sometimes wise to make immediately a free incision, permitting the flow of blood to wash away the virus and also allowing a more

open surface for the actual cautery. One of the best cauterizing agents to use is strong nitric acid. The after-treatment will depend very largely on the promptness and thoroughness of the first treatment. If there is reason to believe that the early cauterization was ineffectual, the Pasteur method of treatment (see PASTEUR, LOUIS) is advisable. This is a complicated method which was elaborated by Pasteur about 1880. He found that the virus was present in the spinal cord of a rabid animal; that its virulence slowly diminished after the death of the animal; that the virus could be artificially weakened by passing it through a series of monkeys until it was powerless; and that, conversely, this virulence could be restored by inoculating the attenuated virus in a series of rabbits. Thus Pasteur made a weak virus and a strong one at will, and he later produced immunity to the virus by the use of his attenuated material. The final plan that was adopted was to kill a rabbit by means of his strong virus, remove its spinal cord, cut this up into short sections and dry it for varying periods of time. In this manner he secured a graded series of cord-sections of gradually decreasing virulence. These were emulsified in salt-solution and used to inject into animals or man, the weaker virus being first used and the stronger later. Two methods are now in vogue—the simpler method, for the less severe bites, in which 19 injections are given in 14 days; and the intensive method, for the severe bites about the neck and face and the large nerve-trunks, in which 28 injections are administered in 21 days. The serum-treatment of the disease is also rapidly becoming a possibility. Two Italian investigators, Tizzoni and Centanni, have made an anti-rabic serum that promises something for the future. For the present, however, the Pasteur method is the most reliable. It is certainly harmless and is worthy of trial. The results are assuring and the statistics, to most minds, convincing. It should not be forgotten that there is a false hydrophobia which is of purely hysterical origin, during an attack of which some patients have died. Consult Bradford, 'Two Lectures on Rabies' (*Lancet*, 3 March 1900); 'Hydrophobia in Germany' (*Hygienische Rundschau*, 7 Nov. 1899); 'Report of Select Committee of the House of Lords on Rabies in Dogs' (Blue Book, 1887); *Medical News* (15 Aug. 1903); Sixteenth Annual Report Bureau of Animal Industry (1899). See HYSTERIA.

SMITH ELY JELLIFFE, M.D.

**HYDROPHYTES**, plants which grow in water or mud. They may be wholly submerged, completely without roots, and derive their sustenance wholly from the water; or may live amphibiously, rooted in soil and lifting some or all of their leaves into the air, and so differ only in a greater or less degree from land plants. Adaptations of water plants are especially to meet the difficulty of obtaining oxygen and of effecting pollination under water. In plants which grow wholly in or under water, roots, when present, are comparatively small and free from hairs, stems are slender and abound in air-space, and leaves are, as a rule, either long and narrow, or else greatly subdivided, so as to expose the greatest possible amount of surface. The cuticle of the leaf, also, is very thin, and

lacks several of the structures, such as palisade cells and stomata, always present in aerial leaves. Water therefore enters easily into the tissues of the plant and carries with it a large amount, not only of oxygen, but of dissolved nutriment, so that in any oceanic plants, and plants of ponds and rivers, no roots whatever are developed, and these live practically independent of any connection with the land. The fertilization of submerged cryptogams is effected by the passing of generative elements through the water, but only a few submerged phanerogams make such use of the agency of the water. The pollen of the eel-grass (*Zostera*) has been modified for under-water efficiency. It does not form round grains, but elongated thread-like filaments which have the same specific weight as the water, and hence neither float nor sink, but move about at the level of eel-grass growth until they come in contact with the stigma of some neighboring flower. In the duckweeds and some other submerged plants, the male flowers break loose, rise to the surface and float away like little boats carrying pollen to the female blossoms, which at that time have risen to the surface but sink again as soon as fertilized. The hydrophytes show many examples of exceedingly wide distribution, as might be expected of oceanic plants, but is not so easily explained of those of fresh waters, many genera and species of which, nevertheless, are cosmopolitan.

**HYDROPLANE.** See **AEROPLANE.**

**HYDROQUININE**, one of the five principal alkaloids of the cinchona barks, having the formula  $C_{20}H_{26}O_4N_2$ . It is found in nearly all samples of commercial quinine (sulphate). Its properties are very similar to the ordinary sulphate of quinia, but as it is soluble to a larger degree, it is more speedy in medical action, and requires a smaller dose to produce a like effect. It is usually prepared from the commercial quinine sulphate, which is dissolved in hot water and carefully recrystallized at the highest possible temperature at which the crystals will form. The hydroquinine remains in the mother liquor—along with the sulphates of any other of the cinchona alkaloids which may have been present in the sample. To this mother liquor is added slowly a solution of potassium permanganate until the whole is tinted a red which does not grow paler upon standing. It is then filtered to remove the precipitate, and the filtrate is made slightly alkaline with ammonia, and shaken with ether, which dissolves out the hydroquinine. The ether solution is drawn off and evaporated and the residue is dissolved with dilute sulphuric acid. Ammonia is then added in quantity just sufficient to neutralize the solution, and the hydroquinine crystallizes in long needle-like prisms.

**HYDROQUINONE, QUINOL, or DI-HYDROXY-BENZENE** ( $C_6H_4(OH)_2$ ), the most used of all photographic developing agents, being practically indispensable in the making of photographic prints on developing paper. Its characteristic property is the great density it gives to the developed image, to the point of harshness of contrast, and for this reason it is almost always combined with a "soft" acting developer, such as metol, edinol, eikonogen, rodinal, paramidophenol, etc. Hydroquinone

fails to work if cold, when it has a tendency to deposit as crystals from the solution. The proper temperature is 65° F. in summer and 70° in winter. At higher temperatures it is liable to produce fog in the shadows and excessive intensity of the high lights.

Hydroquinone is prepared commercially from aniline. A dilution of sulphuric acid is made by dissolving 8 parts of the acid in 30 parts of water: this, when cold, is added to 1 part of aniline, and after cooling,  $3\frac{1}{2}$  parts of potassium bichromate, or sodium bichromate, is added so slowly as to avoid much rise in the temperature of the mixture. To the thick brownish liquid resulting is passed a stream of sulphurous acid gas until the mixture smells strongly of it. It is then filtered to remove the precipitate, and the filtrate is shaken with ether, which dissolves out the hydroquinone. The ether layer is drawn off and distilled, the ether being recovered, and the hydroquinone remaining in the forms of a yellowish (almost white) crystalline powder. It is purified by preparing a saturated solution with water and boiling it with animal charcoal and a little sulphuric acid, filtering and crystallizing.

If chlorine gas be passed through a solution of hydroquinone in benzol, monochlorhydroquinone is obtained, and this also is used largely as a photographic developer under the commercial name of "Adurol."

Previous to the war in Europe the entire American supply of hydroquinone had come from the laboratories of Germany. The chemical workshops of America were called upon to meet the demand, and are producing a quality of the reagent which is unsurpassed. The market, however, has been flooded by shamelessly adulterated samples of all photographic developers, and rigid tests are necessary for products where there is no guaranty by a manufacturer of known integrity.

**HYDROSPHERE** is a term used by geographers to designate the total of the water on the earth. It, therefore, includes the oceans, all lakes and rivers, the water-vapor in the atmosphere and that which has penetrated into the substance of the globe (lithosphere). To estimate the amount of this with accuracy is manifestly impossible, as we cannot easily calculate the bulk of the vapor, and know nothing about the amount contained in the rocks and spaces beneath the surface. It is possible to give some interesting facts as to the masses of water in the oceans and large inclosed seas and lakes on the surface of the earth. The latest calculations by physicists compute the area of the oceans and seas directly connected with them at 139,295,000 square miles, and the area of all lands, including inclosed lakes, etc., at 57,254,000 square miles. The water-area is, therefore, about three-fifths of the total superficies of the globe. Its mass, however, requires multiplication by depth, and the greater part of the oceanic area is covered by water more than 1,000 fathoms deep. Two-thirds are occupied by water exceeding 2,000 fathoms in depth, and one-fifteenth of the oceanic basins lies beneath more than 3,000 fathoms (18,000 feet) of water. The deepest place yet discovered is near Guam Island in the Pacific—5,269 fathoms. This is equal to 31,614 feet, and it

exceeds the altitude of the highest mountain (Everest in the Himalayas, 29,000 feet) by 2,610 feet. This makes the greatest known difference between the lowest and highest points on the earth's surface about 11½ miles; but it must be remembered that where as the mountain-tops are mere points, the "deeps" in the ocean floor are often areas of hundreds of square miles. It is, therefore, evident that were all the solid surface of the earth reduced to a level, the water would cover the globe to a very considerable depth — probably two or three miles. See LITHOSPHERE.

**HYDROSTATIC PRESS**, a machine for compressing, in which a liquid, as water or oil, pumped through a pipe of small diameter, is utilized to exert a multiplied pressure through the increased area of a much larger piston in the large cylinder: called also hydraulic press. The diagram illustrates the principle. Two tubes of unequal area are connected, and the whole vessel filled with water. Let the area of the smaller tube be one square inch, and let the piston that closes it be loaded with one pound.

A pressure of one pound per square inch will be exerted on every part of the boundary of the liquid. There will thus be a pressure of one pound per square inch put upon the piston that closes the larger tube; and if we suppose the area of the piston to be 16 square inches, it is evident that it must be loaded with 16 pounds in order that the pressure to which it is exposed may be equilibrated. Thus a load of one pound on the smaller piston supports 16 pounds on the larger.

The principle of the hydrostatic press was pointed out by Stevinus; but it was Joseph Bramah who, in 1796, by devising a tight packing for the cylinder, gave the principle practical application. The diagram shows a section AA of the collar surrounding the piston P, the shaded area qq representing the walls of the

Principle of the Hydrostatic Press.

Cup-leather.

cylinder. The collar consists of a circle of solid leather, or cup-leather AAA. When water pressure is applied to move the piston, some of it leaks into the ring-space AA, and the leather ring curls and swells, filling the space water-tight, so that there is no leaking. In modern practice this primitive device has been suc-

ceeded by a stuffing box, employing spring steel rings. See HYDROSTATICS; HYDRAULICS.

**HYDROSTATICS**, that branch of engineering science which deals with the mechanics of liquids at rest, and the action of forces upon static liquids; that is, the theories of pressure and equilibrium as concerning liquids, especially water.

The mechanics of confined liquids are based largely on the following conclusion: any increase of pressure at one point of a confined liquid is transmitted almost instantly to every other point. This proposition discards the minute modifications of capillarity, skin friction and surface tension, which are practically negligible; it also dismisses the almost infinitesimal compressibility of a liquid as inconsequential. A liquid has size but not shape; if poured out on a level table it covers the entire surface, and will fill all depressions, but its upper surface will be uniform and level. In a large body of water it is seen that this level conforms to the curvature of the earth. It is a common procedure to explain this level by referring it to the constant pressure of the atmosphere 14.7 pounds per square inch, and this is not misleading if it is borne in mind that the pressure of the atmosphere is due to the attraction of gravitation — to which the water level is actually attributable. A liquid offers no permanent resistance to forces tending to change its shape. The particles of a fluid are mobile; and while in the case of liquids very considerable forces of cohesion are exhibited, yet the particles show great freedom to alter their relative positions, and to pass from place to place within the general mass. A very important property that follows from the nature of fluids is that of the equable transmission of pressure. Suppose a liquid inclosed in a vessel A, which is fitted with a piston P. If pressure is applied to P it will be transmitted in all directions through

FIG. 1.

the liquid. If other openings are made, and if they are fitted with pistons, it is evident that to keep each of these pistons in its place, pressure inward must be applied. The pressure that must be applied to any piston equal in area to the area of P is equal to the pressure on P; and if the area of one of the other pistons is greater or less than the area of P, the pressure required to keep it in its place is proportionately greater than or less than the pressure that is applied to P.

It is thus apparent that there is a normality of liquid pressure, and in calculating such pressure it is only necessary to consider one direction of pressure. The law is: Any additional pressure applied to a confined liquid at any point will be transmitted equally to any other point of contact. This principle finds

application in the hydraulic press. It is to be noted, however, that water under static pressure does not produce work until it begins to move, and *moving* water comes under the head of hydraulics. These two divisions of science are therefore closely related, and need to be studied together. (See HYDRAULICS). In the apparatus known as the "hydrostatic bellows," a true hydrostatic equilibrium is obtained. This experimental contrivance consists of a pair of circular boards connected by a band of pliable leather fastened watertight around the circumferences of the boards (like a pair of bellows). A small tube inserted into an opening near the bottom connects a tall tube rising perpendicularly. Heavy weights may be put on the upper circular board, and if water be then poured into the upright tube they will be raised up by the pressure of the water from below. For the pressure to which the under side of the circular board is exposed is equal to the weight of a column of water whose section

FIG. 2.

is that of the circular board, and whose height is the difference of the heights of the under surface of the top circular board and of the free surface of the water in the small upright tube. When shown in this form the principle here employed is often called the hydrostatic paradox, on account of the very great pressure that a very small quantity of water may be made to produce.

It is a well-known principle that liquids tend to find their own level. Thus, in the accompanying figure, showing a series of connected vessels, the liquid is seen to stand at the same height in the principal vessel and in the variously shaped tubes communicating with it, while from the short, narrow mouthed tube it spouts up to nearly the level of the water in the principal vessel.

Archimedes is credited with discovering the principle that a body immersed in a liquid displaces its volume of the liquid; and that it is buoyed up by a pressure equal to the weight of liquid it displaces. This principle is illustrated in the hydrometer (q.v.). When a solid is immersed either partially or wholly in a liquid, a portion of the liquid is displaced. The solid is at the same time pressed at every point by the liquid, the pressure being always perpendicular

to the surface. The upward pressure on the solid is greater than the downward by an amount equivalent to the weight of the liquid displaced by the solid; for if, instead of the solid, the quantity of liquid displaced by it were present, its weight would be upborne by the pressure on every side. These pressures now act on the solid and whether or not the solid floats under their influence, as much of the weight of the solid as corresponds to this pressure is supported by the surrounding fluid. Experiments that are made for the purpose of determining the specific gravity of bodies heavier than water also depend on this principle. See SPECIFIC GRAVITY.

The conditions of floatage and of stability of a body floating in a liquid are of great importance. A floating body displaces a certain quantity of the liquid, and the weight of the solid body is equal to the weight of the liquid

FIG. 3.

that is displaced by it. To calculate how much of the body is submerged, and how much floats above the liquid, it is only necessary to consider what volume of the liquid would be equal in weight to the weight of the floating body. For example, the specific gravity of ice is about nine-tenths of that of ordinary sea-water. Hence 9 cubic feet of sea-water weigh as much as 10 cubic feet of ice. Thus in an iceberg nine-tenths of the ice is under water, and one-tenth is above the surface. In ships and other floating bodies the stability depends on the form of the body. A sphere of wood floating in water is indifferent as to position. The slightest force is sufficient to overturn it from any given position or to set it rotating in the water. With a ship or other body that must float with one side upward, the stability is quite as important as the floating power. The accompanying figure 4 illustrates the conditions of stability. When a solid body is slightly displaced from its ordinary position of equilibrium, the forces that

FIG. 4.

act upon it are seen to be two-fold. First, there is the force of gravity on the solid acting vertically downward, which, if  $G$  be the centre of gravity, may be considered to act downward through that point; and secondly, there is the resultant of the upward pressures of the various portions of the liquid, which, if  $O$  be the centre of these upward parallel forces, or centre

of buoyancy, may be considered as equivalent to a single force acting vertically upward through that point. In the figure these two parallel forces are seen to form a mechanical couple whose tendency is to right the boat, and bring it back into its ordinary floating position. The metacentre  $M$  is a changing centre, representing the centre of the two forces of gravity and buoyancy. The higher the metacentre above the centre of gravity the more stable is the vessel.

Let  $A B$  in the figure be a line drawn through the point  $G$ , the centre of gravity of the floating body, and  $H$  the centre of the figure of liquid displaced (also the centre of buoyancy) when the body is floating with  $A B$  vertical. Let the body be then slightly displaced, and let  $o$  be the new position of the centre of the figure of the displaced liquid, and let  $M$  be the point in which  $A B$  is cut by a vertical line through  $o$ :  $M$  is the metacentre which will be different or slightly different for every list. If the metacentre is above  $G$  then the equilibrium is stable; if it is below  $G$  the equilibrium is unstable, and the body being slightly displaced, it tends to fall farther and farther from its position of equilibrium. That a vessel may be stable and not overturn, it is apparent that the centre of gravity must be kept considerably below the metacentre. This is why vessels load the keels at times with lead, and why vessels without freight in the bottom of the hold, take in ballast.

Among the instruments and machines founded on the hydrostatic principles here laid down are the barometer, the siphon, the hydrostatic press, and the hydrometer (qq.v.).

The engineering problems involved in the stability of dams, water gates and reservoir walls are those of hydrostatics. The pressure of water behind such structures exerts a constant force toward overturning them, due to its tendency under the influence of gravitation to seek the lowest level. To counteract or counterbalance this force is placed the weight of the dam or wall—in other words the larger attraction which the earth has upon the materials of which they are built than it has for the water. The higher the body of water behind a dam the greater the impulse to run down hill, and hence the greater push against the dam which stands in its way. The form of solid which is most difficult to overturn by pressing against one side of it is that of triangular cross-section, and this is the one used by engineers for dams and reservoir walls. These triangular bodies are built with broad bases, and one "toe" of the triangle pushes up-stream under the water of the pond or lake, which helps in part to hold it down with its weight. Hydrostatic pressures exist also in all water-supply pipes, tending to burst them apart from within. The greater the head of the water-supply the greater the hydrostatic pressure, and the stronger the water-pipes must be made to hold it securely.

**HYDROTHERAPY** (Greek, *ὕδωρ* water, and, *θεραπεία*, cure), a method of treating diseases by the application of hot and cold water, which has come extensively into practice of late years, and is recognized by the medical profession as a very efficient therapeutic agent. The efficacy of water as a hygienic medicine has been recognized from the earliest times. Hip-

pocrates, Celsus and Galen regarded water as of especial value in the treatment of acute diseases; and during the Middle Ages the same view was advocated by many famous physicians. During the 18th century there was a growing belief in its virtue as a curative agent, though rather in acute than in chronic diseases. Some physicians used water for internal treatment, others for external treatment, but hydrotherapy, as now understood, combines both methods. It was originated by Vincent Priessnitz, a Silesian peasant. When a boy of 13, having sprained his wrist, he applied it to the pump, and afterward bound a wet bandage upon it. As this became dry he rewetted it, and thereby reduced the inflammation, but produced a rash on the surface of the skin. Shortly afterward he crushed his thumb and applied the wet bandage as before, and again an eruption showed itself. He concluded that the rash was an indication of impurity of blood; and having instituted a series of observations in regard to various wounds and ulcers on the persons of his neighbors, he was led to form a pathological theory, according to which disease is caused by an accumulation of morbid matter, which must be eliminated from the system by cold water applications and the observance of a strict regimen. His views were confirmed by an accident to himself, in which, through a cart running over him, he received some broken ribs and severe contusions and was given up by the physicians; but on learning their opinion he tore off their bandages and applied others wet with cold water. He also replaced his ribs by inflating his lungs while pressing his abdomen against the window-sill. Either through or in spite of this treatment Priessnitz recovered and the carrying out of this cold-water theory became the object of his life. In rapid succession he invented the sponge-bath, the wet-sheet packing, the sitz, foot and arm baths, the douche, the steam-bath, the dripping sheet, the plunge, the dry-blanket packing and other appliances of the hydropathic system. In 1829 he established, at his native village of Gräfenberg, a range of baths, which speedily grew in reputation and attracted visitors from all parts of Europe. The Austrian government lent him its patronage, and all the opposition of the medical faculty was unable to stem the popularity of the new system. The original establishment at Gräfenberg soon expanded into an extensive suite of buildings, stretching along the slope of one of the Sudetic Mountains, and resorted to by troops of invalids, who sought to regain health by bathing, exercise, simple diet and agreeable society. Similar institutions soon sprung up in other parts of Germany and were at length introduced into England, a hydropathic society having been formed in London in 1842. At the present time hydropathic institutes exist in great numbers throughout the world, and so universal have hydrotherapeutic procedures become that a large body of quacks thrive on the prestige given to hydrotherapy by regular physicians. The theories of Priessnitz are now known to be fallacious.

The work of Winternitz and his disciples has put the general principles of hydrotherapy on a rational footing; there is little doubt, however, that hydrotherapy, like any other therapeutic agent, may be greatly abused. It is by no means a universal panacea. There are a large number

of ways of applying hot and cold water to the body. One enthusiastic advocate has described over 300 separate kinds of application. In general, however, the water may be applied in the shape of tub-baths, ablutions, packs, rain-baths and douches. These may be divided and subdivided as indicated. *Tub-baths* may be full, half or local baths, as to the pelvis, the feet, the hands, etc. The full tub-bath is usually given at a temperature of 55° F., unless special indications are to be met. If the patient's reaction is not of the best, the temperature should be about 60° F., and vigorous friction of the skin should be maintained. The time spent should be short, 10 to 20 seconds. The full tub-bath is a strong tonic. In severe illness the tub-bath should be given only by a trained nurse under the physician's orders. Half-baths are taken at a temperature of 60°-75° F. After wetting the face and chest the patient sits in a tub about one-third to one-half filled with water, sufficient at least to cover the legs and the pelvis. The attendant splashes the cold water over the patient's body, maintaining at the same time a vigorous friction by means of a flesh-brush. The time is from one to five minutes, but the bath should not be continued if the teeth begin to chatter or if there is any evidence of defective reaction, as blueness of the lips, or thin pulse. Local cold baths, such as sitz-baths and foot-baths are very important hydropathic measures. The cold foot-bath, plunging the feet for one to three minutes in cold running water, is of service in sluggish circulation of the feet, neurasthenia and hysteria. Warm full baths at a temperature of 90°-98° F., for a period of from 5 to 20 minutes are very useful as sedatives to the nervous system, particularly so in insomnia and nervousness from overwork, especially when taken at night. The best effect is obtained if they are taken at the time of retiring and are followed by a brief application of cold water, either in the shape of a half-bath, or a douche. After the bath the patient should wrap up in a linen sheet and a blanket to keep up the dilatation of the blood-vessels of the skin. Perspiration is to be avoided, save in particular instances.

**Ablution.**—This is one of the simplest of hydropathic measures. It is a valuable skin and nerve tonic, and is particularly adapted for children and women. It consists in the application of water to the body at a temperature of 50°-60° F., from the hollow of the hand, or by means of a bath-glove or wash-cloth. The entire body is gone over, one part after another being systematically treated. One to two minutes' application followed by vigorous rubbing with a coarse towel or flesh brush is sufficient. Ablution is particularly valuable for reducing temperature, often bringing about quiet, restful sleep in tossing and fretful children.

**Affusion.**—In this treatment a volume of water from a pitcher or a pail is poured over the entire body, or upon certain parts, the patient sitting or standing erect in a tub or bath. The temperature should be 50°-60° F., and the whole procedure should not consume over 10 or 15 seconds. The reaction is obtained by rubbing. In certain muscular tremors, in neurasthenia, etc., this procedure is of service.

**Packs or Compresses.**—These may be dry or wet, general or local. The dry and wet packs

are applied in the same manner. The patient is placed on a narrow bed or couch with a rubber sheet, a blanket and a linen sheet beneath him, the blanket and sheet falling on each side of the couch. The sheet is then brought up and, with the arms to the side, wrapped thoroughly about him, the face alone being exposed. The blanket is then wrapped about the patient in a similar manner. Cloths wrung out in cold water may be applied to the head. In a wet pack the sheet is first wrung out in cold water; in the dry pack it is frequently warmed. The object of the application is to bring about free perspiration, and this is the usual result. Hot drinks may be administered freely. The time given to the application will depend largely on the conditions to be met. If reduction of temperature alone is desired, the patient may remain in the pack until the perspiration is free, and he may then be wrapped up in a dry blanket. In certain uræmic states, and in infantile convulsions, a longer period may be necessary. The wet pack is an excellent procedure in the treatment of alcoholic excesses. The initial effect of a cold pack is constriction of the blood-vessels; this is soon followed by a dilatation which continues throughout the application and is the main cause of the free perspiration. The pulse-rate is reduced and the arterial tension falls. The stress of elimination is taken from the kidneys, the amount of blood within the brain diminishes and sleep is encouraged. In the hot general pack a blanket only is used. This is wrung out in water at 140°-150° F., the temperature at the time of application not being over 105°-108° F. Local packs or compresses are of inestimable service in a variety of conditions. These are usually made of pieces of heavy muslin, cotton flannel or linen, varying in shape according to the site of application. They are wrung out in cold or hot water and applied to the head in headache, to the neck in sore throat, tonsillitis, diphtheria, earache; to the chest in pleurisy, pneumonia, neuralgias; to the heart in rapid overacting heart-action; to the stomach in indigestion; to the joints in sprains, rheumatism and gout; to the abdomen in gastro-duodenal catarrh, irritable bladder, catarrhal appendicitis, colitis, peritonitis. Hot applications are particularly serviceable in painful menstruation. Hot water-bags have largely taken the place of hot compresses since they have been made so handy in shape and size and so reasonable in price.

**The Douche.**—This application is one of the best tonics, but requires special rooms for its use. These are found in the best appointed hydropathic institutes. The douche consists in the application of hot and cold water delivered through a hose. It combines the elements of the water, heat, cold and force. The regulation of the pressure and temperature is an important feature in the scientific use of the douche. See BATH.

**Bibliography.**—Cohen, 'Physiologic Therapeutics Hydrotherapy' (1902); Baruch, 'The Principles of Hydrotherapy' (1900); Kellogg, 'Hydrotherapy' (1902).

**HYDROTHORAX**, dropsical collection occurring in the pleura, which when aggravated exert pressure on the lungs and consequently interfere with the blood circulation. The external sign is a livid countenance accompanied by difficult breathing. In aggravated cases the

fluid is tapped and drawn off through a hollow needle.

**HYDROTROPISM**, the property possessed by most roots and by other plant-organs of growing in the direction of the greatest moisture. It is not only possible to demonstrate by experiment that the growth of root-hairs is in the direction of the greatest water content, but it can also be shown that the root actually curves toward moisture. The advantages of hydrotropism are evident, inasmuch as it enables the plant practically to go in search of water at those times when the supply is more or less inadequate. The stimulus appears to act as follows: the water, absorbed more rapidly on the side of its greatest abundance, doubtless causes an osmotic swelling and tension greater on that side than on the other; and this difference is ample to establish a line of direction toward which the roots turn in their growth. Stems and leaves display no hydrotropism at all, as they do not absorb any water under normal conditions; its one-sided abundance is a matter of indifference to them; it being a general rule that plant parts are indifferent to stimuli to which there is no profit in responding. Tree roots sometimes extend themselves toward a drain and introduce themselves through a crevice in the tiles; finding a combination of air, water and mineral substances they grow profusely, sometimes to so great a degree that they choke the drain completely.

**HYDROZINCITE, or ZINC BLOOM**, A white mineral consisting of basic zinc carbonate supposed to be  $3ZnO.CO_2.2H_2O$ . A common ore mined in Arkansas, Kansas and New Mexico, and also occurs in Inyo County, California and Tintic District, Utah.

**HYDROZOA**, a class of *Coelenterata* (q.v.) embracing the polyps, all of which bear a general resemblance to *Hydra* (q.v.). There are two alternating generations, that is, (1) the sessile asexual polyp, which gives rise to (2) a jelly fish or medusa. The hydroid polyp is like hydra, a two-layered vase-like sac, with a circle of tentacles around the mouth. This gives off by a budding process a bell-shaped medusa, which is much more highly organized than the polyp, having a well-developed digestive and nervous system, and sense-organs (eyes and ears, or otocysts). They have the peculiar cells known as Nematocysts (q.v.), which are numerous in the tentacles, and secrete a fluid resembling formic acid, which may be exploded with danger to their enemies. The *Hydrozoa* are cnidaria capable of producing two different types of individual, the polyp and the medusa. (See GORGO). Each of these develops from the egg through the blastula, porenchymula, gastrula and actinuala. The *Hydrozoa* are at present divided into seven orders, the most important of which are, besides *Hydraria* represented by hydra: the *Hydrocorallinae*, of which *Millepora* (q.v.) is the type; the *Tubulariae*, comprising *Hydractinia*, *Tubularia*, etc.; the *Campanulari*, of which *Campanularia*, *Clytia* and *Obelia* are examples. Near this group belongs the extinct order of *Graptolites*, which were floating forms living in the Paleozoic seas. The last order (*Siphonophora*) comprises the Portuguese man-of-war (q.v.) and other forms, which are beautiful transparent pelagic animals,

very brightly colored and highly specialized. An interesting type is the *Actinozoa* and the subclasses *Zoantharia* and *Aleyonaria*. Consult Hickson, 'Coelenterata and Ctenophora' (in 'Cambridge Natural History,' Vol. I, 1906). See JELLYFISH; POLYP.

**HYENA**, hi-ē'nā, one of a family (*Hyænidæ*) of carnivorous mammals, having relations in structure to the bears, the cats and the civets, familiar in Africa and southern Asia. They are of considerable size, about 150 to 250 pounds for adults, have large, rather short heads, powerful forequarters, feeble and drooping hindquarters and short tails. The eyes are large, and have longitudinal pupils; the ears are long, erect, very open, and directed forwards. The teeth are numerous, massive, tuberculated, and well adapted to aid the muscular jaws crunch the strongest bones, as hyenas are able to do. Hyenas are nocturnal animals which pass the day in solitude in caves or other hiding places, which they quit at night in order to seek their prey in bands. Carrion is a favorite food, and the stench attracts the hyena by night as it does the vulture by day. In some cases they dig up dead bodies and devour them. They also prey on living animals, and flocks of sheep and goats suffer severely from their ravages in some localities. The common or striped hyena (*Hyæna striata*) is a native of Northern Africa and parts of Asia, even eastward to Burma. It is brownish-gray and marked with bands of darker brown on the body, which become oblique on the flanks and legs. The hair upon the line of the back is much thicker and stronger than on any other part, forming a sort of mane, extending from the nape of the neck to the origin of the tail. This species was well known to the ancients, who entertained many absurd notions respecting it, believing that its neck consisted of but one bone; that it changed its sex every year; that it could imitate the human voice, etc. The notion as to the neck is doubtless due to the fact that in age the neck vertebrae are apt to become ankylosed. It is a most uncouth and disagreeable animal, singularly homely, with a sneaking carriage, a fetid breath, and a glandular pouch beneath the anus, of most unpleasant odor. It was formerly supposed that the hyena was untamable, but that it can be completely tamed there is not the shadow of a doubt. The spotted hyena (*H. crocuta*) has a considerable resemblance to the former species, but is larger, and is marked with numerous round blackish-brown spots instead of stripes, nor is the mane so large. This species inhabits many parts of Africa, and was formerly very numerous around the Cape of Good Hope. There is another species, the brown hyena (*H. brunnea*), which differs from the preceding by having stripes on the legs, the rest of the body being of a dark grayish-brown. It also inhabits the south of Africa. An extinct species, the cave hyena, was abundant in England, France and Germany anterior to the glacial epoch, and has left its remains in many caves of these countries. Though named *H. spelæa*, it seems practically identical with the existing *H. crocuta*. The fossil ancestry goes back into the tertiary whence it seems to have sprung from the same stock that gave rise to the viveroids. Consult writers upon nature and sport in Africa and India; Sydecker, 'The Game Animals of Africa' (1908); Roosevelt

and Heller, 'Life Histories of African Game Animals' (1914).

**HYENA-DOG**, an African canine animal (*Lycan pictus*), which takes its name from its hyena-like appearance in shape and color, and is also called Cape hunting-dog because it hunts in packs. It differs from the typical dogs in having only four toes on both the fore and hind limbs, and in its dental fauna, and it seems to be a comparatively recent immigrant into South Africa, since its bones are found in British caves. It preys upon antelopes, cattle, etc., and was a scourge to the early settlements, when it was more numerous and bold than now.

**HYÈRES**, ē'ār', France, a town in the Department of Var, in the southeastern part, 10 miles east of Toulon, with which it is connected by rail. With its suburb, Costebelle, it is a very popular winter resort. At the sea coast, a distance of two and one-half miles, is situated the harbor of Hyères, off which are three little islands called the Iles d'Hyères. The town is located on the southern slope of a hill belonging to the chain of Montagnes des Maures. It is sheltered, has a salubrious climate, and is noted for its fine fruits, vegetables and flowers. The chief objects of interest are the parish church of Saint Louis, dating from the 13th century, the hôtel de ville, library, zoological gardens and a museum. Salt is extensively cultivated. Hyères was founded in about the 10th century, as a harbor from pirates. It was strongly fortified.

**HYGEIA**, hi-gē'ya, according to the Greek tradition, the goddess of health. The name was used at first in the allegorical sense; but later Hygeia came to be regarded as the daughter of Asclepius, and, by some cults as his wife. The origin of the introduction of the worship of Hygeia, together with the date and place of its incipency are difficult to trace. At Titane in Sicily, her worship appears to have been synchronous with that of Asclepius. The cult came from Epidaurus to Rome in the 3d century B.C., where Hygeia was latinized as Valetudo and her worship identified with Salus. At Oropus, she was associated with Amphiaraus, the god of healing; at Athens, the name Hygeia was one of the attributes of Athena, to whom an altar was erected on the acropolis after the great plague. Hygeia is represented as a vigorous young maiden, often accompanied by her father. Consult Roscher, 'Lexikon der griechischen und römischen mythologie' (Vol. I, Leipzig 1884-90).

**HYGIENE**, broadly the science and art of preserving and improving health. Health in this instance is defined as soundness of body, that is, such a condition of all its several parts that they are able to perform their functions without difficulty, and every natural appetite can be satisfied without consequent distress. A typically healthy man is defined as one who lives vigorously, who in every part of his life, wherever it may be, does the largest amount of the best work that he can, and, when he dies, leaves healthy offspring. The objects of hygiene are the rendering growth more perfect, decay less rapid, life more vigorous, and death more remote. It is sometimes called preventive medicine, but it includes more than prevention; and is sometimes referred to as sanitary science, or the science of health; but its aim is not

merely to know, but to act in view of what is known. It is an ancient art, some of its most important precepts formed a part of the wisdom of the Egyptians at least 1500 B.C., and it is probable that from this source were derived many of the sanitary regulations of the Jews as given in the Levitical code. The Mosaic laws recognize the three great principles of cleanliness, isolation, and wholesome diet with a thoroughness that leaves little to be desired. Hence, the Jews were almost immune for many centuries from the plagues which swept away their Christian neighbors; this was one reason why they were often suspected of starting or spreading the plagues. Thence also, through Pythagoras and the earlier Greek philosophers who studied in Egypt, came the rules of the Asclepiadæ, and a large part of the teachings of Hippocrates on this subject. In Egypt, Assyria, India and among the Jews, hygienic rules were framed by the priests, and were promulgated and enforced as a part of their religious systems, the reason given for many of these rules, such as for ceremonial ablutions, for the avoidance of certain foods, for circumcision and other matters connected with sexual hygiene, for the disposal of the dead, and for dealing with certain forms of contagious disease, being simply that they were Divine commands. Under the influence of Greek philosophy these rules were modified and placed upon another basis, the effects of various kinds of diet and exercise were discussed, and finally the famous treatise on airs, waters and places, by Hippocrates, placed the whole subject on a much broader foundation than it had before occupied. In so far as public hygiene is concerned, the ancient legislators had in view what they considered to be the benefit of the community or nation solely, and enforced their regulations to this end with little or no regard to the rights or welfare of individuals. The Jewish laws provide for driving out lepers and destroying their houses, but not for the care of the lepers themselves. The maxim of the Roman law, *Salus reipublice suprema lex*, was executed in the same spirit. Modern hygiene endeavors to preserve both the community and the individual, recognizing that each has rights which should not be sacrificed for the benefit of the other. As regards personal hygiene, the teachings of the Greek and Roman writers, and of those of the Middle Ages, consisted mainly of rules for diet and exercise intended for the benefit of kings, nobles and the wealthier classes. The typical ancient work on personal hygiene is the 'Code of Health' of the school of Salerno, which dates from about the 12th century, and was first printed in 1480. It was several times reprinted and for over two centuries was the most popular book in existence. The great epidemics of the Middle Ages, from the plague of Justinian to the Black Death, seem to have had little effect in advancing hygiene; they were supposed to be visitations of Providence against which human means availed not. In the 18th century some elementary ideas of hygiene had become known: the prevention of scurvy by lemon juice and vegetable diet, of jail fever by less crowding and more cleanliness, and of smallpox by inoculation, were among the foremost advances. Our new scientific acquaintance with ultimate causes for the first time enables us to make hygiene a true science on a

basis of exact knowledge. The next step made in the 19th century, was the recognition of the difference between typhus, typhoid and relapsing fevers, which pointed to different causes and therefore require different methods of prevention. The establishment of a general system of registration of deaths in England in 1838 was a most important step in its influence as public hygiene. The cholera epidemic of 1832 differed widely in the mortality caused by it in different places, and as this became known, public interest on the subject of the causes and possibilities of preventing certain diseases increased, until, in 1849 a committee on the health of towns, appointed by the House of Commons, made a most important report upon water supplies, overcrowding, etc. Thereafter development was rapid and by 1858 a general board of health was appointed for the suppression of health nuisances, etc. The scientific foundations of public hygiene were laid by such men as Pettenkofer, Pasteur and Koch, and their pupils.

**Public Hygiene.**—A very great part of the work of public sanitary officers consists in the prevention of the specific infections and contagious diseases which are liable to become epidemic in a community, and as the majority of these are now believed to be due to micro-organisms, the efforts of health officials are largely directed to measures which will either prevent their introduction or dissemination or will make the surroundings unfavorable for their development, or will destroy their vitality if they are present. The present methods of quarantine or maritime inspection, of isolation of cases of contagious disease, and of disinfection, are based mainly upon the results of bacteriological research, and differ in many respects from those in force a generation ago. The greater the number of persons residing within a limited area, the greater is the need for a general system of sanitary regulations which will prevent individuals from causing or spreading disease, and will secure to each one pure water and air. The greater part of public hygiene, therefore, may be said to be municipal hygiene, and the problems which present themselves to city and town authorities in regard to it are numerous and complicated. It includes general climatic conditions, soil under human habitations, the character of the latter and their cleansing, the disposal of refuse and excreta, and the cleansing of streets.

Climatic conditions cannot to any extent be modified: they must be neutralized, when insanitary, by other conditions pertaining to hygiene. All nations have more or less adapted their habits to their climate, unless acclimated so that they become part of its working: the hours of work or travel, the character of dwellings, the sites, the diet found wholesome by experiment, all form part of a hygienic system built up by social experience and tradition. Those unacclimated may have personal advice from predecessors; too often nothing but personal experience can be of any avail, and frequently that is only acquired by fatal results.

The subject of dwellings includes a number of considerations. The site, if possible, should not be one where the ground water is near the surface, or freshets or tides set back the drainage of closets, or where there are great fluctuations in the level of the ground water, which it

is better to have nearer the surface and steady than lower and more unstable. Filled-in land in cities is often unhealthy, but tenants cannot in practice exercise much choice; the city authorities should prevent bad results by thorough sewerage with a good fall. The construction most important to have right is the plumbing, including the drains at the bottom; it is a commonplace which need not be dwelt on, that leaking sewer pipes and clogged drainage mean the infection of a house with disease-laden air. Paint is better than paper for walls, as it can be washed; and old paper should be scraped off before new is laid on. When possible rooms should be large enough not to need incessant change of air; when not possible, as is usual in cities, plenty of windows and the fullest possibilities of draft should make up; if this, too, is not available, the best systems of artificial ventilation. Unhappily, science is very backward in this class of invention, and small, close, unventilated rooms shorten millions of lives and prematurely break down working power in even the civilized cities of the world. The normal supply should be at least 3,000 cubic feet of air per head each hour, and this largely increased in work or sickness. The volume of consumption and other scrofulous diseases, bronchitis, pneumonia, etc., is directly dependent on foul air, which also increases the virulence of all zymotic diseases. The ventilation of public buildings rests on the same principles, and has the same result. The warming of houses is of great importance, and is generally ill done, with disregard of ventilation. The vast majority of houses in America are overheated even when the air-supply is enough, giving a sensitive skin which very readily "catches cold." The water-supply is a matter of public concern: where there is a flat price, people do not stint themselves. Where there are meters, they often do; but toilets should be kept fully flushed at any cost. In country houses, where city water and sewerage are not available, it is necessary to insist on the frequent cleaning and disinfection of receptacles for excreta. Advice on this point is obtainable gratis from physicians, public health officers and others. If the dry methods are carefully used, they have many advantages in healthfulness over the elaborate city systems.

**Personal Hygiene.**—This has very many divisions: the most obvious are considerations of food, and drink, nerve stimuli, clothing, cleanliness, natural necessities, work and rest, and moral self-control. In the matter of diet, there can be no one rule: "at forty," says the proverb, "one is either a fool or a physician"; and each must use his own experience as a guide to whether meat is a necessity or vegetarianism an advantage, what foods agree with him, whether dry meals give him heartburn or drinking with them impedes digestion, and whether he is eating so much as to make him heavy, impairing his capacity for work and enjoyment, or making his body gross. In general, probably professional and sedentary workers as a class over-eat, and would find their minds more alert and their bodies freer from disorders with less gratification of appetite. Nerve stimuli, ranging from tea, coffee and cocoa, tobacco, alcoholic drinks and opium, are hard to frame a general rule upon; they, too, have infinitely varied effects. Cocoa is

largely a food; coffee with most is an agreeable stimulant, with many an active nerve-poison, producing heavy headaches and incipient stupor; tea is a real nerve food on occasion and in small quantity, while taken steadily and largely it is a poison and a very mischievous one; tobacco sparingly used by grown men probably does little harm, and sometimes saves worse things, but should not be used by those under age, nor by those with weak nerves, and is highly injurious in heart disease, Bright's disease, and venereal diseases; alcoholic drinks suggest too many questions for discussion here; narcotics like opium, hashish, etc., as well as chloral and its like, should be used only on a physician's prescription. Clothing, if there is time and means, can be accommodated to changes of weather and occasion so as greatly to advance health; with most, there must be a rough average. Personal cleanliness within limits is a *sine qua non* of reasonable immunity from disease, and with delicate persons, of reasonably good ordinary health; but even this good thing can be irrationally overused and made mischievous. Too frequent hot baths in a northern climate are a great aggravator of lung-diseases, and one great city (Pittsburgh) had a marked decrease of pulmonary complaints one winter when the water-supply broke down, and people resorted greatly to dry rubbing. Especially it is possible to use too much soap, and keep the natural oil of the skin washed away. Natural necessities should be attended to more constantly than they are: workmen especially often grudge the time, but the waiting till there is severe pressure often creates dangerous bladder and intestinal complaints. Work, for most, is not under their own control; but to some extent resting is, and the average American perhaps owes more to compulsory public holidays than he is aware. There is more temptation to overwork than to idle, for the average man. Exercise should be taken by the sedentary, even a homespun housemethod being preferable to nothing. Grotius preserved his health in prison by whipping a top two hours a day. This should be one of the most rigidly imposed forms of self-control, which in all forms is all-important. Excessive sexuality, either of act or imagination, is simply destructive of will-power as well as bodily fibre; giving way to fits of anger or despondency is almost a recipe for entire nervous wreck. As to laziness, of mind or body, it is one of the worst and most incurable forms of this evil.

The management of children is really personal hygiene, only controlled by another than the subject; the care of the dead belongs to public hygiene; the prevention of disease belongs either to medicine, by the use of drugs like quinine or inoculations, or to house-hygiene as disinfection. The hygiene of the sick-room should be under the direction of the physician. See BACTERIOLOGY; BATH; DRESS; COOKERY; DIETETICS; DISINFECTION; EXERCISE, PHYSICAL; EDUCATIONAL ATHLETICS; HOSPITALS; NURSING; PLUMBING; SANITARY SCIENCE AND PUBLIC HEALTH; WATERS, CITY, DISPOSAL OF; VENTILATION; HYGIENE, MILITARY; MILITARY SANITATION; WATER-SUPPLY.

L., 'Manual of Personal Hygiene' (ib. 1812); Sedgwick, W. T., 'Sanitary Science and the Public Health' (New York 1902).

**HYGIENE, Military.** In all modern armies special attention is given to the personal hygiene of the soldier. Camp diseases are preventable and their presence in a command shows that the laws of hygiene have been violated. In ordinary campaigns sickness disables from five to ten times as many as wounds and any deliberate disregard of sanitary regulations should be regarded as a grave military offense and dealt with accordingly.

In a modern engagement it requires, on an average, an expenditure of from 200 to 400 rounds of ammunition for each one of the enemy put out of the fighting, and considering the number of rounds carried, this expenditure represents the effectiveness of from one to two men. When it is realized that but a single cupful of polluted water may be equally damaging by rendering a fighting man unfit for duty for many weeks, if he survives at all, and may be the means of spreading disease far and wide in a command, then the great importance of faithfully observing hygienic precautions will be appreciated. A great many diseases are due to germs, which are either little animals or small plants so very small that they can only be seen by aid of the microscope. All diseases caused by germs are "catching." All other diseases are not catching. Persons may have these germs sometime without apparently being sick with any disease.

**Care of the Body.**—As certain mosquitos can transmit malaria and yellow fever, use the mosquito bar for this reason as well as for personal comfort.

Keep the mouth clean by brushing the teeth once or twice a day. Decayed teeth cause toothache and lead one to swallow food without properly chewing it, and this leads to stomach troubles of various kinds. Food left around and between the teeth is bad for the teeth and forms good breeding places for germs.

Keep the skin clean. Through the pores of the skin the body gets rid of much waste and poisonous matter. Therefore remove this and keep the pores open by bathing once every day, if possible. If water is scarce, rub the body over with a wet towel. If no water is at hand, take a dry rub. The skin protects the sensitive parts underneath from injury and helps to keep out germs. Therefore when blisters are formed don't tear off the skin. Insert a needle under the skin a little distance back from the blister and push it through to the opposite side. Press out the liquid through the holes thus formed. Heat the needle red hot first, with a match or candle, to kill the germs. When the skin is broken (in cuts and wounds) keep the opening covered with a bandage to keep out germs and dirt; otherwise the sore may fester. Pus is always caused by germs.

Keep your hair short. Long hair and a long beard in the field favors skin diseases, lice and dandruff.

Don't let any part of the body become chilled, as this very often is the direct cause of diarrhoea, dysentery, pneumonia, rheumatism and other diseases.

Wet clothes may be worn while marching or exercising without bad results, but there is great danger if one rests in wet clothing, as the body may become chilled.

When hot or perspiring or when wearing damp clothes, don't remain where a breeze can strike you.

Every day, if possible, hang your blanket and clothing out to air in the sun; shake or beat them with a small stick. Wash your shirts, underwear and socks frequently. The danger of blood poisoning from a wound is greatly increased if the bullet passes through dirty clothes.

Pitch your tent as soon as you can, particularly a shelter tent, even if you camp for one night only.

Always prepare your bed before dark. Level off the ground and scrape out a little hollow for your hips. Get some straw or dry grass if possible. Green grass or branches from trees are better than nothing. Sleep on your poncho. This keeps the dampness from coming up from the ground and chilling the body.

The use of intoxicating liquor is particularly dangerous in the field. Its excessive use, even at long intervals, breaks down one's system. If alcohol is taken at all, it is best after the work of the day is over. It should never be taken when the body is exposed to severe cold, as it diminishes the resistance of the body. Hot tea or coffee is much preferable under these circumstances.

**Care of the Feet.**—A soldier cannot march with sore feet, and marching is the main part of an infantryman's daily duty in the field. All soldiers should be familiar with the proper methods of caring for the feet. Sore feet are generally due to carelessness, neglect or ignorance on the part of the soldier.

The most important factor in the care of the feet and the marching ability of the soldier is the shoe. Civilian shoes, particularly light, patent leather or low shoes, are sure to cause injury and in time will ruin a man's foot. Only the marching shoe issued by the quartermaster corps should be worn, and they must be properly fitted to the individual. New shoes should be properly broken in before beginning a march by wearing them for several hours daily for a week before the march, and they should be adapted to the contours of the feet by stretching them with shoe stretchers with adjustable knobs to take the pressure off painful corns and bunions. Such stretchers are issued by the quartermaster corps, and there should be one or more pair in every company of infantry. On taking the shoes off a very little neat's-foot oil should be rubbed into the leather to prevent its hardening and cracking. If it is desired to waterproof shoes at any time, a considerable amount of neat's-foot oil should be rubbed into the leather. Waterproof leather causes the feet of some men to perspire unduly and keeps them constantly soft.

Light woolen or heavy woolen socks are habitually worn for marching. Cotton socks

are not worn unless specifically ordered by the surgeon. The socks should be large enough to permit free movement of the toes, but not so loose as to permit of wrinkling. Darned socks, or socks with holes in them, should not be worn in marching.

As soon as possible after reaching camp after a day of marching the feet should be washed with soap and water, and the soldier should put on a dry pair of socks and his extra pair of shoes from his surplus kit. If the skin is tender, or the feet perspire, wash with warm salt water or alum water, but do not soak the feet a long time as this, although very comforting at the time, tends to keep them soft. If serious abrasions appear on the feet, or corns, bunions and ingrowing nails cause trouble, have your name placed on sick report and apply to the surgeon for treatment. Cut the toe nails squarely (fairly close in the middle, but leaving the sides somewhat longer), as this prevents ingrowing nails. A footsore army is an army half defeated.

**Water.**—Immediately on making camp a guard should be placed over the water supply. If the water be obtained from a stream, places should be designated for drawing water (1) for drinking and cooking, (2) for watering animals, (3) for bathing and washing clothing. The first named should be drawn farthest up the stream; the others, in the order named, downstream. If the stream be small, the water supply may be increased by building a dam. Small springs may be dug out and each lined with a gabion, or a barrel or box with both ends removed, or with stones, the space between the lining and the earth being filled with puddled clay. A rim of clay should be built to keep out surface drainage. The same method may be used near swamps, streams or lakes to increase or clarify the water supply. Water that is not known to be pure should be boiled 20 minutes; it should then be cooled and aerated by being poured repeatedly from one clean container to another, or it may be purified by approved apparatus supplied for the purpose. Arrangements should be made for men to draw water from the authorized receptacles by means of a spigot or other similar arrangement. The dipping of water from the receptacles, or the use of a common drinking cup, should be prohibited. See MILITARY SANITATION.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**HYGIENE, Social.** See SOCIAL HYGIENE.

**HYGINUS, Gaius Julius,** Latin author. Little is known of his life, except that he came from Spain or Alexandria, studied under Cornelius Alexander Polyhistor, and was made a superintendent of the Palatine Library under Augustus. He wrote on many subjects, ranging from agriculture to commentaries on Virgil and Ciuna, all of which have been lost. Two works attributed to him are the 'Fabularum Liber,' containing legends and biographies of the gods, with many valuable references to lost literary masterpieces; and 'De Astronomia,' a treatise on the stars, dealing with the myths and legends connected with the heavenly bodies. The identity of the author of both of these treatises is well established, but various theories have been advanced to explain the poverty of

the scholarship of the translation from the Greek. The most plausible of these is that the works, as they have been handed down to us, are an abridgment of the original by an inferior Latin scholar of the latter half of the 2d century. Consult Schang, 'Geschichte der römischen Litteratur' (3d ed., Munich 1911).

**HYGROMETER** (Gr. "moisture-measure"), an instrument for determining the degree of humidity or of moisture present in the atmosphere; when of primitive form, calculated only to show the difference between a dry day and a damp day, called hydroscope as when constructed of catgut, hair or other fibrous material, having the property of lengthening when wet and contracting when dry. Sausson's hydroscope employs a human hair, the stretching or shortening of which with variations of moisture in the air moves a pointer on a graduated arc. A similar machine is Richmond's hydrograph, in which the hair is wrapped around a screw-thread, turning a cylinder as it lengthens or contracts, so that a connecting pencil may make a record on the cylinder. The first hygrometer properly so-called was made by Professor Daniell. It consists of a glass tube, bent at right angles into arms of unequal length. Each arm terminates in a bulb, one bulb

tained in the first bulb the temperature is read off at the instant at which vapor begins to condense, and the dew-point is thus obtained. The hygrometric condition, that is, the ratio between the quantity of moisture that the air actually contains and the quantity which it is capable of containing at the existing temperature is then easily deduced.

Regnault's hygrometer, shown in the above figure, is an important modification of Daniell's instrument. *D* and *D'* are two precisely similar cups or thimbles of polished silver; each is surmounted with a similar glass tube into which, by means of a cork, two thermometers are fitted, and the bulbs of the thermometers are covered with ether. Through the cork in one of the tubes a small glass tube *t* passes, and is carried down below the surface of the ether; while a side tube establishes communication with the vertical tube *U V* which is connected with an aspirator *A* (or vessel into which air is sucked at the top to supply the place of water which escapes at the bottom). There are no corresponding side tubes connecting the left-hand tube of the hygrometer *D'*. By means of the aspirator a current of air is drawn through *t*; it therefore bubbles through the ether, causing evaporation and cooling the ether till the dew-point is reached. This is observed with great nicety by means of a silver cap; for the instant the dew commences to deposit, the brilliant polish of the silver is dulled. The temperature of the air is at the same time read off by means of the other thermometer in *D'*. Regnault's hygrometer, both from its construction and from the use of the aspirator, avoids the too great proximity of the observer, which from the nature of the experiments, is objectionable.

Mason's dry and wet bulb hygrometer (sometimes called psychrometer or hydrodeik) consists of two thermometers arranged side by side as in the figure. The dry bulb gives the temperature of the air at the time of observation; and the other bulb, which is covered with muslin, and kept moist by filaments of cotton carried from it into a small cistern of rain or distilled water, reduces the height of the mercury in its tube in proportion to the capacity of the air for drying or taking up additional vapor. This instrument does not give the dew-point directly. The difference between the readings of the two thermometers is multiplied by a special factor for every temperature of the dry bulb. The United States Weather Bureau psychrometer has two thermometers mounted parallel on a jointed handle that permits their being whirled. One thermometer bulb is covered with wet muslin, the other exposed to the air; the difference in the record of the two thermometers is greater as the air is drier.

**HYKSOS**, *hik'söz*, according to the Egyptian annals, a conquering nomadic race from the East, who, under Salatis, their first king, took Memphis and rendered the whole of Egypt tributary. Their name probably means "foreign kings," the explanation "shepherd kings" being of later origin. The date of their invasion and conquest was about 1700 B.C., of their expulsion about 1600 B.C. The seat of their rule was the strongly garrisoned fortress of Avaris, on the northeastern border of the Delta. They followed Egyptian customs, and their six mon-

Regnault's Hygrometer

(usually black) being two-thirds filled with sulphuric ether, and the other bulb being, at the commencement of an experiment, empty. In process of construction the tube is exhausted of air, and is thus filled with vapor of ether through its entire length. A thermometer with a bulb immersed in the ether of the lower arm is inserted in the tube to register variation of temperature, and a second thermometer is attached to the stand of the instrument to show the temperature of the outer air. For use one bulb containing the sulphuric ether has a zone of polished gold, and the other bulb a muslin cover. If sulphuric ether be dropped on the latter, as it evaporates the bulb is cooled, and the vapor of ether is condensed within it from the other bulb; the temperature of which rapidly falls owing to evaporation from it. The operation is carried on, ether being dropped on the second bulb as is required, till the temperature of the first is so far reduced that dew from the surrounding air just begins to condense upon it. By means of the thermometer con-

archs took Egyptian names. It seems likely also that a great part of Syria was subject to them. The only detailed account of them in any ancient writer is an unreliable passage of a lost work of Manetho, cited by Josephus in his rejoinder to Apion.

**HYLAS**, hī'las, a character in Greek legend. He was the son of Theiodamus, king of the Dryopians in Thessaly, and accompanied Hercules on the Argonautic expedition. When they stopped in Mysia near the mouth of the Kios, Hylas went to a certain spring to draw water. The nymphs of the spring drew him down into the depths, and he was lost. The loss of his favorite grieved Hercules greatly, and he threatened to ravage the land of Kios unless Hylas was found. Therefore a day was fixed on which the inhabitants of the island wandered about the country calling the lad's name. The story as it has come down to us is doubtless a later treatment of an old Greek legend.

**HYLIDÆ**, the tree-frog family. This is the fourth family of the *Anura*, or tail-less amphibians and is nearer in its relations to the toads than to the typical frogs (*Ranidæ*). Its members are of comparatively small size and arboreal habits. Technically the family is characterized by an arciferous sternum, sacral diapophyses, teeth in the upper jaw, and the terminal phalanges of the fingers elongated, claw-shaped and swollen at the base, and bearing adhesive discs. This disc is a cartilaginous pad situated between the terminal phalanx and the one preceding it, the muscular contraction of which in action produces one or more furrows on its under side. It is rich in mucilaginous glands on the surface, and enables the frog to cling to the vertical surfaces, as tree-trunks, where it customarily perches, by the combined effect of pressure and stickiness, for no suction is applied, and the assistance of the clawed toes where the surface is rough. The hylidæ dwell in all the warmer and forested parts of the world except Africa, and have extraordinary breeding habits. The hylidæ are almost exclusively American, a few species in Australia, two in China, and the widely distributed *Hyla arborea* of Europe being the only exceptions. The centre of the family is tropical America, where about 100 species have been listed. See TREE-FROG.

**HYLLESTED**, hū'l'le-sted, August, Swedish pianist: b. Stockholm, Sweden, 1858. He began his musical education at a very early age, making his first public appearance in 1863. He was sent to Copenhagen to study under Holger Dahl, where he remained until 1869. He then toured Scandinavia and subsequently spent some years at the Royal Conservatory of Copenhagen. His next connection was as organist of the cathedral and director of the musical society in the same city. In 1879 he went to Berlin, where he studied under Kullak and Kiel. Later he had Liszt as a teacher, and began his various concert tours. He was enthusiastically received in the musical centres of the United States, where he was assistant director of the Chicago Musical College (1886-91) and director of the piano department of the Gottschalk Lyric School (1891-94). After a year's tour in Europe, he made his home in Chicago. He has

composed a number of very fine songs and piano selections.

**HYLOBATES**, an anthropoid ape of the Gibbon group. See GIBBON.

**HYLOGLYPHS**, small wooden tablets, found on Easter Island (q.v.) carved with conventionalized figures. Twelve of these have been preserved. In spite of persistent efforts, the picture writing has not yet been translated satisfactorily. They are chiefly important as the one specimen of an attempt at writing on the part of the South Sea Islanders, except for a rarely used syllabary discovered in 1914.

**HYMANS**, Solomon Louis, loo-ē ē-mān, Belgian historian, journalist, novelist and poet: b. Rotterdam, 1829; d. Brussels, 22 May 1884. He removed to Belgium in boyhood and rose rapidly to distinction as a Liberal journalist. He edited the Belgian *Star* and the Parliamentary *Echo* for some years, and was elected to Parliament in 1859. He wrote 'History of the Marquisate of Anvers' (1848); 'Popular History of Belgium' (1860); 'Political and Parliamentary History of Belgium' (1869-70); 'Notes and Souvenirs' (1876); 'Types and Silhouettes' (1877); 'Brussels Throughout the Ages' (1883-89); two popular novels, 'André Bailly' (1861) and 'The Buvard Family' (1858); and some pleasing poems.

**HYMEN**, the god of marriage in Grecian mythology; originally the Greek name of the marriage song. The common legend is that he is the son of Apollo. No marriage took place without his being invoked to sanction it. He is described as having around his brows the flower of marjoram, in his left hand the flame-colored nuptial veil, and in his right the nuptial torch.

**HYMENOPHLLACEÆ**. See FERNS AND FERN ALLIES.

**HYMENOPTERA**, hī-mēn-ōp'tē-ra, an order of Hexapoda or insects, considered by many entomologists to be the highest and most perfect expression of the insect type. The metamorphosis is complete and extensive. The larvæ are short, thick grubs, footless except in the saw-flies (*Tenthredinidæ*) and in most cases are carefully nurtured and fed in nests. The pupæ have nearly the form of the perfect insects. The imagos are of compact, highly complex construction, with the three regions well marked, except that the first segment of the abdomen is united with the thorax. A considerable part of the large head is occupied by the conspicuous compound eyes, besides which there are three ocelli. The jaws or mandibles are conspicuous biting organs, and the remaining mouth-parts usually form more or less of a proboscis with a large ligula or tongue. Although the wings are small, they move with great rapidity and sustain the body in rapid and extended flight; there are two pairs (usually), membranous, veined and transparent. The hymenoptera are divided by Linnaeus into two sections, the *Terebrantia*, which have an ovipositor instead of a sting in the female, and the *Aculeata* whose females have a sting. A more generally accepted division regards the saw-flies as a primitive sub-order, having no waist or constricted region at the middle, and an incomplete union of the first abdominal segment with the thorax, and also having thoracic and often abdominal legs in the larval stage.

Marked sexual dimorphism is very frequent especially among the social forms, in which a third class of individual, the worker or neuter, in reality imperfect females, also occurs. Many of the ant communities are still farther polymorphic. The order is one of great extent and exceptional interest, as it includes the ants, bees and wasps, the ichneumon-flies, gall-flies and saw-flies, divided into numerous families. Among the ants and bees are exhibited most remarkable and complex social states, which are described in the articles on these groups. The habits of the numerous species of wasps, and especially the varied architecture of their nests, are of nearly equal interest. A remarkable series of adaptations to special conditions are presented by the parasitic ichneumon flies and their allies, which lay their eggs within the bodies of the larvæ or even in the eggs of other insects, on the substance of which their own larvæ feed. Confining their parasitism to plants, the gall-flies produce by the irritation caused by their eggs or secretions deposited with them in the tissues of leaves, twigs or fruits, the familiar excrescences whose shapes are almost as numerous as the species which produce them. (See GALLS). Finally, the saw-flies are least typical of the order but stand nearest to the main hexapod stem. Their larvæ have both thoracic and abdominal legs and closely resemble caterpillars; they are vegetarians and many of them are very destructive to plants. Consult standard works of Entomology (see INSECTS), and the bibliographical list given by L. O. Howard in the appendix to his 'Insect Book' (New York 1902).

**HYMETTUS**, a mountain range in Attica, about 3,500 feet high, about five miles southeast of Athens. Its honey has been famous since ancient times. Its extensive quarries produced a bluish marble, often used for buildings and sculpture; but the white marble was considered superior.

**HYMNOLOGY**. A hymn is the expression of praise to God, designed to increase the reverence and arouse the devotion of a worshipper, and is often the vehicle of prayer. It is usually expressed in lyric verse, but not always. Some hymns are designed to be recited and not sung and are in prose. This is especially true of some Buddhist hymns.

From the beginning of history music and poetry have gone hand in hand. When men turned to worship they endowed it with music and poetry. They gave of their best. The early religions used songs of incantation approaching some of the Psalms of the Old Testament. The incantations from the Assyrian and Babylonian religions are of this character. The Egyptian religion also furnished some specimens. A hymn to the Nile used by its ancient worshippers seems almost like a Psalm. The Buddhist hymns are more like meditations. Ancient Greece was the land of song and all sorts of events were celebrated in poetic setting. Many splendid productions have come to us from the devotees of many religions. The non-Christian world has not known much of congregational singing. That has been peculiar to the Jewish and Christian religions.

The Old Testament contains many hymns finding their culmination of excellence in the Book of Psalms, which has set a standard for

all succeeding years. The songs of Moses, Miriam, Deborah and Hannah, and the lament of David over Jonathan should be mentioned. The temple worship is said to have required great choruses, as many as 12,000 men singing antiphonally at a single service. The volume of sound was so great that it could be heard 12 miles away.

The New Testament furnishes several specimens of early Christian hymns. The first and second chapters of the Gospel of Luke contain the *Gloria in Excelsis*, the *Magnificat*, the *Benedictus*, the lesser *Benedictus* and the *Nunc Dimittis*, early expanded and used in the worship of the church. Other remains of early Christian hymnody are found in Acts iv, 24-30; Ephesians v, 14; 1 Timothy vi, 15, 16; 2 Timothy ii, 11-13; Revelation i, 4-8; v, 9, 10, 12-14; xi, 15, 17, 18; xv, 3, 4; xxi, 10-14; xxii, 17. There are traces of the very early use of these passages as hymns by the church.

The church of the post-Apostolic age was a singing church. Origen tells us of a Christian hymnbook, now lost, called 'The Psalterium.' Pliny's letter to Trajan proves the use of song in worship. The oldest Christian hymn known is one credited to Clement of Alexandria, and probably composed about the year 200. Henry M. Dexter has given a free paraphrase of it in his 'Shepherd of tender youth' widely used in many hymnals. Other paraphrases are also in use. The candle lighting hymn, preserved by Saint Basil, is probably of very early origin. Julian notes 11 metrical translations of this hymn in addition to the prose rendition of Cardinal John Henry Newman.

The Eastern or Greek Church had many hymn writers of note. Methodius, who died about 311, has a hymn in his 'Banquet of Ten Virgins.' The *Ter Sanctus* was a hymn in use before the year 400. Gregory of Nazianzen and Anatolius were noteworthy writers of hymns. With Saint Andrew of Crete began a series of noteworthy hymn writers. Modern hymnals use translations of several of his hymns. Saint John of Damascus, Saint Cosmas and the poets of the Studium are the most noteworthy writers in the 200 years ending about the year 800. Bardesanes, a Gnostic leader, has sometimes been called the father of hymn-writing. His hymns were so popular that Ephrem Syrus wrote new hymns to replace them and thus became the father of hymnody in the Syrian Church.

Saint Hilary of Gaul, Bishop of Poitiers, was the father of hymnody in the Latin Church. Pope Damasus I wrote two hymns. With Ambrose of Milan a new era begins in Latin hymnody. He composed several hymns used in later service books. In the period from the 4th to the 11th century only a few names are worthy of note. Aurelius Clemens Prudentius, born in Spain in the last half of the 4th century, was a writer of many hymns. Coelius Sedulius composed a hymn in acrostics and several others. Venantius Honorius Clementanus Fortunatus was one of the greatest of the Latin hymn writers (d. 609). The next group contained Peter Damiani, Bonaventura, Bernard of Cluny, Bernard of Morlaix, Notker Thomas of Celano, Adam of Saint Victor, and other writers. This is sometimes called the Golden Age of Latin hymnody. The Anglo-

Saxon Church produced the Venerable Bede, its historian and also the father of English learning and English hymnody. Dr. Philip Schaff divides German hymn-writing into six periods: the period previous to the Reformation; the Reformation, 1520-1648; the Confessional Period, 1618-80; the Pietistic and Moravian Period, 1680-1757; the Rationalistic Period, 1757-1817; the Modern Period, including the last 100 years. Martin Luther was the father of German hymnody and German church music. His hymns were sung all over Germany and his opponents declared that his hymns "destroyed more souls than his sermons." Justus Jonas Alber, Nicholas Hermann and Michael Weiss of the Reformation group also contributed to the growth of the Lutheran movement by their hymns. The first German Evangelical hymnbook appeared in 1524 and because it contained only eight hymns was entitled 'Achtliederbuch.'

During the period of the Thirty Years' War several noted poets lived, including Martin Opitz and Michael Altenburg. The latter was the author of the first three verses of the battle hymn of Gustavus Adolphus. The Golden Age of German hymn-writing is in the third period, and found its culmination in Paul Gerhardt (1607-76), a Lutheran pastor in Berlin and Lübben. Johann Franck and Sebastian Michael and Peter Franck, Johann Rist, George Neumark and Michael Schirmer are only a few of the names of the more prominent hymn composers of the period.

In the fourth period, Philip Jakob Spener and August Hermann Francke were the leaders among the Pietists in hymn-writing. The son-in-law of Francke, Johann A. Freylinghausen, is said to have produced the best hymn book of the movement. The list of Pietist hymn composers is a long one. In the Moravian movement Nicolaus Ludwig Graf von Zinzendorf was the author of 2,000 hymns. Of these 205 have been translated into the English language, largely by John Wesley, Mrs. Charles and Miss Jane Borthwick. The Count's second son was also a hymn composer. August Gottlieb Spangenberg, who resided in America for many years, composed three noteworthy hymns.

The German Reformed Church produced Joachim Neander, Friedrich Adolf Lampe and Gerhard Tersteegen, writers of hymns of the first rank.

In the fifth period, Christian F. Gellert, Friedrich Gottlob Klopstock (called the German Milton), J. C. Lavater, Matthias Jorissen and Matthias Claudius were the chief hymn writers.

In the modern period there is a long list of writers of note, including Ernest Moritz Arndt, the Krummachers, father and son, Friedrich Rückert, Albert Knapp, C. G. Barth, Johann Peter Lange, K. J. P. Spitta and Karl Gerok.

French hymnody received a contribution from Jean Racine, and his four paraphrases are still in use. Some portions of the poems of the poet Pierre Corneille have been used as hymns. Fénelon composed a few hymns. Madame Giuyon composed nearly 900 pieces which were set to the music of popular tunes of the day. The Huguenots produced nine small books of *Chansons*, 1532-97. A selection from these was published by Henri Bordier in Paris, 1871.

John Calvin wrote a few hymns. The psalter of Clement Marot and Beza's psalter were used in the Reformed Church until 1705, when a supplement containing a few hymns by Benedict Pictet was added. Cæsar Malan (1787-1864) was the greatest of all the French hymn writers. He compiled 'Chants de Sion,' 1841, to which he contributed several hymns, some of which have been widely used. Later hymn composers include Ami Bost. H. Empaytz, Guers, Galland, and Dr. J. H. Merle d'Aubinge, the historian of the Reformation. In 1834 M. Henri Lutteroth issued 'Chants Chrétiens,' which included 44 from his own pen, and contributions were included from Alexander Vinet, Adolphe Monod and other leaders.

Scandinavian hymn-writing dates from the introduction of Lutheranism. Two brothers, Olaf and Lars Petersen, were the first leaders. Olaf had been a pupil of Luther and Melancthon at Wittenburg. Two other brothers, Lawrence and Peter Anderson, were the next noteworthy hymn-writers. The first hymnary of Norway and Denmark was published at Malmo in 1528 by Claus Martensen Tondebinder; Thomas Kingo, a poet of ability revised it. Gruntvig, the great Danish scholar, exercised a profound influence on the character of Danish hymnology, giving it a more spiritual trend.

Ireland does not possess a distinctive hymnody of its own. Wales is a land of song and has produced some noteworthy hymns. In Scotland the early history of hymnology deals almost entirely with metrical versions of the Psalms. The earliest version is sometimes known as the 'Dundie Psalms,' 1578. The first edition may have been published before the year 1546. The first Scottish Psalter properly so called was issued in 1564. Some of the versions were made by the Scottish and other exiles in Geneva. The Westminster Assembly authorized a new edition which was published in 1650. Later the General Assembly, not satisfied with the Westminster version, authorized other psalters and paraphrases. 'The Scottish Psalter' was prepared by a committee and sanctioned by the General Assembly. The Baptists, Congregationalists, United Presbyterians, Free Church, and Scottish Episcopal Church have each issued a series of hymnals.

The hymnody of England, as in Scotland, had at the beginning only versions of the Psalms. Thomas Sternhold, who was groom of the robes to Henry VIII, was scandalized at the songs sung at court, and that something better might be sung translated 51 Psalms into English metre. The first published edition contains 19 Psalms. A second edition published in 1549 contained 37. The third edition of 1551 included seven additional versions by John Hopkins, and henceforth it was called 'Sternhold's and Hopkins' Psalms.' Next followed the 'Geneva Psalter' of 1558, mentioned above. In 1562 'The Complete Psalter' of Sternhold and Hopkins was published by John Daye. It influenced largely the worship and hymnology of England for a long time. A new version by Nicholas Brady and Nahum Tate appeared in 1695-96. Later many English writers tried their talents in making versions of the Psalms. Julian lists 326 distinct versions.

Isaac Watts has been called the father of English hymn-writing. He is so in a qualified sense. John Donne and George Herbert wrote hymns, and there were occasional hymns written by others before the first hymn-book, 'Hymns and Songs of the Church,' was issued in 1623 by George Withers. Then followed hymn-books by Robert Herrick, Henry Vaughan, Jeremy Taylor, Samuel Crossman, John Austin, John Mason, and Benjamin Keach, besides the many individual hymns of merit including the three unsurpassed hymns of Bishop Thomas Ken. Nevertheless, Watts (q.v.) occupied a large place as a hymn composer. Philip Doddridge soon followed him. Then came the Wesley brothers, John, Charles and Samuel, all poets and sons of a poetical father. Samuel Wesley, Jr., left a volume of poems. Six of his hymns are in common use. John and Charles Wesley issued jointly or singly no less than 64 hymnbooks. The first one was issued at Charleston, S. C., in 1736, and the last at London in 1786. They were gathered by Rev. George Osborn, and published in 13 volumes as the 'Poetical Works of John and Charles Wesley.' John Wesley translated many hymns. Charles Wesley was the author of more than 6,000 hymns. More than 500 hymns of John and Charles are in common use to-day in various hymnals. The Wesleys influenced many followers. There were Thomas Olivers, John Cennick, William Hammond, Edward Perronet, Joseph Hart and Robert Robinson among the Methodists; John Newton, William Cowper, R. Madan, R. Conyers and R. De Courcy of the Evangelical party of the Church of England. They even inspired their opponents, one of the chief of whom was Augustus Montague Toplady, author of 'Rock of Ages.' The Congregationalists were likewise influenced by the movement. Rowland Hill, Ralph Wardlaw and John Dobell each issued hymnbooks.

James Montgomery, a Moravian, was the next great hymn-writer. Seventy-one of his hymns are still in common use. Mrs. Barbauld (1772) and Anne Steele (1760) were among the first women to write hymns. Twenty-one by Mrs. Barbauld are in common use, while 75 of Miss Steele's 144 hymns are still sung. Henry Kirk White should not be omitted from this period. He composed only 10 hymns, but they are all in common use. Reginald Heber wrote some of the greatest and best beloved hymns of the Church.

The Oxford or Tractarian movement produced a notable group of hymn-writers: John Henry Newman, Edward Caswell, Frederick W. Faber and John Keble. Some of their hymns are among the greatest in the language.

Space forbids the mention of the great host of English hymn-writers. We can only mention a few of the most outstanding ones who have appeared since the Tractarian movement. John Mason Neale (1818-66) has rendered a great service to the English-speaking world in his translation of hymns of the Eastern Church. John S. B. Monsell, Sir Henry Williams Baker, Henry Frances Lyte, Sir John Bowring, Francis T. Palgrave, Henry Alford, Mrs. C. F. Alexander, Charlotte Elliott, Frances Ridley Havergal and Sarah Flower Adams must not be omitted. George Matheson, the blind

preacher of Endinburg, gave us 'O love that will not let me go,' a great hymn destined to live.

The first book used in worship in America was 'The Bay Psalm Book,' or New England Version, first published by Stephen Day in 1640. It is supposed that "no less than 70 editions were printed." It was superseded first by the version of Tate and Brady and next by that of Isaac Watts. Hymn writing did not begin until after the War of the Revolution. Some of the most important American hymn-writers are Timothy Dwight, Bishop George W. Doane, Bishop H. U. Onerdonk, John Pierpont, William Cullen Bryant, Phœbe Cary, Samuel Occum, J. W. Alexander, Thomas Mackellar, Samuel F. Smith, Fanny Crosby, the most prolific of all American hymn-writers, Anna Warner, Frank Mason North, Bishop Arthur Cleveland Coxe, and all of our great American poets, besides a long list of minor writers.

**Bibliography.**—The great authority on the subject is J. Julian, 'Dictionary of Hymnology' (London 1892, revised 1907). There are many volumes dealing with the subject. Benson, E. F., 'The English Hymn: its development and use in Worship' (New York 1913); Breed, W. P., 'History and Use of Hymns and Hymn Tunes' (New York 1903); Campbell, Duncan, 'Hymns and Hymn Makers' (London 1898); Duffield, S. W., 'English Hymns: Their Authors and History' (New York 1903), and 'Latin Hymns, Writers and their Hymns' (New York); Fischer, A. F., 'Kirchen Lieder Lexicon' (2 vols., Gotha 1878-79); Hatfield, E. F., 'The Poets of the Church' (New York 1894); Jones, F. A., 'Famous Hymns and their Authors' (London 1903); the various works of Neale on the Hymns of the Eastern Church, and Pick, Bernard, 'Hymns and Poetry of the Eastern Church' (New York 1908); Price, Carl, 'Music and Hymnody of the Methodist Hymnal' (New York 1911).

#### ONE HUNDRED WIDELY USED HYMNS.

Abide with me; fast falls the eventide.— H. F. LYTE.  
A charge to keep I have.— CHARLES WESLEY.  
A few more years shall roll.— H. BONAR.  
All hail the power of Jesus' Name.— E. PERRONET.  
All people that on the earth do dwell.— W. KETHE.  
A mighty fortress is our God.— MARTIN LUTHER.  
Art thou weary, art thou languid.— STEPHEN THE SABAITE.  
Awake my soul and with the sun.— BISHOP T. KEN.

Be strong, we are not here.— M. D. BABCOCK.  
Blest be the tie that binds.— J. FAWCETT.

Children of the heavenly king.— J. CENNICK.  
Christ, the Lord is risen to-day.— CHARLES WESLEY.  
Come O thou traveller unknown.— CHARLES WESLEY.  
Come thou fount of every blessing.— ROBERT ROBINSON.  
Come ye sinners poor and needy.— JOSEPH HART.

Fairest Lord Jesus.— From the German.  
Faith of our fathers living still.— F. W. FABER.  
Fear not O little flock the foe.— ALTENBURG.  
For all the saints who from their labor rest.— W. W. HOW.  
Forever with the Lord.— JAMES MONTGOMERY.  
For thee, O dear, dear country.— ST. BERNARD OF CLUNY.  
Forward be our watchword.— HENRY ALFORD.  
From Greenland's icy mountains.— R. HEBER.

Glory to Thee, my God, this night.— BISHOP T. KEN.  
God be with you till we meet again.— J. E. RANKIN.  
God calling yet shall I not hear.— G. TERSTEBGEN.  
God moves in a mysterious way.— W. COWPER.  
Guide me, oh thou great Jehovah.— WILLIAM WILLIAMS.

Hail thou once despised Jesus.— J. BAKEWELL.  
Hark, Hark, my soul, angelic songs are swelling.— F. W. FABER.  
Hark the herald angels sing.— CHARLES WESLEY.  
Hasten, Lord, the glorious time.— H. AUBER.  
He leadeth me! Oh blessed thought.— JOSEPH GILMORE.  
Holy, Holy, Holy, Lord God Almighty.— R. HEBER.  
Holy Spirit, faithful guide.— M. M. WELLS.  
How firm a foundation.— G. KEITH.  
How gentle God's command.— P. DODDRIDGE.  
How sweet the name of Jesus sounds.— JOHN NEWTON.

If on a quiet sea.— A. M. TOPLADY.  
I heard the voice of Jesus say.— H. BONAR.  
I love Thy kingdom, Lord.— T. DWIGHT.  
I need Thee every hour.— MRS. A. S. HAWKES.  
In the cross of Christ I glory.— SIR JOHN BOWRING.

Jerusalem my happy home.— F. B. P. and J. MONTGOMERY.  
Jerusalem the golden.— ST. BERNARD OF CLUNY.  
Jesus and shall it ever be.— JOSEPH GREGG.  
Jesus calls us o'er the tumult.— MRS. ALEXANDER.  
Jesus lover of my soul.— CHARLES WESLEY.  
Jesus shall reign where'er the sun.— ISAAC WATTS.  
Jesus the very thought of Thee.— ST. BERNARD.  
Just as I am without one plea.— CHARLOTTE ELLIOTT.

Lead kindly light amid the encircling gloom.— J. H. NEWMAN.  
Lead on, Oh king eternal.— E. W. SHURTLEFF.  
Lift your glad voices in triumph on high.— H. WARE, JR.  
Lord dismiss us with thy blessing.— J. FAWCETT.  
Lord I hear of showers of blessings.— ELIZABETH CODNER.  
Lord in the morning thou shalt hear.— ISAAC WATTS.  
Lord of all being, throned afar.— O. W. HOLMES.  
Love divine, all loves excelling.— CHARLES WESLEY.

More love to Thee, oh Christ.— MRS. E. P. PRENTISS.  
My faith looks up to Thee.— RAY PALMER.

Nearer, my God, to Thee.— SARAH FLOWER ADAMS.  
Now thank we all our God.— M. RINKART.

Oh day of rest and gladness.— C. WORDSWORTH.  
Oh for a closer walk with God.— W. COWPER.  
Oh for a heart to praise my God.— CHARLES WESLEY.  
Oh for a thousand tongues to sing.— CHARLES WESLEY.  
Oh God, our help in ages past.— ISAAC WATTS.  
Oh Jesus I have promised.— J. E. BODE.  
Oh little town of Bethlehem.— PHILLIPS BROOKS.  
Oh love that will not let me go.— GEORGE MATHESON.  
Oh Paradise! Oh Paradise!— F. W. FABER.  
Oh sacred head once wounded.— ST. BERNARD.  
Oh worship the king all glorious above.— R. GRANT.  
One more day's work for Jesus.— ANNA B. WARNER.  
One sweetly solemn thought.— PROBER CARY.  
Onward Christian soldiers.— S. BARING-GOULD.

Rescue the perishing.— FANNY CROSBY.  
Rock of Ages, cleft for me.— A. M. TOPLADY.

Safe in the arms of Jesus.— FANNY CROSBY.  
Saviour again to Thy dear name we raise.— J. ELLERTON.  
Saviour breathe an evening blessing.— JAMES EDMESTON.  
Sun of my soul Thou Saviour dear.— JOHN KEEBLE.  
Soldiers of Christ arise.— CHARLES WESLEY.

Take my life and let it be.— FRANCES RIDLEY HAVERGAL.  
Tell me the old, old story.— MRS. HANKEY.  
The Church's one foundation.— S. J. STONE.  
The King of love my shepherd is.— H. W. BAKER.  
There is a fountain filled with blood.— W. COWPER.  
There is a green hill far away.— MRS. ALEXANDER.  
There is a land of pure delight.— ISAAC WATT.  
The Son of God goes forth to war.— R. HEBER.  
The spacious firmament on high.— JOSEPH ADDISON.

We may not climb the heavenly steeps.— J. G. WHITTIER.  
When all Thy mercies, O my God.— JOSEPH ADDISON.  
When I survey the wondrous cross.— ISAAC WATT.  
Where cross the crowded ways of life.— F. M. NORTH.  
While shepherds watched their flocks by night.— N. TATE.  
Work for the night is coming.— A. L. COGHILL.

Zion stands with hills surrounded.— T. KELLY.

### HYMNS. See HYMNOLOGY.

**HYMNS, Latin.** From the beginning, the Church adopted the psalms and made use of various versicles and devotional hymns in its service. Once the persecutions ceased, and Christians had no longer to hold their services so as to avoid notice, this practice grew in significance. The great Fathers of the Church wrote or encouraged the writing of hymns, and by the end of the 4th century a large number

were in use. Hilarius Pictaviensis, Hilary of Poitiers (died 368), made a collection of hymns with the title, 'Liber Mysteriorum,' mentioned by Saint Jerome, now lost, for which he has been called the Father of Western Hymnology. Some of the hymns of Pope Damasus (died 384) whose secretary Jerome was, have been preserved. The greatest hymn writer of the 4th century is Saint Ambrose. Not all the hymns attributed to him are his, but many are, and one at least, the 'Te Deum,' is still in common use. Among the other great hymn writers of the earlier centuries are Saint Augustine, Prudentius, Sedulius (an Irishman of the 5th century), Fortunatus, and Eugenius (of the 6th and 7th centuries), Pope Gregory the Great, Venerable Bede, Alcuin, (8th century), and Peter Damien (died 1072). It is the latter part of the Middle Ages, however, especially the 12th and 13th centuries, that saw the birth of the greatest Latin hymn writers. They are Bernard of Clairvaux and Bernard of Morlaix, Adam of Saint Victor, and Alanus of Lille, of the 12th century, and Thomas of Celano, Bonaventure, Aquinas, and Jacopone da Todi of the 13th century.

At first these hymns in the Western Church were written in the meters of the old Latin poets, but after the introduction of rhyme, they gradually came to follow the new mode. In the earlier Middle Ages an essential change took place in the pronunciation of Latin. "Quantity and pitch were used for accents and emphasis in the early Latin; stress or loudness of sound gradually took their place and the meters changed at the same time. In the Augustan poetry, the arsis is laid on the long syllables, in the later Latin poetry, on accented syllables. . . . In the Latin hymns, the change from one system to the other can be noted. As modern poetry is founded on accents, not quantity, it is in these Latin hymns that can best be studied the gradual rise of modern poetry." (March). The Latin hymns are also of interest because in them can be studied the progress from alliteration to rhyme. At first, the regular recurrence of a vowel sound at regular intervals, made the music of verse. After a time, the addition of similar consonant sounds added to the musical quality and the satisfaction to the ear, and then rhyme as we now know it was complete. The various stages between the two can be recognized and excellent illustrations of the various phases obtained in the larger collections of Latin hymns.

The language of the early hymns is the common speech of the day, colored by Bible idioms. New words appear but only such as are needed for new thoughts. Familiar words are lifted to the standard of poetic diction by application to Christian usage. An extreme simplicity of language just as far as that is compatible with the expression of the profound devotional truths of Christianity characterizes them. They are much simpler than classical Latin poetry, and for that reason deeply influenced popular devotion and thinking and served to modify popular language and poetry. In the history of literature, the Latin hymns occupied an important place because they were the first original poetry of the people in the Latin language. The Latin poetry of the classical period was an echo of Greece "both in substance and form, the matters and meters were

both imitated and the poems were composed for the lovers of Grecian art in the Roman court. It did not spring from the people and it never moved the people, but the Christian hymns were proper folk-poetry, the 'Bible of the people'—their Homeric poems." (March). It was their use by the people that fostered rhyme in the poetry of the modern languages. The folk listened to these Latin hymns sung on the festival days many times every year, (they were required to go to church nearly 100 times a year), became familiar with the cadence of them, and the music of verse, often joined in using them at the time when the modern languages of Latin origin were coming into existence, and these hymns therefore constituted the school in which modern rhymed poetry took its rise.

The supreme place among the Latin hymns is universally accorded to the 'Dies Iræ' (q.v.), written by one of the early Franciscans. Professor Saintsbury says: "There is not likely to be ever lack of those who, authority or no authority, in youth and in age, after much reading or without much, . . . will hold these wonderful triplets, be they Thomas of Celano's or another's, as nearly or quite the most perfect wedding of sound to sense that they know." This enthusiastic recognition has been shared by Crashaw, Jeremy Taylor, Dr. Johnson, Goethe, the Schlagels, Dryden, Scott, Villemin, Trench, Macaulay, and a host of similar persons of ability. Just after the 'Dies Iræ' comes the 'Stabat Mater' (q.v.), written very probably by another of the early Franciscans, Jacopone da Todì. Schaff declares: "It is the most pathetic, as the 'Dies Iræ' is the most sublime hymn of the Middle Ages, and occupies the second rank in Latin hymnology." It has inspired some great musical compositions by the most famous composers. The five other greatest of the Latin hymns constituting an immortal septet are the 'Ad Regias Agni Dapes,' probably written by Saint Ambrose, surely coming from his time; the 'Vexilla Regis,' an unrhymed hymn usually said to have been written by Fortunatus in the 6th century; the 'Jesu Dulcis Memoria' of Saint Bernard of Clairvaux written in the 12th century; the rhythm of Bernard de Morlaix or Bernard of Cluny, a contemporary of Saint Bernard, and finally the 'Pange Lingua Gloriosi' (q.v.), of Saint Thomas Aquinas. There are many other hymns urged by admirers for the place in this list of honor, but those given are surely the favorites. Neale says that Aquinas' 'Pange Lingua' "contests the second place among the hymns of the Western Church with the 'Vexilla Regis,' the 'Stabat Mater,' and the 'Jesu Dulcis Memoria,' . . . leaving the 'Dies Iræ' in its unapproachable glory." It is a supreme surprise to find the greatest scholar of his time possessed as so many think with the greatest human mind after that of Aristotle, thus placed among the greatest of poets, for it is generally recognized that these hymns are among the greatest poetry ever written, unsurpassed and never equalled except by Dante and Shakespeare. (Saintsbury). The loving devotion with which these hymns were written can be very well appreciated from the rhythm of Bernard of Morlaix, out of which a number of the modern hymns on 'Jerusalem the Golden' were composed. It is written in hexameters

following rather strictly the old prosody, but there are two internal sub-rhymes in each line and the lines rhyme as couplets. The difficulties of the task must have been enormous but they have been marvellously overcome and have only served to enhance the beauty of the hymn. Schaff, in his 'Christ in Song' says: "This glowing description is the sweetest of all the Jerusalem hymns of heavenly homesickness," and Dr. Neale says that "it is the most lovely as the 'Dies Iræ' is the most sublime and the 'Stabat Mater' the most pathetic of mediæval poems." Rhyme and metre shackles only make the poet dwell on his theme so thoroughly that his thought has been a fount of devotion all down the ages.

After the beauty of the Latin hymns, their most wonderful feature is the admirable critical faculty, which served to recognize and preserve to posterity so many precious gems of religious poetry, though there must have been at all times, as has been so true in ours, so many counterfeit imitations of mere sentimentality and not true poetry.

**Bibliography.**—March, 'Latin Hymns' (New York 1874); Trench, 'Sacred Latin Poetry' (London 1864); Neale, 'Mediæval Hymns and Sequences' (London 1867); Schaff, 'Christ in Song' (New York 1868); Charles, 'The Voice of Christian Life in Song' (New York 1867); Daniel, 'Thesaurus Hymnologicus' (Leipzig 1841-56, 5 vols.); Mone, 'Lateinische Hymnen des Mittelalters' (Freiburg 1853-55, 3 vols.).

JAMES J. WALSH.

**HYMNS, National.** See NATIONAL HYMNS.

**HYMNS OF HATE**, two German metrical effusions composed in 1914 and 1915 by Ernst Lissauer and a man named Hochstetter. That of the former, 'Hassgesang gegen England' consists of three long stanzas, each ending with "We (or They) have but one enemy—England!" The other has four shorter stanzas each concluding with "God punish England!" This gave rise to a popular expression in Germany of "Gott strafe England!"—a phrase attached to salutations, stamped on medals and for a time printed on little stamps and paper money. Lissauer's "Hymn" was translated into English and sung in London music-halls—the audiences joining in the chorus. Consult Gerard, J. W., 'My Four Years in Germany' (pp. 218 and 308, New York 1917). For translations consult *Current History* (New York February and April 1915); *New York Times* (15 Oct. 1914); *Public Opinion* (London 5 Feb. 1915).

**HYNDMAN**, hind'man, **Henry Mayers**, English Socialist and author: b. London, 7 March 1842. He was educated at Trinity College, Cambridge; and entered journalism. He was special correspondent for the *Pall Mall Gazette* in the war of 1866 between France and Italy, made a world tour 1869-71, and wrote leading articles in favor of free education in the Melbourne *Argus* in 1869. In 1881 he was one of the founders of the Social Democratic Federation, and has since been active in the Socialist movement, being the acknowledged leader of the Marxian Socialists in England. In 1884 he founded and edited the paper *Justice*. His works include 'Historical Basis of Socialism' (1883); 'Socialism and Slavery,'

a reply to Herbert Spencer; 'The Commercial Crises of the Nineteenth Century' (Social Science Series, 1892); 'Economics of Socialism' (1896); 'The Future of Democracy' (1915); the autobiographical 'Record of an Adventurous Life' (1911); and 'Further Reminiscences' (1912).

**HYPATIA**, hī-pā'shī-ā, Greek philosopher of the eclectic school, daughter of Theon, a celebrated astronomer and mathematician, who was at the head of the Neo-Platonic school in Alexandria early in the 5th century. Such was her reputation that she became a preceptress in the school of Plotinus at Alexandria, and expounded the principles of his system to a numerous auditory of students from all parts of the East. Her house became the resort of all the persons of learning and distinction in Alexandria, and, among others, of Orestes the Prefect, between whom and Cyril, patriarch of Alexandria, a conflict respecting authority existed. A fanatical mob, believing that Hypatia encouraged Orestes in his opposition to the patriarch, set upon and murdered her (March 415). Hypatia appears as the central figure of Kingsley's novel of the name (q.v.) 1853.

**HYPATIA, or NEW FOES WITH AN OLD FACE** (1853), is a striking and brilliant historical novel by Charles Kingsley. The scene is laid in Alexandria during the 5th century, A.D., and it is the story of a five-fold conflict among the Jews, the Roman authorities, Gothic invaders, Greek philosophers and Christian sectarians of a pronounced militant character. The main struggle is that between the attempt under the leadership of the gifted and beautiful Hypatia to restore to its former glory the ancient Greek pagan worship and philosophy and the counter efforts of the Christians under the leadership of Cyril to overcome both the Jews and the Greeks, as well as to make dominant their own power under the Roman government. They are successful to the extent of getting the upper hand of the Jews, of discomfiting the Roman prefect and of murdering Hypatia, but their violence is shown in no amiable light. As in all of Charles Kingsley's important books, 'Alton Locke,' 'Yeast,' 'Westward Ho!' and others, genuine satisfaction lies only in the acceptance of a gentle, spiritual and charitable Christianity. This doctrine is most manifest in the final philosophy and triumph over Hypatia of the converted Jew, Raphael Aben-Ezra, and in the ultimate destiny of Philammon, a young monk, who, coming to Alexandria, passed through the various phases of the turbulent life of Alexandria and, rich in experience, spent his last days as a beneficent Christian abbot. The latter character is the real hero of the book in that his various experiences furnish the main thread for the presentation of the philosophical elements and political and spiritual conflicts of the novel; but Kingsley, in order to give a fuller account of contemporary affairs, is obliged to leave his hero from time to time and take the reader to witness such scenes as the defeat of Count Heraclian at Ostia or to visit with Saint Augustine and Synesius at Cyrene. The attempt is a panoramic account of the 5th century with, as is implied in the title, a very decided sermon in favor of spiritual Christianity.

WILLIAM T. BREWSTER.

**HYPERBOLA**, a conic, the Cartesian equation of which, by a proper choice of axis, can be made of the form  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ . The  $x$  axis is called the transverse axis, and the  $y$  axis is the conjugate axis. The length of the transverse axis is said to be  $a$ , of the conjugate axis  $b$ .  $\frac{x^2}{a^2} - \frac{y^2}{b^2} = -1$  is another hyperbola, known as the conjugate hyperbola of the first. The two lines  $\frac{x}{a} = \pm \frac{y}{b}$  approach the hyperbola closer than any assigned limit, and are called the asymptotes of the hyperbola. The points  $(\pm a \left( \frac{\sqrt{a^2+b^2}}{a} - 1 \right), 0)$  are called foci, and have the property that the difference between the distances from a point on the curve to the two foci is constant. The ratio of the distance from a point on the curve from  $(a \left( \frac{\sqrt{a^2+b^2}}{a} - 1 \right), 0)$  to its distance from the line  $x^a = \frac{a^2}{a^2+b^2}$  has the constant value  $\frac{\sqrt{a^2+b^2}}{a}$ . This latter value is called the eccentricity of the hyperbola, and is often written  $e$ , and the lines  $x = \pm \frac{a^2}{a^2+b^2}$  are known as directrices. If  $e = \sqrt{2}$ , the hyperbola is said to be equilateral or rectangular, has perpendicular asymptotes and is congruent with its conjugate. A non-degenerate conic with the equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

is a hyperbola if  $B^2 - 4AC$  is positive. A hyperbola is generated by the section of a cone by a plane which cuts both nappes, and accordingly consists of two infinite branches. Projectively considered, it is a conic with two real points at infinity. See CONIC SECTIONS.

**HYPERBOLE**, hī-per'bō-lē, a figure of speech. It consists in exaggeration for the purpose of making the object described more significant or striking. It is often employed in metaphors and similes.

**HYPERBOREANS**, hī-pēr'bō-rē'anz, a mythical race, inhabiting a land beyond the Rhipæan Mountains. They were supposedly the bearers of sacrifices and gifts to Apollo, and were endowed with eternal youth. The name came to be applied ethnically to races of the Far North. Consult Roscher, 'Lexikon der griechischen und römischen Mythologie.'

**HYPERIDES**, hī-pēr-ī'déz, an Athenian orator: b. about 390; d. about 322 B.C. He studied philosophy and oratory, and began to practise at the law courts. His prosecutions of Autocles, an Athenian general, for treason; of Aristophon during the "Social War" (358-355 B.C.), and of Philocrates for high treason (343 B.C.), distinguished him as one of the leading public speakers of the time. His political sympathies led him to support Demosthenes (q.v.) and the democratic party. In the bitter struggle against Macedon, Hyperides equipped two triremes, and throughout was untiring in

his patriotic zeal. When Demosthenes was accused of having been bribed by Harpalus, the treasurer of Alexander, the loyalty of Hyperides to his leader, long strained, snapped. He was chosen to lead the prosecution, and when the punishment of exile was inflicted on the head of the patriotic party, Hyperides was the choice of the people to fill his place. In the Lamian War against Antipater and Craterus, Hyperides was a conspicuous figure. His career came to an inglorious close at the decisive defeat at Crannon; and he was condemned to death with the other leading orators of Athens. His efforts at flight were unsuccessful. He was overtaken by the agents of Antipater and killed. As an orator, Hyperides was fluent, subtle and popular. He had the power of rendering his speeches simply and tactfully, and with a certain attractive grace and assurance that carried his audience invariably. Of the large number of speeches which have been attributed to Hyperides, about 50 are considered authentic. Research of the last century has brought to light a number of fragments, some of appreciable length. The funeral oration over the Athenians who had fallen in the Lamian War was unearthed at Thebes in Egypt. The speeches 'Against Phillippides' and 'Against Athenogenes' were edited by F. G. Kenyon (London 1893). There is a complete edition of all the literary remains of Hyperides with an ample bibliography, under the title 'Hyperidis orationes sex cum ceterarum fragmentis' (Leipzig 1894). Consult Jebb, R. C., 'Attic Orators' (Vol. II, London 1880); Blass, 'Attische Beredsamkeit' (Vol. III, Leipzig 1898).

**HYPERION**, hi-pě'ri-ón, in Greek mythology, a Titan, son of Uranus and Ge, and father of Helios, Selene and Eos. Homer and later poets apply the name as a patronymic for Helios himself. The attribute of beauty has therefore been connected with the name, as in Shakespeare's comparison of "Hyperion to a satyr."

**HYPERION**, in astronomy, the name assigned to the 7th satellite of Saturn, discovered in 1848, at the Harvard Observatory by G. P. Bond. It is outside the satellite Titan, whose mass causes perturbations in the orbit of Hyperion, which have proved to be a difficult problem in celestial mechanics, and a unique case in the solar system. They apparently give large eccentricity to Hyperion's orbit, and cause the apparent line of apsides to follow the conjunction points of Titan and Hyperion, in a direction contrary to the usual motion of this line.

**HYPERION**. 'Hyperion,' a fragmentary epic in blank verse, published in 1820, was begun while Keats was caring for his dying brother and was continued during his struggles with grief and hopeless love. It is a fragment, yet a masterpiece. The theme, the triumph of the Gods over the Titans, is one of the most august in Greek myth, and the poem, in intensity of feeling and beauty of form, rises to its subject. The poem breaks off in the third book, leaving the hero, "blazing Hyperion," still unconquered, facing the inevitable triumph of the young Apollo. But in its very incompleteness the fragment is perfect;

to end it would have been to weaken it. For the Titans have fallen before "a power more strong in beauty." In a poem that makes the old myth a symbol of the "eternal law" of the evolution of higher beauty, no such dramatic conflict as that of 'Paradise Lost,' no such triumphant consummation as that of 'Prometheus Unbound' is possible. Keats made one quickly abandoned attempt to recast the story. 'Hyperion, a Vision' is but a groping beginning; but the noble lines recording the poet's search for the deeper vision born of suffering remain a poignant promise of the Keats that might have been. Shelley wrote: "If the 'Hyperion' be not grand poetry, none has been produced by our contemporaries." It is poetry of an unescapable grandeur. The random course of 'Endymion' has given way to clear-cut structure; the romantic heroic couplet to a blank verse Miltonic in stateliness, lovely in melody; the misty fantastic scenes to imagery that is reality wrought of the poet's "natural magic." And the conquered Titans are depicted with a nobility, a humanity that alone would place 'Hyperion' at the height of the poetry of Keats. Consult Colvin, Sidney, 'John Keats' (New York 1917); de Sélincourt, E., Introduction and notes in 'The Poems of John Keats' (London); bibliography in 'Cambridge History of English Literature' (Vol. XII).

FRANCES W. CUTLER.

**HYPERMETAMORPHOSIS**. See **METAMORPHOSIS**.

**HYPEROPIA**, hi-pěr-ó'pí-a, a refraction of the eye which may be either acquired or congenital. When the refracting surfaces are not sufficiently convex, parallel rays of light converge on a point behind the retina, instead of on the retina, producing what is generally known as long-sightedness or hypermetropia. Hyperopia is the opposite refraction from myopia. See **VISION**, **DEFECTS OF**.

**HYPERPYREXIA**, hi-pěr-pí-rěk'sí-a. See **FEVER**.

**HYPERSPACES**. **Dimensionality**.—In order to make quite intelligible the concept variously denoted by such terms as hyperspace, space of higher dimensions or dimensionality, multi-dimensional space, *n*-space, *n*-fold or *n*-dimensional space, it is in the first place necessary to explain the meaning of dimensionality and to indicate the way in which the dimensionality, or number of dimensions, of a given space in a given element is determined or ascertained. Because, in order to determine the position of a point in a curve or straight line, it is necessary and sufficient to know *one* fact about the point, as, for example, its distance (with algebraic sign) from a fixed point or origin; a line is said to be a *one*-dimensional space of points. But instead of the point, we may choose for element of the space (line) a pair or a triplet, . . . or an *n*-set of points. In such cases, in order to determine the element, i.e., to pick it out or distinguish it from among all others of its kind, it is necessary and sufficient to know *two* or *three*, . . . or *n* independent facts about it. Hence a line is a *two*- or *three*-, . . . or *n*-dimensional space of pairs or triplets, . . . or *n*-sets, of

points. In like manner a flat pencil (totality of lines of a plane that have a common point) is a one-dimensional space of *lines*; while its dimensionality is 2 in line pairs, 3 in triplets, and so on. For like reasons a plane is a two-dimensional space of *points* or of *lines*. In *circles* its dimensionality is 3, in *conics* 5, in *curves of third order* 9, and so on. It is at once seen that the dimensionality of a given space depends on the entity chosen for primary element, the element, i.e., in terms of which we elect to study and express the properties of the given space. Illustrations abound. A curved surface, as, say, a sphere, regarded as the envelope of (its tangent) planes, is a two-dimensional space of *planes*, while, conceived as the assemblage of (its tangent) lines, it is a three-dimensional space. The reader will observe that the term space is employed generically to denote any unbounded continuum of geometric entities. The generalization is, however, a natural one, for, for geometric purposes, ordinary space is viewed primarily as an assemblage of elements of one kind or another. To determine the position of a point in ordinary space, three independent data (as the distances of the point from three mutually perpendicular planes of references) are necessary and sufficient. Ordinary space is, therefore, *three-dimensional* in *points*, and that is what is meant, consciously or unconsciously, when, without specifying the element (point), it is simply said that space is three-dimensional. But tri-dimensionality is in no strict sense a *definitive* property of ordinary space. For some little understood, probably economical, certainly extra-logical, reason, the point recommended itself to primitive man as the element par excellence with which to geometrize, and so it has become traditional and proverbial that our space is essentially, uniquely, characteristically, intrinsically, exclusively three-dimensional. Such, however, it is not. It is indeed *three-fold* in *planes* as in points, but in *lines* it is *four-dimensional*. So, too, it is *four-fold* in *spheres*, but in *circles* its dimensionality is *six*. In general, it is possible by proper choice of element to endow any given space with any prescribed dimensionality however high. Accordingly, if by hyperspace is meant a space of dimensionality greater than 3, the notion is simple and near at hand, we need not go beyond ordinary space to realize it, we detect it in the line, in the plane, in ordinary space, here, there and yonder. Well, such is one of the recognized significations of the term. But it has "another," namely, hyperspace usually means a space whose *point* dimensionality is four or more. Now this latter meaning is *logically* and *conceptionally* quite consistent with the other; it is indeed a special case of it; but a hyperspace of *points* is difficult or impossible to *picture*, to realize in *visual imagination*, and it is this non-logical circumstance that renders the term hyperspace at once so tantalizing, mysterious, baffling and fascinating to the non-mathematician. To the mathematician, however, whose activities, so far from being confined within the limits of the visual imagination, lie for the most part quite beyond them, the conception in question offers as such no difficulty whatever, and it has long since

established itself among the most approved of orthodox scientific notions.

**Definition of Hyperspace of Points.**—What, then, is a *hyperspace* of *points*? How is the notion arrived at? And what is its utility? The values of a single continuous variable  $x$  are familiarly representable by the points of a right line; the ordered *pairs* of values of two independent variables  $x_1$  and  $x_2$ , by the points of a plane; and the ordered triplets of values of three independents  $x_1, x_2, x_3$ , by the points of ordinary space. To the analyst with geometric bias or predilection, the suggestion immediately and forcibly presents itself and there *ought* to be a space whose points would serve to represent, as in the preceding cases, all ordered sets of values of  $n$  independent variables  $x_1, x_2, \dots, x_n$ . Such a space is not present to *intuition, vision, or visual imagination*. The mathematician is not in the least concerned, however, whether his two or three dimensional geometry appeals to any visible space or not. His geometry is simply the theory of a certain structure which is exemplified by the system of pairs or triads of numbers, and after an imperfect fashion by the space of our experience. The transition to the theory of the systems exemplified by number tetrads, pentads or  $n$ -ads is simple and natural.

**Co-ordinates, etc.**—In point space of  $n$  dimensions the simplest co-ordinates of the point are the distances  $x_1, x_2, \dots, x_n$  of the point from  $n$  mutually perpendicular point spaces of  $n-1$  dimensions. These co-ordinate spaces, taken  $n-1$  at a time, determine  $n$  co-ordinate axes. A linear equation  $\xi_1 x_1 + \xi_2 x_2 + \dots + \xi_n x_n + 1 = 0$  defines or represents an  $n-1$ -dimensional space of order *one*, the analogue of the plane in ordinary space. The  $\xi$ 's are the *negative reciprocals* of the axial intercepts of the  $n-1$ -space. Holding the  $x$ 's fixed and letting the  $\xi$ 's vary, the foregoing equation will represent a point as envelope of its generating  $n-1$ -spaces. Two such equations together define an  $n-2$ -space as their intersection or a straight line as their envelope. Similarly, three such equations serve to represent an  $n-3$ -space as locus of points or a plane as envelope of  $n-1$ -spaces, and so on. A space that is  $n$ -fold in points is also  $n$ -fold in spaces of  $n-1$ -dimensions. Its dimensionality is  $2(n-1)$  alike in lines and in spaces of  $n-2$  dimensions. In general, its dimensionality is  $p(n-p+1)$  if the point space either of  $p-1$  or of  $n-p$  dimensions be taken as generating element. Not only, however, do the two last-mentioned elements furnish the same dimensionality, but they are indeed reciprocal elements of  $n$ -fold point space, for the same system of equations which on proper interpretation defines one of the elements admits of a second (dual) interpretation defining the other. It thus appears that by taking as elements the various simple spaces of less than  $n$  dimensions for generating elements of  $n$ -fold point space, there arise  $n$  geometries of this space; or, if we regard two reciprocal theories as but two aspects of one geometry, the elements in question yield  $n : 2$  or  $1 + (n-1) : 2$  geometries according as  $n$  is even or odd, the element having  $(n-1) : 2$

dimensions being, in case of  $n$  odd, its own reciprocal, or *self-reciprocal*, like the line in ordinary space. See LINE GEOMETRY AND ALLIED THEORIES.

**Remarks on Four-space.**—Thus point space of four dimensions is also 4-dimensional in ordinary spaces (say *lineoids*), the point and the lineoid being reciprocal elements. It is 6-dimensional in *lines* and also in *planes*, which are also reciprocal elements of this space. It appears that this space, unlike ordinary space, does not admit of self-reciprocal construction. An equation of degree  $n$  in point (lineoid) co-ordinates  $x_1, x_2, x_3, x_4$  ( $\xi_1, \xi_2, \xi_3, \xi_4$ ) represents a locus (envelope) of order (class)  $n$ . If  $n=1$ , the locus (envelope) is a lineoid (point). Two linear equations define a plane as locus or a line as envelope; three, if independent, represent a line as locus or a plane as envelope; and four give a point or a lineoid. In general, two planes have, not a line, but only a point in common; reciprocally, two planes are not in general in a same lineoid. A lineoid being determined by four independent points, it appears that two arbitrary lines determine a lineoid. In 4-space a point can pass from the inside to the outside of a (2-dimensional) closed surface, such as an ordinary sphere, without going *through* the surface, just as in ordinary space a point can pass from the inside to the outside of a circle without *crossing* the circumference. Accordingly, in 4-space a 3-fold solid like the human body could be literally seen through, and no ordinary prison-house could confine.

Do hyperspaces exist? Undoubtedly they have *logical* existence, the *concept* of hyperspace being interiorly consistent and available for thought. More mathematics does not demand. The hypothesis of their "physical" existence, "natural" science may yet be compelled to employ. Indeed it has been conjectured that certain chemical phenomena (as of the carbon compounds) may be due to greater freedom of motion than ordinary space affords. However, except in so far as time and space are part of one 4-dimensional system, as is required by the theory of relativity (q.v.) the observations of physics do not find any clear evidence of a motion in the fourth dimension.

**Bibliography.**—The literature of the geometry (both pure and analytical) of hyperspaces is very extensive. It is, however, chiefly contained in the mathematical journals. All scientific nations have contributed to the subject, the Italians probably more than any other. The best work for the beginner is P. H. Schoute's 'Mehrdimensionale Geometrie' (1902). An excellent explanation, addressed to the non-mathematician, of the concept of 4-space is found in Hermann Schubert's 'Mathematical Essays and Recreations.'

CASSIUS J. KEYSER,

*Adrain Professor of Mathematics, Columbia University.*

**HYPERSTHENE**, a mineral of the orthorhombic pyroxines, similar to enstatite and bronzite, but containing more iron. It is found in crystal forms occasionally, but most generally in granular masses as a large constituent of igneous rocks, such as norite, gabbro, hypersthene-andesite, etc. Excellent specimens are found also in connection with labradorite

and other basic feldspars. The color is brownish-black, sometimes with a bronze-reddish tinge, which responds to polishing and is valued for ornamental purposes.

**HYPERTROPHY**, in pathology, the overgrowth of any part or organ resulting from equal increase of all the constituent parts of that part or organ. It may be caused, first, by an increased exercise of the part, an exemplification of which is seen in the blacksmith's arm; second, by an increased supply of blood to a part, the part being healthy. Hypertrophy, as a rule, is a desirable process, the part or organ in question increasing in size and therefore in function just as much as is necessary to supply unusual demands made upon it. Mere increase of size, as in the case of abscess or tumors, in an organ is not hypertrophy.

**HYPNOTICS** are agents that induce sleep. They may be mental, physical or medicinal. Thus certain kinds of music, the human voice and suggestion may have power to induce sleep, which may also follow from eating, or from a walk, or a warm bath before retiring. All such simple measures should be used before drugs are resorted to in the treatment of insomnia (q.v.). Hypnotics *per se* may be divided into two broad groups — those that induce sleep by alleviating pain and those that have no pain-relieving character. The latter are pure hypnotics. Combinations of the two are frequently employed in medicine. The pain-relieving drugs all come under the head of analgesics (q.v.). The pure hypnotics may be divided into a number of groups based on their chemical relationship, for in this class of drugs the relation between chemical composition and physiological action is peculiarly close. Alcohol is one of the most prominent of the hypnotics, but while it is extensively used to induce sleep, the practice of taking a "nightcap" cannot be regarded as a safe one. Substituted alcohols, however, yield some of the most widely employed of all hypnotics. Chloral, paraldehyde, amylen hydrate belong to this series, while from chloral as a basis a number of allied hypnotics have been made. These are chloralamide, chloralose, chloretone, urethane, etc., which are all regarded as less objectionable than alcohol. They all dilate blood-vessels, relieve spasm and induce sleep. In large doses they depress the heart action. Another group of hypnotics includes substituted sulphur compounds. The most important of these are sulphonal, trional and tetronal. They are all closely allied in chemical structure. Sulphonal is the weakest, tetronal the strongest, trional occupies a middle position. In poisonous doses, and even in small doses if long continued, hypnotics of this group cause a form of chronic poisoning in which the red blood-cells are disintegrated. This is shown by the appearance of a cherry-red or purple-red discoloration in the urine. A third group of hypnotics depends on some form of bromine, as bromides. Sodium bromide, potassium bromide, bromal bromoform, etc., are representatives. These are regarded as the least objectionable. They depress the activity of the brain and are useful hypnotics. If used very long the bromine compounds cause skin-erup-

tions, foul breath and heart-depression. See ALCOHOL; CHLORAL; INSANITY; INSOMNIA; NEURASTHENIA; SULPHONAL.

**HYPNOTISM**, hip'no-tism, the process by which one person, called a hypnotist, obtains, holds and exercises control of the will, voluntary powers and sensory organism of another person, the subject (or victim). The character of hypnotism has been a matter of long dispute, and the literature of the subject is very contradictory, but the facts have finally been demonstrated, and come to the knowledge of a number of advanced physicians, who are endeavoring to promulgate them. Hypnotism has been known and practised through the ages, and is referred to in early writings as the "evil eye." There is no reason to doubt that the sorcerers and wizards of olden times were in many cases hypnotists, whose bewitching consisted in hypnotizing others and taking advantage of the supremacy thus gained over them. Dr. James Braid of England, originator of the word hypnotism, in 1841, gave public exhibitions of hypnotism, brought on by inviting the subjects to blank their minds and gaze on a bright object, and then by exercising his will to overcome their wills. Because he made no conscious use of animal magnetism, Braid thought he had discovered something different from mesmerism—the name given to hypnotic therapeutics as practised by Franz A. Mesmer at Paris late in the 18th century. But it is now apparent that mesmerism and hypnotism are identical, except in the method of inducing the state of artificial somnambulism. It has also been demonstrated that the mediumistic trance is accomplished on the same underlying principle—that of robbing the subject or victim of his will power by a partial or total paralysis of the brain. It is also now known that hypnotism is ~~not~~ the harmless pastime ~~and~~ the wonderful curative agent which it has long been ~~supposed to be~~. It is granted by all authorities on the subject that one person may surrender his will, and be put into an abnormal hypnotic sleep through exertion of the will of a hypnotist, and that in this condition the subject or victim can be made to do very many foolish and ridiculous things for the amusement of spectators, or he may be put into such a deep coma that a surgical operation can be performed without his knowledge or feeling any pain, the hypnosis serving the purpose of an anæsthetic. The discovery that hypnotism could be used to put patients to sleep for severe operations was hailed by the surgical profession with delight, as the anæsthetics generally used are not wholly satisfactory. It led to the practice of hypnotism by various medical men, and some of them undertake to use it to cure bad habits, such as the liquor habit, by so-called "suggestion" to the patient while he is under hypnotic influence.

That all practice or experiment with hypnotism is wrong and harmful is not at first apparent, and has been suspected only by a minority. Those stage exhibitors who found money in it, and those physicians who found it an interesting addition to their stock of methods of cure, have generally been loud in defending the practice when attacked, and unquestionably most of the physicians have been

honest in such defense. The continued delusion on the subject has been due largely to the misuse of the simple word "suggestion"—there being so many suggestions which are harmless, and which are employed legitimately to effect cures by stimulating the faith of the patient. Faith is indeed a powerful curative agent, according to views held by many physicians.

But the so-called "suggestion" of hypnotism is a very different thing, because what the hypnotist really does is to paralyze the normal action of the brain of his victim, and rob him of his will power; and then to give him, while this helpless state continues, imperative commands which he is powerless to resist, because he is for the time—in just so far as he is controlled—a slave to the will of his hypnotist. To call this "suggestion" is somewhat like applying the term suggestion to the act of the highwayman who orders one to hand out his money at the point of a revolver.

Foster's 'Medical Dictionary' defines hypnotism as "an abnormal state into which some persons may be thrown . . . by the exercise of another person's will, and consequent obedience to the suggestions."

The 'Standard Dictionary' defines mesmerism as "an abnormal condition resembling sleep, with or without somnambulism, during which the mind of the subject remains passively subject to the will of the operator."

Dr. John D. Quackenbos, in his work on 'Hypnotism in Mental and Moral Culture,' states: "It has long been known that a human being can be thrown into an artificial sleep, during which he sustains such a relation to an operator who has induced it that he is sensitive only to what the operator tells him he is sensitive to, and is wholly subject, so far as his mental operations and physical actions are concerned, to the volition of his hypnotist. A hypnotized person sees, hears, tastes, smells and feels what the operator says he sees, hears, tastes, smells and feels—and nothing else. For the time being his individuality is surrendered to the person who has hypnotized him."

Dr. James R. Cocks says on page 35 of his work on 'Hypnotism': "The moralists . . . are right to condemn a practice which may rob a man of his free will without the possibility of resistance on his part."

Dr. Luys, of the Charity Hospital of Paris, in his 'Clinical Lectures,' says: "You cannot only oblige this defenseless being (hypnotized subject), who is incapable of opposing the slightest resistance, to give from hand to hand anything you choose, but you can also make him sign a promise, draw up a bill of exchange, or any kind of agreement. You can make him write an holographic will, which he will hand over to you, and of which he will never know the existence. He is ready to fulfil the minutest legal formalities, and will do so with a calm, serene and natural manner, which would deceive the most expert law officers. The somnambulist will not hesitate, either, you may be sure, to make a denunciation, or bear false witness. They are, I repeat, the passive instruments of your will."

Prof. L. A. Harraden, in his book 'Hypnotic Exhibitions' (p. 10), relates how "Nancy thereupon made a man of straw and placed it, unknown to the patients, in a well-known

professor's bed. A properly submissive subject was next chosen, put to sleep and furnished with a real dagger. He was then ordered to go and stab the sleeping professor through the heart. The sensitive promptly obeyed in an unmistakably thorough and decided manner."

This same Prof. L. A. Harraden, in 'Hypnotism Made Easy,' p. 5, says: "The subject . . . responds as automatically as a locomotive obeys the manipulations of its driver. He is, indeed, for the time, a mere thinking automaton. He is given up to the domination of any idea that may be made to possess him. . . . His mind, having lost its power of self-direction, cannot shake off the yoke of any dominant idea, however tyrannical, but must execute its behests." He says also on p. 4; "The subject is insensible to his surroundings and yet under perfect control of the operator, who may direct his thoughts into any channel desired and compel him to execute any command."

Dr. J. D. Buck of Chicago writes in 'Life and Action' (Vol. II, p. 368) of a subject or victim of hypnotism: "In whatever degree he is dominated or controlled by the will, wish, idea or purpose of another, incarnate or ex-carnate, to precisely that degree, to the last scruple, is he a *Slave* in his own house, un-rational and irresponsible."

In *Psychical Research* ('Proceedings') (Vol. XI, p. 146) Charles L. Tuckey says of Dr. E. Mesnet of Paris: "He comes to the same conclusion as Bernheim and Leigeois, of Nancy, that these highly sensitive subjects can be subjected to ill treatment, made to sign documents and impelled to commit crimes by hypnotic suggestion."

'The Great Work,' edited by F. Huntley, p. 158, states: "The hypnotic process . . . may be set in motion by any person who possesses the necessary intelligence and will-power, quite regardless of his moral status; . . . it may be invoked by a criminal of the most vicious and degenerate character."

Moreover such subordination is progressive in its insidiously evil tendencies; for, as it has been truly said, the condition is more readily induced the second time than the first, the third time than the second, the subject ultimately becoming so pliant to the will of the operator that a fixed look or a wave of the hand may compel instant obedience.

Dr. I. Sossnitz of New York writes: "Hypnotism is certainly not a cure for any disease. On the contrary, it is harmful in its final effect. The eminent French physician, Charcot, discarded it after a thorough trial, and many other prominent physicians have given it up as harmful. The mysterious and fascinating methods involved in hypnotism, and, above all, the lack of understanding of the fundamental points of hypnotism, are responsible for the successful spreading of this misleading and dangerous 'art.'"

A "modern instance" should find place here, and such an instance is recorded in the files of Chicago newspapers of June 1906. On the 22d of that month Richard G. Ivens, of Chicago, a peaceful, temperate, well-behaved young man of 24, of rather weak will but good character, was hung, having been found guilty

by a jury "of very moderate intelligence" of assault and murder of a young woman. His lawyer presented a good alibi, but the evidence against him was a confession twice obtained by the police under "third degree" methods, and repeated somewhat differently by him in court, but which he at "all other times" repudiated, saying he was innocent. J. Sanderson Christisen, a reporter assigned to the case, who knew something of hypnotism, was so convinced that Ivens was hypnotized on the occasions of the confession and corroboration and wholly innocent of the crime, that he republished the entire case in pamphlet form and sent copies to leading psychologists. On the statements of this pamphlet, Profs. William James and Hugo Münsterberg of Harvard, Dr. Max Meyer of the University of Missouri, Dr. Herbert A. Parkyn of the Chicago School of Psychology, Dr. Joseph Jastrow of the University of Wisconsin and others expressed their belief, some of them quite emphatically, that Ivens' confession was not true, and bore every evidence of being produced by hypnosis.

The foregoing citations are made to emphasize the ample scope of the evidence that hypnotism, when complete, robs the subject or victim of his will power, of his self-control and substitutes the control of another person. The honest physician hypnotist, who still believes in hypnotism as a therapeutic agent, has to face these facts: All authorities agree that hypnotism is an artificial, unnatural or abnormal sleep; they all agree that the victim is robbed of or loses his will power for the time; they all agree that his bodily functions respond to the will of his hypnotist. The victim is robbed of his will just as surely as if he were doped with whisky or morphine, but in addition the robber obtains control of his will. But nature gives an individual power through his will to control his own functions, obviously for the purpose that he and he alone may control them and be responsible; and so long as he exercises his will actively he sets up a barrier that no hypnotist can break down. This is why the hypnotist tells his subjects they must blank their minds and be passive.

These conclusions point to another interesting scientific fact which is making its impress on the scientific world. Mediumship has puzzled the leading scientists for over 50 years. They set out through the *Psychical Research Society* to prove mediumship and spiritualism a sham, and in the end Prof. Oliver Lodge, one of England's leading scientists, admits he is convinced of the reality of these things, and asserts that he has communicated with the spirits of the dead. Lombroso, Flammarion, Stead, Nordau and a host of others now admit Dr. J. M. Peebles' contention that it is possible to communicate with discarnate intelligences. If this be true, the process must be in harmony with universal laws of nature. That there is such a process, and that it is based on the control of the magnetic element of one person's being by another, as in hypnotism, is now confidently urged by many. *See Spiritualism.*

ular Review, New York 1914); Moll, A., 'Hypnotism' ('Contemporary Science Series,' Vol. IX, London 1913); Wilkinson, S., 'Recent Experience in Hypnotic Practice' (*American Society for Psychological Research Proceedings*, New York 1914); Willcox, W. H., 'Use and Abuse of Hypnotics' (*British Medical Journal*, London 1913).

**HYPOCHLOROUS ACID**, an acid having the chemical formula  $\text{HClO}$ , which is formed when chlorine monoxide,  $\text{Cl}_2\text{O}$ , is dissolved in water. The most convenient method of preparing it is by distilling a mixture of dilute nitric acid and a salt of hypochlorous acid. The sodium salt of hypochlorous acid known as sodium hypochlorite,  $\text{NaClO}$ , may be prepared by passing a stream of chlorine gas through a cold dilute solution of caustic soda,  $\text{NaOH}$ ; the reaction being  $2\text{NaOH} + \text{Cl}_2 = \text{NaClO} + \text{NaCl} + \text{H}_2\text{O}$ . Potassium hypochlorite may be prepared in a similar manner. Crude calcium hypochlorite,  $\text{Ca}(\text{ClO})_2$ , known in the trade as "bleaching powder," is prepared by acting upon slaked lime with chlorine gas. Hypochlorous acid and the hypochlorites possess powerful bleaching properties, owing to the readiness with which they part with a portion of their chlorine or of their oxygen. (See BLEACHING). Hypochlorous acid is only known in its aqueous solution, which is a colorless liquid, with a peculiar smell. It decomposes readily with the liberation of chlorine, and the formation of chloric acid,  $\text{HClO}_3$ , the decomposition proceeding rapidly in the sunlight. Hydrochloric and sulphuric acids also decompose it with liberation of chlorine, the reaction in the case of hydrochloric acid being  $\text{HClO} + \text{HCl} = \text{H}_2\text{O} + \text{Cl}_2$ . Heat decomposes the hypochlorites, with formation of the corresponding chlorates and chlorides.

**HYPOCHÆRIS**, *hi-pō-kēr'is*, a genus of plants of the family *Compositæ*. The leaves resemble those of the dandelion, with more hairy surface, and the flowers are arranged and formed like the dandelion, but are smaller. It is generally relished by cattle. The most common species is *Hypochæris radicata*, found abundantly in fields in Great Britain and Europe, and in the eastern United States. The common name is long-rooted cat's ear.

**HYPOCHONDRIASIS**, *hi-pō-* or *hip'-ō-kōn-dri'a-sis*, a morbid condition of the mind in which an individual fears himself afflicted with various diseases. The name comes from the ancient belief that the symptoms of this disorder came from perversions of the vital force in the liver and pylorus of the stomach. The tendency to this condition is frequently inherited; it is more common in males, and is sometimes brought on by excesses. Patients afflicted with hypochondriasis are apt to watch for any expression of abnormality in their bodies, to connect various symptoms, and to reach the conclusion that they are sufferers from some disease. In conditions of perfect health any individual may have slight, temporary twinges of pain, or may show passing changes in the functions of the organs; but by the hypochondriac these abnormalities are seriously regarded, and efforts to disabuse him are usually futile. Such constant fear and worry divert the nervous energy from its proper course, and may cause actual disturbance of the bodily functions that

are serious. The condition known as neurasthenia may follow; also, more rarely, true melancholia. The milder cases continue in actual good health, but become an unhappy burden to themselves and others. In the treatment it is to be remembered that mental occupation outside of the thoughts of self is essential to a cure.

**HYPOCOTYL**, *hi-pō-cōt-īl*, the axis which supports the cotyledons of seed plants. The growth of this part of the plant raises the embryo and holds it in place. Darwin considered it the most sensitive and active organ of the seed plant in its earliest stages.

**HYPOCYCLOID**, in geometry, a kind of roulette, the path traced in the plane of a fixed circle by a point in the circumference of another circle which rolls inside of the fixed circle. It is the opposite of the epicycloid, or the curve traced by a point in the circumference of one circle which rolls on the outside of a fixed circle. In this connection two other roulettes or trochoids may be mentioned: (a) The epitrochoid, the curve traced by a point on the radius (or radius prolonged) of a rolling circle, but not on the rolling circle, but only on the outside of the fixed circle. (b) The hypotrochoid, a curve generated in every respect like the epitrochoid, but with the exception that the generating or rolling circle runs only along the inside of the fixed circle. See CYCLOID; TROCHOID.

**HYPODERMIC INJECTION** (Greek *hypo*, under; *derma*, skin), a method of introducing medicines through the skin into the subcutaneous cellular tissue, sometimes deep into the fibres of a muscle by an instrument specially made for the purpose. This instrument is the hypodermic syringe, which is made of glass, with a graduated scale engraved on it, and fitted with a long, hollow, needle-shaped point of steel. It must be filled before using, to prevent the possibility of introducing air into the veins. Hypodermic injection should never be resorted to excepting under the specific directions of a physician and patients are distinctly cautioned against using "the needle" on themselves. A little carelessness in sterilizing may result in forcing germs into the system, resulting in abscesses or blood-poisoning.

**HYPODERMIC MEDICATION**, as opposed to endermic medication, means the administration of medicine by piercing the skin with a hypodermic needle so as to throw the drug directly into the circulation, and bring it immediately in contact with the seat of pain, if pain is to be treated. There are some drugs which act on the system in a manner which differs in accordance with the method of their administration; thus podophyllin is a powerful cholagogue when administered through the mouth; when administered hypodermically it promotes the secretion of the kidneys. There are, however, distinct advantages of a general character in this method of administering drugs. The action of the drug is more rapid, sometimes instantaneous; the effect is concentrated and intensified; it takes a smaller dose to produce the desired effect; it is sometimes easier and pleasanter than administration by the mouth, and often obviates unpleasant or even dangerous complications. The process of hypodermic injection was invented and brought into vogue by Dr. Alexander Wood of Edinburgh.

**HYPODERMIS**, in plants, a layer of cells underlying the epidermis. Tissues juxtaposed to the hypodermis and cells originating directly under the epidermis are called hypodermal.

**HYPODERMOCLYSIS**, hī'pō-dēr'mōc-lī'siz, the subcutaneous infusion of saline solution, which is steadily replacing blood transfusion in operations. See TRANSFUSION.

**HYPOGENE**, a term applied to the internal forces of the earth that produce deformation of the crust. See GEOLOGY.

**HYPOPHOSPHITES**, salts of hypophosphorus acid (q.v.).

**HYPOPHOSPHOROUS ACID**, an oxyacid of phosphorus, having the formula  $H_2PO_3$ . The free acid is of no importance in the arts, but its salts, which are called "hypophosphites," are used in medicine. The acid is monobasic, only one of its hydrogen atoms being replaceable by a metallic atom. Sodium hypophosphite,  $NaH_2PO_3 + H_2O$ , may be prepared by acting upon caustic soda with phosphorus, phosphoretted hydrogen being given off, while sodium hypophosphite remains in solution. It crystallizes in small, rectangular tablets, which are easily soluble in water and in absolute alcohol. The evaporation of solutions of this substance is often attended by explosions. Barium hypophosphite,  $Ba(H_2PO_3)_2 + H_2O$ , may be prepared by heating baryta,  $BaO$ , with phosphorus and water until the elimination of phosphoretted hydrogen has ceased, the excess of  $BaO$  being then removed by a current of carbon dioxide, after which the solution is filtered and crystallized. Barium hypophosphite crystallizes in monoclinic needles, which are soluble in water, but insoluble in alcohol. Calcium hypophosphite may be prepared in the same manner as the barium salt. It has the formula  $Ca(H_2PO_3)_2$ , and crystallizes in thin, monoclinic tablets, which are soluble in six parts of water, but insoluble in strong alcohol. Free hypophosphorous acid may be prepared by decomposing the barium salt with sulphuric acid, and evaporating the solution at a temperature not exceeding  $230^\circ F$ . It crystallizes in large white tablets, which melt at  $63^\circ F$ ., and are decomposed by heat, with the formation of phosphoretted hydrogen and ordinary tribasic phosphoric acid.

**HYPOPHYSIS**. See PITUITARY BODY.

**HYPOSCOPE** (from Greek words meaning "to see under"), is the name given to an instrument adapted to be secured to the stock of a rifle near the breech, and intended to enable a marksman to fire with accurate aim without exposing his head to the fire of the enemy. The successful American contestants for the Palma trophy at Bisley, England, in 1903, brought back with them this device, which seems likely to play an important part in the warfare of the future. It was invented by William Youlton of Brighton, England, who conceived the idea of it after the battle of Colenso in the Boer War, during which it is stated that not a single Boer was to be seen. Later in the war it was employed with good results, its use at Mafeking receiving particular mention.

The hyposcope consists of a series of mirrors mounted in a tube of inverted L shape; the shorter arm lies across the barrel of the rifle, while the longer arm hangs down at one side.

The first mirror reflects the light coming in along the barrel of the rifle to a second mirror at the elbow of the instrument, which directs the rays downward to a mirror at the lower end of the tube, and thence it passes out at right angles to the eye. Thus on looking in at the eyepiece one can see the sights of his rifle, and take accurate aim while holding the gun above his head. The vertical arm of the instrument comprises two telescoping sections so that, by means of a thumbscrew at the side, this arm may be extended to elevate the device for long-range shooting. The amount of elevation may be accurately determined by means of a fine scale on the upper section. In order to allow for windage, a thumbscrew at the end of the horizontal arm may be rotated to move the mirror contained therein slightly to one side or the other. A scale on this arm shows just how far the mirror must be moved for different velocities and directions of the wind. The entire instrument is very compact and light, weighing about a pound. It is provided with a holster in which it may be encased to prevent it from sustaining any injury when not in use.

The advantages of this instrument in actual warfare will be apparent to all. Only the muzzles of the rifles are exposed to the enemy, and the soldiers are entirely concealed in the trenches. But aside from its advantages as a means of protection, the device will be found greatly to increase the effectiveness of the firing. The fear of being shot while taking aim makes the soldier fire hurriedly and at random; with the hyposcope attached to his rifle no fears will be entertained, and the soldier may fire deliberately and with perfect aim. By applying it to the end of a field-glass, an observer can watch the movements of the enemy without danger of discovery. It has also been designed for use on Maxim guns. Hyposcopes and similar instruments were much used by snipers during the great World War.

**HYPOMATIC UNION**, the union of the divine and human nature in the one person of Jesus Christ. See TRINITY and related references.

**HYPOTENUSE**, in geometry, the longest side of a right angle triangle, opposite the right angle. According to Euclid, the square on the hypotenuse equals the sum of the squares of the other two sides, a theorem whose proof is generally attributed to Pythagoras. Recent research has discovered similar proofs in Egyptian and Chinese philosophies, considerably pre-dating the Greek philosopher.

**HYPOTHEC**, **HYPOTHECATION**, a property lien arising from the operation of law or from a special agreement or contract. In Roman law it empowered the creditor to seize and dispose of the debtor's property. If more was realized from the sale than the amount of the debt such amount was returned to the erstwhile debtor. The debt might arise similar to a mortgage or a lien. See LIEN; MORTGAGE; REAL PROPERTY.

**HYPOTHESIS**, in logic, the antecedent of a conditional proposition. An extensive mathematical or scientific investigation often assumes the form of a vast conditional proposition. In such a case the hypothesis is usually stated once for all at the beginning and taken for granted in the rest of the investigation.

Mathematics is neither more nor less than the study of hypotheses of this type and the deduction of their logical consequences. Thus the axioms of Euclidean geometry form the hypothesis on the basis of which the propositions of geometry are proved. In natural science the truth of the hypothesis, which is a matter of indifference to the mathematician, is of fundamental importance. As this is but rarely, if ever, subject to a direct inspection, and cannot always be deduced from known generalizations, a hypothesis is generally established or destroyed by reference to its logical consequences. While a single unfulfilled consequence of a hypothesis is sufficient to refute it, no number of verified consequences, however large, is adequate to its complete demonstration. However, hypotheses have certain properties, by virtue of which their degrees of difference or similarity may be compared. It is, moreover, a principle generally valid that the fewer and less important are the details in which a hypothesis breaks down, the slighter will be the difference between it and the true hypothesis. Thus a scientific hypothesis, which at first furnishes only a very crude approximation to the observed facts, by the gradual remodeling of detail after detail, comes as close to the truth of the matter as may be desired. The Darwinian hypothesis of natural selection is a good example of this; slow variations have been found an insufficient basis for evolutionary changes, and have been replaced by mutations; the theory of the inheritance of acquired characteristics has been discarded; and the whole notion of the survival of the fittest has been accommodated to these changes in opinion. The modern theory of evolution is thus more firmly established than its predecessor, though it still remains a hypothesis capable of further rectification. See INDUCTION.

**HYPOTHETICAL QUESTION.** See EVIDENCE.

**HYPOXANTHINE.** See SARCINE.

**HYPSONOMETRY** (Greek, "height-measurement"), the art of determining differences of elevation on the earth's surface. Three distinct modes of procedure may be adopted for measuring a given difference in level. The first and most accurate of these consists in running a "line of levels" between the two stations whose difference in height is to be determined. This operation is conducted as follows: Let A, B and C be any three points on the earth's surface, such that the difference in level between any two of them is not more than a few feet; and let us suppose that B lies between A and C, and that it is not more than a few hundred feet distant from either of them. A precise spirit level is set up at B, so that its telescope is higher than either A or C. A graduated staff is then held in a vertical position upon the point A, and the observer at the level determines, by looking through the telescope, which division of the staff is of precisely the same height as the cross-hairs of his instrument. If the height of A is known, we have merely to add to it the known length of the graduated staff, from the ground up to the division that has been observed, in order to ascertain the exact height of the cross-hairs of the level. The staff is next carried forward to the point C and a second observation of the

same kind is made upon it at this point. The height above the ground of the division that is here found to be on a level with the instrument is then subtracted from the known height of the cross-hairs in the telescope and the result is the height of the point C. The instrument is then carried forward to a point, D, situated beyond C, and the altitude of a still more remote point, E, is determined in the same manner, by observing the graduated staff at C and at E, and then calculating the height of E from the known height of C, as determined by the preceding operation. A chain of observations of this sort is called a "line of levels," and it is obvious that the difference of elevation of any two points whatever may be determined with great precision by running such a line from one of them to the other.

The labor and expense of joining two distant points by a line of precise levels are often prohibitively great; and hence when a high order of accuracy is not essential, trigonometric or barometric methods are used instead. In determining the height of a mountain (for example) by the trigonometric method, a conveniently situated station is selected, from which the summit of the mountain can be well seen and the horizontal distance from this station to the vertical line passing through the summit of the mountain is first determined by any of the methods used by surveyors for determining the distance of an inaccessible object. The apparent angular elevation of the mountain is next observed; that is, the angle included between the horizontal plane through the station and the line joining the station to the top of the mountain is measured. If the earth were flat and devoid of any atmosphere, these data would enable us to compute the height of the mountain with considerable precision. For the vertical height of the mountain above the station and its horizontal distance from the station, and the line joining the station to its summit, would constitute the three sides of a right-angled triangle; and the base of this triangle being known, as well as one of the adjacent angles, its vertical height (that is, the height of the mountain above the observing station), could be easily calculated by the ordinary rules of trigonometry. In the actual case, however, the problem is complicated by the curvature of the earth's surface and by the refraction effects due to the presence of the atmosphere. Corrections can be easily applied for the curvature, since that is constant in any given spot, and its value is well known. The refraction effects, however, are variable from time to time, according to atmospheric conditions; and it is impossible to determine them, at any given moment, with a precision sufficient to enable the trigonometric method to compete, in accuracy, with the method of leveling already described.

The third general method of determining elevations on the earth's surface depends upon the fact that the atmosphere possesses weight, so that its pressure diminishes as we pass upward. The difference in depth of two given points below the surface of the sea can be determined with a good deal of precision by noting the hydrostatic pressures at the two points. If these pressures are expressed in pounds per square foot and their difference is divided by the weight, in pounds, of a cubic foot of the

water, the quotient will be the difference in depth of the two points, expressed in feet. The same general principle applies to the determination of the differences of elevation in the atmosphere, only in this case the problem is far less simple in its actual application, because the air, instead of having a practically constant density as water has, is very elastic and compressible and very sensitive to changes of temperature. The observations, therefore, have to be combined by means of a formula which will take these facts into account, so far as possible. In determining differences of height by this method (which is called "barometric hypsometry"), the difference in atmospheric pressure at the two points that are to be compared is usually determined by means of barometric readings, though the boiling-point method, to which reference will presently be made, is also used. The mercurial barometer gives the most accurate results, but the aneroid form is so much more convenient to manipulate and transport that it is commonly preferred for ordinary work. (See BAROMETER). When the difference of elevation between two given stations is to be determined, it is preferable to make the barometric observations at both places simultaneously, simultaneous observations of the atmospheric pressure being also taken. This implies the co-operation of two observers and the possession of two sets of instruments; and hence it is not always feasible. When the work is carried out by a single observer, or with a single set of instruments, the observations should be made first at Station A, then at Station B and finally at Station A again; the average readings at Station A, both of barometric pressure and of temperature, being adopted as the definite observations at that station. In this way the effects of variations of temperature and pressure are eliminated as far as possible. If  $h$  is the average reading of the barometer at the lower station, in inches, and  $H$  is the reading of the barometer at the upper station, also in inches, and if  $f$  and  $f'$  are the temperatures observed at the two stations, on the Fahrenheit scale, then the difference in height between the two stations, as expressed in feet, is approximately

$$(\log h - \log H) \times 60,158.6 \times \left(1 + \frac{f + f' - 64}{900}\right)$$

In place of the barometer, an instrument called a "hypsometer" is sometimes used for determining the difference in barometric pressure between the two stations. The hypsometer is essentially an instrument for determining the boiling point of water with a considerable degree of precision. Water, which at the normal atmospheric pressure boils at 212° F., boils at a lower temperature on the tops of mountains, where the atmospheric pressure is less. The change in the boiling point is approximately 1° F. for every 511 feet of ascent; though this relation is not exact. In the practical application of the method, the boiling point is observed, on the mountain top, by an accurate thermometer which should be graduated as fine as fiftieths of a degree on the Fahrenheit scale. The difference between the temperature so obtained and 212° F. is then multiplied by the constant factor 511 and added to  $n(n-1)$ , where  $n$  is the difference in temperature, and the result is the desired estimate

of the height of the mountain above the sea. This procedure, it will be seen, assumes that at the time the observation is made, the atmospheric pressure at the sea-level has its normal (or average) value, so that water would boil there at 212° F. precisely. This condition will seldom be more than approximately fulfilled, and hence the method by boiling points, as usually carried out, is more uncertain than the barometric method as described above. The thermometric method is very convenient, however, and for this reason it is in strong favor among travelers and explorers, who usually are content with a more or less rough approximation to the height to be measured. The method is capable of being refined further than has here been indicated; but when more accurate results are desired than are obtainable by the process as described above, it is better to make use of simultaneous readings of the barometer and thermometer, at the two stations to be compared. (See SURVEYING). Consult Johnson, 'Theory and Practice of Surveying' (17th ed., rewritten by L. S. Smith, New York 1913).

**HYRACODONTS**, small, long-legged, slender, swiftly-running prototypes of the rhinoceros of the early Tertiary. They had short heavy heads and no horn on the nose, so that they depended entirely on their speed for safety and had much the look and manners of the primitive horses. The group (*Hyracodontidae*) was a large one, but the typical hyracodonts were confined to the Eocene and Oligocene periods of North America.

**HYRACOTHERIUM**. See HORSE, EVOLUTION OF THE.

**HYRAX**, *hīraks*, the type-genus of a group of small rabbit-like animals forming the group *Hyracoidea*. There are two species, not very sharply defined, the daman (*H. Syriacus*), which spreads from the African shores of the Red Sea to Syria, and the Klipdas, or dassy (*H. Capensis*), which ranges from Abyssinia to the Cape of Good Hope. The former is the animal meant by the Scripture reference to "conies," as a "feeble folk." They are gregarious, plant-feeding, and make their homes among loose rocks, where they are little seen during the day. Hence English settlers called them rock-rabbits. The zoological position of these animals is astonishing in view of their size, appearance and rodent-like habits, for they are most nearly related to the elephant and rhinoceros. In west-central Africa live two or three small arboreal species (*Dendrohyrax*). O. Thomas (Proceedings of Zoological Society of London) says that the rules of priority require that the family and genus should be called *Procaviidae* and *Procavia*. They are believed to be little modified descendants of the *Condylarthra*.

**HYRCANIA**, Asia, an ancient district, south of the Caspian Sea, bounded on the east by the Oxus River, and on the southeast by the Elburz (formerly Sariphi) Mountains, which marked the boundary between the district and Parthia; and on the west by Media. Hyrcania covered the territory now occupied by Mazanderan and Astarabad. Its chief city was called Tape by Strabo, and was probably situated on the site of the present city of Astarabad.

**HYRCANUS** (hēr-kā'nūs) I, JOHN HYRCANUS, a Jewish high-priest and prince of the Asmonean family, who ruled in 135-105 B.C. He was the son and successor of Simon Maccabæus. At first dependent on the Syrians, he succeeded in throwing off their yoke, and also in subjugating the Samaritans. He next overcame the Idumæans, and obliged them to submit to Judaism. He afterward confirmed his powers by an alliance with the Romans and made Judæa more powerful than it had been since Solomon's time. He was originally a Pharisee, but ultimately favored the Sadducees.

**HYRCANUS II**, high-priest of the Jews and prince of the Asmonean family, who ruled intermittently from 69 B.C. to 30 B.C. He was the grandson of Hyrcanus I. His younger brother, Aristobulus, seized the government, and finally Pompey removed Hyrcanus from the kingship, and made Antipater of Idumæa governor of the colony. In 47 B.C. Cæsar proclaimed Hyrcanus tetrarch and high-priest. Antigonus, son of Aristobulus, deposed Hyrcanus and removed him to Seleucia, whence later, at the request of Herod, he returned to Jerusalem, where he was finally put to death (30 B.C.).

**HYSLOP**, his'löp, James Hervey, American psychologist and educator: b. Xenia, Ohio, 18 Aug. 1854. He was graduated from Wooster University (Ohio), studied also at Leipzig and the Johns Hopkins universities, taught successively in Lake Forest University, Smith College and Bucknell University, and was appointed professor of logic and ethics in Columbia University. He became well known for his connection with the investigations of the Society for Psychical Research, of which he is the secretary, and as editor contributed extensively to its proceedings and *Journal*. His further work includes articles in prominent periodicals; an edition of Hume's 'Ethics' (1893) with introduction; a textbook on 'The Elements of Logic' (1892); one on 'The Elements of Ethics' (1895); 'Democracy: A Study of Government' (1899); 'Logic and Argument' (1899); 'A Syllabus of Psychology' (1899); 'Problems of Philosophy' (1905); 'Science and a Future Life' (1905); 'Enigmas of Psychic Research' (1906); 'Psychic Research and the Resurrection' (1908); 'Psychic Research and Survival' (1913).

**HYSSOP**, his'tip (*Hyssopus*), a genus of plants of the family *Menthaceæ*, with four straight diverging stamens and a 15-ribbed calyx. The common hyssop (*H. officinalis*) is a perennial shrubby plant about two feet in height. The leaves stand in pairs without petioles. The flowers are blue, growing chiefly on one side of short verticillate spikes. It is a native of the south of Europe and the East, and is sparsely naturalized in the United States. The leaves have an agreeable aromatic odor, and an extract from them is produced by water and spirits. The hyssop of Scripture (that is, the plant whose Hebrew name *ezob* has been translated "hyssop") has not been ascertained. As it "grew out of the wall," it must have been a diminutive plant, and may have been one of the mosses. The most probable and most widely accepted view is that it was the caper-plant (*Capparis spinosa*), but it is not unlikely that the name was applied to several plants of

somewhat similar properties. The name of hedge-hyssop is applied to species of plants of the genus *Gratiola*, belonging to the family *Scrophulariaceæ*.

**HYSTASPES**, his-täs'pēs, the name of several persons in Persian history: (1) The father of Darius I, who, while ruler of Persia, made his son governor of Parthia. He has sometimes been identified with Vishtaspa, the patron of Zoroaster in the Avesta, but later historical research has established the impossibility of this theory. (2) The son of Darius I, and brother of Xerxes. He is mentioned as having led a contingent of Bactrians and Sacæ in the army of Xerxes. Consult Jackson, 'Zoroaster, the Prophet of Ancient Iran' (New York 1898); and Justi, 'Iranisches Namenbuch' (Marburg 1895).

**HYSTERESIS**. See MAGNETISM.

**HYSTERIA**, a morbid state of the nervous system in which the clinical manifestations present a wonderful variety of symptoms closely simulating some forms of organic disease. There is often increased physical irritability; the condition is frequently manifested by neuralgic pains, hyperæsthesias, hallucinations and convulsive and paralytic phenomena. It may be regarded as a brain affection—a mild insanity.

Among the causes of hysteria heredity plays a most important part. There may be direct transmission of the hysterical temperament from parent to child or other nervous manifestations in the family and its branches, such as epilepsy, chorea, neuralgia, insanity, etc. It occurs more frequently in women, but it is much more common in men than is ordinarily believed; it occurs in boys and girls at a tender age or about the time of puberty. Briquet found that one-eighth of his cases were in children under 10 years of age. Anything which lowers the general tone of the nervous system may give rise to it in predisposed persons. Hæmorrhages, severe illness, poor food, anæmia, overwork in uncongenial occupations, anxiety, fright, jealousy, disappointments, make a profound impression; so does an education which fosters and stimulates inherited instability. The enforced social restrictions of women, which they often inflict upon their young children, with lack of proper exercise for physical development and an artificial and premature education and habits heighten this predisposition. Accidents are a frequent cause of the first appearance of hysteria, as has been clearly pointed out by Charcot. The disease may, at times, occur in young girls who have witnessed attacks in others.

To understand the symptoms of hysteria, it must be borne in mind that there are two classes of phenomena. These have been termed the *mental stigmata* and the *mental accidents*. The stigmata are anæsthesias (loss of sensation), amnesias (forgetfulness), abulias (loss of will power), motor disturbances and modifications of character. These are the cardinal symptom-groups that characterize the mental state of the hysteric. Any or all of the mental accidents may likewise be noted—suggestibility and sub-conscious acting, fixed ideas, ecstasy, automatism, convulsive movements, sleep-walking, deliriums, etc. The occurrence of these constitutes important corroborative evidences of

hysteria and while not found in all hysterics, they may be very common symptoms.

Hysterical persons often complain of some of the symptoms found in neurasthenia — neuralgic pains in various parts and hyperæsthetic areas about the abdomen, chest or back, frequently in the neighborhood of the ovary, mammary gland, etc. There may be anæsthetic patches in various parts of the body or there may be complete loss of sensation on one side associated with anæsthesia of the mucous membranes. The special senses on that side are involved — sight, taste and hearing.

There may be irritations of the bladder and urethra; pain in the joints, which may be mistaken for joint disease.

In some cases the senses are exceedingly acute. Persons notice odors imperceptible to others; are often made sick by odors which do not affect normal individuals; may have a liking for odors and substances disagreeable to others. Perverted sense is shown in an abnormal taste, in eating soap, slate-pencils, etc. Hysterical manifestations in some are simply emotional exaggerations; they laugh and cry without cause. In serious attacks there are likely to be various hysterical manifestations. Occasionally tactile sensibility is disturbed and the muscular sense may be abolished. The anæsthesia may affect the mucous membranes of mouth, pharynx and nose, abolishing the reflexes of the parts. The secretions may be diminished or arrested.

Spasmodic convulsions and paralytic phenomena may occur. The spasmodic attack may be rhythmic; may simulate the trembling of organic disease; may be confined to one member or involve the entire half of the body; may be coarse, as in disseminated sclerosis, or a fine tremor, as in paralysis agitans, or the tremor may simulate the trembling of organic brain disease. It may occur in any muscle or group of muscles; may manifest itself as contracture, which may be intermittent or may last continuously for months or years. Contracture may be confined to the strong muscle of the jaw and other muscles in their neighborhood, causing trismus. Spasms of the glottis may take place giving rise to severe difficulty in breathing; or of the pharynx, causing difficulty in swallowing. Globus hystericus is a constant symptom, but is not as frequent as it is often thought to be. Persistent and severe vomiting often occurs, but the nutrition rarely suffers materially from these attacks. Retention of urine is frequent, owing to spasm of the sphincter, and the catheter may have to be used for months.

Paralysis occurs in these cases; it is variable in distribution and may come on suddenly after a convulsive attack or without it; it may be flaccid or associated with contracture; it may come on slowly; it may be confined to one limb or be hemiplegic in type.

Hysterics are easily affected by pleasurable or painful impressions, and there is often a morbid craving for sympathy and attention. They may show moral perversion; may lie, steal, quarrel with and intrigue against their own family; may form and change attachments and dislikes without obvious reason; may manifest aversions, as to frogs, spiders, mice, cats, etc.; may deceive for deception's sake or to excite wonder. Some are painfully depressed;

they have forebodings or are compelled to do certain acts. Here the hysterical insanities are approached on the one hand and the imperative conceptions and neurasthenias on the other.

Hystero-epileptic attacks in their greatest severity are often preceded by general discomfort or by hallucinations of vision and hearing. Usually sudden, they may be preceded by an "aura," globus hystericus, singing in the ear, etc. Breathing is spasmodic; consciousness is obscured; the convulsion may be similar to those of mild epilepsy. In some cases the body is thrown into all sorts of contortions. An extreme opisthotonos may be present, the body being bent backward, resting on the head and heels. Gestures and noises are made. Sometimes religious ideas have an influence over the attitudes assumed; at other times, ideas of demoniacal possession.

From milder forms, recovery is the rule. In graver cases, and when there is a strong neuropathic tendency, the persons will probably pass from one hysterical manifestation to another.

**Treatment.**—In cases where there is deterioration of the physical health, tonics and nutritious diet should be given. Hydrotherapy improves nutrition and also the mental state. Many drugs have been recommended, but they are all uncertain in their action, at one time giving a result and failing at another. Convulsive attacks may at times be stopped by the cold douche to the spine. Isolation from the family circle is of the utmost importance in the treatment of these cases. Every effort should be made to discover the psychic shock which has produced the attack. Only the patient may have knowledge of this and he will not often reveal it. There is no disease the treatment of which it is more difficult to describe. Suggestion-therapy gives by far the best results, but the great difficulty is that good results are rarely permanent.

SMITH ELY JELLIFFE.

**HYSTEROPHYTES**, hîs'tê-rô-fîts. See FUNGI.

**HYTHE**, hith, England, a market town and municipal and parliamentary borough of Kent, about 70 miles southeast of London, served by the South-Eastern and Chatham Railway. It is situated not far from the sea, Romney Marsh intervening, and is a popular resort. Hythe is connected with Sandgate, three miles distant by a sea-wall and parade, and an electric tramway along the shore front. On a height near the town is the interesting church of Saint Leonard, of late Norman style. In its vaults there are several human skulls and bones, supposed to be the remains of Norsemen or Danes killed in battle near the town in 456. The cemetery near the church contains the remains of Lionel Lukin (b. 1742; d. 1834), the

inventor of the life-boat. The guildhall of Hythe was founded in 1794. Saint Bartholomew's Hospital was founded in 1336 by Haimo, Bishop of Rochester, while Saint John's Hospital is still older, the date of its foundation as a lepers' home being unknown. It was remodeled and reconstructed in 1802. In 1854 the government established a musketry school at Hythe, which has far outgrown its original proportions. Not far away from Hythe is Lyme, now three miles inland, which is thought to have been the original harbor, which as one of the Cinque Ports, enjoyed special privileges. The course of the estuary is easily traceable for all the distance between Hythe and Lyme. The latter place has the ruins of a Roman fortress and modern excavations have uncovered many other Roman remains. Great parts of the walls of the Roman fortress still stand, together with a well-preserved circular watch-tower. Some of the material of the Roman *Portus Lemani* were used in the early English church of Lyme, the tower of which was built by Lanfranc. Saltwood Castle nearby is of great historic interest, being very old even in the time of Richard II. In 1026 it was given to the See of Canterbury; was escheated to the Crown after the murder of Thomas à Beckett, and again given to Canterbury by King John. The archbishops resided there until the reign of Henry VIII. In 1882 it was restored as a residence. Hythe, variously spelled Heya, Hethe, Hithe, i.e., landing-place, was already of importance as a seaport in Saxon times. Halfden granted it to Christ Chursh, Canterbury. In the Domesday Survey the borough is given as part of the archbishop's domain, and the bailiff of the town was his appointee. It was one of the Cinque Ports even before the Conquest; its liberties and privileges were confirmed by King John in 1205 as they were under Edward the Confessor. These privileges were again confirmed in Magna Carta, and subsequently by general charters from various kings down to James II. In return for these privileges — freedom from toll, etc., — Hythe with its sisters of the Cinque Ports furnished 57 vessels for the service of the sovereign, and of these five were furnished by Hythe. In 1365 it sent

four members to Parliament, this being the first time it had any representation there. The government of the port until 1574 was vested in twelve jurats; but in that year Queen Elizabeth incorporated it under the title of "mayor, jurats, and commonalty of Hythe." On 29 June privilege was granted to hold a fair for the sale of fish. The filling up of the harbor with sand gradually choked off the sea-borne commerce of the town and it declined considerably in importance. The waterworks are the property of the municipality. Pop. 6,500.

**HYVERNAT**, hi'ver'nat, **Eugène Xavier Louis Henri**, French-American Oriental scholar: b. S. Julien-en-Tarrêt, Loire, 30 June 1858. He was educated at Saint John's Seminary and the University of France, Lyons, the *Seminaire de S. Sulpice* and *Seminaire d'Issy*, Paris. In 1882 he was ordained to the priesthood and the following three years was chaplain of the church of Saint Louis of the French, at Rome. From 1885 to 1889 he was employed as interpreter of Oriental languages at the Propaganda, Rome, and also in 1885-88 as professor of Assyriology and Egyptology at the Roman Seminary. He also spent a year in Armenia on a scientific mission for the French government. Since 1889 he has been chief of the department of Semitic and Egyptian literatures at the Catholic University of America, Washington, D. C., where he is also professor of Oriental languages and archæology. He is a member of the Pontifical Roman Academy dei Nuovi Lincei, the Roman Academy of Archæology, the American Oriental Society and many other learned and scientific societies of both America and Europe. He has published 'Les actes des martyrs d'Egypte' (1886); 'Album de paléographie copte' (1888); with Paul Muller-Simonis, 'Du Caucase au Golfe Persique' (1892). He compiled 'Acta Martyrum,' with Coptic text and Latin translation, with G. Balestri (Paris 1907-08). He edited 'Scriptores Coptici'; 'Corpus scriptorum christianorum orientalium' and collaborated in Vigoureux's 'Dictionnaire de la Bible' and 'The Jewish Encyclopedia,' of which he was consulting editor.

# I

**I** the ninth letter and third vowel of all the alphabets of western Europe, came into the Latin alphabet from the Greek. It is named in Greek *iota*, which is the yod of the Hebrew and the corresponding letter of the Phœnician alphabet from which the Greeks derived it. *Iota* and yod (whence *jot*) being the smallest letter in the Hebrew and Greek, gave occasion for the New Testament phrase "one jot or one tittle." In ancient Latin the *i* appears to have stood for a semi-vowel like *y* as well as for the vowel *i*: thus the Latins would write *Ianus*, *Iulia*, pronouncing them *Yanus*, *Yulia*. And till a comparatively recent date words beginning with *I* and *J* were in English dictionaries classed together.

The dot over the *i* appears first in MSS. of the 13th century. The sound value of *i* in all languages except English is constant and is equal to *e* in *he* and to *i* in *him*. What is called the long sound of English *i* as in *hide* is a diphthong made up of the two vowels *a* and *i*: this value of *i* in English is believed to have been given to the letter not earlier than the 16th century; till then the letter had the same sound in English as in other languages.

In the standard alphabet of philologists the values of the vowels are about as in the languages of continental Europe, in which *i* is sounded as English *e*.

It is the general rule in English pronunciation that *i* followed by two consonants in the same syllable is short; yet when the two consonants are *ld* or *nd* the *i* is nearly always long and diphthongal, for example, *mild*, *rind*; in *wind* (noun) it is short, but in *wind* (verb) it is long. Combined with *o* it forms a true diphthong *oi* as in *oil*; it also forms diphthongs with *e* and *a*, as *rein*, *aisle*, or mere digraphs representing sounds in which often the *i* has no part; examples: *seize*, *pier*, *friend*. Usually a final *e* indicates that the *i* in a word is to be pronounced as the diphthong; for example, *fine* as contrasted with *fin*; yet *genuine* is *genuin*; or the *i* is pronounced as *e* long,—*marine*, *quinine*, *Augustine*.

In Pope's time and long after *oblige* was pronounced *obleege* and rhymed with *besiege*: the *i* in *oblique* is pronounced either *e* or *i*.

*i.e.* stands for *id est*, the Latin for "that is."

**I. H. S.**, an abbreviation for Jesus (Greek ΙΗΣΟΥΣ)—the *H* representing the long *e*. To mark the contraction, the abbreviation was formerly written *I H̄ C* (Greek *C=S*), which in later times became *I H̄ S*. The *H* being mistaken for the Latin *H*, the idea arose that *I H S* meant *Jesus Hominum Salvator*, "Jesus Saviour of Men," and the mark of contraction over the *H* being thus rendered unmeaning, was turned into a cross, as on modern chasu-

bles and altar-cloths. By some the letters were taken to mean *In Hoc Signo*, "In this sign" (i.e., the cross), and by others *In hac (Cruce) Salvo* "In this (Cross) Salvation."

**I. N. R. I.**, the abbreviation of the Latin inscription placed on the cross over the head of Jesus at the order of the Roman governor, Pontius Pilate. The full inscription reads: *Jesus Nazarenus Rex Iudeorum* (Jesus of Nazareth, King of the Jews), John xix, 19.

**I PROMESSI SPOSI.** See **BETROTHED, THE**.

**I. W. W.**, see **INDUSTRIAL WORKERS OF THE WORLD**.

**IAGO**, a character in Shakespeare's 'Othello.' He is the attendant of the hero, and is depicted as a jealous, hypocritical villain. His ambition is to avenge the slights, chiefly imaginary, which he has endured at the hands of his master. While ingratiating himself to Othello, he connives a plot against the chastity of Desdemona, Othello's wife. So successful is his clever villainy, that Othello's jealousy is properly aroused, and he kills his wife. Further events uncover the plots of Iago and he suffers the same fate. See **OTHELLO**.

**IALYSUS**, an ancient city of Rhodes. It was located near the northern end of the island on the western coast, and was probably settled by Phœnician traders. The Dorians colonized the place subsequently, and with Lindus and Camirus it formed the Tripolis of Rhodes. Ialysus was famed for its wealth. In the 5th century the towns of the Tripolis united to found the city of Rhodes. Significant remains of Mycenaean civilization have been unearthed at a necropolis discovered at Ialysus.

**IAMBIC**, in classical prosody, a term applied to verses consisting of feet made up of a short syllable followed by a long. In English, the same designation is used to denote verse in which the feet are composed of an unstressed syllable followed by a stressed, such as:

And in | thy right | hand bring | with thee

The moun | tain nymph | sweet lib | er ty

The iambic form is most easily adaptable to the English language.

**IAMBlichus**, i-am'bli-kus, Greek philosopher of the Neo-platonic school: b. Chalcis, Cœle-Syria; d. about 330 A.D. Little is known of the events of his life beyond the place of his birth and that he came of a noble family and was trained in philosophy under Anatolius and Porphyry. He wrote numerous works, but few have come down to us. His extant works are 'On the Pythagorean Life'; 'The Exhortation to Philosophy'; 'On the General Science of

Mathematics'; 'On the Arithmetic of Nicomachus'; fragments of a work on fate, and on prayer; and 'Theological Principles of Arithmetic.' (See NEO-PLATONISM). Consult Whitaker, T., 'The Neo-Platonists' (Cambridge 1901), and Zeller, Eduard, 'History of Greek Philosophy' (New York 1889).

**IAN MACLAREN.** See WATSON, JOHN.

**IAPETUS**, a Titan, son of Uranus and Gæa. Hesiod claims that he was the father of the giants Atlas, Prometheus, Menœtius and Epimetheus. He participated in the rebellion against the gods and was condemned to live in Tartarus. Consult Myer, M., 'Giganten und Titanem' (Berlin 1887).

**IBA**, ē'bā, Philippines, pueblo and capital of the province of Zambales, Luzon, situated on a river two miles from its mouth, 85 miles northwest of Manila. It has a good anchorage and is on the south coast road. It is a well-built town, and has several fine public buildings. In 1901 a United States meteorological station was established there. Pop. 4,500.

**IBACH**, Lawrence J., American astronomer: b. Allentown, Pa., 17 Jan. 1816; d. Newmangtown, Pa., 9 Oct. 1888. He learned the blacksmith's trade and followed it throughout his life, chiefly at Sheridan, Lebanon County, Pa. He studied with the astronomer Charles F. Engleman, who, on his death in 1860, bequeathed all his charts, books and instruments to Ibach. His benefactor having promised to make several series of astronomical calculations for almanacs Ibach filled the first order (1863), and thereafter till his death made annual calculations for almanacs in the United States, Canada, South America and Cuba. He was commonly known as the "blacksmith-astronomer."

**IBADEN**, ē-bā'dan, Africa, a city of Yorubaland, southern Nigeria, about 125 miles northeast of Lagos, with which it is connected by rail. The town is built of low thatched houses, relieved by a few more modern structures. There are several mosques, and idol houses. Agriculture and handicraft work are the chief occupations of the town. Ibadan is the capital of one of the Yoruba provinces. The government is in the hands of a civil and a military ruler; in addition to which there is a woman who has charge of the disputes of the women. The British maintain a resident and a detachment of Hausa troops there. Pop. about 150,000.

**IBAGUE**, ē'ba-gā', Colombia, a city and capital of Tolima, about 60 miles west of Bogotá. Its situation at an elevation of some 4,000 feet renders its climate particularly salubrious. In addition to its commercial activities, Ibagué is occupied in mining the extensive sulphur and silver mines of the vicinity. The founding of Ibagué dates back to 1550. Pop. about 25,000.

**IBAJAY**, ē-bā-hī', the Philippines, pueblo of the province of Capiz, island of Panay, situated on the Iabajay River, 42 miles northwest of Capiz, the capital of the province. Pop. 15,000.

**IBÁÑEZ**, ē-bā'nyāth, Vicente Blasco, Spanish novelist: b. Valencia, 1867. A member

of the gild of modern Spanish writers of fiction, which includes Fernán Caballero, Valera, Pereda, Palacio Valdés, Pardo Bazán, Pérez Galdós, to mention some of the best who have won recognition at home and abroad as masters of their craft. Vicente Blasco Ibáñez differs from most of them (much less, however, from Galdós than from the others) in that he, a revolutionist, has written largely for purposes of propaganda. Hence, his most effective stories are those in which, as in 'La Barraca,' 'La Bodega' and 'La Catedral,' he inveighs against features of the Spanish social system. He is undoubtedly a Socialist, voicing that protest against the existing order of things which is not uncommonly raised in his native district of eastern Spain. While in certain cases unable to acquiesce in his attacks upon society and its individual categories, it must be admitted that his pictures of phases of Spanish life are often a correct reflection of the facts and make manifest a need of reform. 'The Four Horsemen of the Apocalypse' (1918), added considerably to his reputation. See LA BARRACA.

**IBARRA**, ē-bār'ra, Ecuador, city and capital of the department of Imbabura, 60 miles northeast of Quito. The chief industries are the manufacture of cotton and woolen goods. An earthquake almost demolished the town completely in 1868, since when it has greatly deteriorated. Pop. about 9,000.

**IBERIA**, ī-bē'riā. (1) The ancient name of a district of Asia, between the Euxine and Caspian seas. It now forms part of Russian Georgia, and consists of an extensive fertile plain, surrounded by mountains traversed by four passes. It probably belonged to Persia, until subjected by Pompey and Trajan to the Roman Empire, under which it remained till after the time of Julian. (2) The ancient name of Spain, the Ebro, the principal river, being called Iberus. The Iberian language still lives in the Basque. See BASQUES; CELTIBERI.

**IBERIAN LANGUAGE.** See GEORGIANS.

**IBERIANS**, an ancient people who dwelt by the river Iberus, the modern Ebro of Spain. About the time of Strabo the name was extended to the inhabitants of the entire peninsula. Of the distribution of this race and of its social and other characteristics we have only fragmentary and often contradictory accounts. Anthropologists now employ the term to the men of the Bronze and Neolithic Ages, whose skulls and remains are found in southwest Europe. Consult Keane, 'Man: Past and Present' (Cambridge 1899), and Sergi, 'The Mediterranean Race' (London 1901).

**IBERIS**, ī-bē'rīz. See CANDYTUFT.

**IBERVILLE**, Pierre le Moyne, pē-ār lē mwān ē-bēr-vēl, SIEUR D', French-Canadian naval and military commander: b. Montreal, 16 July 1661; d. Havana, Cuba, 9 July 1706. He entered the French navy, in 1686 took part in the successful expedition for the capture of the English forts on Hudson Bay; in 1689 he captured Forts Severn and Albany. In 1694 he was again on Hudson Bay and captured Fort Nelson; in 1696 he seized and demolished Fort Pemaquid, built for the protection of the New

England settlements, and laid waste the British settlements in Newfoundland, and in 1697, gaining a remarkable victory over a superior British fleet, recaptured Fort Nelson, the last post of the Hudson's Bay Company. In 1698 he sailed from Brest in charge of an expedition to discover the mouth of the Mississippi and plant a colony there, in both of which purposes he was successful. In 1699 he ascended the Mississippi for some distance, and built Fort Biloxi at the head of Biloxi Bay. This post he removed to Mobile in 1701. In 1706 he captured the island of Nevis. He was considered the ablest officer in the French naval service of his time, and is generally called the founder of Louisiana.

**IBERVILLE**, Canada, town and county-seat of Iberville County, Quebec. It is situated on the Richelieu River, about 38 miles southeast of Montreal, and is served by the Canadian Pacific, the Quebec, Montreal and Southern, the Central Vermont and Rutland railways. The principal industries are the manufacture of iron, pottery, agricultural implements, monuments and carriages. Pop. 2,000.

**IBEX**, any of several species of wild goat (q.v.), sometimes placed apart in a sub-genus *Ibex*, distinguished by the form of the horns of the ram, which are large (30 to 50 inches long), backward curving, compressed and marked on the front with bold cross-ridges or knob-like protuberances. The ibexes are larger than other goats, about three feet at the withers, although adults of the Himalayas stand 40 inches high. Their coats are harsh, uniformly brown, becoming much grayer in winter, whitish on the under surface and buttocks, and with darker tints on the face and fore-legs. These animals inhabit the most precipitous and inaccessible heights of lofty mountains, where they assemble in flocks, sometimes consisting of 10 or 15 individuals. During the night they feed in the highest woods, but at sunrise they again ascend the mountains, till they have reached the most perilous heights. They are remarkably swift, and display amazing agility and dexterity in leaping. Several species are distinguished by locality and minor differences. The typical ibex, bouquetin or steinbock (*capra ibex*), once numerous throughout the European Alps, now exists only as a semi-domesticated animal in certain valleys on the Italian border.

Other species are named according to their locality: The Arabian ibex (*C. sinaitica*) of Palestine, Arabia and northern Egypt (see *BEDEN*); the Caucasian ibex or tur (*C. caucasica*), having reddish hair and flattened horns; the Nilgiri ibex (*C. hylocrius*), of southern India; the Nubian ibex (*C. nubiana*), characterized by slender horns; the Abyssinian ibex or walie (*C. walie*), characterized by a protuberance of the forehead; and the great Himalayan ibex (*C. sibirica*), which ranges over the high mountains and plateaus of all central Asia, keeping as near the snow-line as possible, and affording the best sport known to that region of game. They move about in small herds, led by a dominating ram, the size of the herd depending mainly on his prowess in keeping together his family. Every spring the young rams leave or are driven away from the herd. When gestating the ewes seek retired

spots where the hunter cannot readily locate them.

**IBICUHY**, ē-bē-kwē', or **IBICUI**, Brazil, an affluent of the Uruguay River, which rises in the Serra de Santa Anna, province of Rio Grande do Sul, and after a westward course of about 400 miles joins the Uruguay at Yapeyu opposite Saint Martin in Argentina.

**IBILAO**, ē-bē-lā'ō, a head-hunting Philippine tribe inhabiting the border lands of the provinces of Nueva Ecija and Nueva Vizcaya in the central part of the island of Luzon. They are heathens, of the Malay race, with an infusion of Negrito blood. See *PHILIPPINE ISLANDS*.

**IBIS**, a family of wading-birds (*Ibididae*) inhabiting warm regions. They are related to the storks on the one hand and to the spoonbills and flamingoes on the other. Their bills are long, weak, curved and the nasal grooves are very long. The legs are long, the tibia partly naked and the toes long with small webs. In size they are like herons, rather less than storks; and in color present a great and beautiful variety of tints, often with a metallic sheen; the sexes are similar. Ibises are shy birds, which inhabit not only watery and wooded country, but dry plains and rocky gorges. They are capable of a powerful and elevated flight, extending their neck and legs and uttering a hoarse croak. They ordinarily wade for their food, poking in the mud with the long bill for aquatic insects, worms and small shellfish; they also catch fish, and on land eat insects, especially locusts, frogs, newts and crustaceans. Some species breed in communities, like herons, others apart, but the nest is always a rude cradle of sticks on a tree or ledge of rocks and occasionally on marshy ground, and the eggs are usually green, with or without markings. There are 12 or 15 genera and a large number of species scattered throughout the whole tropical zone. The typical genus, *Ibis*, contains the sacred ibis (*I. aethiopica*), called by the natives of Upper Egypt *abu Hannes*, or "Father John," which arrives in Egypt about the time that the inundation of the Nile commences, its numbers increasing or diminishing with the increase or diminution of the waters; and it migrates southward about the end of June. This species is about the size of a fowl; the head and neck are bare; the body white; the wing tipped with shining, ashy black, among which the white forms oblique notches; the secondaries and scapulars, which in summer curve gracefully over the hinder parts, are bright black. This was one of the birds adored by the ancient Egyptians, and of which numerous mummies are found. The Greek and Roman writers give many fabulous stories relating to *ibis*, which Savigny has gathered in 'Histoire Naturelle et Mythologique de l'Ibis.' He concludes that the reverence for this ibis was not due to its alleged destruction of snakes, which, in fact, does not occur, but arose from the birds' return at the time the Nile began to rise, the commencement of the season of abundance. Modern writers on Egyptian customs and antiquities may be consulted further on this point. Many other interesting species occur in Africa, Asia and the Australian region; and many species reside

THE IBIS FAMILY

REPRESENTATIVE IBISES

1 Open-bill (*Anastomus lamelligerus*)

2 Wood Ibis (*Tantalus ibis*)

3 Sacred Ibis (*Ibis religiosa*)

in the American tropics,—two, the white ibis (*Eudocimus albus*) and the scarlet ibis (*E. ruber*), flocking in summer in the southern United States. Both are birds of extreme beauty of plumage, and both have been so ruthlessly persecuted by plume-hunters, seeking feathers of millinery purposes, that the scarlet ibises are nearly exterminated. Fossil ibis remains of the Tertiary period have been located at many points in Europe.

Wood-ibises and shell-ibises are names for birds of other groups, elsewhere described. Consult Taylor, 'Ibis' (1878); Shelley, 'Birds of Egypt'; Whympfer, 'Egyptian Birds' (1909).

**IBN AL-KIFTI**, *ib'n ăl kēf'tē*, Arabian historian and statesman: b. Kift, Upper Egypt, 1172; d. 1248. He greatly encouraged literature, education, art and national progress. See KIFTI, IBN AL-.

**IBN BATUTA**, *bā-too'ta*, **ABU ABDUL-LAH MOHAMMED**, Moslem traveler: b. Tangier, 1304; d. 1378. When he became 21 years of age he started on his journeys. His first trip was along the Mediterranean coast from Tangier to Alexandria. He visited Cairo, Aleppo and Damascus, and then journeyed to Mecca. After crossing to Isfahan and going back to Bagdad, he again made the pilgrimage to Mecca, remaining for three years. His next trip took him down the Red Sea to Aden; then along the African coast, and back by a circuitous route through Oman and Arabia to Mecca again. After a short stay, he again set forth, this time through Syria and Asia Minor, to Kaffa on the Black Sea. This was his first acquaintance with a Christian city. For a time thereafter he attached himself to the Khan Mohammed Uzbek; and, with the court of a certain Greek princess who was of the same train, visited Constantinople. A trip through the lower part of Russia and his return to the Indus occupied the years until 1333. Not long afterward he was appointed kazi of Delhi by the ruler, Mohammed Tughlak. Here he remained for a number of years, retiring when his profligacy had destroyed his prestige. However, when the Chinese emperor had sent an emissary to Delhi and a man was needed to return with his contingent, Ibu Batuta was chosen. A wreck destroyed the party, and he was stranded at Calicut. He journeyed on to the Maldiv Islands, becoming kazi there; visited Bengal, Burma and journeyed far into the interior of China. Eventually he stopped at Jerusalem and Cairo and returned in 1349 to Morocco, and thence to Tangiers. His last wanderings took him to Spain, central Africa and Egypt. His book narrating his many adventures was dictated by orders from the king. His descriptions are vivid and accurate, full of life and color. A French translation by De-frémery and Sanguinetti was published at Paris (4 vols., 1858-59).

**IBN JANACH**, *ha-näch*, **ABULWALID MERWIN**, or **JONAH MARINUS**: Jewish grammarian: b. Cordova, Spain, close of 10th century; d. early 11th century. After receiving training in Hebrew and in medicine, he became interested in philological research. His principal contribution to the study of Hebrew was his work on grammar 'Kitāb-al-Luma'

which was a pioneer study of the whole field. His dictionary 'Kitāb-al-'Usūl' is replete with erudite and comprehensive discussion of the grammatical points involved. The former was published by J. Derenbourg (Paris 1886); the latter by Neubauer (Oxford 1873-75). In translation they have been published by B. Goldberg (Frankfort 1856) and by W. Bacher (Leipzig 1889). Consult Bacher, 'Leben und Werke des Abulwalid Merwan ibn Ganach' (Leipzig 1885).

**IBN KHALDUN**, **ABD AL RAHMAN**, Arabic historian: b. Tunis, 1332; d. 16 March 1406. He was a brilliant student of Arabic lore, and in 1352 entered the public service at Fez; being suspected of malfeasance he was imprisoned for a short time merely on suspicion. He emigrated to Spain and was well received at Granada. In 1364 he was driven back to Africa and was well received by the Sultan of Bougie. On the latter's fall Ibn Khaldun raised an army and entered the service of the Sultan at Tlemcen. In 1378 he was allowed to return to Tunis. Here he prosecuted his studies and produced his history of the Berbers. He set out for Mecca in 1382, but was prevailed upon to tarry in Egypt, where he was made cadi at Cairo. He instituted many reforms and began his history of the Arabs in Spain. In 1385 he made the pilgrimage to Mecca, and on his return was cadi no less than five times. In 1400 he visited Tamerlane at Damascus. His great work is the 'Universal History' in three books, with an introduction and an autobiography. Book one treats on the influence of civilization; book two of the Arabs and other peoples, and book three of the Berbers. An edition in Arabic appeared at Bulaq (7 vols., 1867). Part of the work has been translated by Slane in his 'Histoire des Berbères' (Algiers 1856). Book one was edited by Quatremère (3 vols., Paris 1858). The parts dealing with the Crusades were edited by C. Tornberg (Upsala 1840). Consult Flint, R., 'History of the Philosophy of History' (Edinburgh 1893); Huart, C. I., 'Histoire des Arabes' (Paris 1912); Nicholson, R. A., 'A History of Arabic Literature' (Cambridge 1907).

**IBN KUTAIBA**, *koo-tā'ē-ba*, **QUTAIBA** or **KOTAIBA**, Arabian author: b. Bagdad or Kufa, 828; d. Bagdad, about 889. He was a zealous student of history and philology, and was appointed local ruler at Dinawār. After a few years' service, he was made teacher at Bagdad, occupying this position until his death. Ibn Kutaiba is important as the author of several works which throw light on the Arabian language and antiquities. Of these the most noteworthy are the 'Adab ul-Kātib,' a treatise on literary style (edited by Max Grünert, Leyden 1900); 'Kātib al-ma-Arin,' a popular outline of history (edited by F. Wüstenfeld, Göttingen 1850); and 'Ayun al Akhbār,' a general treatise on government, nobility, character, science, friendship, women and food. It was edited by Brockelmann (Weimar 1898). Consult Brockelmann, 'Geschichte der arabischen Literature' (Vol. I, pp. 120-122, Weimar 1898).

**IBN SINA**, *ib'n sē'nā*. See **AVICENNA**.

**IBRAHIM**, *ē-bra-hēm'*, Ottoman Sultan, third son of Ahmed I. He succeeded his

brother Amurath IV in 1640. His reign was occupied mainly with a war against Crete. He was an oppressive tyrant, with little consideration for his people. The Janizaries finally broke out in rebellion and put him to death.

**IBRAHIM PASHA**, Egyptian general: b. Kavala, Thrace, 1789; d. 1848. His father was Mehemet Ali, the pasha of Egypt. At the age of 16, he was sent as a hostage to the Ottoman Empire, but returned to Egypt after the failure of the English army to gain a foothold in his father's territory. In 1816 he led the Egyptian army in Arabia and was successful in vanquishing the Wahhabis in western Arabia and in Nejd. He proved himself an able commander, and in the War of Greek Independence was appointed in charge of both the naval and land forces in the Morea. His long siege of Missolonghi was conducted with great vigor and resulted in victory in 1826. He was so ruthless in his punishment of the Greek troops that European forces felt called upon to punish him. At the naval battle of Navarino (1827), his fleet met those of the combined English, French and Russian squadrons, and was completely destroyed. Shortly afterward the French expeditionary forces landed in Morea, and in 1828 Ibrahim was compelled to leave the country. He returned to Egypt, but it was not long before his father became engaged in a quarrel with Syria and Ibrahim again took the field. With characteristic impetuosity he laid siege to Acre, captured it and put the Turkish forces to rout. By the Treaty of Kutayah in 1833, Syria was surrendered to Mehemet Ali, and Ibrahim was made governor of Cilicia. There was a lull in hostilities until 1839, when Ibrahim was sent out once more against the Turkish armies, and inflicted a decisive defeat at Nezib. However, by the intervention of foreign powers, the Egyptian armies were defeated on the sea, and their leader was again obliged to return to Egypt. He outlived his father by a few months, and his son, Ismail Pasha, succeeded to the rule of Egypt.

Ibrahim Pasha was distinguished by his extreme energy and vigor, as well as by his intelligence and docility in learning European methods from the armies with which he came in contact. As a ruler, he showed superior judgment and diplomacy, winning over hostile factions with great shrewdness and tact. Consult 'Cambridge Modern History' (Cambridge 1903).

**IBSEN, Henrik**, Norwegian dramatist: b. Skien, Norway, 20 March 1828; d. Christiania, Norway, 23 May 1906. He became an apothecary's apprentice in the little town of Grimstad, being forced to earn a living owing to the impoverished condition of his family, but was determined not to ignore any possibility of obtaining an education by reading and study. His opposition to convention at first took the form, so common among young persons, of an avowed advocacy of the wicked and irregular, expressed in the thought that if he should be destined ever to perform a great deed, it would necessarily be a "deed of night," and in his occupation with the study of the subversive characters of history, including chiefly Catiline (q.v.), who became the hero of his first play ('*Catilina*,' 1850). At Christiania, Ibsen attended a preparatory school in order to pre-

pare for the medical school of the university. He failed in the entrance examinations, however, and undertook the publication, together with two other young men (Aasmund O. Vinje and the bibliographer, Botten-Hansen), of an unsuccessful weekly, *Andhrimnir*. Ibsen's contributions to this paper were short satires and lyrics. He was also much interested in Old Scandinavian history and legend, and began to write a number of dramas on themes connected with these legends, not uninfluenced by the works of Oehlenschläger (q.v.) and H. Hertz, the first of which is '*Kæmpehøjen*' ('The Warrior's Grave,' 1850), which had three performances at Christiania and was later printed serially in a Bergen newspaper (1854). In 1851 the violinist Ole Bull obtained for him the position of manager in the National Theatre at Bergen, which he held until 1857. Very important for Ibsen's artistic development was the trip which he undertook in 1852, under instructions from the Bergen theatre, to inspect the theatres of Dresden and Copenhagen, which were then managed by Devrient and L. Heiberg, respectively. His chief duty in connection with the theatre at Bergen was to produce an original play for performance each year on the anniversary of the theatre's foundation (2 January). The 1855 play was '*Fru Inger til Østraat*' ('Lady Inger of Østraat,' dealing with the events preceding the Reformation in Norway). In 1856 came '*Olaf Liljekrans*' (not printed until 1898, and then only in German, as a part of the nine-volume edition edited by Georg Brandes for S. Fischer, Berlin), and in 1857, '*Gildet paa Solhaug*' ('The Banquet of Solhaug'), a drama from the life of the Norwegian people in the 14th century. From 1857 until the bankruptcy of the Norwegian Theatre at Christiania, in 1864, Ibsen held the post of manager at that institution. In this period he produced only three plays, '*Hærmændene paa Helgeland*' (1868) (introduced to the English and American stage a few years ago by Ellen Terry: '*The Vikings at Helgoland*'), a pregnant, intense, laconic tale of Icelandic family feuds, taken from the Saga of Sigurd, and written in a prose not unlike that of the Icelandic sagas; '*Kjærlighedens Komædie*' ('The Comedy of Love,' 1862), a rimed satiric play dealing with social conditions; and '*Kongsemnerne*' ('The Pretenders,' 1864), another study of Norwegian history, interesting chiefly in that it presents a picture of self-confidence and moral responsibility in their struggle with laxity and irresoluteness, as personified in the persons of King Hakon and Jarl Skuli. In 1864 Ibsen was so fortunate as to obtain a traveling scholarship, and from this time until 1891 he spent almost all his time in foreign countries, where most of his great plays were to be produced, residing chiefly at Rome, Dresden and Munich. The larger, freer, more cosmopolitan life of Europe gave Ibsen a larger outlook than the narrow parochial atmosphere of the small Norwegian city, but he now turned to Norwegian themes with a greater intensity and vigor than before, treating them now as universal in their appeal; no dramatist ever limited himself so completely to his own country in his choice of subject, and none ever treated all his subjects so absolutely from the purely human point of view. '*Brand*' (1866) and '*Peer Gynt*' (1867) are the first of his

great plays. They are the last plays Ibsen wrote before discarding verse. 'Brand' exposes the danger and destructiveness of the idealist who would force others to live according to his ideals, while 'Peer Gynt' satirizes the idealist who constructs a world only for himself and shuts all others out of it.

In 1869 came 'De unges forbund' ('The League of Youth'), a modern social comedy exposing the knavery of conscienceless political agitators and inaugurating the long line of social dramas, dealing with vital and concrete problems of every-day life, to which Ibsen was to devote the rest of his active labors. Once only (in his next play, 'Emperor and Galilean,' an enormous tragedy in two parts, of five acts each) he was to work again in the field of history, producing an impressive study of the clash of free will and historic preordination, impersonated in the character of Julian the Apostate, in his vain effort to restore paganism at a time when the world was already ripe for Christianity. It is the remaining plays, produced after 'Kejsler og Galilæer,' with which readers are chiefly acquainted, which make Ibsen immortal, and which have entirely remolded the dramatic literature of the world since their appearance. They are 'Samfundets Støtter' ('Pillars of Society,' 1877), 'Et Dukkehjem' ('A Doll's House,' 1879), 'Gjengangere' ('Ghosts,' 1881); 'En Folkefiende' ('An Enemy of the People,' 1882); 'Vildanden' ('The Wild Duck,' 1884); 'Rosmersholm' (1886); 'Fruen fra Havet' ('The Lady from the Sea,' 1888); 'Hedda Gabler' (1890); 'Bygmester Solness' ('The Master Builder,' 1892); 'Lille Eyolf' (1894); 'John Gabriel Borkman' (1896); 'Naar vi døde vaagner' ('When We Dead Awaken,' 1900). These 12 plays are a complete *comédie humaine*, a comprehensive indictment of the evils necessarily associated with a disordered society, beginning with 'Pillars of Society,' which is a sort of headline synopsis, in cruder form, of all the plays that follow, and running on through play after play, each taking up and pursuing with merciless clearness some problem outlined but not completely disposed of in its predecessor. Thus, 'A Doll's House' puts the problem of the devoted self-sacrificing wife whose husband values respectability and social position above her affection, and who deserts him that she may know what life really is; it caused Ibsen's provincial critics to ask: "Why did she not remain? Was not her first duty with her two children?" Ibsen accordingly answered this question in 'Ghosts,' the next play, in which, in three terrible acts, he presents the case of a wife who remained with her husband and child. The husband's respectability cloaked a boundless dissoluteness, and the disease contracted in one of his dissipations causes the son to go insane many years later. The disclosure by Ibsen of these evils of modern family life led one of his critics to accuse him of being an "enemy of society," and Ibsen's next play, 'An Enemy of the People,' in which an honest physician calls attention to the infected condition of the waters, from the supposed healing qualities of which his fellow-townsmen earn their living, is his answer. The honest Dr. Stockmann is termed an "enemy of the people" and finally driven out of town. Unqualified truth-telling, even when it may be

personally unprofitable, would appear to be the lesson of this play, but in the 'Wild Duck' his thesis seems to be, as Shaw, his most brilliant interpreter puts it, "that a truth-teller who cannot hold his tongue on occasion may do as much mischief as a whole university full of trained liars." The student wishing a complete interpretation of Ibsen and of the connection between his social plays is referred to G. B. Shaw's, 'The Quintessence of Ibsenism,' from which the above quotation is taken (1st ed., 1891); there is also an interesting but rather crabbed essay on 'Hedda Gabler' by Henry James. The understanding of the later plays, beginning with 'Rosmersholm' (1886), is rendered somewhat difficult by the introduction of numerous symbolic elements. The tone becomes one of bitter resignation, of regret at having wasted opportunities for natural living and real enjoyment. The last 15 years of his life were spent at Christiania, the last seven years in increasing mental disturbance, which indicated that Ibsen's mind was slowly weakening. In 1900, after the last play, 'When We Dead Awaken,' was finished (Ibsen seems to have intended it to be his last, for he called it "A Dramatic Epilogue"), a bronze statue (by Sinding) was erected to him in Christiania. See DOLL'S HOUSE, A; GHOSTS; HEDDA GABLER; MASTER BUILDER, THE; PEER GYNT; WILD DUCK, THE.

The reception of Ibsen's plays in Norway and in foreign countries was at first uniformly hostile. The venomous nature of the attacks by professional literary critics is best evidenced by the quotations given in Shaw's book (see above) from contemporary London newspapers, and is paralleled only by the similar outbursts called forth from the musical critics by the first of the epoch-making innovations of Richard Wagner. The New York press greeted the first American performance of 'Ghosts' in 1902 with equal hostility. But Ibsen's popularity long before his death was already so great that the later plays appeared simultaneously in all the capitals of Europe, translations into the important languages having been prepared before the publication of the original.

**Bibliography.**—Consult Ibsen's 'Collected Works,' with introduction by W. Archer (1906-07); 'Prose Drama,' edited by W. Archer (1890-91); 'Correspondence,' translated by Marison (1905); 'Lyrical Poems,' selected and translated by R. A. Streatfield (1902). Critical works on Ibsen are Jæger, H., 'Henrik Ibsen' (in Danish, 1888; Eng. trans. by Clara Bell, 1890); Brandes, G., 'Det moderne Gjennembruds Mænd' (Copenhagen 1883, trans. by J. Muir as 'Critical Studies,' 1899); Gosse, E. W., 'Ibsen' (1907); Macfall, H., 'Ibsen: the Man, his Art and His Significance' (1907); Moses, M. in Ibsen's *Dichtung*' (Leipzig 1898); Brandes, 'Henrik Ibsen' (Copenhagen 1898); Woerner, 'Henrik Ibsen' (2 vols., Munich 1899 ff.); Litzmann, 'Ibsen's Dramen, 1877-1900' (Hamburg 1901).

JACOB WITTMER HARTMANN, *Assistant Professor of the German Language and Literature, The College of the City of New York.*

**IBSEN, Sigurd**, Norwegian diplomat and author, the son of Henrik Ibsen (q.v.): b. Christiania, 23 Dec. 1859. He lived in foreign countries with his parents until he entered the diplomatic service of Sweden (then forming a united monarchy together with Norway) in 1885. After working for a time in the Foreign Office, he was attached successively to the embassies of Washington and Vienna, but gave up this career in 1889, in order to devote himself to problems of a social and administrative character. He delivered a course of lectures on sociology at the University of Christiania in 1896-97, and in 1899 became head, in the Department of the Interior, of the Section for Foreign Affairs, Commerce and Industry. He was connected in various ways with the administrative service of the united monarchies until their definitive separation in 1905, maintaining to the last his advocacy of a continuance of the policy of union. He has held several editorial positions connected with radical papers. His published works include 'Unionen' (1891); 'Mænd og Magter' (translated into English as 'Human Quintessence'), and 'Robert Frank' (a tragedy, translated into English by Marcia Hargis Janson, New York 1914). The last is the story of a scholarly aristocrat whose reasoning throws him into the arms of the syndicalist movement, as the leader of which he inaugurates a revolution in which he loses his life.

JACOB WITTMER HARTMANN.

**IBYCUS**, ib'i-kūs, Greek lyric poet: b. Rhegium, Italy, flourished in the 6th century B.C. He spent his days wandering about, singing his lyrics and narrating poems. He was for some time a member of the court of Polycrates at Samos. While traveling near Corinth, a band of robbers fell upon him and murdered him. The story is told that when the crime was committed, Ibycus called to a flock of passing cranes to avenge his death. The murderers traveled on to Corinth, and while seated at the theatre there suddenly noticed the cranes circling above their heads. One of their number, terror-stricken, shouted "Behold the avengers of Ibycus," and the crime was betrayed. Ibycus was the author of charming lyrics, mainly love-themes, describing the love-inspiring charms of beautiful boys and girls. The fragments were collected by F. W. Schneidewin (1833). Consult Bergk, 'Poetæ lyrici Græci' (Leipzig 1882).

**ICA**, ē-kā', Peru. (1) A littoral department bounded north by the departments of Huancavelica and Lima, east by Ayacucho, south by Arequipa and west by the Pacific Ocean. Area, 8,718 square miles; pop. estimated at 90,000. Topographically the department slopes from its eastern border to the ocean, with small ranges of hills. It has a hot

and arid climate and the soil is little adapted to agriculture except in the valleys. Gold, copper and iron are mined. Grapes and sugar-cane are grown as well as corn, cotton and indigo. The only industries are those dependent on the viticulture and the sugar-cane crop. (2) A town, capital of the above department, on a river of the same name, 46 miles southeast of Pisco on Pisco Bay, with which it is connected by rail. It was founded in 1563. It is in a grapevine and sugar-cane producing region and has manufactures of wine and brandy. Pop. 9,000.

**ICA, ē'sā', or PUTUMAYO**, a river of South America, one of the chief tributaries of the Amazon. It takes its rise in the Andes in Colombia, flows southeast and empties into the Andes near San Antonio. It is navigable during the wet season for about 900 miles of its course, which is nearly 1,000 miles in length. It waters a woody region, unfavorable to close habitation. There are rubber plantations along the shores. A large part of the Ica was explored in 1878-79.

**ICARIANS**, i-kā'ri-ānz, a communistic society founded and led by Étienne Cabet. For an account of this organization see CABET.

**ICARIUS**, in Greek mythology the hero after whom the Attic deme Icaria is named. Dionysus taught him how to make wine, which he gave to some shepherds. Their companions thinking their intoxication was due to poisoning murdered Icarus. His daughter Erigone was led by the hound Mæra to his grave on Mount Hymettus under a tree on which she hanged herself. During a plague of madness which Dionysus sent over the land, the Athenian maidens, following Erigone's example, hanged themselves. The Acora or "swing" festival later commemorated the propitiation to Icarus and Erigone, who also, with the dog of Mæra, were placed among the stars as Arcturus, Virgo and Procyon.

**ICARUS**, the son of Dædalus (q.v.).

**ICAZBALCETA**, ē-ka-s-bal-sā'ta, Joaquin Garcia, Mexican author: b. Mexico City, 1825; d. 1894. He contributed numerous biographical articles to the 'Diccionario universal de historia y geografía.' His historical researches are most important and are a great storehouse of information. They include 'Colección de documentos para la historia de México' (1858-66); 'Historia eclesiástica indiana, obra escrita á fines del siglo XVI por Francisco Gerónimo Mendieta de la orden de San Francisco' (1870); and 'Nueva colección de documentos para la historia de México' (1886-92); 'Bibliografía Mexicana del siglo XVI,' an exhaustive study, and 'Don Fray Juan de Zumarraga' (1881), the life and work of the first bishop and archbishop of Mexico.

**ICE**, water in the solid state. When sufficiently cooled, water loses its fluidity, and becomes filled with multitudes of needle-like crystals belonging to the hexagonal system (see CRYSTAL), which increase and interlace until the whole mass becomes solidified. In nature, this change begins at the surface of the water and spreads gradually downward, so that the exact course of the freezing is not so easy to trace as it is in the laboratory, where the water can be

uniformly cooled throughout its entire mass. When the freezing process is complete, the crystalline nature of the solid that results from it is not at all obvious. It is clearly visible, however, in snow-flakes, where the hexagonal form is also evident. In a solid block of ice the crystalline structure can also be demonstrated by a method that was used by Tyndall, as a beautiful and instructive lecture experiment. The image of a slab of pure ice is thrown upon a screen by means of a projection lantern provided with a powerful electric light. At first nothing is seen, but very shortly the heat-rays passing through the ice cause it to melt internally, and the melting takes place according to the internal crystalline structure, which is gradually brought out upon the screen in great beauty. Six-sided stars, suggestive of the snow-crystals, appear, and these enlarge and become serrated at the edges as the electric beam gradually destroys the molecular architecture, the process continuing until the ice has been again reduced to the liquid form.

Pure water normally freezes at a temperature which is denoted by 32° on the Fahrenheit scale, and by 0° on the Centigrade and Réaumur scales. It is possible, however, to cool pure water to a temperature considerably lower than this, if proper precautions are taken, without crystallization. As long ago as 1836, for example, Gay-Lussac observed that water, when placed in a vessel and covered with a layer of oil, may be cooled to 10° F. without freezing. If the vessel be slightly shaken or jarred, however, solidification ensues at once.

Pressure has an effect upon the temperature at which water freezes. This effect was predicted, from theoretical considerations, by James Thomson, in 1849. Dewar has since measured its amount with much care, finding that the freezing temperature is lowered by 0.014° F. for each atmosphere of pressure. Small as this quantity is, it is of importance in some branches of physics. In 1858 Mousson, by the application of an enormous pressure, succeeded in reducing the freezing point to 4° below zero, Fahrenheit. The presence of dissolved substances in the water also depresses the freezing point. Sea-water, for example, freezes at about 27° F. (the ice that is formed being nearly free from salt), strong brine is used in the circulating pipes and cooling coils of refrigerating plants, since it can be cooled much below this temperature without freezing.

The effect of pressure in lowering the freezing point is illustrated in the familiar process of making a snow-ball from damp snow — that is, from snow whose temperature is precisely 32° F. Under the pressure of the hand, the freezing point of the snow mass is lowered slightly, with the result that a partial melting of the crystals takes place. When the pressure is removed, the freezing point rises to the normal, and the water that was formed by the pressure alone freezes again, and cements the mass together. (The superficial moisture, due to the warmth of the hand, is not here contemplated. The melting from this cause is a separate phenomenon.) The slight but real plasticity of large masses of ice, such as are met with in glaciers, is probably related to this phenomenon of the variation of the freezing point by pressure, but there is some difference of opinion among the authorities as to the precise way in

which the slow downward flow of these ice masses is accomplished. The melting of ice by pressure, and its subsequent solidification upon the removal of the pressure, is known to physicists as "regelation."

Experiments that have been conducted in connection with precise thermometry, by Pernet and Marek, show that the temperature of melting ice is slightly different, according to the source of the ice, and the way in which it is treated; this variation being independent of the pressure, and probably due to unrecognized impurities. A variation in the melting point of as much as 0.164° F. has been observed; and in order to eliminate the effects of error from this cause, it is necessary, for the purposes of precise thermometry, to adopt a uniform mode of procedure in the treatment of the ice that is to be used for the establishment of the freezing point upon accurate thermometers. Consult Guillaume, 'Thermométrie de Précision' (Chap. 2).

When water that contains solid matter in solution or in suspension is frozen, the solid matter is mostly eliminated, so that the ice is much purer than the water from which it is produced. Some of the solids are almost invariably entangled among the interlacing crystals of the ice, however, so that numerous little particles of foreign matter often remain in the ice, imprisoned in tiny cavities. Bacteria and other germs that may have been present in the original water appear to be largely excluded from natural ice by the freezing process, though some of them are undoubtedly caught among the crystals and retained. In artificial ice, where a mass of water is frozen simultaneously on all sides, so that the solidification proceeds from the outside toward the centre of the cake in all directions, purification from this cause is hardly possible, and the middle part of the ice-cake is likely to be rich in whatever germs the original water may have contained. Fortunately the recent experiments of Sedgwick and others indicate that freezing and protracted storage of the ice is much more fatal to typhoid bacilli than was formerly supposed. Artificial ice, if prepared from distilled water, or from water that is certainly known to be free from disease germs, is undoubtedly safer than natural ice that is taken from streams or ponds of unknown purity; but in choosing between natural and artificial ice from the same identical water, the preference should be given to the natural product.

Water expands upon freezing, one volume of water at 32° F. becoming transformed, by freezing, into 1.0908 volumes of ice at the same temperature; which is equivalent to saying that water expands by one-eleventh of its own bulk upon freezing. The quantity of heat required to melt one pound of ice, from the state of ice at 32° F. to that of water at 32° F., is 142 times as great as the quantity of heat required to raise the temperature of a pound of water from 32° F. to 33° F. The specific heat of ice, near the temperature 32° F., is approximately 0.50. The production of ice by artificial means has increased rapidly in recent years. See REFRIGERATION AND REFRIGERATING MACHINERY.

**ICE, Artificial.** See ICE INDUSTRY; REFRIGERATION AND REFRIGERATING MACHINERY.

**ICE AGE.** See GLACIAL PERIOD.

**ICE BOAT.** See ICE YACHTS AND ICE YACHTING.

**ICE-BREAKER,** a vessel, especially a strong heavy steamer, with powerful engines, for opening up navigable channels in frozen waters. On the Great Lakes of the United States, where such vessels are extensively used, they are generally fitted for carrying cargoes or transporting railroad cars. Such vessels are usually so built as to run their bows up on the ice and break it by means of their great weight.

**ICE INDUSTRY.** Though the use of natural and artificial ice as an article of commercial value practically began only in the first part of the 19th century, yet the artificial production of cold began long before the modern civilized era.

In Greece and Rome during the early ages snow was more commonly used, being placed in cone-shaped pits 45 feet in diameter, 50 feet deep and lined with straw and prunings of trees. The snow was packed down and covered with more straw and prunings, over all of which a thatched roof was placed; after the ice was formed it was cut and carried out through a door left in the side of the pit for the purpose. During the 16th century snow and ice were stored in cellars for the purpose of cooling drinks. This custom spread from Greece and Italy to western Europe and to France during the reign of Henry III in the 16th century, and by the end of the 17th century the sale of snow and ice had become a profitable trade. From that time until the beginning of the 19th century the ice trade was practically at a standstill, no material advance being made in the direction of improving the methods of harvesting the ice supplied by nature; nor was any attempt of any importance made to produce artificial ice. For the purposes of description and comparison, ice may be divided into two classes, the natural and the artificial.

**Natural Ice.**—Probably the first ice cut and shipped as an article of commercial value was sent, in 1799, from New York to Charleston, S. C. This cargo was cut from a pond near Canal street. While this shipment was the first recorded it was of little importance; the real beginning of the industry came in the year 1805 when Frederic Tudor of Boston, shipped a cargo of 130 tons to the West Indies. This resulted in a loss of \$4,500, and Tudor's second shipment, two years later, to Havana likewise was made at a loss enormous for those days. He stuck to the business, however, and finally, in 1812, was granted by Great Britain a monopoly of the trade with her colonies in the West Indies, and later, in 1815-16, Spain granted him the same concession to export to Havana. In 1817-18 the trade was extended to Charleston and Savannah; to New Orleans in 1820; to Calcutta in 1833; and to Rio Janeiro in 1834. Thus a large and lucrative trade with southern countries and southern cities of the United States was built up; competitors began to come into the field, the first of these to enter the export field being the firm of Gage, Hittinger and Company of Boston, who introduced American ice to the people of London. They were in turn followed by a Salem merchant named Lander, and others.

The harvest of natural ice is gathered on an enormous scale in the United States, the de-

mand for the article being due in a large measure to the growth of other industries to which ice was a necessity. Before Croton water was introduced into New York, and as far back as 1825, ice was cut on Sunfish pond, on the outskirts of the city, by some butchers who desired to preserve their stock of meat. In 1826 ice was cut on Rockland Lake, and at first all the ice cut was stored in the ground, but later storehouses at Hubert street and Christopher street were built, and as the demand for ice gradually developed in all the larger Eastern cities, large storehouses were erected near the places where the ice was cut. The capacity of these houses ranges from 10,000 to 190,000 tons, and in size run from 100 to 150 feet in length by 30 to 50 feet in width. For gathering the ice there is an elaborate system of apparatus, but the usual methods employed are as follows: After the snow is cleared from the ice by means of scrapers or snow-plows, an ice-plow, either propelled by steam or drawn by horses—the latter means being more commonly used—cuts deep grooves in the ice in one direction and then repeats the operation at right angles with the first, thus forming rectangular pieces, measuring approximately  $2 \times 3\frac{1}{2}$  feet. As these grooves extend nearly through the ice, it is a simple matter to saw through the remaining thickness, pry the cakes loose with crowbars and float them to the icehouses through channels opened up as the work proceeds. Upon reaching the icehouse the cakes are slid up an incline, with the aid of an endless chain apparatus, operated by horse or steam power; if the icehouse be very close, the same engine that runs the elevator may be used. The hoist or elevator of an icehouse is so located that ice may be conveniently slid in any part of the building. By means of an automatic indicator and trips the elevator is stopped at the proper height and the blocks of ice stored in layers. The floor of the house is built a little lower in the centre than at the sides, so that the weight of the ice may not lean on the walls. The walls are double and insulated to preserve the cold temperature inside.

The cost of harvesting a ton of natural ice varies greatly, it depending to a great extent upon the weather conditions, both during the process of the formation of the ice and during the process of cutting and housing. Under average conditions the cost of harvesting amounts to about 80 cents, though under favorable conditions it has cost only from 25 to 30 cents per ton, but this is exceptional. This, of course, does not include the cost of transportation, delivery, etc., and as the majority of the icehouses are a considerable distance from the centres of consumption, the cost of transportation is a large factor.

The moving of this enormous quantity of ice necessitates the maintenance of a large fleet of barges and other boats for the domestic trade, and of sailing vessels for the export trade, and to the cost of maintaining these vessels, when figuring the cost of harvesting, must be added the cost of towing, loading, discharging, dock and stable rent, repairs of boats, icehouses and wagons, etc., all this before the ice is placed in the hands of the retailer.

Since 1900 the natural crop has tended to reduction owing to increased use of artificial ice. Not much natural ice is now used south

of Baltimore and Washington, and these cities use very large quantities of artificial ice.

The tools used in harvesting this crop are many and varied. Many of them were invented by Nathaniel Wyeth and John Barker of Boston. The ice plow was invented in 1839 and the patent clearing-tooth in 1872. Some of the most common tools now in use are: the snow-scraper or plane, the masher and the plow; augers and axes for tapping the ice in order to drain off surface waters; saws; forked bars for prying the cakes loose; various forms of hooks for handling the cakes; trimming bars for squaring the cakes after loose; adzes, edging tongs and chisels used in packing the ice when in the storehouse; saws and bars for prying loose previous to shipment; and tongs, scales, axes, etc., used on the retail delivery wagon.

**Artificial Ice.**—The manufacture of ice as an industry was begun as early as 1866, but only reached a degree of commercial importance about 1880. The beginning was naturally made in the Southern States, but as it became more generally used, factories sprang up over the entire country. The growth of the "infant industries" throughout the United States gave this industry an added stimulus, because the supply of natural ice was by far too small to meet the requirements of slaughtering and meat packing-houses, refrigerator cars, cold-storage warehouses, etc.

The first experiments for making artificial ice for mercantile uses started with the Italians in the 16th century. The first machine used for the actual manufacture was invented by Dr. William Cullen, this being based on the vacuum principle, the atmospheric pressure being reduced by means of an air pump. Later, in 1795, several experiments were made by a Mr. Walker of Oxford, England, in the line of freezing mixtures. Professor Leslie of England produced a considerable degree of refrigeration by including in the exhausted receiver of an air-pump sulphuric acid, a substance rapidly absorbing vapor. In 1834 Jacob Perkins, an American engineer residing in London, obtained a patent for a machine generally credited with being the forerunner of the modern compressor machine. The refrigerant used in this machine was ether and brine, and was circulated at a temperature of 5° Fahrenheit through pipes which encircled the evaporator containing the ether. After running through the pipes, the brine flowed into a receptacle containing boxes filled with water and thus the water was frozen. Later experiments were made by French and German inventors, boxes being supplanted by cans, and this developed into the manufacture of can ice. Many of the improvements made in the ice-making apparatus are due to the efforts of Prof. A. C. Twining of New Haven, Conn. He patented an ice machine in England in 1850 and in the United States in 1853; in 1855 he invented a machine and put it into active operation in Cleveland, Ohio, which produced 1,600 pounds of ice in 24 hours; and later discovered that ice would be transparent, with the exception of a small porous core, if frozen at a temperature slightly below the freezing point. In 1857 Dr. John Gorrie of Apalachicola, Fla., patented his ice-making machine; this was later followed by the compressed-air machine of Dr. Alexander Kirk; in

1858-60 the machine, upon which the modern ammonia absorption system was founded, was brought forth by Ferdinand P. E. Carre; and later the plate-ice system was introduced by Capt. David Smith of Chatham, Mass., who erected the first machine of this character in the United States at Oakland, Cal. There have been nearly 4,500 patents taken out in the United States alone for refrigeration processes.

Two systems of making ice are now used, the compressor and the absorption systems, the former the more generally used. The first step is the compression of the anhydrous ammonia (that is, ammonia which contains no water) by means of a steam pump, a pressure of from 125 to 175 pounds per square inch being exerted. This raises the boiling point of the ammonia. This pressure heats the ammonia and it gasifies as released. The next step is to reduce the gas to a liquid state by passing the ammonia through pipes which are in contact with the cold water or some other cold substance. By the condensation process the heat is greatly reduced and it loses theoretically all the heat it gained by compression. Thus the temperature of the ammonia falls to 5° or 10° F., and when it is circulated around tanks or cans containing water, the water freezes in a few hours. A good ammonia ice-machine will produce 30 pounds of ice with one pound of coal.

In the absorption process aqua ammonia is first converted into gas by the application of heat which raises the pressure to from 120 to 160 pounds per square inch. The ammonia is then reduced to liquid form by being passed through pipes in contact with cold water. The ammonia is then changed from a liquid to a gaseous form by expansion, the methods being the same as in the compressor system. The expansion draws out any heat in the gas, which, as it passes through the pipes in contact with the water to be frozen, absorbs the heat from them till they are of a like temperature.

A large portion of the ice manufactured in the United States is produced by the can system or the plate system. In making ice by the can system the water is first boiled and allowed to settle, in order to free the ice from any foreign substances and to reduce it to the greatest possible degree of purity. The water is then distilled, boiled again and run through three kinds of filters. A series of tanks, containing a strong solution of brine, is placed under the freezing room and through this brine run the pipes containing the liquefied ammonia gas. Into the tanks containing the brine are submerged the cans holding the water to be frozen. The ammonia in the pipes is expanded into gas as it passes into the brine and absorbs enough heat from the brine and water to form the water in the can into ice. The whole process requires from 20 to 66 hours, according to the size and weight of the blocks of ice and to the temperature of the brine. The can is then raised from the tanks by means of a hoist and dipped into a well of warm water to loosen the contents. The blocks produced weigh from 50 to 400 pounds.

The production of ice by the plate system is much slower and more cumbersome. In this process the tank contains the water to be frozen and into it is placed a hollow iron plate holding the coils of pipe filled with the freezing medium.

Thus the ice is formed on the outside of the iron plate, is taken out and removed and is then ready for use. The mechanism of an ice-plant consists mainly of a steam-boiler, feed-water conveniences, an oil-separator or high-pressure trap for removing the oil that collects in the ammonia, a steam-condenser, feed-water pump, an ice-machine, freezing tanks or cans and a cooling tower, where the heated water may be brought in contact with the atmosphere to quickly reduce its temperature.

The rapid growth of the artificial ice industry is most eloquently shown by the census figures. During the period between 1870 and 1880, the number of establishments increased from four to 35, and the production from a quarter million dollars worth to over half a million. During the next decade the number of factories increased from 35 to 222, and the production rose to almost \$5,000,000 worth. Ten years later in 1900 the census records 787 establishments, with a capital of nearly \$40,000,000, and an annual product of nearly \$14,000,000 worth of artificial ice, most of this manufacture being in the Middle or Central States of the country. By 1905 the factories had increased to 1,320, the capital to \$66,600,000, and the industry gave employment to over 12,000 people, receiving \$5,550,000 in wages and salaries. The total production for the previous year was worth \$23,790,000. In 1910 there were 2,004 factories, mostly capitalized between \$20,000 and \$100,000, and the production was valued at \$42,453,000, while the wage earners increased to 16,000. In 1916 a conservative estimate places the total of factories at 2,500, and their production at \$55,000,000 annually. Pennsylvania is the leading State in the industry, with 200 factories and 11.2 per cent of the country's production. Texas and New York each are credited with 8.9 per cent of the total production, but Texas has 200 factories to about 100 for New York State. Ohio, Indiana and Tennessee are the next States in the industry.

Strange to say the largest item of expense in the artificial ice industry is neither labor nor materials, as in most other manufactures. The material being water costs little and the machinery does the work. The great item of expense is coal, to produce the heat to expand the steam and run the compressor ice-machines.

The cost of producing a ton of ice averages throughout the country for all seasons of the year, between \$1.00 and \$1.50; the average price to the wholesaler ranges from \$2 to \$2.25; and the retail prices range from 15 to 40 cents per hundredweight according to the season. The changes and improvements in the methods of producing artificial ice have so reduced the cost of manufacture that it now competes with the natural product. See REFRIGERATION AND REFRIGERATING MACHINERY.

**ICE IN MEDICINE.** See COLD.

**ICE PLANT** (*Mesembryanthemum crystallinum*), a native of Africa and southern Europe. Its name is derived from the translucent shimmer of the bladder-shaped papillæ which cover the surface. The genus comprises 400 species, nearly all native to southern Africa. In southern California the ice plant is also successfully cultivated; and here, too, flourishes *M. aquilaterale*, a trailing species distinguished by attractive purple flowers. In the Madeira

Islands, the seeds of the plant are eaten by the natives. When burned, it yields barilla, which contains carbonate of soda, valuable in the manufacture of soap and glass. *M. edule* yields the fruit known as Hottentot figs. The flowers of the ice plant are many petaled, colored white, red or yellow and the leaves are thick and compact.

**ICE POLO**, a game played on skates. It differs from ice hockey in that a ball is used instead of a puck; the stick is shaped differently and the formation and play are more open. The team is composed of five men, distributed as follows: one centre, one half back, one goal tend and two rushers. The rules vary slightly, the object of the game being similar to that of hockey. The rink is 150 feet long (i.e., the distance between goals), and the goals are four feet wide. The game is divided into halves of 20 minutes, with 10 minutes' intermission. One goal scores three points.

**ICE YACHTS AND ICE YACHTING.**

The amusement or sport of sailing yachts over the ice has reached its highest development in the United States. The sport abroad is confined to Russia, Sweden and Norway. Boats of the Russian River Club are sailed over a portion of the Gulf of Finland. In 1901 the Stockholm Ice Yacht Club of Sweden built a fleet of fast-racing ice yachts from American designs by Ashley.

The first authentic ice boat in the United States was built by Oliver Booth at Poughkeepsie, N. Y., in 1790. It was a square box mounted on three runners, shod with rough iron, with a rudder post and tiller of wood. In 1850, on the Shrewsbury River, in New Jersey, George D. Allaire constructed an ice yacht of the box order, equipped with rough square iron bars for runners, sharpened with cutting edges. In 1855, on the same river, Nathan B. Clark built a three-cornered platform boat, having sharpened runners, and added a jib to the sprit sails previously carried. The type of side-rail boat came into use about 1871. Jacob Buckhout of Poughkeepsie was the pioneer designer of this type and at the Centennial Exhibition (1876) exhibited the side-rail yacht *Whiff*, built for Irving Grinnell of the New Hamburg, N. Y., Ice Yacht Club. She carried 347 square feet of canvas and measured 40 feet from the top of the bowsprit to the end of the main-boom. The sloop-rigged *Ice* built on these lines carried 1,070 square feet of sail, but this excess of canvas was found impracticable and the building of large boats was abandoned. The revolution in ice yachting began in 1879, when H. Relyea of Poughkeepsie built the *Robert Scott*, having a single backbone and an elliptical steering box. This boat carried 499 square feet of canvass and easily outsailed boats of twice her size. In 1883 the *Jack Frost* was built by Archibald Rogers of Hyde Park-on-the-Hudson and the famous racing yacht *Haze* was built the same year. The *Jack Frost* won the world's pennant in 1883 and the *Haze* in 1884 and 1885. About this time the Shrewsbury Ice Yacht Club of Red Bank, N. J., built a large lateen-rigged boat, the *Scud*, carrying over 600 square feet of duck in a single sail. The Orange Lake, N. Y., Club built at the same time the catboat *Shadow*, carrying 800 square feet of sail and said to be the strongest ice

## ICE-BOATS

"Ice-boating" on the Mojave Desert, Southern California. The "ice" is the compact sand of an ancient salt lake, now 2000 feet above sea-level

yacht ever constructed. Both of these vessels proved unsuccessful as prize or pennant winners. The *Iceide*, owned by J. A. Roosevelt, took the American pennant in four races out of five in the years between 1888 and 1899. The *Jack Frost*, owned by Archibald Rogers, won the pennant in 1887, 1893 and 1902. In March 1904, the *Wolverine* won the Stuart International Trophy, over a 20-mile course. In the last heat the time made was 42 minutes. On 24 Feb. 1907, the same yacht broke all world's records for a two-point course, at Kalamazoo, Mich., making the 20 miles in 39 minutes and 50 seconds, which remains as a record.

**Racing Rules.**—For class racing, ice yachts are divided into four classes: (1) Yachts carrying 600 square feet of sail area and over. (2) Yachts carrying 450 square feet and under

America is open to any American or foreign built yacht.

**Ice Yacht Construction.**—In the modern ice yacht the centre timber or backbone may be made of two pieces joined, or of one solid stick or as a hollow truss. To this is joined at right angles the running plank, which is supported by the two principal runners; the third runner is placed aft on a pivot and operated by a tiller as a rudder. The cabin, steering box or cockpit is attached at the aft extremity of the backbone. The mast is stepped two or three feet forward of the running plank. The backbone running plank, mast and bowsprit are connected and braced by wire ropes. The best material for the main beams is seasoned basswood, which is very light and stiff. The central objects in construction are lightness and

A Modern and Expensive Ice Yacht.

600. (3) Yachts carrying 300 square feet and under 450. (4) Yachts carrying less than 300 square feet. Handicap or time allowance for mixed classes is made as follows: One second per square foot for every foot of canvas carried over the smaller boat, providing the race is sailed in one hour. If the race is sailed in 30 minutes one-half second per square foot is allowed and proportionately in accordance with the time of the race.

The course is usually a triangle, sailed over as required to make the number of stated miles; or a straight course to windward and return or to leeward and return. The standard distances for ice-yacht races are 20 miles, 15 miles or five miles. The larger the yacht the longer the course. Time limit: 20 miles, 1 hour 15 minutes; 15 miles, 35 minutes; 5 miles, 20 minutes.

In the United States and Canada there are many ice-yacht clubs. The challenge pennant of

strength and adaptability for perfect handling. The centre of sail balance should agree with the centre of balance of the hull.

The cost of building an ice yacht of the first class, carrying about 650 square feet, is \$1,200 and of the fourth class, carrying 300 square feet, about \$350.

**Sailing.**—Racing on a lake is preferred to river racing, as there are neither tides nor ice cracks to interfere. Besides the sailing on the Shrewsbury and Hudson rivers there is now regular sailing and occasional racing on Lake Champlain, New York; Lake Minnetonka and Lake Pepin, Minnesota; Lake Winnebago, Wisconsin; Gull Lake, near Kalamazoo, Michigan, and the shores of Lakes Erie and Ontario. The 1914 races were sailed on the Shrewsbury, R. Heitemeyer's *Imp* winning the American pennant in 40 minutes 5 seconds. In a 10-mile race off Red Bank the *Scud* offered 7 minutes

handicap to all comers, but lost to the *Imp*. The 15-mile race for the Heitemeyer Cup was won by W. Content's *Blanche* in 35 minutes 35 seconds. In sailing a yacht the sheets are trimmed flat. The closest a boat will go to the wind is 30 degrees or  $2\frac{3}{4}$  points. The best course, or the one that will take the yacht farthest to windward is 60 degrees or  $5\frac{1}{2}$  points from the wind, when the advance to windward should be at the rate of half the velocity of the wind,

Ice Boat of 1790.

while the actual velocity is equal to that of the wind. The yacht encounters the greatest velocity of the wind when her course is 90 degrees or 8 points from the wind, when the apparent wind is twice the actual velocity. The greatest speed of the boat is attained at 120 degrees or  $10\frac{1}{2}$  points from the wind, when her speed is twice that of the wind. The most rapid progress to leeward is made at 150 degrees or  $13\frac{1}{2}$  points from the wind, when the apparent velocity of the wind will equal its true velocity.

**ICEBERG**, a mass of floating ice, usually detached from the front of a glacier, though the term is also applied to floe ice that has frozen on the surface of the ocean and then broken up. The fronts of many Alaskan and Greenland glaciers are discharging icebergs almost continuously. The ice masses may break away from the glacier as a result of undermining by waves, as a result of large blocks shearing away from the ice cliffs due to their weight and the great height of the cliff (300 to 500 feet in some cases), or as a result of the buoyant effect of the deep water into which they flow.

Ice in the north Atlantic occurs in three forms: slab ice, ice fields and icebergs. Slab ice is sea-ice formed in the river mouths, as in Labrador, occurring in sheet or circular masses. Ice fields are caused by the freezing of the sea itself and come usually from Labrador, though occasionally from Greenland. These two forms are not particularly dangerous to mariners, but may become so by massing or freezing to an unusual thickness. Icebergs, however, which are always freshwater ice, are never anything but dangerous, and

constitute the deadliest menace to navigation that ships have to face.

All the icebergs that are so perilous to travel in the transatlantic routes come from Greenland, in the neighborhood of Melville Bay, or outlying islands. Greenland is itself a huge, dome-shaped island covered with an ice-cap in places probably more than a mile in thickness. The western slope is far more extensive and it is on this side that most of the icebergs are formed; those that are made on the east coast are smaller, fewer in number, and, being quickly broken up by the open Atlantic waves, melt before they float far south.

The immense glaciers on the West Greenland side are constantly descending and push out to sea in enormous "tongues," as they find their way down the ice-covered mountains. These "tongues" form icebergs in three ways. Masses of ice may simply break off of their own weight; the sea waves may undermine the "tongue" until the weight of overhanging ice causes it to fall into the sea—a process called "calving"; or the ground swell of the ocean may dislodge large blocks of ice from the base of the glaciers. This glacier ice is unlike any other, having become exceedingly hard and flintlike from the enormous pressure; and, mingled with it, on the underside, are often boulders, stones, soil and other detritus. This is the birth of the iceberg—masses of ice of all shapes and sizes, launched into the sea every day of the year, but most generously in the short Arctic summer and contributed to by every mile of coast from Cape Farewell to Disco Bay, tributary to 120,000 square miles of ice cap. There is a single glacier that furnishes 200,000,000,000 cubic feet annually in icebergs.

These icebergs, as released, drift across the entrance of Baffin's Bay and Davis Strait to the Labrador coast. Here they catch the Labrador current and drift slowly southward on a journey of weeks or months—that is, for those that manage to escape to the open. The great majority of them become grounded or are immeshed by the numerous islands and bays that mercifully line the Labrador coast and protect the Atlantic in large measure from the iceberg menace. Those that finally make their way through—and they are countless in number—divide into two streams, one passing through the Strait of Belle Isle into the Gulf of Saint Lawrence, and the other, much the larger, going to sea by the way of the Grand Banks of Newfoundland. The "Banks," it is interesting to note, have been formed, it is thought, by the detritus brought down from Greenland by icebergs through unnumbered ages and dropped here, as the icebergs disintegrated, to become the breeding ground of cod, herring and other fish used by man.

When icebergs reach this point, they seem of every size, shape and contour, some of them rising to a hundred or more feet in height, with spires of crests or "minarets" 200 to 300 feet above the base, which may be hundreds of yards in length. From one-eighth to one-ninth of the mass—not necessarily height—lies above water. It must be remembered that mass and height are very different qualities. It is quite possible that an iceberg is disintegrating in such a way that it is as high out of the water as it is deep below the surface.

Icebergs reach the transatlantic routes in

## ICEBERGS

Gigantic Icebergs in the North Atlantic discovered by the United States Revenue Cutter *Seneca*, Easter Sunday, April 12, 1914

Copyright Underwood & Underwood, N. Y.

greatest numbers in April, May and June, but may be met with earlier and later. During the months named a more southern route is chosen by the ocean steamships. The place of most frequent contact with icebergs is at latitude 42° 45' and longitude 47° 52', where the Labrador current meets the Gulf Stream. It was at about this point that the *Titanic* met her fate in April 1912. The iceberg peril is lessened by the issuance of monthly "pilot charts" through the United States Hydrographic Office, which locate ice fields observed the previous month. Little reliance can be placed on the various devices invented to detect the vicinity of icebergs in foggy weather, though an "echo recorder" has been invented which is sometimes of service. But in spite of all precautions icebergs may creep upon a mariner unawares, and, with fog, are his deadliest peril.

Icebergs disintegrate very rapidly, beginning almost as soon as they are afloat. This is due in part to the fact that there is so marked a difference between the tension of the exterior and interior portions of such a mass of ice. The water that melts on an iceberg during the day works its way into crevices, and then, freezing at night, expands and splits the ice, often violently. After the icebergs get out of the Labrador current, disintegration goes on naturally and much more rapidly. They finally disappear about 400 miles south of Nova Scotia, the "Graveyard of the Iceberg," a point which they have to travel over 2,000 miles to reach.

**ICELAND.** An island in the north Atlantic Ocean, on the border of the Arctic Circle, 200 miles east of Greenland. It is an autonomous dependency of Denmark. Its volcanoes, earthquakes and geysers, its lava deserts and glacial snowfields make it an almost impossible land for human occupancy.

**Area and Physiography.**—Iceland is situated between 13° 22' and 24° 35' west longitude and extends from 63° 12' to 66° 33' north latitude. Approximately 300 miles from east to west and 200 from north to south, its area is about 40,450 square miles. Its coast line of 3,700 miles is deeply and irregularly indented by fiords, those of the northwestern peninsula being especially numerous. Three-fourths of the area is on the main island; the remaining portion is that of the northwest peninsula, which barely escapes being an island, as the connecting isthmus is only a few miles wide. This peninsula is largely mountain masses, with an average elevation of 2,000 feet. The main island is a series of volcanic tablelands, high and irregular, ranging from 1,500 to 3,000 feet above the sea. Overlaid here by extensive lava-beds and there by vast névés, or snow-fields, these plateaus present great areas of barrenness devoid of vegetation and are also broken up by ridges, fissures and spurs. More than one-eighth of Iceland is covered by lava-beds and another eighth by névés or glaciers. The only areas suitable for human habitation and industry are the bordering lowlands of the ocean and fiords, with the adjacent fertile valleys. Among the many mountains the highest are Öræfa, 6,424 feet, and Hecla, 5,108 feet. Lakes are numerous though of small size, the largest being Thingvall and Thors, each less than 30 miles in area. The so-called crater lakes, especially those to the west of Vatna, are subject to sudden and violent displacements through volcanic

action. Pasturage for herds and arable lands are almost entirely confined to valleys near the fiords.

**Climate.**—Iceland's climate is typically insular—equable and humid, with cool summers and warm winters. The following data compiled from observations of many years at Stykkisholm, 65° N., closely represent all of the island. The monthly averages of temperature, number of rainy days and amount of rainfall are: January, 50°, 20, and 2.76 inches; February, 27°, 18, 2.48; March, 27°, 18, 1.93; April, 34°, 16, 1.22; May, 40°, 15, 1.38; June, 47°, 16, 1.57; July, 50°, 13, 1.34; August, 49°, 14, 1.54; September, 45°, 18, 2.99; October, 38°, 19, 2.76; November, 33°, 18, 2.28; December, 28°, 20, 2.32. The coast temperatures differ slightly from those given, but on the central tableland vary from two to six degrees warmer in summer, and that much colder in winter. The annual rainfall of the southeastern shores averages 46 inches or more, while that of Grimsey Island, off the north coast, falls to 15 inches.

**Fauna and Flora.**—The woods are represented only by birch, mountain ash and willow, all stunted; trees more than 20 feet high are rare. The floral species number 435 and pertain to the Arctic flora of Europe. Indigenous animals are the blue and white foxes, visiting polar bears and mice. Wild reindeer are from the herds introduced in the 18th century. Of the 100 birds, the majority are aquatic. The most valued is the eider duck, for the down with which it lines its nest.

**Volcanoes.**—The physical features and material prosperity of Iceland have been largely dominated by its volcanoes, whether active or quiescent. During inactive periods the drifting ashes and cinders often destroy the fertility of fields and the pastoral ranges. From the eruptions have come vast masses of lava, which have transformed by their unbroken sheets thousand of square miles of cultivated valleys into desolate deserts. The fearful devastation wrought by eruptions has scarcely been surpassed elsewhere. In two centuries (1625–1860) Katla has been active 13 times, once sending its ashes to Norway. On occasion the lava streams from this volcano melted enormous masses of névé, causing violent floods which through its débris changed many farms into barren wastes. As late as 1875 Askja sent forth great rivers of lava from its crater of 34 square miles.

The most frequent eruptions have been from Hecla, which numbered 43 periods of activity up to 1845; they were generally violent. The outflow of 1783 wasted a large extent of country, while that of 1845 continued at intervals for nearly a year, pouring out a lava stream 50 feet deep and a mile wide.

Hecla has the record for devastation, its single eruption (1783) causing almost inconceivable havoc. It is asserted that no less than 230,000 head of stock were killed, including more than half of the cattle, three-fourths of the horses and four-fifths of the sheep. These frightful losses of fields and of stock caused famine to fall on the land, and in succeeding years 9,500 persons died of starvation, one-fifth of the entire population.

Earthquakes are naturally associated with volcanic energy, though not directly connected with it. The earthquake of 1784 destroyed 92

homesteads and injured 372 others. The damage of that of 1896 was fully as great, half of the 320 homesteads affected being destroyed. The lava beds work the greatest injury, as they gradually diminish the arable and pastoral areas of the island. The greatest lava producers have been Askja, Hecla and Katla; these parent volcanoes are encircled by lava sheets which aggregate in area nearly 5,000 square miles. The Ódadhurum field, to the north of Vatna, is an unbroken sheet of 1,700 square miles, including branches. One danger is the melting of the surrounding névés by the burning lava, thus producing devastating inundations. The most destructive of such floods was caused by the eruption of Oearefa Tokeell (1362), when 40 farms with occupants and stock were swept bodily into the ocean.

**Glaciers and Névés.**—There are 200 or more of névés, or permanent snow-fields, the most extensive, 2,300 square miles being that of Vatna, which borders the Atlantic. While the northern snow-line of Vatna, facing the Arctic Ocean, is at an elevation of 4,000 feet or more, the southerly snow-bearing winds of the North Atlantic are so effective that they bring the névé of the oceanic slopes down to 2,000 feet. From this névé issues a glacier of nearly 200 square miles area. Practically all the glaciers are dead, that is do not reach the sea, though the Breidenmerkur closely approaches the Atlantic. On the Arctic and coldest coast, the lowest glacier terminal is 2,500 feet above the ocean.

**Geysers.**—Hot springs exist in large numbers, and are of three types: quiescent springs, boiling mud lakes, and geysers where boiling water is ejected intermittently. The largest geyser system—numbering a hundred—is about 60 miles northwest of Hecla, and 70 miles from Reikjavik. The best known are the Great and Little Geysers, and Storkr (the churn). The Great Geyser is surrounded by a silicate basin, 70 feet across and 5 feet deep. The vent extends 80 feet downward, and its diameter is about 8 feet. At irregular intervals, varying from 6 to 30 hours, the Great Geyser ejects with a roar a column of boiling water to great heights—80 to 150 feet. The surface water usually has a temperature near 180°, but occasionally reaches 250°.

**Agriculture, Fisheries and Industries.**—About 50,000 persons are engaged in agriculture, of whom a surprisingly large number are owners. Hay is the principal crop, followed by potatoes and turnips. Berries are the only native fruits. Stock-raising is the important factor. In 1914 there were 1,021 goats, 25,380 cattle, 46,644 horses and 585,022 sheep. Grain cannot be profitably grown, thus necessitating importation of cereals. The most important of the exports are the products of the deep-sea fisheries, in which 15,890 persons were engaged in 1914. Cod is the most lucrative, followed by herring and salmon. Industries are limited, only 7 per cent being employed therein. The principal industries are the curing and salting of fish, rendering of oil, preparation of eiderdown and the manufacture—largely domestic—of woolen cloth for local use.

**Minerals.**—Difficulties of transportation and poverty of metallic deposits have delayed the exploitation of the minerals of Iceland. In recent years a mine of the well-known Iceland

spar has been developed, and with the growing demand for fuel the mining of the low-grade coal is also being attempted.

**Communications.**—Keeping pace with inventions, Iceland has emerged from the period of bridle-paths and infrequent mails. Bridges and roads now exist, and the introduction of motors compels further progress. Cable communication with Europe is supplemented by a network of telegraph and telephone lines; this system, 862 miles in length, has about 90 stations in operation. The coast settlements are served by regular steamship lines.

**Government.**—The Minister of Iceland controls such affairs as pertain to Denmark, by whose king he is appointed. His tenure of office depends on the support of the Althing. (See *History*). Iceland votes its own budget, levies its own taxes, and imposes duties on coffee, sugar and tobacco. Its expenditures are kept within its receipts, and there is no public debt. A reserve fund for emergencies exceeds one million kroner.

**Commerce.**—Until 1854 trade was a Danish monopoly. At present 40 per cent is Danish, 25 English, and 10 Norwegian. The larger part of the cargoes are carried in English bottoms. The value of the imports (1913) reached 16,717,000 kroner: they consisted principally of cereals, 12 per cent; clothes, etc., 14 per cent; coal, 15 per cent; and wood materials, 7 per cent. The exports (1913) aggregated 19,128,000 kroner. Of this fish amounted to 64 per cent, mutton to 10, oil and hides, 5 each, horses and eider-down about 1 per cent each.

**Population.**—The inhabitants of Iceland are Scandinavian by race and Lutheran by religion. Once said to number 100,000, they were reduced by famine and epidemics to 47,240 in 1801. The population increased steadily to 72,445 in 1880, but fell off the following decade to 70,927 through an epidemic of measles and by emigration to America. The census of 1911 registered 85,133, and doubtless the number now exceeds 90,000, as the 2,333 births of 1914 exceeded the deaths by 904. The Icelanders are educated, intelligent and temperate. Thrift is shown by the saving-banks where the deposits approximate \$1,500,000. More than one-half the population are agriculturists, and one sixth are engaged in deep-sea fisheries.

**Education.**—In the remote and rural districts the education of children begins at home, aided by traveling teachers and supervised by the clergy. Wherever there is a village or town a regular school system is maintained. Reikjavik is the seat of higher education, headed by a theological seminary and a university. Technical schools are maintained for medicine, navigation, agriculture (there are four on the island), Latin and advanced training for women. There are about 20 Icelandic newspapers and journals, which are widely distributed and diligently read.

**History.**—The definite history of Iceland begins with its settlement in the 9th century by Norwegians, whose emigration was forced by the tyrannical oppression of King Harald Fairhair. The colonists came in clans, their home chieftains ruling selected districts in the new land. These chiefs soon established a representative government, organizing the Althing in which all Iceland participated. For two centuries the laws there made were promulgated

2 Iceberg composed partly of soft ice, which rapidly melts on its journey southward

orally and handed down by memorizing. The introduction of Christianity, in the year 1000, was followed by the development of a rich and remarkable literature. Feudal quarrels and religious dissensions, fostered by the king of Norway, led to civil war. Through emissaries, by means of assassination and bribery, the Althing was influenced to ratify (1264) a Treaty of Union with Norway, safeguarding Icelandic liberties by provisos retaining powers of taxation and of law-making. In 1380, through changes in the Scandinavian dynasty, Iceland passed under control of Denmark.

The epidemic of Black Death (1402-04) threatened extinction, while later famines, piratical raids, smallpox (1707) and volcanic eruptions (especially in 1783) brought untold misery on the people. After an existence of over eight centuries the Althing was abolished (1800), and home government seemed to have perished. But patriotism was not dead, and after years of struggle the Althing was restored in 1843. Denmark attempting (1849) to restrict Icelandic liberty, a constitutional struggle followed, which terminated (1874) by the granting of a constitution. This reformation was accomplished under the leadership of Jon Sigurdsson, on whose monument is engraved, "Iceland's beloved son, her honour, sword and shield." While the Althing was largely elective, the Upper House was formed by 12 members, of whom six were nominated by the king of Denmark, who also appointed the governor. The Crown however exercised very freely its power of veto on Icelandic measures, which led to further struggles. Finally Denmark granted a liberal constitution (1903), under which the Minister of Iceland resides in the country, and depends for his tenure of office on the support of a majority of the Althing. This body now consists of a Lower House, 26 elective members, and the Upper House, with eight of its members elective and six nominated. Icelandic affairs are now largely independent of Danish control. The autonomy of the island is also evident from the royal assent given to the Icelandic national flag, a white cross, with a stripe of red, in a blue field. The measure giving women the right of suffrage receiving royal approval 19 July 1915. On 25 Jan. 1915 the Althing enacted a law forbidding sales of liquors, under which all remaining stock of liquor was exported. Progress is the order of the day, and complete independence is now urged.

MAJOR-GEN. A. W. GREELY,  
Author of 'Handbook of Alaska.'

**ICELAND MOSS**, a lichen (*Cetraria islandica*), found in all the northern parts of the world. It is valued for its nutritious and medicinal properties, and as an article of commerce is collected in Iceland and Norway. In the extreme north it grows even near the sea-level; farther south, only on the mountains. In Iceland it often thickly covers great tracts,

and the gathering of it is a summer industry. It grows about one and one-half to four inches high, consists of an almost erect thallus, and is of a substance leathery and rather cartilaginous. It has a bitter principle which is reduced by steeping in water, and the moss is prepared as food either by pounding and making it into bread or by boiling, with water or milk, till it makes a jelly, in which form it is an agreeable and beneficial diet in some forms of disease, especially in pulmonary disorders. It is also utilized in dressing the warp in weaving, and for sizing paper, being mixed in the vat with pulp. It is also of value as one of the foods of the northern caribou.

**ICELANDIC LANGUAGE.** The Icelandic language is a member of the Scandinavian branch of Germanic languages. Together with Old Norwegian as spoken in Norway and in her Western colonies, the modern Norwegian dialects, and Faroish it forms the Western Scandinavian group, while Swedish and Danish form the Eastern. (See DANISH LANGUAGE). The original settlers in Iceland came from Norway direct or from the Norwegian colonies on the islands north of Scotland. The majority were from southwestern Norway, and with the dialect of this section of Norway the Icelandic language remained most closely related till the 14th century, from which time Icelandic is a language separate from Norwegian. Owing to the island's isolated location, the Icelanders have for a longer time than other countries preserved old habits and customs, and particularly has the ancient language been retained with comparatively few changes. The population has at no time exceeded 100,000, while about 25,000 have in recent years found new homes on the North American continent, about equally divided between Canada and the United States. But the language and literature of this people, so insignificant in number, are of the greatest interest and value.

The history of the Icelandic language may be divided into two periods: Old Icelandic (874 to the time of the Reformation) and Modern Icelandic. In the so-called classical period, from the latter half of the 12th century to 1350, the language of Iceland and Norway was often called "Norrönt mál" (Norse tongue). The "Norn" language is still used about what remains of the Norwegian language on the Shetland Islands (cf. Jakob Jakobsen's 'Etymologisk Ordbog over det norrøne Sprog paa Shetland'). While changes common to the language of Norway and Iceland are developed in this period, there are also certain characteristics in Icelandic distinguished from Norwegian (see NORWEGIAN LANGUAGE), but as by far the most important literature was either produced or preserved in manuscript in Iceland, the Icelandic form became the standard, and even in Norway Old Norwegian is taught in the schools in the Icelandic form. Some differences between Norwegian and Icelandic are: u-mutation of *a* is found in Norwegian only when *u* is dropped in the following syllable, in Icelandic both when it is dropped and when it is retained (Icelandic *forum*, Norwegian *farum*); original *h* has been retained in Icelandic (even till this day) before *l*, *n* and *r*, while in Norwegian *h* was dropped (Icelandic *hlutr*, Norwegian *lutr*; Icelandic *hmiga*, Norwegian *niga*);

ö (æ) becomes (13th century) in Icelandic (æ) (*norröna*, Icelandic *norræna*); later, *e* before *ng* is changed to *ei* in Icelandic. The classical Icelandic was practically uniform throughout the island, with very few dialectic differences. This was owing to the lively intercourse between the different settlements of the island and between these and the mother country, to the annual Althing gatherings and to the flourishing literature. As a literary language it takes the highest rank among the old Scandinavian languages not only on account of its wealth of literary treasures, but also on account of its pliancy, its expressive and elegant style. Both the valuable literary productions and the retention, on the whole, of the more ancient forms give it a fundamental importance for the study of Scandinavian languages and literatures in all their branches. Even at an early date their language became to the Icelanders an object of scientific study, as seen, e.g., in the so-called 'First Grammatical Treatise' in Snorre's 'Edda,' written by an unknown scholar in the 12th century. From the 14th century, Middle Icelandic falls far below the Classical in power and grace. From the orthography, often inconsistent and a mixture of old and new, is seen the transition to the pronunciation which is characteristic of Modern Icelandic. A considerable number of foreign words make their appearance, borrowed from French, German and Danish.

Modern Icelandic as written does not differ very much from Old. Especially from the 19th century, it has in the main retained the orthography of classical Icelandic, while in its earlier periods the orthography resembled more the Middle and was closer to the pronunciation. In this respect it differs very much from Old Icelandic. A number of the vowel sounds have changed. One example: *á* is spoken as the diphthong *au* and before *t* almost as German *ach*. The same is true about the consonants. Examples: *ll* (in certain cases) and *rl* spoken in *dl*. The same sounds as in English *th* in "father" and "think" have *þ* and *ð* retained. The accent is on the first syllable. As to the vocabulary, the modern Icelanders have with passionate zeal practised the exclusion of all foreign words and have formed new words, as occasion demanded it, from native material. There is, on the whole, much similarity between linguistic conditions in modern Greece and modern Iceland. The result of this purism so consistently carried out is that modern Icelandic has fewer words of foreign origin than any other language. New words have in many cases been coined successfully, as *bókasafn* (library), *umræða* (discussion). But in a number of cases these attempts have not been so successful. Where it is impossible to coin new words from Icelandic material, the strictest purists would rather avoid the use of the word or use an Icelandic word that has a somewhat similar significance.

GISLE BOTHNE,

*Professor of Scandinavian Languages and Literature, University of Minnesota.*

**ICELANDIC LITERATURE** — Old Icelandic (800-1500).— The old Icelandic poetry is a development of the old Norwegian, which, however, it soon surpassed. From the middle of the 10th century almost all the skalds (poets) are Icelanders. After the famous Norwegian Eyvind Skaldaspillir, whose 'Hákonarmál,' composed in memory of King Hakon (d. 961) is one of the finest songs handed down from the past, poetic art almost ceased among the Norwegians while it flourished among the Icelanders. The Elder Edda or Sæmund's Edda is a collection of lays, treating of gods and heroes of antiquity. In these famous poems together with the Younger or Snorre's Edda we find the principal sources of our knowledge of Scandinavian and, indeed, Germanic mythology. Many scholars have in recent times discussed both the age and what was the probable original home of the Eddaic poems. The consensus now is that the oldest are from the latter half of the 9th century, and that most of them came from the 10th and the early part of the 11th century. Their original home is Norway and her colonies, and of these principally Iceland, where they were preserved in their written form. Related to the Eddaic lays whose authors are unknown, is the poetry of the known skalds. These poems treat of a variety of themes. Joy and grief, love and hatred find expression in them, but the majority are composed in honor of kings and princes, in whose presence the skald himself recited his poem. The Icelandic skald would visit especially Norway, but also Sweden, Denmark and the British Isles. The princes gave them as a rule a hearty welcome and rewarded them liberally. These poems of praise and songs of heroic deeds often have great historical value, superior to the artistic, and in the sagas are found frequent quotations from them in support of the story. Simple rules of versification, as a rule, governed the lays of the Edda. In the age of the skalds it is much more artificial, bordering sometimes on the incredible. Combined with the rules, to be strictly observed, of metre, alliteration and rhyme was developed an elaborate system of complicated figurative paraphrases (*kenningar*). All this artificiality is far removed from the noble simplicity of early poetry and often makes the skaldic verses unintelligible. To a number of these enigmas, the Skáldskaparmál of Snorre's Edda furnishes the key.

The first great poet of Iceland was Egil Skallagrímsson, the hero of one of the best sagas. This famous viking of the 10th century was both a great skald and a mighty warrior. Of his poems that have been preserved 'Sonar-torrek' ('Loss of the Son') bears the best evidence of his great poetic gifts. In his 'Warriors of Helgeland' Ibsen has imitated it. Glum Geirason composed a poem in memory of the Norwegian king Harald Graafeld and was the first Icelandic skald to compose a poem in praise of a king. Soon this species of poetry was exclusively confined to the Icelanders. But there are also poems of a different kind, as the love songs of Kormak Agmundsson and Gunnlaug Ormstunga who visited Norway in the time of Earl Haakon (d. 995). Hallfred Vandrædaskald composed poems in honor of King Olav Trygvesson (1000). Thormod Kolbrunarskald was one of Saint Olaf's skalds and fell in the same battle as his master (1030). Most famous of all Icelandic skalds is Sigvat Thordsson, who made his home in Norway and was strongly attached both to Saint Olaf and his son Magnus. Best known are his 'Bersöglisvisur' (songs of free speech). Arnor Thordsson and Tjodolf Arnorson were attached to King Harald Hardradi who also was a poet. Of the many poets after the time of King Harald must be mentioned the great historian Snorre Sturlasson who wrote in honor of King Hakon and Earl Skule, his well-known 'Hátatal' (enumeration of metres) in 102 different kinds of verses. Snorre's nephew Sturla Thordsson is the last poet who is known to have composed songs in honor of Norwegian kings ('Hakonarkvida'). In all these songs of praise which principally glorify the warlike deeds of kings and princes, we find comparatively few traces of the changes brought about in customs and views by the acceptance of Christianity. Even in the drápas that were produced after the introduction of Christianity figurative language and expressions are used which get their explanation from the myths of heathen gods and heroes. But it is clear that sooner or later the new religion would furnish the poets new material. Most remarkable and, perhaps, the oldest in this respect is 'Solarljod' ('Song of the Sun'). Even this Christian poem, giving visions of heaven, purgatory and hell, uses much of the heathen material. But it was easy to transfer the practice of singing the praise of kings and warriors to the religious field. Christ and the Saints were looked upon as heroes and warriors. The last and most famous of these religious poems is Eysteinn Asgrímsson's 'Lilja' ('The Lily'), written about 1360. In an original metre, later called the Lily metre, it glorifies the Savior and Virgin Mary. In 1917 were published excellent translations into modern Norwegian and Swedish. There is also an English translation. From the middle of the 14th century the old skaldic poetry is succeeded by the so-called "rimur," a kind of ballad or epical paraphrases with themes from mythology and history. Almost every Icelandic saga or romance has been turned into such lays, and even the historical books of the Bible. The first of this kind is the 'Olafs-rima' (treating of Saint Olaf) by Einar Gilsson in the 14th century. The majority of these poems have as yet not been printed.

Even in the early heroic lays and in the

skaldic poetry the Norwegians and the Icelanders had shown an interest in the history of their people. But the most adequate expression for this we find in the prose literature, of which the best productions are the famous sagas, a name applied both to history and fiction. The skald who composed the historical drápa and the writer of the saga had much in common, and the two were sometimes united in one person. The skald visited foreign countries and brought back with him, as did other travelers, the wealth of material for the prose tradition. From a more primitive beginning this tradition gradually developed; probably under the influence of the Irish saga developed in a similar way, into a well rounded and complete narrative of a certain fixed form, so that the writer who gave it its final shape in many cases only arranged the material for the purpose he had in mind. Another similarity with the Irish saga we find in the numerous quotations of skaldic verses to strengthen and confirm the reliability of the narrative. Most of the sagas treat of conditions on Iceland and of the history of the kings of Norway. In some sagas are found also remarkable experiences among other peoples with whom the Icelanders came in contact. It is especially in this historical field that the Norwegian-Icelandic literature reached its highest point and produced masterpieces that may both as to contents and form be called classical. The Icelandic sagas had their beginning about 1120 and continued down to the close of the 14th century. The first half of the 13th century may be considered the golden age of the sagas. Also in this literary production is seen a development into maturity, a growth and decay. But on the whole, the majority of the sagas show distinct characteristics of a very high value. The description in the so-called historical sagas is wholly impartial, and even in the few cases when we know who the author is he keeps entirely in the background. Often quotations from skalds and other authorities are found, the time of the happenings is carefully stated, and accurate descriptions of the historical places are given, the family connections, the personal appearance and the character of men and women are described in almost complete detail. Especially are the descriptions of character, although expressed in few words, admirable. The style of the saga shows its origin from oral tradition. It is simple and natural, without any long periods, and the frequent use of dialogue reminds one of the speech of every-day. The dramatic style in connection with the artistic arrangement of the subject gives the Icelandic saga a high rank in comparison with any other literature. The historical sagas treat of Iceland as a whole and embrace also the family sagas, whose trustworthiness is considered by modern scholars often very doubtful; the sagas of the kings of Norway; the sagas treating of other countries. Ari Frodi Thorgilsson (1067-1148) is the pioneer among historians. His 'Íslendingabók' ('Book of the Icelanders') gives an account of the early settlement down to 1118. He also began the production of the 'Landnamabók' ('Landtaking Book') which was continued by several others, among them Sturla Thordsson. This unique work tells of the original settlers and their families and contains the names of 3,000 persons and 1,400

places. To the general history of Iceland belongs also 'Kristnisaga' on the introduction of Christianity, to which may be added several sagas of the bishops and collections of legends. 'Sturlungasaga,' the greater part of which was written by Sturla Thordsson, tells the history of the Icelandic republic down to 1284.

The family sagas discuss, with few exceptions, persons and events from the first settlement of the island to approximately 1030. Owing to the fact that in this period Iceland was occupied by the early settlers and that the new faith was introduced and to other causes, the many remarkable events furnished a wealth of material for the oral tradition to build on. These sagas are properly grouped according to the localities they describe. Of the large number only the most prominent may be mentioned. To the South belongs 'Njal's Saga,' the most celebrated and best of these sagas. In the West we find 'Egil's Saga,' also one of the best, telling us about the skald and warrior Egil Skallagrimsson. A continuation, in a way, of this saga is Gunnaug Ormstunga's Saga, short but very beautiful. Hoensa-Thori's Saga contains important contributions to the history of the Icelandic constitution. Eyrbyggja-Saga gives valuable information about customs and manners at the time the new land was occupied and tells about the heathen superstition. Laxdoela-Saga, remarkable for its excellent delineation of character and its vivid style. Gisle Sursson's Saga is a well told story of a man who was outlawed and gives information of the foster-brotherhood of the early days. 'Fostbroedrasaga' tells of Thorgeir Havarsson and Thormod Kolbrúnarskald. To the North District belongs Kormak's Saga telling about his adventurous life and containing a number of love-songs. Hallfred's Saga tells about the fates of the above mentioned H. Vandrædaskald. Vatnsdoela Saga gives fine descriptions of persons and conditions at the time Christianity was introduced. Grettis Saga contains many exaggerations and fables in telling about the outlaw Gretti the Strong. Viga-Glum's Saga is one of the oldest and best and throws much light on the culture of early times. In the North Hrafnkell's Saga gives much valuable information about the worship of the gods, the administration of law and political institutions. The history of Norway occupied the attention of Icelandic writers at an early date. Ari Frodi was the pioneer also in this field. Soon others followed his example, some writing a complete sketch of all of Norway's history, while others confined themselves to the history of one or several kings, especially Olaf Tryggvesson and Saint Olaf. For a short time the Latin language was used. The Norwegian monk Tjodrek wrote his 'Historia Norvegiæ' about 1179, and the Icelandic monks Odd and Gunnlaug wrote in Latin about Olaf Tryggvesson, but this work is now only preserved in an Icelandic translation. 'Agrip af Noregs konungasögum' is the oldest history of Norway that has been preserved, written in the vernacular, briefly telling about the times from Halfdan the Swarthy to Sigurd the Crusader. Agrip is written in Norwegian, but has been preserved in an Icelandic manuscript. Of Icelandic origin is 'Morkinskinna' ('Rottenskin'), a collection of sagas about Norwegian kings from 1035 to 1157, and 'Fagrskinna' ('Magni-

ficient parchment'), a history of Norway from Halfdan the Swarthy to 1177. Among the skaldic poems found in this work is 'Eiríksmal' about King Erik Bloodyaxe. All the above mentioned historical works were preliminary to, and used as sources of, the greatest and most celebrated of historical works in all the old Scandinavian literature, Snorre Sturlasson's 'Heimskringla.' It begins with the story of the royal family of the Ynglings, descended from the gods, and tells the history of Norway down to 1177. The saga of King Sverre (1177-1202) had already been written by one of his contemporaries, the Icelandic abbot Karl Jónsson. The so-called great saga of Saint Olaf is probably an elaboration of Snorre himself of the Olaf's saga in his Heimskringla. Continuations of Snorre's work are, besides the Sverre's saga, the saga about Sverre's three successors and the Saga of King Hakon Hakonsson, whose author was Sturla Thordsson. Of the saga of King Magnus Lagaböter (Law-mender) by the same author, we possess only a fragment. This was the last original Icelandic production on the history of Norway. From the close of the 13th century and through the 14th century there are a number of rather uncritical collections of historical sagas. Among these may be mentioned the 'Flateyrbók' (1370-80), containing not only sagas of Norwegian kings, but also sagas of the Orkneys and Feroes and other minor narratives. The sagas of Erik the Red and Thorfinn Karlsevne tell about the Norwegian discovery of Greenland and Vinland (America). Much information about the early history of Denmark is found in the 'Jomsvikinga Saga' and especially the 'Knytinga Saga.' Contributions to the history of Sweden are found in several minor narratives, while Eymund's Saga gives information about Russia. Another class of sagas is the mythic-heroic ('Fornaldar-sögur'), in which the imagination of the writer has full play. A prominent place in this group has the Volsunga Saga, a narrative with many romantic embellishments, based on the heroic poems in the Elder Edda and others that have been lost. Connected with this saga is the Saga of Dietrich of Bern, compiled from German sources in Bergen, Norway, about 1250. The sagas of Hervor and Half and His Heroes contain many fragments of old poems. Hrolf Krake's Saga and Ragnar Lodbrok's Saga, especially valuable for the study of Danish traditions, give romantic descriptions of the viking age. The beautiful Fridthjof's Saga has furnished material for Tegner's famous poem. This with the saga of Orvar-Odd and others deals with Norway. It becomes difficult to draw the line between these heroic-mythic sagas and the folk-tales to which the transition was easy. To the latter belong the stories of Bard Snæfellsass, Gautrek, Sörle the Strong, and many others. As early as in the 13th century the taste for romances and romantic poems full of strange adventures and sentimental love-stories had spread to the North from foreign countries. We know that at the suggestion of the Norwegian king Hakon Hakonsson and his successors, stories of this kind were translated. There are more than 100 more or less free translations from Latin, English, German and especially French. Some of the translations made in Norway are by Icelanders.

As an example may be mentioned the long *Karlamagnus Saga*, a free prose translation of the French 'Chanson de geste.' Foreign influence is also seen in the legendary sagas. A few of these are of Norwegian origin, but most of them are translations. Best known is the saga of Barlaam and Joasaphat, translated by Hakon Sverreson, king of Norway. Also to be mentioned are *Mariu saga*, 'Postola sögur, Helgra manna sögur.' 'Stjórn' (produced in Norway) retells in a free manner the historical books of the Old Testament and has some additions from Josephus and other sources. 'Grágás' is the name of the code of laws for the Icelandic republic. It is based on the laws brought from Norway by Ulfjot and adopted by the first Althing in 928. The manuscripts are from the 13th century. After the union with Norway a new law was adopted, called 'Hákonarbók' after King Hakon or 'Jarnsida' (Ironsides) from its cover. In 1281, during the reign of Magnus Lawmender, the 'Jónsbók' was adopted. To scientific works belongs the *Younger Edda* or *Snorre's Edda* which gives rules for the skalds, a guidance for young poets. From the beginning of the 15th century, the darkest age of Icelandic history, there is stagnation in the literary activity. From this time the *Norrön* literature, common to Iceland and the mother country, ceases, even in Iceland, while it had ceased in Norway the century before, and as far as the language is concerned, the two countries part company. The terrible Black Death (1402-04), famine and other plagues devastated the country. It almost killed all spiritual life. The old literature seemed for a long time to be forgotten, copyists and annalists ceased their work (1430). There seemed to be no inspiration for either a national or religious revival. The only things of literary interest from this age are the weird folktales, orally transplanted to later generations and increased by them and published only in recent years, while the love of poetry which never became quite extinct found an outlet in the so-called *rimur*.

**Modern Period.**—Printing was introduced in 1530 by the last Catholic bishop, Jon Arason. He was a lyric poet of note. The first, not very good, translation of the New Testament was made by Oddur Gottskalksson, printed in Denmark in 1540. Bishop Gudbrandur Thorlakssson completed in 1584 his fine translation of Luther's German version of the whole Bible. On this translation as on a foundation was created the modern Icelandic literature. From his printing establishment at Holar no less than 85 works were issued between 1574 and 1624. The new literary interest created by the Reformation had an almost exclusively religious character down to 1720. Jon Thorkelsson Vidalin (1666-1720) ranks with the very best preachers of the Scandinavian countries, and his family book of sermons was found in almost every home. In this period Iceland had a large number of writers of hymns. Religious poetry reached its highest in the popular productions of Hallgrímur Petursson (1614-1674). In the Age of Learning, Arngrímur Jonsson Vidalin and Brynjólfur Sveinsson, who discovered the manuscript of the *Elder Edda*, were excellent Latin scholars and published works in Latin. Vidalin published 'Crymogæa' ('Iceland'), the first comprehensive description of

Iceland's nature, people, language and history. Through his correspondence with the Danish scholar Oluf Worm and others a beginning was made in the modern scientific study of Scandinavian antiquities and languages. Even among the Icelandic peasants (Björn Jonsson, Jon Gissursson) is found this awakened interest. Some begin to write "annals," others revive the old custom of copying. The first Icelandic dictionary was written by Magnus Olafsson and published by Worm (1650). The *Magnænum*'. In Latin wrote Finnur Jonsson Pall Jonsson Vidalin published a learned work on the laws. Of the greatest importance are the works of the historian Torfæus (1636-1719) and the famous Arni Magnússon (1663-1730) who brought his great collection of manuscripts to Copenhagen. A large number of poets produced thousands of *rimur* or epic poems. Gudmundur Bergthorsson (1655-1705) produced 252 *rimur* and enjoyed a great reputation. Also a large number of lyric poems were produced. In the beginning of the 18th century Iceland suffered greatly under various misfortunes, especially smallpox, which reduced the population to 32,000.

The language at this time shows Danish influence, especially in business and law. Eggert Olafsson who writes on economic and other subjects, is the first to again revive the national spirit. He was also a poet. Economic works are published in this Age of Enlightenment. The first periodical makes its appearance in Danish. The study of history and literature was revived. Many works were published, often in Danish and printed in Denmark; Icelandic scholars were important contributors as Jon Olafsson, Jon Erichsson, Grímur Jonsson Thorkelin ('*Diplomatarium Arnæmagnænum*'). In Latin wrote Finnur Jonsson the ecclesiastical history of Iceland, Halfdan Einarsson his literary history. The first valuable dictionary was by Björn Halldorsson. It was published by Rasmus Rask in 1814. The first Icelandic periodical was started in 1796. The 19th century is in Iceland as in other countries characterized by a strong, conscious national awakening. It had in its beginning a literary, later also a political, character, which is leading to new political relations with Denmark, if not to complete separation and the establishment of the Icelandic nation. In 1816 the great Danish scholar Rask established with his friends, the Icelandic scholars Sveinbjörn Egilsson, Arni Helgason, Bjarni Thorsteinsson, Finnur Magnússon "*Hid islenzka Bokmentafelag*." The aim of this literary society was to work for the purification of the language and the education of the people. Under very able leaders, especially Jon Sigurdsson (1851-79), the great leader of modern Iceland, this society which is still flourishing has done great services for the development of Iceland in almost all fields, through the publication of old Icelandic works, studies in language and literature, the two periodicals *Timarit* and *Skirnir*. But most of the scholarly contributions to old Icelandic history, literature and philology have been made by these and other great Icelandic scholars independently. Here we have such prominent names as Finnur Magnússon, Sveinbjörn Egilsson, Jon Sigurdsson, Gudbrandur Vigfusson, Eiríkr Jonsson, Jon Thorkelsson, Benedikt Gröndal, Gísli Brynjólfsson, and in

most recent time Finnur Jónsson, professor in Copenhagen, Björn M. Olsen, president of Iceland's University at Reykjavik (1911), Valtyr Gudmundsson. The special history of Iceland has been treated in a number of books. The periodical literature has played an important part. *Eimreidín* is at present the best known periodical. Modern Iceland has produced a number of lyric poets. Some of these have also excelled in other fields. Jon Thorkelson's novels 'Piltur og stúlka' and 'Madur og kona' have been translated into English. There are many good translations from the literature of the Scandinavian and other countries. In most recent time the drama has an excellent representative in Johann Sigurjonsson, also known to English readers.

**Bibliography.**—Jonsson, Finnur, 'Den oldnorske og oldislandske Litteraturs Historie' (Copenhagen 1894-1902); id., 'Den islandske Litteraturs Historie tilligemed den oldnorske' (ib. 1907); Prolegomena to Vigfusson's 'Sturlunga Saga' (Oxford 1878); Vigfusson's 'Corpus Poeticum Boreale' (Oxford 1883); Vigfusson-Powell 'Origines Islandicæ' (Oxford 1905); Morris and Magnusson, 'Saga Library' (6 vols., London 1891-1905); Mogk, 'Geschichte der norwegisch-isländischen Literatur' (Strassburg 1904); Poestion, J. C., 'Isländische Dichter der Neuzeit'; Gudmundsson, V., 'Islands Kultur ved 1900'; Craigie, 'The Icelandic Sagas' (New York 1913); Horn, Winkel, 'Literature of the Scandinavian North,' translated by R. B. Anderson (Chicago 1884), with a bibliography. There are a number of English translations of Icelandic sagas; these include the 'Landnámabók' translated by Ellwood (London 1898); the 'Heimskringla,' translated by David Laing (London 1844; 1889) and by Morris and Magnússon (London 1895); the 'Færeingasaga,' translated by F. York Powell, (1896); parts of the 'Flateyrbók' relating to America, edited by A. M. Reeves in 'The Finding of Wineland the Good' (London 1890); the 'Vösunnga Saga,' translated by W. Morris and E. Magnússon (London 1888); the 'Njáls Saga,' translated by G. Webbe Dasent (New York 1912); the 'Eyrybyggja,' translated by Sir Walter Scott; Thoroddsen's 'Piltur ok Stúlku' (translated by Reeves, 'Lad and Lass,' London 1890). Jon Stefansson's 'Denmark and Sweden' (1917) contains a very brief history of Iceland; 'Islandica' (Cornell University).

GISLE BOTHNE,

*Professor of Scandinavian Languages and Literature, University of Minnesota.*

**ICENI**, i-cē'nī, a tribe which inhabited ancient Britain, occupying the territory now called Norfolk and Suffolk. When Aulus Plautius engaged in battle against the sons of Cymbeline, the Icenii assisted him. However, they resisted the further aggressions of the Romans, and under their Queen Boadicea fought against them. Roman arms were victorious and the Icenii were forced to retire. Consult Oman, 'History of England' (New York 1910).

**ICH DIEN**, ih dēn (Ger. *I serve*), the motto of the Prince of Wales, written on his official crest surmounted by three ostrich plumes. The Welsh derive it from *Eich dyn*, meaning "Behold your man," and tell the story that the expression was first used by Edward I in presenting his new born son to his people.

Another current version of the origin of the phrase is that the Black Prince found the motto inscribed under the plume of John, king of Bohemia, who was killed at Crécy. Historians give preference to the former interpretation.

**ICHANG**, ē'chāng, China, a city in the Province of Hupeh, on the left bank of the Yang-tse River, from which position it derives its great commercial importance. The chief agricultural products are rice, cotton, wheat, barley, wood-oil and fruits. In 1877 Ichang became an open port for European trade. Because of its proximity to the Yang-tse Gorges which are impassable, all downstream traffic must be transhipped. Light vessels can proceed to Ichang proper in an upstream course, and there are certain ships designed especially to accommodate the navigation facilities of the Yang-tse. There is a railway route from Ichang to Kweichow. Pop. (1916) 55,000; total foreign imports, 1,429,897 haikwan taels (1 haikwan tael=about \$.75); native imports, 1,685,492 haikwan taels; and total exports, 3,514,662 haikwan taels.

**ICHIDO**, ē'chē'dō, the private name of Hitotsubashi, leader of the anti-foreign party in Japan and the "last of the Tycoons." See HITOTSUBASHI.

**ICHNEUMON-FLY**, ik-nū'mōn, the name of a large family (*Ichneumonidae*) of insects of the order *Hymenoptera*. As the species of this family are very numerous (more than 1,100 genera have been described) so their manners are extremely diversified; but, in the general outlines of their character, they all agree, particularly in their depredations among the insect tribes. In some the female has the ovipositor in the form of a boring instrument, with which she is capable of perforating the hardest wood. The larvae of wasps are the devoted prey of these insects, who no sooner discover one of their nests than they perforate the material of which it is constructed, and deposit their eggs within it. Others glue their ova to the skin of a caterpillar, while others again penetrate through it and lay their eggs in its body. In all these cases the young, as soon as they are hatched, prey on the caterpillar or larva, without, however, destroying it at once, as upon the life of its victim that of the spoiler appears to depend. The caterpillar, in fact, seems healthy until the larvae of the ichneumon have bored through its skin, have spun their cocoons on its surface and entered the chrysalis state. These carnivorous insects are of various sizes; some are so small that the aphid, or plant-louse, serves as a cradle for their young; others again, from their size and strength, are formidable even to spiders, destroying them with their stings. They are, as a whole, highly beneficial to humanity, as a large part of their prey consists of insects which are injurious to crops and valuable vegetation. Consult Howard, 'The Insect Book' (New York 1901).

**ICHNEUMONS**, ik-nū'mōnz, small carnivorous animals of the civet family (*Viverridae*) and sub-family *Herpestinae*, which are distinguished from the true civets by the straight non-retractile claws, and various skeletal characters. While there are a number of genera the typical and most important is *Herpestes*, many species of which inhabit Africa, southern

1 (1) *Exenterus marginatorus* attacking the larva of the pine-tree moth; (2) the cocoon of the latter as left by an ichneumon-fly; (3) as left by its rightful occupant; (4) *Bassus albosignatus* attacking the larva of the syrphus-fly; (5) male of the same; (6) *Banchus falcator* stealing upon a caterpillar; (7) larva of the ichneumon-fly  
2 *Anomalon circumflexum* attacking a caterpillar; and *Ophion undulatus* thrusting its ovipositor into the body of a caterpillar

3 *Spathius clavatus*, in a window  
4 *Pimpla instigator*, preying upon a willow-moth  
5 Pupa-case of an *Ophion*  
6 Larva of *Microgaster nemorum* emerging from an infested caterpillar of the pine-tree moth  
7 *Ichneumon pisorius*, the left-hand figure being that of a female depositing eggs in a boring in the trunk of an oak

Asia, and the neighboring islands. The teeth are numerous, usually 40; the head is elongated, with short rounded ears; the limbs are short; and the body and stout tail are covered with long hairs. They vary in size from that of a squirrel to a cat. Their food consists of all kinds of small animals; rats and mice, birds and their eggs, snakes, lizards, etc., which they pursue chiefly on the ground but also in trees. The Egyptian ichneumon (*H. ichneumon*) or Pharaoh's rat (or mouse) is famous as one of the many animals venerated by the ancient people of that country, because, it has been said, of its reputation as a destroyer of crocodile's eggs. While the eggs of this reptile may be occasionally devoured, the importance of the ichneumon in this respect is purely mythical; and it was protected, more likely, as a killer of the asp and other venomous serpents. Even now it is kept by many rural households there, as a hunter of rats, snakes and other vermin. The Indian ichneumon or mongoose (*H. mungoos*) is still better known. It lives in a semi-domesticated state, and performs an invaluable service as a destroyer of venomous serpents, whose fangs it generally manages to escape by its wonderful agility. This species has been introduced into Jamaica for the purpose of destroying rats, and has multiplied exceedingly and become a serious pest, though of late years it has been held in check by a great increase in the number of ticks. See MUNGEOOS.

**ICHOLOGY**, ik-nol'ō-jī, that department of palæontology which treats of the foot-prints petrified in sedimentary rocks and made by extinct animals; the science of fossil foot-prints. Such foot-prints frequently occur in all formations, and have sometimes been the first and most instructive intimation of the existence of the animals that made them. This was particularly true of the foot-prints of dinosaurs (q.v.) so numerous and sharply marked in the brown sandstones of the Connecticut Valley; and they have greatly assisted in arriving at a true realization of those reptiles, which were at first regarded as birds. The tracks, trails, burrows, outlines of bodies, feathers and appendages of a vast variety of animals occur in the rocks and interest the ichnologist.

**ICHTHYOL**, a medicinal substance occurring as ammonium and sodium ichthyol sulphonate, the two most important salts of ichthyolsulphonic acid, which is prepared from a bituminous mineral of the Tirol, which contains large amounts of fossilized remains of fish and other sea animals. Ichthyol was first introduced into medicine by Unna of Hamburg, and has proved very valuable when applied externally in certain diseases of the skin, acne, erysipelas, acute articular rheumatism, etc., and for the purpose of removing pain and induration about the inflamed joints. The ammonium salt is liquid, but the sodium salt is solid, and the latter is therefore most frequently employed when the drug is given internally for the purpose of affecting the alimentary canal or the general system.

**ICHTHYOLOGY**, ik'thē-ōl'ō-jī (Gr. ἰχθυρ fish; λόγος, a discourse), is the science of fishes. It is that branch of human knowledge which treats of the aquatic gill-bearing vertebrates, popularly known as fishes to English-speaking people.

**Classification of Fishes.**—In different treatises on fishes there appear very great differences in the classification proposed or adopted. Often in two works of parallel scope scarcely a group will appear in both with the same boundaries or under the same name. For this condition there are several causes. First, the tendency in some minds toward the extreme of subdivision, and in others toward the extreme of aggregation; second, the various values assigned by different authors to different sorts of characters, the actual value of each only to be determined by the final judgment of palæontology; third, the tendency of many writers to give new names to old groups. On this account a single class order may have half a dozen virtually synonymous names. Thus the terms *Chondropterygii*, *Elasmobranchii*, *Plagiostomi*, *Selachii*, *Placodii*, *Antacea*, and other less known names have been applied to the group of sharks and skates. Again various authors, recognizing the validity of a given group, may find it necessary at times to change its boundaries. In such a case a new name may be proposed, or a new definition be given to an old one. Either arrangement may lead to confusion. Thus with some writers, the groups of sharks, under various names may include the order of *Chimæroids*, or, under the same names, the *Chimæroids* may be excluded from it.

**The Chordata.**—The great branch of chordate animals finds its origin perhaps in extinct wormlike types or possibly in marine creatures remotely allied to the horse-shoe crab and to spiders. Common opinion favors the first hypothesis. It differs essentially from the invertebrate branches in the presence of a more

A Diphycercal Tail.

or less developed notochord (which in the higher forms gives place to a backbone), and in the presence of gill-slits, connected with respiration. These gill-slits and accompanying gill-structures are persistent in fishes, while in higher vertebrates they are mostly relegated to the embryonic stages.

The *Chordata* include several classes of marine animals leading up to the true fishes, as follows:

- Entropneusta*.—Balanoglossus (q.v.).
- Tunicata*.—Ascidians (q.v.).
- Leptocardii*.—Lancelets (q.v.).
- Cyclostomi*.—Hag-fishes and Lampreys (qq.v.).
- Cycliæ*.—An extinct (*Palæospodylus*) fish-like form.
- Pisces*.—Fishes, properly so-called; the various primary divisions of which *Elasmobranchii*, *Ostracophori* (*Ostracodermi*), *Arthrodira* and *Teleostomi* are usually called subclasses.

But in view of the uncertainty attached to the mutual relations and origin of these groups, we may follow recent American custom in regarding the elasmobranchs, ostracophores, ar-

throides and teleostomes as distinct classes, the last named group containing the typical or true fishes. On anatomical grounds we must regard the *Elasmobranchii* (sharks) as the most primitive of these classes. As to this, palaeontology gives no certain answer but the tendency of evidence is rather toward regarding the ostracophores as still more primitive. There is no doubt that fishes existed and that some of the classes were well differentiated at a period long antecedent to the deposition of the oldest known remains. The earliest remains of fossil fishes now known occur in the Ordovician or Lower Silurian deposits at Cañon City, Colorado. Among the broken fragments are apparently parts of shields of ostracophores, scales of crocsopterygians and vertebræ of a possible chimæroid. It is probable that primitive sharks existed still earlier than this, but no definable remains precede the Devonian.

The class or sub-class of *Elasmobranchii* (also called *Chondropterygii*, *Antacea*, etc.) agrees with the higher fishes in the presence of lower jaw, shoulder-girdle, pelvic girdle, paired fins, well developed skull, brain and viscera. The gills are well developed, and the general structure and anatomy may be described as fish-like.

In distinction from the true fishes, the gills are differently formed, adnate by their outer margin, there are no membrane bones about the head, the ova are very large, the ventral fins are provided with claspers, there is no trace of air-bladder, the arterial bulb has three series of valves, there is a spiral valve in the rectum, the upper jaw is formed of palatal elements, the typical jawbones of the fish being undeveloped. The lower jaw is also different in structure from that of the true fishes.

The existing elasmobranchs are known as sharks, rays and chimæras. The vast majority of the known species are extinct. There are two strongly marked sub-classes among the elasmobranchs, the *Selachii* or sharks and rays, and the *Holocephali* or chimæras. In the *Selachii* there are five to seven gill-openings, the jaws are distinct from the skull, and the teeth are distinct. In the *Holocephali* there is but one external gill-opening, the jaws are coalescent with the skull, and the teeth are united to form

are broad and fold-like, the notochord is apparently not segmented, the tail is short and keeled, well specialized, its tip abruptly turned upward. There are no spines, the teeth are small, with many cusps. There is probably but one family, the *Cladoselachida* (extinct), *Cladoselache fylleri*, a large elongate shark from the Devonian of Ohio, is the best known species.

The *Acanthodii* are small sharks with a spine at the front of each fin except the caudal. The teeth are minute or wanting, and the skin is covered with small checker-like plates. There are three families, *Acanthoëssida* (extinct), with one dorsal fin, *Diplacanthida* (extinct), with two, and the *Ischnacanthida* (extinct), small sharks found from the Devonian to the Permian.

The *Ichthyotomi* have the pectoral fin developed as an archipterygium or jointed limb with a fringe of rays on one or both sides. The dorsal fin extends along the back, and on the head is a first dorsal preceded by a long spine. There are two well-marked families, *Pleuracanthida* and *Cladodontida*, abundant in the Carboniferous and Permian, but now extinct.

The *Notidami* or *Diplospondyli* have the notochord imperfectly segmented by vertical partitions, and the gill-clefts are six or seven in number instead of five, as in other sharks. Most of the species are extinct, the teeth being found in the rocks from the Jurassic to the present time. Two families are represented, the *Hexanchida* and the *Chlamydoselachida*, the latter ell-shaped sharks of the open sea, chiefly about Japan.

In the large order of *Asterospondyli* the vertebræ are strengthened by secondary plates of calcified tissue, which radiate outward from the small primitive cylinder. In these typical sharks there are five gill-slits, two dorsal fins and one anal fin.

In the most primitive group, the sub-order *Cestraciontes*, the dorsal fins are each armed with a spine, the numerous teeth are small and mostly blunt, differing in form in different parts of the jaw, and the vertebræ are imperfectly formed. A curious fact in geological distribution is that a multitude of early types of shark disappear in the Permian or toward the

A Lancelet (*Branchioistoma*).

bony plates or lamellæ. Both groups are very old in geologic times, having been separated at least since the Devonian. For this and other reasons some writers prefer to regard the sharks and chimæras as separate and co-ordinate groups or classes.

We may without serious violence divide the sharks and rays into six orders; namely, *Pleuropterygii*, *Acanthodii*, *Ichthyotomi*, *Notidami*, *Asterospondyli*, and *Tectospondyli*, the first three of these being confined to Palæozoic time. We may regard the *Pleuropterygii* or the allies of *Cladoselache* as the most primitive, and therefore as standing first in an ascending series.

In this group the pectoral and ventral fins

end of Palæozoic time. Only cestraciont sharks are known to have any representatives in the Triassic, and this group may be ancestral to all modern sharks.

Of the *Cestraciontes* the Palæozoic families of *Cochliodontida* (extinct) and *Orodontida* (extinct), known mainly by the teeth, occur in the Lower Carboniferous. In some and probably all of these forms the dorsal fins were each armed with a spine. The *Edestida* (extinct), known only from coiled whorls of fused teeth, are doubtless closely related to these forms. These are found in the coal measures. The principal living family of *Cestraciontes*, the *Heterodontida*, begins in the Permian, and is represented by five living species all in the

Pacific Ocean, the longest known being the Port Jackson shark of Australia (*Heterodontus philippi*). We may here mention two families of sharks of uncertain relationship, the species confined to the Carboniferous Age. These are the *Petalodontida* (extinct), with blunt teeth and some of them with broad fins like rays, and the *Psammodontida* (extinct), known from the blunt teeth only. Still more uncertain is the group of *Tamiobatida* (extinct) from the Devonian of Kentucky, resembling a ray, but probably a primitive offshoot from the sharks.

The remaining asterospondylous sharks form a sub-order, *Galei*, without dorsal spines, and with the vertebræ more perfectly calcified. The principal family is the *Galeorhinida*. Others are the *Sphyrnida* or hammer-heads, *Scylliorhinida* or cat-sharks, *Ginglymostomida*, *Hemiscylliida*, *Orectolobida*, *Lamnida* or man-eater sharks, *Odontaspida*, or sand-sharks, *Alopiida*, or thresher-sharks, *Mitsukurinida* or spoon-bill sharks, *Cetorhinida* or basking-sharks, *Pseudotriakida* and *Rhineodontida*. Of the *Lamnida* and related families fossil teeth (*Carcharodon*, *Isurus*, *Lamna*) are very numerous from the Jurassic to modern times.

The *Tectospondyli* have the vertebræ each provided with secondary plates of calcified tis-

In the sub-class of *Holocephali* or *Chimæroids* the upper jaw or pterygoquadrate arcade is immovably joined to the skull. The teeth are coalesced into broad plates, and a fold of skin covers the gill-clefts so that there is but one external opening. The vertebral axis is imperfectly segmented, and the notochord is surrounded by partially calcified rings. In all recent genera, and in most others, there is a strong spine in the first dorsal, and in the male the forehead has a singular cartilaginous hook with a brush of spines at the end.

There are fragments referred to the skeleton of a chimæroid found in the Lower Silurian at Cañon City, Col. Numerous forms appear in the Devonian. Four genera, representing three families, are now extant, the *Rhinochimærida* (*Rhinochimæra* and *Hariotta*) in the deep seas, *Chimærida* or elephant-fishes (*Chimæra*) in the north and south temperate seas, and *Callorhynchida* (*Callorhynchus*) in the seas of the southern hemisphere only. Extinct families are the *Ptychodontida* (extinct), the *Squaloraiida* (extinct), and the *Myriacanthida* (extinct). Numerous extinct genera are referred to the *Chimærida*. Fossil fin-spines of many species of sharks and chimæroids, fishes otherwise unknown, occur in the rocks. These are called

Bullhead Shark of California (*Gyropleurodus francisci*).

sue concentrically arranged in one or more series. In these sharks there is no anal fin. To these belong the *Squalida* or dog-fishes, *Dalatida*, *Oxynotida* and *Echinorhinida* or bramble-sharks, these families forming together the sub-order *Cyclospondyli*, having the vertebral centrum a simple constricted cylinder pierced by the notochord. To the *Tectospondyli* proper we may refer a few families of sharks, the *Squatina* (*Rhinida*) or monk-fishes, and *Pristiophorida* or saw-sharks. A third sub-order, *Batoidei*, includes all the skates or rays. These agree with the true *Tectospondyli* in having a number of series of concentric plates within the vertebræ. The body is, however, more or less depressed, the broad pectoral fins outlining a body disk, and the gill-openings lie underneath instead of being lateral, as in all the sharks. The rays are first certainly known from the Jurassic, although several of the Carboniferous shark have ray-like teeth, and have been referred to the group of rays.

The recognized families of rays are the *Pristida* or saw-fishes, the *Rhinobatida* or guitar-fishes, the *Narcobatida* or torpedos, the *Rajida* or skates, the *Dasyatida* or sting-rays, the *Myliobatida* or eagle-rays, the *Mobulida* or devil-fishes, and the *Ptychodontida* (extinct) of the Cretaceous. The earliest of these groups, the *Rhinobatida*, date from the Jurassic.

ichthyodoroules, and their proper classification is often a matter of much uncertainty. The earliest of these are known as *Onchus*, occurring in the Upper Silurian.

*Class Ostracophori*.—The earliest vertebrates actually recognized as fossils are known as ostracophores (ὀστρακῶν, a box: φορέω, to bear). These are most extraordinary creatures, which may be described as jawless, limbless, enveloped in a coat of mail. While they have been called mailed lampreys, the likeness to lampreys is almost wholly negative, resting in the total absence of jaws, limbs and limb-girdles. What the mouth was like can only be guessed, but no trace of jaws has yet been found in connection with it. The most remarkable distinctive character is found in the presence of a hard shell, made of bony plates covering the anterior part of the body, while the backbone is developed as a persistent notochord, imperfectly segmented. The entire absence of jaw structures, as well as the character of the armature, at once separates them widely from the mailed arthrodires of a later period.

This group was originally called *Ostracodermi*, a name preoccupied for the group of bony trunk-fishes (*Ostraciida*). The names *Protocephali* and *Aspidoganoidei* have also been used for them. The still earlier name *Placodermi* included the *Arthrodires* as well.

It may be that they are really allied to certain early crustacean-like forms which they resemble.

The ostracophores are found in the Ordovician, Silurian and Devonian rocks, after which they disappear. The species are very numerous and varied. Their real affinities have been much disputed. Traquair regards them as much modified allies of ancient sharks, which view of the case is supported by features in the structure of the most shark-like of the orders, *Anaspida*. The absence of jaws and limbs separates them widely from true fishes, and there is no clear evidence in the structure of the fins and fin-supports that these structures

*Cephalaspida* (extinct), *Thyestida* (extinct), and *Odontodontida* (*Tremataspida*) (extinct), with many genera and species.

The *Antiarcha* have also bone-corpuscles in the plates, which are also enameled. The sense-organs occupy open grooves, and the dorsal and ventral shields are of many pieces. The head is jointed on the trunk, and jointed to the head are paddle-like appendages covered with bony plates and resembling limbs. There is no evidence that these erectile plates are real limbs. They seem to be rather jointed appendages of the head-plate, erectile on a hinge like a pectoral spine.

Spotted Sting-ray, (*Aetobatus narinari*).

are homologous with the fins and fin-supports of true fishes, or even of sharks. In this group are four well-marked orders, *Heterostraci*, *Anaspida*, *Aspidocephali* and *Antiarcha*.

The *Heterostraci* (*ερεος*, different; *δοτρακον*, box) have no bone-corpuscles in the coat of mail. This order includes the *Pteraspida* (extinct), *Thelodontida* (extinct), *Drepanaspida* (extinct) and *Psammosteida* (extinct).

The *Anaspida* are more fish-like in appearance, having the armature of the head not plate-like, but formed of tubercles. There are two families, all of recent discovery, *Birkeniida* (extinct) and *Euphaneropida* (extinct).

The *Aspidocephali* (also called *Osteostraci*) have bone-corpuscles in the shields, and the shield of the back is of one piece, without lateral line-channels or sense-organs. The order includes four families, *Ateleaspida* (extinct),

There is but one family, *Asterolepida* (extinct). *Pterichthyodes milleri*, named by Agassiz for Hugh Miller, from the Lower Devonian, is the best-known species.

**Class Arthrodirores.**—Another group of extinct mailed fishes is known as *Arthrodira* (*άρθρον*, joint; *δεμή*, neck). In this group jaws are developed, but of peculiar character, the mandibles being regarded as mere dermal elements, not forming part of the skeleton. The head in all the species is covered with a great bony helmet. Behind this on the nape is another large shield, and between the two is typically a hinge-joint, which has been compared to the hinge of a spring-beetle (elater). Some of these plates are traversed by sensory grooves. Nothing whatever is known of the internal structure, and as the skeleton is soft, the backbone notochordal, there is no trace of shoulder-

girdle, nor any certain evidence of limbs, although peculiar structures have been interpreted as such. The presence of a peculiar type of jaws separates the group from the mailed ostracophores, from which the arthrodires differ also widely in the character of the armature.

Dr. Woodward and several other recent writers have regarded the arthrodires as armored, widely modified offshoots of the primitive *Dipneusta*. But the evidence does not seem to justify the union of the arthrodires with the latter group, and it would seem as reasonable to regard them as derived directly from the sharks or the ostracophores. The arthrodiran fishes occur in abundance from the Silurian times to the Mesozoic. In the Devonian their gigantic size and thick armor gave them the leading position among the hosts of the sea, ranging in size "from that of the perch to that of the basking-shark."

The class, called by Dr. Dean *Arthrognathi*, is divided by him into two sub-classes, *Arthrodira*, with a hinge at the neck, and *Anarthrodira*, without hinge. In the first of typical sub-classes are two orders, *Temnothoracici*, with the single family *Chelonichthyidæ* (extinct), *Anthrothoraci*, with the families *Cocosteidæ*, *Dinichthyidæ* (extinct), *Titanichthyidæ* (extinct), *Mylostomidæ*, and *Selenosteidæ* (extinct). To the *Chelonichthyidæ* belongs the noted species *Homosteus* or *Pterichthyodes milleri*, celebrated by Hugh Miller under the name of "the *Asterolepis* of Stromness," in his 'Footprints of the Creator.'

The arthrodires without joint at the neck constitute the order *Stegothalami*, with the families of *Macropetalichthyidæ* (extinct), and *Asterosteidæ* (extinct).

The best known of the many genera of arthrodires is *Cocosteus*, found in the Scottish Devonian.

**Class Teleostomi.**—We may unite the remaining groups of fishes under a single class for which the name *Teleostomi* (*τῆλεος*, true; *στόμα*, mouth), proposed by Bonaparte in 1838, may be retained. The fishes of this class are characterized by the presence of a suspensorium to the mandible, by the existence of membrane-bones (opercles, suborbital, etc.) on the head, by a single gill-opening, leading to gill-arches bearing bilamellate gills, and by the absence of claspers on the ventral fins. The skeleton is more or less ossified in all the *Teleostomi*. More important as a primary character distinguishing these fishes from the sharks is the presence typically and primitively of the air-bladder. This arises at first as a diverticulum from the ventral side of the œsophagus, and develops as a lung, but in later forms it becomes degraded to a swim-bladder, springing from the dorsal side of the alimentary canal, and in very many forms it is altogether lost with age. The group comprises the vast majority of recent fishes, as well as a large percentage of those known only as fossils. In these, the condition of the lung can be only guessed.

The *Teleostomi* are doubtless derived from sharks, their relationship being perhaps nearest to the *Ichthyotomi* or to the primitive *chimæras*. The lowest *Teleostomi* retain the shark-like condition of the upper jaw, made of palatal elements which, as in the *Chimæra*, may be fused with the cranium. In the lower forms also the primitive diphyccercal or protocercal form of

tail is retained, as also the archipterygium or jointed axis of the paired fins, fringed with rays on one or both sides.

We may divide the teleostomes or true fishes into three sub-classes, the *Crossopterygii* or fringe-fins, the *Dipneusti* or lung-fishes, and the *Actinopterygii* or ray-fins. Of these, recent writers are disposed to consider the *Crossopterygii* as most primitive, and to derive from this, by separate lines, each of the remaining sub-classes, as well as the higher vertebrates.

**Sub-class Crossopterygii.**—The earliest teleostomes constitute the class called after Huxley, *Crossopterygii* (*κροσσοβ*, fringe; *πτερυβ*, fin). Its essential character is the retention of the jointed pectoral fin or archipterygium, its axis fringed by series of soft rays. This character it shares with the *Ichthyotomi* among sharks, and with the *Dipneusti*. From the latter it differs in the hyostylic cranium, the lower jaw being suspended from the hyomandibular — and by the presence of distinct premaxillary and maxillary elements in the upper jaw. In these characters it agrees with the ordinary fishes. The skeleton is more or less perfectly ossified. Outside the cartilaginous skull is a bony coat of mail. The skin is covered with firm scales or bony plates. The tail is diphyccercal, straight, and ending in a point. The shoulder-girdle, attached to the cranium, is cartilaginous, but overlaid with long, bony plates, and the branchiostegals are represented by a pair of gular plates.

In the single family (*Polypteridæ*) represented among living fishes the heart has a muscular arterial bulb with many series of valves on its inner edge, and the large air-bladder is divided into two lobes, having the functions of a lung, though not cellular as in the lung-fishes.

The fossil types are very closely allied to the lung-fishes, and the two groups have no doubt a common origin in Silurian times. It is now usually considered that the crossopterygian is more primitive than the lung-fish, though at the same time more nearly related to the ganoids, and through them to the ordinary fishes.

From the primitive *Crossopterygii* the step to the ancestral amphibia, which are likewise mailed and semi-aquatic, seems a very short one. It is true that most writers until recently have regarded such dipneustans as the *Ceratodontidæ* as representing the parents of the amphibians. But the weight of recent authority, Gill, Boulenger, Dollo and others, seems to place the point of separation of the higher vertebrates with the crossopterygians.

Cope and Woodward divide the *Crossopterygii* into four orders or sub-orders, *Haplística*, *Rhipidística*, *Actinística* and *Cladística*. To the last belong the existing species (*Polypterus*) alone. In all these the pectorals are narrow with a single basal bone, and the nostrils, as in the dipneustans, are below the snout.

In the *Haplística* the notochord is persistent, and the basal bones of dorsal and anal fins are in regular series, much fewer in number than the fin-rays. The single family *Tarrasiidæ*, regarded as lowest of the crossopterygians, are small fishes of Carboniferous Age.

In the *Rhipidística* the basal bones of the median fins are found in a single piece, not separate as in the *Haplística*. Four families are recognized, *Holoptychidæ* (extinct), *Rhizodontidæ* (extinct), *Osteolepidæ* (extinct), *Onycho-*

*dontida* (extinct), the first of these being considered as the nearest approach of the crossopterygians to the dipnoans.

In the *Actinistia* there is a single fin-ray to each basal bone, the axonosts of each ray fused in a single piece. The notochord is persistent, causing the backbone in fossils to appear hollow, the cartilaginous material leaving no trace in the rocks. The genera and species are numerous, ranging from the Subcarboniferous to the Upper Cretaceous, and belonging to the single family *Cœlacanthida* (extinct).

In the *Cladistia* the axis of the pectoral limb is fan-shaped, made of two diversified bones joined by cartilage. The notochord is restricted and replaced by ossified vertebræ. The axonosts of the dorsal and anal are in regular series, each bearing a fin-ray. The order contains the single family *Polypterida*, represented by numerous species in the Nile, Senegal and Kongo rivers. In this group the pectoral fin is formed differently from that of the other crossopterygians, being broad, its base of two diverging bones with cartilage between. This structure, more specialized than in any other of the crossopterygians or dipneustans, has been regarded by Gill and others, as above stated, as the origin of the fingered hand (chiropterygium) of the frogs and higher vertebrates. The base of the diverging bones has been identified as the antecedent of the humerus, the bones themselves as radius and ulna, while the intervening, non-ossified cartilage breaks up into carpal bones, from which metacarpals and digits ultimately diverge. This hypothesis is at least a reasonable one. The nostrils, as in true fishes, are superior. The body in these fishes is covered with rhombic enameled scales, as in the garpike, the head is similarly mailed, but in distinction from the garpike, the anterior rays of the dorsal are developed as isolated spines.

The young have a bushy external gill, with a broad scaly base. The air-bladder is double, not cellular, with a large air-duct joining the ventral surface of the œsophagus. The intestine has a spiral valve.

The cranium is remarkable for its generalized form, this forming a trait of union between the ganoids and the primitive *Amphibia* or *Stegocephali*. Without considering *Polypterus*, it is not possible to interpret the homologies of the cranium of the amphibians and the sharks.

*Sub-class Dipneusti or Lung Fishes.*—The *Dipneusti* (δύο, twice; πνέω, to breathe) are a group characterized by the presence of paired fins consisting of a jointed axis with or without rays. The skull is autostylic, the upper jaw being made, as in the *Chimæra*, of palatal elements fused with the cranium and without premaxillary or maxillary. Dentary bones little developed. Air-bladder cellular, used as a lung, in all living species. Heart with many valves in the muscular arterial bulb. Intestine with a spiral valve. Teeth usually of large plates of dentine covered with enamel on the pterygopalatine and splenial bones. Nostrils concealed, when the mouth is closed, under a fold of the upper lip. Scales cycloid, mostly not enameled.

This group has been usually known as *Dipnoi*. But this term was first taken by Leuckart, in 1821, as a name for amphibians, before any of the living *Dipneusti* were known.

The *Dipneusti* agree with the crossopterygians by the presence of lungs, a character which separates them from all the earlier orders of fishes. In its origin the lung or air-bladder arises as a diverticulum from the alimentary canal used by the earliest fishes as a breathing-sac, the respiratory functions lost in the progress of further divergence. Nothing of the nature of lung or air-bladder is found in lancelet, lamprey or shark. In none of the remaining groups of fishes is it wholly wanting at all stages of development.

In the *Dipneusti* or dipnoans, as in the crossopterygians and higher vertebrates, the trachea or air-duct arises from the ventral side of the œsophagus. In the more specialized fishes, yet to be considered, it is transferred to the dorsal side, thus avoiding a turn in passing around the œsophagus itself. From the sharks these forms are further distinguished by the presence of membrane-bones about the head. From the *Actinopteri* (ganoids and teleosts) dipneustans and crossopterygians are again distinguished by the retention of the fringe-fin or archipterygium as the form of the paired limbs. From the crossopterygians the dipnoans are most readily distinguished by the absence of maxillary and premaxillary, the characteristic structures of the jaw of the true fish. The upper jaw in the dipnoan is formed of palatal elements attached directly to the skull, and the lower jaw contains no true dentary bones. The skull in the dipnoan, as in the *Chimæra* is autostylic, the mandible articulating directly with the palatal apparatus, the front of which forms the upper jaw, and of which the pterygoid hyomandibular and quadrate elements form an immovable part. The shoulder-girdle, as in the shark, is a single cartilage, but it supports a pair of superficial membrane-bones.

In all the dipnoans the trunk is covered with imbricated cycloid scales and no bony plates, although sometimes the scales are firm and enameled. The head has a roof of well-developed bony plates made of ossified skin and not corresponding with the membrane-bones of higher fishes. The fish-like membrane-bones, opercles, branchiostegals, etc., are not yet differentiated. The teeth have the form of grinding-plates on the pterygoid areas of the palate, distinctly shark-like in structure. The paired fins are developed as archipterygia, often without rays, and the pelvic arch consists of a single cartilage, the two sides symmetrical and connected in front. There is but one external gill-opening, leading to the gill-arches, which, as in ordinary fishes, are fringe-like, attached at one end. In the young, as with the embryo shark, there is a bushy external gill, which looks not unlike the archipterygium pectoral fin itself, although its rays are of different texture. In early forms, as in the ganoids, these scales were long and enameled, but in some recent forms, deep sunken in the skin. The claspers have disappeared, the nostrils, as in the frog, open into the pharynx, the heart is three-chambered, the arterial bulb with many valves, and the cellular structure of the skin and of other tissues is essentially as in the *Amphibia*.

The developed lung, fitted for breathing air, which seems the most important of all these characters, can, of course, be traced only in the recent forms, although its existence in all

others can be safely predicated. Besides the development of the lung we may notice the gradual forward movement of the shoulder-girdle, which, in the dipneustans, as in the crossopterygians, is attached to the head. In the fishes generally there is no distinct neck, as the post-temporal, the highest bone of the shoulder-girdle, is articulated directly with the skull.

We may divide the dipnoans into two orders, *Ctenodipterini*, with the families *Uronemida* (extinct), *Dipterida* (extinct), and *Ctenodontida* (extinct). These families occur from the Devonian to the Mesozoic. The more specialized order of *Sirenoidei* includes the families of *Ceratodontida* and *Lepidosirenida*, each of these represented by living forms. Most of the *Ceratodontida* are extinct, occurring in the Mesozoic; but two species, *Neoceratodus forsteri* and *N. miolepis*, live in rivers of Australia. No fossil *Lepidosirenida* are known. *Lepidosiren paradoxus* lives in the swamps of southern Brazil and *Protopterus annectens*, *P. dolloi*, and *P. athopicus*, in those of the Nile region.

*Sub-class Actinopteri*.—After setting off from the great group of fishes primitive or archaic types, one after another, we are left at last with only those having fish-jaws, fish-fins, and in general the structure of the typical fish. For all these in all their variety, as a class or sub-class, we adopt the name of *Actinopteri*, suggested by Prof. Cope. The name (*ἀκτίς*, ray; *πτερόν*, fin) refers to the structure of the paired fins. In all these, the bones supporting the fin-rays are highly specialized, and at the same time concealed by the general integument of the body.

In general, two bones connect the pectoral fin with the shoulder-girdle. The hypercoracoid is a flat square bone, usually perforated by a foramen lying above, and parallel with it the irregularly formed hypocoracoid. Attached to these is a row of bones, the actinosts or pterygials, short, often hourglass-shaped, which actually support the fin-rays. In the higher forms the actinosts are few (four to six) in number, but in the lower types they may remain numerous, a reminiscence of the condition seen in the crossopterygians and especially in *Polypterus*. Other variations may occur; the two coracoids are sometimes imperfect or specially modified, and the actinosts may be distorted in form or position. Among the lower *Actinopteri* many archaic traits still persist, and by its earlier representatives the group is joined very closely to the *Crossopterygii*. The great class may be divided into two series or sub-classes, the *Ganoidei*, which retain ancient traits, and the *Teleostei* or bony fishes, in which most of these have disappeared.

Even among the *Ganoidei*, as the term is here restricted, there remains a great variety of form and structure. The group constitutes several distinct orders, and as a whole does not admit of perfect definition. All of the species known have the tail strongly heterocercal. Most of them have the skeleton still cartilaginous, and in some it remains in a very primitive condition. Most of them have an armature of bony plates, diamond-shaped with an enamel like the surface of teeth. All of them have the air bladder highly developed, usually cellular and functional as a lung, but connecting with

the dorsal side of the gullet, not with the ventral side, as in the dipnoans. In all these remain more or less perfectly developed the optic chiasma, the many valves of the arterial bulb, and the spiral valve of the intestines found in the more archaic types. But traces of some or all of these structures are found in some bony fishes, and their presence in the ganoids by no means justifies their separation with sharks, dipnoans, and crossopterygians as a great primary class, *Palæichthyes* as proposed by Dr. Gunther. All forms of body may be found among the ganoids. In the earlier seas they were scarcely less varied and perhaps scarcely less abundant than the teleosts in the seas of to-day. So far as fossils show, the characteristic actinopterosus fin, with its reduced and altered basal

Oceanic Sunfish or Headfish (*Mola mola*).

bones, appeared at once without intervening gradations.

The name *Ganoidei* (*γάνος* brightness; *εἶδος*, resemblance), alluding to the enameled plates, was first given by Agassiz to those forms, mostly extinct, allied to the garpike, and covered with bony scales or hard plates. As originally defined cat-fishes, sea-horses, *Agonidae*, and other wholly unrelated types were included with the garpikes and sturgeons as ganoids.

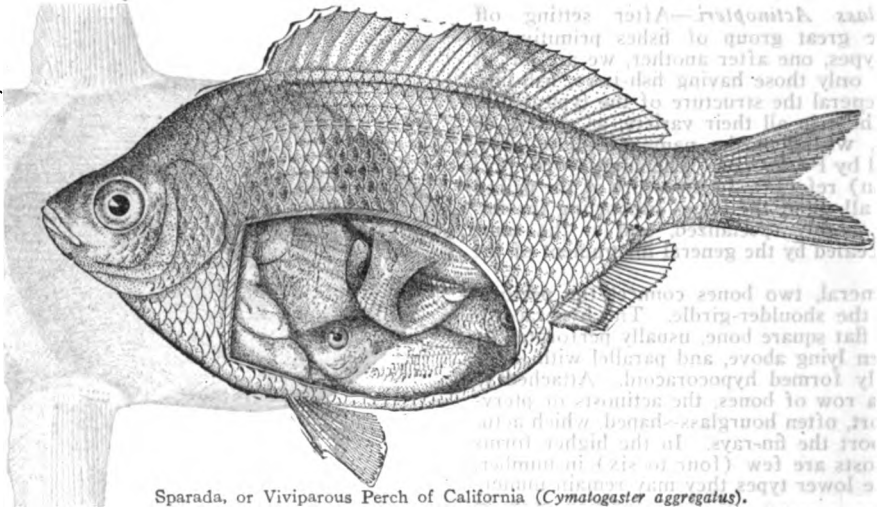

These were eliminated by Johannes Müller, who recognized the archaic characters common to the existing forms. Still later Huxley removed the crossopterygians, and others have shown that the *Ostracophori* and *Arthrodira* should be placed far from the garpike in sys-

tematic classification. Cope and Woodward have dropped the name ganoid altogether as productive of confusion through the many meanings attached to it. Others have used it as a handy group name for the orders of archaic *Actinopteri*. For these varied and more or less divergent groups it seems convenient to retain it.

The order *Lysipteri* (*ἄβου*, a loosing; *πτερόν*, fin) comprises the earliest ganoids, beginning in the Devonian which have the body covered with enameled scales. The families are *Palæoniscida*, *Platysomida*, *Dictyopygida* and *Doryptera*. The order *Chondrostei* (*χόνδρος*, cartilage; *ὀστέον*, bone, includes a great variety of forms, characterized by the less cartilaginous skeleton, the distinctly heterocercal tail, and the presence of bony plates, rather than scales, on most parts of the body. These represent a degenerate offshoot from the *Lysipteri*, the form being less like that of the typical fishes. The earliest members of this group appear in the Tertiary, the most primitive family being the *Chondrosteida* (extinct).

*Amia calva* (*Amiatus calvus*), in the waters of the eastern United States. In these forms there is a gradual transition from diamond-shaped scales, covered with enamel, to the cycloid scales of the ordinary soft-rayed fishes. The line separating the *Lepidoste*i and *Halecomorphi* from each other and from the *Isospondyli* is a very narrow one.

*Sub-class Teleostei or Bony Fishes*.—The fishes which still remain for discussion constitute the great sub-class or series of *Teleostei* or bony fishes. They lack wholly or partly the ganoid traits, or show them only in the embryo. The tail is slightly if at all heterocercal, the fulcra disappear, the actinosts of the pectoral fins are few and large, rarely if ever over five in number, the air-bladder is no longer cellular in most species, nor does it assist in respiration. The optic nerves are separate, one running to each eye without chiasma. The skeleton is almost entirely bony, the notochord usually disappearing entirely with age. The valves in the arterial bulb are reduced in number, and the spiral valve of the intestines dis-

Sparada, or Viviparous Perch of California (*Cymatogaster aggregatus*).

Another family is that of *Belonorrhynchida* (extinct). The *Acipenserida* (sturgeons) are well represented among living fishes. The order *Selachostomi* (*σέλαχος*, shark; *στόμα*, mouth) includes the paddle-fishes (*Polyodontida*), two living species, and one extinct, in the Eocene. The order *Pycnodonti* including the family of *Pycnodontida* (extinct), consists of a deep-bodied, compressed fishes with small mouths and a peculiar physiognomy. The order *Lepidoste*i (*γέπιδ*, scale; *ὀστέον*, bone) includes numerous families with rhombic enameled scales. The families are *Semionotida*, *Lepidotida*, *Isophorida*, *Macrosemiida*, *Pholidophorida*, *Aspidorrhynchida*, and *Lepisosteida*, all extinct save the *Lepisosteida*, represented by four species known as garpike in the rivers of North America. The earliest fossil garpikes occur in the Eocene. The *Halecomorphi* (*halec*, herring; *γοφή*, form) comprise the *Pachycormida*, *Protosphyrenida*, *Liodesmida*, *Oligopleurida*, and *Amiida*. All these have perished, except the *Amiida*, which group is represented by a single species, the Bowfin,

appears. Traces of each of the ganoid traits may persist somewhere in some group, but as a whole we see a distinct specialization and a distinct movement toward the fish type with the loss of characters distinctive of sharks, dipnoi, and ganoids. In a general way the skeleton of all teleosts corresponds with that of the striped bass, and the visceral anatomy is in all cases sufficiently like that of the sunfish.

The mesocoracoid or præcoracoid arch, found in all ganoids, persists in the less specialized types of bony fishes, although no trace of it is found in the perch-like forms. With all this there is found among the bony fishes, an infinite variety in details of structure. For this reason the *Teleostei* must be broken into many orders and these orders are very different in value and in degrees of distinctness, the various groups being joined by numerous and puzzling intergradations.

*Order Isospondyli*.—Of the various subordinate groups of bony fishes there can be no question as to which is most primitive in structure or as to which stands nearest the orders

of ganoids. Earliest of the bony fishes in geological time is the order *Isospondyli* (loop equal; σπῶνδυλος vertebra), containing the allies recent and fossil of the herring and the trout. This order contains those soft-rayed fishes which have the ventral fins abdominal, the mesocoracoid or præcoracoid arch developed (sometimes lost in degeneration), and the anterior vertebræ unmodified, essentially similar to the others.

The ganoids pass by degrees into the *Isospondyli*, and the soft-rayed fishes pass again by imperceptible gradations into those more specialized forms having spines in the fins structures which are again lost in the most modified members of the same group.

Ganoid traits are present in certain families of *Isospondyli*. Among these are the gular plate (found in *Amia* and the *Elopidæ*), presumably derived from the similar plate in the earliest ganoids, additional valves in the arterial bulb in *Albulidæ*, the cellular air bladder of *Notopterus* and *Osteoglossum*, the spiral intestinal valve in *Chirocentridæ*, and the ganoid scales of the extinct *Leptolepidæ*. From these characters it is inferred that the soft-rayed fishes are descended from the *Lepidostei* or

*Benthosauridæ*, *Bothypteroidæ*, *Ipnopidæ*, *Rondeletiudæ*, *Cetomimidæ*, *Myctophidæ* or lantern-fishes, *Rhinellidæ* (extinct), *Dercetidæ* (extinct), *Chirothissidæ* (extinct), *Exocoetoididæ* (extinct), *Maurolidæ*, *Chauliodontidæ* or viper fishes, *Gonostomidæ*, *Astronesthidæ*, *Stomatidæ*, *Malacosteidæ*, *Plagiodontidæ* or lancet-fishes, *Evermannellidæ*, *Paralepididæ*, *Sternoptychidæ* and *Idacanthidæ*.

The order of *Lyopomi* (λυω, loose, πῶγα, opercle), contains a few deep-sea fishes, without mesocoracoid and with the opercular bones distorted. One family, the *Halosauridæ*, with fossil allies.

A series of soft-rayed fishes descended from the *Isospondyli* are grouped together to form the super-order or series called *Ostariophysæ*. These differ from the *Isospondyli* in having families of *Characidæ* and *Erythrinidæ*, the air-bladder being connected, by a series of ossicles called the Weberian apparatus, with the auditory organ.

This series includes the orders of *Eventognathi*, *Heterognathi*, *Nematognathi*, and *Gymnonothi*, immense groups comprising the vast majority of the fresh-water fishes of the world.

The *Eventognathi* and *Heterognathi* have the

Rat-fish or Elephant-fish of California (*Hydrolagus colletii*). A Chimaeroid.

*Halecomorphi*. The more primitive *Isospondyli* approach more nearly to these ganoid forms than to their later descendants, the catfishes, the eels, or the pikes.

Most ancient of the *Isospondyli* is the extinct family of *Leptolepidæ* of the Triassic. Families mostly still extant, but nearly all of them more or less represented in fossils from the Jurassic on, are the *Elopidæ* or tarpons, the *Albulidæ* or lady-fishes, the *Chanidæ* or milk-fishes, the *Hiodontidæ* or moon-eyes, the *Spaniodontidæ* (extinct), the *Pachyrhizodontidæ* (extinct), the *Thryptodontidæ* (extinct) the *Pterothrissidæ*, the *Chirocentridæ*, the *Notopteridæ*, the *Enchodontidæ* (extinct), the *Ichthyodectidæ* (extinct), the *Osteoglossidæ*, the *Phareodontidæ* (extinct), the *Clupeidæ* or herrings, the *Dussumieriidæ* or round herrings, the *Dorosomidæ* or gizzard-shad, the *Engravidæ* or anchovies, the *Alepocephalidæ*, the *Pantodontidæ*, the *Salmonidæ* or salmon and trout, the *Thymallidæ* or graylings, the *Argentiniidæ* or smelt, the *Microstomidæ*, the *Salangidæ* or ice-fish, the *Galaxiidæ* or New Zealand trout, the *Haploclittonidæ*, the *Gonorhynchidæ*, the *Notopteridæ*, and a host of other forms, mostly from the deep seas, constituting (sub-order *Iniomi*) the families of *Aulopidæ*, *Ctenothirissidæ* (extinct), *Synodontidæ* or lizard-fishes,

mouth-parts normal, the maxillary not rudimentary, and the body usually covered with ordinary scales. In the order *Heterognathi* (ἑτερος differing; γνάθος, jaw) the lower pharyngeals are not especially modified, and the jaws usually with teeth. This group comprises most of the river-fishes of South America and Africa with multitudes of genera and species. It includes the families of *Characidæ* and *Erythrinidæ*, the former with and the latter without the adipose fin characteristic of catfishes and salmon.

The order *Eventognathi* ἐν, well; εν, within; γνάθος, jaw, is characterized by the absence of teeth in the jaws, and by the high degree of specialization of the lower pharyngeals, which are scythe-shaped, and in typical forms are armed with a relatively small number of highly specialized teeth of peculiar forms and arranged in one, two or three rows. In all the species the gill-openings are restricted to the sides. there is no adipose fin, and the broad flat branchiostegals are but three in number. In all the species the scales, if present, are cycloid, and the ventral fins, of course, abdominal. The modification of the four anterior vertebræ and their connection with the air-bladder are essentially as seen in the catfishes. The families of *Eventognathi* are the *Kneriidæ*, *Homalopteridæ*, *Cobitidæ* or loaches, *Catostomidæ* or suck-

ers, and *Cyprinidæ* or carp, dace and minnows. The last is the largest family recognized in ichthyology, comprising over 2,000 species, almost all confined to the north temperate zone.

The order of *Nematognathi* or catfishes is characterized among the *Ostariophysæ* by the fact that the maxillary bone is rudimental, forming the base of a long barbel. There are no true scales, the body being naked or mailed, and about the mouth are always fleshy feelers. The multitude of species inhabit chiefly the rivers of the tropics, only the typical catfishes of the principal family of *Siluridæ* occurring in waters

ventral fins. These characters are lost in all or most of the living forms.

The eels may be distributed among different orders. The *Symbranchia* (*ὄβν* together; *βράνχος*, gill)—*Ichthyocephali*, and *Holostomi*—have normal fish-like jaws, and the shoulder-girdle is sometimes joined to the skull. The families are *Monopteridæ* or rice-field eels, *Symbranchidæ*, *Amphipnoidæ* and *Chilobrachnidæ*.

The true eels or apodes have the shoulder-girdle free from the skull, the premaxillaries more or less coalesced with the vomer, and the body elongate and of many vertebræ. The

The Bowfin (*Amia calva*).

of the United States and Europe. The families are *Diplomystidæ*, *Siluridæ*, *Bunocephalidæ*, *Plotosidæ*, *Chacidæ*, *Chlariidæ*, *Hypophthalmidæ*, *Argidæ*, *Sisoridæ*, *Pygidiidæ*, *Loricariidæ* and *Callithyidæ*, the members of the last three groups armed with a bony coat of mail.

The order *Gymnonoti* contains elongate eel-like fishes without dorsal fin and with the tail excessively long. The vertebræ are modified, as in the preceding orders, but there is no meso-coracoid arch. The families are *Electrophoridæ* and *Gymnotidæ*, all river-fish of South America.

The order *Scyphophori* contains river-fishes of Africa in which the small mouth is at the end of a long snout. There are no pharyngeal teeth,

families are *Anguillavidæ* (extinct) with distinct caudal and sometimes with ventral fins, *Anguillidæ* or true eels, *Congridæ* or conger-eels, *Simencheylidæ*, *Muranosocidæ*, *Nettasomidæ*, *Nemichthyidæ*, *Ophichthyidæ*, *Ilyophidæ*, *Heterocongridæ*, *Dysommidæ* *Enchelidæ* (extinct), *Muranidæ* or morays, *Myrocongridæ* and *Moringuidæ*.

The small order of *Carencheli* contains one family, *Derichthyidæ*, characterized by the snake-like neck and the structure of the jaws.

The order *Lyomeri* includes deep-sea eels of enormous gape, with the parts of the head very loosely joined, and with the fifth gill-arch not modified to form a pharyngeal. There are

Channel Cat-fish (*Ictalurus punctatus*).

and the opercular bones are considerably modified. In all there is a deep cavity on each side of the cranium, covered by a thin bony plate, the supertemporal bone. The families are *Mormyridæ* and *Gymnarchidæ*.

Next we may place a long series of more or less related families, known collectively as eels. In all these the upper jaw is more or less degenerate, the ventral fins are wanting, and the shoulder-girdle has typically lost its connection with the skull. The earliest fossil eels have traces of scales, the caudal fin separate, and, according to Dr. O. P. Hay, abdominal

two families, *Saccopharyngidæ* and *Eurypharyngidæ*.

Still more aberrant is the small order of *Heteromi* (*ἕτερος* differing; *ὤμος* shoulder), the spiny eels, elongate fishes, having the shoulder-girdle detached from the head and the coracoids united in an imperforate plate. This group includes eel-like fishes of the deep sea, with spines in the dorsal fin—the families, *Protomotocanthidæ* (extinct), *Notacanthidæ* and *Lipogenyidæ*.

Another order of uncertain relationship is that of *Opisthomi*, with normal coracoids,

spines in the dorsal fin, and the shoulder-girdle remote from the skull. It contains one family, the *Mastacembelidæ*, small fishes from the streams of tropical Asia and Africa.

Another small order, the *Xenomi* (ξένος strange; ὤμος shoulder), has the coracoids rudimentary and cartilaginous, with no basal bones or actinosts to the pectoral fin. One family, *Dalliidæ*, containing the black-fish of the marshes of Alaska and Siberia.

In the order *Haplomi*, the mesocoracoid arch

girdle, the scales are often ctenoid, and the edge of the upper jaw is formed by the premaxillary alone, the maxillary being always toothless.

But it is impossible to define or limit the group by any single character or group of characters. It is connected with the *Isospondyli* through the *Haplomi*, on the one hand, by transitional groups of genera which may lack any one of their characters. On the other hand, in the extreme forms, each of these distinctive

Muræna.

is wholly undeveloped, as is the case in all of the other groups remaining to be enumerated.

In common with the soft-rayed fishes in general, the air-bladder has a persistent air-duct, the fins are without spines, the ventral fins are abdominal and the scales are cycloid.

There is no adipose dorsal in the *Haplomi*, the dorsal is inserted far back, and the head is generally scaly. Most, but not all, of the species are of small size, living in fresh or brackish waters, and they are found in almost all warm regions, though scantily represented in California, Japan and Polynesia. The families are *Esocidæ* or pikes, *Umbridæ* or mud-minnows, *Poeciliidæ* or killifishes, and *Amblyopsidæ* or blind-fishes of the caves. The *Gonorhynchidæ* and the extinct families of *Crossognatahidæ* and *Cobitopsidæ* may be doubtfully added to this group.

**Order Acanthopterygii.**—The most of the remaining bony fishes constitute a natural group for which the name *Acanthopterygii* (ἀκανθα, spine; πτερον fin or wing), may be used. This name is often written *Acanthopteri*,

characters may be lost through degeneration. Thus fin-spines, ctenoid scales and the homocercal tail are lost in the cod-fishes, the connection of ventrals with shoulder-girdle fails in certain peculiar forms, and the development of the air-duct is subject to all sorts of variations. In one family even the adipose fin reappears.

The *Acanthopterygii* or preferably *Acanthopteri*, the *Physoclysti* of Müller, the *Thoracices* of older authors, and the *Ctenoidei* of Agassiz, include substantially the same series of forms.

Among the many subordinate groups, suborders or super-families, a few stand out as susceptible of definition. Among these is the group of *Salmopercæ*, composed of perch-like fishes, with spines in the fins and with ctenoid scales, yet retaining at the same time the abdominal ventrals and the adipose fin of the salmon. This constitutes the family of *Percoptidæ*, trout-perches or sand-rollers. The extinct *Erimatopteridæ* and *Asineopidæ* probably belong here.

The sub-order *synentognathi* agree externally with the *Haplomi*, but have the lower

Barracuda (*Sphyrana barracuda*)

a form equally correct and more euphonious and convenient. These are characterized, with numerous exceptions, by the presence of spines in the fins, by the connection of the ventral fins to the shoulder-girdle, by the presence, in general, of more than one spine in the anterior part of dorsal and anal fins, and as a rule of one spine and five rays in the ventral fins, and by the absence in the adult of a duct to the air-bladder. Minor characters are these: The pectoral fins are inserted high on the shoulder-

pharyngeals solidly united, and the air-duct lost in the course of development. The families are *Belonidæ*, the gars, *Scombresocidæ*, the sauries, *Hemiramphidæ* or half-beaks, and *Exocætidæ* or flying-fishes. This order and the *Haplomi* are joined by Hay under the name of *Mesichthyes*, the groups forming a perfect transition from soft-rayed to spiny-rayed fishes.

The group of *Percesoces* has the general traits of the spiny-rayed fish, with the ventral

fins abnormal. Here belong the *Sphyranida* or barracudas, the *Atherinida* or silversides, and the *Mugilida* or mullets. Another sub-order, *Rhegnopteri*, includes the *Polynemida* or thread-

has proposed to unite them as a distinct order. *Phthinobranchii* ( $\phi\theta\iota\nu\omega\nu$ , waning). The *Hemiobranchii* include the families *Gasterosteida* (sticklebacks), *Protosyngnathida* (extinct),

A Flying-fish (*Cypselurus speculiger*).

fins. Other transitional forms, with the ventrals abdominal, and spines usually present in the fins, constitute the sub-orders of *Hemiobranchii*, *Lophobranchii* and *Hypostomides*. In

*Aulorhynchida*, *Fistulariida* (cornet fishes), *Aulostomida* (trumpet-fishes), *Urosphenida* (extinct), *Rhamphosida* (extinct), *Marcorhamphosida* (snipe-fishes), and *Centriscida* (shrimp-fishes). The more degenerate sub-order of *Lophobranchii* includes the *Solenostomida*, the *Syngnathida* (pipe-fishes), and the *Hippocampida* or sea-horses. The singular order of *Hypostomides* includes the *Pegasida* (sea-moths or sea-dragons).

A Sea-horse (*Hippocampus*).

In another sub-order we may place the *Berycoidei*, fishes perch-like in general structure and usually well armed, with the ventral fins thoracic, but their number of rays never I, 5, the typical number in all perch-like forms. The berycoids are especially characterized by the presence of the orbitosphenoid bone, a structure wanting in all perch-like families; are the earliest in time of the fishes of this pattern, appearing in the Cretaceous or earlier. The families are *Berycida*, *Trachichthyida*, *Holocentrida* or soldier-fishes, *Polymixida*, and *Monocentrida* or pine-cone fish.

Another group or sub-order *Zeoidei*, agrees well with the beryces in the presence of more than five soft rays in the ventral fins and in the armature of the fins. It differs, however, in the character of the skeleton, the post-temporal, especially being adnate to the skull, as in the butterfly-fishes or *Chatodontida*.

One family, *Zeida*, the John-dories, belongs here. In the same group we may place provisionally an extinct family, *Amphistiida*. Dr. Boulenger has suggested that to fishes allied to the *Amphistiida* we may trace the origin of the John-dories, and of the great group of flounders as well. This is an interesting suggestion, but the actual line of descent is as yet not proved.

The sub-order *Selenichthyes* includes the family of *Lampridida* or opahs. In this group is a single species, a huge fish almost as deep as long, with the hypercoracoids greatly developed and the ventral fin with many soft rays, an archaic character unknown in other spiny-rayed fishes.

all of these the bones of the gill-arches are reduced in number, and the gill-structures are distinctly degenerate. For this reason Dr. Hay

In this neighborhood perhaps belongs the sub-order of *Heterosomata*, or flounders, characterized by the twisting of the cranium, an arrangement which permits the fish to lie flat on one side on the sand, while both eyes are turned to the upper or colored side. In this

structure, but the scales are usually coarser and rougher, and the structure less adapted to swift movement. Many members of this group are confined to the fresh waters. The families are *Centrarchida*, the sunshines, *Kuhliida*, the silver-bass, *Elassomida*, the pigmy-perch,

Mackerel (*Scomber scombrus*).

group there are no fin-spines. The young flounder when first hatched has the skull and eyes symmetrical, and the modification of the head proceeds by degrees.

There are two families, *Pleuronectida* or flounders, and *Soleida* or soles.

To the group or super-family *Scombroidea* belong a great variety of fishes, usually swift in motion and with thin soft scales, the ventral fins, if present, having a spine and five soft rays.

The families are *Rachicentrida*, the sergeant-fishes, *Pomatomida* or bluefishes, *Carangida* or Cavallas, *Nematistiida* or papagallos, *Scombrida* or mackerels, *Palæorhynchida* (extinct), *Lepidopida* or scabbard-fishes, *Trichiurida* or cutlass-fishes, *Istiophorida* or sail-fishes, *Xiphiida* or sword-fishes, *Coryphænidæ* or dolphins, *Bramida* or pomfrets, *Pteraclidida*, *Stromateida* or harvest-fishes, *Icosteida* or rag-fishes, *Acrotida*, *Zaprorida*, *Louvarida* or Louvars, *Menida*, *Leiognathida*, *Steinegeriida*, and *Tetraonurida* or square-tails. The *Grammicolepida* perhaps belong in this neighborhood.

*Aphredoderida*, the pirate-perch, *Percida*, the river-perch and darters, *Apogonida*, the beardless mullets, *Scombrovida*, *Acropomida*, *Serranida*, the bass, *Lobotida*, the flashers, *Rypticida*, the soap-fishes, *Kyphosida*, the chopas, *Scorpidida*, *Theraponida*, the slave-fishes, *Hamulida*, the grunts, *Lutianida*, the snappers, *Sparida*, the porgies, *Cætionida*, *Gerriida*, the mojarras, *Mænida*, the picarels, *Sciaenida*, the drums, *Centropomida* (or *Oxylabracida*), the robalos, *Polycentrida*, *Nandida*, *Oplegnathida* or stone-wall perch, *Sillaginida*, *Pentacerotida*, *Priacanthida*, the catalufas, *Mullida*, the surmulletts. Remotely allied to the percoid fishes are the *Pseudochromidida*, the *Opisthognathida* or jaw-fishes, the *Malacanthida*, the *Latilida* or tile-fishes, and possibly the *Cepolida* or band-fishes.

The group or sub-order of *Labyrinthici* comprises fresh-water fishes of the Indian region, with a peculiar apparatus for storing water connected with the gills. The families are *Osphromenida* or gouramies, *Anabantida* or climbing perch, *Helostomida*, *Luciophalida*, and *Ophiocephalida* or snakehead-fishes.

Yellow Perch (*Perca flavescens*).

The imperfectly known families, *Bathyclupeida*, *Stephanoberycida* and *Pempherida* have some resemblance to berycoids, but the ventral rays are I, 5.

The great group or super-family *Percicoidea* agrees with the mackerel-like fishes in general

Another group, called *Pharyngognathi* by Müller, is characterized by the complete union of the lower pharyngeals, a character developed independently in the *Synentognathi* and in some *Sciaenida*. It contains three sub-orders or super-families. The *Chromides*

have a single nasal opening on either side. Of these there are two families, the *Pomacentridæ* or damsel-fishes, chiefly beautiful inhabitants of the coral reefs, and the *Cichlida*,

perhaps derived from ancestors of the *Zeoidea*, is known as *Squamipinnes* or *Chatodontoidea*. These are characterized in general by the union of the post-temporal or uppermost bone of the

Brook or Speckled Trout (*Salvelinus fontinalis*).

river-fishes of the tropics of both continents.

The *Holconoti* comprise the viviparous perch or surf-fishes of California and Japan; one family, *Embiotocida*.

The *Pharyngognathi* proper, having two nostrils on either side, smooth scales and the gills three and one-half, constitute four families, *Labridæ*, wrasse-fishes or doncellas,

shoulder-girdle with the skull. The ventral fins in these fishes have one spine and five (rarely fewer) rays. The scales are small and often rough. The presence in the more primitive forms of 24 vertebrae and five soft rays in the ventrals indicates the common origin of these fishes with the members of the scombroid, percoid and labroid groups. While the more

Moorish Idol (*Zanclus cornutus*).

*Odacida* *Siphonognathida* and *Scarida* (Caliodontidæ) or parrot-fishes, in which the teeth are united to form a bird-like beak.

A large group of more or less related forms,

primitive of the chatodontoid series much resemble primitive members of the other series, the extremes of the former represent a wide divergence, specialization and degeneration.

The typical families are the *Ilarchidæ* or spade-fishes, the *Chatodontidæ* or butterfly fishes, characteristic of coral reefs, and the *Zanclidæ* or Moorish idols. Aberrant types are the *Toxoidæ* or arches, *Ephippidæ* (*Scatophagidæ*), *Antigoniidæ* or boar-fishes and *Drepanidæ*. Still more aberrant are the *Acanthuridæ*, tangs or surgeon-fishes, the *Siganidæ*, with the last ventral rays spinous like the first. From the tangs are descended the degenerate types known collectively as *Plectognathi*, the bones of the jaws being more or less consolidated. Three sub-orders exist among these forms, *Sclerodermi*, with separate rough scales and separate teeth, the *Ostracodermi*, with the body enclosed in a bony box, and the *Gymnodontes*, with the teeth coalescent into one or two plates in each jaw.

To the *Sclerodermi* belong the three families, *Triacanthidæ*, *Balistidæ* or trigger-fishes, and *Monacanthidæ* or file-fishes. To the *Ostracodermi* belong the *Ostraciidæ* or trunk-fishes, and to the *Gymnodontes*, the *Triodontidæ*, the *Tetraodontidæ* or globefishes, the *Tropidichthy-*

*Caracanthidæ*, the *Hexagrammidæ* or green-fishes, the *Anoplopomidæ* or skil-fishes, the *Zaniolepidæ*, the *Ophiodontidæ* or "blue cod," the *Erllepidæ* or "fat priest" of Japan, the *Scorpenidæ* or rose-fishes and sea-scorpions, the *Platycephalidæ*, the *Bembridæ*, the *Hoplichthyidæ*, the *Cottidæ* or sculpins, the *Cyclopteridæ* or lump-fishes, the *Liparididæ* (*Cyclogasteridæ*) or sea-snails, the *Rhampnocottidæ* the *Agonidæ*, sea-poachers or alligator-fishes, the *Triglidæ* or sea-robins, the *Peristedidæ* and the *Cephalacanthidæ* or flying gurnards. The last three families differ considerably in osteology, and are segregated by Dr. Gill as the sub-order *Cranioni*.

In the sub-order *Discocephali* the spinous dorsal fin is modified to form a sucking disc. This is placed on the head, and is made of two series of flat plates. There is one family, the *Echineididæ* or remoras.

The large family of *Gobiidæ* forms a super-family called *Gobioidea*. The gobies are distinguished by numerous minor traits, the restricted gill-openings, the short spinous dorsal

A Californian Globefish (*Ovoides setosus*).

*idæ*, the *Chonerhinidæ*, the *Diodontidæ* or porcupine fishes, the *Heptadiodontidæ* (extinct), and the *Molidæ* or head-fishes.

A small group known as the super-family *Cirrhitoidea* is characterized by the thickened and unbranched character of the lower pectoral rays, the third suborbital being at the same time not enlarged. Here belong the *Cirrhitidæ*, the *Aplodactylidæ*, the *Latrididæ* and possibly the *Trichodontidæ*. This group seems to mark a direct transition from the perch-like fishes to those with mailed cheeks.

The sub-order of mailed-cheek fishes, *Pareioptila*, is characterized by the presence of the suborbital stay, a process extending backward from the third suborbital to or toward the upward limb of the preopercle. This stay is subject to great exaggeration in some forms, while in others it is much reduced. It is, however, always present in these fishes and in no others. In the more primitive types the ventrals have one spine and five rays. There are 24 vertebrae, and the scales are normally developed. In the extremes there are remarkable cases of specialization on the one hand and of degeneration on the other.

The families of mailed-cheek fishes are the

and usual connection of the ventral fins among others. With the gobies may be associated the small family of *Oxudercidæ*.

To the sub-order *Jugulares* we may refer many families which agree in having the ventral fins inserted before the pectorals. The super-family *Trachinoidea* for the most part retain the normal number of ventral rays, the spine and five soft rays. To this group belong the *Trachinidæ* or weavers, the *Uranoscopidæ* or stargazers, the *Percophidæ*, *Nototheniidæ*, *Pteropsaridæ*, *Harpagiferidæ*, *Chanichthyidæ*, *Champsodontidæ*, *Bovichthyidæ*, the *Draconetidæ*, *Callionymidæ* or dragonets, the *Platypteryidæ*, and perhaps the *Chiasmodontidæ* and *Hemerocetidæ*.

Other divergent or aberrant families in this neighborhood are the *Comephoridæ* or Baikal-fishes, the *Bathymasteridæ* or ronquils and the *Gadopsidæ*. The *Batrachoididæ* or toad-fishes represent the group *Haplodoci*.

The group *Xenopterygii*, without spinous dorsal and with a large sucking disc between the ventral fins, contains the *Gobiesocidæ* or cling-fishes.

The super-family *Blennioidea* contains the blennies and their relatives, with the ventrals

jugular and always few-rayed. Here belong the *Blenniidae*, *Pholididae*, *Stichæidae*, *Xiphasiidae*, *Cryptacanthoidæ* or wry-mouths, *Anarrhichadæ* or wolf-fishes, *Ptilichthyidae*, *Cerdalidae*, *Patacida*, *Gnathacanthida* and the extinct family of *Blochiidae*.

Very closely allied to the blennoid series, and also belonging to the *Jugulares*, is the superfamily *Ophidioidea*, differing in the absence of fin-spines. Here belong the *Zoarcidae* or eelpouts, the *Ammodytidae* or sand-launces, the *Blekeriidae*, the *Brotulidae*, the *Brotulophidae*, the *Ophidiidae* or cusks, the *Fierasferidae* or pearl-fishes, the *Xenocephalidae*, *Scytalinidae*, *Congrogadidae* and *Bregmacerotidae*.

A sub-order of uncertain relations, characterized by the absence of foramen in the hypercoracoid, by the peculiar form of the tail, by the jugular insertion of the ventrals and the absence of spines, is the *Anacanthini*. Here belong the *Gadidae* or codfishes, the *Merlucciidae* or hakes, the *Macruridae* or grenadiers, the *Ateleopodidae* and *Bathyonidae*.

Still more uncertain are the relationships of

ological philosophy; (3) Genera of fishes, involving a complete classification of the forms he knew, his genera corresponding to the groups now called families; (4) Synonymy of all species recorded by authors, and (5) Description of all the species actually examined by Artedi. Of true fishes (exclusive of whales) 228 species are recorded by Artedi—a small portion of the 12,000 species now actually known (1903).

But the work of Artedi is masterly in its method and shows a stronger touch than that of any of his successors in ichthyology until the time of Cuvier. In the 'Systema Naturæ' Linnæus did little more for fishes than to substitute binomial names for the descriptive phrases of Artedi.

After Artedi, and independently, the group of fishes was arranged in genera by Klein and by Gronow, both writers of ability, but neither with the genus for taxonomy shown by Artedi.

With the 'Règne Animal' (1817-28) of Cuvier, a new era in zoology began. In this epoch-making work the "Animal kingdom," as

Black-banded Rock-fish (*Sebastes nigrocinctus*).

the sub-order *Taniosomi*, ribbon-shaped fishes of the deep sea, soft in body and often reaching an immense size. The families are *Trachypteridae* or deal-fishes, *Regalecidae* or oar-fishes. The *Lophotidae* or crest-fishes show some resemblances to these.

Finally we may close the long series with the order of *Pediculati*. These are jugular fishes, degenerate in structure, the small gill-opening behind the pectoral fins. The families are *Lophiidae*, the anglers, *Antennariidae* or walking-fishes, *Ceratiidae* or sea-devils, and *Ogcocephalidae* or sea-bats.

**History of Systematic Ichthyology.**—The title of "Father of Ichthyology" is justly given to Petrus Artedi, a Swede, associate and intimate friend of Linnæus. Artedi was the first to recognize the meaning of genus and species in ichthyology, and to supply the outlines of a rational classification. After Artedi's untimely death (by drowning in a canal in Holland), Linnæus edited his manuscripts, publishing them in 1738, in five parts, as follows: (1) Ichthyological biography; (2) Ichthy-

the title indicates, was "arranged according to its organization." Comparative structure found its reflection in the schemes of classification. The application of the principles of morphology was carried out in detail with the fishes in the great 'Histoire Naturelle des Poissons' (1828-49) of Georges Dagobert Cuvier and Achille Valenciennes, long the most valuable general work on fishes. The only general work on fishes since Cuvier and Valenciennes is the monumental 'Catalogue of the Fishes of the British Museum' (1859-70) by Dr. Albert Günther. In this work 6,843 species are described and 1,682 doubtful species are mentioned in foot-notes, the number of species known in 1870 being estimated at 9,000. Since that date about 3,000 have been described, the number of living species at present, according to an enumeration made by Dr. Boulenger, being about 12,000. The number of fossil species known may be estimated at 3,000 to 4,000.

The systematic arrangement of Cuvier was extended and modified by Louis Agassiz to include the multitude of fossil forms made

known in his 'Poissons Fossils.' Still more important corrections and changes in the general scheme of classification were suggested by Johannes Müller, the greatest comparative anatomist of the 19th century. Other valuable contributions to taxonomy have been made by Dr. Günther, Dr. Edward Drinker Cope, and especially by Dr. Theodore Gill, a critical writer, doubtless the first taxonomist of the age, and whose views have been accepted in substance if not in name as representing our best present knowledge of the origin and relationship of forms among the vertebrate animals. The contributions of Geoffroy Saint-Hilaire, Pieter van Bleeker, Carl Gegenbaur, Ramsay H. Traquair, George Albert Boulenger, Louis Dollo, Bashford Dean, Karl Zittel, Arthur Smith Woodward, C. Tate Regan, G. Brown Goode, Samuel Garman, Charles H. Gilbert and Barton W. Evermann to the systematic arrangement of the higher groups of fishes have also been of great value.

the Red Sea and neighboring parts of Africa, 'Atlas zu der Reise im nördlichen Afrika' (1828) and 'Neue Wirbelthiere' (1837), rank with the very best of descriptive work.

In Italy, Charles Lucien Bonaparte, Prince of Canino, has published an elaborate 'Fauna Italica' (1838), and numerous minor papers. O. G. Costa published (about 1850) a 'Fauna of Naples.'

In France, the fresh-water fishes are the subject of works by Emile Blanchard (1866) and Emile Moreau. Léon Vaillant has written on various groups of fishes. The 'Mission Scientifique au Mexique,' by Vaillant and F. Bocourt, is a most valuable contribution to our knowledge of the fishes of Mexico. In this field our knowledge has been much extended by the work of Seth E. Meek and of Mr. Regan.

In Holland the chief great works have been those of Schlegel and Pieter van Bleeker. Professor Schlegel, of the University of Ley-

A Ribbon-fish or Oarfish (*Regalecus*).

In modern times the students of systematic ichthyology have been very numerous. The local faunal work in various nations has been very extensive. In Great Britain we may note Parnell's 'Natural History of the Fishes of the Firth of Forth' (1838); William Yarrell's 'History of British Fishes' (1859); the earlier histories of British fishes by Edward Donovan and by William Turton, and the works of Jonathan Couch (1862), and Dr. Francis Day (1888), possessing similar titles. H. G. Seelye has also a useful 'Synopsis of the Fresh-water Fishes of Europe.' William Swainson studied the fishes of Sicily, W. Thompson those of Ireland and Rev. Richard T. Lowe and J. Y. Johnson have done excellent work on the fishes of Madeira.

In Germany and Austria the chief local works have been those of Heckel and Kner on the fresh-water fishes of Austria (1858), and C. Th. von Siebold on the fresh-water fishes of central Europe (1863). The two memoirs of Eduard Rüppell on the fishes of

den, described in 'The Fauna of Japonica' the fishes collected about Nagasaki in Japan by Ph. Fr. de Siebold and Bürger.

Pieter van Bleeker (1819-78), a surgeon in the Dutch East Indies, is the most voluminous writer in ichthyology. His chief work is the 'Atlas Ichthyologique des Indes Orientales Néerlandaises,' illustrated by colored plates. The writings of Dr. Bleeker constitute the chief source of our knowledge of the fauna of the East Indies. Dr. Van Lidth de Jeude, of the University of Leyden, is the author of a few descriptive papers on fishes.

The fish fauna of Cuba has been the lifelong study of Dr. Felipe Poey y Aloy (1799-1891), a pupil of Cuvier, for a half century or more the honored professor of zoology in the University of Havana. Of his many useful papers, the most extensive are his 'Memorias sobre la Historia Natural de la Isla de Cuba,' followed by a 'Repertorio' and an 'Enumeratio' on the same subject. Before Poey, Guichenot of Paris had written on the fishes

collected in Cuba by Ramon de la Sagra. Philip H. Gosse (1810-88) wrote on the fishes of Jamaica. Much earlier, Robert Herrmann Schomburgk (1804-65) wrote on the fishes of British Guiana. Other papers on the Caribbean fishes were contributed by Johannes Müller and F. H. Troschel, and by Richard Hill and J. Hancock.

Besides the work in South America of Marcgrave, Agassiz, Reinhardt, Lütken, Steindachner, Jenyns, Boulenger and others already named, we may note the local studies of Dr. Carlos Berg in Argentina, Dr. R. A. Philippi in Chile, and special records of Humboldt, Garman, J. F. Abbott and others in recent times. Carl H. Eigenmann and also Jordan and Eigenmann have studied the great collections made in Brazil by Agassiz, the work of Dr. Eigenmann now comprising most of our detailed knowledge of the fish-fauna of equatorial America. Steindachner has described the collection of Johann Natterer and Gilbert also those made by Dr. John C. Branner. The most recent extensive studies of the myriads of Brazilian river-fishes are those of Dr. Eigenmann.

A Ceratiid (*Canlophryne jordani*)

In New Zealand, F. W. Hutton and J. Hector have published a valuable work on the fishes of New Zealand. Later writers have given us a good knowledge of the fishes of Australia. Notable among them are W. Maclay, James Douglas Ogilby and Edgar R. Waite. Clarke has also written on 'Fishes of New Zealand.'

The most valuable work on the fishes of Hindustan is the elaborate treatise on the 'Fishes of India,' by Francis Day.

The most recent as well as the most extensive studies of the fishes of Japan were made in 1900 by the present writer and his associates, John Otterbein Snyder and Shigeo Tanaka.

The scanty pre-Cuvierian work on the fishes of North America has already been noticed. Contemporary with the early work of Cuvier is the worthy attempt of Prof. Samuel Latham Mitchill (1764-1831) to record in systematic fashion the fishes of New York. Soon after followed the admirable work of Charles Alexandre Le Sueur (1780-1840), artist and naturalist, who was the first to study the fishes of the Great Lakes and the basin of Ohio. Constantine Samuel Rafinesque (1784-1842), the third of this remarkable but very dissimilar trio, published numerous papers descriptive of the species he had seen or heard of in his various botanical rambles. This culminated in his elaborate but untrustworthy 'Ichthyologia Ohiensis.' The fishes of Ohio received later a far more conscientious, though less brilliant,

treatment at the hands of Dr. Jared Potter Kirtland (1793-1877), an eminent physician of Cleveland, Ohio. In 1842 the amiable and scholarly James Ellsworth Dekay (1799-1851) published his detailed report on the New York fauna, and a little earlier (1836) in the 'Fauna Boreali-Americana' Sir John Richardson (1787-1865) gave a most valuable and accurate account of the fishes of the Great Lakes and Canada. Almost simultaneously, Rev. Zadock Thompson (1796-1856) gave a catalogue of the fishes of Vermont, and David Humphreys Storer (1804-91) began his work on the fishes of Massachusetts, finally expanded into a 'Synopsis of the Fishes of North America' (1846) and a 'History of the Fishes of Massachusetts' (1867). Dr. John Edwards Holbrook (1794-1871), of Charleston, published (1860) his invaluable record of the fishes of South Carolina. The monograph on Lake Superior

(1850), and other publications of Louis Agassiz (1807-73) are well known. One of the first of Agassiz's students was Charles Girard (1822-95), who came with him from Switzerland, and in association with Spencer Fullerton Baird (1823-87) described the fishes from the United States Pacific Railway Surveys (1858) and the United States and Mexican Boundary Surveys (1859).

Most eminent among the students and assistants of Professor Baird was his successor, George Brown Goode (1851-99), whose greatest work, 'Oceanic Ichthyology,' published in collaboration with Dr. Tarleton Hoffman Bean, was barely finished at the time of his death. The work of Theodore Nicholas Gill and Edward Drinker Cope has been already noticed.

The present writer began a systematic 'Catalogue of the Fishes of North America' in 1875, in association with his gifted friend, Herbert Edson Copeland (1849-76), whose sudden death, after a few excellent pieces of work, cut short the undertaking. Later, Charles Henry Gilbert (1860-), originally a student of Professor Copeland, took up the work, and in 1883 a 'Synopsis of the Fishes of North America' was completed by Jordan and Gilbert. Dr.

Gilbert has since been engaged in studies of the fishes of Panama, Alaska and other regions, and the second and enlarged edition of the 'Synopsis' was completed in 1898, as the 'Fishes of North and Middle America,' in collaboration with another of the writer's students, Dr. Barton Warren Evermann.

As students of the extinct fishes, following the epoch-making 'Poissons Fossiles' of Louis Agassiz, some of the notable names are those of Pander, Asmuss, Heckel, Hugh Miller, Traquair and Eastman. An indispensable 'Handbuch der Palæontologie' is that of Karl A. Zittel, translated by Charles R. Eastman. The most valuable general work is the 'Catalogue of the Fossil Fishes in the British Museum' in four volumes, by Dr. Arthur Smith Woodward, a worthy companion of Günther's Catalogue of living fishes.

States, and the remains of two species and of some allied forms, as *Aptornis*, are found in western Kansas, but they became extinct at the end of the period. See BIRDS, FOSSIL.

**ICHTHYOSAURIA**, ik'thī-ō-sā'rī'a, **ICHTHYOPTERYGIA**, or **FISH-LIZARDS**, an order of reptiles, embracing primitive marine forms with a fish-like body, long head and tail, and no distinct neck, whose remains are found exclusively in the Mesozoic, and most plentifully in the Lias. Remains of these lizards are sparse in the middle Jura, but numerous in the upper Jura of southern and western Europe; and are found in the Cretaceous of Europe, the East Indies, Australia, New Zealand and Chile. They varied in length from 3 to about 30 feet, and, as shown by their numerous coprolites (q.v.), fed upon fishes and

Atlantic Bat-fish (*Malthe vesperilio*).

In America Dr. John Strong Newberry and Prof. Edward W. Claypole have studied the fossil fishes of Ohio. Edward Drinker Cope and Dr. Joseph Leidy have written on the Eocene and Cretaceous fishes of the Rocky Mountains. Numerous recent papers of importance have been published by Dr. Bashford Dean, of Columbia University, Dr. Charles R. Eastman, of Harvard, and Dr. Oliver Perry Hay, of New York. Other important records are due to Orestes St. John, A. H. Worthen, Charles D. Walcott, J. F. Whiteaves, S. W. Williston and the Redfields, father and son.

Besides all this there has risen, especially in the United States, Great Britain, Norway, Canada and Australia, a vast literature of commercial fisheries, fish culture and angling, the chief workers in which fields we may not here enumerate even by name. See FISH; FISHES, GEOGRAPHICAL DISTRIBUTION OF.

DAVID STARR JORDAN,  
Chancellor Emeritus, Leland Stanford Junior University.

**ICHTHYOPSIDA**, ik-thī-ōp'sī-da. See HERPETOLOGY.

**ICHTHYOPTERYGIA**. See ICHTHYOSAURIA.

**ICHTHYORNIS**, ik-thī-ōr'nīs, a genus of fossil carinate birds constituting an order *Ichthyornithes* and family *Ichthyornithidae*. They were about the size of, and presumably had much the habits and appearance of, rather large gulls, but they had extremely large heads, and both mandibles of the long pointed beak were studded with sharp, backward pointing, snake-like teeth, each set in a distinct socket. These sea-birds fished in the great inland sea which during the Cretaceous Age covered so much of the present western half of the United

cephalopods (squids). "The members of this order," remarks Zittel, "differ conspicuously from all living reptiles and are distinguished chiefly by their fish-like form of body, paddle-shaped limbs with numerous oval or polygonal phalanges, large head with elongated rostrum, short amphicœlous vertebræ, and naked integument." They had no dermal armament like crocodiles, but the snout was prolonged, narrow like that of a gavia or a dolphin, the teeth were acutely conical, crocodile-like and thickly set in a groove without separate sockets; as many as 400 have been counted in a single mouth. The eyes were surrounded by a circle of wedge-shaped sclerotic plates. That they breathed air is plain from the absence of branchial arches, the shape of the hyoid bones, and other evidences of pulmonary respiration; and their viviparous habit is demonstrated by several well-preserved skeletons embracing embryonic remains in the abdominal cavity,—as many as seven young in one case. As regards external form and adaptation to a marine existence, the ichthyosaurus "depart as widely from other reptiles as whales do from land mammals, and occupy as isolated a position." Their composite character is most puzzling to the phylogenetist, and nothing is certainly known as to their origin or descent, except that they certainly were modified from terrestrial ancestors. The only family is *Ichthyosauridae*, which existed from the Lias to the Cretaceous periods, and contains the small-sized and primitive genus *Mixosaurus*, the typical and exclusively Old World genus *Ichthyosaurus*, *Baptanodon* (q.v.), and *Shastasaurus*, the last two being American in their distribution and recovered from the upper Jura and Trias rocks of Wyoming, Nevada and northern California. Consult Zittel-Eastmann, 'Text-

book of Palæontology,' (Vol. II, New York 1902); Gadow, 'Amphibia and Reptiles' (London 1901).

**ICHTHYOSIS**, ik-thī-ō'sis, a congenital, chronic disease of the skin characterized by dryness, harshness, increased thickness, atrophy of the sebaceous glands, resulting in a scaly appearance. It usually affects young children. It is little understood, but a diet of fresh, juicy vegetables is recommended.

**ICHTHYS**, ik'this, a symbol used by the early Christians. It was derived by taking the first letters of the common title of Christ "Jesus Christ, the Son of God, the Saviour," in Greek (Ι/ησοῦς Χ/ριστὸς Θ/εοῦ Υ/ιὸς Σ/ωτήρ, which spells Ιχθϋς, the Greek word for fish. The acrostic and the figure of the fish thus became the symbol of Christ.

**ICON BASILIKE**. See EIKON BASILIKE.

**ICONOCLASTS**, i-kōn'ō-klāsts (image-breakers), that Christian party in the Church of the 8th and 9th centuries who would not tolerate images in the churches or places of worship. The Byzantine emperor, Leo the Isaurian, issued an edict in 726 ordering the people to abstain entirely from paying religious reverence to sacred images and a second edict soon after ordered the destruction of the images. This order occasioned commotions, first in the islands of the Archipelago; and as the Popes Gregory II and III, as well as Germanus, the patriarch of Constantinople, declared the veneration of sacred images to be in consonance with the Church's doctrine and constant practice, and the Emperor Leo refused to recall his edict on their command, they excommunicated him, and his subjects in Italy threw off their allegiance. Thence arose two parties, the Iconolatæ (image worshippers) and the Iconoclasts. Leo's son and successor, Constantine Copronymus, held the same views as his father. He convened a council at Constantinople (754), in which the use as well as the worship of images was condemned. Constantine's son, Leo IV, who ascended the throne 775, followed the same course, but proceeded with more clemency and moderation. On the death of Leo IV, in 780, he was succeeded by his son, Constantine, under the guardianship of Irene, mother of the latter, and widow of Leo. Irene favored the orthodox party, and on attaining this position of authority, openly avowed her sentiments, and summoned a council to be held in 787, under her protection at Nicæa (Nice) in Bithynia, to pass upon the question at issue. This council condemned the Iconoclasts. Among the Greeks the controversy concerning images broke out anew after the banishment of Irene (802), and lasted about half a century. Her successor, Nicephorus, did not, indeed, remove the images from the churches, but he forbade the adherents of the images from persecuting their adversaries. Finally the Empress Theodora, by a council held at Constantinople (842), restored the worship of images among the Greeks, which was confirmed by a second council, held 869-70, in the same place. Consult 'Seances Academy des Inscript' (May 1903); Tougard, 'La Persecution Iconoclaste' (1897).

**ICONOSTASIS**, i'kō-nōs'tā-sis, in a Greek church, the screen dividing the sanctuary from the church proper. This is usually ornamented

with pictures of Christ, the Virgin and saints. The screen has three doors generally, whose curtains are dropped while Mass is being celebrated.

**ICTERIDÆ**, ik-tēr'i-dē, a family of birds, the American orioles, or hangnests, and black-birds (qq.v.).

**ICTINUS**, ik'ti-nūz, a Greek architect, who flourished at the time of Pericles. He designed the Parthenon at Athens, the hall for the mysteries at Eleusis and the temple of Apollo Epicurius at Bassæ near Phigalia. Little is known of his life.

**ICY CAPE**, Alaska, a promontory so named on account of the immense masses of ice by which it is usually surrounded. On the north coast it projects into the Arctic Ocean west of the Otakah River, about midway between Capes Lisburne and Barrow. It was discovered by Cook in 1778, and was the farthest point that he reached north of Bering Strait.

**IDA**, (1) Asia Minor, the classical name of Kaz-Dagh, a mountain range, 30 miles south-east of the plain of Troy, with its highest peak, Gargaron (4,650 feet), near the head of the Gulf of Adramyti. In mythology it is famous as the range where Ganymede was stolen; where Paris pronounced judgment on the beauty of the rival goddesses and where the celestials stationed themselves to witness the battles for Troy on the nether plain. (2) The classical name also of a mountain (now Psiloriti) in Crete (q.v.), the loftiest (7,500 feet) of the range which traverses the island. The most celebrated legends connected with it are those relating to the infancy of Zeus.

**IDA GROVE**, Iowa, a town, the capital of Ida County, 28 miles north of Denison, on the Maple River, and on the Chicago and Northwestern Railroad. Farming and stock-raising are carried on largely in the vicinity, and the town has flour mills, grain elevators and manufactures of machinery, harness, brooms and bricks. Among municipalized installations are a heating and an electric-lighting plant. Pop. 2,090.

**IDAHO** (Indian, 'Mountain Gem'), one of the Northwestern States of the United States. Its extreme length from north to south along the western border is 485 miles. The width varies from 50 miles in the northern part where it borders on the Dominion of Canada to about 300 miles in the south. The total area is approximately 84,000 square miles of which about 534 is water surface. The capital is Boise.

**Topography**.—Idaho is widely diversified topographically, having many hills and mountains, interspersed with fertile valleys, rugged canyons, mountain gorges, wide upland meadows and wooded parks, broad plateaus, rolling prairies, sage brush plains, great rivers with cascades and cataracts, beautiful lakes with jetting bays, studded with great pines and Douglas fir. The Cabinet, Cœur d'Alene and Bitter Root mountains, principal spurs of the great Rockies, form the eastern boundary separating Idaho and Montana. From these mountain chains spurs are sent out west and southwest through nearly every part of the State to the great plains of the Snake River Basin which extends in crescent shape across

# IDAHO.

Estimated population, 428,586

the southern part from east to west and forms nearly half the west central boundary separating Idaho from the States of Oregon and Washington. The Boise, Payette, Salmon and Clearwater rivers, all affluents of the Snake, drain the central part of the State. The Spokane, Pend d'Oreille and Kootenai rivers make outlet for the waters of the beautiful lakes of Cœur d'Alene, Pend d'Oreille, Kaniksu and Spirit Lake, all in the extreme northern part. A small portion of the southeastern part is drained through the Bear River into Salt Lake. This river also forms an outlet for Bear Lake, a beautiful body of water about half of which lies in the extreme southeastern part and extends into Utah.

**Climate.**—Idaho extends through seven degrees of latitude. Its altitude ranges from about 700 feet to more than 12,000 feet. Its northern end lies within the path of the rain areas which pass eastward from the north Pacific Ocean while the southern portion lies well out of that path. As a result of these complex factors the climate is so diverse as to render description difficult and accurate graphic representation impracticable. The lower Snake, Salmon and Clearwater River valleys have a very pleasant and equable climate. The higher valleys have most agreeable summers with long winters and heavy snowfall. The temperature of Idaho is varied, ranging from 108 degrees above in summer to 45 degrees below zero in winter. The mean temperature is 56 degrees. The normal annual precipitation is about 17 inches, ranging from 37 inches in Shoshone County in the northern part of the State, to six inches in the southern section.

**Soils.**—The rock from which the soil of central and southern Idaho was derived is known as the Columbia River lava, or basalt. There were successive flows of this lava, as is demonstrated by intervening sedimentary deposits. Above the lava the soil is fine and of a dark color, while the subsoil, of equally fine texture, is always of dark yellow or brownish color without pebbles or sand grains. The soils on the older lavas are usually light colored and contain sand and fragments of rocks and minerals. In the region of the great intermountain plateau along the course of the Snake River the soils consist of the fine, silty loams, formed through the weathering of the rolling basaltic country at higher levels, or they consist of ash-like and silty loams of ancient lake beds within which volcanic ash was deposited to great depths. Wherever water is available for the irrigation of these lands they have proven wonderfully fertile for the production of general and special crops. On the basaltic uplands heavy yields of grain and vegetables are obtained without irrigation. The soil of the northern part of the State is sandy and of a clayey loam less fertile yet it produces good crops without irrigation.

**Geology.**—There are many unusual geological phenomena in Idaho. The "City of Rocks" in Cassia County is as strange as, and but little less magnificent in scale than, the Garden of the Gods in Colorado. A thousand homes in Boise, the capital city, and the great Natatorium are heated by natural hot water from springs. Some of the cities obtain their summer water from springs at almost freezing temperature;

in winter they obtain their water from other springs at 78° F. Near Richfield in Lincoln County is an ice cave in the lava beds with an ice dome that thaws out in winter and freezes in summer. There are many farms upon which cellars have been dug and deep wells have been bored for domestic water from which come streams of very cold air that is used for refrigerator purposes. There are hot mineral springs on the upper Salmon and Hood rivers—many along the course of the Snake River, and in southern Bannock County there are soda and other mineral springs noted for their medicinal properties. The magnificent cataracts of the Snake River are not surpassed in grandeur in the United States. The Shoshone Falls are 46 feet higher than those of Niagara. In central Idaho there are a number of streams that are "lost"—that, crystalline up to the last, sink away into the desert and disappear. In the very tops of some of the highest mountains are beautiful fresh water lakes fringed with tall pines and fir. Great lava planes extend along the Snake River Basin in width from 10 to 60 miles. These are of relatively recent overflow as evidenced by the numerous geysers and hot springs. They are rich in various fossils.

**Agriculture.**—There are considerably over 6,000,000 acres of land in Idaho under cultivation. There are numerous areas of irrigated and dry farm land on the alluvial bottoms and upon the bench lands of the small and large valleys included within the Rocky Mountain portion of the State. In Idaho, agriculture may be considered under three separate divisions, namely: humid farming, dry farming and irrigated farming. The humid section comprises the northern part of the State, where 67 per cent of the crop is wheat. Great areas of logged-off lands are now being put under cultivation and are specially adapted to the growing of clover. The chief crop in the dry-farming region, the southeastern part, is wheat raised by intensive cultivation. By far the greater proportion of the agricultural land, however, is found in the great intermountain plateau along the course of the Snake River where the largest irrigation systems in the country are maintained. These embrace 5,003,833 acres with canals aggregating 10,491 miles in length, and constructed at a cost of more than \$90,000,000. These canals are assured an abundance of water by great dam and reservoir systems, among which are some of the largest and best in the world. The Jackson Lake reservoir on the head waters of the south fork of Snake River is one of the largest in the United States. The Arrowrock dam, storing water for irrigating 240,000 acres of land, is the highest dam in the world. The average yield of wheat per acre here is 26.6 bushels; of oats, 40.6 bushels. Idaho produces more alfalfa than any other State in the Union of equal acreage, the yield for 1917 being approximately 1,500,000 tons. An average yield of nearly three tons per acre is obtained. Idaho has about 140,000 acres of orchard. Her apples have won some of the greatest horticultural honors known. Idaho prunes are the finest in the world.

**Stock Raising.**—Idaho's stock growing has increased almost in keeping with its increased growth in agricultural development and population, chiefly due to available public range and

wise Federal supervision of the extensive forest reserves on which hundreds of thousands of beef cattle and sheep graze during the summer season. There is ample winter provender on the great alfalfa farms of the Snake River valleys. In 1917 Idaho had nearly 500,000 beef cattle and 3,250,000 sheep. The dairy industry is growing rapidly. In 1918 there were about 140,000 milch cows in the State.

**Forests.**—Although lying partly within the arid belt, Idaho is well forested. Approximately 20,000,000 acres or 37 per cent of the total land area of the State is forested. Ample provision is made for the protection of the forested area by the fact that out of the total of 129,000,000,000 feet board measure, 71,000,000,000 feet or 55 per cent is included in the national forests, leaving 50,000,000,000 feet privately owned and 8,000,000,000 otherwise held by the government or State. In area about 90 per cent or 18,000,000 acres of the forest is under national control. Much of the area contains immature stands which have not yet reached the producing stage but will repay protection. The large white pine forests of northern Idaho are among the most valuable in the United States. Lumber production is increasing rapidly, the cut being mainly soft woods, western pine, white pine, larch and Douglas fir.

The following table gives the names of the national forests in Idaho, area, headquarters of supervisor and last proclamation date effective:

FOREST	Land area within national forest boundaries			Date of latest proclamation	Forest headquarters
	National forest land	Other lands	Total		
Boise.....	1,058,941	59,173	1,118,114	Dec. 24, 1910	Boise
Cache.....	492,668	16,633	509,301	Oct. 9, 1917	Logan, Utah
Caribou.....	681,540	30,090	711,630	April 18, 1914	Montpelier
Challis.....	1,259,237	10,753	1,269,990	May 21, 1914	Challis
Clearwater.....	785,103	122,743	907,846	July 1, 1911	Orofino
Coeur d'Alene.....	662,611	127,623	790,234	July 1, 1911	Coeur d'Alene
Idaho.....	1,193,439	15,841	1,209,280	Mar. 23, 1912	McCall
Kaniksu <sup>1</sup> .....	198,757	260,220	458,977	May 6, 1910	Newport, Wash.

Salmon.....	1,621,707	21,653	1,643,360	May 19, 1913	Salmon
Sawtooth.....	1,203,387	16,743	1,220,130	May 19, 1913	Hailey
Selway.....	1,693,711	108,289	1,802,000	July 1, 1911	Kooakia
Targhee.....	977,847	47,893	1,025,740	June 6, 1917	Saint Anthony
Weiser.....	562,609	98,291	660,900	July 1, 1911	Weiser
Total.....	17,623,464	1,715,879	19,339,343		

<sup>1</sup> A portion of these forests lie within adjoining States. The areas given are only for that part within Idaho.

**Manufactures.**—Manufacturing has more than kept pace with the growth of the State in population. Idaho has some of the largest lumber mills of the world. The Potlatch with a daily capacity of 750,000 board feet of lumber in a 24-hour run is considered the largest and the Boise-Payette with a capacity of 500,000 feet a close second. The State has an abundance of water power available for use in manufacturing. Idaho claims the establishment of the first commercial potato flour factory in the United States. It is located at Idaho Falls. Idaho's six beet sugar factories, located at

Sugar City, Lincoln, Blackfoot, Burley, Twin Falls and Rupert, produced 102,000,000 pounds of sugar in 1917. Another factory was built at Shelley in 1917. Others are now in course of construction. The chief manufactured products are lumber, beet sugar, concrete, packed meats and flour. Large fruit evaporating plants were erected and operated at Meridian and Payette in 1917.

**Mining.**—Idaho is the largest lead-producing State in the Union. The total production of lead from Idaho's mines in 1917 aggregated 395,883,000 pounds. With an output of 12,496,017 ounces of silver in 1917, Idaho ranks a close second with the other principal producing States of the Union. The zinc mines of Idaho produced 96,123,000 pounds of this metal in 1917. The consolidated Interstate-Callahan mine of the Coeur d'Alene district ranks third among the individual producers of the United States. Copper mining is of less importance, there being a total yield of a little over 7,000,000 pounds in 1917. Gold placer mining was the original source of mining activity in Idaho. The State is credited with a total yield to date, since the original discoveries at Pierce City, of \$200,000,000 in placer gold, which was mostly derived from mountain basins in the central granite batholith formations. The placer industry is now at a low ebb which is due to the practical ground exhaustion of the larger mines. Idaho produced, in 1917, 41,326 ounces of fine gold. Among the rare metals that are known to exist in Idaho are tungsten, molybdenite,

nickel, tin, antimony and quicksilver. Idaho possesses the richest resources of phosphate rock in the world, located in the southeastern part of the State. Its resources of the commoner mineral substances in the form of fire-clays, Portland cement, etc., are practically inexhaustible.

**Transportation.**—There are 2,430 miles of steam and about 150 miles of electric roads in the State. From Lewiston, boats run on the Snake and Clearwater rivers, carrying freight from the inland through the Columbia River to the Pacific. Stages ply

daily to nearly all parts of the State not accessible by railroads. On 1 Jan. 1917, Idaho had spent a total of \$856,979 in general State funds on highways and bridges. The programs for expenditures for State highways alone

bonded debt amounted to \$2,227,750 and a sinking fund of \$400,000. The assessed value of real and personal property for 1917 amounted to \$444,857,675.

**Education.**—The Idaho system differs from

STATISTICS OF IDAHO MANUFACTURES — 1912.

KIND OF MANUFACTURE	Number of establishments	Capital invested	Number of proprietors and firm members	Number of employees		Total number persons engaged in industry	Total salaries and wages for year		Average number hours worked per day	Average number days worked per year	Total value of products, 1912
				Male	Female		Male employees	Female employees			
Saw and planing mill products <sup>1</sup>	274	\$18,123,808	360	6,553	49	6,962	\$4,391,000	\$20,525	10	238	\$11,346,000

Tobacco manufactures	24	74,753	25	73	29	127	93,951	12,856	8	286	187,803
Ice, manufactured	9	424,341	18	30		48	25,200		10	280	145,863
<b>Total</b>	<b>707</b>	<b>\$31,700,104</b>	<b>1,004</b>	<b>10,114</b>	<b>451</b>	<b>11,569</b>	<b>\$6,839,835</b>	<b>\$172,578</b>			<b>\$24,487,976</b>

<sup>1</sup> Does not include detached planing mills doing custom work.  
<sup>2</sup> Includes commercial plants only.  
<sup>3</sup> Plants operating under government supervision.  
<sup>4</sup> Since compilation of above statistics, manufacture of liquor has been prohibited.

during the years 1917 and 1918 amounted to \$2,345,000. State highways connect all principal parts of Snake River Valley in the south and the chief centres of population and industry of the north. A north and south highway is now being constructed to connect the northern and southern parts of the State which have hitherto been separated by great mountain chains and river valleys almost impassable.

**Banking and Finance.**—On 20 Nov. 1917 there were 137 State banks with total deposits of \$44,663,884. The reserve of all State banks reporting for call on that date shows an average of 30 per cent. Individual deposits held subject to check in these banks was \$30,728,763.97 Individual saving deposits was \$2,965,802.95, averaging about \$7 per capita.

For the two years ending 30 Sept. 1916 the receipts and disbursements were as follows:

Cash in hand, 1 Oct. 1914	\$1,246,356
Receipts, 1914-16	6,119,406
<b>Total</b>	<b>\$7,445,762</b>
Disbursements 1914-16	6,260,832
<b>Balance in treasury, 30 Sept. 1916</b>	<b>\$1,184,930</b>

The revenues are derived from general tax levies, receipts from the department of the secretary of state, interests on funds and receipts from other departments. Disbursements are, of course, made to defray the expenses of State government and to maintain the various State institutions. On 30 Sept. 1916 the State

all others in its complete unity of the school affairs of the State, from the primary grades to the university, which are under the supervision of one single State Board of Education. This board consists of five members appointed by the governor, and one ex-officio member, the State superintendent of public instruction. Three members act as a governing board for the six State educational institutions, including the university, the two State normal schools, the Idaho Technical Institute, the Industrial Training School and the State School for the Deaf and Blind. This same board exercises general supervision over the public elementary and high schools. The State Board of Education has the duty of assisting the legislature in every possible way in framing and enacting the educational laws, and it is the duty of the board, prior to each meeting of the State legislature, and in ample time for due consideration by said legislature, to prepare a financial budget setting forth the financial needs of all State educational institutions under its supervision and control.

Idaho spends annually on her public schools approximately \$4,500,000. It has 147 public high schools and 11 private academies, 1,594 public school buildings and 3,636 teachers. There are two State normal schools — one located at Albion and one at Lewiston. An excellent State university is located at Moscow, embracing the following colleges: letters and science, agriculture, engineering, law, school of

forestry, school of mines, extension division and experiment station. The Technical Institute is located at Pocatello and an industrial training school at Saint Anthony. The School for the Deaf and Blind is located at Gooding.

**Charities and Corrections.**—The State Penitentiary located at Boise, the State Insane Asylums located at Blackfoot and Orofino, an Institute for the Feeble-Minded at Nampa and the State Industrial School at Saint Anthony all own agricultural lands and cattle in connection, cultivated and cared for chiefly by the inmates of these institutions, making them almost, if not quite, self-supporting. The Orphans' Home at Boise and the School for the Deaf and Blind at Gooding is supported by State appropriations.

**Militia.**—The State of Idaho has no armories. The strength of the National Guard of Idaho in the Federal service, 1 Jan. 1917, was 56 officers and 1,073 men. This has been increased since the declaration of war with Germany.

**Religion.**—In religion Idaho is predominantly Latter-Day Saint, or Mormon, with Catholics, Methodist, Baptist, Presbyterian, Christian, etc., following in the order named.

**Indians.**—A total Indian population of 3,791, consisting of remnants of what were once five great tribes, reside now within three reservations in Idaho. Their number is fast decreasing and ere long the red man of Idaho, who not more than 40 years ago was held in continual fear by the white pioneer, will be known only in story. Yet the memory of the race will be everlasting, because of the many beautiful words that the white settler has adopted from the Indian language, and has given to the mountains and the valleys, the lakes and the streams, the counties, cities and towns. Vital statistics of the Indians of Idaho show a death rate that greatly exceeds the rate of birth. The Cœur d'Alene Reservation, comprising 104,077 acres, is located in Kootenai County. It is inhabited by 623 Cœur d'Alene and Spokane Indians. The office of the superintendent of the reservation is located at Tekoa, Wash. The Fort Hall Reservation in Bingham and Bannock counties, with headquarters at Fort Hall, Idaho, includes 454,239 acres of land. It is set apart for the Bannock and Shoshone Indians and for the Lemhi tribe, which was moved from the reservation in Lemhi County. There are 1,779 Indians on the Fort Hall Reservation. The Nez Percés at Fort Lapwai, near Lewiston, are considered the most highly civilized Indians in Idaho. The tribe numbers 1,389, all of whom have discarded their native attire and have adopted modern customs. There are 212,390 acres in the Fort Lapwai Reservation. Agriculture is the principal occupation followed by the Indians of Idaho. Sufficient land is set apart for them to ensure each Indian a liberal income should he choose to cultivate the soil. However, much of the land is rented to white farmers, the Indians generally only cultivating small tracts. This work is done largely by the women. Houses have been built for the Indians, but in most instances they prefer their tepees. In northern Idaho the native dwellings may be seen erected near the houses, while on the Fort Hall Reservation fully 300 Indians

live in tepees. Of the Nez Percés, 235 live in permanent houses with floors and 240 live in houses without floors. Many Indians of the State have discarded the costume of the savage. However, on the Fort Hall Reservation there are 1,233 Indians who wear native attire. Extensive agricultural development has taken place on the Fort Hall Reservation during the past 10 years. Approximately 47,800 acres of land on this reservation are under irrigation. Schools are maintained in each of the reservations by the Federal government and by churches. Missions are also located among the Indians. The majority are favorable to education. There is an average enrolment of 415 pupils at the three reservation schools. Idaho and Nevada share the Duck Valley Reservation, which is inhabited by the Piute and Western Shoshone Indians. The Idaho portion of this reservation is in Owyhee County. The Indian affairs are under the direction of the Department of the Interior.

**Population.**—Population (1870) 13,999; (1880) 32,610; (1890) 84,385; (1900) 161,772; (1910) 325,594. In 1910 the urban territory contained 21.5 per cent of the population. The chief cities are Boise with population of 25,000; Pocatello, 15,000; Twin Falls, 6,000; Idaho Falls, 5,500; Lewiston, 6,043; and Cœur d'Alene 7,291. There are 42 counties in the State.

**History.**—Lewis and Clark were the first white men to visit the territory in 1805–06. The first permanent settlement was made at Fort Hall. The first agriculturalists and home-builders were Mormons who settled at Franklin. Idaho originally formed a part of the Oregon country and was claimed by the United States, Great Britain, Spain and Russia. At the time of the Florida Purchase, in 1819, Spain transferred her rights to the United States. Russia did likewise in 1824. In 1818 a treaty had been concluded between the United States and England under which they were to jointly occupy this region. In 1846 this joint occupation was terminated by the establishment of the international boundary at approximately 49° N. which now marks the northern boundary of Idaho. On 3 March 1863 Idaho Territory was organized from parts of the territories of Washington, Dakota and Nebraska. It then included the area now comprising Idaho, Montana and a part of Wyoming. The organization of Montana and Wyoming as Territories in 1864 and 1868, respectively, left Idaho with its present boundaries. In 1889 a State constitution was adopted, and on 3 July 1890 Idaho was admitted into the Union.

**Suffrage, Elections, etc.**—Idaho extended to women the right of suffrage, 27 Nov. 1896, being one of the first States in the Union to grant this privilege. Every male or female citizen of the United States 21 years old who has actually resided in the State for six months and in the county where he or she offers to vote 30 days next preceding the day of election, if registered as provided by law, is a qualified elector, except those guilty of crime, under guardianship, idiotic or insane. At least 40 days before each general election and whenever he orders a special election the governor issues an election proclamation. All general elections are held in the several precincts in

the State on the Tuesday succeeding the first Monday in November every even year. Special elections, when effecting counties only, may be called for public good by the county commissioners, or may be called for a county, district or the State by the governor on 10 days' notice. All elections must be by absolutely secret ballot. By legislative enactment approved 3 March 1915 the State of Idaho was, on 1 Jan. 1916, constituted a prohibition district and the manufacture, disposal and transportation of intoxicating liquors for beverage purposes prohibited in the State of Idaho. All candidates of political parties for Congress and for all elective State, district and county offices, at regular elections are nominated at a primary election conducted substantially the same as a general election. At least 30 days prior to the primary each candidate for office, or some qualified voter in his behalf, files his nomination paper in the proper office. Such paper must set forth that the candidate for office is legally qualified to fill said office and represents the principles of the party for which he was filed. A primary ballot is prepared for each political party on which is arranged in proper order the names of the candidates regularly nominated for office. When an elector offers to vote he calls for the ballot of the political party of which he is a member. He may vote for a first and second choice. The person receiving the highest number and not less than 40 per cent of the first choice votes, or if no person receives 40 per cent of the first choice votes then the person receiving the highest number of first and second choice votes becomes the nominee for such office of the party nominating him.

**Municipal Corporations.**—The legislature provides by general laws for the incorporation, organization and classification of cities and towns in proportion to population, which laws may be altered, amended or repealed by the general laws. Any county or incorporated city or town may make and enforce, within its limits, all such local police, sanitary and other regulations as are not in conflict with the charter or with the general law. A municipal corporation can in no way become a stockholder or raise money for, or make donations to, or loan its credit to any company, corporation or association, except for school, water, sanitary and illuminating purposes.

**Government.**—The powers of the government of the State are divided into three distinct departments, the legislative, executive and judicial. The legislative power is vested in a senate and house of representatives. The senate at present consists of 37 members and the house of 65 members. These are elected for the term of two years. Each county is entitled to one senator; the representatives are apportioned by the counties according to population, each county being allowed at least one representative. The sessions of the legislature are held biennially, commencing on the first Monday after the first day of January and are limited to 60 days except at the members' expense. The governor may convene the legislature by proclamation, but no extra session shall continue for longer than 20 days. The executive department consists of a governor, lieutenant-governor, secretary of state, State auditor, State treasurer, attorney-

general and superintendent of public instruction, each of whom shall hold office for two years beginning the first Monday in January next after his election. The supreme executive power of the State is vested in the governor. He is commander-in-chief of the military forces of the State, except when called into actual service of the United States. He has power to nominate, and by and with the consent of the Senate appoint, all officers whose offices are established by the constitution and to appoint other officers whose election or appointment is not otherwise provided for, to fill vacancies that may be caused by death, resignation or otherwise in office created by constitution or statute.

The governor, secretary of state and attorney-general, constitute the Board of Pardons, a Board of State Prison Commissioners and a State Board of Examiners. The superintendent of public instruction, the secretary of state and attorney-general constitute the State Board of Public Instruction of which the superintendent is president. The governor, secretary of state, attorney-general, State auditor and superintendent of public instruction constitute a State Board of Land Commissioners. The judicial power of the State is vested in a court for the trial of impeachments, a Supreme Court, District Court, Probate Court, court of the justice of the peace and such other courts inferior to the Supreme Court as may be established by law for any important city or town. The court for the trial of impeachments is the senate, the judgment of which does not extend beyond removal from and disqualification to hold office in the State. The power of impeachment rests solely with the house of representatives. When the governor is impeached the chief justice shall preside.

The Supreme Court consists of three justices, and are elected by the electors of the State at large for a term of six years. At least five terms of the Supreme Court are held annually. It has jurisdiction to review, upon appeal, decisions of District Courts or judges thereof. It has original jurisdiction to issue writs of mandamus, certiorari, prohibition and habeas corpus and all writs necessary to complete its appellate jurisdiction. It also has original jurisdiction over claims against the State, but its decisions are merely recommendatory, and reported to the legislature. The State is divided into 10 judicial districts for each of which a judge is elected by the electors thereof for a term of four years. A District Court is held in each county at least twice a year and has original jurisdiction in all cases both at law and in equity, also certain other appellate jurisdiction. The Probate Courts are courts of record and have original jurisdiction in all matters of probate, and to hear and determine all civil cases where in the debt or damage claimed does not exceed the sum of \$500 exclusive of interest, and concurrent jurisdiction with justices of the peace in criminal cases. Justices of peace have such jurisdiction as may be conferred by law, but not of any case wherein the value of property of the amount in controversy exceeds the sum of \$300, nor where the boundaries or title of real property are called in question.

## The governors of Idaho have been:

B. HARVEY ALLRED,

*Speaker of the Idaho House of Representatives, 1918.*

**IDAHO, University of,** the State university situated at Moscow, established in 1889 and work was begun in 1892; it is open to both men and women, and there is no tuition except moderate fees in law and music. The government is by the State Board of Education; the curricula offered include the classical course, general science, forestry, home economics, education, civil, mining, electrical, mechanical, engineering, agriculture and law. The Agricultural Extension Division, with headquarters in the State House, Boise, has a staff of 17 workers besides the county agriculturists, and carries on its work by lectures, movable schools, demonstration trains, demonstration farms, etc. The annual income, derived mostly from Federal and State appropriations, is about \$255,000; in 1916 the number of students was 865; the number of professors and instructors 85 (not counting the extension staff).

**IDAHO FALLS,** Idaho, city and county-seat of Bonneville County. It is situated on the Snake River, 30 miles northeast of Blackfoot, and is served by the Oregon Short Line. The chief industry is the manufacture of sugar.

Agriculture is also extensively carried on. The municipality owns its own waterworks and electric-lighting plant. Pop. about 5,000.

**IDAHO SPRINGS,** Colo., town in Clear Creek County, on the Colorado & S. Railroad, about 35 miles west of Denver. It is situated in the plateau region of the Rocky Mountains at an elevation of about 7,600 feet in the picturesque Clear Creek Cañon. The hot and cold soda springs make it a famous resort for health seekers. Since 1859 when gold was discovered at Jackson's Bar, now a part of the town of Idaho Springs, this district has been most productive in its yield of gold and has notable mining tunnels, of which the Newhouse tunnel is the longest in the world. The chief industrial establishments are concentrating mills, lumber-wards and machine-shops. Pop. 2,154.

**IDDESLEIGH,** idz'li, Earl of. See **NORTH-COTE, STAFFORD HENRY.**

**IDDINGS, Joseph Paxson,** American geologist: b. Baltimore, Md., 1857. He was educated at the Yale Sheffield Scientific School, where he also took graduate work and instructed in mechanical drawing and surveying (1878). Later he went to Columbia University, specializing in geology and microscopic petrography, and continued further study in these fields at Heidelberg. On his return to the United States he was employed by the United States Geological Survey from 1880-92, and again in 1895. Interim he was assistant professor of petrology at the University of Chicago (1892-95), and full professor (1895). In 1914 he was honorary Silliman lecturer at Yale, and was made honorary associate in petrology at the United States Natural Museum (1917). Dr. Iddings is a member of various American and European scientific societies, and in addition to numerous reports and contributions to scientific magazines was joint author of 'Geology of the Yellowstone National Park' (1899); 'Quantitative Classification of Igneous Rocks' (1903). He translated and published in abridged form H. Rosenbusch's 'Microscopical Physiography of the Rock-Making Minerals' (1898); and has written also 'Rock Minerals' (1906); 'Igneous Rocks' (1909, Vol. II, 1913); and 'The Problem of Volcanism' (1914).

**IDE, Fannie Ogden** ("RUTH OGDEN"), American author: b. Long Island, 1853. She has written various juvenile stories, among them 'A Loyal Little Red-Coat' (1889); 'A Little Queen of Hearts' (1892); 'Little Home-spun' (1896); 'His Little Royal Highness' (1897); 'Tattine' (1900); 'Loyal Hearts and True' (1900); 'Friendship' (1904); 'The Good and Perfect Gift' (1904); 'Little Pierre and Big Peter.'

**IDE, Henry Clay,** American jurist and diplomat: b. Barnet, Vt., 18 Sept. 1844. He was graduated at Dartmouth in 1866, became State attorney 1876-78, and was a member of the Vermont State senate 1882-85. In 1891 he was appointed United Commissioner in Samoa, and later (1893-97) was chief justice of Samoa under the joint appointment of the United States, Germany and England. He became in 1900 a member of the Taft commission; secretary of finance and justice of the Philip-

pires, September 1901; vice-governor 1 Feb. 1904; and in 1906 governor-general. He was Ambassador to Spain from 29 March 1909 to 23 August 1913. Besides numerous contributions to the *North American Review* and other periodicals he was the author of 'Code of Procedure in Civil Actions and Special Proceedings in the Philippine Islands' (1901); 'The Land Registration Act' (1903); 'The Internal Revenue Law of the Philippine Islands' (1904).

**IDE**, id, a fish (*Leuciscus idus*), of the roach family. It frequents the northern lakes of Europe, spawning in April and May in the river outlets. The ide is relished as food. In Germany a species of ide is marketed as an ornamental specimen for aquariums, because of its golden sheen.

**IDEA**, philosophical and psychological term denoting that which is imaged or conceived in the mind. The word idea has however borne very distinct meanings in the history of philosophy and psychology. Probably to no other term of the kind have there been attached so many different shades of meaning as to the word idea. Yet what the word signifies is, of much importance. Till the end of the 17th century, idea had the signification given to it by Plato. The word originally meaning appearance, image, shape, and employed even in philosophy before Plato received and retained from his time a specific sense. With Plato it denotes in the world of things the counterpart of the concept, an immutable essence or being, accessible only to thought. Plato's doctrine of ideas gave stability and objectivity to philosophical concepts. A bold logical fantasy in Platonism transfers concepts to the external world, hypostatizing them into independent essences standing over against us. The world of thought which thus originates becomes for Plato the core of all reality, the supporter of the world of sense.

Thus it was Plato who won for the term idea the prominent position it holds in the history of philosophy.

Originally Greek, the term appears to have passed without change into the Latin tongue. In Greek, as we have said, it seems to have meant appearance, shape or form, whence by an easy transition it acquired the connotation of nature or kind. It is equivalent to *eidōs* of which it is merely the feminine, but Plato's particularity for this form of the term and its subsequent adoption by the Stoics secured its ultimate triumph over the masculine form. Plato's view comes to this: To the universal notions or concepts which constitute science or general knowledge as it is in our mind, there correspond *ideas* in the objective world. These ideas are not something indwelling in the individual things, as for instance form in matter, or the essence which determines the nature of the object. Each universal platonic idea has its own separate and independent existence apart from the individual object related to it. It also seems to proceed from or to dwell in some celestial world. There is indeed community between the ideas and objects of sense experience. This community consists in participation. The ideas are prototypes, the sensible objects, copies; imperfect imitations of their archetypes.

In the tenth Book of his *Laws*, Plato discusses 10 kinds of motion, reducing them to

two kinds. Inasmuch as he regarded the truth or essence of ideas to consist in self-activity as we see it manifested in life and mind, it will be well to recall these two modes of motion. The one Plato called "movement through another"; he called the other movement through self. For him the latter is the origin of the existence of all being and all change. And it is precisely here that we find Aristotle in agreement with Plato. The former arrives at the same thought and calls it *ousia* but retains idea, Greek *eidōs* for "species," using "entelechy," to convey the notion of the "self-active cause of life." For Plato the ideas were independent sovereign forms. In post-classical Hellenism, we find Philo of Alexandria using idea to denote the thoughts of the Divine Spirit. Accordingly we here not only have a unity as a source of all multiplicity, but the whole of reality is supported and spiritualized by a universal Soul. Likewise, mighty movements were introduced by the fact that the powers mediating between the Deity and mankind were combined into the unity of the Logos or World-Reason, the first-born Son of God. Even with Origen the essence of reality consists of an invisible world of ideas. Thenceforth the doctrine becomes a constituent element in Christian speculation; and material being originates subsequent to this invisible world, and continually requires its constituting and animating power.

From Descartes onward usage has become confused and inconstant. John Locke in particular ruined the term for English philosophy, where it has ceased to have any recognized definite meaning. He tells us: "Whatever the mind perceives in itself, or as the immediate object of perception, thought, or understanding, that I call idea." He says further that he has used the term to express whatever it is which is meant by phantasm, notion, species or whatever it is which the mind can be employed about when thinking. In fact, with Locke, idea appears to denote indifferently a sensation, a perception, an image of the imagination, a concept of the intellect, or emotional feeling, and sometimes the external material object which is perceived or imagined. Yet in spite of Locke the word was used in the Platonic sense in literature as well as in philosophy till the 17th century. Examples in literature are to be found in Spencer, Shakespeare, Hooker and Milton. Thus in 'Paradise Lost':

"God saw his works were good,  
Answering his fair idea."

The fortune of the word idea is curious enough. Employed by Plato as described above it stands in lofty contrast to the unreal images of Plato's sensible world. But it was lowered by Descartes who extended it to the objects of our consciousness in general. And when, after Gassendi, the school of Condillac had analyzed our highest mental faculties into our lowest, idea was still more degraded from its Platonic position. "Like a fallen angel, it was relegated from the sphere of Divine intelligence to the atmosphere of human sense. . . ." (Hamilton).

Locke followed Descartes who, instead of employing the words image, species, phantasm in speaking of the mental representations of sense-perceptible objects, used the word idea. Hume tells us that all the perceptions of the

human mind resolve themselves into ideas and impressions. With him the idea is a purely mental structure or content which is a less vivid copy of an original sensation, emotion or volition. With Kant an idea becomes a transcendental conception of the pure reason, such as the idea of God. With Hegel the highest thought of the logic is named by him *Idee*, suggesting Plato's highest principle. *Idee* thus suggests the final category of the Hegelian dialectic—the realized ideal, energy in its supreme manifestation; it is the Absolute Idea, or the Absolute. At the present time many psychologists use the word idea only for a complex that does not arise from direct outward impressions. They thus use it for the so-called memory-images. For ideas formed from outward sense-impressions they generally use the word perception. Wundt does not regard this distinction as of any importance, since, as he says, there is really no valid difference between memory ideas and the so-called sense perceptions. Yet, according to Professor Stout, the existence of ideas is subsequent to that of perceptions, and even implies some complexity of perceptual cognition. Perhaps, however, all agree that ideas are symbols, symbols having a meaning. The whole realm of mental representations may be viewed with regard to either their symbolism or their significance. Considering their symbolism ideas of things as well as ideas of relations are not unreasonably regarded as products of the mind. But considering their meaning, ideas represent realities. In other words, their contents or that which they signify is real. There are indeed some ideas that are not even representations. Such are solely of an auxiliary nature, comparable to tools of the mind. Such are hypotheses. This brings us to the concept of content. Content, *obiter dicta*, is absolutely incomprehensible from a merely mechanical view of the world. For who could explain the meaning of a word mechanically? Content involves a principle of order—that of objective reality, meaning and dependency. We perceive this for example in the relationship of the characteristic marks of a logical concept to one another. Only grossest misunderstanding can confound the inner structure of such a concept with the juxtaposition within a mere sense-presentation. The fundamental form of connection in the case of such a concept is one of system. Each element stands within a whole, under the influence of a whole, and remains subject to its compelling power, while the various elements mutually determine one another.

Nowadays it is not seldom that one comes across the word idea combined in phrasal connection with other words. A consideration of the more important of these cannot be out of place. Some psychologists speak of a dominant idea. They mean by this an imperative or insistent idea, such as besets the mind, and this in spite of all effort to inhibit it and in spite of one's assurance of its unreasonable character. We may remark here that every idea considered, not as a mere feeling, but as a brain-movement fit to serve as an irritation to action will, if not inhibited, pass into an action, whether it be connected with consciousness or not. Thus a persistent or obsessing idea may become dangerous to the one holding it. It is usually a train of thought which a subject can-

not banish or escape, though he recognizes its falsity or triviality. Such imperative or dominant ideas exist in all degrees of intensity, from the "sound that sings in the ear" to such obsessions as agoraphobia. In this sense it is the same with a fixed idea. Fixed ideas are delusional ideas or trains of thought which dominate the mind in certain forms of insanity or monomania.

By a free idea experimental psychologists understand an idea or representation which is dissociated from sense-perception or presentation and from the organic impulses connected with sense-perception. A free idea is thus one which may take its place in an associative train, and may be used in the process of discrimination.

By an implicit idea, Höfding understands the idea or group of ideational elements that fuses with the presentation in the act of perception. It is thus the ideational associate that raises a datum of sensation to the rank of a perception. An extrinsic idea is a temporal or spatial idea. Spatial and temporal ideas are immediately distinguished from intensive ideas by the fact that their parts are united in a definitely fixed order. Ideas with such a fixed arrangement are called in general extensive ideas.

Thus no word in philosophy or psychology has been responsible for more confusion than the word idea. Yet what the word signifies is of utmost importance. Its sense in the minds of some philosophers is the key to their entire system. Nowadays it sometimes means merely an opinion; sometimes mental images; and we even find it employed merely as an element in a periphrasis (as in "to have an idea on"). It is thus one of the most important words in the history of thinking and at the same time one of the least understood. See INNATE IDEAS.

**IDEA OF A UNIVERSITY, The.** Cardinal Newman's 'Idea of a University' is a collective volume composed (1) of a course of nine lectures delivered (1852) to the Roman Catholics of Dublin, (2) of 10 occasional lectures and essays addressed (1854-58) primarily to the members of the Catholic University of Ireland while Newman was its rector. The former part is a consistent whole, dealing consecutively with fundamental considerations of university teaching: with theology as a branch of knowledge, with the relations of theology to other knowledge, with knowledge considered as its own end and in relation to learning to professional skill, and to religion, and finally with the claims of knowledge upon the Church. The second part deals with the relations of Christianity to letters and to science, with the study of literature, with elementary studies, and with a few more special topics. Of these 19 discourses the best known are 'Elementary Studies,' which is largely in vivacious dialogue, and 'Literature,' which is so persuasive and suggestive that it has been widely quoted both as counsel and as a model of style. The other discourses have more general interest than is immediately suggested by their titles. To dismiss them as special in subject and audience is to ignore both the unfailing force and beauty of Newman's expression and the largeness of his philosophical conceptions. Educated himself at Oxford, he was never provincially Eng-

fish; and during his maturity his associations in the Roman Church with men of Continental training widened his acquaintance with the practical problems of higher education. But his great claim upon the general public, a claim hardly second to his literary distinction, is that he deals, not with the technic of pedagogy, but with university education as the development of the whole man. His conception of this total development as essentially moral, pervading his exposition, makes it both large and persuasive. Though the university as "a place of teaching universal knowledge" has for its immediate object the intellectual rather than the moral, yet "practically speaking, it cannot fulfil its object duty . . . without the Church's assistance . . . the Church is necessary for its integrity." Animated by this idea of the integration of university studies in the development of Christian manhood, his discussions embrace not only such practical matters as the relations of teaching to research, but the larger aspects of liberal education.

CHARLES SEARS BALDWIN.

**IDEALISM.** This word is not easy to define briefly, as it is used in many connections where the common element in the various significations it takes on are not at first sight apparent. We may say at once, however, that idealism is a fundamental attitude or point of view from which men interpret the world, or some special phase of human experience. Its essential characteristic is found in the fact that it interprets the reality with which it deals as having a meaning, an idea, apart from its sensible appearance, and assumes that in this inner significance its truth and ultimate essence consists. Not the outward show of things, not the fact of coexistence and sequence among sensible phenomena, but the meaning or "idea" is for idealism the point of primary importance in understanding either the world as a whole, or any of its various parts. Now, as Plato perceived, this inner idea of anything is ultimately identical with its "good," i.e., what it is good for, its purpose or function in a rational system of things. Accordingly, the essence of idealism is found in its teleological mode of explanation. This point of view, when logically carried out, implies further that what is real is rational or intelligible, since its idea can be grasped. That means, in other words, that mind or intelligence is the ultimate principle in which things find their explanation. Moreover, it of course follows that the material world with its mechanical laws is in some sense secondary and derivative. Idealism is thus directly opposed to materialism (q.v.) and mechanism, which takes matter or energy or some unintelligent form of existence as the *primum* from which everything else is derived. Realism, as a philosophical theory, affirming the existence of a reality apart from subjective experience, is not properly contrasted with idealism; though, as we shall see later, these terms are used to denote opposing tendencies in literature and art. It is, however, a mistake to suppose that idealism denies objective reality and reduces the world to sensations and ideas in the mind of the individual. On the contrary, the more adequately the principle of idealism is grasped, the more completely is justice done to the objective side of experience.

Science, including philosophy, religion, art and literature, are all different ways of interpreting life and existence, involving, indeed, varying attitudes of the self toward reality, and varying degrees of explicitness. Religion, art and literature differ from science and philosophy in not being reasoned interpretations of reality, but primarily expressions of the emotional or feeling aspects of experience. Yet the various sides of experience are not independent and isolated, but act and react on one another as parts of a functional unity. Consequently, the interpretations of religion, art and literature presuppose more or less explicit theories about the nature of things. These, however, exist in the form of unexamined assumptions and uncritical standards of value. With regard to these interpretations, we can at once say that all forms of religion which rise above mere fetishism necessarily presuppose an idealistic view of the world. This is obviously true of a religion like Christianity. But even if a religion denies individual immortality and the doctrine of a personal God, it cannot exist without assuming that the universe is to some extent governed by the ideas and purposes of a superhuman power (or plurality of powers), and that it is not therefore a mere play of mechanical phenomena. Art and literature, too, are naturally—at least in their highest forms—affiliated with idealism. For the emotional and æsthetic satisfaction at which they aim can be fully attained only on the assumption that the ultimate nature of things is in harmony with the demands of the human spirit, and that therefore these ideals are not vain illusions. There are, however, two causes which at certain periods bring about a reaction against idealism in these fields and give rise to what is known as realistic art and realistic literature. In the first place, the conceptions of science and philosophy are at certain periods so prevalently mechanical and naturalistic as to fetter the wings of imagination and render impossible any idealistic interpretation on the part of art and literature. If the world is demonstrably unmeaning and mechanical, there is no permanent artistic satisfaction in a false idealism. The imagination cannot be divorced from reason, but must find its satisfaction in representing things in harmony with their true nature and known laws of action. But, again, realism in art and literature may be the result of a one-sided idealism, which, by ignoring the aspect of things that science emphasizes, gives rise to the same divorce between the truth of fact and the truth of art. It is clear that if idealism is to prevail in these fields it must not ignore the facts and laws of the natural world, or run counter to them, but must do justice to these facts while its transcends, through its interpretations, the scientific standpoint. Mere idealism, then, is an unsatisfactory standpoint in art and literature, and the reaction toward realism to which it gives rise is justifiable and necessary. In a somewhat similar sense, "idealist" is used popularly as a term of reproach to denote a person who ignores the facts and practical conditions of any situation, construing it in a one-sided way in terms of his own ideas of what ought to be. But idealism, to be adequate, must go beyond the uncritical ideas of the individual. The true idealist is the man whose ideas are

adequate to the situation in all its complexity and concreteness, whose interpretation of what is and ought to be is derived from a penetrating analysis of all the objective conditions.

What of the relation of natural science and philosophy to idealism? It is obvious that the very task of the natural sciences necessitates the adoption of conceptions which are fundamentally different in character from those employed by idealism; for science is primarily concerned with the relations of particular phenomena. It is always concerned with the mechanism of the parts, and knows nothing of the ideal purpose or significance of wholes. As Kant said, "where mechanism ceases there ceases also the possibility of scientific explanation." This is the ground of the long-standing quarrel between natural science on the one side and idealistic philosophy and religion on the other; the former can interpret the world only in mechanical terms, while the latter must read it in terms of teleology.

The history of thought shows that both these methods of explanation have steadily confronted each other in philosophy. Idealism and materialism were developed almost simultaneously in Greece—the former by Plato and the latter by Democritus—and the division between these opposing principles under one form or another persists until the present day. Although philosophical systems necessarily vary with the changing intellectual and social conditions of different periods, yet it remains true, as Fichte said, that in principle "there are and can be only two systems of philosophy, idealism and materialism, and that neither one can directly refute the other, since they are constructed upon totally different planes." Materialism, as philosophy, adopts the conceptions and methods of the natural sciences, and differs from the latter only in the greater scope and generality of its problems. It aims to be (in Spencer phrase) "completely unified science." Idealism, as we have already seen, has a different problem from that set by science, and states its conclusions in terms that are quite foreign to the latter.

It is usual to distinguish between subjective and objective idealism. The former is an incomplete and undeveloped form, and finds its best representative in Berkeley (q.v.). It resolves material existence into a series of ideas in the mind of the individual, holding, in Schopenhauer's phrase, that "the world is my idea." The proof that it offers for this position is based mainly on the epistemological thesis that we know and can know nothing but our own ideas. The difficulties and inconsistencies of this view are now generally recognized, and the idealism of the present day is known as objective idealism. This does not deny the existence of external reality, but finds implicit in it the same principles of reason and purpose that are present in the individual mind. Indeed, this is true of the great idealistic thinkers of all times—of Plato and Aristotle, no less than of Schelling and Hegel. As a philosophical system, idealism has, of course, to formulate its conclusions in a series of logical propositions and to furnish proofs of their validity. In doing this it does not depend upon the Berkeleyan argument mentioned above, but rather proceeds by way of a criticism of the

standpoint and categories of natural science. That is, idealistic philosophy attempts to show that the scientific standpoint, when taken as philosophy, i.e., as an ultimate account of the nature of things, is in itself incomplete and inconsistent and that when the necessary supplementations and corrections are made it points the way to a view of the world as a rational and purposive system. To make our view of the world completely consistent, many idealists maintain, we are obliged to hold that all its parts are included in an all-embracing system of experience, which finds its unity and its ultimate reality in the ideals and purposes of an Absolute Mind.

*Professor of Logic and Metaphysics, Cornell University.*

**IDEAS, Association of.** See ASSOCIATION OF IDEAS.

**IDENTITY**, meaning in general the state of being the same, can be predicated properly only of individual things. The philosophical consideration of identity has been undertaken from three different points of view. Identity was thus approached as:

(1) The logical law of identity; (2) the metaphysical concept of the identity of a thing; (3) the special psychological form which this concept takes in the case of a conscious being or person.

1. There are certain very general principles exemplified in all thought, and some have supposed the task of logic to consist merely in developing their implications. These principles are known as the law of identity, the law of contradiction and the law of excluded middle. We are concerned here only with the law of identity; the other laws have been named to reveal the position of this law among its correlatives in the science of thought. The law of identity may be formulated by saying that "whatever is, is"; or symbolically, that "A is A." In other words, if we think about anything then we *must think*, according to the law of identity, *that it is what it is*. This so-called necessity of thought amounts really to the apprehension of a necessity in the being of things. The law of identity and the law of contradiction is metaphysical or ontological. In the case of the former law, this is because whatever *is* must be *determinately* what it is,—that one must think it *is*. The law of excluded middle is so far different as a disjunctive proposition expresses doubt, and doubt belongs to mind, not to things. Unless the primary laws of thought were laws of things as well, our thinking would be doomed by its very nature to misapprehend the nature of things.

The logical law which we are now consider-

ing in particular is best understood as simply the positive form of that axiom of all consistent thinking which the law of contradiction states negatively. Thus we are reminded by the latter that a judgment cannot be now true, now false. But if true at all, it must remain true always. For if the truth of a judgment fluctuated without any change in the subject matter of such judgment, all thought would amount but to confusion. All the functions peculiar to thought receive their differentiating characteristic only through a detachment from the flow of sense-presentation and by establishing themselves as independent of it: the judgment presents its content as something fixed in contrast to the stream of presentations; it proclaims its connection of ideas to be something that does not pass away with the act of connecting them, but persists in face of all the changes of the psychical life. Thus all truth is eternal.

2. Sir William Hamilton well observes that the identity is the relation between our cognitions of a thing, not between things themselves. Let us consider briefly the metaphysical relations of the logical law of identity. It is metaphysical, we said, because whatever is must be *determinately* what it is, that one must think it so. Owing to considerations like these, philosophers find it difficult in admitting the possibility of an absolute change—change when nothing remains the same. For in such a change one cannot say *what it is* that changes. In this spirit Kant remarked "only the permanent can change." May we not suspect, however, that the great Königsberg thinker here unthinkingly reifies, employing his favorite "thing-in-itself," synonymous with Spencer's "absolute"? For let one ask: What is that which remains unchanged or permanent? How are we to conceive it? And how are we to conceive of the junction between the abiding nature of a "thing" and the changing states? These are very difficult questions to answer, as any perusal of Berkeley will show. For no doubt what the word "thing" conveys is a mere logical construction,—all the aspects of a "thing" alone being real. Cognition analyses "things" into bundles of *relations* and all these relations together making up the thing. What appears to be the truth is that the conceptions "things" and "relations" are inventions pure and simple for describing certain parts of the whole, as well as certain interactions and interconnections in a world-conception. In reality there are no things. These are only actions. In the notion of "things" inheres the physical assumption of a continuity. By *being* itself we understand the *immediacy* of ceaseless change. In a hypothetical sense, continuity may be allowed to be a necessary condition if two appearances are to be classed as appearances of the same thing. By one "thing"—a "Hilfsconstruction" as it is—we mean a combination of sensible continuity and causal connection; it is a certain series, namely, those which would commonly be said to be of the thing. If the a priori belief in permanence or continuity had not existed the laws which are now formulated in terms of this belief might just as well have been formulated without it. Things are those series of aspects which obey the laws of physics.

The metaphysical discussion of identity is concerned with a number of other questions

such as the foregoing. It would lead us too far afield to discuss them all here. (See *METAPHYSICS*). Philosophers discuss in this connection besides the various senses in which identity is known from qualitative likeness, in particular the relation of identity to difference; whether identity excludes difference, or on the contrary implies difference. Such questions are, on the whole, no doubt partly verbal, and partly psychological; but they also lead very often back to very fundamental problems of philosophy.

(3) The psychological problem of personal identity was raised into prominence by the somewhat paradoxical discussion of Locke in his 'Essay Concerning Human Understanding.' These discussions David Hume, in his 'Treatise on Human Nature,' subsequently followed up with an analysis in keeping with the skeptical bias of his thought. The difficulties of the notion of personal identity which appear in these early essays are even more complicated in modern psychology. Into psychological literature of late have been introduced the terms "double personality," "double soul" and "double ego." To many minds the difficulties seem rather increased than diminished by the introduction of these strange combinations; they are phrases which tend rather to mystify than to clear our ideas. While the words serve for certain problems it is well to observe that authors are not lacking who deal with the psychological problem as if they were talking of a psychic fluid or vapor floating about us. On the bases of these hypotheses, of course everything becomes possible, and the human body may as easily be considered as not as the haunting place of two or even of a multiplicity of ghosts. We have no need of such hypotheses. For the spheres of the peripheral and the central soul are not distinctly separated by any definite boundary. Therefore the difficulties raised to meet the notion of personal identity by those who cite cases of double and alternating personality need not be regarded as insuperable.

A few observations on the situation as a whole will help us to grasp more easily the idea of a continuity underlying the notion of personal identity. First, a man is not the sum of the material particles of which at any given moment he consists. The material particles are not the really essential elements that makes a man what he is. For instance, all animals breathe the same air; but all animals are not therefore persons. In truth a man's material existence is constantly undergoing change, and yet we remain the same person to-day that we were yesterday. But let us ask a question; it will confirm our notion that this is true. Let one ask, am I for that reason another person because I cannot think the same thought twice with the same molecules? Does the thought change because the oxygen engaged in the first act of thinking has entered into new chemical combination and is soon to be discarded from the system as waste? One knows that to answer this in the affirmative is like declaring that the significance of a word changes when it is written once in pencil and once in ink. And yet it is not easy to discover the grounds of such conviction. For there are other considerations than materiality which appear to go yet deeper, making us seek the position of the continuity which we suspect to exist, even at a lower,

more profound level. Says even Ernst Mach, whose achievements for psychology are by no means small: "It would hardly be possible for there to be greater difference in the egos of different men than appear in the course of a year in *one* man. When, to-day, I look back upon my early youth, if the chain of recollection were not present to my mind, I should have to believe (apart from a few special points) that the boy was another individual." These and a number of equally interesting observations leads him to declare that the "ego is a little absolutely permanent as are bodies." We are prevented, however, from assenting to this conclusion by the consideration that our ego is in reality more than a current of sense impressions, as Mach understands it. Some understand by such words soul, ego, personality, etc., mere states of consciousness, and Mach here appears to be among them. It is apparent that a difference in terms is here the underlying difficulty. When Mach denies the independence and permanence of the ego, this is because he confuses the *consciousness* of the ego with the living ego itself. Our very knowledge is shaped by *our* independent work. Moreover, it is necessary to call particular attention to the fact that above and beyond all intellectual processes there develops an inner life, a life which exhibits, in spite of all manifoldness, a permanent character, persisting through all changes and movements. Right through all his work and the complexities of his development man has always drawn further and further away from the mere life of his senses. He has more and more converted outward events into inner experience; more and more resisted the mere influx of sensations. And all this is no mere intellectual phenomena. It is the unfolding of a rich actuality, the nearest and surest of which we have any knowledge; and this alone teaches us how mentally to shape and reshape our sense impressions. There is thus a unity of a spiritual kind which persists with living force in the face of all the changes and obscurations of consciousness, as in sleep. As opposed to Mach's dissipation of the "ego," there are thus experiences of the spiritual life which corroborate Goethe's conviction:

"Und keine Zeit und keine Macht zerstückerl  
Geprägte Form, die lebend sich entwickelt."

Which may be freely translated

"And neither Time nor Might dissolves  
Identity that life evolves."

But let us examine yet a little more clearly. We have alluded to the familiar fact that material particles of living beings are constantly changing. In anyone's body there persists no sameness of substance whatever. The identity of a living being is not maintained through the presence of a soul-monad, but through the preservation of its *form*. By life we understand organization. By soul we understand the *form* of an organism. Mind, spirit, soul, ego, are synonyms. We speak of soul when we emphasize the sentiments of a man; of mind when we refer mainly to man's rational powers; of spirit and ego when thinking of the significance and character of thought without reference to bodily conditions. That which pertains to soul is called psychical; that which has meaning is called spiritual; that which characterizes intellection is called mental. All the many subcon-

scious and conscious memories which form the elements of our mentality are definite traces of former sense-impressions, reacting upon new sense impressions and embodying sentiments, and thoughts, the forms of which are preserved in the cerebral system, the substance of which is constantly changing. But man's personal identity consists not in any way in an identity of material particles, but in the sameness of soul-form which is preserved by the continuity of his existence. This we think is the whole secret of personal identity.

**IDES**, one of the threefold divisions of the Roman month. See CALENDAR.

**IDIOCY**, that condition in which there is permanent mental deficiency which has resulted from a disease or deficiency of development of the brain either before or at the time of birth or at an early period of life. It is thus academically distinguished from a psychosis, which is a condition of mental disturbance occurring in the developed brain. Idiocy is a term of very wide applicability owing to the fact that very many grades of arrested development occur. In a general sense it is applied chiefly to the worst of these forms, while the term imbecility is used to denote the milder forms. The distinction between idiocy and imbecility is thus a somewhat arbitrary one, for the two conditions shade into each other by almost imperceptible degrees. An idiot is unable to attend to himself; an imbecile may.

**Causes.**—The causes which result in idiocy and imbecility are often very obscure. A large proportion of cases are congenital; that is, they arise from causes acting *in utero*. The child is born with a brain already hopelessly impaired. Heredity is thus a very evident cause; defects in the ancestral stock and vices in the parents and near progenitors are doubtless very active. Alcoholism, syphilis and other chronic poisoning, chiefly lead, are certainly among these causes; as well as consanguinity and various diseases in the parents. Injuries to the mother while pregnant may be responsible. The subject of ante-natal disease is still a very obscure one, but evidence is not lacking to show that the fetus may suffer from disease; and in the critical stage of development of the brain before birth this organ may suffer irreparable damage. The same may be said of the infant and very young child. Injury and disease may act most disastrously upon the undeveloped brain. Thus blows upon and injuries to the head may cause idiocy; also injuries at the time of birth, due to difficulties in the labor, may act. The various infectious diseases of childhood are responsible for some cases; thus scarlet fever, measles, whooping cough and cerebro-spinal fever have been noted as causes of permanent arrest of development. No doubt in many cases it is difficult or even impossible to detect the active cause.

The following are the most universally recognized varieties of idiocy:

**Microcephalus.**—In this form the brain and its enveloping skull-case remain abnormally small. In extreme grades the deformity is very striking. These are among the lowest and worst forms of idiocy, and in some cases there is scarcely a spark of intelligence. The patient cannot be said to do more than vegetate. The original cause probably acts in these cases at a

very early period in the ante-natal life, and determines an almost complete arrest of brain development.

**Hydrocephalus.**—In this form the natural cavities or ventricles of the brain become enormously distended and the skull is correspondingly enlarged. The mental impairment varies within wide limits. In some cases the idiocy is almost if not quite as great as in microcephalus, but in other cases a fair degree of intelligence is preserved. There may be also various forms of paralysis, speech defect, epileptoid seizures and impairment of the special senses. Hydrocephalus probably depends upon closure of one or other of the outlets of the cerebro-spinal fluid between the ventricles of the brain.

**Porencephalus.**—Occlusion or stoppage of one of the main arteries of the brain at an early period of development, not necessarily ante-natal, may cause such an arrest of development of a portion of the brain-mass that a cavity results, and this is called porencephalus. Such a stoppage of an artery may be caused presumably by injury or by one of the infectious diseases. The symptoms are usually arrest of development of the mental faculties in various degrees, speech defects, paralysis, such as hemiplegia, athetoid movements and epilepsy.

**Mongolian Idiocy.**—In some cases the patient bears a real or fancied resemblance to certain racial types, as the Negroid, Mongolian, etc. The latter of these is the best marked, and is now included (after Langdon Down) in most descriptions. The patient's head is deficient in the posterior region; he is of short stature, has oblique and widely separated eyes and a flattened nose. The attempt is made by some writers to construct special mental features for the Mongolian idiot, but with not very great success. He is simply an idiot, with varying degrees of mental power, and his resemblance to a Calmuck is only accidental.

**Paralytic Idiocy.**—In the fœtus and in the infant and very young child certain accidents or diseases may cause cerebral hemorrhages, which, just as in the adult, cause in turn various kinds of paralysis. The most common are hemiplegia or paralysis of the arm and leg on one side; diplegia, or paralysis of both arms and legs; and monoplegia, or paralysis of one limb. Such an accident in early life is apt to cause more or less idiocy or imbecility in addition to the paralysis. Some of these patients also have epileptic attacks.

**Epileptic Idiocy.**—A rather large proportion of feeble-minded children also have epileptic attacks. This symptom may be associated with paralysis of various kinds, as already said, or it may not be complicated in any way with marked physical defects. It is only too likely, however, to induce a progressive mental deterioration; or, to speak more accurately for some cases, to prevent a normal brain development. The epileptic child is usually feeble-minded—some more, some less.

**Sensorial Idiocy.**—In some cases the organs of sight or hearing, or both, may be defective or undeveloped, and the child's brain does not develop normally merely because it is deprived of these important avenues of sensation. Such children may have more brain capacity than at

first appears, and they can be educated. In some cases, however, as in some deaf-mutes, the mental faculties remain more or less undeveloped.

**Genetous Idiocy.**—Ireland, a well-known authority, proposes this term for a certain class of congenital idiots, but it is not very distinctive. It includes feeble-minded children, usually of a rather low grade, who are born with undeveloping brains. The term really applies to many members of the other groups already referred to.

**High and Low Grade Idiots.**—These terms and intermediate ones are often applied merely to designate feeble-minded children according to the approximate degree of their lack of development. While lacking in scientific precision, such terms denote conveniently various grades of idiocy. There are many idiots who are not microcephalic, nor hydrocephalic, nor Mongolian, nor paralytic, nor epileptic, nor in fact to be included in any usually accepted class, and yet they are unmistakably idiots, and often of low grade. The truth is, that all classifications must remain unsatisfactory until we know more about the causation and pathology of the various forms.

**Cretinism.**—A highly specialized form of idiocy is cretinism. This is always associated with defect in the thyroid gland; sometimes this gland is entirely absent, in others it is immensely hypertrophied, and thus practically destroyed. Cretinism is endemic in some countries, as in and about the Alps and Pyrenees. The cretin is both physically and mentally stunted. He is of low stature, of peculiar and characteristic physiognomy, of pale and unhealthy skin, usually beardless, sometimes sexually undeveloped, and with many defects in the skeleton and muscular system. Mentally he is usually an imbecile at least, and in some cases even quite idiotic. Cases vary very widely, however, in the degree of feeble-mindedness. In the United States cretinism is only sporadic.

**Pathology.**—As already indicated, idiocy is due to a wide variety of causes, and therefore its pathology also varies extensively. Among the processes found in the brains of idiots are sclerosis, atrophy, porencephalic defects, old inflammations, occluded and destroyed blood vessels, distended ventricles and thickened membranes.

**Treatment.**—In recent years the effort has been made to train and educate the feeble-minded child, and to develop in it as far as possible the defective mental faculties. Training schools for these patients now exist in this country and in Europe, and the most humane and enlightened efforts are being put forth to ameliorate the condition of these unfortunates, and to render the more hopeful of them useful members of society. It is needless to say, however, that not much can be accomplished with feeble-minded children of low grade, and with the very lowest nothing whatever can be done. With the imbecile and demi-imbecile, however, the results obtained sometimes justify the pains and expense. For the vast majority of feeble-minded children asylum treatment is desirable, even indispensable. These unfortunate patients cannot associate with healthy children, and they require a special environment. The prospect for cure in most cases is quite hopeless.

Cretins may be cured by the use of thyroid gland. See also *INSANITY*.

**Bibliography.**—Brush, 'Idiocy and Imbecility' (in Keating's 'Cyclopedia of the Diseases of Children' Vol. IV, 1890); Ireland, 'Idiocy and Imbecility' (1887); White and Jelliffe, 'Modern Treatment of Nervous and Mental Disease' (1913), and 'Diseases of the Nervous System' (3d ed., 1914); Seguin, 'Idiocy, and its Treatment by the Physiological Method' (1866); Tuke, 'A Dictionary of Psychological Medicine' (1892).

**IDIOM**, id'yŭm, a form of phrasing or terminology peculiar to a language. Its basis is in popular usage rather than in grammatical or logical construction. The same term is applied to a dialect or general variation of a language. Idioms are not capable of literal translation into other languages, e.g., the French "ça m'est égal" is rendered by the English idiom "it's all the same to me."

**IDIOSYNCRASY**, id'io-sin'krā'si, any individual peculiarity, either mental or physical. Such peculiarities are frequently a sign of abnormality or insanity, such as a peculiar arrangement of one's dress, pronounced antipathy to certain persons, constant obsession that attempts are being made to poison one, etc. Physical peculiarities arise mostly from abnormalities in the metabolic system of the individual, such, for instance, as a rash caused by eating a small quantity of strawberries, lack of response to certain stimulants, medicines, etc.

**IDIOT**. See *IDROCY*.

**IDITAROD**, ē-dē'ta-rōt', Alaska, a mining town, located in the region of the Iditarod and upper Innoko valleys, 510 miles distant from Seward. It is a prominent gold-mining centre and has wireless telegraphic communication.

**IDO**. The artificial language known as Ido had its origin in the work of the *Délégation pour l'Adoption d'une Langue Auxiliaire Internationale*, founded in 1900. The Delegation devoted seven years to an examination of more than 60 schemes for an artificial language and in 1907 appointed a working committee of 16 eminent representatives of all important language groups with the object of summing up the previous work of the Delegation and adopting an international auxiliary language capable of serving the needs of science, commerce and general intercourse. The committee, after exhaustive consideration, decided to adopt in substance the Esperanto (q.v.) of Dr. Zamenhof, because of its many excellencies, but with certain important alterations, the chief of which were: (1) the replacement of certain letters requiring special type by Latin letters, thus allowing the language to be printed anywhere; (2) suppression of certain useless grammatical rules in regard to the invariable use of an accusative form and concord of adjectives; (3) regularization of word derivation, in order to make the language a more fit instrument for the expression of exact thought; (4) enrichment of the vocabulary by all words necessary to translate exact ideas, in accordance with the principle of maximum internationality. The initiation of most of these reforms was chiefly due to Marquis L. de Beaufront, the Saint Paul of the Esperantist movement, who submitted them to the committee in a pamphlet

under the pseudonym of "Ido" (i.e., a derivative) and which were voted on and unanimously adopted without knowledge as to the author. Rapport was attempted with the leading Esperantists in the hope that they would carry out these necessary reforms. The Esperantists, however, then at the height of their success and for certain practical reasons, refused to consider any changes. There was then formed the *Uniono di la Amiki di la Linguo Internaciona*, with an academy for linguistic study and a directing committee, composed of such eminent scholars as the philologist, Otto Jespersen of Copenhagen, the philosopher and authority on international linguistics, Louis Couturat of Paris; scientists as L. Pfaundler of Graz, R. Lorenz of Zürich, and F. G. Donnan of Liverpool, with the famous chemist, William Ostwald of Leipzig, as president. A monthly journal, *Progreso* (Paris), was established under the editorship of Professor Couturat. The academy, with the criticism and suggestions of more than 100 other persons interested in the subject, continued the work along the lines laid down in the recommendations of the delegation committee and in 1914 had practically completed its labors. During the years 1915-16 there were printed the large revised Ido-French and Ido-German dictionaries and considerable work done on an English edition. Because in a formative period, no extensive propaganda of Ido has heretofore been attempted, yet the *Uniono* has received the adherence of several thousands and had brought about, prior to the war of 1914, the printing of about a dozen small journals in the language.

Ido is indebted to Prof. Otto Jespersen for the happy formula which best expresses its basic principle: "That international language is best which is easiest for the greatest number of men" (an adaptation of Bentham's famous ethical formula).

The vocabulary of Ido is made up by adopting as root-words that form of word most readily recognizable by the greatest number of Europeans and not merely by empirical selection, as in Esperanto, or by counting each language as of equal importance without reference to the numbers using it, as in *Idiom Neutral*. As a result, Ido is but the quintessence of existing European language without the unnecessary duplications, rules and exceptions. It can practically be read at sight by any educated European. To speak and write it properly demands considerable study, because of the numerous idiomatic phrases which exist in all natural language, yet it is beyond comparison easier of acquirement than the like task of learning any foreign language. Because of the large proportion of Romance roots found in the English and the adoption of many Latin derivatives into the Germanic and Russian languages, Ido has a predominately Romance appearance. The spelling is phonetic, with an avoidance of double letters, difficult diphthongs and heavy accumulations of consonants difficult of pronunciation.

The grammar is entirely without the irregularities which make natural languages so difficult and is very simple, though sufficient for all logical demands. All nouns end in -o in the singular, -i in the plural; adjectives in -a; adverbs in -e; gender follows the natural method of the English; the verb is invariable

in number and person; the auxiliary verb *esas* is used for the passive and compound tenses of the active, *esas amata* (is being loved); *esas amanta* (is loving); the indicative present, past and future is formed by adding -as, -is, -os; conditional, -us; imperative, -ez; infinitive present, -ar; active and passive participle, -anta and -ata.

The logical system of word derivation is chiefly the work of Professor Couturat. One has but to learn the root word and a limited number of prefixes and suffixes in order to give grammatical form to any idea which the root word is capable of expressing, or from any one grammatical form to work back logically to the other forms. This system of word-building wonderfully simplifies and enriches the vocabulary, furnishing, as Professor Couturat states, "an instrument of precision for the analysis and exact expression of thought, which is very superior, from the point of view of logic, to our traditional languages, encumbered as they are by confused and ambiguous expressions."

The following sentence, translated from Lincoln's Gettysburg address, may serve to indicate some general differences between Ido and Esperanto. The Lord's Prayer which follows is written in Ido. Generally speaking, all consonants are pronounced as in English; the vowels having the values of a, as in father; e, as in vein; i, as in machine; o, as in soul; u, as in rule:

## ESPERANTO

Antan kvar dudektoj da jaroj kaj sep niaj praavoj kreis sur tia chi kontinento novan nacion, naskitan en libereco kaj dedichitan a la propozicio ke chiuj homoj estas kreitaj egaluloj.

## IDO

Ante quar duadeki e sep yari, nia avi genitis sur ica kontinento nova nacion, konceptita en libereco, e dedi-kita a ta principo, ke omna homi esas kreita egala.

## ORIGINAL

"Fourscore and seven years ago our fathers brought forth upon this continent a new nation, conceived in liberty, and dedicated to the proposition that all men are created equal."

## LORD'S PRAYER

Patro nia qua esas en la cielo, vua nomo esez santigata; vua regno arives; vua volo esez obediata, quale en la cielo, tale sur la tero. Nia singladi' panon donez a ni cadie; e remisez a ni nia debaji, quale anke ni remisas a nia debanti; e ne duktes ni aden la tenteso, ma liberigez ni del malajo. Amen.

**Bibliography.**—For the general problem, consult 'Histoire de la Langue Universelle' and 'Les nouvelles Langues internationale' (par Couturat et Lau, Paris 1907); for the Delegation, 'Conclusions du Rapport sur l'etat present de la Langue internationale' (par Couturat et Lau, Paris 1907); for Ido, 'International Language and Science' (Ostwald et al., London 1910).

L. H. DYER.

**IDOL**, in a sense now obsolete, or nearly so, an image (Greek *ειδωλον*) or likeness of anything; in later and chiefly present signification, any image or likeness of a deity used or designed as an object of worship. By extension the term has also come to be applied to anything which is an object of adoration or of supreme affection or regard. The Eastern custom of making statues of highly revered religious teachers has led many to conclude that the figures of Buddha, Brahma, Vishnu, etc., are idols, subject to worship. This is an error. Max Muller says: "The religion of the Veda

knows no idols. The worship of idols in India is a secondary formation." It may be questioned whether the images of various savage or half-civilized tribes, as the totem-poles of our American Indians, are strictly idols. However, they become such when the popular idea places them in the position of God and they are worshipped as deities. (See next article).

**IDOLATRY**, the worship of idols in any sense; in the restricted usage ordinarily observed, it is the worship of the Deity or of a deity under a visible form; and from the point of view of the Christian, or any other religion which rejects the worship of images, consists in worshipping as God what is not god. With regard to the origin and character of idolatry, there is a wide divergence of opinion. The Christian religion conceives idolatry as a declension from the one true God, sees in the various forms of heathen worship only more or less complete degradations of an original revelation and ascribes to it the same origin as to sin. Some philosophical and historical writers on the other hand see in idolatry an innate searching after God and accordingly the first stage of human development, the necessary beginning of a knowledge of God. Idolatry may assume various forms. One nation seeks its god in the powers of nature, worships the heavenly bodies and the elements and creates for itself a nature-worship; another develops a hero-worship and a third has merely an animal and image worship, the lowest form of which is fetishism (q.v.). To this last and rudest form of idolatry, that consisting in animal and image worship, the name of idolatry is sometimes confined. See IMAGE WORSHIP.

**IDRIA**, *ē'drē-a*, Austria, town in the Crownland of Carniola, 25 miles west of Laibach. It is important as a mining-centre for quicksilver since 1497. Since 1580 the mining has been controlled by the state, which in normal times has limited the output to an average of about 500 tons a year. The town contains a bobbin factory, a factory for electric equipment and at trade school. Pop. 16,876.

**IDRISI**, *id'rē-sē*, or **EDRISI**, **Abu-Abdallah Mohammed**, Arabian geographer: b. about 1090; d. about 1160. He studied at the Moorish University of Cordova, traveled through various countries bordering on the Mediterranean, visited France and England and was then invited to the court of Roger II of Sicily, where he resided under the patronage of Roger and his successors till his death. He constructed at the request of Roger a terrestrial globe of silver, on which the figure of the earth was shown with as much accuracy as the state of geographical knowledge then permitted. He accompanied this with a descriptive treatise bearing the title 'Nuzhat Almushtāk,' completed about 1150. An old manuscript of this work was discovered at Paris in 1820 and published in a French translation by Jaubert. The Latin translation 'Geographia Nubiensis' (Paris 1619), is considered more reliable. Under the title of 'L'Italia,' Schiaparelli and Amasi published an Italian translation of a part of it in 1883. Two of Idrisi's original MSS. are in the Bodleian Library at Oxford and two in the Bibliotheque Nationale at Paris. Idrisi's fame grows with the years, as he appears the first to have recognized and recorded

the sphericity of the earth. Consult Brockelmann, 'Geschichte der Arabischen Litteratur' (1898).

**IDUMÆA.** See **EDOM**.

**IDYA**, a name of Britannia, long a favorite with the poets.

**IDYL**, or **IDYLL** (from a Greek diminutive meaning a "little form or image"), a short and highly finished descriptive poem, especially if it treats of peaceful and pastoral subjects. It is a complete picture in small compass and may refer to a great variety of subjects and is frequently pastoral because pastoral life, at once simple and picturesque, affords the best material for such short descriptive poems. The term is indefinite, even prose and pictures having been termed idyls. The 'Idyls' of Theocritus and the 'Idyls of the King' by Tennyson (1859) are conspicuous examples of the use of the term. Any one who has read these will grasp a fuller conception of what pictures in verse or prose are best entitled to be called idyls. It is an error to assume that idyl is as definite a descriptive term as epic or eclogue.

**IDYLLS OF THE KING, The.** 'The Idylls of the King' may be called Tennyson's greatest work because the poem occupied much of his time for all his literary life, because it presents in pictorial form ideas which in Tennyson's mind lay at the bottom of modern life and of his own thinking, and because it is expressed in the beautiful blank verse of which he was a master. "We know not of a nobler subject; we know not where to look for one who could have more nobly thought it out" wrote Dean Alford at the time of the poem's appearance. In 1833 Tennyson wrote 'Morte d'Arthur,' now a part of 'The Passing of Arthur,' and in 1859 he published 'Enid,' 'Vivien,' 'Elaine' and 'Guinevere,' poems on topics drawn from the Arthurian cycle, but apparently without thought of more unity than came from the contrast of the different characters. In 1869 these pieces were republished with several others in the form of a complete poem. Minor changes were made even as late as 1885 when 'Balin and Balan' was added. These different idylls, finally 12 in number, are grouped into one poem not only by their presentation of the same world of men and women but by their development of a single action, the rise and fall of the power of King Arthur, the legendary hero of England. In Arthur, however, Tennyson says he has in mind not the figure of ancient folk-myth, nor even the legendary hero of Geoffrey and Mallore, but a figure indicating "sense at war with soul." This symbolic under-meaning gives further unity to the poem. Arthur stands for the human soul in its strife with the evil of the world. It comes from no one knows where, is united to the body, strives, conquers and in time finds the world too much for it and passes away no one knows whither. These symbolic conceptions are most common in the poems written after the poet had conceived the general idea of his work. A minor form of unity is given by the indication of the mystical year: Arthur is born New Year's night; is married in May; the adventures of Gareth, the type of his knights, is in early spring; the quest of The Grail in full summer; the Last Tournament is

in autumn; and Arthur passes from earth on the last night of the year. The poem gives a decorative panorama of the legend-cycle of King Arthur, which is the English national epic material. As each succeeding century presents the old stories in the form of its day so Tennyson's figures in the 'Idylls' are ideal conceptions of the 19th century. The blank verse in which the poem is presented is one of Tennyson's great achievements and the figured poetry is also characteristic of the poet. Not only have we true picture, but abundance of pictorial figure and pictorial suggestions. The poem has delighted the most naive story lover and the most earnest seeker after ideas in poetry. Studies of the 'Idylls' will be found in most books on Tennyson, but they are more particularly treated in the books on the 'Idylls' by H. Elsdale (1878); H. Littledale (1893); M. W. Maccullum (1894); C. B. Pallen (1904); and L. Dhaleine (1905). An authoritative and contemporary criticism is that of Dean Alford in the *Contemporary Review* (Vol. XIII, 104). This, with another, Tennyson himself considered the best reviews of the 'Idylls.' He himself did not care to have his symbolism pushed too far, chiefly because he did not like to have his very concrete poems made into a series of abstractions. He said that the "thought within the image" was more than any one interpretation. The 'Life of Tennyson' by his son (Vol. II, chap. V) gives the poet's own thoughts on his work.

EDWARD EVERETT HALE.

**IDYLS OF THEOCRITUS, BION AND MOSCHUS.** See **THEOCRITUS, BION AND MOSCHUS, IDYLS OF**.

**IDZU**, é'dzoo, Japan, a province of the empire on the so-called Eastern Maritime Circuit, or Tokaido, formed of a hilly peninsula bounded on the east by the Bay of Sagami and west by the Bay of Suraga. It is about 32 miles long and about half that in width. It is traversed by the Kanogawa. The highest mountain of the peninsula is Amagisan, which rises to a height of 4,800 feet. Silk-worm culture and allied industries form the chief occupation of the inhabitants. There are numerous hot springs and watering places. Mishima is the chief town and Shimoda the chief port. Consult Reim, 'Japan' (London 1884) and Satow and Hawes, 'Handbook for Travelers in Central and Northern Japan' (Yokohama 1881).

**IERNE**, i-ér'ne, a name of Ireland (Eire, Hibernia, Juverna), found in ancient Greek writers.

**IFNI**, éf'nē, Morocco, a seaport, situated opposite the Canary Islands on the west coast. Since 1883 it has belonged to Spain. Pop. 6,000.

**IFUGAO**, í'foo-gou', a tribe of northern Luzon, Philippine Islands. They are of Malay origin, are head hunters and practise tattooing. They are noted for their expertness in agriculture, to which their rough hillsides are but ill-adapted. They have terraced the mountainsides more than any other native people and their plots are watered by an ingenious irrigation system. They are good woodcarvers and work iron and steel.

**IGBARA**, ěg'ba-ra, a negroid people of the Sudan. See FULAH.

**IGLAU**, ěglou, Austria, town of Moravia, on the Iglawa, 55 miles northwest of Brünn, on the border of Bohemia. It contains a Rathaus, several ancient churches, military barracks and a cloth hall. It is an important industrial centre, with woolen and cloth manufactories, spinning factories, dye works, cigar factory, furniture work, tanneries, shoe factories, potteries and sugar mills. It has a good trade in the products of all these establishments and also in lumber and agricultural products. Until the Thirty Years' War it was a silver-mining centre, but in that conflict it suffered greatly, being twice occupied by the Swedes. Pop. 38,369, including about 4,000 Czechs.

**IGLESIAS, José María**, ě-glā-sě-ās, Mexican historian and publicist: b. City of Mexico, 5 Jan. 1823; d. 1891. He studied law in the University of Mexico, was appointed professor of jurisprudence there, became Secretary of Justice in 1857, and, after service as head of the Treasury Department, again held the post in 1853-67. In 1868 he was elected to Congress, in the same year was appointed Secretary of the Interior, in 1873 chosen president of the Supreme Court. After the fall of Lerdo de Tejada, he established a government which soon yielded to the superior power of Diaz. His publications include 'Apuntes para la Historia de la guerra entre Méjico los Estados Unidos' (1852); and 'Revistas históricas sobre la Intervención Francesca' (1870).

**IGLESIAS, Miguel**, Peruvian military officer: b. Cajamarca 1822; d. 1901. After the usual career in the army passing through the various grades he became Minister of War in 1880. In the following year during the war with Chile he made a heroic defense of Lima against the invaders. He was made prisoner, but effected his escape. He agreed to cede the southern provinces of Peru to Chile provided she would withdraw from the rest of Peru. In 1883 he became President of Peru and late the same year concluded the Treaty of Ancón with Chile. Political opposition to the treaty was very strong, however, and the party of General Caceres forced an agreement from Iglesias under which both retired pending an election. Caceres was elected and Iglesias quitted Peru.

**IGLESIAS, Pablo**, Spanish Socialist leader: b. Coruña, 1850. He became a printer and from his 18th year was prominent in trades union circles, which in Spain were of their very nature Socialistic. He was elected to the federal council of the Spanish International in 1871 and was a member of the staff of the Socialist paper, *La Emancipación*. In 1878 he was one of the founders of the Socialist Labor Party and subsequently served as chief of the Printers' Association and the Federation of Typographers. In 1885 he became editor of *El Socialiste*, the official organ of Spanish Socialism and for over 30 years labored strenuously to advance the position of his party. He was elected to the Cortes in 1910 and three years later became head of the Central Labor Union.

**IGLESIAS**, Sardinia, a southern city and episcopal see. The cathedral built by the Pisans dates back over 700 years. Mines of zinc and

lead furnish the city's chief industries. Pop. of city 10,411; of commune 20,000.

**IGLOO**, ig'loo. See ESKIMO.

**IGLOOLIK**, Canada, a small island in the Arctic Ocean, near the east end of Fury and Hecla Strait in lat. 69° 21' N. and long. 81° 53' W. It is noted as the place where Parry wintered in 1822-23.

**IGNACIO**, ěg-nā'thě-ō, José de Jesu María, German Jesuit: b. Paderborn, 1721; d. 1780. His family name was Herman Loessing. After some years in the Jesuit order he was appointed professor of rhetoric and philosophy at the College of Old Mexico. For over 10 years he collected antiquities, inscriptions, etc., of the ancient inhabitants of Mexico, which he brought back with him to Europe. In 1768 he was appointed librarian to the archbishop of Cologne. His published works include 'De Arte Hieroglyphum Mexicanorum' (1774); 'Historia Novæ Hispaniæ' (1777); 'Reisen in Neu-Spanien' (1778); 'Historia Regni Aztecorum' (1780); 'Cosmographia' (1780).

**IGNACIO** (ěg-nā'sě-oo) ISLANDS, Mexico, a chain of islands in the Gulf of California, off the Bay of Topolobampo, in the state of Sinaloa. The chief are Macapule and Altamura.

**IGNATIEFF**, ig-nā'tyěf, Nikolai Pavlovitch, COUNT, Russian military officer and diplomat: b. Saint Petersburg, 29 Jan. 1832; d. 1908. In 1849 he received his commission as an officer in the Guards, took part in the war in the Crimea and in 1858 reached the rank of major-general. As diplomatic representative of the tsar he concluded the Treaty of Aigun with China in 1858; was subsequently sent to Bokhara, and in 1860 was named Minister Plenipotentiary to Peking. In 1863 he became chief of the Asiatic department of the Ministry of Foreign Affairs and from 1864 to 1877 was Russian Minister to Turkey. He did much to bring on the war of 1877 between Russia and Turkey, by fomenting agitation among the various Balkan peoples subject to the sultan. He was eclipsed for a time by his opponents but in 1881 he was appointed Minister of the Imperial Domains and later of the Interior. He persecuted the Jews relentlessly. He was dismissed from office in 1882.

**IGNATIUS**, ěg-nā'shĭ-ūs, Father. See LYNNE, JOSEPH LEYCESTER.

**IGNATIUS OF ANTIOCH**, Christian bishop and martyr: b. Syria, c. A.D. 50; d. Rome, A.D. 110-117; was called in Syriac *Nurona*; and probably received at baptism his second name, Theophorus, "the God-bearer." Of his early life nothing is certain. Origen, 'Homil. vi in Luc., sec. 1,' speaks of him as the second bishop of Antioch after Peter. Theodoret, 'Epist. 151,' says that "Ignatius, who is known far and wide, received the high priesthood by the right hand of the great Peter." The 'Chronicon' of Eusebius, in Saint Jerome's revision, groups Ignatius of Antioch with Papias of Hierapolis and Polycarp of Smyrna as disciples of John the Evangelist. The Martyrium Ignatii, accepted as historical by Pearson and Ussher but rejected by Lightfoot, is copious in its details of the martyrdom of Ignatius. The authentic letters of the martyr

give the following account of the journey to martyrdom. Ignatius was condemned to death (Ephes. 12, Trall. 3, Rom. 4), and sent to Rome "to make a Roman holiday." He made no appeal to Cæsar, as had Saint Paul. His chief desire is that no appeal be made in his behalf (Rom. 1, 2, 5, etc.). Likely the cause of the journey to Rome was merely the clamor of the Roman populace, during Trajan's reign, for the butchery of men as well as beasts in the arena. The martyr probably set sail from Seleucia, the port nearest to Antioch. His guard of 10 soldiers gathered in other victims as they proceeded toward Rome. The route was across Asia Minor, from a Cilician or Pamphilian port, to Philadelphia, on to Sardis, and thence to Smyrna. Here Ignatius was received by his friend Polycarp, and met by delegates from the churches of Ephesus, Tralles and Magnesia. During this stay at Smyrna, the letters to the Ephesians, the Trallians, the Magnesians and the Romans were written. The guards seem to have been a brutal set. Ignatius speaks of them as "ten leopards" (Rom. 5); and says he "has been fighting with wild beasts." From Smyrna the prisoner was taken to Troas, where he wrote his letters to Philadelphia, to Smyrna and to Polycarp. From the letter of Polycarp to the Philippians, we learn of the martyr's stay at Philippi; and of the request made by that church for the letters of Ignatius. To this request and Polycarp's compliance, is probably due the first collection of the seven authentic Epistles of Saint Ignatius. His martyrdom is witnessed to by Origen, Homil. in Lc. vi; and is assigned by Eusebius, (*Historia Ecclesiastica*, iii, 36,) to the reign of Trajan. Seven of the Epistles of Saint Ignatius are now quite generally admitted to be authentic, those to the churches of Ephesus, Magnesia, Tralles, Rome, Philadelphia, Smyrna and to Polycarp. These are the collection witnessed to by Eusebius, Saint Jerome and many later Fathers, and admitted by such critics as Lightfoot, Harnack, Zahn and Funk. Of doubtful authenticity are the letters to (1) Mary of Cassobola; (2) Hero, deacon of Antioch; to the churches of (3) Tarsus, (4) Philippi, and (5) Antioch. Admittedly spurious are two letters to John the Apostle, one to the blessed Virgin Mary, and one from her to Ignatius. The Epistle to the Romans is chiefly personal. It reveals the writer's enthusiastic devotedness, intensity of personal love for Jesus Christ and ardent yearning for martyrdom. The other six authentic letters are chiefly doctrinal. They teach the divine institution of the Church as a visible society (Philad. 3), her unity (ib., Magn. 13), holiness (Eph. 9), catholicity (Smyrn. 8), infallibility (Philad. 3), hierarchical constitution and priesthood (Magn. 13, Eph. 9), together with the primacy of the Roman see (Rom., Introd.).

**Bibliography.**—The best editions of the Epistles of Saint Ignatius are: Zahn (1876); Funk (1901); Lightfoot (1889); Cf. Newman, J. H., 'The Theology of Saint Ignatius,' in *Historical Sketches*, I (1890); Gasquet, 'Saint Ignatius and the Roman Primacy' in *Studies* (1904).

**IGNATIUS' BEAN.** See SAINT IGNATIUS BEAN.

**IGNATIUS OF LOYOLA.** See LOYOLA, IGNATIUS OF.

**IGNEOUS** (ig'nē-ūs) **ROCKS**, the term applied in geology to those rocks the special structure of which is due to their having been once in a molten state, from which they were solidified into their present character. They include lava, basalt, granite (qq.v.), etc. Such rocks are not stratified, and may occur in connection with sedimentary rocks of any age, as the igneous rocks have usually been erupted from the heated interior of the earth and forced up toward, sometimes to, the surface. A detailed classification of igneous rocks is given in the section on *Igneous Rocks* in the article on **ROCKS**.

**IGNIS FATUUS**, ig'nīs fāt-ū'ūs (Latin *ignis*, fire, *fatuus*, foolish), an atmospheric light or a luminous appearance sometimes seen in swamplands, in churchyards and over stagnant waters. The light usually appears shortly after sunset; it is common in the north of Germany, in Italy, in the south and southwest of England, and the west of Scotland, and has been noticed in many other countries in undrained marshy districts.

The appearance generally resembles a flame; seen closely, the color appears as bluish, reddish, greenish or yellowish, merging into purple, but never a clear white. Sometimes the flame seems fixed in position, shining steadily close to the ground or a few feet above it; again, it appears in rapid motion, sometimes rising high in the air, at others separating into smaller flames, which are seen advancing, retiring, recombining, etc.

Some supposed appearances of the *ignis fatuus* are probably due to luminous insects, or to the phosphorescence of decaying vegetable matter. By setting all such possible cases aside, both fixed and moving *ignes fatui* have been proved to exist, although the spectrum of the light seems not to have been fully observed. The common hypothesis that *ignis fatuus* is the flame of burning marsh-gas,  $CH_4$ , is untenable, for although this gas is produced abundantly in many marshy places, it cannot ignite spontaneously. The more plausible suggestion that phosphoretted hydrogen,  $PH_3$ , which is spontaneously inflammable, might be produced in churchyards or marshes where there is decaying animal matter does not account for some of the effects observed. The early supposition of a phosphorescent vapor is more reasonable, although excepting that of free phosphorus, which could not occur in nature, no such vapor is known to exist. The phenomenon was undoubtedly more common a century ago than it is now, and its disappearance in many localities may be directly traced to the draining of fens and marshes.

Popular names for the *ignis fatuus*—Will-o'-the-Wisp, Jack-a-Lantern, Spunkie, etc.—abound in folklore, and the superstitions regarding it are connected with many stories of travelers mistaking the marsh-lights for those of cottage windows, and with tales of evil spirits deceiving men into dangerous places, often to their doom.

**IGNITION**, in gas engines, the firing of the explosive mixture of gases—in the cylinder

of the reciprocating engine; in the pressure chamber of the rotary engine. In the earliest types of gas engine ignition was accomplished by an outside flame kept burning before a slide door, which was opened when the cylinder had been charged. After compression of the gases was introduced, the ignition was secured by a platinum tube projecting into the cylinder, and heated red-hot by an outside flame blown into it. In the modern gas engines ignition is accomplished by a "fat" electric spark, produced either by a battery, a magneto, or a small dynamo. There are two systems of electrical ignition: the "jump-spark," or high tension system; and the "make-and-break" or low tension system. In the first, the electric current is taken into the cylinder through a "plug," at the inner extremity of which is a break, or "gap" in the continuity of the metal conductor, across which gap the current is forced to leap. This gap ranges in width from one-third inch where a coil is used in the circuit, to one-sixty-fourth inch where there is no coil. The fact that the explosion of the gaseous mixture is not actually instantaneous, but requires an appreciable time, has led to the use of two sparking plugs in cylinders of large capacity. In this case one of the plugs is a double pole member, and the firing current is sent first through this, going afterward through the ordinary plug. A gain of power ranging as high as 30 per cent has been noted as a result of this double firing.

The make-and-break system is in use chiefly in small marine or motorboat engines. Within the cylinder are two polar extremities of the battery conductor, and one of these is moved by a mechanism outside of the cylinder, so as to make contact with the other, and this contact is immediately and suddenly broken, when a spark is produced. This method does not require as strong a current as that necessary to make the leap across the gap in the spark plug, but with a coil in the circuit the spark is big enough and hot enough to be entirely dependable. See AIRPLANE ENGINE; AUTOMOBILE ENGINE; INTERNAL COMBUSTION ENGINE.

**IGNITION SYSTEMS.** See INTERNAL COMBUSTION ENGINE.

**IGNORANCE OF THE LAW.** Every person is presumed to know the laws of his own country, and what is termed ignorance of the law is a lack of understanding of those laws. Such want of understanding furnishes no excuse for their violation and cannot be pleaded even in extenuation of their infraction. But this presumption does not extend to the municipal laws of countries or states other than that in which a person resides. Such laws are regarded as foreign and a knowledge of them on the part of one who disregards them must be established by proof in the same manner as any other facts are proved. This applies only to a non-resident of such foreign state, and as soon as a person becomes even a temporary resident thereof he is presumed to know its laws and to yield obedience to them. He cannot plead his want of opportunity to become acquainted with them.

**IGNORANTINES** (*Fratres Ignorantiae*). See BROTHERS OF THE CHRISTIAN SCHOOLS.

**IGOROT**, Țgō-rōt, the inhabitants of the districts of Bontoc, Benguet, Lepanto and Amburayan of northern Luzon. They live by agri-

culture and practise irrigation. Their dwellings are always found in groups and are roofed with grass or huge leaves. The Bontocs are head hunters. The total number of Igorots is placed at 211,500. Consult Jenks, 'The Bontoc Igorot' (Manila 1905). See PHILIPPINE ISLANDS.

**IGOR'S** (ē'gōrz) **MARCH**, Song of, an antique battle song, associated with the name of Igor, Prince of Novgorod, son of Prince Swajatoslaw II of Tchernigof. Igor in his 51st year is recorded to have engaged in an unsuccessful war with his neighbors (1202), and from that time has been looked upon as the national poet of old Russia, on account of a lyrical epic poem, or ballad, called in Russian, 'Slavo o Polku Iгореve' ('The Song of Igor's March'). It has come down to modern times, somewhat like the songs of Ossian. The poem was probably produced by one of the followers of Igor, and in 1795 was found by Count Alexis Mussin-Putckin in a cell of a monastery in Jaroslav. It was discovered among some 14th century MSS., and was first published by the Count at Moscow in 1800. The original was lost in the fire of the Napoleonic campaign (1812), which destroyed the Count's fine library. Another copy with many variants was found in 1864 among the papers of Catharine II and published at Saint Petersburg the same year. It has been translated into several European languages. Consult Wolfsohn, 'Schönwissenschaftliche Litteratur der Russen' (1843); Wjasemski, 'Bemerkungen zum Igorlied' (1875).

**IGUALA**, or **IGUALA DE ITURBIDE**, ē-gwā'la dā ē'toor-bē'dā, Mexico, town of the state of Guerrero. It is the largest town of Guerrero and is located in a thriving agricultural region, also remarkable for its silver mines, which have been worked from the earliest days after the advent of the Spaniards. Here on 24 Feb. 1821 Iturbide announced the Plan of the Three Guarantees, known also as the Plan of Iguala. The town was severely shaken by an earthquake in 1907. Pop. 8,195.

**IGUALADA**, ē'gwā-lā'dā, Spain, city in the province of Barcelona, on the Noya, 45 miles northwest of Barcelona. It is located in a mountainous region, but the surrounding land is fertile nevertheless. It is surrounded by the ruins of its ancient walls, being once a strongly fortified place. The Benedictine monastery of Montserrat is in the neighborhood. Cotton, linen and other cloths are manufactured in considerable quantities. Pop. 11,754.

**IGUANA**, i-gwā'nā, a large lizard of the typical genus of the family *Iguanida*. This family is distinguished by having pleurodont teeth, a thick, villous, nearly immobile tongue, a round pupil and by various skeletal characters. The 350 species belong to about 50 genera and, with the exception of a few in the Fiji Islands and Madagascar, are confined to America, in the warm parts of which they fairly swarm. Only one species (*Sceloporus undulatus*) reaches as far north as the Middle States. They vary greatly in appearance and habits; most are arboreal, many terrestrial, and one, the Galapagos *Amblyrhynchus*, is even marine; the majority eat insects, but some are herbivorous. The true iguanas, of which *I. tuberculata* is the best known, are rather widely distributed through the West Indies, Central and

South America. Owing to the high crest or fringe which extends along the back and tail, the deep, fringed, gular pouch, and the loose-fitting skin, these animals present a remarkable appearance. The trunk and tail are covered with small granule-like scales, and the head with larger plate-like ones; the feet are large and powerful; the tail very long, slender and compressed; and the teeth high and finely serrated. A length of five feet or more is commonly attained. The iguanas are arboreal, their mottled green color serving admirably to conceal them among the foliage; but when alarmed they have the habit, remarkable in a lizard, of retreating into the water of the streams along which they live. The 20 or 30 large eggs are deposited in a burrow usually dug in the bank of a stream or sometimes in a hollow tree. Notwithstanding its formidable size and aspect, the iguana is a timid, harmless creature, and the stories sometimes told of its ferocity are pure fabrications; moreover, it is purely vegetarian in its diet. The flesh is a favorite article of food with the natives, and many travelers have pronounced it to be white, tender and sweet, and is regularly brought to the markets. Consult Wallace, Müller, Bates, Belt, Gosse and other authorities on South and Central America. See LIZARD.

**IGUANODON**, a dinosaur (q.v.).

**IGUAZÚ**, é'gwa-soo', a river of Brazil, which takes its rise in Paraná, near the Atlantic seaboard and flows in a general westward direction for nearly 800 miles to its junction with the Paraná. For part of its course it separates the states of Paraná and Santa Catharina, and also Brazil from Argentina. Its lower course is broken by rapids and falls which render navigation impossible; among these are the great Falls of Iguazú, among the finest in the world. For long stretches of its middle course the river is navigable. Consult Bernárdez, Manuel, 'De Buenos Aires al Iguazú' (2d ed., Buenos Aires 1901).

**IGUVIUM**. See EUGUBINE TABLES.

**IHRE**, é'rë, Johan, Swedish philologist: b. Lund 1707; d. 1780. He received his education at the University of Upsala; subsequently made extensive travels in France and England, and became assistant librarian to the Swedish Academy of Science. In 1748 he was made professor of *belles-lettres* and political economy. The government gave him \$10,000 to compile his great work, the 'Glossarium Suiogothicum' (1769), which laid the foundation of Swedish philology. Many other works of his are extant, worthy in the form of academic disputations. The most valuable are those dealing with the gospels of Ulfilas.

**II KAMON NO KAMI NAOSUKE**, äë-ëë käh-mönë nō käh-mëë, näh-wō-sōō-këë, the Japanese statesman who succeeded in opening Japan to foreign trade and residence; b. 30 Nov. 1815; d. 24 March 1860. Descended from ancestors (987-1011), who served the Mikado in subduing the Ainu aborigines. At 27, Ii was made the 14th lord of Ii-dani (valley of Ii), whose predecessors occupied a castle in the fief assigned Iyeyasu (q.v.). On 25 Dec. 1850, he was given the title of lord of Hokoné, and on 4 June 1858, when the American envoy Townsend Harris (q.v.) was pressing the Yedo government for a commercial treaty, at a time

when internal politics were in turmoil, the shogun, a boy, and the Yedo and feudal systems decadent, Ii was made premier. Although the Mikado Koméi, and the Imperial Court at Kioto violently opposed the idea, the Lord Ii, with the example of India and China before him—the French and British fleets being then in the neighboring Chinese waters—took the responsibility and signed the American treaty, which was soon followed by others, with Europeans. With an iron hand, wielding the jailer's and the executioner's sword and without regard to name or rank, Ii overcame his most active opponents. He dispatched an embassy to the United States in the United States steamship *Powhatan* which, after arrival, made the tour of the American cities, being everywhere warmly welcomed and sumptuously entertained. On 4 March 1860, while on his way to the castle in a snow storm, a band of 18 ronin (q.v.) attacked his train. In the bloody battle that ensued, Baron Ii was beheaded and 29 men were killed or wounded. After a generation of obloquy and misrepresentation, Ii's name came to be held in universal popular reverence. The intensely strong opposition of the devotees of ultramikadoism long prevented a proper memorial to Ii from being reared in Tokio, where it should be; but in Yokohama a noble monument has been reared in his honor. His son was educated in Brooklyn, N. Y. Consult Alcock 'Capital of the Tycoon' (1863); Satoh, 'Agitated Japan: The Life of Baron Ii' (1896); Griffis, 'Townsend Harris' (1906), and, in fiction, Maclay, 'Mito Yashiki' (1889).

**IK MARVEL**. See MITCHELL, D. G.

**IKAO**, ë-kä'ō, Japan, a summer resort in the province of Kotsuke, 88 miles from Tokio. It is located on the slope of Mount Haruna and contains several hot springs to which great numbers resort for curative purposes.

**IKUNO**, ë-koo'nō, Japan, town in the prefecture of Hyogo, 35 miles northwest of Kobe. It is situated in a great silver-mining region, the mines being a government monopoly. Day and night shifts are employed. Some gold is also produced. • Pop. 3,000.

**IL CORTEGIANO**. 'The Cortegiano' of Baldassare Castiglione (1528) deals with the "formation of the perfect courtier." The author represents these dialogues as a social "game" actually played at the court of Urbino, presided over by the Petrarchistic genius of Cardinal Pietro Bembo and reckoned as the most elegant centre of fashion in Italy at that time. 'The Cortegiano' thus gives striking and authoritative portraits of leading personalities of the Italian Renaissance, and its vivid picture of society ranks, for scope and reliability, above the prefaces to Bandello's tales and even above the autobiography of Cellini. In central intent the volume has a narrow purpose: it is the handbook of the professional court gentleman, hard to distinguish from the perennial Italian adventurer. No inconsiderable portion of the maxims of Castiglione reflect that hard-headed materialism made so famous by Machiavelli in sociology and political theory. Castiglione is as free from delusions about human nature as the great Florentine secretary. He is equally expert in the psychology of malice. 'The Cortegiano' like 'The Prince' places sagacity above

## LIZARDS

other virtues. The courtier's business is to succeed in life, not by good intention, but by a triumph of wits. But upon this aspect of Castiglione's ethics, so typical of his race and period, the vast public which 'The Cortegiano' has reached through the centuries has been loath to linger. In a broader sense the "perfect courtier" has been taken as the model for any gentleman of the leisure class. The Italian tyrannies, in fact, of the early 16th century, reached the perfection of Italian social life at a time when Italy, assimilating the best that French and especially Spanish chivalry had to offer, was leading the world in good manners and setting to a large extent the standards of cultivated elegance that have ever since prevailed. 'The Cortegiano' is the code book of this refinement, less naively detailed than the 'Galateo' of Cardinal della Casa, but far more profound in theory; and specific enough in precept, as Castiglione elaborates his sound general premise that the fundamental problem of good form is to acquire a "sense of other people," to strike a just balance between self-assertion and regard for others. What most engages in Castiglione, aside from his personal traits of urbane composure, a kindly, good-humored and deferential condescension, is the passion for "fullness of life" both in action and in cultural attainment. His interlocutors frequently stand aghast at the demands they make on the ideal gentleman, and his partner, the ideal lady (Book III). The courtier must be expert in arms and statecraft, learned in "the two languages," a scholar and writer in his own tongue, accomplished, at least as connoisseur, in the fine arts, with some skill in music and a flawless training in dancing, games of chance and skill, hunting, athletics, as well, of course, as in conversation for all situations and people, in etiquette and the art of dress. Never was a book on manners so nobly and liberally conceived. For Castiglione would have his courtier incarnate the highest moral ideals and express the widest culture of his environment. In its review of the ethical, philosophical and æsthetic problems that preoccupied the cultivated people of its time, 'The Cortegiano' possesses an additional and very special interest, as reflecting the astounding general culture of the aristocrats of the Italian Renaissance. Among these discussions we may signalize the comparison of painting and sculpture (I), the richly illustrated analysis and classification of types of humor (II), the development of the "courtly" theory of the Italian national language, historically important (I), and the theory of contraries applied to social criticism (II). But decidedly the most famous portion of the book is the treatise on Platonic love put into the mouth of Bembo, himself the author of Platonic dialogues entitled 'Gli Asolani.' This theory of love is really a theory of knowledge: by love of the good and beautiful in woman or in man, we are brought to know and love the good and beautiful in universal divine forms. This "philosophy" of love may have a certain scientific basis in the relations of the religious and sexual instincts. But as a social fad, persistent through all the old régime, it was never more than a justification and a pretext for sensualistic idling and an excuse from serious thought on woman's status in society; though it did say many beautiful things on love and woman and

created a phraseology suggesting certain humane ideals. 'The Cortegiano' did as much as any other one book to spread these Platonic notions and remains one of the most typical expositions of this kind of pseudo-thought.

ARTHUR LIVINGSTON.

IL PÆSE DI CUCCAGNA. See PÆSE DI CUCCAGNA.

IL PASTOR FIDO. With the 'Aminta' of Tasso the 'Pastor Fido' of Battista Guarini (1538-1612) is associated as closely in the mind of posterity as their authors were associated in friendship and in the service of the House of Este at Ferrara. The success of the 'Aminta' was, in fact, Guarini's inspiration for writing his famous pastoral drama, which, if it never obscured the glory of its delicate predecessor, at least came to enjoy a fame just as wide and an authority even more unquestioned by the theorists of style and dramatic poetry in the following century. The success of the 'Pastor Fido' in this latter respect realized the author's predominant purpose in composing it. Guarini belongs to the age before him in his acceptance of the canons of Aristotelian poetics. He belongs to the age after him in the sense that he tried to criticize those canons, by demonstrating that the "kinds" of poetry recognized by the earlier criticism were not the only ones, and that other new ones could be invented though the inventor still remained faithful to the fundamental and unalterable principles of poetic imitation laid down by Aristotle. In its conception, thus, the 'Pastor Fido' was a work of ingenuity, aimed at proving that the tragic and comic elements, separated by Aristotle, could be "legally" blended in a new "species" of art to which the name "tragi-comedy" came to be applied. There is nothing remarkable, historically, about such a literary ambition. Poets before Guarini's time wrote dramas and epics to prove that the rules illustrated in the great classical poems could be applied to works in the modern national languages. Those of his day and after him went farther, and after discovering the new "genres" in theory each tried also to compose the enduring masterpiece which would illustrate the new laws and become the model for all successive imitations. The main obstacle to success in such attempts was the envy of competing poets. The 'Pastor Fido' made its way to the longed-for goal only after polemics which lasted for several decades, though the author enjoyed the unusual lot of surviving them and in his own life time witnessing the canonization of his poem.

What makes these old literary quarrels uninteresting now is that they view "plot" as the principal subject for discussion. They throw no light on what are now regarded as true literary values. Even Guarini's treatment of the 'Pastor Fido' itself, called by him the 'Handbook of Tragi-comedy,' has little value as an æsthetic interpretation. In the history of dramatic technique, considered from the modern point of view, the 'Pastor Fido' would be classified as a play of the strict Italian Renaissance tradition; the action is of little importance genetically. Faithful to the method of the Greeks, its dramatic method is to contemplate lyrically the psychological effects of the action, which is not produced by the psychological traits of the characters. As was true of the

'Aminta,' however, we may say of the 'Pastor Fido' that the sources of its interest to erudites is not the source of its permanence among the great works of literature. This is due, rather, to its intensified development of one of the traits of Tasso's play: its passionate sensuousness, gracefully veiled, and resting on a humor, equally delicate, which comes much less from the consciously comic element than from the playful mechanical nature of the whole world with which the pastoral deals. This trait endeared it to the idle and elegant aristocratic courts of the old régime. To it also people of the present time occasionally revert for a sip of that honeyed, melancholy and sophisticated refinement of licentious gallantry which passed away with the old world, as a fashion, though its moods are part of all human nature.

A very just appreciation of the 'Pastor Fido' may be found in Mr. Boulting's 'Life of Tasso.' There is a translation by Fanshaw (London 1676).

ARTHUR LIVINGSTON.

**IL PENSEROSO.** Some general remarks on 'Il Penseroso' will be found in the article on the companion poem 'L'Allegro' (q.v.). 'Il Penseroso' presents the contemplative or thoughtful mood or humor. We need not think of these sketches of mood or humor as representing different people; Milton probably recognized them both in himself, as many others may do. If he did, we must remember that the contemplative mood grew upon him with years and, indeed, was more nearly his real self. The poem begins by getting rid of "vain deluding joys." We need not think of these as the joys of the cheerful, active life celebrated in 'L'Allegro'; they are rather the extravagance of the active humor, just as the "loathed Melancholy" of 'L'Allegro' is not the contemplative mood expressed in the other poem, but an exaggeration or perversion of it. Next comes the address to the "Goddess sage and holy" whom he calls "divinest Melancholy." One reason for thinking that we have here the truly Miltonic mood is that this part of the poem is longer than the corresponding part in 'L'Allegro'; the poet has more to say, just as he has later in the poem. The thoughtful mood is accompanied by Peace, Quiet, Leisure, Contemplation. Then Milton gives an idea of the day's occupation; it is mostly taken up in reading and study, begun after the evening's walk and carried on far into the night, or even to the cloudy morning. By day the meditative man walks in the quiet grove or the studious cloister. In this poem Milton looks ahead, as he does not in 'L'Allegro' and sees the quiet and retired end of life, in which experience and wisdom have matured into something like the voice of God. As is noted of 'L'Allegro' the poem is an example of the classic or literary poetry, especially as thought of in the 17th century. The classic form and mythology together with the rather conventional idea make it seem old-fashioned to us. But it has the power and virtue of the true classic; it is always pleasing, never losing its power to appeal to the heart and mind. For editions see L'ALLEGRO.

EDWARD E. HALE.

**IL PIACERE.** See PIACERE.

**IL SIGNOR IO.** A tale rather than a novel, slight in form and in plot, 'Il signor

Io' ('Mr. Myself,' 1882), by Salvatore Farina, is one of the finest works of the Milanese novelist. Lit up by a gentle yet sympathetic humor, partaking both of the caricature of Dickens and the playful tenderness of Goldsmith, no more delightful picture of the petty domestic tyrant and unconscious egoist can be imagined than this Italian professor of philosophy, Marco Antonio Abate, whose love of creature comfort sacrifices first his wife and then his daughter to his gentle despotism. The first part of the novel is autobiographical. With a bland, almost childlike artlessness, Marcantonio's diary betrays his selfishness in unconscious self-indictment, a masterly portrayal of his egoism. In the subsequent part of the story, the lonesome father (his daughter long since driven from his heart and home) seeks solace in remarriage. With an unctuous humor the author shows Marcantonio under the assumed name of "Mr. I. O." advertising for a wife, alternately hoping and despairing as the replies come in, one of which by a trick on the part of the son-in-law brings about the reconciliation so inevitable in Farina's novels.

A past master in the portrayal of the petty incidents of domestic life, an artist in the treatment of simple characters, a great admirer of family ties and children, a writer possessing a graceful and charming style, Farina in the kindly optimism of 'Il signor Io' has succeeded in uniting the technical execution of the realist to the tenderness of the idealist. In Marcantonio he has depicted an ingratiating character, a sympathetic figure despite all his defects, lovable because so essentially human. Consult Croce, B., in *La Critica* (Vol. IV, 1906); Marc-Monnier, 'Un humoriste italien,' in *La Revue des Deux-Mondes* (Paris 1882, pp. 405-438); *The Scottish Review* (Vol. X, 1887, with a translation of some extracts, pp. 235-266).

ALFRED G. PANARONI.

**ILES, George,** American author: b. Gibraltar, 20 June 1852. He received a secondary education in Montreal and from 1887 was employed in literary work in New York. His original works include 'A Class in Geometry—Lessons in Observation and Experiment' (1894); 'Flame, Electricity and the Camera' (1900); 'Inventors at Work' (1906); 'Leading American Inventors' (1912). He also edited 'The Reader's Guide on Economic, Social and Political Science' (1891; with R. R. Bowker); 'A List of Books for Girls and Women and their Clubs' (1895; with A. H. Leypoldt); and 'A Bibliography of Fine Art' (1897), and gave \$10,000 to the American Library Association to defray the cost of 'The Literature of American History' (1902), a bibliographical guide which appeared under the direction of the publishing board of the association. He subsequently edited 'Little Masterpieces of Science' (6 vols., 1902); 'Little Masterpieces of Autobiography' (6 vols., 1908).

**ILEX,** a tree often mentioned in the Latin classics, the evergreen oak or holly (*Quercus ilex*). See AQUIFOLIACEÆ.

**ILFRACOMBE,** il'fra-köm, England, a seaport and fashionable health resort in North Devon, on the Bristol Channel, 14 miles northwest of Barnstable. It has a fine harbor and promenade and the town, built in terraces on a hill, is noted for its picturesque situation and

the beauty of the surrounding scenery. Pop. 8,935.

ILI, il'ē, a river of central Asia, flowing partly in China and partly in Russia. It takes its rise in the Tian-shan Mountains in Dzungaria, flows west and northwest and empties into Lake Balkash by several mouths after a course of about 700 miles, about half of which is navigable. In its upper course it is called the Tekes.

ILIAD. Homer, as Horace says in the 'Ars Poetica,' does not begin the tale of Troy with the egg of Leda; that is, he does not frame his tale in a complete handbook of Greek mythology, but plunges into the midst of things and hastens to the event. Similarly a modern epitomizer must proceed at once to the story of the 'Iliad.' The real siege of Troy may have been a contest for the trade of the East and not an expedition to recover the beautiful Helen of Sparta, daughter of Zeus, wife of Menelaus, and sister of Castor and Pollux (consult Leaf, Walter, 'Homer and History'). But the conjectures of modern scholarship add nothing to the story as told by Homer and by the excavations on the hill of Hissarlik.

The Iliad conforms to Aristotle's prescription that an epic poem should not be a chronicle or a biography (as e.g., 'The Life and Death of Jason'), but a unified action. The 'Iliad' by its title is the poem of Ilium, the poem of the siege of Troy. But the first word *menis*, wrath, indicates the unity of the real subject — the quarrel of Achilles with his overlord, the commander-in-chief, Agamemnon, and its fateful consequences for the course of the war and for Achilles himself. A few words suffice for the essential plot. In the 10th year of the siege Achilles in the assembly takes the part of the soothsayer Calchas who announces that Apollo has sent a pestilence upon the Greeks because Agamemnon has refused to return to her father, the priest Chryseis, the girl Chryseis, his prize from the spoils of a captured Trojan town. After a fierce altercation, Agamemnon sullenly renounces Chryseis but threatens in revenge that he will deprive Achilles of the girl Briseis whom Achilles deeply loved although she was the captive of his spear. Achilles does not overtly resist the authority of the overlord, but when Briseis is taken from him he renounces his allegiance and remains in his tent (hut), eating his heart, aloof from the war. His mother, the sea goddess Thetis, hears his laments, rises from the sea, learns the story of his wrongs, and appeals to Zeus to punish Agamemnon by bringing defeat upon the Greeks in the absence of Achilles. Zeus, unable to resist the appeal of Thetis, who clasps his knees and reminds him of former benefits, gives the promise and confirms it by the nod of his head which in Homer's sublime description was the inspiration of Pheidias' colossal statue of the god at Olympia. The first book closes with a description of the assembled gods on Olympus in which the jealous spouse of Zeus, Hera, taunts him with his concession to Thetis, and her son, the lame Hephaestus (Vulcan), plays the rôle of peacemaker and provokes unextinguishable "Homeric" laughter by assuming the function of Hebe, the beautiful maiden cupbearer of the gods.

The subsequent action of the poem shows how when the promise of Zeus has been fulfilled, when the Greeks are driven back to their camp upon the shore, and Hector is firing their ships, Achilles so far relents as to send forth to the battle his dearest friend Patroclus at the head of his Myrmidons. Patroclus is slain by Hector, and in a frenzy of passion and grief Achilles hurls himself into the war, does terrible execution upon the Trojans, and after pursuing Hector thrice about the walls of Troy kills him in single combat. The ransom of the body of Hector by his father Priam, his burial, and the lamentations of Andromache, Hecuba and Helen for the chief defender of Troy conclude the episode and the action of the poem, which occupies about 45 days.

If rigidly restricted to this outline the poem would be a *menis* or song of the wrath, an Achilleis or story of Achilles. It is an Iliad, an episode of the Trojan War built up about the unity of this central action. The broader compass is made possible by the retardation of the main action, the fulfilment of Zeus' promise, and the filling up of this time with episodes that familiarize us with the leading personages on either side, display the prowess of other Greek chieftains, yet reveal their inadequacy to supply the lack of the invincible Achilles, and heighten the dramatic suspense and deepen the moral lesson of the poem by portraying Achilles' implacable and eloquent rejection of a last despairing appeal of the Greek chieftains. As an exercise in the abstract logic of plot construction, it is possible to extract from the 'Iliad' a swifter moving story of Achilles that omits some or all of these things and narrates the wrath and nothing but the wrath. It would not be nearly so good a poem as the present 'Iliad,' and there is not an atom of evidence that it ever existed. Retardation and digression in reasonable measure have always been devices of the story teller's art, and there are no great poems and few great novels in the world that attempt to obey the prescriptions of Poe's undeviating logic of the short story.

In the 'Iliad' as we have it, digression, retardation or preparation fill the greater part of Books II–XI. Book II exhibits a debate in the assembly on the continuation of the war, a march out for battle, and a muster roll of the forces, the 'Catalogue of Ships,' a sort of domesday book of early Greece. In Book III a truce is arranged, and the issue is staked upon a single combat between Paris, the author of the war, and the injured husband, Menelaus. Helen and King Priam survey the Greek army from the walls of Troy and Helen's description introduces to us many of the leading personages of the poem. In the 4th book the breaking of the truce by the Trojans is distinctly interpreted by the poet as insuring the moral superiority and the ultimate triumph of the Greek cause. The exploits of Diomedes and the confused fighting of the 5th book may seem a mere digression to modern readers, but would not offend hearers who are interested in Diomedes and who enjoy vivid descriptions of fighting for its own sake. Diomedes' success provides a fairly plausible motive for Hector's return to Troy in the 6th book to invoke the aid of Athena, guardian of the city. And this gives occasion for the meeting with

his wife and the exquisite episode known as the parting of Hector and Andromache. Like the scene of Priam and Helen on the wall this may be justified as a device of poetic perspective. The poet had to bring within the action of 45 days whatever scenes were needful for our intelligence of the story or to make it impressive to our feeling. The subsequent fortunes of Hector in the battle interest us infinitely more after we have seen him

Kiss his child and tossing high in air  
Thus to the gods prefer a father's prayer,

and have overheard the ineffable tenderness and patriotic resignation of his farewell to his wife.

Hector's return to the battlefield is marked by what strict logic regards as a superfluous replica of the duel between Paris and Menelaus—a similar single combat between Hector and Ajax, the mightiest Greek champion in the absence of Achilles. The general course of the fighting in books VII and VIII finally goes against the Greeks, who at the end of the 7th book build a wall to protect their camp, another instance perhaps of the unavoidable license of poetic perspective. All this prepares and supplies a motive for the episode of the 9th book, the embassy of Ajax, Odysseus and old Phœnix to offer atonement to Achilles on the part of Agamemnon and implore him to come to the rescue of his old companions in arms. Achilles' refusal was thought by Gladstone to be the finest speech in the world. Together with the parting of Hector and Andromache it should be meditated by critics who really believe that our enlightened age can feel only an historical curiosity about the rude and primitive art of Homer.

The 10th book relates how on the same night Odysseus and Diomedes capture and kill the Trojan spy Dolon, and surprising the Trojan camp slay the newly arrived ally Rhesus, king of the Thracians, and drive away his white steeds. At the beginning of the 11th book the dawn of the 26th day ushers in a long and confused battle which lasts to the end of the 18th book. Near the end of the 11th book Achilles standing at the stern of his great ship observes the retreat of the Greek wounded, exults over their desperate need of him in language that literal minded critics have deemed incompatible with Agamemnon's offer of atonement in the 9th book, and dispatches Patroclus to learn the course of the battle. Various delays detain Patroclus in conversation with prolix old Nestor or in attendance on a wounded friend until after many alternations the battle goes against the Greeks and Ajax makes a last stand against Hector endeavoring to fire the ships. Then at the end of the 15th book Patroclus hastens back, and with his reproachful appeal to Achilles at the beginning of the 16th book we enter into the main current of the dramatic action that moves swiftly to the tragic dénouement. The descriptions of the fighting in books XI to XV may be said to be strung together on the thread of Patroclus' mission, and are relieved by vicissitudes of fortune, splendid exploits such as Hector's first breach in the Grecian wall (end of Book XII) and the mythological machinery (in Book XIV) of Hera's seduction and beguilement of Zeus in order to give Poseidon opportunity to aid the Trojans.

In the 16th book Patroclus clothed in the

armor of Achilles goes forth to battle at the head of the Myrmidons, and after slaying the great Lycian champion, Sarpedon, is himself killed and stripped of Achilles' arms by Hector whose death he foretells as he dies. Another book of fighting, the 17th, recounts the contest for the corpse of Patroclus and the exploits of Menelaus. The 18th book tells—in Mrs. Browning's words—

How Achilles at the portal  
Of the tent heard footsteps nigh,  
And his strong heart half immortal  
Met the *Keitai* [he lies dead] with a cry.

His lamentations as in the 1st book call his goddess mother from the sea. She promises to procure him new armor from Hephæstus, and meanwhile he steps unarmed to the trench and shouts so terribly that the Trojans give way and the Greeks recover the body of Patroclus. This is one of the two passages that Tennyson selected for experimental translation. The other is the description or simile of the shepherds in the moonlight at the end of the 8th book—in which Pope's translation so conspicuously failed and which is often used by critics to test the merits of new translations. The last 200 lines of the 18th book are occupied by a description of the scenes of Homeric life depicted by Hephæstus' art on Achilles' shield—a wedding, a trial for homicide, a siege and an ambuscade and a battle, a harvest scene, a vintage scene, a fight with lions attacking a herd, a dance.

The 19th book contains the formal renunciation of Achilles' wrath, his somewhat indifferent reconciliation with Agamemnon, the return of Briseis, the preparations for another battle, and the final picture of Achilles driving forth in his car in all the terrors of the divine armor. The fighting of the 20th and 21st books, though relieved by some magnificent passages, does not quite meet the expectations of modern readers. The battle between the gods who descend to the Trojan plain was perhaps not taken altogether seriously by Homer. And Achilles' contest with the river god Scamander and his rescue from the pursuing waters by the fire god Hephæstus are fantasies in which the proportion of allegory is not easy to determine. The climax of the 22d book, however, in which Hector is slain, leaves nothing to be desired in natural pathos of human feeling, dramatic intensity and firmness of artistic composition. This is the book selected in Jebb's 'Homer' for analysis as an illustration of Homer's style. When the Trojans are driven within their walls, Hector, whose overconfidence has been the chief cause of the disastrous rout, feels in honor bound to redeem his previous boast that he would not flinch from confronting Achilles' self. In spite of the piteous appeals of father and mother he remains without the gates, and though in a moment of uncontrollable panic he flees thrice around the sacred walls he had kept so well, he at last makes a brave stand and accepts the doom which he half foresaw when he parted from Andromache. Some modern critics have held that the poem should properly end with this climax. That was not the feeling of the Greeks nor apparently of Homer. Andromache's lament for Hector concludes the 22d book on a note of pathos which it would be impossible to sustain. The art of the poet,

therefore, interposes in the 23d book the relief of the long and interesting and sometimes slightly humorous description of the funeral games which Achilles held in honor of Patroclus. In the 24th and last book we return to Hector, whose dead body Achilles maltreats, to the indignation of the gods, who arrange for its ransom. Priam, guided through the night by Hermes, finds his way to the hut of Achilles and endures what no mortal man hath ever borne, to put to his lips the hands that slew his son. In a scene of unequalled pathos the two, bethinking them of their dead, mingle their tears. Priam returns to Troy with the body of his son; and the beautiful threnodies of Andromache the wife, of Hecuba the mother, and of the guilty Helen, who now has no one left to say a kind word to her in all broad Troy, conclude the poem. As a late Greek epigrammatist writes:

Hector whom Homer sings to every age,  
The sole support of Ilium's god-built walls,  
Thy funeral sealeth that immortal page;  
The rest is silence when great Hector falls.

The appetite of unspoiled childhood will always relish Homer whether as the older generations did in the rhetorical rhyme of Pope or as is the present fashion in the Biblical prose of Lang, Leaf and Myers. But the sophisticated taste and the distracted attention of the adult reader can recover this freshness of appreciation only by an effort. The effort is well worth making.

Of course regarded merely as documents the Homeric poems repay study. "The multitude of things in Homer is wonderful," says an older English critic. There are few books in the world that depict a life, a stage of civilization, so completely and so vividly as do the Homeric poems. And this interest is now doubled by the possibility of comparison with the immense array of facts brought to light by the excavations of Troy, Mycenæ, Tiryns, Orchomenus and in Crete, and the enormous literature of speculation that has grown up about them.

There are greater obstacles to the unfeigned enjoyment of the 'Iliad' as poetry. Some conception of the beauty that unavoidably escapes in translation can be gained only by the comparison of several translations, by the use of such imitations as Matthew Arnold's 'Sohrab and Rustum' and by the study of such appreciations as Arnold's essay on translating Homer, the introduction to Pope's translation. Mackail's lectures on Greek poetry, Jebb's 'Homer' and his 'Lectures on Greek Poetry,' and the too few pages of literary criticism in Professor Murray's fascinating but fantastic 'Rise of the Greek Epic.' Any one of these taken by itself and too absolutely may mislead. Arnold's 'Sohrab and Rustum,' for example, will give nothing of the divine energy of Homer or of that rapidity of movement which Arnold himself says is the chief note of the Homeric style. It will merely help us to appreciate certain qualities of Homeric imagery, the elaborate Homeric simile turning on one slight, but sharply defined, point of resemblance. Chapman's 'Homer,' to which Keats' sonnet has sent many readers destined to disappointment, in its most inspired passages reproduces as no other version can the fiery passion, the intensity, the impetus of Homer's battle fury. But the harmony, the grace, the reasonableness of

Homer's sustained art are lacking, and for continuous perusal even the polished declamatory rhetoric of Pope will serve many readers better than the intolerable ruggedness and the un-Homeric conceits of the Elizabethan. Readers who cannot be at the pains thus to employ many aids in recovering something of the spell of the original may at least clear their minds of the conventional cavils of modernistic cant. If the excess of fighting wearies them, they are no more required to read the 'Iliad' through continuously than so to read the 'Faerie Queen' or 'Paradise Lost.' Having the main story in mind they may read in various versions the speeches of Achilles, the parting of Hector and Andromache, the description of the shield, the 22d book, the games, the ransom of Hector, or whatever attracts them most. And if modernistic or pseudo-scientific critics seek to mar our enjoyment by laying it down that the Homeric simile, the standing Homeric epithets, the repetition of certain formulas or motives are in themselves notes of a childish, a primitive, an inferior art, we have only to ask ourselves how do they know it? Is it true? Or may not these traits of Homeric style together with the roll of the Homeric hexameter be rather, as the overwhelming majority of the best informed modern critics from Sainte-Beuve to Quiller-Couch believe, the effectively and consciously employed conventions of the noblest art of poetry that has yet been given to man?

PAUL SHOREY,  
*Head of Greek Department, University of Chicago.*

**ILINIZA**, or **ILINISA**, Ecuador, a mountain, 20 miles south-southwest of Quito. It is capped by two peaks, the southernmost, as determined trigonometrically by Reiss and Stübel, being 17,406 feet high. Iliniza is presumably an extinct volcano, but there is no record of an eruption. The upper portion is covered with perpetual snow, and usually cloud-capped.

**ILION**, N. Y., village, Herkimer County, on the Mohawk River, the Erie Canal, and on the West Shore and the New York Central and Hudson River railroads, about three miles west of Herkimer and 12 miles southeast of Utica. Ilion is in the vicinity of the locations of some of the old "castles" of the Indian tribes who inhabited the Mohawk Valley. White people lived here in the early part of the 19th century, but no permanent settlement was made until 1828. It is situated in an agricultural county, but the village is noted for its manufacturing industries. The chief manufactures are typewriters, firearms, sewing-machines, filing cases, bicycles, knit goods, flour and some dairy products. Its export trade consists chiefly of the manufactured articles and farm products. It has a public library, municipal waterworks, electric-lighting plant and a number of fine public buildings. Pop. 8,900.

**ILISSUS**, il-is'us, Greece, a small river flowing through Athens, famous in the classical age, but now unimportant and often wholly dry.

**ILITHYIA**, il-ith-i'ya, in Greek mythology, the goddess who assisted women in childbirth. In after times she was according to one myth identified with Artemis, and according to another, with Hera.

**ILIUM**, or **ILION**, a name of Troy (q.v.), in Asia Minor, which was founded by Ilius.

**ILİYATS**, il'ë-yats, a nomadic Moham-medan race of Persia, Khiva and Turkestan. The name Iliyat is the plural of *iel* (ell), a tribe equivalent to the Arabic *kabilah*. The Iliyats are mostly of Turkish, Arabic and Kurdish descent, and form an important portion of the population of Persia and adjacent countries; their actual numbers are not known, but it is said that the Iliyat tribes tributary to Khiva number 195,000. They live in tents and have no settled habitations. They are of the Sunni sect, but are not very strict. The women are said to be chaste, and many of the best families in Persia are of Iliyat origin.

**ILKESTON**, il'kës-tôn, England, a town of Derbyshire, 10 miles northwest of Derby. It first comes into history in 1251 when it was given the right to hold a fair, but it was not incorporated as a town until 1887. The gas works, water supply system, public market and cemetery are the property of the town. Nearby are coal mines and iron foundries. The town manufactures hosiery, lace and stoneware. Pop. 31,673.

**ILLÆNUS**, il-lë'nūs. See **TRIBOLITES**.

**ILLAMPU**, ë-lyäm'poo, or **SORATA**, a mountain of Bolivia, in the eastern Cordillera, overlooking Lake Titicaca, 50 miles north-northwest of La Paz. It is about 21,500 feet in height, and is believed to be the highest mountain of the Bolivian Andes, though this distinction is also claimed for Illimani (q.v.); it is probably exceeded by the Cerro de Huascan in Peru and by Aconcagua in Chile. Illampu is a magnificent mass, with three principal peaks, of which the most northern one which frequently is called Illampu by itself, has never been scaled. Seen from Titicaca it is the grandest mountain in America. Consult Conway, Sir W. M., 'The Bolivian Andes' (New York 1901); De Bonelli, L. H., 'Travels in Bolivia' (2 vols., London 1854); Forbes, D., 'Geology of Bolivia and South Peru' (In *Quarterly Journal of the Geological Society*, Vol. XVII, p. 7, London 1861).

**ILLE-ET-VILAINE**, ë-lä-vë-län', a maritime department, formed out of the northeast portion of northwest France, old province of Brittany; area, 2,699 square miles; pop. (1911) 608,098, mostly of Celtic race. It is watered chiefly by the Vilaine and its tributary, the Ille, which unite near Rennes, the capital of the department. Ille-et-Vilaine consists of a granite plateau traversed by ranges of low hills. It is agricultural, cultivation having been greatly improved during recent years. The cider of this district is the best in France; the butter of Rennes is celebrated; the horses of the department are noted for their endurance and are in great request for the army; and bee-keeping is prosecuted. Iron is mined; slates are quarried; and salt is extracted. Saint Malo is the principal seaport.

**ILLEGAL PRACTICES**. See **CORRUPT PRACTICES ACTS**.

**ILLEGALITY**, the condition which arises when an act is performed in violation of the law. Its principal effect is to deprive the act

of a legal status and if a contract, to render it unenforceable. A state of illegality results from positive statute expressly forbidding the act, such as gambling, or from general considerations of public policy. The law generally refuses to undo an illegal act, but innocent third parties may secure relief.

**ILLEGITIMACY**, the legal status of children born out of wedlock, is a subject discussed under three points of view, moral, legal and economic. As to what constitutes illegitimacy is variously defined in different countries where great variety exists both in theory and practice. As to the legal status of illegitimate children from the moral point of view, see **BASTARD**.

Only in a few European countries are statistics available to show the extent of illegitimacy, and there are no statistics in Canada. In the United States there seems no efficient national system of registration of marriages and births. Some of the individual States record the illegitimate births, but the figures are misleading, because incomplete. Thus, the State of Indiana, a few years ago, returned 38,370 legitimate and 560 illegitimate births—the illegitimate being only about 1.46 of the whole.

In the following table is shown the comparative prevalence of illegitimacy in the principal European cities:

**ILLEGITIMATE BIRTHS TO EVERY 1,000 BORN.**

Vienna.....	449	Dresden.....	208	Hamburg....	138
Prague.....	499	Milan.....	204	Frankfort....	132
Munich.....	439	Rome.....	194	Turin.....	132
Stockholm...	396	Venice.....	189	Antwerp.....	129
Moscow.....	300	Breslau....	186	Cologne.....	124
Budapest....	299	Bucharest..	175	Palermo.....	101
Copenhagen..	279	Liège.....	174	The Hague... 99	
Paris.....	268	Christiania	162	Naples.....	86
Petrograd...	236	Berlin.....	154	Rotterdam... 70	
Trieste.....	211	Ghent.....	144	London.....	64
Leipzig.....	211				

None of the above figures are presented as absolutely accurate. They can only be approximate in the best case, for in every country there must always be a large number of bastards who either are not registered at all, or who are registered as legitimate. But as far as they go the figures are instructive. They do not, however, enable one to form any conclusion as to the causes of illegitimacy in respect either of religion, of education, of industrial occupation or of distribution of population. Neither can any theory be well evolved from a racial basis.

From the only available statistics the following table has been prepared showing the average rate of illegitimacy in various countries:

	Per cent of illegitimates to total births		Per cent of illegitimates to total births
England and Wales...	4.60	Portugal.....	14.00
Scotland.....	6.80	Rumania.....	5.00
Ireland.....	2.60	Russia.....	3.00
Austria (average)...	14.10	Spain.....	5.40
Lower Austria.....	26.00	Sweden.....	14.88
Upper Austria.....	20.00	Norway.....	7.90
Dalmatia.....	3.59	Switzerland...	4.80
Hungary.....	8.00	Brazil.....	25.00
Belgium.....	9.30	Canada.....	
Denmark.....	10.00	Costa Rica....	24.00
France.....	8.20	Guatemala — Whites	50.00
Germany (average)...	9.47	Indians.....	25.00
Upper Bavaria.....	15.67	New South Wales...	4.65
Prussia.....	8.24	Victoria.....	4.78
Alsace-Lorraine.....	8.10	Queensland....	3.97
Greece.....	1.60	West Australia...	3.95
Holland.....	3.22	Tasmania.....	3.40
Italy.....	7.45	New Zealand....	3.12

In Scotland, where education is general, and thrift national, the rate of illegitimacy is notoriously high. And, as regards morals, it should be remembered that a high percentage of illegitimacy may mean that there is little or no prostitution. In Europe, generally, although not universally, there seems a tendency to decrease in the rate of illegitimacy; but how far that appearance may be due to moral causes it is impossible to say.

**ILLICHPUR.** See **ELLICHPUR.**

**ILLIMANI,** *ël-yë-mä'në*, Bolivia, a volcanic mountain mass of the East Andean Cordillera, about 20 miles south of La Paz. It is a serrated ridge with four principal peaks, the loftiest of which, Condor Blanco, is 21,149 feet above sea-level. Illimani signifies "snow-mountain"; the line of perpetual snow commences at 15,000 feet, and there are glaciers on the north side at an elevation of 16,350 feet. At an altitude of 15,950 feet there is a considerable lake also bearing the name of Illimani. Among the first Europeans to make the ascent of the highest peaks are Wiener, Grumbhow and Ocampo in 1877 and Sir Martin Conway in 1898.

**ILLINGTON, Margaret,** American actress: b. Bloomington, Ill., 23 July 1881. She was educated at Illinois Wesleyan University and studied at the Chicago Musical College. She made her debut in 'The Pride of Jennico,' at the Criterion Theatre, New York, in 1900, played in Daniel Frohman's Stock Company at the Lyceum Theatre, New York, in 1902-03 and in the latter year created the leading rôle in 'The Japanese Nightingale.' Subsequently she played the leading rôles in 'The Two Orphans' (1904); 'Mrs. Leffingwell's Boots' (1905); 'The Lion and the Mouse' (1906); 'His House in Order' (1906); 'The Thief' (1907). She starred in 'Kindling' (1911-12); 'Within the Law' (1913-14); 'The Lie' (1915-16); 'Our Little Wife' (1916-17) and was a co-star with John Drew in 'The Gay Lord Quex' (1917-18). In 1903 she married Daniel Frohman, but later separated from him and in 1909 was married to Edward J. Bowes of San Francisco.

**ILLINGWORTH, John Richardson,** English clergyman and author: b. London, 26 June 1848; d. Longworth, 22 Aug. 1915. He was graduated from Christ Church College, Oxford, in 1871. From 1872-83 he was tutor of Keble College and Fellow of Jesus College, Oxford. After 1883 he was rector of Longworth in Berkshire. From 1905 he was honorary canon of Christ Church, Oxford. He was select preacher at Oxford University in 1882, and filled the same office at Cambridge University in 1884 and 1895. In 1894 he delivered the Bampton lectures. He was the author of several volumes, 'Sermons preached in a College Chapel' (1888); 'University and Cathedral Sermons' (1893); 'Personality, Human and Divine' (Bampton Lectures, 1894); 'Divine Immanence' (1898); 'Reason and Revelation' (1902); 'Christian Character' (1904); 'The Doctrine of the Trinity' (1907); 'Divine Transcendence' (1911); 'Gospel Miracles' (1915). Consult 'Life and Work of John Richardson Illingworth' (ed. by his wife, 1917).

**ILLINOIS,** *il'i-no'* or *-noiz*, the eighth State admitted into the Union, and since 1890 the third in population, is one of the North Central States of the United States. It is widely known as the "Prairie State." It lies between 87° and 35' and 91° and 40' W. longitude, and between 36° and 59' and 42° and 30' N. latitude. By the enabling Act of Congress, by virtue of which the State was organized, its boundaries were fixed as follows: "Beginning at the mouth of the Wabash River, thence up the same, and with the line of Indiana, to the northwest corner of said State; thence east with the line of the same State to the middle of Lake Michigan; thence north along the middle of said lake, to north latitude 42 degrees 30 minutes; thence west to the middle of the Mississippi River; and thence down along the middle of that river to its confluence with the Ohio River; and thence up the latter river along its northwestern shore, to the beginning."

**Topography, etc.**—Illinois is practically surrounded by water. It is bounded on the northeast by Lake Michigan, on the north by Wisconsin, on the east by Indiana, on the south by Kentucky and on the west by Iowa and Missouri. It is separated from the two last named States by the Mississippi River, from Indiana by the Wabash and Ohio, and from Kentucky by the Ohio. Illinois has a gross area of 56,665 square miles, but 622 square miles represent water surface. Its extreme length is 385 miles and its extreme breadth 218 miles. It ranks twenty-third in size among the States of the Union. With the exception of Georgia, its area is greater than that of any one of the original States of the Union. It comprises a territory larger than that of England, or of Belgium, Switzerland and Holland combined. The largest county, McLean, has an area of 1,166 square miles, and the smallest, Putnam, an area of 176 square miles. With two exceptions—Louisiana and Delaware—Illinois is the most level of the States. Its greatest elevation is 1,150 feet above the sea, and its mean elevation is 550 feet. The larger part of its surface consists of level or slightly undulating prairies, but a portion of the extreme northwestern part is hilly, and there are occasional bluffs upon the Illinois and Mississippi rivers. In the extreme south also there is a range of hills rising to a height of about 1,000 feet.

**Soil.**—The soil consists of a rich black loam, or mold, underlaid by drift deposits, in many places of great depth, and varying from 10 to 200 feet. There are three sources of the soil in this State. The residuary soil, resulting from the decay of the original rock layers, is the first. Before the visit of the first ice sheet the entire State was probably overlaid with thick layers of residuary soil. A second kind of soil came from the first ice sheet, which brought into the State great quantities of waste material from the regions around and beyond the lakes. This was left scattered over the State, but it soon weathered and with the addition of humus made a black and rich prairie soil. After the disappearance of the first ice sheet and the making of the waste material into soil, there was a thick deposit of loess, which covered not only the glacial soil but also the residuary soil. After thousands of years there

was a second ice invasion which reached as far south and west as the line traced west and north from Paris. A second glacial layer of waste several feet thick was thus left upon the loess beds. Illinois consequently has soil whose source is the residuary rocks (the area being very limited), soil from the loess deposits and that from the last ice sheet in the northeastern counties. The soil of the river valleys is alluvial and is especially fertile. The northern part of the State is especially well suited to the cultivation of hay, the north and central parts to Indian corn, the east to oats and the southwest to wheat.

**Rivers, etc.**—The water courses flow generally from the north and northeast to the south and southwest. The principal river of the State, the Illinois, is formed by the junction in Grundy County, 40 miles southwest of Chicago, of the Kankakee and Des Plaines. The last-named river takes its rise in Wisconsin and flows in a southerly direction, while the headwaters of the Kankakee are in northern Indiana. The Illinois is navigable for 245 miles and is connected by the Illinois and Michigan Canal with Lake Michigan. Other rivers in the State are the Sangamon, which flows in a westerly direction into the Illinois; the Kaskaskia, which flows in a southwesterly direction and empties into the Mississippi near the ancient village of Kaskaskia, the first capital of the State; Rock River, which flows in a southwesterly direction from Wisconsin and empties into the Mississippi not far from the city of Rock Island; the Little Wabash and the Embarras, which flow into the Wabash in the southeastern part of the State; and the Vermilion and the Fox, which are tributaries of the Illinois.

**Climate.**—Illinois lies between the isotherm of 55 on the south and 47 on the north. It is notable for extremes of temperature. Warm winds sweeping up the Mississippi Valley cause extreme heat; the Arctic winds from the north, unblocked by mountains, cause the extremes of cold. The range of extremes is greater in the north than in the south. Thus at Winnebago extremes have ranged from 26° F. to 110° F., and at Cairo from 16° F. to 106° F. The mean temperature for Springfield, near the central part of the State, is 52° F. The variation is about 2° F. for each degree of latitude. The State is well watered. The number of inches of rainfall is about 40 for the south end of the State, but it decreases to about 34 in the north. The mean annual snowfall increases from about 12 inches in the south to about 40 in the north. The source of the rainfall is chiefly the revolving storms from the northwest. At Cairo in the south, except during February, the prevailing winds are southerly, and as far north as Springfield they are southerly from April to January. Throughout the northern half of the State, except along the shore of Lake Michigan, where they vary from northeast to southwest, the winds are mostly from the west or northwest from October to March, and very variable for the rest of the year.

**Population.**—In 1810, one year after its organization as a Territory, the population of Illinois was 12,282; in 1820, two years after its admission as a State, its population was 55,211, and in rank it was the 24th State in the Union;

in 1830, its population was 157,445 and its rank the 20th; in 1840, its population was 476,183 and its rank the 14th; in 1850, its population was 851,470 and its rank the 11th; in 1860, its population was 1,711,951, and its rank the 4th; in 1870, its population was 2,539,891 and its rank the same as in 1860; in 1880, its population was 3,077,871 and its rank still 4th; in 1890 its population was 3,826,351 and its rank the 3d; in 1900, its population had increased to 4,821,550 while its rank remained the same; in 1910, its population was 5,638,591 and its rank was still third. An analysis of the population as shown by the census of 1910 reveals the following interesting facts; 2,600,555, or 46.1 per cent, were native whites of native parentage; 1,723,847, or 30.6 per cent, were native whites of foreign or mixed parentage; 1,202,560, or 21.3 per cent, were foreign born whites; and 109,049, or 1.9 per cent, were negroes. Of the total native population, 76.8 per cent were born in Illinois, and 23.2 per cent outside the State. Of the total white stock of foreign origin, Germany contributed 34.7 per cent; the Scandinavian countries, 11.3; Ireland, 11.3; Austria, 9.6; Russia, 7.8; England, 5.8; Italy, 4; Canada, 3.7; Scotland, 1.8; Hungary, 1.8; and Holland, 1.1. Of the foreign born white population, Germans composed 26.5 per cent; Austrians, 13.6; Russians, 12.4; Swedes, 9.6; Irish, 7.8; Italians, 6; English, 5; Canadians, 3.7; Hungarians, 3.3; Norwegians, 2.7; all other countries, 9.2. Of the negro population, 66.8 per cent were born outside of the State. In most of the 102 counties the proportion of foreign born whites is small, being less than 5 per cent in 40 counties, and over 25 per cent in only six. Over two-thirds of the foreign born whites live in Cook County. Their percentage is 28.7 in the urban population and 9.5 in the rural; the percentage for the negroes is 2.5 in the urban and 1.1 in the rural districts. The male population predominates. In 1910 there were 2,911,674 males to 2,726,917 females or 106.8 males to 100 females; in 1900, the ratio was 105.3 to 100. Among native whites, in 1910, the ratio was only 101.5 to 100, but among foreign born whites it was 127.3 to 100. In the urban population there were 104.9 males to 100 females, and in the rural 109.9. These people occupied 1,006,848 dwellings and the total number of families was 1,264,717 or 125.6 families to 100 dwellings. The average number of persons per dwelling was 5.6, and the average number per family was 4.5. Cook county claimed 2,405,233 persons, Saint Clair County ranked next with 119,870, and Peoria County was third with 100,255. Taking the State as a whole, it had 100.6 people to the square mile in 1910, as compared with 86.1 in 1900, and 68.3 in 1890. The population according to census estimates increased from 5,638,591 in 1910 to 6,152,257 in 1916, and its density, consequently, from 100.6 to 109.8

**Cities.**—In 1910, 61.7 per cent of the entire population resided in incorporated places having 2,500 inhabitants or over; in 1900, the per cent was 54.3. In the same years the figures for the United States as a whole stood 46.3 and 40.5; for the New England States, 83.3 and 79.9; for Rhode Island, 96.7 and 95.1; for Massachusetts, 92.8 and 91.5. According to the last census there were 32 incorporated places in the State which had a population of over

ILLINOIS.

Estimated population, 6,152,237

10,000. Chicago had 2,185,283; 11 others had over 25,000 but less than 100,000; the rest had between 10,000 and 25,000. On 1 July 1916 the estimated population of the five leading cities was: Chicago, 2,497,722; East Saint Louis, 74,708; Peoria, 71,458; Springfield, 61,120; Rockford, 55,185. In July 1915 some of the other cities ranked as follows: Decatur, 38,526; Joliet, 37,472; Quincy, 36,764; Aurora, 33,613; Danville, 31,554; Evanston, 28,012; Elgin, 27,844; Bloomington, 27,054; Moline, 26,927; Galesburg, 23,923; Alton, 22,483; Belleville, 21,144; Waukegan, 19,471; Freeport, 19,293; Cicertown, 19,102; Cairo, 15,593; Jacksonville, 15,456; Kankakee, 14,190; Champaign, 14,171; Kewanee, 13,517; Mattoon, 12,400; La Salle, 12,110; Lincoln, 11,685. Within the last few years the following cities have probably passed the 10,000 mark: Canton, Monmouth, Maywood, Ottawa, Urbana, Mount Vernon and De Kalb.

**Education.**—Illinois has an excellent public school system. Education is free and compulsory for children from 7 to 14. In 1860, Illinois had 464,304 pupils, 8,223 male teachers, 6,485 female teachers, and expended \$1,512,211 in wages, and \$2,259,868 for all school purposes. For the school year ending June 1915 Illinois had an estimated number of 1,493,473 children from 5 to 18; 1,064,221 enrolled, an average duration of 160 school days, 5,918 male teachers and 26,902 female teachers; she paid \$23,179,650 in salaries, and expended for school purposes \$39,508,058. During this period the average annual cost per pupil enrolled increased from less than \$5 to about \$40, and the average yearly wage of the teacher increased from a trifle over \$100 to about \$700. Religious education and training cannot be given in the public schools, but they are fairly well cared for by the churches, which in the order of their strength are Roman Catholic, Methodist, Lutheran, Baptist, Presbyterian and Disciples of Christ.

Higher education is provided for by a number of normal schools, colleges and universities. The public normal schools of the State are located as follows: The State Normal University at Normal; the Southern Illinois State Normal University at Carbondale; the Northern Illinois Normal School at De Kalb; the Eastern Illinois Normal School at Charleston; and the Western Illinois Normal School at Macomb. The Chicago Normal School, since 1896, has been maintained by appropriations made by the Chicago board of education. Most of the teachers of the State receive at least part of their training in these schools. In 1916 there were 147 male teachers, 171 female teachers, 1,893 male students and 7,548 female students in the six public normal schools. There were, in addition, four small private normal schools which contained 37 male teachers, 44 female teachers, 164 male students and 437 female students.

In 1915 Illinois had 32 universities, colleges and schools of technology. These employed 2,056 male professors and instructors and 485 female. In the preparatory departments there were 2,983 male students and 1,306 female; in the collegiate departments there were 8,764 male students and 7,247 female; the resident graduate students numbered 1,679 male and 1,017 female. The total receipts, exclusive of additions to the endowment, were \$8,846,776.

Of these 32 institutions, four were exclusively for women and four for men. In 1916 the State had 15 theological schools with 1,656 students, 11 law schools with 3,136 students, 8 medical schools with 2,264 students, 3 dental schools with 1,294 students, 3 schools of pharmacy with 339 students, and 2 schools of veterinary medicine with 650 students. The three great universities of the State are Northwestern, Chicago and Illinois. The latter stands at the head of a liberal system of free public education. It was incorporated as Illinois Industrial University 28 Feb. 1867, and it was opened 2 March 1868 at Urbana. The name was changed in 1885. From 4 teachers and 77 pupils in 1868, it increased to 54 teachers and 418 pupils in 1889, and to 868 teachers and officers and 6,828 students 21 Feb. 1917. About 558 of these students were in the schools of medicine, dentistry and pharmacy at Chicago.

**Charitable Institutions.**—Until recent times each charitable institution was under the control of a separate board of trustees, managers or commissioners, with some supervision in most cases by an unpaid State Board of Public Charities. By the act of 1909, repassed in 1912 and in effect 1 July 1912, however, all the "charitable institutions" were placed under the direct management of a single salaried Board of Administration, and subject to the visitation and inspection of an unpaid State Charities Commission. The five members of the single board of management were to be appointed by the Governor for a term of six years, confirmed by the Senate, and required to give all their time to the work. Their salary was to be \$6,000. The State Treasurer is treasurer for all the institutions. One member of the Board of Administration, as fiscal supervisor, was to be business manager for all the institutions. Supplies were to be purchased for all on competitive bids, and a uniform system of accounts and purchases was to be maintained. One member of the Board of Administration was required to be a trained specialist in the care of the insane, who form the largest group in the State institutions. In addition to this highly centralized system of administration, there were the following elaborate provisions for the inspection and investigation of the institutions: by the Board of Administration itself; by the unpaid Charities Commission, which acts largely through the executive secretary; and by the local boards of visitors for each institution. The Charities Commission was to have the supervisory and visitatorial power of the old Board of Public Charities. Its duty was purely advisory and recommendatory, based upon independent investigation into the whole field of public and private charity. The law required the Commission to inspect all State charitable institutions, all jails, almshouses, workhouses, houses of correction, all private institutions for mental and nervous diseases and for the care of children, to which the Board of Administration issues its license. In brief, the Commission had, by law, supervisory and inspectional powers over all institutions, for whose management and administration the Board of Administration was responsible. The only executive or administrative duty belonging to the Commission was that involved in the collection of criminal statistics. The Illinois Administrative Code, effective 1 July 1917

(see *Government*) again modified these arrangements. The department of public welfare now has charge of the charitable, penal and reformatory institutions of the State. It performs the functions of the old Board of Administration, three boards of commissioners and managers for the two State penitentiaries and reformatory and their subordinate officials, the board of prison industries, and board of pardons. The Code makes provision for an alienist, a criminologist, a fiscal supervisor, a superintendent of charities, a superintendent of prisons, a superintendent of pardons and paroles, and an unpaid board of public welfare, which takes the place of the present State Charities Commission.

In 1916 there were 21 charitable institutions under the management and control of the Board of Administration. They included the State hospitals or asylums for the insane at Chicago, Kankakee, Elgin, Moline, Jacksonville, Alton and Anna; the hospital for the criminal insane at Chester; the school and colony for the feeble-minded at Lincoln; the epileptic colony at Dixon; the Psychopathic Institute with clinical laboratory at the Kankakee State Hospital; the Soldiers' and Sailors' Home at Quincy; the Soldiers' Orphans' Home at Normal; the Soldiers' Widows' Home at Wilmington; the School for the Blind and the School for the Deaf at Jacksonville; the Training School for Girls at Geneva; the School for Boys at Saint Charles; and the Charitable Eye and Ear Infirmary and the Industrial Home for the Blind at Chicago. Twenty-one thousand people were housed in these institutions, and 75,000 additional people received treatment annually at the Charitable Eye and Ear Infirmary in Chicago. Farms are operated in connection with most of the institutions, and over 1,500 head of cattle are maintained on the institution farms. Kindness is practised towards the inmates, and the 3,500 employees are well treated. The latter have an eight hour day, and one day's rest out of seven. The cost of maintenance is about \$5,500,000 yearly.

**Penal Institutions.**—The Illinois State Reformatory, located at Pontiac, has excellent buildings and appointments for the care of its inmates. Under the law no one can be admitted who has reached the age of 21 at the time of the commission of the offense for which he is sentenced. Trade schools and a farm are provided for and every effort practicable is made to reform the inmates. The Illinois State penitentiary is located at Joliet and the Southern Illinois penitentiary at Chester. The State legislature appropriated \$2,803,014 for the State penal and reformatory institutions for the biennium beginning 1 July 1917. The latest statistics at hand show that on 1 Jan. 1910 Illinois had 5,111 sentenced prisoners in penal institutions or 90.6 per 100,000 of population. Of this number, 3,000 were supposedly native white, 1,197 foreign born white, 911 negro, and three other colored persons. During that year 27,942 were committed to prison, or 495.5 per 100,000 population.

**Corporations.**—The first corporation was the Bank of Illinois, located at Shawneetown and chartered 28 Dec. 1816. Within the 100 years since that time, over 93,000 corporations have been created. Between the adoption of the Constitution of 1818 and that of 1848, about

2,700 corporations were created by special acts. On 16 Dec. 1824 the first statute in the nature of a general corporation act was approved. Manufacturing companies could be created by filing articles of incorporation with the secretary of state at a cost of 75 cents. This statute, however, remained a dead letter. The Constitution of 1848 authorized the creation of corporations by general law, and prohibited their creation by special act, except for municipal purposes and in cases where the general assembly thought that the objects of the corporation could not be obtained under general laws. Corporations, nevertheless, were still created by special acts, and the double system lasted till 1870. Then, because of the numerous evils arising under the system, the new Constitution prohibited the legislature from creating corporations by special act except for charitable, educational, penal or reformatory purposes; and these corporations were to remain under the control of the State. The first corporation created under a general law was the Illinois and Mississippi Telegraph Company, whose articles were filed 2 May 1849. From that time until 1 July 1872, when the present general incorporation act went into effect, 2,200 corporations filed articles in the office of the Secretary of State. This was an average of less than 100 corporations a year. The average now is about 3,300 per year. On 1 May 1916, the total number of corporations licensed to do business at one time or other in the State was 93,908. Not over 5,000 of these were created in the first half century of the State's history, and only 30,380 were chartered in the first 75 years. In the last 25 years about 60,000 corporations have been registered. The greatest increase took place in the decade from 1882 to 1892, which showed a gain of nearly 300 per cent over the previous 10 years. The increase is now comparatively uniform, each decade showing a gain of about 25 per cent. In 1915, domestic corporations paid fees amounting to \$222,756.16 and foreign corporations paid \$97,314.90. The law requires corporations organized for profit to make a yearly report, and in Feb. 1915, 15,900 Illinois corporations and 2,280 foreign corporations reported to the secretary of state, making an apparent total of 18,180 corporations doing business then. These figures, however, do not include banks, home building and loan associations, which report to the auditor of public accounts, and insurance companies, which report to the superintendent of insurance. Moreover, annual reports are not required from railroads. For these reasons, it seems fair to assume that about 30,000 corporations are now active in the State.

Illinois now ranks next to New York and Pennsylvania in the paid-in capital for national banks. This system, established 25 Feb. 1863, was a success and achieved the purposes for which it was primarily created; the establishment of a market for government bonds, the establishment of a uniform currency, and the abolition of "wild cat" currency. The National Banking system followed, in Illinois, the "Free Banking Law" of 1851 under which 115 banks of issue were in operation just prior to the Civil War; these banks issued nearly 1,000 different kinds of bills and counterfeiting was easy. The new law remedied these evils. Banking showed a steady growth, though slow

ILLINOIS

State Capitol at Springfield

at first. From 14 Oct. 1900 to 31 Oct. 1915, 305 national banks with a total capital of \$20,333,500 were organized. These banks fall into three general classes: those with a capital of \$25,000, those with a capital of \$25,000 to \$50,000, and those with a capital of \$50,000 or over. During the time indicated, 182 banks of the first class with a total capital of \$4,500,000, 21 of the second class with a total capital of \$733,500, and 102 of the third class with a capital of \$15,050,000 were organized. On 2 Sept. 1915, 470 national banks reported; their combined capital was \$76,105,000. Other banks also are strong. Thus, on 23 June 1915, saving deposits in Illinois State banks and trust companies aggregated \$294,534,096.83.

Some provisions of the laws, other than the few indicated in the historical sketch above, are: no State bank shall be created and the State shall not own stock in any corporation for banking purposes; every stockholder in a banking corporation shall be individually liable to its creditors for double the amount of his stock; the rolling stock and all other movable property of all railroads in the State are to be considered personal property, and subject to execution for the debts of such companies; railroad corporations are prohibited from consolidating with parallel or competing lines; all railroads in the State are declared to be public highways, and free to all persons for the transportation of their persons and property thereon, under such regulations as may be prescribed by law—the general assembly to establish reasonable maximum rates of charges for the transportation of passengers and freight; the right of eminent domain by the State against such corporations shall never be abridged; the general assembly by appropriate legislation shall prevent unjust discrimination and extortion in the rates of passenger and freight tariffs on all railroads in the State; appropriate legislation is authorized for the protection of producers, shippers and receivers of grain and produce; the general assembly is prohibited from releasing the Illinois Central Railroad Company from its charter obligation to pay the State the agreed percentage of its gross earnings; and no county, city, town or township is permitted to become a subscriber to the capital stock of any railroad, or private corporation, or to make donations to, or loan its credit in aid of any such corporation.

**Transportation.**—Illinois is especially favored for commerce. The early French settlers came to the State by way of the Saint Lawrence River and the Great Lakes; many of the English settlers came by way of the Ohio River and its tributaries. Nearly three-fourths of its boundaries are navigable rivers. It has 4,000 miles of river navigation. About 65 miles of the shore line of Lake Michigan lie within the State. The Mississippi River is connected with the Great Lakes by means of the Illinois and Michigan Canal, which extends from the Chicago River to LaSalle on the Illinois River, a distance of nearly 100 miles. The Chicago Drainage Canal, extending from Lake Michigan to the Des Plaines River and thence to the Illinois River, gives connection with the Mississippi. Still another canal connects the Illinois River at Hennepin, a few miles below LaSalle, with the Mississippi River at Rock Island. The first railway constructed in the West was the Northern Cross Railroad from Meredosia on

the Illinois River to Springfield. This was completed in 1842, but in 1850 there were only 111 miles of railroad in the State. The Illinois Central Railroad was completed in 1856. Railways were constructed rapidly, and by 1870 Illinois had a greater railroad mileage than any other State in the Union. The first Railway and Warehouse Commission in the United States, with authority to fix freight and passenger rates, was established in Illinois in 1871. In 1907 the legislature passed a bill making it unlawful for any railroad to charge more than two cents a mile for carrying passengers between points within the State provided tickets were bought before entering the cars; otherwise three cents might be charged. In 1915, Illinois had over 12,000 miles of railroad and nearly 4,000 miles of electric railways. The roads having the longest mileage 30 June 1915, were the Illinois Central, 2,024; the Wabash, 669; the Cleveland, Cincinnati, Chicago and Saint Louis, 650; the Elgin, Joliet and Eastern, 327, and the Gan Dalia Railroad, 303.

**Manufactures.**—Illinois is easily the most important manufacturing State west of the Alleghenies. Three factors have contributed largely to this—abundant raw materials, cheap coal and adequate transportation facilities both by water and by rail.

In 1849, 11,559 wage-earners or 1.4 per cent of the population were employed in manufactures; in 1879, 144,727 or 4.7 per cent; in 1909, 465,764 or 8.3 per cent. The gross per capita value of the products increased from \$19.42 in 1849 to \$340.38 in 1909, and the percentage which the manufactures represented of the total value of the products of manufacturing industries in the United States from 1.6 in 1849 to 9.3 in 1909. Illinois ranked fifth in the value of manufactures in 1849, and third in 1909. In the last named year, she had 18,026 manufacturing establishments. These employed 561,044 persons, paid out \$364,768,000 in salaries and wages, turned out products valued at \$1,919,277,000 from materials costing \$1,160,927,000, and thereby added a value of \$758,350,000 in the process of manufacturing. These figures do not include the government arsenal at Rock Island, which, in 1909, employed 1,698 wage-earners and reported the value of its products at \$3,114,338.

In 1909, the 21 leading industries with products valued at over \$20,000,000, with the number of their establishments and the average number of workers employed were as follows: (1) Slaughtering and meat packing, \$389,595,000 (28.4 per cent of the total product of the United States), 109 and 26,705; (2) foundry and machine shop products, \$138,579,000, 1,178 and 52,266; (3) clothing, men's, including shirts, \$89,473,000, 715 and 36,152; (4) printing and publishing, \$87,247,000, 2,608 and 28,644; (5) iron and steel, steel works and rolling mills, \$86,608,000, 24 and 17,584; (6) agricultural implements, \$57,268,000 (39.1 per cent of the total product of the United States), 79 and 19,240; (7) distilled liquors, \$55,200,000 (27 per cent of the total product of the United States), 9 and 750; (8) flour-mill and grist mill products, \$51,111,000, 461 and 2,464; (9) lumber and timber products, \$44,952,000, 814 and 16,567; (10) iron and steel, blast furnaces, \$38,300,000, 6 and 2,493; (11) bread and other bakery products \$36,118,000, 2,099 and 8,611; (12) cars and

general shop construction and repairs by steam railroad companies, \$32,229,000, 73 and 23,131; (13) liquors, malt, \$28,449,000, 106 and 4,398; (14) furniture and refrigerators \$27,900,000, 267 and 13,575; (15) cars, steam railroad, not including operations of railroad companies, \$27,001,000, 28 and 10,945; (16) electrical machinery, apparatus and supplies, \$26,826,000, 143 and 9,641; (17) copper, tin and sheet-iron products, \$22,823,000, 483 and 7,473; (18) tobacco manufactures, \$21,870,000, 1,944 and 8,034; (19) gas, illuminating and heating, \$21,052,000, 78 and 6,301; (20) paint and varnish \$20,434,000, 74 and 1,792; (21) soap, \$20,181,000, 34 and 2,188. The average number of wage-earners in 1909 was 465,764. Of this number 382,691 were males 16 years of age and over, 76,156 were females 16 years of age and over and 6,917 were under 16 years of age. The percentages for the three were 82.2, 16.3 and 1.5. The proportion of wage-earners under 16 in all manufacturing industries combined was only one-half as great in 1909 as in 1899. There was a moderate increase during the decade, however, in the proportion of female wage-earners 16 years of age or over, while the proportion of males 16 years of age or over showed a slight decrease. In 1909, 84.2 per cent of the workers employed in the men's furnishing goods industry were females 16 years of age or over, 75.4 per cent of those in the millinery and lace goods industry were females 16 or over, and 67.4 per cent of the workers in the women's clothing industries belonged to this class. Other industries employing large numbers of female wage-earners 16 years of age and over were: printing and publishing, slaughtering and meat packing, and the manufacture of clocks and shoes, electrical machinery, tobacco products and fancy and paper boxes. Of the wage-earners under 16, 46.9 per cent were employed in seven industries. These were the men's clothing industry with an average of 995; printing and publishing, with 739; the manufacture of fancy and paper boxes, with 410; the boot and shoe industry, with 334; the manufacture of pianos and organs, with 309; the confectionery industry, with 205; and foundries and machine shops, with 202. In the manufacture of patent medicines and compounds, the proportion of children in the total number of wage-earners was highest—8.1 per cent—but the average number employed was only 151.

The value of the total manufactured product in Chicago alone, in 1909, was \$1,281,171,000 or about two-thirds of the total. Peoria and Joliet held second and third place among the manufacturing cities. In 1914, Illinois had 18,388 establishments, 15,854 proprietors and firm members, 95,130 salaried employees, 506,943 wage-earners, and \$1,943,836,000 invested capital. These manufacturing industries paid \$128,478,000 in salaries and \$340,910,000 in wages, used material costing \$1,340,183,000 and turned out products valued at \$2,247,323,000, thereby adding a value of \$907,140,000. The total value of the product has practically doubled within 15 years, the value being only \$1,259,730,168 in 1899.

**Agriculture, Mining, etc.**—Illinois takes very high rank as an agricultural State; 32,471,000 acres under cultivation being reported for 1910, as compared with 32,795,000 in 1900,

a decrease of 1 per cent. In 1910, the total number of farms in the State was 250,853; the estimated value of the land and buildings was \$3,511,194,000 as compared with \$1,765,582,000 in 1900. The increase was 99 per cent. In 1900 the average value of a farm with its equipment was \$7,600; in 1910, \$15,505. The average value of the land per acre in the two census years was \$46.17 and \$95.02. The total value of farm lands was \$1,514,114,000 and \$3,081,564,000 or a gain of 104 per cent. The value of farm buildings in the two years was \$251,468,000 and \$429,630,000, and the increase was 71 per cent. The larger farms are generally in the north and the smaller in the extreme southern portion of the State.

The census of 1880 showed the number of tenant farmers in Illinois to be larger than in any other State of the Union, and quite a little capital was made of the "eighty thousand tenants" then operating Illinois farms. In 1910, Illinois had 104,379 tenant farms out of a total of 251,872, but her rank had sunk to eighth. In 1910, owners operated 145,107 farms embracing 17,787,063 acres, which, with buildings, were valued at \$1,765,992,310; managers operated 2,386 farms embracing 554,463 acres, and valued at \$65,008,033; tenants operated 104,379 farms embracing 14,177,411 acres, and valued at \$1,691,792,227. The percentage of farms operated by owners was 57.61, by managers 0.95, and by tenants 41.44. The average size of the farms operated by owners was 122.58 acres, by managers 234.06, and by tenants 135.82. The average value of the farms and buildings operated by owners was \$12,170.28, by managers \$27,245.61 and by tenants \$16,208.17. Of the 145,107 farms operated by owners, 86,713 were free from mortgage, 55,792 were mortgaged, and 2,602 were not reported. The per cent reported as mortgaged was thus 39.2. The per cent in that year ranged from 5.4 in New Mexico to 51.8 in Iowa; for the United States as a whole it was 33.6. Illinois had 36,938 farms operated by owners owning the entire farm. The value of the land and buildings was \$454,857,222, and the amount of debt was \$115,799,646. The average value of each farm was \$12,314, and the average debt \$3,135, the ratio of debt to the value being 25.5. At the same time the United States had 1,006,511 farms operated by owners owning the entire farm. The value of land and buildings was \$6,330,236,951 and the amount of debt, \$1,726,172,851. The average value per farm was \$6,289 and the average debt was \$1,715, the ratio of debt to the value being 27.3. For Illinois, the ratio of debt to the value of the farm had decreased from 34.6 in 1890 to 25.5 in 1910; for the United States as a whole the decrease was from 35.5 to 27.3.

Illinois has an active live stock industry. On 1 Jan. 1917, there were 1,452,000 horses (farm animals) valued at \$153,912,000; 150,000 mules valued at \$17,250,000; 1,057,000 milch cows valued at \$71,876,000; 1,251,000 other cattle valued at \$54,168,000; 898,000 sheep valued at \$7,363,000 and 4,440,000 swine valued at \$60,883,000. In 1916, Illinois produced 306,800,000 bushels of corn valued at \$257,712,000; 172,095,000 bushels of oats valued at \$87,768,000; 16,225,000 bushels of wheat valued at \$26,771,000 (in 1915 the figures were 53,250,000 and \$53,-

200,000); 4,495,000 tons of hay valued at \$50,794,000; and 7,250,000 bushels of Irish potatoes valued at \$12,978,000 (in 1909 the figures were 14,924,000 and \$9,104,000). In 1909, Illinois produced 1,125,000 pounds of tobacco valued at \$123,750; in 1916, the production was only 525,000 pounds and the value \$52,000. In 1916, 1,616,000 barrels of apples (4,716,000 in 1915), 780,000 bushels of peaches, and 354,000 bushels of pears were produced. The wool production of Illinois in 1909 was 4,725,000 pounds, and the value of the product was \$1,296,540. In 1915, 3,975,000 pounds were produced and the average price was 25 cents a pound; in 1916, only 3,855,000 pounds were produced, but the average price was 30.1 cents and the value was about \$1,160,355. At the time of the last census, Illinois was producing about 125,000 feet of lumber yearly at a valuation of over \$2,500,000. At the same time, her fisheries employed about 5,000 persons and yielded a product valued at \$1,500,000.

In 1909, Illinois ranked next to Pennsylvania in the value of the products of mining industries. The gross value was \$76,658,974; the net value, \$76,556,994. Bituminous coal mining with a product valued at \$53,030,545 was easily the leader. The petroleum and natural gas wells with a product worth \$18,883,102 ranked second. The output of zinc in 1913 was about 2,236 short tons and the value was \$250,432; flour-spar was produced to the amount of 85,854 short tons and a value of \$550,815; the limestone and sandstone output was valued at \$4,140,953; and clay products (bricks, tiles and pottery) were valued at \$15,195,874. In 1913 the total mineral product was valued at \$131,825,221; the average year since the last census, however, has seen a product worth over \$100,000,000. In 1915, 2,447,220 long tons of pig iron, 5,156,869 barrels of cement, \$350,371 worth of natural gas, 24,942,701 barrels of petroleum, 1,686,998 short tons of coke, and 58,829,576 short tons of coal were produced. The coal fields of Illinois cover an area of about 42,900 square miles. Since 1882 very careful reports of coal production have been kept. In that year, 11,017,069 tons were produced, and 20,290 men employed; in 1914 the figures stood 60,715,795 tons and 80,035 men. The leading counties in the latter year were: Williamson, 7,681,006 tons; Franklin 6,595,799; Sangamon, 5,723,046; Macoupin, 4,981,057; Saint Clair, 4,009,258. All were in the southern or south central part of the State.

Chicago is the great distributing and receiving point, due partly to lake transport and excellent railroad facilities. The former brings millions of tons of iron ore, and millions of bushels of oats, wheat and maize every year. Receipts by lake transport for Chicago, in 1914 included 586,134,000 pounds of fresh beef, and the shipment, 1,027,327,000 pounds. During the year 1915, 107,471,640 dozen eggs, 180,303,840 pounds of butter, 9,063,000 barrels of flour, 4,648,000 bushels of rye, 26,167,000 bushels of barley, 70,704,000 bushels of wheat, 95,357,000 bushels of corn, and 133,475,000 bushels of oats were received in Chicago. The value of the live stock received at the stock yard in the same year was \$370,938,156. Shipments received by down-town packers increased the total to \$379,099,642. The official valuation of livestock re-

ceived at the Chicago Stock Yards that year was: Cattle, \$192,116,472; calves, \$5,714,075; hogs, \$120,349,047; sheep, \$23,044,562; horses, \$29,754,000.

Everything considered Illinois is one of the wealthiest States in the Union. In 1904, the estimated true value of all property and of specified classes of property stood as follows: Real property and improvements, \$5,468,492,926; live stock, \$268,731,540; farm implements and machinery, \$48,593,486; manufacturing machinery, tools and implements, \$227,543,320; gold and silver coin and bullion, \$150,074,503; railroads and their equipment, \$805,057,000; street railways, shipping, waterworks, etc., \$327,591,493; all other \$1,520,471,923; total \$8,816,556,191. For these same items, in the order named, the figures for 1912 stood: \$10,056,319,512; \$386,701,265; \$79,473,427; \$451,299,068; \$205,185,274; \$926,403,787; \$784,713,023; \$2,640,354,876; \$15,484,450,232. In the first named year, New York and Pennsylvania were ahead of Illinois, but in 1912 Illinois stood second to New York.

**Constitution.**—Three constitutions have been in force in Illinois since its admission as a State. The first was formed by a convention of 32 delegates from the 15 counties of the territory, which met at Kaskaskia in August 1818. This constitution, under which the State was admitted; remained the organic law of Illinois for 30 years, or until the adoption of the constitution of 1848. In the meantime, the State had gradually increased in wealth and in population. Many new counties had been organized, and the northern boundary of actual settlement had been extended from the county of Madison to the Wisconsin line. Chicago and other cities unknown to the framers of the first constitution had sprung into being. A futile attempt to procure the calling of a convention to frame a new constitution was made in 1823. In 1846, the question of calling a convention was again submitted by the legislature; the returns showed a large majority favorable, and delegates were accordingly chosen in April 1847. This convention, consisting of 162 members, assembled at Springfield in June of that year and its work was concluded 31 August. Unlike the first constitution, this one was submitted to the people. It met with popular approval and by its terms went into operation on the first Monday of April 1848; it remained in force until the adoption of the present constitution. The latter was formulated by a convention of 85 members which assembled in Springfield, 13 Dec. 1869. This constitution was submitted to popular vote and approved, and since August 1870, has been the fundamental law of the State. By a two-thirds vote in each House the general assembly may submit to the electors, the question of calling a convention to alter or amend the constitution, to be voted upon at the next general election; by the same vote in the general assembly proposed amendments to the constitution (without the intervention of a convention) may be submitted to the electors for adoption or rejection. One of the most important provisions of the present constitution is the division of the powers of the government into legislative, executive and judicial. The legislative power is prohibited from releasing the indebtedness, liability or obligation of any corporation or

individual to the State or to any municipal corporation therein, and to authorize lotteries or gift enterprises for any purpose. Two important mandatory provisions upon the general assembly were incorporated in the constitution: One requiring legislation protecting coal miners, and the other the passage of liberal homestead and exemption laws. Under the former constitution, the State and people had suffered from special legislation. To cause the discontinuance of such legislation and the enactment of general laws when necessary, the general assembly was prohibited from passing local or special laws in any of the following cases, viz.: For granting divorces; changing the names of persons or places; laying out, opening, altering and working roads or highways; vacating roads, townplots, streets, alleys and public grounds; locating or changing county seats; regulating county and township affairs; regulating the practice in courts of justice; regulating the jurisdiction and duties of justices of the peace, police magistrates and constables; providing for changes of venue in civil and criminal cases; incorporating cities, towns or villages or changing or amending the charter of any town, city or village; providing for the election of a board of supervisors; summoning and impaneling grand or petit juries; providing for the management of common schools; regulating the rate of interest on money; the opening and conducting of any election or designating the place of voting; the sale or mortgage of real estate belonging to minors or others under disability; the protection of game or fish; chartering or licensing ferries or toll bridges; remitting fines, penalties or forfeitures; creating, increasing or decreasing fees, percentage or allowance of public officers during the term for which said officers are elected or appointed; changing the law of descent; granting to any corporation, association or individual the right to lay down railroad tracks or amending existing charters for such purpose; granting to any corporation, association or individual any special or exclusive privilege, immunity or franchise whatever.

**Government.**—The supreme executive power of the State is vested in a governor, "who shall take care that the laws be faithfully executed." He must be 30 years of age and for five years next preceding his election a citizen of the United States, and of this State. His term of office is fixed at four years. Some of his powers are: Giving the general assembly information by message of the condition of the State at the commencement of each session, and recommending such measures as he deems expedient; convening, by proclamation, the general assembly upon extraordinary occasions; removing officers of his appointment for incompetency, neglect of duty or malfeasance in office; and granting reprieves, commutations or pardons after conviction for all offenses. He is commander-in-chief of the military and naval forces of the State—except when they are called into the service of the United States. He has a qualified veto power upon all bills passed by the general assembly, but bills may be passed over his veto by a two-thirds vote of each House. In case of his death, resignation, or conviction upon impeachment, the duties of his office fall upon the lieutenant-governor, who acts as president

of the Senate. He, with the secretary of state, the attorney-general, the auditor of public accounts, the treasurer and the superintendent of public instruction, is elected in the same manner, and except the treasurer, for the same length of time as the governor; the treasurer's term is two years.

A significant change for efficient and economic government, which marks Illinois as the leader in this respect went into effect 7 March 1917. The primary object of the new law—"The Civil Administrative Code"—of Illinois was to reorganize and consolidate the numerous state administrative officers, boards and commissions into a limited number of state departments as in the national government. Nine principal departments—finance, agriculture, labor, mines and minerals, public works and buildings, public welfare, public health, trade and commerce, registration and education—are created. These departments will absorb the functions of 40 executive officers, 50 boards and commissions, and a larger number of subordinate officials. All of the officials are appointed by the governor with the consent of the senate and for a term of four years (with the exception of the normal school board). Several new positions are created, and the more important officers receive larger salaries—the directors receive from \$5,000 to \$7,000 each. The net reduction in official positions, however, is about 100. Persons in the classified service are assigned to positions in the new departments. At the head of each department is a director. Under the directors there are subordinate officials. These are: In the department of finance, four divisional heads; in the department of agriculture, besides a food standard commission, an assistant director and six divisional heads; in the department of labor, besides an industrial commission consisting of five officers, an assistant director and three divisional heads; in the department of mines and minerals, an assistant director, a mining board consisting of four officers and the director of the department, and a miners' examining board of three officers; in the department of public works and buildings, an assistant director and eight divisional heads; in the department of public welfare, an assistant director and six divisional heads; in the department of public health, an assistant director; in the department of trade and commerce, an assistant director and four divisional heads, besides the public utilities commission consisting of five officers; and in the department of registration and education, an assistant director, a superintendent of registration and a normal school board consisting of 10 officers with the director of the department and the superintendent of the public instruction. Advisory and non-executive boards were created as follows: A board of agricultural advisors and a board of state fair advisors, a general board of free employment advisors and local boards, five advisory boards in the department of public works, a board of public welfare commissioners, a board of public health advisors, and two advisory boards in the department of education and registration. The qualifications, powers and duties of all directors, assistant directors, division heads and members of advisory boards are specified in the law. The salaries of the officers created are also specified,

but it is provided that members of advisory and non-executive boards shall not receive salaries. The law specifies the hours during which all public offices are to be kept open. The director of each department has authority to prescribe all necessary regulations for the conduct of his office. The Civil Service Law was not repealed, but no director needs to or should retain more employees than are necessary. All fees and funds received by any state officer or department are to be paid into the treasury within 10 days after their receipt. The governor is to submit to the general assembly, within four weeks after its organization, a budget containing the amounts recommended by him for the respective departments, offices and institutions and for all other public purposes together with the estimated total revenues and the amount to be raised by taxation.

The judicial powers of the State are vested in a Supreme Court, circuit courts, county courts, justices of the peace, police magistrates, and in such courts as may be created by law for cities and incorporated towns. The Supreme Court consists of seven judges and their term of office is nine years. The State is divided into 17 circuits, and the term of the circuit judges is fixed at six years. Inferior appellate courts of uniform organization and jurisdiction, and composed of circuit judges, have been created. The legislative power of the State is vested by the constitution in the general assembly which consists of the senate and house of representatives. Senators must be 25 years of age, and representatives 21; both must be citizens of the United States and five years resident of the State. No person convicted of infamous crime or a public defaulter is eligible as senator or representative or to any office of profit or trust in the State. In addition to the ordinary official oath, each senator and representative is required to swear in substance that his election has in no way been secured by bribery. The number of senators is fixed at 51, and of representatives at 153; minority representation is provided for in the election of representatives. Senators are elected for four years (about half retire every two years) and representatives for two. Their salary was fixed at \$5 per day during the session by the constitution, but it may be and has been changed from time to time by legislative act. A majority of members elected to each house constitute a quorum. Bills may originate in either house subject to amendment in the other. No act is to embrace more than one subject and that is to be contained in the title. Every bill must be read at large upon three different days in each house, and upon final passage the yeas and nays must be taken on each bill separately. No money may be drawn from the treasury save in the pursuance of an appropriation made by law. The general assembly is permitted to make appropriations for expenditures incurred in suppressing insurrection or repelling invasion.

Local government is of two general types—rural and urban. In each county from 9 to 13 officers are elected. The most common officers are the county clerk, the county judge, the county treasurer, the clerk of the circuit court, the State's attorney, the sheriff, the coroner, the county superintendent of schools and the county surveyor (a statutory officer). Any

county may adopt or discontinue the system of township organization, on petition and a popular vote. Eighty-five of the 102 counties in Illinois have the township system. In the 85 counties there are 1,430 civil townships, with an average area slightly less than 36 square miles. Most of these townships are decidedly rural, with a population of from 1,000 to 2,000, but except in Chicago, where the townships have been practically abolished, they include cities and villages within their limits; hence there are a number of townships which have from 10,000 to 60,000 people. Cook County, like those counties in which townships are not found, is governed by a Board of Commissioners. These towns have limited powers, much less than in New England, for the important matters attended to by the towns there are looked after in Illinois by the cities, villages and school districts. The townships are vested with corporate capacity, however, and may levy local taxes, make by-laws for a few enumerated purposes, vote to prohibit the granting of liquor licenses, and elect a number of officials for road and judicial administration and for the assessment and collection of taxes. The annual town meeting—of little importance—is held on the first Tuesday in April for the election of officers and the transaction of business. The ordinary town officers are supervisor, town clerk, assessor, collector, three commissioners of highways, and two to five justices of the peace and constables. Assistant supervisors are elected in the larger towns. The supervisor and assistant supervisors are members of the county board. The former acts also as town treasurer, and in many cases as overseer of the poor. The duties of the other officers are indicated fairly well by their titles. City government, until recently, was carried on largely under the authority of a mayor and a council, the former being an executive with appointive and veto power and the latter a legislative body. Chicago has created separate municipalities for different functions. In 1915 it had 22 governments and its citizens voted for 250 officials. Besides the mayor and councilmen, Chicago voters elected the city clerk, city treasurer, 31 municipal judges, and the bailiff and clerk of the municipal court, which is an elective, but not a taxing body. There were 16 independent park commissions with taxing authority. Within the last decade, however, the older system has been replaced to a certain extent by a newer and more efficient government—the commission form. The law making this possible was passed in 1910. It provides that when in cities and villages not exceeding 200,000, electors equal in number to one-tenth of the votes cast for mayor at the last preceding election petition the county judge for the commission form of government it is his duty to submit the proposition at a special election to be called within 60 days, and at this election a majority of the votes cast determines the result. Within five years after its passage, 39 cities and villages, including the capital, adopted the new form; many others have adopted it also within the last two years. The law abolishes the system of ward aldermen and the distinct powers of the mayor and council. The general authority and responsibility for the municipal government is entrusted to a council, consisting of a mayor and four com-

missioners elected at large. The executive and administrative work in cities under the commission plan is divided among the five departments, each assigned to one of the commissioners. The mayor is in charge of the department of public affairs. The other departments are: Accounts and finances, public health and safety, streets and public improvements and public property. The council elects a city clerk, city attorney, treasurer and other municipal officers as corporation counsel, comptroller, chief of police, chief of fire department and library trustees. In cities of over 20,000 the mayor and commissioners are required to devote at least six hours a day to their official duties.

**Revenue.**—The general assembly is empowered to provide needed revenue by levying a tax, by valuation, so that every person and corporation pays a tax in proportion to the value of his, her or its property. Certain property, however,—religious, charitable, etc.—may be exempted by general law. The so-called "general property tax," which is the chief support of State and local government, is assessed upon real and personal property at a supposed valuation of one-third of its "fair cash value." In Cook County and the counties not under township organization, the assessment of taxes is largely a county affair; in other places it is entrusted to the town assessors. Assessments are subject to revision by a county board of review and the State board of equalization. The latter consists of 26 members, elected by congressional districts. There is also an ex officio State Tax Levy Board and a Court of Claims. Other sources of revenue for the State are the inheritance tax and a special tax on the Illinois Central Railroad—7 per cent of the gross earnings. This tax in the first 51 years amounted to \$24,400,446.27; for some time it has yielded over a million dollars a year. For municipal governments there are licenses and similar charges. In 1917 Illinois faced an increase of 33 1/3 per cent in the cost of State government for the next two years. The amount asked, \$60,000,000, was just twice the amount appropriated six years ago, and \$14,000,000 in excess of the appropriations made in 1915. It was cut down somewhat.

**Suffrage.**—The qualified electors are all male citizens 21 years of age, who have resided in the State a year, in the county 90 days, and in the district 30 days next before the election. Women have the right to vote for all officers in the State, State and local, not created by the constitution, and in national elections for the president. The president is voted for by electors who are chosen as the State legislature may direct. On the other hand, senators and representatives in Congress are chosen by electors qualified to vote for members of the most numerous branch of the State legislature—a constitutionally created State office. Voting is by ballot and persons convicted of infamous crimes are excluded from the right of suffrage.

**Militia.**—All able-bodied male citizens between the age of 18 and 45 except those exempt by State or national law are subject to military duty and are designated as the Illinois State Militia. This body is divided into the organized and unorganized militia. The first is divided into the Illinois National Guard and the Illinois Naval Reserve. The Illinois National Guard forms the land forces in time of peace accord-

ing to the statute of 1909, it may consist of not more than 1 major-general, 3 brigadier-generals, 24 battalions of infantry, 1 regiment of cavalry, a corps of engineers, 3 batteries of field artillery, a signal corps, and a field hospital and ambulance corps, with the needed line, staff and non-commissioned officers and the officers of the retired list. The act provides that the infantry be organized into eight regiments, composed of 12 companies with a maximum of 1,154 men, commanded by a colonel. Two or more regiments of infantry commanded by a brigadier-general form a brigade. The statute provided that the staff be organized into the following 10 departments: The adjutant-general's department, the inspector-general's department, the quartermaster's department, the subsistence department, the ordnance department, the medical department, the pay department, the judge-advocate's department, the corps of engineers and the signal corps. This organization was considerably altered by the executive order of the governor which went into effect 1 Jan. 1914. The whole division organization was abolished, the office of major-general was discontinued, the number of brigadier-generals was reduced to two, and the subsistence department was consolidated with the quartermaster's corps. The Illinois Naval Reserve forms the naval force in time of peace. As provided in the statutes, it consists of a ship's complement of 12 divisions, with the necessary line, staff, warrant and petty officers, and the officers of the retired list. It is organized as a ship's crew, commanded by a captain. He is assisted by an executive officer known as the commander, a navigating officer of the rank of lieutenant commander, an ordnance officer and an equipment officer of the rank of lieutenant. The crew is divided into 12 divisions, of which two are steam engineers and one a band. In 1912, 521 officers and 5,586 men were enlisted in the National Guard; in 1916, the figures were 500 and 6,099. In 1912, 50 officers and 587 men were enlisted in the Naval Reserve; in 1916, the figures were 39 and 628. The governor has authority to call out the military forces to suppress mobs, riots or disturbances, and on such occasions commanding officers may make arrests without process.

**Politics.**—Illinois is divided into 25 congressional districts, but she has 27 representatives in Congress, two being elected at large. The reason for this is that the Illinois legislature did not redistrict the State after the last congressional reapportionment. The electoral vote of the State at successive presidential elections, since its admission in 1818, has been cast as follow, viz.: In 1820, for Monroe; in 1824, one vote for Adams and two for Jackson; in 1828 and 1832, for Jackson; in 1836 and 1840, for Van Buren; in 1844, for Polk; in 1848 for Cass; in 1852, for Pierce; in 1856 for Buchanan; in 1860 and 1864, for Lincoln; in 1868 and 1872, for Grant; in 1876, for Hayes; in 1880, for Garfield; in 1884, for Blaine; in 1888, for Harrison; in 1892, for Cleveland; in 1896 and 1900, for McKinley; in 1904, for Roosevelt; in 1908, for Taft; in 1912, for Wilson; in 1916, for Hughes. During this period the vote of Illinois in the electoral college increased from 3 to 29. Since the Civil War, the Republicans have met with well-nigh uniform success over their old rivals, the Democrats. Other parties, however, have sprung into existence, temporarily at least. In

1872, such men as Governor John M. Palmer, Senator Lyman Trumbull and Gustavus Koerner joined the Liberal Republicans. The National Grange or Patrons of Industry organized in 1869 for the object of uniting all agriculturists for the better securing of their rights as shippers and producers and for the social, moral and educational uplift of their children, entered politics in 1874. Aided by the Democratic Party and dissatisfied elements as the Independent Reform Party and the Democratic Liberal Party they defeated the Republican candidate for superintendent of public instruction and elected many fusion candidates in the smaller divisions of the State. No party secured a majority of the legislature. The Greenback Party in 1876 and other cheap money parties later on developed some strength. The most powerful third party movement, however, occurred in 1912, when Roosevelt as the standard bearer of the Progressives polled 386,478 votes as compared with 405,048 for Wilson, and 253,593 for Taft. In the election of 1916, the vote of the parties was as follows: Republican, 1,152,549; Democratic, 950,229; Socialist, 61,304; Prohibition, 26,047; Socialist Labor, 2,488.

**History.**—The name of the State is derived from "Illini," an Indian word meaning "men." The euphonic termination added by the early French explorers gives the name "Illinois." In 1659, Pierre Radisson and Medard Chonart des Grossilliers seem to have reached the upper Mississippi, but the real history of Illinois begins with the coming of Marquette and Joliet. In June 1673, they landed upon the east bank of the Mississippi in what is now Illinois. They descended the Mississippi to a point possibly within 400 miles of its mouth. Marquette established a mission at the ancient village of the Kaskaskias. La Salle, Tonti and Hennepin were also early discoverers. The former is credited with building the first fortress in the State, Fort Creve Coeur, in 1679, and with discovering the mouth of the Mississippi River. Here, on 9 April 1682, he took formal possession of "the Louisiana country" in the name of his master, Louis XIV of France. Permanent French settlements were made at Kaskaskia, Cahokia and Fort Chartres about 1720. At first "the Illinois country" was the dependency of Canada but by decree of the Royal Council in 1717 it passed under the government established for Louisiana. A little later, in 1721, it became, by virtue of the same authority, one of the separate provinces into which the Louisiana country was then divided. A commandant and judge were duly appointed, and the seat of authority was transferred to Fort Chartres. Population meanwhile gradually increased in the great American bottom, then embracing the French settlements in Illinois. The French, however, claimed more than they had the ability to hold, and in the long continued struggle with their old rivals, they were decisively defeated on the Heights of Abraham at Quebec, 13 Sept. 1759. By the treaty of Paris, 1763, the Illinois country passed to Great Britain. British domination in the Mississippi Valley, however, was of short duration. While the Revolutionary War was in progress George Rogers Clark at the head of a band of some 200 followers and bearing the commission of Patrick Henry, governor of Virginia, crossed the Ohio River, and landed near Fort Massac. After a perilous

six days' march he surprised and captured Kaskaskia, 4 July 1778, and soon the whole Illinois country acknowledged his authority. In the month of October, following the capture of Kaskaskia, the Virginia House of Delegates extended civil jurisdiction over the territory. Courts were established at Cahokia and Kaskaskia, and an election was held for civil officers. John Todd was lieutenant-commandant of the Illinois country from 1778 to 1780. In 1783, the territory passed to the United States by treaty, and a year later Virginia magnanimously ceded her claim to the national government with the understanding that the lands be sold to pay the war debts of the States.

In 1787, the Ordinance for the Government of the Northwest Territory was passed. The commission of Arthur St. Clair, the first governor, bears the date of 1 Feb. 1788, and soon thereafter judges and other officers were appointed, and the new government was duly organized. In 1790, Governor St. Clair paid his first visit to Kaskaskia, the county bearing his name having been established meanwhile. Five years later out of its territory, the county of Randolph was created. The county seats of these two historic counties were Cahokia and Kaskaskia. Pursuant to the provision of the Ordinance of 1787, the Northwest Territory having attained the requisite population, a general assembly was convened in Cincinnati in February 1799, and Illinois was now, for the first time, represented in a legislative chamber. In May 1800 Congress created Indiana Territory, which included the present States of Indiana and Illinois, and the seat of government was established at Vincennes. General William Henry Harrison, later a President of the United States, was the first governor. By judicious treaties with the Indian tribes, he maintained peace and obtained the cession of valuable grants which in time became the homes of white emigrants. The fierce hatred of the Shawnee chief, Tecumseh, for the whites was, in part, the result of these grants. His own tribe allied with the Pottawatomies and the Kickapoos failed to exterminate, as was the intention of Tecumseh, the white settlers, and ended with his own disastrous defeat at Tippecanoe in 1811, by which the power of these tribes was broken. The Fort Dearborn Massacre, 1812, also came about in part because of disputed land claims. From 1806 until 1809 a strong effort was made to organize Illinois as a separate territory. This movement succeeded in February 1809, and the capital was located at Kaskaskia. In 1812, a representative assembly was chosen, a territorial constitution adopted, and a territorial delegate in Congress was elected. Emigration from the older States had set in, and by 1818 the population of the territory was near 40,000. The general assembly in January of that year petitioned Congress for statehood. Nathaniel Pope was then territorial delegate, and through his influence the northern boundary was made 42° 30' instead of 41° 39', which seemed likely to prevail before his amendment. The bill, as amended, was passed, and on 3 Dec. 1818, Illinois was duly admitted as a State.

The social history of Illinois is intensely interesting. The first school was taught by Samuel J. Seeley in 1783 at New Design, in what is now Monroe County. The first Methodist church in Illinois was founded in 1793 at Shiloh in the

New Design settlement, and the first camp meeting was probably held near the same place in 1807. The first Baptist church in Illinois was also organized at New Design by David Badgley in 1796. One of the first Presbyterian churches was organized at Turkey Hill, a settlement four miles southeast of Belleville, 20 April 1820. Early missionaries and traveling ministers seemed disgusted with the religion and morals of early Illinois settlers, but the latter, it must be remembered, were typical frontiersmen. A Mr. Low, who was in Shawneetown in January 1818, describes conditions as follows: "Among its two or three hundred inhabitants there was not a single soul that made any pretensions to religion. Their shocking profaneness was enough to make one afraid to walk the street; and those who on the Sabbath were not fighting and drinking at the taverns and grog shops were either hunting in the woods or trading behind their counters. A small audience gathered to hear the missionary preach. But even a laborer who could devote his whole time to the field might almost as soon expect to hear the stones cry out as to expect a revolution in the morals of the place." Thomas Lippincott, for some time editor of the *Edwardsville Spectator* and later one of the trustees of Illinois College, said of Shawneetown in 1818: "We found a village not very prepossessing; the houses, with one exception being set up on posts several feet from the earth. The periodical overflow of the river accounts for this." The first newspaper of the State was the *Illinois Herald* started at Kaskaskia, 6 Sept 1814, by Matthew Duncan. In 1819, times were hard, prices were low and money was extremely scarce. A cow and a calf would not bring over \$5.00; wheat was 35 cents a bushel, and corn was as low as 10 cents. The following prices prevailed at Albion in 1819: a fine turkey, 25 cents; chickens, 12 cents; beef, 5 cents per pound; eggs, 12½ cents per dozen; cheese, 30 cents per pound; butter, 16 cents; bacon, 15 cents; flour, \$9.00 per barrel; deer (whole carcass including the skin), \$1.50; melons, 12½ cents; honey, \$1.00 per gallon; whisky, \$1.00 per gallon; fine Hyson tea, \$2.00 per pound; moist sugar, 31 cents; coffee, 62 cents; fish, 3 cents. During the first decade which followed the organization of the State, the habits of the people, in the main, were simple and their wants few. Barter in a large measure supplied the place of a medium of exchange. Commerce, in so far as it had any existence with the outer world, was by wagons across the Alleghanies, and by flatboats down the Ohio and the Mississippi. The log cabin furnished protection to the pioneer from the winter's storm. With rude implements of his own construction, he cultivated his fields, and with his rifle defended his loved ones from the incursions of the savage. At the time of its admission, there were only 23 post-offices within the limits of the entire State. At the period indicated and for years afterwards, the frontiersman regarded himself as especially favored if located within a dozen miles of a post-office. The mails reached the settlements weekly or monthly upon horseback or by stage coach. The log cabin with its puncheon floor supplied the double purpose of temple of learning, and place for public worship. Articles of apparel, were, with rare exception, of home manufacture. Railroads, col-

leges and universities were unknown. The first seminary in the State was organized at Rock Springs, 1 Jan. 1827 by John Mason Peck; it is now known as Shurtleff College and is located at Alton. Less than 10,000 persons were engaged in agricultural pursuits. Chicago had scarcely a place upon the map. Population drifted northward, however; in 1819 Vandalia had been made the capital, but in 1836 it was changed to Springfield. From 1818 to 1860, the most interesting internal questions were those relating to slavery, banking and internal improvements. Northern Illinois had been largely settled by people from the free States; southern Illinois, by people from the slave States. In 1823 the legislature, by the necessary two-thirds vote, submitted to the people the question of calling a convention to revise the constitution. This was undoubtedly with the object of introducing slavery. For 18 months the most intense excitement prevailed. Political leaders and newspapers were divided. Governor Coles, a Virginian and a former slave holder, Thomas Birkbeck, a gifted English writer, J. M. Peck, an influential Baptist minister, and Daniel P. Cook, an eloquent speaker, opposed the convention. Jesse B. Thomas, Richard M. Young, John McLean, E. K. Kane, John Reynolds, Thomas Reynolds and Ex-Governor Bond took the stump for the convention. The *Edwardsville Spectator*, the *Illinois Intelligencer* at Vandalia, and the *Illinois Gazette* at Shawneetown opposed the convention; the other two papers, the *Republican Advocate* at Kaskaskia and *The Republican* at Edwardsville favored it. The election on 2 Aug. 1824 resulted in the defeat of the convention by a vote of 6,640 to 4,972. The total vote cast was 11,612 as compared to 4,671 for presidential electors in November of that year. Eleven counties out of 30 favored the convention. They were Alexander, Pope, Jackson, Franklin, Gallatin, Hamilton, White, Jefferson, Wayne and Fayette. Johnson was a tie. Union was against the convention by 27 votes. All these countries, except Fayette, were in what was then regarded as the South. Slavery sentiment still persisted, however, and on 7 Nov. 1837, Elijah P. Lovejoy was murdered by a pro-slavery mob at Alton for trying to publish an anti-slavery paper. After this, sentiment seemed to change, and in 1842 the Liberty Party was organized; in 1848, it united with the Free Soil Party. The Republican Party was definitely organized in 1856. Immigration from the northern States had outweighed that from the southern States. As early as 1816 the territorial legislature had passed a law chartering banks at Shawneetown, Kaskaskia and Edwardsville. The charter incorporating the State Bank of Illinois was passed in 1821, and was to continue 10 years. The capital was \$500,000. The parent bank was to be located at Vandalia, and the branch banks at Edwardsville, Brownsville, Shawneetown and Albion. State bank bills were issued to the amount of \$500,000, but they soon depreciated to 30 cents on the dollar. The State had lost at least \$100,000 in this banking business, but after the expiration of the charter, in spite of bitter opposition, another State bank with a capital of \$1,500,000 was created. The principal bank was located at Springfield with a branch at Vandalia. The Shawneetown bank was revived with a capital of \$300,000.

In 1842, however, both the State Bank at Springfield and the Bank of Illinois at Shawneetown became bankrupt. The following year both were forced into liquidation, and the former was given four years to wind up its affairs. The "Free Banking Law" modeled after the New York Plan of 1838 was not passed until 1851. The State, however, lost heavily in other enterprises besides banking. In 1840 the people woke from their dreams to find that the State was \$14,000,000 in debt, its bonds worth only 14 cents on the dollar, and with nothing to show for it except a 25-mile railroad from Springfield to Meredosia. This was sold afterwards for \$106,000 in State bonds. The question of repudiation was agitated, but Governor Ford's decided stand in favor of payment without defalcation or discount saved the credit of the State. A large part of this indebtedness was due to unwise internal improvements. In 1837 alone, a bill appropriating \$10,200,000 was carried over the veto of the governor and the council of revision. This sum, with the exception of \$400,000 for improving the Wabash, Illinois, Rock, Kaskaskia and Little Wabash rivers and the Western Mail Route, and \$200,000 to pacify disappointed counties, was allotted for various railroads. It increased the debt from \$271,276 to \$6,668,784. The most important result of early internal improvements is the Illinois-Michigan Canal which was completed in 1848, after some 12 years of spasmodic work at a cost to the State of over \$5,000,000. The Illinois Central Railroad was given its charter in 1851, and the road was completed in 1856. The total cost according to Mr. Ackerman, president in 1883 when the statement was made, was \$40,000,000. Illinois has seen her share and borne her part in war. As the result of the Black Hawk War of 1831-32, Indian depredations ceased, and the remnants of the once powerful tribes disappeared forever from the State. What is known in local history as "the Mormon War" occurred in Hancock County on the Mississippi River. Nauvoo was the seat of Mormon authority and the site of a splendid temple. In 1844, Joseph Smith, the Mormon leader, was assassinated by a mob, and soon thereafter his followers left the State. Illinois furnished six regiments and some independent companies during the Mexican War and 255,092 soldiers to the Federal army during the Civil War. Strong opposition to the Federal policy, however, developed in 1863 and 1864. The Knights of the Golden Circle, a secret organization, sympathized with the South. One of the ways in which they showed their discontent was by trying to dissuade soldiers home on furlough from returning to their regiments at the end of their leave of absence. In the elections of 1864, nevertheless, the Republicans and Union Democrats united, and after an exciting campaign carried the day. In the Spanish-American War Illinois furnished nine regiments of infantry, one of cavalry and one battery of light artillery. In August 1917 the State was about 5,000 men ahead of her quota for the World War. Since 1865 the only additional questions that can be considered are those relating to labor and capital and improved highways. With the increasing importance of industry, so well revealed by the World's Columbian Exposition

held at Chicago in 1893, and with stronger organizations the relations between labor and capital have become more important. There are no authentic records for the beginning and growth of the Illinois State Federation of Labor prior to its seventh annual convention which was held in Jacksonville 14 Jan. 1890, but at that time there were 11 delegates who represented approximately 35,302 union men. At the convention held at Alton, 18 Oct. 1915, there were 596 delegates who represented 750,000 organized workers. Strikes have been common, and riots all too frequent. On 4 May 1886 a mob collected on Haymarket Square, Chicago, and when the police approached seven of the latter were killed by the explosion of a bomb. Eight men, termed anarchists, were tried for the crime; four were hanged, three were sent to the penitentiary and the other committed suicide. In 1894 the American Railway Union went out on a strike at Chicago. President Cleveland ordered Federal troops to the scene in order to preserve order and protect the mail. On 14 Aug. 1908 a race riot broke out in Springfield and for nearly two days lawlessness triumphed. Four regiments of militia were needed to restore order. Seven people were killed, more than 50 were wounded and property valued at over \$100,000 was destroyed. Early in July 1917 an even more disastrous and disgraceful race riot occurred at East Saint Louis, due largely to the industrial and social discontent aroused by the rapid influx of negro workers. The roads of Illinois deserve mention. The Tice Road Laws, 1913 and 1915, established system in the matter of improving highways. The law provides that about 18 per cent of all public roads of the State shall be "State Aid Roads." These are to be constructed or improved by funds furnished by the State and the counties in equal amounts. Under this arrangement, when improved, the State undertakes to maintain them forever at its expense, provided they are constructed of as good a type as concrete or brick. If the construction is of gravel or macadam the county shares equally with the State in the cost of maintenance; if the road is of earth, the cost of maintenance is borne wholly by the counties. The type of road to be constructed is left to the county boards provided they can agree; if they cannot determine the matter, the State Highway Commission may select the kind. These roads reach into every community of the State. Thirty per cent of the citizens reside along the system of State aid roads and 75 per cent of the people live along or within a mile of these thoroughfares. Not a home in the State will be further than four and a half miles from these State aid roads. The following funds made available by equal appropriations from the Federal government and the State have been definitely allotted by the Department of Public Works and Buildings, acting in conjunction with the board of highway advisers: (1) \$1,413,000 to the National Old Trails road beginning at the Indiana State line and connecting Marshall, Greenup, Effingham, Vandalia, Greenville, Collins and East Saint Louis; (2) \$1,020,000 to the Lincoln highway connecting Chicago, Wheaton, Geneva, De Kalb, Rochelle, Dixon, Sterling, Morrison and Fulton; (3) \$2,215,000

to the Chicago-Springfield road connecting Chicago, Joliet, Morris, Ottawa, LaSalle, Peoria, Mason City and Springfield; (4) \$958,000 to the Springfield-East Saint Louis road connecting Springfield, Carlinville, Staunton, Edwardsville and East Saint Louis; (5) \$114,000 to the Dixie highway connecting Chicago, Chicago Heights, Mommence, Watseka and Danville; (6) \$400,000 to the road from Chicago to the Wisconsin line connecting Chicago, Waukegan and Zion City. These allotments cover the amount to be received up to and including 1 July 1920, available as follows: \$1,326,000, 1 July 1917; \$1,326,000, 1 July 1918; \$1,765,000, 1 July 1919, and \$2,209,000, 1 July 1920.

N. H. DEBEL,

*Professor of Economics, Goucher College.*

**ILLINOIS, University of,** the State University, situated at Urbana. It was founded in

acceptance of the national land grant of 1862 (see COLLEGES, LAND GRANT) and was incorporated in 1867 as the Illinois Industrial University. It was opened 2 March 1868, with a faculty of three and about 50 students. In 1870 women were admitted; in 1877 the State legislature granted power to confer degrees; and in 1885 the name was changed to the University of Illinois. It was the first American university to give shop instruction, a mechanical shop being equipped in 1870. It is governed by a board of trustees, consisting of three ex officio members, including the governor, and nine elective members. The undergraduate department includes the college of liberal arts and sciences, of engineering and of agriculture; corresponding graduate courses are given; other departments of the university are the State library school, the school of music, the college of law, the college of medicine, the college of dentistry and the school of pharmacy, the three latter being situated in Chicago. The university has a number of valuable scientific collections; the agricultural experiment station, organized under the Federal law of 1887, is controlled by the university trustees, and is supported by State and national appropriation; the general university library numbers 325,000 volumes besides pamphlets; other libraries under university control are the library of State Laboratory of Natural History (8,000 volumes and 39,266 pamphlets), the library of the college of law and special collections in connection with the professional schools. The annual income amounts to \$2,500,000, mostly from a one-mill tax; the number of students in all departments was 6,150 on 1 Nov. 1915, the number of faculty and administrative officers, 780.

### ILLINOIS CENTRAL RAILROAD.

The history of the Illinois Central Railroad embraces many interesting episodes, some of which bore directly in their effect on the building up of the nation, of the State of Illinois and of the city of Chicago. Prior to the incorporation of this line, the State of Illinois had vainly endeavored to establish an effective and profitable central railroad. In doing this, a large State debt accumulated and the outlook for wiping out that debt was not at all promising when the act to incorporate the Illinois Central Railroad Company was approved by Governor French on 10 Feb. 1851. As events have proved, this act produced results more momentous in the history of the State and of the United States than any act approved by an Illinois executive before or since.

The inception of this important enterprise dates back to 1835, when two of the State's most famous men, Hon. Sidney Breese and Hon. Stephen A. Douglas, first discussed publicly the advisability of penetrating the centre of the State by means of a railroad and thus opening up a vast territory which at that time was an uninhabited and partially unexplored wilderness. On 16 Jan. 1836, the State legislature passed an act incorporating "The Illinois Central Railroad Company." Two years later an attempt was made to start this road, which was intended to run 457 miles. The sum of \$3,500,000 was appropriated for the route, but within a few months the difficulties surrounding the situation in the matter of actual track-

laying became so great that, after an expenditure of \$506,000, principally on surveys and preliminary work, the plan was abandoned.

In 1843 a private corporation entitled "The Great Western Railroad" secured a charter and began work, but soon became discouraged and surrendered their charter. In 1849 this charter was renewed, only to be again surrendered to make room for the road now operating and known as The Illinois Central Railroad. At the time the road was commenced by the present corporation it was estimated that the aggregate cost would be about \$15,000,000. The actual cost for construction, including all extension up to the present time, has been nearly \$50,000,000.

**Original Charter Directors.**—The 12 directors selected in 1851, under the charter and known as the "Charter Directors," included nine prominent New York men and three well-known citizens of Boston. The directors from New York were Robert Schuyler, George Griswold, Gouverneur Morris, Jonathan Sturges, Thomas W. Ludlow, John F. A. Sanford, Henry Grinnell, Joseph W. Alsop and Leroy M. Wiley. Those from Boston were Franklin Haven, Robert Rantoul, Jr., and David A. Neal.

**Population.**—In 1850, shortly before the chartering of the railroad, Illinois stood 11th in population and 17th in wealth among the States. The marked difference during the following 10 years is worthy of note as showing the direct effect of improved and extended railroad accommodation. In 1860 Illinois stood fourth in population among the States, also fourth in wealth.

**Railroad Conditions in 1851.**—In 1851, when the charter of the present road was granted, the population of Chicago was 30,000. That city had no railroad connection with the East nor in any other direction. In the same year the Hudson River Railroad, 140 miles, from New York to East Albany, was opened. Other events of importance during 1851 were the extension of the Baltimore and Ohio Railroad to Cumberland and the opening of an Erie Railroad line from Pierpont on the Hudson of Dunkirk on Lake Erie. Wisconsin had 20 miles of railroad at that time. The railroad mileage of Indiana was 228 miles, and of Kentucky 78 miles. Just prior to the chartering of the Illinois Central there were 111 miles of railroad track in the State. When the 50th anniversary of the road was held at Chicago in 1901 it was announced that the company was then operating railroads in 13 States.

**Development.**—The first section of the road, covering 705.50 miles, and running from Chicago to Cairo and from Centralia to Dubuque, was opened on 27 Sept. 1856, being about five and one-half years after the issuing of the charter. Since the opening of this main line other lines have been purchased, including part of the Saint Louis, Peoria and Northern railroads from Springfield to East Saint Louis, Illinois, in 1900. This purchase was followed by a number of other purchases and absorptions.

**Roads Acquired by Purchase, etc.**—From Springfield to East Saint Louis, Ill. (part of the Saint Louis, Peoria and Northern); Peoria, Decatur and Evansville, extending from Pekin, Ill., to Evansville, Ind., with a branch to New

Harmony, Ind.; Chicago, Madison and Northern; Kankakee and Southwestern; Chicago and Springfield; Saint Louis, Alton and Terre Haute; Chicago, Havana and Western; Mound City; Chicago and Texas; Riverside and Harlem; the parts of the Rantoul and Illinois and Indiana railroads lying in the State of Indiana, extending from West Lebanon to State line and from Switz City to State line.

**Leased Lines.**—The leased lines of the Illinois Central Railroad are Kensington and Eastern; South Chicago; Blue Island; Peoria and Pekin Union; Dubuque and Sioux City; Chicago, Saint Louis and New Orleans and the Canton, Aberdeen and Nashville railroads.

**Mileage.** (See Annual Report, p. 15).—The corporation now controls one of the most important groupings of railroad lines in the United States. The total mileage operated, according to the latest official report available, is 4,766.93 exclusive of the Yazoo and Mississippi Valley Railroad (1,371.98 miles). The length of the main line, from Chicago to Cairo, Ill., is given as 364.73 miles; Omaha Division, from Chicago to Council Bluffs, Ia., 513.96 miles; New Orleans Division, from Cairo to New Orleans, La., 547.79; Louisville Division, from Memphis, Tenn., to Louisville, Ky., 398.12 miles; other lines owned or leased operated in the system, 2,549.12.

**Additional Tracks.** (See Annual Report, p. 15).—The length of line having two tracks is 799.62 miles; third and other additional main tracks, 194.49 miles; sidings, etc., 2,129.65. The gauge of this system is 4 feet 8½ inches. The average weight of steel rails is 72.78 pounds.

**Charter Tax.**—The charter of the company, reserved to the State of Illinois, calls for payment, in lieu of taxes, of 7 per cent of the gross receipts of the 705.50 miles of road originally built under that charter. The total amount paid to the State of Illinois under the provisions of this charter, from the opening of the road in 1855 to 30 June 1916, was about \$34,000,000.

**Dividends.**—Between the beginning of operations in 1851 and 30 June 1916, the stockholders received about \$189,000,000 as dividends out of the earnings of the company.

**Rolling Stock.**—The rolling stock of the company, 30 June 1916, included 1,419 locomotives, 521 passenger and chair cars, 32 café dining cars, 165 baggage, mail and express cars, 43 postal cars (3 of these partly owned), and 61,048 freight cars, making a total, with minor items under this head, of 62,347 cars.

**Earnings.**—The earnings of the road, for the year ending 30 June 1916 amounted to \$69,077,342.56, or \$14,490.37 per mile. These earnings were divided as follows: Passenger traffic, \$16,836,511.03; freight traffic \$46,457,388.45; miscellaneous earnings, \$5,783,493.08.

**Net Earnings, Receipts and Dividends.**—The net earnings of the road for the year ending 30 June 1916 were \$17,903,614.82.

**Expenses.**—Operating expenses of the road for the year ending 30 June 1916 amounted to \$51,173,727.74, or \$10,734.73 per mile. The amount paid for taxes (1915-16) was \$3,724,020.73.

**Bonded Debt.**—The bonded debt of the road, including about 30 investments, aggregates \$280,239,000. Of this total the last issue that matured was \$88,000, issued in 1880 and ma-

turing in 1910. An issue of \$2,800,000, placed in 1869, matured in 1917. The next, following in order, is an issue of \$968,000 made in 1881 and maturing in 1921; an issue of \$470,000 made in 1883 and maturing in 1923; an issue of \$538,000, made in 1886 and maturing in 1931; an issue of \$241,000, made in 1887 and due in 1932; an issue of \$34,500,000, issued in 1895-1905, and due in 1951; and \$25,000,000 issued in 1892, and due in 1953.

**Opening up of the State.**—The beginning of active operations in establishing the line marked the beginning of State development throughout a vast area which, up to that time, had been inaccessible to traffic of any kind except by means of the most rural contrivances, utterly inadequate for any but the most restricted local demands. The new move toward opening up commercial possibilities immediately doubled the price of public lands. These tracts were readily bought up as conditions improved and steadily increased in value year by year.

At a critical juncture in the nation's history, when it became necessary to move regiments, brigades and divisions of western troops to the scene of active Civil War operations, the Illinois Central Railroad provided the only available means of adequate rapid transportation. At the same time, the existence of that railroad and its excellent management made the prompt supply of rations and forage possible.

**Payment of State Debt.**—As mentioned in a previous paragraph, the attempt of the State to operate successfully a central railroad ended in utter failure. In 1851 the people of Illinois were under a burden of some \$60,000,000 as the outcome of the experiment. The establishment and active operation, with ever continuing development of the road, enabled the whole of that debt to be paid off in due course with proper interest.

**Other Benefits to State and City.**—The persistency of the railroad authorities in extending their own lines and giving added vitality to smaller railroads made possible the cultivation of the Grand Prairie, previously waste, thereby raising the prestige of the State as a productive national factor of extraordinary importance. It is on record that over \$3,000,000 has been expended since about 1836 by the railroad company upon the construction of dikes, piers and breakwaters to protect the city against lake encroachments. Very great benefits, too, have been derived by Chicago from being brought into close commercial touch with prairie lands and the agricultural area of the Lower Mississippi Valley. Chicago has also gained an outlet by rail to the Gulf of Mexico. It is said, to the credit of the Illinois Central Company, that the extent and vigorous administration of its affairs during the period extending from the inception of the World's Fair in 1893 until its close made the success of that enterprise possible by furnishing ample transportation within its jurisdiction for the immense passenger and freight traffic which impended there from start to finish.

**Statistical.**—The States in which the Illinois Central Railroad is now operating are Illinois, Indiana, Wisconsin, Iowa, Nebraska, Minnesota, South Dakota, Kentucky, Tennessee, Mississippi, Louisiana, Missouri and Alabama. The present total mileage of the road, includ-

ing leased lines and the Yazoo and Mississippi Valley Railroad, is nearly one-half the railway mileage of the State. The total number of stockholders in the company, according to the latest report of the Interstate Commerce Commission, is 10,697. The par value of stock outstanding since 1908 was \$109,296,000. The highest rate at which stock was quoted in 1904 was 159; lowest 125¾. The highest rate quoted for 1905 was 183; lowest 152¾ at end of 1910, around 135.

Other lines operating in Illinois are the Santa Fé; Baltimore and Ohio; Chicago and Alton; Chicago and Northwestern; Chicago, Burlington and Quincy; Chicago Great Western; Chicago, Indianapolis and Louisville; Chicago, Milwaukee and Saint Paul; Chicago, Rock Island and Pacific; Cleveland, Cincinnati, Chicago and Saint Louis; Erie; "Frisco System"; Grand Trunk; Great Central Route; Iowa Central; Lake Erie and Western; Lake Shore and Michigan Southern; Louisville and Nashville; Michigan Central; Missouri Pacific; Mobile and Ohio; New York, Chicago and Saint Louis; Pennsylvania; Southern; Toledo, Saint Louis and Western; Vandalia; Wabash and Wisconsin Central.

**ILLINOIS COLLEGE**, an institution located in Jacksonville, Ill., the oldest college in the State, founded in 1829, largely through the efforts of the "Yale Band," an eastern organization of seven college men. The first president was Edward Beecher, brother of Henry Ward Beecher. In 1916 the total attendance was 370 students with 25 instructors. The endowment in that year was about \$389,000; total value of endowment and plant being about \$707,000. The institution is coeducational and includes in addition to the college department, a conservatory of music, and the preparatory department, Whipple Academy. The college library contains about 19,000 volumes.

**ILLINOIS INDIANS** (*Iliniwek*, men), a confederacy of Algonquian tribes, formerly occupying southern Wisconsin, northern Illinois and sections of Iowa and Missouri. It comprised the Cahokia, Kaskaskia, Michigamea, Moingwena, Peoria and Tamaroa. Early explorers differ greatly in their estimates of the number of the confederation. They were almost continually at war with the Sioux, Foxes and other northern tribes. A struggle with the Iroquois about 1675 greatly weakened them and liquor obtained from the French well-nigh destroyed their morale. By 1750 they numbered about 2,000, which was greatly reduced in the war of extermination by the Lake tribes in revenge for the murder of Pontiac. In 1778 the Kaskaskia still numbered over 200 souls, while the Peoria and Michigamea together numbered 170. In 1800 there were only 150 left. In 1883 the survivors represented by the Kaskaskia and Peoria, sold their lands in Illinois and removed west of the Mississippi, and are now in the northeast corner of Oklahoma, consolidated with the Wea and Piankashaw. In 1905 their number was 195. The Illinois were tall and robust, with pleasant visages. They appear to have been timid, easily driven from their homes by their enemies, fickle and treacherous. They were excellent archers, and used also in war a kind of lance and a wooden club. Polygamy

was practised and unfaithfulness in a wife was punished by cutting off the nose of the offender. It was not the custom of the Illinois, at the time the whites first became acquainted with them, to bury their dead. The body was wrapped in skins and attached by the feet and head to trees. It is supposed, however, that the skeletons were later placed in the earth. Prisoners of war were usually sold to other tribes. The huts of the northern tribes were made like long arbors and covered with double mats of flat flags or rushes sewed tightly together. There were four or five fires to each cabin and two families to each fire. The towns were not inclosed. Cahokia, Kaskaskia, Matchinkoa, Moingwena and Peoria are among the villages of these tribes which were known to the white pioneers. Consult 'Handbook of American Indians' (Vol. I, pp. 597-599, Washington 1907).

#### ILLINOIS AND MICHIGAN CANAL. See CANALS.

**ILLINOIS RIVER**, the principal affluent of the Mississippi, formed by the confluence of the Kankakee, Des Plaines and Du Page rivers, in Grundy County, about 40 miles southwest of Chicago. Its entire course of nearly 500 miles is within the State, through a fertile, undulating country, rich in bituminous coal deposits. It flows first westward to Ottawa and La Salle, at Depue bending southwestward past Lacon, Chillicothe, Peoria, Pekin, Havana and Beardstown, and near Naples turning due south and joining the Mississippi about 18 miles above Alton, at the mouth of the Missouri. The river is 1,200 feet wide at its mouth and is navigable throughout to La Salle where a ship canal about 120 miles long connects it with Lake Michigan at Chicago, thus ensuring a clear waterway from the Great Lakes to the Mississippi and the Missouri. The Illinois has numerous tributaries of which the Fox and Sangamon rivers are the chief.

**ILLINOIS STATE NORMAL UNIVERSITY**, located at Normal, a suburb of Bloomington, Ill., was founded in 1857. It is the oldest State normal school in the Mississippi Valley, and has furnished principals or instructors for nearly all of the younger normal schools in the central and western States. Up till 1916 it had given instruction to 27,576 normal students, nearly all of whom have become teachers. Its graduates number 2,616. The school occupies five buildings upon a beautiful campus of five acres. It is well equipped with a library, laboratories, gymnasium and apparatus for instruction in all the various branches of study. Its revenue, about \$230,000 per year, appropriated from the State treasury, includes the interest derived from the college and seminary funds, granted by the Federal government in 1818. It is governed by the Board of Education of the State of Illinois, a body of 15 appointed by the governor. The State superintendent of public instruction is ex officio secretary of the board. Its sole purpose is to prepare teachers for the schools of the State; accordingly students are required to sign a pledge declaring their intention to teach. Tuition is free. The organization includes the teachers' college with a full four-year course to prepare high-school teachers, principals and superintendents; the normal

school to educate teachers for the elementary and rural schools; the university high school and the elementary training school. The two latter serve for the practical training of student teachers. The scope of its work includes the preparation of every kind of teacher needed in the public schools. The required work includes courses in pedagogy, psychology and general method, history and philosophy of education, school management and the Illinois school system and one year of practical teaching in the training department. Along with these are provided courses in special method in the various branches of the elementary and high-school course. Special courses are provided in manual training, art, vocal music, the household arts, commercial branches and agriculture. The attendance in 1916 was 2,806, besides 630 in the training department. The regular faculty of instruction numbers 61; 40 additional teachers are employed in the summer school. The presidents of the institution have been Gen. Charles E. Hovey (1857-61); Richard Edwards (1862-76); Edwin C. Hewitt (1876-90); John W. Cook (1890-99); Arnold Tompkins (1899-1900); David Felmley (1900-).

**ILLINOIS WESLEYAN UNIVERSITY**, founded in 1850 under the auspices of the Methodist Episcopal Church, at Bloomington, Ill. The college courses provide for the degrees of B.A., B.S., LL.B. It has, also, a preparatory school and a law school. The number of students is 640, professors 40, volumes in library, 12,000.

**ILLITERACY**, inability to read or write, or both. The basis of estimation is either a general census of the population over a certain age, the percentage of those unable to sign their marriage certificates, or the records of army recruits. The following table gives the percentage of illiteracy in the several nations among those over a certain age, varying from 5 to 12. The dates are generally in the neighborhood of 1910.

COUNTRY	Year	Per cent illiterates
Austria	1910	18.7
Belgium	1910	12.7
Bulgaria	1905	65.5
England and Wales	C. 1910	5.8
France	1906	14.1
Germany	C. 1900	0.11
Greece	1907	57.2
Hungary	1910	33.3
Ireland	1911	9.2
Italy	1911	37.0
Malta	1901	57.5
Netherlands	C. 1900	4.0
Portugal	1911	68.9
Roumania	1909	60.6

**ILLUMINATED MANUSCRIPTS.** See MANUSCRIPTS, ILLUMINATED.

**ILLUMINATI**, i-lū-mī-nā'tī ("the illuminated"), a name taken by or given to various groups of individuals existing during the past 2,000 years, who believed in and taught a doctrine of illumination or inner light. The fundamental idea of their faith was that living a life of purity and service would open the inner senses, so that they would obtain spiritual sight or clairvoyance, becoming seers, etc., able to see and converse with the angels, discarnate intelligences or beings of higher planes. Many have thought that these associations, which are hinted at as existing at various periods since the time of Christ, were survivals of the Eleusinian mysteries (q.v.). They had many ideas in common with the Hermetic and other old philosophies, but were specially characterized by a conviction that it was possible to do the things later recorded of Joan D'Arc and of Emmanuel Swedenborg, both of whom believed that they were in regular communication with and directed by intelligences from the heaven world. In 1490 a reference is found of them under the title of Aluminados. In 1511 the Spanish Inquisition (consult 'Los Heterodoxos Espanoles,' Vol. V, 1881), considered a case of a woman of this order, who claimed to hold conversations with the Virgin Mary. She escaped, but at later dates the Inquisition severely prosecuted many who held such doctrines. Among them were the Guerists, who flourished mainly in France in the 17th century. The Illuminati were closely related to the Rosicrucians (q.v.), of which a modern organization exists. There are many Freemasons who believe that their own organization was founded on an earlier body, perhaps more or

less identical with the Illuminati, as many of the teachings are similar. The Perfectibilists of Germany and the Martinists of France were also sometimes known as Illuminati, from their teachings. Adam Weishaupt has written several German works that discuss the progress and beliefs of the Illuminati. Compare **MYSTICISM**. Consult Tschackert, 'Hauck's Realencyclopädie' (1901).

**ILLUMINATING GAS.** See GAS ILLUMINATION.

**ILLUMINATING GAS ENGINE.** See INTERNAL COMBUSTION ENGINE.

**ILLUMINATION.** See GAS ILLUMINATION; ELECTRIC LIGHTING; STREET LIGHTING; LAMPS.

**ILLUSION**, in psychology and in epistemology, a perception which fails to reveal the true character of an object perceived. The word illusion is used in three different ways: (a) The mental construction, on the basis of data which are real in their own proper sphere, of a psychal object, which an illuded person accepts as real, but which is unreal or fantastic; (b) a mental object thus constructed; (c) the general mental acceptance and substitution of what is unreal for real.

In short, an illusion is an error. An error is nothing more than a psychological condition of blindness to the truth. By truth may be understood an inner assimilation of reality. The number of errors is unlimited, truth alone is one. When in psychological literature the word illusion occurs, it conveys one of the two ideas which receive definition respectively in definitions *a* and *b*; the notion conveyed in above occurs less frequently. Illusion is thus any mistaken mental construction which has reliable data as its point of departure. It always means a misinterpretation of the significance of a particular sensory impression. A sensory impression is the effect of an event upon a sentient being. But illusions occur in connection with not only the senses of taste, smell, touch, hearing and seeing, but also with certain other and more obscure modes of consciousness. In truth it must be said that the senses represent reality neither wrongly nor rightly. All that science can say about the sense-organs in this connection is that under different circumstances they produce different sensations and perceptions. So that the term sense-illusion is a very misleading expression. The circumstances which condition sensation are extremely various in character. They are partly external, being inherent in the objects, partly internal, being inherent in the sensory organs, and partly interior, being confined in their activity within the central organs; and therefore, it can sometimes appear, when notice is taken of only the external circumstances, as if an organ acted differently under identical conditions. Thus it became customary to call the unusual effects sense-deceptions or sense-illusions. Consult Ernst Mach, 'Über die Abhängigkeit der Netzhautstellen von einander' (in the 'Vierteljahrsschrift für Psychiatrie,' Leipzig and Neuwied 1868). Indeed there are no such things as illusions of sense at all. Objects of sense experience, even when they occur in dreams, are the most indubitably real objects known. The truth is, that that which makes us call such ob-

jects unreal in dreams is merely the unusual connection in which they stand with other objects of sense. Objects of sense are called real when they have the relation with other objects of sense which experience has led us to regard as normal. Failing this, we call them illusions. But what is deceptive or illusory is only the inferences to which they give rise. In themselves, they are every bit as real as the experienced objects of waking life. And conversely, sensible objects of waking life must not be assumed to have any more intrinsic reality than sensible objects of dreams. It is only by some reality not merely sensible that dreams can be condemned. Illusion thus is a broad term. It covers all those errors of the logical operations as well which are not of the persistence or of the indirect delimitation, in any system of beliefs, which characterize delusions.

In mental pathology it is necessary to distinguish illusion from delusion (just used) and hallucination. In common parlance these terms are often confused, and many use them as if strictly synonymous. But this is not so among writers in psychiatry, for in this science these three terms are very clearly differentiated. And it is highly necessary that these distinctions should be observed, because these terms stand for very different phenomena in mental disease—phenomena of different value and importance, and each with its own special significance as to a patient's condition. An illusion is distinguished from an hallucination in a twofold manner. In an hallucination the trustworthy data are absent; that is, the determining elements in the construction are either purely imaginative or of organic origin. Both these cases manifest themselves on the border, or over the border, of the pathological. Hallucination is narrower in application than the word illusion. It is confined to the perceptual—objects of sense in contrast with the delusion of the higher mental processes. The limits of the three terms among themselves is however largely practical. The central processes of illusion and of hallucination, arising from organic causes, are one and the same. In most cases of either, the influence of the delusional elements are due to the earlier condition of the mind—notably, to emotional states. The cases of so-called pure sense-illusion, on the other hand, are really cases of perception, not of illusion at all; since they are normal, constant and (contrary to the vulgar opinion) common to all individuals, and also exposed by resort to *tests* outside of the sphere of the particular sense concerned. Still a distinction between the usual and normal sense-deceptions and the abnormal and unusual false interpretations of sensory impressions and stimuli is very desirable. Some misinterpreting mental attitudes or factor seems necessary to the formation of the ordinary illusion. In the abnormal type of illusion its aetiology and nature is not much distinguished from hallucination. This fact is illustrated by the illusions of the insane. In the case of the insane, it is very difficult to decide whether there exists an illusion or pure hallucination, correlated with sensory and bodily elements. Ordinarily, when the mind is acting in a perfectly normal way and there is nothing to confuse its impressions or to obstruct its proper perceptive powers, a sensation, whether of the eye, ear, taste or skin is conveyed to the con-

sciousness and is recognized correctly. Thus a sound, as the note of a bird or the voice of a friend; or the sight of some object, as of an animal moving in the distance, is properly conveyed to the intelligence and is properly recognized. But this process may be interfered with in various ways. Even the normal mind may make mistakes in the interpretation of sensations, and still more so may the mind that is impaired. It thus happens that all illusions are not necessarily evidences of a diseased mind; this faulty action of the senses, or of the perception, may and often does happen in the cases of persons of sound mind. For instance, a person walking along a path in the dusk may mistake a bush for an animal; he simply misinterprets an object and this object is not imaginary but has a real existence. So, too, the mirage which sometimes appears at sea, might lead a perfectly ignorant person to maintain that he saw a ship inverted sailing in the sky. These are instances of illusions in which the normal mind may be temporarily deceived. But the normal mind tends to correct its illusions, and this it does sooner or later according to its opportunity and its degree of knowledge. In this respect the insane mind differs from it; the illusions of the insane are usually firmly believed in; there is no spontaneous tendency on the part of the insane mind to correct its illusions. On the contrary, they are firmly embraced and are often made the starting point of a train of associated morbid ideas, whereby the mental disorder is all the more confirmed.

An hallucination differs from an illusion in the fact that it is entirely subjective. In a strict sense it is a disorder of perception in which the external sense organs do not participate and it leads to a belief on the part of the patient that he perceives some external object, whereas in fact there is no such object corresponding to the perception. In other words, it is a disorder of perception giving rise to a false belief in a sensation. For instance, a person believes that he hears the voice of an acquaintance speaking to him, when there is no voice either of the acquaintance or of anyone else; or, again, a person thinks he has a vision of a deceased friend or of some other spiritual being, whereas there is no external object or person whatever giving rise to this or any other sensation. The whole process, therefore, is subjective or within the patient's own mind; it is without any objective equivalent. It is thus readily seen that an hallucination is much more deeply seated than an illusion, and is a much more direct evidence of a disorder of the mind. Some authorities doubt indeed whether a true hallucination ever occurs in a normal person; what appears to be so in any given case would probably be found on strict inquiry to be an illusion. Although this may be an extreme position, the fact remains that hallucinations are very rare in the sane and very common in some forms of insanity; and that, as in the case of illusions the sane tend to correct them, while the insane adhere to them with unswerving belief. The most common hallucinations of the insane are the visual and the auditory, and they are sometimes very grave symptoms. Auditory hallucinations are especially dangerous, for they may lead the patient to commit acts of violence in response to their suggestions.

A delusion differs from both an illusion and

an hallucination in the fact that it is not a sensory disorder—but a derangement entirely within the intellectual sphere. It is an erroneous belief, but one which is due entirely to mental disorder. The latter part of this definition is essential, because a delusion is essentially something more than a mere error of belief or judgment. It is an erroneous belief that is due to insanity, or to a disordered mind. Mere errors of belief may and do occur in persons who are sane: no person, in fact, is exempt. Such errors may be due to ignorance, prejudice or faults of education, but they are not evidence of insanity; otherwise the whole world would be insane. In the case, however, of an insane pauper who believes that he is a multi-millionaire, or that he is emperor of the United States, there is obviously something more than a mere erroneous belief in the sense of an error of judgment or opinion. Such a patient has developed an idea which no sane man in similar circumstances could have developed; in other words, he has a delusion, and he is not insane because he has the delusion, but he has the delusion because he is insane. The insanity or mental unsoundness is the fundamental fact and is shown usually by other symptoms besides the tendency to form delusions. As in the cases of illusions and hallucinations, the insane cling to their delusions with great tenacity; no argument, no logic moves them. The delusions of the insane are usually distinguished as systematized and unsystematized. In the former the delusion has a certain consistence, coherence and endurance; in the latter the ideas are more or less incoherent and changing. Delusions again may be expansive or depressive, according to the emotional tinge. See also IMAGINATION; INSANITY.

**ILLUSIONS, Optical.** See ILLUSION.

**ILLUSTRATION OF BOOKS.** There are two kinds of book-illustration: (1) an artist's attempt to make visual representation of scenes, or characters, or objects described in the text; (2) decoration and ornamentation for the purpose of embellishing the page. In both cases the illustration of books has followed the development of graphic art and the mechanical developments in the processes of book-making. The books that have been the most frequently illustrated are the Bible; the 'Arabian Nights'; 'Æsop's Fables'; the 'Fables of La Fontaine'; the 'Stories of King Arthur and his Round Table'; Dante's 'Divine Comedy'; Perrault's 'Fairy Tales'; Grimm's 'Fairy Tales'; 'Reynard the Fox'; and the plays of Shakespeare.

The earliest known illustrated work is the wonderful set of Egyptian papyrus rolls called 'The Book of the Dead,' written 15 centuries before Christ. The pictures painted in colors prove, notwithstanding their stiff hieratic style, that the ancient Egyptians were expert draughtsmen and understood the art of producing direct illustration of very high pictorial quality. References in the writings of Latin authors show that illustrated books were very abundant in Rome in the libraries of the wealthy. These were manuscript books adorned by painters or by draughtsmen. The earliest specimen of an illustrated manuscript that may be seen by the public (and, perhaps, it may be the oldest Celtic manuscript extant), is the

famous 'Book of Kells,' dating from the 7th century and preserved in Trinity College, Dublin. The 'Book of Kells' is not only a superb example of the scribe's patient handwriting, but its abundant colored pictures and large decorative initial letters and borders of the pages show that Celtic taste was highly advanced and that Celtic fingers were highly trained in the art of book-ornamentation.

During the Middle Ages books were the luxury of the wealthy. Comparatively few persons could either read or write. Learning was almost confined to the monasteries. The bookish man was usually a monk, for those who loved study usually entered the priesthood. Noblemen, as a rule, spent their time fighting or practising arms in the tilt-yard of the castle and their wives, daughters and sweethearts were occupied in household affairs or sat before their embroidery frames (see EMBROIDERY). In the evening the household and guests assembled in the great hall of castle or manor-house, where often some strolling minstrel or *trouvère* would recite, or chant, a famous story. Perhaps this would be one of the great Arthurian group, such as 'Launcelot of the Lake' or 'Tristan and Iseult'; perhaps one of the Charlemagne cycle, such as 'Huon of Bordeaux'; or 'Bertha with the Big Foot'; or one of the Crusader's tales, such as 'Baldwin, Count of Flanders.' Such stories were called "Romans" and took the place of our modern novel. They were kept in circulation and made popular by these traveling minstrels and *trouvères* (as they were called in France), and would have been handed down orally, if unrecorded. Happily, however, in the monasteries and in private households, monks, scribes and painters copied these famous works and illustrated them, finding models and inspiration in what they saw around them. These specialists in the art of "illuminating" were lavish with their work which was of beautiful style, marvelous in minute detail and of exquisite finish. The small medallions, or pictures, called "miniatures," were sometimes done by one person and the decorative initial letters and borders by another worker, who also inlaid the gold leaf, whence the adjective "illuminated." Bibles, missals, breviaries, books of hours, books of music and dry chronicles were illustrated in like style throughout Europe. Wealthy lords purchased these superb books and specially ordered books for gifts from monasteries, when they did not keep their own artists. René d'Anjou had a staff of copyists and book-painters and his library was famed in the 15th century. Many of his sumptuous volumes are now owned by the Emperor of Austria. The Bibliothèque nationale in Paris owns the largest collection of "illuminated manuscripts" of the Middle Ages in the world. The British Museum also has a fine collection, including the 'Harleian Ms.' and so has the Bodleian library in Oxford. The New York Public Library possesses some choice specimens of "illuminated manuscripts" and an excellent collection is permanently exhibited at the Metropolitan Museum in New York. A superb collection of "illuminated manuscripts" perished in the burning of the University in Louvain by the Germans in 1914—an irreparable loss. Apart from their artistic beauty these "illuminated manuscripts" afford unlimited suggestion

to decorators for motives of design and original lettering. They are, moreover, a storehouse of information for the historian, because the ancient illustrators depicted the scenery, architecture, costumes and personages that they saw around them. Many an old Flemish and French town appears in a Bible in a gold-brightened miniature as the artist's idea of Jerusalem, or Bethlehem, and many a contemporary king or queen masquerades as a Biblical character. In the case of Froissart's 'Chronicles,' however, the painter depicted actual scenes and real portraits. Therefore the pictures in an illuminated Froissart are often more valuable to the modern student than even the vivid writing of the old French chronicler.

This particular kind of book-illustration came from the Byzantine monasteries and spread throughout Europe. Old Persian manuscripts show that the art is of Oriental origin. The same style of decoration was followed in embroidery; and church vestments were adorned with needle-wrought pictures similar to those in the "illuminated manuscripts." See **EMBROIDERY**.

The fashion of book-illustration changed when printing was invented in the 15th century. Pictures drawn by the artist were now cut on blocks of wood by a special worker and inserted in the page of type. Some of these old wood-cuts were crude and rough with coarse lines and some were colored in gaudy tues. English billed sheets, called "broad-sides," and chap-books sold by peddlers for a few pennies were illustrated in this way.

The Italian artists with their refinement of taste and imaginative qualities made the illustrated Italian books of the Renaissance veritable works of art. They are highly prized by the book-collector. The decorative title-pages, borders, vignettes, tail-pieces, initial letters and pictures produced by the Italians — particularly the Florentines — form a chapter by themselves in decorative art as well as in the art of book-illustration. The ornamentation of these Italian books can be compared only to the filagree-work of the goldsmiths of the Renaissance; and it is most natural that the designs should be similar, since many of the Florentine painters of the early years of the Renaissance were goldsmiths. Such was Sandro Botticelli (1444-1510), for example, whose illustrations of Dante's 'Divina Commedia,' made in 1492 for Lorenzo di Pier Francesco, rank among the most wonderful of all engravings. One rarely thinks of Botticelli, the great painter of spring ('Primevera'), 'Venus Rising from the Sea' and the 'Madonna of the Magnificat,' as an engraver; but these pictures for Dante's work, preserved, some in the Vatican and some in the Berlin Cabinet, show Botticelli as one of the greatest masters of the single line — almost Japanese in his simplicity and directness. These illustrations were sketched in silver print and finished with pen and ink. A few of them are in color. The style of the Renaissance is to be found in every illustrated book of the 15th and 16th centuries, whether published in Italy, France, Spain, England, the Low Countries, or in the Holy Roman Empire (which included the present Austria and Germany). Every title-page was ornamented with leafy scrolls, mermaids, sirens, cupids' heads, sea-horses and mythological figures or interlaced strap-work;

and every chapter and section began with a decorative initial letter and ended with a tail-piece. Even treatises on medicine and hand-books for the use of furniture-makers had such rich embellishments. On books of travel and geography the illustrators lavished all their skill. Maps appealed especially to the Renaissance illustrators and open to the student a vast field of information and to the decorator a world of design.

The books illustrated by Dürer (1471-1528) and Holbein the younger (1497-1543) are examples of the Renaissance as interpreted by the German mind. Holbein had great influence upon contemporary English taste, as he resided in England and was a great friend of the leader of taste and literature — Sir Thomas More. In the decoration of books the fashionable style of the day is always to be found. Therefore, in the days of Louis XIV we see the influence of Bérain and Lepautre taking the place of the Renaissance style. In the next period, that of the Regency and Louis XV, the styles of Watteau, Fragonard, Huet and Boucher are just as noticeable. Correspondingly in England the "Chippendale" style (derived from the Louis XV style) appears on many a title-page, exhibiting interlacing curves, rock-and-shell (*rococo*), dripping water, Chinese mandarins, pavilions and floral emblems. Then comes the pseudo-classic Louis XVI period, with its elongated ovals, slender lines, urns, trophies and classic ornamentation. It is only necessary for an expert to open a book in order to tell the period of its manufacture, even if there is no date on the title-page. Some of the most charming ideas and loveliest ornamentation are to be found in various editions of La Fontaine's Fables, Molière's plays and, in fact, all the plays and novels of the 17th and 18th century authors. The French have always excelled in the art of book-illustration, both in color and in black-and-white. Throughout the 18th century and until the last quarter of the 19th, when the half-tone process of reproduction was introduced, the artist's work was reproduced by means of the wood-cut, or steel engraving, or copper-plate etching. (See **ENGRAVING**). Nothing is more charming than the old wood-cut, which has a peculiar softness and delicacy. For the development of its technique Thomas Bewick (1753-1828), an Englishman, was largely responsible. Bewick was remarkable for his great precision of outline, his tint and his so-called "white line." His illustration of 'British Birds,' Gay's 'Fables' and Æsop's 'Fables' are classic. His contemporary, William Blake (1757-1827), was a remarkable instance of an inspired genius at creation and a master of technique. All artists study Blake's 'Illustrations to the Book of Job' (1826). The next period of English illustrators is headed by George Cruikshank (1792-1878), who never quite gets away from caricature in which he was a master. Cruikshank is somewhat vulgar at times, but he has humor and often a delightful fancy. His illustrations of several old 'Fairy Tales' appeal to artists. One can hardly ever think of Dickens' works apart from Cruikshank, who shares fame as a Dickens illustrator with John Leech (1817-64) and Hablot K. Brown (1815-82), known as "Phiz."

It is interesting to speculate on how Thackeray would have treated the 'Pickwick

Papers' if Dickens had given him the requested permission to illustrate them. William Makepeace Thackeray (1811-63), was almost as great a draughtsman as novelist. In his illustrations for his own novels—'Vanity Fair,' for instance—he presents a world of humor, sometimes direct and sometimes subtle, which appeals as strongly to artists as to lovers of literature. Thackeray evidently inspired the work of W. S. Gilbert (1836-1911), whose delightful illustrations of his own 'Bab Ballads' are unsurpassed in the field of humorous drawing. Like Thackeray, Gilbert gets marvelous effects with the greatest economy of line. The pose of a dancer's foot, the sweep of a skirt, or the expression of the eye, are quite sufficient to excite laughter.

Of enormous influence in both England and America, as well as in his own France, was Gustave Doré (1833-83), a native of Alsace. Doré's chief illustrations were for editions of Rabelais (1854); Balzac's 'Contes drolatiques' (1856); Dante's 'Inferno' (1861); 'Don Quixote' (1863); La Fontaine's 'Fables' (1863); Milton's 'Paradise Lost' (1866); Tennyson's 'Idylls of the King' (1867); and Coleridge's 'Ancient Mariner' (1876). So popular were the pictures of this artist that there was practically a Doré cult for years. The next group of illustrators was headed by Sir John Millais (1829-96), who made successful pictures for an edition of Trollope's novels. Rossetti, Holman Hunt, Ford Madox Brown and others followed, and contemporary novels, stories and poems show the types and fashions of the day even better than the fashion-plates. Dante Gabriel Rossetti (1828-83) illustrated his own poem the 'Blessed Damosel' and the pictures enjoyed great vogue.

Of extraordinary decorative quality is the work of Aubrey Beardsley (1872-88), who in an edition of Pope's 'Rape of the Lock' allowed his fancy free play but restrained his hand for a fine display of technical skill. He also made a remarkable frontispiece for Ben Jonson's 'Volpone.'

For pure imagination, original treatment and magnificent technique nothing equals the illustrations made by Sir John Tenniel (1820-1914), for Lewis Carroll's 'Alice in Wonderland' (1866) and 'Alice Through the Looking-Glass' (1870). Tenniel so perfectly realized Lewis Carroll's ideas of Alice and the strange creatures she saw in her dreams that these books present one of the happiest examples of the illustrator's art. Tenniel also illustrated the 'Arabian Nights' (1863).

Hugh Thomson (1860), an English artist, has been nearly as successful as Austin Dobson in portraying the 18th century. His illustrations of Mrs. Gaskell's 'Cranford,' Jane Austen's novels, Charles Reade's 'Peg Woffington' and Goldsmith's 'She Stoops to Conquer' are charmingly treated with a light, sympathetic touch.

Another devotee of the 18th century is Randolph Caldecott (1846-86), whose delightful humor and trained brush and pencil turned to light work. He is best remembered in his series of nursery rhymes and ballads including 'John Gilpin,' 'Elegy of a Mad Dog' and the 'Great Panjandrum Himself.' Caldecott also illustrated Mrs. Ewing's stories (1878).

An illustrator who has had great influence

upon the art of book illustration is Kate Greenaway (1846-1901). Her excellent drawing, her exquisite color and her graceful ornamentation are supplemented by a charming interpretation of the 18th century, resulting in a "Greenaway style." Miss Greenaway's illustrations for Madame d'Aulnoy's 'Fairy Tales' (1871) are not so well known as her illustrations of the poems of Jane and Anne Taylor, Browning's 'Pied Piper' and many nursery rhymes.

Another English woman-illustrator, Beatrix Potter, attracted attention about 10 years ago for her lovely color and quaint fancy and humor. Her illustrations to her miniature 'Peter Rabbit' books are masterpieces. Among illustrators in color, Walter Crane (1845-1915), is conspicuous. His best work has been done in illustrated books for children, such as the 'Baby's Opera,' the 'Baby's Bouquet,' 'Cinderella,' 'The Three Bears,' 'Masque of the Flowers,' etc. Walter Crane has also done beautiful work in black and white, including an edition of Grimm's 'Fairy Tales.' The latest illustrator in color about whose great talent three countries are agreed is Edmund Dulac (1882), a Frenchman, who now resides in London. He brings out, year after year, the most artistic books. Dulac ranks among the greatest illustrators of the present day. He is noted for his splendid and harmonious treatment of color and his poetic ideas. Dulac has illustrated the 'Arabian Nights' (1907); Shakespeare's 'Tempest' (1906); the 'Rubaiyat of Omar Khayyam' (1909); 'Sleeping Beauty and Other Tales' (1910); Edgar Allan Poe's 'Bells and Other Poems' (1911); and Hans Andersen's 'Snow Queen and Other Tales' (1912).

American illustrators have, generally speaking, followed the lead of English artists. One of the most original illustrators is F. O. Darley (1822-88), a New York artist, who did an enormous amount of work for magazines and illustrated a great number of books. Darley was not only a fine draughtsman, but he possessed vigor, style and fancy. Those who own editions of Washington Irving, James Fenimore Cooper, Nathaniel Hawthorne and Longfellow with pictures by Darley are fortunate. Darley's technique was drawn from the English school, but he was thoroughly American in style and feeling. He was too American to catch the spirit of Dickens; consequently, his illustrations to Dickens's works fall below his own standard, as shown in his treatment of American authors.

The most famous American illustrator of the 19th century was Edwin A. Abbey (1852-1910), whose sympathies turned to literary subjects. Abbey's illustrations to Shakespeare are admired in England as well as in America. He also illustrated many plays of the 18th century. Many American illustrators have attained just fame for skilful drawing and clever treatment of subject; and because of this general excellence few names stand out prominently and few Americans have attracted attention because of any single performance. Arthur B. Frost (1851-), however, achieved a triumph with his illustrations in pen-and-ink for the first series of 'Nights with Uncle Remus.' Frost caught the high imaginative qualities of Joel Chandler Harris and produced pictures that

show a wonderful blending of the negro and animal set forth amid realistic Southern scenes and they exhibit a delicious humor. They are as closely identified with the text as Tenniel's pictures are with the text of 'Alice in Wonderland.'

The invention of the half-tone process made the reproduction of photographs an easy matter. Illustrated books became more plentiful and cheaper, although, from an artistic point of view, the old woodcut, which gives a direct reproduction of an artist's work, take superior rank. In one particular, however, the half-tone photograph has fulfilled a mission in the illustration of books of travel. In olden days an album of pictures, drawn, or painted, by an artist—J. W. M. Turner, for instance,—and reproduced by steel engravings, was a gift book for the wealthy. Today, the more accurate camera and the quick and inexpensive half-tone have brought the illustrated book of travel within the reach of every purse.

ESTHER SINGLETON.

**ILLYRIA**, i-līr'ī-ā, or **ILLYRICUM**, a name anciently applied to a considerable region on the east side of the Adriatic Sea, the inhabitants of which were the ancestors of the modern Albanians. In 228 B.C. it became a Roman province. After various vicissitudes under different rulers it formed part of the Franco-Napoleonic empire as the Illyrian provinces. In 1815 it reverted to Austria and became the kingdom of Illyria, a title it retained until 1849, when it was divided into the provinces of Carinthia, Carniola and the Coastlands. The inhabitants are Slavs, Germans and Italians.

**ILLYRIANS**, the people who about the time of Herodotus dwelt on the eastern shores of the Adriatic Sea. Little is known of their racial origin. They were represented as a barbarous people by the Greeks, but archæological research shows the stages of their civilization from the Neolithic Age onward. Implements of iron and bronze, silver, amber and glass ornaments attest a high degree of culture. In Dalmatia they were mixed with the Celts, and Celtic place names are common there to the present day. The Albanian language is probably derived from one of the two groups into which the ancient Illyrian tongues were divided. Consult Brugmann, K., 'Kurze vergleichende Grammatik der Indogermanischen Sprachen' (Strassburg 1904).

**ILMENITE**, or **MENACCANITE**, also known as titaniferous iron ore, is a black, heavy, mineral crystallizing in the hexagonal system. It is widely distributed, occurring in diorites and many other igneous rocks. It is an oxide of iron and titanium containing when pure 36.8 per cent iron and 31.6 per cent titanium, and is frequently associated with magnetite. Iron ore containing ilmenite occur in vast masses in the Adirondack region of New York, in Quebec, Canada, and in northern Minnesota, and ilmenite is a common constitu-

ent of the black sands found on some ocean beaches. The presence of titanium decreases the fusibility of an iron ore, hence the failure of many attempts to work back sands in the blast furnace. It is likely, however, that the titaniferous iron ores will become important sources of iron by the development of special methods for their treatment. See **TITANIFEROUS IRON ORES**.

**ILOCOS NORTE**, ē-lō'kōs nōr'tā, Philippines, a province of Luzon, occupying the north-western part of the island; greatest length, 79 miles; area, 1,265 square miles (including the dependent island). Chief town, Laoag. Two mountain chains inland extend parallel with the coast; the surface otherwise is much broken by foothills, but it is fertile and well watered. Among the natural wonders of the province is a grotto 39 acres in extent and of great beauty, situated in Lice Mountain. The products include rice, cotton, chocolate, corn, sugar and a fair grade of tobacco; there are deposits of iron and copper in the mountains, the latter having been worked by the natives. The chief industries are agriculture, horse and cattle raising, fishing and the weaving done by the women. Civil government was established in September 1901; the people of the province are among the most progressive and industrious of the native races. Pop. 179,000, mostly Ilocanos and Igorot.

**ILOCOS SUR**, soor, Philippines, a province of Luzon, on the west coast, bounded on the north by Ilocos Norte and on the south by Unión; length 70 miles; area 492 square miles (including dependent islands). Chief town, Vigan. The eastern boundary consists of a chain of mountains rising 4,150 feet in Nagupu and sloping toward the coast in terraces; the rivers are small. The coast road runs through the province from north to south, connecting the important towns and villages. The soil is fertile, the principal products are rice, corn, sugar, indigo, chocolate, peanuts and vegetables; the chief industries, other than agriculture, are the weaving of cotton cloth, the manufacture of baskets, hats, card cases and pipes, and cattle raising. There is also considerable trade, carried on mainly through the native markets in the different towns, and some export. Civil government was established 1 Sept. 1901. Pop. 187,500, mostly Ilocanos.

**ILOILO**, ē-lō-ē'lō, Philippines, province of Panay, including the eastern and southeastern coast of the island; greatest length, 111 miles; area, 2,102 miles (with dependent islands). A range of mountains follows the northern and western boundary lines; the rest of the surface is undulating, sloping to the sea. There are several large rivers, the most important being the Jalaur and the Jaro. This province has some of the best roads in the archipelago; the principal towns are connected with the capital, Iloilo, and some of the rivers are navigable for native boats to the foot of the mountains. The products include sugar-cane, corn, rice, coffee, chocolate, tobacco and hemp; there are also in the province deposits of gold and iron, stone quarries and extensive forests. The chief industries are live-stock raising, the weaving of fabrics of pineapple fibre (piña) and cotton and the manufacture of sugar. In

1899 the United States troops occupied the province, immediately began operations against the insurgents who were located there with headquarters at Santa Barbara, and succeeded in dispersing their forces. In April 1901 civil government was established. The inhabitants are mostly of the Visayan race and are generally Catholic, though some of the mountain tribes are still heathen. Pop. 423,500.

**ILONGOT**, i-lŏn'gŏt, or **IBALAO**, e'ba-lou, a primitive people of Malayan stock, who dwell in northern Luzon, P. I. They are head hunters and are among the least known and least civilized tribes in the Philippines. Their dwellings are scattered and their social organization is of the most primitive and simplest type. They number about 3,000.

**ILOPANGO**, ē-lŏ-pān'gŏ, Salvador, Central America, a lake of volcanic origin, six miles southeast of the city of San Salvador, about 10 miles long by 6 miles broad. It has several islets, one of conical shape about 400 feet high, formed during a volcanic eruption in 1879-80. Fish abound, although the waters exhale a disagreeable sulphurous odor, and are unpotable. The surface of the lake is 1,200 feet below the level of the surrounding country; when ruffled by a breeze the waters have a singularly brilliant parrot-green color. It is regarded as one of the most beautiful lakes in Central America, and is a resort for the people of the capital.

**ILORIN**, ē-lŏ-rĕn, or **ALORI**, ā-lŏ-rĕ, West Africa, the capital of a province in British North Nigeria, 170 miles northeast of Lagos. It is encircled by an earthen dyke and has several mosques. The principal industries are leather-making, pottery, wood-carving and cloth weaving. Mohammedanism is the religion of the majority of the inhabitants. Pop. about 60,000.

**IMAGE**, in optics, the picture or impression produced by the luminous rays from an object reflected or refracted in mirrors or lenses when they enter the eye of an observer as if they had proceeded from a representation of the object. More correctly, the image is the locus of the foci (or circles of least confusion. See **FOCUS**) of rays from consecutive points of the object. When the light rays actually pass through the points of the image the image is real and may be thrown upon a white screen. If no screen is interposed the image can be seen by an eye placed in the pencil of rays which pass through it. When the light rays do not actually pass through the points of the image, but diverge from one another on leaving the mirror or lens, the image is said to be virtual, and cannot be thrown upon a screen; it becomes visible to an eye placed in the pencils of rays which appear to have passed through it. See **LENS**; **MIRROR**; **OPTICS**.

**IMAGE**, **Psychological**. The term as employed in psychology has two different meanings. Traditionally, the image is a copy or representation of a former perception, or a compound of such representations, as for example, the picture we see when with closed eyes we recall or imagine some object. Such an image, however, is complex, and by analysis it reduces to a number of simple images which synthetically combine to form an idea just as

a number of sensations combine to form a perception. A more careful terminology, therefore, would regard the image as simple and would define it as "an elementary mental process, akin to sensation and perhaps indistinguishable from it, which persists when the sensory stimulus is withdrawn or appears when the sensory stimulus is absent." (Titchener). Notwithstanding the greater accuracy of this second definition we shall (since we are interested primarily in the general nature of imaginal experience), employ the term in its common rather than in its technical sense. We shall, therefore, take the image to mean the conscious representation of former experience.

It is a moot question whether the image differs psychologically from sensation. Some psychologists believe that the image is more filmy, and faded out than sensation, and that its intensity and duration are characteristically less. But to this it is replied that these are differences in degree, and not in kind; that sensations themselves show these differences. The only certain distinction, therefore, is logical rather than psychological; we say that we have a sensation when the stimulus is present and an image when the stimulus is absent. In everyday life, of course, there are still other cues which are taken by the individual to mark off sensory from imaginal experience; images are frequently less distinct, they are of shorter total duration, they fluctuate, they fade out and disappear, they do not belong to the situation in which at the moment we find ourselves, etc., but all these when taken as cues are meanings which we put upon the bare experience, and, therefore, we often find that we are wrong, that the experiences which we take to be perceptual are, after all, imaginal.

If, however, we compare different kinds of image, then we find some that are clearly more like sensations than others. One group contains images which are conditioned upon recent stimulation of the sense-organ. The positive after-image which has the same quality as the sensation which precedes it, the negative after-image which always appears in an antagonistic quality, and the memory after-image which is similar to the positive but has other conditions—all three occur upon the cessation of the stimulus, and are undoubtedly sensory in character.

There are others, which we may call concomitant images because they fill out or occur concomitantly with perception, that are not so obviously sensory as those in the first group. The memory color image by means of which we always see an object in the same color quality that is familiar to us in daylight; the "tied image" which, for example, appears in mutilated letters or outline drawings as gray lines or patches of color, and thus fills out the lacunæ in the perception; and finally the image of synæsthesia, the best known example of which is colored hearing (sound accompanied by color)—all of these have the marks of sensory experience as regards their relative stability, uniformity of occurrence in the same individual, and their concomitance with other sensory experience; but, on the other hand, they appear also to be conditioned upon associative tendencies in the brain, i.e., we see ob-

jects according as they mean, or, as in synæsthesia, there is probably some abnormality among the associative fibres. Images in this group are, therefore, peripheral in character but centrally initiated.

There remain still other images which are dependent neither upon recent stimulation, nor upon concomitant perception but only upon associative tendencies. There are two kinds of these "free images," the image of memory and the image of imagination. So long as the images are simple, psychology is unable to distinguish them, but in the complex form they are accompanied either by the feeling of familiarity or by the feeling of strangeness. In the former case the idea comes to us as consciously familiar, and we call it the image of memory; in the latter the idea comes to us as new, and we designate it the image of imagination. When once we have learned to recognize them, however, we find that their life histories are not the same. The image of memory, for instance, is subject to change in the course of time—it may fade out, it may approximate to a type, or it may be incorporated into a new complex part of which is imaginal. The image of imagination, on the other hand, is more stable, it may maintain both form and quality for a long time and then it dies away. Furthermore, an image of memory may appear in different modes without change of meaning, e.g., a series of non-sense syllables may be learned visually and recalled verbally, whereas the image of imagination cannot be replaced by imagery from another sense department.

All modes of sense experience may be represented in imagery. But visual images are most common; then, in descending order of frequency comes auditory, touch and temperature, pain, taste and smell, and finally kinaesthetic and organic images. Kinæsthetic imagery is so similar to kinæsthetic sensation that it is distinguished with difficulty, and auditory imagery so frequently occurs concomitantly with throat-kinæsthesia that the existence of pure auditory imagery has mistakenly been called into question.

Finally there is large individual variation in the nature and frequency of characteristic imagery. In some individuals imagery is clean cut and intensive; in others indistinct and weak. Again, in some individuals nearly all forms are experienced; in others scarcely any imagery is to be discovered. It has been found, however, that an individual's imagery tends to conform to one of four types. There is first a versatile type which employs visual, auditory and verbal-kinæsthetic images without preference for any one. Secondly, there is a visual type in which visual imagery is predominant although verbal-kinæsthetic imagery is also used. Thirdly, there is an auditory-kinæsthetic type, and finally, an almost purely verbal-kinæsthetic type. It should be remarked, however, that these types are only approximations. The kind of imagery which an individual employs at any given moment depends in large part upon such varying conditions as age, mental habits and the circumstances of that moment.

*Assistant Professor of Psychology, Cornell University.*

**IMAGES, Veneration of,** the practice of venerating, worshipping and honoring in public or private graven or painted representations of sacred things or persons. Because of the general prevalence of idolatrous worship of images, the Jews in the Old Law were forbidden the making of images, although evidence of the lawfulness of the practice is afforded in the positive command to "make two cherubim of beaten gold on the two sides of the oracle," to "make a brazen serpent and put it up for a sign." Though the walls of the catacombs, which were the refuge of the first Christians in times of persecution, show many symbols, such as the anchor, palm branch, dove and fish, it was not those primitive believers who introduced images and pictures into the churches. Indeed, during the great struggle against heathenism, there was a strong opposition to any form of idolatry. It was not until after the period of the persecutions that the use of sacred images or paintings became open and undespised. The Council of Elvira (A.D. 306) decided against the use of pictures in churches, yet during the following 90 years pictures of martyrs and saints were set up in sacred edifices. The representation of Christ in the form of a man was ordained at the Sixth General Council (Constantinople 692), instead of, as heretofore, under the symbol of the Lamb. Images of the Holy Trinity were later sanctioned by the Second Council of Nice (787), though a distinction was laid down between adoration (*latreia*) and reverence (*douleia*), the latter to be paid only to the persons represented, and not their images. With the spreading of the custom came the adoption of incense and candles. A school of iconoclasts—image-breakers—arose in the Eastern Church during the 8th century, entirely condemning not only the veneration paid to the images, but even the existence of them. In 726 the Emperor Leo III prohibited the practice and soon after (730) ordered the images to be destroyed. The Church split into two parties over the question, each in turn persecuting the other. The controversy, which lasted over a century, was ended under the Empress Theodora by a council at Constantinople in 842 declaring in favor of image worship among the Greeks. The decision was confirmed by another council in 869-70. In the modern Greek Church *ikons* or pictures are permitted, but no graven images; in the Roman Catholic Church the use of images was continued. Though not accepted by the English Church of that period, images were later introduced. Consult Damascene, 'Treatise on Holy Images,' translated by M. H. Allies (1898).

### IMAGINARY CONVERSATIONS.

Opinions may differ as to the relative position of Landor's 'Imaginary Conversations' among the major classics of English prose, but the right of the book to be numbered among them can scarcely be called in question. The 'Conversations' have never been popular in the broad sense of the term, nor did Landor intend them to be so. It was always his endeavor, in the phrase of Bacon, "to single and adopt his reader." To read the 'Conversations' with pleasure requires not only a considerable background of learning, especially in history, but also a respect for and sensibility to refined literary style. In the 'Conversations' Landor attempted to restore to life, as far as the imagination can do so, illustrious or at least interesting characters of the remote and the near past, to set them in a situation congenial to their self-expression, and then permit them to reveal in dialogue what to Landor seemed their significant phases of mind and personality. The incidents of the action which Landor employed are not usually recorded events of history, but constructions of his own imagination fashioned to harmonize plausibly with his characters. This imaginative revivification of personality was not merely pictorial, not merely objectively dramatic in intent. Landor's effort was to do more than tell a story, it was to picture the souls of his personages, to show how they may have felt and thought. This was obviously the most difficult task he could have set himself, calling as it does both for the scientific accuracy of the historian and the creative exuberance of the poet. The 'Conversations' cover, moreover, an extraordinary range of subjects, including statesmen, philosophers, scholars, writers, soldiers and what for lack of a better term, we may call gentlemen and ladies, from almost every civilized people of the world. They differ considerably in length, in method of treatment, and also in interest. Occasionally we have the feeling that the dialogue is not really conversation, that speech succeeds speech without much relation to the character of the speakers, so that the names of the characters being removed, we seem to have an uninterrupted flow of comment on an idea. This happens when the characters have not been found with a really vital situation. Not a few inaccuracies in matters of detail have been pointed out in the 'Conversations,' and occasionally the dialogues seem longer than the importance of their thought justifies. But all qualifications having been made, the 'Conversations' still remain distinguished for their learning, their wisdom, and above all for their sympathy with the intellectual passions of mankind.

Various attempts have been made to classify the 'Conversations,' sometimes as to subject matter, sometimes as to the difference of manner or spirit in which they were written. Landor, however, seems to have had no system in mind when he composed them. They were written at different times, in the end reaching a total of about 150, over a wide stretch of years, but they were not produced according to a program, and consequently cannot well be reduced to one. Individual moments of life interested Landor most, not general states of society or complicated sequences of events, and therefore one would not look for a high de-

gree of organization in the relation of the dialogues to each other.

Perhaps the least contestable merit of the 'Conversations' is their possession of the virtue of style. It is customary to speak of Landor's style as classic, and so it is in its restraint and evenness, in its unflinching sense for dignity and beauty of form. It is not, however, the monumental and oratorical style of Roman prose that one thinks of in reading Landor, but rather Greek prose style, with its nice balance between colloquial ease and literary formalism. Landor passes lightly from familiar conversation or exposition to the language of poetry, often of restrained eloquence. Perhaps his most charming passages are the short idyllic and lyric amplifications which are to be found in every 'Conversation' the subject of which permits such graceful embroidery. More serious passages are cast in severe but never elaborately artificial form. Indeed Landor's prose is always easy, though never realistically familiar, always consciously artistic, though never painfully labored. It has neither the rapidity, nor the curtness, nor the concealed ingenuity not infrequently found in later English prose. It is distinctly a 19th century prose style, but about it there still lingers some of the serene dignity of the literary ideals of the preceding century. In this sense also Landor's prose may be designated as classical.

GEORGE PHILIP KRAPP.

*Professor of English, Columbia University.*

### IMAGINARY QUANTITY.

An imaginary or complex quantity is an expression consisting of a pair of real numbers, or numbers which can be represented by positive or negative terminating or non-terminating decimals. The pair consisting of  $a$  and  $b$  is written  $a + ib$ , which is in general different from  $b + ia$ . A complex quantity of the form  $a + i0$ , is said to be real, but must not be confused with a number which is real in the primary sense, notwithstanding the many common properties which the two possess. A complex quantity of the form  $0 + ib$  is called a pure imaginary. If  $x$  be the complex quantity  $a + ib$  and  $y$  is the complex quantity  $c + id$ ,  $x + y$  is defined as  $(a + c) + i(b + d)$ , and  $xy$  as  $(ac - bd) + i(bc + ad)$ . Most of the theorems of arithmetic and algebra suffer no loss of validity by their transference to complex quantities, while, as was proved by Gauss, every algebraic equation in complex algebra has at least one root. For this reason, complex algebra is the algorithm of mathematicians *par excellence*.

$0 + i1$ , or  $i$ , as it is written, has the property that its square is  $-1$ , so that it is often written  $\sqrt{-1}$ . It cannot be defined as  $\sqrt{-1}$ , however, for in ordinary algebra  $\sqrt{-1}$  is meaningless, and operating with meaningless symbols yield sheer nonsense. On the other hand, if we start with complex algebra, the symbol  $i$  is usually one of the initial concepts.

The so-called Argand representation of the complex number  $(x + iy)$  is the point  $(x, y)$  on a Cartesian co-ordinate-plane. If the angle between the  $x$ -axis and the line from the origin to  $(x, y)$  be  $\theta$ , and the distance from the origin to  $(x, y)$  be  $\rho$ , we get the result that  $x + iy = \rho (\cos \theta + i \sin \theta)$ . It may be shown that  $[\rho (\cos \theta + i \sin \theta)] [\rho' (\cos \theta + i \sin \theta)]$

$=\rho\rho' [\cos(\theta + \theta') + i \sin(\theta + \theta')]$ , so that the multiplication of two points on the Argand diagram is attained by adding their  $\theta$ 's or arguments and multiplying their  $\rho$ 's or amplitudes. The addition of two points results in a point which forms a parallelogram together with them and the origin.

**IMAGINATION.** Early in the history of psychology, imagination meant nothing more than the ability or power of having mental images. (See **IMAGE, PSYCHOLOGICAL**). Later, a distinction was made between the imaging of previous experience (reproductive imagination), and the forming of new images from the old (productive imagination). Still later, the former was subsumed under the term "memory," and the latter became the sole meaning of imagination. As now understood, however, imagination is something more than the mere having of discrete images or ideas. It is rather a sequence of mental processes which is directed in its course either by the perceptions or feelings of the moment (passive imagination), or by some dominating idea or disposition which looks to the creation of a new object (creative imagination). Psychologically regarded, the characteristic process of this consciousness is the image of imagination. But, psychologically again, it is wrong to suppose as some psychologists have formerly supposed, that the images in and of themselves may combine to form novel compounds. Hobbes says, for instance, that "when a man compoundeth the image of his own person with the image of another man, as when a man imagines himself a Hercules or an Alexander, . . . it is a compound image." Hobbes was led into this error because he did not distinguish between the image as bare unmeaningful process and the image as object, as logical meaning. We now know that the meaning which the image carries is not intrinsic to the image, that it may be carried by other processes than the image, and that under certain circumstances it may have no representation whatever in consciousness. Furthermore, all associations, i.e., combinations, are functions of meanings; there is nothing in the images themselves to condition their combination. But when a new meaning has been reached we may find in consciousness an imaginal process which carries the new meaning, and which, when regarded as object, may bear the likeness of the object meant. Only in this way may a compound image such as Hobbes describes be attained.

This image, the image of imagination, appears only in minds of a certain constitution and its mode varies, of course, according to differences in ideational type. In some cases the imaged object is so complete and distinct in form and so stable in quality that it serves as a guide to the artist who undertakes a formal expression of his new creation. Legouv e, for example, is said to have remarked to Scribe, "When I write a scene I hear, you see; at each phrase which I write, the voice of the person who is speaking strikes my ear. You, who are the theatre itself, your actors walk, act before your eyes: I am the listener and you the spectator." "Nothing could be more correct," Scribe replied; "Do you know where I am when I am writing a piece? In the middle of the parterre." We know also that Goethe and Dickens visualized their scenes

and that the latter heard his characters speak; that Schubert, Mozart and Beethoven heard their music before it was expressed in notes and that some painters have had visual ideas so stable in form and color as to serve as models.

The image of imagination is, as has been said, the characteristic feature of the imaginal consciousness. But like the patterns of thought and action, the imaginal is a determined consciousness; the ideas proceed in an orderly way. In passive imagination the images follow the course of perception as when we see the incidents related by a story-teller, or hear the character speak in the drama we read. In these cases, as Titchener says, "a certain indefinite direction is given to our ideas by the presented stimuli; then the ideas as they come in their predetermined order, are supplemented in this imaginal way." In constructive imagination, on the other hand, the successive ideas not only have a direction, but they also drive forward to an end, namely, the new creation. The determining factors here are dispositions in the nervous system which may or may not find conscious representation. In the first place we have what Ribot calls the "instinct of creation, the need of producing in a determined line." This, if mentally expressed, comes as a vague ambition or aim, and the disposition serves to restrict all ideas that do not fit in with the ambition or aim. Then without warning but usually after long incubation and as the result of some chance situation, or some grouping of associative tendencies, a new meaning, a happy thought, is born. If the new meaning is carried in consciousness by an image and if it has upon it the feeling of strangeness, then it is the image of imagination. The feeling of strangeness, however, alternates with a feeling of satisfaction, of joy, sometimes of exaltation. It is not surprising that in view of the suddenness of its initiation, its unaccountableness, its feeling of strangeness and the joy which it brings, the new idea often seems to come as an inspiration from on high. Sometimes the new conception comes in its complete form. George Sand, for example, says of Chopin: "Creation was spontaneous, miraculous; he wrought without foreseeing. It would come complete, sudden, sublime." But at other times and more frequently, the new idea is vague, incomplete, or only in outline, and the period that follows is one of hard labor characterized by secondary attention, conflicting ideas and variable moods. This is the period when the painter cleans and recleans his canvass, the musician writes and rewrites his themes, the poet casts and recasts his lines. But all the while the image of imagination serves both as model and as goal assisting the dispositions in keeping the imaginal consciousness true to its course.

There remains to mention a third feature of the imaginal consciousness, the feeling of empathy. There seems to be a natural tendency for an individual of the imaginal type to feel himself into a situation. It is not enough for the artist to picture the scene he creates; he becomes a part of it. He not only invents a character; he lives it. Scribe projected himself into the pit and watched his actors act; he might equally well have become the characters themselves, as Dickens became Little Nell and suffered as she suffered. Psychologically,

empathy is a conscious attitude that analyzes into images of imagination and kinesthetic sensations. Its counterpart in perception and memory is imitation.

Assistant Professor of Psychology, Cornell University.

**IMAGO.** See METAMORPHOSIS.

**IMAM**, i-mām, or -mām, a Mohammedan chief or leader; a title given to the four successors of Mohammed, and to the 12 great leaders of the shūtes. In Turkey, applied to the functionaries who call the people to prayer from the minarets, perform circumcision, etc. They are chosen by the people, and confirmed by the secular authority, under whose jurisdiction they also are in criminal and civil affairs.

**IMBECILE**, weak or feeble in mind. The ordinary use of this term is to express a degree of mental weakness somewhat less than idocy. See MENTAL DEFECTIVES.

**IMBECILITY.** See MENTAL DEFECTIVES.

**IMBER**, im'ber, Naphtali Herz, Hebrew poet: b. Zloczow, Galicia, 1854; d. 1909. In his boyhood he was well trained in the Talmud, and for purposes of study traveled in Turkey, Egypt and Palestine, becoming most proficient in Hebrew and other Oriental languages. He went to England and for some time was a collaborator of Israel Zangwill. He came to the United States in 1892 and traveled about extensively, living successively in New York, Boston, Chicago, San Francisco and Los Angeles. He published several volumes of verse and contributed numerous articles to the Hebrew press. His works include 'The Mystery of the Golden Calf'; 'The Keynote to Mystic Science'; 'The Treasures of Ancient Jerusalem'; 'The Letters of Rabbi Akibah'; 'The Education of the Talmud'; 'The Music of the Psalms' and the hymn 'Hope of Zion.'

**IMBRIANI**, em'brē-ā'nē, Vittorio, Italian poet: b. Naples, 24 Oct. 1840; d. 1 Jan. 1886. He pursued historical and philosophical studies at Naples, Zürich and Berlin; later became a soldier, serving in the wars of 1859 and 1866; and had a political career marked by much antagonism caused by his passionate and fearless temperament. The best known of his works are 'Canti popolari delle provincie meridionali' (1871-72); 'Dodici canti pomiglianesi' (1876) and 'La novellaja fiorentina' (1877). Distinctive of his critical work is 'Fame usurpate' (1877) in which he analyzes as a worthless production Goethe's 'Faust.'

**IMBRICATED SNOUT-BEETLE.** See SNOUT-BEETLE.

**IMBROS**, an island in European Turkey, west from the entrance to the Dardanelles. It is 18 miles long, east to west, 8 miles broad,

and terminates west in Point Auflaka, and east in that of Basse. Area, 87 square miles. It is mountainous, rising in its loftiest peak to the height of 1,959 feet; well wooded, and intersected with richly-fertile valleys, producing wine, honey, oil, cotton and lead. It has only two towns — Flio and Castro. Pop. 8,000, mostly Greeks.

**IMHOFFER**, em'hōf-ēr, Gustav Melchior, Austrian Jesuit and explorer: b. near Graz, Styria, 1593; d. 1651. Entering the Jesuit order he was sent as missionary to Peru in 1624. In 1636 he crossed the Andes and reached the head waters of the Amazon. He was the first European to make a connected account of the whole course of that river. It was first published at Madrid in 1640. The London edition of 1689 is entitled 'A Relation of a Journey along the River Amazon.' Subsequently Imhoffer was made director of the College of Bahia. The Society of Jesus published a number of works by him on the peoples, languages and customs of the aborigines who came under his notice.

**IMIDE**, i-mīd, or -mid, a chemical substance derived from ammonia, NH<sub>3</sub>, by replacing two of the hydrogen atoms by a divalent radical. If all three of the hydrogen atoms of the ammonia are replaced by one trivalent radical, the compound is called a nitrile. When one or more of the hydrogen atoms of the ammonia are replaced by a corresponding number of monovalent radicals the compound thus formed is called an amide or an amine, according to the nature of the radical by which the hydrogen is replaced. See AMIDE; AMINE.

**IMITATION.** Imitation is the process of reproducing by one's own act the observed actions of others. Its beginnings lie therefore in perception. It is the result of a desire to change from the rôle of spectator to that of actor. Imitation may be of two kinds (1), a primitive and (2) a developed form. The primitive form is an unconscious copying of some object of perception; and is simply a reaction in response to the outer stimulus which excites it. The best example of this kind of imitation is to be found in the sounds which a baby is wont to repeat when it has once heard them. It is a peculiar characteristic of the primitive imitation that the sound, for instance, when once imitated becomes in turn a new stimulus to start the process over again, the result being that the imitated sound is repeated rapidly again and again until the organs are wearied, or the attention is diverted. The exercise is evidently found to be pleasurable, and is therefore continued indefinitely. Mr. Baldwin has given the name "circular reaction" to this kind of self-perpetuating process. The name also of "suggestive imitation" has been given to this class of acts which appear imitative to an observer, but are not consciously felt to be so by the imitator.

The second form of imitation is more complex, and marks a more developed stage of consciousness. The imitation has now become a conscious act. The object perceived has aroused some degree of interest, and there is consequently a conscious effort to reproduce it with the original set before one as a model. In imitation which is of this form, we find the process intimately connected with the attention. In attention there is always a conscious striving

for a more accurate knowledge of the object of perception, and imitation serves to gratify this desire, inasmuch as one comes to closer quarters as it were with any act when one tries to reproduce it. Knowledge of it comes then from the inside. This means a concentration of attention, and a consequent result of more definite and satisfying knowledge. Moreover, attention will vary as the interest, for that which one attempts to do himself is always far more interesting than merely that which is observed.

In the development of consciousness imitation as a social factor plays a most conspicuous part. Through it a child acquires all of its social tendencies, and becomes a part of the social organism in which it is to live and move and have its being. Its education starts with the first rudimentary efforts at imitation; and is carried on from this initial stage to the very highest and most advanced forms in constant dependence upon the imitative tendencies. Through imitation the knowledge of one generation is acquired by the succeeding, and a continuity in development is assured which makes for the progress of the race.

In this connection it is to be noted, however, that with the imitative impulse there are two other tendencies which have free play and a wide scope. These tendencies must be reckoned with also. They are the tendency to social opposition, and the tendency to inventiveness. The tendency to social opposition is a desire for self-assertion, an impulse primarily to do something different from that which others are doing merely from a feeling of native opposition. This impulse is seen in very young children, and remains throughout life. It is often recognized as unreasonable, but nevertheless irresistible. It is a fertile source of the differences of opinion which so early develop in childhood. It prevents a slavish imitation and the loss of initiative in action. However in order to act in a manner which differs radically from one's social environment, there is implied a preliminary training of an imitative sort; for there must be a basis of common activity in order that a departure from the accepted mode may have any significance, and there must be also a body of common beliefs, in order that there may be any such thing as real difference of opinion. The other tendency is a more pronounced and a more definite form of opposition to imitation; it is the tendency to inventiveness, not for the sake of opposition, nor as the result of an inevitable clash of opinion in one's social setting, but for the sake of producing that which is suggested from within, and not from without. It is the working out of one's own individuality without waiting for a copy or model. It is a shifting of the centre of interest from some object which is perceived, to some object of the inner sense, a fancy born within the brain, an idea which has its origin in the depths of one's own consciousness. This tendency is seen even in early acts of imitation, a tendency to depart from the copy, to introduce variations of design, to improve upon the model.

Here again in order that there may be increased power of independent production, there must be a previous schooling in the art of exact imitation. The original artist is not one

who has never copied from a model nor studied the works of the masters. It is the interplay of the imitative impulse with the tendencies to social opposition and to inventiveness which make progress possible. Progress is not repetition nor is it on the other hand activity which swings clear of any past. Where there is progress there is imitation, but the kind of imitation which allows full range for inventive play and independent opinion.

There is a special form of imitation which appears on a large scale in the so-called mob impulse, where individuality seems merged in the tendencies of the mass, and imitation is in the nature of a reaction. The individual is swept along with the crowd, not because he wills it necessarily, but because the action of the crowd carries him away as with a flood. This kind of imitation has been given the name of "plastic imitation." Much study has been devoted of recent years to the relation of imitative impulses in animals to congenital tendencies. The instinctive furnishes a strong predisposition to imitation, and in many of the early activities of animals it is most difficult to draw a line of distinction between instinct and imitation. See IMITATION IN ANIMALS; MIMICRY IN NATURE.

JOHN GRIER HIBBEN,  
*President of Princeton University.*

**IMITATION IN ANIMALS.** This is a somewhat technical phrase used in zoology to designate the fact that certain kinds of animals have acquired, by the gradual process of natural selection, a resemblance to other animals, which are said to be "imitated," although, of course, no effort to become like them is consciously made. This is one of the two principal phases of what is called "protective resemblance" the other being an acquired and protective likeness to some vegetable or inanimate object that causes it to be overlooked by its enemies; this second phase is termed "mimicry," and is described under that head. While the advantage gained by mimicry is that the animal is either overlooked altogether, or else mistaken by its enemy for something of no value to the latter, that gained by imitation is that the animal is avoided by predatory kinds because it is mistaken for something harmful or at least distasteful. The methods by which, according to the theory of Darwin and his followers, these conditions are matured are explained in the article NATURAL SELECTION; but it should be said that other, or at any rate modified, views of the method have been advanced by other and later writers.

The most widely quoted and typical case of apparently advantageous imitation is that of the South American heliconid butterflies, which are evil-smelling creatures so distasteful to both monkeys and birds that they are very rarely if ever eaten, and hence fly about in the

sunshine as carelessly as if they knew they were safe. Now, in the same situations are found butterflies of an entirely different family (*Pieridæ*) that have none of the inedible qualities of the heliconids, and they, too, fly about freely and are rarely if ever caught, or attempted to be caught by creatures that prey on butterflies, although both are rather clumsy fliers. The conclusion then seems logical that the pierids are getting benefit from their masquerade, however it may have come about. Similar cases of imitation among butterflies may be found in all parts of the world, in some groups a whole genus affecting a more or less close imitation of another genus or family, and elsewhere only a single species in a genus approximating some unrelated form; furthermore, cases occur where the female alone of a species will imitate another species, whereas the male acquires no such resemblance; this seems to follow the rule, so widely illustrated in all classes of animals, that nature provides for the preservation of the female far more carefully than for the male, who in the inferior ranks of life at least appears to be of little or no importance after he has performed the duty of fertilization.

Many notable illustrations of our theme may be gathered among the insects of the United States. A conspicuous one is the case of one of our large butterflies of the genus *Basilarchia*. All the species of this genus, with one exception, are dark-colored, with a light border containing blue spots round the margins of the wings, as in the common "mourning cloak"; the single exception is *Basilarchia hipparchus*, which has a tawny brown color, diversified by black bands and marks. This brown basilarchia almost exactly copies our very common milkweed butterfly (*Anosia plexippus*). Here there seems no adequate motive for, or advantage gained by, the apparent imitation, and it suggests when it is closely studied various difficulties in respect to the whole subject.

But not all cases of this adaptation are confined to resemblances between two insects or other creatures of the same class. A certain butterfly becomes an almost precise duplicate of a dragon-fly; spiders in both North and South America take the form of ants, and a well-known small black wasp of our own country is so ant-like that it is called the cow-ant or velvet-ant. Few town-bred persons go into the country in summer without mistaking for a hummingbird one or other of the big hawk-moths that poise on whirring wings before flowers very much after the manner of the bird, which is scarcely larger. These and similar cases are ruled out by some thinkers on the ground that they are not imitations but cases of parallel development. Many kinds of insects imitate the stinging, and therefore dreaded, tribes of bees and wasps, including flies, beetles and so forth. One common American fly (*Volucella*) "imitates the honey-bee so closely that one would hesitate to handle it even after being told that it is harmless"; and it profits by the deception to lay its eggs inside of hives. Other flies copy bumblebees so closely as to be remarkable, and they imitate their habits as well as their form and colors. "The drone-fly, for example," says Metcalf,

"which imitates a honey-bee, has the same kind of buzzing flight, and when standing occasionally teeters its abdomen up and down, as is characteristic of the bees and wasps. Some of these mimicking flies even protrude and withdraw the tip of the abdomen, as does an angry bee or wasp," threatening to use a sting it does not possess.

Hints have already been given that scientific men are not agreed on the interpretation of all these phenomena, or the causes of them. An attempted discussion of the many questions involved is not possible here. Those who care to go more deeply into the matter should read the evidences and arguments in the books of such men as A. R. Wallace, H. W. Bates, Thomas Belt, Fritz Müller, S. H. Scudder, Lloyd Morgan, W. Bateson and others. A brief and excellent discussion of the matter will be found in 'Animal Coloration,' by F. E. Beddard (London 1892), where many good references to other sources are given.

ERNEST INGERSOLL.

**IMITATION OF CHRIST**, The. Fontenelle the French philosopher said that the "Imitation of Christ is the most influential book that ever came from the hand of man, the Scriptures having come from the hand of God." That seems much to say; yet it would be easy to confirm the expression out of the mouths of many of the most distinguished writers and thinkers of the nearly 500 years since the book was written. Lamennais declared that the "Imitation has made more Saints than all the books of controversy. The more one reads, the more one marvels. There is something celestial in the wonderful simplicity of it." La Harpe the distinguished French dramatist and critic said after reading it in prison "Never before or since have I experienced emotion so violent and yet so unexpectedly sweet." Nor was it only for Latin minds of preceding centuries that it had such a deep appeal, for in our time it has been the favorite reading of Chinese Gordon, Field Marshall Lord Wolseley, the late Emperor Frederick the Good, and Stanley the Explorer, while the greatest lawyer of our time, Lord Russell of Killowen, always carried a copy of it with him for daily reading.

Saints have praised it highly, for it is a gem in their collection. Saint Francis de Sales declared that "its author is the Holy Spirit." Saint Ignatius Loyola recommended his Jesuits to read in it every day. Saint Philip Neri called it his "precious treasure." Bossuet and Massillon, Fenelon and John Wesley, Dr. Johnson and Cardinals Newman and Manning made it their favorite reading. Minds of very different tendency, however, leaders in modern thought with a drift far from conventional Christianity, were quite as emphatic in their expressions. Comte the founder of Positivism wrote, "It is an inextinguishable treasure of true wisdom" and he recommended its daily reading to his disciples. Renan the rationalist was scarcely less fond of it. George Eliot rivalled Lamennais in her praise of it when she said, "It works miracles to this day, turning bitter waters into sweetness." Matthew Arnold declared it "the most exquisite document after the New Testament of all that the Christian spirit has ever inspired." Still more surprisingly with his admiration for the ancients, he added, "its moral

precepts are equal to the best ever furnished by the great masters of morals, Epictetus or Marcus Aurelius." The little book that has thus deeply affected the spiritual and intellectual leaders of humanity for almost 500 years was no chance production. It was written, as after long controversy seems now quite certain, in the first half of the 15th century by Thomas à Kempis (1380-1471), a member of the Brotherhood of the Common Life who spent some 70 years in the Monastery of Mount Saint Agnes of that order in the Rhine land. Among the students of the brotherhood were such men as Erasmus, Cardinal Nicholas of Cusa, Agricola, Alexander Hegius and Wimpheling. Thomas à Kempis was the spiritual director of the monastery, and his conferences formed the basis of the Imitation of Christ. He wrote other books but none of the marvelous power of this one.

The original title of the *Imitation* is said to have been *Ecclesiastical Music*. Lamartine called it "the poem of the soul." Its style in the original Latin has a rhythmic quality that makes it easy to understand both designations. There are passages in it like that on love (Book III, Chap. 5) that if read beside a chorus from such a Greek tragedy as 'Antigone,' will stand even this severe comparison in lofty poetic quality. It is undoubtedly the essential poetry of the 'Imitation' that has given the book its permanence. This quality permeates the work and makes every bit of it appeal to the human heart, hence doubtless the tradition that when opened at random the passage that the eye lights upon will always be responsive to the mood of the seeker. It is much more than the work of a great genius in psychology; it is the production of a seer, one who saw more deeply into human nature than is given to any but a very few among mankind. Probably our most satisfactory definition of a poet is that he is a seer, and that the author of the 'Imitation' was to a marvelous degree.

The four books of 'The Imitation' contain (1) Admonitions useful for the spiritual life; (2) Admonitions leading to the interior life; (3) Of interior consolation; (4) A devout exhortation to Holy Communion. It might seem as though the contents then would be too mystical and impractical for men of affairs and of serious intellectual interests, and yet it is to many of these particularly that the book has had its special appeal. Dr. Johnson's favorite expression in it was "If thou canst not make thyself such as thou wouldst be, how canst thou have another to thy liking?" Such aphorisms as "Know that the love of thyself is more hurtful to thee than anything of this world"; or "For all praise patience; but how few are there that desire to suffer?"; or "Faith is required of thee and a guileless life, not loftiness of understanding, nor the depth of the mysteries of God," taken almost at random from the three latter books are but typical examples of à Kempis' brief sentences which have the precious quality of applying almost directly to whatever a man has in hand at the moment when he opens the 'Imitation.' Consult Cruise, Sir Francis, 'Thomas à Kempis' (London 1887); Kettelwell, 'Thomas à Kempis and The Brothers of the Common Life' (ib. 1882); Scully, 'Life of The Venerable Thomas à

Kempis' (ib. 1901); Walsh, J. J., 'The Century of Columbus' (Chapter Latin Literature, New York 1914); Wheatley, 'The Story of the 'Imitatio Christi'' (London 1891).

JAMES J. WALSH.

**IMMACULATE CONCEPTION,** the privilege by which the Virgin Mary, according to Catholic doctrine, was conceived without original sin. As this doctrine is distinctively Catholic, the following exposition is along the lines of the common teaching of Catholic theologians.

**Meaning.**—The dogma of the Immaculate Conception of the Mother of God was defined, by Pope Pius IX, 8 Dec. 1854, in the bull *Ineffabilis Deus*. The most important words of this definition are the following:

In honor of the holy and undivided Trinity, for the splendor and adornment of the Virgin Mother of God, to extol Catholic faith and increase the Christian religion, by the authority of our Lord Jesus Christ, of the blessed Apostles Peter and Paul, and by our own authority, we declare, pronounce and define that the doctrine, which holds that the most blessed Virgin Mary, from the first moment of her conception, by a singular grace and privilege of Almighty God, in view of the merits of Jesus Christ, Savior of the human race, was preserved free from all stain of original sin, is revealed by God and therefore to be firmly and constantly believed by all the faithful.

In the above definition the word *conception* does not refer to the act of conceiving, but to the term of that act. The body of Mary was formed in the ordinary and natural way. Just so soon as the newly created soul animated her body (probably the primordial cell wherefrom the full formed body was evolved), then and then only could the person be said to be conceived. Now, according to the ordinary course of fallen nature, Mary would at that very moment of her conception have been tainted with original sin. Such is the teaching of Saint Paul: Just as through one man *the sin*,—i.e., original sin,—came into the world, and through *the sin* came death; so death passed unto all men, for that all men sinned. . . . Briefly then, just as through a single downfall the result was (*εἰς*) condemnation for all men; so, too, through a single decree of justification the result was (*εἰς*) for all men that justification which meaneth life. For, as, through the disobedience of one man, the whole race was made sinful; so, too, through the obedience of one man, the whole race will be made just. (Romans v, 12, 18, 19). This ordinary course of fallen nature was by a special privilege not the course of Mary's nature. She is "our tainted nature's solitary boast" in that her nature was never tainted, never fallen. The stain of original sin was not removed from her soul; it was simply excluded. In one and the very same moment, Mary's soul was created, animated her body, and was sanctified by the exclusion of original sin and by the infusion of divine grace. She, who was fore-ordained to be the Mother of the Christ, was, from the very first instant of her existence as a human person, freed from original sin and filled with grace; and that through no merit of her own, but entirely in view of the merits of Him who was foreordained to be her divine Son, Jesus Christ.

**Defense of the Definition.**—To the Catholic there is no need of any defense of the definition of the Immaculate Conception. He accepts the Church as his authoritative teacher

in matters of faith and morals. She cannot err in handing down the message of him who said:

"All power hath been given me in heaven and upon earth. Therefore go ye, make disciples of all nations, baptise them in the name of the Father and of the Son and of the Holy Ghost, teach them to observe all things whatsoever I have commanded you. And, lo, I am with you all days, even to the end of the world. (Matthew xxviii, 18-20).

When the Council of Trent, Session V, 17 June 1546, declared that it had no intention to include "the blessed and immaculate Virgin Mary, Mother of God," in its decree on the universality of the fall of man by Adam's sin, the immediate consequence was still greater motive of credibility of the doctrine of Mary's stainlessness, and still greater increase of Catholic devotion to her privilege of exclusion from Adam's taint. So that the definition of Pius X caused no surprise. For five years his commission had studied the attitude of the whole Catholic world. The Immaculate Conception was found to be believed all the world over. All hoped and prayed for the definition that "the doctrine is revealed by God, and therefore to be firmly and constantly believed by the faithful." All rejoiced, when the Vicar of Christ, speaking *ex cathedra* as the universal pastor of all the faithful, clearly indicated the defined article of faith. The definition was new; the doctrine was old,—as old as the deposit of faith entrusted to the Church to guard and define. The Church cannot add to this deposit of revelation. Her part is to follow the injunction of Saint Paul: "Guard the glorious deposit, by the help of the Holy Spirit who is within us" (2 Timothy i, 14). She receives no new revelations; but defines and guards the old. In every new definition of an old truth, she fearlessly takes her stand "in defense of the faith that has once for all been entrusted to the keeping of the saints." (Jude iii).

And yet the dogma of the Immaculate Conception was at least implicitly contained in Holy Writ, and explicitly taught by the Fathers of the Church. To show such content is beyond the range of this brief article. Only the outline of the argument may be indicated.

1. Gen. iii, 14-15, the curse of the serpent may be thus translated from the Hebrew:

Since this thou hast done,  
Accursed art thou  
Beyond all beasts and brutes of the wild,  
All the days of thy life.  
On thy belly shalt thou crawl,  
Biting the dust.  
Enmity shall I set  
Between thee and the woman,  
Between thy offspring  
And her offspring.  
They shall smite thy head,  
Thou shalt smite their heel.

In its *literal* meaning, this curse includes the victory of the woman and her offspring over Satan and his offspring. The woman is Eve; her offspring are all the just,—the physical Christ and the Mystic Christ, or the Church. In its *typical* meaning, the curse includes the complete victory of Mary over Satan. For Eve is the type of Mary. And yet such complete victory would not have been, had Mary ever been tainted with sin,—even with original sin.

2. Luke i, 28:

Hail, full of grace, the Lord is with thee; blessed art thou among women.

These words of Gabriel's greeting mean such fulness of grace, such intimate union with God, such blessedness beyond all women, as to preclude all taint of sin, even of original sin.

3. The Fathers, who follow such an interpretation of these two passages of Scripture and defend the freedom of Mary from all sin, may be found in any of the works of our bibliography.

4. A fourth reason for the definition of the Immaculate Conception, given by the bull "Ineffabilis Deus," is the fitness of the privilege unto the Mother of God. The eternal decree of God the Father to save the human race by the merits and satisfactions of the Word incarnate included the choice of a mother to the God-man; and it was most fitting that this mother should be embellished with a superabundance of grace, and that naught of sin should ever tarnish her soul.

WALTER DRUM, S.J.,  
Professor of Scripture, Woodstock College,  
Maryland.

**IMMANUEL**, or **EMMANUEL**, Hebrew name employed by the prophet Isaiah, the signification of which—"God with us"—is not by itself proof that the child to whom it was to be given would be divine. But in Matt. i, 23, it is declared that the name had been divinely applied in a special prophetic manner to the child Jesus. The prophecy itself (Isaiah vii, 14) appears to call for a fulfilment near at hand, and in accordance with the ordinary laws of nature, the mother of the promised child being unmarried at the time the prophet spoke. The birth of such a child in fulfilment of a special promise might be a sufficient sign for a deliverance from national calamity. But as the whole prophecy of Isaiah has supreme reference to a spiritual salvation (some modern scholars to the contrary notwithstanding), the sign of the lower deliverance may have also an ultimate application to the higher; a woman unmarried pointing forward to the virgin mother, and an ordinary child taken as a prophetic emblem of the child Jesus miraculously conceived and born. That this is the true interpretation is argued from (1) the New Testament account of the Nativity, the inspired authority of which is established by independent evidence; (2) by the Scripture exhibition of the character and works of Jesus in attestation of His claim to be the Deliverer and Savior who had been foretold as to be sent forth from God. Consult McFadyen, John Edgar, 'The Book of the Prophecies of Isaiah' (New York 1912).

**IMMENSEE**. This touching little story by Theodor Storm was first published in 1850 and brought its author general recognition. In a quiet hour at twilight an old man, called Reinhardt, sees his life—as far as Elizabeth, the playmate of his youth, is connected with it—pass before his inner eye. He sees the happy

scenes of their childhood, the light and shade of his student days stand out before him, he recalls his one and only visit to her, after she had married a friend of his. A mood of resignation gradually pervades his recollections, for he and Elizabeth had loved each other, and yet they had not been united.—'Immensee' is typical of Storm's early prose tales. It strikes the key of resignation, that resignation which consists on the one hand in an insuperable longing for happiness, on the other hand in that purity and quiet which distinguish men who, free from all bitterness, look at life with the realization that their innermost desires can never be satisfied and seek refuge in the recollection of more promising days of the past. The story is told in a series of only vaguely connected "situations" which are to set forth such poetry as may be contained in every-day life and the lyric atmosphere of which crystallizes at certain points into finished poems. Consult edition of Theodor Storm's Works (Vol. I, pp. 1-38, G. Westermann, Braunschweig); Schütze, P., 'Theodor Storm' (2d ed., 1907, pp. 100-109); Schmidt, Erich, 'Charakteristiken' (Vol. I, 2d ed., 1902, 'Theodor Storm,' pp. 404-408).

EWALD EISERHARDT.

**IMMERMANN, Karl Leberecht**, German dramatist and satiric novelist: b. Magdeburg, 24 April 1794; d. Düsseldorf, 25 Aug. 1840. His parents were the *Kriegsrat* Gottlieb L. Immermann and Friederike Wilhelmine, née Wilda. The family was purely Prussian and nationalistic in its convictions, which induced a patriotic fervor in Immermann that was to last for some time. He studied law at Halle (1813-17), but his course was interrupted by his participation in the wars of liberation, and a resulting illness, which prevented him from facing the enemy until the battles of Ligny and Waterloo. In Düsseldorf Immermann helped to found a Theaterverein (1832) and conducted model performances and lectures on dramatic art until 1837. As a poet, Immermann may be considered as a transition from romanticism to realism; he regarded himself now as a follower of Goethe and Tieck, now as a member of the Jung Deutschland movement. His two most famous works are novels of contemporary life, 'Die Epigonen' ('family memoirs,' Düsseldorf 1836), and 'Münchhausen, eine Geschichte in Arabesken' (Düsseldorf 1838-39), in which latter he attempts to satirize the unnatural cynicism of the upper and middle classes of his day, in contrast to which he inserts the country tale 'Oberhof' into the work, which is of all his productions the only one to achieve lasting popularity. His historical plays are 'Ein Trauerspiel in Tirol' (1827, later known as 'Andreas Hofer'), 'Kaiser Friedrich II' (1828), 'Alexis' (trilogy from Russian history, 1832), 'Memorabilien' (1840-43), 'Theaterbriefe' (1851), give his views of literary and dramatic art. See MÜNCHAUSEN.

**IMMERSION.** See BAPTISM.

**IMMIGRATION.** Immigration into the United States viewed historically is but a continuation of the movement of peoples from the far east into southeastern Europe, then into Europe proper, and finally over seas to the two Americas and Australasia. Peoples, races and

groups have been in movement as far back as history records; they have drifted from place to place as the result of wars, conquests, famines, the opening up of new lands, and the changing of climatic and economic conditions. The wandering of the peoples following the incursion of the barbarians into Italy was an immigration movement. It differed from immigration to-day in that the wandering of tribes was a movement of races rather than of individuals and families.

**Early Immigration to America.**—Immigration to America differs from the migrations of early peoples in that it is a movement of families and individuals rather than of nations, races and clans. It has been so from the very beginning. And the character of American immigration has changed with changing conditions in Europe on the one hand, and the changing industrial and economic conditions in America on the other. The first immigrants to New England were driven to this country by religious intolerance. They made the first settlement. And the early settlers in New England, inspired as they were by religious motives, have profoundly affected the subsequent migrations of the same people out of New England to the middle and the far West. We can trace the ethical influences of early Puritanism as far west as California; and individuals and groups made their way to Ohio, Iowa and even distant California.

But the primary motive of immigration to America is not religious. Only a handful of immigrants have been driven to this country in the search for either religious or political freedom. The overwhelming majority of immigrants have come to this country as a result of economic forces; economic forces at work in Europe, or the greater economic opportunities which America afforded. This is almost exclusively true of all immigration since the 17th century.

For nearly three centuries the immigration to America was almost exclusively from the British Isles, Germany and Scandinavia. There were Swedish settlements in New York and Delaware; Dutch settlements in New York; south German settlements in Pennsylvania and the South. But the great bulk of immigration up to very recent years has come from Great Britain and Ireland, the Scandinavian countries and Germany. The migration from Germany was particularly strong from the revolutions of 1848 down to shortly after the Franco-Prussian War. There has been but little French immigration to America, and relatively few immigrants from Switzerland and Holland.

This is the "old immigration," so called. This is the immigration that gave America its Anglo-Saxon quality. It was unmixed with Latin, Slavic or Oriental peoples. From the very beginning it was a peasant immigration. It came in search of a new home in a country where free land could be had for the asking. And it built an agricultural civilization. For two centuries and a half civilization of the United States was predominantly agricultural, just as it was predominantly Anglo-Saxon. The incoming waves of immigrants moved west just beyond the line of settlement. They picked up small farms of from 30 to 60 acres; only such farms as an individual could himself cultivate. Each oncoming generation moved west-

ward, settling New York, Ohio, Indiana, Kentucky, Tennessee, Illinois, Michigan and Wisconsin. Only a small portion of the immigrants settled in the towns or cities. Up to the Civil War, and even as late as 1880, our immigration was not only predominantly of Anglo-Saxon, Scandinavian and Germanic stock, it was also predominantly agricultural.

During the three decades which followed the Civil War the American West was rapidly peopled. Kansas, Nebraska, Texas and the northwest were taken up by homesteads, or were divided into great estates as a result of the Pacific railway aid grants. In a few years' time western America was appropriated, and by the end of the last century the public domain and practically all of the free land in America had been appropriated. All over the West, even in California, Oregon and Washington, great stretches of land were held by the railroads, divided into great timber or grazing preserves, and by 1890 the possibility of absorbing immigration on the land, which had existed for three centuries, had come substantially to an end.

**Changing Immigration.**—This marks the end of the first great epoch in American life. This definitely altered the source from which immigration came, as well as the economic conditions of America. The "old immigration" was a home-seeking, land-owning, agricultural immigration. It was primarily Anglo-Saxon, and primarily agricultural as well. The "new immigration," so called, comes from south and central Europe. It was primarily agricultural at home; it became almost exclusively industrial in America. It came in response to economic conditions in this country, just as had the earlier immigration from the north. But the suction which drew the new immigration was high wages in the rapidly expanding industrial and mining centres of the East. It did not go to the land; not because it was unwilling to, but because the land was all gone. It was compelled to go to the cities and mining camps, where it congregates in race groups and settlements and remains more or less segregated from American life and institutions. The new immigration created the immigration problem and the movement for restriction, which was traceable to several things:

1. Race hostility and the protest of those descended from Anglo-Saxon and Teuton stock to the rapid increase of Italian, Slavic and Oriental peoples.

2. Religious protest against the large Catholic infusion from central and southern Europe.

3. Economic protest from American labor against the competition of cheap European labor willing to accept—temporarily at least—a lower standard of living than that to which American labor was accustomed.

**Immigration Legislation.**—The passing of free land, the economic pressure of vast numbers of unorganized workers, together with racial and religious influences, led to a movement for the restriction of immigration. Other forces contributed. Mine owners, contractors and employers in the United States sent agents to Europe who brought in great bodies of men who broke strikes or destroyed the solidarity of labor; the steamship companies stimulated immigration; while European countries dumped undesirables of all kinds on America. But the most powerful forces behind the movement for

the restriction of immigration were economic and racial.

Early restrictive legislation was not in fact restrictive. It was selective. No attempt was made to limit the number of people who could come to this country; the attempt was to bar out those who were considered undesirable because of economic, moral or political reasons. During the fiscal year ending 30 June 1914, 33,041 persons were debarred as feeble-minded, tuberculous, afflicted with loathsome contagious disease; as beggars, paupers or likely to become a public charge; as contract laborers, criminals, polygamists, anarchists, prostitutes and those coming for an immoral purpose; or for other reasons. Of this number the great majority were excluded on economic grounds: 15,784 being excluded as paupers or likely to become a public charge; 4,531 as imbeciles or afflicted with some disease; 2,793 as contract laborers; 755 as criminals; 31 as polygamists; 1 anarchist; 385 prostitutes; 354 for attempting to bring in prostitutes or females for an immoral purpose, and 322 under the provisions of the Chinese Exclusion Act. There were 6,537 excluded under surgeons' certificates for defective mentality or physical unfitness to earn a living. The excluded and debarred persons in 1914 constituted 2 per cent of the total immigration for the year.

**Restrictive Legislation.**—On 1 May 1917 a new law went into effect, passed 5 Feb. 1917, whose avowed purpose was to limit immigration. It was avowedly directed against immigration from southern, central and eastern Europe. Immigration was to be limited by the "literacy test," which excluded all aliens "over 16 years of age, physically capable of reading, who cannot read the English language or some other language or dialect, including Hebrew or Yiddish." There are many exceptions to the literacy test which permit the admission of otherwise inadmissible aliens, such as a father or grandfather over 55 years of age, wife, mother, grandmother, unmarried or widowed daughter, and children under 16 years of age. The law also mandatorily excludes immigrants from a great part of Asia. In addition the head tax was increased from \$4 to \$8.

**Old and New Immigration.**—Up to about 1890, as stated above, the bulk of the immigration to the United States came from northern Europe. Since that time immigration has been predominantly from southern and central Europe. In 1914, in which fiscal year the total number of immigrant aliens numbered 1,218,480, the races and principal countries of Europe and Asia contributing to our immigration were the following:

Italians (South) .....	251,612
Italians (North) .....	44,802
Hebrews .....	138,051
Polish .....	122,657
Crotians and Slovenians .....	37,284
Lithuanians .....	21,584
Magyars .....	44,538
Roumanians .....	24,070
Russians .....	44,957
Ruthenians .....	36,727
Slovaks .....	25,819
Spaniards .....	11,064
Syrians .....	9,023
Bohemians .....	9,928
Armenians .....	7,785
Bulgarians, Servians and Montenegrins .....	15,084
Greeks .....	45,881
Total .....	890,669

Immigration from the races of northern Europe was as follows:

Dutch and Flemish .....	12,566
English .....	51,746
Finnish .....	12,805
French .....	18,166
German .....	79,871
Irish .....	33,898
Scandinavian .....	36,053
Scottish .....	18,997
Welsh .....	2,558
<b>Total .....</b>	<b>266,660</b>

At the outbreak of the European War there were nearly 15,000,000 persons of foreign birth in the United States. Of these the great majority were of the new immigration from southern and central Europe. And they were almost exclusively engaged in industry, and especially in the unskilled trades. The new immigration, too, is largely urban. It settled in the great industrial cities and in the mining regions. The population of New York, Cleveland, Chicago, Boston and other industrial centres, is from 73 per cent to 78 per cent of persons of foreign birth or those immediately descended from persons of foreign birth.

Illiteracy is very high in the countries from which the new immigration of recent years has come. Illiteracy of the population over 10 years of age is in Bulgaria, 65.5 per cent; Greece, 57.2 per cent; Hungary, 33.3 per cent; Italy, 37 per cent; Roumania, 60 per cent; Russia, 69 per cent; Servia, 78.9 per cent; Spain, 58.7 per cent. On the other hand illiteracy in Denmark falls to 2 per cent; in England and Wales, 1.8 per cent; Germany, .05 per cent; Sweden, 2 per cent; Switzerland, 3 per cent. The new immigration law will automatically exclude immigration from those countries of southern and central Europe from which immigration in recent years has been particularly heavy.

**Immigration and the War.**—The European War has suspended immigration. Whereas immigration in the years immediately preceding the war rose to the high-water mark of an average of 1,200,000 annually, since the outbreak of the war it has steadily diminished in numbers. The total volume has been as follows: In 1915, 326,700; 1916, 298,826; 1917, 295,403. This immigration has come almost exclusively from the Scandinavian countries, from Italy, Greece, Spain, Portugal and from the other non-belligerent countries of Europe, and from Mexico. FREDERIC C. HOWE,  
*Commissioner of Immigration for the Port of New York.*

**IMMIGRATION, Bureau of,** a sub-section of the Department of Labor, charged with the administration of the Immigration Laws. The bureau is directed by a commissioner-general whose annual salary is \$5,000. See UNITED STATES — IMMIGRATION.

**IMMIGRATIONS, Animal and Vegetal,** into America began in early geological times. At the dawn of the Age of Mammals, when the great Mesozoic reptiles were disappearing, and the Tertiary Era introduced the dominance of mammalian and other types of animal life, that became more and more modernized as time advanced, the circumpolar regions of the Northern Hemisphere seem to have been a continuous mass of land. The climate was mild, and animals and plants had free space in which

to wander right around the northern world. The origins of the strange primitive creatures then prevalent are unknown; but their scanty fossil remains show their substantial identity in Europe, Asia and America. Before long—as geological time is reckoned—changes in the restless crust of the earth caused separation of North America from both Asia on the west and Europe on the east, and fossils of the Middle Eocene show that local types speedily developed in every continent. This independent and divergent adaptive modification continued until the Eocene had merged into the Oligocene, as shown by rocks of the White River formation in eastern Wyoming. Land connection had been restored by a lifting of the Bering Sea region, and an isthmus thus formed between Alaska and Siberia. By this bridge came new forms from Asia, while American migrants wandered into the Old World; but the interchange was very limited, bringing to us only certain small forerunners of the sabre-toothed "cats," of the mustelines of some early creodonts (as *Hyænodon*), and of primitive rodents. At this time were introduced also the anthracotheres, short-legged, somewhat swine-like, hooped animals, which have no near relatives in the modern world, but had been previously well represented in Europe. There came also the earliest of the horses (*Eohippus*), the first opossums and a few others. The Oligocene was followed by the Miocene, a period of mild climate and wide-spread volcanic activity, in which land connection with Siberia, long interrupted, appears to have been restored, and when the first small forms of proboscidiæ entered this continent, on which subsequently they developed so extensively. "The place of origin and ancestry of these animals," says Prof. W. B. Scott, "were long exasperating puzzles. Appearing suddenly in the Miocene of Europe and North America, in which regions nothing was known that could, with any plausibility, be regarded as ancestral to them, they might as well have dropped from the moon for all that could be told respecting their history. The exploration of Eocene and Oligocene beds of Egypt has dispelled the mystery, and shown that Africa was the original home of the group." Pliocene time witnessed important introductions from both Asia and South America, where an independent fauna was developing. The most striking novelty, probably, were the bears—a distinctly Old World family. Among the notable importations in the next, or Pleistocene, period, were the antelopes and the bisons. These instances of animal invasion in the distant past are only a few of the list that might be compiled were palæontologists as certain of the foreign origin of some groups as they are of others. More important to us than this, however, is consideration of the invasions of animals and plants within historic times. Horses, cattle, sheep, dogs, cats and poultry, were brought in by the conquerors of tropical America, and by the colonists of its northern coasts, and these aids to agriculture, hunting and housekeeping were too quickly followed by invading foreigners of a harmful character. In the same way grain-plants, forage-plants, garden vegetables, fruits and ornamental trees, shrubs and flowers, came into the country from all parts of the world. Some, unsuited to the conditions, died out; or, like tea and indigo,

proved unprofitable and have been neglected. With the ships that brought these beneficent additions to our fauna and flora came many unwelcome visitors—true invaders in the modern sense of the word. Weeds innumerable began with the first settlements. Most of them were accidental importations, in seed, or in the discharged ballast of ships, or were attached to trees, shrubs and plants imported. Some were garden-flowers, controllable and harmless at home, but here flourishing inordinately and spreading into fields and highways; others, weeds and grasses pestiferous everywhere; others the molds, smuts and similar bacteric or fungoid diseases afflicting grains and fruits. It was long before the government took any precautions against such evils.

Simultaneously, and in a similarly careless way, various animals gained entrance and became pests, among them innumerable injurious insects. One of the most noticeable of the early invaders of this kind was the Hessian fly. The famous gypsy moth began here with escapes from an entomologist's collection near Boston in 1869. Among higher animals the house-mouse and black rat came across the Atlantic in early days, the brown rat previous to the Revolution, and these have become troublesome and even dangerous everywhere. (See RAT). Later, unwise persons imported the European ho se sparrow ("English" sparrow), about 1851. A few years later the skylark, European goldfinch and some other birds were introduced, but fortunately have not become naturalized. Starlings were set free in New York city in 1890, bred abundantly and threaten to become a costly nuisance. Rabbits are common in domestication, but by good fortune have not colonized wild, as has happened so disastrously in Australia. Lapp reindeer have been colonized in Alaska to the great advantage of the Eskimos there.

A few years ago the United States government, warned by naturalists, began to realize the danger in further invasions of this kind, and laws were passed requiring inspection of every plant and animal brought into the country, to make sure that some new and harmful insect or disease did not come with them; and prohibitions were made against the importations of foreign animals, especially certain dreaded ones, as the mungoos. These precautions are in the hands of the Department of Agriculture, and have been highly beneficial in their purpose and effect.

It was formerly believed that human invasions had taken place in prehistoric times on a large scale. Some of the theories, as of arrival of peoples from Egypt, or India, or Polynesia, or Japan, were highly fanciful; but more reasonable was the belief that this continent was populated by the invasion, thousands of years ago, of immigrants from Asia by way of Siberia and Alaska. It is not to be denied that something of the sort may have taken place in the very remote past on an extended scale, but there is no direct evidence of it, either then or more recently.

ERNEST INGERSOLL.

**IMMISCH**, im'ish, Otto, German classical scholar: b. Wartha, Lusatia, 1862. He received his education at the University of Leipzig, was appointed lecturer there in 1889 and professor in 1896. From 1907 to 1913 he was professor at Giessen and in the latter year was appointed to a chair at Königsberg. He published 'Philologische Studien zu Plato' (1896; 1903); 'Die innere Entwicklung des griechischen Epos' (1904); an edition of Susemihl's 'Aristotelis Politica' (1909); 'Wie studiert man klassische Philologie?' (1909); 'Das Erbe des Alten' (1911).

**IMMORALITY**, in general, a course of conduct at variance with the accepted standards of a community, and more especially those of a sexual character. Until recent times the law except in a few instances took no cognizance of immoral acts which in their consequences affect only the immediate participants, but the present tendency everywhere appears to be the extension of the law to regulate the private lives of persons, subjecting at the same time all offenders to legal penalties. See ADULTERY; DRUNKENNESS; FORNICATION; GAMBLING.

**IMMORTALITY** (Lat. *immortalitas*, in + *mortalis*, "not mortal"). The doctrine that the soul continues to exist after death, or more specifically the doctrine of eternal personal survival. To the question "What becomes of the soul after death?" various answers have been given by different philosophers and civilizations. The most noteworthy of these answers may be grouped as follows: (1) Complete annihilation (the Materialists); (2) Survival of the soul for an indefinite period in a world of filmy shadows (Aboriginal); (3) Eternal existence in a moral world of retribution (Christian and certain idealistic philosophies); (4) Transmigration (Indic, as early as the Upanishads; the Egyptians, Plato, the Pythagoreans, and sporadic amongst aborigines); (5) Absorption into an Infinite or Absolute Being (Pantheism; the Buddhistic Nirvana, where the individual is annihilated only in the sense that the seed is annihilated in the fully developed plant,—the seed's life-goal); (6) The survival of the individual in the form of the posthumous influence of his personality and achievement, which is scarcely more than a metaphorical use of the term Immortality (many Evolutionists and Positivists; cf. also Ostwald, Münsterberg); (7) Merging or diffusion of the psychic energy of the individual into an unseen hypothetical etheric energy (quasi-materialistic).

Belief in some form of immortality is widespread, although not universal. It is found in all stages of civilization from the lowest form of aboriginal life to the highest Occidental culture. The doctrine varies from a belief in an indefinite survival-period after death to the belief in eternal personal life, the latter being the legitimate use of the term Immortality.

**Aboriginal Civilization.**—Amongst primitive peoples, belief in the survival of the soul is due mainly to four things: (1) Their prevailing animism, which ascribes a soul to everything; (2) The phenomena of dreams and apparitions; (3) The instinctive will to survive and the instinctive aversion to annihilation; (4) The belief in the substantial character of the soul as an entity. "Looking at the religion of the lower

races as a whole, we shall at least not be ill-advised in taking as one of its general and principal elements the doctrine of the soul's future life." (Tylor, 'Primitive Culture,' Vol. II, p. 19). By "future life" is not meant immortality in the strict sense, but simply the soul's survival after death. Amongst aboriginal peoples we find two forms of the doctrine: Transmigration and the independent personal existence of the soul. It must be noted, however, that the dominant idea in the lowest civilization is simply the continuance of the soul in a new life similar to the present life. The abode of souls is usually in some distant part of the earth, less frequently in the nether world or the sky (some Hindus represent the seat of happiness to be vast mountains on the north of India), where they pursue a life modeled after this life, without ethical coloring. To some aborigines the idea of a bodiless existence is unintelligible or ludicrous (cf. Lubbock, 'Origin of Civilization,' 5th ed. p. 378). In the Tonga Islands, the chiefs are thought to be immortal, while the common people are held to be mortal. Amongst the Fijians the belief prevails that everything has a spirit, and they even hope that every coconut will be made anew in Paradise. (Peschel, 'The Races of Man,' 2d ed., p. 259). They do not restrict future life to man or even to animals. So also the Itelmes of Kamschatka believe in the rebirth of all creatures "down to the smallest fly." (Peschel, *op. cit.* p. 259). The Fijians think that as is their condition at death, so will their condition in the next world be. The infirm and diseased will find it difficult to make the long journey to Mbulu; consequently it is a custom to put the aged to death before they become too weak to travel. A common belief amongst some primitive peoples is that the individual has several souls, as amongst the Chippewa Indians, the Khonds of Hindustan, and in Madagascar. The Sioux Indians believe that man has four souls, as has also the bear (in their view the most human of animals). The Totemism of the Indians rests on the theory that the souls of ancestors have passed into the bodies of animals. Certain Eskimos put a dog's head in a child's grave, because the dog is skilful in finding its way and can guide the child's soul to the spirit-land. (Tylor, *op. cit.* p. 424). The Hottentots place the body of the deceased in the same position as the embryo occupied in the mother's womb, symbolizing thereby their belief that in the womb of the earth's darkness the dead will mature and come to birth. The lower races, in general, regard the soul as a filmy body, i.e., a corporeal entity capable of life and action, and needing, consequently, no bodily renewal. The idea of a resurrection of the body is, however, often found amongst primitive peoples, although it forms no important feature of their belief, as it does in the doctrine of immortality in Persia, later Judaism and the Pauline Epistles. On the whole, one may say that the difference between the conception of lower races and that of higher civilizations regarding the immortality of the soul is that the former look upon the future life as a continuance of the present type of sense-life, with activities analogous to the present crass activities, a corporeally refined shadowy state, with a decrease in the struggle for existence and an increase in the amount of pleasure. The higher civilizations, on the other hand,

make the doctrine of judgment and retribution paramount, spiritualize the conception of the soul and its future life, eliminate geographical definiteness from the soul's abode and correlate the conception of immortality with a system of religion and ethics.

**The Egyptians.**—In the earliest known civilization of Egypt, the problems of religion and eschatology were central interests. In the remotest period of their history, the Egyptians believed in an invisible deity or deities and in the future life of the soul. The human soul is of the divine substance, an emanation from Ammon-Ra. At death it passes to the seat of judgment at the gateway of Amenti (the Hellenic Hades) and there it is adjudged by the 42 assessors (representing the 42 sins of which the soul must be innocent) of the dead, before the supreme tribunal of Osiris. The soul that is proved pure at the judgment returns to its divine origin, while the soul that has led an impure life is condemned to reincarnation and passes into an animal life to attain purification through probationary metempsychosis. The theory of the future life of the soul amongst the Egyptians is based on the metaphysical view that the soul is an emanation from an original cosmic soul, on the ethical view that the present life is a probationary period, and on the conception of the moral fitness of the soul for reabsorption into its original source, the sun-god Ra—the head-spring of all light and life. See BOOK OF THE DEAD.

**Hebrews.**—Sheol, or the realm of shadows, appears in the early history of the Jews to be an amplification of the idea of the grave, as the dark abode of departed spirits, where souls dwell bodiless, unconscious, without feeling. The references in the early part of the Old Testament Scriptures to a future life are rare and vague, and the doctrine of the immortality of the soul is nowhere explicitly taught in the early books. The rites of necromancy were discouraged by the prophets and lawgivers of ancient Israel as antagonistic to belief in the God of life, whose realm excluded Sheol (or the realm of the dead), until post-exilic times. Eternal life belongs to God alone, and to those celestial beings who have eaten of the tree of life and live forever. In connection with the Messianic hope and under the influence of Greek and Persian ideas, the later Jews adopted a doctrine of resurrection of the body which made room for belief in the soul's continuous life. The Cabalists took up the doctrine of transmigration (Gilgul, "rolling on" of souls) according to which the soul of Adam passed into David and shall pass into the Messiah, as is mystically set forth in the letters of that name (Ad[a]m). The Platonic doctrine of pre-existence is also found in the rabbinical philosophy. Immortality conjoined with the dogma of the resurrection is the prevailing conception in the post-exilic literature, the latter (resurrection) becoming fixed in the Mishna and liturgy. Since the time of Moses Mendelssohn, who rehabilitated the doctrine of Plato in his 'Phædon,' progressive Judaism tends to lay less emphasis on the resurrection of the body, and greater emphasis on a purely spiritual immortality, the former dogma being discarded in the Reform rituals.

**The Greeks.**—The origin of the doctrine of immortality amongst the Greeks is lost in the

remotest antiquity. It is found in the early traditions of the Orphic and Dionysiac mysteries, in the poems of Homer and Hesiod, and forms a central tenet in the philosophy of Pythagoras, a contemporary of Buddha-Siddhattha and Lao-Tze. The view of Pythagoras includes the doctrine of transmigration, which may have been suggested to him by the theology of the Orphic mysteries or by Pherecydes, rather than by the Egyptians (Zeller, 'Pre-Socratic Philosophy,' Vol. I, pp. 71, 514). The great problem of a man's life is moral purification, which he pursues in a divinely governed Cosmos, where his chief end is to become like God. The soul is imprisoned in the body because of sins committed in a pre-existent state, and after death passes into a superior or inferior state, according as it has served Good or Evil. In the ascending stages of metempsychosis the soul is prepared for moral redemption. Although the belief in some form of immortality prevailed amongst the Greeks throughout their history, and probably came into their philosophy from their religion, it was not until Plato that a philosophic basis was furnished to the doctrine. The Platonic arguments for the immortality of the soul may be summarily stated as follows: (1) The fact that the mind brings to the study of truth a body of interpretative principles and axioms with it, as part of its native endowment, shows that they can be only reminiscential and, therefore, derived from a pre-existent state; (2) The soul is an ultimate unity (i.e., monadic in character) and, therefore, not being composite or divisible, it cannot be disintegrated; (3) The soul ( $\psi\upsilon\chi\eta$ ) means the "principle of life," having the idea of life essentially immanent in it, and inseparable from it, and therefore it must exclude the opposite idea, death; (4) The soul is self-moving, deriving its activity from within; consequently its motion and therewith, its life, must be perpetual; (5) The soul as an immaterial reality is essentially related to the immaterial, invisible, eternal idea; and as the former is akin to the latter in nature, so is it also akin in duration; (6) The superior dignity and value of the soul argue for its survival of the crass body, and even the crass body persists for a time; (7) The cyclical movement of nature shows everywhere the maintenance of life by opposition, as night, day; sleeping, waking; the dying seed, the germinating flower. This is an argument from analogy: out of the decay and death of one living organism, a new life is generated; (8) The instinctive aspiration of the soul toward a future existence shows that the belief is founded in natural law; (9) Things that are destructible are destroyed by their peculiar evil or disease; the peculiar evil of the soul is vice, which corrupts the soul's nature, but does not destroy its existence; (10) The world as a moral and rational world demands a future life of rewards and punishments for the rectification of inequalities in this life, else the wrong would ultimately triumph, as in a bad play. This argument is based on the ethical claim that there must be a final equivalence between inner worth and external condition or reward. The views of the Greeks, and especially the views of Plato, have had a profound, an incalculable influence on Christian thought, on early theological formulæ and on the sum of Occidental philosophy. Plato was not merely a framer of philosophy, an intellec-

tual interpreter of reality, but still more a man of religion, a seer.

The question of the pre-existence or survival of the soul is not a scientific problem. Positive science is impotent either to prove or disprove the dogma. It is a problem for religion, and its ultimate appeal is to faith. So long as science keeps within its borders, it is neither philosophy nor religion, and has no verdict to pronounce upon ultimate reality. The dogma of immortality in the higher civilizations is largely based on the philosophical theory of the ideality of human life, and on the demand for an ideal completion of experience which involves a transexperiential world. It is a postulate of purposiveness, of teleology in the ethical realm.

The general tendency of modern biological science and cerebral physiology has been to discard the doctrine of immortality, although the relations between molecular movements of the brain, on the one hand, and thoughts and feelings, on the other, are known to science merely as concomitants, and in no case as products or effects. James ('Human Immortality,' 1898) has endeavored to "draw the fangs of cerebralistic materialism" by ascribing to the brain a "transmissive" function, instead of a "productive" function. Tait and Stewart ('The Unseen Universe,' London 1894) postulate an unseen world, from which the known visible world has arisen and to which we must resort for the origin of molecules as well as for an explanation of the forces that animate these molecules; and it is reasonable to suppose, as these physicists say, that the ultimate unseen universe is connected by bonds of energy with the visible universe and is capable of receiving energy from it and of transforming the energy thus received. To say that the visible world is either eternal or has the power of originating life contradicts the result of observation and experiment (*op. cit.* p. 246). Therefore, the hypothesis of an eternal unseen universe is necessary to explain the evolution of the matter and life of the visible world and the only method of avoiding a break in the continuity of reality. The law of the conservation of mass and of energy, the law of biogenesis (every living being presupposes an antecedent life), and the law of continuity (there is no break in reality, the universe is of a piece) make the assumption of an unseen universe the easiest mode of explaining the empirical. Further, the postulate of a rational cosmic energy is necessitated by the ordered character and inherent teleology of reality. The law of continuity and conservation of energy necessitate the further conclusion that the psychic energy of the individual is not lost, but transmuted into the unseen world.

During the 18th century and the early part of the 19th, the dogma of immortality was widely discussed. The French materialists denied the doctrine in every form, regarding the psychic life purely as an organic function. In the system of Identity (Schelling) and Spinozism no place for the doctrine is found. In Fichte's idealism the creative Ego is not the individual, but the absolute Ego; the individual Ego realizes itself only by negating its individuality, by universalizing itself, and the Ego thus exemplifying the conceptual life of truth, con-

tinues to all eternity, as an indestructible part of the reality of the Absolute Ego. Hegel paid little attention to the problem, but the early Hegelians split into two factions, the one affirming and the other denying the doctrine (cf. Feuerbach, Richter, Weisse, Göschel, Conradi). In Lotze's teleological idealism the immortality of the soul (which is hardly more than casually mentioned) is based on the principle of value; that thing will continue forever which by reason of its excellence should be an abiding constitutive part of the Cosmical Order, but one cannot say that all human souls are immortal. This idea of a conditional immortality, determined by ethical value, reappears in later discussions (cf. McConnell, 'The Evolution of Immortality'), i.e., immortality is simply a moral achievement.

According to Kant, scientific demonstration is not applicable to these three truths: the Existence of God, the Freedom of the Will and Immortality. They are postulates of morality. The work of man as a moral being, with infinite potentialities, i.e. infinite perfectibility, necessitates an infinite time for their realization. The laws of the moral life are drawn from a transcendental sphere, free from conditions of time and space, and so the very essence of man's moral being is invested with the eternal. Man is infinitely progressive and perfectible in his moral and intellectual evolution, and this fact points indubitably to a further existence. If death were the end, the moral ideal would be illusory, and man would perish a fragment. An infinite moral imperative implies an infinite moral ability. Duty demands moral perfection. Further, the moral ideal is a character-ideal, an ideal of personal aim, which implies a personal destiny, and the non-illusoriness of the moral life implies the possibility of realizing its ideal.

One may fairly say that since the time of Kant the dominant note in the discussion of immortality has been ethical. The main postulates on which faith in the dogma has been based in the late literature of the subject are the moral perfection of a World-Governor, the basic rationality of the universe, and the worth of human life (cf. Gordon, 'Immortality and the New Theodicy,' p. 46).

The advocates of psychical research claim to find in spiritistic phenomena a proof not only for the existence of disembodied spirits, but also for their power to communicate with spirits still incarnate. The examination of these phenomena, however, is as yet in an unsatisfactory stage, and in any case the phenomena, so far as we know, have no bearing on the problem of the duration of survival.

The chief traditional arguments adduced in support of the doctrine are: (1) The ontological argument, which bases immortality on the immateriality, simplicity and irreducibility of the soul-substance; (2) The teleological argument, which employs the concept of man's destiny and function, his disposition to free himself more and more from the conditions of time and space, and to develop completely his intellectual and moral potentialities, which development is impossible under the conditions of earthly life; (3) The theological argument; the wisdom and justice of God guarantee the self-realization of personal beings whom he has created; (4) The moral argument, i.e., the moral

demand for the ultimate equivalence of personal deserts and rewards, which equivalence is not found in this life; (5) The historical argument; the fact that the belief is widespread and ancient, showing it to be deep-seated in human nature, and the historical fact of the resurrection of Christ and the statements of the New Testament Scriptures.

As to the attitude of men in the present time toward the doctrine, Osler ('Science and Immortality') happily groups them into three parties: (1) The Gallionians (cf. Acts of the Apostles, xviii, 14), i.e., the Scientists who study the How of the universe and who regard the dogma as without the pale of science, neither affirming nor denying its truth, although tending to reject it; (2) The Teresians (Saint Teresa, 1516-82), i.e., the seekers of the Why of the universe, the mystics who "live by faith" and have the "will to believe," who read a purpose in human destiny and teleology in the world; these are of the spirit of Plato; (3) The Laodiceans, who study neither the How nor the Why of the universe, who are absorbed in empirical problems and the sense-life; these have no practical concern with the doctrine.

*Sage Professor of Ancient Philosophy, Cornell University.*

**IMMORTELLE.** See EVERLASTING FLOWERS.

**IMMUNITY.** It has been a common observation that certain individuals are prone to the infectious diseases, and others not. Some children in a family always "take things hard," while others are not susceptible. This resistance to the poisons of the infectious diseases, or to the bacteria that cause the poisoning, is termed immunity. It is a relative quality of living matter, and is not confined to man alone, for lower animals, and even plants, show marked variations in their reactions to chemical and organic poisons. Thus certain plants are capable of growing in soils impregnated with metallic poisons of sufficient strength to destroy animal life; many animals are immune to poisons that would kill man; thus birds are comparatively immune to strychnine; young children can take comparatively larger doses of belladonna than adults; the diseases of plants are almost unknown among animals, and vice-versa; certain diseases affect the lower animals and are rare or unknown in humans, and the reverse condition also holds true; thus swine-plague is comparatively unknown in other animals than pigs, and such human diseases as typhoid fever and cholera are not common in lower animals; thus plants, lower animals and man, individually and collectively, enjoy certain relative immunity from destruction when exposed, under ordinary circumstances, to disease-producing agencies.

Natural immunity may be so modified as to be lost entirely, certain forms of disease predisposing the sufferer to ready secondary infection, as, for instance, is seen when tuberculosis follows measles; or a partial immunity be made more effective, or a new immunity conferred. This has been termed acquired immunity. The evolutionary doctrine would tend to interpret natural immunity as an inherited acquired immunity. In the case of man immunity sums up those powers of resistance which the body naturally possesses, or which it acquires in the struggle with infectious diseases, both in endeavoring to destroy the bacteria—bacteriolytic power—and to counteract the toxics—antitoxic power. Modern pathology has shown that the battle-field is a large one, and that the opposing forces are numerous and their powers largely unknown; and it must be remembered that the struggle has been going on for millions of years.

The observation that certain diseases—as measles, scarlet fever, smallpox—once acquired, confer a marked immunity, led up to vaccination, this inoculation against smallpox being the first conquest of disease by such means. It is certain that others will follow. Certain diseases—notably pneumonia, influenza, erysipelas—confer an immunity, but it is not lasting; thus demonstrating the principles of variability in the "immune bodies" as a class, and of an active and a passive immunity which may be conferred by various means, an active immunity being acquired by the animal for itself by direct adaptation, a passive immunity being conferred by a body made in the blood-serum of another animal.

Former theories for explaining the varied picture in this rapidly widening study have been numerous. They may be classed under the *exhaustion theory* of Pasteur, which assumed that the bacteria used up the available food-

supply and died; or, as the laity often express it, "the disease wore itself out." This theory has been thoroughly disproved. The *retention theory*—that the bacteria are killed by their own products—is also untenable. The *mechanical, humoral* and *phagocytosis* theories, which teach that the bacteria are destroyed by the humors or cells of the body, are partly true, but do not convey the whole truth, which in fact may never be known. The most popular theories of the present time are chemical, and that known as Ehrlich's *side-chain theory* is uppermost in discussion. This theory is extremely elaborate, but its fundamental principle is that the blood-serum of man and other animals may be so modified, in whole or in part—experimentally played upon, as it were—that it can be made to overcome the effects of infections, of poisons, or of both. The development of the diphtheria antitoxin in the blood-serum of the horse, to counteract the effects of the toxin of the diphtheria bacillus in man, was the first important practical deduction of this great principle. It was the first illustration of the production of a successful passive immunity in human pathology. In the discovery of the diphtheria antitoxin it was hoped that all the infectious diseases were conquered, but this hope was premature, as it was learned that other diseases involved other factors of a more elusive character than the simple toxin. The destruction not only of the bacteria within the body, but the neutralization of the poison as well, was found necessary, and hence the terms bacteriolytic immunity and antitoxic immunity. Ehrlich's side-chain theory tries to explain antitoxic immunity in chemical terms. He assumes that the cell-body has a number of side-chains upon it—receptors, as they are termed. These are capable of combining with food-products for the metabolism of the cell. There are certain receptors that can combine with toxic products as well, with damage to the cell. Antitoxins, according to Ehrlich, consist of surplus receptors made by the cell and cast off in the blood-serum. These unite with the toxin in the serum, and thus save the receptors of the cell for their normal food-taking properties. Any surplus of receptors over and above those combined with the toxin molecules floating in the blood are available as free antitoxins in the treatment of toxin-caused disease.

The other phase of the subject of immunity is concerned with the ability of bodies themselves to destroy bacteria—bacteriolytic immunity. It is known that if the blood-serum of certain animals is injected into an animal of a different species, the red blood-cells of the injected animal are destroyed. This process has been termed hæmolysis, and is observed under other conditions, as in poisoning by drugs, such as acetanilide, sulphonal, etc. A similar action of blood-serum on certain bacteria can be brought about by artificial means, thus manufacturing a *bacteriolytic* serum for use in destroying given bacteria in the human body. The various terms that are used in elaborating this hypothesis may best be expressed in the form of a chart, since in medical literature so many synonyms have been in vogue. See table next page.

As Prudden writes, "there seems to be abundant ground for the belief that the pro-

tective agencies which are evoked in both natural and artificial immunization are simply those which the body makes use of in its normal metabolism, exaggerated and diverted to different ends, it is true, in the face of emergencies, but giving evidence of the birth of no new physiological capacities." "The new methods of research and the far-reaching conceptions which they have stimulated and fostered seem likely to mark a new era in physiological chemistry, and to link more closely than any other extension of knowledge in our time some of the most subtle and urgent problems of medicine to the wider outlooks of general biology." See PATHOLOGY.

Virgin'; the 'Assumption of the Virgin'; the 'Annunciation'; the 'Resurrection of Jesus'; 'San Michael overcoming the Devil,' and the 'Four Evangelists.' The 'Marriage of Saint Catherine,' the 'Virgin Surrounded by Saints,' and three Madonnas are all in the gallery of the Museum. The cathedral of Imola possesses a 'Virgin and Saint Paul'; 'Saint Peter'; 'Zachariah and Saint Isabel.' Other works are in Munich, Berlin, Petrograd and Rome.

IMOLA, Italy, city in the province of Bologna, on the Santerno, 20 miles southeast of Bologna. It contains an ancient cathedral, two other interesting churches, several fine palaces, a communal library, a citadel, prison, lunatic

IMOLA, é'mò-là, Innocenzo da, Italian painter, who took the name of his native town Imola, where he was born about 1480 and died about 1550. At the time in which he flourished family names were not so much used as at present and it was quite a common occurrence to name a person familiarly and constantly from the place, district or country of his origin. So Innocenzo di Pietro Francucci was called and answered to the name Imola. He was one of the trade artists and decorators of his day and worked in the shops of several noted painters who contracted for large orders for decorative paintings for churches and occasionally for other purposes, including shipments of paintings to the Spanish colonies in America, more especially to Mexico. He seems to have learned from the various great painters with whom he came into contact, imitating one after another. Thus, at various stages in his life his work carries reminiscences of his different masters. In his later work his coloring is strongly in the style of Raphael. Imola's figures are graceful and his designs good and generally satisfying but they lack the originality and inspiration of the greater artists of his day. Among his paintings are the frescoes in the church of San Michele of the Wood, Bologna, which were for a long time painted over with water-colors. These fine paintings, which cover the walls and roof of the ancient choir of the edifice, represent the 'Burial of the

asylum and an agricultural school. Its industrial establishments include silk mills, soap and leather works, brickyards and gunpowder works. Wine and vegetables are important items of trade. Imola is the Roman Forum Cornelia, a station of the Via Æmilia. For centuries it was little heard of until the period of the ascendancy of the Lombards. In 1480 it came into the possession of the lords of Forlì and in 1500 was added to the states of the Church. Pop. 86,000.

IMPACT, the action which results on the coming together of two bodies, one or both of them in motion. If an ivory ball fall on a marble table which has a thin coating of oil, after impact the ball is found to have on its surface a patch of oil, which shows by its size that the ball must have been compressed at the moment of impact. When two bodies come into collision they compress each other at the points that touch until they have each the same velocity; during this time of compression each body acts upon the other with exactly the same impulse, the momentum lost by the one being gained by the other; if now the bodies are perfectly inelastic no further mutual rebound will take place; if the bodies are elastic they will regain their old shape, and the mutual impulsive forces of restitution will cause separation. The impulsive forces of restitution are found to be less than those of compression; that is (see IMPULSE), the momentum lost or gained by either of the bodies during the second or restitution part of the impact is less than the momentum lost or gained in the first or compression part of the impact in a certain ratio which is called the elasticity of the bodies. In a perfectly elastic body this ratio would be equal to 1, in a perfectly inelastic body it is 0.

Thus, when one ivory ball comes into direct collision with another of equal size at rest, the

first comes to rest and the second moves in the direction of motion of the first before impact, but with a slightly diminished velocity. When two equal ivory balls come together with equal and opposite velocities each returns on its old path with a velocity slightly lessened. When one perfectly inelastic body overtakes or meets another directly the common velocity after impact is equal to the sum or difference of momenta of the bodies before impact divided by the sum of the masses.

In a collision of two balls not perfectly elastic it may be shown that the total energy of motion (see ENERGY) of the two balls after collision is less than it was before, some of it having been converted into heat.

**IMPALE**, in heraldry, the arrangement of two coats of arms on one shield and side by side with a pale marking the division. See HERALDRY.

**IMPANATION**. See CONSUBSTANTIATION.

**IMPEACHMENT**. A trial, usually of a public officer, for a high crime or other offense. In England the House of Commons is the prosecutor and the issue is tried and determined before the House of Lords. Impeachment in England dates back to a very early day, and has continued, with some interruptions in the 15th, 16th and 17th centuries, to the present. It has now lost much of its former importance. The charges against the defendant are in the form of articles, and he may employ counsel to represent him and call witnesses in his defense. The vote of each peer on the question of the guilt of the defendant is taken separately, and if he is found guilty, the Commons may or may not move for judgment as they see fit, frequently refusing to do so, which amounts virtually to a pardon. Political offenders may be impeached when danger exists of their escaping punishment by the usual methods. Impeachment lies against persons of all ranks and for misdemeanors and crimes of all degrees. The practice of impeaching ministers has been rendered obsolete by the doctrine of ministerial responsibility to Parliament. Likewise the impeachment of judges is no longer necessary, the power of removal existing in the Crown.

In the United States by the constitutions of most of the States impeachment proceedings are instituted in the Senate, although in a few States the ordinary courts of law have jurisdiction of such proceedings. There is considerable conflict of judicial opinion on the question of impeachment, particularly on the offenses for which it lies, whether a State officer is subject to impeachment after he has ceased to hold office, etc. An offender who has been impeached may, in certain cases, later be tried and punished by the courts for the same offense. By constitutional provision in many jurisdictions none but State officers are subject to impeachment, and this necessarily excludes county and municipal officers. Among some of the offenses which by constitutional provisions are subject to impeachment are treason, bribery, misconduct and maladministration in office, habitual drunkenness, neglect of duty, common law and statutory crimes and corrupt practices and oppressive conduct by judges and others. The rules of evidence in impeachment proceedings are the same as those which prevail in criminal trials. To justify a conviction, therefore, the guilt of

the accused must be established beyond a reasonable doubt. Under the constitutions of some of the States no person may be impeached by a concurrence of less than two-thirds of the senators elected.

There is a marked difference in some particulars in impeachment proceedings in the United States and England. For instance, in the United States the only penalty after impeachment is removal from office, while in England any legal penalty, even capital punishment, may be inflicted. In many of the States, by constitutional provision, cases of impeachment are excepted from the pardoning power, whereas in England, as stated above, the Commons have virtually the pardoning power in all cases. In England a commoner may be arrested when impeached or he may be compelled to give security for his appearance, and a peer may be arrested for a capital offense, while in the United States there is no power of arrest in any case.

**IMPEDIMENTS TO MARRIAGE**. See MARRIAGE.

**IMPERIAL**, Cal., city of Imperial County, on the Southern Pacific, 25 miles south of Old Beach. It contains a meat-packing plant, creamery, cement works, cotton compress, a soap works and a stock yard. The water supply system is owned by the municipality, which also maintains a public library and a high school. The city is situated in the famous Imperial Valley, where irrigation is extensively practised. Pop. 1,250.

**IMPERIAL CITY**, a designation of Rome, for ages the mistress of the world.

**IMPERIAL FEDERATION**, a term in English politics for the consolidation of the British Empire, so as to combine its resources for the maintenance and defense of common interests, while leaving intact the existing rights of colonial parliaments in local affairs. The idea was first advocated by Thomas Pownall, governor of Massachusetts in 1764. In the 19th century one of its most outstanding colonial advocates was Joseph Howe, the Canadian statesman. The foundation of the Imperial Federation League by W. E. Forster in 1884 may be said to have marked the beginning of organized movement in this direction. The celebration of the 60th year of Victoria's reign in 1897 was the occasion of a gathering in London of the prime ministers of all the self-governing colonies, who were entertained as the guests of the country. This was the third occasion of a meeting of representatives of the colonies, the first having met in London in 1887 and the second in Ottawa in 1894. After taking part in the queen's procession and the attendant festivities the premiers met the Secretary of State for the Colonies (Chamberlain) in conference. The subject of Imperial Federation was discussed at one of these meetings; and though more than one of the premiers directly advocated the representation of the colonies in a council sitting in London, the opinion of the greater number was expressed in the observation that the colonies were very well as they were at present. Further conferences were held in 1902, 1907 and 1911. The 1902 conference agreed to co-operate with the imperial authorities as regards defense; Australia and South Africa offered to contrib-

ute to the cost of the British navy; a resolution was passed declaring that free trade within the empire was not practicable; but favored inter-imperial preference. This conference was presided over by Chamberlain, the strongest advocate of reciprocal preferences. But in 1907, with a Liberal government in power pledged to the maintenance of free trade, the reaffirming of the resolution passed in 1902 on imperial preference was strongly dissented from by the representatives of the home government. The creation of an imperial general staff was approved, as was a British resolution in favor of fiscal freedom to each part of the empire. In 1911 imperial preference was not brought up, and a resolution in favor of giving the self-governing dominions liberty to withdraw from most-favored-nation treaties was passed, but owing to the strong opposition of foreign governments no steps have been taken in this regard. These conferences, it may be said, are held every four years, the Prime Minister of Great Britain, the Colonial Secretary, and the prime ministers of the self-governing dominions being designated as the ex-officio members. The delegates, however, have no power to bind their respective countries. Partly as a result of these conferences various modifications in the fiscal policies of the dominions and colonies have taken place. In 1897 Canada granted unconditional preference on British goods and this was subsequently increased. The West Indies, Ceylon, the Straits Settlements and New South Wales were accorded the preferential terms of the Canadian tariff in 1898. The South African Customs Union established a British preference in 1903, to which Canada was admitted a year later; and in the same year New Zealand granted a British preference on a limited list of imports. One of the most valuable results of the Imperial Federation movement and of the various imperial conferences has been in a co-ordinated scheme of defense for the whole empire and in the sharing of the burden. The outbreak of the Great European War saw a rallying of all the dominions to the help of the mother country, and that although they were free to assist or to refrain from lending assistance.

Consult Chamberlain, 'Imperial Union and Tariff Reform' (speeches); the proceedings of the several imperial conferences; Seeley, 'The Expansion of England'; Jebb, 'The British Question: A Survey of Alternatives'; Kirkpatrick, 'Imperial Defence and Trade'; Polard, 'The British Empire'; Amery, 'Union and Strength'; Lucas, 'Greater Rome and Greater Britain.'

**IMPERIAL GUARD**, the name given to the consular guard when Napoleon I became emperor of France in 1804. At first it was about equal to a division. It fought with good effect at Austerlitz and Jena. Afterward it was greatly increased, being subdivided into "Old Guard," "Middle Guard" and "Young Guard," and in 1814 amounted to more than 100,000 men. It was disbanded in 1815, but revived by Napoleon III on 1 May 1854, and took part in the Crimean War in 1855. In 1870 it surrendered at Metz to the Germans and was soon after abolished. Consult Houssaye, H., and others, ed., 'La Vielle Garde Imperiale' (Tours n.d.).

**IMPERIAL INSTITUTE**. The Imperial Institute of the United Kingdom, the Colonies and India, designed to commemorate the jubilee of Queen Victoria (1887), aims at comprising complete collections of the products of the various parts of the British Empire, a commercial intelligence department for the promotion of trade and industry and a great school of modern Oriental languages (opened in 1890). In 1902 its management was transferred to the Board of Trade.

**IMPERIAL SERVICE ORDER**, The, an order instituted by Edward VII, in 1902, and designed to honor those who have served the Crown at home or abroad continuously for a term of years. The term is usually 25 years, but those who serve in torrid or unhealthful regions of the colonies may receive the order after 16 years of service. The order comprises a sovereign and 425 companions. Of the latter 250 must belong to the Home Service and the remainder to the Colonial Service.

**IMPERIAL VALLEY**, a large section of country in the middle of Imperial County, Cal. The county is 84 miles long from east to west and 54 miles from north to south and has an area of 4,536 square miles or about 2,600,000 acres. Its southern boundary is the international line between Mexico and the United States; its eastern line is the Colorado River; on the north is Riverside County, while on the west the San Jacinto or Coast Range of mountains separates it from San Diego County. The territory is below sea-level and some 300 feet below the level of the Colorado River to the east. In the northeastern part of the county is the Salton Sink or Sea, which has a water surface area of 247 square miles. The Imperial Valley section of this county is about 400,000 acres in extent, nearly one-sixth of the entire county area. It extends from the boundary line on the south 40 miles northward and has a width of about 30 miles. The climate of the section is one of great heat and dryness. Summer temperature is sometimes as high as 112° or 116°, but there is a very low humidity. The winter is mild, the temperature rarely falling below the freezing point. Precipitation is small and variable. The average annual rainfall at Imperial City for a period of five years was 4.45 inches.

The territory was part of what for generations had been known as the great Colorado Desert, an arid land with temperature rising as high as 125° to 140°, a barren waste where neither man nor beast could live. The silt which had been deposited by the river had made a good soil, although scientists were slow to recognize this. But when the subject of the irrigation of Western lands in the United States assumed prominence after about 1890, it was realized that this desert valley was a rich field for reclamation. Plans for irrigation were considered before 1900 and were tentatively entered upon at once. Within six years from the beginning of irrigation there were 125,000 acres of productive farm land in the valley, 40,000 acres of alfalfa and 85,000 acres of grain and other crops, 20,000 head of beef cattle, 4,000 milch cows and much other stock. The annual production of commodities for shipment reached the value of \$2,000,000. The range of products is wide. The land is too valuable for grazing

or grain crops but an extensive system of farming fruits and vegetables is the best paying. Cantaloupes, asparagus, alfalfa, grapes, oranges, onions, honey, hogs, poultry and dairy products are the main dependence of the farmers. Dates are also being cultivated. Cotton culture has been introduced and a great success has been attained in the growth of the valuable long staple cotton.

Imperial was the first town established, located near the centre of the valley. The county-seat is El Centro. Brawley, termed the "Garden City," is the distributing and shipping point for 80,000 acres of rich farming country. Holtville on the banks of the Alamo River, Calexico, on the southern border of the county, and Heber, situated half way between Calexico and El Centro: these three complete the sextette of the valley towns, all which, except Heber, were incorporated towns of the sixth class in 1909.

The water that irrigates Imperial Valley is taken from the Colorado River at a point four miles north of the international boundary line near Yuma, Ariz. The headings there provide for the admission of water sufficient for more than two and a quarter million acres of land. The canal carries the water to the former channel of the Alamo River leading northward toward the Salton Sea and the first 60 miles, over a semi-circular course, are in Mexico. Just before leaving Mexican territory and entering Imperial Valley the canal divides into four main branches and these main canals are in turn divided and subdivided again and again until the net work of waterways covers the entire valley, there being in all over 1,000 canal miles.

In 1905 the floods of the Colorado River breaking through a canal cut which had been made on Mexican soil, just south of the boundary line, widened and deepened until the entire flow of the river was turned west down the steep slope of the hills into the valley and the Salton Sink, threatening the destruction of farms and other property.

The situation was serious and President Roosevelt took cognizance of it by action and by a subsequent message to Congress that raised what up to that time had been a matter of merely local interest and importance into a question of national concern. To aid in the efforts to close the break, the Southern Pacific Railroad, whose tracks were imperiled and whose traffic was seriously impeded, took charge of the situation. The break was closed in November 1906. A month later there was another runaway of the river and the water broke through the newly constructed levees, again forcing itself into the basin of the Salton Sink.

In this emergency President Roosevelt without waiting for congressional action arranged with the Southern Pacific Railroad to go on with the work of repairing the break and restoring the river to its proper channel in order to save the valley and the Laguna Dam which was then in process of construction by the government. This work was successfully done and in 1911 Congress reimbursed the railroad company for the expenses which it had incurred. This relief accomplished, measures were at once instituted for the permanent protection of the valley from the annual floods of the Colorado River and for the meeting of its irrigation needs.

**IMPERIALISM**, the national policy which tends toward the expansion of national domination and national ideas over a geographical area wider than that of national boundaries. As a policy, it is as old as civilization itself; an empire was established by the Hyskos which extended from Euphrates to the Nile, and a great Egyptian empire was established by Thothmes III. Thus ancient Rome extended her dominion and system of government, her laws and language first over the whole of Italy, then over Sicily, northern Africa, Spain, Gaul, Britain, Greece and parts of Asia. Charlemagne's idea was to hold France, Germany and Spain under one imperial head. Napoleon wished his empire to comprise all Europe. English nationalism has been partly a wide scheme of colonization, and partly, as in India, a plan for bringing under British rule, a cluster of Oriental races, while leaving them free in regard to local laws, customs and beliefs. Nothing has been more remarkable within the last 40 years than the overseas expansions of territory on the part of the greater powers. Great Britain, France, Germany, Russia, Italy, Belgium, Japan and the United States have all engaged in the quest for territory. Germany's rise as a colonial power dates from 1880, with the founding of the German Commercial and Plantation Association of the South Seas and the first territorial acquisition in Samoa. The impulse to expansion was given by the great wave of protection that followed after the Franco-Prussian War, and by the desire to arrest the tide of German immigration to the United States by affording room for adventurous youth under its own flag. Land hunger, the control of markets for raw material and the exploitation of native races, the seeking of outlets for surplus population, and the necessity for defensible and scientific frontiers, are among the motives which impel the powers to seek expansion. In the case of the United States, the succession to the colonial estate from which Spain was dispossessed as a result of the Spanish-American War, the shrinkage in the size of the world from what it was in the days of the Founders of the Republic, and the legitimate fear that the island outposts of the Americas, or even part of the South American continent, might be seized on by such an aggressive and overmastering power as the German Empire, has caused the departure from its former position of splendid isolation to be acquiesced in by the people of the United States. "Bearing the white man's burden," to quote Kipling; "pegging out claims for posterity," in the words of Lord Rosebery; and the arrogant image of the Emperor Wilhelm II, "seeking a place in the sun," are some of the phrases employed descriptive of modern Imperialism. But, in the opinion of its adversaries, it is held to evoke a spirit of aggressive and exclusive nationalism, protectionist in its trade policy,—and that too, while it is admitted that the policy of the British Empire, the largest holder of overseas estate has up to the present time been to grant to foreign nations in the colonies and dependencies equal trading privileges with its own subjects. But the Imperialism Movement with which the name of Chamberlain is associated was frankly exclusive and protectionist, and the majority of the more enthusiastic British Imperialists are ardent protectionists. And there is no doubt that the national

IMPEYAN PHEASANT (*Lophophorus impeyanus*).

jealousies excited by the scramble for markets and the passion to acquire colonial possessions have been a fruitful source of international suspicions and perturbations, and contributed not a little to the jealous and acquisitive temper that found its culmination in the disastrous struggle that broke on the world in August 1914. In the United States the term imperialism has been used in a more or less factitious sense. The avowed object of the government at Washington in the Spanish War was the liberation of Cuba from the Spanish yoke. The term "imperialism" was employed as a political catch-word in the Presidential campaign of 1900, especially with regard to the purchase of the Philippines. The other extra-territorial possessions of the United States are Alaska, Porto Rico, Hawaii, Guam, Samoan Islands and Virgin Islands of the United States (formerly Danish West Indies). The Supreme Court on 2 Dec. 1901 decided on the constitutionality of expansion. The principles settled by the decision are thus to be stated: (1) The Constitution does not follow the flag till it is planted on new territory by special act of Congress. (2) The extension of the sovereignty of the United States to new territory guarantees the enjoyment of liberty, the right to property and the protection of the United States to the people thus affected in securing justice and public order and promoting peaceful progress. (3) The islands acquired from Spain by the Treaty of Paris are "property of the United States," and Congress can dispose of these islands in any way conducive to the interests of the people of the United States and of these islands.

A corollary of these propositions finds expression in the statement that the territory of the United States may be described under three heads: (1) The States. (2) Incorporated Territories. (3) Unincorporated territory, belonging to the United States.

This gives to the nation three different classes of people dependent upon it: (1) Citizens vested with full political power, or the residents of the States. (2) Citizens of the incorporated Territories, who are not vested with full political power as long as they are residents of the incorporated Territories. (3) The people of the "territory belonging to the United States," as such, who cannot become citizens of the United States till Congress extends to such territory they occupy the privileges of the Constitution.

**IMPETIGO**, im-pě-ti'gō, popularly known as PUSTULAR TETTER, HONEY SCAB and HONEY SICKNESS, a skin disease found mostly in children, consisting in an eruption of itching pustules, appearing in clusters, and terminating in a yellow, thin, scaly crust. They appear chiefly on the head and face, and sometimes on the hand. Feverishness and sensations of chilliness accompany the disease. The treatment is both external and internal, the former consisting in the application of ointments, as graphite. An incomplete diet is believed to be a prominent cause.

**IMPEYAN** (im'pī-an) **PHEASANT**, a pheasant of the genus *Lophophorus* generally; specifically the species (*L. impeyianus*) of southern Kashmir, first brought to notice by Lord and Lady Impey. These are among the most splendidly clothed of birds, rivaling the humming birds in the brilliance of their metallic

hues. There are four or five species, each restricted to a particular region in southeastern Asia. The Himalayan species or Monal (*L. refulgens*) is the best known and is often exhibited in zoological gardens. The male is perhaps the most gorgeous of the *Phasianidae*, presenting a wonderful combination of sparkling metallic purples, blues, browns and greens, with golden and coppery reflections and contrasting patches of snowy white and deep black; on the head is a crest composed of long racquet-shaped feathers. The female is plainly colored. High up in the mountains near the snow line the monal lives during the summer, breeding up to an elevation of 12,000 feet, but in the autumn, as the weather becomes cold, it gathers into flocks and descends to the deep woods or, in very severe weather, even to the cultivated lowlands. It both runs and flies swiftly, but is chiefly terrestrial, and feeds largely on roots and grubs dug from the ground. The impeyan pheasant has the black and white areas replaced by golden green.

**IMPLEMENTS, Agricultural.** See FARM MACHINERY.

**IMPORTANCE OF BEING EARNEST.**

**The.** If one were to select a single one of Oscar Wilde's plays which should best exemplify his contribution to English drama, one might well choose 'The Importance of Being Earnest,' although it is neither the most important nor the best known of them. This apparent contradiction is explained by the fact that, being a farce (his only one), the artificial conventionality of plot and the unreality of the characters which so obviously mar his comedies, are not conspicuous faults in this gay trifle. Consequently one can give oneself up unreservedly to the enjoyment of the play of brilliant wit and delicate satire of which Wilde was a master. Here is "literary farce," *par excellence*. The dialogue is a continuous succession of sparkling epigrams, witty paradoxes, quick repartee and delightful, unexpected turns of phrase. Even the title is a clever pun.

In plot and technical structure also, Wilde shows himself less conventional and more ingenious in this play, slight as it is, than in most of his others. In a very amusing scene between two young gentlemen in the first act it transpires that Jack, who lives in the country and is constrained to lead a very decorous life there on account of a young ward who lives in his household, has invented a scapegrace brother, named Ernest, whose supposed escapades furnish the excuse for Jack's frequent visits to town. Algernon, on the other hand, has invented an elderly invalid friend in the country to whom he is touchingly devoted whenever he wishes to escape a tiresome engagement in town. These imaginary characters are utilized to build up a series of delightfully absurd situations in the second act for which the audience has been skilfully prepared but which are nevertheless unexpected.

'The Importance of Being Earnest' was written in 1895, shortly before its author's sensational trial and imprisonment, and was the last play that he wrote. It was first produced at the Saint James Theatre in London in February 1895, and later in the same year at the Empire Theatre in New York.

GRACE R. ROBINSON.

## IMPORTS AND EXPORTS

**IMPORTS AND EXPORTS**, taken together, represent the foreign trade of a country; and, as such, they are indicative of its commercial status among nations. Imports are classified as those for consumption by the population, and those for re-export. In the classification of exports, therefore, the re-exports appear again, along with the domestic production of the country. Generally speaking, a large volume and variety of imports for consumption are the mark of a prosperous people of many wants, and of means to buy to their satisfaction; and large imports usually are accompanied by large exports, the latter going to pay for the former, as near as may be, the balance of the account being settled in gold.

The relative activities of populations may therefore be gauged in large measure by their

imports and exports. Thus, in Table A, the best showing is made by New Zealand's people, with a per capita export of \$141, and a per capita import of \$110. They not only paid with their exports for what they imported, but the balance of trade was in their favor by \$31 per capita. Next in rank comes Switzerland, with a per capita of \$122 export, and \$118 import. Belgium and the Netherlands each show a total foreign trade of \$221 per capita, although the balance of trade is against them. At the other end of the scales are Liberia, with a total foreign trade of less than \$1; China, with less than \$3; and British India, with but little over \$3.

The dates given in the table are the latest complete figures issued authoritatively by the individual countries named.

TABLE A

COUNTRY	Population	Imports	Exports
Argentina 1916	8,066,000	\$209,800,000	\$524,329,000
Australia 1916	4,875,000	373,400,000	299,999,000

Venezuela, 1916	2,816,000	20,634,000	22,707,000

Table B gives the imports and exports of the United States for the fiscal years ending on 30 June of the several years quoted. With the values of imports are included the value of goods intended for re-export, which appear in another column. The last column shows the balance of trade from year to year, in all cases in favor of this country. The effect of the war upon the foreign trade of this country is plainly exhibited.

given to them which was called the Salon des Refusés (Salon of Rejected Works). One of the most striking pictures there was a landscape at sunset by Claude Monet (1840) entitled an 'Impression.' The name was adopted for the new style; and painters who worked more or less in the same manner were called Impressionists. This group of men led by Manet, Monet, Edgar Degas (1834-1918), Paul Cézanne (1839-1906), Camille Pissaro (1831-

TABLE B

YEAR	Imports	Re-exports	Domestic exports	Balance of trade
1880.....	\$667,954,746	\$11,092,305	\$823,946,253	\$167,683,912
1890.....	789,310,409	12,534,856	845,293,828	68,518,275
1900.....	849,941,184	23,719,511	1,370,763,571	544,541,898
1905.....	1,117,513,071	26,817,025	1,491,744,641	401,048,575

**IMPOST**, in architecture, the plane or place at which a horizontal stone, beam, arch, etc., rests on the column, pier or wall. It is often marked by horizontal moldings. Imposts have received various names, according to their character. Thus, a continuous impost is one in which the moldings are carried perpendicularly down the pier, as in the later decorated Gothic; a discontinuous impost, one where the moldings abut and are stopped on the pier; shafted impost are those in which the arch moldings spring from a capital and differ from those of the pier.

**IMPOSTS**. The word may properly be used to designate any tax or levy, but specifically it signifies the duties levied on the foreign trade of a country, both imports and exports. The United States Constitution forbids the several States to lay impost except such as may be necessary to secure adequate execution of inspection laws; and all moneys thus collected shall be turned over to the United States Treasury.

**IMPOTENCY**, a diseased condition of the male in which he is incapable of generation; any incapacity to perform the generative function, successfully. As such condition defeats the presumed object of marriage it is regarded as a bar, and cause for annulment, sometimes divorce, except when the natural result of old age. In the old common law failure to consummate the marriage relation within three years is presumptive evidence, and constitutes a sufficient ground for divorce, or annulment of marriage. As a cause for annulment or divorce it is in the United States a matter of State legislation.

**IMPRESSIONISM** is the name given to a school of painting that began to manifest itself in Paris in 1863, when the works of Edouard Manet (1832-83) and his friends were rejected by the Salon jury of that year. The emperor, Napoleon III, liberally minded, demanded that these innovators should at least have the right to exhibit together and a special room was

1903), Alfred Sisley (1840-99), and Auguste Renoir (1841), received nothing but abuse and ridicule for 30 years. Their pictures, which now command enormous prices, were condemned for years by the Parisian critics and painters who led the taste of the period. A few far-sighted patrons, however, encouraged these great artists who worked industriously and patiently, producing an enormous number of works and obeying the creative instinct without any other dogma than the passionate observation of nature. The Caillebotte collection, bequeathed by Gustave Caillebotte to the Luxembourg Gallery in Paris, and a special exhibition of their works at the Paris Exposition of 1900 compelled recognition. The public — in fact, the whole world — awoke (as it did to the sculpture of Rodin) to the truth and beauty of the Impressionist masters. To-day their place in art is unquestioned and secure.

Impressionist ideas may be summed up as follows: In nature no color exists by itself. The coloring of objects is a pure illusion. The only creative source of color is the sunlight which envelops all things. Our vision has formed the habit of discerning in the universe two things: form and color. Only artificially are outline and color distinguished one from the other. Light reveals the forms; and, playing upon different states of matter, i.e., the substance of leaves, the grain of stones, etc., the fluidity of the air, gives them dissimilar coloring. When the light disappears, forms and colors vanish. Everything has a color; and it is by the perception of the different color surfaces striking the eye, that forms, i.e., the outline of these colors, are perceived. The idea of distance, the idea of perspective and the idea of volume are given by darker, or lighter, colors. This is called in painting the sense of values; and values are the only means by which depth on a flat surface can be expressed. Color, being the irradiation of light, it follows that all color is composed of the same elements as sunlight, namely, the seven tones of the spectrum. These seven tones appear different,

owing to the unequal speed of the waves of light. The colors vary with the intensity of light. There is no color peculiar to any object, but only more or less rapid variation of light. The speed depends, as is demonstrated by optics, on the degree of the inclination of the rays, which, according to their vertical or oblique direction, give different light and color. The colors of the spectrum are thus recomposed on every object. According to the time of day, i.e., according to the greater or smaller inclination of the rays (scientifically called the angle of incidence), the green of a leaf and the brown of a tree-trunk are modified. If a painter wishes to recall color to the beholder of a picture, the composition of the atmosphere which separates objects from the eye must be studied. Therefore, the atmosphere is the real subject of the picture, and whatever is represented only exists through its medium. Another principle is that shadow is not absence of light to be represented with ready-made tones of bitumen and black, but is light of a different quality and value. In a shadow the rays of the spectrum vibrate with different speed. The third conclusion resulting from this is that colors in the shadows are modified by refraction. For instance in a picture representing an interior the source of light (a window) may not be indicated. The light in the picture will be composed of the reflection of rays whose source is invisible and all the objects in the room catching reflections will consequently influence each other. Their colors will affect each other even if the surfaces be dull. A red vase placed on a blue carpet will lead to a very subtle but mathematically exact interchange between this blue and this red; and this exchange of luminous waves will create between the two colors a tone of reflections composed of both. These composite reflections will form a scale of tones complementary of the two principal colors. The science of optics can work out these complementary colors with mathematical exactness. If for example, a head receives the orange rays of daylight from one side and the bluish light of an interior from the other green reflections will necessarily appear on the nose and in the middle of the face. Here we touch upon the very foundations of Impressionism. The painter must paint with only the seven colors of the spectrum and discard all the others: that is what Claude Monet has done boldly, adding to them only white and black. Instead of composing mixtures on his palette the painter places on his canvas nothing but the seven colors juxtaposed, leaving the individual rays of each of these colors to blend at a certain distance, so as to act like sunlight itself upon the eye of the beholder. Such, then, is the dissociation of tones, which is the main point of Impressionist technique. It has the immense advantage of suppressing all mixtures, of leaving to each color its proper strength and consequently its freshness and brilliancy. The difficulties are extreme. The painter's eye must be subtle. Light becomes the sole subject of the picture: the interest of the object on which it plays is secondary. Painting becomes a purely optic art, a search for harmonies, a sort of natural poem, quite distinct from expression, style and design, which were the principal aims of former painting. It is only

natural that it is principally in landscape painting that the Impressionists have achieved the greatness that is theirs.

Impressionism is more than a school: It is a *movement*, a reactionary movement, against classic and romantic subject. It is anti-intellectual, protesting against every literary, psychological, or symbolical subject, and warring against historical painting, mythological painting and false idealism, substituting for such subjects what might be summed up in the word *character*. To search for and to express the true character of a site, a human being, or an object, seems to the Impressionists more significant than to search for exclusive beauty. Before the days of Manet a distinction was made between *noble* subjects and *genre* (scenes of familiar life) subjects: the Impressionists consider all subjects worthy of the painter's brush, if nobly treated.

The Impressionists, coming immediately after the Barbizon School (Millet, Corot, Rousseau, Diaz, etc.), have had as much, if not more, influence than those painters who worked in the Forest of Fontainebleau. Among the principal exponents of Impressionism in other countries are the Americans, Child Hassam, John S. Sargent, Henry Golden Dearth, J. W. Alexander and Mary Cassatt; the Spaniards, Sorollo y Bastida, Zuloaga, Dario de Regoyos and Rusiñol; the Italians, Boldini, Segantini and Michetti; the Danish, Kroyer; the Belgians, Théo van Rysselberghe, Claus, Verheyden, Heymans, Verstraete and Baertson; the Norwegian, Thaulow; the Dutch, Jongkind; and in England the "Glasgow School," Lavery, Guthrie and John Lewis Brown. Consult Duret, 'Les Impressionistes' (Paris 1906); Mauclair, 'The French Impressionists' (London, n. d.); Muther, 'History of Modern Painting' (London 1896).

ESTHER SINGLETON.

**IMPRESSMENT**, the act of seizing (goods, etc.) for the public service, or of forcibly conscripting individuals for work in connection with war. When men are taken for the army or navy this is usually termed conscription in the draft (q.v.). As an act of military necessity many persons are more or less forced into activities in a war in which they are not directly engaged, and their conveyance, vessels, etc., may be commandeered in a very high-handed manner. Impressment was especially common in the English navy in the 16th and 17th centuries and well into the 18th. The merchant marine imitated the method in picking up sailors in ports. The right of changing one's natural allegiance (see CITIZEN; EM-BARGO) was not acknowledged as a legal right in the 18th and early 19th century by any nation but the United States, which lacked power to enforce it against the world. Great Britain denied it, and Chancellor Kent early in the 19th century admitted that the denial was common law. During the Napoleonic wars, that country in its struggle for life, especially on the seas, demanded the help of all its citizens; and not only refused to recognize any ceremonies of naturalization, but seized its alleged subjects wherever it found them, searching neutral vessels on the high seas and impressing into its service whoever were claimed as such. The naval officers were the reverse of particular

whether they made mistakes and kidnapped born Americans, and many hundreds of the latter were impressed in this way. Not only this, but the right of search in itself, were rasing grievances which worked up the national temper to the pitch of explosion, resulting in the War of 1812; the right of search resulted in the bloody outrage of the *Leopard* on the *Chesapeake* (q.v.), which was one of the chief agencies in bringing about the Embargo.

**IMPRISONMENT** is one of the three classes of punishment for crime, death and penal servitude being the other two. It has always been a power inherent in courts of justice to imprison for contempt of their authority, and under certain conditions for non-payment of debt. In criminal proceedings a person may, by a warrant of a justice of peace or magistrate, be imprisoned before trial, provided the justice considers it is not a proper case for allowing bail; and though in minor offenses an accused person may insist on being discharged on tendering sufficient bail, yet in more serious crimes it is in the discretion of the justice to accept or refuse the bail tendered, and on his refusal application may be made to judges of the common-law courts to accept bail. Imprisonment may be with or without hard labor, or it may be solitary. Penal servitude may be inflicted for life, or any shorter term, but in the case both of imprisonment and penal servitude the convict can at any time apply for commutation or remission. In the case of misdemeanors and other petty offenses tried summarily at common law and under a variety of statutes, imprisonment is usually awarded with the option of a fine. In the case of juveniles they are often said to be "detained" in a reformatory. Serious crimes as burglary, murderous assault, rape, counterfeiting, etc., receive long terms of imprisonment varying according to the laws of the States. The duration of term of imprisonment is usually partially in the discretion of the judge who sentences, and various laws specifying "imprisonment for not less than (so many) years and not more than (so many)." Provision is made for reduction of term in prison by reason of good behavior, and prison terms may be reduced by commutation of sentences or by subsequent pardon. In New York State one-year term means but 8 months and 20 days, if behavior is uniformly good, while a 10-year term can thus be reduced to 6 years, 1 month and 20 days and a 60-year term to 22 years, 8 months and 10 days. The unlawful detention of the person by any one, or "false imprisonment," constitutes a personal injury, and may be treated as a criminal or as a civil offense. See **DEBT**; **PENOLGY**.

**IMPRISONMENT FOR DEBT** is the restraint of the liberty of a debtor in a civil action. An arrest for debt is usually made by some mandate of a court having jurisdiction, after the nature and amount of the debt has been established by due process of law. But sometimes a debtor is restrained of his liberty on a preliminary proceeding, by order of a court, for the purpose of holding him to bail. In the United States, imprisonment for debt is made only by virtue of statutory regulations, several States having constitutional provisions prohibiting it under certain circumstances, and

seven of them having absolutely prohibited restraint in any form of personal liberty on account of debt, by such provisions; namely, Alabama, Georgia, Maryland, Mississippi, Missouri, Tennessee and Texas. Several of the States provide in their constitutions that there shall be no imprisonment for debt except in cases of fraud on the part of the debtor. In some of the States acts have been passed providing for imprisonment founded on contracts deliberately entered into, while others have provided that only absconding debtors shall be subject to imprisonment. The tendency of modern legislation is adverse to imprisonment for debt. Many of the States have provided in case of imprisonment that the restraint shall be made as free from indignity as is consistent with the safe-keeping of the debtor, and that his restraint shall be considered more in the nature of misfortune than as punishment for an offense.

**IMPROVED ORDER OF RED MEN**, an American civic society, with benevolent and social characteristics, organized 14 Oct. 1833. Founded upon the manners, traditions and customs of the aborigines of the Western World, the Order adopted their unique figures of speech, which it transmits with historical accuracy. Knowing that some time the Indian race will become extinct it intends to occupy an original place in public interest as the repository of Indian customs, Indian traditions and Indian nomenclature. The Order's motto is "Freedom, Friendship and Charity." Its interpretation, as promulgated by official authority, may be concisely stated in these words: Freedom, in honor of that race to whom the forests, the plains, the hills and the valleys of this land were as free as the air to the eagle, and in memory of the early struggles to wrest these United States from dependency to foreign rule. Friendship, to commemorate the unswerving loyalty with which an Indian maintained a noble and unselfish affection for him to whom it was pledged, and which makes sweet and lasting the relations that one member bears to another. Charity, the love expressed to a brother by those who meet around the brightly burning council fire; the sympathy which is pleased at his success, and the fraternal affection that grieves over his sorrows and disappointment.

**Government**.—The Order is organized along the familiar lines of civic societies. Its supreme power is the Great Council of the United States, and from this body emanates all authority for the establishment of local branches in towns and cities; also Great Councils in States and Territories and in the Dominion of Canada. State and Provincial Great Councils, under restricted delegated authority, exercise governmental oversight,—within their respective jurisdiction,—similar to that of the Great Council of the United States. Local branches of the Order are Tribes, Degree Councils and Councils of the Degree of Pocahontas. The Great Council of the United States has for its chiefs, or officers, the presiding and executive official, who is called the Great Inchoonee; the Great Senior Sagamore, second in authority; Great Junior Sagamore, third officer; Great Prophet, who is often a Past Great Inchoonee; the Great Chief of Records, or Grand Secretary; the Great Keeper of Wampum, or Grand Treasurer; Great Tocakon, the messenger of

the presiding officer, or Grand Marshal; the Great Minewa, an officer in charge of the inner wicket; and the Great Guard of the Forest, guardian of the outer door. State Great Councils have chiefs whose duties correspond to the officers of the supreme body, as follows: Great Sachem, presiding chief; Great Senior Sagamore, Great Junior Sagamore, Great Prophet, Great Chief of Records, Great Keeper of Wampum, Great Sannap, Great Mishinewa, Great Guard of Wigwam, Great Guard of Forest. The chiefs of a tribe are: The Sachem, who presides; Senior Sagamore, Junior Sagamore, Prophet, Chief of Records, Keeper of Wampum, Collector of Wampum, First and Second Sannap, four Warriors, four Braves, the Guard of the Wigwam and Guard of the Forest. In Degree Councils the chiefs governing them are similar to those of a tribe. The Councils of Pocahontas admit white women to membership, and those of the order who have attained to the Chief's Degree. The chiefs of the council,—whose duties are defined in an ornate ritual,—are: Pocahontas, presiding officer; Wenonah, Powhatan, Keeper of Records, Collector of Wampum, Keeper of Wampum, First and Second Scout, First and Second Runner, two Counsellors, four Warriors, Guard of Wigwam, and Guard of the Forest. Provision has also been made for the establishment of State Great Councils of the Degree of Pocahontas, similar in authority to those of the Tribal Branch, the officers of which run parallel with local councils. The names of the chiefs have the prefix of "great," and these Great Councils are given jurisdiction over this degree, all under the sovereignty of the Great Council of the United States. After various attempts to organize a branch for the "display element," legislation created, in 1899, the Red Men's League, with a uniform resembling the "Continental," and a perfect military code. Into this organization were merged prior uniformed bodies and beneficial councils. The adoption of consistent laws at once secured a continued increase in this branch of the Improved Order of Red Men.

**Ritual.**—The ceremonies of the Order are purely American. The ritual stands, and must ever stand, unique and distinct, growing more valuable as the only realistic demonstration of those mystic ceremonies of the aborigines, which otherwise might fade into oblivion. Founded, as has been stated, on the manners, traditions and customs of the American Indian, it portrays an existence more fascinating the longer it is studied, and gives the keynote to those bursts of eloquence which were at once the wonder and the admiration of the early missionaries, and of which the renowned "Black Hawk" is a shining example. The work of the Order is divided into three sections or degrees—the Adoption, the Warrior's and Chief's—each of which illustrates a phase of the characteristics mentioned. The degrees of the auxiliary branches of the Order are written in harmony with the general theme of the original ritual.

**Nomenclature.**—The attention arrested by the recital of this Order's official life is greatly enhanced when its terminology is considered. The expressions used not only differentiate the Improved Order of Red Men from other civic societies, but these form links connecting it with prior organizations of Red Men. This is

further outlined in the "history" following. Time is not computed as in the common era, but according to a phraseology that has a hidden meaning and significance to the "initiated." Up to 1865, the Jewish style, namely, the year of the world, was used in dating documents. This was superseded by a revised system and "G. S. D.," or Great Sun of Discovery, was adopted, the year 1492 being considered G. S. D. 1. For convenience the year begins with that of the common era, and the enumeration follows: A year, *Great Sun*; a month, *Moon*; January, *Cold Moon*; February, *Snow Moon*; March, *Worm Moon*; April, *Plant Moon*; May, *Flower Moon*; June, *Hot Moon*; July, *Buck Moon*; August, *Sturgeon Moon*; September, *Corn Moon*; October, *Traveling Moon*; November, *Beaver Moon*; December, *Hunting Moon*; a week, *seven suns*; a day is a *sun*, and a night is a *sleep*. Morning is called the *rising of the sun*; evening, *setting of the sun*; noon, *high sun*; midnight, *low sun*; an hour is a *run*, and a minute a *breath*. Examples: 30 July 1903 A.D. would be expressed as "30th Sun, Buck Moon, G. S. D. 412," 1903—1491=412. "Tribes . . . shall, within two seven suns after the last council sleep in Hot and Hunting moons, transmit," etc. Wampum Belt signifies treasury, and wampum or money is computed as follows: *Fathom*, one dollar; *foot*, a dime and an *inch* is one cent. To illustrate: "In case the wampum shall at any time be reduced to a less amount than five feet for each member, or to less than 50 fathoms, the tribe," etc. Non-members are called *pale faces*; tribal jurisdictions are *hunting grounds*; Great Councils govern *reservations*; opening and closing meetings consist of *kindling and quenching council fires*; minutes are called *records*; addresses or reports, *talks* or *long talks*; attending to business is *following the hunt*, and wronging another, *crossing the path*. *Wigwam* and *teepee* signify the halls of meeting, and *council chambers*, a room therein. Voting is called *twiggig*.

**History.**—An attempt has been made to establish a succession from the patriotic societies of the American Revolution to the Improved Order of Red Men, but without much historical basis. That such organizations, founded in 1763, existed, there is no doubt. Moreover, the War of 1812, with England, served to foster the assembling and banding together of men fired with patriotic ardor. It is quite likely these associations may have led to the formation of the societies of Red Men—possessing the terminology hereinbefore mentioned,—known to have flourished between the years 1813 and 1830, of which fragmentary records have been preserved. The impulse also may have come from the Tammany societies of the national period prior to 1812. A society of Red Men existed in Philadelphia, Pa., in 1824, and there were branches in other cities and States at earlier and later dates; but the movement, which began in Baltimore, Md., in 1833-34, really seems to be the authentic date of foundation. The Improved Order of Red Men was anti-convivial in its character, and was first brought into public prominence by the observance of Saint Tammany's Day (still on the calendar), 12 May 1837. The Order spread, and, on 20 May 1835, the Great Council of Maryland was instituted, and soon became an incorporated body. On 30 Jan. 1847 the Great Council of the

United States was formed as the supreme government, and this, in turn, became a corporation, by special charter from the legislature of Pennsylvania, approved 30 March 1866. The policy of the Order has been to possess a legal standing in the State; and a brotherly hand extended early secured the adherence of the scattered bands of Red Men to the "improved" institution, so that unity of effort soon promised much for the future. The fortunes of the "Improved Order," however, were fluctuating at first, and, until 1881, when it began to assume its present proud proportions of over 479,000 members, embracing the entire republic, and reservations in Canada, and disbursing annually in benefits over \$1,649,800, and since organization over \$34,612,000.

Consult 'Official History,' edited by Charles H. Litchman, revised by Charles C. Conly (1893-99), and 'Documentary History of New York'; 'Constitutions and Digest, I. O. R. M.'

H. L. STILLSON,  
*Fraternity Historian.*

**IMPSONITE.** A natural bitumen or asphalt closely resembling albertite but only slightly soluble in turpentine. Brittle and burns without fusing. Occurs in Nevada and Oklahoma.

**IMPULSE.** This is a term used in mechanics to designate the "time integral" of a force. If the force is constant, the impulse it produces in a given time is the product of the force and the time in question. If the force is variable, its time of action may be divided into an infinite number of equal intervals. Then the impulse will be the sum of the products of each variable value of the force by the common infinitesimal time interval just defined. Impulse is a quantity of the same kind as momentum; that is, it is the product of mass and linear velocity.

It should be observed that in the case of impulses in nature the forces are never infinite and their times of action never infinitesimal, though it is sometimes convenient to adopt these fictions in analysis. (See DYNAMICS; FORCE). Consult Thomson and Tait's 'Natural Philosophy' (Part I), and Gray, A., and J. G., 'Treatise on Dynamics' (London 1911).

**IMPUTATION,** as a term in Protestant theology, is used to signify three things, first, the imputation of the sin of Adam to all of his posterity, second, the reckoning of the sins of man to Christ, third, the reckoning of the righteousness of Christ to believers. Thus, on the theory of imputation the sin of Adam is so attributed to each individual of the human race as to be considered in the Divine counsels as the act of that individual, who is thus rendered guilty of it. When sin is spoken of as imputed to Christ it is meant that the condition or state which was actually man's becomes by imputation judicially his, and thus in law Christ became fitted to be a sacrifice and sin offering for man. Had he not been man's substitute by the imputation of sin he could not have become his substitute in the endurance of the penalty of sin. The two are inseparably connected. In the very same sense in which Christ was made sin men are made the righteousness of God in him. According to this view he was made sin, not actually and personally, but by imputation; and men are made righteousness, not actually and

personally, but by imputation. Consult Broughton, L. G., 'Salvation and the Old Theology' (New York 1908).

**IMUS,** ē'moos, Philippines, pueblo of the province of Cavite, Luzon, eight miles southeast of Cavite, the provincial capital; it is an important road centre. In 1896 it was the stronghold of the insurrection, Aguinaldo and other chiefs having their headquarters in its principal building. Pop. about 15,000.

**IN-BREEDING, Evils of.** See BREEDING.

**IN CÆNA DOMINI,** in sē'nā dom'ī ni, a papal bull, so called from its first words, it being annually read "at the Lord's Supper" on Holy Thursday. Its earliest form was that promulgated in 1363 by Urban V against all heretics and favorers of heretics. The bull was annually promulgated at Rome till the year 1770, when a much modified document took its place, this in its turn being withdrawn by Pius IX in 1869.

**IN FORMA PAUPERIS** (in the form of a pauper), legal term applied to a person who obtains leave to carry on an action at law without paying the fees of court and other costs.

**IN MEMORIAM.** 'In Memoriam' by Tennyson is one of the great elegies of the English language. 'Lycidas' and 'Adonais' would probably both come to mind in comparison, but neither is so widely known, nor does either answer so exactly to the spirit of the 19th century. 'In Memoriam' expresses the grief of the poet over the death of an early friend, but with the expressions of personal grief there is also an interpretation of the problems of death and the future life. The poet himself said: "This is a poem, not an actual biography. 'I' is not always the author speaking of himself, but the voice of the human race speaking through him." Beside his own personal feeling, then, Tennyson in his poem gives voice to the sentiment of his time on Death and Immortality,—and in this effort he was remarkably successful. So capable a judge as F. W. Robertson said: "To my mind and heart the most satisfactory things that have ever been said of the future state are contained in this poem." Many other such opinions might be quoted. F. D. Maurice thought that the author had made a definite step toward the unification of the highest religion and philosophy with the progressive science of the day. Henry Sidgwick subsequently wrote of certain stanzas: "I feel in them the indestructible and inalienable minimum of faith which humanity cannot give up because it is necessary for life." Such opinions probably would not prevail to-day on the part of liberal and radical thinkers, but they serve to show how actually Tennyson's poem was something more than an expression of individual feeling. It expressed a very general sentiment of the race. This depth of thought comes in part from the fact that the poem was not written all at one time (like Browning's 'La Saiziaz' a little later) but was gathered together in the course of 17 years. Arthur Hallam had been Tennyson's closest intimate at Cambridge and in following years. In 1833 while traveling on the Continent he died. The poem presents a development of thought and emotion from the first passionate despair to the matured wisdom that sometimes comes

with time. Four different stages are clearly shown by the three sets of stanzas describing the celebration of three returns of Christmas. The poem presents what has been called the "The Way of the Soul" (A. C. Bradley),— a passing from the first stupor and confusion of grief, through a growing acquiescence often disturbed by the recurrence of pain, to an almost unclouded peace and joy. The following main divisions are generally marked: (I) Absorption in grief; (II) Reflection on the idea of continued life and an advance from mere sorrow; (III) Resignation and Faith; (IV) Awakening of a new sentiment of the possibilities of life. The poem however is not chiefly noteworthy for thoughts which might have been expressed in prose. The ideas are themselves poetical, namely, the plain conceptions of philosophy on life transfused with imagination. The poem gives not so much argument as a way of thinking and feeling. The particular poetic expression is in a stanza-form which had been rarely used before, but which Tennyson in this poem made his own and indeed believed that he had invented. The stanza-form is such a slight variation from a very common one that it seems remarkable that no one should have used it before, but it is so absolutely the right thing in 'In Memoriam' that it is practically a real creation of Tennyson's. There are several commentaries on 'In Memoriam,' especially those by A. C. Bradley and John F. Genung. In Vol. I, Chapter 14 of the 'Life' by Tennyson's son will be found the chief authoritative facts concerning the poem.

EDWARD EVERETT HALE.

**IN OLE VIRGINIA**, a collection of negro dialect stories published by Thomas Nelson Page in 1887, is a revelation of the life of the ante-bellum South as it was found in the best homes of Virginia. It is not the whole truth with regard to slavery, but it suggests the social atmosphere of the somewhat feudal state of society as it existed among the better classes of Virginia. The medium through which this social life is revealed is the old-time negro as he looks somewhat wistfully back to the good old times when the relations between the races were kindly and gentle. Through the mists of the years he recalls in picturesque words the Southern colonel; the younger, more light-hearted young men, who threw themselves almost recklessly into the festivities and duelling of that era, and later became the most dashing and indomitable soldiers of modern times; the various types of Southern girls — the light-hearted, tender Polly, or Miss Charlotte "comin' down de grand stairway, lookin' like she done come right down from de top of de blue sky and bring a piece of it wid her," or Meh Lady in her bridal dress, "white as snow from her head to way back down on de floh behine her, and her veil done fall roun' her like white mist, and some roses in her hair." These types, all presided over by the dignified matron of the plantation — the gentle, classic, serious mother — are seen participating in fox-hunts, tournaments, weddings, harvest festivals, and above all the Christmas celebrations that have made Virginia social life famous throughout the world. Always in the background is the stately colonial mansion with its polished halls, grand

stairways and noble porticoes. In "Unc' Edinburgh Drownin'" we hear the infectious music of the banjos, the laughter of the dancers, the festive noise and merriment of the cabin and the mansion. In some of the stories, notably in "Marse Chan," we see the breaking up of the old order and the tragedy of the Civil War.

EDWIN MIMS.

**IN PARTIBUS INFIDELIUM** ("in the regions of the unbelievers"). Titular bishops of the Catholic Church since the 13th century until 1881 were styled *episcopi in partibus, etc.* At first they were bishops without a diocese, and their titles were derived from places where there was no longer a bishop's see. The usage originated after the Greek schism, and became general in the time of the Crusades. The places conquered by the Crusaders in the East were furnished with Catholic bishops; but when these conquests were again lost the popes continued to appoint and consecrate the bishops to whom a special field of labor could not be assigned in Europe. Hence coadjutors and missionary bishops were consecrated to titular sees. Upon the re-establishment of the Catholic hierarchy in England in 1850, English bishops ceased being termed bishops *in partibus*. The term was abandoned in 1881 by order of Leo XIII, because many of these ancient sees had become the territory of Christian nations, rendering the old term inappropriate. It is now usual to term prelates consecrated to distant sees titular bishops.

**IN PERSONAM**, spoken of legal rights, means such as are maintainable only against a specific person and not against the whole world. (See **IN REM**). Rights *in personam* arise out of a specific engagement between individuals, or out of domestic or fiduciary relations. But the majority of rights *in personam* spring from the violation of rights either *in rem* or *in personam*. A right once violated, a right of action against the violator immediately arises. An action brought against the violator is also called an action *in personam*.

**IN REM**, spoken of legal rights, means such rights as are not only maintainable against a specific person (see **IN PERSONAM**), but can be maintained against the whole world. Nor are rights *in rem* limited to property rights, but include all rights, such as freedom from personal assault, from causeless imprisonment, from trespass. The term includes the right not only of suing for damages, but of seizing and detaining certain articles. In admiralty practice this is a common resort, though in ordinary processes for the recovery of land or goods, it is rarely made use of nowadays.

**IN THE TENNESSEE MOUNTAINS**, a collection of short stories published in 1884 by Charles Egbert Craddock (Mary N. Murfree), reveals and interprets the primitive and elemental types of character to be found in the mountains of East Tennessee and western North Carolina. Many years before the Southern people had awakened to the undeveloped human resources in these mountains, the author, who had been in the habit of spending her summers in the Cumberland Mountains, felt and depicted the humor, the pathos, the kindness and tragedy of these contemporary ancestors — men and women, who in their moun-

tain coves had let the tides of civilization sweep on past them, leaving them in a state of arrested development. The more savage and the more gentle elements of their character are revealed at country stores, in blacksmiths' shops, at still-houses and in various forms of social life such as hunting, dancing, playing cards, political campaigns and religious revivals. If we have the blundering brutality and strength of ignorance, we have also the noble and tragic self-sacrifice of such women as Cynthia Ware, whose lover is saved by her devotion from his prison life only to pass out of her life and that of the mountains into the more material civilization of the valley; or Celia Shaw, who has a revelation of a life of culture as contrasted with her own crude family life only to be made aware that she cannot share it. Throughout the stories we are made to feel that "the grace of nature is in its way a fine thing; the best that art can do — the polish of a gentleman — is hardly equal to the best that nature can do in her higher moods." As a background for these well-told stories there is always the presence of the mountains. Perhaps no American writer of fiction has surpassed Miss Murfree in descriptive writing. At times the art of interweaving the human story and the almost personal life of nature is perfect. At other times it is overdone. The best stories in the volume are 'Drifting Down Lost Creek,' 'A Star in the Valley' and 'Sledge at the Settlement.'

EDWIN MIMS.

**IN THE VALLEY** (1890), by Harold Frederic, is eminently representative of the historical novels which, during the later years of the 19th century in the United States, contended, for a time successfully, with the prevailing vogue of realism. As in so many stories of the type, the hero — a Mohawk Valley Dutchman — finds himself pitted against a brilliant villain — of course a British officer — who for a time wins the heroine — thrown among "Tories" and British but steadfastly loyal to her native colony — only in the end to lose her to the slow-witted though courageous and honorable Douw Mauverensen, who is historian as well as hero of the tale. The book adheres to the New York tradition, early set down in Irving and Cooper, of respect for Dutch prudence, suspicion of British perfidy and active prejudice against all New Englanders, particularly those from Connecticut. There are also faithful black slaves and ferocious Indians. So far 'In the Valley' accepts the conventions of its order, but it goes beyond them in other respects, for it lacks the customary tinsel of archaisms and pretensions, and is not always sentimental. Frederic, later distinguished by his energetic naturalism, was, in this romance, prophetically spare and terse. Years of preparation, he said, went to the making of the book, which is full of unobtrusive erudition regarding life in the Mohawk Valley and in Albany from 1757 to 1777, when the diverse nationalities of the region were drawing together into a common Americanism. For them it was both a civil and a foreign war; the battle of Oriskany, by checking the British and Indians, not only left the valley in the hands of the colonials but also prevented the junction of St. Leger and Burgoyne and so contributed to the decision reached at Saratoga. 'In the Valley,' compact and dramatic throughout,

comes to its fitting climax with the fight at Oriskany.

CARL VAN DOREN.

**INAGUA**, *ē-nā'gwā*, Great and Little, two of the Bahama Islands in the West Indies, at the southern extremity of the group. Great Inagua has an area of 660 square miles, and Little Inagua 36 square miles. The largest town of Great Inagua is Matthew Town, and the entire population is not over 1,500.

**INAJA** (*in-āj'a*) **PALM**, a palm (*Mari-miliana regia*), indigenous to the region of the Amazon, South America. It is noted for its strong stem which seldom exceeds 20 feet in height, and for its long drooping leaves which are often 15 feet long. Hunters use the spathes as cooking pots and the Indians as baskets and cradles. The fruits are eaten by the Indians, who also make hats and ropes from the fibres of the leaves.

**INAUGURATION DAY**. When the Constitution had been ratified by the requisite number of States the Continental Congress, by resolution of 13 Sept. 1788, set the first Wednesday of the following March (4 March 1789), as the "time for commencing proceedings" under the new form of government. Owing to delays of various kinds, such as difficulties of travel, etc., members of the first Congress were very slow to assemble in New York, and a quorum of both Houses was not obtained until 6 April. The counting of the electoral vote, the notification of Washington and his journey from Mount Vernon to New York took until 23 April, and his inauguration was set for 30 April. His term of office was, however, construed as having commenced on 4 March, the date set by the Continental Congress for the inauguration of the new government, and so it came to an end on 4 March 1793, although it lacked nearly two months of the four years provided for by the Constitution.

**INCA**, or **YNCA**, the name of a tribe of Peruvian Indians — not exclusively that of a royal family or caste, as has been commonly asserted. The members of this tribe sometimes called their war-chief "Cuzco," meaning chief or lord of Cuzco, but probably more often "the royal Inca," or simply "the Inca." (Consult 'Royal Commentaries of the Yncas,' by Garcilasso de la Vega, Lisbon, 1699, Part I, chapters 8 and 15). The latter usage was in the end adopted by Spanish chroniclers; and Garcilasso, half Spaniard, half Indian, in the 15th chapter of his commentaries, which were written, he tells us, 71 years after the conquest, uses both the longer and the abbreviated forms — "Yncas Kings" and "Yncas" — though feeling that he must explain that he means by the latter the "native kings of Peru." Throughout the tribe mother-right prevailed, and marriages were contracted between members of different clans; therefore offices could not descend from father to son; and especially the office of war-chief, or Inca par excellence, must usually have been filled by selection. The tribal dialect was called Quichua. See also PERU.

**INCA SEMI-CIVILIZATION**, the state of advancement in arts and learning reached by the most progressive tribe of South American Indians, occupying a portion of the Andean Sierra, and exercising control, in the regions

now known as Peru, Ecuador and northwestern Bolivia, over many other tribes of the highlands and lowlands before the Spanish conquest.

In the articles INCA, CUZCO and PERU, reference has been made to certain popular misconceptions touching Inca government, chronology and the tribal name. It is necessary to add that the evidence at present available is entirely insufficient to warrant such assertions as the following, which occurs in one of the leading works of reference: "The Inca was the absolute but, in most cases, kindly ruler.

. . . In many respects the Inca government will compare favorably with any which at that time existed in Europe"; or this, from a popular account published in December 1903: "The Inca race had developed in pre-Columbian times an astonishing and marvelous civilization." Far from lending itself to such conclusions, the evidence furnished by Spanish writers of the 16th and 17th centuries, when their works are tested and corrected by a comparison with the results of modern archaeological research, points to social conditions which cannot be ranked above semi-civilization. Moreover the objects collected by archaeologists to illustrate or represent industrial and artistic activity in ancient Peru in point of fact illustrate and represent the activities of a race very slightly elevated above semi-barbarism. In the customary treatment of their dead a lack of higher symbolism made itself felt oppressively; the crouched position of the body, bound in a tawdry pack, and the commonplace offerings buried with it suggested nothing better than the petty comforts, or ignoble miseries, of a life forever limited to alternating phases of servile toil, crouching rest, sensual indulgence and childish diversions. The various tribes of the Sierra, from Quito to Lake Titicaca, were bound together by roads which ran from one highland village to another; the lowland Indians were held in subjection through fear alone, the Inca supremacy signifying to them a prolonged reign of terror.

Some of the war-chiefs may have been "kindly rulers"; we shall, in all probability, never know whether they were or not. Cristoval de Molina, who described the "Fables and Rites of the Yncas," and who, in order to gain the knowledge of those rites which he imparts, "assembled a number of aged persons who had seen and participated in them in the days of Huayne Ccapac," believed that some definite, if scanty, records existed. He says: "It is so that these people had no knowledge of writing, but in a house of the sun called Poquen Cancha, which is near Cuzco, they had the life of each one of the Yncas, with the lands they conquered, *painted with figures* on certain boards." Another chronicler, Juan de Santa Cruz, who wrote about 1620, says: "I affirm that I have heard, from a child, the most ancient traditions and histories, the fables and barbarism of the heathen times." Such as these are the sources of our knowledge of the story of the Inca rulers. Some of the events in the lives of the war-chiefs were depicted, as valuable records or as parts of an ornamental design, in a "house of the sun"; otherwise all rests upon the prattle of Indian dotards and of Indian nurses. Accounts written by the conquerors themselves (for example, Xeres) leave almost everything to the imagination. We may be certain, at least,

that tradition retained most accurately the traits of the last two or three native chiefs, whom the "aged persons had seen"; and though we may not condemn the unknown by reason of the credibly reported misconduct of the known, we shall be obliged to suspend judgment, instead of accepting the easy platitudes now current with respect to the succession of war-chiefs from Manco down to Huayna. The shameless private life of Huayna Ccapac is set forth in the 'Antiquities of Peru' by Juan de Santa Cruz. As for that great war-chief's still more famous son, we read in Garcilasso de la Vega's 'Royal Commentaries of the Yncas' (Book IX, Chapters 35-37) that Atahualpa summoned all Incas of the blood royal to assemble at Cuzco, and put them to death. "The cruelty of Atahualpa," says this historian, himself half Inca, "was greater than that of the Turks, for, not content with the blood of his own 200 brothers, the sons of the great Huayna Ccapac, he passed on to drink that of his nephews, uncles and other relations . . . so that none of the blood royal might escape, whether legitimate or bastard. They were all murdered in different ways." The same fate was meted out to all the loyal captains of his rival Huascar; furthermore "he ordered all the women and children [of royal blood] to be assembled, of whatever age and condition, reserving only those who were dedicated to the sun in the convent of Cuzco. He ordered that they should be killed outside the city, by little and little, and by various cruel tortures, so that they might be long in dying." The varieties of ingenious tortures mentioned by Garcilasso are similar to those inflicted by North American aborigines upon captive women and children and "though the work could have been done in a shorter time, they prolonged it in order to enjoy the cruelties more fully."

It appears to be altogether improbable that the Inca semi-civilization, if it had not been interrupted by the coming of the Spaniards, would have reached the height of 16th or 17th century European civilization, or by native merit have kept abreast of the advancing nations of the Old World. That the tribe had neglected to provide itself with a written language, and failed to develop high ideals in art, we have already noticed. A third essential for progress was equally wanting: the Incas had no money, or any medium of exchange corresponding to the wampum of the Indians who lived near the North Atlantic coast. But it is impossible for any people deprived of trustworthy records of human experience to construct a convincing system of morality; and without some convenient medium of exchange an extensive and pacific commerce is equally impossible. Both deductive and inductive methods of reasoning must, therefore, lead an unbiased student of old Peruvian institutions to the conclusions that, at home, inveterate and fully sanctioned practices made for degeneration; while steady blackmail, varied by occasional slave-raids, took the place of mutually beneficial dealings with neighboring, subject or independent tribes.

Limitations of the race's genius or experience may be exemplified in the department of music. The Inca musicians used drums which "were made by stretching a skin over a hoop of wood or over one end of a short section of the trunk of a tree which had been hollowed out to a thin cylinder." (Compare 'The Mu-

sical Instruments of the Incas,' by Charles W. Mead, assistant Department of Archaeology, American Museum of Natural History). Other musical instruments of percussion in common use were copper bells, in form resembling sleigh-bells; rattles, made of small shells, gourds and nuts, often strung together and attached to the wrists, ankles or other parts of the body, in dancing; also cymbals of rudimentary form. Wind instruments were the syrinx or pan-pipe, consisting of reeds of graduated lengths, held in position by a cross-piece of split cane lashed to the reeds with a cord made of llama wool—the reeds being sometimes closed at the lower end, sometimes open, and occasionally arranged in double rows, yielding octaves; flutes, made of cane or bone, "simply tubes, open throughout their length, and all belonging to the class known as 'end-blown,'" not scientifically constructed and not attuned one to another; resonator whistles, emitting several different notes; trumpets, made either of terra cotta or of conch shells,—primitive instruments, producing only four or five distinct tones (as shown by actual test of specimens taken from the ancient tombs); a double musical water bottle, consisting of two pottery vessels connected near the bottom in such a way that water passes freely from one to the other, and in its passage (when the vessels are swung backward and forward) forces air through an opening near the top, producing a series of whistling sounds; and finally the "cornets" mentioned by Garcilasso ('Royal Commentaries') and Herrera—instruments formed like the oboe, rather than the cornet in the modern sense. With this enumeration the list is exhausted. Such evidence as we have at the present time disproves the existence in Peru of any form of stringed instrument before the coming of the Spaniards. In other words, the unaided genius of the Inca Indians, exerting itself in the field of music, stopped short of the more complex instruments: ancient Peruvians were satisfied with the wild discords evoked from pan-pipes, flutes (or fifes), drums or clashing shells, all of rude construction.

And, as in music a great volume of sound—not harmony—was the desideratum, so in architecture they neglected beauty and strove to attain resistant mass, with walls as solid and homogeneous as possible—the prime essentials in a country shaken by destructive earthquakes; and their solicitude in this respect suggests that the tribe, before the migration to which old legends refer, may have dwelt in the volcanic western part of the Sierra. (See PERU). Hence the so-called "cyclopean" walls of the temples and palaces, structures built to endure, for which the builders utilized enormous stones of irregular shapes, fitted together so skilfully that mortar was not required.

It is safe to say that nearly all features of the ancient industrial life of the tribes inhabiting the Andean Sierra and Peruvian coast strip are either intimated or plainly shown by specimens in the archaeological collections of the United States and Europe. (See article ANCÓN). With the utmost care products which are not properly to be classified as Incan have been separated from those showing the activities of the dominant race; and such care is obviously indispensable, for the Incan objects do not stand out from the rest quite unmistakably.

One finds practically nothing to support the theory that there was ever a nearly unrelated, or a wholly distinct and marvelously superior, Inca civilization. Especially instructive are the examples of the potter's art which have been secured in great numbers—representing such different social classes as the warrior, musician and water-carrier. Costumes, weapons, occupations, etc., are depicted faithfully, though without artistic charm. Fabrics of cotton, or woven from the wool of the llama, vicuña and alpaca; looms, spindles and colored threads, bear witness to the wide extension of the industry of weaving so often mentioned by early writers. Offerings made to the dead in the graves which have been discreetly rifled recall the fact that agriculture shared with warfare the distinction of being the chief occupation of able-bodied men. Inca women are shown to have been eminently domestic in their tastes and employments, ruling supreme in the house, taking no part in public affairs. Gold and silver appear to have been not less abundant—perhaps they were even more abundant—in the lowlands than in the highlands: at any rate vessels formed from the precious metals are found more commonly in the burial places near the coast. It is not to be supposed that the natives failed to appreciate the beauty and utility of silver, gold and copper. An ingrained preference for the clumsy methods of barter prevented them from adopting any medium of exchange or setting apart one or more of the metals to be used as "money."

MARRION WILCOX.

**INCANDESCENCE.** See ELECTRIC LIGHTING.

**INCANDESCENT GAS-LIGHT.** See GAS ILLUMINATION.

**INCANTATION** (from Latin *incantare*, to enchant), a musical formula chanted, sung or monotoned, and supposed to create a magical or beneficial influence. The mother's crooning lullaby of all ages is a typical incantation to soothe the child to slumber. The use of incantation is found among all nations back to the earliest historical records. Akkadian spells of the ancient Chaldeans have been disclosed. Homer and Theocritus among Greeks, Virgil and Horace among Romans, give the poetical formulæ of incantations and they are found in Egyptian and Hindu literature. The Vedic *mantras* or incantations have their parallels in the Japanese *majinahi*, the Maori *karakias* and the *matamanik* of the North American Indians. In the British Isles, in Germany, in all European countries their traces are found in local folklore. See MAGIC.

**INCAPACITY**, in law, the state of being unable to incur either a civil or criminal liability. It may be due to several causes, such as the minority or infancy of a party, lunacy or drunkenness. It existed formerly to a certain degree in the case of married women, but has largely been removed by legislation. Children under seven years are presumed incapable of committing crime of any sort.

**INCARNATION** (from later Latin, *incarnatio*, first used by Irenæus, A.D. 180, derived from *in* and *carnem*, into flesh), the permanent assumption of human form or human nature by a divine personage. In the Christian religion,

the incarnation signifies the assumption of human Nature by God in Jesus Christ. The classical statement is John i, 14, "And the Word became flesh, and tented among us." This is the central teaching of the Christian religion, and the source of its claim to universal acceptance and to finality. Very intimately bound up with it, though distinguishable from it, are the important teachings of the divine sonship of Christ, his sinlessness, his pre-existence and virgin birth and inevitable deductions affecting the Trinity (q.v.) and the atonement (q.v.).

**I. Sources in the New Testament.**—(a) The gospels show how the disciples became convinced of the incarnation as a fact. The impression of the greatness of Christ's personality; his miracles, which showed his sovereign power over disease and nature; his sinlessness, proved not so much by express declaration and outward conduct as by a combination of the most penetrating ethical insight and moral power with an entire absence of any sense of sin or moral failure or need of forgiveness; the intimacy of his knowledge of God and communion with him; his claims that moral character and future salvation were decided by relation to himself; his assumption of authority to forgive sin, and his promises of rest to weary souls, who came to him; the experience of this forgiveness and rest in their own hearts—all predisposed the disciples to this belief. Yet the most powerful factor, taken in connection with the foregoing elements, was Jesus' claim to be the Messiah (q.v.), who had been prophesied in the Old Testament scriptures and was a familiar figure in the later current Jewish literature. This claim meant nothing less than that he would be the future judge of all men, the bringer of the supernatural kingdom of God, and king in that kingdom. This claim was acknowledged by Peter at Cæsarea Philippi with Christ's joyful approval, was constantly asserted by implications of more than human authority and by the use of the phrase, "Son of Man," which means nothing more nor less than Messiah, and was maintained, although Christ knew that it would cost him his life, in reply to the High Priest's question in the trial before the Sanhedrin. The resurrection, however, decisively and forever settled the matter in the mind of the disciples. After that event, they had no further doubts. John's gospel truly represents the growth of their faith to the climax, when Thomas calls the risen Jesus, "My Lord and my God."

(b) The early Church consequently proclaimed Jesus the Messiah, sitting not on David's throne, but at the right hand of God, and cited the resurrection as proof. They called Jesus Lord, using the very word used of Jehovah in the Septuagint, and in connections which exclude any other reference. The opening chapter of the earliest Pauline Epistle, 1 Thessalonians, associates God and Christ on terms of practical equality. 2 Cor. iv, 4, 6, and Col. i, 15 assert that Christ is the image of the invisible God, cf. 2 Cor. v, 19. 1 Cor. viii, 6 and Col. i, 16-18 make Christ the mediator of creation. 2 Cor. iii, 17 identifies him with the divine Spirit, and, according to the best modern expositors, Paul in Rom. ix, 5 calls him "God blessed forever." The earliest epistles already

show that the pre-existence of Christ is no new idea to be explained and enforced, but the common property of Christians, cf. Rom. viii, 3, 1 Cor. xv, 47, 2 Cor. viii, 9, Gal. iv, 4. These thoughts are developed at length in Phil. ii, 6-11 and Col. i, 15-20. The familiar and incidental reference to these teachings as matters of course in the belief of the Church dispose us to believe that they have their root in Christ's own declarations of pre-existence as recorded in John's gospel, John xvii, 5, 24; viii, 58; iii, 13; vi, 62, 33, 38; xvi, 28, etc. The other New Testament writers shared these views of Christ's pre-existence, cf. Heb. i, 1-3, and 1 John i, 1-4. The Prologue of John i, 1-18, is the climax of the development of the teaching in the New Testament.

Historically viewed then, the early Christians believed without any doubts in the incarnation on the basis of a synthesis of proofs derived from Christ's personality, his moral spotlessness and force, his miracles, his Messianic claims, his resurrection and their own experience of his forgiving and renewing power, and not on the basis of the virgin birth, which is never mentioned outside the opening chapters of Luke and Matthew. This teaching, however, was welcomed by men, who believed the fact of the incarnation, as an explanation of its method, and is accepted by most believers to-day in the same relation. It is therefore not essential to the teaching of the incarnation, which might have taken place in other ways, but is the gospel-given history of the method adopted by God to bring the incarnation about, and, logically considered, it is burdened by no more difficulties than any other possible method would probably be. It does not appear improbable to those who already believe in the incarnation. The historicity of the virgin birth has recently been keenly attacked on the most diverse grounds, principally by those who eliminate the supernatural. Its defenders are taking the position that though the reports of it were late in being disclosed, as shown by absence of mention of it in the rest of the New Testament, they are in fact the most archaic Christian documents. In support of this, they point to the Aramaic coloring of the narratives; their Hebrew background; their primitive Christian viewpoint; their simplicity, beauty and delicacy; the reasons which immediately suggest themselves why such a story should be withheld till Jewish opposition had decreased, and the principal actors had passed from the stage; and their inexplicability on any other hypothesis than their truth.

**II. The Church Doctrine.**—The New Testament fails to give any answer to the questions of the exact relationship of Father, Son and Holy Spirit, and of the manner in which the divine and the human in Christ were related to each other, and these matters formed the subject of the first great theological controversy, during which the teaching of the incarnation was defined and developed principally in opposition to misapprehensions of it by different parties and individuals within the Church.

(a) The earliest were the nearly opposite errors, Ebionitism (see EBIONITES) and Docetism (see DOCTÆ), both of which began in the 1st century and flourished during the 2d. The Ebionites were a sect of Jewish Christians

who held that Jesus was naturally born, was merely a prophet, received an extraordinary endowment of the Spirit at his baptism, and was finally exalted to Lordship at his resurrection. It was merely Judaism in semi-Christian dress; against it the Fathers asserted the full teaching of the incarnation, and it soon passed away.

(b) Gnosticism (q.v.), which started with the assumption of the inherent evil of matter, almost necessarily drifted into Docetism, the doctrine that Christ could have no real relation to matter, that his body was merely apparent, a vision and delusion, or at least of a spiritual nature different from a human body, and not subject to suffering and death. This view was held in different forms and was shared also by Manichæism. (See MANICHÆANS). It is a practical denial of the possibility of the union of the divine and the human. Docetism was very early. It seems to be opposed in 1 John iv, 2, and 2 John vii. The apocryphal Gospel of Peter, discovered in 1886, is Docetic. It was attacked by Ignatius. The fathers met it by an insistence on the real humanity of Christ. After large influence, it passed away with Gnosticism. Justin Martyr, Irenæus, Clement of Alexandria, Origen and Tertullian were the principal theologians who defended and developed the teaching of the Church during this period.

(c) With Sabellianism (see MONARCHIANS, SABELLIUS) condemned in 262, began the real contest. Sabellius urged that the Trinity is not a trinity of persons in one substance, but merely three different or successive forms of the revelation of the one person. Christ was pre-existent because the one person persisted under the change of revelation-form. The Patripassians were Sabellians, who logically asserted that it was the Father who suffered on the cross. Sabellianism, variously modified, has constantly reappeared, and is now known as the doctrine of a modal Trinity. The controversy with Sabellianism did much to sharpen the definition of the Church.

(d) The greatest battle over the teaching of the incarnation was brought on by Arius (see ARIANISM; ARIUS), a presbyter of Alexandria, about 318. Arius held that Christ was a pre-existent divine being, but of a different essence from the Father (heteroousios), created by the Father out of nothing but himself the creator of the world, and the incarnate Saviour. The Semi-Arians taught that Christ was not of a different essence from the Father, nor, as the orthodox asserted, of the same essence (homoousios), but of a similar essence (homoiousios). This was a very elastic and ambiguous view. The great defenders of the coequality of the Son and the Father were Athanasius (q.v.), the father of orthodoxy, at one time called, "Athanasius versus mundum," Basil, Gregory of Nazianzen and Gregory of Nyssa (qq.v.). The whole Christian world rang with the contest, which culminated, but did not end, with the decision of the Council of Nicæa, the first œcumenical council, in 325 A.D., in these words, "We believe in one God, the Father Almighty, maker of all things visible and invisible. And in one Lord Jesus Christ, the Son of God, begotten of the Father (the only-begotten, that is, of the essence of the Father, God of God), Light of Light, very God of very God, begotten not made, being of one substance (homoousios)

with the Father; by whom all things were made (both in heaven and in earth); who for us men, and for our salvation, came down and was incarnate and was made man; he suffered, and the third day he rose again, ascended into heaven; from thence he shall come and judge the quick and the dead." After a renewed struggle, this creed, slightly enlarged, was reasserted at the second œcumenical council at Constantinople, 381 A.D.

(e) Apollinarianism (see APOLLINARIANS), as well as Arianism, was condemned at this latter council. It was a reaction against Arianism, and taught that Christ had a human body and animal life, but that the pre-existent Logos took the place in Him of the human mind and spirit. Against this extreme, the Church protested that Christ had a real human soul as well as a real human body.

(f) Nestorius (q.v.), bishop of Constantinople, objected to calling Mary "the mother of God." This position led him, however, to join the human and divine in Christ so loosely that he was accused, probably unjustly, of giving Christ not only two natures but making Him two persons, at best a man inhabited by God. He was irregularly deposed at Ephesus in 431 A.D., but the verdict was generally accepted that the Church must insist on two natures vitally united in one person.

(g) The opposite extreme was attempted about 448 by Eutyches (q.v.), an abbot of Constantinople. He maintained that Christ had only one nature, a fusion of the human and divine, and something different from either. This period of controversy was closed by the celebrated formula of the Council of Chalcedon (see CHALCEDON) 451 A.D. as follows: "We, then, following the Holy Fathers, all with one consent, teach men to confess one and the same Son, our Lord Jesus Christ, the same perfect in Godhead and also perfect in manhood: truly God and truly man, of a reasonable (rational) soul and body; consubstantial (coessential) with the Father according to the Godhead, and consubstantial with us according to the Manhood; in all things like unto us, without sin; begotten before all ages of the Father according to the Godhead, and in these latter days, for us and for our salvation, born of the Virgin Mary, the Mother of God, according to the Manhood; one and the same Christ, Son, Lord, Only-begotten, to be acknowledged in two natures, *inconfusedly, unchangeably, indivisibly, inseparably*; the distinction of natures being by no means taken away by the union but rather the property of each nature being preserved, and concurring in one Person and one Subsistence, not parted or divided into two persons, but one and the same Son, and only begotten, God the Word, the Lord Jesus Christ; as the prophets from the beginning (have declared) concerning him, and the Lord Jesus Christ himself has taught us, and the Creed of the Holy Fathers has handed down to us." This declaration has ever since been considered by the strictly orthodox the limit of human wisdom on this subject.

(h) Still it did not immediately end the controversy. Eutychianism revived in Monophysitism (see MONOPHYSITES), or the doctrine of one nature in Christ, which convulsed the Eastern Empire for more than a century; while its cor-

ollary, Monothelism (see MONOTHELITES), the doctrine that Christ had one will, unfortunately induced the Church in the sixth œcumenical council at Constantinople in 689 A.D. to assert that will belongs to nature rather than to person, that consequently Christ had two wills, never at variance. This completed the orthodox statement.

III. Modern Views.—Since the Chalcedonian formula (see *g* above) followed the lines recommended by Pope Leo I, it was accepted by the Western Church, although it subsequently fell somewhat into the background before the development of the idea of the Church as the body of Christ. Briefly, though the incarnation was discussed in the Middle Ages, no progress was made, and the great Reformed Churches made, and still make, their Christological declarations on the basis of the Chalcedonian formula.

(a) While the great creeds and the great mass of the Christian Church still rest here, many modern Protestant scholars insist on re-examining this great central doctrine as they do all others, seeking a restatement more in accordance with modern points of view. There is an inclination, on the one hand, to magnify the incarnation as the great specifically Christian doctrine, and on the other, to object to the ancient definition of it as too fine-spun and metaphysical, going beyond what it is given men to know. These scholars insist on a reevaluation of the Scripture statements and the historical facts on which the doctrine is based, especially on giving to the fact of Christ's growth in knowledge and wisdom, and to his true humanity generally, its proper weight, on proceeding on the lines of history and ethics rather than on the lines of metaphysics. Many deem the ancient formulas full of bad psychology and impossible philosophy, and demand a restatement in line with the progress of human thought in other departments of knowledge. Many even of these, however, would agree that the general results of the earlier contest must be preserved as the expression of the universal faith of believers from the apostolic age to the present.

(b) The first of these attempts was made by the Socinians (see SOCINUS) in Poland in the 16th century. They rejected the Trinity, and held Christ to be not divine, but more than a mere man, in that he was conceived of a virgin, was absolutely holy and was finally exalted to absolute power. The Socinians gave birth to the modern Unitarians (*q.v.*), who reject the deity of Christ, and in varying degrees look on him as the ideal of humanity, "the best we know," or, at least, as one of the prophets. This shades off into

(c) Pantheistic conceptions, to which Hegel gave a powerful impulse. There is an essential unity of the human and divine; humanity is itself divine. The pre-eminence of Jesus is seen in that he first awoke to the consciousness of this fact, and represents it in its purest and strongest form. The great body of Christian believers fail to find in the Unitarian or pantheistic statements a sufficient explanation of the Christ of history and experience.

(d) The Kenotic theories propounded by Thomasius, Gess and Martensen, have a more orthodox origin and result. They are based on

Phil. ii, 6-8, especially the words "he emptied himself" (*ekenosen*), and are inspired by the desire to present the full human development of Christ. The Kenotists in varying degrees declare that the pre-existent Christ at the incarnation divested himself of the attributes of omnipotence, omniscience and omnipresence, and *became* man, retaining, however, the essential attributes of truth, holiness and love. By thus depotentiating the divine nature to the level of the capacity of the human, it was hoped to overcome the dualism of the ancient statement. These theories have had wide influence, but are severely criticised as metaphysically impossible.

(e) A theory of gradual or progressive incarnation was matured by Dorner (*q.v.*). There is no self-limitation of the pre-existent Logos, but a limitation of his self-communication to the human nature. Jesus Christ progressively became conscious of his divine nature and realized it fully only at the resurrection. Christ became conscious of his Godhood just as He became conscious of his manhood. Its opponents hold that this theory is Nestorianism in a more subtle form and does not really do away with dualism.

(f) The present dominant German theological school, the Ritschlian (see RITSCHL, ALBRICHT), follows a new method of procedure. Instead of beginning to discuss the incarnation with a consideration of the self-witness of Jesus or of the apostolic testimony, it begins with the Christian's experimental knowledge of Christ as Redeemer, and consequently asserts that none but the possessor of a Christian experience can have any real knowledge of his person. What the believer has learned of Christ in his experience leads him to call Jesus God, for none but God can do for the believer what Jesus has done. Christ is the full and perfect revelation of God in His Grace and truth; Christ's will, too, is the will of God, namely, the establishment of the kingdom of God, and to found this was Christ's unique vocation in the world, a vocation to which He was absolutely true; in all his life and sufferings He was absolutely independent of and superior to the world, and so gained unlimited sovereignty over it. But if we meet God in Christ so as to *experience* the divine power and presence, God himself must be in Christ and in some true sense Christ must be God. How this can be is a matter of metaphysics which is insoluble and does not concern us. Ritschlianism thus attempts to prove the deity of Christ from experience, and to free Christianity from the entanglement of metaphysics on the one hand, and make it independent of the results of biblical criticism on the other. From such a viewpoint, it regards the doctrine of the two natures as a hindrance, and the virgin birth as a matter of indifference, something to be decided on the grounds of historical criticism. The tendency of the leading living theologians of the school is toward a personal pre-existence, and some form of the doctrine of the Trinity. Kaftan declares that "Christ's historical person stands in a connection of nature with God which is altogether unique and can never be repeated." Consult Garvie, 'The Ritschlian Theology,' Chap. 9.

(g) The modern conceptions of the universe,

and especially of evolution, have had their influence on the modern belief in the incarnation. (1) In many different schools of thought, the idea gains currency that the incarnation was an ethical, not a metaphysical, necessity of God's nature, a necessity of His love and grace, and would have occurred in some form, even if sin had never entered the world. The incarnation was no afterthought to repair an unforeseen calamity, but has its place in the eternal purpose of God alongside of and conditioning the plan of creation which made sinning possible. (2) Theistic evolution suggests not only that Christ is the consummate flower of the race, "the end and goal of the whole ascent of life, the perfect man beyond whom there can be none higher," but that this perfect man is raised to the throne of divinity. (3) It is also seen that the finality of the Christian religion can be guaranteed only on the ground of the deity of Jesus Christ; for if Christ was one like us, however superior to all who have yet existed, there is no certainty but that during the ages another may arise superior to Him. The incarnation is thus the central doctrine of Christianity, and its maintenance in some form or other is vital to its existence. See also **CHRISTOLOGY**.

FREDERICK L. ANDERSON.

*Professor of New Testament Interpretation,  
Newton Theological Institution, Newton  
Centre, Mass.*

**INCE-IN-MAKERFIELD**, England, a town of Lancashire, southeast of Wigan, on the Leeds and Liverpool Canal. It has large collieries, forges, iron foundries, cotton mills and railroad car shops. The water-supply system is owned by the municipality. Pop. 22,000.

**INCENDIARISM**, or **ARSON** (from Lat. *incendere*, to set on fire), the criminal malicious voluntary burning of the property of another. In common law the term is confined to the burning of houses or buildings of whatever kind. In Roman law the penalty of death was provided for the incendiary; and in all civilized countries provisions have been made for the severe punishment of criminals of this

class. The Saxon law of England also provided the death penalty for incendiarism; and even as late as the reign of King John the law remained, in this respect, unchanged. In Saxon times, and probably even later, the sentence of the court was carried out by burning, and later by hanging. Under the Tudors, any one convicted of incendiarism was deprived of the right of clergy, and even in particular cases was held to have committed high treason. The English Malicious Damage Act of 1861 defined as incendiarism (and as such, felonies), the setting fire to any church, chapel, meeting-house or place of divine worship, to a dwelling-house, any person being therein, to a house, outhouse, manufactory, farm buildings or any other similar building, with the intention of defrauding any one; to buildings belonging to railways, ports, docks or harbors; or any public building. Any one convicted of any one of these crimes may be imprisoned for life, or for a shorter term, not however less than three years. The burning of grain fields comes under this act and provides for punishment of the same sort, not to exceed 14 years' imprisonment at hard labor; but the penal servitude may be for life in case of the setting fire to peat or coal or stacks, provisions or stores of straw, grain and like products, at the discretion of the court; while if the coal be in mines, the extreme penalty is 14 years. Death is the penalty provided for maliciously and wilfully setting fire to government ships, docks, magazines, arsenals, ammunition stores or buildings connected therewith. Other vessels, stores, and so forth, come under the Malicious Damage Act already mentioned. The laws against incendiarism in the United States are very much the same as those in England; but each State has its own regulations on the subject. The death penalty is provided only in case death results from the crime, in which case the criminal is prosecuted not for incendiarism, but for murder. In general, the laws of all of the States provide that something must actually be burned before the crime of arson may be charged. In the United States it is, in most States, not considered incendiarism or arson to burn one's own property even when it is clearly proved that the act was done with the intention of defrauding an insurance company or other interested party, or to get rid of goods or evidence. In this case special laws have been provided for the crime. But here again each State has its own particular laws on the subject. Consult Holdsworth, 'History of English Law' (London 1910); Pollock and Maitland, 'History of English Law' (Boston 1899); Russell, 'Treatise on Crimes and Misdemeanors' (London 1896); Stephen, 'Digest of the Criminal Law' (London 1894).

**INCENSE**, a mixture of gums, spices, etc., constituting an aromatic compound burned in religious rites of remembrance and giving off a sweet odor. The custom of burning incense is ancient and widely spread, its earliest purpose having been the fumigation and purification of the animal sacrifices and fruit offerings of the altar. Among the Jews the rite was later enjoined as part of the memorial worship of the sanctuary (Ex. xxx, 27); the ingredients of the incense also being laid down, and it was to be burned on a special altar called the altar of incense. This altar was made of acacia

(shittim) wood, and was overlaid with gold, hence it was called the golden altar, as distinguished from the altar of burnt-offering, which was made of brass. The incense was burned daily—morning and evening. The early Christian Church is not recorded as burning incense, but it came into use about the 5th century. Its use was abandoned in the Church of England in the reign of Henry VIII, but was revived by the High Church party late in the 19th century. It has always formed part of the ritual of the Catholic Apostolic Church (q.v.) founded by Edward Irving in 1835. Both the Greek and the Latin churches use incense in worship. Among Catholics it is used at every high mass, at consecration of churches, in processions, funerals, etc. In Europe frankincense is commonly employed as incense, but in America the modern ingredients are usually benzoine, gum olibanum and styrax, and sometimes balsam and powdered bark of cascarilla. This mixture is allowed to fall on hot charcoal in the censer and burns promptly.

**INCEST**, *in law*, cohabitation or sexual intercourse between persons so related that they cannot legally marry. It is a punishable offense in the United States and many other countries. Although incest is not an offense by the common law, sexual intercourse or an attempt thereat between certain near relatives is punishable in England by statute, passed in 1908. Until 1887 it was punishable in Scotland by death, but the usual sentence was imprisonment for life.

**INCH**, **James Robert**, Canadian educator: b. Petersville, New Brunswick, 1835; d. 1912. He received his education at Mount Allison University and from 1864 to 1878 was principal of Mount Allison Ladies' College. From 1878 to 1891 he was president of the University of New Brunswick and also served as superintendent of education of New Brunswick. He was vice-president of the Dominion Educational Association in 1895. In 1906 he was prominent in the movement seeking to effect a union of the Congregationalists, Methodists and Presbyterians of Canada and in 1907 he took part in the Imperial Educational Conference at London. In 1909 he resigned the post of superintendent of education.

**INCH**, a lineal measure, the 12th part of a lineal foot, anciently said to consist of three barley corns. A statute of Edward II (1324) makes "three barley corns round and dry," the definition of an inch. The English inch is equal to 2.54 centimeters. The old Scotch inch was slightly longer than the English. The ordinary divisions of an inch are halves, quarters, eighths, etc.; the Romans divided them into twelfths. For micrometer, measurements divisions into hundredths and thousandths are customary, ten-thousandths being about the limit. Reduced to centimeters the square inch is 6.4516, and the cubic inch 16.387.

**INCH-WORM**. See MEASURING-WORMS.

**INCHBALD**, **Elizabeth Simpson**, English actress, dramatist and novelist: b. Stanningfield, Suffolk, 15 Oct. 1753; d. London, 1 Aug. 1821. In 1772 she was married to an actor named Inchbald, and the same year went upon the stage. She retired from this profession in 1789 and devoted herself to literature. Some of her plays, which belong to the class of high

comedy, still keep the stage, but her greatest success was the novel 'A Simple Story' (1791), which was translated into several languages. She also wrote 'Nature and Art,' and among her plays may be cited 'Such Things Are'; 'The Married Man'; 'The Wedding Day'; 'The Midnight Hour'; 'Every One Has His Fault'; and 'Lovers' Vows.' See A SIMPLE STORY.

**INCHCAPE ROCK**. See BELL ROCK.

**INCHCOLM**, *inch'kôm* (**ISLE OF COLUMBIA**), Scotland, a small island in the Firth of Forth, off the coast of Fife, from which it is separated by a channel about one mile wide. The island is about 1,000 yards long by about 600 in width and is rich in ecclesiastical ruins, especially an abbey of the Canons of Saint Augustine, founded here in 1123. The monastery suffered greatly in the wars between England and Scotland. Consult Simpson, 'Emona and the Islands of the Forth' (Edinburgh 1861).

**INCINERATION**. See CREMATION.

**INCISED MEANDERS**. See MEANDERS.

**INCLINATION**, **Magnetic**, or **MAGNETIC DIP**. See DIPPING NEEDLE.

**INCLINED PLANE**. The inclined plane is a mechanical device for overcoming a part of the weight in lifting or raising a heavy body. When the plane is level it supports or opposes the whole of the weight or attraction of gravitation exerted upon the body. As one end of the plane is raised the plane supports less and less of the weight, until, when the plane stands vertical, it supports none at all. To move a body up an inclined plane, and so raise it to a higher elevation, only such force is needed as to overcome that part of gravity which is not supported by the plane. Therefore the smaller the angle of elevation of the plane from the horizontal, the less power will be needed to move it up the plane, and the longer the plane will have to be to raise it to a given height; and, conversely, the steeper the plane, the more power must be used, but the quicker will the elevation be accomplished, and the shorter the plane required. The equation of the inclined plane is

$$\text{Power} \times \text{length} = \text{weight} \times \text{height}.$$

The principal of the inclined plane is most commonly and universally applied in the screw, which is no more than an inclined plane wrapped around a cylinder. Other applications are the cam and the wedge.

**INCLOSURE**, *in law*, the fencing in of common lands by the lord of the manor, by which he extinguishes the common rights. (See COMMONS). Consult Gonner, 'Common Land and Inclosure' (New York 1912).

**INCO-ORDINATION**, a lack of control over muscular movements. In inco-ordination there may be (1) some interruption in the paths of the motor impulses as sent from the motor areas in the brain to the muscle-centres in the spinal cord; or inco-ordination may result from (2) deficiency in the incoming sensory paths, thus causing an interference with the sense of muscular localization. One of the most familiar illustrations of inco-ordination is seen in acute alcoholism. In this condition the lack of motor control is largely due to interference in the conduction-paths of motor im-

pulses. The intoxicated person is unable to control the movements of his hands to make them perform in their wonted fashion ordinary acts. In locomotor ataxia, a disease in which inco-ordination of the movements is very striking, the inco-ordination seems to result from a loss of muscle and joint sense, whereby the patient's mind is rendered unable accurately to realize just where his limbs are. Inco-ordination is a symptom of a number of different forms of poisoning, and is extremely characteristic in diseases such as locomotor ataxia, multiple sclerosis, chorea and paralysis agitans. It also characterizes a number of infantile diseases.

**INCOMBUSTIBLE FABRICS**, asbestos cloth or ordinary cloths immersed in tungstate of soda, phosphate or sulphate of ammonia, or silicate of soda, so as to render them fire-proof. Such fabrics are used mostly for curtains and scenery in theatres and in most cities asbestos fire curtains are required in all theatres. Fire-proofing engineers, however, maintain that too much faith must not be placed in such materials as most of them lose their efficiency with the lapse of time after application. Consult 'Fire Tests with Textiles' (in 'Red Book No. 129,' issued by the British Fire Prevention Committee, 1908) and 'Fireproofing Cotton Goods' (in Vol. VI, No. 2, Quarterly of the National Fire Protection Association, Boston).

**INCOME.** Superficially, nothing seems easier to define than a man's income. It is the money which he has to spend in a given period of time, say a week, a month or a year. Fundamentally, however, few things are more difficult to define. A spendthrift may easily spend more than his income, thereby depleting the fund of wealth previously accumulated either by himself or by some one else and put into his possession. His real income would not exceed such a sum as he could spend without depleting its source. Many a small business man and many a small farmer, though not classified as spendthrifts, may easily spend more than their income by failing to allow for the depreciation of their capital or the depletion of their soil.

A business man, however, may allow one form of capital to depreciate by failing to replace it, preferring rather to spend the money which would be necessary for that purpose for some other form of equipment, thus maintaining the total amount of his capital intact. What he spends in order to maintain his capital cannot be considered as income. Similarly, a farmer may allow his soil to become slightly depleted, provided he spends the money which would be necessary to maintain it for some other form of equipment which then becomes a part of his capital. Many of our pioneer farmers found that method necessary in order to equip their farms with buildings, wells, fences, tools and live stock.

On the other hand, it is not uncommon for a man to live frugally and spend a part of his income, not for purposes of consumption, but for the purpose of adding to his capital. Such increments of capital are usually called parts of his income, but some prefer to call them sources of deferred income. If, for example, a man should save \$1,000 out of this year's receipts and spend it for new equipment,

adding that amount definitely to his total fund of capital, we should ordinarily say that his income for the year included that \$1,000, in addition to the amount actually spent for purposes of consumption. Others would say that this \$1,000 is not a part of this year's income, but that it becomes a source of income in future years, that, in short, he had deferred his income from this year until future years. The present writer does not approve of this usage, preferring to call the \$1,000 a part of this year's income.

Before attempting a final definition of a man's income, it is necessary to distinguish between his money income and his real income. His money income is the amount of money which he can spend in a given period of time, without increasing or decreasing his wealth, that is, leaving him at the end of the period with the same quantity of wealth as at the beginning. His real income is the quantity of desirable objects which his money income will enable him to purchase. In a time of rising prices, he will find that his real income is falling even though his money income remains the same, and in a time of falling prices he will find that his real income is rising if his money income remains the same. His real income, therefore, is the quantity of goods which he may consume in a given period of time without increasing or decreasing his fund of wealth, whereas his money income is the amount of money which he may spend under the same conditions.

It is a common mistake to attempt to define the national income as well as the individual's income in terms of money. In a time of rising prices it may appear as though the national income is enormously increasing. Stated in terms of money, our national income was greater in 1917 than in any previous year. Yet fewer consumable goods were produced in proportion to the population than for many years. Our wheat crop was short of the pre-war average by at least 150,000,000 bushels, yet its total value as stated in terms of money was the greatest in our history. The same may be said of a large number of our most important products outside the list of war materials. In terms of consumable articles, or of articles which contribute anything to our national well-being in normal times, our national income is very small. In terms of money values it appears to be very large, but this appearance is altogether deceptive. Needless to say, the well-being of society is not measured by the number of pieces of money which are handed about in the process of exchange. It is measured in terms of products. In short, our national income is that part of our national production which is left after we have replaced all deterioration or depletion of our national equipment. It is this which determines how well we may live without depleting our national wealth.

THOMAS N. CARVER,  
*Professor of Political Economy, Harvard University.*

**INCOME TAX.** Definition.—An income tax is a tax, the amount of which is determined with reference to the income of the taxpayer.

**The Income Tax as a Theory of Taxation.**—The underlying theory of taxation has undergone many changes. But to-day the com-

monly accepted principle of taxation is that of faculty or ability—the principle that each individual should be held to help the state in proportion to his ability to help himself. No one form of taxation entirely meets this theoretical test, but under modern conditions income is the best test and, in most cases, measures the ability of the individual better than most other forms of taxation. Quite properly, however, no modern tax system relies entirely upon an income tax. The income tax is therefore a method of taxation which should form an important part in any system of taxation, but which should not be the sole method of taxation.

Many perplexing questions arise in the practical application of the income tax. What is income? Is it gross or net income? Are gifts, inheritances and speculative revenues included? Is money income only referred to, or, also, the equivalent of money income? Is income derived from labor or services to be put on a par with income received from invested capital, inheritances or speculations? Is the small income to be taxed in the same proportion as the large? Is the man of no family to be taxed in the same proportion as one having dependents? These questions not only bring out many of the perplexing questions which arise in connection with the income tax but also emphasize the necessity of incorporating in a well-rounded system of taxation other tests of ability to pay, such as property, product, expenditure and even polls.

In addition to these more or less abstract questions as to the fairness of the income tax, we must consider the practical question of assessment. The income, as a matter of fact, is notoriously the most difficult of all taxes to assess with scrupulous justice and accuracy.

If rightly drawn and efficiently administered the income tax is undoubtedly an indispensable part of any progressive system of taxation.

**History of the Income Tax.**—The income tax is not entirely a modern invention, although the part which it played in general taxation before the last century was an insignificant one. The Italian cities of the Middle Ages, particularly Florence, developed an income tax. There are some traces of the income tax in England during the 17th century. In France, however, the income tax was considerably developed before the 19th century. The *dixième* or 10th, enacted in 1710 by Louis XIV, was a real income tax, which finally failed and disappeared because of administrative defects. The development of the income tax in Florence in the 15th century and in France in the 18th century was in each case the result of an advanced economic development and in each case failed because of deplorably inefficient administrative methods.

(1) *England.*—Although the principle of taxing persons according to the size of their incomes had existed in one form or another in England for many centuries, the first English income tax in the modern sense of the term was originated by William Pitt in 1799. It divided incomes into four main schedules and made allowances for children and life insurance premiums. This law was repealed in 1802.

In 1803 an income tax strikingly like the one now in existence was imposed, known as Addington's Property and Income Tax. It provided for particular returns from particular

sources and imposed a flat rate of one shilling on the pound, thus omitting entirely the progressive principle. This law, primarily a war tax, was repealed in 1815.

In 1842 Sir Robert Peel revised the tax and although continued for temporary periods and although there was much talk of abolishing it, Gladstone really established it as a part of the fiscal system of England in 1853. It has remained in operation, with certain modifications, up to the present.

The classes of taxable income in the English income tax are as follows: (a) Income arising from the ownership of lands and houses; (b) income arising from the use or occupation of land; (c) income from interest, annuities or dividends; (d) income from any profession, trade, employment or vocation; (e) income from public office or employment.

The tax is levied at the rate of 5 per cent on incomes exceeding £160 (\$800). Certain abatements are granted, however, so that the tax is graduated in amount up to that on an income exceeding £700. On incomes less than £800 an abatement of £10 for each child is also given.

In the budget of 1909, David Lloyd George introduced the new principle into the income tax, that of a super-tax. This was fixed at 2½ per cent on those portions of incomes over £5,000 which exceed £3,000. There was also introduced the principle of differentiation, which covers that rate of tax on earned incomes as compared with unearned incomes.

The English income tax has been a success and is now an integral part of the tax system of the country. In the fiscal year 1913-14, it raised £47,249,000 or 23.8 per cent of the total revenue of the United Kingdom. Since the outbreak of the war the income tax has become an even more important source of revenue. On 5 Dec. 1914, the rates were doubled. The revenue derived from the income tax for 1915-16 amounted to over £128,000,000, or more than 38 per cent of the total revenue. The Budget for 1916-17 estimates the amount to be derived from the income tax at £195,000,000.

In the budget for 1916-17 the rates of the income tax were still further raised and the scale now stands as follows:

Rates for earned income:	Per cent
Not exceeding £500.....	11½
Exceeding £500, but not exceeding £1,000.....	12½
Exceeding £1,000, but not exceeding £1,500.....	15
Exceeding £1,500, but not exceeding £2,000.....	18½
Exceeding £2,000.....	25
Rates for unearned income:	
Not exceeding £500.....	15
Exceeding £500, but not exceeding £1,000.....	17½
Exceeding £1,000, but not exceeding £1,500.....	20
Exceeding £1,500, but not exceeding £2,000.....	22½
Exceeding £2,000.....	25
Exemptions and abatements:	
Not exceeding £130.....	Exemption
Exceeding £130, but not exceeding £430.....	Abatement of £120.
Exceeding £430, but not exceeding £600.....	Abatement of £100.
Exceeding £600, but not exceeding £700.....	Abatement of £70.

Several special war concessions have been made to compensate for reduction of income due to the war. For example, instead of averaging income for the three years preceding the year of assessment, the latter may be included as one of the three. Again, anyone whose income is less by 10 per cent than that for which he is assessed is entitled to a refund. Special reductions have also been made to persons

serving in the army or navy, the Red Cross Society or other similar organizations. Persons whose income does not exceed £700 obtain an abatement of £25 for every child under 16 years of age.

Life insurance premiums, up to an amount not exceeding one-sixth of the total income, may, with certain limitations, be deducted from income before assessment.

Other changes in the income tax have tended to smooth out the rough places and make it more easily workable and flexible.

The reasons for the success of the English income tax may be summed up as follows: (a) Blending of regard for local interests and fiscal productiveness; (b) ingenious system of administration; (c) absence of inquisitorial procedure; (d) system of stoppage at the source; (e) moderations of rate; (f) principle of differentiation; (g) principle of progression.

(2) *New Zealand*.—New Zealand was the first of the British colonies to adopt a comprehensive income tax. It was first adopted in 1891. The tax applies only to incomes above £300. The rate on the amount of income between £300 and £1,300 is 2½ per cent, and over £1,300 is 5 per cent. In 1913-14 the income tax yielded £554,271, or 4.5 per cent of the total revenues of the colony (but 9.4 per cent of the revenue raised by taxation). The total cost of assessment and administration was only 1.31 per cent. The total yield of the tax in New Zealand is small because incomes derived directly from land are exempt from the income tax, land being the subject of a special tax assessed on capital value. Since the war began the rate of the tax has been increased by one-third.

(3) *Australia*.—Each of the six Australian colonies has an income tax. That in New South Wales was introduced in 1895; Queensland in 1902; South Australia in 1884; Tasmania in 1902; Victoria in 1895; Western Australia in 1907.

The laws in the various colonies are generally similar. The chief difference is that some distinguish sharply between earned and unearned incomes, or as it is sometimes put, income from property and income from personal exertion. In some of the colonies the income tax is closely connected with and complicated by the land tax. The amount of exemption varies from £100 to £200. The rate of taxation varies from 1 to 5 per cent. The maximum is usually 5 per cent, which is levied only on the highest incomes. In each of the colonies the income tax is fiscally important and in South Australia brings in as much as 55 per cent of the total revenues.

(4) *Germany*.—The German Empire, as such, does not levy any income tax. Each of the 26 German states has a complete or partial income tax. The systems are extremely varied, but all partake to a considerable extent of the prevailing militaristic organization.

Prussia is not only the most important, but in some respects most progressive, and needs special comment, because the income tax there has many excellent features. The Prussian income tax was first provided for in the law of 1891. Incomes of less than 900 marks are exempt. Certain other exemptions are granted, such as military pay, sinking funds and some other special forms of income.

The tax is very finely graduated, beginning

at the lowest class at only .57 per cent. From this rate it increases by very small increments to 3.15 per cent in the class 9,500—10,500 marks. For higher incomes the rate is approximately 4 per cent. For companies with limited liability the rate is very slightly higher. Persons having a taxable income of not more than 3,000 marks may deduct 50 marks for each dependent.

The method of administration is inquisitorial in the extreme and a variety of checks are provided. Each person is required to make out a declaration, but the amount of income taxable is decided by one tribunal for those having incomes of less than 3,000 marks and another for those of greater incomes.

In some municipalities local taxes are assessed on the basis of the royal tax returns, in some cases the taxes amount to 100 to 200 per cent of the government income tax. The government, in order to meet certain deficiencies, has added a super-tax, varying from 5 to 50 per cent in various income clauses, and for persons and corporations.

The average annual yield of the Prussian income tax during the five years ending 31 March 1912, was 298,120,000 marks or 70.8 per cent of the income of Prussia from taxation. Later figures, owing to the war, are not available.

(5) *Other Countries*.—Practically every important industrial and commercial country of the world has developed an income tax. If space permitted, it would be especially worth while to review the legislation of France, Italy and Switzerland. In practically every country where it has been tried the income tax has become a permanent and important part of the fiscal system.

In South America, however, the principle of the income tax has not been popular and the only country that has had an income tax for several years is Brazil. In Bolivia, there is a tax on dividends of certain corporations, but nothing in the nature of a comprehensive income tax law. In Uruguay there is a tax on revenue derived from certain rents. In one or two other countries the income tax has been proposed, but has not met with much favor.

**The Income Tax in the United States.**—Some difference of opinion exists among authorities on taxation as to whether certain early colonial taxes in this country were really income taxes in the modern sense of the term. In the 17th century the system of taxation in Massachusetts colony contained certain elements resembling an income tax. Certain of these principles have continued in operation there even down to the present.

Similarly in the colonies of Connecticut, Rhode Island, New Hampshire, Vermont, Virginia and South Carolina, there are to be found many expressions in their tax laws indicating that "faculty" or "ability" in income, was to be the chief measure in determining the amount of tax to be paid.

Since the formation of the Union, income taxes have been in force for varying periods in at least 20 States. This form of taxation has been tried in almost every known form. Wherever tried the State income tax has always been an almost unqualified failure. There has been just one exception to this general experience and that is in Wisconsin, where conditions are

in many respects entirely abnormal. A study of the history of the income tax in our States leads to the conclusion that the failure of the tax has been due to the administration of the laws. This in turn may be attributed to four causes: (1) The method of self-assessment; (2) the indifference of State officials; (3) the persistent effort of taxpayers to evade the tax; and (4) the nature of the income. State lines mean little in this country and usually income, both personal and corporate bears very little relation to State boundaries. Experience seems to teach, therefore, that the income tax cannot effectually be applied in this country on a Statehood basis.

(1) *The Civil War Income Tax.*—The first and practically the only experience of the Federal government with income taxation was primarily as a war tax during the period of 1861-72. The law as first passed provided for a tax of 3 per cent on incomes from \$600 to \$10,000; of 5 per cent on those from \$10,000 to \$50,000 and of 7½ per cent on those over \$50,000. By later amendment these rates were changed, and the exemption was raised in 1867 to \$1,000. The provision for the income tax, which was merely a part of the general revenue act, was not reenacted in 1872 and ceased to exist as a revenue measure. Although little administrative machinery was provided and despite the fact that the law was clumsily and unskillfully drawn, it may be said to have been fairly successful. During the years 1863 to 1873 a total of \$376,150,204 was raised, amounting to about 20 per cent of all internal revenue. In 1865, 28.3 per cent of the revenue was raised in this way. Even so, the tax probably brought out only a small proportion of the total taxable income.

(2) *The Federal Income Tax of 1894.*—The second income-tax provision in this country became a law on 28 Aug. 1894. It provided a tax of 2 per cent upon all incomes exceeding \$4,000. There were many defects and incongruities in the act. For example (1) income of less than \$4,000 from corporate dividends was taxed, income from other sources not taxed; (2) personal property by gift or inheritance was taxed, inheritance of real estate was not taxed; (3) inheritance of personal property was taxed 2 per cent; (4) farmers were not taxed upon produce retained and consumed by them; (5) no provision was made for collection at the source; (6) no allowance was made for size of families.

Immediately the constitutionality of the tax was called into question in the case of *Pollock vs. Farmers' Loan and Trust Company* (157 U. S. 429; rehearing 158 U. S. 601). The constitutional provision involved was the following:

"Representative and direct taxes shall be apportioned among the several States, which may be included with this Union according to their respective numbers, which shall be determined by adding to the whole number of those bound to service for a term of years and excluding Indians not taxed, three-fifths of all other persons."\*

"No capitation or other direct tax shall be

laid unless in proportion to the census hereinbefore directed to be taken."

The court decided after a rehearing, by a majority of one, that the income tax as a whole was unconstitutional. The essential reasons as stated by the court were as follows:

"First. We adhere to the opinion already announced that taxes on real estate being undisputably direct taxes, taxes on rents or income of real estate are equally direct taxes. Second. We are of opinion that taxes on personal property, or on the income of personal property, are likewise direct taxes. Third. The tax imposed by sections twenty-seven to thirty-seven, inclusive, of the act of 1894, so far as it falls on the income of real estate and of personal property, being a direct tax within the meaning of the Constitution, and, therefore, unconstitutional and void because not apportioned according to representation, all those sections, constituting one entire scheme of taxation, are necessarily invalid."

(3) *The Sixteenth Amendment.*—In a special message to Congress on 16 June 1909, President Taft recommended that Congress propose "an amendment to the Constitution, conferring the power to levy an income tax upon the national government without an apportionment among the States." The amendment as finally agreed upon by Congress for submission to the several States was as follows:

"Congress shall have the power to lay and collect taxes on income from whatever source derived, without apportionment among the several States, and without regard to any census or enumeration."

This amendment was ratified by 42 States and the seemingly impossible, an amendment to the constitution, had been accomplished. The amendment became a part of the constitution on 25 Feb. 1913.

(4) *The Income Tax of 1913.*—The income tax now in operation in this country became a law on 3 Oct. 1913. It marks a new era in the history of American finance. It aims to redress the inequality of taxation which was a predominant feature of the American fiscal system.

(a) Who is liable to the Income Tax? The law applies to every American citizen, including those resident abroad. It applies to every person residing in this country. It applies to non-residents having incomes obtained from this country.

The law applies to every corporation, joint-stock company or business association (with a few exceptions) in the United States. Double taxation is avoided by permitting individuals to make deduction for income on which the tax has already been paid.

(b) What is taxable income? The law of 1913 states that net income "Shall include gains, profits and incomes derived from salaries, wages, or compensation for personal services of whatever kind, and in whatever form paid; or from professions, vocations, businesses, trade, commerce, or sales or dealings in property, whether real or personal, growing out of the ownership or use of or interest in real or personal property; also from interest, rents, dividends, securities, or the transaction of any lawful business carried on for gain or profit, or gains or profits and income derived from any

\* Important decisions preceding the one in question on this point were: *Hylton vs. U. S.*—3 Dallas 171 (1796); *Pacific Insurance Co. vs. Soule*—7 Wallace 435 (1868); *Veazie Bank vs. Penno*, 8 Wallace 533 (1889); *Scholey vs. Rew*—23 Wallace 331 (1874); *Springer vs. U. S.*—102 U. S. 586 (1880).

source whatever, including the income from, but not the value of, property acquired by gift, bequest, devise, or descent."

The term income in this connection is confined to actual money income. The general view is that income is regular and periodic and that irregular returns in the shape of inheritances should be reached by the inheritance tax. Profits from transactions in stocks and real estate are included only when realized. A clear distinction seems to be made between gross and net income.

(c) *The Tax Rates.*—The tax applies to individual incomes only when they exceed \$3,000; \$4,000 in case of married persons. There is no minimum exemption in case of corporations. The tax is a graduated one, and the rates are progressive. A tax of 1 per cent is imposed on all incomes exceeding the minimum, and an "additional" tax is imposed on higher incomes in accordance with the attached schedule.

PERCENT	On amounts exceeding	And not-over
1.....	\$20,000	\$50,000
2.....	50,000	75,000
3.....	75,000	100,000
4.....	100,000	250,000
5.....	250,000	500,000
6.....	500,000	.....

(d) *Stoppage at Source.*—In respect to collection this law is unlike any preceding law in this country. It provides that all payers of income, whoever they may be, shall deduct the annual legal tax. There are three exceptions only: (a) dividends on stocks of corporations; (b) interest on bonds; (c) payments to a corporation.

(e) *Certain Administrative Features.*—It is specifically provided that no income return shall be divulged. Every person having an income in excess of \$3,000 must file on or before 1 March under oath a complete return of his income. Corporations are required to file this statement at regular periods. Delay or fraud are heavily penalized in the case both of individuals and corporations.

(5) *Amendments of 1916.*—In the revenue act of 1916, an entirely new income tax law takes the place of the one enacted on 3 Oct. 1913. Essentially the law is the same, but there are some modifications which are of considerable importance. The most significant changes are a doubling of the "normal" rate and increases in the "additional" rates, especially those falling upon the very large incomes. The normal rate has been raised from 1 to 2 per cent. The following table compares the old and the new rates:

PART OF INCOME TO WHICH APPLICABLE.

Old law	New law	Tax, Per cent
\$20,000 to \$50,000	\$20,000 to \$40,000	1
50,000 to 75,000	40,000 to 60,000	2
75,000 to 100,000	60,000 to 80,000	3
100,000 to 250,000	80,000 to 100,000	4
250,000 to 500,000	100,000 to 150,000	5
500,000 to any excess	150,000 to 200,000	6
	200,000 to 250,000	7
	250,000 to 300,000	8
	300,000 to 500,000	9
	500,000 to 1,000,000	10
	1,000,000 to 1,500,000	11
	1,500,000 to 2,000,000	12
	2,000,000 to any excess	13

A serious attempt was made in Congress to lower the \$3,000 exemption, but this was finally

retained as in the original act. Under the old law it was held that profit, however made, must be included; the new law allows for losses in incidental transactions, not exceeding profits of a similar kind. Non-resident aliens are now required to pay the tax so far as it concerns interest on bonds with underlying assets situated in the United States.

The new law, then, aside from the increase in rates, makes no great changes in substance. Practically all of the changes that are made are for the better and represent a natural development following administrative experience. The changes in form are much more noticeable and extensive. The arrangement of the old law was unfortunately haphazard and unsystematic; references were unnecessarily difficult, various terms and phrases were ambiguous, and there was a looseness in the use of even technical terms that was very confusing. The recast law is a great improvement in regard to these matters.

(6) *Critique of the Law.*—The theory of the income tax as a part of our fiscal system may be accepted without further question. The application of that principle of taxation in the present law has, however, been seriously criticized. Without argument, the main points of criticism may be briefly summarized as follows: (a) The exemption of incomes below \$3,000, and for families below \$4,000, is undoubtedly high. If the exemption were lowered, many additional persons would be added to those taxed, but it is doubtful if the amount received would be commensurate with the task of collection. (b) The stoppage-at-the-source provision throws much of the burden of collecting the government's revenues upon banks, trust companies, corporations and other agents. To meet this difficulty it was suggested that information-at-the-source be substituted for stoppage at the source. The law, however, remains unchanged in this respect. (c) Certain discrimination against incomes received in the form of corporate dividends. The phraseology of the law also requires double and even multiple taxing of holding companies. (d) There is double taxation of both resident aliens and non-resident citizens. (e) The principle of differentiation between funded and earned incomes, common in most other countries, is not introduced. (f) The monetary conception of income is almost exclusive and no account is taken of income in the shape of farm produce or house rent, consumed by the producer or owner.

(7) *Practical Results of the Income Tax.*—The success of any tax may be measured by the net amount of revenue collected, by the equality of assessment, and by the friction between the tax collecting authority and the tax payers. The federal income tax is as yet too new to warrant a final judgment. The amount of revenue collected has been considerable. The cost of collection has, however, been large. The friction between the tax collecting authority and the taxpayer has undoubtedly been greater than is warranted. It will undoubtedly decrease as the collectors gain experience and ability in levying the tax.

During the fiscal year 1915-16, 366,443 corporations reported. Of these, 190,911 showed an aggregate income of \$5,184,492; 389 upon which there was assessed income tax in the aggregate sum of \$51,844,423.89; 175,523 returns

showed an operating deficit, or no taxable income. During the fiscal year 1915-16, there was actually collected \$56,972,720.88.

The following comparison shows the increased efficiency of the tax and the administration of it during the past two years:

	1915	1916
Returns received.....	299,445	366,443
Taxable returns.....	174,205	190,911
Total taxes assessed.....	\$38,986,952.18	\$58,549,081.91
Per cent increase.....		66.5

The results of the personal income tax were larger than those from the corporate income tax, and are extremely interesting in their range and distribution. Income tax collections from individuals amounted to \$67,943,594.63 for the fiscal year 1915-16, as against \$41,046,162.09, in the fiscal year 1914-15, and \$28,253,534.85 for the fiscal year 1913-14.

The following table gives the amount of normal and additional tax collected in the last two years, 1915 and 1916:

	1915	1916	Increase
Income tax, normal.....	\$16,559,492 93	\$23,995,777 28	\$7,436,284 35
Income tax, additional:			
Net incomes—			
\$20,000 to \$50,000.....	4,106,673 36	6,091,775 71	1,985,102 35
\$50,000 to \$75,000.....	2,500,890 33	4,071,361 94	1,570,471 61
\$75,000 to \$100,000.....	2,102,927 01	3,623,472 62	1,520,545 61
\$100,000 to \$250,000.....	5,949,104 55	10,936,326 15	4,991,221 60
\$250,000 to \$500,000.....	3,328,423 78	6,393,858 64	3,065,434 86
Exceeding \$500,000.....	6,439,004 54	12,647,862 91	6,208,858 37
Accepted offers in compromise, etc.....	63,645 59	183,159 38	119,513 79
<b>Total.....</b>	<b>\$41,046,162 09</b>	<b>\$67,943,594 63</b>	<b>\$26,897,432 54</b>

Perhaps as interesting to the general student of economics and sociology, as to the expert in taxation, is the range of incomes from which the tax was collected. The following table gives the number of persons in each income group:

Income group	Number
\$3,000 to \$4,000.....	69,045
4,000 to 5,000.....	58,949
5,000 to 10,000.....	120,402
10,000 to 15,000.....	34,102
15,000 to 20,000.....	16,475
20,000 to 25,000.....	9,707
25,000 to 30,000.....	6,196
30,000 to 40,000.....	7,005
40,000 to 50,000.....	4,100
50,000 to 75,000.....	4,791
75,000 to 100,000.....	2,056
100,000 to 150,000.....	1,793
150,000 to 200,000.....	724
200,000 to 250,000.....	386
250,000 to 300,000.....	216
300,000 to 400,000.....	254
400,000 to 500,000.....	122
500,000 to 1,000,000.....	209
1,000,000 and over.....	120
Married.....	266,153
Single (Men.....)	47,583
Women.....	22,916
Married women rendering separate return.....	4,819
<b>Total.....</b>	<b>336,652</b>

The function of collecting the federal income tax is lodged in the office of the Commissioner of Internal Revenue. This office also collects revenues on liquors, tobacco, documents, proprietary medicines, playing cards, etc. It is, therefore, impossible to say exactly what is the cost of collecting the income tax. Allowing a reasonable overhead the collection of the in-

come tax probably costs not less than \$1,950,000 or 1.56 per cent of the amount taxed.

Chief of Bureau of Foreign and Domestic Commerce, Washington, D. C.

**INCONNU**, in-kō-nū', Fr. ān-kō-nū', the French-Canadian name of a fish of the rivers that enter the Arctic Ocean (*Stenodus mackenziei*), intermediate between a salmon and a whitefish in its characteristics, and of great value as food for the people of that region. Specimens often weigh 10 to 15 pounds.

**INCORPORATION**, (1) the act of forming a legal corporation, or the body so formed. In England, incorporation is generally under the control of Parliament, corporations being created usually under general statutes but sometimes under special acts. They may be created also by royal charter. In the United States they are created by Congress or the legislatures of the various States, usually under general statutes. The process of incorporation is simple, consisting of filing a certificate of incorporation with the proper officer, giving the names of the incorporators, directors, etc. By incorporation and compliance with other legal formalities, the association acquires rights similar to those possessed by a natural person. It can usually acquire and convey property, sue and be sued, make contracts, elect or remove officers or members, etc. It becomes a complete legal entity, distinct from the incorporators or its members. The courts in the United States generally have power to determine whether any given petition for incorporation has met all legal requirements. The certificate of incorporation constitutes the charter of a corporation formed under general statutes, whereas in the case of a corporation formed by royal grant or special act, the grant or statute creating it constitutes the charter of the corporation.

(2) The act of uniting, as papers, by reference in a will. Such papers in the case of a will are treated as part of it. See **CORPORATIONS, LEGAL**

**INCREMENT, The Unearned.** See **SINGLE TAX.**

**INCUBATOR**, a machine employed for the artificial hatching of chickens from eggs. Such devices were known to mankind from early ages. Pliny says that the Egyptians thus hatched 100,000,000 chickens a year. While artificial incubation was introduced into France and England during the 18th century, the incubator was brought to greatest perfection in the United States in the 19th century. The first

patented invention of the modern incubator was in 1847, but any practical success in such machines cannot be met with before 1877, when Rouillier and Arnould exhibited their hydro-incubators at the Paris Exhibition.

There are two general classes of incubators, those in which hot air is used for the maintenance of heat and the application of it to the eggs, the other in which hot water serves this purpose. An automatic incubator of first-class make it equally efficient whichever of these two heating mediums is employed, but there are many different types of machine offered for sale, and the struggle between cheapness and efficiency sometimes leads to the sacrifice of the latter. There are certain essentials to an incubator which must be attained at any cost, and the machine that is deficient in any one of these is a failure, which means that it cannot guarantee to yield of living chicks at least 80 per cent. The following may be enumerated as absolute requisites in a good incubator: (1) An egg chamber heated at a uniform temperature. It is best that the heat should come from above, when it is likely to be reverberated from the floor of the chamber and to more evenly affect the eggs, and may at once strike the germinal vesicle which from its lightness always rises to the upper surface of the yolk. (2) A source of heat which is self-regulative. The thermo-regulator in general use is actuated by an arm thrust within the egg chamber, and must be sensitive to an atmosphere of  $\frac{1}{2}^{\circ}$  or at most  $1^{\circ}$  above that which is desired. (3) Good ventilation within the egg chamber, with some provision by which a certain degree of moisture may be maintained in the air. (4) Added to this, is a good turning apparatus. There are very many devices for effecting this purpose; perhaps the best is that of a tray fitting exactly over the tray in which the eggs are laid, and by the turning of which the eggs may be replaced in a reversed position in the applied tray.

Of course the aim of a true incubator is to reproduce as accurately as possible by artificial means the conditions of natural hatching under a setting hen. Thus the supply of heat and air must be conformable to a fixed standard. The temperature is to be kept unchanged at  $100^{\circ}$  F., or a little above that, by placing the incubator in a room not exposed to draughts. To make accident in this respect impossible, a cellar, or specially built chamber, should be used, where no access of colder air may cause a fall in temperature, and a sensitive thermo-regulator furnish automatic means of preventing excessive heat from destroying the vitality of the eggs. Moisture must be preserved in the air of the egg chamber that the eggs may not be shriveled by excessive evaporation. There must also be adequate ventilation, that no harmful gases sicken or kill the hatching chick. The turning of the eggs is considered necessary, because the sitting fowl has the habit of so doing, but the eggs should not be disturbed after the 18th day, nor the incubator be opened after that date, until the hatch is completed. With regard to the moisture of the air, it has been considered proper after studying the progress of evaporation, as reckoned from the loss of weight in a fertile egg during the process of hatching, that a humidity of 45 per cent is the safest degree of saturation.

Various ways have been resorted to of taking care of the chickens after they leave the incubator. They must at first be kept in an atmosphere of from 90° to 100°, at least for the first week, and heated places of shelter, known as brooders, must be prepared for them. There are many patterns and kinds of brooders, which are manufactured by the same firms as those which make incubators. The requisites for brooders are: (1) The temperature of the first week, as given above should be gradually lowered. (2) The greatest diligence should be applied to secure and maintain cleanliness, dryness and good ventilation. (3) Their construction should be such that newly-hatched chickens may always be in view. As the chicks grow toward fledging, facilities should be afforded them to leave the brooder for exercise. See also **POULTRY**. Consult Cooke, P., 'Successful Incubation' (Los Angeles 1911); 'Incubators and Chicken Rearers' (New York 1912); Hawks, G. B., 'Incubation and Brooding' (Clinton, Wis., 1909); Hurst, J. W., 'Successful Incubation and Brooding' (London 1911); Robinson, J. H., 'Principles and Practice of Poultry Culture' (Boston 1912).

**INCUBUS** (Lat. "one who lies upon"), a spirit to whom was ascribed the oppression known by the common name of nightmare, in Greek *ephialtes* (from *epi*, and *hallomai*, I leap upon). These demons play an important part in the superstitions of the Middle Ages, having been perhaps not infrequently employed, like the older gods of Greece, to cloak the advances of earthly lovers. See **NIGHTMARE**.

**INCUMBRANCE**, in general, any charge or burden upon real property held by any one other than the real owner. It thus includes judgments, leases, mortgages, mechanics' liens and even restrictive agreements. In a conveyance of real property the seller usually agrees to a covenant against incumbrances under the terms of which he secures the buyer from any loss arising through any incumbrance upon the property at the time of the sale.

**INCUNABULA**, is a term applied by bibliographers to editions of books printed during the early period of the art, and is generally limited to works which appeared previous to 1500. The incunabula are divided into xylographic and typographic, the former those printed from engraved blocks, the latter from movable types. Among the most highly esteemed of the incunabula are those which are first editions of the ancient classics. See **BIBLIOGRAPHY**.

**INDAJA PALM**. See **ATTALEA**.

**INDEMNITY CONTRACT**, a form of contract which, while not of recent origin, is becoming much more common than formerly. Such a contract is any form of written agreement between two parties whereby one party agrees to indemnify or save harmless the other party for loss or damage arising out of a particular transaction, or against some specified claim of a third party. It is an original contract and must be in writing in order to come within the statute of frauds. Such contracts are frequently made in the form of a mortgage. But the substance and not the form is important, and the courts have usually given them a liberal construction with the intent of furnishing the party to be indemnified with all of

the protection that was manifested in the minds of the contracting parties when the contract was signed. Indemnity contracts are not adverse to public policy; but they are not binding when they undertake to protect persons against the consequences of illegal acts. Like other contracts, they must be founded on a sufficient consideration, and furnish indemnity only to the party named as indemnitee, and do not extend to a person having only a contingent or collateral interest in the subject matter of the contract.

**INDENTURE**, in law, a form of deed between two or more persons, usually executed in duplicate on one piece of paper or other similar material, and the parts separated by a notched or toothed cut. Indenting is seldom practised to-day, but the instrument retains the name. The term should be carefully distinguished from a deed poll, which is now identical in form. An indenture is required only where the grantee or obligee assumes an independent obligation from the grantor or obligor, whereas a deed poll is required where an obligation is assumed by one party only or by a number of persons in the same obligation.

**INDEPENDENCE**, Iowa, city and county-seat of Buchanan County, on the Wapsipicon River, 70 miles southwest of Dubuque, and on the Rock Island and the Illinois Central railroads. It is the centre of an extensive horse-breeding, farming and dairying region. There is located here the well-known Rush Park, with its kite-shaped race track, the State insane asylum for northern Iowa, public library and other buildings. Culverts and gas engines are manufactured and the electric-light plant and waterworks are owned by the municipality. Pop. 3,683.

**INDEPENDENCE**, Kan., city and county-seat of Montgomery County, located on the Verdigris and Elk rivers, 85 miles south of Kansas City, on the Atchison, Topeka & Santa Fé and Missouri Pacific railroads. The city has interurban connections with all the principal cities and towns in this section. It is the centre and distributing point for a large and rich agricultural district, has a number of large manufacturing plants, is the home of the Kansas Natural Gas Company, headquarters for the Mid-continent Oil and Gas Company, home of the Prairie Oil and Gas Company, whose building is the largest in the State. There is abundance of natural gas and oil in the surrounding territory. Some of the largest plants are cement mills, planing mill and revolving-door plant, sash and door plant, glass plant, oil refinery, rubber plant, iron foundries, alfalfa mills and creameries. There are also a number of important smaller concerns. The city has a public library, federal building, municipal building, court house, and the finest and best hotel in the State. Pop. 13,386.

**INDEPENDENCE**, Mo., city and county-seat of Jackson County, five miles from Kansas City, on the Kansas City & Indianapolis, Missouri Pacific, and the Chicago and Alton railroads. The city is considered a residential suburb of Kansas City. The town was settled in 1827, and in 1838 the Mormons' rendezvous was located here, and from hence the Latter-day Saints pursued their journey to Utah. It was the scene of exciting events during

the Civil War, the capture of the Federal garrison in 1862, and a Confederate defeat in 1864. Stock-breeding, fruit-growing and canning are the chief industries along with numerous domestic manufacturers. Under the charter of 1889 the city is governed by a mayor and city council elected every two years. The electric-light plant is owned by the municipality. Pop. 9,859.

**INDEPENDENCE, Ore.**, city of Polk County, 12 miles southwest of Salem, on the Willamette River, and on the Independence and Monmouth, and the Southern Pacific railroads. Great quantities of hops are grown in the district and form an important article of trade. There is also a good trade in cereals and other agricultural products. Its industrial establishments comprise a creamery, foundry and machine shops, saw mills and flour mills. Pop. 1,160.

**INDEPENDENCE, Declaration of.** See **DECLARATION OF INDEPENDENCE.**

**INDEPENDENCE HALL,** Philadelphia, a low plain brick building on Chestnut Street, begun in 1732, but not completed until 1747, as a state-house for the colony of Pennsylvania, as closely connected with great national events as Faneuil Hall or the Old South in Boston. It was occupied as a state-house while unfinished, in 1736; the tower was added in 1750. After its completion it was used by the assembly, the supreme court, and the governor's council of the province of Pennsylvania. Here the Continental Congress held its sessions; here Washington was appointed commander-in-chief of the Continental armies, on John Adams' motion; here the Declaration of Independence was adopted and was read from its steps to the assembled crowds in front. The Convention of 1787, which framed the Constitution, was also held here. It is now maintained as a museum of historical relics, especially of the Revolution. In the tower is still kept the famous "Liberty Bell" (q.v.). In recent years it has been carefully restored to its original appearance. Consult Belisle, D. W., 'History of Independence Hall' (Philadelphia 1859); Etting, F. M., 'An Historical Account of the Old State House, etc.' (2d ed., Philadelphia 1891).

**INDEPENDENCIA,** ěn-dā-pān-dān'sya, on **FRAY BENTOS,** frī bān'tōs, Uruguay, capital of the Department of Rio Negro on the Uruguay River. The chief industries are stock-raising, meat-packing and the manufacture of meat products. The city is well laid out and there are several fine modern buildings, including government edifices, the hospital and schools. The river is navigable to ocean steamers, thus increasing the importance of the town as a business centre. Pop. about 10,000.

**INDEPENDENT CATHOLIC CHURCH OF THE UNITED STATES,** or **OLD CATHOLICS,** a Polish religious body organized in Chicago, among disaffected Roman Catholics. Its founder, Rev. Anthony Kozłowski, attended one of the conferences of the Old Catholic Church in Europe and was there consecrated a bishop. The church has acquired considerable property in Chicago and has established a hospital, dispensary, orphanage, home

for the aged, primary, grammar, high and industrial schools. The society had in 1915 over 18,500 members, and 35 ministers and 41 churches.

**INDEPENDENT ORDER OF ODD FELLOWS.** See **ODD FELLOW.**

**INDEPENDENT VOTE.** See **VOTE, VOTERS, VOTING.**

**INDEPENDENTS.** See **CONGREGATIONALISM.**

**INDETERMINATE SENTENCE.** A sentence to imprisonment without a fixed time for its termination. It is in accordance with the new principle of penology that the object of imprisonment is primarily the reformation of the offender and consequently that he is to be released as soon as he has reformed and shown his fitness to again become a member of society. In practice, the indeterminate sentence has minimum and maximum limits. Thus a prisoner may be sentenced for not less than four nor more than seven years. The indeterminate sentence was first applied in New York to boys and was not extended to adults until 1876, when the Elmira Reformatory was established. Massachusetts and Ohio soon followed the example of New York and at present about half the States of the Union have adopted the indeterminate sentence in their penal codes. European countries have not taken to the plan, mainly because of their century-old concepts of crime, punishment and vindictiveness which more properly belong to less enlightened age. See **PAROLE SYSTEM; PRISONERS, PROBATION OF.**

**INDEX,** a series of references arranged in alphabetical order usually placed at the end of a book. The need of indexing has become more and more apparent as the mass of material published has increased and the spread of education has increased by tens of thousands the numbers of people who wish to make use of this material. It was at one time seriously proposed, both in England and America to deprive an author who published a book without an index, of the privilege of copyright. In general there are two classes of books to be indexed — viz. books of facts and books of opinion. In indexing the former experience, care and common sense must be exercised, and the work must be systematic and not casual. In the latter class the same qualifications are required and something else — viz. the insight of the precis writer. The index maker must have a fair knowledge of the subject in hand and must also take into account the viewpoint of the reader and the needs of the latter. An index must be exhaustive in its indication of the various points of the book, and concise in expression, and in addition the indexer must be careful in the choice of his headings or leaders. The same subjects must be collected under one heading and must not be separated under synonyms. An author frequently uses periphrases to escape from the repetition of the same fact in the same form; but these periphrases will give little

information if inserted as headings in an index, and it is in this power of selecting the best catchword that the good indexer manifests his superiority over the commonplace worker. There are other kinds of indexes; but these require an explanatory adjective, as classified, chronological, etc. In indexing names it is most important to specify the cause of reference, as a block list of references after a name is almost useless. It is also important to bring all the references to one man under one heading, and not to separate them under the different names or titles he may have borne. There should be one index for a complete work and not a separate index for each volume. No classification should be allowed in an alphabetical index as the consulter is only confused and annoyed if he has to look in a succession of alphabets arranged under such headings as original articles, notes, correspondence, etc. The preparation of an index involves three operations: compiling, arrangement, and printing. Each index maker will find out the mode of procedure which is most suitable to himself; a good way, now well nigh universal, is to make each entry on a separate slip, after which the slips are arranged in alphabetical order. Library supply firms supply different types of slips and alphabetical trays, which are an important aid to the indexer. When the slips have been arranged care must be taken to see that there are no repetitions of the same subjects under various synonyms. Words spelled alike, but of different meaning must be repeated as headings. Now is the time to make the cross references, and here considerable judgment is required. When the entries are short and few, it is better to repeat them than to refer from one to the other; but in the case of long entries cross references are very advantageous and it is always well to refer to cognate headings. No reference to the contents of a general heading, which is without subdivision, should be included. If a general heading is divided into sections, and each of them is clearly defined, they should be "cross-referenced," but not otherwise. Alteration and revision of headings will be found necessary frequently. The value of an index is greatly enhanced by the proper setting out of the entries with judicious use of different types. When a book is a complete treatise on a special subject, a well-made index will form an admirable key to the subject and be in itself intrinsically useful. The above general principles apply to indexes of separate books; but indexes are made to a particular subject in which the references relate to several books. The increase of these indexes is much to be desired as they form admirable helps to knowledge. Consult Clarke, 'Manual of Practical Indexing' (London 1905); Kaiser, 'Systematic Indexing' (New York 1911); Petherbridge, 'Technique of Indexing' (London 1904); Wheeler, 'Indexing: Rules and Examples' (Albany 1905; rev. ed., 1913).

**INDEX, Cephalic, Cranial, etc.** For some years anthropologists have taken special care in determining geometrically the forms and dimensions of the human cranium among the different races of mankind. The task is a difficult one because the human cranium is not a rectangular box. Various procedures have come into general use to determine the measure of

the distances of the head, the skull, the facial cavities, and the brain capacity. Indexes are the terms used to define the relations existing between these linear distances and the following are the principal. The Cephalic index is the relation which exists between the transverse diameter of the head and the anteroposterior diameter. The latter is taken from the middle and lower part of the frontal bone to the furthest part of the occiput. The transverse diameter is the greatest line at right angles to the anteroposterior. In practice it is assumed that the length equals 100, and the width is represented as a percentage of this. The result is the index for which the formula is

$$\frac{\text{greatest width} \times 100}{\text{length}} = \text{cephalic index}$$

This index is an important medium for classifying skulls. A low index indicates a great length as compared with the width, giving an elongated or oval skull. A high index indicates a rounded skull. A common classification of skulls on the basis of this cephalic index is the following:

Subdolicho cephalic.....	Below 70
Dolicho cephalic.....	70 to 77.8
Mesoticephalic.....	77.8 to 80.
Subbrachy cephalic.....	80 to 83.3
Brachy cephalic.....	83.3 to 85.
Hyperbrachy cephalic.....	Above 85

It must be remembered that these divisions are arbitrary and vary slightly for the cephalic index, and even in different countries. As a general result of this classification we find that Eskimos, African negroes, Fuegians, Veddahs, Maoris, Fiji islanders, and certain peoples of northern Europe are dolichocephalic, while American Indians, Malays, Mongols, Lapps, Finns, Poles, Tyroleans are brachycephalic. British, French, Germans, Greeks, Japanese, Chinese are mesoticephalic. The cephalic index alone is insufficient for a proper classification of the skulls or heads of the different races. Recourse is had therefore to other indices which taken in conjunction with the cephalic, will give the shape of the head. The frontal index is the relation between the least frontal diameter and the greatest cranial diameter. By contrasting height with length a vertical index is obtained according to which we get platycephals, or low skulls; metriocephalic, or moderate; and acrocephalic, or high skulls. The facial index is that resulting from a comparison of the length and width of the face. The length is measured from the root of the nose to the tip of the chin, the forehead being part of the cranium and therefore excluded; the width is calculated by the projecting convexities of the zygomatic arches. High faces are those above and low faces those below 90. A nasal index is measured from its height and width, the latter calculated from the width of the nasal wings. According to the result a skull or head is leptorhine, or narrow below 48; mesorhine, or medium from 48 to 53; and platyrhine, or broad nosed, above 53. The orbital index is that resulting from the relation of the height and width of the orbit or pyramidal chamber which lodges the eye-ball. The width is calculated from the *dacryon* on the inner wall to the most distant point on the outer edge of the

wall. The width being always greater than the height the formula for the orbital index is:

$$\frac{\text{height} \times 100}{\text{width}} = \text{orbital index}$$

According to this index we have megaseme, or great orbits, above 89; mesoseme, from 84 to 89; and microseme, below 84. Other indexes are the pelvic, the sacral, the dental and the pilastric obtained by measurement and computation similar to those described above. Methods differ widely according to the different schools of anthropologists. Consult Broca, 'Instructions générales pour les recherches anthropologique' (Paris 1879); 'Deniker, 'Races of Man' (London 1900); Bertillon and Chervin, 'Anthropologie métrique' (Paris 1909); Livi, 'Antropometria' (Milan 1900); Ranke, 'Der Mensch' (Leipzig 1911).

**INDEX KEWENSIS**, kû-ên'sis, a work of reference giving the names of flowering plants, compiled under the direction of Sir Joseph D. Hooker, director of the Royal Gardens at Kew, London, by Benjamin Daydon Jackson. With Bentham and Hooker's 'Genera Plantarum' as a basis for the limitation of genera a record was made of every genus and species of phanerogamous plants published up to 1885, and the geographical distribution of each species was indicated. To each name, whether retained or synonymic, full reference to its place of publication was added, retained names, and not necessarily the first specified name, being the earliest under which they were published in the recognized genus. A first supplement brought the work down to 1895; a second supplement covering the years between 1896-1900 appeared in 1905; and a third supplement in 1913 covered the years 1901-05. The index originated with Darwin, who supplied the funds for its operation. Its need arose from the difficulty found in identifying many plant species. The work of Hugh Falconer on Indian plants and of Marianne North in all parts of the world was of great value in adding scientific accuracy to this important work.

**INDEX LIBRORUM PROHIBITORUM**. The Index of Prohibited Books, commonly spoken of as the *Index*,—is a specific list of books which ecclesiastical authority prohibits Catholics from reading. This article will briefly give the history of the Index, the right of censorship claimed by the Catholic Church, and the exercise of that right.

**I. History of the Index.**—The first Roman Index appeared in 1559, under Paul IV, long after civil authority had instituted censorship and lists of prohibited writings. The latest Index is that of Leo XIII, a fifth edition of which was published in 1911, at the order of Pius X. Until recently this list of prohibited books was drawn up under the supervision of the Congregation of the Index; and a book was put on the Index by decree of the Congregation of the Roman Inquisition, or of the Holy Office, or of the Index. On 25 March 1917, Pope Benedict XV, by *Motu Proprio*, merged the Congregation of the Index into that of the Holy Office. Hence this latter Congregation, whose purpose is to safeguard Catholic teaching in faith and morals, now has charge of the editing of the Index. As a rule, the books contained in this authoritative list were written by Catholics.

Precisely because the authors were in communion with the Church, explicit condemnation by a Roman Congregation was called for. On account of the relatively small Catholic population in English speaking countries, very few books in that language have been put on the Index. In the general laws of the Church, ample provision is made against the reading of non-Catholic books opposed to Catholic faith and morals. To read books that have been put on the Index or otherwise prohibited by the Holy See, one must obtain either a general or a particular permission from the competent ecclesiastical authority. As the Index is only one element of the legal practice of the Catholic Church in the matter of censorship, it is important here to state what right the Church claims in this sphere of her activity and how she exercises this right.

**II. The Right of Censorship.** (1) *In Civil Society.*—In every full formed society, the unitive principle is authority. This principle vivifies into a living whole, organizes into a social organic unity, the various elements that would else be independent, separate, disparate, hostile, mutually destructive entities. Authority has for its object those means, which are necessary to the very existence and well being of the social organism whereof it is the vitalizing and unifying principle. One such means is the censorship of the press. Legitimate authority, in every full formed society, may exercise censorship of the press, as a necessary means to the end for which the social organic unity exists. This censorship is twofold,—anticipatory or repressive,—according as it is exercised before or after the publication of the matter censored. By *anticipatory censorship*, the authority of a nation at war prohibits the publication of all news that may help the enemy, requisitions wireless stations, commandeers the cable and telegraph, censors private letters, and dictates what things shall not be published by the press. By *repressive censorship*, the same legitimate authority punishes as criminal the use of the mails for treasonable propaganda, and suppresses publications that have printed prohibited matter. All this obtains in civil censorship.

(2) *In the Church.*—Ecclesiastical censorship is like to civil, but in a different sphere of activity. The Catholic Church claims to be not a civil society, but a full formed spiritual society,—a social organic unity, whose members have the same spiritual aim, no matter how they are at variance in civil aims; a living social organism, unified and vitalized by the same principle of spiritual authority, no matter how they differ in the civil authority that unites them into civil societies. To the members of this spiritual society, supreme authority in matters of faith and morals is an attribute of the Pope, the successor of Saint Peter in the Apostolic See. Upon this supreme authority, as upon an adamant rock, is builded the whole fabric of the Church; unto this supreme jurisdiction is granted the tremendous divine power of binding and loosing, to be exercised either directly or indirectly in regard to all who belong to the spiritual organic unity of the Church. "Thou art Kípha (a Rock), and upon this Kípha I shall build my Church; and the gates of hell shall not prevail against it. And I will give to thee the keys of the Kingdom of heaven. And whatsoever thou shalt bind upon

earth, shall be bound also in heaven; and whatsoever thou shalt loose upon earth, shall be loosed also in heaven." (Matthew xvi, 18-19). This power of binding and loosing, be it vested supremely in the Pope or subordinately in any other member of the hierarchy, includes the right of both anticipatory and repressive censorship of printed matter, as a means necessary to the attainment of the spiritual end proposed by the Church.

**III. Exercise of Censorship.**— Catholics do not frown upon the exercise of this right of ecclesiastical censorship as tyrannical. They deem that, if there be in such repressive measures of the Church any *seeming* tyranny, it is the tyranny of love and not of hate. Just as a mother is narrow minded and will not allow her child to drink a solution of arsenic in water, merely because it looks harmless, so the Church is narrow-minded in protecting her children from poison in faith and morals. They may reject her motherly love, and give up membership in her community; but so long as they freely will to be her children and to share in the graces of her sacramental life, they must abide by her censorship in matters of faith and morals.

The ecclesiastical laws now governing censorship are given in the *Codex Juris*, canons 1384-1405. Twelve classes of prohibited publications are enumerated in canon 1399; they are all such as would lead to the poisoning of the wells of doctrine in the matter of faith and morals. In keeping these wells pure, ecclesiastical authority is only following out Saint Paul's injunction to Timothy: "Guard the glorious deposit (of faith) by the help of the Holy Spirit who dwelleth in us" (2 Timothy 1-14). The laws, by which ecclesiastical authority guards the deposit of faith are binding upon all Catholics. To prevent the reading of certain books, canon 2318 *Codex Juris* enacts the penalties incurred by violation of the more serious enactments of ecclesiastical censorship. They are ipso-facto excommunicated from the Church, who publish "books by apostates, heretics and schismatics, that defend apostasy, heresy or schism; likewise they who defend, or wittingly and without due permission read or retain such books or other books that have been *nominatim* prohibited by Apostolic Letter."

**INDEX NUMBER**, a statistical method of showing the changes in the value of money and of investigating and measuring variations in the prices of commodities in general or of a special group of the latter. An index number is the result of a combination of several items, each of which is a ratio between the price of a certain commodity at a particular time, and its price at another period which is taken as a standard. Such ratios are usually expressed as percentages. Thus the price of wheat in 1918

may according to a certain system be set down as 119, in comparison with its price from 1900 to 1910; that is the price of wheat in 1918 is to average price of wheat in the decade 1900-10 as 119:100. By some writers the term index number is applied to each item, as well as to the combination. Percentages are usually made by striking an average of them, but a result of equal generality is obtained from their sum. A good method of constructing an index number is to take a number of articles, say 25, compare the price of each at the current date with its price at the period taken as a basis or standard and express the result as a percentage, placing the sum of these percentages as the index number. Such a process involves the following considerations: what commodities are to be considered? How are prices to be ascertained? How are ratios between the prices of each at the current period and the basic period to be combined? These problems vary according to the purpose in view. A general plan is to include articles of consumption rather than materials or implements; retail prices should be used, not wholesale; general wages are excluded, but payments for personal services should be included. The proper combination of ratios is a weighted average. A general principle to be observed in assigning the weights is the importance of each to the consumer. A very extensive literature has grown up concerning index numbers and the problems arising from them. Both the British Association for the Advancement of Science and the International Statistical Institute have gone into the question thoroughly. The question at issue is what average should be used in combining the index numbers for the individual commodities. If the weighted arithmetic mean is used, the question is what weights are to be applied? Moreover, it is necessary to determine what commodities are to be included. *The Economist* table includes only 22, Sauerbeck 35, Falkner 223 and the United States Bureau of Labor 340. For these, in turn, various prices may be used (average prices or single quotations, wholesale or retail prices according to the plan followed), all of which again may depend on various sources such as trade journals, statements of merchants, government reports, etc. The standard year or standard period has also to be chosen. Mean index numbers may be utilized to determine other general tendencies besides the movement of prices. Thus the level of wages for large districts may be determined in this way, or the level of wages in a single great industry or special class of labor industries. The United States Bureau of Labor Statistics publishes an index number of wholesale prices and also indexes of retail prices. Consult 'Bulletin of the United States Bureau of Labor Statistics' whole No. 181 (October 1915, pp. 6, 10, 11, 257-263); Boyley, 'Elements of Statistics' (London 1901); Layton, W. T., 'Introduction to the Study of Prices' (London 1912); Secrist, Horace, 'Introduction to Statistical Methods' (New York 1917); Zizek, Franz, 'Statistical Averages' (New York 1913).

**INDEX OF REFRACTION.** See LIGHT.
