MENDOZA, Argentina, city, capital of the province of Mendoza, at the base of the Andes, on the eastern side of the mountains, on the railroad which extends from Buenos Aires to Valparaiso, Chile, about 600 miles west by north from Buenos Aires and 165 miles east of Valparaiso. It is about 2,400 feet above the sea. The city was founded in 1559. It belonged to Chile previous to 1776. In 1861 it suffered from an earthquake which killed about 10,000 people and destroyed a great part of the city. The Transandean Railway connects the city via Villa Mercedes with all the large cities of the eastern coast, also with Santa Fe and Corrientes. It has eight banks, seven department stores and is an important trade centre. It is the seat of two national normal schools, a national college and an agricultural institute. Pop. about 58,790.

MENE, mē'nē (numbered); **TEKEL** (weighed); **UPHARSIN** (divided), the Chaldee words traced on the wall at Belshazzar's feast and significant of his impending doom (Dan. v). The astrologers could not read them, because they were written in antique Hebrew characters, but Daniel understood their awful meaning; and the same night witnessed their fulfilment.

MENEDEMUS, founder of the school of philosophy called Eretrian from his native city Eretria: b. about 351; d. about 277 B.C. Traditions vary as to whether he turned to philosophy under the influence of Plato, or under that of Stilpo of Megara, but his tenets seem to have most resembled those of the Megarian school.

MENELAUS, měn-ē-lā'ŭs, *in Greek legendary history,* the son or grandson of Atreus and brother of Agamemnon (q.v.). From his father-in-law, Tyndareus, whose daughter Helen he married, he received the kingdom of Sparta or Lacedæman. Paris, son of Priam, king of Troy, having carried off his wife, Helen, with a part of his treasures and some female slaves, and conveyed them to Troy (q.v.), Menelaus, accompanied by Ulysses (q.v.), went thither to demand the restitution of his wife and property, and this being refused, he summoned the Greek princes to revenge the affront according to their promise. After the conquest of Troy, Menelaus took Helen to return with her to his native land. Eight years he wandered before he reached home. On the island of Pharos (q.v.) he surprised Proteus asleep and compelled him to disclose the means which he must take to reach home. See TROJAN WAR.

MENELEK, emperor (negus) of Abyssinia: b. 1842; d. December 1913. He was the son of a king of Shoa and secured the throne with some fighting in 1889, in which year he signed the Treaty of Uccialli with Italy. He discovered some years later that by the Italian text of the treaty he was bound to conduct his foreign affairs through the Italian government, while the Amharic text made this optional. He accordingly wrote to Queen Victoria in 1893 and protested against the treaty as infringing upon his sovereign rights. In 1896 he fought a war with the Italians and severely defeated them in the battle of Adowa. His complete independence was then recognized by Italy and the other European powers. He concluded treaties of commerce with Great Britain and other countries and co-operated with the British army against the Sudan dervishes. A humane and just ruler, he endeavored to apply the arts of civilization to his backward country. He was succeeded by Lij Yassu, who was dethroned in 1917.

MENENDEZ DE AVILES Y MARQUEZ mā-nēn'dĕth dā ä-vē-lās' ē mär'kĕth, Pedro, Spanish captain, founder of the city of St. Augustine, Fla.: b. Aviles, Austria, 1519; d. Santander, 17 Sept. 1574. In June 1565 he sailed with 1,500 men in 19 vessels to dislodge the French in Florida; landed there 28 August and 6 September began a fort, the nucleus of the present town. He attacked the French garrison at Fort Caroline, during the absence of part of the force, which had set out to attack him but was storm-stayed and finally wrecked. Menendez slaughtered the remnant at the fort and those saved from shipwreck. He returned to Spain in 1567; visited America twice again, strengthening Saint Augustine in 1568, and in 1570 sending a party of colonists to the Chesapeake and up the Rappahannock where they were massacred by the natives. He was recalled to Spain shortly before his death. During the last two years of his life he was governor of Cuba. Consult Winsor, J., 'Narrative and Critical History of America' (New York 1886).

MENENDEZ Y PELAYO, ē pā-lī'ō **Marcelino,** Spanish critic: b. Santander, 1856; d. there, 19 May 1912. He was educated at Madrid and Paris; in 1878 became professor of philosophy and letters in Madrid; three years later was elected to the Spanish Academy; and in the late nineties became director of the Biblioteca Nacional. He lectured often, especially at the Athenæum in Madrid. For several years he was dean of the faculty of letters at the University of Madrid, he served a term as senator, was counsellor of public instruction and chief of the board of archives. He received many honors, including the grand cross of the Order of Alfonso XII. His literary style was finished and elegant and he was ever a staunch defender of Catholicism. He wrote 'Estudios criticos sobre Escritores Montañeses' (1876); 'Horacio en Espa

(1877); 'Historia de los Heterodoxos Españoles' (1880–81); 'Calderon y su Teatro' (1881); 'Odas, Epistolas y Tragedias' (1883); 'Historia de las Ideas estéticas en España' (1884–91).

MENENDEZ PIDAL, Ranion, Spanish critic, philologist, educationalist and general literary man: b. Coruña, 13 March 1869. Educated at the universities of Madrid and Taulause he became professor of Romanic philology at the former (1899). See PIDAL RANION MENENDEZ.

MENEPTAH, or **MERNEPTAH,** king of Egypt about 1250 B.C. He succeeded his father, Rameses II, and reigned for a period of 20 years. His reign was troubled by an invasion from Libya, but he succeeded in crushing it and thereafter set about the construction of numerous buildings and monuments, especially at Tanis. In 1898 his mummy was discovered at Thebes and now reposes in the Cairo Museum. Previous to 1896 it was thought that Meneptah was identical with the Pharaoh of the Exodus, but in that year an inscription was uncovered in which it was stated that Israel was settled in Palestine in the fifth year of Meneptah. This inscription is of prime historic interest as fixing the period of the settlement of Israel in Palestine and as the only mention of Israel on Egyptian monuments. For the inscription consult 'Der Sieges-hymnus des Meneptah auf der Flinders Petrie Stele' (in *Zeitschrift für ägyptische Sprache,* Vol. XXXIV, Leipzig 1896). Consult also Breasted, J. H., 'History of Egypt' (2d ed., New York 1909) and Budge, E. A. T. W., 'History of Egypt' (New York 1902).

MENES, mē'nēz, according to Egyptian traditions, the first king of Egypt. Herodotus relates that he was the founder of Memphis, which he built on a piece of ground which he had recovered from the Nile by altering the river's course. According to Diodorus, Menes introduced into Egypt the worship of the gods, as well as a more elegant style of living. He has been identified by some with the Mizraim mentioned in Gen. x, 6. A tomb supposed to be that of Menes was discovered near Nakâdeh by De Morgan in 1897. Consult Sethe, K., 'Menes und Grundung von Memphis'; Breasted, J. H., 'History of the Ancient Egyptians' (New York 1908). See EGYPT.

MENG-TSE, měng-tsĕ'. See MENCIUS.

MENGER, Karl, Austrian political economist: b. Neu-Sandez, Galicia, 1840. He was educated at the universities of Vienna and Prague, where he gave special attention to law and political economy. In 1872 he began his long connection with the University of Vienna, being appointed full professor of political economy in 1879. He was created life member of the Austrian House of Peers in 1900. As an economist he is undisputed leader of the new school of economics in his country and is opposed to the traditional system hitherto followed. He has published several important works, including 'Grundsätze der Volkswirtschaftslehre' (1871); 'Untersuchungen über die Methode der Sozialwissenschaften und der politischen Oekonomie insbesondere' (1883); 'Die Irrtümer des Historismus in der deutschen Nationalökonomie' (1884); 'Beiträge zur Währungsfrage in Oesterreich-Ungarn' (1892) and the article "Geld" (in 'Handwörterbuch der Staatswissenschaften,' 3d ed., 1909).

MENGS, Anton Raphael, German painter: b. Aussig, Bohemia, 12 March 1728; d. Rome, 29 June 1779. In early childhood his father, Ismail Mengs, a miniature painter of little talent, who was settled at Dresden, took him in hand to make a painter of him, and in 1741 carried him to Rome and set him to study the antique and to copy Michaelangelo and Raphael. He was compelled to do a certain task in painting every day; his day's work subjected to severe criticism; and he was even punished if it was not satisfactory. From this constant practice he early gained skill as an artist, and when he returned to Dresden his talent and proficiency were at once recognized by August III, who appointed him court painter and gave him permission to return to Rome. At Rome he attended the Academy and in 1748 produced a large and elaborate composition, 'The Holy Family,' taking as model for the Mother of Jesus a beautiful peasant girl, whom he afterward married. On his return to Dresden he was commissioned to paint an altar-piece, 'The Ascension of Christ,' for the high altar of the Chapel Royal, and was given permission to return to Rome for the purpose of doing so. A new academy of painting having been opened in the capitol he was appointed director and painted for the Celestines the ceiling of their church, San Eusebio, for Cardinal Albani the 'Parnassus' in the ceiling of his villa, and several oil paintings, including 'Cleopatra,' 'The Holy Family' and 'The Magdalen' for private persons. When King Charles III of Spain summoned him to Madrid he executed for him in fresco there 'The Assembly of the Gods' and 'The Descent from the Cross'; he also completed the altar-piece for Dresden. He returned to Italy in 1769, stayed eight months at Florence and painted for the Pope a ceiling fresco for the Vatican Library. In 1772 he went to Spain and produced for the king the fresco 'Apotheosis of Trajan,' his finest work, but returned to Rome in 1775. On his death the Cavalier d'Azara set up a statue to him and Catherine II of Russia raised a splendid tomb for him in Saint Peter's. He was certainly one of the most important painters of his day, and if he possessed none of the free and living originality of genius he was a master of noble composition and design. He was catholic in taste and eclectic in style, drawing inspiration from the antique, as well as imitating Raphael, Titian and Correggio, whose styles he tried to blend. Consult Woermann, 'Ismail und Raphael Mengs' (in the *Zeitschrift für bildende Kunst,* No. 5, 1893).

MENHADEN, a species of fish (*Brevoortia tyrannus*) of the herring family (*Clupeidæ*), appearing in vast schools along the Atlantic Coast of America. Owing to the large number of local names applied to this species much confusion concerning its identity and distribution exists in the minds of fishermen and others. The name "menhaden" (Indian) is used chiefly in southern New England. North of Cape Cod the fish is called pogy, or occasionally hardhead; in New York and New Jersey, bunker or marshbunker; the fishermen of Delaware

and Chesapeake bays know it as bay alewife, and in the latter region and southward also as bug-fish or bug-head; still farther south it becomes the fat-back, and so on. From the other herrings the menhaden is readily distinguished by its very large head, large mouth, complex gill strainers and crenulated scales. The body is deep, the fins small, the mouth toothless and the color bluish and silvery, with one large and several small black spots.

Like some other pelagic and migratory fishes the menhaden is exceedingly irregular in its movements and variable in abundance and distribution from year to year, but its general range is from Nova Scotia to Brazil and oceanward, so far as observed, to the Gulf Stream. In spring it approaches the coasts and extends northward with the alewives and other species, probably for the purpose of spawning in brackish water, though little is actually known of its spawning habits. In winter Cape Hatteras marks the northern limit of its abundance. The menhaden swims in compact schools of large size, the movements of which at the surface, or sunken to a greater depth, are extremely irregular.

These irregularities are owing, no doubt, to corresponding variation in its food-supply, which consists wholly of the minute organisms, both vegetable and animal (plankton), that are caught as the fish swims with open mouth, straining the water through its lips and gill-arches as it goes. Owing to its strong oily taste and extreme bonyness its value as human food is very slight, but as furnishing food for other fishes, as bait, and for the manufacture of oil, fertilizer and other products, it has a very great economic importance. Large companies control its capture for the latter purposes and, besides pound nets, utilize many steamers provided with purse seines and derricks, by means of which entire schools are taken at a haul and lifted on deck. The oil is extracted and the solid parts ground up for fertilizer at factories on shores. The product varies from year to year, but the total weight of fish taken runs into the hundreds of million pounds. The catch of fish and industries involved reached their highest level of importance in the latter part of the last century, since which both have much diminished, whether by reason of over-fishing or because the menhaden no longer come to the northern part of the coast in so great abundance, is not determined. Consult Goode, 'History of the Menhaden,' Report United States Fish Commission, 1879, and recent reports of the United States Bureau of Fisheries.

MENHIRS, elongated, rough-hewn monoliths standing with one end in the ground. They are found of various sizes, from about 6 to as much as 67 feet high, the latter being the height of that at Locmariaquer in Brittany. Singular superstitions naturally attach to some of them. See STONES, STANDING.

MENIERE'S DISEASE, a disease of the ear first described by the French physician, Emile Antoine Ménière, in 1861. It is one form of auditory vertigo and usually attacks persons of middle age. The principal causes are sunstroke, influenza, rheumatism, anæmia and venereal diseases. The attack is usually very sudden and appears to be due to hæmorrhage into the labyrinth. The seizures may occur at irregular intervals of days or even weeks. While the symptoms of dizziness, vertigo, nausea, etc., gradually disappear the deafness is generally permanent. Potassium iodide is most serviceable in reducing the dizziness. See EAR.

MENIN, Belgium, town in the province of West Flanders, on the Lys and on the Belgo-French frontier here demarcated by the river, seven miles southwest of Courtrai, and 30 miles southwest of Ghent. It contains lace and cotton mills, tobacco factories, etc. In the neighborhood there were extensive tobacco plantations previous to the war of 1914–18, in which Menin suffered severely. It fell to the Germans during the great rush of both armies northward to the sea; was taken by the British in a spirited attack, but was subsequently evacuated by them for strategic reasons. The British having noted a German concentration of troops and *materiel* in Menin made an aerial attack upon it which brought damage to a great number of buildings. Pop. 18,600.

MENINGITIS. The brain is enveloped by three membranes called the meninges. Next to the skull comes the dura mater, then the arachnoid and innermost is the pia mater. These three membranes are prolonged from the brain in three envelopes of the spinal cord. Meningitis is an inflammation of the meninges of the brain or of the spinal cord. It is very rarely a primary condition, but is usually secondary to infection from micro-organisms of many types, or results from chronic poisonings such as lead, alcohol, etc. Hence modern medicine speaks of various meningitides rather than one meningitis. When the surface of the brain is wounded by some object breaking through the skull, or a piece of broken bone of the skull, thrust inward by some blow, an artery is ruptured and the blood flows between the membranes. Such a condition is called traumatic meningeal hæmorrhage. When the dura mater becomes inflamed after a wound, or after inflammation of other parts of the head, as the ears, teeth, etc., there results a condition called pachymeningitis externa. Inflammation of the meninges, however, is generally confined to the pia mater and the arachnoid and is then called leptomeningitis. Pachymeningitis, inflammation alone or chiefly of the dura mater, may extend to the other membranes. Inflammation of the cerebral meninges is cerebral meningitis; of the spinal meninges, spinal meningitis; of those of the brain and spinal cord together, cerebro-spinal meningitis. Ascending meningitis is a meningitis ascending from the lower part of the spinal cord.

Pachymeningitis has one form involving the external surface of the dura mater and resulting from blows or other injuries, and from osseous growths. There may be no well-defined symptoms, but usually is local headache and tenderness on pressure. The onset is usually sudden. Many cases of meningitis of the type called "serous" are not other than pachymeningitis. If the dura mater, which is normally free, is bound to the skull by fibrous exudation, and especially if pus forms and hæmorrhages occur, there are symptoms of pressure. Inflammation of the internal portion

of the dura mater may result from the extension of inflammation from adjacent parts, such as the ear, the frontal or the ethmoidal sinus; or it may attend cases of pernicious anæmia, chronic syphilis, tuberculosis and chronic wasting diseases. It occurs chiefly in old age, but has been seen in children. There are fibrinous deposits and extravasation of blood in cysts (hæmatoma), and occasionally pus forms. The brain is anæmic, sometimes softened. The symptoms are those of irritation — convulsions, vomiting, dilated pupils which are not affected by exposure to light, a slow irregular pulse, etc.— and those of compression or pressure — coma, etc. Pachymeningitis is usually fatal.

Cerebral meningitis (simple or cerebral meningitis), in the acute form, is not common, and is most apt to occur in men engaged in hard mental pursuits. It may be caused by injuries, by sunstroke, by spirituous liquors, etc., and is very dangerous, death usually occurring in from three to eight days. The brain is reddened and covered more or less with pus and coagulated fibrin or lymph, and its superficial layer is softened. There is almost always watery effusion into the brain-cavities. The symptoms are those of three stages: (1) Headache; (2) delirium; (3) coma. At first there may be slight fever, some photophobia, frequency and irregularity of the pulse and some contraction of the pupils. There is a disposition to vomit, a slowness in movements of the bowels and often hyperæsthesia. Then comes delirium, which may or may not be active; the patient talks much and tries to get out of bed; does not obey readily. There is more or less trembling of the limbs, with difficulty in moving them. One pupil is likely to be dilated. Sometimes strabismus occurs; the pulse is very irregular; and paralysis begins. Then follows coma, loss of sense, sensation and of voluntary motion; there is sighing, the pulse is frequent and weak, the pupils do not respond readily to light and the capillaries of the skin and eye are congested. Recovery from this disease cannot occur after the period of coma begins.

Sub-acute or chronic cerebral meningitis is a secondary disease, sometimes associated with chronic syphilis, Bright's disease, alcoholism, etc., though the cause is not always ascertained. The lesions are similar to those of acute meningitis, but less pronounced. There is less of serum and pus, and the exudated fibrin is more circumscribed. The symptoms are insidious and vague. Headache, vomiting and photophobia are rare. The slight delirium is followed, it may be, by somnolency, irregular pulse, strabismus and sighing respiration. With coma the pulse is rapid, 120 or more, and the patient dies as in acute meningitis.

Tubercular meningistis, also known as acute hydrocephalous granular meningitis and basilar meningitis, is an acute tuberculous inflammation of the pia mater, caused by a deposit of miliary granules over the surface of the brain, but most numerous at the base, in the track of the cerebral vessels, and in their sheaths. There is a noticeable vascularity, especially in the ventricles. The pia mater is thickened and opaque and covered with a semi-purulent exudation. Serum fille the ventricles and formina, pressing upon the convolutions, and assists in softening portions of the brain. The lesions in this disease are rarely limited to the brain; tubercles are found in other organs, especially the lungs. The disease is a phase of that protean malady, tuberculosis, though the cerebral lesions may first be noticed. The primary causes are a hereditary diathesis (scrofulous or tuberculous), foci of caseous degeneration in some organ, a suppurating joint, or a scrofulous inflammation of bone. The physically weak children of tuberculous parents are most subject to this disease, and in cases where strong children are attacked there is generally found a tubercular relative. Though the disease is essentially a disease of early life (from nine months to 10 years), it also attacks adults. Most of those affected die in from two to six weeks. The symptoms may be classed under three heads: (1) Obscure symptoms; (2) those of rapid development; (3) those of coma. There are seen listlessness, loss of appetite, occasional vomiting, slowness of the bowels and somewhat frequent pulse. Sometimes there is headache, a remittent form of fever and then rapid development of diagnostic symptoms. The patient talks a good deal. One of the most important symptoms is a change in the disposition through which the child, although bright and lively before, suddenly becomes listless, or excessively emotional, a condition which may continue for several weeks. There are irregularity of the pupils and pulse, a sharp "cephalic" cry, severe headache, insensibility to light and sound, grinding of teeth, a flushed face in paroxysms, usually before convulsions, rolling and drawing back of head, urine scanty and high-colored, oscillation of the eyes, obstinate constipation, etc. With coma comes strabismus; the pupils do not contract under the influence of light, but will contract and expand when the bowels rumble or the patient is moved. There are convulsions, paralysis and automatic movements of the feet and hands, it may be for hours. The thumb may be turned in. There is a hollowed abdomen (boat-shaped) and congestion of the eyes, a puri form secretion sticking the eyelids together; involuntary discharge of bowels and bladder, are common. For treatment of this affection place patient in bed, in a quiet room; give easily digested food; apply an ice-cap to the head and warmth to the feet. Further treatment should be in the hands of a physician. Much can be done by parents and guardians to prevent the onset, by not developing the nervous system at the expense of the muscular and digestive systems. Precocious children are to be judiciously restrained, and outdoor life encouraged. Tuberculous meningitis in adults is commoner in men than in women, and most frequently occurs between 17 and 30. It is generally fatal in 2 to 14 days, about one in 200 cases recovering.

Spinal meningitis is not common; it is usually caused by injuries, is liable to occur in children with spina bifida and is rarely amenable to treatment. Death occurs usually in from 8 to 10 days, either from extension of inflammation to the brain and pressure there by fluid, or from asphxyia due to spasms of the respiratory muscles. The lesions are similar to those of cerebral meningitis. The chief symptoms are pain in the spine and extremities, increased by movements

of the body, great sensibility of the surface of the body, spasms of muscles, opisthotonos and dyspnœa.

Epidemic cerebro-spinal meningitis, or spotted fever, is due to a special micro-organism, the diplococcus intra-cellularis. Death frequently occurs in a few hours; recovery usually requires 30 or more days. The disease has spread over sections of this country two or three times, mainly in the winter and spring. The exact manner of its transmission is not known. One form is characterized by fever with no eruption; the other by fever and an eruption. The symptoms are a chill or chilliness, followed by nausea and vomiting, fever, violent headache, sometimes with pain down the spinal column, general hyperæsthesia, great prostration, vertigo, tetanic rigidity of muscles, irritability or apathy, delirium and other symptoms of meningeal irritation, followed more or less rapidly by those of coma. In the majority of patients if the head is raised when the patient is lying on his back, the knees are involuntarily flexed. When there is an eruption it usually appears early and consists of dark blotches, from the size of a pinhead to that of a nickel, and is not marked on the extremities.

Where death occurs within 12 hours from the time of attack only a congestion of blood-vessels of the brain and, it may be, of the spinal cord, is generally found. Almost always there is lymph or pus beneath the pia mater, and sometimes serous effusion in the pleura, pericardium or peritoneum. The blood undergoes a change, ecchymoses are found sometimes in the muscles, or in connection with the pericardium or pleura. This disease is best treated with a serum, which was first produced in the monkey but now is successfully derived from the horse. The serum is given in frequent doses depending on the severity of the case, from 12 to 24 hours apart; this treatment has reduced the mortality to 30 per cent. In the chronic variety serum therapy is of no avail; the application of cold to the head should depend upon the desires of the patient. Pain has to be reduced by morphine. Consult Jelliffe and White, 'Diseases of the Nervous System' (3d ed., 1917).

SMITH ELY JELLIFFE, M.D.

MENIPPUS, mĕ-nĭp'ŭs, Greek cynic philosopher, a native of Gadara in Palestine, and supposed to have flourished about 260 B.C. His writings were chiefly of a satirical kind. Lucian styles him "the most snarling of cynics," and in two or three of his dialogues introduces him as the vehicle of his own sarcasms. It appears that his satires were composed in verse and prose, on which account those of Varro were denominated Menippean, and for the same reason the name of Satire Ménippée was given in France to the celebrated piece written against the League and Philip II of Spain, its head. His writings are lost.

MENKEN, Adah Isaacs (originally DOLORES ADIOS FUERTES), American actress: b. near New Orleans, La., 15 June 1835; d. Paris, France, 10 Aug. 1868. Making her début with her sister as danseuses, at the New Orleans French Opera House, she was received with marked favor and visited Cuba, Texas and Mexico. On her return to New Orleans, she published a volume of verse and taught French and Latin at a girls' academy in the city. In 1858 she appeared in 'Fazio' in New Orleans, and went to England in 1863–64, assuming the rôle of Mazeppa at Astley's which won her popularity. On 30 Dec. 1866 she played in Paris for 100 nights, and later in Vienna and London. Her last appearance was in Paris in May 1868. She was famous for her fine form, and many marriages and divorces; Alexander I. Menken, John C. Heenan, J. H. Newell and James Barcley being her successive husbands. Her mind seems to have been as winning as her physical beauty, for among her friends were numbered Charles Reade, Dickens, Swinburne and the elder Dumas.

MENNO SIMONS, Dutch religious reformer: b. Witmarsum, Friesland, 1492; d. Oldesloe, Holstein, 19 Jan. 1559. He was ordained priest in the Roman Catholic Church and took pastoral work in the village of Pingium (1524), and from a study of the New Testament, undertaken (1530) to solve his doubts about transubstantiation, he was induced to become an evangelical preacher and finally left the church of his ordination. The martyrdom of Sicke Snyder at Leeuwarden for Anabaptism impelled him to consider the Scriptural grounds for infant baptism. He was finally converted to the cause of the Anabaptists, but never sympathized with the excesses of Münzer and wrote a diatribe against John of Leyden (1535). In 1537 at the request of a number of Anabaptists of Groningen he assumed the functions of an Anabaptist preacher and exercised, by his moderation, a most salutary influence on his fellow-ministers. He now married, his change in faith having superseded his vow of celibacy, and began to travel as an evangelist not only in Friesland but throughout Holland and Germany as far as to Livonia. Being persecuted from place to place he finally settled in Oldesloe in Holstein, where he closed his ministry with the consciousness of having founded a large and flourishing sect, whose subsequent history is related under the title Mennonites (q.v.)

Views of Menno Simons.— Menno was rather a preacher of a system of personal sanctity than either a dogmatist or a violent fanatic like some of the Anabaptists. He was a man of pure moral and devotional enthusiasm, whose account of his own conversion reads like a passage from the 'Confessions' of Augustine. He sums up the results of his labors as consisting in the conversion and recovery of the wicked. Yet he formulated a somewhat vague profession of faith. He believed in the divinity of Christ, who was born on earth *in* Mary, that is without taking upon him human flesh and blood. He rejected infant baptism, and baptized those only who made a personal profession of faith in Christ. He particularly emphasized the power of excommunication possessed by the Church, without which "the spiritual Kingdom of God on earth cannot," he said, "exist in purity and piety." He believed in the coming millennium (q.v.); he excluded civil magistrates from church membership on the ground that the church was a theocracy whose magistrates were the ministers. He declared that war and all taking and administering of oaths were unlawful, and re-

garded human science as useless, even pernicious to a Christian. These decrees, however, as modified by the explanations of Menno, differed little from those generally promulgated by the Reformed bodies of his day. His principal teaching was of a moral and practical character. He was a meek, humble, noble-minded man, carried away with the spirit of his times, encouraging all that was good and pure among his followers, and sternly rebuking the guilty. The best edition of his work is 'Opera Omnia Theologica of al de Godgeleerde werken vann Menno 'Simonis' (1681). Consult Harder, 'Leben Menno Simons' (1846); Roosen, 'Menno Simons den evangelischen Mennonitengemeinden geschildert' (1848).

MENNONITES, a body consisting of a dozen or more branches of followers of Menno Simons, akin to Baptists in faith and practice: Menno Simons (1492–1559), a Holland Anabaptist, was not the founder of the body that bears his name, but was a convert to it several years after it began, and became its chief leader and author. He early left the priesthood of the Roman Catholic Church, espousing the views of the Anabaptists, but opposing the fanatical extremists of Münster. His books were his chief contribution to the movement, which really grew out of the division of Protestantism which is called by the name Anabaptist. The Anabaptists were opposed to the baptism of infants, baptizing only on confession of faith. The followers of Menno Simons became numerous in Holland, Germany and Switzerland, and thousands were persecuted to death, particularly in Holland, because of their views in regard to the temporal power. Rising in the first half of the 16th century (they were first called Mennonites in 1550, though the name was never generally adopted in Europe as it was in America) they increased under persecution and emigrated to Russia and the United States to escape it — to the former country near the close of the 18th century and to the latter from 1640 on, coming from Holland, and Germany to New York and New Jersey. They were drawn to Pennsylvania by William Penn's announcement that those settling in that colony would enjoy freedom in the practice of their religious faith. The Society of Friends in England assisted the Mennonites of Holland to emigrate. The first Mennonite colony was formed at Germantown, near Philadelphia, in 1683. Thence they spread to Lancaster, Bucks, Berks and other counties in Pennsylvania and from that State to other States and to the Canadian provinces. They came in constant contact, in colonial and post-colonial days, with the Indians, but like the Friends, being opposed to bearing arms and inclined to peace they suffered little from attacks by the savages. It is worthy of note that a Mennonite meeting at Germantown as early as 1688 adopted a protest against the traffic in slaves, saying that those "who steal or rob men and those who buy or purchase them" are all alike.

Though Mennonites are widely divided among themselves on questions of practice and principle, they are in substantial agreement in holding doctrines of the evangelical type, as expressed in a declaration of faith adopted at Dort, Holland, in 1632, which confession is generally accepted by the Mennonites of America. They adhere to the principles of autonomy of the churches, freedom of conscience, separation of church and state, adult baptism, non-resistance and practical piety. Baptism is administered on confession of faith, not by immersion, but by pouring, the candidate either kneeling or standing in water and the minister taking up water in both hands and pouring it upon the head, using the scriptural formula. In the ministry there are bishops, or elders, ministers, who are pastors or evangelists, and deacons, who are almoners and assist in administering the ordinances and take charge of congregations in the absence of bishop or minister. Ministers are selected by members of the church, who go one by one to a private room for the purpose. If more than one are thus selected choice between them is made by lot. A bishop has charge of all the churches in his particular district and ordains the ministers and deacons. He is selected in like manner as ministers and deacons. The Lord's Supper is observed twice a year, in the spring and in the fall, preceded by an examination of each member in faith and standing, and followed by the ceremony of feet-washing and the kiss of peace, the sexes separating for this purpose.

Mennonites are opposed to the judicial oath and many practise non-conformity to the world. Their polity provides for the autonomy of the churches, but appeals are taken to the conference. Decisions of conference are submitted to the churches for approval.

The 12 or more branches in America differ so little in some instances that it is difficult to distinguish between them except by name. The census of 1916 reports three bodies in the group not in existence, or not known, in 1906. The distinctive bodies are: (1) Mennonite Church; (2) Conservative Amish; (3) Old Order Amish; (4) Church of God in Christ; (5) Old Order Mennonite (Wisler); (6) Reformed Mennonite; (7) General Conference of Mennonites; (8) Defenceless Mennonites; (9) Mennonite Brethren in Christ; (10) Mennonite Brethren Church; (11) Krimmer Brueder Gemeinde; (12) Hutterian Brethren. There are besides small unattached bodies which may be grouped as miscellaneous, including the Kleine Gemeinde, Stauffer Mennonites, etc.

A historical distinction, which also marks a difference in doctrinal position, may be traced between two European groups and through their descendants in America: (1) Those of Holland, Switzerland and northwestern Germany, and (2) those of Prussia, North Germany and Russia. These emigrated from Holland and used the Dutch tongue until after the middle of the 18th century, when they adopted the German which they still employ. They are of the orthodox type. The first group became liberal or rationalistic and are not in fellowship with the representatives of the second group.

1. Mennonite Church.— This is the largest and oldest body of this faith in America. It is descended from the colony which settled in Germantown. In tendency it occupies middle ground between the stricter and the more liberal schools. Since 1896 it has had a biennial General Conference, composed of dele-

gates elected by the State conferences. The Amish body is represented in this conference — the two churches are practically one — and cooperates in the conduct of the general missionary, educational and benevolent work. The board of missions has missionaries in India and in America, with a department of city missions. The chief educational institution is at Goshen, Ind. Two unincorporated organizations help members who sustain losses by fire, storm, etc., one for Mennonites and Amish, the other for Mennonites and Old Mennonites. The property listed for this purpose aggregates more than $12,000,000. The Mennonite Church is growing in numbers. In 1906 it returned, according to the government census, 18,674 members; in 1916 that number had almost doubled — 34,965. There are 509 ministers and 307 churches in the Middle Western and a few of the Southern States, by far the larger number being in Pennsylvania. *The Mennonite,* of Berne, Ind., is the weekly organ of the denomination in English. There is also a German weekly at the same place.

2. Conservative Amish Mennonite Church. — This is a small body of the Amish type, with only one conference, 14 churches, 30 ministers and 1,066 members, census of 1916. The Amish Mennonites date from 1690, separating from the Mennonites in Switzerland and Alsace on account of their laxness of discipline. The name is derived from Jacob Ammon or Amen, who insisted that the doctrines set forth in the Dort Confession of Faith should be interpreted literally and accepted strictly. In late years this strictness has been relaxed and the main body of Amish is practically reunited with the Old Mennonites in the Mennonite Church.

3. Old Order Amish Mennonite Church. — This body represents the stricter descendants of Jacob Amen and the Swiss Amish of the 18th century. While the main body of Amish were approaching agreement with the main body of Mennonites, the stricter wing were holding the older position resulting in the organization in 1865 of the Old Order Church. This body is opposed to building churches, holding that one place is as sacred as any other and that separate church buildings savor of ritualism. They therefore hold their meetings in private houses, which necessarily makes their congregations small. A Sunday service usually continues about four hours, and is exclusively in German. They use the old hymnal, *Ausbund,* first published for the Swiss brethren in 1571 and reprinted many times in America. The tunes supposed to be the original have never been committed to musical notation and of course never printed. The sermon is without text, and traces God's dealing with the race from Adam down, setting forth the sinfulness of sin and God's love and care for his obedient children. On communion Sundays services are continued from morning till night without intermission, several ministers being in attendance to keep them going. There is no church property, except hymnbooks, plain benches and utensils necessary to the preparation of a plain dinner. Houses and clothing of families, who observe a sort of community life, are very plain, carpets, curtains and wall pictures being forbidden. They have a few Sunday schools and no missionary or benevolent societies, schools or periodicals. They use the ban in discipline, following the example of the original Amish, who in some cases use the extreme penalty of separation of husband and wife. The person against whom the ban was pronounced was cut off from social and family intercourse with all members of the church and was treated as an outcast. The census of 1916 credits the Old Order Amish Church with 7,893 members, an increase of nearly 3,000 in 10 years, 90 churches and 253 Ministers.

4. Church of God in Christ.—A small body of reformers, led by John Holdeman who insisted that the Mennonite Church had forsaken its original foundations. It originated in Ohio in 1859. Holdeman revived the ban as formerly observed in Europe. The body had subsequently considerable accessions of Russian Mennonites, under whose influence the stricter views were gradually relaxed. The census of 1916 credits this body with 17 ministers, 21 churches, and 1,125 members. There has been little change in the first two items since 1906 but the number of members was doubled.

5. Old Order Mennonite Church (Wisler). — Jacob Wisler led a movement in opposition to innovations, such as revival meetings, Sunday schools, etc., which resulted in the organization, in 1870, of the Old Order Church. Other small bodies in Canada, Virginia and elsewhere, which occupied a similar position, joined with the Wisler movement, which holds strictly to the Dort Confession of Faith. The Church has 32 ministers, 22 churches and 1,600 members (census of 1916), each item indicating an advance since 1906.

6. Reformed Mennonite Church.— This branch is also the result of a reform movement toward stricter regard for doctrine and discipline, led by Francis Herr and his son John. The Herrites have no fellowship whatever with other churches, and conduct no Sunday schools or missions. They are decreasing in number. In 1916 they had 26 ministers, 25 churches and 1,281 members, mostly in Pennsylvania.

7. General Conference of Mennonites in North America.— An attempt to unite various Mennonite bodies holding practically the same doctrinal views and observing the same practices, resulted in a general conference in Iowa in 1860, and the organization of this body. Groups of Russian and German churches subsequently joined with it. It is active in missionary and educational work. There are boards of home missions, of foreign missions, of publication, of education and of emergency relief. Three colleges are maintained at Newton, Kan., Bluffton, Ohio, and Freeman, S. D. Several periodicals, including *The Mennonite* weekly, are published at Berne, Ind. The General Conference accepts the Dort Confession, but does not observe the foot-washing ceremony in connection with the Lord's Supper, nor does it require the women to have a head covering during prayers and worship. Its platform of union is acceptance of the Dort Confession, salvation by grace through faith in Christ, baptism on confession of faith, refusal to take oaths, peace, non-resistance and practice of scriptural discipline. The General Conference, which is gaining in numbers, has, according to the census of 1916, 194 ministers, 117 churches and 15,407 members.

8. Mennonite Brethren in Christ.— This branch grew out of an evangelistic effort in Pennsylvania, in 1853. The first conference was formed in 1858. The movement spread and three groups came into existence, which united in 1879; subsequently other groups joined the body which took its present form and name in 1883. There is a general conference which meets every four years, and five district conferences in the United States and two in Canada. A weekly newspaper, *The Gospel Banner,* is published in New Carlisle, Ohio. The General Conference has 95 ministers, 110 churches and 4,737 members.

9. Defenceless Mennonite Church.— A small body of 854 members, which insists upon a definite experience of conversion, organized under the leadership of Henry Egli, in 1860, an offshoot of the Amish branch. It has a mission in Africa and is akin to the conference of Defenceless Mennonites known, until recently, as the Minnesota and Nebraska Conference of Mennonites and now affiliating with the Mennonite Church. (See 1. *Mennonite Church, supra.*)

10. Mennonite Brethren Church.— This body, which was not reported by the census of 1906, has three district conferences in the United States and one in Canada. It conducts home and foreign missions and has a college at Hillsboro, Kan., where it publishes the *Zion's Bote.* The census of 1916 gives this church 81 ministers, 53 churches and 5,127 members.

11. Krimmer Brueder Gemeinde.—A union of two bodies of Brueder Gemeinde, which came originally from Russia, where they separated from the main body of Mennonites, because they were thought to be lax in religious life and discipline. They differ from other Mennonites in baptizing by immersion and not by pouring, and they formerly differed among themselves as to the mode, one group baptizing with a forward, the other with a backward movement. There are 894 members, with 34 ministers and 13 churches.

12. Hutterian Brethren.— These are descendants of the Hutter Brethren of South Russia. Their leader was Jacob Hutter who was burned at the stake at Innsbruck, in the Tyrol, in 1536. The Hutterian Brethren are not strictly Mennonites, but agree with them and are so classed. They formerly observed community life in South Dakota, and have sometimes been called Bruederhoef Mennonites. They have (census of 1916) 982 members, with 32 ministers and 17 churches.

The *Kleine Gemeinde,* the *Stauffer Mennonites* and the *Central Conference* are small groups, differing in minor particulars among themselves and from other Mennonite bodies. They aggregate about 2,500 members. The grand total of Mennonite bodies, according to the census of 1916, is as follows: 1,398 ministers, 840 churches and 79,591 members. The increase in 10 years was nearly 25,000 members.

Author of 'Religious Forces in the United States,' etc.

MENOBRANCHUS, an alternative designation of *Necturus.* See PROTEIDÆ.

MENOCAL, Aniceto Garcia, American civil engineer: b. Cuba, 1 Sept. 1836; d. 20 July 1908. He was educated in Havana and was graduated from the Rensselaer Polytechnic Institute in 1862. In 1863-69 he was engaged as sub-chief engineer of the Havana waterworks and in 1870 returned to New York, where he was two years in the engineering of the waterworks department. He was chief engineer of all the surveys made for the Isthmian Canal by the United States government and was sent to Paris in 1879 as member of the Canal Congress. He furnished the estimates of the cost of the canal and was a member of the boards for selecting coaling stations in the Philippines, Porto Rico and on the coast of Liberia, Africa. He was a member of several scientific societies and published many of his official reports, etc.

MENOMINEE, the French FOLLES AVOINES, a tribe of North American Indians of Algonquian stock, formerly known in upper Michigan and Wisconsin, along the Menominee River and Green Bay, and ranging west to the Mississippi and south to the Fox River. Their name signifying "wild-rice men," hence the French translation is derived from their use as a staple food of the abundant wild rice of the region. Their descendants numbering about 1,400, civilized and Roman Catholics, inhabit Green Bay Reservation, Wisconsin. Consult Hoffman, J. W., 'The Menominee' (in Bureau of American Ethnology, 14th Annual Report, Washington, 1896).

MENOMINEE, mē nŏm'ĭ-nē, Mich., city, county-seat of Menominee County, at the mouth of Menominee River, on Green Bay, and on the Chicago, Milwaukee and Saint Paul, the Wisconsin and Missouri and the Chicago and Northwestern railroads, opposite Marinette (q.v.), at the southern point of the Northern Peninsula, and about 46 miles northeast of the city of Green Bay, Wis. The first settlement was made in 1799 by Louis Chappieu, a French fur trader. The first lumber mill was built in 1832, but the town was not incorporated until 1883. It is situated in an extensive lumbering region, and it is one of the largest lumber-shipping ports on the Great Lakes. Its chief industries are connected with the lumbering interests, and its great sawmills have an annual capacity of 275,000,000 feet. The principal manufactures are lumber in all forms, paper, shoes, boxes, machinery, telephones, steam-boilers, beet-sugar, electrical machinery, auto trucks and lumbering camp outfits. The city has an agricultural college, a fine high school, public and parish schools and a public library which contains about 5,000 volumes. It has Saint Joseph's Hospital, the county buildings and several fine churches. The government is vested in a mayor and council elected annually. The city treasurer and the justice of the peace are elected by the people; the other adminis-

trative officers are chosen by the mayor and council. Pop. 10,507.

MENOMINEE RANGE. See IRON ORE, *Iron Ore Districts.*

MENOMONIE, Wis., city, county-seat of Dunn County, on the Red Cedar River, and on the Chicago, Saint Paul, Missouri and Ohio and the Chicago, Milwaukee and Saint Paul railroads, about 65 miles east of Saint Paul, Minn. It is in an agricultural region and near the lumber section of the State. The chief manufactures are lumber, wagons, carriages, machinery, foundry products, bricks, pianos and flour. The trade is principally in lumber, pianos, flour, brick, Menomonie is the seat of the Stout Institute, a State institution for the teaching of trades and for the preparation of teachers of industrial arts and household arts. It has a county training school for the preparation of rural school teachers, and a County Agricultural School. It has the Mabel Tainter Memorial Library, which contains about 18,000 volumes. The Dunn County Asylum is near, but just outside the city limits. Pop. 5,036.

MENOPAUSE, the cessation of menstrual flow in women; climacteric. This epoch is reached generally between the 45th and 52d years, and is frequently marked by nervous disturbances. The power of child-bearing terminates at the menopause. It is popularly termed the "change of life." A woman who begins child-bearing early and gives birth to a large family usually has her menopause earlier than a childless woman. The approach of the menopause is marked by irregular — usually delayed — menstruation, and sometimes the latter flows are very profuse and weakening. See CLIMACTERIC; MENSTRUATION, DISORDERS OF.

MENOPOME, a giant salamander of the genus *Cryptobranchus* (formerly (*Menopoma*). See HELLBENDER.

MENPES, Mortimer, English artist: b. Adelaide, South Australia, 1859. He went to London when 19, studied at South Kensington; spent three years in Brittany at Pont Aven; traveled in Japan, where he learned something from Kyosai, in India, Burma and Cashmere, then through southern Europe and Mexico; and wherever he went continued his early experiments in color and his attempts to reproduce the atmosphere of various localities. Originally he used the color as dry as possible, then mixed it with petroleum and finally used poppy-oil as a medium. He revived the lost art of printing in color from etched plates; made some excellent dry paint etchings, notably one of Hals' 'Archers of Saint Adrian,' and published several volumes of pictures. His English house was made in the East, and is a wonderful piece of Oriental workmanship in gold and black. He has published 'World Pictures' (1902); 'Whistler as I Knew Him' (1904); 'India' (1905); 'Sir Henry Irving' (1906).

MENSA, or MONS, *in astronomy,* one of the 14 constellations which Lacaille discovered at the Cape of Good Hope. It is named from the mountain which is a conspicuous feature of the landscape at the Cape. The constellation is a very inconspicuous one near the South Pole, its brightest star being only of 5.3 magnitude.

MENSTRUATION, the periodical discharge of the menses or bloody fluid from the female generative organs. In women it normally occurs at intervals of one lunar month, or 13 times a year (hence the use of the term *menses,* Latin plural of *mensis,* month). Its first appearance marks the stage of puberty, and is usually attended by definite changes — enlargement of the breasts, showing development of the mammary glands, growth of the ovaries, of the uterus and external genital organs, etc., and by other signs, physical and mental, of approaching womanhood and maturity. It usually begins in temperate climes between the 13th and 15th year; in hot climates it is apt to commence as young as 12 years, and in very cold climates as late as 17 years; its periodic recurrences continue until the menopause (q.v.) or final cessation of the discharge, which ordinarily arrives somewhere between the 45th and 52d years. The recurrent periods of its appearance, as well as their duration, vary with different females, and not infrequently in the same individual; the variations, however, not always indicating abnormal or pathological causes. The immediate cause of menstruation is the breaking away of an ovum or egg from one of the ovaries. (See OVARY.) Menstruation is often at first, and in many persons throughout the catamenial age, attended by characteristic pains and symptoms, with physiological and psychological conditions of disturbance or depression, which sometimes call for special hygienic treatment. During pregnancy (with exceptional cases) there is no menstrual flow, its cessation being one of the earliest signs of conception. Observance of wholesome rules of exercise, rest, etc., helps to maintain normal conditions of body and mind, the reverse of which, owing to neglect of such rules, so often makes the menstrual function a visitation of dread and distress.

Disorders of Menstruation. — These include amenorrhœa, dysmenorrhœa, menorrhagia and metrorrhagia. Amenorrhea is an absence of the menstrual flow from some cause other than pregnancy or the approach of the menopause (q.v.) or tardy establishment of the menstrual function. It is a symptom of anæmia (q.v.), or may be due to a constitutional condition such as profound nerve-fag or tuberculosis. Strychnine, iron and ergot may be administered internally, or the physician may apply local treatment. (See DYSMENORRHŒA). Menorrhagia is an abnormally profuse flow during the menstrual period, due to one of several conditions. If not checked by rest, a physician is necessary, as also in metrorrhagia, which is a sanguineous flow between the menstrual periods.

MENSURAL MUSIC. Mensural or measured music is a term applied to a historical style of composition in which the tones bore exact relations to each other in regard to length or time. Such a designation and the occasion for it may appear strange, as precise rhythm seems to belong to the essence of music. This, however, is not the case: there was a period when notes were not exactly measured, and mensural music is a subsequent development from this early practice.

All European music of a higher character

was originally cultivated in connection with speech or poetry. This is true of the music of the Greeks as well as the early Christians. But speech is not necessarily rhythmical. Ordinary speech is not so at all, and even poetry is not always characterized by the exact time relations typical of strictly measured music. A trochee can be delivered either in two or three part time, the accented syllable matching the unaccented in duration or requiring double as much time. And in impassioned utterance rhythmical relations are apt to be lost sight of altogether. Moreover, any rhythm which the accompanying tones may possess would be theirs only by virtue of the words to which they are added: it would be a rhythm of the poetry, not of the music.

Such was the case in Greek music. Although instrumental performances were also in vogue among the Greeks, music with them, as we have said, was primarily vocal. We know little of its exact character, but are probably justified in regarding it as a species of recitative, the words guiding the course of the tones. In Christian times the earliest fixed type of the art was the Ambrosian chant, formulated by Saint Ambrose of Milan in the 4th century. This, too, was similar to Greek music in its adherence to the rhythm of the words. A change was wrought by Pope Gregory the Great, two centuries later. What distinguishes his chant from the Ambrosian is supposed to be the uniform length of its tones, giving it a character similar to that of our choral. However, this is probably true only in part. According to the historian Ambros, the sections of the chant which were sung by many voices may have been measured and regular, but the utterances of the priest must have retained much rhythmical variety. The real difference is formulated by him as follows: "The Ambrosian chant was based essentially on the poetical metre, the Gregorian on the musical." Whatever the exact nature of the difference, however, there is no doubt that Gregory effected a liberation of the tones from the rhythmical shackles of the words. And this was a gain of far-reaching importance. Music had now won its independence, and the way was prepared for the development of mensural composition.

The more immediate occasion for this development was the introduction of harmony. Just as music had primarily been vocal, so also it had been unisonal in character. Though a second tone may occasionally have been added to the principal part, nothing like the later polyphony was attempted. In the 9th century, however, the so-called Organum of Hucbald makes its appearance. In this the theme is systematically accompanied by one, two or three other voices, singing intervals of a fourth, fifth and octave in parallel motion. The point was now reached beyond which no further advance was possible without an exact designation of the length of the notes. As long as the singing had been confined to a single person this was not necessary. Nor was it necessary in the case of several persons chanting in unison, if the length of the notes was regulated by the natural accent of the words, or if all the tones were of equal length. In the Organum, however, a certain care was already required. The singers had to stand so that they could see as well as hear each other, and one among them acted as leader, introducing the new notes at the proper moment. The Organum now developed in various directions. There was a more independent progression of parts, contrary alternating with parallel motion, and the tones no longer coincided with each other note for note, but one voice sang two or more tones while the other sang one. Manifestly this required an understanding as to the relative duration of the tones, and a method of designating the differences graphically. The first person to formulate the solution of this problem was Franco of Cologne, who lived about the year 1200. Previous to him tones of two lengths, the longa and brevis, had already been recognized. He also admitted the duplex longa or maxima,— twice as long as the longa, and the semi-brevis,— half as long as the brevis. The notes in question were represented as follows:

maxima longa brevis semi-brevis

Rests were also indicated by Franco, by means of appropriate signs. The bar-line was not yet in use, but measure was recognized, being at first confined to triple or "perfect" time. Duple or "imperfect" time was only permitted at a later date.

There were many complexities in the system as promulgated by Franco and his followers. Thus the length of the notes was not only determined by their own character and appearance, but also depended on the neighboring notes. There were "alterations" and "imperfections," "prolations" and "ligatures," but space will not permit us to enter into all these involved details, which have only a remote historical interest. The rules governing mensural music were further elaborated — among other writers — by Marchettus of Padua, who lived about a century after Franco; and Jean de Muris, a celebrated theoretician of the 14th century. Notes of shorter duration were gradually introduced, such as the minima, semiminima, fusa and semi-fusa. And the notation too was modified, until it finally assumed the appearance to which we are accustomed to-day. Together with the Organum, mensural music furnished the basis for all subsequent advances in the art. It was the indispensable prerequisite for the growth of rhythmical and contrapuntal variety. It made possible the wonderful development in part writing which was soon to take place in the Netherlands, and which was eventually to lead to the glories of modern instrumental and choral music. In fine, it may be regarded as one of the two or three great elementary contributions to the art, on which the dazzling superstructure of modern beauty and inspiration has been erected.

ALBERT GEHRING,
Author of 'The Basis of Musical Pleasure,' etc.

MENSURATION. Mensuration is that branch of applied mathematics which treats of the metrical relations of geometric figures, in particular of the length of lines, the magnitude of plane and solid angles, the area of surfaces and the volume of solids. The term is used both for the act and for the art of measuring geometric magnitudes. Mensuration is not usually treated as a separate branch of mathe-

matics, but occurs as an integral part of various subjects, such as plane geometry, solid geometry, trigonometry and integral calculus. For a discussion of the measurement of plane, diedral, spherical and solid angles and of the relations between the sides and angles of a triangle (plane or spherical) the reader is referred to the article on TRIGONOMETRY. The present article will give formulas for lengths, areas and volumes of the simpler and the regular figures and methods of approximation for the more complex or irregular figures.

The measure of a geometric magnitude is its ratio to a fixed magnitude of the same kind selected as the unit of measurement. Throughout this article the unit of area is assumed to be a square each side of which is equal to the unit of length, and the unit of volume is a cube whose edges are likewise of unit length. The purpose of a formula is to show how one of these numbers (ratios) may be found from certain others which are supposed to be known or obtainable. Thus formula (XIX) says that the ratio of the area of a circle to that of a square each side of which is a foot long (that is, the area of the circle measured in square feet) may be obtained by multiplying together the ratio of the circumference to the unit of length known as a foot, the ratio of the radius to the same unit of length, and the number ½. It is important to recognize that in using any formula the units must all be of the same system. The number of acres in a field cannot be found directly from formula (X) by multiplying together the number of rods in two adjacent sides: this would give the number of square rods in the field. Nor is the number of gallons in a barrel given by formula (LXV) when the radii are measured in feet or in inches, but the number of cubic feet or cubic inches, as the case may be. In order to change any measure from one system of units to another the following table may be found useful:

To change		Multiply by	Inverse
in.	to cm......	2.53998	.393704
ft.	to m.......	.304797	3.28087
miles	to km......	1.60933	.621377
sq. in.	to sq. cm...	6.45148	.155003
sq. ft.	to sq. m....	.0929013	10.7641
sq. ft.	to acres....	.0000229568	43560.
sq. yds.	to acres....	.000206612	4840.
sq. miles	to acres....	640.	.0015625
cu. in.	to cu. cm...	16.3866	.0610254
cu. ft.	to litres....	28.3161	.0353156
cu. in.	to gallons...	.004329	231.
cu. cm.	to gallons...	.000264184	3785.238

[in.= inches, ft.= feet, yds.= yards, sq.= square, cu.= cubic, m.= meters, cm.= centimeters, km.= kilometers].

(For other multipliers see WEIGHTS AND MEASURES). The second column of figures serves to change the unit in the opposite way to that indicated by the rest of the table: thus to change meters to feet multiply the number of meters by 3.28087; for instance, 10 meters is equal to 32.8087 feet.

In many cases the computation of area or of volume may be accomplished most easily by mechanical means. For the measurement of the area of plane figures ingenious and effective instruments known as planimeters have been invented. Two historic instances are the finding by Galileo of an approximate value for the area of a cycloid by cutting it out of a sheet of copper and weighing the model, and the discovery by Archimedes of a fraud in Hiero's new crown through measuring its volume by submersing it in water and measuring the water displaced. To apply this last method, multiply the number of ounces of water by 1.73, or less accurately by $\frac{7}{4}$, and the result will be the number of cubic inches in the object; or, measure directly the volume of the water displaced.

LENGTH OF LINES.

Circle.—The *circumference* of a circle is equal to the diameter multiplied by

3.14159265358979323846264338328 ......

This constant is usually denoted by the Greek letter π (pī) and is approximately equal to

$$3\tfrac{1}{7},\quad \tfrac{355}{113},\quad \text{or}\quad 3.1416.$$

Use the first if an error of one two-thousandth of the final result may be neglected, and the last if an error of one four-hundred-thousandth is negligible.

The above theorem may be written

$$l=\pi d,$$
$$=2\pi r, \qquad \text{(I)}$$

where l = length of circumference, d = diameter and r = radius.

The length l of the arc AMB in Fig. 1, in which MD is the perpendicular at the middle point of the chord AB, AE is tangent to the circle at A or perpendicular to the radius OA, OE is perpendicular to AM, the chord of half the arc or the angle AOE is one-fourth of the angle AOB, may be found by any one of the formulas

$$l=\frac{\pi}{180}dr,\quad \frac{\pi}{180}=\frac{1}{57} \quad \text{(error about [illegible])} \qquad \text{(II)}$$

$$l=c+\frac{8}{3}\frac{h^2}{c}, \qquad \text{(III)}$$

$$l=2k+\tfrac{1}{3}(2k-c), \qquad \text{(IV)}$$
$$=\tfrac{1}{3}(8k-c),$$

$$l=t+s, \qquad \text{(V)}$$

in which d = number of degrees in the angle AOB, r = radius OA, c = chord AB, h = height MD, k = chord of half the arc AM, t = length

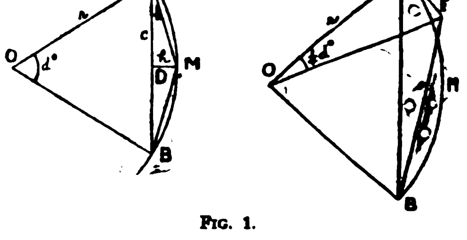

FIG. 1.

of AE, and s = length of BE. Formulas (III), (IV) and (V) are only approximate, the error being small only if the angle AOB or the ratio of h to c be small. Thus for an angle of d=90° the arc is 1.5708 . . . , whereas formulas (III), (IV) and (V) give 1.576 . . , 1.5696 . . , 1.5732 . . , respectively.

Parabola.—The length l of the arc AVB of the parabola in Fig. 2 is

$$l=\sqrt{y^2+4x^2}+\frac{y^2}{2x}\left(\log\frac{2x+\sqrt{y^2+4x^2}}{y}\right)\ldots, \quad \text{(VI)}$$

where $x=VD$, $y=AD$, and the logarithm is taken to the base e.

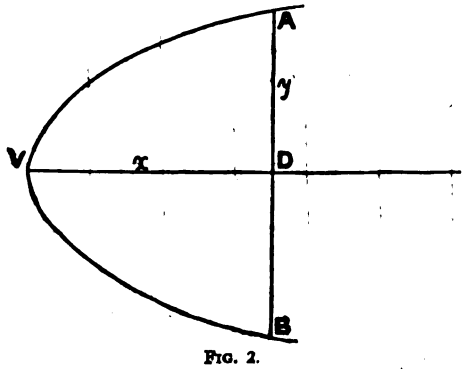

Fig. 2.

Ellipse.—The length l of the circumference $ABA'B'$ of ellipse in the next figure (Fig. 3), in which F and F' are the foci ($BF=BF'=OA$), is

$$l=2\pi a\left(1-\tfrac{1}{4}e^2-\tfrac{3}{64}e^4-\tfrac{5}{256}e^6\ldots\right), \quad \text{(VII)}$$

or approximately

$$l=\pi\sqrt{2(a^2+b^2)} \quad \text{(VIII)}$$
$$=4.443d;$$

where e is the eccentricity $\left(OF/OA=\frac{1}{a}\sqrt{a^2-b^2}\right)$; $a=OA$, one-half the longest diameter; $b=OB$, one-half the shortest diameter; $d=AB=\sqrt{a^2+b^2}$.

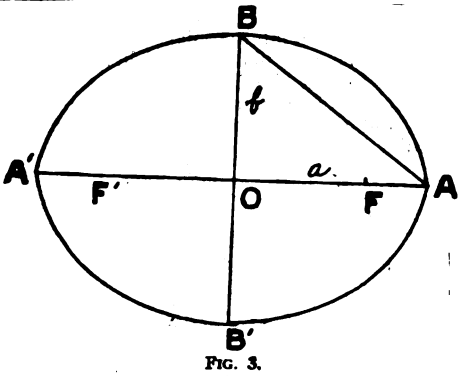

Fig. 3.

General Methods of Approximating the Length of Any Curved Line.—Divide the line into parts each of which differs but little

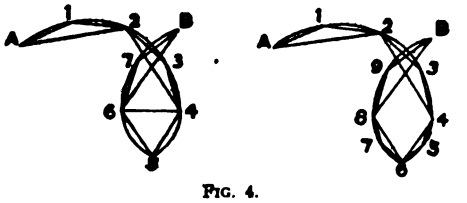

Fig. 4.

from a small circular arc. Then each portion may be found by any one of the formulas (III), (IV) or (V). A convenient method for the use of formula (IV) is indicated by the diagram herewith (Fig. 4) and formula (IX). The only restrictions upon the location of the points 1, 2, 3, 4, . . . in addition to that given above is that the odd-numbered ones must be half-way between the others and that there should be an odd number of points in all.

$$l=(\overline{A1}+\overline{12}+\overline{23}+\ldots)+\tfrac{1}{3}[(\overline{A1}+\overline{12}+\overline{23}+\ldots)-(\overline{A2}+\overline{24}+\overline{46}+\ldots)]. \quad \text{(IX)}$$

Area of Plane Figures.

Rectangle.—The area a of a rectangle, the lengths of two adjacent sides of which are b and c respectively, is

$$a=bc. \quad \text{(X)}$$

Triangle.—The area a of the triangle ABC (Fig. 5) is

$$a=\tfrac{1}{2}hb, \quad \text{(XI)}$$

$$a=\tfrac{1}{2}bc\sin A, \quad \text{(XII)}$$

$$a=\sqrt{s(s-a')(s-b)(s-c)}, \quad \text{(XIII)}$$

or

$$a=\tfrac{1}{2}b^2\frac{\sin A\cdot\sin C}{\sin(A+C)}; \quad \text{(XIV)}$$

where a', b, c are the lengths of the sides BC, CA, AB, respectively; h is the perpendicular distance (height) of B from AC; s is one-half of the sum of the sides: $s=\frac{1}{2}(a'+b+c)$.

If one angle of the triangle (say A) is a right angle, both formulas (XI) and (XII) simplify: namely, the era is one-half the product of the two sides which enclose the right angle ($a=\frac{1}{2}bc$). For a simple method of finding the area of an equilateral triangle. ($a'=b=c$) multiply the square on one side by $\frac{13}{20}$ ($a=\frac{13}{20}b^2$, approximately), see formula (XVIII).

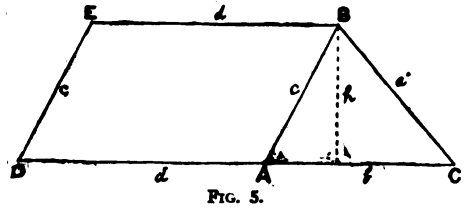

Fig. 5.

Parallelogram.—The area a of the parallelogram $ABED$ (Fig. 5) is

$$a=d\,.\,h, \quad \text{(XV)}$$

or

$$a=cd\sin D, \quad \text{(XVI)}$$

where c and d are the lengths of two adjacent sides, D is the angle between them, and h is the perpendicular distance between the two parallel sides whose length is d.

Trapezoid.—The area a of the trapezoid $CBED$ (Fig. 5), any four-sided figure with two of the opposite sides (BE and DC) parallel, is

$$a=\tfrac{1}{2}h(d+e), \quad \text{(XVII)}$$

where h is the perpendicular distance between the two parallel sides and d and e are the lengths of the parallel sides ($d=BE$, $e=DC$).

Regular Polygon.—The area a of a polygon bounded by n equal sides each of length s and having its n angles all equal is

$$a=s^2\times\frac{n\cot\frac{180^\circ}{n}}{4}. \quad \text{(XVIII)}$$

The following table gives (approximately) the value of the multiplier in the simpler cases:

NAME	n	$\frac{n \cot \frac{180°}{n}}{4}$
Triangle	3	.433013
Square	4	1.
Pentagon	5	1.72048
Hexagon	6	2.59808
Heptagon	7	3.63391
Octagon	8	4.82843
Nonagon	9	6.18182
Decagon	10	7.69421
Undecagon	11	9.36564
Dodecagon	12	11.19615

Thus, for instance, if the side of a regular hexagon be 9 feet, its area is $81 \times 2.59808 = 210.4445$.

Irregular Polygon.— The area of an irregular polygon may be found by dividing it into parts each of which is a triangle, parallelogram, rectangle or trapezoid. Thus if we draw a system of parallel lines across the polygon, one through each vertex, each part will be a triangle or trapezoid and its area may be found by formulas (XI) or (XVI).

Circle.— The area a of a circle, whose radius is r and whose circumference is l, is

$$a = \tfrac{1}{2}lr, \qquad \text{(XIX)}$$

or $a = \pi r^2$, $\pi = 3.1416 = \frac{22}{7}$ (nearly). (XX)

The area a of the sector $OAMB$ (Fig. 1), in which l is the length of the arc AMB and d is number of degrees in the angle AOB, is

$$a = \tfrac{1}{2}lr, \qquad \text{(XXI)}$$

or $a = \frac{\pi}{90} dr$, $\frac{\pi}{90} = .034906585 = \frac{1}{28.65}$ (nearly).

The area a of the segment $AMBD$ (Fig. 1) is

$$a = \tfrac{1}{2}r(l - r \sin d°), \qquad \text{(XXII)}$$

$$a = \tfrac{2}{3}ch + \frac{h^3}{2c} \text{ (approximately)}, \qquad \text{(XXIII)}$$

or

$$a = \tfrac{4}{5}ch \text{ (approximately)}, \qquad \text{(XXIV)}$$

where r, l, c, h, d have the same meanings as in formulas (II), (III), (IV) and (V).

Parabola.— In Fig. 2 the area a of the segment $VABD$ with base $AB = 2y$ and height $VD = x$ is

$$a = \tfrac{2}{3}xy. \qquad \text{(XXV)}$$

Ellipse.— In Fig. 3 the total area a' of the ellipse $ABA'B'$, of which the length of the longest diameter $A'A$ is $2a$ and the length of the shortest diameter BB' is $2b$, is

$$a' = \pi ab, \quad \pi = 3.1416 \qquad \text{(XXVI)}$$

General Methods of Approximation.— Any plane area can be divided into parts each of which is a rectangle or differs from a rectangle in that one side is a simple curve as in Fig. 6. It is therefore sufficient to give methods by which an area, such as $ABB'A'$ following, may be measured.

1. The Trapezoidal Method.— Divide the base line AB into any number of equal parts, AP, PQ, QR, . . . , TB and erect the perpendiculars PP', QQ', . . . , TT'. Then if each portion $A'P'$, $P'Q'$, ... , $T'B'$ of the curve $A'B'$ is nearly coincident with its chord, the area a is

$$a = \overline{AP}[(\overline{AA'} + \overline{PP'} + \overline{QQ'} + \ldots + \overline{TT'}) - \tfrac{1}{2}(\overline{AA'} + \overline{BB'})]. \qquad \text{(XXVII)}$$

2. Simpson's Rule.— Divide the base line into any *even* number of parts (in Fig. 6 it is

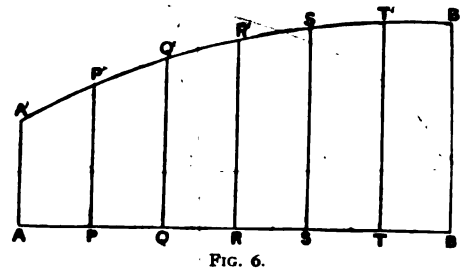

FIG. 6.

divided into six parts); erect the perpendiculars as before. Then

$$a = \tfrac{1}{3}\overline{AP}[\overline{AA'} + \overline{BB'} + 2(\overline{QQ'} + \overline{SS'} + \ldots) + 4(\overline{PP'} + \overline{RR'} + \overline{TT'} + \ldots)]. \qquad \text{(XXVIII)}$$

3. Weddle's Rule.— Divide the base into exactly *six* equal parts (as in Fig. 6), then

$$a = \tfrac{3}{10}\overline{AB}[5(\overline{PP'} + \overline{RR'} + \overline{TT'}) + \overline{RR'} + \overline{AA'} + \overline{QQ'} + \overline{SS'} + \overline{BB'}]. \qquad \text{(XXIX)}$$

SURFACE AND VOLUME OF SOLIDS.

Prism.— This includes any solid two of whose faces, known as the *bases*, are equal polygons situated in parallel planes and all the other faces, the *lateral* faces, are parallelograms. Thus in the following diagram (Fig. 7) the polygons ABC . . . and $A'B'C'$ . . . are the bases and the parallelograms $AA'B'B$, $BB'C'C$, . . . are the lateral faces. The edges AA', BB', CC', . . . are the lateral edges. The polygon UVW . . . lying in a plane perpendicular to one, and so to all, of the lateral edges is called a *right section*. The right section is equal to the base if and only if the lateral edges are perpendicular to the base.

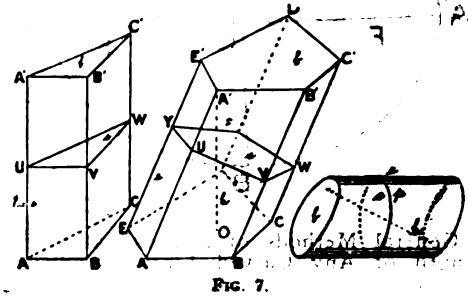

FIG. 7.

For the lateral area a which is the sum of the lateral faces $AA'B'B$, $BB'C'C$ . . . , and the volume v of a prism we have the formulas

$$a = e(\overline{UV} + \overline{VW} + \ldots), \qquad \text{(XXX)}$$

$$v = es, \qquad \text{(XXXI)}$$

$$v = hb, \qquad \text{(XXXII)}$$

in which e = length of a lateral edge (AA' or BB' . . .), s = area of a right section (UVW . . .), h = height, i.e., distance between bases, b = area of a base.

The volume v of a *truncated triangular prism*, that is one with three lateral faces and

whose bases are not parallel (therefore the lengths e_1, e_2, e_3 of the lateral edges not equal) is

$$v = \tfrac{1}{3}s(e_1+e_2+e_3). \qquad \text{(XXXIII)}$$

Any truncated prism may be divided into truncated triangular prisms and its volume thus found. For a four-sided prism whose opposite lateral faces are parallel this gives

$$v = \tfrac{1}{2}(e_1+e_2)s, \qquad \text{(XXXIV)}$$

where e_1, e_2 are a pair of opposite edges.

Cylinder.— This includes any solid having two *bases* which are equal plane figures bounded by curved lines (such as circles, ellipses or irregular figures), and situated in parallel planes, and the rest of the surface of the solid such that it may be thought of as consisting of an infinite number of parallel straight lines. If we call the length of each of these (equal) parallel lines e, the formulas for the prism given above (XXX, XXXI, XXXII) apply also to the cylinder, namely, the lateral area a and the volume v are

$$a = ep, \qquad \text{(XXXV)}$$
$$v = es, \qquad \text{(XXXVI)}$$
$$v = hb, \qquad \text{(XXXVII)}$$

where p is the length of the boundary, and s is the area of the section of the cylinder by a plane perpendicular to one of the lines lying on the lateral surface.

If the right section of a cylinder be a circle, the base, unless a circle, is an ellipse and its area is found by formula (XXVI). If in such a circular cylinder the bases are not parallel and the distance between the centres of the bases is l, then the area a and the volume v are

$$a = lp, \qquad \text{(XXXVIII)}$$
$$= 2\pi rl, \qquad \text{(XXXIX)}$$
$$v = ls, \qquad \text{(XL)}$$
$$= \pi r^2 l, \quad \pi = 3.1416, \qquad \text{(XLI)}$$

where r is the radius of the right section. These formulas are equivalent to (XXXV) and (XXXVI) when the bases are parallel, since then $l = e$.

Pyramid and Cone.— The volume v of any solid, such as those in Fig. 8, whose sur-

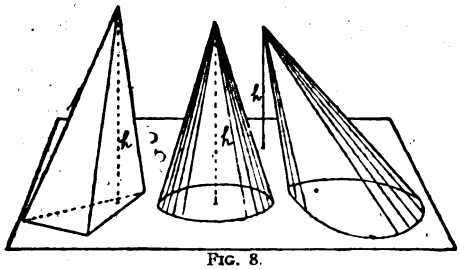

FIG. 8.

face consists of a base, which is a plane figure of *any* kind, triangle, polygon, circle, ellipse, etc., and of triangles or curved areas which may be thought of as composed wholly of straight lines, joining the boundary of the base to some point (the vertex) not in the same plane as the base, is

$$v = \tfrac{1}{3}bh, \qquad \text{(XLII)}$$

where b is the area of the base and h is the perpendicular distance (height) of the vertex from the plane of the base.

For a right circular cone, that is one in which the base is a circle and the line joining the vertex to the centre of the base is perpendicular to the plane of the base, the area a of the curved (lateral) surface is

$$a = \pi re, \quad \pi = 3.1416 \qquad \text{(XLIII)}$$

where r is the radius of the base and e is the distance from the vertex to any point in the circumference of the base.

Prismatoid.— The volume v of any solid, whose total surface consists of two plane figures (the *bases*), of any character whatever, lying in parallel planes, and a lateral surface made up of triangles, trapezoids, or curved portions which may be thought as made up of straight lines joining the boundaries of the bases, is

$$v = \tfrac{1}{6}h(b_1+b_2+4m), \qquad \text{(XLIV)}$$

where h is perpendicular distance (height) between the bases, b_1 and b_2 are the areas of the bases, and m is the area of a section of the solid by a plane parallel to and half-way between the planes of the bases; or

$$v = \tfrac{1}{6}h(b + 3q), \qquad \text{(XLV)}$$

where b is one of the bases and q is the area of a section parallel to and two-thirds of the way from, that base to the other.

Solids of Revolution. Sphere.— The area s of the surface and the volume v of a sphere of radius r are

$$s = 4\pi r^2, \quad 4\pi = 12.56637 \ldots \qquad \text{(XLVI)}$$
$$v = \frac{4\pi}{3}r^3, \quad \frac{4\pi}{3} = 4.18879 \ldots \qquad \text{(XLVII)}$$

The volume v and lateral area a of a *segment* of a sphere (that is the part lying between two parallel planes) are

$$v = \frac{\pi}{6}h[h^2+3(r_1^2+r_2^2)], \quad \frac{\pi}{6} = .5236 \ldots \qquad \text{(XLVIII)}$$
$$a = 2\pi hr, \qquad \text{(XLIX)}$$

where h is the height of the zone (perpendicular distance between the parallel planes of the bases), r_1 and r_2 are the radii of the bases respectively, r is the radius of the sphere.

Spheroid.— For a *prolate* spheroid, that is the solid formed by revolving an ellipse about its longest diameter (in Fig. 3, about AA'), the area s of the surface and the volume v are

$$s = 2\pi\left(b^2 + \frac{ab}{e}\sin^{-1}e\right), \qquad \text{(L)}$$

or $s = 2\pi b(b+fa)$, (approximately) (LI)

where a, b and e have the same significance as in (VII) and (VIII) and

$$f = 1+\tfrac{1}{6}c+\tfrac{3}{40}c^2+\tfrac{5}{112}c^3+\tfrac{35}{1152}c^4+\tfrac{63}{2816}c^5+\ldots,$$

in which $c = 1-\frac{b^2}{a^2}$. Or less accurately

$$s = \frac{\pi}{3}b\left[7a+b\left(6-\frac{b}{a}\right)\right], \quad \frac{\pi}{3} = 1.0472; \qquad \text{(LII)}$$

$$v = \frac{4\pi}{3}ab^2, \quad \frac{4\pi}{3} = 4.18879 \ldots \qquad \text{(LIII)}$$

The volume v of a *segment* of a prolate spheroid (part cut off by a plane perpendicular to the axis of revolution) the height of which is h, is

$$v = \frac{\pi}{3}h^2\frac{b^2}{a^2}(3a-h), \quad \frac{\pi}{3} = 1.047198 \ldots \qquad \text{(LIV)}$$

For an *oblate* spheroid, that is the solid formed by revolving an ellipse about its short-

est diameter (in Fig. 3, about BB') the corresponding formulas are

$$s=\pi\left(2a^2+\frac{b^2}{e}\log\frac{1+e}{1-e}\right), \quad \text{(LV)}$$

or $$s=2\pi(a^2+gb^2), \quad \text{(LVI)}$$

where

$$g=1+\tfrac{1}{3}d+\tfrac{1}{5}d^2+\tfrac{1}{7}d^3+\tfrac{1}{9}d^4+\tfrac{1}{11}d^5+\ldots,$$

in which $$d=1-\frac{b^2}{a^2};$$

$$v=\frac{4\pi}{3}ba^2, \quad \frac{4\pi}{3}=4.18879\ldots \quad \text{(LVII)}$$

The volume v of a segment of an oblate spheroid is

$$v=\frac{\pi}{3}h^2\frac{a^2}{b^2}(3b-h). \quad \text{(LVIII)}$$

Paraboloid.— The volume v of the solid formed by revolving VAD in Fig. 2 about VD as an axis is

$$v=\frac{\pi}{2}xy^2, \quad \frac{\pi}{2}=1.5708\ldots, \quad \text{(LIX)}$$

which is just one-half the volume of the circumscribing cylinder.

The General Solid of Revolution.— The volume v of the solid formed by revolving any curve about a line lying in the same plane and not intersecting it, for instance by revolving $A'B'BA$ in Fig. 6 about AB as an axis, is

$$V=\frac{\pi}{3}\cdot\overline{AP}[\overline{AA'}^2+\overline{BB'}^2+2(\overline{QQ'}^2+\overline{SS'}^2+\ldots)+4(\overline{PP'}^2+\overline{RR'}^2+\ldots)]. \quad \text{(LX)}$$

Or, as it is perhaps usually easier to measure the circumferences of the circles generated by PP', etc., than their diameters, if we denote the circumferences generated by A', P', $Q'\ldots$, B' by a, p, $q,\ldots$, b, respectively, the above formula may be written

$$v=\frac{1}{12\pi}\cdot\overline{AP}[a^2+b^2+2(q^2+s^2+\ldots)+4(p^2+r^2+\ldots)],$$

$$\frac{1}{12\pi}=.0265258\ldots \quad \text{(LXI)}$$

The Regular Solids.— The area of the surface and the volume of the five regular solids may be found by means of the multipliers given in the following table:

NAME	Area = (edge)$^2\times$	Volume = (edge)$^3\times$
Tetrahedron	1.7320508	.1178511
Cube	6.	1.
Octahedron	3.4641016	.4714043
Dodecahedron	20.6457788	7.6631189
Icosahedron	8.6602540	2.1816950

(LXII)

General Method.— The volume of solids which do not come under any of the types treated above may be measured by an application of the prismatoidal formula (XLIV). Let $a_1, a_2, a_3, \ldots, a_m, a_{m+1}$ be the areas of a set of plane sections parallel to a suitably chosen base and dividing the solid into an even number $(2n)$ of portions; a_1, a_{m+1} being the end sections (that is, the solid lies wholly between a_1 and a_{m+1}). The distance between consecutive cutting planes is to be the same throughout and to be taken so small that between the odd-numbered sections the solid is approximately a prismatoid. The area of a section may be found by surrounding it by a rectangle and measuring (by XXVII, XXVIII or XXIX) the portion of the rectangle outside of the section. If the distance between the sections be h, then

$$v=\tfrac{1}{12}h[a_1+a_{m+1}+2(a_3+a_5+a_7\ldots+a_{m-1})+4(a_2+a_4+a_6\ldots+a_m)]. \quad \text{(LXIII)}$$

Barrel.— If d be the inside diameter of the end of a barrel, c the inside diameter at the middle, and l the length (or height) of the barrel, then the prismatoidal formula (XLIV) gives as the volume v

$$v=\frac{\pi}{6}l\left(\frac{d^2}{2}+c^2\right), \quad \frac{\pi}{6}=.5236. \quad \text{(LXIV)}$$

The following is said to be a better approximation:

$$v=\frac{\pi}{9}l\left(d^2+\frac{5}{4}c^2\right), \quad \frac{\pi}{9}=.349\ldots. \quad \text{(LXV)}$$

The volume v of the smaller portion of a partly filled barrel, that is, of the contents if the barrel is less than half full and of the empty portion if it is more than half full, is

$$v=.000472h(d^2+a^2+4b^2), \quad \text{(LXVI)}$$

where h is the distance of the surface of the contents from the nearest end, a is the diameter at the surface of the contents, and b is the diameter half-way between the surface and the nearest end.

WILLIAM FINDLAY

MENTAL DEFECTIVES. See CHILDREN, DEFECTIVE; EDUCATION OF FEEBLE-MINDED OR MENTAL DEFECTIVES.

MENTAL DISEASES. These are diseases which show themselves in alteration of conduct or behavior. They are faulty adjustments within the individual which, due to faulty mental functioning, interfere with social values mutually agreed upon by particular groups, large or small. Such faulty mental functioning may be brought about by a vast variety of causes and be contributed to by a variety of defects or disturbances in many parts of the body. Mental disease may come and go, just as any other type of disease, and mental disease may be due, most frequently is due, to disorders primarily located in other parts of the body than the brain, although a mental disease means that the guiding function of the body as a whole, i.e., the mental functioning, is disturbed by faulty brain functioning.

A mental disease, therefore, only means that the adjustment of the individual as a whole,— the personality,— to his social environment is sufficiently disturbed to interfere with the well-being of that personality. It is primarily because such faulty adjustment tends to exclude the sick individual from his fellow-men,— the group or socius,— that mental disease is so much feared by the individual and is looked upon with dread and superstitious awe by the folk in general. In general it may be said that there are two aspects or trends of behavior exhibited by the individual in his reactions to his environment, conscious and the unconscious, and so there are two attitudes to be reckoned with in problems of mental disorders. If a man's tongue is cut out he cannot speak, and there are times when he apparently cannot speak, even though he has a whole tongue. Maybe his muscles are paralyzed. That may be

due to some change either in the nerve pathways leading to or from the brain which permit speech, or in the part of the brain to which these nerve pathways lead or in some other part. An attempt has been made to locate the part of the nervous system affected by means of the behavior of the man who cannot speak, both his actions in the use of his voice and his other actions. For, because of the close interrelation of all parts of the human being, certain types and groups of behavior will generally be found connected, as for instance if a man's inability to speak is due to some affection of the nerves between tongue and brain, there will be certain other physical symptoms, but if it is due to an improperly functioning centre in the brain, some other anatomically more distant activity will be affected. Thus a morbid area at the periphery might affect only one nerve, but if nearer to the centre it might affect two or more nerves, while directly at the centre it might affect all the nerves emanating from that centre and the activies regulated by them.

Human behavior is not merely physical, but is also mental, while the means we have of perceiving that behavior are exclusively physical. That is, the expression of some other person's mind can be reported to me only through the physical actions of other person as perceived by me. From this it appears that the diseases known as mental may be the *beginning* of a process which starts in purely mental conditions or the *end* of one which starts in purely somatic conditions. Physical traumata may indeed be the result of a lack of co-ordination due to defects of nerve function which in turn may be due to a mental conflict. Adler has brought out the fact that a very unfortunate series of physical injuries to the eye of one patient were the result of a maladaptation in co-ordination of such a nature that the reflex actions that generally operate to protect the eye did not work in this case. From this he deduces his theory of *organ inferiority*, an interesting corollary to some of the theories of the analytic psychology. For if the nervous constitution of this patient did not permit the usual reactions he would not necessarily be awkward because of an unconscious wish, as is the supposition of the majority of psychoanalysts. If a mental disease is an end product of a chain of bodily causes, which have been acting for some time, it is most likely that some or all of them will have manifested themselves before the time of the manifestation of the mental disease, and that the presence of these somatic symptoms will be associated with the mental disease and regarded as its causes. But if, on the other hand, the mental disease is itself the beginning and not the end of the process, it will require much more subtle tests to discover it, particularly in its earlier stages. It will be, too, of the utmost importance to detect, as early as possible, these beginnings which are manifested both in mental and in physical behavior, in order that remedial or preventive measures may be adopted at the earliest possible moment. In mental as in diseases of other bodily functions it is the preventive measures that are the most productive of good results. The greatest strides in making a decrease in mental diseases, as well as in those disorders thought of as bodily not greatly affecting the mental functions, come from taking the disorder in hand as soon as possible. Thus it would be most desirable to have teachers in all schools equipped with a means of detecting very early those early signs of later mental disorders which, although at present extremely elusive, are yet gradually, day by day, becoming clearer through analysis. Those in charge of the young should be the first to observe signs of a possible subsequent mental weakness, even in children apparently normal, and should be in a position to advise parents and guardians how to offset the deleterious factors in the child's environment. It is furthermore increasingly clear in what manner the overloading of the nervous system can produce not only mental disease, but, through the effect of the conflict between psychical requirements and physical constitution (an effect which is believed to take place in the nerve cells themselves), this overloading of the nervous system produces disorders in the physiological processes, and may therefore in the end produce what has been called an organic disease, namely, an alteration in the mode of working of one or more organs of the body, a condition which sooner or later undermines the general health.

It is noteworthy that a classification of mental diseases based on their relation to physical factors is not satisfactory, for the reason that the disturbances in mentality are not always found associated with lesion or degeneration of any or all parts of the brain and nervous system. In other words, a brain and nervous system which to all tests now applicable proves perfect in every respect may be found in the case of a person whose reactions to environment have been so unsatisfactory in adaptability that he has not been able to act his part in society, which has had either to support him as an otherwise harmless dependent or confine him as a destructive element. From this point of view the modern attitude toward mental disease is that it is a regression, whether from physical or psychical causes, to the condition of a more infantile or a more archaic type of mentality. It is recognized that the actions of the child resemble those of an earlier grade of human society, such as was the maximum of development in prehistoric ages; furthermore, that the responses of the modern individual to an environment which is daily becoming more and more complex are demanding of the individual a much more delicate adjustment and adaptation. Whether the failure to adapt is caused solely by a physical lack in the make-up of the cerebral and neural constitution is beyond the present power of physiology and histology to determine. It is therefore quite as useful to classify mental diseases purely from the mental standard, providing, however, the already ascertained connections between certain types of reaction and the discoverable lesions in the neural substance be not ignored. Therefore the present tendency in neurology is to make an analysis upon a purely psychical basis, namely, the mental mechanisms (q.v.) which have been observed to obtain both in the unconscious and in conscious life. It is now known that a phobia, or sudden unreasonable and excessive fear of some definite thing such as snakes, thunderstorms, knives, dogs, horses or what not, is neither to be explained on any conscious basis nor to be re-

moved by an appeal to reason or to consciousness alone. Similarly the habits of mind named obsessions or compulsions are amenable neither to drugs nor to the conscious adjurations to forget them or avoid them, but only to the education of the character through the freeing of the fixated libido.

Classification.—Almost every alienist of repute has attempted a classification of the forms of insanity. The subject is one of peculiar difficulty, owing largely to the fact that our intimate knowledge of many of these various forms is far from complete.

A scheme of classification adopted by Jelliffe and White regards the diseases of the nervous system as falling into three general classes: (1) Those of the physico-chemical systems, affecting the neurology of metabolism, and expressed in visceral neuropathology and diseases of the glands with internal secretions; (2) those of the sensory-motor systems, including affections of the cranial nerves, the peripheral neurons, the spinal cord, medulla, cerebrum and cerebellum and the meninges, with syphilis of the nervous system, and (3) those of the psychical or symbolic systems (neuroses, psychoneuroses and psychoses). The last contains the manic-depressive group, the paranoia group, epilepsy, dementia precox, exhaustion and toxic psychoses and those associated with organic diseases, with senility, arteriosclerosis, and finally idiocy, imbecility and feeble-mindedness.

A more detailed elaboration of this appears as the 1918 classification of the American Medico-Psychological Association. The methods of examination of the nervous system include a questionnaire covering the family history of the patient and his illnesses, and an elaborate physical examination of the vegetative nervous system, of the sensory and motor systems, followed by a thorough mental examination which in many respects is somewhat similar to the questions of the "intelligence tests" and qualification tests of the army. The alienist comes in contact with a great many diseases whose mental element is very small, no greater in fact than that of the so-called physical diseases. The disorders in the physico-chemical systems produce diseases with mental aspects, but aspects no more mental than those of the diseases affecting the organs, muscles, glands, etc., to which those nerves go. It is only when we come to what are called the neuroses that we find mental behavior alone or predominantly disordered. These affections were called neuroses or "nerve troubles" on the supposition once accepted that the mental behavior was caused exclusively by some peculiarity, whether called abnormality or merely variation, in the structure of the nerve cells themselves. At the present time, however, scientific thought tends toward the theory that mental disease is determined by the loss of balance between the organism and its physical and psychical environment. Thus there are nervous systems congenitally so weak that they are practically disintegrated by the conflict of the individual and society, a conflict which is, as often as not, absolutely unconscious, and which occurs in the simplest and least complicated social environment. In such natures mental disease at once appears because of the individual's inability to adapt himself to the rudimentary requirements imposed upon him from without. On the other hand, there are neural constitutions so strong or elastic that they are equal to a very severe strain of adaptation even to extraordinarily complicated environment. Such constitutions will naturally adapt themselves, retaining their own personal equilibrium and health, to conditions which would completely upset a weaker (that is, less adaptable) constitution. It may be here noted that the European War brought out many such diversities of neural constitution in those subject to "shell shock" or other war psychoses, together with improved methods of testing for congenital neural weakness. These tests have resulted in putting in positions of less nervous strain those who are unable to stand the greater. A similar allotment of individuals to the various tasks of life would naturally result in less nervous disease. For it is evident, when both factors are taken into consideration, the constitutional factor and that supplied by the environment, that mental disease is largely a matter of proportion between the nervous system and the load which is placed upon it. For example, a person who is not obliged to struggle for existence may never develop a mental disease which he would have developed, had he been subjected to the stress of adverse circumstances, while, on the other hand, his affluence may make him introversional, and, after the age of puberty, cause him rapidly to run counter to the demands of a true social existence.

The rôle of the unconscious in the etiology of mental diseases is a dominant one, and the comparative indefiniteness of the delimitations of the various types of mental disorders is due to the newness of any scientific knowledge concerning the unconscious portion of mental functioning. The neurologist should have, though unfortunately comparatively few do, as thorough a knowledge of the unconscious mental mechanisms as can be acquired, in addition to the medical specialist's knowledge of anatomy, physiology and histology. Recognition of the unconscious as a factor in the causes of mental disease requires the understanding that the present day unconscious is the direct descendant of the prehistoric consciousness. It is as if the human psyche were like the earth's surface constructed in strata, the lowest of which was the earliest deposited; much, too, as if the conscious life of successive generations from the earliest human and animal life were retained in the psyche of the present day as are the annual rings of growth in the stems of trees. The part played by the conscious or unconscious mental factor in the vegetative or visceral physiology is less evident to the general student than that played by them in the sensori-motor systems or in the psychical or symbolic systems. Yet there are good reasons to suppose that even so serious a disease as pulmonary tuberculosis may be helped, if not cured, by the patient's being taught how to secure control of the unconscious portion of his ego. The exciting causes for this disease, as well as of hysterical coughing and asthmatic attacks, may lie either in the physico-chemical, the sensori-motor or the psychical level. The connection between the diseases of the glands of internal secretion, the thyroid, parathyroid, hypophysis, pineal gland, etc., and the manifest mental condition is shown in the case of cretinism and of

exophthalmic goitre. In these diseases it is quite as likely that the cause is mental as that it is physical, and in such event, we should have to regard exophthalmic goitre as a symptom of a mental disease rather than the mental factors accompanying it as symptoms of the physical disease. Similarly the very widespread disorder, migraine, is possibly to be regarded as the projection upon a vegetative system, the vaso-motor, of a conflict which originates in the psychical level. Conflicts at the psychical level, which are usually caused by the lack of adaptation to social environment referred to above, may be projected upon the sensori-motor systems and produce retinitis, progressive facial hemiatrophy, various facial palsies, vertigoes, auditory and visual aphasia, tic douloureux, sciatica, shingles and peripheral palsies, and other diseases, many of which were considered up to recent times to have only physical causes.*

But the conflict, conscious or unconscious, which occurs at the psychical or symbolic level of the ego is manifested in predominantly mental modes in the so-called neuroses, psychoneuroses and psychoses. Of the psychoneuroses the commonest are *hysteria, compulsion neurosis* and *anxiety hysteria.* Of the actual neuroses there are *anxiety neurosis* and *neurasthenia,* while special cases present mixtures of these neuroses. As a mental disease, and not as popularly used to denote an uncontrolled emotional state, *hysteria* is now regarded as a partial dissociation of the personality, in which certain mental elements, namely, emotions and ideas, have been rejected from consciousness into the unconscious where they have an existence which is at least partly independent — an existence which is of vital importance to the welfare of the individual because it is an existence in which the split-off ideas and emotions have a growth or development of their own. This development is different in hysteria and in compulsion neurosis. In hysteria the mental elements, which are repressed from consciousness into the unconscious, direct or control a portion of the libido in such a way that its force has an incidence not upon the world of external reality, as is the case with the average person, but in the shape of work done in some shape or other. On the contrary the incidence of the libido falls upon the physiological functions themselves or upon certain of them through a variety of symbolic selection. This process, which is known as hysterical *conversion,* produces very many so-called symptoms, mostly of a bodily nature. There results from this a large number of disorders which the general practitioner is prone to regard as having only a physical cause, and he prescribes drugs, which rarely have the desired effect. Possibly the commonest form of this is the hysterical headache, which is rarely recognized of psychogenic origin, although it is so completely analogous to the "nine o'clock illness" of school children, who use this gentle form of unconscious malingering as a means for escaping their responsibilities. "An adult ought to make a call upon a recently bereaved friend." This is recognized as a distinct obligation but the patient's infantile necessity of escaping reality and seeking pleasure makes the duty seem a very onerous affair. Thus arises a conflict between duty, born of conscious appreciation of the social obligation, and desire, born of the childish inability to make the necessary sacrifice of personal comfort. As a result the patient develops a headache and so, being ill, does not have to go. While the mechanism in other hysteric conversions is more complicated, it is no less clearly proved, so that the number of what are ordinarily taken as symptoms having a merely somatic cause, and which are through analysis seen to be merely hysterical conversions, is augmented daily. Disturbances of sensibility, such as hemianæsthesia or insensibility to touch and pain on one side of the body only, disturbances of motility such as choreiform movements, tics and certain occupation spasms, disturbances of speech, sometimes including stuttering, visceral disturbances showing vomiting and diarrhœa, vaso-motor disturbances and emotional disturbances, particularly in cases of great exaltation or depression, are all likely to be caused by the hysterical dissociation before mentioned, in which some mental factor is repressed and therefore driven without the pale of conscious control.

In *compulsion neurosis* there is no conversion, which implies a shifting of the incidence of the libido power from the external world, which is its natural goal, to the physiological processes of the individual; but there is another kind of shift, namely, from the external world to the mental states themselves. In this condition the numerous physical symptoms mentioned as being found in hysteria are generally absent, but their place is taken by variation from the conventional modes of thinking. Such variations to be sure are far from unpleasant, if they do not become too great, for they add much of piquancy and interest to a person's character. But when the departure from the conventional is excessive and both compulsive and unaccountable, the condition merits the term neurosis and requires treatment from the analyst. There are compulsive thoughts, compulsive doubts, fears, acts, rituals of dressing and undressing or eating for which this kind of neurotic can give no reason. He generally does not attempt to rationalize them but admits he does not know why he always has to act or think in his own peculiar way. Analysis has convinced Freud that "obsessions are always transformed *reproaches,* returning from repression, which always refer to a pleasurably accomplished sexual action of childhood" and that "the compulsive ways of thinking and acting are only substitutes for the reproaches which are symbolical distortions formed in order to prevent a recognition on the part of the patient of the real meaning, so as to keep from his consciousness a realization of the circumstances of his guilty conduct."

Paranoia is a group of mental diseases containing the paranoia as defined by Kraepelin, and various mixed aberrant forms, some of which are called paraphrenias. In general it is a disease in which there are delusions of persecution that have been pretty well systematized. The disease progresses usually through four rather well-defined stages. In the first the patient is unduly concerned about his health,

*Hawthorne had an inkling of this when, in his 'Scarlet Letter', he wrote: "physical disease, which looks like a thing in itself, and separate, may be only a symptom of a disturbance in the spiritual (mental) part of our being."

and particularly about what goes on around him in relation to himself. That is, he considers more things are said and done with reference to himself than does the ordinary person, and he begins to reason it all out that there must be some agreement in the actions of persons or things around him, usually for his discomfiture or ruin. Hallucinations of hearing are common. The result of his thinking himself to be the victim of persecution is that he sometimes becomes very dangerous, and attacks the persons whom he regards as his persecutors. In advanced cases the system of ideas worked out in justification of the suspicions of persecution or conspiracy is very elaborate, and includes frequently falsifications of early memories, which contribute the grain of truth in some of the projected reproaches. Another classification of the paranoia group of mental diseases is that into two divisions, the *original* and the *acquired*, the first being the inevitable development of a character which was of such a constitution as to develop into exactly this form of mental disease, in spite of an environment even partly favorable to a wholesome life, and the second, the effect of an untoward environment upon a neural constitution which might in more favorable circumstances have escaped this fate. According as hallucinations are or are not present, these groups are further divided respectively into *paranoia hallucinatoria* and *paranoia combinatoria*. Furthermore the individual cases are described as persecutory, expansive, querulous, litigious, inventive, reformatory, religious and erotic, according to the forms which the more prominent mental symptoms show. A third division of the paranoia group is into delirium of interpretation and delirium of revindication. In the first the erratic element is in the interpretation of the factors of the environment of the patient, who remains otherwise quite clear minded, and in the second there is a tendency toward the formation of a fixed idea, either egocentric or altruistic. As paranoia was considered an incurable, progressive and chronic disease, those cases which through analysis have been shown to have at the basis of them an idea that could be traced out and corrected, and which therefore have been called acute paranoias, necessitated a further reconstruction of the concepts underlying the classification. The result of this is that the content of the mental states in this form of disease is not now considered so indicative as the mental mechanisms involved. This implies again that it is not so much the delusion, or the suspicion itself, or any other of the symptoms, which used to be considered characteristic of the disease, but it is the inability on the part of the patient to adapt his ego to those ideas which form the so-called content of the paranoid state. The delusion, for example, is found to have been made by the patient for the purpose of making a certain emotion tolerable which he could not get rid of. The removal of the delusion would not in such a case help, for another would have to be supplied in its place, to explain the original emotion, which would itself remain. The emotion or a lack of control over the emotions is thus seen to be the most fundamental cause of the disease. The explanation of paranoia consists, therefore, in the emotional lack of control, which fixes upon certain ideas and is unable to change them, and furthermore in an exaggeration of the mechanism of projection. (See MECHANISMS, MENTAL). Finally Sigmund Freud states that paranoia is dependent upon a homosexual fixation in the psychosexual development of the individual. Treatment of paranoia has been more earnest and determined of late, as more and more cases have been handled with greater success, but it is to be remembered that the curable cases are now by many regarded as only paranoid forms of other mental diseases, and that the true paranoiac is known as paranoiac virtually only by the failure of all efforts to improve him. Psychoanalysis is the only means by which any satisfactory knowledge can be gained of the unconscious mechanisms dominating any given case, and only by a thorough study can it positively be determined how much or how little can be accomplished in the way of therapeusis.

Epilepsy and various convulsive types of reaction including the classical epilepsy, some attenuated forms such as affect epilepsies, and those of gross brain disease, constitute a class of mental disease in which there is well-known physiological and anatomical change in the brain itself. The disease is apparently hereditary, in the sense that in the history of all epileptics there is usually to be found some taint in the family or in collateral branches. The epileptic convulsion of the classical type is a spasm with unconsciousness, preceded by a warning called the aura, and followed by a gradual wakening or a deep sleep. The variations are exceedingly numerous. Modern investigation has shown that there is some association between the epileptic fit and the gratification of an unconscious wish. Epileptics are likely to be of a low order of intelligence and their reactions to be analogous to those of children or infants. Some cases indeed do turn out later to be imbeciles. Treatment is not generally considered to be of avail, except possibly in psychogenic cases, where analysis can sometimes straighten out the complexes of the patient. The best care is secured in the colony plan where training in healthful outdoor occupation is possible.

The *Dementia Precox* (Schizophrenia) group of mental diseases contains the so-called dementia simplex, hebephrenia, catatonia, some paranoid forms and certain mixed or atypical states. The mental symptoms of the dementia precox group include an emotional dullness which is thought to be due to the fact that in this disease the patient shuts himself into his own thoughts and is therefore less moved by external occurrences than are ordinary persons. That is, his thoughts lose their reference to external reality and the result in the worst cases is that nothing in external reality can move or arouse the confirmed dementia precox patient. Another feature which is an outcome of this segregation from external interests is his so-called negativism, which is shown in his either refusing entirely to do what he is told or doing it as negatively as possible. Thus, if he is told to hold out his hand, he puts it behind his back; if told to stick out his tongue, he shuts his mouth tight. This segregation of the behavior from all relations with external reality (and in the last analysis reality amounts to little more than the relations of the indi-

vidual with other persons), is a splitting of the personality, which is the reason for the alternate name of dementia precox: schizophrenia or "split mind." The detailed features of this separation of the behavior from all that in the average man is in close connection with his behavior are as numerous as all the possible types of relation of the individual with his environment. Some of these are suggestibility, failure of voluntary attention, disturbance of orientation, disorders of memory. The delusions have been shown in many cases to be symbolisms of the conflict going on in the unconscious. The fact that the conflict is unconscious accounts for the difficulty of getting at it and of re-establishing satisfactory relations with the patient. Other symptoms are physical such as the mannerisms, stereotyped modes of action, unusual words or expressions so frequent in dementia precox, and the rigidity and stupor which characterize some of the patients.

Whatever reactions to the environment remain in the patient are marked by an archaic or primeval character, such that in the evolution of human behavior the highest, most complicated and latest acquired types are those first to be lost. In the disease the individual reverts or regresses to a form of behavior which may possibly be supposed to have been valid and current in prehistoric ages. As behavior may be regarded as built outward from a central core, this form of psychosis is what is known as an introversional one, that is, one in which the libido introverts or regresses to a more fundamental and therefore more archaic form of gratification. There are other physical concomitants sometimes noticed, such as an unusually small heart or a tendency to pulmonary tuberculosis. The onset of the disease is either gradual or sudden. If gradual it may be mistaken at the beginning for other types of mental disease, such as the manic-depressive, hysteria, compulsion neurosis, etc. It is in this disease more difficult than in most others to make any satisfactory statement as to whether it has a physical or a mental origin. As the bodily changes so far discovered have been so few and their bearing so uncertain, it is more advantageous at the present time to explain the disorder on a purely psychological basis. The patient is faced with a situation in which the balance between environment and congenital ability to adapt to it is inevitably lost, whether because of the disproportionate burden placed upon him by his environment or because of his innate weakness rendering him unable to support the average load. In this connection it is to be remembered that many ordinary persons declare their burden is too heavy for them to bear, and that few ever know their extreme abilities; consequently the loss of balance may have a purely psychical cause lying within the unconscious desire of the particular person. When a person says that something will drive him crazy, he is unwittingly expressing an unconscious desire, not to become ill mentally, but to receive the care and symbolic homage which is given to the mentally ill. The severity of the mental symptoms may be regarded as a measure of how far the unfavorableness of the environment has driven back the individual patient from reality. There are cases of moderate confusion which appear in almost all respects perfectly natural persons, and only later develop a disorder great enough to dissociate them from their fellows; while in the so-called catatonic cases the inability is generally complete. The cases which have subsequently become well have gradually made an adjustment to reality in some form, either indirectly through the formation of delusions, or directly by a final domination of the reality motive. Cases that do not get well tend to sink to lower levels till they reach one on which they can succeed in maintaining themselves with comparative steadiness. This is notably the case in institutions, while in the world of life such persons join the ranks of tramps, prostitutes and petty criminals, thus finding their appropriate level.

The treatment of the physical condition is always according to the nature of the bodily symptoms, and the treatment of the mental condition must take into consideration the involvement of the higher or psychological levels of the personality and give as much analysis as possible, in order to reconstruct the social relations if that can in any way be done. Prevention of this disease is one of the most important ends that could be achieved by civilization, and is primarily attained through eugenic methods, lacking which the only means at present known lie in the correction of all irregularities of character as early as they may be observed in childhood and an absolutely frank and scientific handling of the question of sex, the source of much that is anomalous in human character.

A division of infection and exhaustion psychoses comprises those resultant upon fever, exhaustion or collapse and upon typhoid fever. While all these diseases have mental aspects, the treatment of them is so essentially in accordance with the disease of which they are themselves virtually only the symptoms that they need not be described here in detail. There is a special form of mental reaction following the over-indulgence in alcohol, in opium, cocaine, bromides, carbon monoxide, lead, mercury or from uremia, diabetes mellius, pellagra and certain gastro-intestinal diseases. In none of the mental diseases is the matter of individual psychology more important than in alcoholism, as the reasons for drinking which are assigned by people in general are merely rationalizations. (See MECHANISMS, MENTAL). The real cause why people drink to an extent which harms them is that their neural constitution craves the gratification which they get from this source alone. The very fact that a man or woman cannot stop drinking therefore stamps them at once as having a weakness in their nervous constitution. The alcoholic takes his peculiar way in creating an artificial balance, so to speak, in order to make up for the loss of balance between his neural constitution and the demands made upon it by his environment. It is his way of taking the cash and letting the credit go. Alcohol is the quickest path for some persons to shut out the world of reality, which has been found too arduous, and to open up the world of fantasy, the fact that the individual is unable to face reality being the really important point. Accordingly it is not surprising to find that ordinarily the alcoholic is in other respects, aside from his alcoholism, an example of general inefficiency. His unconscious appreciation of his essential inferiority is partly what leads him to flee from the world

of reality to the world of intoxication fantasy. That alcoholism is an indication of a deep physiological weakness, too, is to be inferred from the high mortality in pneumonia and other diseases among alcoholics.

The same remarks could be made about the mental aspects of over-indulgence in opium, morphine, cocaine and other poisonings. The amount that any given individual can stand depends, as is well known, on the individual's constitution. The more he can stand, the stronger the constitution; but from another point of view, the greater need he has for some drug to change, through its effect upon himself, the nature of his relations with the external world, the weaker he is as a mechanism and the less suited he is for the field of activity in which he finds himself. In all of these drug indulgences the treatment of the patient by means of other drugs is merely palliative and does not go to the root of the matter. The only hope of doing this is through psychoanalysis, after the acute disturbance has ceased. There are psychoses, too, associated with organic diseases such as apoplexy, chorea, paralysis, multiple sclerosis, polyneuritis and heart disease; also with presenile, senile and arteriosclerotic conditions.

Finally feeble-mindedness, idiocy, imbecility, regarded as defects in personal endowment or development, have the mental aspect that they cannot live in society acceptably to the degree of being either self-supporting, or of supporting anyone else. The economic importance of these defective classes is being recognized and the more as psychological methods have been devised for grading all individuals into the classes which show characteristic differences parallel with the differences between children of ages between 1 and 14 years of age. Very extensive researches by Binet, Simon, Goddard and Terman have shown that the general intelligence grows steadily up to age 14, while above that age there are roughly three groups, the low, average and high adult intelligence. What is meant by feeble-mindedness, imbecility and idiocy can be given a very exact form in a table like the following:

Mental age	Capabilities	Class
Under 1 year.	Helpless	Low class idiot
1 year	Feeds self. Eats everything	Middle class idiot
2 years	Eats discriminatingly	High class idiot
3 years	No work. Plays little	Low class imbecile
4 years	Tries to help	Low class imbecile
5 years	Only simplest tasks	Middle class imbecile
6 years	Tasks of short duration. Washes dishes	Middle class imbecile.
7 years	Little errands in house. Dusts	High class imbecile
8 years	Errands, light work; makes beds	Low class moron
9 years	Heavier work. Scrubs, mends, lays bricks, cares for room	Low class moron
10 years	Good institution helpers. Routine work	Middle class moron
11 years	Fairly complicated work with only occasional oversight	Middle class moron
12 years	Uses machinery. Cares for animals. No supervision. Cannot plan	High class moron

The advantages of these so-called intelligence tests, so clearly shown in the organization of the national army, are of further advantage in finding out whether a mental defect is inherited or acquired, because in the inherited mental defects a termination of the individual's ability to go through the tests is quite even. He can do all of the tests of ages one to seven, for example, but cannot do any of those above that age. On the other hand the case is not so clean cut with acquired defects, the individual being able to do some but not all of those tests several years above his mental age and not all of them below it.

In conclusion it should be emphasized that the mind and the body are one unity and whatever affects the one is not without effect upon the other, that it is almost if not quite impossible to draw the line between mental and bodily disorders, and that the ultimate truth will be found in the statement that mind is but the function of body and body but the perceptible expression of mind. Therefore few diseases can be regarded as exclusively mental and but few as exclusively physical. Consult Jelliffe and White, 'Diseases of the Nervous System' (3d ed., 1919); and White and Jelliffe, 'Modern Treatment of Nervous and Mental Disease' (Vol. II, 1915).

SMITH ELY JELLIFFE, M.D.

MENTAL HYGIENE. Hygiene has usually been conceived of as a system of measures for the creation of conditions *without* for the maintenance of the *bodily health*. Mental hygiene is an effort to create favorable conditions *within* which will make for *mental health*. Whereas hygiene heretofore has dealt with external conditions which are favorable to health, such as fresh air, sunshine, pure food, exercise, etc., mental hygiene deals with the principles of right living as they apply to the regulation of our thoughts, our feelings, our activities. In its practical applications mental hygiene attempts to deal with the problem presented by the tremendous demands of our fundamental instincts for adequate expression. It sees in human failures inability to adequately harness these instincts, while in success it sees them adequately expressed in activities that are at once creative and socially acceptable and valuable. The principles of mental hygiene receive their formulation as a result of an understanding of the development of the human mind from earliest infancy to adulthood expressed in terms of a constant interplay and compromise between instinctive desires and social repressions. These principles will receive their application along two main lines of endeavor. One by applying them to the scheme of education, modifying it and minimizing the severity of these conflicts, and secondly, in individual instances by an examination of the particular situations under which difficulties have produced disturbing symptoms in the individual.

As soon as the difficulties of the individual are seen as evidences of his endeavor to make his particular instinct-constellation fit in with the social requirements, it is seen that a vast amount of convention, particularly the criminal law, is the reaction of society against instinctive manifestions by an effort at forcible repression, and just as education would not be complete if it stopped wholly at efforts of repression just so mental hygiene points out that society's methods of dealing with its delinquents are not complete when measures of repression, censure and condemnation alone are used. As

in dealing with the child it is necessary to search for and help to develop all the positive characters of value, so in dealing with the delinquent it should be society's effort to search for and develop to their fullest extent all those strivings for better things which no one is without.

This new point of view is applicable to every relation which involves the individual and society, and its ideal must be to bring about a state of understanding rather than a blind clashing of instincts between these two. When this is done individual instinctive indulgence, instead of being met by blind social condemnation, will be met by an intelligent vision which sees the indulgence as a relatively infantile, undeveloped type of reaction and which sets about to bring to pass a different reaction formula by methods of repression where necessary and to the extent necessary carefully checked by adequate controls but which does not neglect those educational procedures without which no repression is safe.

The practical application of the principles of mental hygiene must come about as a result of a more complete understanding of the developmental stages of the human individual and this means specifically a more complete understanding of the development of the child. This is the "century of the child" and in many ways the advances that have been made in child study point the way toward an adequate hygiene of mind. This is so because in all of the defective and delinquent conditions, as we find them either in children or adults, we see evidences of defective psychological development either gross or in detail. In other words, the adult delinquent, or the mentally ill adult, presents distinct evidences of having been arrested at some point in his psychological development, so that in that portion of his behavior which is circumscribed by this limitation there are the outward appearances of infantilism or childishness. The moods, the grouches, the irritabilities, the petty dishonesties, lying and pilfering, the subtle cruelties and deceptions, selfishness, over-conscientiousness, prudery, emotionalism and a thousand other traits of character are all the better understood when they are seen to be childish types of reaction, and are almost immediately appreciated as such as soon as the analogy is suggested.

The immediate problem of mental hygiene as addressed to such character traits as have been enumerated above is to approach their study in the individual case with a view to unfolding the causative factors which have, within these certain areas of conduct, prevented the individual from progressing along the usual lines of development and having succeeded in this endeavor, helping the individual to find avenues of expression for this pent-up energy in more useful ways.

All these results have been made possible by a study of the development of the child and realization for the first time that the child is not simply a small adult, but has standards of conduct, points of view, attitudes of mind which it is extremely difficult, if not impossible, for the adult to feel himself into. An appreciation of these facts, together with an attitude toward the individual which is truly constructive, the parental attitude in the best sense, is what is needed. So that in the treatment of these sick individuals there is arising in society an attitude which is a development of the parental instinct as a result of better understanding.

The defects in the parental instinct have been that children have been considered the property of the parents, existing only for their use and satisfaction. This has been the history of the child throughout the ages. Now it must be appreciated that a greater sacrifice is demanded of the parent if the child is to grow up to successful adulthood. Only the interests of the child should be considered by the parent, and not the parent's personal desires. On the other hand the child should be weaned from considering that the parents belong to it and exist for its pleasure, otherwise a dependent attitude upon the love of the parents will persist into adult life. The basic necessity, therefore, for the healthy adult is a healthy relationship between parent and child which results finally in a normal, healthy emancipation of the latter, resulting in the greatest possible attainment of individual efficiency.

WILLIAM A. WHITE, M.D.
Superintendent Saint Elizabeth's Hospital, Washington, D. C., Professor of Psychiatry, George Washington and Georgetown Universities.

MENTAL PROCESS. A term used in psychology to denote the phenomena of mind viewed as changing rather than as timeless substances. One of the great changes which has come over philosophy in the past century or so is the obsolescence of the notion of substance. It is realized more and more that the unity of phenomena is to be explained, not by the fixity and homogeneity of a stuff behind them (see PANPSYCHISM), but as the persistence of a certain type of change or process. Just as the physicist has ceased to worry much about the nature of matter or the ether and has given himself wholeheartedly over to the study of their laws of change, the psychologist has come to see the utter barrenness of the substantial conception of mind, and now interprets the mind and all phenomena pertaining to it under the category of process. The mind itself is often treated as the stream of its states, while these are no longer regarded as instantaneous, but rather as undergoing a temporal waxing and waning of their own. Consult James, W., 'Principles of Psychology' (New York 1890); Stout, G. F., 'Analytic Psychology' (London 1896); Titchener, G. B., 'Textbook of Psychology' (New York 1910); Wundt, W., 'Grundzüge der physiologischen Psychologie' (6th ed., Leipzig 1908-11).

MENTAL SCIENCE, the science of mind: (a) properly, a synonymous term for psychology, or that branch of metaphysics which treats of the aggregate of knowledge concerning the mind and mental operations. (See PSYCHOLOGY; INDIVIDUAL PSYCHOLOGY; SOCIAL PSYCHOLOGY; and related references). (b) A term also applied to various empirical systems of religious and philosophical thought, which propound the doctrine that most physical ailments are curable by faith, or rational exertion of the mind, without the aid of medicine. See CHRISTIAN SCIENCE; EMMANUAL MOVEMENT; FAITH; NEW THOUGHT; SOUL.

MENTAL TESTS. In the early eighties the experimental method was developed in the

study of mental life through the establishment of various psychological laboratories. Certain aspects of this work, though not originally aimed at any practical application, did attract the attention of those interested in abnormal minds, the psychiatrists, and to a lesser extent the attention of those interested in controlling the development of minds, the educators. Gradually there came to be developed in this way methods of investigation somewhat more direct and somewhat simpler than the typical laboratory experiment — methods aimed at probing or measuring mental capacities for diagnostic purposes — and these methods became known as "mental tests."

The things tested were at first mainly sensory vacuity and sensory discrimination, like keenness of vision and ability to notice small differences of pitch; motor ability, like speed of tapping, accuracy of aiming and steadiness; memory in its varied aspects, like memory for nonsense syllables, recognition of forms and colors and capacity to commit to memory; imagination, both passive and active; and especially quickness of association, that is, the speed with which a person, on being given a word, can respond to it with another word related to the first in some prescribed manner. There were also many attempts at measuring capacity to attend, as by the various "cancellation" tests in which the examinee had to cross out, or cancel, designated materials, e.g., every *a* in a page of print; and again by tests in which words, pictures, diagrams, etc., were exposed to view for a very brief time by specially devised instruments. Much was expected, too, from the development in the laboratory of very elaborate apparatus and technique for measuring reaction time, i.e., the speed with which a person could respond by a designated movement to a given signal, e.g., by pressing a telegraph key on seeing a flash of red light — a type of work evidently closely connected with that just mentioned in the measurement of speed of association.

Now, with a few exceptions, these attempts to develop a series of mental tests from the experimental methods of the laboratory psychologist have been worth while, but the progress thus made in measuring special aspects of mental life has been entirely overshadowed in the mind of the lay public by developments in another direction — namely, in the determination by mental tests of levels of general intelligence.

About 1905 the French psychologist, Alfred Binet, reported the result of an attempt made by him in conjunction with a physician, Dr. Simon, to devise a system of tests that would serve to select children of subnormal mentality for segregation for special instruction in special classes. In 1908 and again in 1911 the same authors published improved editions of what is now generally referred to as the "Binet-Simon Scale for Intelligence Testing," or, more briefly, as the "Binet Tests."

The root idea of the Binet scale is to assemble a considerable number of relatively simple short tasks of varied character and to classify these into groups which correspond with the average or "normal" performance of children of a given age. Each "age" is represented by five or six tests. Thus, in the recent "Stanford Revision" of the Binet tests, prepared by Dr. L. M. Terman of Stanford University, an eight-year-old child is given these tasks: counting backwards from 20 to 1; drawing a simple plan for finding a ball lost in a field; answering certain simple inquiries like "What should you do if a playmate should hit you accidentally?"; stating the similarities between things like wood and coal; defining words like balloon, tiger; knowing the meaning of at least 20 of a set of prepared terms.

Others of these mental tasks, to name a few at random, are the counting of pennies, the naming of colors, memory for digits, the interpretation of fables, the detection of absurdities in statements, etc.

In addition to the Terman arrangement American examiners are wont to use editions of the Binet tests prepared by Dr. Goddard, formerly of the Vineland Training School, by Dr. Kuhlmann, of Faribault, Minn., by the late Dr. Huey, formerly of Johns Hopkins University, or by Dr. Wallin of the Saint Louis public schools. Whatever be the precise form employed, the Binet tests yield results, known as the "mental age." If this coincides with the chronological age the child is said to be "normal" or "at age"; if the mental age be higher the child is "mentally advanced," "accelerated," "superior" or "gifted"; if the mental age be lower the child is "mentally retarded," "inferior," "dull" or "subnormal." It is customary to indicate the degree of deviation relatively, by multiplying the mental age by 100 and dividing by the chronological, or life age: then, as will be understood, the "intelligence quotient," or "I. Q.," is 100 or thereabouts for the average or so-called "normal" child, runs below 100 for those below average mentality and above 100 for those above average mentality. Roughly speaking, a child with an I. Q. below 80 may be termed mentally subnormal and above 120 may be termed gifted. About five children in 100 are as inferior and about five are as superior as indicated by I. Q.'s of 80 and 120 respectively.

The amount of activity stimulated by the work of Binet has been truly surprising. Bibliographies prepared by Dr. Kohs list 711 books and articles dealing with the Binet tests up to 1917. Practical application has been most common in the direction of Binet's original aim, i.e., in detecting subnormal mentality and in measuring its degree. Thus, special classes for backward or for subnormal or for actually feeble-minded children are now commonly recruited with the aid of these tests. Similarly in juvenile courts the tests have proved valuable in showing the presence of arrested mental development or low degrees of general intelligence in a large proportion of the delinquents brought to trial.

Among other developments from the original Binet scale should be mentioned the Yerkes-Bridges "Point Scale" in which many of the Binet tests are used, but a method of scoring by points is substituted for the Binet age-level principle.

The usefulness of the Binet method, great as it undeniably is, is purchased at the expense of certain limitations: finer differences in degree or type of intelligence are not well revealed; adults cannot be so successfully tested as children; it cannot be administered simultaneously to a group of persons.

The sporadic efforts of various psychologists to overcome these limitations, to develop a series of group tests to measure the general mental ability of adults, have been powerfully stimulated and co-ordinated by the advent of the war. As a result of preliminary trials in 1917 there has been developed and put into wholesale operation in the army cantonments a system of mental testing that virtually affords a "mental survey" of the distribution of intelligence in all the various groups of men composing a modern army. The system includes, beside the regular group tests, special tests for men who do not speak or write English well, and also various supplementary individual tests for the examination of men who fail to do well in the regular group tests.

It is clear already that the successful use of mental tests in the army, following the success obtained in educational and correctional institutions, will contribute much to the spread of the idea that a measurement of mental ability is as important and as feasible (even if not always as precise) as a measurement of physical ability. The idea that applicants for positions in commercial and industrial organizations — salesmen, clerks, skilled workers, executives — should demonstrate their mental ability by passing suitable mental tests is bound to make rapid headway; similarly, the idea that in our public schools the most efficient instruction demands the segregation of children into groups of approximately like native ability as well as of approximately like school attainments.

These rapid developments in the use of mental tests will mean the creation of a new profession — that of the consulting or the applied psychologist. We may expect that in the not distant future persons of varying degrees of expertness will proffer their services in applying mental tests to the solution of various educational, sociological, medical, industrial and commercial problems. It will become necessary for the sake of this new profession of "human engineering" to warn the public against the charlatans who are already trading on the name of "psychologist." In essence, the situation would appear to be this: the mere quasi-mechanical administering of well-known tests, like the Binet tests, may be entrusted to a person of comparatively meagre professional training; the interpretation of the results of tests demands a fair working knowledge of psychology, a good college training and perhaps a year of special drill in the handling of tests under direction; the devising of tests to meet special needs, the prescription of educational, sociological, penological and other treatment for the modification of human behavior demands not merely these qualifications but also a well-rounded and intensive knowledge of mental life and a systematic knowledge of psychology, in other words, demands the psychologist as well as the "mental tester." We may expect that eventually some sort of public if not legal recognition will be given to these different uses of mental tests and to the qualifications necessary for undertaking them.

Author of 'Manual of Mental and Physical Tests.'

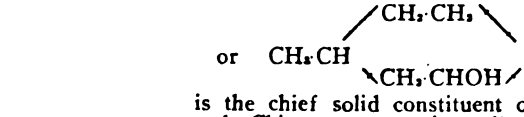
MENTCHIKOF, or MENSHIKOV, Alexander Danielovitch, Russian soldier and statesman: b. Moscow, 6 Nov. 1672; d. Berezov, Siberia, between November 1729 and February 1730. He was of obscure parentage, but succeeded in entering the service of Prince Lefort, the favorite of Peter the Great, later discovering and thwarting a conspiracy against his patron's life. After serving in the campaign of Azof, he accompanied the Tsar on his trip through Holland and England, and on the death of Lefort became his chief adviser. He was created field-marshal and prince by Peter, and prince of the German Empire by Leopold I, and during the absences of the Tsar acted as regent. During the campaign of 1706 he defeated the Swedes at Kalish, and in 1709 was largely instrumental in securing the victory over Charles XII at Pultowa. In 1710, as commander of the Russian forces in the north, he took Riga, occupied Pomerania and Holstein, and conquered Stettin. His arbitrary acts, however, finally resulted in his court-martial by Peter, though the death sentence was commuted to fine. He was one of the principal factors in the accession of Catharine I to the throne (1725–27), and till her death was all-powerful, and even after Peter II succeeded to the throne he had absolute control of the government. He was about to marry his daughter to the young Tsar when he was suddenly overthrown by Dolgoruki (September 1727) and banished to Siberia.

MENTHACEÆ, sometimes known as *Labiatæ,* a family of dicotyledonous herbs or shrubs distributed mainly in temperate climates. The species, of which there are more than 3,000 grouped in about 150 genera, are characterized by four-cornered stems; opposite, exstipulate leaves; mostly two-lipped flowers generally in whorls, cymes or heads; and one to four achenes in a persistent calyx. They are noted for their volatile oils, which in many instances are of economic importance either as perfumes or as flavorings. Some species are cultivated for ornament, but probably the best known are those which have been used for centuries for flavoring food, such as sage, thyme, savory, marjoram, mint, balm and basil (qq.v.). The kinds used most frequently in perfumery are probably lavender, rosemary and patchouli. One species, variously known as Chinese or Japanese artichoke, chorogi and knotroot, *Stachys sieboldi,* yields edible tubers which are eaten raw or cooked in Asia, France, and to a small extent in the United States. Many labiates have at some time been reputed medicinal but are now rarely used except to disguise

the taste of disagreeably flavored drugs. The best-known genera represented in the United States are *Nepeta* (catnip), *Mentha* (mint), *Origanum* (marjoram), *Salvia* (sage), *Thymus* (thyme), *Marrubium* (horehound), *Satureia* (savory), *Lavandula* (lavender), *Monarda* (horsemint), *Ocimum* (basil), *Melissa* (balm), *Scutellaria* (skullcap), *Lamium* (dead nettle), *Calamintha* (calaminth), *Teucrium* (germander), and *Trichostema* (blue curls).

MENTHENE. See METHANE.

MENTHOL, peppermint camphor, $C_{10}H_{19}OH$,



is the chief solid constituent of the Japanese and Chinese peppermint oil (from *Mentha piperita* Linne, or *Mentha Arvensis*). American and English oils contain menthol in much smaller quantities, and the menthol obtained from these sources is said to differ from Chinese or Japanese menthol in its crystalline structure.

The commercial product is chiefly obtained from the Japanese oil of peppermint, which sometimes contains from 70 to 90 per cent of menthol. For the extraction of menthol the oil is cooled to a very low temperature, when prismatic crystals separate out. The yield is considerably increased by subjecting the peppermint oil to fractional distillation and then cooling the residue. A number of substances are sometimes used to adulterate the commercial product; among these may be mentioned hydrated magnesium sulphate, paraffin, wax, thymol and various inorganic compounds. The pure substance should possess a sharp melting point and should completely volatilize when heated on a water-bath in an open vessel. Menthol separates in long prismatic crystals. It melts at 43° C., and boils at 212° C. The crystals possess a strong peppermint odor and a cooling taste. It dissolves readily in alcohol, ether, chloroform, carbon bisulphide, strong acetic acid and in a number of oils. Its solubility in water is very slight but the water solution possesses the odor and taste of the substance.

The molecule of menthol contains three asymmetric carbon atoms, and a number of stereo-isomerides are possible; the commercial product consists mainly of the laevo modification. Menthol exhibits the properties of a saturated secondary alcohol. Careful oxidation with chromium trioxide converts it into the corresponding ketone, menthone. With acids it yields esters. With phosphorus pentachloride it forms menthyl chloride. Heated with phosphoric anhydride or zinc chloride it forms menthene, $C_{10}H_{18}$. With copper sulphate it yields cymene, and with hydriodic acid, in the presence of phosphorus, it forms hexahydrocymene.

Menthol acts as a mild local anæsthetic. In the form of cones or in solution in various solvents it has been used as a remedy for neuralgic headache, toothache, catarrh of the nose, asthma, diphtheria, diarrhœa, sciatica and tuberculosis of the bone. Sometimes it is also employed as the chief ingredient in atomizers, inhalers, toothpastes, ointments, liniments, and in a number of preparations for internal use.

V. S. BABASINIAN,
Professor of Chemistry, Lehigh University.

MENTONE, mĕn-tō'nĕ (Fr. MENTON, mŏñ-tôñ), France, a seaport town and health resort on the Mediterranean, in the department of Alpes-Maritimes, near the Italian frontier, and 15 miles northeast of Nice. It is charmingly situated on a promontory about the middle of a bay five miles in circuit, encircled by abruptly rising hills. The ancient walls of the feudal town are still standing, and there the streets are dark and crooked. The new part of the town, with numerous fine villas, stretches along the base of the hill on which the old part is situated, parallel to the sea. The climate of Mentone is mild and equable; it is rare that the thermometer descends as low as the freezing point, or rises higher than 86° F., hence making Mentone a favorite resort for persons in delicate health. There is a considerable trade in fruit, in flowers and leaves used in the manufacture of perfumes, and in olive-oil. The town of Mentone belonged to the principality of Monaco from 1346 to 1860, but in the latter year was ceded to France. In the vicinity, but on Italian territory, are the grottoes of Baoussé Rousse, popularly known as the Caves of Mentone, famous for the valuable evidences of prehistoric man that they have yielded. Pop. (of commune) 18,000.

MENTOR, according to Greek legend, the faithful friend of Ulysses, who entrusted to him the care of his domestic affairs during his absence in the war against Troy. The education of the young Telemachus fell to his charge, and when the latter set out on his voyage in search of his father Minerva accompanied him under the form of Mentor (Odyssey, ii, 390; iii, 12, etc.), acting the part of a prudent and experienced counsellor to the young hero. This character of a sage adviser is more fully developed in the Télémaque of Fénelon, in which Mentor plays a conspicuous part.

MENZALEH, mĕn-zä'lĕ, or **MENZALA,** Egypt, a large lake or lagoon (one of several at the Nile delta), extending from Damietta to the Suez Canal, and running parallel with the Mediterranean, from which it is divided by a narrow slip of land, from 2 to 12 miles in breadth. Length of the lake from northwest to southeast, about 50 miles; average breadth, about 20 miles. It receives the Pelusiac and Tanitic branches of the Nile, and communicates with the sea by three openings called Dibeh, Gemileh and Om Farejeh. The lake is of comparatively recent origin, and covers what was a fruitful district of the delta, having formed through neglect of the dams. There is a small town of the same name on the south side of the lake. The Suez Canal cuts into its eastern edge from north to south.

MENZEL, mĕn'zĕl, **Adolf Friedrich Erdmann von,** German artist: b. Breslau, 8 Dec. 1815; d. Berlin, 9 Feb. 1905. In 1830 his parents settled in Berlin, where his father had a lithographic studio, and where the son studied a little in the academy and more by himself. At 18 he published a cycle of lithographs called 'An Artist's Wanderings,' which immediately attracted attention; four years later he had begun to draw historical scenes from the past of Brandenburg and had commenced painting in oils with 'Checker-Players' (1836) and 'Judgment' (1837). About the same time his work as an illustrator opened up with the 400 pictures

for Kugler's 'Frederick the Great' (1840), in which Menzel showed himself original, dramatic and historically correct. This vein he followed out in his 200 illustrations for the 'Works' of Frederick the Great, and in 600 more accompanying a work on the army of Frederick the Great (1856); as well in his oil paintings, a dozen or more, of various scenes in Frederick's life. A trip to Paris in 1867, so the French critics claim, worked a change in Menzel's methods, so that he applied himself more to problems of light and shade. After 1890 he used color less and less and in his pencil drawing broke away from mere line to the use of a cloudy treatment. He was one of the greatest of German artists of his day; and in 1899 he received the Order of the Black Eagle, conferring hereditary nobility. Apart from his historical pictures, mention should be made of the 'Modern Cyclops' (1875), the interior of a Silesian rolling mill, with excellent lights, and of social satires like 'Carnival Morning' (1885). Consult Jordan, 'Das Werk Adolf Menzels' (1895); and lives by Sondermann (1895), and Knackfuss (1897); Singer, 'Drawings of Adolf von Menzel' (London 1908).

MENZEL, Wolfgang, German author: b. Waldenburg, Silesia, 21 June 1798; d. Stuttgart, 23 April 1873. He studied at Jena and Bonn, became a follower of F. L. Jahn and the Turnerei, and was for four years schoolmaster at Aarau in Switzerland. In 1825 he returned to Germany, having already made himself known to the literary world by his 'Elastic Verses' (1823). He edited and contributed to magazines, and wrote a very great number of works, poems, romances, histories, criticisms, political polemics and Christian theology. From 1826 to 1848, and again later, he was editor of the *Litteraturblatt* in Stuttgart. His chief writings include histories of Germany (1825), German literature (1827), German poetry (1858) Europe (1853–57), and the world ('Universal History' 1862–72). He also produced a work of mythological research (1842), a book on the pre-Christian doctrine of immortality (1869), and autobiographical memoirs (1876). He was often involved in controversy, assailing with equal zeal theological rationalists and political radicals. His attacks upon Gœthe and other authors were fully equaled for virulence by the criticisms upon Menzel himself, made by Heine and some of the younger German writers.

MEQUINEZ, or **MEKINEZ,** Africa, a town of Morocco, 40 miles southwest of Fez. It is one of the capitals and the sultan maintains there a palace. There is a historic mosque and many other fine buildings, especially those of the 18th century, when the town was the preferred residence of Sultan Muley Ismail. There is an ancient city wall with nine gates. There are tanneries and potteries. Pop. 30,380.

MEPHISTOPHELES, mĕf-ĭs-tŏf'ē-lēz, a name for the devil, which has been made popular by Goethe's 'Faust.' He was also a chief character in Marlowe's 'Dr. Faustus.' Goethe derived it from an old popular legend, in which it is spelled *Mephistophiles* or *Mephistophilis*. The etymologies of the word are as various as the spelling. Some suppose it to be an irregularly formed Greek compound from the negative *mē; phōs*, light; and *philos*, loving, thus signifying "not loving the light." Others surmise that it may be derived from the Latin *mephitis* and the Greek *philos*, in which case it will signify literally "loving the mephitic vapors of hell." The Mephistopheles of Goethe has little in common with the devil of the popular imagination. He appears, especially in the original form of the drama of Faust, as a real man of flesh and blood, who only preserves those traits of the popular devil of the Middle Ages which are compatible with a true human individuality — as the companion of Faust, as a selfish and malevolent votary of pleasure, always looking to the real, and bringing back Faust by cold and heartless irony, from barren speculation to the enjoyment of the present life.

MER DE GLACE, mār dè glās, France, an Alpine glacier on the northern slope of Mont Blanc, with an area of 16 square miles and an extreme length of about nine miles. It is formed by the confluence of three branches called the Glacier du Géant, the Glacier du Lechaud and the Glacier du Talèfre and is noted for its beautiful scenery. It ends as the Glacier des Bois whence flows the Arveyron River, in the valley of Chamouni. From the village of Chamouni the Mer de Glace is easiest visited and Mont Blanc ascended. The glacier has an average flow of two feet a day during summer and autumn.

MERAMEC SPRING, an unusually large spring in Phelps County, Mo., about seven miles south of Saint James. The water flows as an underground stream in limestone and emerges as a great spring with a flow averaging 125 cubic feet per second.

MERAN, mā-rān', Austria, a celebrated health resort in Tyrol, charmingly situated on the river Passer, near its entrance into the Adige, at the foot of a hill called the Küchelberg. It is the chief town of a small district of the same name. It consists of an old and a new town, the latter with handsome villas and hotels, and numerous fine residences and old castles in the neighborhood. The old town is mainly on the Laubengasse, which is a long, narrow, winding street. The Polish church and other buildings date from the 14th and 15th centuries. It is believed to have been settled originally in the 9th century. Lying in a sheltered situation on the southern slope of the Alps, it possesses a mild and equable climate, and is much frequented in winter by invalids with pulmonary affections. Permanent population 11,570.

MERCADANTE, Saverio, sā-vā'rē-ō mĕr-kā-dān'tā, Italian composer: b. Albamura, 26 June 1797; d. Naples, 17 Dec. 1870. He studied music at the college of S. Sebastiano in Naples under Zingarelli. From flute and violin he turned to vocal music; won great success with a cantata 'L'Unione delle Belle Arti' in 1818, and with an opera 'L'Apoteosi d'Ercole' in 1819; was made chapel-master of the Novara Cathedral (1833) and director of the Naples Conservatory (1840); and in 1862 became totally blind. He wrote many masses and other ecclesiastical music, such as 'The Seven Last Words'; but is best known for his operas, of which the following, out of a total of 50, should be mentioned: 'Elisa e Claudio,' 'Il Bravo,' 'Il Giuramento,' 'I Briganti,' and 'Le due illustri Rivali.'

MERCANTILE AGENCY, a business enterprise, usually an incorporated company, which agrees to furnish subscribers who pay a yearly fee, with information as to the business responsibility, financial standing and credit rating of business houses, whether conducted by private individuals, firms or corporations. They also sometimes have a department for the collection of debts, and sometimes they sell two or three different services, at different prices. The business originated in the United States in 1837, following a financial panic, it being recognized that it was necessary for business houses to obtain better information in the giving of credits. Lewis Tappan was the founder of the first mercantile agency in New York City. The most conspicuous concerns now in the business are R. G. Dun and Company and the Bradstreet Company of New York; a good rating by either is highly prized by merchants. They issue large books, usually once a year, and loan them to subscribers for their own use; in these books appear lists of addresses and the kind of business, followed by letters or signs indicating their financial responsibility, their promptness in paying bills, etc. Subscribers are also entitled to send in for special reports, giving more detailed or later information. The agencies obtain their information — (1) direct from the parties in question, sending a representative to interview them, and asking for a statement, but in no case indicating who wants to know their standing; (2) by inquiry of the concerns from whom the party buys goods; (3) by exchange of information between other agencies or people likely to know their reputation. Concerns that are noted in the agency books as prompt pay, or as being worth $5,000 or more, are usually spoken of as "rated" houses. The highest rating is usually worth $1,000,000 or more, and prompt pay.

In addition to agencies doing a general confidential reporting business on all classes of business houses all over the country, there are others that confine themselves to a particular industry, as Typo, which reports on the houses engaged in printing, publishing and allied industries. The laws recognize that such exchange of information is legitimate, and essential to the conduct of business on a credit basis, and an action for libel in sending out a bad report will not hold against an agency that conducts its business in a fair manner. However, the reports have to be made confidential; if promiscuously circulated, they might become libelous. For it unquestionably happens that at times the agencies report concerns as having less money and less standing than they are entitled to, and they can make mistakes. But as long as they try to be fair, and send out their reports under the seal of confidence, the law protects them. Abuse of the system, to revenge, spite or for blackmail, is practically unknown. The agencies are more apt to err in the matter of continuing to rate concerns too high when their financial standing is impaired. When large concerns have failed it has frequently happened that the mercantile agencies had continued to report them in good standing up to the last. Therefore the credit men of the large houses do not pin their faith entirely to commercial ratings, but use other means wherewith to know the truth. In the very large cities there are credit men's associations, where they confer as to ways and means of keeping credits safe. While there is opportunity for better and more accurate reporting as to credits, it is true that the mercantile agencies of America handle their business extremely well, and constitute one of the most important links in the artificial chain between the industries of the nation. Consult Errant, 'The Law Relating to Mercantile Agencies' (1889); Reinhard, 'A Treatise on the Law of Agency' (1902).

MERCANTILE LAW. See LAW, MERCANTILE.

MERCANTILISM. See ECONOMICS.

MERCANTINI, Luigi, Italian poet: b. Ripatransone, in the Marches, 20 Sept. 1821; d. Palermo, 18 Nov. 1872. Against his inclinations he was intended by his father for the priesthood, but he deserted that vocation before taking orders and turned to school teaching. For a time he was professor of Italian and Latin literatures in Sinigaglia. He wrote a number of patriotic songs, including "I tre Colori," but gained his greatest popularity by the song which is now the Italian national anthem or "Inno di Garibaldi." See GARIBALDI HYMN.

MERCAPTANS (Latin, "taking up mercury") or **THIO-ALCOHOLS,** *in chemistry* a large class of substances having the same constitution as the alcohols, but differing from them by having the oxygen atom in the hydroxyl replaced by sulphur. They are oily liquids or crystalline solids having an offensive, garlic-like odor, and are all insoluble in water. They possess acid tendencies that are more marked than those of the alcohols, and combine with metallic oxides to form salts which are known as "mercaptides." They combine with especial facility with mercuric oxide and take their name from this circumstance. Ethyl mercaptan is the best-known members of the series, and it is this substance that is understood when "mercaptan" is spoken of, without further qualification. Ethyl mercaptan, C_2H_5SH, is prepared by acting upon ethyl chloride, C_2H_5CL, with potassium hydrosulphide, HKS; the potassium atom and the ethyl radical changing places as indicated by the equation $C_2H_5Cl + HKS = C_2H_5SH + KCl$. Ethyl mercaptan is a colorless, mobile liquid, boiling at 99° F. It is very inflammable, burning with a blue flame, and it mixes readily with alcohol and ether, though only to a very slight extent with water. Like the other mercaptans, it forms salts with the oxides of the metals, the hydrogen atom that is associated with the sulphur being the one that is replaced by the metal. The mercury salt, $Hg(S.C_2H_5)_2$, may be prepared very readily by agitating the mercaptan (or its alcoholic solution) with red oxide of mercury, HgO. Its formation is attended by the liberation of considerable quantities of heat, and the mercaptide itself is obtained in the form of soapy white scales. All of the metallic mercaptides are decomposed by hydrochloric acid. The mercaptans of fatty radicals all give a fine green color when treated with a solution of isatin in strong sulphuric acid and this reaction (as well as their insufferable smell) is used as a test for their presence.

MERCATOR, mėr-kā'tȯr, **Gerardus** (Latinized form of GERHARD KREMER), Flemish mathematician and geographer: b. Rupelmonde, Flanders, 5 March 1512; d. Duisburg, 2 Dec. 1594. He studied at Louvain, and became a lecturer on geography and astronomy, making his instruments with his own hands. In 1544 he was arrested for heresy, being liberal in his views. He escaped, but 42 of those arrested with him were burnt alive. Recommended to Charles V, Mercator entered into the emperor's service, and executed for him a celestial globe of crystal, and a terrestrial globe of wood. In 1559 he retired to Duisburg and received the title of cosmographer to the Duke of Juliers. His last years were devoted to theological studies. He is known as the inventor of a method of projection called by his name, in which meridians and parallels of latitude cut each other at right angles, and are both represented by straight lines, which has the effect of enlarging the degrees of latitude as they recede from the equator. The method is convenient in mapping small areas. His first maps on this projection were published in 1569; the principles were first explained by Edward Wright, in 1599, in his 'Corrections of Errors in Navigation,' whence the discovery has sometimes been attributed to him. His 'Tabulæ Geographicæ' (1578) is the best edition of the maps of Ptolemy. See MAP.

MERCATOR'S CHART, or PROJECTION. See CHART.

MERCED, Cal., city and county-seat of Merced County, on the Atchison, Topeka and Santa Fe, the Southern Pacific and the Yosemite Valley railroads, 150 miles southeast of San Francisco. It lies in the valley of the Joaquin and Merced rivers, has a library, sanitarium, county hospital and courthouse. It has extensive farming, dairying, fruit growing and livestock interests. Pop. 3,102.

MERCEDES, mėr-sā'dās, Argentina, town in the province of Buenos Aires, on the Pacific Railroad, about 50 miles west of the city of Buenos Aires. In 1779 it was founded as a military station. An Irish colony settled here about 1800. Mercedes is in a region where the chief occupation is raising sheep and cattle. It has several manufacturing establishments, among which are flour-mills, soap factories and cattleyards. The shipments are principally wool, hides and flour. The town has a public library and a college. Pop. about 22,782.

MERCEDES, Uruguay, a town in the district of Soriano, on the Rio Negro, about 10 miles from where it empties into La Plata, and about 75 miles north of Buenos Aires. Pop. 15,667.

MERCENARIES, or STIPENDIARIES, foreigners or others who received pay for their services as soldiers, especially as distinguished from government soldiers or those owing military service to the crown or nation. Hired professional soldiers appear very early in the history of military organization. Foreign mercenaries appear in the armies of Alexander the Great and the Romans. They were common in all armies, but generally engaged for a single campaign only. In England, Harold had a body of Danes in his army when he defeated the Norwegian king — the hus-carls, a body originally established by Canute. William III had for some time a body of Dutch troops in his pay after he became king of England; and throughout the 18th century Hessian and Hanoverian regiments were constantly in the pay of the British government for temporary purposes. Hessians fought for Great Britain in the Revolutionary War; and the landgrave of Hesse, who sold his troops at so much a head, received upward of $2,500,000 for Hessian soldiers lost in that struggle. Americans have fought as hired soldiers in China, South Africa and in nearly all the countries of Central and South America. They are generally known as "soldiers of fortune." Most of the officers in the regular Chinese army are either Englishmen or Americans. But most famous of all mercenaries were the Swiss soldiers, who were hired, sometimes by the cantons themselves, over all Europe, and formed many famous body guards. They were long employed by the French monarchs; and the Vatican at Rome still has its Swiss guards.

MERCER, mėr'sėr, **Henry Chapman,** American anthropologist: b. Doylestown, Pa., 24 June 1856. He was graduated from Harvard in 1879; was curator from 1894 to 1897 of American and prehistoric archæology at the University of Pennsylvania; honorary member of the United States Archæological Commission, Madrid, 1893. He was editor for anthropology in *American Naturalist,* 1893 to 1897; made extensive investigations and studies in anthropology in America, discovering serveral unknown extinct species, and 1897 to 1917, made and presented to the Historical Society of Bucks County, Pa., an extensive collection of objects illustrating the Colonial and early history of the United States by means of the implements and handiwork of the pioneer settlers. In 1916 he built and presented to the society a fireproof museum for preserving the above collection. He established a pottery at Doylestown, Pa., in 1898, experimented upon and developed the processes of the Pennsylvania Germans for making and decorating pottery, inventing in 1899 a new method of manufacturing tiles for mural decoration and in 1902 a new process for making mosaics; was awarded the Grand Prize, Saint Louis Exposition, 1904, and bronze medal for archæological work, Madrid, 1893; also bronze medal for tile work, Massachusetts Society of Arts and Crafts. He is a Fellow American Association for the Advancement of Science and member of the American Philosophical Society, the Academy of Natural Sciences of Philadelphia, the Numismatic and Antiquarian Society of Philadelphia, Geographical Society of Philadelphia. He has published 'Lenape Stone' (1885); 'Hill Caves of Yucatan' (1896); 'Researches upon the Antiquity of Man in the Delaware Valley and Eastern United States' (1897); 'Tools of the Nation Maker' (1897); 'The Bible in Iron or the Pictured Stoves and Stoveplates of the Colonial United States' (1915).

MERCER, Hugh, American general: b. Aberdeen, Scotland, about 1720; d. near Princeton, N. J., 12 Jan. 1777. Educated as a physician, he served as surgeon's assistant in the army of the Young Pretender at the battle of Culloden. Emigrating in 1747 to America, he settled in Virginia, and resided there, in the

practice of his profession, until 1755, when he volunteered in the expedition led by Braddock to Fort Duquesne. At the outbreak of the Revolution he promptly joined the Continental army, and obtained the rank of brigadier-general. He subsequently accompanied Washington on his retreat through New Jersey, and rendered valuable assistance at the battle of Trenton. In the succeeding action at Princeton he was mortally wounded and died a week later. Mercer County, N. J., was named in his honor.

MERCER UNIVERSITY, Macon, Ga., is an institution having its genesis at a meeting of the Baptist Associations of Georgia, at Powelton, 27 June 1822, held to discuss, among other matters, the question of ministerial education. In 1827, at a similar meeting, held in Washington, Ga., the project was further discussed, and in 1829 Josiah Penfield, of Savannah, bequeathed $2,500 as a fund for education, on condition that the Baptists should raise an equal amount. This was promptly done, and two years later it was resolved to establish "a Classical and Theological School . . . open only for those preparing for the ministry." It was soon seen, however, that the school could not be so restricted, and in 1832 this bar was removed. Mercer Institute was established on a site of 450 acres, at Penfield, in January 1833, with 39 students,—"Penfield" in memory of Josiah Penfield, and "Mercer," after Dr. Jesse Mercer, early conceiver and patron of the school. In 1837 a charter was obtained giving the institution collegiate rank and changing its name to "Mercer University." Thereafter it grew steadily. The successive presidents were B. M. Sanders; Otis Smith; John L. Dagg; N. M. Crawford; H. H. Tucker; A. J. Battle; G. A. Nunnally; J. B. Gambrell and P. D. Pollock. President P. D. Pollock was a most efficient president for seven years, and after a lingering illness died in office. Following him, Prof. Charles Lee Smith, of Missouri, was elected president, served one year and then resigned. Following him, Dr. S. Y. Jameson, of Georgia, was elected president and served efficiently for seven years, resigning June 1913. Prof. J. F. Sellers of the department of chemistry of Mercer University was appointed acting president for one year. June 1914 the board of trustees elected Dr. W. L. Pickard president.

The registration of Mercer University is now over 400; the departments are college of arts and sciences, law, pharmacy, education and a pre-medical course. The university gives the degrees of bachelor of science, bachelor of arts, master of arts, bachelor of law, pharmaceutical chemist and graduate of pharmacy, accredited certificates in education, receives and gives credit on the pre-medical course for a medical degree, and a B.S. degree. The university has the same requirements for entrance and graduation as all the State universities of the South. The campus has in it about 60 acres and nine large buildings, besides a number of cottages. The working plant is valued at $250,000, and the endowment in round numbers is about one million dollars. The work done in Mercer University is fully accredited at such institutions as the University of Michigan, Columbia University, New York, and leading institutions in America and Europe. It is justly regarded as one of the most potent factors in the educational life of Georgia and the South, and is increasing in the number of students and material equipment from year to year. The faculty in 1918 numbered 23.

MERCERIZING AND MERCERIZED COTTON.—A process invented by John Mercer, of Lancashire, England, for treating cotton fibre or fabrics. The system was first patented in 1851. The process consists in steeping the cloth in a solution of caustic alkali. The cloth shrinks about one-fourth and takes more brilliant colors in dyeing than unmercerized cotton goods. Cotton may be mercerized either in the yarn or in the cloth, and a variety of machines are made for this purpose. Some of these machines operating on the cloth employ a tension to obviate same after shrinkage. This gives a greater yardage, but it reduces the gloss. The name has sometimes been incorrectly extended to sizing of cloth to give it a better sheen. True mercerizing gives a lustre to the cotton cloth, because the fibres are drawn closer and flattened, presenting a smooth surface that reflects the light. A variation in the caustic soda process is employed to give the modern crimped or crepe effects. Consult Murphy, 'The Textile Industries' (London 1912).

MERCERSBURG, mĕr'sĕrz-bĕrg, Pa., borough, in Franklin County; at the terminus of a branch of the Cumberland Valley Railroad, about 70 miles southwest of Harrisburg. It was settled in 1730 and was originally called Black Town. It was incorporated in 1821. The borough was enlarged in 1901. It is in a farming section of the county, but has some coal and iron interests. It was formerly noted for its educational institutions, which were under the auspices of the German Reformed Church in America. It is the seat of the Mercersburg Academy, and was the home of James Buchanan (q.v.). Pop. 1,410.

MERCERSBURG THEOLOGY, a school of religious philosophy founded by F. A. Rauch of the German Reformed Church in 1836, the work being taken up by John W. Nevin (q.v.) and Philip Schaff (q.v.). The name comes from the Mercersburg (Pa.) Theological Seminary of the German Reformed Church, where the teaching of this system spread. The Mercersburg theology urged that the Church was not a voluntary society of believers but a historic and spiritual growth — an attitude showing markedly less hostility to the Roman Catholic Church; that old confessions cannot express the modern faith of the Church; that the sacraments are more than symbols; that church worship should be orderly — hence the 'Liturgy' (1858) and 'Order of Worship' (1866); and that religious education is of prime importance. The Mercersburg movement infused new life into the German Reformed Church. Consult Appel, 'Life of John Williamson Nevin' (1889).

MERCHANT, Francis Walter, Canadian educator: b. Oil Springs, Ontario, 1855. He received his education at Toronto University, taught for many years in high schools and collegiate institutes. In 1900–08 he was princi-

of the London (Ontario) Normal School; from 1908 to 1911 was chief inspector of schools in Ontario and in 1911 became director of industrial and technical education in the province of Ontario. He is a senator of Knox College, Toronto.

MERCHANT MARINE OF THE UNITED STATES. The merchant marine of the United States — that is to say, the shipping on ocean, lake and river engaged in the carrying of merchandise, mail and passengers — is the second largest shipping in the world, only the fleet of Great Britain exceeding it. By far the larger part of this American shipping has long been employed in domestic navigation between one American port and another. But the shipping registered for foreign commerce, which after a splendid growth began to decline before the Civil War, began again to increase in 1914 with the Great War in Europe.

America throughout most of its history has been distinctively an adventurous and successful maritime country. For many years after the founding of Jamestown and Plymouth the construction of ships for coastwise and overseas trade was the chief manufacturing industry pursued upon this continent. There was an abundance of stout timber near the water's edge, and the pioneers brought a love of the sea from Great Britain, Sweden and Holland.

Maritime spirit, stirred by necessity, was especially active in the northern colonies. Lord Bellamont, colonial governor, declared in 1698: "I believe I may venture to say there are more good vessels belonging to the town of Boston than to all Scotland and Ireland, unless one should reckon the small craft, such as herring boats." In the colonial era the sea was the easiest highway connecting the long range of settlements that clung to the Atlantic Coast. Small craft — ketches and schooners — ran along shore and to the West Indies, and brigs and ships to the British Isles, France, Spain, Portugal and the Mediterranean. Colonial shipyards made swift improvement in rigs and models, and found a market for their craft abroad. Out of 1,332 vessels built in Massachusetts between 1674 and 1714, 239 were sold for British or foreign registry. In 1724 Thames builders complained that their trade was being destroyed by the emigration of their best mechanics to America.

Shipbuilding and navigation were the most energetic and profitable of vocations, and were particularly encouraged by colonial governments. Bounties were granted for the construction of ships, and shipwrights were exempted from compulsory military service. To spirited youth the sea made irresistible appeal. Sir Joshua Child, chairman of the British East India Company, in his discourse on trade lamented that there were "none so apt as the North American colonies for the building of ships; nor none comparably so qualified for the breeding of seamen, not only by reason of the natural industry of the people, but principally by reason of their cod and mackerel fisheries, and in my opinion there is nothing more prejudicial and in prospect more dangerous to any mother kingdom than the increase of shipping in her colonies, plantations, or provinces."

In response, the British Parliament prohibited the importation of Continental products into the colonies except in English-built ships, and even sought to destroy the colonial trade with the West Indies. The colonists retaliated by forming associations to boycott British manufactures. Against such resistance the repressive British laws failed, and the merchant ships and sailors of America so steadily increased that at the outbreak of the Revolution there were more people in northern New England engaged in shipbuilding and navigation than there were in agriculture.

These merchant ships and sailors proved a powerful resource in the war for independence. The Continental navy as a whole was weak and unsuccessful. In 1781, the seventh year of the war, there survived only nine Continental cruisers carrying 164 guns, while American privateers, converted from merchant ships and owned and managed by merchants, numbered 449, carrying 6,735 guns. These private-armed ships, with merchant officers and crews, in the course of the Revolution seized or destroyed three times as many British vessels as did the regular Continental sloops and frigates. And in the year 1777, when the battles of Bennington and Saratoga were fought, the American merchant seamen afloat in private-armed ships nearly equalled the strength of the army under the immediate command of Washington. These swarming American privateers cruised not only in mid-Atlantic but in the British Channel, the Irish Sea and all around the coasts of the United Kingdom. Their harrying of British commerce brought a stream of arms and supplies to the Continental government and did more than Paul Jones' victories in the *Ranger* and the *Bon Homme Richard* to impress the governments of France and Holland with the vigor and audacity of the American people and the probable success of the American cause.

From dread of the maritime strength of the new republic the British government made war on the American merchant marine as soon as the Revolution itself had ended. An Order in Council barred American ships from the British West Indies, and forbade the importation into the United Kingdom of all but a few products if conveyed in American vessels — it being insisted further that these American vessels should bring only the products of the particular States in which they belonged. British shipowners were forbidden to purchase American-built vessels, which in 1775 were supposed to constitute one-third of the British mercantile marine. "The ministry," it was declared, "suppose they have now put a finishing stroke to the building and increase of American vessels." Lord Sheffield argued that the Barbary pirates of North Africa, preying on defenseless American merchant craft, were really a blessing to Great Britain, and London merchants told Franklin that "if there were no Algiers it would be worth England's while to build one."

Until the new Federal government was established in 1789, British shipowners dominated American ocean commerce. Our merchant shipping registered for foreign voyages amounted to only 123,893 tons in this year 1789, and 76 per cent of our own imports were conveyed beneath foreign colors.

Striking Early Growth of American Tonnage.— Washington and his colleagues felt that this condition was perilous and intolerable, and

Adams, Jefferson and Madison prevailed upon the first Congress under the new Constitution to embody in its very first act, passed on 4 July 1789, "for the support of the government, the discharge of the debts of the United States and the encouragement and protection of manufactures," an important clause allowing a discount of 10 per cent of the tariff duties on all goods imported in ships built and owned by American citizens. Further and heavier rebates were allowed on teas imported direct from the East Indies in American vessels — for the purpose of encouraging an American East India fleet — and, moreover, a sharp preference in tonnage duties was granted to all American vessels, which practically barred foreign vessels from the coastwise carrying trade.

Five years later, in 1794, the discount of 10 per cent of the tariff duties on goods imported in American vessels was changed to an addition of 10 per cent to the duties on goods imported in foreign vessels. For many years thereafter this powerful government preference for American shipping remained the distinctive national policy of the United States. This was justified not only by commercial considerations but by patriotic regard for the national defense. Jefferson, as Secretary of State, wrote in 1794: "To force shipbuilding is to establish shipyards; is to form magazines; to multiply useful hands; to produce artists and workmen of every kind who may be found at once for the peaceful speculations of commerce and for the terrible wants of war."

What followed this vigorous maritime protectionism of the fathers of the republic was a growth of American shipping well described by a historian of the period as "without parallel in the history of the commercial world." American merchant tonnage registered for overseas voyages rapidly advanced from 123,893 in 1789 to 411,438 in 1792, and to 667,107 in 1800, while the proportion of American imports and exports conveyed in American vessels rose from 23.6 per cent in 1789 to 76.4 per cent in 1792 and to 89 per cent in 1800.

The Napoleonic wars had a double effect upon American shipping. In the first place, these wars gave a great opportunity to America, the chief of neutral carriers. But, on the other hand, and offsetting this advantage, both the British and the French governments began an unscrupulous war of seizure and spoliation on American ships wherever bound, while Great Britain ruthlessly impressed American seamen, native and naturalized, into her naval service. Yet American shipping, in spite of all difficulty and danger, grew and prospered until in 1810 the fleet registered for foreign commerce amounted to 981,019 tons, conveying 91.5 per cent of our imports and exports. New York, Philadelphia, Boston and Salem were sending ships to the East Indies. In 1789–90 the *Columbia* made her famous voyage to the Northwest coast and the Orient — the first American merchantman to circumnavigate the globe.

When, tardily, in 1812 the American government declared war on Great Britain, principally to revenge the wrongs of our sailor-citizens, the merchant ships and seamen proved again a tremendously effective weapon, as they had in the first war for independence. The United States navy in the War of 1812 comprised on the ocean only 23 vessels of all classes, mounting 556 guns. These 23 men-of-war captured 254 naval and merchant craft of the enemy. But American merchantmen armed and converted into privateers in 1812–15 numbered 517, mounting 2,893 guns. These privateers, with their merchant crews, took 1,300 prizes, valued with their freights at nearly $40,000,000, or five times the number of the prizes of our regular ships-of-war. Again Yankee shipowners and sailors carried the conflict right to the coasts of the United Kingdom, and attacked rich convoys wherever they could be found. The merchants of Glasgow in September 1814 protested to the Admiralty that "a horde of American cruisers should be allowed, unresisted and unmolested, to take, burn or sink our own vessels in our own inlets and almost in sight of our own harbors." It was the exploits of the privateers chiefly, and not the loss of a dozen frigates and sloops in single-ship duels, that quickly made the British mercantile community thoroughly weary of this second war with the Americans.

British diplomacy at the close of the War of 1812 proved more successful than British armed strength. In a commercial convention framed after the Treaty of Ghent, the United States was persuaded to embark upon a plan of miscalled reciprocity in which both governments bound themselves to grant no more preference to their own ships in the direct trade between American ports and the United Kingdom. At the same time, however, the British government craftily reserved to itself the West India trade and barred American ships out of all but direct trade with British East India possessions. This costly defeat of American diplomacy was sharply resisted by national lawmakers, but the plea prevailed that the terms of the convention really bound the United States and must be confirmed by Congress. Immediately there came a decline in the American merchant marine, and an increase in British maritime prosperity. Conditions were nominally equal but actually unequal, for British vessels could make triangular voyages to the United States, to the West Indies and back to Europe, while American ships could not. American tonnage suffered further by the conclusion of so-called reciprocity agreements with other maritime states of Europe, whose participation in our own carrying trade greatly increased, and whose vessels it was discovered, could be operated at a lower cost because of the lower range of European wages.

But American shipowners did not abandon the uneven struggle. When they lost trade in the north Atlantic they turned to the Northwest coast, to the East Indies and to the mid-Pacific archipelagoes. They built larger and swifter ships which could make three voyages while dull Europeans were making two. American registered shipping, which had fallen since the War of 1812 to 581,230 tons in 1819, rose steadily to 701,517 tons in 1827. In that year the London *Times* said:

"It is not our habit to sound the tocsin on light occasions, but we conceive it to be impossible to view the existing state of things in this country without more than apprehension and alarm. Twelve years of peace, and what is the situation of Great Britain? The shipping interest, the cradle of our navy, is half ruined. Our commercial monopoly exists no longer; and thousands of our manufacturers are starving, or seeking

redemption in distant lands. We have closed the Western Indies against America from feelings of commercial rivalry. Its active seamen have already engrossed an important branch of our carrying trade to the Eastern Indies. Her starred flag is now conspicuous on every sea, and will soon defy our thunder."

Of this era Prof. J. R. Soley, the historian, has written:

"In every respect we may say that this period (1820–28) represents the most flourishing condition of shipping in American history. Although since that time commerce has increased twelve-fold, and although in the year preceding the Civil War our registered tonnage was three times as large, yet we have never since 1830 reached the position in respect to the carrying trade to and from American ports that was maintained during this decade, but, on the contrary, have receded from it further and further."

Success had made our national lawmakers too confident, for in 1828 Congress took another step in miscalled reciprocity by offering to abandon the preferential duty system, under which American shipping had grown so wonderfully, if competing foreign nations would do the same. This change resulted unfortunately, American registered tonnage falling off from 757,998 in 1828 to 537,563 in 1830. Inland States, or those having no large ownership of ocean carriers, had now come to dominate the policy of the American government. British vessels, of which in 1830 only 78,947 tons had entered the United States, now rapidly increased to an average of 212,661 tons. While in the decade 1830 to 1840 American tonnage gained but 40 per cent in all the ports of the world, British tonnage in American ports increased nearly 300 per cent. In 1840 the proportion of American imports carried in American vessels had fallen to 82.9 per cent. Yet ship for ship American wooden vessels were still pre-eminent. Says the British historian, Grantham:

"Previous to the development of steamships, the preponderance of shipping was falling rapidly into the hands of American shipowners. Thirty years ago one of the great objects of interest at the docks in Liverpool was the American sailing packet, and it was considered that a stranger had missed one of the lions of the port who had not visited these celebrated ships. The same prestige was felt everywhere: on the Atlantic and Pacific oceans, in India, China, and in all the best trades American ships were most in demand."

Errors of national policy in the too early reduction and abandonment of the preferential or protective policy of Washington, Adams, Jefferson and Madison had hurt American shipping and checked its normal growth. But, on the other hand, the blunders of the lawmakers had been to a great extent retrieved by the persevering and progressive spirit of the shipbuilders, shipowners and seamen of the United States.

Steamers, Packets and Clippers.— Steam shipbuilding and navigation were first made practicable in America. The *Clermont* of Robert Fulton in 1807 was the first successful steam-driven craft. The *Savannah* in 1819 had made the first steam transatlantic passage. In 1823, when the steam merchant fleet of the United States was first enumerated, it had a total tonnage of 24,879 — engaged almost entirely in coast and river voyages. By 1833 our steam fleet had advanced to 101,306 tons, and by 1840 to 198,184 tons, of which only 4,155 tons were registered for foreign commerce. Moreover, American shipbuilders, contrary to frequent assertions, were quick to recognize the value of iron, and the first iron sea-going steamer, the *Bangor,* was built at Wilmington, Del., in 1844. Nevertheless, with all this spirit of energy and progress, American shipping faltered when it ceased to receive some degree of preference from its own government. Our shipping, still nearly all wood-built and sail, registered for foreign commerce stood at a tonnage of 904,476 in 1845 — a handsome total but less than the 981,019 tons of 1810. The growth of our merchant shipping had fallen behind the growth of population. In 1810 the United States had owned 13.43 cubic feet of registered tonnage per capita. In 1845 it owned only 4.54 cubic feet per capita.

In 1840 British steamships launched and driven by subsidies — a subject considered elsewhere — had appeared on the route between America and Europe, and also in British trade with the West Indies, South America and the East Indies. Up to that time the transatlantic fast freight, passenger and mail service had been dominated by the American flag. Nearly all of the lines of sail packets were of United States ownership and construction. The Black Ball line, the Swallowtail line, the Dramatic line, the Red Star line, the Williams and Guion line and others employed vessels comparable in size with the East Indiamen of Great Britain and far superior in speed and handiness. These packets should be carefully distinguished from the clippers which came afterward. Packets were swift but capacious vessels, large carriers for their tonnage, with accommodations in the cabin for first-class and between decks for steerage passengers. They were strongly built of wood, many in New York yards along the East River and others on the Delaware and in New England. Their passenger traffic was carefully regulated by Federal laws. The packets carried the higher cost freight, and their rates were above those of ordinary merchantmen. But they were profitable ships because of the swiftness and regularity of their voyages, the best of which were from 14 to 20 days from New York to Liverpool. The packet era began in the early years of the last century and practically ended by 1860, when steam became supreme — though a few sail packet ships remained in transatlantic passenger and freight service long afterward.

The first real clipper ships of a sharper model, loftier spars and relatively less freight space appeared in 1843, the result of an intensifying rivalry of steam and canvas. Some of these clippers were employed on the New York packet lines, but most of them were engaged in the long-voyage trade to China and India, and particularly in the Argonaut trade to California. It was the California trade preeminently that created the greatest and most famous of American clipper ships from 1850 onward. For this trade the *Sovereign of the Seas,* the *Flying Cloud* and other stately examples of the genius of Donald McKay were constructed. This California trade under historic American laws was American domestic commerce, in which only American vessels could participate. These ships sailed under register as if for foreign trade and indeed often engaged in world-round carrying — proceeding from California across the Pacific to the Orient and loading there for the Atlantic coast of the United States or for Europe. American registered tonnage rose rapidly from 1,258,756 in 1849 to 2,379,396 in 1860. This extraordinary

increase was principally due to the California trade and its demand for ships of high speed and large dimensions. It does not represent any proportionate increase in American overseas carrying, for the 75.2 per cent of our imports and exports conveyed in 1849 in American vessels had shrunk in 1860 to 66.5 per cent. Under miscalled reciprocity the American flag in the decade before the Civil War was not holding its own in the overseas commerce of the United States, though its tonnage was apparently mounting. Moreover, this decade before the war was characterized by the sharpest and most disastrous decrease of American shipbuilding in all our national history.

Decline before the Civil War.— In the year 1855 a total of 583,450 tons of shipping had been launched in the United States, but this had fallen off to 156,602 tons in 1859 and stood at only 214,797 tons in 1860. This decline is all the more significant when it is added that the 381 square-rigged ships and barks built for foreign commerce in 1855 had decreased to 89 in 1859 and to 110 in 1860. Revolutionary movements in Europe in 1848, the Irish famine of 1847 and the Crimean War of 1854–56 had given a temporary impetus to American shipbuilding and navigation because of an exceptional demand for ships for the export of foodstuffs and for immigration and transport service. But when these passing factors had lost their force, an alarming decline set in in our ocean tonnage, in years of peace, under a low tariff policy, before the firing of the first gun of the Civil War.

This decade before the war had witnessed a momentous change from sail to steam and from wood to iron. But, contrary to frequent assertions, it had not found American shipbuilders and shipowners unprepared. The first British Cunard steamships had appeared in 1840 on the route from Liverpool to Halifax and Boston. They were wooden side-wheel craft, with a speed of from 9 to 10 knots and a tonnage of about 1,200. In fresh breezes they were often beaten by the powerful American packet ships, but they had an advantage in light or contrary weather. These Cunard steamers received at first a British mail subsidy of $425,000 a year, which was subsequently doubled. It was manifestly impossible for American steamships of like cost to compete with them without government encouragement. The subject was actively taken up in Congress, and in 1845 and 1847 laws were enacted providing mail subsidies for American lines. The first United States service was from New York to Havre and Bremen, with $200,000 a year for 20 voyages. Other lines were established from New York to the West Indies, to the Isthmus of Panama and in 1848 northward from the Isthmus to California and Oregon. Like the Cunard ships, the vessels employed were wooden side-wheel steamers, of from 1,000 to 2,400 tons. They were designed and built principally in New York by skilful builders, who had created the famous packet and clipper fleet. In 1847 a contract was concluded with Edward K. Collins and his associates for a first-class steamship line from New York to Liverpool, with a subsidy of $385,000 a year, subsequently increased to $858,000. The Collins steamers were much larger than the Cunard ships, or of 2,800 tons. Under such government encouragement ocean steamship building rapidly increased in the United States. In 1849 our deep-sea steam fleet had amounted to 20,870 tons, but in 1855 had grown to 115,045 tons — so that our ocean steam fleet and Britain's were practically equal, though America's represented by far the more rapid and successful development. The Collins liners uniformly beat their British rivals on the route to Liverpool and secured the bulk of the first-class passenger and freight traffic.

For reasons set forth in detail elsewhere in the article on steamship subsidies, the mail subventions were taken away from the American lines in the crisis of their rivalry with their British competitors, when every advantage seemed to favor the flag of the United States. One by one the American lines succumbed — except those to the West Indies and the Isthmus of Panama, which came partly within the protection of the coastwise service. The Stars and Stripes had vanished from the regular year-round steam trade of the north Atlantic before the Civil War began. The blow which Congress struck against American steamship lines was in part responsible for the sinister decrease in American shipbuilding that marked the half-decade from 1855 to 1860.

The Civil War did not destroy the American merchant marine. That war found our merchant marine already decreasing. What the war did do was to accelerate a tendency that had already developed. Anglo-Confederate cruisers like the *Alabama* and the *Florida* destroyed only 110,000 tons of American shipping all told, but created, as it was intended that they should do, such an extraordinary insurance hazard for other American ships that they could not profitably be sailed beneath the Stars and Stripes — so that in the four years of the war 751,595 tons of shipping, or about one-third of our entire fleet registered for deep sea carrying, was sold to European shipowners. In 1861 our shipping registered for foreign commerce amounted to 2,496,894 tons and in 1866 there remained only 1,387,756 tons. Wreck and wear and tear accounted for part of the loss, and many American shipyards had been forced to abandon merchant work for naval construction.

The Geneva award of $15,500,000 against the British government for British complicity in the work of commerce-destroying probably covered the actual value of the ships and cargoes seized by the *Alabama* and her consorts, but did not make good the vastly larger sums of money lost by those American shipowners who were forced by these depredations to pay excessive insurance rates or accept unremunerative freight rates or lay their ships up in idleness or sell them at one-half or one-third of their cost to foreigners. That award did not make good what American shipowners suffered from the diversion of their accustomed trade to European carriers.

The disastrous consequences of active British sympathy with the Confederacy and British raiding of our maritime commerce far outlasted the Civil War. Not only were the *Alabama*, *Florida*, *Shenandoah*, etc., British-built, but they were armed with British guns and partly officered and almost altogether manned from the British naval and mercantile service.

In the Civil War it was the American mer-

chant marine that enabled the United States government to maintain that close blockade of Southern ports which was so strong a factor in the final defeat of the Confederacy. More than one-half of the steamships, four-fifths of the officers and five-sixths of the men engaged in this vital work came directly from the merchant service. Masters and mates of American steamships and sail ships gave the navy 7,500 volunteers officers, the best educated and most skilful men of their calling in the world, and these officers were followed into the war fleet by more than 50,000 merchant seamen. Without the great resources of the American merchant marine of 1861, the quick and sustained expansioin of the United States navy would have been impossible. Until new cruisers were built, the fastest and the most efficient steamers of the blockade fleet were vessels from the coastwise and West India lines, and these lines supplied besides an adequate fleet of supply craft and transports.

Stagnation after the War.—For a few years after the Civil War, American ocean shipping seemed to gain new headway, though between 1861 and 1865 European shipowners utilized the opportunity to strengthen their grip on the chief trade routes of the world. American merchants and shipbuilders fought with energy and courage, and our registered tonnage rose in 1867 to 1,515,648, and remained at or near that figure for a decade thereafter. In 1878 the total registered tonnage was 1,589,348. American steamships without government aid could not compete on the great mail lines with British or French steamships subsidized by their governments. In the case of Great Britain these subsidies, liberally continued for many years, had given a powerful stimulus to iron shipbuilding and engine and boiler construction, and yards which were originally developed by the demands of the mail contracts had turned to building steam freighters of the slow but useful and familiar "tramp" type.

Following the apparent line of least resistance, American shipowners and builders swung from the extreme clippers of the decade before the Civil War to so-called medium clippers, particularly for the Cape Horn and other long-voyage trades. These medium clippers were not so fast as their racing predecessors, but had a greater capacity for cargo, with more strength and seaworthiness. For a long time these large American wooden sail ships successfully competed with British iron sail ships, but were finally driven from the seas, first by insurance discriminations enforced against wooden hulls by the British Lloyd's, and then by the liberal subsidies provided for sail ships by the French government. Except for a few inadequate and short-lived mail subsidies like those to the Brazil line and the Oriental service of the Pacific Mail, no national aid whatever was given to American ocean shipping from 1865 until 1891. A subsidy system similar to Great Britain's was strongly urged by the maritime and commercial States, but was regularly defeated by the influence of European steamship interests and the opposition of the agricultural South and West in Congress.

But in 1891 both the Senate and the House passed a cautious mail subsidy measure granting subsidies for postal lines of steamers. This legislation, however, was so seriously crippled by the insistence of Western lawmakers on reducing the original rates in the House of Representatives that though the measure has maintained a fast American mail line to Europe and several other lines to the West Indies and to Australasia, it has failed of any more extended purpose. This is the legislation which, coupled with the admission of the British-built *New York* and *Paris* to American registry, made it possible for the International Navigation Company to undertake in 1895–96 a weekly American mail service from New York to England and France. The Ocean Mail Act of 1891 maintains also the Ward line of American steamers from New York to Cuba and Mexico, the Red D line from New York to Venezuela and the Oceanic line from San Francisco to Australasia. Total expenditures under this act in recent fiscal years have been from $1,000,000 to $1,200,000 a year, or less than half of the amount expended for like purposes by the government of Canada, and one-fifth or one-sixth of the total mail subsidy payments to the 30 lines of British postal steamers which constitute the backbone of the British mercantile marine.

President Roosevelt in 1904 earnestly recommended an investigation by Congress of the causes of the decline of the American merchant marine, with a view to recommending remedial legislation. A Merchant Marine Commission of five senators and five representatives, of which Senator J. H. Gallinger of New Hampshire was chairman, was authorized by Congress and published its report in 1905, urging national encouragement to regular steamship services to the West Indies, South America, South Africa, Australasia and the Orient, and the granting of tonnage bounties to cargo vessels. A bill carrying these provisions passed the Senate, but the bounty to cargo ships was eliminated in the House, and every subsequent effort to enact even legislation for mail lines was defeated in the House, though by the slenderest of majorities. Again, as before the Civil War, a large part of the agricultural South and West resisted any and every form of national aid to the ocean shipping industry, and again this opposition was reinforced by the formidable influence of the European steamship organizations which were now monopolizing nine-tenths of the ocean carrying trade of the United States.

A Trial of "Free Ships."—A policy of "free ships," or the free admission of foreign-built vessels to American registry for at least the overseas trade, had found some advocacy for many years in the press and in Congress, and on 24 Aug. 1912, in connection with the Panama Canal Act, the Senate and House changed the traditional policy of the nation by offering free registry for the overseas trade to foreign-built vessels of American ownership not more than five years old, and capable of carrying dry and perishable cargoes. The new expedient absolutely failed. Up to the outbreak of the war in Europe on 1 Aug. 1914, not one foreign-built ship had sought and secured register under this legislation. The reason assigned was the higher cost of operation that would have to be assumed under American laws and regulations. About 1,000,000 tons of ocean shipping, it is estimated, were owned and controlled in 1912 by American capital, but navigated under for-

eign flags to take advantage of foreign mail subsidies or of the lower range of foreign shipboard wages.

But when the European War broke out, many of the American owners of this foreign tonnage, particularly of that part of it under British or German colors, sought the protection of the flag of the United States in order to escape capture by the enemy. Therefore, Congress, on 18 Aug. 1914, passed as an emergency measure an act amending the previous act, broadening its provisions and authorizing the President to suspend the requirement of law that the officers of these foreign-built ships should be American citizens. These foreign-built ships admitted to American registry were further exempted from compliance with our inspection and measurement laws and regulations.

A great many foreign-built craft sought American registration under this measure. It was discovered that the hoisting of the American flag was the signal for a demand from foreign officers and crews for the wage scale and food scale of Americans. The result was an immediate and large increase in the cost of manning and maintaining these foreign-built ships, so that they came upon the same basis as American ships of native construction. It was demonstrated, therefore, that a free-ship policy in itself could not suffice to solve the problem of the American merchant marine in overseas trade. Though nearly all maritime governments, as the great war drew on and as the need of ships became more pressing, enacted laws forbidding the transfer of vessels to foreign purchasers, yet before this action was taken a considerable fleet of foreign-built vessels had been naturalized under the Stars and Stripes. This reinforcement from foreign fleets and the diversion of large coastwise carriers from domestic trade to overseas navigation, due to the high freight rates that had prevailed since the war began, suddenly and greatly increased the amount of American tonnage registered for foreign carrying from 1,066,288 on 30 June 1914, to 2,185,008 on 30 June 1916. In these same two years the proportion of American imports and exports carried under the American flag had risen from 9.7 per cent to 16.3 per cent.

A Swift War Growth.—The European War brought to the United States such a sharp realization of the need of a greatly increased fleet of American ships as the "delivery wagons" of American commerce, that immediate and positive action was demanded from Congress. This took the form at first of a proposal for ambitious government ownership and operation of merchant vessels, for the purchase or construction of which it was provided that $50,000,000 should be at once appropriated. But the principle of government participation in the merchant shipping business was so earnestly opposed in Congress and by the mercantile community that the law finally passed on 7 Sept. 1916 contained as its main feature authority for the appointment of a United States Shipping Board, which should have the power to supervise ocean freight rates for the purpose of preventing unjust combinations of ocean carriers or the exaction of excessive charges.

This Federal Shipping Board was given, moreover, general authority over the merchant marine, and was authorized to devise the best methods to increase it. Government ownership and operation of merchant tonnage was reduced to a minimum, with the stipulation that no ship should be purchased by the government unless it were about to be withdrawn from American commerce without an intention on the part of the owner to return it within a reasonable time and that no ship controlled by the government should be operated by the government unless private capital could not be persuaded to employ it. Moreover, the operation of any vessel on the part of the United States must cease at the end of five years from the conclusion of the European War. The government, however, was authorized by the new law to continue indefinitely to purchase, lease, charter or transfer vessels to be employed by private shipowners, and was even authorized to secure foreign-built vessels for operation in the coastwise trade of the United States.

When on 6 April 1917, the United States itself entered the war, it was recognized that an extraordinary effort must be made to support our Allies with food and munitions, and also to transport our American army to Europe and to sustain our troops with their essential equipment and supplies after they had landed. Therefore, the new Shipping Board, on 16 April 1917, organized the Emergency Fleet Corporation for the carrying out of the vast program of ship construction that had become imperative. There were at that time 37 shipyards building steel vessels and 24 yards building wooden seagoing vessels in the United States. In these yards were 235 shipways. In the presence of war, the previous reluctance to give national aid to maritime industry suddenly vanished. The Emergency Fleet Corporation advanced generous funds for the expansion of existing shipyards and the creation of new yards, and enormous contracts for new tonnage were distributed to builders on the Atlantic and Pacific coasts, the Great Lakes and the Gulf of Mexico. The major part of these contracts called, of course, for steel-hulled ships but after some hesitation the building of several hundred wooden steamers was also authorized, in the full understanding that steam-driven wooden craft of large dimensions were inferior to steel ships for overseas service, but in the conviction that Lloyd George's call for "ships, ships and yet more ships" for the desperate need of the Allies justified the unusual expedient.

Though unforeseen difficulties delayed the work on both steel vessels and wooden vessels, yet the extension of old and the creation of new yards, the launching of hulls and the fabricating of machinery were forced with such zeal that at the signing of the armistice on 11 Nov. 1918 there were 341 shipyards and 1,284 launching ways in the United States. The number of workmen in American shipyards had increased from 45,000 to 380,000. The shipbuilding capacity of the United States had become far greater than that of the United Kingdom. On 31 Oct. 1918 no fewer than 106 steel steamers of 6,000 gross tons or over were under construction in American yards as compared with 66 of 6,000 gross tons or over in British yards.

The total construction added to the American merchant marine during the 19 months of America's participation in the war comprised 875 vessels of 2,941,845 gross tons. In addition, the United States possessed at the end of the war 88 vessels of 562,005 gross tons which had been taken over from enemy nations. Congress had made available for the work of the Shipping Board and the Emergency Fleet Corporation about $4,000,000,000 of national funds, to be expended in the purchase and building of ships, the extension or creation of shipyards, the operation of ships and the training of American officers and seamen. In part the rapidly increased fleet was manned from the Navy and the Naval Reserve.

RECORD OF REGISTERED AND ENROLLED AND LICENSED AMERICAN TONNAGE WITH PROPORTION OF FOREIGN TRADE CARRIED IN AMERICAN VESSELS.

Tonnage registered for foreign trade		Tonnage enrolled and licensed for coastwise trade		Proportion of American imports and exports carried in American vessels	
Year	Tons	Year	Tons	Year	Per cent

Before the war, in 1914, good steel cargo steamers could have been built in America for about $65 per deadweight ton. Because of the war increase in materials and wages, the relative inefficiency of many of the new shipyards and their workmen due to inexperience, and the pressure of the war emergency, the Emergency Fleet Corporation was compelled to pay from $150 to $200 per deadweight ton, and even more, for the construction of steel cargo steamers of the same general character. It was very clearly demonstrated that allowing foreign shipowners to carry our imports and exports for so many years had proved in the end not an economy but an extravagance.

On 27 March 1919 Chairman Edward N. Hurley of the United States Shipping Board formally proposed a plan for the future operation of the new government-owned American merchant fleet, which by 1921, including ships bought, built and contracted for, would amount to 2,000 vessels of about 10,000,000 tons gross register. Mr. Hurley urged that the ships should be sold at the world-price to private shipowning companies in which the government should be represented by one director, that 25 per cent of the purchase price should be paid down, and the remainder paid in instalment through a 10-year period — the government meanwhile to be protected by a mortgage which should have priority above all other liens. Chairman Hurley further recommended a method by which a merchant marine development fund could be provided for, to assist American shipping on routes where the service might at first be unprofitable.

It is in the deep sea or registered tonnage that is embodied the real problem of our merchant marine. The coastwise or enrolled and licensed shipping of the country, as distinguished from the foreign-going or registered shipping, has had a steady, constant growth under the national policy which from 1789 onward had reserved domestic carrying on ocean, lake or river between American ports to ships of the American flag and of American construction. In spite of the unparalleled railroad development of the United States, American domestic shipping had grown from 68,607 tons in 1789 to 6,818,863 tons in 1914 — incomparably the greatest coastwise shipping in the world, greater than the entire coastwise and overseas tonnage of the German Empire in 1914, or equivalent to threefold the entire tonnage of France or Norway and fourfold the tonnage of Japan before the war. The progress of this immense domestic shipping has been singularly uneventful, and more than one-third of its tonnage is to be found on the great northern lakes, where an enormous movement of iron ore, coal and grain has demanded carriers of the heaviest dimensions.

Many of the present coastwise steamers on the Atlantic and Pacific have been employed in naval auxiliary service as ammunition ships, fuel ships, general supply ships and transports, and the specific requirement is made in the Ocean Mail Law of 1891 that all subsidized American steamers in the foreign trade shall be built on designs approved by the Navy Department, and be turned over to the government in war.

The new shipping law of 7 Sept. 1916 provides that vessels built, purchased, leased or chartered under this legislation shall be so far as possible adapted "for use as naval auxiliaries or army transports or for other military or naval purposes."

MERCHANT MARKS. See MONOGRAM; TRADEMARK.

MERCHANT OF VENICE, The. 'The Merchant of Venice,' entered in the stationer's register in 1598, and published in quarto form in 1600, was written about 1594 or 1595. Several stories that had long had currency in the world — notably the story of the caskets as a device for the choice of suitors by a wealthy heiress, and the bond story of the rich Jew and his debtor — are happily blended in this play, and thereto are added the story of the rings, the romantic minor plot of Lorenzo and Jessica, and the comic character of Launcelot Gobbo. Shakespeare never constructed a better plot, or one better calculated to win popular approval. It meets every demand of stage-management. Although the two main incidents — the choice of the caskets and the pound of flesh — are almost childishly absurd, they are made to seem probable and even natural by the romantic atmosphere in which the characters move. Whether walking the streets of Venice or watching the moonlight sleep sweetly upon the banks of fair Belmont we breathe the air of the Renaissance in Italy. All the characters fit in perfectly with this background except Shylock. Unquestionably to an Elizabethean audience the impression made by him was partly humorous and not at all typical. With his huge nose and the red wig of the traditional Judas he was fair game, not only for the characters in the play, but for those in the pit. His practice of usury and his Jewish qualities rendered him the legitimate object of hatred and ridicule — his passionate words of rage only increased the laughter of an Elizabethean audience. While Shakespeare gave sufficient ground for this interpretation of the character, he has so humanized him as to produce a different effect on a modern audience. His famous words, "Hath not a Jew eyes, etc.," are an instinctive protest against race hatred and in favor of social sympathy. Whatever may be doubtful in the interpretation of Shylock, there is none in the interpretation of Portia. There is no better illustration of the power with which Shakespeare transformed his material than in the change of Portia from "a piratical and widowed siren, who persuades merchants to stake their all against her hand that they will possess her person, and who then drugs them at supper" into one of the most charming characters of all times. Her beauty of person, brilliancy of intellect, nobility of soul, and gift of poetical expression, all combine to produce an effect not surpassed by any other creation of the dramatist. She is the bond of union between the casket story and the pound of flesh story, and all the other characters group themselves naturally about her. The concluding scene of the play at Belmont, after the excitement of the trial scene and the disappearance of the sinister character Shylock, is one of the supreme passages of poetry in the language — almost magical in its beauty of background and expression.

EDWIN MIMS.

MERCHANT VESSELS, Neutral, Rights of. In time of war neutral merchant vessels are entitled to navigate the high seas as in time of peace although in the interest of belligerents they are subjected to certain restrictions such as the liability to search by belligerent cruisers for the purpose of ascertaining whether they are carrying contraband to the enemy or seeking to run a blockade. See BLOCKADE; RIGHT OF SEARCH.

No belligerent may lawfully declare a portion of the high seas to be a war zone within which neutrals shall be excluded from navigating, although he may warn them that a certain portion of the high seas is to be a theater of naval operations and that they will be exposed while traversing it to the dangers incident to the conduct of such operations therein. Within such area belligerents have no greater right of visit, search or capture in respect to neutral vessels than they have anywhere else on the high seas. It is also doubtful whether belligerents have a lawful right to plant mines in the open seas in such a way as to expose neutral vessels to the danger of destruction while innocently navigating the waters thereof, although it is to be regretted that the Second Hague Conference declined to adopt a proposal of the British delegation prohibiting the laying of mines in the open seas. See SUBMARINE MINES.

Neutral vessels have a right to enter the ports of a belligerent so long as they are not blockaded and they may transport supplies to and trade with such ports, subject to the rules governing traffic in contraband goods. (See CONTRABAND). Whether neutral vessels may in any circumstances be destroyed by a belligerent was much discussed during the World War. The question was first raised during the Russo-Japanese War of 1904–05 on account of the sinking by a Russian cruiser of the *Knight Commander*, a British merchant vessel, a portion of whose cargo consisted of contraband goods consigned to ports in Japan. The Russian commander justified his act on the ground that on account of lack of coal and inability to spare a prize crew he could not send the ship into a home port for adjudication by a prize court, hence his only alternative was to allow the prize to go free or destroy it. The act aroused intense indignation in England and was denounced by Lord Lansdowne as "a very serious breach of international law." The Russian contention, he asserted, would justify the wholesale destruction of neutral ships taken by a cruiser at a distance from her base for the reason that she could not spare a prize crew or lacked a sufficient supply of coal. Seven other neutral merchantmen were destroyed by the Russians during their war with Japan. During the recent war German naval commanders have acted on the Russian theory and have generally destroyed their prizes, neutral as well as enemy vessels, because it was impossible to take them in for adjudication. (See the article on CONTRABAND for a discussion of the cases of the *Frye* and the *Maria*).

In no war of the past have neutral merchant vessels suffered so heavily as in the present one. More than 800 neutral ships, American, Danish, Dutch, Greek, Italian, Norwegian, Portuguese and Swedish, were sunk while peacefully navigating the high seas—in most cases by German submarines or cruisers. In a few cases the destruction was due to error but in the majority of cases the reason alleged was that the vessels were carrying contraband. The naval regulations of most states authorize the destruction of prizes under certain circumstances and some of them make no distinction between enemy and neutral vessels. Thus the American instructions for blockading vessels and cruisers in 1898 (Art. 28) authorized destruction of prizes which for "controlling reasons" such as unseaworthiness, existence of infectious diseases, and lack of a prize crew could not be sent in for adjudication. Likewise, if there was imminent danger of recapture the prizes might be destroyed. The prize regulations of many other states contain somewhat similar provisions. The German prize code authorizes destruction of neutral vessels for carrying contraband, for breach of blockade or other unneutral service, if the taking of the ship in would expose the captor to danger or impede the success of his operations; if, for example, the captured vessel is unseaworthy or is unable to follow the captor, or in case the captor cannot spare a prize crew or has an insufficient supply of coal or is near the enemy's coast (Art. 113). Many writers on international law however deny the right of belligerents to destroy neutral prizes. The question was discussed at length at the Second Hague Conference but on account of the divergence of views there expressed, no agreement was reached. It was again discussed at the London Naval Conference in 1908–09. The British delegation proposed as it had done at The Hague in 1907 that the right of belligerents to destroy neutral merchant vessels be prohibited in all cases whatsoever and it was supported by the Japanese delegation. The proposals of most of the other powers, however, recognized the right to destroy in certain exceptional cases and this view finally prevailed. The rule adopted affirmed the general principle that a neutral vessel cannot be destroyed but must be taken into a prize court for adjudication. Nevertheless, by way of exception, the right to destroy was admitted in cases where conveyance of the prize to port would involve danger to the captor or to the success of the military operations in which he was at the time engaged (Art. 49). The effort of the British delegation to obtain an express affirmation that inability to spare a prize crew should not constitute a sufficient justification for destruction failed to receive the approval of the Conference. By article 40 of the Declaration it was provided that a vessel carrying contraband is liable to condemnation, and consequently to destruction, when more than half its cargo consists of contraband goods. Not all vessels carrying contraband therefore may lawfully be destroyed. The rules adopted by the Conference, although representing a compromise between two conflicting views, undoubtedly provided some safeguards against arbitrary destruction of neutral vessels. While the Declaration has never been ratified by any government represented at the Conference the various belligerents put into effect at the outbreak of the present war with certain modifications, none of which, it appears, altered the rules regarding destruction of neutral vessels. See MINES, SUBMARINE; CONTRABAND; RIGHT OF SEARCH; WAR ZONES.

JAMES W. GARNER.

MERCHANT VESSELS, Transfer of from Belligerent to Neutral Flags. On account of the liability of enemy merchant vessels to capture, their owners frequently at the outbreak of war or when war becomes imminent between their own country and a foreign power seek to withdraw them from the risk of capture by transferring them by sale or otherwise to neutral registry. Are belligerents bound to recognize the lawfulness of such transfers and refrain from capturing enemy vessels so transferred?

The practice of states has not been uniform in respect to such transactions. British and American practice has heretofore admitted the validity of such transfers made during or in contemplation of war provided they were bona-fide, that is, if the transfer was a fully perfected transaction, in which the purchase price had passed from the purchaser to the former owner, the ship being actually delivered and duly registered in accordance with the registry laws of the state whose flag it was to fly, the former owner reserving no interests or title in the vessel so transferred. Consult the cases of the *Benito Estenger,* 176 U. S. 568 (1899); the *Sechs Geschwestern,* 4 c. Rob. (1801); the *Baltica,* Spinks Prize Cases, 98 (1856); and the *Ariel,* Moore's Privy Council Cases IX, 128 (1857).

During the American Civil War large numbers of vessels under American registry were transferred to neutral flags in order to avoid capture by Confederate cruisers. During the war between Chile and Peru in 1879 and the conflict between France and China in 1883 many vessels were transferred to American registry for similar reasons. During the Crimean War a number of Russian vessels were transferred to the American flag and the validity of the transfers were generally sustained by the British prize court.

The French and Russian rules, however, have heretofore denied the legality of all such transfers made after the outbreak of hostilities. At the London Naval Conference of 1908–09 an attempt was made to harmonize the conflicting views and certain rules governing the validity of such transfers were agreed upon and adopted by the conference. By article 55 of the Declaration of London transfers to neutral flags *before* the outbreak of war was recognized to be valid unless it was proved that the transfer was made in order to evade the consequences to which an enemy vessel, as such, is exposed. The Declaration laid down certain presumptions of intent to evade the consequences of capture, as where the bill of sale is not on board in case the transfer has been made less than 60 days before the outbreak of war. But these presumptions were declared to be rebuttable by evidence showing the contrary intent. The onus of proving that the transfer was made for the purpose of avoiding capture was placed on the captor, not on the owner. To be valid in any case the sale must be

unconditional, complete and in conformity with the laws of the countries concerned.

By article 56 of the Declaration transfers made *after* the outbreak of war were declared to be void unless it was proved that they were not made to evade the consequences of capture. Certain absolute and irrebuttable presumptions of invalidity were laid down, such as where the transfer was made in a blockaded port or during the course of a voyage or where the right to repurchase the vessel was reserved by the vendor. Unlike the rule governing transfers before the outbreak of war, the rule as to transfers made during the war is based on the presumption that the transfer is void and the onus of proving the contrary is on the owner rather than on the captor.

The Declaration of London, however, never having been ratified, its rules relating to transfers were not legally binding on the belligerents during the World War. There being no general rule as to the right of transfer from belligerent to neutral flags, each belligerent was free to apply its own rule.

The question of the validity of transfers made during the World War was raised in the case of the *Dacia* in 1915. This vessel was a Hamburg-American liner which, while lying in an American port, after the outbreak of the war, was purchased by an American citizen and admitted to American registry in pursuance of a recent act of Congress authorizing the admission to American registry of foreign-built ships. Subsequently while on a voyage from New York to Rotterdam the *Dacia* was captured by a French cruiser and placed in the custody of a prize court which condemned it and ordered it to be sold. The prize court applied the old French rule which denies the legality of transfers made during war. It might, however, have treated the Declaration of London as binding and then condemned the ship on the ground that the transfer was made with a view to evading the consequences of capture. Had the *Dacia* been captured by a British cruiser the British prize court could hardly have condemned it without departing from the precedents set by Lord Stowell and Dr. Lushington in the earlier cases. It was doubtless owing to this fact that the *Dacia* was by prearrangement between the British and French authorities captured by a French cruiser and sent to a French prize court for trial, thus ensuring it certain condemnation.

The Administration Ship Purchase Bill which was before Congress in 1915 raised the question whether the purchase after the outbreak of the war of belligerent merchant vessels by a corporation, a majority of the stock of which was owned by a neutral government, would be an unneutral act and whether the opposing belligerent would be bound to recognize the validity of such transfers. It was the avowed intention of the supporters of the bill that in case it became law purchases of German merchant vessels then laid up in American ports should be made and the vessels so purchased should be admitted to American registry.

The view was expressed by Mr. Lansing, then counsellor of the Department of State, and by Senators Lodge, Root, McCumber, Burton and others that such transfers would not have been in accord with the principles of neutrality since neutral governments are forbidden to do many acts which it is permissible for neutral individuals to do. It was unofficially announced in England and France that the British and French governments would not recognize the validity of such transfers and that in case any enemy merchant vessel were purchased by the proposed corporation and appeared on the high seas under the American flag they would be captured and put into a prize court for the purpose of testing the validity of the transfers. The failure of the bill to become law removed what would doubtless have become a source of controversy between the United States and Great Britain and France. Tested by the rules of strict neutrality the proposed purchase by a corporation, controlled by the government of enemy ships which had been driven from the high seas to take refuge in neutral ports to avoid capture and the sending of those vessels on the high seas under the protection of a neutral flag would undoubtedly have been an unneutral act against which injured belligerents could justly have complained.

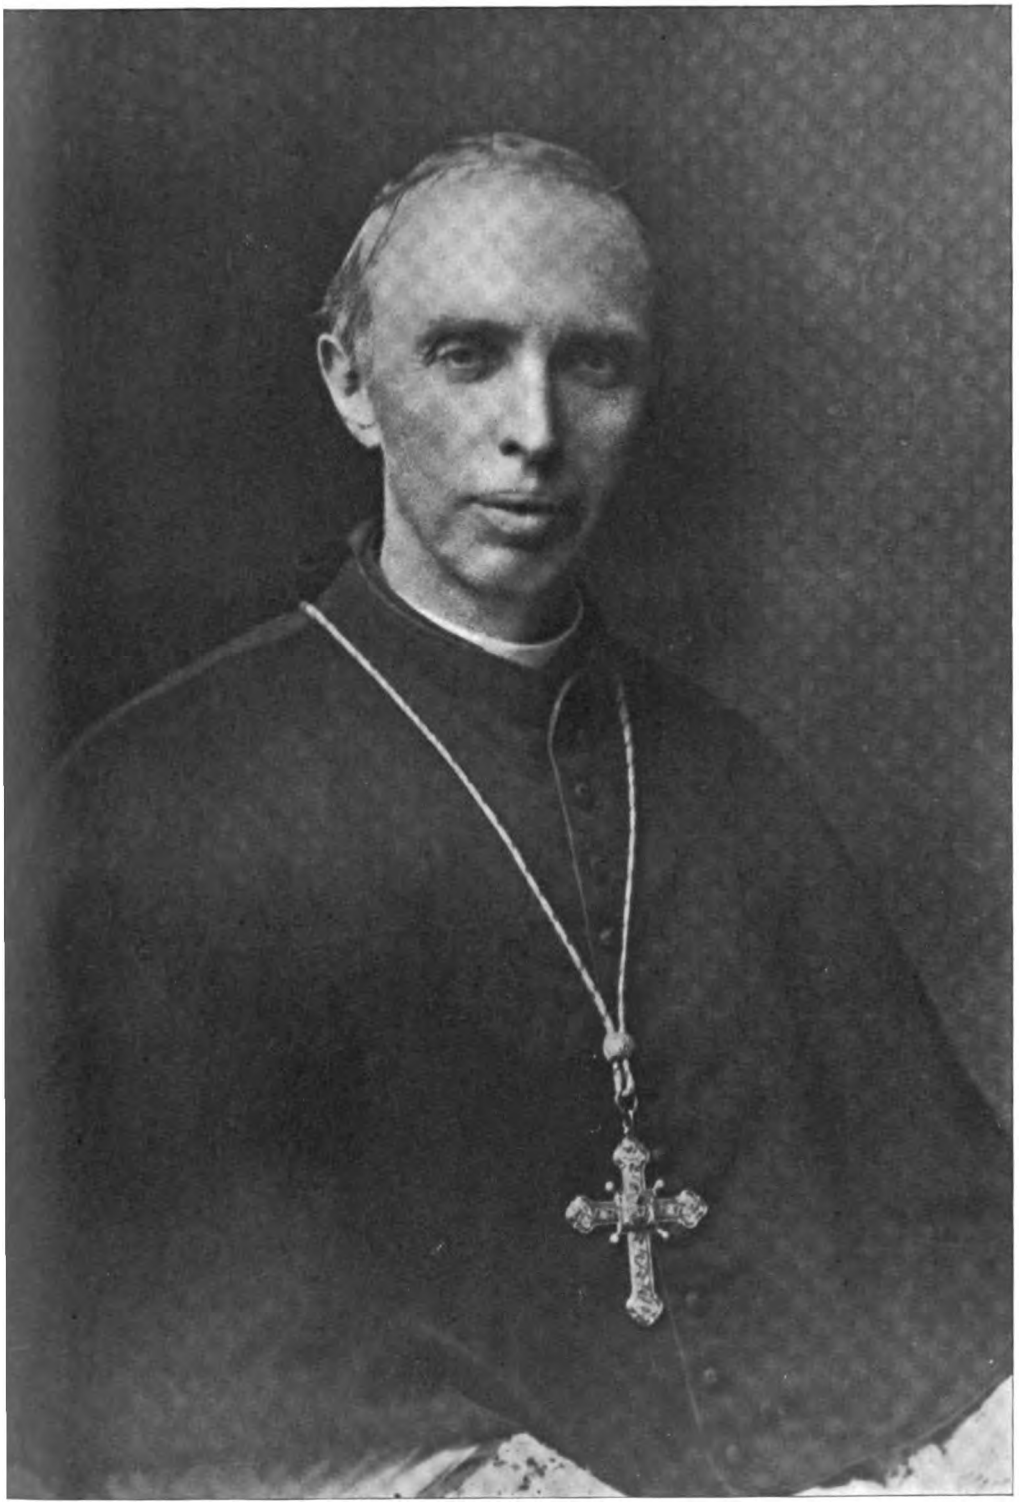
JAMES W. GARNER.

MERCIA, mėr'shi-ą, England, the largest kingdom of the Saxon heptarchy, now comprised in the Midland counties on both sides of the Trent from the North Sea to Wales. Mercia was founded by Crida in 585. Like the other Anglo-Saxon kingdoms it had a stormy history, being almost continually at war with some of its neighbors. In 827 it was conquered by Egbert, who united the different kingdoms of England into one. As its frontiers extended to those of the other kingdoms, as well as to Wales, it derived its name from that circumstance (Anglo-Saxon *mearc*, march or boundary. See ENGLAND, *Geographical History*.

MERCIE, Antonin, äṅ-tō-năṅ mėr-sē, French sculptor and painter; b. Toulouse, 30 Oct. 1845. He studied under Jouffroy and Falguière; won the first Prix de Rome in 1868, and in 1872 obtained a medal of the first class for his bronze statue of the young David, now in the Luxembourg. His masterpiece was 'Gloria victis' (1874), followed by a nude throned Juno (1877); a marble statue of 'Painting' (1890); 'William Tell,' now in Lausanne; monuments to Thiers, Meissonnier (in front of the Louvre), and Jules Ferry, and 'Napoleon' on the Vendôme Column. He painted a Venus, now in the Luxembourg. In 1891 he was elected an Academician.

MERCIER, Desiré Joseph, Belgian cardinal, archbishop of Malines and primate of Belgium: b. 21 Nov. 1851 at Braine-l'Alleud, province of Brabant. Educated at Louvain, Paris and Leipzig, he was ordained priest in 1874 and became professor of philosophy at the University of Louvain. Here he organized the Institute Supérieure de Philosophie, based on the teaching of Saint Thomas Aquinas and founded under the auspices of Pope Leo XIII. As a distinguished lecturer Professor Mercier —as he then was— earned a high reputation for literary and scientific abilities, united with



HIS EMINENCE CARDINAL DESIRÉ MERCIER

Archbishop of Malines, Belgium

zeal, leadership and exalted purpose. He wrote several volumes of note, e.g., 'Les Origines de la Psychologie Contemporaine' (1897), 'Métaphysique Générale' and 'Critériologie,' which passed through numerous editions, as well as others of a less didactic character. He was also the founder of the *Revue Neo-Scholastique* when officiating as head of the school of neo-scholastic philosophy. On 8 Feb. 1906 it was announced that "Dr. Mercier, president of the Institute of Advanced Philosophy at Louvain," had been appointed archbishop of Malines. Though at first a general surprise, the appropriateness of selecting him to the episcopal bench soon became apparent. With energy and amiability he devoted himself to the administration of his diocese, and on 15 April 1907 was created and proclaimed cardinal and primate of Belgium. The German conquest of Belgium in the early stages of the European War brought him into world-wide prominence by the fearless and determined attitude he adopted toward the ravagers of his country. In the papal conclave of September 1914, after the death of Pope Pius X, a number of the assembled cardinals decided to give Mercier their vote in the election for a new pope as a demonstration of sympathy with Catholic Belgium. He was supported by the French and English cardinals, while the Germans and Austrians protested against what they called undue interference of politics in the highest spiritual functions of the Church, and Cardinal Della Chiesa was ultimately elected. Cardinal Mercier arrived in London 12 Sept. 1914, and on the following day (Sunday), accompanied by the late Duke of Norfolk, was received in audience by the king and queen. In the afternoon he witnessed a remarkable and enthusiastic demonstration in Westminster, organized by Irish members of Parliament and attended by many thousands of people. He returned to Belgium the same night and exerted himself during the long period of the German occupation to ameliorate the sufferings of his compatriots. He came into frequent collision with the German authorities, notably von Bissing (q.v.). The cardinal's pastoral letters, collected and published by Burns and Oates (London 1918), form a series of earnest exhortations to the practice of Christian fortitude and hope amid the horrors and afflictions of war.

MERCIER, Honoré, Canadian lawyer, journalist and politician: b. Iberville, Quebec, 15 Oct. 1840; d. Montreal, 30 Oct. 1894. He was educated at Saint Mary's (Jesuit) College in Montreal and afterward studied law at Saint Hyacinthe, being admitted to the bar in 1865. During his legal studies (1862–64) he was editor of the *Courier de Saint Hyacinthe,* the Conservative organ of the district; but as a journalist he was among those who opposed Canadian Confederation. This led him to abandon his editorship and to sever his connection with the Conservative party. During the years immediately following the confederation of 1867 Mercier devoted himself to his profession, but in 1871 he reappeared in politics as the leader of the National party (also called the Parti noir), whose leading aim was to curtail the power of the Dominion government in favor of provincial rights. On this platform he was elected to the federal Parliament for Rouville in 1872, but did not stand for re-election to the Parliament of 1873. After some four years devoted to the successful practice of law at Saint Hyacinthe, Mercier was elected (1879) to the legislative assembly of Quebec, being appointed solicitor-general of the province in the ministry of M. Joly. On the defeat of the Joly administration in the same year, Mercier passed into the opposition, of which he presently became leader. In 1881 he left Saint Hyacinthe to practise law in Montreal. In 1885 the French Canadian population was thrown into a ferment by the trial and execution of Louis Riel, the leader of the North West Rebellion (q.v.). Mercier, heading the agitation thus occasioned, declared Riel to have been a "victim of the fanaticism of Sir John A. Macdonald." On the strength of the feeling thus aroused, the Conservative party was defeated in the provincial elections of 1886 and Mercier found himself at the head of the administration. In this capacity he carried through the legislature the famous Jesuit Estates Act, a measure intended to compensate the Jesuits for the property confiscated by the Crown at the time of the papal dissolution of the order. In spite of the agitation throughout Canada against the act the Mercier government was upheld in the election of 1890. In the same year grave charges of peculation were brought against the Premier and his colleagues on the ground that a subsidy of $100,000, intended for the Baie des Chaleurs Railway, had been diverted to political uses. Investigation resulted in the dismissal of the ministry (15 Dec. 1891), action which was ratified by the overwhelming defeat of the Mercier party in the election which ensued. The criminal charges brought against Mercier, as a result of this and a second official investigation, ended in a verdict of not guilty. Mercier remained a member of the assembly but with diminished influence and shattered health.

MERCUR, mėr'kėr, **James,** American soldier: b. Towanda, Pa., 25 Nov. 1842; d. West Point, N. Y., 22 April 1896. He was graduated from West Point in 1866 and commissioned in the engineering corps. He was engaged in surveys made under the government and in 1867–72 was assistant professor of natural and experimental philosophy at West Point, after which he was in command of an engineering corps and in 1876–81 assisted in clearing the New York harbor of the obstructions at Hell Gate. He was professor of civil and military engineering at West Point from 1884 until his death. He published a revised edition of Mahan's 'Permanent Fortification' (1887) and the original works, 'Elements of the Art of War' (1888); and 'Military Mines, Blasting and Demolitions' (1892).

MERCURIC CHLORIDE. See CORROSIVE SUBLIMATE.

MERCURIC CYANIDE. See HYDROCYANIC ACID.

MERCURY, mėr'kū-ri, the Roman god Mercurius who presided over commerce and gain. See HERMES.

MERCURY, the planet of the solar system which is nearest to the sun. Owing to the position of its orbit, far inside of that of the earth, it is never seen by us at any great distance from the sun, but seems to swing back and forth, first on one side of the central lumi-

nary and then to the other. (See SOLAR SYSTEM). Its time of revolution is a little less than three months and therefore less than one-fourth that of the earth. When, starting from a point between the earth and the sun, it has completed a revolution, the earth has moved forward in its orbit, and, in consequence, nearly 30 days more are required to catch up with the earth and again come into conjunction with it. Consequently the time of one synodic or apparent revolution is nearly four months. It follows that its greatest elongations from the sun occur at intervals of nearly 60 days, alternately to the east and to the west. When near its greatest eastern elongations it may be seen in the west toward the close of twilight. When west of the sun it may be seen in the morning before daybreak. To the naked eye it seems to shine as a star of the first magnitude. But as it is never seen in a perfectly dark sky except when very near the horizon, it is not readily observable in high northern latitudes. It is said, in fact, that Copernicus died without ever seeing this planet.

With the aid of a telescope, Mercury may be seen the greater part of the time — in the afternoon when it is east of the sun; in the morning when it is west of it. But it is never seen fully illuminated unless near the farther part of its orbit, beyond the sun, when it may be lost in the effulgence of the sun's rays. When it approaches nearest to us, only a small portion of the hemisphere presented to us is illuminated. Owing to these unfavorable conditions observations on it are extremely difficult, and it cannot be said that anything is certainly known of its physical constitution. The difficulty is increased by its being much the smallest of all the major planets. The result is that nothing is positively known as to the time of the rotation on its axis. About 1800, Schroeter, a celebrated observer of the planets, thought it rotated in a little more than 24 hours. But Herschel found no foundation for this belief, and could see no evidence whatever of a rotation. About 1889 Schiaparelli, the celebrated Italian astronomer, making a very careful study of the planet, under the favoring sky of Milan, was led to the conclusion that, like the moon, Mercury's time of rotation was the same as its time of revolution in its orbit, so that it always presented the same face to the sun. A similar conclusion was reached by Lowell at the Flagstaff Observatory. But the difficulty of seeing any well-defined features on the planet is such that conservative astronomers are still in doubt on the subject, and regard the time of rotation as still unknown and not likely soon to be determined.

The most remarkable feature presented by the motion of Mercury is that the perihelion of its orbit is found to move forward considerably faster than it ought to by virtue of the attraction of the known bodies of the solar system. The cause of this motion has perplexed astronomers for half a century; it was at first supposed by Leverrier to be due to the attraction of one or more unknown planets between Mercury and the sun. Another explanation was sought in the assumption that the sun's gravitation diminishes somewhat more rapidly than it would according to the law of the inverse square. If this were so, the perihelion of all the other planets ought to be effected by a similar motion, and in particular there should result disturbances in the motion of our moon which, now that the extremely abstruse mathematical theory of that body (based upon the law of gravitation), has been so perfected, it is certain do not exist. Similar discrepancies have been detected in the motions of some of the other planets, notably in the node of Venus and in the perihelion of Mars. When the disturbing pull of the exceedingly tenuous, lens-shaped cloud of particles known as the Zodiacal Light is computed and allowed for, it is found that not only these, but also the historic discrepancy in the motion of the perihelion of Mercury, disappear. It is very probable that the true explanation of them is to be found in this source.

At varying intervals the motion of Mercury in its orbit causes the planet to pass between the earth and the sun; it is then seen as an intensely black, round dot crossing the sun's disc. The next four transits will occur on 7 May 1924, 8 Nov. 1927, 10 May 1937 and 12 Nov. 1940. None of these will be visible, however, from the United States. The first transit which will be completely visible here will occur on 13 Nov. 1953 and 6 Nov. 1960. But little use is made of transits of Mercury. Attempts have been made to detect traces of an atmospheric ring about the planet during the transit, as may be done during a transit of Venus (q.v.), but these have not been certainly successful. Newcomb subjected 21 transits from 1677 to 1881 to a critical discussion to ascertain whether there might be found from them any indication that the time of rotation of the earth on its axis,— the unit of time throughout astronomy,— had changed during this interval. There was found no conclusive evidence in any appreciable change in the length of the day. It has certainly not increased or diminished by so much as 0.01 second in the course of the past 2,000 years.

ERIC DOOLITTLE,
Director Flower Astronomical Observatory, University of Pennsylvania.

MERCURY, Fulminate of. See FULMINATES.

MERCURY, or **MARKERY,** a perennial herb (*Chenopodium bonus-henricus*) of the natural order *Chenopodiaceæ*. Like other members of its genus, it has mealy foliage and inconspicuous greenish flowers. The tender shoots which appear in early spring are valued as a substitute for spinach, for which purpose the plant is frequently cultivated. In Europe it is better known as Good King Henry. It will grow in any garden soil with practically no attention.

MERCURY, Medical Uses of. Mercury uncombined is used only for its bulk. As it is without medicinal effect, at one time as much as two pounds of uncombined mercury would be given for the purpose of mechanically dislodging some obstruction in the intestines. Triturated with some other substance it is valuable medicinally and produces specific mercurial effects, local and constitutional. Such compounds are "blue mass" (blue pill), mercury with chalk (gray powder), mercurial ointment and mercurial plaster. All mercurial compounds entering the circulation have a peculiar influence

over nutrition. This is especially true of salts of mercury, such as mercurous chloride or calomel, mercuric chloride or corrosive sublimate and mercurous iodide or the green iodide of mercury. In small doses, especially in syphilis, mercury has a definite toxic action on the spirochete which is the known parasite which causes syphilis. In large doses mercury acts as a corrosive poison and tends to inflame the mucous membrane of the mouth, stomach and intestines. Calomel and blue pill are largely used for their laxative effects. Mercury in the various forms of powder, ointment, lotion and plaster is used to remove body-vermin, relieve itching and as a remedy in certain skin affections. Mercuric chloride, known as corrosive sublimate, is a powerful antiseptic and is taken internally in very minute doses. See TOXICOLOGY.

MERCURY, or **QUICKSILVER**, a metallic element which has been known for many centuries and which is distinguished from the other metallic elements by the fact that it is liquid at ordinary temperatures. Mercury occurs native in the metallic form, but by far the larger part of it is obtained by distilling the native sulphide, cinnabar (HgS), in a current of air which is regulated so as to burn the sulphur of the sulphide, while leaving the mercury in the metallic state. Cinnabar occurs abundantly at Idria, Austria, at Almaden, Spain, and at New Almaden, near San Francisco Bay, and it is from these sources that the mercury of commerce is chiefly obtained. It occurs as veins and disseminated deposits, the ores of which are believed to have been introduced by hot waters of magmatic (q.v.) origin. Spain is the largest producer and the chief output in the United States comes from California, though deposits are known in Texas and Oregon. Mercury freezes at 37.9° F. below zero and boils, at the ordinary atmospheric pressure (760 mm.), at 675° F. Its specific gravity at 32° F., when compared with water at 39° F., is 13.596. Its specific heat at ordinary temperatures is about 0.0331, and its average coefficient of expansion between 32° F. and 212° F. is 0.00010085 (Fahrenheit scale). The ratio of the specific heat of the vapor at constant pressure to its specific heat at constant volume has been found, experimentally, to be 1.666, which indicates that the molecules of the vapor are monatomic and that they behave, so far as their collisions among themselves are concerned, as though they were elastic spheres. (See GASES, KINETIC THEORY OF). Mercury may be freed from dust and dirt by filtering it through leather. To remove tin, lead and other dissolved metals, the mercury may be left for some weeks in contact with concentrated sulphuric acid and subsequently digested with dilute nitric acid; or it may be several times distilled. Various other modes of purification are also known.

The metal is chiefly used, in the arts, for the extraction of gold from crushed ore or fine gravel, the ore being washed by a gentle stream of water over a copper plate which is amalgamated with mercury. The gold particles, being heavy, sink through the water so as to come into contact with the copper plate, where they are held by the mercury in the form of a gold amalgam. (See GOLD and AMALGAM). In physics, mercury is also greatly used for filling thermometers and barometers, and for many other purposes. It is likewise used in medicine, both in the metallic form and in its compounds with other elements. Metallic mercury, when rubbed up in a mortar with confection of roses until its globules are so fine as to be indistinguishable to the eye, is known as "blue mass" and is administered in the form of pills, as a cholagogue.

Mercury has the chemical symbol Hg (from "hydrargyrum," its Latin name), and an atomic weight of 200.3 if O = 16, or 198.8 if H = 1. It forms two oxides, each of which give rise to a series of stable salts. The metal does not oxidize upon exposure to air at ordinary temperatures, but when heated nearly to its boiling point in air or in oxygen it slowly oxidizes, with the formation of mercury monoxide (or mercuric oxide), HgO. When prepared in this manner the monoxide is crystalline and red, and for this reason it is familiarly known as the "red oxide." The same substance may be prepared in an allotropic form by precipitating a solution of mercuric nitrate by the addition of caustic potash, the monoxide then coming down as an amorphous yellow powder. The red oxide turns black when strongly heated, but recovers its color upon cooling. When heated to redness the monoxide decomposes into metallic mercury and free oxygen. It can, therefore, be used as a source of oxygen; and it was in fact by heating this substance that oxygen was first discovered by Priestley. By acting upon the red oxide or upon metallic mercury by excess of nitric acid, mercuric nitrate, $Hg(NO_3)_2$, is formed; while if nitric acid is allowed to act upon excess of mercury, mercurous nitrate, $HgNO_3$, is obtained. The corresponding sulphates of the metal are obtained by acting upon metallic mercury with sulphuric acid, mercuric sulphate ($HgSO_4$) or mercurous sulphate (Hg_2SO_4) being obtained, according to the conditions of the experiment. Mercuric sulphide, HgS, which occurs native as the mineral cinnabar, and which is also known as vermilion, is bright red in color and may be prepared artificially by heating mercury with sulphur, or by passing sulphuretted hydrogen gas through a solution of mercuric salt. When obtained in the latter way it comes down as a black amorphous powder, which may be brought into the normal red crystalline form by sublimation. Mercury forms two chlorides which are extensively used, especially in medicine. Mercuric chloride (also known as "bichloride of mercury" or "corrosive sublimate"), $HgCl_2$, is prepared by heating a mixture of equal parts of mercuric sulphate, $HgSO_4$, and common salt, NaCl; the reaction being $HgSO_4 + 2NaCl = HgCl_2 + Na_2SO_4$. The bichloride is fairly soluble in water and dissolves readily in a solution of sal ammoniac. It is also quite soluble in alcohol. It crystallizes in the trimetric system, melts at 509° F. and boils at 563° F. It is intensely poisonous and is one of the most powerful germicides known. It is used in surgery and medicine as an antiseptic and disinfectant, and is occasionally administered internally in very small doses. Mercurous chloride, HgCl (more familiarly known as "calomel," or as the "mild chloride"), is a white powder, insoluble in water and is greatly used in medicine, both as a cholagogue and otherwise. It may be prepared in various ways, but the usual method is

by heating four parts of corrosive sublimate with three parts of metallic mercury; the mercury combining with half of the chlorine of the corrosive sublimate, as indicated by the equation $HgCl_2 + Hg = 2HgCl$. The calomel sublimes and must then be ground to a fine powder and thoroughly washed, in order to remove any free soluble corrosive sublimate that may not have been decomposed. The so-called "white precipitate," which is obtained when ammonia is added to a solution of corrosive sublimate, has the composition NH_2HgCl. Mercurous oxide, or "black oxide of mercury," Hg_2O, may be obtained as a black powder by digesting calomel with excess of caustic potash. It decomposes into the red oxide and metallic mercury upon exposure to light, or upon being heated to the boiling point of water. Many other compounds of mercury are known, but they are of less importance than the ones here given.

MERCURY VAPOR LAMP. See VAPOR MERCURY LAMP, THE HEWITT.

MERCY, Fathers of, Roman Catholic religious congregation founded on the restoration of Louis XVIII, 1814, and approved of by the Pope (1834) under the title 'Society of the Priests of Mercy.' The object of the society is the conversion of sinners by mission preaching and the practice of the corporal works of mercy. In 1839 the order founded houses in New York and Saint Augustine, Fla., and the fathers have churches for the French population in Brooklyn and Manhattan. The mother house was originally at Paris, but was removed to Rome in 1903 as a result of the Association Law. Consult Delaporte, 'Vie de Jean-Baptiste Rauzan' (1857).

MERCY, Sisters of, a name given to members of several religious communities founded for the purpose of nursing the sick at their own homes, visiting prisoners, attending lying-in-hospitals, superintending the education of females and the performance of similar works of charity and mercy. Communities of Sisters of Mercy are now widely distributed over Europe and America. There are also religious orders under the same name connected with the Anglican Church. The term is applied more specifically to the Order of Our Lady of Mercy, a Roman Catholic order founded for the objects above enumerated in Dublin 1827. The first house in America was established in Pittsburgh, Pa., 1843, and from it have sprung 65 convents. Consult 'Leaves from the Annals of the Sisters of Mercy' (1881). See MCAULEY, CATHERINE.

MERCY-SEAT (Heb. *Kappo'reth,* covering or lid, that is, of the sacred ark in the ancient Jewish tabernacle), an unfortunate and inappropriate term as applied to the cover of the chest or ark containing the two tables of the law and overspread by the wings of the Cherubim. Between these wings appeared the Shekinah or fiery symbol of the divine presence hovering over the mercy-seat, which consisted most probably of a sheet of the finest gold (Ex. xxv, 17, etc.; xxx, 6; xxxi, 7, etc.). The New Testament writers seem to hold that the term contains by implication the idea of the propitiation (q.v.) (Heb. ix, 5; Rom. iii, 24). The high priest sprinkled on it the blood of the yearly atonement, and some writers think that the term covering as applied to it refers more to the covering of or atonement for sins than to its use in covering the treasures of the ark. In any case the idea of a seat, as if the expression in Psalms xcix, 1, "he sitteth between the cherubims" referred to the earthly tabernacle is inappropriate. Consult Pratenias, 'De Judæa Arca' (1727); Werner, 'De Propitiatorio' (1695). See SHEKINAH.

MEREDITH, George, English poet and novelist: b. Hampshire, 12 Feb. 1828; d. London, 18 May 1909. Details of Meredith's life are meagre; little is known of his parentage or of his education except that he was sent to school in Germany and later studied law, which he gave up for literature. For a time he was a pupil of T. L. Peacock (q.v.), whose daughter became his first wife. His residence was for some years at Box Hill in Surrey.

His first work in literature was a volume of poems published in 1851. This was followed in 1856, by 'The Shaving of Shagpat,' a brilliant fantastic Oriental tale in which some interpreters have professed to see a political satire. In 'The Ordeal of Richard Feverel' (1859) however, he began the course of studies in human temperament which have made his name famous. The novel, unquestionably one of the most powerful in the language, deals with the ordeal of adjustment to the world of a high-spirited youth; it is the conflict between temperament and desire, represented in the hero and a variety of conventions, most rigidly typified in the "system" of his father, Sir Austin Feverel. The effect of the book is chiefly tragic. 'Evan Harrington' (1861), the next novel, is wholly comic in idea; the characters are embodiments of various "humors," most strikingly represented in the intriguing Countess; the plot, as in all of Meredith's novels, is quite secondary in interest and springs from the characters. 'Modern Love,' a sequence of brilliantly phrased, intricate, 16-lined sonnets was published in 1861. 'Emilia in England,' now called 'Sandra Belloni,' appeared in 1864 and its sequel 'Vittoria' three years later. The story is that of a young Italian girl of unaffected manners and character and her life among people of very diverse temperaments and social ideas; the theme of the novel may be regarded as the conflict, among very real people, of the genuine with the sentimental character. Between the two novels appeared in 1865, 'Rhoda Fleming,' perhaps the simplest of all Meredith's novels in style and a powerful study in character. It deals, on the whole, with a conventionally more humble order of society than is usually found in Meredith's novels, and is rather more direct, but few things in fiction are more impressive than the almost instinctive steadfastness of the heroine or more gloomy than the spiritual confusion that she tries to set in order. In 'The Adventures of Harry Richmond' the note is again chiefly comic. Much of Meredith's best work lies in the freshness of the varied scenes of this book and in the hero's father is perhaps as typical a character of the novelist as can be found, a man whose adventurous fancy and devotion to his son "informs" numberless odd and extravagant acts. Another excellent study of a different sort is 'Beauchamp's Career' (1876). It is the analytical, yet lively, story of a young man whose earnestness of character and whose activity caused him, from a conventional point of

view, to fail in life. Like other of Meredith's novels it is a great contribution to our understanding of the varieties of human temperament and to our sympathy with them.

In 'Beauchamp's Career' perhaps more than in any of his preceding novels Meredith directly explained his aim in drawing character; it was to present a type of motive and to show how it dominates and gives unity to a series of acts. The motive which causes action is, so to speak, temperamental rather than deliberate; in typical examples like the Countess in 'Evan Harrington,' or Beauchamp, for instance, Meredith is interested in the expression of temperament rather than a story. The Countess, on the face of the matter, wished for the social advancement of her family; what she really wanted was scheming for the sake of scheming and her social ambitions were but the medium of expression. This manner of approaching character, indeed, dominated all the character drawing in Meredith's novels, but it was not expressed as a deliberate theory until the publication, in 1877, of 'On the Idea of Comedy and the Uses of the Comic Spirit.' The essence of this essay is that comedy is one of the most wholesome and effectual ways of probing and purifying the ills of the world, that good comedy, as in the plays of Molière, really enables the reader to recognize what is genuine and discard what is sentimental; unfortunately, instead of good comedy we often are treated, in most literature, to painful moralizings. Meredith's fullest and finest expression of this idea is in his 'The Egoist' (1879), unquestionably his masterpiece and one of the chief glories of English fiction. Egoism, that love of self which prevents men from seeing things in their true relations, is one of the fundamental failings of mankind and Meredith has drawn it, in the inimitable Sir Willoughby Patterne, as a figure of colossal proportions. The novelist's skill and dispassionateness as an artist was never better shown than in the fact that he refuses to give conventional rewards and punishments; for the hero's unfailing egoism permits him in the end to turn to the flattering of his vanity what would ordinarily be regarded as humiliation.

Pursuing his end, an analysis and a synthesis of the springs which govern action, Meredith in his next novel, 'The Tragic Comedians' (1880) took a story from contemporary European court life and explained it as a piece of dramatic psychology. The comparative shortness of the novel makes it a good study of the author's method. This novel, too, indicated a tendency on his part to depict the motives and the psychology of people actually in existence rather than, as in 'The Egoist' and its predecessors, to draw the embodiment of a type of "humor." This tendency was certainly evident in his next novel, 'Diana of the Crossways' (1885), his greatest popular success, and is shown in the fact that certain of the incidents and characters excited curiosity as, to their originals. It is manifest also in his last three books, 'One of Our Conquerors' (1890), 'Lord Ormont and His Aminta' (1894) and 'The Amazing Marriage' (1895), which are perhaps less broadly representative and more particular than his earlier novels. Meredith's writings also include four short stories, 'The Tale of Chloe,' 'The House on the Beach,' 'Farina' and 'The Case of General Ople and Lady Camper.'

Meredith, who was one of the last great novelists to hold over, as it were, from the age of Victorian literature, belongs to the so-called psychological school, of which the great popular representative is George Eliot, with whom he is practically contemporary. He differs from her in several important respects: The comedy of character (as the term is understood with Cervantes and Molière) as well as the tragic side of life, is reflected in his pages. His attitude is detached and impersonal and he never allows his sympathies to intrude upon his study of the type he is treating, a characteristic which accounts for the criticism sometimes made that he lacks temperament and which is doubtless one of the reasons for his comparative unpopularity. He is more interested in his characters as types of temperament than as individuals, and in this field he has perhaps represented the greatest range and variety of human motive that is to be found in English fiction. Taking strata of society, on the whole, conventionally above those treated by George Eliot, he has made them representative of a great variety of "comic" motives. As a moralist, his attack has been upon those types which are broadly termed sentimental, and in this respect his pictures of such men as Wilfred Pole and Willoughby Patterne are inimitable. The person that he most approves is the simple, considerate, intelligent being, well represented in such minor heroes as Merthyr Powys, Vernon Whitford, Dartrey Fennellan and Tom Redworth, and pictured to the height of brilliancy in his real heroines. In no other novelist, in no English writer except Shakespeare, can be found so splendid a galaxy of women: Rose Jocelyn, Janet Ilchester, Renée, Cecilia Hilkett, Jenny Denham, Clara Middleton, Emilia, Carinthia Jane and many others, as well as such older ladies as Lady Jocelyn and Lady Charlotte Eglett, are the best tribute to womankind that English literature possesses, and the creation of them is an achievement of the very first rank. His style is frequently criticized as involved and epigrammatic, but no novel contains passages of greater poetical charm. See DIANA OF THE CROSSWAYS; EGOIST, THE; MODERN LOVE; ORDEAL OF RICHARD FEVEREL, THE.

Bibliography.—The best complete American edition of the poems and novels is by Messrs. Scribner, in 16 volumes. Commentary is scattering and appears chiefly in the form of contemporary reviews. Consult Brownell, 'Victorian Prose Masters' (1901); Lynch, Hannah, 'George Meredith' (1891); and, for a varied symposium, LeGallienne, 'George Meredith, Some Characteristics; with a Bibliography by John Lane'; and for his place in the history of the novel, Cross, 'The Development of the English Novel' (1899). Consult also Ellis, S. M., 'George Meredith: His Life and Friends' (London 1919).

W. T. BREWSTER,
Professor of English, Columbia University.

MEREDITH, Louisa Anne Twamly, Australian author and artist: b. Birmingham, England, 20 July 1812; d. Hobart Town, Tasmania, 21 Oct. 1895. She had already published a volume of verse (1835); and 'The Romance of Nature,' illustrated by herself (1836), before

she married her cousin Charles Meredith (1839) and removed to Australia, whence they went to Tasmania five years later. She continued her literary activity till the end of her long life and for many years before her death had been the most prominent Tasmanian author. Among her books, many illustrated by herself, are 'My Home in Tasmania' (1852); 'Over the Straits' (1860); 'Tasmania: Friends and Foes, Feathered and Furred' (1880). Her prose works were popular in Australia and had also a circulation in England and this country; and her verse, of which she published several collections, was at once pleasing and unpretentious.

MEREDITH, Owen, the pseudonym of Bulwer-Lytton. See LYTTON, EDWARD ROBERT BULWER.

MEREDITH, Samuel, American patriot and first Treasurer of the United States: b. Philadelphia, Pa., 1740; d. 10 March 1817. His father was a Welshman and a friend of George Washington. Meredith became a member of the Pennsylvania colonial legislature, and when the American Revolution broke out he entered the Colonial army as major, took part in several battles and was made brigadier-general for gallant services. He gave £10,000 in silver for carrying on the war, and was exiled from Philadelphia when the British occupied it. Meredith served in Congress in 1787–88 and in 1789 became the first Treasurer of the United States, advancing to the government, on taking the office, $20,000 and later $120,000, for which he was never reimbursed. He remained in the office of Treasurer until 1801.

MEREDITH, SIR William Ralph, Canadian jurist: b. Westminster, Ontario, 31 March 1840. He was educated in the University of Toronto and was admitted to the bar in 1861, when he established a law practice in London, Ontario. He became queen's counsel in 1876 and in 1881 removed to Toronto. In 1872 he entered the provincial legislature of Ontario as member for London, and for 16 years he was leader of the Conservative opposition during the long reign of Mowat as Premier. In that position he showed a disposition to subordinate provincial rights to those of the Dominion; and he was an advocate of manhood suffrage, secret ballot, the enlargement of powers to municipalities and workmen's compensation. In 1894 he was appointed chief justice of the Court of Common Pleas and in 1912 chief justice of Ontario. In 1896 he was appointed a commissioner for the revision of the provincial statutes, and in 1905 he was one of the commission that investigated the affairs of Toronto. He was knighted in 1896, and has been chancellor of the University of Toronto since 1900.

MEREZHKOVSKI, Dmitri Sergeyevich, Russian critic and novelist: b. Saint Petersburg, 1865. He was educated in his native city and published his first volume of verse at the age of 23. In 1893 he published an essay on the decadence of Russian literature which attracted general attention. In 1901–02 appeared his 'Critical Studies of Tolstoy and Dostoyevsky as Men and as Artists' and 'The Religion of Tolstoy and Dostoyevsky,' which proved him a critic of high order. Next there appeared his trilogy of historical novels dealing with the perennial conflict between Christianity and paganism. Collectively known as 'Christ and Antichrist,' this work has appeared in many modern languages. It includes 'Smert Bogov' (Eng. trans., 'The Death of the Gods,' London 1901), in which the chief character is Julian the Apostate; 'Voskresenie Bogi' (Eng. trans., 'The Forerunner,' ib. 1902) with Leonardo da Vinci as chief character; and 'Antikhrist: Petr i Aleksyey' (Eng. trans., 'Peter and Alexis,' London 1905). He also wrote the dramas 'Paul I' (1908) and 'Alexander I' (2 vols., 1913). Consult collected edition of his works (15 vols., Saint Petersburg 1911–12) and Phelps, W. L., 'Contemporary Russian Novelists' (Boston 1913).

MERGANSER, or FISH-DUCK, a duck of the genus *Mergus,* distinguished by the slender cylindrical bill, the upper mandible terminating in a strong hooked "nail," and the margins presenting the appearance of rows of tooth-like processes. The most widely distributed is the red-breasted (*Mergus serrator*) known as sheldrake in America where it is less numerous than in the Old World. The goosander (*M. merganser*) and the nun or smew (*M. albellus*) are familiar European and Asiatic species, while the hooded merganser (*Lophodytes cucullatus*) or sawbill is familiar in North America. The mergansers feed chiefly upon fishes and swim and dive after their prey with great ease and dexterity. They are essentially northern in their distribution, breed in the far north and migrate southward on the approach of the colder season. The nest is built of grass and roots and is lined with down. It is usually placed in a hollow of the bank near water, but some species prefer the greater security of a hollow tree. The flesh is coarse and rank. Eight or 10 species are known in various parts of the world. The female alone incubates, but the male watches near the nest. From 8 to 14 eggs are laid and the young enter the water as soon as they are hatched.

MERGENTHALER, mĕr'gan-tā-lèr, **Ottmar,** American inventor: b. Würtemberg, Germany, 10 May 1854; d. Baltimore, 28 Oct. 1899. He was a watchmaker by trade; came to the United States at 18, entered the employ of the United States government at Washington where he kept clocks and electrical devices throughout government buildings in order; improved apparatus used in the signal service, and in 1876 removed to Baltimore, where he devoted himself to perfecting a type-setting machine. On this he spent several years, his scheme going through four stages, the last of which was the linotype (q.v.). When he had patented this machine he had much difficulty in introducing it. It was perfected by the addition of the Rogers spacer and numerous minor inventions by Philip T. Dodge and others, brought its inventor large profits and is now in very common use in large printing establishments. Mergenthaler also invented a machine for making fruit gift-baskets of veneered wood.

MERGER, *in law,* the sinking or obliteration in conveyancing of lesser estates or property into greater ones, or the consolidation of two or more estates; a term used in financial or business circles, meaning the consolidation or combination of a particular class of manufactories, railroads or other business interests

generally in the nature of a trust. Late in the 19th century it became common in the United States for a group of corporations, which it was desired to bring together for monopolizing an industry, to "merge" by forming a holding company, which took over the majority stock of each subsidiary company in the merger and gave in exchange the stock of the holding company. To test the validity of such mergers a suit was brought against the Northern Securities Company, and after exhaustive arguments and much delay the United States Supreme Court declared that the procedure was "in restraint of trade." Since then corporation mergers have ceased. The principle still holds good, however, in both civil and criminal law, that the lesser may merge into the greater. In contracts the acceptance of a high grade of security is held to extinguish the lower grade. When a bond is given for the performance of a contract the obligation to fulfil the contract is merged in the bond as the higher obligation. See TRUSTS.

MERGUI (mĕr-gē') **ARCHIPELAGO,** a chain of islands in the Bay of Bengal, off the coast of Tenasserim in Burma, the more northern ones forming a part of the British district of Mergui; area, 10,000 square miles. They are generally covered with trees and present many picturesque features, rising at some points to the height of 3,000 feet. The largest island is Kings Island, some 25 miles long. Some tin is found here. The chief town is Mergui, with a population of about 15,000. The locality is one of the dampest on the globe, the rainfall exceeding 100 inches annually. The inhabitants belong to a race called Selungo. They give little attention to agriculture, obtaining a sustenance mainly by fishing, pearl gathering and selling edible birds' nests. The Selungs are peaceful and industrious, but few in number. The adjoining seas abound in fish and excellent oysters; pearls of good quality are found. Pop. about 115,000.

MERIDA, Mexico, the capital city of Yucatan. The city was founded in 1542 and is situated on a plain. There are railway connections with all important points in the interior and several lines of steamers ply between its port, Progreso, 25 miles distant, and Vera Cruz, New York and other prominent commercial ports. The surrounding country is almost entirely devoted to the sisal hemp industry, which has reached enormous proportions in the state. Hides, sugar, chicle and indigo are also exported. There are manufactories of cotton goods, cigars, panama hats, leather, soap, etc. The principal buildings are the government palace, the municipal palace, the Casa del Conquistador Montejo (the first Spanish house built in the city), the old cathedral, the School of Arts, the Penitentiary, Literary Institute or State College, Normal School for Teachers, Meteorological and Astronomical Observatory, Yucatan Museum, Catholic College of San Ildefonso, schools of medicine, surgery, pharmacy, jurisprudence and notarial instruction, the Literary Institute for Girls, the College for Girls, the Catholic School for Girls, the Tereseano College, the Primary School of Arts and Works and the Institucion de Beneficiencia Privado, founded by Leandro L. Ayala at an outlay of $1,000,000. There are an asylum for maniacs, a lazareto, a maternity hospital, three other hospitals, an asylum for mendigos, two theatres and an arena for bull fights. The Hidalgo Park contains a statue of Gen. Cepeda Peraza, and one symbolizing the peace of the state. Near the great cathedral are also large statues of Saint Peter and Saint Paul. A body of public security, a jefe politico and an inspector-general preserve order and ensure safety to all. The streets are paved with asphalt. Merida contains two local financial institutions — the Banco Yucateca, with a capital of $8,000,000, and the Banco Mercantil de Yucatan, with a capital of $6,000,000, and a branch of the National Bank and an agency of the Bank of London and Mexico. Pop. about 50,000.

MERIDA, Spain (the Roman *Augusta Emerita*), a small decayed town of the province of Estremadura, on the Guadiana, 32 miles east of Badajoz. It is unique in Spain, and is in some points a rival of Rome itself on account of the number and magnitude of its remains of Roman antiquity. The Guadiana is here crossed by a Roman bridge of 64 arches (originally 81; 17 destroyed in 1812) and with a length of 2,575 feet and a breadth of 26 feet; it was erected by Trajan. There is another Roman bridge over the Albarregas, 450 feet long, 25 feet wide, still quite perfect, in spite of the traffic of 18 centuries since its erection. There are also remains of a castle built by the Romans, and among other most noteworthy monuments of antiquity are an old half-Roman, half-Moorish palace, the Casa de los Corvos, constructed out of a temple dedicated to Diana, several aqueducts, an ancient amphitheatre and a circus. Merida was founded in 23 B.C., and flourished in great splendor under Roman and Moor until 1228, when it was taken from the Moors, after which it began to decline. Pop. 7,390.

MERIDA, Venezuela, town, capital of the state of Los Andes, 5,290 feet above sea-level, 60 miles south of Lake Maracaibo, at the foot of the Sierra Nevada de Merida, which tower to a height of about 15,000 feet. It was founded in 1558 by Juan Rodriguez Saurez. It was almost wholly destroyed by an earthquake in 1812 and again seriously damaged in 1894. It is the seat of a bishop, contains a fine cathedral, one of the two national universities of Venezuela, and has several high schools. Its manufactures are carpets, woolen and cotton goods. Pop. about 15,000.

MERIDEN, Conn., city, in New Haven County, on branches of the New York, New Haven and Hartford Railroad, about midway between Hartford and New Haven. Originally the town of Meriden was a part of Wallingford until 1806, when the town of Meriden was incorporated. In 1867 it was granted a city charter. It is situated in an agricultural region, but the city is noted for its large number of manufactories. Some of the principal manufactures are cutlery, silver and plated ware, steel pens, hardware, machinery, screws, vises, glassware, cut glass, malleable iron, bronzes, firearms, brass castings, curtain fixtures, gas and kerosene fixtures, self-playing attachments for pianos and organs, woodenware, tinware, granite, agateware, lamp trimmings, etc. The shipments are principally manufactured arti-

cles, fruit, vegetables and tobacco. The educational institutions are the public and parish schools, a high school and the Curtis Memorial Library. It has the Curtis Home for Orphan Children and Aged Women, the Connecticut School for Boys and the Meriden Hospital. The government is administered under a charter of 1897. The mayor, who holds office two years, appoints fire and park commissioners, board of taxation and apportionment, police and board of public works. The council elects the health officer, board of compensation, tax collector, plumbing inspector, boiler inspector and fire marshal. The treasurer, sheriff, clerk and auditor are chosen by popular vote. Pop. 31,000.

MERIDIAN, Miss., city, county-seat of Lauderdale County, on Alabama and Vicksburg, Alabama Great Southern, Meridian and Memphis, Mobile and Ohio, New Orleans and Northeastern and Southern railroads. It is the largest city in Mississippi in population, manufactures and commerce, surrounded by fertile farm land of which cotton and vegetables are the chief agricultural products. Among numerous industrial establishments are lumber mills, fertilizer factories, cotton-seed-oil mills, cotton mills, cotton compresses and railroad shops. The annual wholesale trade is $20,000,000; the average annual bank clearings approximate $17,000,000. Meridian is the seat of the East Mississippi Female College (M. E.), founded in 1867 and opened in 1869, the Lincoln School (Congregational), the Meridian Academy (Methodist Episcopal South), both for colored students, a Catholic high school and Saint Aloysius Academy for Girls. Among prominent features are the municipal building, county courthouse, public library, Scottish Rite Cathedral, Stonewall Club, handsome churches and fine business and banking buildings. The Mississippi-Alabama Fair, held annually at Meridian, is the second largest agricultural and stock exhibition in the South in number of exhibits and attendance. Since 1912 the commission form of government is in operation; the city owns the waterworks and has a modern equipped and salaried fire department. Electric car service, electric and gas lighting are furnished by a company with a plant of sufficient capacity for a city of 100,000 inhabitants. During the Civil War, Meridian was devastated by General Sherman, 14–20 Feb. 1864, and in March 1906 a large portion of the city was destroyed by a tornado. Pop. 30,000.

MERIDIAN (Miss.), **Expedition to.** In January 1864 General Sherman concentrated two divisions of 10,000 each at Vicksburg under Generals McPherson and Hurlbut, and 3 February marched eastward with the purpose of destroying Meridian, 150 miles distant, as a railroad centre, and possibly penetrating to Selma, Ala., or, if the opposing forces did not seem too strong at Mobile, to turn southward from Meridian and attempt the capture of that city. Gen. Sooy Smith was to co-operate with a cavalry force from Memphis; General Dodge, in command at Pulaski, Tenn., was to hold Logan at Bellefonte, Ala., for a diversion toward Rome, Ga.; and General Thomas was to demonstrate toward Dalton to prevent troops being sent by General Johnston to Sherman's front. Sherman entered Jackson on the 6th, after heavy skirmishing with cavalry. Decatur was reached on the 12th. Meridian was taken the 14th, the Confederate force, under Gen. Leonidas Polk, being much less than Sherman's withdrawing toward Demopolis. The arsenal, extensive storehouses and cantonments were burned. The work of destroying the railroads centring at Meridian began on the 16th, 61 miles being rendered utterly useless to the north and east and 55 miles toward Mobile. This destruction was of the most systematic and thorough character; 10,000 men worked at it for five days; 61 bridges and culverts and more than a mile of trestles over swamps were burned; all rails were renderd useless. The object of the expedition was fully gained, as Meridian was not wholly restored as a railroad centre during the war. Thereafter, the transporting of supplies eastward from the State of Mississippi was seriously interrupted for a long time and was greatly impeded up to the close of the war, while all military operations which required railroad facilities were rendered extremely difficult.

The expedition, however, was not as successful as had been hoped. The Confederates, by the exercise of great energy in the face of many difficulties, so strengthened Mobile as to forbid an advance in that direction. Sherman, not receiving the cavalry support under Gen. Sooy Smith which he had reason to expect from Memphis, was unable to push on to Selma, Ala., one of the great manufacturing cities and storehouses for military supplies of the Confederacy. Smith, in turn, had been unavoidably detained, and Sherman returned to Vicksburg, reaching its vicinity 26 February. His command had marched between 300 and 400 miles, had crossed Mississippi and inflicted well-nigh irreparable military damage; but had been prevented from carrying out his full program by Confederate activity in assembling forces in his extreme front.

MERIDIAN, one of the imaginary north and south lines on the surface of the earth that may be conceived of as passing through both poles and serving to indicate the longitude of places, and with a parallel of latitude mark their exact position. If one conceive the earth sliced into on one of these lines, the resulting surface is the plane of the meridian. There are also corresponding lines called astronomical or celestial meridian, which are imaginary circles of the celestial sphere passing through the poles of the heavens and the zenith of any place on the earth's surface. These correspond exactly to the geographical meridians, that is the celestial is exactly above the geographical meridian of any place. Every place on the globe has its meridian, and when the sun arrives at this line it is noon or midday, whence the name (Latin, *meridianus — medius,* middle and *dies,* day). (See LONGITUDE). The inconvenience arising from having a fixed meridian in different countries is sufficiently obvious, and geographers, navigators and astronomers have all found it frequently a source of confusion. After years of fruitless discussion the question of a reference or first meridian for the world came before an international conference held at Washington, 1 to 22 Oct. 1884. There, although the representatives of France and Brazil dissented, it was agreed to recommend

the meridian of Greenwich both as the astronomical and as the geographical reference meridian of the world, longitude to be reckoned east and west from this up to 180°. At the same time it was advised that the astronomical day should begin at midnight, mean Greenwich time, the hours for astronomical purposes being reckoned as before from 0 to 24. This arrangement began on 1 Jan. 1885. Previously many foreign map-makers had accepted the meridian of Greenwich as first meridian, Germans and Americans apparently having no jealousy of Great Britain in regard to the matter. The change of time has had some importance for astronomers, but ordinary civil time is still computed much as before. The zone system of reckoning standard time was adopted in the United States in 1883 and in Australia in 1895. In the former country there are four zones: the Eastern, taking time from the meridian of 75° W. (5 hrs. slow on Greenwich time); the Central, with standard meridian 90° W. (6 hrs. slow); the Mountain, 105° W. (7 hrs. slow); and the Pacific, 120° W. (8 hrs. slow). There are three Australian zones: Queensland, New South Wales, Victoria and Tasmania, with 150° E. (10 hrs. fast) as standard; South Australia, with 135° E. (9 hrs. fast); and Western Australia, with 120° E. (8 hrs. fast). Other standards adopted with reference to Greenwich are: 15° E. (1 hr. fast) for Mid-Europe; 22½° E. (1½ hrs. fast) for Cape Colony; 30° E. (2 hrs. fast) for Natal; 135° E. (9 hrs. fast) for Japan; and 172½° E. (11½ hrs. fast) for New Zealand. The meridian is also applied to the laying out of the earth, magnetism on a chart, north and south line cutting the magnetic pole, or the vertical plane formed by such line is a magnetic meridian. Consult any map for the meridian lines.

MERIDIAN CIRCLE, *in astronomy,* an instrument used in observatories to combine the functions of a transit instrument and of the old mural circle. It has a telescope mounted to turn in a circle, always in the plane of a meridian. Of course the axis must be accurately laid east and west, and for this purpose solid masonry piers are commonly provided. A vertical circle is carried on the axis of the transit instrument and revolves with it, its divisions being read by micrometer microscopes mounted solidly on one of the piers. In this way both coordinates of the position of a heavenly body, its right ascension and declination, are determined at the same meridian passage — a great saving of time over the old method with the instruments. See TELESCOPE.

MÉRIMÉE, mā-rē-mā, **Prosper,** French author: b. Paris, 28 Sept. 1803; d. Cannes, 23 Sept. 1870. He was educated at the Collège Henri IV and studied law though he never practised it. Under the pseudonym "Joseph Lestrange" he published in 1825 'Theatre de Clara Gozul, Comedienne Espagnole,' an assumed translation from the Spanish of eight prose comedies, but in reality his own work. From that time onward he continued to publish works at frequent intervals and at the same time had an official career of importance. Following the revolution of July 1830, he was made secretary to the ministers of commerce and marine, in 1831 was appointed inspector of ancient monuments, in 1844 became a member of the Academy, and senator of France in 1853. He was a commander of the Legion of Honor in 1860. Beside publishing several important works connected with his duties as inspector of ancient monuments he was the author of 'Colomba' (1840), a very popular novel of the Corsican vendetta; 'Carmen' (1847), a romance upon which the famous opera 'Carmen' by Bizet is founded; 'Lettres à une Inconnue,' his most famous work (1873); 'Lettres à une autre Inconnue' (1875); 'Lettres à Panizzi' (1881); 'Une Correspondance Inédite' (1896). The four works last named are Mérimée's most characteristic writings revealing him as a most loyal devoted friend. They differ widely from his other works, which though often brilliant are hard and unsympathetic, while these are tender and romantic. As a master of style Mérimée had few equals in his day. (See CARMEN; COLOMBA). Consult Filon, 'Mérimée et ses Amis' (1894); Haussonville, Mérimée (1888); Tourneux, 'Prosper Mérimée, ses Portraits, ses Dessins, etc.' (1879).

MERINO, a woolen or worsted fabric, introduced about 1826, and so named because made from the wool of merino sheep. The word is originally the title of an inspector of sheep pastures in Spain, and became attached to the short-wool Spanish sheep. The breed did not originate there, however, being imported from Africa by the Moors and bred by the Spanish. The wool was so highly regarded that they have been exported for breeding all over the world, but especially to Australia See WOOL, MANUFACTURE OF.

MERINO SHEEP. See SHEEP.

MERIT, Order of, a British order instituted by King Edward VII, 26 June 1902, to confer distinction on persons in military, scientific, artistic and professional circles. The number is limited to 24. In 1917 there were 17 members, and three honorary members (four military).

MERIT SYSTEM, The. See CIVIL SERVICE REFORM.

MERIVALE, mĕr'i-vāl, **Charles,** English historian and ecclesiastic: b. Barton Place, Devonshire, 8 March 1808; d. Ely, 27 Dec. 1893. He was educated at Cambridge, took orders in the English Church, was rector of Lawford, Essex, 1848–69, and dean of Ely from 1869. He published 'The Fall of the Roman Republic' (1853), which forms the first part of his popular 'History of the Romans under the Empire' (latest ed., 1890); 'General History of Rome' (1875); 'Lectures on Early Church History' (1879); etc. Consult 'Autobiography and Letters' edited by his daughter (1899).

MERIVALE, Herman, English statesman and political economist; brother of Charles; b. Dawlish, Devonshire, 8 Nov. 1806; d. London, 9 Feb. 1874. He was educated at Oxford, where he was professor of political economy 1837–42. He was under-secretary for the colonies, 1848–59, becoming perpetual under-secretary for India in 1859. He wrote 'Colonization and Colonies' (1841), a much valued work; 'Historical Studies' (1865); 'Memoirs of Sir Philip Francis' (1867).

MERIVALE, Herman Charles, English author: b. London, 1839; d. 15 Jan. 1906. He

was educated at Harrow and Oxford, became a barrister of the Inner Temple in 1864 and edited the 'Annual Register' 1870–80. Among his publications are 'The White Pilgrim and Other Poems' (1875); 'The Cynic' (1882); several plays; 'The Whip Hand' (1884); 'The Dove' (1888). He was a son of J. H. Merivale.

MERIWETHER, Lee, American lawyer, social reformer and author; b. Columbus, Miss., 25 Dec. 1862. Having obtained a secondary education at Memphis, Tenn., he there published the *Free Trader* with a brother, Avery, in 1881–83, and in 1885–86 toured Europe afoot from Gibraltar to the Bosporus for study of the condition of Continental workingmen and of the protective tariff. In 1910, on the 25th anniversary of this "Tramp" trip through Europe, he covered the same route in an automobile; the contrast between walking and motoring abroad, and the changes that had taken place in the manners and customs of the peoples of Europe between 1885 and 1910 were interestingly set forth in a book entitled 'Seeing Europe By Automobile' (New York 1911). He was appointed by the Secretary of the Interior to write for the United States Labor Bureau a report on the 'Condition of European Labor,' published in the annual report of the bureau for 1886. In 1886–89 he was employed as a special agent of the Department of the Interior for which he made investigations of labor in the United States and the Hawaiian Islands, and in 1891 visited the island prisons of the Mediterranean. He was admitted to the bar in 1892, and in 1893 entered practice at Saint Louis. In 1889–90 and 1895–96 he was labor commissioner of Missouri. His reports on municipal government and street-railway franchises led to his nomination in 1897 for the mayoralty of Saint Louis on the Democratic ticket. He was defeated at that time and also in 1901, when he was candidate of the Public Ownership party. Besides his various reports, he has published 'A Tramp Trip: How to See Europe on Fifty Cents a Day' (1887); 'The Tramp at Home' (1890); 'Afloat and Ashore on the Mediterranean' (1892); 'Miss Chunk' (1899); 'A Lord's Courtship' (1900); 'Seeing Europe by Automobile' (1911); and other works.

MERLE D'AUBIGNÉ, Jean Henri. See D'Aubigné, Jean Henri Merle.

MERLIN, mĕrlĭn, a semi-legendary British prophet and magician, supposed to have flourished toward the end of the 5th century. The accounts of him are hopelessly mixed with fiction. He was said to be the son of a demon and the daughter of a British prince, and was brought up at Caer-Merlin, a city supposed to be the modern Carmarthen. He received from his father the power of working miracles and was the greatest sage of his time, the counsellor and friend of English kings. Vortigen, according to the legend, on the advice of his magicians, had resolved to build an impregnable tower for security against the Saxons but the foundation was scarcely laid when the earth opened by night and swallowed it up. The magicians informed the king that to give firmness to the foundation he must wet it with the blood of a child born without a father. After much search the young Merlin was brought to the king. Merlin disputed with the magicians and showed them that under the foundation of the tower was a great lake, and under the lake two great raging dragons, one red, representing the British, one white, representing the Saxons. The earth was dug open, and the dragons began a furious battle; whereupon Merlin wept, and uttered prophecies respecting the future state of England. Merlin is a character in Tennyson's 'Idylls of the King.' A collection of the prophecies attributed to him appeared in Paris in 1498, at London in 1532 and 1533, at Venice, 1554. They can be traced back to about 1360. His prophecies were published at Edinburgh in 1615 and contain also those ascribed to the Cambrian or Welsh Merlin. Consult Child, 'Her Book of Merlin' (New York 1904); Tennyson, Alfred, 'Idylls of the King.'

MERLIN. This dramatic narrative poem by Edwin Arlington Robinson is among the most distinguished and significant products of recent American literature, and bids fair to take its place beside the best of its very admirable kind. It is entirely modern in its spirit and treatment, with lines like these that mark its date:

> "Time swings
> "A mighty scythe, and some day all your peace
> "Goes down before its edge like so much clover."

In Mr. Robinson's poem King Arthur and his knights are not romantic heroes, as other poets have made them, not "our conception of what knighthood should be"; they are a modern poet's conception of what leaders of men always and universally are,— king, warrior, lover, fool; Arthur, Gawaine, Lancelot, Dagonet. Nor is Mr. Robinson's Merlin like Tennyson's — a magician in his dotage falling a victim to the wiles of a false woman. He is a prophet whose "memories go forward"; he is a man "Who saw himself, A sight no other man has ever seen," and he follows Vivian, "a woman who is worth a grave," because Fate wills it so. It is not the age of chivalry but our own time, our own double world of hope and of reality, with its loves, faith, fears, wars and failures that Mr. Robinson revivifies in 'Merlin.' The philosophy of the poem, that faith and creative love will someday save the world, is a lustrous background for the story: "The torch of woman, who, together with the light That Galahad found, is yet to light the world." As a tale Merlin is vivid and compelling, with scenes, like that of Merlin's first meeting with Vivian and his final parting, which rival the best in drama for beauty and intensity.

Edith J. R. Isaacs.

MERLIN, or **STONE-FALCON,** a small and handsome European falcon (*Æsalon regulus*) prevailingly blue, known throughout the temperate parts of the old world, and very similar to the American pigeon-hawk (q.v.) It is fierce and courageous, and is trained in falconry for the pursuit of the birds that form its natural prey.

MERMAID, a mythical being living within and under the sea, having the form of a woman above the waist and that of a fish below it. They are usually described as having great personal charms, and as using these for the purpose of luring imaginative and amorous men to

destruction by enticing them into the depths of the sea; and, as a correlative, they are sometimes represented as securing their own destruction by quitting the sea, through marriage with some favored human husband by which they magically obtain temporarily a complete human form and soul, but always end in bringing disaster to one or both of the sacrilegious pair. Mermen are also occasionally heard of, but take an unimportant part in the legendary lore of the sea.

This mediæval notion is doubtless a survival of the primitive fancies, half fearful, half poetic, which created the classic conceptions of tritons, nereids, and the like. Shakespeare wrote (Ant. and Cleop., II, 2, 211):

> "Her gentlewomen, like the Nereides,
> So many mermaids, tended her."

All of these ideas probably arose from a mixture of observed human resemblances in certain marine animals with purely mystical fancies which peopled the ocean with similitudes to terrestrial creatures. Primitive men have everywhere derived a large part of their sustenance from the natural products of the waters; and always the vastness and mystery of the sea, full of strange creatures and incomprehensible phenomena, have powerfully affected the imagination of the ignorant and superstitious. To this day the ocean is more familiar and more important in the life of many isolated peoples, who dwell upon its margin and derive their support almost exclusively from it, than is the land; and they invest it and everything it contains with a wondering regard which the inlander can neither share nor understand. To these, even in civilized regions (as on the coast of Ireland or the Hebrides) mermaids remain only one of many present realities, herding sea-cattle and lying in wait for unwary humanity as surely as when sea-horses raced over the Ægean waves with the car of Poseidon or the Sirens tempted the mariners of ancient Greece. In one form or another such stories have been rife in the folk-lore of all maritime peoples since prehistoric times; and, although not so widespread, the belief in mermaids, and their kith and kin, is still a matter of firm faith with hosts of persons in all parts of the world. Folk-lore abounds in evidence of this.

The physical basis for these notions rests upon the resemblance which some marine animals bear to human beings when seen at a distance and in certain attitudes. Such, in northern countries, are various seals, which formerly abounded upon the coasts of western Europe, and still are to be seen in the less frequented spots. They have a way of lifting their round heads and shoulders from the water, with a queer human intelligent look upon their faces, and hugging their young to their bosoms with motherly affection. Impressed with this resemblance, easily turned into a story to beguile a long winter evening or to amuse a child, and growing with imaginative repetitions, the northern peoples were quick to believe the similar and more elaborate stories brought to them by early voyagers from the Mediterranean, and so the tales grew and changed into the rich folk-lore of the coasts of the North Sea.

The southern stories, embellished by classic culture into the sea-myths of Neptune, Proteus and the sea-nymphs of old, and descending into the mermaids and mermen of mediæval folk-lore, yet alive around the Mediterranean and Oriental seas, and among sailors generally, probably have their root in the aspect of the East Indian and African dugongs (q.v.). Near at hand these uncouth monsters would never be mistaken for human beings; but seen at a distance, by fearful and wondering voyages along the coast, such an error might easily happen, for they frequently stand upright among the weedy shallows of the coasts, perhaps draped with loosened vegetation like long hair, and holding to their breasts a young one who nurses from pectoral mammæ much as a human baby would do. Such reports, brought back to the enquiring poetic minds of Greece, might easily blossom into the tales of sea-mythology which formed so large and real a part of the popular belief as well as of the legendary lore of the classic age of India, Persia and the Mediterranean peoples. The fish-gods of the Phœnicians and other idolaters are closely related.

From this has come down to us the extensive and varied use of mermaids and mermen in heraldry. "In French heraldry," says Robinson, "the mermaid is called the Siren; in German she has two tails; in the Italian she carries a harp; and in many cases in each country she is crowned. In England it is a very ancient crest, and among others the lords Byron, the earls of Portsmouth . . . and many others display the sea-maiden in their armorial bearing. With her comb and looking-glass she smiles at us from the shields of the Holmes, Ellises, Lapps; and as a supporter holds up the arms of the Viscounts Boyne and Hood, the earls of Howth and Caledon, and is borne by the heads of the families of Sinclair of Rosslyn, and Scott of Harden. Two mermaids crowned are the supporters of the Boston arms."

Artificial mermaids, claiming to be preserved realities, have formed a part of the stock of curiosities of wonder-shows since time immemorial; and most of those exhibited since the days of Barnum have been the products of Japanese ingenuity.

ERNEST INGERSOLL.

MERMAID'S HEAD, a globose sea-urchin, as one of the heart-urchins.

MERMAID'S PURSE, the egg-case of the skate (or shark), which is often cast up empty on the shore.

MERMAN. See MERMAID.

MERO, or **MEROU,** a West Indian name for a jewfish (q.v.).

MEROBAUDES, Flavius, a Spanish rhetorician and poet of the first half of the 5th century A.D., eminent also as a general, has left us a short hymn in honor of Christ and fragments of five historical poems. L. Jeep in his edition of Claudian (Leipzig 1876–79) publishes four of these poems.

MERODACH, mĕr'ō-dăk, or **BEL-MERODACH.** See BEL.

MEROÉ, mĕr'ō-ē, Egyptian Sudan, a city and state of ancient Ethiopia, in the northeastern part of Africa. The city is still represented by ruins and pyramids near Kabati on the Nile north of Khartum and the state forms the district often spoken of as the Isle of Meroë, extending southeast to Abyssinia, and in the

northwest forming a part of Nubia. It was distinguished for its mineral and cereal wealth and at an early date was the centre of an active and varied commerce including the great caravan trade between Ethiopia, Egypt, Arabia, northern Africa and India. The government was in the hands of a caste of priests, who chose a king who was obliged to live and act according to certain prescribed rules. The priests could sentence the king to death in the name of the gods, and he was forced to submit. The priests were of a lighter complexion than the other inhabitants and may have come from India. Ergamenes, king of Meroë in the 3d century B.C., during the reign of Ptolemy II in Egypt, first made himself independent of this oppressive priesthood by murdering the priests in the golden temple. Meroë and Axum (in Abyssinia), which appears to have been a colony of Meroë, remained the centre of the southern commerce till the time of the Arabians. The existing monuments of their architecture, and many other vestiges, exhibit an advanced religious and social cultivation. The University of Liverpool in 1910–11 financed excavations here, interesting ruins were uncovered and many valued relics obtained. Consult Budge, 'The Egyptian Sudan' (London 1907).

MEROPE, the title of an Italian tragedy in blank verse by the Marquis Francisco Scipione Maffei (1675–1755), first performed at Modena in 1713. Appearing just after the dreary period of 17th century stagnation in Italian letters, it obtained a European reputation. More than 60 editions were published and it was widely translated. It attained in Italy an unprecedented success on the stage and is important also for its influence upon the development of the Italian theatre, whose standard Maffei raised perceptibly.

The subject of the play is taken from Greek mythology as related by Apollodoro (II, 8–5) and Pausanias (IV, 3–6). Merope is the queen of Messena whose husband, Cresfonte, and two children have been murdered by her brother-in-law, Polifonte, who then usurps the royal power and attempts to force the queen to marry him. On this tragic story Euripides wrote his 'Cresfonte,' which is not extant. Maffei was the first modern dramatist to handle the material and reveal its superb possibilities. He dispenses with the love element so prevalent at that time in the French theatre and proves that without it a play can retain the interest of the spectator. His idea is that such a play shall depict but a single passion, in this case a mother's love for her son. The scene (III, 4) in which Merope, believing that she has in her grasp her son's slayer, discovers in him her own son, the transition from anger and vengeance to surprise and then to the motherly love, is profoundly impressive. The dénouement, the death of the tyrant (V, 6), at the foot of the altar, is equally effective. Notable as are the tragedies of Voltaire and of Alfieri dealing with the same subject with the power characteristic of each of these master minds, nevertheless in intensity of plot interest and in dramatic treatment, Maffei's 'Merope' remains unsurpassed. Consult 'Opuscoli e lettere di Maffei' (Milan 1844), for the text and interesting material. A school edition, edited by A. C. Clapin was published in London in 1890. The text, with variations and introduction, appeared later in No. 108 of the 'Bibliotheca Romanica.'

JAMES GEDDES, Jr.

MEROSTOMATA, a sub-class of arthropods, allied to the *Crustacea,* and represented by only a single survivor (the horsefoot crab), but including a large series of fossil forms which flourished in the Palæozoic Age from mid-Cambrian onward. They were somewhat scorpion-like in form, although sometimes of gigantic size, and ranked between the superior trilobites and inferior arachnids. The Merostomata are characterized by having six pairs of ambulatory limbs about the mouth, the first of which terminate in some, if not in all, cases in chiliceræ. The others serve as organs of locomotion, and their coxal joints for prehension and mastication. The prevailing opinion is that the body is divided into two parts (cephalothorax and abdomen) instead of three (head-shield, thorax and abdomen) has been changed by recent discoveries that make the trilobate character of the structure indubitable, and establish a close relationship with the trilobites. The sub-class comprises three orders, *Xiphosura,* the horsefoot crabs (q.v.), several species of which still exist; the *Synxiphosura,* Silurian and Cambrian fossil forms; and *Eurypterida* (see EURYPTERUS). Consult Packard, 'Zoology' (1897), and Zittel-Eastman, 'Textbook of Paleontology' (Vol. 1, 1900), which contains an extensive bibliography.

MEROVINGIANS, mĕr-ō-vin'jĭ-ąnz, the first dynasty of Frankish kings which ruled in the northern part of Gaul, since called France. They derived their name from Merowig (Merovæus), the grandfather of Clovis. They ruled from 496 till 752, when they were supplanted by the Carlovingians. Pepin the Short caused the overthrow by deposing Childeric III, and sending him to a monastery. See FRANCE.

MERRELL, John Porter, American naval officer: b. Auburn, N. Y., 7 Sept. 1846; d. New London, Conn., 8 Dec. 1916. He was graduated at the United States Naval Academy in 1867, served with the European fleet 1867–70; was on signal duty on the Washington and Darien expedition of 1870–71, was in charge of the naval ordnance proving grounds 1877–79. He was also for a time an instructor at Annapolis and had command of the Atlantic fleet. He also did active work in the Department at Washington. He was retired by operation of law 7 Sept. 1908. In 1895–96 he was a member of the State Department Commission to investigate anti-foreign riots in the province of Szechuen, China.

MERRIAM, Augustus Chapman, American classical scholar: b. Locust Grove, N. Y., 1843; d. Athens, Greece, 1895. He was graduated at Columbia University in 1866 and after 1868 was connected with that institution successively as tutor, adjunct professor of Greek and professor of Greek archæology and epigraphy. Dr. Merriam did much to promote the study of classical archæology in the United States. In 1887–88 he was director of the American School at Athens. He published 'The Phæacians of Homer' (1880); 'The Greek and Latin Inscriptions on the Obelisk Crab in Central Park' (1883); 'The Sixth and Seventh Books of Herodotus' (1885); 'The

Law Code of Gortyna in Crete' (1886); 'Telegraphy among the Ancients' (in Papers of the Archæological Institute of America: Classical Series III, Cambridge 1890).

MERRIAM, mĕr'i-ăm, **Clinton Hart,** American biologist and author: b. New York City, 5 Dec. 1855. He was graduated from Yale in 1877 and from the College of Physicians and Surgeons in New York in 1879, and practised medicine 1878–85. He was United States Bering Sea commissioner in 1891 and visited Alaska in the interest of fur seal investigations. He has held various commissions from the government in the field of biology and has made explorations in its interest in the far West. In 1910 he was placed in charge of the biological and ethnological investigations carried on under the fund established by Mrs. Harriman. He has written 'Birds of Connecticut' (1877); 'Mammals of the Adirondacks' (1882–84); 'Results of Biological Survey of San Francisco Mountain Region and Desert of Little Colorado in Arizona' (1890); 'Flora and Fauna of the Death Valley Expedition' (1893); 'Life Zones and Crop Zones of the United States' (1898); 'Indian Population of California' (1905); 'Totemism in California' (1908); 'The Dawn of the World' (1910), and about 400 papers on zoological, botanical and ethnological subjects.

MERRIAM, Henry Clay, American soldier: b. Houlton, Me., 13 Nov. 1837; d. 1912. He was graduated from Colby University, and began the study of law; but in 1862 entered the Union army as captain in a Maine regiment. He was at the battle of Antietam in 1862, and organized the colored troops in 1863, being lieutenant-colonel of the Louisiana Native Guard (a negro regiment) at the close of the war; he led the assault on Fort Blakely 9 April 1865, and obtained a medal of honor from Congress for gallant conduct. In 1866 he was appointed major in the regular United States army, and rose to the rank of brigadier-general in 1897 and major-general of volunteers in the Spanish War, 1898. He served in many expeditions against the Indians, and protected American citizens in the valley of the Rio Grande in the revolutionary troubles (1873–76). In 1898 he was commander of the departments of the Columbia and California, and organized, equipped and forwarded the troops to the Philippines; and in 1899 was sent to the Philippines in command of the army of occupation. In January 1900 he was placed in command of the Department of the Colorado, and in 1901 was retired from active service. He is the inventor of the Merriam infantry pack.

MERRIAM, John Campbell, American educator and paleontologist: b. Hopkinton, Iowa, 20 Oct. 1869. In 1887 he was graduated at Lenox College, Iowa, and in 1893 received the degree of Ph.D. at the University of Munich. In 1894–99 he was instructor in paleontology and historical geology; in 1899–1905 assistant professor; in 1905–12 associate professor, and after 1912 professor of paleontology at the University of California. Professor Merriam is a Fellow of the American Association for the Advancement of Science, of the American Palæontological Society, and other learned bodies. He is the author of numerous papers on fossil reptiles and fossil mammals of western North America, and on the general historical geology of the Pacific Coast region.

MERRIAM, William Rush, American financier: b. Wadham's Mills, N. Y., July 1849. He was graduated from Racine College, Wisconsin, in 1871 and entered the First National Bank of Saint Paul where he was cashier in 1873. In 1880 he was president of the Merchants' National Bank there and in 1882 became a member of the State legislature of Minnesota and was speaker in 1886. He was elected governor of Minnesota in 1889 and was director of the United States census in 1898–1903.

MERRICK, Frederick, American educator: b. Wilbraham, Mass., 1810; d. 1894. He received his education at the Wilbraham Wesleyan Academy and at Wesleyan University. He was made principal of Amenia Seminary at Amenia, N. Y., and held the chair of natural science at Ohio University, Athens, Ohio, from 1838 to 1843. In the latter year he began his connection with Ohio Wesleyan University which continued until his death. For 13 years he was president of that institution. Merrick was a supporter of the Underground Railway and otherwise an active Abolitionist. He was ordained to the ministry of the Methodist Episcopal Church and took part in the General Conferences of 1860, 1864 and 1876. He endowed the Merrick lectureship at Ohio Wesleyan University. He published poems and contributions in religious journals and the volume, 'Formalism' (1865).

MERRICK, mĕr'ik, **Leonard,** English novelist: b. Belsize Park, London, 21 Feb. 1864. He was educated at Brighton College, and among his novels, several of which have been reprinted in this country, are: 'Mr. Bazalgette's Agent'; 'The Man Who Was Good'; 'Cynthia: a Daughter of the Philistines'; 'When Love Flies Out of the Window.' He is also the author of several plays.

MERRIFIELD, mĕr'i-fēld, **Webster,** American educator: b. Williamsville, Vt., 27 July 1854; d. 22 Jan. 1916. He was graduated from Yale in 1877 and was an instructor there 1879–83. From 1884 to 1891 he was professor of Greek in the University of North Dakota, professor of political economy, 1891–1903, and president of the institution since 1891.

MERRILL, Elmer Truesdell, American university professor: b. Millville, Mass., 1 Jan. 1860. In 1881 he was graduated at Wesleyan University and subsequently studied at Yale, 1885–86, the University of Berlin, 1886–87, Rome 1892, 1895, 1898–99, 1903, and in England. In 1882–83 he was instructor in classics at the Massachusetts State Normal School, Westfield; in 1883–86 tutor in Latin at Wesleyan; in 1887–88 professor of Latin at the University of Southern California; in 1888–1905 Robert Rich professor of Latin language and literature at Wesleyan University. In 1905 he became professor of Latin language and literature at Trinity College, Hartford, and in 1908 was appointed professor of Latin at the University of Chicago. Dr. Merrill was chairman of the American School of Classical Studies in Rome in 1900–01 and professor there in 1898–99. Since 1906 he has been associate editor of *Classical Philology.* He has edited 'Poems of Catullus' (1893); 'Fragments of Roman Satire' (1897); 'Selected Letters of the Younger Pliny' (1903); 'C. Plini Cæcili Secundi Epistularum Libri Novem' (1914).

MERRILL, Frederick James Hamilton, American geologist: b. New York, 30 April 1861. In 1885 he was graduated at the Columbia School of Mines, received the degree of D.Ph. there in 1890 and was assistant in the New Jersey Geological Survey 1885–89. In 1890–93 Dr. Merrill was assistant State Geologist of New York. In 1890–94 he was assistant director, in 1894–1904 director of the New York State Museum. He had charge of the New York exhibits at the expositions, Chicago 1893, Buffalo 1901 and Saint Louis 1904. Since 1904 he has been in private practice as mining geologist. He published 'Salt and Gypsum Industries in New York' (1893); 'Mineral Resources of New York' (1896); 'Road Materials and Road Building in New York' (1897); 'Natural History Museums of the United States and Canada' (1903).

MERRILL, mĕr'il, **George Edmands,** American Baptist clergyman and educator: b. Charlestown, Mass., 19 Dec. 1846; d. Hamilton, N. Y., 11 June 1908. He was graduated from Harvard in 1869, and from the Newton Theological Seminary in 1872. Entering the Baptist ministry, he was pastor at Springfield, Mass. (1872–77); at Salem, Mass. (1877–85); at Colorado Springs (1885–87); and at Newton, Mass. (1890–99). In 1899 he was called to the presidency of Colgate University, Hamilton, N. Y., where his administration improved the standard and awakened interest in many new lines of college activity. He wrote 'Story of the Manuscripts' (1881); 'Crusaders and Captives' (1890); 'The Reasonable Christ' (1893); 'The Parchments of Faith' (1895).

MERRILL, George Perkins, American geologist: b. Auburn, Me., 31 May 1854. He was graduated at the University of Maine in 1879. He has been head curator of the department of geology in the United States National Museum since 1897, and professor of geology and mineralogy in George Washington University since 1893. He was special agent for the 12th census. He has published 'Stone for Building and Decoration' (1891–1903); 'Rocks, rock-weathering and Soils' (1897–1907); 'Handbook of the Department of Geology United States National Museum' (1892); 'Non-Metallic Minerals' (1901–04–10); 'History of North American Geology' (1905); 'Catalogue of Meteorite Collection in United States National Museum' (1915), and many papers to scientific societies. Dr. Merrill is a member of the Geological Society of America, of the Washington Academy of Science and of other learned bodies.

MERRILL, Lewis, American soldier: b. New Berlin, Pa., 28 Oct. 1834; d. Philadelphia, 27 Feb. 1896. He was graduated from West Point in 1855, and at the outbreak of the Civil War was appointed colonel of a volunteer cavalry regiment and served with distinction through the war. He was active in warfare with the Indians and performed the notable service of breaking up the Kuklux Klan in 1868, which was recognized by Congress after some delay by promotion to the rank of lieutenant-colonel of cavalry. He retired from active service in 1891.

MERRILL, Selah, American Congregationalist clergyman and archæologist: b. Canton Centre, Conn., 2 May 1837; d. 1909. He was educated at Yale and at the New Haven Theological Seminary and was ordained to the ministry in 1864 when he entered the Federal army as chaplain. He held pastorates in Leroy, N. Y., and in San Francisco, and was for a time professor of Hebrew at Andover Theological Seminary. In 1882–86, 1891–94 and after 1898 he served as United States consul at Jerusalem and made valuable archæological researches and discoveries there. In 1907 he became consul at Georgetown, Guiana. He wrote 'East of the Jordan' (1881); 'Galilee in the Time of Christ' (1881); 'The Site of Calvary' (1885); etc.

MERRILL, Stephen Mason, American Methodist bishop: b. Jefferson County, Ohio, 14 Sept. 1825; d. Keyport, N. J., 12 Nov. 1905. He studied for the ministry and was ordained by the Ohio Conference in 1846, and in 1868–72 was editor of the 'Western Christian Advocate.' In 1872 was appointed bishop. He published 'Christian Baptism'; 'Union of American Methodism'; 'Sanctification' (1901); 'Miracles' (1902).

MERRILL, William Emery, American military engineer: b. Fort Howard, Wis., 17 Oct. 1837; d. near Edgefield, Ill., 14 Dec. 1891. He was graduated from West Point in 1859 and for a year prior to the outbreak of the Civil War was assistant professor in engineering at West Point. He went to the front in 1861, and served with distinction at Yorktown, Chickamauga, Missionary Ridge and other famous battles and in 1864–65 had charge of the railroads which supplied the armies in Georgia and Tennessee and was brevetted colonel for his services. After the war he served as chief engineer on the staff of General Sherman and was engaged in western surveys and the improvement of rivers. He was in charge of the improvement of the Ohio River at the time of his death which occurred on a railroad train. He wrote 'Iron Truss Bridges for Railroads' (1870) and 'Improvement of Non-Tidal Rivers' (1881).

MERRILL, Wis., city, county-seat of Lincoln County; on the Wisconsin River, and on the Chicago, Milwaukee and Saint Paul Railroad; about 145 miles north of Madison. It was settled in 1875 and incorporated in 1883. It is in a part of the State where the chief industries are connected with lumbering. Merrill has manufacturing establishments for shingles, laths, planed lumber, sawed lumber, sash, doors and blinds, clapboards, lumber for interior finish, flooring, etc. It has a high school, a daily newspaper, an opera house, a courthouse which cost about $100,000, and the T. B. Scott Public Library. Pop. 8,689.

MERRIMAC, mĕr'i-măk, a river of New Hampshire, which has its source at Franklin where the Pemigewasset and Winnipisaukie rivers unite. The Winnipisaukie is the outlet for the lake of the same name; the Pemigewasset has its rise in the northern part of Grafton County, in the White Mountains. The Merrimac flows nearly due south into the State of Massachusetts when it turns, continuing its course east, then northeast to the Atlantic Ocean. The mouth of the river is a tidal estuary which is navigable for steamers of good size. At the entrance is a sand bar which is constantly changing, and which is a hindrance

to navigation. The river is navigable for small steamers as far as Haverhill. The extensive water-power of the Merrimac has been the main cause of the development and prosperity of the entire region. Some of the largest cotton-mills of the country were erected on its banks, and many woolen mills, carpet mills and other manufactories. Newburyport is at the mouth of the river. Other important places on its banks are Haverhill, Lawrence and Lowell, in Massachusetts, and Nashua, Manchester and Concord in New Hampshire. The length from the source of the Pemigewasset to the ocean is 183 miles; its drainage area 5,000 miles.

MERRIMAC, The, a frigate of the United States navy. See MONITOR AND MERRIMAC, THE.

MERRIMAN, mĕr'ĭ-măn, **Henry Seton.** See SCOTT, HUGH STOWELL.

MERRIMAN, Mansfield, American engineer and author: b. Southington, Conn., 1848. He graduated from the scientific department at Yale in 1871, was with the United States Corps of Engineers for two years, and in 1875 became instructor in civil engineering at the Sheffield Scientific School (Yale). In 1878 he resigned to accept a position as professor of civil engineering at Lehigh University, which he occupied for 29 years. During a part of this period he was also called upon to assist the United States Coast and Geodetic Survey. Since 1907 he has devoted most of his time to consultation on important works, mainly in hydraulics. He has written many textbooks, widely used by the colleges. Among them are 'Method of Least Squares'; 'Mechanics of Materials'; 'A Text Book on Roofs and Bridges' (4 vols., Jacob co-editor); 'Treatise on Hydraulics'; 'Handbook for Surveyors'; 'Strength of Materials; 'Precise Surveying'; 'Elements of Sanitary Engineering'; 'Elements of Hydraulics.' Every one of these has passed through several editions. He was also chief editor of the 'American Engineers' Pocket Book,' and has contributed to numerous technical and scientific papers.

MERRITT, Ernest George, American physicist: b. Indianapolis, Ind., 28 April 1865. In 1881–82 he studied at Purdue University and in 1886 was graduated M.E. at Cornell. He made graduate studies at Cornell in 1887–88 and at the University of Berlin in 1893–94. In 1888–91 he was instructor in physics, in 1892–1903 assistant professor, and after 1903 professor at Cornell. From 1909 to 1914 he was dean of the Graduate School. Dr. Merritt is a contributor to scintific journals on investigations in physics.

MERRITT, mĕr'ĭt, **Wesley,** American soldier: b. New York, 16 June 1836; d. Washington, D. C., 3 Dec. 1910. He was graduated from West Point in 1860 and served with honor through the Civil War and for bravery at Gettysburg was brevetted major. His services at the battles of Yellow Tavern and Winchester gained for him the rank of brigadier-general and major-general. He was assigned chiefly to frontier duty from the close of the Civil War until 1882 when he was made superintendent of West Point and in 1887 placed on duty at Fort Leavenworth, Kan. He commanded the Department of the East, 1897–98 and in May 1898 was put in command of the United States troops in the Philippines and conducted the campaign to a successful termination. After the close of the Spanish-American War he was ordered to Paris in order to assist the work of the American peace commissioners. He was retired in June 1900.

MERRITT, William Hamilton, Canadian mining engineer: b. Saint Catherines, Ontario, 1855. He received his education at Upper Canada College, the Royal Military School, and the Royal School of Mines, London. Returning to Canada he practised his profession in Toronto; was a member of the Canadian commission to the Paris Exposition of 1878 and subsequently was made lecturer in mining engineering in the Kingston School of Mining. He became a cornet in the governor-general's body-guard in 1884, took part in suppressing Riel's rebellion in 1885, in the Boer War in 1899–1902. Mr. Merritt was also chosen president of the Ontario Mining Institute. He contributed to the 'Proceedings' of the London Geological Society, the 'Proceedings' of the American Institute of Mining Engineers; the 'Proceedings' of the Canadian Institute and is author of 'Economic Minerals of Ontario' (1896) and 'Field Testing for Gold and Silver' (1900).

MERRY, William Walter, English Anglican clergyman and classical scholar: b. Worcestershire, 6 Sept. 1835. He was educated at Balliol College, Oxford, and has been rector of Lincoln College there from 1884. He is widely known for his editions of the classics published by the Clarendon Press and including the 'Odyssey' (Books I to XII, 66th thousand; XIII to XXIV, 16th thousand; and the plays of Aristophanes. He is the author of 'The Greek Dialects' (1875).

MERRY DEL VAL, Rafael, cardinal of the Roman Catholic Church: b. London, 10 Oct. 1865. His father, Don Marquis Merry del Val, was partly of Irish ancestry, being descended from the Irish family Merry established in Spain; and his mother, daughter of Don Pedro José de Zulueta, Count de Torré Diaz, although of Spanish origin, was English by education. At the time of Rafael's birth his father was secretary to the Spanish embassy, London, the boy's early studies being pursued in the English metropolis. Later he attended the Jesuit College of Saint Michael, Brussels, afterward taking a course at Ushaw, and was subsequently chosen private tutor to Alfonso XIII. When his father was appointed Spanish Ambassador to the Vatican young Rafael accompanied him to Rome and entered the Gregorian University where, in preparation for the priesthood, he studied philosophy and theology, receiving the degree of doctor of philosophy and theology conferred by this institution. At the age of 24 he was ordained a priest and, although intended for the diocese of Westminster, was retained in Rome and soon became cameriere participante to Pope Leo XIII. Four years later he was appointed master of the robes and privy chamberlain to Leo XIII, taking up his residence in the Vatican. Despite Monsignor Merry del Val's youth his linguistic knowledge, which included a fine command of English, French, Spanish and Italian, and his cosmopolitan training qualified him admirably for the fulfilment of various important missions. In 1887 he accom-

panied the papal envoy, Monsignor Scilla, to Queen Victoria's jubilee and in 1896 went as papal delegate to Canada to investigate the question of separate Catholic schools in Manitoba, his report to the Holy See calling forth the *Affari vos,* Leo XIII's famous letter to the Catholics of Canada. It was likewise in 1896 that Monsignor Merry del Val was made secretary to the commission appointed to determine the validity of Anglican orders. In 1899–1901 he was president of the College for Noble Ecclesiastics, in 1900 was consecrated titular bishop of Nicæa and in 1902 made titular archbishop of Nicocia. The same year he was appointed papal envoy to the coronation of King Edward VII and his book on the 'Truths of the Papal Claims' was given to the public. In the interregnum following the death of Leo XIII, Cardinal Oreglia, dean of the College of Cardinals, named Archbishop Merry del Val secretary to the conclave of cardinals that elected Pius X. This pontiff appointed the young archbishop Papal Secretary of State and on 9 Nov. 1903, elevated him to the cardinalate. Cardinal Merry del Val is secretary of the Congregation of the Venerable Fabric of Saint Peter's; archpriest of the Vatican Basilica and also a member of the Commission for the Codification of Canon Law. His term of office as Papal Secretary of State expired at the death of Pius X.

MERRY ENGLAND, a popular name for England. The word merry is used, not in the sense of gaiety, but according to its earlier meaning, that is, agreeable, or pleasant; as in the phrase, "merry month of May."

MERRY MOUNT, a district near the present town of Quincy, Mass., which in the early colonial days of New England was occupied by a party of men belonging to the Church of England. They paid little respect to the rigid and austere habits of the Puritans whom they greatly offended by the laxity of their manners. An attack was made upon this settlement by the forces of the Plymouth colony in 1630. John Lothrop Motley, the historian, produced in 1849 a romance entitled 'Merry Mount.'

MERRY WIVES OF WINDSOR, The, Shakespeare's greatest prose play. It contains only about 15 per cent of verse lines, and in the spirit of its scenes is equally subdued, save for a flash of the old fire in the fairy poetry at the close. Dennis and Rowe report a story, current at the opening of the 18th century and inherently plausible, to the effect that this play was written within two weeks to the special order of Queen Elizabeth, who desired to see Falstaff in love. The wish is worthy of the Queen's taste and the manner in which it was satisfied indicates that Shakespeare did not work spontaneously. In point of time the play belongs with the greatest comedies — with 'Much Ado about Nothing,' 'Twelfth Night,' and 'As You Like it.' It was licensed for publication in January 1602 and most likely composed shortly before, for it is hard to believe that the Falstaff of this play can have been created while recollection of the great Falstaff of 'Henry IV' (1597, 1598) was very fresh in the author's mind. There is a radical difference between the two characters. In the 'Merry Wives' Falstaff loses most of his peculiar wit and all the graver, pathetic side of his character. He loses his charm, not only for the spectator but for his companions. There is a sense of positive disaster in seeing the invincibly lovable knight of 'Henry IV' and 'Henry V' betrayed by his own creatures, Nym and Pistol (II, i), just as there is in hearing the Titanic liar of the Gadshill episode ignominiously relating to Brook-Ford (in III, v) the whole sorry truth of his discomfiture. "I do begin to perceive that I am made an ass," he is forced to say in the final scene, and Shakespeare must have felt as keenly as his readers the pity of thus reducing Falstaff to the level of Dogberry and Bottom. The play is brisk and entertaining, and is constructed with masterly technique, but it deals wholly with the externals of character and with unlikely incidents. Its type-figures — Slender, Sir Hugh, Dr. Caius, the Host, — when compared with Mercutio, Sir Toby, or the old Falstaff, are like pygmies after giants. There is no reason to believe that 'The Merry Wives of Windsor' was regarded with special favor by the Elizabethans. After the Restoration it seems to have become one of the most popular of Shakespeare's comedies, though Samuel Pepys registers emphatic dissent when noting in his diary that on 15 Aug. 1668 he saw 'The Merry Wives of Windsor,' "which did not please me at all, in no part of it." Precisely a century after its first publication, in 1702, a revised version by Dennis was brought out with the title, 'The Comical Gallant, or The Amours of Sir John Falstaffe.' Since the rise of the romantic movement, it has been one of the least liked of Shakespeare's comedies.

TUCKER BROOKE

MERSEN, Treaty of, effected 8 Aug. 87[illegible] at Mersen, Holland, between Charles the Bald of France and his half brother Louis of Germany by which Lotharingia or Lorraine, the kingdom of their nephew Lothair II (d. 869) was divided between the east and west Frankish realms — France and Germany. From this date the history of the two national divisions and of the European state system begins.

MERSEY, mėr'zĭ, England, a river formed at Stockport by the union of the rivers Goyt and Tame. It flows in a general southwest direction to Runcorn, where it expands into an estuary two to three miles broad, near the mouth of which, on the north side, is Liverpool with Birkenhead opposite, and below which it joins the Irish Sea. Since 1886 a railway tunnel under the Mersey has afforded communication between Liverpool and Birkenhead. The entire length of the river, including the estuary, is 70 miles. Principal affluent, the Irwell, by which it is navigable. The Bollin and the Weaver are affluents from Cheshire. With the Mersey and Irwell is now closely connected the great Manchester shipcanal (q.v.) which opens into it.

MERSHON, Ralph Davenport, American electrical engineer and inventor: b. Zanesville, Ohio, 14 July 1868. In 1890 he was graduated at Ohio State University; from 1891 to 1901 was connected with the Westinghouse Company at Pittsburgh and New York, and thereafter entered private practice as consulting engineer. He installed several important high voltage transmission systems in Colorado, Montreal, Tokio, Japan and in South Africa. He invented the six-phase rotary converter, a com-

pounded rotary converter, a system of lightning protection for electric apparatus and a compensating voltmeter. In 1912–13 he was president of the American Institute of Electrical Engineers and is a member or Fellow of several scientific societies. He is the author of numerous technical papers.

MERSINA, Asia Minor, town on the southeast coast of Asia Minor, five miles south by west of Adana. It is the principal seaport of the south coast. The climate is unhealthful in summer. The harbor is an open roadstead. An American mission is located here and there is also a consular agent of the United States. Pop. 15,000, half of whom are Christians, Armenian, Greek and European.

MERSON, Luc Oliver, French painter: b. Paris, 21 May 1846. He studied at the École des Beaux Arts and was a pupil of G. Chassevent and of Pils. His first picture exhibited in the Salon was 'Leucothea and Anaxandros' (1867). In 1869 he carried off the Grand Prix de Rome, the supreme ambition of art students, by his painting 'The Soldier of Marathon.' He produced the same year 'Apollo the Destroyer,' now in the Museum of Castres. In 1872 he painted 'The Martyrdom of Saint Edmund of England' (Museum of Troyes). Since then he has devoted his pencil to the portrayal of legendary and mythological scenes and incidents. His chief works in this class are 'The Vision, a Legend of the 14th Century' (1873); 'A Patriot Sacrifice' (1874); 'Saint Michael' (1875); 'Saint Francis and the Wolf of Agubbio' (1878); 'Saint Isidore' (a triptych) (1879); 'The Judgment of Paris witnessed by Eros' (1884); 'Mankind and Fortune' (1892); 'The Annunciation' (1903). He has also frescoed with scenes from the life of Louis IX the walls of the Saint Louis gallery in the Palais de Justice at Paris.

MERTHYR TYDFIL, mĕr'thĕr tĭd'vĭl, or **TYDVIL,** Wales, a market and manufacturing borough of Glamorganshire, 24 miles by rail northwest of Cardiff, on the Taff, at the northern end of Taff Vale. It is the third largest place in Wales, and with the suburbs is 27 square miles in area. From an unimportant village in 1780, Merthyr Tydfil has become a prosperous centre of steel and iron manufactures, owing to its situation near the valuable coal and mineral fields of South Wales. Bessemer steel was first rolled into rails here. Since the local iron became reduced, the pig is mainly imported from Spain. The town has undergone much modern improvement and is noted for its municipal enterprises, one of its investments being the purchase of the historic Cyfarthfa Castle, with a small lake and 62 acres of ground, and converting them into a public park. Public baths and two sewage farms are maintained. Pop. about 83,946.

MERTON, Walter de, English bishop: d. about 27 Oct. 1277. He was graduated at Oxford University, of which he was appointed chancellor by Henry III in 1261, and three years later instituted the collegiate, or separate house system of the English University, by establishing the college which is called after his name. Here the secular clergy were to be educated in philosophy, the liberal arts and theology. The system he thus introduced has been the secret of success both to Oxford and Cambridge, and was originated chiefly with the object of raising up secular schools which might check the power of the monasteries and eventually supersede them as centres of education. He was appointed bishop of Rochester in 1274.

MERTON COLLEGE, Oxford, England, was originally founded in 1264 at Malden, Surrey, by Walter de Merton (q.v.), and removed to Oxford in 1274, where its collegiate buildings are among the oldest and most interesting in the city, the chapel especially being noted for its proportions and beauty. The foundation consists of a warden, 19 fellows, 18 postmasters or scholars, 34 exhibitioners, four lecturers, two chaplains, and in 1912, 150 undergraduates. Among its famous alumni are Harvey, the demonstrator of the circulation of the blood. Anthony Wood, Sir Thomas Bodley and Sir Richard Steele.

MERU, mĕr'oo, in Hindu mythology, the sacred mountain at the earth's centre on whose summit resides Siva, sustaining and uniting earth, heaven and hell. It contained the cities of the Hindu gods, and was the abode of the celestial beings. It was believed that the planets revolved around it.

MERV, mĕrv (sometimes written Meru), Russia, an oasis in Central Asia, in the south of Western Turkestan, and about 120 miles north of the frontier of Afghanistan, now traversed by the railroad from the Caspian to Samarkand. It has an area of 1,900 square miles, and is crossed by the 37th meridian and 62d parallel. One-fourth of this area is artificially irrigated. It is watered by the Murghab and produces wheat, cotton, sugar, silk, etc. In the midst of the oasis are the ruins of the ancient town of Merv, founded by Alexander the Great, and subsequently held by Syrians, Arabs, Mongols and Persians. A new town New Merv, has grown up on the Murghab, where the Trans-Caspian Railway crosses the river, with a citadel; it has been made the capital and its population is about 15,000. The oasis generally is the principal seat of the Tekke Turcomans, who from this centre used to make predatory incursions into Persia and Afghanistan. In 1815 the oasis was subjugated by the Khan of Khiva, to whom it remained tributary for about 20 years. Subsequently Persia attempted to make good the claims which it had long made to this district, and in 1860 fitted out an expedition for the purpose, which, however, miscarried completely, as did another expedition in 1876. In 1881 General Skobeleff led a Russian expedition against the Tekke Turcomans, captured their stronghold of Geok-Tepe, and received the submission of their principal leader. The district of Merv subsequently came under the power of Russia. Merv is of great strategical importance, and considerable interest was attached to it in connection with the advances made by Russia in the direction of India. Pop. 250,000.

MERWIN, Henry Childs, American lawyer: b. Pittsfield, Mass., 5 Aug. 1853. He was graduated from Harvard in 1874 and was for some years lecturer in the law school of Boston University. Has been employed by the Massachusetts legislature since 1900 to write and revise statutes. Beside editing several legal works he is the author of 'Patentability of Inventions' (1884); 'Road, Track and Stable',

(1893); 'Life of Aaron Burr' (1899); 'Life of Thomas Jefferson' (1901); 'Life of Bret Harte' (1910).

MERYCODUS, or **COSORYX,** a small antlered antelope fossil in the Miocene formations of the western United States. It was about the size of a dorcas gazelle, but with shorter limbs and neck and belonged to the family *Antilocapridæ,* now represented only by the pronghorn; but it bore relatively tall three-tined antlers, which were deciduous and precisely like those of deer. Minute lateral toe-rudiments hung high above all the hoofs, but these were relatively smaller than in deer; in the modern pronghorn no trace of these remains. It was probably a collateral ancestor of the antelopes. *Blastomeryx* is a closely related genus somewhat more primitive. A very complete skeleton, collected by W. D. Matthew, is exhibited in the American Museum of Natural History at New York.

MÉRYON, Charles, shärl mā-rē-ôn, French etcher: b. Paris, 23 Nov. 1821; d. Charenton, 14 Feb. 1868. He entered the navy, after studying at Brest, but failing health, forced his resignation, and he settled in Paris, studying etching there. His chief works were picturesque spots in old Paris, many since destroyed. A series of 23 plates by him appeared 1850–54. His last years were spent in an insane asylum at Charenton. Consult Wedmore, 'Méryon and Méryon's Paris' (1879); Burty, 'L'Œuvre de Charles Méryon,' translated by Huish (1879); Bouvenne, 'Notes et Souvenirs sur Charles Méryon' (1883).

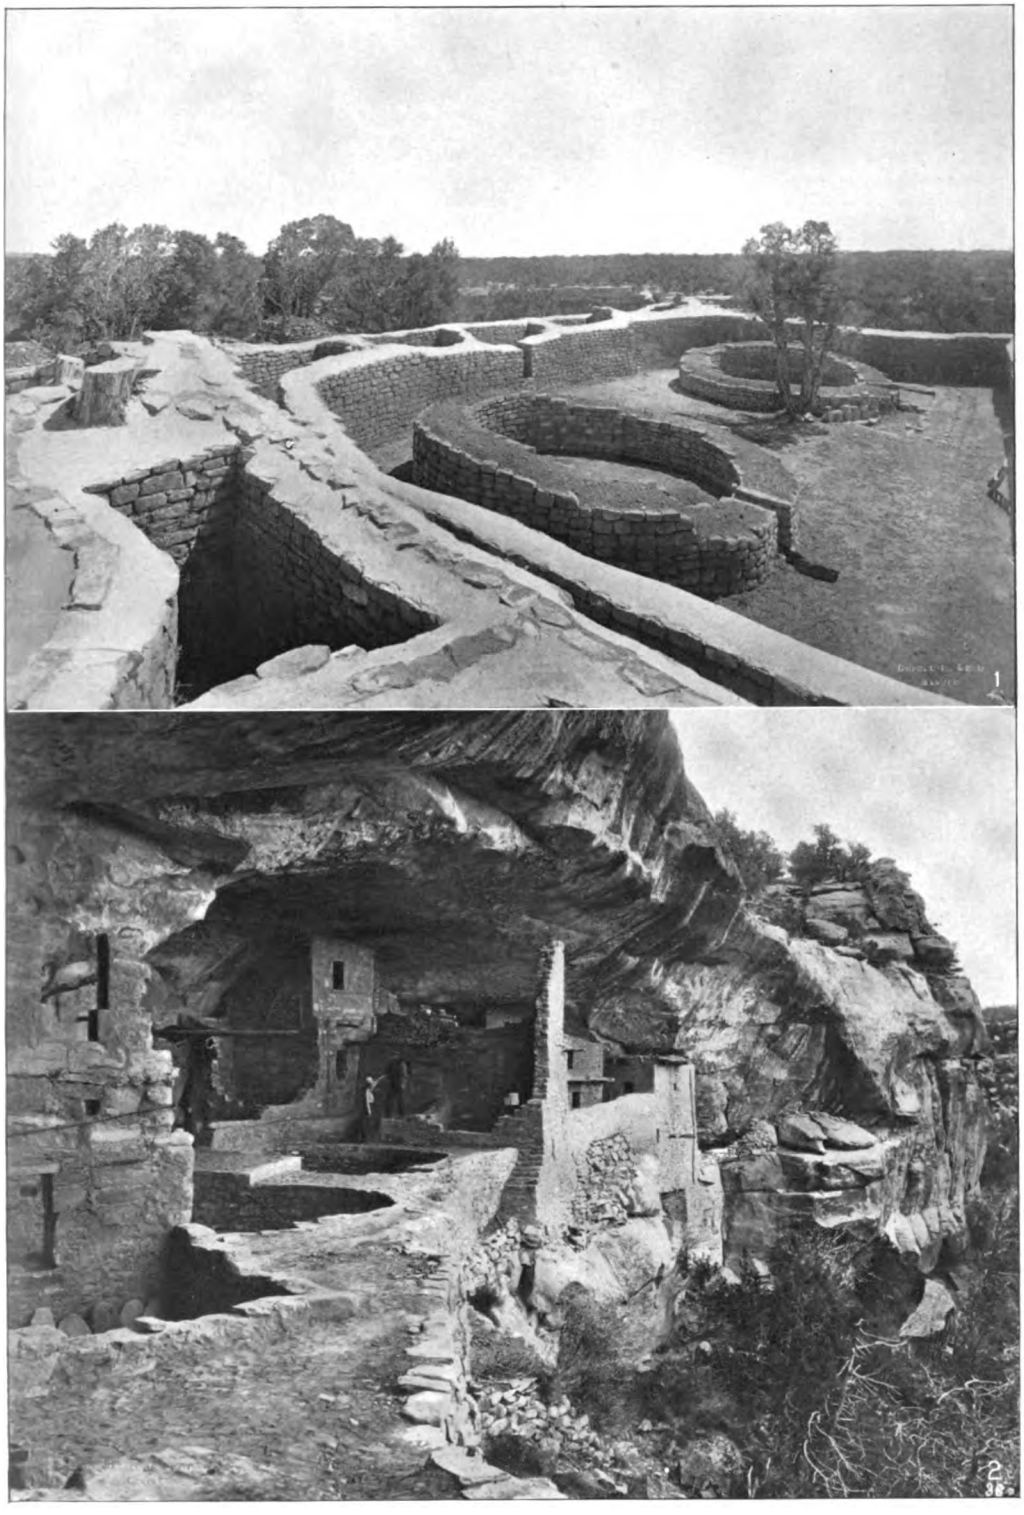
MESA, Ariz., town in Maricopa County, on the Arizona Eastern Railroad, 20 miles southeast of Phœnix. It contains numerous Toltec remains, a government experimental farm and power plant, the Granite Reef Dam, a public library and fine school buildings. It has extensive agricultural, fruit-growing and stock-raising interests. The town grew from a Mormon colony established here in 1879. The municipality owns the water supply system. Pop. 1,690.

MÉSA, or **TABLE MOUNTAIN,** any flat topped hill which stands out prominently above the surrounding area. The flatness is usually due to a horizontal layer of hard rock capping the hill. Many of our most noted mesa areas are the result of lava flows that cap and protect softer layers beneath. Butte is sometimes used in a similar sense, though it is more often applied to steep-sided prominent hills that are not notably flat-topped.

MESA VERDE NATIONAL PARK, Colo., a reservation of 48,966 acres in Montezuma County, southwestern Colorado. Within its area, in canyons of the Mancos River, are the most remarkable of the many ruins of prehistoric cliff dwellings in the southwestern United States. The Mesa Verde (Sp. "green-table" so named from its vegetation) is a high table-land, dividing the Mancos and Montezuma valleys. This mesa is elevated above the valleys some 2,000 feet, and rises abruptly from their floors, with precipitous sides, like the walls of a canyon. The northern extremity of this great mesa terminates in Point Lookout, which juts out between the two valleys, a landmark for miles in all directions. The highest part of the Mesa Verde National Park, Park Point, near the northern boundary, is 8,572 feet above sea-level, while Point Lookout has an elevation of 8,428 feet above sea-level. The northern edge of the mesa terminates in a precipitous bluff, averaging 2,000 feet above the floor of the Montezuma Valley. The general slope of the mesa is to the south, so that a person on the northern rim has a view in all directions. The surface of this table-land is broken by innumerable canyons, which start from the very edge of the mesa on the northern and western sides, and, growing deeper and more rugged as they descend, finally open out into the Mancos Canyon. These canyons have many great caverns in their side walls, with the overhanging rock for roofs, and in these caverns are found the ruins of the cliff dwellings. The principal ruins are found in Navajo, Cliff, Soda, Long and Rock Canyons, though there are hundreds of lesser ruins in all the canyons in the park. Spruce Tree House is in Spruce Canyon, a branch of Navajo; Cliff Palace is in Cliff Canyon; Balcony House is in Soda; Peabody House and Inaccessible are in Navajo; Long House is in Rock Canyon. A ruin in Long Canyon was entered by one of the rangers in 1914 for the first time since it was abandoned by its original tenants. Its difficult approach had protected it from all vandalism, and it was found just as it had been left, no one knows how long ago. One sealed room contained a fine collection of jars and implements. It was reached by swinging a ladder over the cliff, anchoring it at the top, and letting it swing. Down this swinging ladder the ranger went and then anchored it at the bottom. Now tourists make the descent. These ruined houses, or villages, are found in the recesses of the canyon walls and, protected from the weather, are remarkably well preserved. Some of them are small, with only a few rooms, while others are large and must have accommodated a large population. The ruins found on the mesas, without the protection of the overhanging cliffs, have not withstood the ravages of time and are now but mounds of stone and earth.

While the ruins in the Mancos Canyon were explored as early as 1874, the most important escaped discovery until 1888, when R. Wetherill and C. Mason of Mancos, in search of a stray herd one day in December, penetrated a pinyon wood to the edge of a deep-side canyon. "On the opposite cliff, sheltered by a huge, massive vault of rock, there lay before their astonished eyes a whole town, with towers and walls, rising out of a heap of ruins." They named the place "Cliff Palace," and the same day discovered nearby, in another canyon, another large cliff dwelling to which they gave the name of Spruce Tree House, from a great spruce growing among the ruins. The word dwelling is misleading, for most of these buildings were villages. Spruce Tree House, for instance, was undoubtedly a town of importance, harboring at least 350 inhabitants.

The arrangement of houses in a cliff dwelling of the size of Cliff Palace, for example, is characteristic and intimately associated with the distribution of the social divisions of the inhabitants. The population was composed of a number of units, possibly clans, each of which had its own social organization more or less



1 SUN TEMPLE, MESA VERDE NATIONAL PARK, SOUTHWESTERN COLORADO

This ruin, in "The Land of the Cliff Dwellers," was excavated in 1915 by Dr. J. Walter Fewkes, of the Smithsonian Institution, Washington, D. C. It is 131 feet long. Dr. Fewkes is of the opinion that the structure was intended for religious and not domiciliary purposes

2 BALCONY HOUSE, MESA VERDE NATIONAL PARK, SOUTHWESTERN COLORADO

This ruin is the third in size of the numerous prehistoric ruins on the Mesa, and one of the most interesting and most spectacularly situated. Two kivas, or underground ceremonial chambers, are shown in the foreground

distinct from others, a condition that appears in the arrangement of rooms. The rooms occupied by a clan were not necessarily connected, although generally neighboring rooms were distinguished from one another by their uses. Thus, each clan had its men's rooms, which was ceremonially called the "kiva." Here the men of the clan practically lived, engaged in their occupations. Each clan had also one or more rooms, which may be styled the living rooms, and other enclosures, for granaries or storage of corn. The corn was ground into meal in another room containing the *metate* set in a bin or stone box, and in some instances in fireplaces, although these were generally placed in the plazas or on the housetops. All these different rooms, taken together, constitute the houses that belonged to one clan.

The conviction that each kiva denotes a distinct social unit, as a clan or a family, is supported by a general similarity in the masonry of the kiva walls and that of adjacent houses ascribed to the same clan. From the number of these rooms it would appear that there were at least 23 social units or clans in Cliff Palace. The kivas were the rooms where the men spent most of the time devoted to ceremonies, councils and other gatherings. In the social conditions prevalent at Cliff Palace the religious fraternity was limited to the men of the clan.

Apparently there is no uniformity in the distribution of the kivas. As it was prescribed that these rooms should be subterranean, the greatest number were placed in front of the rectangular buildings, where it was easiest to excavate them. But when necessary these structures were built far back in the cave and enclosed by a double wall, the intervals between whose sections were filled with earth or rubble to raise it to the level of the kiva roof. In that way they were artificially made subterranean, as the ritual required. Easily reached from Denver and Colorado Springs, Mancos on the Rio Grande Southern Railroad is the preferable starting point by stage or automobile to explore the mesa. Consult United States Department of Interior Bulletins 'The Mesa Verde National Park' (Washington, D. C., 1915); Nordenskjold, B., 'The Cliff Dwellers of the Mesa Verde' (Stockholm 1893).

MESABI RANGE. See IRON ORE — *Iron Ore Districts.*

MESCAL, a fiery liquor produced in Mexico from several species of Agave (q.v.). The most famous liquor, however, is made from the "hearts" of the species *Agave tequileana.* The city of Tequila, in the state of Jalisco, is the centre of this particular industry. The Tequila Agave resembles in the appearance of its stiff lance-like leaves the sisal hemp plant, though it sends out its leaves from a great bulb-like cellular mass which forms the heart of the plant. This heart, when denuded from its leaves and detached from the root, is cleft in two, and a dozen of these pieces make a fair load for a mule, for they must be transported from the fields where grown to the city, sometimes a journey of several miles. These hearts are roasted in pits, within the distillery enclosures, dug four or five feet deep and considerably wider. A hot fire is built of mesquite wood, and large stones distributed through the fuel. The "heads" are then heaped over the burning mass until a huge mound is formed, which is covered first with grass and then with earth, and the mass left several days to cook. When the mound is opened the raw product is found to have changed to a dull brown in color, and the juices to have been converted into sugar. White hot and steaming, the mass is taken to another pit, stone-paved, on the bottom of which revolves a heavy stone crusher, really an arrester operated by mule power. Here it is ground into pulp and the semi-liquid mass carried in deep trays on the heads of Indians to the vats where it remains to ferment. Then it goes to the rude stills, and is run off as mescal. The commercial mescal is a colorless liquor sometimes with a slight amber tint, though much of it is like alcohol. Some of the higher grades are given fancy names which serve as trademarks. It is far too strong a liquor to be drunk with impunity, though its fiery quality seems to suit the Mexican taste for hot things. Zotol is another liquor, made in the same way from the bulb-like heart of a species of *Dasylirion,* which is said to be as strong as 95 per cent alcohol. These liquors should not be confounded with aguardiente, which is made from sugarcane. The Mexican name means burning water.

MESCALA. See MEXCALA.

MESCALEROS (Spanish, mescal, a native drink used in Mexico, Guatemala, and along the southern boundary of the United States), an Apache tribe so called because of their love of mescal. Somewhat of a nomadic character, they covered territory, at times, between the Rio Grande and the Pecos in New Mexico and southward into Mexico. They gave the governments of the United States and Mexico trouble, from time to time, but not so much as their relatives in Arizona and northern Mexico. In 1873 a reservation of 475,000 acres was set apart for the use of the Mescaleros in Southern New Mexico. The tribe now numbers about 500.

MESDAG, měs'dăg, **Hendrik Willem,** Dutch marine painter: b. Groningen, 23 Feb. 1831. He was a banker, following in his father's footsteps, until his 36th year, when he devoted himself to art, studied under Alma Tadema, who was a relative, and under Roelofs, and lived at The Hague, with a studio at Scheveningen. He takes a foremost rank among modern painters of the sea, and conveys the idea of water-masses and motions very felicitously. The report circulated in American newspapers of his death 4 Aug. 1902 was false. Mesdag's pictures include 'Fishing Boats at Scheveningen,' 'Strand of Scheveningen,' 'Morning on the Scheldt,' 'In Peril,' and many other views of the North Sea. Consult Zilken, 'H. W. Mesdag' (English version by Bell, 1896); and Marius, 'Dutch Painting of the Nineteenth Century' (1908).

MESENTERY, a double fold of the peritoneum which attaches the small intestine to the spinal column, but in such a manner as to permit great freedom of motion. The corresponding support of the large intestine is the mesocolon, with the mesorectum. The mesentery contains between its folds several blood-vessels, lacteals, lymphatics, nerves, and the ganglia called mesenteric glands, which are connected with the lymphatico-lacteal system.

It is about four inches wide, and extends nearly the whole length of the intestine. It is subject to several diseases, the most frequent of which is tubercular degeneration of some of its numerous glands. For this and other diseases of the mesentery, see PERITONITIS.

MESHA, king of Moab mentioned in II Kings iii, 2–27. This monarch threw off the yoke of Israel, then ruled by Ahab and the latter's sons, Ahaziah and Jehoram. Later Jehoram, with the aid of the kings of Judah and Edom, defeated Mesha and his hosts. Mesha was defeated and besieged in Kir-hareseth, but managed to hold out against his enemies although his country was overrun. See MOABITE STONE.

MESHED, mĕsh'ĕd, or **MESHHED,** mĕsh'-hĕd, Persia, capital of the province of Khorasan, in an extensive valley 500 miles northeast of Ispahan. It is surrounded by walls, and has many ruinous houses, but its principal street is spacious and handsome, having a water-course, the banks of which are shaded by trees, passing through it, while at its extremity are seen the splendid cupola and gilded minarets of the mosque containing the shrine of Iman Riza, the son of Ali, the founder of the Shiites. This tomb has a gorgeous interior, a vast hall, like the central nave of a cathedral, rising loftily into a central dome ornamented with the richest colors and a profusion of gilding. This shrine attracts a vast number of pilgrims. Here also is the mosque of Gohur Shah, considered one of the most beautiful and splendid in Persia. The chief manufactures are velvets, sword-blades and some silk and cotton goods. A considerable number of the inhabitants are employed in cutting the turquoises obtained in the vicinity. The situation of Meshed on several great caravan routes makes it an important entrepôt for the produce of surrounding countries. The customs receipts for the territory approximated $250,000 annually up to 1914, but fell off nearly one-half during the World War. Pop. about 61,500.

MESHTROVITCH, Ivan, Jugoslav sculptor: b. Otavice, Northern Dalmatia, 1883, the son of a Croat. He was educated at the Vienna Academy of Arts and first exhibited his work in that city in 1902, and in 1911 his studies for the Serbian National Temple at Kossovo were shown in Rome. An artist of the highest type, endowed with astonishing ability, he is regarded in Europe — especially in England — as one of the greatest sculptors that ever lived. In 1915 a representative committee brought him to London and organized an exhibition of his works at the Victoria and Albert Museum. Art, political idealism, mythology and religious mysticism are inseparably bound up in his creations. His remarkable talent is expressed in the eclectic variety of styles of which he is master; it would seem that all known styles culminate in Meshtrovitch: Egyptian, Greek, Baroque, Byzantine, Assyrian and the most violently realistic modernism. Consult 'Ivan Meštrović: A Monograph' (London 1919), by Sir John Lavery, Dr. Seton-Watson and others, with 68 photographic plates.

MESMER, Friedrich (or **Franz**) **Anton,** frĕd'riç ăn'tŏn mĕs'mĕr, German physician: b. Itzmang, near Constance, Baden, 23 May 1733; d. Meersburg, Baden, 5 March 1815. He was educated in medicine by Van Swieten at De Haen of the University of Vienna, made some study of astrology, came to believe in the influence of the stars, and attributed this supposed influence to magnetism. Having at first believed in the cure of diseased bodies by the use of magnets, he came wholly to discard the magnets and declared that an occult force, which he called animal magnetism, pervading the universe, resided in himself and afforded him an influence over others. In 1778 he went to Paris and set the town astir. He had undoubtedly an honest belief in the efficacy of his discoveries but he took advantage of popular interest to enshroud his methods with mystery. Finally the government appointed a committee of noted physicians and members of the Academy of Sciences, including Benjamin Franklin, to investigate the matter; and the committee in a report, admitting many facts but attributing them to physiological causes and not to any such supposed agency as animal magnetism, so discredited Mesmer that he went to London, and later to Germany. The name mesmerism was formerly applied to the entire class of phenomena now known as hypnotism (q.v.). It is now claimed that there is a force in the human body generally called magnetiscor, which is under the control of the human will, and that when the control of this force passes to another hypnotism occurs. Among his writings are 'Mémoires sur la Découverte du Magnétisme Animal' (1779); 'Histoire Abrégée du Magnétisme Animal' (1783); and the 'Mémoire de F. A. Mesmer sur ses Découvertes' (1799). See ANIMAL MAGNETISM; HYPNOTISM.

MESMERISM. See HYPNOTISM.

MESNE (mēn) **PROCESS,** *in law,* an intermediate process which issues pending the suit upon some collateral interlocutory matter. Sometimes it is put in contradistinction to primary and final process, or process of execution, and then it signifies all such processes as intervene between the beginning and end of a suit.

MESODERM. See ANATOMY, COMPARATIVE; EMBRYOLOGY.

MESOHIPPUS. See HORSE, EVOLUTION OF THE.

MESONERO ROMANOS, mā-sō-nā'rō-mä'nōs, **Ramon,** Spanish writer: b. Madrid, 1803; d. 1882. After a short time spent in mercantile life he turned to journalism, and after some time spent on the Madrid *Press* he founded the *Semanario Pintoresco Español,* which he continued to edit and manage until 1842. Mesonero was a great lover of his native city which, in his youth, was still the old-fashioned Spanish capital teeming with true native life, before it had begun to reflect the fashions, customs and manners of Paris. He rubbed elbows with his fellow city-dwellers everywhere and on every occasion; and out of this intimacy sprang interesting and well-written sketches of popular types, manners and customs. His comprehensive knowledge of his native city appears in 'Manual de Madrid' 'Escenas Matritenses' (2 vols., 1836); 'Memorias de un setentón' (1880), and 'El Antigno Madrid.' Mesonero is one of the masters of modern Spanish. His language is ever graceful, tending to a slight diffuseness, but always preserving its purity and idiomatic

complexion and force. A collected edition of his works was published in Madrid in 1881 under the title 'Obras completas de Ramón Mesonero Romanos.' In 1903–05 two volumes more of his hitherto unpublished writings also appeared in Madrid. Consult for biographical sketch, Northup, G. T., 'Selections from Mesonero Romanos' (New York 1913).

MESONYCHIDÆ, a family of Creodonts, prevailingly North American, which were more highly specialized than any other. They acquired a wolf-like form, with a very long slender tail, and legs and feet digitigrade gait indicating powers of speed beyond those of any other creodont. Their heads, however, were disproportionately large and bear-like. The general structure, nevertheless, shows that they could not have been rapid and aggressive in their habits, and their teeth suggest that they lived principally on vegetable diet. Their development into hyenalike creatures may be traced to nearly the close of the Eocene.

MESONYX, a primitive carnivorous animal of the group *Creodonta* (q.v.), which must have resembled in external aspects, when alive, the modern Tasmanian wolf of Australia. Its remains are found fossil in the fresh-water formations of Eocene Age along the eastern base of the Rocky Mountains, and a complete skeleton is mounted in the museum of Princeton University, and a restoration is exhibited in the American Museum of Natural History in New York. This specimen (*Mesonyx obtusidens*) indicates an animal as large as a Saint Bernard dog, with its hindquarters drooped somewhat, like those of a hyena and a very long, slender tail. It is the type of a large family (*Mesonychidæ*) of wolf-like beasts widely distributed in Eocene time. Consult Woodward, 'Vertebrate Palæontology' (London 1898); Osborn, 'Age of Mammals' (New York 1910).

MESOPHYTE (Gr. "mid-grower"), *in botany and forestry,* a term used of plants which grow naturally in soil of moderate moisture. Thus the term is contrasted on the one hand with xerophyte, "dry-grower," and hydrophyte, "wet-grower," these latter terms being applied to plants requiring very little or very much moisture. Since soil of moderate moisture varies from moist to dry, whereas both the dryer and wetter soils are comparatively invariable in this respect, it naturally follows that Mesophytic plants show more adaptability to conditions of moisture than either hydrophytes or xerophytes. For the same reason, no doubt, the mesophytic flora, being comparatively stronger, is denser and marked by much wider variations of species, than the scanty and monotonous growths of poorer, because of wetter or dryer, soils.

MESOPOTAMIA, from Greek *mesos,* middle, and *potamós,* river: a geographical term applied to the territory lying between the Euphrates and Tigris in Western Asia. The Arabs call those rivers El-Frat and Shatt respectively; the latter is also called Ed-Dijleh in its lower course. The boundaries of this region (which forms no single political division) are not very definite; roughly speaking, it includes all (Turkish) territory south of Diarbekr and running parallel with the Persian frontier down to the gulf. As regarded by geographers, it is bounded on the north by the Armenian Taurus, on the east by the Iranian frontier mountains, on the south and west by the Syrian Steppes, and the Persian Gulf on the southeast. The territory is divided into the three vilayets of Mosûl, 35,130 square miles; Bagdad, 54,540 square miles; and Basra, 53,580 square miles; total, 143,250 square miles. The population of Mesopotamia is generally stated to be about 2,000,000, but competent observers consider 1,300,000 to be nearer the mark. The country to which the name properly applies as extending between the two rivers has a gradual fall of nearly 1,000 feet from the spurs of the Taurus range to an old coastline south of Hit, whence an almost unbroken plain stretches to the Persian Gulf. The natives give the name of El Jezireh (the island) to the upper or northwestern portion, and that of Irâk Arabi (the ancient Babylon) to the lower or southeastern section. This latter, indeed, is often excluded as being beyond the confines of Mesopotamia proper. Low ranges of hills break the great plain of Upper Mesopotamia; between them the Khabur and its tributaries flow to the Euphrates, through a desolate region that was once thickly populated. The mountain district bordering the plain and stretching to the Persian frontier forms part of "Kurdistan," a mere name that has no concrete geographical existence, being mostly comprised in the vilayet of Diarbekr and belonging mainly to Mesopotamia. Ethnically it includes the Kurdish and the Arab nomad tribes — respectively of Iranian and Semitic stock. Upper Mesopotamia is rich in grain, wine and pasturage; the lower is flat, dry and unfruitful. Between the Khabur and the Euphrates lies the Biblical *Aram-Naharaim,* or Syria of the Two Waters, also called *Padan-Aram,* or Syria of the Plain. It is mentioned in the Old Testament in connection with Isaac and Jacob (Gen. 24 and 27). The Greek title was probably not in use till after Alexander the Great invaded the East. The soil consists of a sandy clay of excellent agricultural properties; only where water fails is it incapable of cultivation. Its remarkable fertility is shown by the fact that it still remains unexhausted after having supported through many centuries the Assyrian, Babylonian and Persian empires. The number and vastness of the ruins that lie scattered over this region from Babylon to Nineveh still bear silent testimony to its former flourishing condition. Since the cuneiform inscriptions gathered from these ruins have yielded up their secret to the researches of modern science, we have learnt with certainty that the plains of Mesopotamia were the scenes of successive civilizations, rivaled in splendor and antiquity only by those of ancient Egypt. To-day, in certain localities, may be found lions, leopards, wild asses, boars and gazelles.

Mesopotamia is essentially a land of origins; so far as we know it cradled the human race and nurtured it for centuries until a new era was introduced by the Flood incidents, which are recorded not only in the Hebrew Scriptures, but also in the cuneiform inscriptions. Its early history is one of constant struggles for supremacy between contending nations. Mesopotamia and its adjacent plains have been associated with some of the most important turning-points of human history; for milleniums

these lands contained the capitals of great world-empires and have been closely connected with the most thrilling epochs of history. Even in the World War of 1914–18, Mesopotamia — by reason of the Bagdad Railway schemes — played a rôle the importance of which is as yet but inadequately recognized, for that railroad was the keystone in the German aspirations toward a world-empire. The Mesopotamians sprang from the Chaldæans, the primitive inhabitants; from the Cushites, who in the reign of Nimrod built the cities of Edessa and Nisibis; and from the descendants of Shem, of the tribe of Thara. The Hebrew race took its rise from this land when Abraham came from Ur of the Chaldees and settled in Canaan. It was also in this plain of Shinar that the confusion of tongues occurred. Babylonia was the mother of astronomy, and the 12 divisions on the dials of our clocks originated there, while the influence of Hammurabi's famous laws has penetrated down the ages into the legal codes of modern times through the intricate systems of Greek and Roman legislators. Mesopotamia was originally a part of Nimrod's dominions, the founder of Calneh or Nippur. After an interval of more than 700 years (2000 B.C.) Cushan Rishathaim reigned in Mesopotamia, who extended his territory over the Euphrates. The Israelites, who then possessed Palestine, were compelled to pay him tribute for the space of eight years. In the Golden Age of the Assyrian power (790 B.C.) Mesopotamia was entirely subjected to that empire, and suffered the fate of its subsequent conquerors. Trajan brought it under Roman dominion in 106 A.D., but the Persians did not permit the Romans to remain long in undisturbed possession, for it was a constant cause of war between the Roman and Persian empires, and at last Jovian surrendered it to the Persians in 363 A.D. When the Arabs in 651 established a new empire upon the ruins of the Sassanide kingdom, Mesopotamia was also obliged to submit to the storm. In 1040 it fell into the hands of the Seljuks. From that time it had many rulers in rapid succession. Genghiz Khan made himself master of it in 1218, but in 1360 it fell into the hands of Tur Ali Bey. Timur conquered it 40 years later, and in 1514 it was incorporated in the Persian Empire under Ismael Sophi. In 1554, however, the Persians were compelled to surrender more than half of it to the Turks; and though they again recovered the lost portion in 1613, they were unable to withstand the attacks of Amurath IV, who united this in 1637, with many other provinces, to his empire. Despite its vicissitudes and the wars fought on its soil, the country remained rich and prosperous until the battle of Kadisia (635 A.D.) placed it at the mercy of the Arabs. Assyria and Babylonia were the wealthiest countries of antiquity, and Mesopotamia was the richest part of the great Persian Empire. In olden times Babylonia was perfectly irrigated, but the wonderful system of canals fell into ruins under the Turks. As the nomads pressed forward the peasants were driven from their lands, and the great irrigation works were neglected, and the Euphrates, no longer controlled, spread out into wide fever-bearing marshes. The work of devastation commenced by the Arabs was completed by Tartars, Mongols and Turks, with the result that one of the most fertile regions in the world became practically a desert abandoned to nomads. Arabs now form the majority of the population, though the original inhabitants are still represented by Kurds, Yezidis or "devil worshipers," Nestorians, Chaldæans or Roman Catholic Aramœans and Jacobites in the north; and by Salians in the south. There are about 80,000 Arabic-speaking Jews resident in Mesopotamia who guard with reverence the traditional tombs of Joshua near Bagdad, of the prophet Ezekiel near the banks of the Euphrates, and of Ezra the Scribe on the Tigris near Kurnah. Besides its wealth of biblical associations, Mesopotamia is a land of sacred memories to hundreds of millions of Mohammedans. Two gilded domes on the splendid mosque at Kazmain cover the tombs of eminent teachers; this and the mosque at Samarra are Shiah shrines. A mile away, on the left bank of the Tigris, is the stately Hanifi mosque of the Sunnis at Muaththam, and the famous mosque of Abd ul Kadir is in Bagdad. The tomb of Mohammed's barber, Salman Pàk, is near the ruined arch of Ctesiphon. The holy Mohammedan cities of Kerbela and Nejif are near the banks of the Euphrates, to which thousands of embalmed corpses are brought by pilgrims every year from India and Persia for interment. Under the blighting misrule of the Turk Mesopotamia has become one of the most desolate countries on earth, swarming with vermin and insects. What little manufacture is carried on is used for home consumption. Sugar, cloth, coffee, iron, indigo and copper are imported; the chief exports are dates, wool, cereals, gum, rice and hides. The foreign trade is mainly with Great Britain, India and Persia. Passengers and merchandise are carried down the Tigris from Diarbekr to Bagdad on rafts of inflated sheepskins. Sailing boats are used below Samara, while from Bagdad to Basra on the gulf river steamers ply. Steamers can navigate the Euphrates as far up as Meskineh. The principal towns are Diarbekr, Urfa (Edessa), Harran, Mosûl and Bagdad. Basra, on the Shatt el-Arab (the confluence of the Tigris and Euphrates from Kurna) is the port of transhipment from river to ocean craft. Mesopotamia has the evil reputation of being the home of the bubonic plague, and British mission doctors have labored there for many years to grapple with that disease and the deadly cholera.

Mesopotamia and the War.— It has already been mentioned thaat Mesopotamia was the keystone of the Pan-German scheme by reason of the Bagdad Railway. According to German authorities on the subject, there were three alternative plans to promote the expansion of Germany into a great world-empire. In the early stages of the Pan-German movement, the vision of its advocates was fixed upon South America as the most promising territory upon which a Greater Germany might be built. Here, however, the Monroe Doctrine stood in the way. The British Empire, as the largest landholder in the world, then became the focus of the Pan-Germanists, and here, again, a formidable barrier stood in the path — the British navy. Two avenues being thus barred by obstacles which could only be removed by an overwhelmingly powerful fleet, a third plan presented itself, a plan which provided for an

overland expansion where no Monroe Doctrine existed and no British navy could intervene. The scheme was to gain control of the Balkan peninsula by the elimination of Serbia, the only hostile barrier separating the Central Powers from a friendly power, Bulgaria. This accomplished, the road lay open to Constantinople, a junction which, in its turn, opened the door to Asia, via the Persian Gulf; to East Africa and Australia. The principal artery of communication lay in Mesopotamia — the Bagdad Railway. It was calculated that this project could be carried out without coming into physical contact with either British territory or navy, and would place Germany in a position eventually to strike both at India and Egypt, a variation of Napoleon's plan of campaign for breaking the power of Britain. According to Prince Bülow, former German chancellor, this undertaking "threw open to German influence and German enterprise a field of activity between the Mediterranean Sea and the Persian Gulf, on the rivers Euphrates and Tigris, and along their banks. If one can speak of boundless prospects anywhere, it is in Mesopotamia" ('Imperial Germany,' p. 116). These words were no exaggeration, for Sir William Willcocks, an English engineer who had surveyed the country and planned a gigantic system of irrigation, part of which he had carried out before the war, had said, in 1903, that "Of all the regions of the earth, no region is more favored by nature for the production of cereals than the lands on the Tigris." This authority stated that the irrigable area of Mesopotamia was from two to three times as large as that of Egypt, which leads to the presumption that the country could support some 30,000,000 people. Persia and Turkey being decrepit and moribund states, the Pan-Germanists saw in Mesopotamia a field for exploitation which would make it for Germany what Egypt was to Great Britain or Morocco to France. German professors had painted the possibilities of this region to enthusiastic audiences in glowing colors, and had not omitted to point out that a German foothold on the Persian Gulf would imperil the position of Great Britain in India and Egypt. Now the most important route of the British Empire is the sea-route from England to India and Australia via the Suez Canal. The value of the Persian Gulf as a strategical British position has been pointed out by Admiral Mahan, on account of the Red Sea being merely a continuation of the Suez Canal, both of which could be dominated by a hostile power holding the gulf. The British, however, have not awakened to the importance of the gulf only in recent years, for already in the days of Queen Elizabeth it was visited by English vessels; before ever the Turkish crescent appeared on the shore of Arabia the English flag was known and respected in the Persian Gulf. The East India Company planted a depôt at Bandar Abbas in its early days and for nearly two centuries fought with Dutch and Portuguese rivals. The Anglo-Indian navy first surveyed the gulf and provided for its lighting to guide navigation. For 50 years the British hunted the pirates in the gulf and destroyed their strongholds. Altogether, for 300 years the British have been the guardians of the gulf, by protecting Persia, suppressing gun-running and slavery, fighting the plague and introducing the elements of sanitation among the natives on the coastline. All that Great Britain took in return was a spot on an island for a telegraph station; but she allowed no compromise on one point — that no power should be permitted to seize territory and no other flag should dominate those waters: The future of India and of the empire was bound up with British prestige in the Persian Gulf. These considerations explain the suspicion and mistrust of Great Britain regarding the absorption of Mesopotamia by Germany — an avowedly hostile power. In 1899 a German company obtained a concession from the Sultan to build a railroad from Konieh — the terminal of the Anatolian Railway — to Bagdad and Basra on the Persian Gulf, and from that year dates the German penetration of Mesopotamia. On realizing the political objects underlying the scheme, Great Britain protested and a diplomatic conflict began which was still in progress when the war broke out. During 1913–14 a strange medley of diplomatic negotiations were being held on the question of Mesopotamia and the railway, in which England, France, Russia, Germany and Turkey were involved, with the result that Germany obtained the acquiescence of the powers to be the sole *concessionnaire* of the railroad, though England forced Germany and Turkey to fix the terminal well inland at Basra. The lighting, marking and policing of the gulf by England was confirmed by Turkey. Meanwhile, Russian diplomacy had succeeded in creating intangible "spheres of influence" in Turkish territory by which the German railroad through Mesopotamia was hemmed in on either side, while Great Britain held the key of the exit. As compensation for being restricted at that exit, Germany received a concession to build a line from the Bagdad Railway to Alexandretta on the Mediterranean. At a later date Great Britain was apparently willing to grant an extension of the German sphere, for Prince Lichnowsky (q.v.) records in his famous Memorandum that "the greatest concession Sir Edward Grey made to me personally was the continuation of the line to Basra. We had not insisted on this terminus in order to establish connection with Alexandretta. Hitherto Bagdad had been the terminus of the line. The shipping on the Shattel-Arab was to be in the hands of an international commission. We also obtained a share in the harbor works at Basra and even acquired shipping rights on the Tigris, hitherto the monopoly of the firm of Lynch." He goes on to say that "by this treaty the whole of Mesopotamia became our zone of interest. . . ." This treaty, of course, was neither signed nor published owing to the outbreak of the war, otherwise the ex-ambassador remarks, "an agreement would have been reached with England which would have finally ended all doubt of the possibility of an Anglo-German co-operation." See WAR, EUROPEAN: TURKISH CAMPAIGN.

Editorial Staff of The Americana.

MESOZOIC ERA, *in geology,* the mid-period of life in geologic time, also called the Secondary Period. Paleozoic precedes and Cenozoic follows this era, these two terms referring respectively to "older" and "newer," or "earlier" and "later," forms of prehistoric life. The subdivisions of the Mesozoic are the Triassic, Jurassic and Cretaceous periods (qq.v.).

The Life of the Mesozoic.—The life history of the era can be best understood, by first referring to the life of the Paleozoic (q.v.). That era was closed under conditions (aridity, glaciation and mountain making) unfavorable to plant and animal life, and as a result many unfit genera failed to live from Paleozoic on into Mesozoic. The long-hinged brachiopods, so characteristic of the earlier era, became extinct early in the latter. A few of the more primitive types persisted, but brachiopods became relatively unimportant. The old straight cephalopods practically became extinct with the passing of the Paleozoic. The nautilus type lived on through, even to the present time, but the era was characterized particularly by the dominance of a type called the ammonites, which appeared in late Paleozoic and died out at the close of the Cretaceous. They evolved rapidly and are valuable time markers. The Mesozoic has often been called the age of reptiles. This group of vertebrates, which appeared toward the close of the Paleozoic, in primitive form, developed rapidly into a number of highly specialized types. The Dinosaurs (terrible reptiles) developed along several lines. The carnivorous group walked on two legs, the two front limbs being very short. It was this reptile that made the famous three-toed tracks of the Connecticut Valley. Some of these Dinosaurs got to be as long as 40 feet. Herbivorous types also developed, great awkward beasts, some of them 80 feet long, 16 feet high and weighing probably 30 tons or more. This type were the largest land animals that ever lived. Late in the era peculiar armored Dinosaurs also appeared, with great horns on their heads and spikes on their tails. The Ichthyosaurs (fish reptiles) took to the sea and developed fins, much after the manner of modern fish. The Pterosaur (wing reptiles) developed the power of flight, some of them having a wing spread of 20 feet. These unusual reptiles all died off suddenly at the close of the Cretaceous, and in the following era reptiles took on a modern aspect. Peculiar birds with teeth, the first known representatives of the feathered world, are found fossil in Jurassic and Cretaceous rocks. A few primitive mammals, mostly of very small size, are known in the Mesozoic, but the group did not develop rapidly until after the close of this era. Among plants the common groups of flowering plants did not appear until Cretaceous times.

Paleogeography of the Mesozoic in United States.— During Triassic and Jurassic times practically all of the United States east of the Mississippi was land. During Cretaceous times sea encroached on the coastal plain but did not reach the eastern interior region. The history of the west was more complex. During the Triassic a considerable part of the Pacific Coast region was under water but most of the interior was land. Similar conditions prevailed during early Jurassic, but late in the period a great arm of the sea encroached from the Arctic, reaching as far south as northern Colorado. The great differences in fossils seem to indicate that this bay was not connected with the Pacific directly. This arm of the sea withdrew before the end of the period which was marked in California and Oregon by great folding and intrusions of igneous rock making the mountain ranges known as the Sierra Nevada and Cascades. In the west the Upper Cretaceous was marked by a great inland sea, over the site of the Great Plains and Rocky Mountains, reaching from the Gulf of Mexico to the Arctic Ocean. Toward the close of the period this sea retreated, leaving great swamps in which coal was formed. The Era was brought to a close by a great period of folding known as the Laramide Revolution which uplifted the Rocky Mountain Range.

MESQUITA, māsh-kē'tā, **Salvador** de, Brazilian poet: b. Rio de Janeiro, 1646; d. Rome, in the early 18th century. He went to Rome, where he entered holy orders and became well known for his Latin scholarship. His 'Sacrificium Jephthæ' (1680), a sacred drama, established his poetic fame among contemporaries. His tragedies from profane history, 'Demetrius,' 'Perseus' and 'Prasias Bithynus,' all appearing at Rome between 1690 and 1700, also had once high rank.

MESQUITE, a tree or shrub (*Prosopis glandulosa* and *P. juliflora*) of the family *Mimosaceæ.* Several species of mesquite are very common in the southwestern United States from Texas to California, extending southward through Mexico and tropical America. In the United States they are usually shrubs, but farther south large trees. The branches are armed with spine, the leaves compound of numerous leaflets, the flowers small and greenish, in spikes, and the fruit of long indehiscent pods. In the arid southwest the mesquite is often the only source of firewood which is not obtained from the branches, but from the very large roots. The pods are eaten by cattle, and sometimes by people, for their sweet pulp and seeds. The screw-pod mesquite or tornillo is *Prosopis pubescens,* another southwestern plant, whose pods are coiled in a close spiral, resembling a screw.

MESS, in the army and navy, and particularly the latter, a company of officers, or crew of a ship, who eat, drink and associate together; in military language, a sort of military

ordinary, established and regulated by the rules of the service, for all the officers in a regiment, and supported by their joint subscriptions, supplemented by a small government allowance. Similar institutions are extended to the non-commissioned officers of a regiment. The enlisted men mess by companies as a rule, but often it is desirable to cut the company into squads for mess purposes. The post commander usually appoints some officer to take charge of mess arrangements. In active service the officers are apt to mess with their own troops, but in camps they have their separate mess. In the navy it is usually convenient to have a captain's mess, another for the wardroom officers, another for the junior officers, another for the warrant officers, etc. The men's mess for the sailors or marines is styled the "general mess," but this is usually divided into sections, as a matter of convenience. It has become common to employ ammunition passers as mess attendants.

MESSAGER, André Charles, French composer: b. Montluçon, 30 Dec. 1853. He received his musical education at École Niedermeyer, Paris, and subsequently studied under Saint-Saëns in the same city. He was appointed organist at Saint Sulpice in 1874. A symphony of his won the gold medal of the Société des Compositeurs in 1876. In 1880 Messager became music director at Sainte Marie-des-Batignolles. Three years later he completed the comic opera by Bernicat, 'François des bas bleus,' and in 1885 produced his own operettas, 'La Fauvette du temple' and 'La Béarnaise.' The following year saw the production of his ballet, 'Les deux pigeons' at the Opéra. Messager's reputation, however, was most enhanced by the comic opera 'La Basoche,' produced at the Opéra Comique in 1890 and in English in London in 1891. It was followed by the operas 'Madame Chrysanthème' (1893); 'Mirette' (1894); 'Les petites Michus' (1897) and 'Véronique' (1898); 'Les dragons de l'impératrice' (1905); 'Fortunio' (1907); 'Béatrice' (1914). Messager became conductor at the Opéra Comique in 1898; was one of the directors of the Covent Garden Opera in 1901–07, and first conductor at the Paris Grand Opéra after 1907. From 1907 to 1914 he was also joint director with Broussan of the Grand Opéra and after 1908 was conductor of the Concerts du Conservatoire.

MESSALA (mĕ-sā'lą) **CORVINUS, Marcus Valerius,** Roman soldier, orator and writer: b. about 65 B.C.; d. about 2 B.C. He received a part of his education in Athens, returned to Rome before the second triumvirate and joined the Senatorial party. He fought with Brutus and Cassius at Philippi, 42 B.C., and afterward attached himself successively to Antony and Octavius, served at the battle of Actium, 31 B.C., and the same year was chosen consul. He subdued Aquitania, of which he was made proconsul and was honored with a triumph. For a time he was a prefect of Rome and held the office of augur. Messala was the friend of Horace and other distinguished men of the age, a zealous patron of literature and art, notably of the poet Tibullus, and one of the most eminent of Roman orators.

MESSALINA, mĕs-ą-lī'ną, **Valeria,** Roman empress. She married Claudius (later emperor) in 38 A.D.; bore him a daughter, Octavia, and a son, Britannicus; proved herself vicious, licentious and vulgar by her many open amours; and in her husband's absence formally married Gaius Silius, whom she attempted to make emperor. Claudius refused or delayed to punish her, and Narcissus, the emperor's favorite, had her put to death (whether with Claudius' knowledge or not is not known) in 48 A.D. Her reputation was whitewashed in Stahr's 'Agrippina, die Mutter Neros' (1880).

MESSENE, mĕ-sē'nē, the capital of Messenia in Peloponnesus, founded by Epaminondas (369 B.C.) after his victory of Leuctra over the Lacedæmonians, and situated at the foot of the hill of Ithome, the fortress of which formed the acropolis of the new capital. The latter was surrounded by massive stone walls, flanked with towers, of which there are still considerable remains at the modern village of Mavromati. The Greek Archæological Society, in 1895, excavated a colonnade and other parts of the ancient agora. Messene with its acropolis was, next to Corinth, the strongest city of Peloponnesus. It was supplied with water from a fountain called Clepsydra, the spring of which still exists.

MESSENIA, mĕ'sē'nĭ-ą, Greece, a nomarchy in the western part of Morea (Peloponnesus), bounded on the north by Elis and Achaia and Arcadia, on the east by Arcadia and Laconia, on the south and west by the Ionian Sea. The greater part of the surface is a fertile plain, but there are mountainous lands in the east and northeast. Kalamata, the capital, is in the southeast on the Gulf of Koron (Messenian Gulf). When Messenia was a state of ancient Greece its chief cities were Methone and Pylos (Navarino). Later Messene (Mavromati) was the capital, and the strong mountain fortress was Ithome. A ridge of Mount Taygetus separated Messenia from Sparta. Messenia is celebrated for the long struggle of the inhabitants with the Lacedæmonians in defense of their liberty. In the first Messenian War (743–723 B.C.) the Lacedæmonians, with the Athenians, invaded Messenia. For 20 years the Messenians defended themselves valiantly under their king Aristodemus, who in consequence of an answer of the Delphic oracle which promised them the victory on condition of the sacrifice of a virgin of the royal family, offered his own daughter as the victim. Her lover, to save her life, declared her to be pregnant by himself; and Aristodemus, to prove her innocence, stabbed her with his own hand, and caused her to be opened and sacrificed. The Messenians, though for some time successful, were finally obliged to submit by the loss of Ithome. About 40 years after they again rose, and thus commenced the second Messenian War (685 B.C.), which ended in their entire subjugation. A part of the Messenians emigrated to Sicily, and there founded Messana (see MESSINA) on the site of the ancient Zancle (668 B.C.). Those who remained were reduced to the state of helots. After 200 years of servitude they again took up arms. This third Messenian War lasted 10 years (465–455 B.C.), and resulted in the expulsion of the Messenians from the Peloponnesus. Epaminondas restored them, gathering together the exiles from the various lands

in which they were scattered. Within the space of 85 days they completed and fortified Messene (369 B.C.) and maintained their independence till the country was conquered by the Romans (146 B.C.). The Messenians remained true to their customs, manners and language through all changes of fortune.

MESSHED. See MESHED.

MESSIAH, The, is a term which is, in John i, 41, and, in John iv, 25, but without the article, applied to Jesus of Nazareth, as the appointed king of the Kingdom of God. The Greek word which is the translation of the Aramaic term meaning Messiah, namely, χριστός, in English Christ, is used of Jesu in this same sense throughout the New Testament. The word Messiah itself is a modified transcription of the Greek word Μεσσίας. The extract transcription would be Messias, as the word appears in the Authorized Version in both the passages cited above, and the form Messiah is due to the influence of the form of the original Aramaic and Hebrew word. For the word which appears in Greek as Μεσσία was, in Aramaic and Hebrew, מָשִׁיחַ (Mâsî·ḥ). All the forms of the term Messiah, as well as the Greek equivalent, χριστός, and the English Christ, mean Anointed One, and refer to Jesus, when applied to him, as God's Anointed King.

In the Old Testament, מָשִׁיחַ (Mâsî·ḥ) (English Messiah) is used, in a few cases, without the article, and as an adjective, of priests, who were anointed to their office (Lev. iv, 5 and 16, vi, 22). But, in the definite sense of the Anointed One, or the Messiah of Jehovah (the Lord's Anointed), it is used, with a very few possible exceptions, only of kings. Thus, in 1 Sam. ii, 35, it is used of the kings of Israel in general. In 1 Sam. xii, 3 and 5, xxiv, 6 and 10, it is used of Saul; and, in 2 Sam. xiv, 21, xxiii, 1, it is applied to David. In Lam. iv, 20, it denotes Zedekiah, King of Judah; and, in Isa. xlv, 1, it is applied to Cyrus, King of Persia. Two possible exceptions to its use to denote kings may be found in Psa. cv, 15 (quoted in 1 Chron. xvi, 22) and Hab. iii, 13, where it seems to be used to mean the nation of Israel as the priest people of Jehovah, although, even in these cases, it may refer only to the king. In Daniel ix, 25 and 26, it is very difficult to decide the true meaning of this word, because of the great uncertainty in relation to the correct interpretation of these verses. According to the various interpretations which have been given to them this word would mean a high priest, a royal ruler, or that great king of the kingdom of God known to us as Jesus of Nazareth. It is not certain, however, that both times it is used in these verses it has the same meaning. In Psalm ii, 2, the best and most probable interpretation would make the term denote the great coming king known to us as Jesus the Christ. This is the only passage in the Old Testament in which this term can be taken with any reasonable degree of probability to refer to our Saviour.

In the post-canonical literature, the first clear application of the term Messiah to the great coming king of Israel is found in the Psalter of Solomon, dating from about 63 B.C. In this poetical collection we have a full and clear description of this king and his work under this title. There are, indeed, in the Sibylline Oracles and the Book of Enoch, expressions and terms which must be supposed to refer to the coming and expected king of Israel, but the name Messiah is not used in these writings.

While the pre-Christian use of the term Messiah to denote the divinely appointed and eternal king of the Kingdom of God is thus limited, the Old Testament abounds in statements and teachings relating to this king, and that form of the Kingdom of God in which he is to be ruler and sovereign. In some of the passages relating to this final form of the Kingdom of God it is said that Jehovah himself will be the king, as he was, in reality, in all the history of the kindom of Israel. Consult as examples of passages of this kind, Isa. ii, 2–4, Isa. xxxiii, 22, Ezek. xx, 33, Ezek. xxxiv, 15, Zeph. iii, 15, Zech. xiv, 16. In other passages, in harmony with the idea that, while Jehovah was always the real king of Israel, he was represented in the government by a vicegerent king, his anointed on the throne of David at Jerusalem, it is declared that a great and eternal coming king, who, in some of the passages, is stated to be of the line of David, shall reign as king in the final form of the Kingdom of God. Among the passages of this kind may be cited Psa. cx, Isa. ix, 6 and 7, Jer. xxiii, 5–8, Jer. xxx, 8 and 9, Ezek. xxxiv, 23 and 24, Ezek. xxxvii, 24 Hosea iii, 4, Micah v, 2–5, Zech. ix, 9. Just what will be the relation, in person and in nature, between Jehovah and this Davidic king, is not made clear, or even asserted, in the Old Testament.

Independently, therefore, of the use of the term Messiah, there was a natural and sufficient basis in the Old Testament for the widely-spread belief in regard to the coming of a future Davidic king called the Messiah, which appears to have existed in the time of Jesus. In this belief Jesus himself shared, and this king Messiah, or Christ, he both virtually and formally claimed that he himself was. A virtual claim of this kind is found in Matt. xvi, 13–20, and in the parallel passages, Mark viii, 27–30, and Luke ix, 18–21, and also in the act done by Jesus, of which we have the record in Matt. xxi, 1–11, and the parallel passages, Mark xi, 1–10, and Luke xix, 29–40. A formal claim of Jesus to be the Messiah is found in John iv, 25 and 26.

The rejection of the claims of Jesus by the Jewish nation, and the continuation in that nation of the belief in a coming Messiah, were the occasion of the appearance in Jewish history of several who claimed to be the Messiah after the time of Jesus. Of all these the one who was most generally received as the Messiah by the nation, and who accomplished the most for his people, was Simon bar Cochba (or bar Kozeba), who flourished 130–35 A.D., in the reign of the Emperor Hadrian. For two years and a half, bar Cochba reigned as king, and, at the head of an army of 200,000 men, defied the might of Rome. But, in the end, he and his nation were both crushed beneath the power of Rome.

The Jews of the present day are not all of the same opinion in regard to the Messianic hope. The conservative, or Orthodox, Jews are still looking for the coming of the Messiah, the

great king of the line of David. With the liberal, or Reformed, Jews, so far as the term Messiah is used at all, it is made to stand for a personification of a system of ideas and doctrines, and the coming of the Messiah will be the universal acceptance and the world-wide domination of Jewish ideas and the Jewish religion.

MESSIAH, The ('Der Messias'). Klopstock's 'Messiah' is German Pietism's most important contribution to literature and modern Germany's most pretentious epic poem, consisting of 19,458 dactylic hexameters as compared with the 12,310 of Homer's 'Odyssey.' When the first three cantos appeared in 1748 in the 'Bremer Beiträge ('Bremen Contributions') it took the public a year to get accustomed to the novelty of its form and content, after which its success was unprecedented, its readers awaiting with impatience the next two cantos, which appeared in 1750, and the next five, which appeared in 1755. On these 10 the fame of the work must rest; for the following cantos, appearing five in 1768 and five in 1773, were probably as disappointing then as tiresome now.

The theme is the redemption of mankind, and the poem starts with Christ's entry into Jerusalem on Palm Sunday, the most exalted subject at hand for the young Jena student of theology, who at the academy of Pforta had come under the influence of Milton through the writings of Bodmer. On going to Leipzig in 1747 Klopstock recast the prose beginnings into hexameters, thus breaking with the traditional Alexandrines and loosing a storm of criticism on his head from the school of Gottsched, while that of Bodmer applauded. It has been said that the work of no German poet before Richard Wagner aroused such controversy. Goethe's Autobiography tells us that his father banished the book from the house because of its blank verse. However, Klopstock broke the sway of the French in epic verse as Lessing did later in the drama, demonstrating the nearer affinity of German to English. He learned a great deal from Milton, but his nature was essentially lyrical, contemplative, mystic, and he often smothers the epic possibilities of his subject in a flood of fervent, more or less seraphic, religious ecstasy, which exhausts the reader. Instead of strong contrasts, going from darkness to light, from misery to bliss, he attempts to portray a mental state of continuous, dazzling brilliancy. Instead of an alternation of clashes there is a contemplative passivity, from which result endless repetitions and long drawn out speeches; so to speak, a massive elaboration of the text of Händel's oratorio, which was but seven years older. Certain descriptions, however, are very successful, such as those of hell, the council of the devils, their punishment through transformation, the trips through the universe made by angels and devils, and especially the vision of the last judgment. Klopstock's taking over of the Miltonic cosmography gave him the opportunity of portraying a great struggle between the powers of light and darkness for the soul of Christ and therefore of man, but instead his angels paralyze their adversaries with a look, which method of warfare is not epic, though perhaps pietistic.

His forte is to excite feeling and to lend expression to the inexpressible even when his characters become speechless. No German poet before him had so mastered the capacities of the language, whether in choice of words or in rhythmic cadence. In a sense he became the creator of modern poetic diction. A flood of epic imitations on various biblical subjects attested his contemporary influence, and all the younger poets of his day learned from him, but the 19th century admired him from an ever increasing distance. Lessing 'Briefe,' XV, 'Brief: Ueber das Heldengedicht: Der Messias' (1753).

CARL E. EGGERT,
Assistant Professor German, University of Michigan.

MESSINA, mĕs-sē'nā, Sicily, town and seaport, capital of the province and on the strait of the same name. Messina is walled, flanked by bastions and defended by a citadel on the south and several forts both on the east and west. The harbor is one of the best in the Mediterranean and so much resembles a sickle that the town took its original Greek name from that implement, called *zancle*. Fronting the harbor is a broad quay called the Marina, adorned with statues and fountains and forming a favorite promenade. The streets of the old town are narrow and dirty, but the modern town, built

since the earthquake of 1783, is generally composed of houses of two stories and has spacious streets, well paved with blocks of lava. Among the public edifices are included nearly 50 churches, many of them of great beauty and adorned with fine sculptures and paintings. The cathedral is a Gothic structure, with a somewhat heavy exterior, but supported within by vast pillars of granite, supposed to have belonged to a temple of Neptune. The viceroy's palace, the archiepiscopal palace, the senate house, grand seminary, college, large and well-endowed hospital, numerous convents, two theatres, lazaretto and arsenals are some of the other buildings worthy of notice. The manufactures consist chiefly of silk goods. The trade, both transit and general, is extensive. The principal exports are silks, olive oil, linseed and other seeds, oranges, lemons and other fruits; corn, wine and spirits; salted fish, licorice, lemon-juice, shumac, essences, rags, brimstone, etc. The tunny and other fisheries are carried on to a considerable extent. A destructive earthquake visited the locality 28 Dec. 1908 destroying about half of the buildings and causing the loss of more than 77,000 lives, probably more than half of them residents of Messina. The principal shock was at 5.21 A.M., and the tidal wave that followed, 10 feet in height, swept all before it on the low shore. Notwithstanding this frightful casualty, the city so far recovered that in 1910 the exports were $11,000,000 and the imports about $5,000,000. Messina has a government university, founded in 1549, which had 692 students in 1901. It has departments of law, medicine, science and classics. It has also a naval seminary and a number of elementary schools. Messina, under the name of Zancle, is said to have been founded 1004 B.C.; the Messenians obtained possession 668 B.C.; it became a free city of Rome 241 B.C.; the Saracens captured it in 831; Richard I of England with his crusaders spent six months there in 1191, sacking the town on leaving; from 1282 to 1713 the Spaniards ruled, though the French held it briefly 1676–78; in 1743 a plague killed 40,000 of the inhabitants; in 1783 an earthquake caused large loss of life; in 1854, 15,000 died of the cholera; in 1860 the city came under Italian rule, and was peaceful and prosperous until the 1908 tragedy. The population before the earthquake was 150,000, but in 1911 was reduced to 126,557.

MESSINA, Strait of (Italian, *Faro di Messina;* Latin, *Fretum Siculum*), a channel which separates Sicily from Italy and connects the Tyrrhenian and the Ionian Sea. It has a length of about 20 miles, and gradually widening toward the south, attains, on the parallel of 38°, a width of 11 miles; but in the north, where it is narrowest, does not exceed two miles. The depth is great, in some parts over 4,000 feet, and a strong current continually running with the tide makes the navigation somewhat difficult, but by no means so formidable as was fabled by the ancients, to whom the rock of Scylla, and the whirlpool of Charybdis, on the opposite side, but at some distance to the south, seemed so dangerous that it was generally believed to be almost impossible to avoid the one without being dashed upon the other.

MESSMATES, Animal. See COMMENSALISM.

MESSMER, Sebastian Gebhard, Catholic archbishop of Milwaukee: b. Goldach, Canton Saint Gall, Switzerland, 29 Aug. 1847. Having passed the eight grades of the common school of his home village, he spent three years at the high school in the neighboring town of Rorschach on the Lake of Constance. In 1863 he went to the ecclesiastical preparatory college of Saint George's near the city of Saint Gall, where he finished his classical studies. In 1866 he proceeded to the University of Innsbruck in Tirol to study philosophy and theology and there was ordained to the priesthood, 25 July 1871. In October of the same year he came to Seton Hall College, the diocesan seminary of Newark, N. J., where he taught various theological branches until 1889, when he was called to the chair of canon law at the newly-founded Catholic University at Washington. Before going there he spent the winter of 1889 at Rome, where he attended the lectures of the present Cardinal Giustini on the Justinian or Roman Law, and in June 1891 took the degree of doctor of canon law in the Collegio Appollinare. In November 1891 Dr. Messmer was by the Holy See appointed bishop of Green Bay, Wis. He was consecrated bishop on 27 March 1892, by his life-long friend, Bishop Zardetti, of Saint Cloud, Minn., later Archbishop of Bucharest in Roumania. After the death of Archbishop Katzer of Milwaukee in 1903 Bishop Messmer was appointed Archbishop of Milwaukee where he was installed on 10 Feb. 1904. Dr. Messmer has been a constant contributor of articles to various ecclesiastical periodicals, and has edited a number of smaller works on canon law, catechetics, liturgy and the Bible; also the 'Works of Bishop England D.D.' (7 vols.). With Bishop McFaul of Trenton, N. J., Dr. Messmer, the Bishop of Green Bay, became one of the founders of the Catholic Federation of America in 1901. Since 1916 he has been honorary president of the Catholic Hospital Association of the United States.

MESTIZOS, mĕs-tē'zōs, or **METIS** (Spanish, mixed), half-breeds; those of mixed blood, especially those descended from Indian and Spanish or Indian and Portuguese. In Mexico the European Spaniards are called *Chapetones* or *Gachupines.* See CREOLE.

MÉSZÁROS, Lazar, Hungarian revolutionary soldier and patriot: b. Baja, County of Bács, 20 Feb. 1796; d. Eywood, Herefordshire, England, 16 Nov. 1858. He was first educated for the Church, but subsequently studied law at Pesth. In 1813 he was summoned to join the Hungarian army by the Emperor Francis; later entered the Austrian army, taking part in the campaigns of 1814–15 against Napoleon and subsequently in Italy; and several years later was appointed colonel. He was in Italy in 1848, serving as a colonel in an Hussar regiment, when he was chosen by Count Batthyani who had formed a new Cabinet, for the portfolio of Minister of War. Acting in this capacity he was largely instrumental in bringing the Hungarian army to a high degree of efficiency. In September of that year, having gone to the scene of war in the south, he was defeated before the Rascian ramparts of Szent Tamas. When Austria purposed the subjugation of Hungary, Mészáros took command

the Hungarian forces in the north, but on 4 January his army was routed at Kaschu. In April 1849 after the declaration of independence he again took command of the Hungarian forces, but after the defeats at Szöreg and Temesvár in August he fled to Turkey. He subsequently lived in England, France, the island of Jersey, and in 1853 came to the United States.

META, mā'tä, a river of South America, which has its rise on the eastern slope of the Andes Mountains near Bogotá in Colombia. It is formed by the junction of two small mountain streams, which unite about 40 miles southeast of Bogotá; then flows east-northeast into the Orinoco; a course of about 650 miles.

METABETCHOUAN, mĕt"ą-bĕt-choo-ăn', Canada, a river of Quebec flowing into Lake Saint John from the south. It is a broad stream, 90 miles long, and navigable for a considerable distance. The celebrated Falls of Metabetchouan over 230 feet high are near its mouth.

METABOLISM (Greek *μεταβολή* a change), the whole series of physico-chemical processes connected with the manufacture of protoplasm and with nutrition and growth. Under the term is included all those changes by which various energy transformations are made possible in the human body. It has been divided into constructive metabolism (anabolism), and destructive metabolism (katabolism). The former comprises the processes by which the substances taken as food are converted into protoplasm, while katabolism is the means by which the protoplasm is broken down into simpler products, such as the excretory or waste matters. Metabolism thus comprises the elementary vital phenomena of plant and animal life. These are the occurrences associated with changes of substance, of form and of energy. All organisms undergo continual changes of their substance or protoplasm, etc., alterations of their form and transformations of the energy which they get from the environment. The human body is essentially an energy transformer. Thus as regards food, since all living matter is continually undergoing decomposition, it must take in substances that contain all the chemical elements of which it is constructed, but the food differs with every form of cell. Plants live chiefly on inorganic substances and animals on organic, that is, material already prepared; no animal being able to live on simple inorganic compounds. Among animals there is a remarkable adaptation to a single kind of food. For example the larva of the fur-moth lives exclusively upon the hairs of fur, which consist of pure keratin; this substance, which is closely allied to proteid, is therefore capable of furnishing all the elements necessary for the formation of the protoplasm of this caterpillar. Dogs when worked hard have been found to be able to live on pure proteid food. On the other hand, according to Verworn, it is impossible for an animal to live solely on carbohydrates or fats, or even on the two together, since there is no nitrogen in these substances.

Vital motion or metabolism is a complex sharply characterizing living organisms, and the taking in of food and the excretion of waste products give to the organism the material with which to regenerate itself and to grow. Metabolism is increased by heat, the consumption of oxygen being increased in cold-blooded animals, but warm-blooded animals undergo a decrease under heat. Thus man in winter has a much more active metabolism than in summer, since he consumes more food at low temperatures.

It is claimed by Verworn that every species of animal possesses a specific metabolism, and that under certain conditions products of metabolism may stimulate an animal to increased growth, while under other circumstances they may retard growth. Thus the usually deadly uric acid in moderate amounts exerts a favorable influence on the size of larvæ of sea-urchins. Illustrations are afforded by experiments in raising snails and water-fleas (*Daphnia*) in small volumes of water; besides the diminished volume, the water fouled by their excretions may not only dwarf but gradually kill them, or produce changes of form. Metabolism is more active in the young than in the adult. Between 9 and 14 a boy requires as much food as a full-grown man, and during the next five years more than a man. The same is not true of girls who increase the amount of metabolism up to the 11th year.

Consult Verworn, 'General Physiology' (New York 1899); Vernon, 'Variation in Animals and Plants' (New York 1903); Starling, 'Human Physiology' (Philadelphia 1915); Bayliss, 'Principles of General Physiology' (New York 1915).

METACENTRE, *in hydrostatics,* the point of intersection of a vertical line passing through the centre of gravity of a floating body as a ship *in equilibrio,* and a vertical line through the centre of gravity of the fluid displaced, if the body be turned through a small angle, so that the axis takes a position inclined to the vertical. If the metacentre is above the centre of gravity, the position of the body is stable; if below it, it is unstable. In shipbuilding a vessel must be so designed that its metacentre (its changing centre of buoyancy) is not likely to oscillate so as to permit capsizing.

METACHROSIS, the change of color brought about in the surface of certain animals, either voluntarily or involuntarily, to make them conform to their surroundings. It is exhibited in many of the lower animals as a protective device, especially in cuttlefishes, caterpillars, various amphibians, especially frogs and certain lizards, notably the chameleons. The dark pigment to which the brown or gray colors of metachroic caterpillars are due is deposited in the cells of the outer skin, while the green coloring matter is found in the underlying fat; and, as Carpenter says, experiments have shown that the presence or absence of both kinds of pigment is determined by the surrounding objects through the quality of the light reflected from them, the suppression of the superficial dark pigment allowing the deeper green to show through the skin, and thus give its hue to the caterpillar. It has been shown that the formation of the dark pigment is hindered by the action of certain yellow rays which are absorbed by dark objects, but reflected from green leaves and shoots. The process of change in squids, frogs, etc., through nervous and muscular control of pigment sacs, called chromatophores, is somewhat different, and is explained in the article CHAMELEON.

The power possessed by these animals of adapting their color to their surroundings must be of great value in ensuring preservation from enemies. Consult Beddard, 'Animal Coloration' (1892).

METACINNABARITE, a native sulphid of mercury, occurring amorphously, when it is black or dark gray, or in tetrahedral crystals. To its black color it owes its early popular name, Æthiops mineral. Metacinnabarite is found in California.

METAGENESIS, or HETEROGONY, a term proposed by Owen for a form of parthenogenesis. It is that form of alternation of generations (q.v.) of which one generation reproduces only asexually, by division or budding, the other exclusively by laying eggs. A good example is the mode of reproduction of hydromedusæ in which the hydra-like stage gives rise to medusæ, the latter laying eggs. Another case is that of the aphides, whose asexual individuals produce multitudes of young by budding, the next generation consisting of males and females, the latter laying fertilized eggs. An individual of the first generation is called the nurse; one of the second generation the sexual animal.

Another term for this phase of reproduction is heterogony (or heterogenesis), which Hertwig defines as "regressive alternation of generations." He mentions another form of heterogony where two generations with different forms and structure alternate. For example, a hermaphroditic thread-worm (*Ascans nigrovenosa*) lives in the lungs of frogs; it produces a form (*Rhabdonema nigrovenosum*) which lives in mud, and which lays eggs giving rise to the ascaris of the frog.

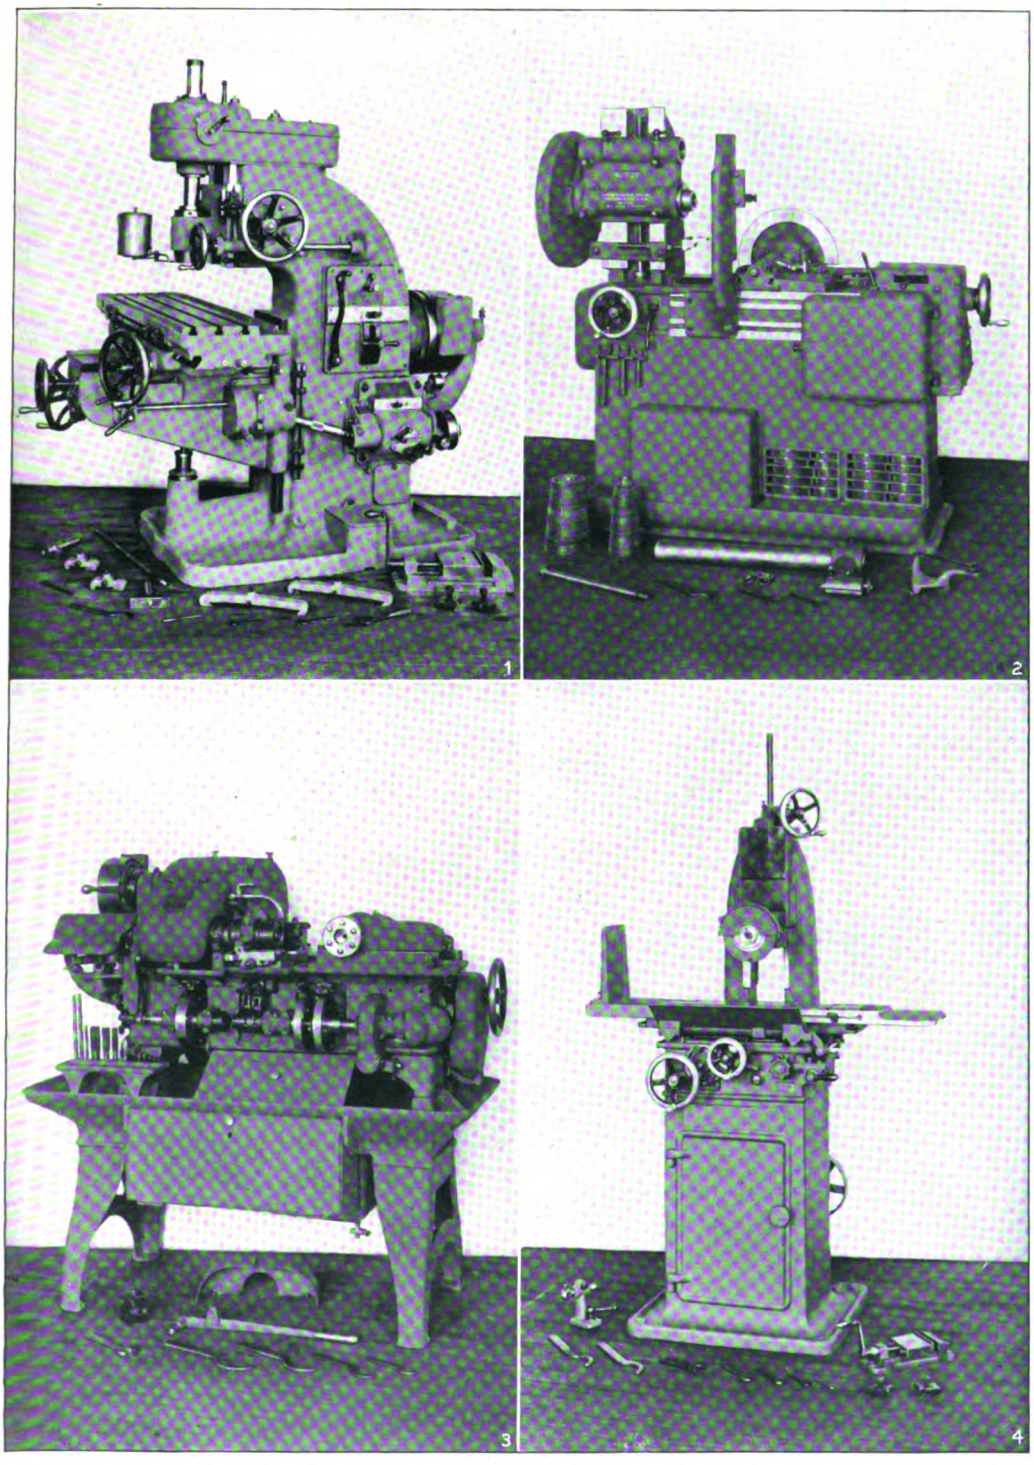
METAHEWETTITE, a dark red mineral consisting of hydrous calcium vanadinite occurring in microscopic crystals with uraninite and carnotite at several localities in Utah. Probable composition $CaO.3V_2O_5.9H_2O$; a source of vanadium.

METAL WORK, any work done in metals, but especially handwork practised as a decorative art, in which the materials are metal and the designs are executed in repoussé or relief. This may be accomplished either by carving or expert hammering as of thin sheet metal. The term includes jewelry (q.v.) and goldsmith's work; hence its materials are often the precious metals and its end personal adornment. But it is often applied to larger work and especially to metal decoration in architecture, apparently a later development in the arts than was the jeweler's trade, which flourished in classical antiquity, and everywhere seems to have quickly followed the most primary knowledge of metallurgy in industrial evolution. The Middle Ages were the great period of metal work, notably in connection with Gothic art. Even the more valuable metals were lavishly used in this epoch, as before in the Byzantine period, and since in the architecture of the Greek Church, above all in Russia. One of the foremost instances of Italian metal work is to be found in the altars of Saint James at Pistoria and of the baptistery of Saint John in Florence. Each of these was the work of a line of great artists, whose elaborate work upon them covered more than a century. Cellini (q.v.) was the greatest metal worker of the 16th century. Even more important than the work in silver and gold are the great bronze doors in the Florence baptistery, one by Ghiberti and another by Pisano, each the product of a score of years of labor, and both dating from the 15th century. Wrought iron work began to be used in the 12th century; between the 13th and the 18th centuries in the shape of gates, grilles and screens in ecclesiastical and in German locks and hinges of great beauty, it came to its most perfect form. The sepulchral brasses of German, French and English churches should also be mentioned. See BRASSES.

METAL WORKING MACHINERY, a term including practically all machines by which metals are converted into shapes required by modern structural work and the industrial trades. They may be conveniently arranged under the following named classes: Lathes; borers or drills; punches; shears; milling machines; grinders; riveters; drop hammers; bending rolls; rolling machines; presses; planers; saws and special machines.

Lathes are turning machines used to obtain cylindrical surfaces by rotating a bar of metal against a fixed cutting tool. They are also used for spinning sheet metal into form. The principal parts are the head stock holding the driving cone and revolving spindle; the tail stock supporting the back centre, and capable of being clamped at any point on the centre line of the bed or frame, and the rest or carriage bearing the tool head. The bar of metal to be worked is fastened to the head and tail stock and rotated or turned by belts from shafting or by electric motors, while the rest carrying the cutting tool is moved parallel with the axis of the bar from the surface of which a spiral shaving is removed. By suitable attachments the lathe may be used for tooling flat surfaces, sawing or grooving and cutting gear wheels. These machines are made in a great number of sizes, of which the principal forms may be designated as follows: (1) The hand lathe, driven by hand power, usually by a drill-bow but sometimes by an assistant at the crank, is without self-acting feeding devices for regulating the cutting tool. (2) The foot lathe, small and light, worked by the operator's foot and adaptable to work as delicate as that of the watchmaker and jeweler. (3) The self-acting lathe; in which the cutting tool is held in a carriage which is moved by mechanical means, causing it to traverse automatically the object being turned — these lathes are adapted for screw cutting and are often so designated. (4) The chucking or face lathe; for turning cylinders several feet in diameter and many feet in length, such as engine cylinders and the tubing and jackets of large ordnance. The turret lathe belongs to chucking class, but the face of the chuck is horizontal, the revolving spindle being vertical. (5) The boring lathe, used for working on internal cylindrical surfaces. A bench lathe is a small model of any of the several types so arranged that it may be bolted to a work bench. An automatic lathe is one of the larger types fitted with mechanism by which it stops itself when the work it is set to do has been completed. Any lathe may belong to the single geared or back gear

METAL WORKING MACHINERY



1 Verticle Spindle Milling Machine

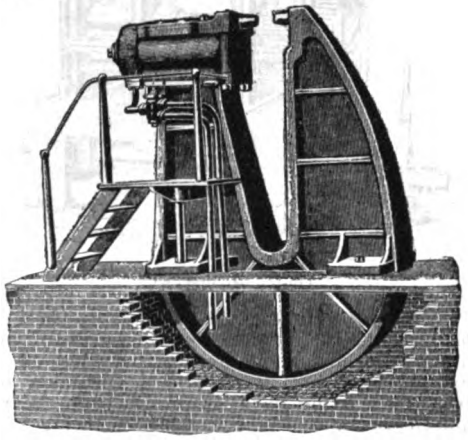
2 Steam Drop Hammer

3 Horizontal Milling Machine

type. In the latter a set of gear wheels operates a back shaft, by which the speed of the work may be greatly reduced. Overhead shafting on the lathe standards or on the ceiling provides means for giving a revolving motion to the tools at work, thus affording a combined motion of great variety and intricacy for involved work.



150-Ton Fixed Riveter.

Borers or Drills.— Boring machines, if operated by hand power, are called "hand-drills," otherwise, "power drills." They are of two types, the horizontal and the vertical. The cutting tool is formed upon an axially rotating spindle designed to bore or drill cylindrical holes. They vary greatly in size and pattern; in the number of spindles employed and the manner of their arrangement. Large holes, either horizontal, vertical or inclined, such as engine cylinders, tubing for ordnance and hollow shafting, are worked on a boring lathe, carrying usually two or more separate spindles clamped in a cylindrical tool head. Drills are especially useful as reamers to finish holes made by punches, and also to give exact cylindrical forms to the internal surfaces of hollow castings of any kind.

Punches.— Punching machines are of the single or multiple type, capable of punching one or several holes at a time. They are used for punching rivet holes in boiler and armor plates, plates for girders and other structural metal work. The perforation is accomplished by the thrust of a cylindrical punch under great pressure. Though usually made to punch round holes they are also worked with "drifters" which square up the round holes. The power employed is steam or hydraulic, generated by individual engines for large and belt-driven machinery for small work.

Shears.— Shearing machines and punches are similar in general construction and operation, excepting that in the former cutting edges which pass each other like the blades of a pair of scissors take the place of the punching tool. Their name and action sufficiently describe the purposes for which they are used.

Milling Machines.—Are of great importance in the manufacture of iron work of moderate dimensions such as parts of sewing machines, automobiles, rifles and pistols. In general construction a frame-work carries a spindle actuated by a pulley, and a table upon which chucks or holding devices are arranged. Gear-wheel attachments to the cone pulley provide for changes of speed or greater driving power at the cutters. The advantages gained by their use are as follows: The rotary cutters insure a continuous cutting operation, with a constantly changing cutting edge; the outlines of the work and the form of the cutting edges are exactly similar; once adjusted, all work is turned out uniform in size and shape, and any unlimited variety of shapes may be obtained by simply varying the form of the cutters, while the only special operating skill required is to maintain the form of the cutters and set the work.

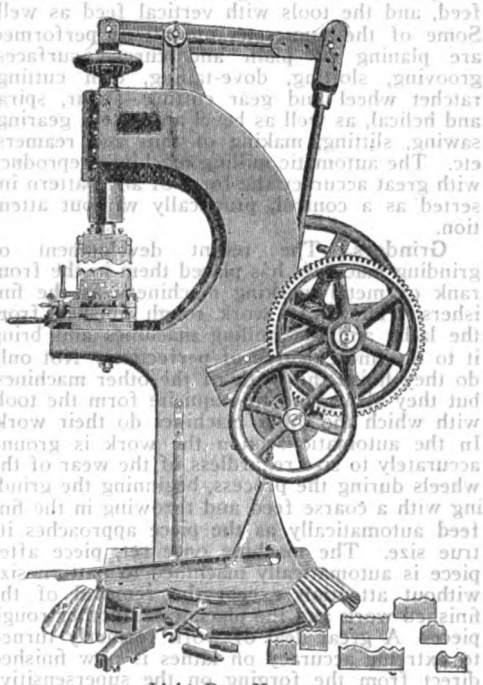
The modern milling machines have been brought to a high degree of perfection and produce work in a truly wonderful variety. The milling cutters are worked singly or in "gangs" of many forms on the same shaft. The tables are provided with longitudinal feed and cross feed, and the tools with vertical feed as well. Some of the numerous operations performed are planing of plain and curved surfaces, grooving, slotting, dove-tailing, cam cutting, ratchet wheel and gear cutting — spur, spiral and helical, as well as bevel and worm gearing, sawing, slitting, making of taps and reamers, etc. The automatic milling machines reproduce with great accuracy the form of any pattern inserted as a control, practically without attention.

Grinders.— The recent development of grinding machines has placed them in the front rank of metal working machinery as the finishers. They take work rough finished from the lathe and the milling machines and bring it to the finest degree of perfection. Not only do they finish the work of the other machines, but they also grind to exquisite form the tools with which the other machines do their work. In the automatic section the work is ground accurately to size regardless of the wear of the wheels during the process, beginning the grinding with a coarse feed and throwing in the fine feed automatically as the piece approaches its true size. The machine once set, piece after piece is automatically machined to pattern size without attention except the removal of the finished work and the placing of another rough piece. A great deal of work formerly turned to extreme accuracy on lathes is now finished direct from the forging on the supersensitive automatic grinder and with a very considerable saving of time. See GRINDING.

Riveters.— Riveting machines are made in two forms, stationary and portable; the former used in heavy work are operated by pressure generated by steam or hydraulic power, while in the portable form the moving die is actuated by steam or compressed air, with hammer-like blows. They are employed to drive and head hot rivets in boiler work, bridge building and other structural work with results far superior to hand work in rapidity and efficiency. The usual form of the stationary type is a U-shaped frame or yoke. The ends of the arms are provided with dies projecting inwardly, one being fixed while the other has a reciprocating motion. The rivet being placed in the hole is compressed endwise between the dies; the pressure forces the metal of the rivet into the ir-

regular edge of the hole, clamps the plates together and forms the rivet head.

Drop Hammers.— Heavy drop hammers are used for forging and also for welding, and are operated by hydraulic or steam power. They consist of an anvil upon a solid base of steel blocks laid over oak timbers to give elasticity to the machine. Above the anvil vertical housings capped by steel arches support the hammering ram and the platforms upon which the piston cylinder and other actuating machinery is placed. By the use of swages, fullers and flatters, hot metal is hammered into forms, often by the use of a progressive series of dies. The largest hammer of this kind was erected in 1891 at Bethlehem (Pa.) Steel Works. Its general dimensions and weight are as follows: Height, 90 feet; width, 42 feet; weight of anvil and foundation, 1,800 tons; weight of housings, steam chests, pressure cylinders and piston, about 1,000 tons. Ram 19 feet long, 10 feet wide and 4 feet thick,

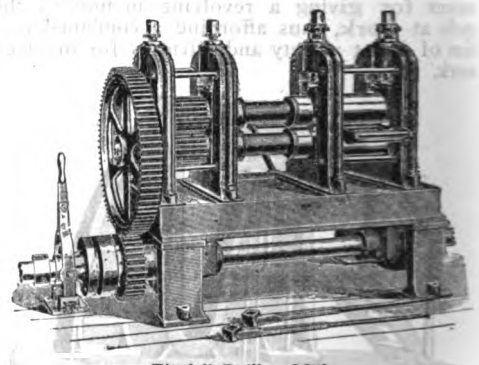


Light Drop-Hammer.

weighing 100 tons. Lighter forms of drop hammers are actuated by compressed air and are called pneumatic hammers. They are used principally as cornice bending machines.

Bending Rolls and Benders are used generally in boiler and tank work; the metal plates being drawn by rotation between three rolls so arranged that their axes form the edges of a triangular prism, their relative adjustment determining the curve to which the plate is bent.

Rolling Machines are used to flatten out metal bars into plates and commercial shapes, such as I-beams, railroad rails, etc. As designed at present they accomplish in a short space of time a great variety of work which in times past was turned out by the more laborious and expensive processes of lathe turning and forging. One class is used to manufacture boiler and armor plate and the general run of heavy sheet metal; while another class produces the thin sheet metal down to the finest grades such as tinfoil.



Tin-foil Rolling Mill.

Presses.— By the use of **presses** sheet or plate metal is converted into utensils of any desired form. They are usually operated by hydraulic power; are provided with dies between which the metal is pressed into the required form, and are capable of being constructed to exert an unlimited amount of pressure. Forging presses are made in all sizes adapted for uses ranging from the pressing of watch-cases to the forging of steamship shafts and of armor plates weighing up to 14,000 pounds. Forgings thus made are superior to hammered forgings. They are designed for working metals either hot or cold.

Planers.— Planing machines are used to obtain flat surfaces on metal. There are two types; those in which the motion of the table relative to the cutting tool is rectilinear and those in which that motion is rotary. In general construction a planer consists of a traversing table on which the work is fastened; a bed to receive the table and guide it in a right line; a cross slide to support the slide rest carrying the tool; standards bolted to the bed and supporting the cross slide, and the mechanical devices for feeding and regulating purposes. The power supplied from shafting by belts is transformed by gear-wheel attachments into the reciprocating motion of the table, causing it to slide, back and forth between the vertical guides, thus bringing the work against the cutting tool which shaves off successively, side by side, narrow thin strips of metal until a perfectly flat surface is produced. Planers are built in various sizes, the larger machines being equipped with tables 7 to 8 feet in width and 20 feet long.

Saws.— In metal working, saws belong to the class commonly termed finishing machines. For cutting plates and bars into shorter lengths they are in extensive use, affording a great economy of time. They are built in a great many sizes and forms, both stationary and portable, equipped with single cutters or cutters arranged in gangs. For cutting off large bars such as steel beams, rails and similar shapes, saws with single cutters are generally used, the object being fastened to a carriage and moved into contact with the edge of the circular cutter. Some machines used for lighter work are so arranged that the circular saws are moved

into contact with the bars. The cutters are of two kinds. The friction discs made of soft mild steel, without teeth, measuring about 44 inches in diameter and three-sixteenths of an inch in thickness, are used for cutting off either hot or cold metal. They are run at a high rate of speed, about 15,000 feet per minute, rim velocity. The toothed cutters vary greatly in diameter and thickness; are made of highly-tempered steel, and are used for clean cutting in cold metal. They are usually run at a low rate of speed, the rim velocity varying from 130 to 150 feet per minute. Friction discs run at rim velocities between 20,000 and 25,000 feet per minute are called fusion discs, from the fact that the intense heat generated by the friction actually melts the metallic dust ground off by the cutter.

Special Machines.— This term includes an almost endless variety of metal-working machinery, capable of enumeration only in a very general way. They are used for special purposes such as making pins, nails, rivets and pens; the tapping of nuts and the threading of bolts. Although often of very complex construction they turn out work with great rapidity and precision. In its special field metal-working machinery has not only displaced hand labor in all countries, and especially in the United States, but by its use structural work such as the building of magnificent buildings and bridges, powerful engines and mammoth ships have been produced far beyond the capabilities of that which is known industrially as hand labor. G., 'Modern Milling Machines' (London 1906); Pull, E., 'Modern Milling' (New York 1917).

METALLIC CURRENCY. See CURRENCY.

METALLOGRAPHY. See IRON AND STEEL, METALLOGRAPHY OF.

METALLOID (Gr. "metal-like"), *in chemistry*, any non-metallic element. These are 13, namely, sulphur, phosphorous, fluorin, chlorin, iodine, bromine, silicon, boron, carbon, nitrogen, hydrogen, oxygen and selenium. The distinction between the metalloids and the metals is slight. The former, excepting selenium and phosphorus, do not have a "metallic" lustre; they are poor conductors of heat and electricity, are generally not reflectors of light and not electropositive; that is, no metalloid fails of all these tests. The term seems to have been introduced into modern usage instead of non-metals for the very reason that there is no hard and fast line between metals and non-metals, so that "metal-like" or "resembling metals" is a better description of the class than the purely negative "non-metals." Originally it was applied to the non-metals which are solid at ordinary temperatures.

METALLURGY, the extraction of metals from their ores and so refining and fashioning them as to fit them for use in the metal industries, is the most ancient of arts. The annals of history show that the degree of civilization attained by a race was directly proportional to the extent to which they made use of metallurgical processes. In fact, a prominent metallurgist of the 19th century when delivering an introductory address to students of metallurgy was accustomed to charge them that "in proportion to the success with which the metallurgic art is practised in this country, will the interests of the whole population directly or indirectly in no inconsiderable degree be promoted."

As an industry, it requires a wide knowledge of the sciences, embracing chemistry, physics and mineralogy, as well as the professions of mechanical and electrical engineering. As some of the oldest historical works make reference to metallurgical processes, the actual practice of the art must go much farther back into prehistoric ages. It had its inception at the time when men, ever advancing, replaced their stone implements by others of greater usefulness made from metals. Their methods of extracting and refining were in many respects comparable with those used to-day except in the introduction of mechanical improvements. The early development of chemistry was very closely allied with metallurgy. Many of the older treatises on theories of chemistry are attempts to explain metallurgical reactions. Prominent among these was the separation of lead from the precious metals, gold and silver, by its combination with oxygen, a process practised and much speculated upon by the ancients. Gold was probably the first metal known as it occurs naturally in the metallic state, is bright, heavy and easily worked. Iron, copper, silver, tin and lead were other metals known to prehistoric men. Quicksilver is mentioned in the times of the Greeks and Romans. In the 15th and 16th centuries we hear of antimony, bismuth and zinc, with arsenic added at the close of the 17th century. Nickel, cobalt, manganese and platinum came in the 18th century, the remainder belonging to the 19th and 20th.

There are four great periods in the annals of metallurgy. The first extended from prehistoric times to the 1st century A.D., when Pliny, the Elder, in his work, 'Naturalis Historia,' collected all existing knowledge concerning metals to his day. The second period ending with the 15th century had as its chronicler Agricola, in 'De Re Metallica.' Next came a period of comparative stagnation with relatively few important advances until the 19th century ushered in the fourth, our present period, one filled with development.

Properties of Metals.—All metals are distinguished by numerous characteristic properties which fit them for their various industrial applications. A brief outline of these follows: *Density.*—All common metals except aluminum are relatively heavy, specific gravities ranging from 6 to 22½. The density of metals varies, within moderate limits, due to methods of casting, rates of cooling and subsequent mechanical treatments. All metals except bismuth are lighter when liquid than when solid; i.e., they contract on solidification. *Color and Lustre.*— The metals vary considerably in color and lustre and many industrial uses depend upon these differences, particularly in reference to the use of metals for ornamentation. *Opacity.* —This is a property of all metals under normal conditions. *Crystallization.*—All metals crystallize in definite geometrical forms on free

solidification. *Structure.*— This is revealed in fractures examined by the eye and in polished and etched sections examined under the all-powerful eye of the microscope. Unmistakable evidence of the thermal and mechanical treatment which the metal has undergone is furnished the expert by such examination. Such a study often serves to distinguish one metal from another, making unnecessary the resort to chemical analysis. *Hardness.*— There are several methods of determining this property: scratch hardness, or resistance to abrasion; indentation hardness, or the resistance offered to penetration by a body of greater hardness, as in the familiar Brinell method where a hardened steel ball is used for this purpose; rebound hardness, measured by the height to which a hard body will rebound when allowed to fall upon the metal being tested as typified by the Shore sclerescope method; cutting hardness, or the resistance offered to cutting by a hard tool. This is usually measured by determining the number of revolutions of a standard drill to produce a given penetration. *Strength.* — This property is measured by resistance to rupture; by slow direct pull, bend, compression or twist; by sudden blow; by repeated bending or blows or a combination of both. *Brittleness* and *Toughness.*— These two, opposing properties, are indicated by the way in which the metal behaves when subjected to strength tests. The same metal may appear as brittle or tough, depending on the conditions of test. *Plasticity.* — This property accounting for malleability and ductility, is the ability of the metal to flow under pressure in the hot and in the cold state. It is all important in the working of metals in the industries. If metals did not possess this property, the operations of hammering, rolling, drawing, spinning, etc., through which all metal articles must pass, during fabrication, would be impossible. *Weldability.*— This is the capacity of pieces of metal to unite into one continuous metal when heated and brought into intimate contact. *Fusibility.*—All metals except mercury are solid at ordinary temperatures, yet they can be melted — brought into a state of fusion — by application of sufficient heat. *Volatility.*—All metals may be vaporized at high temperatures. *Diffusion.*— This is the property of molecules of one metal to migrate into another when brought into intimate contact, either in the liquid or solid states. *Occlusion.*— The rapidity and ease with which metals dissolve gases is augmented by high temperatures. Expansion and contraction with changes in temperature; thermal and electrical conductivity; magnetic permeability, or ability to conduct lines of magnetic force, are all properties which find great application in the industrial use of metals.

Although metallurgy is concerned with the extraction and purification of metals, few of them are used in the pure state. Practically all of the metal produced finds its way into alloys before it comes to the consumer's hands. Alloys, from the Latin, *alligo*, "to bind to," were defined by Birminguccio as "amicable associations of metals with each other." Alloys may be formed by fusion, compression or electro-deposition. By far the most of them are formed by fusion. By the alloying of metals new properties result which increase their suitability for commercial uses; for instance, an alloy is produced with a coefficient of expansion of zero to make possible the manufacture of clocks which will be accurate at all temperatures. Wire is produced with the same coefficient of expansion as glass for use in electric light bulbs. Before the metallurgist gave us this alloy we used the rare metal platinum for this purpose. Alloy steels of unheard-of strength and anti-fatigue properties are produced for use in automobiles and aeroplanes. Innumerable articles of common and special use show that most metallic objects are alloys possessing special properties to meet special needs. Frequently the change of a few tenths of a per cent of the amount of a constituent present in an alloy will cause the most startling changes in the properties of the resultant metal. Of all the innumerable operations of metallurgy there is hardly one which does not require the application of heat for its successful promotion. Heat is usually supplied by the combustion of a fuel and must be applied in many different ways and under various conditions to suit the metallurgical process to be carried out. Therefore, knowing the metallurgical requirements we must know the characteristics of the available fuels in order to determine which are to be used and the methods of using them to produce desired results.

Fuels.—Although fuels are complex chemical combinations, the main heat-producing elements of all are carbon and hydrogen. When a fuel is once kindled the combustion will continue as long as the heat evolved is sufficient to keep the temperature above the ignition point. Essential conditions for perfect combustion are: first, sufficient air brought into intimate contact with the fuel; second, sufficient time in which it may act; third, temperature suitable for combustion must be maintained throughout. From these considerations it is evident that less excess air need be used with gaseous than solid fuels to get an intimate mixture. Mechanical methods of producing mixtures are frequently employed. The form of solid fuel affects combustion, porous fuels taking more air, caking fuels causing imperfect combustion, etc. With perfect combustion, the products are carbon dioxide and water. The atmosphere in the furnace resulting from the products of combustion may be either neutral, oxidizing or reducing. A neutral atmosphere which results from perfect combustion is very difficult to maintain. Under ordinary conditions we either supply an excess of air which results in an oxidizing atmosphere, or we do not furnish enough air for perfect combustion and this results in a reducing atmosphere. There are long and short flame fuels depending upon the amount of combustible gases evolved and the facilities existing for mixing air and gas. All these are important considerations in the use of fuel and design of combustion chambers. Fuels are rated by their calorific values. There are three classes: solid, liquid and gaseous. The solid are classified as natural (wood, peat, lignite, coal) and prepared (charcoal, coke, begasse, etc.). The liquid fuels are natural, as petroleum; and artificial, as distilled oils, tars, etc. The gaseous fuels may be divided as natural gas, or artificial (manufactured gas, oil, water, coal, blast furnace, producer gas, etc., etc.). Each of these different classes of fuels presents its own problem in

combustion and its characteristics must be known and considered in designing the furnace in which it burns. A furnace which burns coke well, will not burn tar at all. In blast-furnace work the compressive strength of the fuel must be considered as that determines the weight of charge it can support.

Apparatus.— Having determined the conditions and methods by which the heat is to be generated and applied to the metallurgical process, we must consider the requirements of a containing vessel which will stand the oftentimes intense heats employed, have a certain amount of strength and at the same time exert beneficial, not harmful, chemical effects on the charge. The materials to which we turn to play this part in our sequence of processes are known as refractories. An ideal refractory not only should be a poor heat and electrical conductor, but must also resist the action of the high temperature causing it to melt away, resist the effects of sudden temperature changes, have mechanical strength and resist chemical changes. As no single material having all these qualities exists, metallurgical furnaces must be constructed in parts, i.e., a refractory inner lining, an intermediate insulating section and an outer wall for strength and protection. The principal constituents of refractory materials are aluminum silicates or clays, silica, alumina, lime, magnesium, chromite. These materials, though relatively infusible in themselves at the temperatures of metallurgical processes, must in order to be in shape to be used as furnace walls, be mixed with other ingredients which increase their mechanical strength at the expense of refractoriness. The common forms in which refractories are used, are as follows: Fireclay, composed of hydro-silicate of alumina combined with fragments of other materials. It is plastic when wet, becomes brick-like when burned at red heat. It is used as clay for binder and in making firebricks. Silica, mostly used as silica bricks, is made from quartzite, sandstone, ganister, etc., all consisting principally of silicon dioxide. Bauxite clay, principally an oxide of alumina is combined with a little silica and made into bricks. Lime pure is not much used as a refractory. Limestone mixed with fireclay is used in lining the test of a cupelling furnace. Calcined magnesite, containing a high per cent of magnesium oxide, is used either in the granular or brick form. Dolomite, a magnesium calcium carbonate, is not much used in brick form but is usually, after calcining and crushing to small size, mixed with dehydrated tar and rammed in to make a furnace bottom. Chromite, a compound principally of the oxides of chromium and iron, is used in the brick form and as a cement. Carbon bricks also find a use where a reducing atmosphere is required.

Refractories are classed chemically, as acid, basic or neutral; and by this arrangement, silica is the principal acid refractory. Bauxite, lime magnesite and dolomite are basic, while fireclay and chromite are neutral. Acid and basic materials in contact with each other readily slag and melt away. They cannot be used in contact with each other but may be used in the same furnace with a separating layer of neutral material.

Furnaces.— Metallurgical furnaces are divided into two broad classes: first, those in which the heat comes directly from the combustion of fuel; second, those in which electrical energy supplies the heat. Under class one fall the hearth furnaces, as the smith's forge; and the shaft furnace, as the blast furnace and the cupola. In these the fuel and charge to be heated are in direct contact. Then there are the reverbatory furnaces for roasting and smelting, where combustion takes place in a separate chamber and the charge is heated by the flame, also the closed vessel type of furnace, as crucible, retort, muffle, etc., where the charge is inside sealed off from the source of heat which plays on the outside. Under this class also, come those furnaces which are merely containers, using no outside fuel, the heat coming from the charge itself, as the roasting kiln, bessemer convertor, etc. The electrical furnaces are classed as: direct resistance, the charge itself being a part of the electrical circuit or resistor; indirect resistance where the charge is surrounded by an electrically heated resistor; direct arc furnaces, the charge forming one or both poles of an arc; indirect arc, the charge being in a space heated by an arc; arc resistance, where the charge is one pole of an arc and also a part of the electrical circuit.

Ores.— The metals occur in nature either as pure native metal or in combination with other materials in an ore. Ore is defined as a metal bearing substance from which a metal, alloy or metallic compound can be extracted at a profit. It usually consists of one or more economic minerals and a waste product or gangue. Ores are named according to their leading useful metal and are classified by the gangue as siliceous, calcareous, ferrugeneous; or broadly speaking, as acid and basic fluxing ores. Another classification refers to treatment, as smelting or milling ores. The metals occur in nature as native metals, gold, silver, copper, mercury; as oxides, iron, tin; as sulphides, and under this class come selenides, tellurides, arsenides, antimonides; as halides, silver, mercury; salts of acids, carbonates. silicates, etc. The largest number of commonly worked ores are in the oxide and sulphide classes.

Methods of Treatment.— It is here, by the treatment of the ores that we can divide metallurgical methods into two broad classes: wet metallurgy and dry metallurgy. The wet method of treating an ore involves a leeching by a chemical solvent, followed by a means of separation of the required metal from solution. The dry method involves smelting and subsequent purifying methods by means of high temperatures. Considering dry metallurgy, the ore as it is dug out of the ground is seldom in a condition fit for smelting. Some ores may only require to be crushed to a uniform size, as the oxide ore of iron, haemitite; others must be heated to drive off moisture and volatile matter, called calcining; others must be roasted; still others are weathered. Calcination, or the driving off of volatile matter, at a low temperature is usually carried out in heaps, stalls or kilns. Calcining in heaps consists of building up a pile of alternate layers of wood or coal and ore to the height of five or six feet, then igniting at the bottom and letting it burn itself out. This process is usually carried on in yards where protection from the winds

which will cause uneven burning, is afforded. The stall is the first improvement on the heap and consists of a four-walled enclosure, three permanent and the fourth built in after charging with fuel and ore. After the material is ignited the heat set free is sufficient to keep the process going. The process must be continuous and the losses of heat be kept at a minimum. This process is suitable only in ores which are rich in sulphur. A very large number of ores require a roasting preliminary to smelting. Roasting consists of heating the ore in contact with oxygen, chlorine, carbon, water vapor or sulphur, to a temperature below fusion or at most to incipient fusion with the purpose of driving off a volatile component. Roasts may be oxidizing, reducing, chloridizing or sulphating, according to the ore and the product desired. The most common form of roast is the oxidizing roast of sulphide ores to eliminate the sulphur and if carried to completion leaves a metallic oxide of the metal for smelting. This is called dead or sweet roasting and requires prolonged heating and much stirring. Otherwise, the sulphite is converted partially into oxide and partially into sulphates with some remaining sulphide. The chloridizing roast is used as a preliminary to a wet metallurgical process whereby a chloride is produced which is amenable to solvents. Roasting may be carried out in heaps, stalls, shaft furnaces or reverbatory furnaces.

The smelting for which the calcination, roasting, crushing, etc., are preliminary preparations processes, consists in separating the metal and gangue by their difference in specific gravities after fusion. A necessary adjunct of the smelting operation is a flux which renders the naturally infusible gangue readily fusible by the formation of a slag with it which is easily separated from the heavy metal. The fluxes are earthy materials and may be acid or basic, depending on the character of the ore used. Acid gangue in the ore requires basic flux and vice versa. Lime, a basic flux, is usually used in the carbonate form or limestone. Fluorspar, calcium fluoride, is used only in small amounts to increase the fluidity of the slag. Barytes, strongly basic, also reacts as a desulphurizing agent. Silicious or acid fluxes are sand, quartz, etc. Smelting is usually either oxidizing or reducing. The reducing smelting in treating oxide ores has for a reducing agent carbon monoxide formed from coke which is a part of the furnace charge. Oxidizing smelting is practised mainly with the purpose of refining a crude metal as many metallic impurities can be removed in this way. Other metallurgical processes are liquation, where advantage is taken of the difference of melting points of easily fusible compounds from infusible ones, when the combination is heated to the lower melting point the more easily fusible runs out leaving the highly infusible gangue; distillation and sublimation, where the metal is driven off as a vapor, then condensed as a liquid or solid; scorification, or the roasting of an alloy with the object of removing the more oxidizable metal as a slag. This process is used practically only for separation of silver and lead. Other processes are cupellation, similar to scorification where the oxidizing is carried out on a hearth or cupel which is of a material to absorb the fused oxide.

Wet metallurgy in general involves the separation of a metal in the form of a soluble salt from the insoluble gangue by means of a solvent followed by the recovery of the dissolved substance, by evaporation or precipitation. Amalgamation is a process in which the ore, usually gold or silver, is treated with mercury which dissolves the metal, and on subsequent heating the mercury distilled off, leaving the metal. The ores need to be in a finely divided state and in such form as to be readily amenable to solvents which frequently means preliminary treatment, as roasting, weathering, etc. The solvents in common use are water, aqueous solutions of gases; acids; bases, salt solutions. These solvents are used diluted and are warmed. Ores for leeching are classed as sands and slimes, the sands being coarse enough to permit the leeching by percolation. The slimes are so fine as to prohibit this method and require an agitation of slime with solvent. This gives a colloidal solution which must be coagulated, then separated by filtration or decantation. The solution is then concentrated by evaporation and the salt crystallized out. In dealing with precipitates they are usually dried in muffle, or reverbatory furnaces. The modern and most efficient method of treating slimes is by the flotation process of separation. The slime or pulp is fed into the bottom of a tank and agitated with oil and compressed air. Under this treatment the metal particles float on the surface while the gangue particles sink.

Metals produced by the above methods are rather impure. For final refinement of a metal and its production in the purest possible form electrolysis is resorted to. Reduced to its simplest form electrolysis consists of a solution of a salt of the metal to be purified in which two electrodes are dipped, one being of the impure metal and the other of the pure. When the electric current is passed through this bath the electrode of impure metal is dissolved away and chemically pure metal is deposited on the other electrode. After the metal is produced by some of the above processes it is usually made into some alloy by fusion with other metals and elements, then cast from the molten state into the finished shape or into ingots which must be forged by hammering, rolling, pressing, etc., into the desired form. These hot working operations are frequently followed by cold rolling as strips, sheets, spinning or pressing for shapes, cold drawing for wire. All these operations require careful and frequent heating and cooling. The metal must be annealed to remove strains and make it soft. In the case of steel produced by alloying carbon and iron it may be used for tools which require hardening and tempering by heating to a definite temperature, quenching in water or oil, then reheating to some lower temperature.

All of these processes fall under the metallurgist's care as surely as the original extraction and refining. See ALUMINUM; COPPER; COPPER, DISCOVERY AND DEVELOPMENT; COPPER AND BRASS INDUSTRY; ELECTROCHEMICAL INDUSTRIES; IRON AND STEEL INDUSTRY and articles on the other metals.

METALS. The elements which compose all natural objects are divided by chemists into two classes, metals and non-metals. Formerly the classification was based on physical properties, and the metals were then defined as those elements which were opaque, had a metallic lustre and were good conductors of heat and electricity; now the division is made on chemical properties, upon the foundational principle that the hydroxides of metals are bases, while the hydroxides of non-metals are acids. However, no sharp line can be drawn between the metals and non-metals, since a few of the elements will classify as either. Some metals have a high specific gravity, but lithium, sodium, potassium, etc., float on water, and in general the metals of highest specific gravity are least active chemically. Of the 83 recognized elements, 64 are regarded as metals.

The following classification of the elements usually placed in the group metals is that arising from the application of the periodic law (q.v.).

Class I. Two sub-classes: (1) Lithium, sodium, potassium, rubidium and caesium; (2) copper, silver and gold.

Class II. Two sub-classes: (1) Calcium, strontium, barium and radium; (2) glucinum (or beryllium), magnesium, zinc, cadmium and mercury.

Class III. Three sub-classes: (1) Aluminum, gallium, indium and thallium; (2) cerium, lanthanum, neodymium, praseodymium, samarium, europium and gadolinium; (3) terbium, dysprosium, holmium, yttrium, erbium, thulium, ytterbium, scandium, lutecium and celtium.

Class IV. Two sub-classes: (1) Titanium, zirconium and thorium; (2) germanium, tin and lead.

Class V. Two sub-classes: (1) Vanadium, niobium (or columbium) and tantalum; (2) arsenic, antimony and bismuth.

Class VI. Chromium, molybdenum, tungsten and uranium.

Class VII. Manganese.

Class VIII. Three sub-classes: (1) Iron, nickel and cobalt; (2) rhodium, ruthenium and palladium; (3) osmium, iridium and platinum.

A mass of any metal is considered to be composed of atoms arranged in molecules, and any change in the arrangement of the molecule means a change in physical characteristics. Thus crystalline structure may be obliterated by rolling or hammering a metal and by the same means the specific gravity may be increased, since the molecules are forced nearer together.

All metals with the exception of bismuth are lighter when molten than when cold. Bismuth, like water, reaches its greatest density just before solidifying. The relative specific gravities of some common metals in the solid and in the liquid state are shown by the following table, compiled by Sir Roberts-Austen.

The fracture of a metal is not a distinguishing property but an evidential feature which gives much information about the manner in which it cooled, the presence of impurities, etc., and is of great practical value. Thus foundry iron is in many instances still graded and sold by its fracture, and in smelting copper and refining lead the decisive points in the processes are determined by the fracture of test samples. Slow cooling, as with chemical solutions, tends toward the formation of large crystals, giving a coarse fracture, while a sudden cooling may prevent the formation of crystals and thus give a fracture of fine texture. Crystalline structure, which determines fracture, may be affected by repeated shocks or vibrations. In this way the wrought-iron chains on railroad cars to prevent accident in case of a coupler breaking may by the jolting of ordinary service become so crystalline as to break when needed. Very low temperatures, as shown by the experiments of Dewar, also affect in a marked manner the crystalline structure of some metals. Any metal is fusible; though arsenic sublimes at 356° F., it may be fused under the pressure of its own vapor. When heated, metals show a red and finally a clear white color. The temperatures corresponding to these colors are approximately: incipient red, 975° F.; dark red, 1290°; incipient cherry red, 1470°; clear cherry red, 1830°; white, 2370°; dazzling white, 2730°.

METAL	Sp. g. of solid	Sp. g. of liquid
Iron (pig)	6.95	6.880
Zinc	7.20	6.480
Tin	7.50	7.025
Copper	8.80	8.217
Bismuth	9.82	10.550
Silver	10.57	9.510
Lead	11.40	10.370

The color of a metal depends on its selective absorption of light waves of different wave lengths. Unless the light penetrates the metal, it is all reflected and the metal looks white. The selection of light rays may be from several parts of the spectrum; this is the case with copper which has a reddish hue. Anything which increases the absorption deepens the color. This can be done by reflecting a ray of light many times from two or more surfaces made of a given metal. Silversmiths and goldsmiths accomplish the same result by finely grooving a metal surface. Owing to this absorption of light by a metal the color of the light reflected differs from that transmitted. Thus gold can be made so thin that some light will get through. This light is bluish green, while in reflected light, gold appears yellow. Silver is white by reflected light, while the transmitted light through silver foil is blue.

Malleability is the property that permits a metal to be hammered or rolled into sheets. Ductility that which permits it to be drawn into wire. Both are dependent on the tenacity of the metal, the latter more than the former. The relative malleability and ductility of the principal metals is as follows:

Order	Malleability	Ductility
1	Gold	Gold
2	Silver	Silver
3	Copper	Platinum
4	Platinum	Iron
5	Palladium	Nickel
6	Iron	Copper
7	Aluminum	Palladium
8	Tin	Aluminum
9	Zinc	Zinc
10	Lead	Tin
11	Nickel	Lead

Certain physical constants of some of the metals are shown in the following table:

METAL	Symbol	Atomic weight	Specific gravity	Melting point, °F
Aluminum	Al	27.10	2.6	1217
Antimony	Sb	120.10	6.7	1166
Arsenic	As	74.96	5.7	1560?
Barium	Ba	137.37	3.7	887
Bismuth	Bi	208.00	9.8	520
Cadmium	Cd	112.40	8.6	610
Cæsium	Cs	132.81	1.8	79
Calcium	Ca	40.07	1.6	1490
Celtium	Ct	*	*	*
Cerium	Ce	140.25	6.7	1184
Chromium	Cr	52.00	7.0	2768
Cobalt	Co	58.97	8.5	2690
Copper	Cu	63.57	8.9	1981
Dysprosium	Dy	162.50	*	*
Erbium	Er	167.70	4.7	2282?
Europium	Eu	152.00	*	*
Gadolinium	Gd	157.30	*	*

Yttrium	Y	88.70	*	2930?
Zinc	Zn	65.37	6.9	787
Zirconium	Zr	90.60	4.15	3090?

* Not yet (1917) determined. The interrogation point indicates that the figure quoted is approximate.

The mobility of the molecules of a metal is increased by temperature. Thus a coiled nickel wire may be made absolutely straight by suspending a weight from one end and heating the wire to white heat by the flame from an alcohol lamp or Bunsen burner. Zinc at its melting point is brittle, but at a temperature of 150° is quite malleable.

Metals can occlude gases. Thus a given volume of palladium cooled from red heat in hydrogen absorbs 900 times its volume of that gas. Hydrogen passes through red hot iron or platinum, and nascent hydrogen, assisted by atmospheric pressure will pass through a thin plate of cold iron as shown by Deville. A liquid metal can penetrate a solid; a bar of tin rubbed with mercury absorbs enough in a very short time to become brittle. A solid metal may penetrate another when both are cold. This can be shown with plates of gold and lead rolled together and allowed to stand.

For further information about the different metals, see special article under the title of each; as ALUMINUM; ANTIMONY; IRON; LEAD; SILVER, etc. Consult Friend, J. N. (editor), 'Textbook of Inorganic Chemistry' (9 vols. London 1914–17).

METAMERISM, *in chemistry,* that variety of isomerism in which chemical compounds have identical percentages of composition and also like molecular weight. When two or more chemical compounds have the same empirical formula, but consist of different radicals united by an element (or a radical) that is common to them all, the compounds are said to be "metameric," and the property itself is called "metamerism." The common element that unites the radicals is usually oxygen or nitrogen. Good examples of metamerism are afforded by the compound ethers and amines. Dipropyl ether, methyl-amyl ether, and ethyl-butyl ether, for example, all have the empirical formula $C_6H_{14}O$ but dipropyl ether contains two propyl radicals (C_3H_7), methyl-amyl ether contains one radical of methyl (CH_3), and one of amyl (C_5H_{11}), and ethyl-butyl ether contains one radical of ethyl (C_2H_5) and one of butyl (C_4H_9); the two radicals being connected, in each case, by an oxygen atom. The structural formulæ of these respective compounds are therefore as follows:

Dipropyl ether.	Methyl-amyl ether.	Ethyl-butyl ether.
$\begin{matrix}C_3H_7\\C_3H_7\end{matrix}>O$	$\begin{matrix}CH_3\\C_5H_{11}\end{matrix}>O$	$\begin{matrix}C_2H_5\\C_4H_9\end{matrix}>O$

The following amines, which all have the empirical formula C_3H_9N, illustrate metamerism in which nitrogen is the connecting element:

Propylamine	Methylethylamine	Trimethylamine
$N\begin{Bmatrix}C_3H_7\\H\\H\end{Bmatrix}$	$N\begin{Bmatrix}CH_3\\C_2H_5\\H\end{Bmatrix}$	$N\begin{Bmatrix}CH_3\\CH_3\\CH_3\end{Bmatrix}$

Metamerism may be regarded as a species of accidental isomerism. When metameric compounds are treated with reagents which destroy the bonds between the constituent radicals and the atoms (of oxygen or nitrogen) by which they are united, the several members of the metameric group that is so treated yield totally different products, because they contain totally different radicals.

In zoology, metamerism signifies the repetition of parts in an organized body, as in segmented worms, certain vertebrates, orthropods and lobsters. The meres or segments fall into two classes, those in which the meres repeat with no apparent change and those in which there is modification as the series progresses.

METAMORPHIC GEOLOGY, that branch of geology that deals with the causes and results of metamorphism (q.v.).

METAMORPHIC ROCKS, those rocks of either igneous or sedimentary origin which

have undergone sufficient heat and pressure to be altered into a different kind of rock. In this way limestone becomes marble, sandstone is changed to quartzite, and shale passes over into slate or schist. Metamorphic rocks are usually most abundant in regions of mountains where the rocks have undergone much folding and compression. See MARBLE; QUARTZITE, METAMORPHISM, and the section on *Metamorphic Rocks* in the article on ROCKS.

METAMORPHISM. When rocks of either igneous or sedimentary origin undergo sufficient change so that they largely develop new minerals, and become other types of rocks, they are said to be metamorphosed, and the process is called metamorphism. Such changes may be brought about in many ways. One of the most familiar is the process of weathering (q.v.) by which the minerals of a granite, for example, undergo alteration, the quartz remaining behind as quartz, the feldspar altering chiefly to clay, and the soluble lime, magnesia, potash and soda going to the sea, the first two to form limestone, the latter to produce the salt of ocean water. Thus the complete weathering of a granite and the sorting of the products finally results in the formation of shale, sandstone and limestone. This phase of metamorphism is called katamorphism. It is produced by the atmospheric agencies and results in simpler mineral compounds and rocks.

If on the other hand, a sedimentary rock be subjected to intense heat or pressure, or both, the minerals present recombine to form new minerals, usually more complex, which are better suited to conditions of heat and pressure. This phase of metamorphism is usually called anamorphism. In general usage, the term metamorphism is commonly restricted to what is here termed anamorphism, that is, to those changes due to heat and pressure. The term metamorphic rocks (q.v.) is wholly restricted to rocks which have undergone changes of anamorphic nature. Thus, for example, a shale which has resulted from the weathering of a granite, though it has undergone metamorphism in the broadest sense, is not considered a metamorphic rock.

The heat and pressure which cause metamorphism may be produced by compression and folding over large areas, in which case there is said to be dynamic or regional metamorphis; or they may be due to the intrusion of large masses of highly heated igneous rock (magma), in which case there is said to be contact metamorphism.

Regional metamorphism results largely from pressure, heat is only incidental. The most common minerals to result are those which are flat like mica (q.v.), or elongated like hornblende (q.v.). These naturally develop in parallel arrangement with their smallest dimension opposed to the pressure, that is their larger dimension is at right angles to the compression. This seems to be the easiest way in which such minerals can develop. As a result of this arrangement, such rocks split more easily in certain directions, just as wood splits parallel to the grain. This is called cleavage, and is best manifested in slates (q.v.) and schists (q.v.).

Contact metamorphism, on the other hand, is due largely to heat; pressure plays a less important part. The changes at a contact may be of several types. The rocks may be simply baked or they may be actually fused. The minerals present may recombine to form new minerals. There may be much new mineral matter actually added from the igneous mass, as in the case of contact ore deposits, where ore minerals make up a large part of the contact rock. Or the heat of the igneous mass may drive off substances already present, especially water and carbon dioxide. At most contacts these processes have probably all played a part. The intensity of the metamorphism and the width of the altered zone depends on several factors, such as the size and temperature of the igneous body, the amount of the water or steam present, and the resistance of the enclosing wall rock. A quartzite (q.v.) wall rock may be little changed, while a limestone (q.v.), because of its greater solubility, may be profoundly altered. An abundance of steam aids in producing a marked effect, since it readily works its way out through pores in the rock, carrying much mineral matter. Alteration produced largely by steam or hot water is termed hydrothermal metamorphism. Changes produced by ordinary circulating waters are sometimes termed hydrometamorphism. See CLEAVAGE; GEOLOGY; METAMORPHIC ROCKS; ORE DEPOSITS. Consult Van Hise, C. R., 'A Treatise on Metamorphism,' (U. S. Geological Survey, Mon. XLVII, Washington 1904); Leith, C. K., and Mead, W. J., 'Metamorphic Geology' (New York 1915); Leith, C. K., 'Rock Cleavage' (U. S. Geological Survey, Bull. 239 Washington 1905); Grubenmann, U., 'Die Crystallinen Schiefer.'

METAMORPHOSES. Ovid's 'Metamorphoses,' or 'Transformations,' were published in the year 8 A.D., when the poet was 50 years old. They were finished just before the issue of the imperial order which consigned Ovid to banishment at Tomi on the Black Sea for the remaining eight years of his life. In consternation at the punishment which had overtaken him, he elsewhere tells us that he consigned to the flames his own copy of the poem. But other copies were already in the hands of his friends; it is to these that we are indebted for the preservation of the work.

The poem consists of 15 books in hexameter verse descriptive of the various transformations through which various men and women were conceived to have gone. In the conception of the Greeks almost every river, rock, spring, tree and mountain had attached to it the legend of some such wonderful metamorphosis. Thus the poplar trees are the weeping sisters of Phaëthon; the laurel is Daphne; a spring is Arethusa; etc. The source of this multitude of transformations found in ancient legends is doubtless to be sought in the ancient conception of inanimate objects as animate. Each rock and tree and hill with the Greeks and Romans was a personal being endowed with a spirit. Thus the poplar trees and the fountain and the laurel were regarded as animate to start with; they had not merely become so by receiving the souls of certain men and women. To the vivid imagination of the Greek the waving form of rustling tree or shrub, the moving mass of bubbling or falling water suggested life and individual spirit. The problem was to account for the present form. The inanimate objects represented as the result

of transformations had, accordingly, been conceived as animate from the outset, and the stories of their transformations are merely later inventions devised to account for their primitive conception as personal beings.

Some 250 of the stories belonging to the body of Greek and Roman legend and mythology receive treatment in Ovid's work, which thus becomes a fairly complete treatise on the classic myths. Among the most important of these are the stories of Deucalion and Pyrrha, Daphne, Phaëthon, Cadmus, Semele, Echo, Narcissus, Pentheus, Pyramus and Thisbe, Ino, Perseus and Andromeda, Niobe, Procne and Philomela, Medea, Theseus, Scylla, Daedalus, Philemon and Baucis, Hercules, Orpheus, Adonis, Thetis.

Relatively little space is devoted to the actual metamorphosis in Ovid's poem. The transformation is simply the culmination of a story, generally one of some length. Thus after detailing with great fullness the adventures of the ill-fated Phaëthon with the horses of Phœbus, the poet finally concludes by briefly recounting the transformation of Phaëthon's mourning sisters into poplar trees. So with the other stories; the transformation holds an inconspicuous place, being simply the feature common to all. The different narratives are woven together most ingeniously. There is no break. Each is connected with the preceding and following by some natural link, so that we have one continuous narration from the transformation of the stones of Deucalion and Pyrrha into men to the transformation of Julius Cæsar into the comet which appeared after his death. By the poet's fiction, therefore, the treatment is made to assume the illusion of chronological sequence. In the last books Ovid approaches the legends of the Trojan cycle and of early Roman history, gradually bringing the reader to the events of his own day.

With great artistic skill the poet varies the manner of presentation. The larger part of the stories are his own narration, but monotony is avoided by resort to other devices. Thus a number of legends are put in the mouth of Orpheus. Others are recounted by the three daughters of Minyas to while away the time as they sit at their spinning.

The 'Metamorphoses' is Ovid's masterpiece and has always enjoyed high favor. The poet's own faith in his work is indicated by the concluding verses of the final book, in which he gives free expression to his confidence in the immortality which he feels it has won for him: "Over the stars his name shall soar; as far as the Roman dominion reaches his work shall be read, and it shall live for all eternity."

The most recent translation is by F. J. Miller in the Loeb Library.

CHARLES E. BENNETT.

METAMORPHOSIS IN ANIMALS, the changes which in many animals take place between the time of birth and maturity. The causes are most probably changes of habitat, of seasons, of food and the acceleration in growth resulting from the approach of sexual maturity. Familiar examples are the change of the caterpillar into the butterfly, of the tadpole into the toad or frog.

In the frog and toad, metamorphosis is complete and thoroughgoing. The embryo on hatching from the egg has a large head and body, but no tail; in a few days its tail grows out and it becomes a tadpole, when it is fish-like but without fins or limbs. With the growth of the tail, the external gills appear, and the mouth is formed, while the intestine becomes very long and closely coiled. The mouth is armed with horny, comb-like plates, on which develop great numbers of microscopic teeth which are shed continuously. In changing from the tadpole to the toad or frog, the body, including the skull and rest of the skeleton, and the viscera are made over anew; the external gills disappear as the lungs develop, the true teeth appear in the jaw, the intestine becomes short and straight, and the creature instead of nibbling decaying leaves or dead animals feeds on living snails and insects. Soon the tail becomes absorbed, finally the hind legs grow out, the gills disappear, the front legs bud out and the adult form is attained. While most amphibia pass through such a metamorphosis, in a few forms, owing to the absence of water or other changes in the environment, development is direct, the metamorphosis being suppressed. Metamorphosis may be retarded by cold and shortened by hunger, and in the amphibians or in insects the changes are greatest in modern and specialized forms, as frogs and toads.

The metamorphosis of the butterfly is the most complete of those of all insects. The life of the insects is divided into four stages, that is, the egg, larva, pupa and imago or adult. During the larval and pupal periods the insect is, so to speak, a different animal from the adult. The caterpillar is provided with big jaws and eats voraciously; in shape and structure it differs widely from the winged adult. The pupa or chrysalis is also different from the larva, and also from the imago; it takes no food and rests almost motionless. On the other hand, the butterfly has no jaws, while its maxillæ form a long coiled-up tongue, beautifully adapted for probing the corollas of flowers. Though these changes appear to be sudden, the internal alterations of cells and tissue which lead to them are gradual. From one to three days before assuming the pupa state the caterpillar becomes restless and stops eating. If a spinner it spins a cocoon, or if not it enters the earth to undergo its transformation into a chrysalis, or if a larval butterfly it attaches itself to some fixed object, as a tree or fence. Profound changes now take place in the mouth-parts as well as the nervous, muscular and other systems of internal organs.

But the changes are most marked in the flesh flies and their allies. At the end of the maggot stage, the internal organs are destroyed, breaking up and forming a creamy mass, and the appendages and wings arise from minute internal masses of cells called "imaginal buds" which are present in the maggot. The body is thus entirely made over anew. But while the process of destruction of the larval organs and appendages goes on, there is also a constructive process, during which the organs of the adult state are being built up. It is thus evident that the sharp division of the life-history of the insect into larval, pupal and imaginal stages only applies to the external surface of the body. The internal processes of development, on the other hand, form a continuous series of transformations between which is no sharp line of demarcation. Yet as a whole the form of the

larva, pupa and imago are kept distinct in adaptation to their separate environments and habits.

Hypermetamorphosis.— This name is applied to the changes undergone by certain beetles (*Meloë, Stylops*, etc.), in which there are more than the usual number of larval and resting or pupal stages. Thus, in the common oil-beetle (*Meloë*) and in the blister-beetles (*Epicauta*), the larva hatches as a minute, active, triungulin creature which is a parasite in bees' nests, feeding on their eggs; it passes into a second larval stage, when it is grub-like, inactive, the body being thick, cylindrical, soft and fleshy; this passes into a motionless semi-pupa, and thus after molting assumes a footless larval form; it then transforms into a true pupa like other beetles. There are thus four distinct larval stages, besides the pupa and beetle. Now these stages correspond to the habits and food of the young beetle, and these supernumerary stages and marked changes of form are evidently due to changes of environment, of habits and of food, resulting in the atrophy of limbs in certain stages. This throws light on the causes of metamorphism in general.

No Distinct Metamorphosis in the Primitive Insects.— The wingless insects (*Synaptera*) do not pass through a metamorphosis. And it appears, as first suggested by Fritz Müller, that the habit of metamorphosing is an acquired one. Thus in the more primitive winged insects, such as the cockroach, grasshopper, bugs, etc., metamorphosis is incomplete, the young differing mainly from the adult in not having wings. Also the most primitive arthropod animals, such as the horse-foot crab (q.v.), the spiders and myriapods, pass through no metamorphosis.

Metamorphosis in the Lower Animals.— The more specialized cœlenterates (*Medusæ*), the echinoderms, mollusks and crustaceans, as well as many worms, undergo remarkable changes of form. (See LARVA). The larva of the marine annelids is a top-shaped ciliated creature (*trochosphere*) entirely different from its parent. The marine mollusks pass through a larval condition (*religes*). The young of the sea-urchin, star-fish and holothurians differ remarkably from their parents in being bilaterally symmetrical, transparent and free-swimming; they serve as scaffoldings from which the body of the adult is developed. The shrimps, etc., are hatched in a nauplius or six-legged form, and crabs in a zoëa form.

METAPHOR, a figure of speech expressed in a single leading word; a similitude — for example, "The man is a lion," is a metaphor; "The man is as bold as a lion," is a simile. Metaphor is an ideal characterization or illustration which may be affirmed by one mind and denied by another, or affirmed and denied by the same mind at different times; it is a kind of comparison in which the speaker or writer rejects the circumlocution of the simile and attains his end immediately by establishing the identity of his illustration with the thing spoken of. It is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and has been a favorite figure with poets and orators and makers of proverbs in all ages. Even in ordinary language the meanings of words are in great part metaphors; as when we speak of an *acute* intellect or a *bold* promontory: all such words are *in metaphor*, and the *language* may be called *metaphorical*.

METAPHOSPHORIC ACID. See PHOSPHORIC ACID.

METAPHYSICAL DETERMINISM. See DETERMINISM.

METAPHYSICS (from Gr. *Meta ta phusika*, "after physics," alluding to the position of Aristotle's treatise on metaphysics in his works). Metaphysics and epistemology (q.v.) are the twin sciences of the nature of reality and of our knowledge thereof. Metaphysics seeks for the criteria of being, epistemology for those of truth. As the truth is generally conceded to possess some peculiarly intimate relation to reality which is not found in the case of error, and as our sole avenues of access to reality are those of experience, be it sensory, rational, emotional or volitional, the boundary line between epistemological and metaphysical opinions is of the most obscure and wavering nature, so that a separate study of the two disciplines is exceedingly unprofitable. We shall accordingly shift our standpoint continually from that of one science to that of the other.

Metaphysics is not a subject which one can study or refuse to study at will; whether it is explicit or not, there is always some criterion of truth, of reality, that permeates our barest common sense. This may be metaphysically inadequate, but must be metaphysical. When I draw a distinction between a dream and an experience of waking life, between a truth and a lie, between a fact and an error, I am drawing a metaphysical distinction. When a physicist reduces the table before him to a vast aggregate of electric charges, or asserts the basic identity of time and space, or interprets light a transverse electromagnetic vibration, he is nothing if not metaphysical, for he is drawing a distinction between the appearance of things and their underlying reality. Even those who claim to be agnostics or sceptics in the professor's chair are tainted with metaphysics in their daily life, for the only agnosticism, the only scepticism which can free itself from all blemish of metaphysics is an agnosticism, a scepticism so complete that it does not even tentatively maintain any criterion of reality or unreality, of truth or falsity.

We have accordingly three stages of metaphysics to discuss: (1) the metaphysics of common sense; (2) the metaphysics of the natural scientist; (3) the metaphysics of the technically trained philosopher.

(1) The Metaphysics of Common Sense. — The average philosophical layman, be he educated or not, believes that the wall he sees in front of him, the cane that he holds, the song that he hears are real, with an immediate and underived reality. He is confident that the wall, the cane, even the song would be the same with nobody to experience them. He is also confident that he exists, and that his existence is utterly independent of any experience he may have. Now, this view that the object is out there and I am in here, and that seeing is something which needs no analysis (for so the layman believes), works remarkably well providing I only see things that are so. It is, however, clear that in my dreams and other illusions I frequently see things that in some

manner are not so. If seeing is an immediate relation between me and my object, what is my object when I dream of something which, in every common-sense interpretation of the words, does not exist?

This is obviously the highest common factor of metaphysics and epistemology, for it unites the fundamental questions of the two sciences, the question of truth and that of reality. What is more, it is in essence the one cardinal problem of both sciences, the great problem of error. The problem of error may be approached from two different angles, according as there are supposed to be real entities which form the objects of erroneous experience, or no such entities at all. In the latter case, experience must be interpreted as not essentially a subject-object relation. As we shall see, practically all the earlier modern philosophers hold that erroneous experiences have objects. The second alternative is indicated in Spinoza and appears in the philosophies of Kant and Hegel.

(2) The Metaphysics of Natural Science. — Of course, science as such can have no peculiar metaphysics, for the truth is essentially one — unless we adopt the pragmatist attitude — and cannot be changed into a falsehood merely by looking at it through the spectacles of a particular discipline. Nevertheless, there is a certain conventional metaphysics which may be read between the lines of the majority of scientific textbooks, the habitat of which is the laboratory and the specimen-box. Though this may be traced to the Greeks, it owes its incarnation in its present avatar to Descartes and Locke. Both these writers, who are conventionally called dualists, since they believe in the essential distinctness of mind and matter, are really rather what one might name ternarists, inasmuch as they posit between the self and its objects a third class of entities, the ideas, by the mediation of which the mind or self is aware of the outer world. Dreams differ from true waking experiences in that the ideas they contain have no realities corresponding to them. Modern science has turned the real universe into a world of movements of material particles, or of electric charges, without any intrinsic color or sound, and has relegated these latter qualities to the realm of ideas. The physical correlates of these ideas are, of course, particles or charges in motion. By the mediation of the nervous system these particles or charges and their movements are supposed to produce certain alterations in the brain — Descartes considered that they were in the pineal body, while the advance of modern science has placed them in the cerebral cortex — which have as invariable concomitants certain ideas or ideational processes. It is these that form the sole direct object of human inspection.

This theory is perfectly successful in explaining error, but remarkably inadequate in accounting for anything else — any knowledge, that is, which is not a mere accidental blundering belief. The situation is quite analogous to that of a man gazing at the cover of a book and trying to know what is inside. This knot or rib in the cloth *may* cover an exposition of this or that theory, but if the book is permanently locked up, and is opaque, we can never know this. We consequently find that at the very beginning additions and modifications were made in the theory. These, however, belong to

(3) The Metaphysics of the Technical Philosopher. — Modern philosophical tradition may be said to commence with Descartes. Accordingly, he is the first man with whom the metaphysical issues of the present day receive the division and treatment with which we are familiar. We have seen that he divided the world into separate realms, apparently of mind and matter, but really of soul, matter and ideas. Nevertheless, he saw the difficulties of the problem of error and tried to give it a more adequate solution than that pertaining to the conventional philosophy of natural science. As the founder of modern mathematics he tried to introduce mathematical criteria of truth into metaphysics, and so he starts with the proposition, "I think, therefore, I am," the denial of which he regards as self-contradictory in the same sense in which "2 has a rational square root" is self-contradictory. Having thus obtained the existence of the self, he goes on to demonstrate that God exists: "I have an idea of a most perfect Being, and this idea can only come from the Being with the one perfection my idea lacks, that of existence." Once he has got this Being, Descartes asserts that our knowledge of matter receives its guarantee in the honesty of God. This relieves the difficulty we encountered in the metaphysics of the scientist, the difficulty of bringing ideas and their objects into relation, but it is not by any means completely satisfactory. If God is honest, how can we make blunders? By failing to have our ideas clear and distinct, says Descartes. But how can an honest God permit vague ideas? This involves us in the interminable and fruitless controversies concerning the relative power and goodness of God which were so characteristic of the mediæval schoolmen at their worst.

Descartes' philosophy thus involves a *Deus ex machina*. His followers, without exception, laid far more emphasis on this phase of his philosophy than he himself. In the systems of Geulincx and Malebranche, God becomes the agent causing every change in mind and matter, who for each change in the one wills that there shall be a corresponding change in the other. From this Occasionalism it is but a step to the monism of Spinoza, for whom mind and matter are but two among an infinite number of aspects of the one reality, God. From another standpoint, the entire world is the content of intellection, without the mediation of the Cartesian and Lockean "ideas." Spinoza retains the logical, mathematical, intellectualistic standards of truth and knowledge which were set up by Descartes, but he has also a mystical, emotionalistic view of the nature of reality, in that he believes that this is most truly perceived through the Intellectual Love of God.

The *Deus ex machina* survives in the views of the next great continental philosopher, Leibnitz. Instead of the two substances, mind and matter, of the Cartesian tradition, he supposes an infinity of substances, the monads, all partaking to some extent of a mental nature. In place of calling upon God's continual intervention to keep these experiences in accord with the facts, Leibnitz supposes that at the Creation the Lord foreordained that all these many experiences should keep time, just as two perfect clocks, wound up and set together, will agree

on all subsequent occasions until they run down. It will be seen that the problem of error appears in the philosophy of Leibnitz almost in its Cartesian form.

Leibnitz regarded the monads as possessing ideas of various grades of clearness and distinctness, and believed that matter was made up of those with the vaguest ideas. Because he considered matter to be of the nature of mind, Leibnitz is called an idealist, and is classed together with Berkeley, whom we shall next consider. By observing the vast distance that separates the philosophies of these two men, it will be possible to see how little content inheres in this term, which, with its contradictory realism, has been singled out by a certain American philosophical school as the index of a grand dichotomy of all philosophical systems.

Berkeley belongs to the British empiricistic tradition. His immediate philosophical ancestor is Locke. Unlike Locke, however, Berkeley saw that no object not directly given can furnish a test of empirical reality, nor an aid in its explanation. Accordingly, his world consists of selves and their ideas or sense-data. This does not mean that he rejected natural science, but that he insisted that all its propositions were capable of expression in terms of ideas. Such ideas as are not immediately given to any person he considered to reside in the mind of God, one of whose functions it becomes, to put it crudely, to watch things when nobody is looking and to see that they do not vanish away. However, it will be noticed that an idea in the mind of God which is not experienced by us is as inert, remote and useless from an explanatory point of view as a bit of matter. Furthermore, the self apart from its ideas does not appear to play any great part in knowledge. Given an experience, nothing more seems to be added by the adjunction of the self. For these reasons, the next successor to the British tradition, David Hume, rejected both the Berkeleyan matter — thinking God and the soul as a specific entity, and interpreted the world purely and simply as an aggregate of sense-data.

We thus see the contrast between the natural-scientific and the Humian view of the universe; for the naïve scientist, a bit of experience is really an aggregate of atoms in motion, whereas for Hume an atom in motion would have to be interpreted in terms of bits of experience. Unfortunately, Hume possessed neither the scientific knowledge nor the logical mechanism to carry out this process in any but the crudest and most schematic way, and his philosophy of space, time and causality is in detail as bare and inadequate and unsatisfactory as any yet devised. Recently, however, Bertrand Russell, who is essentially a Humian in spirit, though he adopts the independent nature of the soul as at any rate a plausible hypothesis, has developed a treatment of these subjects, and of many other allied ones, which is at once scientific and at bottom after the manner of Hume. Matter, for instance, is treated as the system (Hume would have erred by saying "the sum") of its appearances; an atom or electron becomes a class of sense-data or a relation between them, or something of this general nature. The scientific analysis in terms of atoms and electrons is recognized as valid, but as based on a deeper analysis into the experiences out of which atoms and electrons are artefacts.

This recrudescence of British empiricism, however valid its opinions and valuable its results may be, is off the main stream of philosophical development during the latter part of the 18th century and the entire 19th. This main stream has its source in Kant, who, to continue the metaphor, marks the junction of the currents of British and of Continental thought. What is most distinctive in the thought of Kant is his definite and final occupation of the standpoint of epistemology, as the true ground for the determination of the problems of metaphysics. Now in so doing, Kant is making thought the measure of reality, and this seems to be only repeating the judgment of Spinoza. But there is a great difference. Kant declines to accept Spinoza's doctrine of thought and reality. The real is more than the content of thought. In fact Kant returns to the ancient intuition of thought as formal, and the real as in some sense its correspondent. This was also the tradition of Locke and his school, from which Hume departed, as we have seen, with a result that is often called scepticism. Now the history of Kant's thought shows that, while he clung to the belief in the mere formal character of thought, his tendency was also strongly in the direction of scepticism. Moreover it was on account of his failure to completely achieve what he calls his Copernican revolution, and which was in fact a reaction toward a constitutive doctrine of thought, that he was never able, during the whole of his critical period, to reach a satisfactory conception of the relation of thought to reality. Had Kant completely achieved the mental revolution he proposed, the result would have been, that in epistemology he would have asserted the doctrine of Spinoza, the identity of the real with the content of thought. The knowable world would thus have been identical with the real world and Kant would have escaped the dualism between knowledge and reality into which he actually fell. Kant also denies the universality of thought; at least in the ontological sense. The thought that functions epistemologically is my human relative thought which can only pronounce judgments that are subjectively valid for me, but have no ontological value for reality. The Kantian metaphysics is a corollary from his epistemology. What Kant calls critical idealism is first an epistemology, secondly a metaphysic. As an epistemology it teaches that my thought is constitutive for me; that is, that its content is valid for my subjective connation. It gives me a world, in other words, in which I can work out the practical issues of my life, but it does not give me the world of real things in themselves with respect to which my attitude must be one of renunciation. As a metaphysic critical idealism simply carries its program out in the field of ontology. The presumption of the identity of what is thought with the real cannot be carried out objectively. Kant's metaphysics is therefore necessarily negative. Thought is able to complete itself ontologically, it is true, but the ideals it reaches have no other than subjective value. Their hypothetical content can never be identified with the real, and the Kantian is per force obliged to represent the whole ontological region as an indeterminate X and to look for

the satisfaction of his wants to extra-metaphysical forces. These he finds in the domain of ethics.

In Hegel we have also an example of a thinker who approaches metaphysics along the epistemological way. But Hegel is a much more thoroughgoing thinker than Kant. He starts no doubt with the Kantian traditions in mind and his first great task, the development of his logic, is formal. But Hegel is not a formal thinker, in the sense that he divorces content and form. Thought is formal. This Hegel is not afraid to confess, but it is also ontological. At the same time there are no outlying realities, like the Kantian things in themselves. How is this? Are we to have the spectacle of a lapse into Spinoza? Our apprehensions are ungrounded, for Hegel asserts calmly that the form creates the content. Hegel asserts the identity of thought and reality in the sense that the real is, and is only, what the thought thinks it to be. It is the real by virtue of the thought thinking it to be. This sounds like a dangerous kind of subjectivity, till we learn that by thought Hegel means, not my thought or yours, as simply my or your intellectual function, but the thought that is universal and that thinks the universal. So much for Hegel's epistemology. In Hegel's system epistemology and metaphysics are simply two aspects of the same thing. In epistemology we have the system logically conceived; that is in view of the process which the finite thought of the individual must pass through in order to apprehend it; whereas in the metaphysics we have the system presented in its unity as a self-completing whole. Epistemologically the dialectic is the movement by which results are achieved; metaphysically it is the Divine Spirit of the system as a whole. Error is accounted for precisely by the disparity between individual and universal thought.

One of the most remarkable aspects of the metaphysics of the past century is the strong voluntaristic or emotionalistic trend which is to be observed among writers of the most different philosophical ancestry. Schopenhauer, though in many ways a follower of the Kantian tradition, interpreted the course of events as the manifestation of a world-will, which performs the functions of the Kantian thing-in-itself. This will manifests itself in man as will in the ordinary sense, while in matter it is seen as force. A view which displays an analogous voluntaristic or rather activistic trend, though in every other respect most unlike that of Schopenhauer, is pragmatism, the chief exponent of which was the American philosopher, William James. This view states that the truth of a theory or the reality of a system is not merely determined but constituted by what is in some sense the ease with which it can be applied and the value of the results of this application. A similar position is that of Henri Bergson, who maintains that the analysis of science yields us only half-truths, while the real nature of the world is shown to us by intuition, which exhibits it to us as the working of a certain vital impulse.

There is no metaphysics at the present time which can lay claim to a general acceptance. The 19th century domination of all philosophy by the memories of Hegel and Kant is passing away, and the tendency of worshiping these great men as philosophical demigods is well-nigh extinct. Their followers, numerous though they are, must dispute their realm with the modern critical adherents of the British tradition, armed with modern logic, mathematics and science, and with the pragmatisto-Bergsonian tendency.

Before closing this article, let there be a word of caution to the reader against that facile metaphysical criticism which depends on labels. We have already seen that the line of cleavage between idealism, or the view that all things are either thoughts or their thinker, and realism, which asserts the existence of other entities, does not of itself mark one of the great philosophical dichotomies; Berkeley, the first typical British idealist, and Leibnitz, the idealist of the Continent, both, fall into the epistemological difficulties which are generally accepted as characteristic of realism, in that the problem of the relation between the knower and the known remains in what is essentially the Lockean or Cartesian stage. The distinction between spiritualism, which is almost a synonym of idealism, is that it regards matter as constituted of psychical material, and materialism, which analyzes mind in terms of matter, is similarly not a touchstone to the real nature of the views which it denies. The only really satisfactory method of metaphysical criticism is by the careful individual analysis of each philosophical system according to its own concepts. See EPISTEMOLOGY; PHILOSOPHY; PHILOSOPHY, HISTORY OF; and the articles on the individual philosophers mentioned.

NORBERT WIENER

METASOMATISM. According to the United States Geological Survey, "Metasomatism may be defined as the process by which, through chemical interchange, a mineral or aggregate of minerals undergoes partial or

complete change in chemical constitution." More simply stated, metasomatic ore bodies are formed when the ore substance replaces the rock particle by particle, instead of filling already existing cavities. Replacement is frequently used as a synonym for metasomatism, and ore bodies so formed are usually called replacement bodies. Replacement, unfortunately, is used loosely by some writers, to indicate cavity filling, and these authors use the term metasomatic replacement in the same sense in which others use the term metasomatism. According to the most careful usage metasomatism and replacement are synonyms, and apply to ore bodies replacing the wall rock particle by particle. "Metasomatic replacement" is then pleonastic.

METASTASIO, Pietro, pē-ā'trō mā-tās-tā'zē-ō (properly PIETRO TRAPASSI), Italian poet: b. Rome, 13 Jan. 1698; d. Vienna, 12 April 1782. His poetical talents were early displayed in improvisations, and often he drew about him a crowd to listen to some versified narrative. The jurist Gravina, who thus accidentally became acquainted with his talents, took him under his protection, called him (by an Italianized translation of his name into Greek) *Metastasio,* paid great attention to his education, and on dying in 1717 left him an estate of $20,000. On 15 April 1718 he was received into the Arcadian Academy with the name of Artino Corasio, and in 1720 entered at Naples the office of the attorney Castagnola, who discountenanced literary work, and kept him severely to the law. He wrote anonymously 'Gli Orti Esperidi' (1722), but the authorship was soon revealed, and Metastasio left the lawyer's office, studied further, and wrote a series of musical dramas, or melodramas in the true sense, which were set by leading composers and given with great success. In 1730 he settled in Vienna as court poet, and there in 1730–40 wrote his best works, 'Demetrio,' 'Issipile,' 'Demofoonte,' 'La Clemenza di Tito,' 'Attilio Regolo.' In the consideration of Metastasio's rank as a poet, his work must be viewed not absolutely, but with regard to its original environment, as done in collaboration with a composer, and rendered by great artists. He wrote, too, for the predominantly vocal system of Italian musical drama; and with this his poetry fell into comparative neglect. His writings have been praised by so good a critic as Symonds for excellent versification, ease of diction, effective simplicity of construction and frequent imagery of the highest rank. His lyrical verse and criticisms are also of value. The best collected edition of his works is that of 1780–82 (Paris). Consult Massafia, 'Pietro Metastasio' (1882); also Lee, 'Studies of the 18th Century in Italy' (new ed., 1908).

METASTASIS (1) *in medicine,* a change in the seat of a disease, attributed to the translation of morbific matter to a part different from that which it had previously occupied, or to the displacement of the irritation. Mumps is a disease peculiarly liable to induce metastasis. In adult males the inflammation often goes to the testicles, producing orchitis, and in adult females to the breasts or ovaries, in the latter case ovaritis. Mastoiditis often results in similar shifting of the inflammation by the travel of blood clots, and the inflammation may reappear in any of a dozen places. (2) *In botany,* a change produced upon a substance designed for the nutriment of a plant, to make its assimilation more easy. Thus, when the starch formed in the leaf of a potato has to be transferred to the tubers as a depot of nutritial material, it is first changed into a soluble substance — glucose. See METABOLISM.

METATE, the stone implement on which grain and other substances, more especially corn, were ground before the discovery of America and are still ground throughout the territory of the United States occupied by the Pueblo Indians, and in Mexico, Central America and much of South America, more especially the west coast. See MORTAR.

METAURUS, mę-tâ'rŭs, or **METAURO,** mā-tow'rō, Italy, a river in the Marches, which flows northeast past Saint Angelo in Vado, and falls into the Adriatic, southeast of Fano; total course, about 50 miles. It is noted for the victory gained by the Romans under the consuls Claudius Nero and Livius Salimator near its banks over the Carthaginians under Hasdrubal 207 B.C.

METAVOLTINE. A sulphur-yellow mineral occurring in aggregates of hexagonal scales at Madeni Zakh, Persia. Dichroic. Hardness, 2.5; specific gravity, 2.53; composition: Sulphuric acid, 46.90; sesquioxide of iron, 21.20; protoxide of iron, 2.92; potash, 9.87; soda, 4.65; water, 14.58. Much of the mineral called misy belongs to this species.

METAYER, mĕ-tā'yer, Fr. mā-tā-yā (L. Latin, *medietarius*), a name given in France to the cultivator of a *metairie* or farm who reserves for himself one portion of the produce as the price of his labor and gives the proprietor the other, which represents the rent of the land after deducting what is necessary to keep up the stock. The greater part of the centre and south of France, and almost the whole of Italy, is cultivated by metayers, who are in general upright, economical and industrious. This system of farming on shares, usually half and half, has been tried to some extent in the southern United States, but has never been popular either with farmer or tenant. The tenant is inclined to let the farm run down, because of uncertainty that he will have it in following years. The system also seems to work against the introduction of improved machinery. See AGRICULTURE IN THE UNITED STATES.

METAZOA, one of the two great sections into which Huxley divides the animal kingdom, the other being the Protozoa. The Metazoa embrace all animals composed of more than a single cell, that is all that develop through eggs or ovum. The *Porifera* or sponges are the lowest of the Metazoa. See ANATOMY, COMPARATIVE; PROTOZOA.

METCALF, William, American steel manufacturer: b. Pittsburgh, Pa., 1838; d. 1909. In 1858 he was graduated at the Rensselaer Polytechnic Institute, Troy, N. Y., and from 1860 to 1865 supervised the manufacture of Rodman and Dahlgren guns at Fort Pitt, Pittsburgh. In 1868 he entered the steel manufacturing field and in 1898 organized the Bræburn Steel Company, of which he was president for 11 years. It is said that Metcalf made the first crucible steel in America. He was president of the

American Institute of Mining Engineers in 1881 and of the American Society of Civil Engineers in 1893. He published 'Steel—A Manual for Steel-Users' (1896).

METCALFE, Samuel L., American physician and scientist: b. near Winchester, Va., 1798; d. 1856. In 1823 he was graduated in the medical department of Transylvania University; established a medical practice at New Albany, Ind., and visited England in 1831. Upon his return to his native country he made a geological tour in Tennessee, North Carolina and Virginia. Later he settled in New York where he took up scientific work. He published 'Narratives of Indian Warfare in the West' (1821); 'A New Theory of Terrestrial Magnetism' (1833); 'Caloric: Its Mechanical, Chemical and Vital Agencies in the Phenomena of Nature' (2 vols., 1843; 2d ed., 1859).

METCHNIKOFF, Elie, Russian bacteriologist: b. Kharkoff, Little Russia, 15 May 1845; d. Paris, France, 15 July 1916. Following his education at Kharkoff, Metchnikoff studied at Giessen and Munich, and in 1870 he was appointed professor of zoology at Odessa. He held this post until 1882, when he resigned to devote himself to private researches into the anatomy of invertebrates. It was while working at lowly organized forms of life such as sponges that he first made the observations which constituted the basis of all his subsequent work. In 1888 he had attracted the notice of Louis Pasteur, the founder of the famous Pasteur Institute for the treatment of rabies, in Paris, and he was invited to become one of Pasteur's associates. In 1895 he succeeded as the director of the institute, a post which he held to the time of his death. In his study of longevity, Metchnikoff came to the belief that it should not be uncommon for persons to live to the age of 150 years. He found every indication that the human mechanism was calculated to last far longer than it actually does. His researches showed among other things that animals which had no large intestines lived to an advanced age, particularly birds, which preserve their youthful agility and spryness to the end of their long span. In the case of human beings he found that even among those whose sufferings were terrible, there were few who wanted to be put out of their agony by death. They all wanted to live. If the normal specific longevity were attained by human beings he believed that old and not degenerate individuals would lose the instinct for life and acquire an instinct for death and that as they had fulfilled the normal cycle of life, they would accept death with the same relieved acquiescence as they now accept sleep. On his seventieth birthday, in 1915, Professor Metchnikoff received a present of a golden book, forming a unique record of the latest scientific researches, signed by men of science of the day. Although there was much controversy in the scientific world regarding his original ideas, he was fully recognized as one of the most eminent bacteriologists. In 1908 the Nobel prize for medical research was divided between the late Dr. Paul Ehrlich, of Berlin, and Professor Metchnikoff. The $20,000 which he thus received he devoted entirely to the furtherance of his scientific researches. Personally he was not well-off, and throughout his long life sacrificed all but the plainest living necessities to the cause of science. He was the author of a number of books including 'Lectures on the Comparative Pathology of Inflammation' (London 1893); 'Immunity in Infective Diseases' (New York 1905); 'Etudes sur le nature humaine; essai de philosophie optimiste' (1903). English translations of his lectures are 'The New Hygiene' (Chicago 1907); 'The Nature of Man' (New York 1910). He edited, with Sacquépée and others, 'Médicaments microbiens, etc.' (1909). Consult 'Annales de l'Institut Pasteur' (Paris), and Slosson, E. E., 'Major Prophets of Today' (Boston 1914).

METELLA, Cæcilia, daughter of Metellus Creticus. Her tomb is the best known of the many that once lined the Appian Way for some miles beyond the walls of Rome, because of the law which forbade burial within the city limits.

METELLI, mē-tĕl'ī, a Roman family of the *gens Cæcilia*. QUINTUS CÆCILIUS METELLUS MACEDONICUS defeated the Achæans, took Thebes and invaded Macedonia, etc., and received a triumph 146 B.C. QUINTUS CÆCILIUS METELLUS NUMIDICUS rendered himself illustrious by his successes against Jugurtha, the Numidian king. He took, in this expedition, the celebrated Marius (q.v.) as his lieutenant, was soon recalled to Rome, and accused of extortion and ill-management, but was acquitted of these charges. He celebrated a triumph at Rome 107 B.C. His son, QUINTUS CÆCILIUS METELLUS received the surname of PIUS on account of the love which he displayed for his father when he besought the people to recall him from banishment in 99 B.C. In 83 B.C. he joined Sulla, with whom, three years later, he was united in the consulship. QUINTUS CÆCILIUS METELLUS CRETICUS conquered Crete, and reduced it to a Roman province in 67 B.C. QUINTUS CÆCILIUS METELLUS PIUS SCIPIO, the adopted son of Metellus Pius, in 52 B.C. was colleague in the consulship with Pompey, who had married his daughter Cornelia. Hence he exerted himself to the utmost to destroy the power of Cæsar and strengthen that of his son-in-law. He commanded the centre of Pompey's army at the battle of Pharsalia, and thereafter fleeing to Africa was defeated by Cæsar at Thapsus 46 B.C. He died by his own hand.

METEMPSYCHOSIS. This ancient theory has at times been confounded with reincarnation. While both imply that man lives again the propositions present radical differences. See REINCARNATION; TRANSMIGRATION.

METEORIC WATER. See GROUND WATER.

METEORITES, also called AEROLITES, METEORS and METEORIC STONES, are bodies that enter the earth's atmosphere from without and, being intensely heated by impact with the air, are partially consumed before reaching the ground. If the fall occurs at night, the meteorite is seen as a ball of fire passing over the heavens and frequently leaving a brilliant train of material behind it; usually sparks and fragments are thrown off from the head, and sometimes this bursts in pieces with a loud explosion and finally reaches the ground in hundreds, or even thousands, of pieces. If not too far away from the observer, its passage through the air may be heard as a continuous

roaring sound accompanied by frequent detonations of great volume; if a final, louder explosion is both seen and heard, the distance from the observer to the meteorite at the time may be very accurately determined by the consideration that sound travels but 1,040 feet a second while the transmission of light is practically instantaneous. The reader who is fortunate enough to witness a meteoric fall should therefore take means to estimate the number of seconds which elapse between when the explosion is seen and when the sound reaches him. This is usually done by beginning to count, or to repeat the letters of the alphabet, or some piece of doggerel at the first instant and breaking off at the second. By a repetition immediately afterward, which is timed by a watch, a quite accurate approximation will be obtained. If in addition the apparent position of the meteor among the stars is noticed at the beginning and end of its appearance or (if the phenomenon is witnessed in the daytime) if the approximate bearing and elevation above the ground are noted at the two instants, the time being also stated, at least approximately, the observer will have secured a record which will be of real scientific value.

Meteorites are of two classes — the stony meteorites and the iron meteorites. The former are about 10 times more numerous than the latter. In the iron meteorites iron usually forms more than 90 per cent of the entire mass, but it is almost invariably alloyed with nickel. In the stony meteorites mineral combinations occur which are peculiar to these bodies, and serve as one of the ear marks by which they may be recognized when they were not seen at the time of their fall.

Other distinguishing marks of meteorites are found in their physical appearance and structure. They are covered with a blackish crust formed by surface melting during their passage through the air. This crust consists mainly of oxide of iron, and is magnetic. Pits and hollows are formed in the surface of a meteorite by the fusing of the less refractory minerals and these are a characteristic feature.

When a portion of the surface of an iron meteorite is polished and then etched with acid peculiar markings, called from the name of their discoverer Widmannstatten figures, make their appearance. These are among the most trustworthy criteria of the meteoritic origin of suspected masses of native iron.

About one-third of the chemical elements known in the laboratory have been found in meteorites. But no new element has ever yet been discovered in them. The following elements occur, in greatly varying quantity, sometimes a mere trace being present:

Iron	Carbon	Oxygen
Nickel	Sulphur	Hydrogen
Cobalt	Phosphorus	Nitrogen
Copper	Silicon	Chlorine
Aluminum	Sodium	Chromium
Tin	Calcium	Titanium
Magnesium	Potassium	Lithium
Arsenic	Manganese	Helium

As the true nature of shooting stars was not understood until after the investigation that followed the great shower of 1833, so the true nature of meteorites was recognized only after a remarkable fall of those bodies which occurred at L'Aigle in France about noon on 26 April 1803. Nine years before, in 1794, Chladni, a German physicist, had formulated the theory that meteorites before encountering the earth traveled in independent orbits in space, but his conclusions were not generally accepted until the occurrence at L'Aigle had focused the attention of men of science. On that occasion between 2,000 and 3,000 meteoric stones were scattered over an area about nine miles long by three miles wide. The French astronomer, J. B. Biot, visited L'Aigle, carefully examined the fallen stones and collected and discussed the evidence of eye witnesses. Thereafter the old idea that meteors and meteorites were simply atmospheric phenomena was abandoned, and the fact of their extra-terrestrial origin was generally recognized. It is now perfectly certain that meteorites cannot have originated in volcanic eruptions on the earth or on the moon, as some have supposed, but that they came from remote parts of our solar system, or, more probably, from beyond its borders, or even from the region of the stars. That this is so is definitely proved from the velocities (many times observed), with which they encounter the earth. It is found that before the collision they must have been falling toward the sun along such elongated paths that upon reaching the earth's orbit their velocity of motion was very approximately 26 miles a second. This is the velocity which a body would acquire in falling to this distance from the sun from an infinitely great distance away, and leaves no room for doubt that each of these bodies was pursuing its own independent orbit about the sun before it suffered collision with the earth.

Many records of the fall of meteorites have been found in ancient annals, and in modern times, with so many observers continually watching the sky, the number of meteorites seen in flight is annually quite large, although the actual falls observed are always comparatively rare. The number entering the earth's atmosphere in a year has been estimated all the way from 70 up to 3,000 or 4,000. In 1879, on 10 May, there was a shower of meteoric stones in Iowa, the largest mass weighing more than 400 pounds. The last considerable fall in this country was recorded on 19 July 1912, when a remarkable detonating meteorite fell near Holbrook, Ariz. In this case the explosion so completely shattered the mass that the largest fragment found weighed but 14 pounds. Upward of 14,000 separate stones were gathered, their total weight being 481 pounds.

Perhaps the most famous meteorite of antiquity was the so-called stone of Egos-Potamos, which fell in Thrace in 466 B.C., and which was described as equaling two millstones in size. Plutarch speaks of it in his life of Lysander. In the Middle Ages the Stone of Eusisheim was very celebrated and became the object of superstitious reverence. It fell at Eusisheim in Alsace on 7 Nov. 1492, when the Emperor Maximilian was at that place. Fragments of this body were taken to Paris and London, but the principal mass, weighing more than 200 pounds, was suspended in the choir of the church of Eusisheim.

Almost every large meteorological museum contains specimens of meteoric stones and meteoric irons. There are some remarkable examples in the National Museum at Washington. An iron mass, supposed to be of meteoric iron, discovered at Cañon Diablo, Arizona, proved,

on examination a few years ago, to contain minute black crystals resembling the diamond, and a meteorite which fell in Russia contained similar black crystals of carbon.

It is yet a disputed question whether the huge masses of iron, weighing many tons, which were brought from Greenland to Stockholm by Baron Nordenskjöld, are really of meteoric origin. The same question attaches to a similar mass which Rear Admiral Peary transported from Greenland to New York. Other masses of this kind exist in various parts of the world. There is no record of their having fallen from the sky. A complete catalogue of all the meteorites of North America, together with a description of their falls, an analysis and a detailed description of the structure in each of them, and also a very complete bibliography was published in 1915 by O. C. Farrington. This work forms volume XIII of the 'Memoirs of the National Academy of Sciences' (Washington).

METEORITIC HYPOTHESIS, the theory of cosmogony profounded by Sir Norman Lockyer, to the effect that all astronomical systems, including the nebulæ themselves, and in particular those consisting of a central body and satellites result, not from the condensation of a nebula, but from the interferences and collisions of meteors more or less fortuitously grouped in space and with more or less fortuitous velocities. The structure of Saturn's rings and the behavior of the outermost planets seem to be susceptible of a better explanation on this theory than on the nebular hypothesis (q.v.), but certain difficulties have been met in connection with a peculiar line in the spectrum of the nebulæ, for the nebulæ, which according to the meteoritic hypothesis are formed from the substance of meteorites, contain an element, nebulium, found nowhere else in the universe.

METEOROLOGICAL SOCIETY, The Royal, a scientific body with headquarters in London. Its organization dates from 1850, and in 1866 it was incorporated. All theories and facts pertaining to meteorology are sought for in its records, the development of that science in all departments being the object of the association. Besides fellows, the Society consists of honorary members, this membership being bestowed upon distinguished persons of other than English nationality. The Society publishes the *Meteorological Record* and the *Quarterly Journal.*

METEOROLOGY, *μετέωρον+λεγειν,* literally the science of the things in the air. Meteorology has come to mean that part of natural philosophy that treats of the physics of the air and the mechanics of its motions. It includes climate (q.v.) and weather. The distinction in the meaning of the two terms is apparent when it is stated that one may well speak of the weather of to-day, or last month, or some past year, but not of the climate of a day, a month or a year, which is determined by finding the averages and the extremes of all the weather conditions for a long series of years: of the temperature, precipitation, humidity, sunshine, cloudiness and wind velocity and direction.

Theoretical Meteorology aims to trace out the workings of definite laws to explain the various atmospheric phenomena, and properly may include a study of variations in solar radiation, as effecting the earth's temperatures, or as the primary causation of terrestrial storms.

Applied Meteorology strives to apply the theory of meteorology to the art of weather forecasting, which, so far, has not passed beyond the empirical stage, and in various ways to utilize knowledge of the physics of the air in the commercial industries.

History.— The term science was not applicable to man's knowledge of the atmosphere at the time Virgil, Cicero and Aristotle wrote of the weather. As late as the time of the founding of the first of the 13 original colonies at Jamestown, Va., in 1607, practically nothing was known of the properties of the air or of methods for the measuring of its phenomena. The development of the thermometer and Torricelli's invention of the barometer in 1643 made study and investigation possible.

American scientists may well be proud of the services rendered by their countrymen to humanity in adding to our knowledge of the atmosphere. The act of the great Franklin in drawing down the lightning of the clouds and identifying it with the electricity of the laboratory was but one of his important contributions to meteorological science. In 1747, while taking observations at Philadelphia of a lunar eclipse, in co-operation with his brother at Boston, he learned that storms moving from the west, as all storms of the middle latitudes do, first begin with easterly winds, and as they approach a place of observation become westerly, and he came near discovering the cyclonic system of storms. Following the winter of 1783, famous in history for the phenomenal severity of its cold, and its long duration, Franklin, in a letter to a correspondent in Europe, called attention to the violent eruption of Mount Hecla the preceding year, and suggested that the dust therefrom may have been carried into the high strata of the atmosphere and spread around the earth by the winds. His idea was that this dust would screen off some of the sun's rays and add to the cold of winter. As in many other things, he had a prophetic vision, for there no longer is doubt that violent volcanic eruptions throw into the upper air large quantities of dust particles which, by swiftly moving easterly currents in the middle latitudes and westerly currents in the tropics, are so distributed around the earth as not only to effect the colors of the sky for two or three years after, but to modify the weather. Doubtless the earth in this year of 1919 still is feeling the cooling effects of the explosion of Katmai, in the Alaskan Peninsula, in 1912, augmented by volcanic explosions in Japan in 1913.

The author of the Declaration of Independence, Thomas Jefferson, took daily observations of the weather. He even carried his thermometer to Philadelphia and twice recorded the temperature of Independence Hall on 4 July 1776. He owned one of the only two barometers then in the colonies. In co-operation with James Madison (after bishop), who lived at Williamsburg, some 200 miles east of Monticello, he determined that changes in the barometer first begin several hours earlier at the westernmost station. The British ransacked his home and broke his barometer. It is said

that he berated them more for the destruction of his cherished instrument of the weather than he did for their burning of the National Capitol. As early as 1735 Hadley, an Englishman, had published an article explanatory of the trade winds, and Dalton, another Englishman, in 1793, made the first attempt to explain the phenomena of the atmosphere through the principles of philosophy. It was then believed that storms were straight-line gales. It remained for Redfield, an American, in 1831 to publish an epoch-making essay, in which storms were described as progressive whirlwinds, turning counter clockwise, with an easterly movement of translation for the whole system of spirally in-flowing air. Espy followed, in 1841, and showed that rainfall is caused by ascending currents, cooling by expansion as they rise until the water vapor becomes saturated. By the same line of reasoning he explained how descending air must heat by compression. In 1843 Tracy made an important contribution to the subject. Redfield had claimed that the air in storm-whirls neither moves in concentric curves nor along radical lines into the interior of the storm, but spirally inward. Tracy proved that Redfield was right, for he showed that the rotation of the earth must deflect all air currents to the right of the initial direction in the northern hemisphere, whether in storm-whirls or out of them. From 1840 to 1860 the other Americans who added most to our knowledge of meteorology were Maury, Coffin, Henry, Lapham and Loomis. Mathew Fontaine Maury, of the United States navy, was the pioneer in marine meteorology. He mapped the oceans and determined the direction and force of winds and water currents. In 1855 he published his 'Physical Geography of the Sea and its Meteorology.' See WEATHER BUREAU.

Source of the Atmosphere.— The larger planets of the solar system are believed by many scientists to have hot atmospheres still in violent agitation. According to the La Placian hypothesis of the origin of the earth, millions of years ago it also had a similar atmosphere. Much of the hot vapors which largely composed the earth's atmosphere during the early period of its existence, have been absorbed by its rocks or filtered away into space. The residual is supposed to constitute our present atmosphere. The moon shows no refraction or diffusion of light, such as would occur with an atmospheric envelope. It is dead. It died young because it is too small to have sufficient attraction of gravitation to long retain a life-sustaining atmosphere, or in fact, any atmosphere, the darting molecules of which have high velocities, and are captured by larger celestial bodies. Before the sun can have an atmosphere suitable for life an incomprehensible period will have elapsed, its light will have gone out, its heat will have ceased to reach the earth and the other planets in appreciable quantities, the earth will have been dead millions of years, and the sun itself will only receive heat and light from the feeble rays of the stars which, unlike itself, have not ceased to shine. Even though it have a suitable atmosphere, it must remain dead, for there is no external source whence it can receive appreciable heat.

Those who follow the Planetesimal hypothesis are required to believe that the earth's atmosphere has never been hot and has grown denser, rather than rarer, with the growth in size of the earth.

How Atmospheres are Lost.—Gases that cannot be held by the moon may be held by the earth and those that can escape from the earth may be held by the larger planets. An understanding of how gases are lost through the kinetic energy of molecules requires that careful account be taken of the relations that exist between the attraction of gravitation of planets, their temperatures, and the weight of the molecules of the different gases that compose their atmospheres. The speed of the molecule depends on its temperature and its mass, being less at low temperatures and greater at high temperatures, and light molecules moving more swiftly than heavy ones. A gas is composed of molecules that dart about at velocities which, in connection with numerous collisions (seven or eight millions for each molecule near the earth in $\frac{1}{10^{10}}$ of a second) and the energy of each molecule, may allow a certain proportion of them at any one time, to reach velocities so great that, if they pass into the outer layers of the air, where collisions are infrequent, they escape from the attraction of the planet and pass away never to return. According to the kinetic theory it would appear that the earth's gravitation and the temperature of its outer air are such as to retain without appreciable loss argon, carbon dioxide, oxygen, nitrogen, vapor of water, and ammonia, but that helium and hydrogen, because of their lesser specific gravity, escape from the top of the atmosphere about as fast as they are supplied from hot springs and other sources at the bottom.

Proportion of Gases Aloft.—Samples of air taken at various elevations up to nine miles show the atmosphere to be a homogeneous mixture, with the proportions the same at all elevations; but this is what one would expect from the mixing of the air by the ascending and descending whirls of cyclonic storms. Storms operate only in the lower air and all ascending and descending currents practically cease below the 10-mile level. Above this altitude it reasonably may be assumed that the heavier gases steadily lose in proportion to the lighter ones until at about 60 miles nothing but hydrogen and helium remain.

Atmospheric Air.— The earth is surrounded by four important atmospheres — nitrogen, oxygen, vapor of water and carbon dioxide — and others of less importance, each comporting itself, in accordance with Dalton's law, practically as it would do if the others were not present, except that its rate of diffusion is retarded by their presence. This composition is atmospheric air — usually called air. Both by volume and by mass oxygen and nitrogen are the principal atmospheres. They, like the others, are in mechanical mixture and not in chemical combination. Because of their relatively greater importance separate articles are devoted to nitrogen and oxygen (qq.v.). But it should not be thought that because some of the other constituent gases are relatively small in amount they are not vitally important in carrying on of the functions that nature seems to have assigned to the air.

As well as germs, dust and cloud particles, air, over land, contains sulphates in minute quantities, and over the sea and near the sea-

shore salt left from the evaporated spray can always be detected.

Carbon Dioxide.— In cities the amount of carbon dioxide is considerably greater than in the country, frequently rising to 0.07 per cent by volume, and even to 0.10 per cent when there is but little wind to scatter what accumulates near the ground. In crowded theatres Angus Smith found as much as 0.32 per cent and in mines 2.5 per cent. The latter amount would soon be destructive to animal life. This gas is 1.50 times as dense as an equal volume of air. Its density causes it to collect in mines, sewers, cellars and other low and confined places, unless there is forced ventilation. The sweep of the American cold wave, with its heavy air moving at a high velocity, is highly beneficial. It searches into cracks, crevices and into enclosures that are not hermetically sealed and expels the foul air. All nature feels the revivifying effects of rain and high wind; one washes out the carbonic-acid gas (carbon dioxide) from the air, with the dust and other particles in suspension; the other enters our habitations and drives out the poisonous atmospheric accumulations. It cannot be too strongly impressed upon the reader's mind that oxygen, the life-sustaining principle of the air, decreases, and carbon dioxide, a poison, increases in air that is breathed, or in air in which candles, oil-lamps or gas are burning; and that all places of habitation, especially those that are used for sleeping-rooms, should have a continuous supply of fresh air.

Water vapor is another of the four important atmospheres. It may vary in amount from a fraction of 1 per cent for the arid regions to 5 per cent of the weight of the air for the warm humid regions. It is a little over one-half as dense as atmospheric air. When the air has taken up all the water vapor that it can contain at a given temperature it is said to be *saturated*. Saturation seldom occurs in free air, except inside of a dense fog or cloud, or within the thin stratum of air that by contact with a cold surface has had its temperature lowered to the point of condensation. Even during heavy downpours of rain the air near the earth is usually capable of evaporating some of the rain that is falling through it. In fact light precipitation may be entirely taken up by the lower air and never reach the earth. The *dew point* is the temperature of saturation. The *relative humidity* is expressed in percentages of the amount necessary to saturate. At a temperature of 32° F., air resting over a moist surface may continue to increase the amount of its vapor of water until it contains 2.11 grains per cubic foot, which amount is sufficient to exert a pressure in all directions equal to the downward pressure of 0.18 inch of mercury; it will then be saturated and its relative humidity be 100 per cent. The point to which attention is especially directed is that the pressure of 0.18 inch indicates the maximum pressure of water vapor at 32° temperature, and any further evaporation must be accompanied by an equal amount of precipitation. Now, if this air be suddenly raised in temperature to 51° its capacity per cubic foot will be increased to twice what it was at 32°, the 2.11 grains will only be equal to one-half the number necessary to saturate and the relative humidity be expressed by 50 per cent instead of 100 per cent. *The absolute humidity* is expressed in grains per cubic foot, or by the pressure in inches of mercury. The *hygrometer* measures the amount of water vapor.

Ozone has powerful bleaching and disinfecting properties. By reason of the unstable condition of the molecular structure it is a much more active oxidizing agent than oxygen and this fact in part accounts for the less amount observed in the air near the ground and for the almost total absence of ozone from the air over large cities, where decaying organic matter exists at all times in comparatively large quantities, the ozone rapidly entering into chemical union with whatever is in the process of decay. Ozone in the minute quantities found in nature is healthful, but the quantity is not large that will cause the death of an animal confined in the air containing it. It may be that the invigorating effects of the crisp air of a frosty morning, and of the dry air of the cold waves of winter, are due, in part at least, to the ozone and electricity in the air; and may not the healthfulness of mountain air be due to the increase with elevation of the quantity of ozone and electricity, as well as to the less quantity of dust and disease germs? Sea air also is rich in ozone and deficient in dust and noxious germs. The maximum daily amount greets the early riser, for ozone is present in greatest quantity between 4 and 9 A.M., and in winter the amount is greater than in summer.

Dust in the Air.— Dust rains into the atmosphere from outer space, and meteors that are consumed through the heat generated by striking into our air contribute to the supply. Other sources are volcanoes, combustion, salts from the spray of the ocean and small particles of matter lifted up by the winds.

A recent research by Humphrey shows that each of the important volcanic eruptions since 1750 have effected a cooling of the earth's temperatures through the action of dust shot into the upper air and wafted about the earth. It is shown that the ratio subsisting between the size of the dust motes and the wave lengths of solar and terrestrial radiations is such as to reflect back into space more of in-coming heat than there is intercepted out-going heat from the earth. Each important eruption has affected the temperature of the earth and the color of the sky for from one to three years.

Heat of Interstellar Space.—Although the ether transmits through all space the various forms of solar energy, none of this energy becomes thermal until it is intercepted by the atmosphere of our earth or by the gaseous envelope of some other planet, or by the body of some meteor or comet or by cosmic dust. Objects or planets without atmospheres like our moon are, therefore, nearly devoid of temperature, approaching absolute zero, which theoretically, is — 450° F.

Earth's Heat.— It is believed that the interior of the earth still retains an intensely hot temperature, and that this hot mass is surrounded by a cool crust that is a poor conductor; so that only a small amount escapes into the atmosphere. The innumerable stars, though their average temperature probably is equal to that of our sun, are too distant to have an appreciable effect in heating the exterior of the earth. It is apparent, therefore,

that the sun, with an absolute temperature over 20 times as high as the absolute temperature of the earth, controls the surface temperature of our planet and its atmosphere.

Sun's Heat Variable.—The number of gram-calories received per minute on a square centimeter of normal surface outside the earth's atmosphere is called the *solar constant.* In Abbot's refined measurements at Mount Whitney he obtained values of the solar constant varying from 1.93 to 2.14, the mean for the first two years being 2.022.

Variable Quantity of Heat Received Each Day.— The quantity of heat that falls upon a horizontal area at the top of the earth's atmosphere during any consecutive 24 hours depends upon four conditions: (1) The altitude that the sun attains when it crosses the meridian at noon, (2) the length of the day time, (3) the distance of the earth from the sun, and (4) constancy of solar radiation; these are in a perpetual state of variation, except that near the equator the day and the night are always equal.

Quantity of Solar Rays Absorbed by the Atmosphere.— On the average the atmosphere of the earth absorbs about 76 per cent of the total incident solar energy. About one-half is absorbed by a cloudless atmosphere, and nearly all absorbed or reflected away by a cloudy air. On the average 52 per cent of the earth's surface is obscured by clouds all the time which, according to Abbot, reduces the total amount of insolation that reaches the earth to but 24 per cent.

Terrestrial Radiation.— When solar radiation is absorbed either by the gases of the air or by dust in suspension in it, or by the earth itself, the energy of the ether is transmuted into molecular vibrations of the matter that absorbed it. The temperature of the matter is raised and it itself sends out radiations in the form of heat-waves, which readily escape through the atmosphere unless intercepted in their passage by cloud or water vapor. There is no permanent increase in the temperature of the earth or atmosphere, therefore there must be a continual loss of heat in some way, and this is brought about by the outward radiation of earth and air toward interplanetary space. During the spring and summer the gain of heat by the atmosphere is greater than the loss; during the autumn and winter these conditions are reversed.

Why Mountain Peaks are Cold.— The absorption of solar and of terrestrial radiation by the air is greater in its lower levels, where dust, water vapor and clouds are densest, while the transmission of both incoming and outgoing radiation is more rapid through the pure air aloft. Thus we account for the coolness of all mountain peaks.

Nocturnal Cooling of Earth and Air.— Terrestrial radiation goes on day and night, winter and summer. During daylight the gain of heat is greater than the loss, while at night the reverse is true. After the sun has passed below the horizon both the earth and the air continue to cool by radiation, unretarded by the counteracting effect of insolation. The earth loses heat, even under a clear sky, more freely than the air, with the result that the surface of the ground and of vegetation and the air in close proximity thereto may sink to a temperature 10° or 15° lower than that of the air at considerable elevations. This condition is called *temperature reversion.* It occurs both winter and summer. The greater difference will occur when there is but little wind to mix the air. On a clear night in summer there may occur an increase in temperature up to a height of 200 to 600 feet, and then a steady fall, reaching the surface temperature at about 2,000 feet elevation, unless radiation be diminished by saturation of the soil or the location be adjacent to a considerable body of water.

Unequal Heating of Land and Water.— The thermal effect of a given quantity of heat falling upon various forms of matter differs with the substance; this is notably apparent when the matter is land, water or air. The same amount of heat will raise the temperature of a water surface only about one-fourth as much as it will raise the temperature of a land surface. Water rejects by reflection a considerable amount of the solar radiation that reaches it, while land reflects but a small part, and of that which falls upon the top layer of water much is expended in the process of evaporation and does not impart warmth to the water. Solar radiation also penetrates water to a considerable depth and is quite uniformly absorbed by the whole stratum penetrated. These conditions give to large water surfaces and the air immediately over them a much lower temperature during the day and a much higher temperature during the night, and also lower temperatures during summe. and higher temperatures during winter, than occur over a land surface of the same latitude and approximate elevation.

Ocean Temperatures.— Because of the displacement of oceanic isothermals by ocean currents it is impossible to name a definite temperature as prevailing over oceans at all places on a given parallel of latitude. But in a general way it may be stated that at the equator there is a surface temperature of 82° to 84° F., which changes less than a degree between day and night, and not over 5° between winter and summer; at a depth of 400 fathoms the temperature is 44° and unchangeable, and below 1,000 fathoms it is but little above the freezing point of fresh water — namely, 34° to 36°. At latitude 70° north the temperature has but little diurnal variation, and a yearly range of from 35° in winter to 45° for summer; at a depth of 400 fathoms it remains steady at 32°. From this level there is a gradual decrease to a depth of 1,000 fathoms, where a constant temperature of 28° exists, and below this to the bottom there is no change.

Vertical Decrease of Temperature.— From the Paris records the mean fall in temperature per 1,000 feet up to a height of 20,000 feet is 2.4 in winter, 2.8 in spring, 2.6 in summer, 2.5 in autumn and 2.6 for the year. From the Berlin records it is 3.1 winter and spring and 3.0 in summer and autumn. It should be noted that the decrease is greater at Berlin, which is farther from the influence of the ocean than is Paris. In the interior of the United States it is still greater.

Isothermal Layer.— During the past 15 years the atmosphere has been explored to altitudes of from 15 to 30 kilometers by the sending up of sounding balloons equipped with suitable instruments. We find that there are two distinct strata in our atmosphere that inter-

mingle but slightly: a lower turbulent one, in which all of the ascending and the descending whirls that constitute storms and cold waves operate, and in which the temperature decreases rapidly with elevation; and an upper or outer one, in which there is such small change of temperature with elevation, so far as observations have reached, that it is called the *isothermal layer*. The lower stratum is about 12 kilometers in depth; the upper one extends to limits unknown. The average temperature for summer at the top of the storm stratum is — 52° C., and 8 kilometers higher in the isothermal stratum, — 51°. In winter the temperatures at these two places are — 58° and — 57° C. Note that the temperature slightly increases with elevation in the region above storms; although we feel justified in assuming that farther out the temperature must lose with altitude until at the outer limits of the atmosphere it approaches absolute zero. The greatest altitudes reached showed about one-half the difference in the temperature between winter and summer that is found at the earth's surface.

Diurnal Range of Temperature.— The average difference between the temperatures of day and those of night diminishes with ascent in the free air until at only a few thousand feet from the surface of the earth (3,000 to 5,000) there is no difference between the heat of midday and that of midnight. The diurnal range of temperature is greatest at the equator and diminishes irregularly with latitude, being greater over land than over water on the same parallel.

Annual Range of Temperature.— The annual range of temperature increases with latitude, being the greatest for the interior of continents and least for islands and near the oceans. It decreases with gain in elevation in free air, being about 7° C. at 18 kilometers about the earth.

Frosts.— As previously explained, a given quantity of heat being absorbed by different substances of unequal specific heats will produce a different temperature in each; the lower the specific heat of a substance the higher will be its temperature; and besides different substances have different coefficients of absorption and reflection. Therefore ,under the same insolation rocks, clay, vegetation and other substances come to temperatures that differ by many degrees. The air next to earth largely partakes of the temperature of the surface, and in consequence when the sky is clear so that incoming and outgoing radiations may progress freely and the air is little disturbed by wind, wide variations in the temperature of a thin stratum of lower air may occur over adjacent plots of ground of precisely the same elevation, but different covering, and frost form. Difference in elevation may also cause marked differences in minimum air temperatures where the surface covering is uniform and frosts of varying degrees of intensity occur. During clear, cool nights with light winds, frosts will occur in bogs or on low, damp ground, while in the surrounding uplands the temperature may be 10° to 20° higher.

Atmospheric Pressure.— The attraction of gravity on the gases of the atmosphere causes them to exert a pressure on the surface of the earth. The average pressure at sea-level is about 14.7 pounds per square inch. If we remove the air from the inside of a vessel by means of the air pump or otherwise, then the external pressure becomes at once apparent. This pressure is in all directions, upward as well as downward; it is measured by the mercurial barometer. See BAROMETER.

To get the true pressure of the air it is necessary to apply corrections for temperature (32° F. is the standard), gravity, which varies with latitude, and instrumental error; and when barometer readings from several stations are to be compared it is required to reduce them to what they would be if the stations all had a common level. Usually they are reduced to sea-level by adding to each the inches of mercury equivalent in weight to the column of air between the barometer cistern and sea-level. This is the pressure usually entered on weather charts.

Isobars.— In order to present graphically the distribution of atmospheric pressure over the earth's surface it is customary to draw lines through points having the same sea-level pressure. These lines are called isobars.

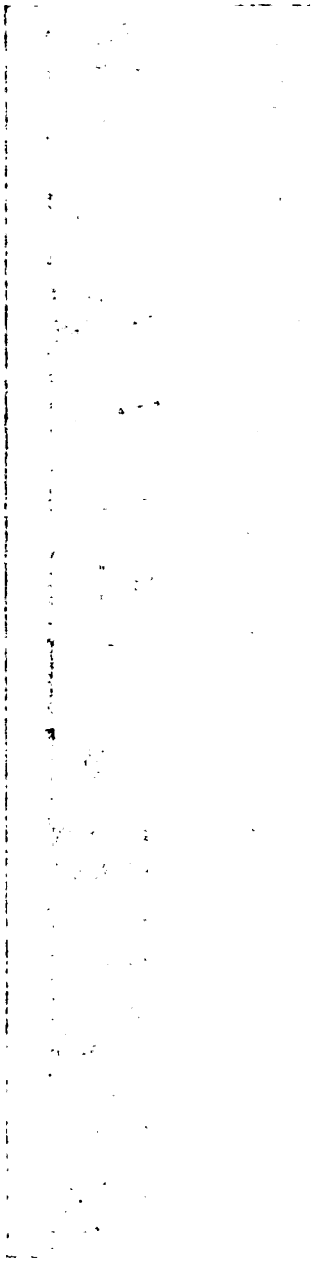
Barometric Gradient.— The distance between isobars shows the steepness of the barometric gradient. The unit of horizontal distance usually employed is the distance of 1° on a meridian. Thus, if the difference in pressure between two points is one inch and the distance between them is equal to the length of 10° on a meridian the barometric gradient is 0.1 of an inch.

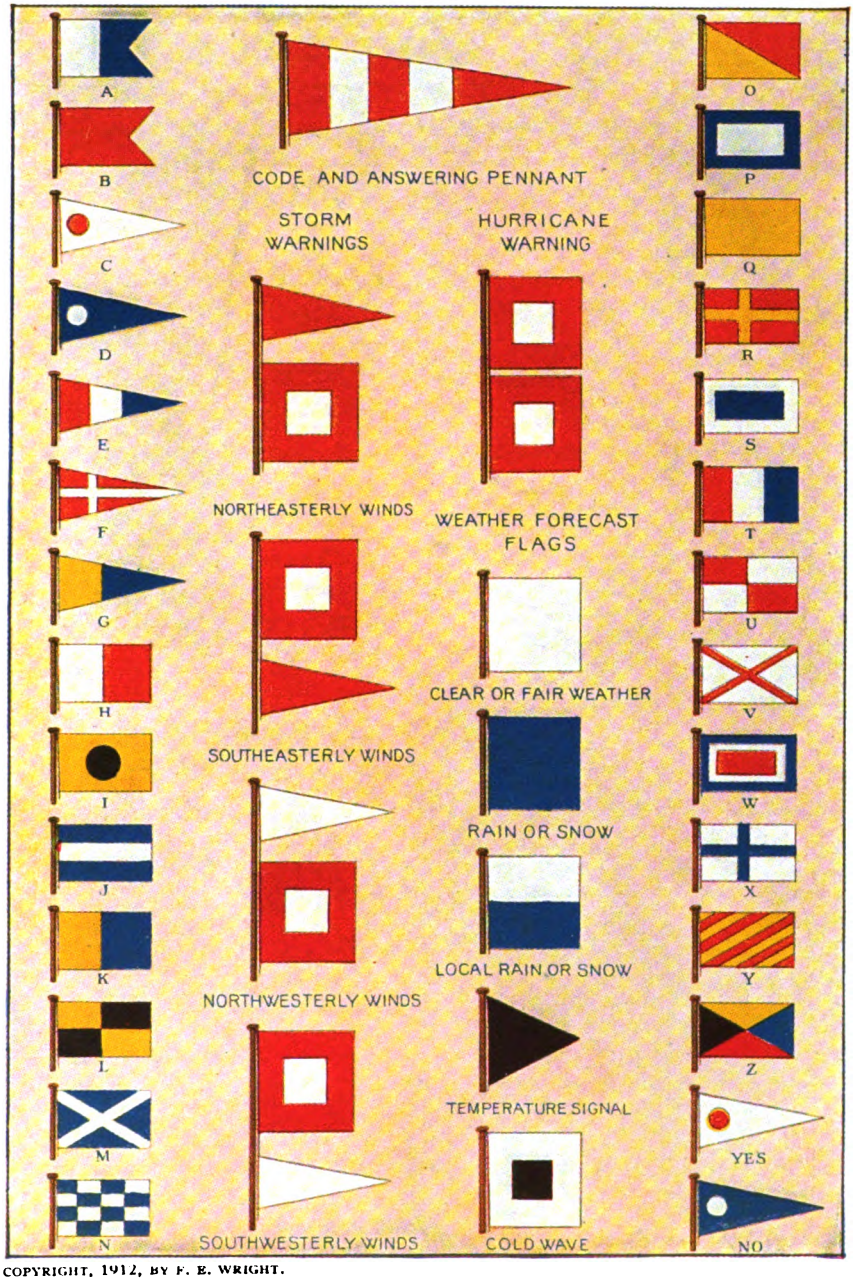
Distribution of Pressure.— The average of all the pressures of the year show belts of high pressure at about latitude 35° north and south, and a belt of low pressure at the equator, all of which move north and south appreciably with the annual march of the sun.

W. J. Humphreys computes the vertical temperature gradient to be as follows:

Height		Pressure	
Kilometers	Miles	Millimeters	Inches
0	0	760	29.92
11	6	168	6.61
20	12.4	39.6	1.56
30	18.6	8.04	0.33
40	24.9	1.65	0.065
50	31.1	0.466	0.018
100	61.1	0.0076	0.0003
150	93.2	0.0043	0.00017

There is a close relation between temperature and pressure. If one takes the average pressures for all the warm months and those of all the cold months it will be found that continents have low pressures in summer and high pressures in winter, and that the intensity of the lows and of the highs will bear a definite relation to the size of the continental area and its distance from the equator. These conditions are reversed on the oceans, the lows occurring in winter and the highs in summer. The heat of summer raises the land to a higher temperature than it does the water. The air expands, rises and overflows to the oceans, leaving a deficient pressure on the continents and an excess on the seas. In winter the land loses heat much more rapidly by radiation





INTERNATIONAL CODE AND U. S. WEATHER BUREAU SIGNALS

than does the water. It contracts, and in the higher levels flows back from the water.

The average hourly pressure for a considerable period will show the barometer rises from 4 A.M. to 10 A.M.; then falls to 4 P.M., and rises to a second daily maximum at 10 P.M.; when it slowly falls to a secondary minimum at 4 A.M. These variations are greatest at the equator, diminishing with latitude until they are hardly distinguishable at the poles.

General Circulation.— In the tropics the winds blow almost continuously from the northeast in the northern hemisphere and from the southeast in the southern hemisphere, with irregular winds, mostly from the west in extra-tropical regions. The explanation of the trade winds is that the heat of the sun raises the temperature and expands the air most where its rays fall nearly perpendicularly. This causes the air to ascend in the region of the equator and to flow in along the surface from either side. Since, however, air moving from higher to lower latitudes passes successively over parallels having greater easterly motion than its own, or rather greater than the parallel whence it started, it would, on account of its momentum, fall behind the diurnal motion of the earth and be deflected more and more to the west. Over the warmest belt it would rise. In rising it would cool by expansion, so that in flowing away from the equator, as it must do to make room for the air continually flowing in at the surface, its tendency would be to gradually fall, reaching the surface in temperate latitudes and contributing to create the belt of high pressure existing at latitude 35° each side of the equator.

The air aloft in going from low to high latitudes passes successively over parallels of latitude having less and less easterly motion, so that it runs ahead of the diurnal rotation of the earth or is deflected more and more to the east, giving us the prevailing westerly winds of the temperate zones when this air comes to earth.

From the isothermal level downward to the surface, between latitudes 30° and the poles, there are cyclonic circulations, central at the poles. The centrifugal force of these winds, because they run ahead of the earth, is greater than it would be if they ran with it, and consequently the air of high latitudes, as it encircles the globe, tends to pile up over latitudes farther south.

Local Circulation.—As previously indicated, the permanent circulations are due to equatorial heating and polar cooling and to the great subpermanent high pressure and low pressure systems created by the different heating effects of continents and oceans. Recently these systems have been called Great Centres of Action. They are built up and disintegrated and change their geographical positions slowly. While they do not have a velocity of translation, like the ordinary cyclones and anti-cyclones that move across continents and oceans and cause the changes of weather that occur from day to day, they do profoundly influence the intensity of storms and the path along which they may move. They, therefore, determine, in a general way, whether the character of the weather for weeks at a time shall be wetter or drier, colder or warmer, than the seasonal average.

Cyclones.— The cyclone, or low pressure, is a system of spirally inflowing winds which ascend in the region of the centre, cool by expansion with gain in altitude and usually cause precipitation in the form of rain or snow. At or below the heights of the wispy cirrus clouds the air flows outward, and at some more or less remote place moves downward in the form of an anti-cyclone. Storms move eastward in the middle latitudes and westward in the tropics, and rotate counter-clockwise in the northern hemisphere and in the opposite direction in the southern hemisphere. While the velocity of gyration may be anywhere from zero to 100 miles per hour, depending upon the steepness of the barometric gradient toward the centre, the velocity of translation of the whole whirling mass usually varies from 20 miles per hour in summer to 40 miles in winter.

Anti-cyclone.— In the anti-cyclone all the movements of the cyclone are reversed except the direction of translation. The air flows downward near the centre and spirally outward along the surface of the earth. It usually is accompanied by clear, cool and settled weather, and this notwithstanding the fact that the air heats by compression as it descends, which apparent inconsistency will be explained in the paragraph on Cold Waves.

Origin of Storms.—Any flowing together of the air between two anti-cyclones must produce a cyclone, and it has been shown that the unequal heating effects of land and water surfaces may be sufficient to initiate cyclonic and anti-cyclonic action.

A hypothesis to account for the beginning of storms that is attracting the attention of meteorologists, assumes that the earth, at times, passes through shafts of extra solar heat, which expand the air at the equator more than they do at higher latitudes, causing the atmosphere at the equator to bulge up until masses at high levels gravitate toward the poles. These masses cool by expansion and by radiation, gain in specific gravity and sink to the earth in the middle latitudes or the north part of the temperate zone. As they come down they rotate in an anti-cyclonic manner and constitute cold waves. Each descending mass forces the ascent of cyclonic whirls or storms on either side. The storms thus formed may move eastward for great distances, crossing continents and oceans before being disintegrated. According to theory these extra heat shafts from the sun may persist for months and return to affect our weather with each 25-day rotation of the luminary. An allowance of 18 days is made for the air to perform the overhead circulation from the equator after each heat impulse before the cold wave appears on our western border. According to this hypothesis these cold masses should settle over land in winter and over oceans in summer, which agrees with observed fact.

Abbot's researches have shown much of the varied character of solar radiation. With a continuation of his work and of that of Kimball, of the Weather Bureau, whose investigations were begun and continued for many years under the direction of the author, the time may come when the general character of seasons may be foretold.

Temperatures of Cyclones and Anti-cyclones.— According to Ferrel and other early

students temperature is supposed to be arranged systematically about the centres of cyclones and anti-cyclones. We now know that such is not the case, that the cyclone as a whole is not a warm area, nor is the anti-cyclone a cold area, but that the rising temperature occurs on the western side of the high area and on the eastern side of the low area, and that the falling temperature is on the western side of the low area and on the eastern side of the high area.

Hurricanes.—The hurricane of the West Indies is the same as the *typhoon* of the Philippines and the China coast. The ordinary cyclonic storm that crosses the United States is about 1,000 miles in diameter. The hurricane is a cyclone usually of only about 100 to 300 miles in diameter, but with a gyratory velocity far in excess of the storms of the temperate latitudes. It occurs in the tropics, moves westward and northward at the rate of only 7 to 12 miles per hour, while the air inside of the storm may be whirling at the rate of over 100 miles. At latitude 26° its path recurves in the form of a parabola, and the storm passes to the northeast. They occur mainly in the four months July to October.

Tornadoes.— The tornado also is cyclonic in its movements, but instead of being 1,000 miles in diameter like the continental cyclone, or 100 miles like the tropical hurricane, it usually has a diameter of gyration of only about 100 to 300 yards, and its speed of rotation is so terrific that no instruments have ever held together long enough to measure its velocity, which must equal or exceed that of a rifle bullet, as the writer has seen wheat straws that were shot by the wind of a tornado one-half inch into the tough body of an oak tree, and a two by four pine scantling driven through five-eighths of an inch of solid iron. As a rule they occur in the spring of the year, in the southeast quadrant of a cyclone, when the temperature and humidity are high. Their direction nearly always is toward the northeast. They occur with the greatest frequency in the States bordering on the Mississippi River.

Thunderstorms.— The thunder storm turns about a horizontal axis instead of a vertical one, as in the case of the tornado. On land thunderstorms occur most frequently at specified hours of the day or night, such as 3 to 5 in the afternoon or 9 to 10 in the evening, and sometimes even at 2 or 3 in the morning, but no such periods are observed over the ocean. They occur at any hour of the day or night with equal frequency. In regard to the electrical phenomena of the atmosphere it is not safe to hazard definite statements, but possibly auroras are due to earth-captured solar electrons, while the lightning of a thunderstorm owes its origin, chiefly at least, to the electrical separation produced by the action of wind on raindrops.

Cold Waves.— The area and intensity of cold waves depends upon the size of the continents and their distance from the equator. The interiors of North America and of Siberia experience more severe cold than occurs at either pole. Departures from the normal temperature of a time and place are due to the dynamic heating and cooling of the air through its upward and downward motions below the six or seven-mile level. Air heats by compression at the rate of about 1° for each 3[illegible] feet of descent in the anti-cyclone, but this heating induces clearness through the evaporation of clouds and allows a rapid loss of heat by radiation. And then the temperature of the air before it starts on its downward journey is so low that notwithstanding the heat of compression, it may be extremely cold when it reaches the earth. However, it is difficult to formulate any hypothesis that will fully account for the cold of the east side of the anti-cyclone being so much greater than that of the west side, or for the heat of the east side of the cyclone being so in excess of that of the west side.

Warm Waves.— In summer there come periods of stagnation in the drift of the highs and the lows. At such times if a high sluggishly rests over the south Atlantic Ocean between Bermuda and the coast of the United States and a low over the northern Rocky Mountain region, there will result what is popularly known as a warm wave, for the air will slowly and steadily flow from the southeast, where the pressure is greater, toward the northwest, where the pressure is less, and, receiving constant accretions of heat from the hot, radiating surface of the earth, finally become abnormally heated. This superheated condition continues until the high over the ocean dies out or drifts away. Consult Davis, 'Elementary Meteorology' (Boston 1894); Ferrel, William, 'Treatise on the Winds' (New York 1893); Flammarion, 'Thunder and Lightning' (Boston 1906); Hann, 'Lehrbuch der Meteorologie' (3d ed., Leipzig 1914); Milham, 'Meteorology' (New York 1912); Moore, 'Descriptive Meteorology' (ib., 1910); Waldo, 'Practical Exercises in Elementary Meteorology' (Boston 1899).

WILLIS LUTHER MOORE,
Professor of Meteorology, George Washington University.

METEOROLOGY, Marine, differs from that of land areas chiefly from the fact that the rays of the sun penetrate more deeply into the ocean substance than into the land and that the diffusion of this heat through the water body is practically uniform. The ocean thus becomes a vast storage reservoir of heat which is but slowly returned to the atmosphere. The effect upon the ocean climate is to render it more equable. An example of this is seen in the climate of the British Isles, Ireland particularly, where the prevalent west winds coming from the great ocean area temper the climate to a remarkable degree. It is a fact notable in this connection that in the approach of winter in the northern hemisphere, when the frost line on the land areas has reached as far south as the parallel of 38° N., on the ocean areas it is not at 65° N. Ocean storms are generally more severe than land storms, but exhibit a close approximation to theoretical form and their progress can be much more accurately foretold. Consult McAdie, A. G., 'Principles of Aerography' (Chicago 1917); Moore, Sir J. W., 'Meterology Practical and Applied' (London 1910).

METEORS. See SHOOTING STARS.

METH. See MEAD.

METHANE, CH_4, also known in the impure state as Marsh Gas, or Firedamp, is found in large quantities in the gases evolved from petroleum wells, oil springs and mud volcanoes. It is present in stagnant pools (hence the name marsh gas) and in certain localities where organic matter is allowed to decay in a limited supply of air. The firedamp of coal mines is methane mixed with a small percentage of carbon dioxide, nitrogen and oxygen. Enormous quantities of methane are present in the burning gases that constitute the "Holy Fire" at Baku in the neighborhood of the Caspian Sea. Methane is formed in the fermentation of compounds like cellulose, milk sugar or calcium butyrate, in the thermal decomposition of alcohol, ethane, ethylene or acetylene and in the dry distillation of vegetable matter. Illuminating gas, produced by the destructive distillation of coal, may contain as much as 40 per cent of methane by volume.

The compound may be prepared in a fairly pure state, (1) by treating commercial aluminum carbide with water; (2) by the interaction of hydrogen and an oxide of carbon at 250° C., in the presence of finely-divided catalyzers like cobalt, nickel or iron; (3) by heating a mixture of fused sodium acetate and dry soda-lime; (4) by the interaction of carbon bisulphide, metallic copper and hydrogen sulphide at an elevated temperature; (5) by maintaining charcoal from sugar in a stream of pure, dry hydrogen at 1.150° C. Chemically pure methane has been prepared by the reduction of methyl iodide. In this process the iodine is mixed with equal volume of alcohol and treated with the "zinc-copper" couple.

Methane is a colorless inodorous gas with a density $=0.559$ (air $=1$). It burns with a faintly luminous flame and with the evolution of much heat. Mixed with air or oxygen in certain proportions and then ignited it explodes violently, one volume of methane forming with 9.5 volumes of air an extremely explosive mixture. On account of its low boiling point methane was for a long time known as one of the permanent gases. It was liquefied by Cailletet in 1877. The liquid is colorless, boils at — 164° C. and solidifies at — 185.5° C. when the pressure is diminished to 80 millimeters.

Methane is a saturated compound and is extremely stable. Reagents like fuming nitric acid, strong sulphuric acid or phosphoric anhydride have practically no action upon it even at elevated temperatures. In the presence of chlorine, bromine or fluorine, methane undergoes a chemical change by substitution, i.e., by the replacement of one or more hydrogen atoms by equivalent atoms of the halogen. Long contact with chlorine, for example, even in diffused daylight and at ordinary temperatures, will convert methane into CH_3Cl (methyl chloride), CH_2Cl_2 (methylene chloride), $CHCl_3$ (chloroform) and CCl_4 (carbon tetrachloride), a molecule of hydrochloric acid being evolved with the introduction of each atom of halogen. At temperatures not lower than 1.300° C. methane has been completely decomposed into carbon and hydrogen. With a mixture of nitrogen and hydrogen in the electric arc it has been successfully converted into hydrocyanic acid. Patents have also been taken for the oxidation of methane (under the catalytic action of tan bark) into formic acid, methyl alcohol and formaldehyde. See GASES IN MINES AND COAL.

METHODIST BOOK CONCERN. See METHODIST EPISCOPAL CHURCH.

METHODIST CHURCH (SOUTH). See METHODIST CHURCHES OF THE WORLD.

METHODIST CHURCH UNION. The Methodist Episcopal Church was divided in 1844 by the subject of slavery. This led to the formation of the Methodist Episcopal Church, South. Beginning with a conference at Cape May, in 1876, several attempts have been made looking toward union. The General Conference of the Methodist Episcopal Church, South, appointed a commission in 1914. The next General Conference of the Methodist Episcopal Church which met at Saratoga, N. Y., in 1916, also appointed a commission. The commissions have held several meetings together but have not yet arrived at conclusions. The bond between the two denominations is very close. They have already united in some of their mission work, especially in education and publication. Many leaders of the Methodist Protestant Church look forward to the time when their body will also be included in the union. The combined membership would be in excess of 6,000,000. In the meantime the three largest groups of Colored Methodists including the African Methodist Episcopal Church, the African Methodist Episcopal Zion Church and the Colored Methodist Episcopal Church, have taken the preliminary steps looking toward union in 1924. They hope that the negro members of the Methodist Episcopal Church will unite with them. The total combined membership of the four groups would be more than 3,000,000.

METHODIST CHURCHES OF THE WORLD. A group of 25 organized bodies which represent an evangelical type of the Christian religion, and which, rising under the Wesleys in England, in the 18th century, has been spread to all countries and has become one of the great Christian Communions.

History of English Methodism.— The rise of Methodism was on this wise. John and Charles Wesley, clergymen of the Church of England, as their father was before them, formed, 1729, at Oxford University, with others, a club for the promotion of personal religion. Being very earnest young men, they proceeded to draw a series of rules of conduct, which were somewhat strict for the times, and observed so carefully that they were called in derision, "Methodists," and their little company was termed the "Holy Club." They prayed much, read devotional books and visited the sick and unfortunate. The age was one of laxness in religious observance and of indulgence in gambling, drinking and other vices and immoralities, which invaded church circles. This tended to deepen the earnestness and enthusiasm of the young reformers and a revival was the natural outcome, the sweep and influence of which no one of them could have imagined. Three men of remarkable power were at the head of the movement, John Wesley (born in 1703), preacher, leader, organizer, author, indefatigable worker; Charles Wesley

(born in 1707), pupit orator, unequaled hymn writer; George Whitefield (born in 1714), evangelist, whose fiery zeal and persuasive eloquence won tens of thousands on both sides of the ocean. All of them great preachers, John was pre-eminently the organizer. His religious experience passed through several stages, the last of which was in 1738, when at a Moravian meeting in London, he "felt his heart strangely warmed." The next year he began to organize converts into societies, which was the actual epoch of Methodism. Opposition in the Church of England, which closed its churches to him, compelled him to resort to open-air preaching which multiplied his hearers and made the movement a people's movement. The preaching was clear, direct, simple, setting forth the doctrine of a free, full, present salvation from sin by faith, and presenting religion of the heart rather than of the head. The Wesleys never severed their relation with the Church of England, nor abandoned its doctrinal and ecclesiastical systems. Methodism in England was a movement within the Church, to which the societies looked for the sacraments until after the death of the founder.

The Methodist system was a gradual development out of the conditions which forced Wesley to take steps contrary to his High Church ideas. Consecrated places being shut to Methodist meetings, he had to build chapels and hold services in schools, private houses and barns, and in the open air; ministers being too few to do the preaching, he called to his aid laymen; societies increased so rapidly that it was necessary to plan for their care, hence the annual conference; changes in appointments being necessary, the itinerancy was developed to regulate them. Other distinctive features of Methodism, the class meeting for testimony and prayer; bookrooms for the publishing and sale of a growing body of denominational literature, and the conference study for the training of preachers not college bred, were likewise in answer to the demand of a rapidly expanding propaganda.

British Methodism did not, after the death of John Wesley, escape the fate of division. Indeed, radical doctrinal differences developed between him and Whitefield, and a separation took place, the latter being a pronounced Calvinist and the former a strong Arminian. One cause or another brought a number of separations, with 9 or 10 different branches. By the process of union several of these have disappeared and there are now five distinct bodies, not including the Welsh Calvinistic Methodist Church which affiliates with the Presbyterian churches.

1. Wesleyan Methodist Church.— John Wesley dominated in absolute fashion the organization he had created, until the success of the American Revolution compelled recognition of the independence of the societies in the United States and in England, as long as he lived. He held both property and patronage; but in anticipation of his death (1791), he prepared a "Deed of Declaration" which constituted 100 preachers, selected by himself, a Legal Conference to hold the Church property and provide for the annual appointment of the preachers. Thus was distributed the large powers which he had held in his own hands and which he was apparently unwilling to entrust to any individual as his successor.

The first Wesleyan Methodist Conference was held in 1744, when Wesley counseled with his preachers and a few clergymen who favored his work, and rules were adopted for the benefit of the societies and the preachers. Later separate conferences were held in Ireland, which Wesley had first visited in 1747, and in America, in 1773, whither two preachers had been sent in 1769. In 1770 there were upward of 29,000 members and probationers in the British societies, and at the time of Wesley's death 71,568. This success had not been obtained without a great deal of hard labor, in which Wesley himself was the chief, continually traveling, preaching at all hours of the day and night, and enduring besides the natural discomforts of his journeys and exposures, obloquy, abuse and even mob and individual violence.

After his death the Conference was at odds on the question of the administration of the sacraments. At its session in 1792, it prohibited them, removing the prohibition in 1793 and subsequently providing for them, and later still for the ordination of ministers. In the 19th century, Home and Foreign Missionary societies were formed and other denominational enterprises instituted. There are two colleges, Wesley, at Sheffield, and Queen's, at Taunton, and a theological college in four places. Lay members were admitted to the Conference in 1878. Beside the annual Conference in England there are conferences in Ireland, France and South Africa. The Church has in Great Britain (1917) nearly 492,000 members and probationers, and in other conferences and its foreign missions, 361,398; in all, 853,398. Methodism is intensely missionary in its spirit, by which it has been carried to the ends of the earth. Wesley's first missionaries were sent to the American colonies and next to the West Indies. The Missions in Africa and Ceylon were begun in 1811 and 1813, respectively. Now the missions of the Methodist bodies of Great Britain, Ireland and Australasia are in all the continents, some of the earlier and most notable successes being in Fiji and other South Sea islands, from which savagery was banished long ago. The various Methodist bodies reported to the Ecumenical Methodist Conference in 1911 an aggregate of $2,540,000 in income for foreign missions which are in the countries of Europe, Asia, Africa, South America and the West Indies.

2. Primitive Methodist Church.— The rise of this body in 1810 was due to the condemnation by the Wesleyan Conference of camp meetings which Lorenzo Dow, an American preacher, had introduced in England, and the exclusion of Hugh Bourne and other ministers for promoting them. The Primitive Church is the largest of the branches which have separated from the original body, having (1916) 205,217 members. It gives a large place to laymen in its government. Hartley College, Manchester, belongs to it.

3. United Methodist Church.— The result of a union of the Methodist New Connexion, formed in 1796 by Alexander Kilham, who was excluded from the Conference for determined opposition to what he called the despotism

the Conference; the Bible Christians, formed in 1810 by William O'Bryan (who had been excluded as a layman) to give more power and opportunity to laymen; and the United Methodist Free Churches, which was itself an organization into which had been merged (1857) several bodies known as "Protestant Methodists," "Wesleyan Methodist Association," "Wesleyan Reformers" and others, all arising out of disciplinary processes by the original body. The Church resulting from the union of 1907 numbered, in 1917, 182,624 members.

4. **Wesleyan Reform Union.**—A small body of 8,770 members, continuing the organization which refused to enter the union of 1857.

5. **Independent Methodist Churches.**—There are 146 of these churches, which are congregational, or independent, with 391 ministers and 9,298 members.

These four bodies have in all 405,949 members. Adding the 853,398 Wesleyan Methodists gives a grand total of 1,259,307 members for the British group, with 6,263 ministers and 16,955 churches. The British group, together with the Australasian, constitutes the Eastern Section of the Ecumenical Methodist Conference, the Western Section consisting of the American churches and the Methodist Church of Japan, which was organized of mission churches of the Methodist Episcopal Church, the Methodist Church of Canada and the Methodist Episcopal Church, South. The Conference meets decennially and is represented in the intervals by an Ecumenical Commission.

Methodism in Australasia.—British Methodism was early planted in the Australasian colonies, the first church in that continent having been formed in 1816. Most of the British branches came in process of time to be represented there, but a union movement which began in 1896 in New Zealand and spread to Australia resulted in a merging of all branches in 1902, save the Primitive Methodists of New Zealand, who maintained a separate existence. There are two bodies:

1. *Australian Methodist Church*, a body of 149,878 members, with 985 itinerant ministers (1917). It has a General Conference, and prosecutes vigorously missions among the natives and the pagan South Sea Islanders and in India. It is also active in education.

2. *New Zealand Methodist Church.*—This body has 24,730 members, with 198 ministers. It manifests missionary zeal and promotes education.

Methodism in America.—The largest group of Methodist churches is that of the United States, consisting of 16 bodies, to which must be added two bodies for Canada and one for Japan, all constituting the Western Section of the Ecumenical Methodist Conference—19 bodies in all, with 8,622,395 members.

1. *Methodist Episcopal Church.*—Immigrants from Ireland and England brought Methodism to the American colonies. The first to land, so far as known, was a company of German Palatines, who had settled in Ireland, and who came thence to America to engage in linen-weaving. The head of the group was Philip Embury, a local preacher, and their class-leader. They arrived at New York in August 1760, probably held meetings occasionally, but formed no society, so far as the record shows, until 1766 when Embury began to preach regularly and formed what was known as the "first Methodist society in America." Two years later the "first Methodist church in America" was built and opened. The third building occupies the original site, and John Street Methodist Church, New York City, is the oldest Methodist society in America. "About the same time," as the historical statement of the Methodist Discipline has it, Robert Strawbridge, a local preacher from Ireland began to preach and form societies at Sams Creek and vicinity, in Frederick County, Md. A log chapel was built soon after. Some claim that the Maryland beginning was prior to that of New York. The matter is in controversy. In response to urgent letters from New York, Wesley sent over (1769) two preachers, Pilmoor and Boardman, to help the "brethren in America." These were followed by others, including a young Methodist preacher from England, Francis Asbury, who arrived in Philadelphia in 1771. All the other men sent by Wesley returned to England before, or at, the outbreak of the Revolutionary War; but Asbury threw in his lot with the Americans and remained to spread Methodism from Georgia to Canada and to the regions beyond the Alleghenies. He organized societies, compiled a book of discipline for their regulation, and administered it with fidelity and firmness. The founder of American Methodism had qualities as a leader and organizer as great, in some respects, as those of Wesley himself, to whom he yielded nothing in zeal, devotion and capacity for work. No man of his time knew the cities, towns and frontier settlements better than Asbury, who held a firm grip of preachers and societies through the formative period, from the time of his arrival in 1771 to the day of his death, 21 March 1816. When he came, 316 Methodists were reported for the American continent; when he died, the number had reached 214,235, surpassing by several thousand the strength of the mother Church in England.

New York, Philadelphia and Baltimore were the early centres of the new denomination; but the greater work was done in the country districts, which, covered with a system of circuits, brought groups of small societies under the care of preachers and multiplied the power of the humble itinerant. The first annual conference was held in Philadelphia in 1773, with 10 preachers, all Europeans, all of the lay order, present. It acknowledged the authority of Wesley and his conference, accepted the doctrine and discipline of British Methodism, forbidding, in loyalty to Wesley, the administration of the sacraments, for which Methodists must look to the Episcopal churches. Opportunities for this were few, and Asbury's iron hand could not always enforce obedience to this rule. Unordained preachers, selected from among converts who had "gifts and graces," served the societies for the next 10 years, there being none others, and none with power to ordain. After the new nation was recognized, the Church was organized. At a general conference of the preachers in Baltimore late in December 1784, a letter was presented from Wesley saying that as the colonies were now independent, both in civil and ecclesiastical matters, he deemed it necessary that the Methodist societies, long deprived of the ordinances, should have them and should have their own

form of government. Having failed to secure ordination for any one from the bishop of London and having for some years been convinced that presbyters and bishops are of the same order, and therefore have the same right to ordain, he had appointed Thomas Coke and Francis Asbury to be joint superintendents in North America. Upon Coke, already a presbyter of the Church of England, he had laid hands in a ceremony of ordination or consecration. The General Conference proceeded to organize the Methodist Episcopal Church, with doctrinal standards, including 25 articles of religion, adopted from the 39 articles of the Church of England, and a discipline. It elected Coke and Asbury as superintendents, or bishops, defining their powers and duties, and Coke ordained Asbury deacon, elder and bishop. This action of the Conference had the effect of settling the controversies which had distracted the societies over the administration of the sacraments, and it provided for ordained men, at a time when such were few and far between, even in the older denominations.

From this time on the Church grew in numbers, annual conferences were created, the itinerancy firmly established, a publishing house set up for denominational literature, schools opened, provision made for training ministers in a course of conference study, and the institutions of an aggressive denomination, including a Church press, home and foreign missions, Church extension, a fund for superannuated ministers, etc., gradually developed.

The peculiar features of the Methodism of Wesley were also those of the Methodism of Asbury: itinerant preachers, whose appointments were changed every year or oftener, then every two years; local preachers from whose ranks the itinerants were recruited; class-leaders for 12 or more members, for prayer, testimony and advice; probation for six months for new converts; Gospel preaching of a fervent type designed to convict of sin and bring repentance and faith in God for salvation and sanctification; a ministry of two orders, deacon and elder, and circuits connecting several societies under one preacher. American Methodism differed from English Methodism in its conference system — quarterly, for the societies, held by the presiding elder; district, for all the societies under the care of the presiding elder; annual, for the itinerants, and general, for legislation and administration and judicial decision; bishops for the whole church, not diocesan, but itinerant. The General Conference, characteristic of all branches, meets once in four years. Lay delegates were admitted in 1872. They equal in number the ministerial delegates.

Its missionary enterprise has been widespread and extensive. It had from 1819 to 1905 one society for home and foreign missions. Since the latter date, it has had a Board of Foreign and a Board of Home missions and Church Extension. The home operations include all classes of population, English and foreign-speaking, also Indian and Negro. For this work the expenditure in 1917, including the Woman's Home Society, was more than $2,400,000. The Foreign Board, together with the Woman's Foreign Society, expended in 1917 $3,716,000. The foreign work, is in Europe — Russia, Finland, Scandinavia, Germany (two annual conferences), Austria-Hungary, Bulgaria, Switzerland, France and Italy — aggregating 74,488 communicants; in Mexico and South America, 18,422 communicants; in India, Burma, Malaysia and the Philippines, 279,646 communicants; in Japan, China and Korea, 82,424; and in Africa, 20,332.

The grand total of Foreign mission communicants is 475,212. The growth of the Church in the United States was almost without parallel. At Asbury's death in 1816 it had 214,235 members; at the end of 1916, 100 years later, it had had, including missions on all continents, save Australia, 4,128,064, notwithstanding losses by repeated division, with 20,503 itinerant ministers, 15,239 local preachers and 30,738 churches, with 4,579,029 in its Sunday schools, and 596,629 in its Epworth Leagues, not including junior members. The estimated value of its church and parsonage property was upward of $250,000,000. Its universities, colleges, seminaries, academies, etc., are numerous, strong, well-endowed and prosperous. Its hospitals, homes for aged and children have come into existence in the last half-century, and are found throughout its boundaries. It is a polyglot Church, having services in German, French, Bohemian, Italian, Spanish, Portuguese, Greek, Swedish, Norwegian, Danish and other European tongues and also in various Indian dialects.

Division has disturbed the Methodist Episcopal Church almost from the first; O'Kelly led out a small company of dissidents in 1793; several organizations were formed before 1820 by withdrawing colored members; a large number were alienated in 1830 as the result of controversy over what was characterized as autocratic rule; later the slavery question became a dividing factor, resulting in a separation in 1841–43, and in 1844–45 in the largest division of all, taking away nearly half of the members reported at that time. Some of the divisions have disappeared, but of those remaining all but one, the Primitive, grew out of differences in government, administration and discipline.

2. *Methodist Episcopal Church, South.*— The existence of slavery in the South after it had ceased in the rest of the States, the struggle to expand it to the border States, and the enforcement of the Fugitive Slave Law sharply accentuated and divided American opinion, and inevitably drew the Churches into the controversy. Anti-slavery sentiment became vigorous and outspoken in the North and roused strenuous opposition in the South. The Methodist Church tried to repress abolition agitation in its ranks, on the one side, and to avoid complicity with the institution, on the other. When Bishop Andrew became a slave holder, through inheritance by his wife, the opposing opinions forced a solution upon the General Conference of 1844. The sentiment of the Northern delegates supported a resolution advising Bishop Andrew to "desist from the exercise of office" so long as he continued to hold slaves. The other bishops united in suggesting that the matter be postponed to the conference of 1848, and that meantime, the work of the bishops be so arranged that Bishop Andrew be given oversight in that section of the country where his services would not meet with objection. But this and other compromises were put aside, under the

fear that otherwise the Church would be broken up in portions in the North, and the resolution was adopted by a vote of 110 to 68. The next day the General Conference refused to say that the action was simply advisory. Thereupon Southern delegates, who had refused to allow Bishop Andrew to resign, entered a protest, and a special committee was appointed to see what could be done. This committee reported a plan of separation which was adopted by a large majority. In the event of the formation of a separate body in the South, the plan provided for an equitable division of the book concern accounts, stock, funds, etc., if the annual conferences should agree to the necessary change in the constitution; those in the South did so agree, but the Northern conferences refused. The General Conference of 1848 declared the "plan" null and void; but meantime the Southern conferences had organized the Methodist Episcopal Church, South.

The new body had in 1846 upward of 455,000 members, including 125,000 negroes. It suffered much in common with other churches in the South during the Civil War, which was fought on territory occupied by it, its losses in members, white, being 112,000 in the period 1860–66; but by 1869 these had more than been made good. Small separations (see CONGREGATIONAL METHODISTS infra) have occurred since, but growth has been continuous and large, reaching 100 per cent in the 30 years ending with 1917, when there were 2,172,628 members, 7,530 itinerant ministers, 1,745,233 scholars in Sunday school, 131,129 members of the Epworth League, 17,376 churches, valued at $63,824,000. It has prosperous home and foreign missions, a full equipment of educational institutions and benevolent organizations. Since Vanderbilt University ceased to be accepted as an institution of the Church, two universities have been established, Emory, at Atlanta and Southwestern, at Dallas, Texas. There are also numerous colleges and other institutions for both sexes. The Methodist Episcopal Church, South, expended in 1917 a total of $1,336,000 on its home and foreign missions which are under one administration. Its foreign missions are in Mexico, Cuba, South America, China, Japan, Korea and Africa.

In doctrine, discipline and government the Church, South, does not differ, except in a few particulars, from the body from which it separated. It gives its bishops a qualified veto over legislation they may deem unconstitutional, there is a limited lay representation in the annual conference, and probation for membership is not required. Appointments of ministers to the same charges is subject to limitation to a term of years, a restriction which the Northern body removed in 1896. A joint commission of 25 from each Church is endeavoring to agree (1918) upon a plan for a reunion of the two Churches, which promises ultimate success. The feeling in the Southern General Conference (Atlanta Ga., May 1918) resulted in a nearly unanimous vote to continue the commission, but there was nothing in the action to remove the deadlock on the race question between the two Churches. The reunited Church would have nearly five and a half million members, with more than 28,000 ministers and 48,000 churches. The plan also provides for a merging of colored bodies in a sectional conference, with representation in the General Conference, which is to unite all the sectional or regional conferences.

3. *Methodist Protestant Church.*— This body was created by a general convention held in November 1830, in Baltimore, of Methodist reformers, most of whom had been expelled or had withdrawn from the Methodist Episcopal Church. They had advocated reduction of the power of bishops; the election of presiding elders, instead of appointment by the bishops; the admission of laymen to all conferences, and various other reforms. They had distinguished leaders, including Nicholas Snethen and Asa Shinn. The new body began its existence with 83 ministers and about 5,000 members, and grew for a time quite rapidly. It admitted laymen to the general and annual conferences, and substituted presidents, elected annually, for bishops, and arranged for the appointment of pastors by a stationing committee. The anti-slavery agitation resulted in a division of this Church (1858) and the creation by the Northern conferences of the Methodist Church. After the close of the war the two Churches were reunited under the original title, which the Southern branch had retained. At the reunion in 1877 there were 116,542 members. The gains in the last 25 years have not been very large. There were in 1915 about 200,000 members, with 1,410 itinerant ministers, including women, and 2,400 churches. There are publishing houses at Baltimore and Pittsburgh, missionary and other denominational societies and educational institutions. Its foreign missions are in Japan, India and China, on which upward of $59,000 was expended in 1917.

4. *Wesleyan Methodist Church.*— Methodist ministers and members, mostly in the State of New York, who demanded the abolition of slavery and were opposed to secret societies, organized this body in 1843. It refused to admit to membership persons connected with slavery or secret societies, and rejected the episcopacy. Within two years after its organization it had 15,000 members; but has grown little since, having in 1916 about 20,000, with 600 ministers and about as many churches. It has a publishing house at Syracuse, N. Y.

5. *Free Methodist Church.*— This body was organized in 1860 by a convention of ministers and laymen, some of whom had been expelled from the Genesee conference of the Methodist Episcopal Church as the result of agitation on subjects of doctrine and practice. Free Methodists insist on non-conformity to the world, plain and simple living, oppose costly churches and emphasize the doctrine of sanctification. They have bishops, elected every four years. Their publishing house is in Chicago. The Church had in 1917 nearly 35,000 members, with 1,250 itinerant ministers and 1,175 churches. It has missions, home and foreign, and educational institutions. It raises nearly $125,000 a year for its foreign missions in China, India, Japan, Africa, the West Indies and Panama.

6. *Primitive Methodist Church,* the result of immigration from England and Canada, and not of any division on this side of the sea. It has two annual conferences and 8,600 members.

7. *Congregational Methodist Church,* the outcome (1872) of withdrawals from the Methodist Episcopal Church, South, on account of ob-

jections to its system of government. A small body known as the New Congregational Methodist Church separated in 1881 from the original body. There was also a colored Congregational body, which has disappeared. The two which remain have together about 18,000 members, mostly in the South. Independent Methodist churches have dwindled to the point of extinction.

Colored Methodist Churches.— Methodism with its fervent appeals and experiences attracted negroes from the first, both North and South. "Black Harry" accompanied Bishop Asbury on some of his journeys, and often spoke with moving power to his own people. Asbury's attitude toward slavery was one of opposition, and he had little or no caste prejudice. Accordingly many negroes became members of the Methodist Episcopal Church, particularly in the cities of New York, Philadelphia and Baltimore. The service of white ministers was not always obtainable or satisfactory, and as early as 1787 some colored people in Philadelphia withdrew and Bishop White, Protestant Episcopal, ordained one of their number to serve them. Bishop Asbury likewise ordained, 1799, Richard Allen, a slave, who had bought his freedom. Including 341,000 colored members in the Methodist Episcopal Church in 1917, and the various distinct colored branches, there are in all about 1,800,000 negro Methodists. (The United States census of 1916 considerably reduces this number, but the Churches say the government figures are too low).

8. *African Methodist Episcopal Church,* organized in Philadelphia, 1816, with Richard Allen, ex-slave, as its first bishop. In doctrines, discipline and government it does not differ materially from the Methodist Episcopal Church, from which it sprang. It has been very prosperous, and under the leadership of Bishop Daniel A. Payne, who graduated from the Reformed Theological Seminary of Gettysburg, it has taken great interest in education. It has four universities, including Wilberforce University, in Ohio. It began foreign missions early in its history in Africa, the West Indies and elsewhere. It has 16 bishops, 5,000 ministers, 6,000 churches and 620,000 members. United States census figures for 1916 are 552,265.

9. *African Methodist Episcopal Zion Church,* organized in New York City as a society for separate worship in 1796, formally as a denomination in 1820. It was the result of a desire of colored members to conduct their own worship. They built a church called Zion and occupied it in 1800. For some years white ministers served it as pastors. Then they secured colored ministers. James Varick was their first bishop. Since 1880 their bishops have been elected for life instead of for four years. It has nine bishops and a full list of denominational boards for its missions and benevolences, and several colleges. It carries on foreign missions in Africa, the West Indies and Guiana. Its publishing house is in Charlotte, N. C. The number of its members, 1915, was 569,000, with upward of 3,500 itinerant ministers and 3,200 churches. The United States census of 1916 cuts down the membership to less than 259,000.

10. *Colored Methodist Episcopal Church,* organized in 1870, under the auspices of the Methodist Episcopal Church, South, of ministers and members connected with the latter body, which reported nearly 208,000 colored members in 1860. Seven years later it had only 54,000, the rest having gone into the various colored churches or into the Methodist Episcopal Church, which created the Freedmen's Aid Society after the war. The Colored Methodist Episcopal Church has grown rapidly, reporting in 1900 about 205,000 members. In 1917 it had 251,560 members, with 3,400 itinerant ministers and 3,285 churches. It has colleges and benevolent societies, eight bishops and a publishing house at Jackson, Tenn.

There are minor colored bodies: (a) Union American Methodist Episcopal Church, beginning in Wilmington, Del., in 1813; (b) African Union Methodist Protestant, dating from 1817; (c) Zion Union Apostolic, organized in 1869; Reformed Methodist Union Episcopal Church with a few members. These bodies have together some 35,000 members.

Methodist Church of Canada.— Methodism reached Canada both from the British Isles and the United States. The first preacher to hold services there was Laurence Coghlan, one of Wesley's preachers, who began work in Newfoundland in 1765. Methodists from John Street Church, New York, arrived in 1783, and Dr. Coke ordained in Baltimore, Md., two men for Nova Scotia. In 1791 the New York conference sent preachers to Nova Scotia and New Brunswick. Bishop Asbury himself visited Canada in 1811. Out of these beginnings came several branches in Canada, the Methodist Episcopal, the British Wesleyan, the Primitive, the Bible Christian and others. The first named became an independent body in 1828 and united, excepting a remnant, with the Wesleyan Church in 1833. In 1874 the Methodist Church of Canada was formed by a union of several bodies, which was made complete in 1883 by the merging with it of other bodies. With the exception of a small colored organization and of a few churches belonging to Methodist Churches of the United States, the Methodist Church of Canada is the one Methodist body north of the border. It has an itinerant general superintendent, a quadrennial general conference, numerous annual conferences, strong educational institutions, home and foreign missions, and a publishing house in Toronto. In 1917 it had 383,103 members, 2,809 itinerant ministers and 3,782 churches. Negotiations have long been pending for a union of this Church with the Presbyterian and Congregational churches. It has been approved by the respective Churches, but has been postponed until the end of the war. The Methodist Church of Canada conducts its missionary operations through one society, assisted by the Woman's organization. Its foreign missions are in Japan and China, on which it expended in 1917 $850,000.

1. *British Methodist Episcopal Church,* a small body of colored members in Canada, with one bishop, one annual conference and 700 members.

2. *Methodist Church of Japan,* an independent Church organized in 1907 of ministers and members of the missions of the Methodist Church of Canada and of the two Methodist Episcopal Churches of the United States. It has a bishop, several annual conferences, 3,

ministers, 297 churches and 19,570 members, all Japanese.

METHODIUS, mĕ-thō'dĭ-ŭs. See CYRILLUS AND METHODIUS.

METHUEN, mĕ-thū'ĕn, **Paul Sanford,** BARON, English general: b. Corsham Court, Wiltshire, 1 Sept. 1845. He is descended from Sir Paul Methuen who effected the treaty, named after him, between England and Portugal in 1703. He studied at Eton; entered the Scots Guards in 1864; saw special service on the Gold Coast in 1873; received a medal for bravery in the Ashanti campaign in 1874; became attaché in Berlin (1877), assistant quartermaster-general Home District (1881) and quartermaster-general in Egyptian War (1882); won a C. M. G. in Bechuanaland (1885); was in command of the Home District from 1892 to 1897; and commanded one of Buller's divisions in the unsuccessful attempt at the beginning of the South African War to relieve Kimberley. At Magersfontein he was terribly beaten. With Lord Roberts he marched on Pretoria in May 1901. In March 1902 he was captured between Vryburg and Lichtenburg, but immediately released. His ill success in South Africa was attributed to the difficult circumstances, and he was placed over the Eastern Command after the Boer War. In 1907 he was commander-in-chief in South Africa and in 1909 governor of Natal. He received the Grand Cross V.O. in 1910 and was created field-marshal in 1911.

METHUEN, Mass., town, in Essex County, on the Spicket River and on the Boston and Maine Railroad, about two miles north of Lawrence. It was settled in 1641 but was a part of Haverhill until 1725 when it became the town of Methuen. The government is administered, as in the early days, by town meetings. It has a number of manufacturing establishments, chief of which are cotton and woolen factories, bell foundry, organ factory, knitting mills, hat factory, worsted goods and yarn factories and basket factories. It has good schools and the Nevins Memorial Library. Pop. about 14,000.

METHUEN TREATY, a commercial treaty between Great Britain and Portugal, signed in 1703 and annulled in 1835, having to do with the tariff on wines and wool. It was negotiated by Sir Paul Methuen, the British Ambassador to Portugal.

METHUSELAH, mĕ-thū'sĕ-lą ("a man with a dart?"), Hebrew patriarch. The name appears in old manuscripts also as Mathusala

and Mathusale. It has been variously translated as "Man of God," "Man of the Javelin," "Man of Sin," "Man of Selah." Because Selah was a title of the god Sin, these other derivations are possible. He is remarkable as the oldest man mentioned in the Bible, his age being stated in Genesis v, 27 as 969 years. According to Hebrew chronology and to that of the Samaritan version (which, however, reduces his age to 720 years), he died in the year of the Flood; but the Septuagint calculation makes him die six years earlier. Few will be found who believe that a man ever attained such an age. The most rational conclusion is that the original writer had in mind a period different from the year of 365 days. Consult Langdon, S., in 'Proceedings of Biblical Archæology' (London 1914).

METHYL ALCOHOL. See ALCOHOL and METHYL.

METHYL AND ITS DERIVATIVES, *in chemistry;* this name is given to the hypothetical radical CH_3, assumed to exist in methylic alcohol and in very many other carbon compounds. Methyl forms the first of the series of alcohol radicals, the general formula of which is C_nH_{2n+1}, and gives rise to an almost innumerable list of compounds. In the year 1848 Frankland and Kolbe, by the action of potassium on ethyl cyanide, obtained a gas the composition of which agreed with the formula C_2H_6; now such a body may be regarded either as (1) ethyl hydride $C_2H_5.H$, or (2) as two atoms of methyl linked together to form one molecule.

$$\begin{matrix} CH_3 \\ | \\ CH_3 \end{matrix}$$

For a considerable time the new substance was supposed to be free methyl, that is —

$$\begin{matrix} CH_3 \\ | \\ CH_3 \end{matrix}$$

and to be isomeric, but not identical with ethyl hydride $C_2H_5.H$.

According to the generally received views concerning atomicity (see CHEMISTRY) such a body as CH_3 could not exist in the free state; it was therefore in keeping with chemical theory to believe that in the moment of its liberation the atoms of this substance should combine together in pairs to form the stable molecule —

$$\begin{matrix} CH_3 \\ | \\ CH_3 \end{matrix}$$

A few years later Frankland succeeded in preparing the same body by the action of zinc on ethyl iodide, $Zn + 2CH_3I = ZnI_2 + 2CH_3$. Frankland compared the action of chlorine on this supposed $2CH_3$ with the action of the same gas on the so-called ethyl hydride ($C_2H_5.H$), and concluded that the two bodies were not identical. Schorlemmer has, however, studied this action of chlorine more carefully, and he finds that the resultant substances are the same in each case. The reactions which take place between equal volumes of chlorine and of the gas C_2H_6 may be thus formulated:

(1) $C_2H_6 + Cl_2 = C_2H_5Cl + HCl$.

(2) $C_2H_5Cl + Cl_2 = C_2H_4Cl_2 + HCl$.

The first reaction is the principal one; small quantities of the body $C_2H_4Cl_2$ (dichlorethane) are, however, always formed. The identity of the two substances formerly known as free methyl and ethyl hydride has been disproved, so that we now know of only one body having the formula C_2H_6; to this substance the name of ethane is given; it forms the second hydrocarbon in the marsh-gas, or C_nH_{2n+2} series. From these considerations it is evident that the radical methyl is known only in combination with other bodies. By the action of chlorine on certain methyl compounds the body CH_2Cl is obtained, from which again the bodies CH_2Cl_2, $CHCl_3$ and CCl_4 may be produced. The oxide of methyl $(CH_3)_2O$, or methyl ether, is produced by the action of sulphuric acid upon wood spirit; this ether may be taken as typical of a large series, in which one of the groups CH_3 is replaced by another radical (either alcoholic or acid). The hydroxyl derivative of methyl, or methylic alcohol, CH_3OH, is prepared in many ways. The most generally employed method consists in rectifying the product obtained by the dry distillation of wood (hence its common name — wood alcohol or wood naphtha); but in order to obtain perfectly pure methyl alcohol it is necessary to prepare a methylic ether, generally methyl oxalic ether, decompose this by distillation with water, and dehydrate the alcohol so obtained by means of quicklime. Methylic alcohol is a colorless mobile liquid, having a specific gravity of .8142 at 32° F.; its boiling point lies about 140° F. It mixes with water in all proportions with the evolution of heat. It burns with a clear blue flame. It is a ready solvent for fats, resins, camphors and fatty oils. The presence of a certain amount of methylic alcohol in ordinary or ethylic alcohol does not interfere with the use of the latter substance in many chemical operations. Such a mixture is known in commerce under the name of *methylated spirit.* Methylic alcohol yields by oxidation formic acid (CH_2O_2), thus $CH_4O + O_2 = CH_2O_2 + H_2O$.

Another important series of methyl derivatives consists of substances known as *methylamines;* these are strongly basic and are generally regarded as ammonia in which one, two or three hydrogen atoms are replaced by one, two or three atoms of the radicle CH_3, thus giving rise to two other groups — the dimethylamines and the trimethylamines. Thus we know of the substances NH_2CH_3, $NH(CH_3)_2$, and $N(CH_3)_3$. Further, as we know of such bodies as ammonium iodide and chloride, so we are acquainted with the corresponding methyl-ammonium salts $N(CH_3)_4I$ etc. Methylene is a colorless gas with a strong odor resembling ammonia. It is highly inflammable, and burns with a yellow flame. The group CH_3 may also be introduced into many of the natural alkaloids (see STRYCHNINE), giving rise to methyl derivatives of these bases. Another extensive series of derivatives are the methylenes, of large importance in the manufacture of dyestuffs.

METHYLATED SPIRIT, alcohol or spirit of wine containing 10 per cent of wood naphtha, which contains a large proportion of methylic alcohol (see METHYL). It is much used in the arts as a solvent, for preserving specimens, in the manufacture of varnishes and for burning in spirit and other lamps.

METHYLENE, Bichloride of, an organic compound of great value as an anæsthetic. It is a colorless fluid having an odor like that of chloroform, and is pleasant to inhale.

METHYLENE BLUE, an aniline dye a bluish crystalline powder having a bronze-like lustre. It is used in medicine, and in malaria is given as a substitute for quinine. See DYES.

METIS, mē'tis, *in ancient mythology,* the first wife of Jupiter, whom he was said to have devoured, after which Minerva (q.v.) was formed within his head.

METLAHKATLA, mĕt-lä-kä'tlä, or **METLAHKATLAH,** the native name of the oldest and most successful mission among the Indians of British Columbia, founded in 1857, by William Duncan, an English missionary, who developed a model community from a tribe of the lowest cannibals. A government school was opened there in 1913. Consult Arctander, K. J., 'Apostle of Alaska' (New York 1909).

METONIC CYCLE, a period of 19 solar years, after which the new and full moon fall on the same days of the year as they did 19 years before. This cycle was the discovery of Meton, a celebrated Athenian mathematician, 432 B.C. The Metonic cycle contained 6,940 days, which exceeds the true length of 19 solar years by 9¼ hours nearly. On the other hand, it exceeds the length of 235 lunations, or synodic revolutions of the moon, by 7½ hours only. In the ecclesiastical calendar the number of the year in the cycle is called the golden number (q.v.). The cycle is supposed to commence with the year in which the new moon falls on the 1st of January.

METRE, mē'tėr, the unit of length in France,=39.37079 English inches, roughly one yard 3 1/3 inches. The metre was intended to be the ten-millionth part of the quadrant of a meridian of the earth. The *centimeter,* the one-hundredth part of a metre or nearly 4/10ths of an inch, possesses more advantages in physics as a unit of length; it is also found very convenient for many purposes for which the English yard is employed. See METRIC SYSTEM; WEIGHTS AND MEASURES.

In music, the equalization of time in the division of a composition. The measure (q.v.) is the smallest element in metre; two measures make a *section,* two sections make a *phrase* and two phrases make a *period.* See MUSIC.

In poetry, that measure of verse that determines the rhythm. It is commonly divided into feet and lines; a series of feet is a colon. See POETRY.

METRIC SYSTEM, The. In the latter half of the 17th century, the French astronomer, Jean Picard (1671), and the Dutch physicist, Christian Huyghens (1673), proposed as a standard unit of length that of a seconds pendulum at sea-level on the 45th degree of latitude. This is only about six millimeters shorter than the meter now in use. Some years earlier, Sir Christopher Wren had advocated that a half-seconds' pendulum should be chosen as such a unit; this would have approximated one-half the length commonly given to the ancient cubit. In 1670 the French mathematician, Abbé Gabriel Mouton, had suggested as a length unit one minute of the earth's circumference, what is now in use as a geographical mile, and he had divided and subdivided this decimally, giving a good Latin terminology for the various divisions and multiples. However, more than a century was to elapse before, under the inspiring influence of the spirit of innovation born of the French Revolution and its precursor, the American War of Independence, a new, scientific and logical system of weights and measures was created, one which has already replaced the old and illogical systems in a great part of the world and is probably destined to become, before many years shall have passed, the universal system. In view of the opposition to any change in this direction still shown by many to-day in England and the United States, it is a strange coincidence that in the very year (1790) when the first steps leading to the establishment of the metric system were taken in France, a new system of weights and measures was offered by John Miller to the British House of Commons, and also by Thomas Jefferson, the Secretary of State, to the House of Representatives of the United States. Jefferson's report formulated a decimal division of the various units. A still closer approximation to the metric system was present in that proposed by the inventor, James Watt, who selected as the unit of mass a definite volume of water, and provided for a simple interrelation of the units of length, area, volume and mass; he communicated this to Talleyrand.

As has been stated, it was in 1790 that the project for a new system of weights and measures was taken up by the French National Assembly. In March of that year, Talleyrand published a proposition to this effect, which he and Prieur des Vernois submitted to the Assembly. That body after referring the project to the Committee on Agriculture for preliminary consideration took it up on 8 May 1790 and on 22 August, a decree, sanctioned by Louis XVI, provided for the establishment of a new system, invited other nations to participate in the project and entrusted to the Académie des Sciences the task of determining on the unit to be employed as a standard. Some representatives from Spain, Italy, Denmark, the Netherlands and Switzerland took part in the discussion of the plan. The Académie des Sciences, in accord with the provisions of the decree, appointed a committee composed of the scientists Borda, Lagrange, Lavoisier, Tillet and Condorcet, and on 27 Oct. 1790, this committee submitted its report to the Assembly. To secure additional data, a second committee was appointed, in which Laplace and Monge were substituted for Lavoisier and Tillet. This second committee, in its report of 19 March 1791, recommended the adoption of the one ten-millionth part of the quadrant of the terrestrial meridian as the standard unit of length. The Assembly accepted this suggestion, and on 26 March 1791 appointed five commissions, each charged with some department of the arduous task. It was decided to make, as an exact basis of calculation, a measurement of an arc of 10 degrees on the meridian of Paris. The composition and attributions of the commissions were as follows:

1. Cassini, Méchain, Legendre; to measure the difference of latitude between Dunkirk and Barcelona, and to compute the triangles.

2. Monge and Meusnier; to compute the bases.

3. Borda and Coulomb; for the observation of the pendulum.

4. Lavoisier and Haüy; for researches as to the weight of distilled water.

5. Tillet, Brisson and Vandermonde; for comparison of ancient measures.

On 1 Aug. 1793, the Convention passed a decree, on the proposition of Arbogast, to the effect that the use of the new system should be declared obligatory at the end of the year. In this decree the nomenclature of the system was determined. Unavoidable delays in the measurement of the arc necessitated some successive modifications, and it was not until the 11th Ventôse, An III (1 March 1795) that an approximately definite report was sent in, to be followed by the decree of 18th Germinal, An III (7 April 1795), which finally established the different parts of the metric system. Lavoisier and Haüy were assisted by Le Fevre-Gireau and Fabbroni in determining the exact weight of a definite volume of water.

The decree of 7 April ordered the continuation of the operations for the exact determination of the units, and to this end provided for 12 commissions to be named by the Committee of Public Instruction. The members chosen were: Berthollet, Borda, Brisson, Coulomb, Delambre, Haüy, Lagrange, Laplace, Méchain, Monge, Prony and Vandermonde. On 16 July 1795, Borda and Brisson presented their report of the verification of the meter, but the measurement of the meridian arc, begun by Delambre and Méchain, 25 June 1792, could only be terminated in 1799. It is interesting to learn that, some years later, the work was continued in the Balearic Islands by Biot and Arago.

As a first step in the legislative enforcement of the system, a decree of 23 Sept. 1795 (1st Vendémiaire, An IV) had provided that its use should be obligatory in the commune of Paris, and in the 'Constitution de l'An IV (1795–96)' its principle was formally recognized. On 16 Oct. 1798 (25th Vendémiaire, An VII), there assembled in Paris a body composed of the delegates of 10 independent nations, designated to establish finally the fundamental units. The report, made in the following year by Van Swinden, of the Batavian Republic, gave the conclusions arrived at, and determined the length of the meter as 443 296/1000 lines of the old "Toise de Pérou," the latter being approximately equivalent to 6.3944 English feet. This report was adopted by the Convention 22 June 1799 (4th Messidor, An VII), and the prototypes in platinum of the meter and kilogram were presented by the Institute. They were immediately deposited in the Palais des Archives of Paris, copies being placed in the Conservatoire des Arts et Métiers, and in the Observatory of Paris, while iron meters were consigned to several foreign countries, including the United States.

It is well worthy of note, in view of the eventual absolute success of the metric system, that at first its progress was slow. For quite a time the people continued to cling to the old measures, and this led, under the First Empire to the promulgation of a ministerial edict, dated 28 March 1812, authorizing the employment of "transitory measures"; among which were the use of a *toise* (fathom) of 2 meters (the actual length of the old *toise* was 1.949 meters), of an *aune* (ell) of 1.20 meters, of a *boisseau* (bushel) of 12.5 liters, etc. It was not until the monarchy of Louis Philippe that absolutely final and decisive action was taken in the matter. The Marquis de Laplace presented to the Chamber a report, upon which was based the law of 4 July 1837, according to the terms of which "all weights and measures except those established by the laws of 18th Germinal, An III and of 19th Frimaire, An VIII (7 April 1795 and 10 Dec. 1799)" should be prohibited after 1 Jan. 1840. Belgium, Holland and Greece were the first countries to adopt the metric system, and before the end of the 19th century, it had become the standard with 40 nations, and had attained world-wide use in science.

Nearly a score of years before the passage of the French law just mentioned, the movement for the adoption of the system in the United States had already found able advocates, one of the most notable being John Quincy Adams who in a report made to the Senate, on 22 Feb 1821, proposed that an international conference should be held to study the merits of the metric system and to provide for co-operation with France tending toward its universal adoption. In the same year two metric standards, made of platinum, were sent to the United States by Albert Gallatin (1761–1849), then Minister to France. They were both authenticated by a certificate from the great physicist Arago, stating of the kilogram that it differed less than 1 milligram from the original "kilogramme des Archives." In form it is a cylinder with flat bases, the edges slightly rounded. Height and diameter are nearly equal, approximately 39.5 millimeters each. The only distinguishing mark is a faint lathe or tool mark of a point within a circle. The square mahogany box in which it was placed bore the following words engraved on a silver plate attached to the cover: "Kilogramme comparé pour son Poids a l'Etalon Protype des Archives de France, et vérifié par M. Arago. Fortin fecit." Despite the assertion that its variation from the standard was but 1 milligram, it was found, when compared in 1879 with the British platinum kilogram, to be 4.25 milligrams light, and this finding was confirmed in 1884, when it was taken to the International Bureau of Weights and Measures at Sèvres, and compared with two auxiliary kilograms known to have the same values as the kilogram of the Archives. The final determination gave the error as −4.6 milligrams. The intrinsic worth of this platinum kilogram to-day, with the metal quoted at $.65 per ounce Troy, would be $3,375, while at the time it was made the value would hardly have exceeded $300.

Older than the Arago kilogram is the "committee meter," as it has been called, which was given to Mr. F. R. Hassler, later superintendent of the Coast Survey, by J. F. Tralle, the deputy from the Helvetic Republic in the committee charged with providing for the production of the metric standards in 1799. It was brought by Mr. Hassler to the United States in 1805, and was a short time later donated by him to the Philosophical Society of Philadelphia. Not long afterward, when Mr. Hassler took

up the Coast Survey work, the society placed this standard at his disposal, and until 1890 it served as the standard for the determinations made by the survey. This meter is made of iron, and is marked with the stamp of the committee, which was a small ellipse, having three quadrants shaded, the remaining one bearing the figures 10,000,000, that of the number of meters in a quadrant of the earth's meridian.

Almost a half century elapsed after the proposal of a metric conference by John Quincy Adams before this project was realized. On 1 Sept. 1869, a decree of Napoleon III summoned an international conference to provide for the production of new and absolutely exact metric standards of mass and length. Fifteen nations responded to this invitation, and the delegates assembled in Paris, 8 Aug. 1870. In spite of the fearful disasters of the French armies and the consequent rapid invasion of French territory by the Germans, five meetings were held before the conference was forced to disband. The following were the 15 countries accepting the invitation of the French government to send representatives to this first Paris conference, of August 1870: Austria, Ecuador, France, Great Britain, Greece, Italy, Norway, Peru, Portugal, Russia, Spain, Switzerland, Turkey, United States, Colombia.

The project was not abandoned, however, and a second conference was called two years later, under the Third Republic, and representatives of 30 nations assembled in Paris on 24 Sept. 1872, remaining in session until 12 October of that year. Their deliberations resulted in the adoption of 40 resolutions bearing on the construction of the new standards; of these 21 especially applied to the meter and 12 to the kilogram, the remainder referring to various details of the plan to be pursued, and to the precautions to be taken for the preservation of the standards when produced, as well as for the maintenance of their invariability. A most important point was the exact determination of the alloy to be employed, and the eventual decision was that it should be one of 90 per cent platinum and 10 per cent iridium, a tolerance of 2 per cent in excess or deficiency being permitted. This alloy possessed at once a high degree of hardness and of resistance to chemical action, and also was susceptible of receiving an exceedingly fine finish. A main share in the task of ensuring the production of a thoroughly satisfactory amalgamation of the metals was entrusted to the chemist, Henri Sainte-Claire Deville. The first ingot made had a weight of 238 kilograms and is commonly known as the "alloy of 1874," from the year in which it was produced. This alloy, however, did not meet with the approval of the commission, although several standards were made out of it to test its qualities. It was now determined to have recourse to the skill and experience of the great London firm of platinum refiners, Messrs. Johnson, Matthey and Company, and as a result of patient effort they were finally able to offer a casting which was found by the chemists of the International Commission, and by those of the French section, to exceed the requirments; from it were made 31 prototype meters and 40 kilogram weights. The meters were sent, early in 1887, to the International Bureau to be compared with the "mètre des Archives" and also with one another. By 1889 this task had been accomplished, and on 26 September of that year the work of the International Committee received the approval of a general conference assembled at Paris. The meter and the kilogram found to be in closest agreement with the meter and kilogram of the Archives were denominated the "International Meter," and the "International Kilogram," and were deposited at the International Bureau of Weights and Measures, in a vault provided with three separate locks, the keys to which are in the possession, respectively, of the Custodian of the Archives of France, the president of the International Committee and the director of the International Bureau. This vault must not be opened oftener than once in a year, and in the presence of the three officers to whom the keys have been confided. To each of the contributing countries were given two of each of the new standards, which were all accompanied by attested certificates of comparison, two hard glass thermometers, each of which had a table of corrections in terms referring to the hydrogen scale, and a piece of the alloy cut from the end of the bar and destined to be used in testing the coefficient of expansion; each kilogram had a rock-crystal bedplate and other requisites for its safe conveyance. The meters allotted to the United States, Nos. 21 and 27, bore corrections of +2.5 microns and —1.6 microns, respectively; the probable error of the determinations being estimated, as a result of 784 individual comparisons, at less than 0.2 microns. The two kilograms assigned were numbered 4 and 20, and had corrections in weight of —0.075 and 0.039 milligrams, and in volume of 46.418 and 46.402 milliliters, respectively. Here from 1,092 individual weighings the error of the determination is less than 0.002 milligrams. Meter No. 27 and Kilogram No. 20 were carefully packed and brought to this country under seal by George Davidson of the Coast and Geodetic Survey. On 2 Jan. 1890, President Harrison received them at the Executive Mansion. The seals were broken in his presence, and he gave a certificate to the effect that they had been received in good condition, and that he was fully persuaded they were the standards to which the report referred. The other kilogram and meter were received in July 1890, and were deposited in the Office of Weights and Measures where the meter and kilogram recognized by the President as national standards had already been placed. By a decision made by the superintendent of weights and measures, on 5 April 1893, and approved by the Secretary of the Treasury, the international meter and kilogram were made the fundamental standards of length and mass in the United States, this applying to the customary weights and measures as well as to those based on the metric units. The standards passed under the control of the Bureau of Standards on its establishment 1 July 1901, pursuant to the provisions of the act of 3 March 1901.

The International Prototype Meter is an irido-platinum bar, 102 centimeters in length. Three lines are engraved near each end of the bar; they are from six to eight microns wide, and about one-half millimeter apart, and the meter is defined as the distance between the middle line of each group, when the temperature of the bar is at 0° C. The lines used to define

the meter and its subdivisions were traced at the Conservatoire des Arts et Métiers in Paris.

While the preliminary work for the production of the new standards was in progress, in March 1875, another international conference was called by the French government, in which France, the United States and 15 other nations out of the 19 represented signed a convention on 20 May 1875, providing for the establishment and support of a permanent International Bureau of Weights and Measures, the management and control of which should be in the hands of an international committee having 14 members, each from a different country. As a site for this bureau, the French government assigned a piece of ground at Sèvres, in the Park of Saint Cloud, declaring it to be neutral territory. It was agreed that the expenses of the bureau were to be borne by contributions paid by the contracting governments, the amount being proportionate both to the population of the country and the extent to which the metric system was used there.

The routine work of the bureau is performed under the supervision of a body termed the International Committee of Weights and Measures. This is in turn subject to the control of a general conference to which all the contracting governments send delegates, and which is to meet at least once every six years. This conference is charged will all questions regarding the measures to be taken to spread the use of the metric system in the countries which have not yet adopted it, and it is also called upon to pass definitely upon any new fundamental determinations that may be proposed.

The Advantages of the Metric System and its Proposed Adoption by the United States and Great Britain.— The initial difficulty and expense incident to a substitution of the metric system for that now in use in the United States and Great Britain have been much exaggerated by many writers on the subject. There would be no necessity for absolutely replacing the machinery appliances now in use; all that would be needed in the great majority of cases would be to re-mark them in accordance with the metric scale, and to adjust their operations in accord with metric requirements. It has indeed been truly said that the only machines that would altogether lose their usefulness would be those for making the old measures. It need never be necessary to change the present lathes, drills, shapers, etc., since there would be no necessity for the manufactured objects to have a particular metric size; all that would be needed would be to have them marked and listed in the metric designations of their actual size. It should be borne in mind, in this connection, that at present the sizes of parts are seldom exact unit sizes, since they are not made to conform to an arithmetical rule but to the exigencies of their practical mechanical use.

The metric system finds an earnest advocate in Hon. William C. Redfield, Secretary of the Department of Commerce. In an address at the Fifth Annual Meeting of the Chambers of Commerce of the United States, in Washington, on 2 Feb. 1917, he said of our present system of weights and measures that it «stands as a bar across that path to foreign trade which it is necessary that we should tread.» In another address, made before the Philadelphia Chamber of Commerce, 10 Jan. 1917, he noted that it required four pages of an official publication to describe the various kinds of bushels that exist in America, and that the Philadelphia mint buys all its supplies and common metals by one kind of weights and measures, its precious metals by another, and does all its laboratory work by a third, this latter being, of course, the metric system. As at least a step in the right direction, he cites the frequent use in drawings of a decimal division of feet and inches.

As to the best means of generalizing the use of the metric system in the United States, Dr. Samuel W. Stratton, director of the Bureau of Standards, writes: «Commerce, technology, and science have, on account of their international character, availed themselves of the advantages of the metric system more than manufacturing, which is local, and, unlike exporting, not in direct touch with world markets. Hence science and commerce with their world-wide outlook should be the advisers of industry, and their conclusion is that the first principle is to supply what the customer needs, and that international business requires international weights and measures.»

As to one of the great merits of the system, we have the following emphatic opinion from the late Lord Kelvin (William Thompson, 1824–1907): «I believe I am not overstating the truth when I say that half the time occupied by clerks and draughtsmen in engineers' and surveyors' offices — I am sure at least one-half of it — is work entailed upon them by the inconvenience of the present farrago of weights and measures. The introduction of the French Metrical System will produce an enormous saving in business offices of all kinds — engineering, commercial, and retail shops.»

The Rt. Hon. Arthur J. Balfour, replying in 1895 to a deputation advocating the introduction of the system in England, used the following words: «Upon the merits of the case I think there can be no doubt whatever that the judgment of the whole civilized world, not excluding countries which still adhere to the antiquated systems under which we suffer, has long decided that the metric system is the only rational system.»

As a step in the direction of the metric system, the decimalization of the coinage has found some favor in England recently, the present florin (a two-shilling piece) being proposed as a new monetary unit since it is exactly one-tenth of a pound sterling. As the British farthing is one ninety-sixth of a florin, an exceedingly trifling reduction of its value would make of it a «cent» representing the one-hundredth part of the florin, and worth only a very small fraction less than one-half of the United States or Canadian cent. Another idea has been to add ten-pence to the value of the pound, which would then contain 250 pence or 1,000 farthings of unchanged value. A new florin, as the tenth of this new pound, would then be worth 100 farthings. It is interesting to note that the proposition to decimalize the British coinage by making the florin, the tenth part of a pound sterling or sovereign, a money of account, and sub-dividing it into hundredths, has for several years been essentially introduced in Peru, where

the gold *libra*, coined as an exact equivalent of the British pound sterling, is divided into 10 silver *soles*, the sol thus being worth exactly $0.48665, or the same as the British florin. The sol is in turn divided into 100 *centavos* worth 0.48665 cent of our money.

Probably no profession would benefit to a greater extent by the introduction of the metric system in the United States and Great Britain than would that of mining-engineering. This is eminently an international science, and to maintain a place in the first rank of his profession the mining engineer must keep himself constantly informed as to the latest methods and improvements introduced in foreign lands. Wherever the metric system is employed, all the data on this profession are expressed in metric weights and measures. When, however, the United States engineer wishes to use these data in connection with his own work, or to compare them with those recording native methods and machinery, he is forced to make a number of very tedious calculations before he can arrive at any exact comparisons. An approximate idea he may indeed quickly gain, but in any exact science all mere approximations are practically useless.

The metric system has for some time been in exclusive use in the medical department of the United States army, and with the entry of the United States into the war against the Central empires, it was used in the manufacture of certain sizes of guns, notably in those conforming to the famous French "75's," the 75-millimeter guns that have proved their superiority to the other field artillery of similar size and also of the 105 millimeter and the 155 millimeter guns. The General Chief of Staff wrote in January 1918, that it was followed in the preparation of operation orders and in map construction for the troops in France, as well as for firing data for artillery and machine guns to be used there. The artillery and machine gun material intended for service abroad was modified to conform with metric measurements.

Another step in furtherance of the adoption of the metric system is one that has recently been taken in the gem-dealers' industry. This concerns the adoption, in precious stone commerce, of an international metric carat of 200 milligrams, to take the place of the various and discrepant national carat-weights that have for so long been sources of serious annoyance, inconvenience and loss of time for gem-dealers. In a paper read in Chicago before the International Congress of Weights and Measures, held in connection with the World's Columbian Exposition of 1893, the writer suggested dividing the carat into 100 parts, and constituting a standard international carat of 200 milligrams, that is, 5 carats, or 20 pearl grains, to a French gram. This represented a depreciation in weight of only about 2½ per cent from the carat-weights most in use. Great credit for having definitely initiated this much-needed reform is unquestionably due to M. C. E. Guillaume, Director of the Bureau International des Poids et Mesures at Sèvres, who energetically and successfully advocated the reform in 1906 before the Commission des Instruments et Travaux, in Paris.*

Simplicity of the Metric System.— There is only one system of weights and measures in the world by means of which, if a voyager were wrecked on a desert island with only one measure, and that so small that it could be put in a lady's thimble, he could reconstruct all the measures for distance, for weight and for capacity, could map out the island, weigh up to tons and know the capacity of any receptacles he might construct. That system is the metric system, and that measure is the cubic centimeter, made hollow, and graduated on the edge in millimeters.

Having this, he could mark a stick up to a meter, dividing it into decimeters, centimeters and millimeters. This meter multiplied a thousand times would give him the kilometer — the standard measure of distance. It would also enable him to determine how many square meters the island measured, and hence how many ares (100 square meters) and hectares (10,000 square meters) it covered in area. Or, he could fill the cubic centimeter with water, which would weigh one gram, and multiplying this by a thousand would give him a kilogram, the standard measure of weight. The cubic centimeter would hold one milliliter of water and 1,000 milliliters would give him the liter, the standard measure of capacity.

The meter for the unit of length, the liter for the unit of capacity and the gram for the unit of mass or weight is the sum and substance of the metric system. These three units (meter, liter, gram) with the following divisions and multiples are winning their way into general use because they are best suited for practical purposes.

The prefixes from the Latin, milli; centi; deci; representing respectively a thousandth, a hundredth and a tenth, and those from the Greek, deka, hecto and kilo representing respectively 10, 100 and 1,000 may be used with any of the metric units. Investigation and experience in the United States and in metric countries, however, indicate the desirability of holding to the metric weights and measures given in the foregoing table, as these are considered sufficient and best for professional work, the industries and trade. Ten meters, for instance, is briefer and more readily understood than one dekameter.

The metric weights and measures were all based on the unit of length. The liter, the unit of capacity, is almost exactly equivalent to a cubic measure 10 centimeters on each edge or 1,000 cubic centimeters (cm^3 or cc). As greater accuracy could be obtained by basing the unit of capacity upon the unit of mass, the definition was written as follows: "A liter is a unit of capacity equivalent to the volume occupied by the mass of one kilogram of pure water at its maximum density at a temperature of 4° C. (39.2° F.) and under the standard atmospheric pressure of 760 mm." One milliliter, equivalent to 1.000027 cubic centimeters of water, weighs one gram. Technically, however, the gram is one thousandth of the kilogram, which is the standard for mass or weight.

* G. F. Kunz, The International Language of Weights and Measures,' *The Scientific Monthly*, Vol. IV, No. 3, March 1917, pp. 215–219, paper read, as retiring chairman, before Section I (Social and Economic Science) of the American Association for the Advancement of Science, in New York City, 27 December 1916.

TABLE OF THE METRIC SYSTEM AND EQUIVALENTS.

	Correct English spelling		Standard abbreviations
Length	10 millimeters	= 1 centimeter	10 mm = 1 cm
	100 centimeters	= 1 meter	100 cm = 1 m
	1000 meters	= 1 kilometer	1000 m = 1 km
Capacity	1000 milliliters	= 1 liter	1000 ml = 1 l
Weight	1000 milligrams	= 1 gram	1000 mg = 1 g
	1000 grams	= 1 kilogram	1000 g = 1 kg
	1000 kilograms	= 1 metric ton	1000 kg = 1 t

LENGTH.

1 centimeter	= 0.3937 inch	1 inch	= 2.5400 centimeters
1 meter	= 3.2808 feet	1 foot	= 0.3048 meters
1 meter	= 1.0936 yards	1 yard	= 0.9144 meters
1 kilometer	= 0.6214 statute mile	1 statute mile	= 1.6093 kilometers
1 kilometer	= 0.5396 nautical mile	1 nautical mile	= 1.8532 kilometers

CAPACITY.

1 milliliter	= 0.0610 cubic inch	1 cubic inch	= 16.3867 milliliters
1 milliliter	= 0.2705 U. S. fluid drachm	1 U. S. fluid drachm	= 3.6966 milliliters
1 milliliter	= 0.0338 U. S. fluid ounce	1 U. S. fluid ounce	= 29.5729 milliliters
1 liter	= 1.0567 U. S. liquid quarts	1 U. S. liquid quart	= 0.9463 liter
1 liter	= 0.9081 U. S. dry quart	1 U. S. dry quart	= 1.1012 liters
1 liter	= 0.2642 U. S. gallon	1 U. S. gallon	= 3.7853 liters
1 milliliter	= 0.2816 British fluid drachm	1 British fluid drachm	= 3.5515 milliliters
1 milliliter	= 0.0352 British fluid ounce	1 British fluid ounce	= 28.4123 milliliters
1 liter	= 0.8799 British liquid quart	1 British liquid quart	= 1.1365 liters
1 liter	= 0.2200 British imperial gallon	1 British imperial gallon	= 4.5460 liters

MASS OR WEIGHT.

1 gram	= 15.4324 grains	1 grain	= 0.0648 gram
1 gram	= 0.6430 pennyweight	1 pennyweight	= 1.5552 grams
1 gram	= 0.7716 apothecaries' scruple	1 apothecaries' scruple	= 1.2960 grams
1 gram	= 0.2572 apothecaries' drachm	1 apothecaries' drachm	= 3.8879 grams
1 gram	= 0.0353 avoirdupois ounce	1 avoirdupois ounce	= 28.3495 grams
1 gram	= 0.0322 troy ounce	1 troy ounce	= 31.1035 grams
1 kilogram	= 2.2046 avoirdupois pounds	1 avoirdupois pound	= 0.4536 kilogram
1 kilogram	= 2.6792 troy pounds	1 troy pound	= 0.3732 kilogram
1 metric ton (1000 kilograms)	= 0.9842 long tons (2240 lbs.)	1 long ton	= 1.0160 metric tons (1000 kilograms)
1 metric ton	= 1.1023 short tons (2000 lbs.)	1 short ton	= 0.9072 metric ton

The equivalents given in this article are based upon the following fundamental equivalents:

39.370000 United States inches	= 1 meter
39.370113 British inches	= 1 meter
0.2641776 United States gallon	= 1 liter
0.2199753 British Imperial gallon	= 1 liter
1 United States avoirdupois pound	= 0.4535924277 kilogram
1 British avoirdupois pound	= 0.4535924300 kilogram

A quantity can usually be expressed as a whole number if the proper metric weight or measure is selected. Even when a fraction is needed to express the metric equivalent of another weight or measure, one or two figures to the right of the decimal point generally give sufficient accuracy. Equivalents such as those in the tables here given are intended to be used only to the required degree of accuracy. For example, four inches is equal to about 10 centimeters; if greater accuracy is desired 10.2 centimeters or 102 millimeters may be taken.

GEORGE F. KUNZ.

METROPOLIS CITY, Ill., city, county-seat of Massac County, on the Ohio River, here spanned by a fine modern bridge, and on the Illinois Central and the Chicago, Burlington and Quincy railroads, about 190 miles south by east of Springfield. It is in a healthful locality built on a high bluff, with an incline toward the river. The site was selected in 1700 by the French, when Fort Massac was erected; but no permanent settlement was made until 1838. It was incorporated in 1843. The city has lumber mills, basket and box factories, flour mills, potteries, veneer and furniture factories, and municipal electric light and water plant. The city is the trade centre for nearly all of Massac County and is an active shipping point in all directions by rail and water. The form of government is aldermanic. There are good schools, the R. W. McCartney Public Library, the Odd Fellows' Temple, a sanatorium, a city hall, courthouse, music-hall, several fine churches and recreation parks. Pop. 5,000.

METROPOLITAN, the Greek name of an archbishop, whose see is the chief place or metropolis of a province. The metropolitan is above the bishop, but below the patriarch. The title of patriarch, however, is in use only in the Eastern churches. In Russia the metropolitan is at the head of the hierarchy. In the Roman Catholic Church an archbishop may bear this title even though he does not have a metropolis as a see, thus the archbishop of Westminster is styled metropolitan.

METTERNICH, mĕt'tĕr-nĭh, Clemens Wenzel Nepomuk Lothar, PRINCE, Austrian statesman; b. Coblenz, 15 May 1773; d. Vienna

11 June 1859. He was educated at Strassburg; when only 17 represented the Westphalian princes at the coronation of Leopold II; settled in Vienna in 1794; and assured himself a place in diplomacy by marrying the granddaughter of the Austrian chancellor, Kaunitz, in 1795. This marriage not only gave him entry to the best society, but brought wealth, and at the Congress of Rastatt he represented the Westphalian collegium, where he served his apprenticeship in politics. In 1801 he was sent to Dresden by Austria; two years later to Berlin; there a part of his mission was to cultivate the friendship of the French Ambassador. He did this so well that that official induced Napoleon to suggest to Austria that Metternich would be a most acceptable representative at the Tuileries; and so in 1806 he was sent to Paris, where he ingratiated himself with Caroline Murat, sister to Napoleon, and with Tallyrand. On the outbreak of the war between France and Austria, Metternich was put to much personal inconvenience by Napoleon, who forcibly detained him for some time. Thereafter he entered eagerly into the anti-Napoleonic league; assisted in the formation of the Quadruple Alliance; and as Germany proved successful, took no part in the national sentiment which arose, but directed himself solely to the aggrandizement of Austria, hence doing his best to preserve the French boundaries as they had been and to render Austria the only gainer among the powers by the reapportionment of Europe. He is credited with having planned and brought about the marriage of Napoleon and Maria Louise. In the years that followed he carried things his own way in Austria, planned the Holy Alliance and was extremely reactionary in his internal and foreign policies. In the difficult times of Napoleon's supremacy and his fall Metternich guided Austria policies with a masterly hand. As a diplomatist he was the equal of any of his time. In 1814 he visited England and formed the quadruple alliance. He was the master spirit at the Congress of Vienna and for 15 years thereafter was the leading statesman of Europe. The Revolution of 1830 in France showed the ill-success of his program; and the rising of 1848 and the insurrection in Vienna itself made it necessary for the Emperor Ferdinand to demand his resignation. He kept some power even then, his counsel being frequently sought. A. C., 'Metternich, Life and Career' (New York 1911).

METZ, mĕts, Germany, an important fortified city and episcopal see of Alsace-Lorraine, on the Moselle, which here divides into several arms, 79 miles northwest of Strassburg. It is the third city of Alsace-Lorraine and has four representatives in the First Chamber of the Prussian Diet. The major part of the town stands on a height within the fortifications, outside of which there is a series of strong detached forts of excessive strength. Metz is also the centre or seat of control of the group of forts which includes Diedenhofen and Bitsch. In 1912 the garrison numbered 25,000. The cathedral is a late Gothic structure, surmounted by a spire of open work 397 feet high. There are imposing public buildings. The manufactures consist of woolens, cottons, hosiery, hats, muslin, glue, leather, etc. Several battles were fought in the neighborhood and under its walls between the Germans and French in August 1870. The Germans subsequently invested the town and, being reduced to a state of famine, on 28 October it capitulated with 180,000 officers and men under the command of Marshal Bazaine. The near-by cemetery of Chambiere holds the remains of over 7,000 French soldiers who perished here. It was included in the cession of territory to Germany at the Peace of 1871. Metz was anciently known as Divodurum, and later the Romans rechristened it Mediomatrica, of which Metz is a contraction. The Romans built military roads through the territory, and a fine aqueduct, of which traces remain. Attila sacked the town in the 5th century. After the retirement of the Huns, the Franks obtained control and made it the capital of Austrasia. In 870 it was included in East Francia, and developed under German influence. Its prosperity increased, and in the 13th century, as a free imperial city, it attained the zenith of its prosperity. It was taken by the French in 1553. This ownership was later confirmed by the Peace of Westphalia in 1648. Thereafter it remained until 1870, with the rest of Alsace-Lorraine, a peaceable French territory. For its history in 1870–71, see FRANCO-GERMAN WAR. Marshal Pétain entered the city at the head of the Tenth Army on 19 Nov. 1918 amid great rejoicing. After 47 years of German domination Metz was reunited to France. Pop. 68,598.

MEUDON, mè-dôn, France, a town southwest of Paris, near the Seine, on the railway to Versailles, six miles to the west. It had formerly a fine château, built by Louis XIV, surrounded by the Forêt de Meudon, still a favorite holiday resort of the Parisians. This château was fitted up in 1812 by Napoleon I for Marie Louise, and it was a residence of the Napoleons under the Second Empire, but was ruined during the siege of Paris in 1870. An astronomical observatory has since been established in the remains of the castle. The Duchess of Galliera established here a home for the aged and for orphans, at a cost of $2,800,000. Meudon has glass-works, bleach-fields, extensive government munition works and other industrial establishments. Rabelais was for a short time curé of Meudon. Pop. of commune about 12,292.

MEULEN, mē'lĕn, **Adam Frans van der,** Flemish painter: b. Brussels, 11 Jan. 1632; d. Paris, 15 Oct. 1690. He studied under Snayers; removed to Paris; and there became court painter to Louis XIV, for whom he painted many battle scenes.

MEUNIER, mē-nē-ā, **Constantin,** Belgian artist: b. Brussels, 1831; d. there, 4 April 1905. He is known as a historical and genre painter as well as a sculptor of considerable power, though his naturalistic pictures are sometimes revolting; and it would seem as if his studies in Madrid had brought him under the influence of Ribera and his sanguinary school. He has produced some vivid pictures of life in the colliery district amid whose unlovely surround-

ings he has made his home. His 'Martyrdom of Saint Stephen' in the Ghent Museum is quite in the spirit of Ribera and shocks the mind by its brutal literalness. 'The Peasants' Rebellion' is an example of his energy and force as a realist in modern life. His statue 'The Lost Son' is in the Berlin National Gallery.

MEUNIER, Étienne Stanislas, French geologist: b. Paris, 1843. A student of the Paris faculty of sciences, he attained his doctor's degree in 1869 and was laureate of the Academy of Sciences in 1878. In 1892 he was appointed professor of geology at the National Museum of Natural History. He was made a knight of the Legion of Honor, and has been vice-president of the Geological Society of France. His chief publications are 'Le ciel géologique' (1871); 'Géologie des environs de Paris' (1875; rev. ed. 1912); 'Geologie régionale de France' (1889); 'La géologie comperée (1895); 'Nos terrains: géologie populaire' (1898); 'La géologie générale' (1903); 'La géologie expérimentale' (1904); 'Les convulsions de l'écorce terrestre' (1910).

MEURICE, Francois Paul, frän-swä pōl mė-rēs, French dramatist: b. Paris, 1820; d. there, 11 Dec. 1905. He was educated at the Collége Charlemagne and entered upon a literary career. He worked for a time in collaboration with Dumas, with whom he made a translation of Hamlet, and was entrusted by Victor Hugo, his brother-in-law, with the publication of his complete works. He published 'Benvenuto Cellini' (1852); 'Fanfan la Tulipe' (1858); 'Cadio' (1868); 'Césara' (1869), etc.

MEURSIUS, mēr'sī-ūs, Johannes Van Meurs, Dutch scholar and historian: b. Lovsduinen, 1579; d. 1639. Besides 'Glossarium Græco-Barbarum' (1614); and 'Athenæ Batavæ' (1625); for his edition of Greek authors he wrote numerous introductory essays which J. F. Gronovius reprinted in 'Thesaurus Antiquitatum Græcarum.' His complete works were edited by Lami (12 vols., Florence 1741–63).

MEUSE, mēz, or mūz, river which rises in France in the south of the department Haute-Marne, and with a northward trend crosses the northwestern corner of the department Vosges where between Bazielles and Noncourt it has a subterranean course of three and a half miles. It traverses the departments Meuse and Ardennes, and on reaching Sedan enters Belgium. At Namur where it receives on the left its largest tributary, the Sambre, almost doubling its volume, it changes its course to northeast, and passes Liège, where it is augmented by the Ourthe; it separates Dutch from Belgian Limburg, passing Maestricht and Roermond, at the latter of which it receives the Roer. In the northern part of Dutch Limburg its course is changed to northwest, and subsequently it becomes west. The whole of its after-course is through the Netherlands, in which it forms for some distance the boundary between North Brabant and Gelderland. It finally joins the left bank of the Waal, one of the arms of the Rhine, and gives its name to the accumulated flood of these streams, which, proceeding west through Holland proper, is divided near Dordrecht into two great rivers, the one of which bends round to the north and reaches Rotterdam; the other branch continues west; shortly after the two branches again unite and discharge themselves into the North Sea. The direct length of the Meuse is 230 miles; and its length including windings is 580 miles. It is navigable for about 460 miles. A section of the Meuse River was selected by the French government before 1870 as the location for a chain of protective forts which became known as the Meuse line. These forts extend for 31 miles from Verdun to Toul, being disposed along the eastern banks of the river. The names of the forts are Verdun, Saint Mihiel, Genicourt, Troyon, Lionville, Saint Agnant, Gironville, Jous sous les Cote and Tours. There was also constructed a second line of forts from Pagny to Neufchateau. This region saw some of the heaviest fighting of the Great World War. See WAR, EUROPEAN.

MEXCALA, mās-kā'lā, or **MESCALA** mės-kā'lā, a river of Mexico, in the southern part, which has its rise in the mountains southeast of the City of Mexico, and flows generally west for 450 miles to the Pacific. It is called Atoyac in the first part of its course, and as the boundary line between the states of Michoacàn and Guerrero, it is called Rio de las Balsas. The port of Zacatula is at its mouth. It is a swift-flowing stream, and has a number of low cascades and rapids.

MEXIA, Tex., city in Limestone County on the Houston and Texas Central and the Trinity and Brazos Valley railroads, 40 miles northeast of Waco. Natural gas and oil are produced nearby and cotton and corn are extensively cultivated. The city has a broom factory, cotton mills and oil mills, city hall, railroad repair shops, and a public library. The commission form of government is in operation. Pop. 2,690.

MEXICAN ARCHÆOLOGY. See MEXICO — ARCHÆOLOGY.

MEXICAN HAIRLESS DOG, a small terrier-like dog, of uncertain origin, without hair except a tuft on the crown of the head, another on the tail and a few scattering wisps on the body; the skin is grayish black, wrinkled and dry. Clavigero describes a large hairless dog found among the Mexicans by the Spanish conquerors, whose puppies were esteemed as an edible delicacy; and others are recorded as having occurred in ancient Peru and on various of the West Indian islands.

MEXICAN JUMPING BEAN. See JUMPING BEANS.

MEXICAN LITERATURE. See MEXICO — LITERATURE.

MEXICAN NUN, The, name given to JUANA INEZ DE LA CRUZ, Mexican poet: b. San Miguel de Nepantla, near Mexico, 12 Nov. 1651; d. Mexico, 17 April 1695. She was well known in Mexico for her learning, took the veil in the convent of San Jerónimo, after some years abandoned her studies wholly for the duties of the convent, and sold her library in aid of charity. Her death occurred during a severe epidemic. Among her works are 'Poésias Sagrades y Profanas'; 'El Neptuno Alegórico', and the comedy 'Los Empeños de Una Casa.'

MEXICAN ONYX, a stained and banded

variety of Calcite. It is not true onyx. See CALCITE; ONYX.

MEXICAN SUBREGION, a faunal district of the Neotropical region embracing the low hot coast region of Mexico. See ZOOGEOGRAPHY.

MEXICAN TEA. See GOOSEFOOT.

MEXICAN WAR, The. The annexation of Texas in 1845 laid the foundation for the war with Mexico. Although Texas had been for many years practically free, and had been recognized by the United States, England, France and other countries, yet Mexico still refused to acknowledge its independence. When therefore the United States proposed to admit Texas into the Union, Mexico gave warning that the annexation would be equivalent to a declaration of war, and 6 March 1845 protested, and soon afterward withdrew her Minister and severed diplomatic relations. Her acts, however, scarcely justified her threats, as at that time at least little or no preparation was made for war. It has, therefore, been claimed that had the American government used a conciliatory policy peace might have been preserved, and friendly relations re-established.

At the moment, however, the Mexican people and authorities were in a rather belligerent attitude, due in part to pride, and in part to an expectation that the United States would soon be involved in a war with Great Britain over the Oregon boundary, in which case Mexico would have a powerful ally to aid her. Did President Polk at this point seek to strengthen this hope in the minds of the Mexicans, intending at the proper moment to make a compromise and peace with England, as was done, and thus leave Mexico at the mercy of the United States? Perhaps history can never answer the question, but events at least seemed to march in harmony with the thought. For Mexico soon found herself in the dilemma that she must either sell California to the United States, receiving in return a goodly sum of money to appease her pride, or engage in a war to sustain her honor and territorial integrity. Mexico bravely, but perhaps not wisely, chose the latter alternative, not fully realizing the inequality of the contestants, nor the depth of the humiliation to which she would be subjected. Doubtless President Polk preferred to acquire California without war; but its acquisition was to be the principal measure of his administration. Hence if war was the only means to secure it, war it must be; at least enough to get possession of the desired territory.

Causes of the War.— The immediate occasion, however, of the war was the dispute in regard to the western boundary of Texas. Proclaiming her independence in 1836 Texas asserted that her western boundary was the Rio Grande to its source, thence due north to the 42d degree of north latitude. The following year the United States recognized her independence, and in December 1845, by a joint resolution, admitted her into the Union as a State, providing that boundary disputes were to be settled by the United States. President Polk accepted the boundary line claimed by Texas, and 13 Jan. 1846 ordered Gen. Zachary Taylor to march to the eastern bank of the Rio Grande as the western boundary of the United States. Mexico insisted that the Nueces River — 100 miles eastward — was the true western boundary of Texas, and therefore that General Taylor was now on Mexican soil. On 25 April 1846, the first blood was shed in a conflict between a band of Mexican troops that had crossed to the eastern side of the Rio Grande and a company of American soldiers. The news of this action was immediately communicated by General Taylor to President Polk, who sent his now noted message to Congress, asserting that war was begun by the act of Mexico on American soil. Congress accepted, after a stormy debate in the Senate, the President's statement, and war was recognized as existing.

Other causes than the two already noted were also at work, and help to make a decision in regard to the justness of the war still more difficult. Mexico for many years had been in a chronic state of revolution. The natural result followed. American citizens in Mexico sustained property losses and doubtless were frequently unjustly arrested and even imprisoned. Claims arising from these causes had been in part settled under a convention of 1840; but many of them were still pending. Some were just; more, either unjust or extravagant in amount. President Polk united these unsettled claims with the boundary question, and demanded that Mexico receive an envoy extraordinary with power to settle both — on its face an eminently fair proposition. On the other hand, Mexico professed to be ready to receive an ambassador to settle the boundary dispute, but declined to receive Mr. Slidell as our minister when commissioned to settle all disputes, insisting that the two questions were distinct in kind and origin and should not be united. President Polk in his message asserted that this action of Mexico was in violation of her promise to receive a minister, and hence justified his administration in its measures, and forced him to take possession of the disputed territory.

The need of more slave territory was perhaps another factor in causing the war. At least many from the South took an aggressive position on all questions in dispute between the two countries and thus made a peaceable settlement more difficult. Both the economic and the political reasons for more territory began to be felt by 1846 — the one to have new soil over which to spread the land-exhausting system of slavery; and the other to have new territory out of which to carve new slave States that the equilibrium between slave and free States might be maintained. Some other forces tending to arouse the war and aggressive spirit may be noted. The cry of "manifest destiny" played a part. Many, especially in the West, felt that the Pacific Ocean was the natural western boundary of the United States. They also demanded the "Golden Gate" that commerce might be opened up with the Orient. The two great parties — the Whigs and the Democrats — divided quite sharply on the question; in fact so completely that the war became almost a party, instead of a national, issue. The Democrats, as a rule, supported the administration and its claim that the war was just. The Whigs, on the contrary, asserted that it was a most unholy and unrighteous war, and characterized it as Polk's war. Lincoln, entering Congress in 1847, became a severe critic of the

policy pursued, while Tom Corwin of Ohio went so far as to use this language: "If I were a Mexican I would tell you, 'Have you not room in your own country to bury your dead men? If you come into mine we will greet you with bloody hands, and welcome you to hospitable graves.'"

President Polk summarized his reasons for recommending that Congress recognize war as existing as follows: "The grievous wrongs perpetrated by Mexico upon our citizens throughout a long period of years remain unredressed; and solemn treaties . . . have been disregarded. . . . Our commerce with Mexico has been almost annihilated." He then adds: "As war exists, and . . . exists by the act of Mexico herself, we are called upon, by every consideration of duty and patriotism, to vindicate, with decision the honor, the rights, and the interests of our country."

The Campaigns.—The war with Mexico was accepted as a fact by Congress 13 May 1846. There were four principal fields of action in its prosecution. (1) Along the Rio Grande, under the command of Gen. Zachary Taylor; (2) in California, where Capt. John C. Frémont and Admiral Stockton were in command; (3) in New Mexico, with Gen. Stephen W. Kearney leading the American forces; and (4) from Vera Cruz to the City of Mexico, under the command of Gen. Winfield S. Scott, the commander-in-chief of the American armies. Everywhere success attended the American arms. Perhaps it was the first war in history, lasting two years, in which no defeat was sustained by one party, and no victory won by the other.

General Taylor defeated the Mexican troops at Palo Alto 8 May; at Resaca de la Palma the following day and captured Matamoras on the 18th. He remained near that city for some weeks to recruit his army and prepare to advance into the interior. On 24 September he entered Monterey, after a siege of four days, and a gallant resistance by the Mexicans. Taylor's most famous victory, however, was won 23 Feb. 1847, at Beuna Vista. General Scott gave orders, which unfortunately fell into the hands of Santa Anna, the Mexican general, for General Taylor to send some nine regiments to aid Scott in his proposed attack on Vera Cruz. Santa Anna immediately marched his whole command against Taylor, expecting to crush him in this weakened condition. It was 20,000 men against about 5,000. But the skill of Taylor, the persistence of his army, the organization and equipment of the American troops, won a great victory. Taylor became the hero of the hour, and Buena Vista made him an irresistible Presidential candidate.

Frémont's course in California has been a subject of keen controversy. As leader of an exploring expedition he was already in northern California, and early in 1846 was recalled to the Sacramento Valley. California was the goal of the political policy of Polk's administration. The means to secure its acquisition were uncertain. It might be gained by war; or by filling the territory with American settlers who in course of time might bring it into the Union as Texas had already been annexed; or it might be effected by securing the goodwill of the native Californians who were already jealous of Mexican rule. The latter policy seems to have been the one adopted by the administration. The American consul at Monterey, Mr. Larkin, was developing this policy with a good prospect of success, it is claimed, when Frémont appeared on the scene. He seems to have developed a fourth policy, namely, the establishment of an independent government under the control of the American settlers in the Sacramento Valley. This movement resulted in the "Bear Flag Republic," and virtual civil war between the native Californians and the American settlers. At this moment the Mexican War began and the "Bear Flag" was replaced by the "Stars and Stripes." It has been claimed by some California historians that Frémont's course, had not the Mexican War come at the moment it did, might have lost California to the United States. The native Californians, alienated as they were by his course, might have put themselves under an English protectorate in revenge for the treatment accorded them. Be this as it may, by the end of the year all California was conquered and held by American troops, and Frémont was regarded as the hero who had won the "Golden Gate" by his energy and decision. Santa Fé was captured by General Kearney, and New Mexico secured with almost no loss of life. By the end of the year, therefore, all the territory that the administration desired was in the possession of its armies, but Mexico was still unconquered.

Scott had been chafing in Washington during the summer and fall of 1846 while Taylor was winning his brilliant victories. He asked to go to the front to assume chief command, but the administration retained him at the capital under the plea of needing his advice. As it happened this Democratic war was officered by Whig generals. Scott had already been a Whig candidate for President. The charge was now made that Scott was kept from command for fear that success might make him a more formidable candidate in 1848. Finally, when he was sent to the front in January 1847, the cry was raised that the purpose was to dim the lustre of Taylor's victories, or at least to divide the popular support between the two generals in such a way as to destroy the political prospects of both.

General Scott invested Vera Cruz in March 1847, and by the 27th had captured the fortress which had been thought to be almost impregnable, and was ready to enter the city. On 8 April he started into the interior, and on the 18th captured Cerro Gordo; the 19th, Jalapa, and the 22d Perote. On 15 May he entered the important city of Puebla. Remaining here for some weeks he again advanced, in August, toward the capital, and on the 10th came in sight of the city of the Montezumas. Two important victories were won 20 August—at Contreras and at Churubusco. He captured Molina del Rey 8 September, and five days later the victory of Chapultepec gave him the City of Mexico itself which he entered on the following day with an army of only 6,000 men. The war was practically over, but the victory was so complete that it began to be a question whether there was any government left with sufficient power to negotiate a treaty of peace. An agitation began with friends both in and out of Congress, as well as in the cabinet, looking to the annexation of the whole of Mexico

Calhoun on the one hand, Webster and a majority of the Whigs on the other, joined hands to defeat this plan. President Polk was finally forced to make the ultimate decision. N. P. Trist was sent in March 1847 to Mexico to make a treaty of peace. Failing he was ordered in the fall to return to Washington; but disobeying instructions he remained in Mexico, and on 2 Feb. 1848 concluded a treaty of peace in harmony with his original instructions. The administration was in a quandary. To ratify meant to condone the disobedience of Trist. To reject meant a prolongation of the war, and time to perfect the intrigue for the annexation of "All Mexico." President Polk, after some hesitation, decided to send the treaty to the Senate for its consideration. Received 23 February, it was ratified, after some amendments, 10 March, by a vote of 38 to 14. On 30 May ratifications were exchanged and the war was at an end.

The Mexicans had fought bravely, even stubbornly and at times skilfully, yet in every contest, even when the odds were greatly in their favor, without a single victory. In part superior leadership and training won for the soldiers of the northern republic; in part their cooler and more persistent character; but in the main it was not bravery, nor generalship, nor even character that won. It was science and education applied in the equipment of the armies, the guns of the soldiers, the cannon on the ramparts and the powder in the arsenals which made the one so much more effective than the other that the most daring bravery was no counterpoise.

The Treaty of Peace.— The treaty of Guadalupe Hidalgo gave to the administration of President Polk the territory that his diary informs us he intended to acquire, California and New Mexico. Mexico in return for the loss of its fairest northern provinces was paid $15,000,000, and released from all claims of all kinds held by citizens of the United States against her, estimated at $3,250,000, which the United States assumed. Boundary lines were drawn, and provision made in regard to other questions at issue between the two countries.

Results.— Usually successfully waged wars redound to the credit of the party in power. In this case, however, the Democratic party, the author and supporter of the war, was defeated by the Whig party, the party of opposition and criticism, in the Presidential election of 1848. The Whigs made use of the popularity of a successful general to defeat the party that had made his glory possible. Evidently the American people were ready to accept the fruits of the war, but also ready to punish the party they believed had wrought in a wrong manner. A large number of young officers, destined to renown in later years proved their worth in this war. U. S. Grant and Wm. T. Sherman, Robt. E. Lee, "Stonewall" Jackson and Jefferson Davis, in the great Civil War, foreshadowed, in this Mexican struggle, the greatness that was to be theirs in the "days that tried men's souls" from 1861 to 1865. The acquisition of 522,568 square miles of territory — an empire four times as large as Great Britain, was the most important immediate as well as remote result. It was important in the issues that its acquisition precipitated. Should it be slave or free territory? Who should determine its institutions? Out of this question grew the larger one, who had the right to control the institutions of the territories in general? To settle the first question David Wilmot, a Democrat of Pennsylvania, proposed the celebrated "Wilmot Proviso" (q.v.) which would exclude slavery forever from all territory acquired from Mexico. Four long years of intense and bitter debate followed. This question and a series of others were settled temporarily in the Compromise of 1850. The second question was answered by the phrase "Non-intervention," which meant, or soon came to mean, one thing to Douglas and the Northern Democrats, and another to Davis and the South. Three main theories were evolved or defended in answer to the third query. (1) That Congress had the right to control the institutions of the Territories and could make them slave or free at its will. (2) The Dickinson-Cass-Douglas doctrine of Popular or "Squatter" sovereignty:— the doctrine that the people of a territory themselves, while yet in a territorial status, determined their own institutions. (3) The radical Southern view that slaves were property, and, as property might be taken into any Territory,— the common public domain of the States, — with no constitutional power anywhere to hinder or prevent. It was important secondly in its industrial and political effect on the nation. The United States now had an outlook on the Pacific Ocean comparable to that on the Atlantic. China, Japan and the East were brought within the circle of its influence. Conditions favorable to further expansion were prepared. In addition to the great effect on commerce thus prefigured, that on wealth and industry was not less. The gold, silver, copper and other mineral wealth of the Rocky Mountain region was turned into the pockets of the American people. This vast addition of territory and wealth tended also to emphasize national pride and ambition; to arouse a still more intense belief in "manifest destiny"; to develop a more optimistic tone, and perhaps also to produce a more materialistic spirit.

HOWARD W. CALDWELL,
Head Professor American History, University of Nebraska.

MEXICO (Sp. *Méjico*, officially *República Mexicana* and *Estados Unidos Mexicanos*), the southernmost country of North America and a federal republic, situated between 14° 30′ 42″ and 32° 42′ north latitude, and between 86° 46′ 8″ and 117° 7′ 31″ longitude west of the meridian of Greenwich. Its name is closely allied with the group of tribes who called themselves *Mexica* or *Azteca*. The name is derived from the tribal war-god, Mexitl, also called Huitzilopochtli. The Spaniards gave the name Mexico to all the countries in which they found the Aztecs supreme at the time of the Conquest. Mexico is one of the most interesting of the countries of the Western Hemisphere, because of its aboriginal civilization and social customs, many of which have persisted to our own day. It is also of importance because of its great natural resources, which now bid fair to be utilized for the benefit of her children instead of the predatory foreigner. These topics, together with the geography, art, architecture, literary history, commercial life and political history, are here treated under the following heads:

1. Area, Boundaries, etc.
2. Minerals and Mineral Production.
3. Agriculture and Stock-raising.
4. Commerce.
5. Manufactures.
6. Transportation and Communication.
7. Banking and Finance.
8. Government.
9. Army and Navy.
10. Education.
11. Religion.
12. Mythology.
13. Art.
14. Architecture.
15. Ethnology.
16. Literature.
17. History.
18. Diplomatic Relations of the United States with.

1. AREA, BOUNDARIES, ETC. Mexico's total area is 767,326 square miles, and its boundaries are the United States on the north, Guatemala and Belize on the southeast, the Pacific Ocean on the south and west, and the Gulf of Mexico and the Caribbean Sea on the east. Its coast line on the east is 1,772 miles in length and on the west or Pacific side, 4,594 miles. The northern or United States boundary was fixed by treaty 2 Feb. 1848 and 30 Dec. 1853, and extends from the mouth of the Rio Grande, on the Gulf of Mexico, following that river a distance of 1,136 miles, beyond El Paso, Texas; thence to a point on the Pacific Ocean, one marine league due south of the southernmost point on the Bay of San Diego. The total length of the northern boundary line is 1,833 miles. The Guatemalan boundary line was fixed by treaty 27 Sept. 1883 and 1 April 1895; and the Belize line by treaty signed 8 July 1893 and ratified 19 April 1897. The length of the southern boundary of Mexico is 642 miles.

By the treaty of Guadalupe-Hidalgo, ratified 2 Feb. 1848, and the Gadsden treaty of 30 Dec. 1853, Mexico ceded to the United States 930,590 square miles of her territory, or 163,264 more than half. The first-named treaty involved 362,487 square miles of domain, now part and parcel of the United States, as follows: Texas, 265,780 square miles; Colorado (in part), 18,000; Kansas (in part), 7,766; New Mexico, 65,201; Oklahoma, 5,740. Under the terms of the second or Gadsden treaty the United States acquired 522,568 square miles, which are now held as follows: Arizona, 82,381; California, 157,801; Colorado (in part), 29,500; Nevada, 112,090; New Mexico, 42,000; Utah, 84,476; Wyoming (in part), 14,320. By virtue of the same treaty a later addition was ceded, consisting of 31,535 square miles to Arizona and 14,000 to New Mexico.

Political Divisions and Population.— Mexico is divided politically into 27 states, three territories and a federal district. These with their areas and populations, capitals and populations, are as follows:

STATES AND TERRITORIES	Area (in square miles)	Population	Capital	Population
Aguascalientes	2,950	120,511	Aguascalientes	45,190
Baja California*	58,328	52,272	N. District, Ensenada	2,170

Population.— The official statement of the Mexican government that the population of the country had increased to 8,743,014 in 1869, to 10,791,685 in 1886, to 13,607,259 in 1900 and to 15,063,207 in 1910, does not necessarily mean that the population had increased at the rate this increase in the census enumeration would seem to indicate, but rather that the gradual pacification of the country under the Diaz administration, the extension far and wide throughout the land of the administrative arms of the government, and a certain decrease in illiteracy had made the work of the census taker more effective. A prominent official connected with the census department in Mexico City expressed it as his opinion, in the presence of the writer, in 1910, that the actual population of Mexico was at that date nearer 20,000,000 than 15,000,000. Fundamentally the population of Mexico is Indian and mestizo (a mixture of Indian and European). (See MEXICO — ETHNOLOGY). The official census of 1910 showed about 20 per cent white population; but it must be remembered that a large percentage of the so-called whites have a certain amount of Indian blood in their veins; in fact there are very few of the older families that have not come under this influence. All children born of Mexican parents, whether in Mexico or in a foreign land, are, in the eyes of the law, Mexican citizens; and foreigners may become Mexican citizens by naturalization by making application to the department of foreign relations, provided they have resided five years in the country.

Topography.— In length of coast line the peninsula of Lower California leads with 1,864 miles, Yucatán following with 615, Sonora 524, Sinaloa 317, Vera Cruz and Guerrero 286 each, Oaxaca 255, Tamaulipas 249, Campeche 224, Chiapas 137, Tabasco 119, Colima 99 and Michoacán 81. The greatest length of the republic is from northwest to southeast, 1,942 miles; and the greatest width, east and west, is from the mouth of the Rio Grande to the United States' western boundary, 1,833 miles; and the narrowest is from the bar at Coatzacoalcos (Puerto Mexico), on the Atlantic side, to San Francisco del Mar, on the Pacific, 134 miles. Mexico, California and Tehuantepec are the principal gulfs on the Mexican coast, the first named being the largest in the world. In the commercial development of this continent they have performed and still perform a most important part. Mexico's great mass is the lofty Rocky Mountain plateau, which fills it almost from ocean to ocean, leaving but a narrow strip of coast. Entering from Guatemala (where a spur connects with the limestone and coral tableland of Yucatán), the system trends west, forming a tableland 150 miles wide at Oaxaca, with a steep descent and slender coast on the Pacific, but a more gradual one by terraces to the Gulf of Mexico in Tabasco and Vera Cruz. This spreads out and stretches northward to the vast plateau of Anahuac, 4,000 to 8,000 feet high, where the oceanic relations are reversed, the Atlantic side being precipitous and the Pacific terraced. There is no single range corresponding to the Andes or Northern Rockies. The so-called *cordilleras* are merely the outer escarpments of the plateau, though often far above its mean level. Loftiest of these is the Sierra Madre of the Pacific, traceable at a mean elevation of over 10,000 feet from Oaxaca to the United States. It skirts the western coast within from 60 to 70 miles of the entrance to the Gulf of California. Thence onward a far wider coast land has silted up. Along the Gulf of Mexico are the correspondent cordilleras of Tamaulipas and Nuevo Leon, 6,000 feet in mean elevation. The southern central plateau maintains its height of 7,000 to 8,000 feet with great persistency to within 40 miles or less of the Atlantic. Through Lower California is a similar ridge some 3,000 feet high. The plateau is not a level surface. Railroad elevation north from the capital varies by 4,500 feet, declining northward; while the centre is intersected by short secondary ridges and valleys, mostly with the north-northwest trend. Most important of these is the Anahuac cordillera, surrounding the valleys of Mexico and Puebla; its culminating point is the Nevado de Toluca ("snow peak"), 15,163 feet. But across this, and generally confounded with it, is a newer transverse ridge from ocean to ocean, traced by five active or recently quiescent volcanoes and several extinct cones, among which are Popocatépetl, 17,882 feet, and Ixtaccíhuatl, 17,338 feet, in the centre, southeast of Mexico City, and Orizaba, eastward bordering Vera Cruz state, 18,696 feet. On the Pacific side is Colima (volcano), 12,989 feet; and the line runs out to the Revillagigedo volcanic islands. The sierras of Guerrero, Oaxaca and Chiapas are nearly parallel to this. The other high mountain peaks of the republic are the Malinche, between the state of Tlaxcala and Puebla, 14,643 feet; the Coffre de Perote, Vera Cruz, 14,042; Ajusco, in the southern part of the Valley of Mexico, 13,075; Tancitaro, 12,661, and Petamban, 12,300, in Michoacán; Derrumbadas, 11,801, Ocelazin, 11,480, and Peñal, 10,744, in Puebla; Cempoaltepec, 11,139, Oaxaca; Lanitos, 11,021, Guanjuato; Tzirate, 11,022, Michoacán; Zumate, 10,994, and Navajas, 10,289, Hidalgo; and Laurel, 10,138, Aguascalientes. The mountains of Mexico are exceptionally picturesque and interesting, affording innumerable views beautiful in the extreme.

Rivers.— Mexico possesses comparatively few rivers, and of these few are large and deep enough to be of commercial importance. Many of those marked on the map of the republic are either wholly or practically dry a part of each year. This is especially true of the northern half of the country. The most important rivers are the Rio Grande (Bravo del Norte), which forms the northern boundary line of the republic for 1,097 miles; the Pánuco, which rises in the mountains of the state of Mexico and empties into the Gulf of Mexico at Tampico, after a course of 360 miles; the Papaloapan, the source of which is in the mountains of Oaxaca and which crosses the state of Vera Cruz, emptying into the Gulf of Mexico at Alvarado; the Coatzacoalcos, which also has its source in the state of Oaxaca, and crosses the state of Vera Cruz, emptying into the gulf at Coatzacoalcos, its length being 186 miles; the Grijalva, which rises in Guatemala and crosses the states of Chiapas and Tabasco, to the Gulf of Mexico, 327 miles away from its source; the Usumacinta, which also has its source in Guatemala, crossing the Mexican state of Tabasco

and emptying into the gulf a short distance south of Frontera, its length being 450 miles. Official reports state this to be "the most navigable river in Mexico."

The Tuxpan River, which has its source in the state of Hidalgo, crosses Puebla and Vera Cruz and empties into the gulf at Tuxpan. It is navigable for small boats. The Lerma, 457 miles in length, which rises in the mountains of Tenango, in the state of Mexico, crosses Jalisco and Tepic and empties into the Pacific at San Blas. The Balsas, 428 miles long, the source of which is in Puebla and which crosses Mexico, Morelos, Guerrero and Michoacán, empties into the Pacific at Zacatula, in the latter state. The Yaqui, 391 miles long, which rises in the Tarahumari Mountains, in the state of Sonora, empties into the Gulf of California a short distance below Guaymas. The Fuerte, 335 miles long, which rises in the state of Chihuahua, crosses the state of Sinaloa and empties into the Gulf of California. Other rivers are the San Pedro, 298 miles; Nazas, 279; Ures, 260, and Sinaloa, 260.

Lakes and Lagoons.— The principal lakes of Mexico, none of which are large, are Chapala, in Jalisco, a beautiful body of water some 51 miles long and 18 miles wide, the shores of which have become a favorite summer resort for wealthy residents of Mexico City, Guadalajara and other parts of the republic; Pátzcuaro (in Michoacán), around which there clusters a wealth of historic, artistic and poetic interest; Cuitzeo, in the same state; Chalco, Xochimilco and Texcoco, in the Federal District and state of Mexico; Tepancuapan, in Chiapas; Tequesquitongo, Coatelolco and Hueyapan, in Morelos; Catemaco, in Vera Cruz; Caivel and Carpintero, in Tamaulipas; Encantado, in Tabasco; Bacular, in Yucatán; and Uriria, in Guanajuato. The principal lagoons are the Terminos, in Jalisco and Michoacán; Tamiahua, in Vera Cruz; Madre in Tamaulipas; Mezcaltitlan, in Tepic; Coyutlán, in Colima; Tecpan and Coyuya, in Guerrero; Superior and Inferior in Oaxaca; Paras, Coyote and Agua Verde, in Coahuila; Guzmán, Jaco, Patos and Santa María in Chihuahua; Xaltocán, San Christóbal, Zumpango and Lerma in the state of Mexico; Meztitlán and Apan, in Hidalgo, and Santa Ana, in Tabasco. There are numerous other smaller lakes and lagoons in the republic, which are of much local importance, but which do not appear on the ordinary maps.

Valleys.— The principal valleys of the republic are those of Toluca, Mexico, Cuernavaca, Puebla, Oaxaca, San Francisco and Orizaba, all of which are extremely rich in soil and most favorably situated as to climate and other conditions affecting their products, which include very nearly every article grown in other parts of the American continent.

Climate.— The chief natural glory of Mexico is its climate, which, though not as invigorating as that of some other countries, is one of the most delightful in the world. In few localities is there ever intense cold or intolerable heat. It is seldom that death results from freezing, and sunstroke is practically unknown. In the tierra caliente or hot country, the temperature varies from 77° to 82° Fahr., in the shade, while on the central plateau, which includes the capital city, it is much cooler in summer and warmer in winter than in the United States. In Mexico City the maximum summer temperature in the shade is 85°, and winter temperature 72°; in Puebla, 84° and 75°; in Oaxaca, 94° and 83°; in Jalapa, 89° and 87°; in Querétaro, 90° and 80°; in Guanajuato, 91° and 82°; in Pachuca, 80° and 77°; in Saltillo, °89 and 76°; in Mérida, 103° and 92°; in Mazatlán 91° and 84°. The average night temperature in Mexico City from June to October is about 55°. The warmest months of the year in that city are April and May, the last two months preceding the beginning of the rainy season, which there extends from June to November. In the regions near the gulfs and the Pacific Ocean, the rains are much heavier and more frequent, and begin earlier and end later. The average rainfall on the coasts is 44 inches and on the table-lands 24 inches. In Mexico there are but two seasons — the rainy, or summer, and the dry, or winter. The temperatures of the spring and autumn months differ very slightly, and the seasons merge into each other quite imperceptibly. The nights are always cool, except in the hot country, where they are seldom uncomfortable, the gulf and Pacific breezes compensating for the heat of the day. There are no radical or sudden changes of temperature; no prolonged term of heat or cold or storm; and on the table-lands all seasons are so nearly alike that most persons wear clothing of the same weight all the year. Except in the northern states, artificial heat is seldom provided, either in homes or places of business, even in mid-winter.

In few other countries is to be found such diversity of climate as in Mexico, whose west coast extends across 18 parallels of latitude, and where the altitudes of the towns and cities range all the way from 26 feet above the sea at Vera Cruz, to 8,760 at Toluca, each plateau or step in the ascent illustrating in its fruits, foliage and flowers the influence of every climatic phase and condition. The white peaks of Orizaba, Popocatepetl and Ixtaccíhuatl look down upon a broad panorama of indescribable beauty to be seen only in this land of perpetual spring. The summer rains on the upper plateaus intensify the green of the verdure, increase the number and beauty of the flowers, develop the fruits, sweeten the atmosphere, and drive away disease. The sun's rays, being always perpendicular, in the middle of the day are very intense. In the shade, however, it is never uncomfortable.

Flora and Fauna.—The physical conformation of Mexico is most favorable to the development of a wonderfully rich and varied economic flora. In the hot lands or coast regions, from the sea-level to an altitude of 1,500 or 2,000 feet, cocoanuts, cacao, vanilla, peppers, nutmegs, ginger, cloves and other spices and all the fruits of tropical countries are successfully and profitably grown; while sugar cane, coffee, rice, cotton, tobacco, hemp, oranges, lemons, limes, bananas, mangoes, apples, peaches, papayas, pears, plums, figs, cherries, grapes, zapotes, pineapples, mameys, pomegranates, yams, sweet potatoes, Irish potatoes, most of the edible roots, and in fact about all the varieties of fruits and vegetables grown anywhere are found and successfully cultivated in altitudes up to and including the valley of Mexico, 7,500 feet above the sea. Wheat, corn

and most of the grains of commerce produce crops in some of the states, twice or three times in a year — notably in Vera Cruz, Tabasco, Chiapas, Oaxaca, Guerrero, Michoacán, Jalisco, Mexico, fifty-two species of cereals and vegetables, 87 of fruits, 100 of odoriferous flowers, 56 of building woods, 21 of cabinet woods, 8 of gums, 3 of resins, 12 of forages and 113 of medicinal plants, reach a high degree of perfection in Mexico. Flowers of almost innumerable varieties, from the gorgeous orchid of quaint and curious form and wonderful combination of colors, to the modest daisy, violet and tuberose, grow wild, in extravagant profusion, all the year round, the range of altitudes meeting the requirements of all the members of the floral kingdom The flower markets of Mexico City, which are chiefly supplied from the chinampas (gardens in the bed of the half-drained lakes of the neighborhood), are among the objects of interest most enjoyed by the visiting tourist, and they testify to the beauty and brilliancy of the Mexican flora. This country has been deservedly named "the land of flowers," for everywhere and all the year there are flowers of every hue and color. In the forests of the republic, especially in the tropical lands, are found many varieties of trees the timber of which possesses great value for building or cabinet purposes. Pine of several varieties, balsam, lignum vitæ, Spanish cedar, mahogany, oak, rosewood, mesquite, olive, palm, almond, fir, sesame, cedar, camphor, india rubber, copal, cacao, 12 species of dye woods and numerous varieties of oil-bearing trees are among the varied products of the country, the arboreal vegetation of which embraces 114 different species of woods. Included in the fauna of Mexico are the American lion (puma), jaguar, ocelot, wildcat, wolf, coyote, bear, wild boar, sloth, monkey, hare, rabbit, squirrel, armadillo, deer, beaver, otter, mole, marten, leopard, turtle, which are principally found in the sparsely settled mountains and in the forests of the tierra caliente. None of these are much hunted, the inhabitants of the country having little or no taste for this kind of sport. In the tropics there are many varieties of rich plumaged birds, and song birds are found in all altitudes. Parrots and parakeets abound in the coast regions and are highly prized for their talking qualities and brilliant colors of green, yellow and red. Among the many species of song birds are the zenzontla or mocking bird, the clarin and the nightingale. The birds of prey include the eagle, hawk, turkey buzzard and owl. The cotorra, talking loro, humming bird, sparrow, blackbird, turtle dove, woodpecker, swallow, magpie, heron, falcon, kite and great numbers of others, which inhabit the forests or fields where there is abundance of insect and other food for their sustenance, are found in Mexico. In all localities where there are fresh-water lakes, lagoons, ponds or rivers there are great numbers of wild ducks and geese, and in the forests the wild turkey abounds. Wild bees are numerous, and the Indians derive quite an income from securing their honey and marketing it in the cities and towns. Of domestic or barnyard fowls the number and variety are very extensive, and their consumption is enormous. The waters of the Mexican gulfs, lakes and rivers are well stocked with many varieties of fish of excellent quality, the most prized being the red snapper. The markets of Vera Cruz, Tampico and other coast cities daily display a tempting supply and variety from the gulfs, the Pacific and the accessible rivers; and large quantities are shipped to inland points by railway, in refrigerator cars. In the immediate vicinity of Tampico many tarpon of large size are caught. Of reptiles there are many varieties, both venomous and harmless, especially in the southern forests. In the first named class are included boas, covals and rattlesnakes. There are many varieties of scorpions, tarantulas and lizards, some of the latter being so large as to be utilized by the natives as an article of food. To the latter class belongs the iguana which often measures over five feet in length.

2. MINERALS AND MINERAL PRODUCTION. For three centuries Mexico was the greatest of silver producing countries; from the single camp of Guanajuato came one-fifth of the silver mined during that period; and for one straight century the same camp gave to the world two-fifths of its silver. Yet to-day, after almost 400 years of exploitation, Guanajuato has still uncounted unexploited wealth. Yet Guanajuato is but one of many great Mexican mining camps, known to the world for centuries. Whether the natives of Mexico prior to the Conquest formally worked gold, silver and copper mines is an open question; but that they did exploit the placer deposits of the rivers of the country there is no doubt. Placer gold in quills passed as currency in Mexico at the time of the discovery and for years afterward. Gold, silver and copper ornaments, idols and other figures beautifully and often elaborately worked, existed in vast quantities at the time of the fall of the capital of the Aztecs. Since then, throughout four centuries, examples of the metal work of the natives of Mexico and Central America have frequently come to light; and still to-day explorers find these eloquent witnesses of the culture of the Indian empires of America in the graves of their nobles and princes and the ruins of their great cities.

Spanish Colonial Period.—With the fall of the capital of the Aztecs in 1521 there began a period of wonderful mining activity throughout the vast extent of the empire of the Montezumas. From the time of their landing on the shores of Mexico near the side of modern Vera Cruz in 1519, until the conquest of the city of Tenochtitlán two years later, Cortés and his followers were inspired by a dream of great wealth to be amassed from the treasure of the emperor of the Aztecs. This dream was made more vivid by the presents in gold with which the unfortunate Indian ruler sought to bribe his unwelcome guests to leave the country. After the fall of the city the Spanish adventurers awoke to find their dream of sudden wealth unrealized in so far as the capital of the Aztecs was concerned. But they lived in an age when strange fantasy colored the lives of men. If the much-desired El Dorado was not in Mexico City, then it was somewhere else; and the hunt for the golden treasure was continued. Thousands of buscones (prospectors) radiated in all directions from the capital in search of the hidden treasure. In this hunt mines of fabulous richness were discovered and towns sprang up

like mushrooms in the almost inaccessible fastnesses of the mountains. By 1537, when the first official report of the vice-regal government was made, the mining industry had become firmly established in many parts of the colony and was already paying important contributions into the treasury of the Spanish court. From the establishment, in 1535, of a settled government under the direct representative of the Crown, this mining activity increased with great rapidity and continued to extend itself farther and farther from the capital, the centre of colonial life in New Spain; and the dream of finding El Dorado was never altogether dissipated during the 300 years of Spanish rule in New Spain. While the glitter of gold was always before the eyes of every buscon the soft, white gleam of silver brought unexpected wealth to thousands who often squandered their newly-acquired fortunes in the search for the elusive yellow metal. How great was this treasure of silver wealth that Spain extracted from the rugged sierras of Mexico may be gleaned from a study of the report of the government mint. From 1537, when the newly-established royal mint issued its first statement of mining activity, to 1821, when Spain withdrew from the colony, the recorded silver production of the mines of Mexico amounted to $2,082,260,657. During the same period the gold output was only $68,778,411, or less than one-thirtieth of the silver returns. Large as these returns are, it must be remembered that probably not more than half the ore mined was ever reported to the government because of the excessively heavy taxes exacted by the Crown, which claimed as its right the royal one-fifth, and frequently, under one pretext or another, succeeded in extorting more from the mine owners. Quicksilver and powder, the most important aids of the miner in Spanish colonial days, were royal monopolies and consequently were sold in Mexico at from three to five times their market values. These and certain local, city and port exactions mulcted the miner of at least another fifth of the output of his mines. Transportation of ore from remote interior points, over almost impassable mountain trails, occupied from weeks to months in transit between the mines and the capital or the nearest port. Provisions and mining supplies had to be brought to the camp in the same slow and costly manner. All these extraordinary expenses made it possible for the miner to work only the richest ore and forced him to leave untouched veins which, in modern times, have become sensational ore-producers. It forced him also to sort out the richest of his rich ores and to leave the poorer on the dump heap. These dump heaps,, worked over by modern mining methods, have produced millions to foreign investors.

During the Spanish colonial period Mexico was literally the silver treasure-house of the world; and most of this wealth went to Spain; and it all, whether it went to the Crown or to Spanish adventurers and capitalists, contributed to make Spain the richest country in the world, thus shaping her destiny and making of her people a nation of adventurers seeking fortune in the vast colonial possessions covering the greater part of two continents, and disdaining the industries, trade and commerce. With her vast wealth Spain purchased from the rising industrial countries of those days, the Netherlands and England, what she required at home; and the mines of the colonies paid for it all. As a natural result, the national life of Spain was disrupted and the industries languished where wealth came so easily; and she taught the colonies to view life from her own point of view. Mining and the manipulation of vast estates became almost the only occupation of a gentleman. So, from year to year, from every mining centre in Mexico and the other Spanish American colonies, buscones were sent out constantly in increasing numbers to look for new mines. Men pawned their all to go on the same quest. Every decade witnessed its rush from one promising mining district to another. Taxco, Guerrero, was opened as a mining camp in 1522, the year after the fall of Mexico City; and from there numerous mining expeditions were sent forth to seek for new centres of wealth. One of these reached the far-distant state of Chihuahua in 1544. The discovery of Parral, Santa Bárbara and other rich mines caused a rush of miners from the centre and south of the country toward the north and west. In 1546 Zacatecas became the centre of this mining excitement, which began to shift, in another two years, to Guanajuato. In the same year the Bolaños mines of Jalisco began to attract attention and other centres of rich mineral deposits were discovered in Zacatecas. The following year Hidalgo came into notice through the sensational discoveries of ore at Real del Monte. All these mining districts are still producing ore with no signs of exhaustion and most of them are admittedly but partially exploited. In 1552 Durango was invaded and three years later, the discovery of bonanza ore in the Sombrerete mines brought the state of Zacatecas into the galaxy of shining silver stars. In 1574 Charcas, San Luís Potosí, opened silver mines destined to make the state famous. About the close of the 16th century, the chief mining interests of Mexico centred about Mapimí, Durango, which promised to become a great gold and silver producer. Scores of other more or less important mines were opened in the following years, among the most noted being Guadalcázar, San Luis Potosí, 1622; Batopilas, Chihuahua, 1632; Candelario, Chihuahua, 1638; Santa Eulalia, Chihuahua, 1700; El Caballo and other mines in the same state, 1703; the famous Magdalena district, Sonora, 1725; Talapujahua, Michoacán, 1740; a new Real del Monte district, 1759; the Valencia, Guanajuato, 1760; Catorce, San Luis Potosí, 1773 and La Purísima in the same state, 1780. All the districts mentioned were wonderful producers. The Mapimí mines, in Spanish times, made numerous owners wealthy, and since the establishment of the republic German capitalists have made of them one of the greatest gold and silver producing centres of the republic. The Batopilas mines have made the state of Chihuahua famous and attracted foreign capital to themselves and to neighboring mines. The recorded output of the Candelario mine for 100 years was $35,000,000, but so notorious was the avoidance of the payment of the government taxes, that the amount was undoubtedly very much more. At the beginning of the 18th century El Caballo claimed to be the richest mining district in the world. In 55 years its recorded output was over $85,000,000. The

Parral district, famous in Spanish colonial days for its wonderful richness, has, in modern times, under English, American, German and other foreign management, justified its reputation as one of the most extensive and generally mineralized districts in Mexico. The Real del Monte, which also produced wealth in Spanish hands, its output in one year being $15,000,000, has since, under English capitalists, extended its field of operations and has made itself known wherever silver is bought and sold. But the greatest single silver mine in the world is the Valencia, which paid to the government from 1766 to 1826 taxes on $226,000,000. It probably produced over $5,000,000 a year for 60 consecutive years. Vast sums of English and American capital invested in this district have done much to develop it along modern lines and to make it known. In the one year 1713 it is recorded as producing $14,000,000; and so much ore did it yield for a number of years that it made all its owners immensely wealthy. The Talpujahua mine in eight years yielded $18,000,000. The 17th century was one of development for Spanish miners in Mexico and the 18th one of wonderful production. Toward the close of this latter century the recorded yearly output of the mines of Mexico was $27,000,000.

The Revolutionary Period.— This, beginning in 1810 and continuing till 1821, disrupted all the affairs of the colony. Mining suffered so severely that it did not recover completely for nearly half a century after the Spaniards had left the country. In 1821 the output of the mines of Mexico had dropped to less than $5,000,000 a year.

From Iturbide to Díaz.— Mexico, under the administration of the emperor Iturbide, through the national congress in 1823, favored the development of the mining interests of the country. It abolished most of the exactions imposed upon miners during the 300 years of Spanish rule, and passed mining laws allowing foreigners to enter the mining business in Mexico. Notwithstanding the unsettled state of the country, the inducements offered to forign capital were so great that vast sums of English money poured into the country for investment in mining enterprises. This was the beginning of that great English influence which remained paramount in Mexican mining affairs until the beginning of the Díaz régime in 1876. During this period the records of the mints show silver $797,055,080; gold $47,327,383 and copper $5,227,855. Since then copper has become one of the largest and most important products of the republic. After the departure of the Spaniards from the country few people in Mexico were possessed of sufficient capital and knowledge to work the mines abandoned during the revolution, many of which had reached depths requiring powerful pumping and other machinery and exploitation on an extensive scale to make the business pay. The English were quick to see the opportunity thus presented; and many companies were formed to acquire and work these old mines and to exploit new ones. In six years (1822–28) six powerful English companies, with a combination capital of 3,000,000 pounds sterling, entered the Mexican field. Among these companies were: The United Mexican Mines Association, owning mines in many states of Mexico; the Anglo-Mexican Company, which also acquired many mines; and the Real del Monte Company. These English companies did what the Spaniards had never been able to do. They transported powerful modern pumping and other machinery over apparently insurmountable sierras and made it possible to work the rich ore below the water level of vice-regal days. They thus practically created new mines. Among these British investments are included most of the famous mines of those days; Valencia, Mellado, Villalpando, La Luz, Charcas, Catorce, Fresnillo, San Ildefonso, San Dimas, San Francisco, Guanacevi, Parral, Santa Eulalia, Batopilas, Real del Monte, Santa Gertrudis, Blanco, El Oro, Temascaltepec, Bolaños, Tezhuitlán (famous copper district), Taxco and Real del Castillo.

From Díaz to Madero.— From 1857 to 1883 the control of the Mexican mining laws was in the hands of the officials of the state governments. This did a great deal of harm to mining interests, created confusion and laid the door wide open for grafting. So in 1883 the Federal government was forced to assume charge of the direction of all mining affairs. At the same time a commission was appointed to consider the mining situation and to reform the mining laws, which it did in such a liberal spirit that mining again took a fresh and vigorous start. Porfirio Díaz began his administration in 1876 with a broad view of the necessities of his country. He extended the hand of welcome to capitalists of all nations who might help him to realize his dream of a greater and more prosperous Mexico. When Díaz returned to power in 1884 after González' four years of office, he continued vigorously the policy of encouraging the mining interests of the country, which during his first term of the presidency (1876–80) had reached the value of $103,000,000 gold and silver, with the additional potential energy of hundreds of new mining claims registered, properties opened up and many abandoned mines put into operation once more. About this time American, German and French capitalists appeared upon the scene and began to compete vigorously with English investors for a share in the Mexican mining business. By 1884 this competition had already become strong, and from then on it grew in intensity until, in 1913, when the revolution practically halted mining throughout the republic, it had assumed large proportions. Of the newcomers the Americans were the most aggressive. In 1884 Edwin Ludlow, representing American capitalists, began boring for coal in Mexico; and five years later the great coal deposits of Coahuila, at Sabinas and other points, were in full operation. In the 10 years following 1895 over 6,000,000 tons of coal were mined in Mexico, and by 1910 the output had reached 1,500,000 a year. The discovery and exploitation of coal in the republic gave great impetus to mining and other industries. Between 1885 and 1910 Lower California, Michoacán, Coahuila, Sonora and Puebla became great copper-producing states and as such attracted large sums of foreign capital, American and French; and the production of copper rose from 11,620 tons in 1895 to 55,000 tons in 1905. Owing to the slump in the price of this metal, this increase was not kept up during the next five years. Copper and petroleum and its products

were, however, the only mining interests that continued active throughout the revolution, the output of the former being valued, in 1912, at $38,500,000. Mexico ranks easily in second place among the great copper-producing countries of the world. In 1906 official returns showed in the republic 35,087 copper mines and mines containing copper values. After eight years of exploitation of antimony Mexico had, in 1910, become the world's greatest producer of this metal, with vast deposits still untouched. Two years later her production of antimony had reached almost $2,000,000 per annum. At the beginning of the first Díaz administration capitalists began to pay attention to the gold deposits of the country, with the result that, between that date and 1909, considerably over $1,000,000,000 gold was mined. Even in 1912, notwithstanding the revolution, the gold mined was valued at over $50,000,000, while the fiscal year 1908–09 had produced $62,700,000. In 1894 the introduction of the cyanide process began to replace the old patio process, thus giving an added impetus to the mining of low-grade ores and this helped the mining business very materially. A few years later foreign capitalists began the utilization of water-power for the production of electrical power and electrical plants appeared in different parts of the republic. Of these the most extensive and important is that of Necaxa which supplies the power to light the City of Mexico and to run the tramways and many of the factories of the Federal District. It also furnishes 30,000 horse power to El Oro and electrical energy to other neighboring mining centres, including Pachuca. Mexico, on account of its mountainous nature, possesses a real wealth of water-power, which must soon be brought into use to develop her vast mineral riches, a very considerable part of which, owing to adverse natural conditions, still remains untouched. The most noteworthy development of the mineral wealth of the republic of recent years is to be found in the vast petroleum fields stretching down the Gulf Coast from Matamoras to Campeche, and probably farther, for the southern end seems to connect with the oil fields of Colombia. So great are these fields and so vast their wealth that Mexico must soon become the first oil-producing country of the world. Although oil was known to exist in Mexico for many years, it was not until 1901 that the Mexican Petroleum Company, a California corporation, began prospecting for oil in the neighborhood of Ebano, near Tampico. About the same time W. Pearson and Son came into the field, with unlimited English capital. Then followed a rapid development of the oil fields near Tampico and on the Isthmus of Tehuantepec, Tuxpam, Minatitlán, the Papantla district and other points in the neighborhood. By 1907 the production of oil in the republic had reached 1,000,000 barrels a year and by 1913, 16,746,000. Two years later the output was 35,000,000 of which about 75 per cent was exported and in 1918 it was over 60,000,000. The returns in the near future promise almost double that of 1915 owing to the great well of the Mexican Petroleum Company opened in December 1915, which is said to exceed in flow the whole oil output of the State of California. According to the report of the Mexican Secretary of Industry, Commerce and Labor (1918), there are over 600,000 kilometers of oil lands in the republic. These extend along the Gulf Coast, the coast of Lower California and the Pacific coast, of these only 15,000 have been exploited. See bibliography under article MANUFACTURES.

3. AGRICULTURE AND STOCK RAISING. In normal times the chief agricultural product of Mexico is Indian corn, which is valued at from $80,000,000 to $100,000,000 a year; yet, owing to the unscientific methods of cultivation still in use, it often happens that corn enough is not grown in the country for its own needs, in which case the government is forced to throw off the duty and, in extreme cases, to import corn itself in large quantities and to sell it to the masses at cost. The next most valuable product of Mexico is henequen which is valued annually at over $40,000,000. As the greater part of this product is exported it constitutes the chief wealth of Yucatán, which has grown to be, for its size and population, the richest state in the republic, though it was once the poorest. Although Mexico has never been looked upon as a wheat-producing country, yet the owners of large estates have lately come to realize that its capacities in this direction are practically unlimited and an annual output of wheat valued at over $20,000,000 is not uncommon, while this figure is sometimes exceeded. One of the products of Mexico which have become of national importance within very recent years is rubber (including *guayule*), the output of which was over $33,000,000 in 1911, with vast extents of young rubber plantations rapidly coming into bearing. The following statistics of the growth of this industry are eloquent:

YEAR	Rubber	Guayu
1906–07	$6,679,000	$ [illegible]
1907–08	8,892,000	1,2[illegible]
1908–09	8,719,000	4,541
1909–10	16,760,000	9,46[illegible]
1910–11	21,188,000	11,7[illegible]

In the fiscal year ending 30 June 1911 the exports of henequen were valued at over $25,000,000; the cattle exports were $4,438,000, which did not include vast numbers which left Mexico without the knowledge of the government from those parts of the country under the control of rebel factions. Some of these went to Guatemala, but the greater part to the United States. In the same year the value of the hides exported reached nearly $10,000,000 from the territory controlled by the then existing government. In normal times the value of the products of sugar cane (sugar, alcohol, rum, molasses and cognac) is second only to that of corn, reaching, as it does, usually over $40,000,000 a year. This is a branch of the native industries which is capable of great expansion since Mexico possesses vast bodies of land suitable to the cultivation of sugar cane. The five years of the revolution showed a very considerable increase in the exports of coffee, rubber, chicle, tropical fruits, guayule, henequen, fine dyewoods, cabinet and building woods, tobacco and vanilla. Owing to the fact that the revolutionists had gotten possession of the great sugar state of Morelos the sugar cane output decreased to less than 1,000,000 pesos and the industry became practically paralyzed, from which condition it has not yet recovered, principally because the production of the sugar cane in

its products calls for the investment of heavy capital and the employment of skilled labor in certain departments.

A brief reference to the chief features of the agricultural industry of the country will prove instructive and interesting.

Sugar.— The greater part of the cane is grown at altitudes above 2,000 feet, but the best results are obtained in the lower country, where it matures sooner and where it may be cut twice annually without necessitating replanting more than once in upward of 10 years. In the Cuernavaca Valley, state of Morelos, the first sugar estates were cultivated by negro slaves, bought at Vera Cruz, at from $300 to $400 each. But the experiment proved unsatisfactory and free labor was soon substituted. Now the plantations are worked chiefly by Mexican labor and the mills are supplied with modern machinery.

Tobacco.— This industry is also developing great possibilities. The climatic and soil conditions, especially in the tropics, are very favorable to the best results, and whereas in Cuba the soil, after 400 years of constant use, has become comparatively unproductive, in Mexico no artificial stimulant is needed and the flavor and aroma of the tobacco are conceded to be equal to those of the Cuban product. The chief tobacco states are Vera Cruz, Oaxaca, Hidalgo, Tabasco and Chiapas. Much of the Mexican tobacco is bought up two or more years in advance of production and resold as fine Cuban tobacco.

India Rubber.— While there has been much unsatisfactory experimentation with the rubber tree, the failures have generally been chargeable to lack of knowledge or experience or to the introduction of illegitimate speculation at the expense of practical results. There now exist in southern Mexico a number of large and very successful rubber plantations, which have already proved that cultivated rubber can be made a paying proposition. These are chiefly in Vera Cruz, Chiapas, Campeche and Oaxaca.

Agave or Maguey.— This plant, from which is extracted the drink known as pulque, which the natives use in immense quantities, is perhaps the most important feature of the agricultural interest of the central plateau. Although pulque contains only about 7 per cent of alcohol, it is intoxicating when drunk in large quantities. It possesses important medicinal qualities, is a tonic and very nutritive. From 350 to 700 agaves or magueys to the acre are planted. They mature in eight years and give sap for a period of about five months, producing from 125 to 160 gallons of pulque each. The plants cost about $2 each by the time they have matured, and give a return of from $7 to $10 each. The pulque is secured by making a cavity in the centre of the plant, from the top, large enough to hold a few quarts, which are drawn out by rude syphons once a day. The leaves of the plants sometimes grow to be 12 feet long and weigh from 25 pounds to 100 pounds each.

Banana.— This fruit is successfully grown everywhere in Mexico between sea-level and an altitude of 5,000 feet. It is easily cultivated and very profitable. Frequently a return of $1,000 is realized from an outlay of $500 in a single season. A plantation of 1,000 plants, costing $500, will, under favorable conditions, earn this amount, even though the methods used be faulty, the care exercised insufficient and the variety poor. A favorable feature of banana growing is the fact that the ground occupied by the plants may also be utilized at the same time for the cultivation of coffee or other profitable products. Few other tropical fruits develop and become profitable as quickly as does the banana. Especially agreeable are some of the smaller varieties, although they may not be as much sought after as the larger and more pretentious ones. Their flavor possesses qualities not found in any other known variety.

Orange.— The oranges of Mexico are rapidly and surely winning favor in the markets of the North. Their true worth has only recently come to be understood and appreciated by consumers. Although the orange finds favorable conditions in all the tropical and sub-tropical states, the best results thus far have been attained on the shores of Lake Chapala, in the state of Jalisco and in Vera Cruz, Michoacán, Sonora, Morelos, Durango, Nuevo León, Oaxaca and Puebla. The leading producers in 1914 were Jalisco, Yucatán, Michoacán, Sonora, Morelos, Durango, Nuevo León, Oaxaca, Puebla, Sinaloa, Hidalgo and Vera Cruz. Although the oranges of La Barca, in the state of Jalisco, are considered the best in the republic, they have already found competitors in the products of Michoacán, Vera Cruz, Morelos and other localities equally favored by nature. The best results in orange growing are secured at elevations below 2,500 feet. The trees begin bearing when three or four years old and increase until the 12th or 15th year. Frost never occurs in any of the orange-growing regions of Mexico.

Lemon.— It is doubtful if any product indigenous to the soil of Mexico has been as sadly neglected as the lemon. So largely has it been relegated toward the lower end of the list of tropical fruits, in favor of the lime, that it can with difficulty be obtained in the markets, and when found is generally unsatisfactory in quality. And this, notwithstanding the existing very favorable conditions of soil and climate and the increasing demand in the world's markets. A very considerable part of the lemon crop of Mexico consists of wild fruit which, in many sections and especially on the Pacific Coast, is large and of excellent quality. It grows in the forests and jungles of the semi-tropical lands, at about the same altitude as the orange.

Lime.— This successful rival of the lemon, in Mexico, is grown chiefly in the states of Guanajuato, Puebla, Michoacán, Mexico, Jalisco, Oaxaca, Guerrero and San Luis Potosí. The lime of Mexico is of very excellent quality, but like the lemon and the orange, can be greatly improved by the adoption of proper methods of cultivation and the exercise of reasonable care.

Pineapple.— In the production of this fruit Mexico excels and is constantly improving her output. The towns of Córdoba and Amatlán, in the state of Vera Cruz, have long been noted for the size and quality of the pineapples grown in the regions round about them. The fruit is also successfully raised in the states of Puebla, Hidalgo, Tabasco, Chiapas, Oaxaca, Morelos, Guerrero, Michoacán, Colima, Jalisco and Nayarit. It thrives best at elevations of 2,000 to 3,000 feet. It was cultivated before the Con-

quest. Its leaves have for centuries been utilized to a greater or less extent in the manufacture, though by crude methods, of rope, twine, thread, mats, bagging, hammocks, paper and cloth of various colors. The value of pineapples grown in 1913 is given as $642,382, the chief producers named in the official reports being the states of Nayarit (then territory of Tepic), Hidalgo, Vera Cruz and Tabasco.

Other Products.— Included in the general category of agricultural products and of the numerous other articles closely allied to them, which are or can be successfully cultivated in Mexico, may be mentioned the yucca, or starch plant, which is said to contain six times as much nutritive matter as wheat, and which is grown principally in the states of Vera Cruz, Oaxaca, Chiapas, Tabasco and Yucatán; chicle, or chewing gum, of which over $4,340,000 worth has been exported to the United States in a single year; the mango, one variety of which (the Manilla) seems to combine about all the more delicate and delicious flavors of the choice fruits of the world. Being very perishable, it cannot be transported a great distance without suffering serious depreciation in value. The apple, peach and pear are all grown in various parts of the republic, but none has yet been brought up to anything like the standard of excellence reached in the United States, notwithstanding that almost all the natural conditions are exceptionally favorable to their cultivation.

Stock-raising.— The plains of northern Mexico and the valleys of the southern portion offer most favorable opportunity for profitably engaging in the livestock business. The climatic and other conditions are very favorable, the grasses are most nutritious. The transportation rates and facilities are such that cattle can be raised in Mexico and shipped to the markets of the United States at a good profit. An idea of the increase of this industry in Mexico may be gained from the reports by the government of the number of cattle exported annually. These show a regular and very considerable increase in normal times. The Para grass of the southern Mexican states is always green, grows luxuriantly and is very nourishing. It is estimated that an acre of this will feed two head of stock the year round, and that three acres in pasture will fatten four head. Because of the great number of flies and ticks in the low country, very young stock thrives better on the higher plains of Durango, Chihuahua, Michoácan, etc. Mexico has an abundance of sustenance to provide for an enormous increase of her present supply of livestock of every kind. The states of Durango, Sonora, Chihuahua, Nuevo León, Coahuila, Sinaloa, Tamaulipas, Vera Cruz and Michoacán constitute an admirable field for the carrying on of the cattle industry. As far back as 1883, there "roamed over an area of 300,000 square miles in the northern part of the country," according to a well-known writer, "1,500,000 cattle, 2,500,000 goats, 1,000,000 sheep, 1,000,000 horses and 500,000 mules, and there were 20,574 cattle ranches in the republic, valued at $515,000,000." Between the cities of Jalapa and Vera Cruz, and between Vera Cruz and Córdoba, great numbers of cattle were to be seen from passing railway trains, their sleek and well-rounded sides testifying to the excellence of the indigenous grasses before the revolution came to partially destroy an industry that promised to become very much greater in the near future.

The future of agriculture in Mexico is now apparently brighter than it has ever before been. The government has attempted to settle questions which have long been calling for solution; and among these none is of more importance than that of the division of land. The law of the republic calls for the subdivision of the large estates of the country and for the creation out of the Indian and mestizo population of a gradually increasing agricultural class which shall grow into a great middle class in the not distant future. See bibliography under article MANUFACTURES.

4. COMMERCE. The efforts of the various governments of Mexico since 1876 have been steadily directed toward the encouragement and extension of the commerce and industries of the country, external and internal. This has been done in the face of many and great difficulties. At the beginning of the Diaz régime Mexico was overburdened with debt, torn and wasted by revolution and party dissensions. Railway and other communications were lacking; and ports, harbors and regular coast and ocean routes, both passenger and traffic, in the modern sense of the term, were non-existent. Therefore steady and profitable international relationship had not yet been established. Mexico also lacked the educational knowledge and experience necessary for the building up of these. The third of a century spanning the beginning and the end of the Diaz régime witnessed a complete change in the commercial conditions existing in the republic. During this period harbors were constructed to accommodate great ocean-going vessels; international relations were extended and broadened; and the industrial, educational and commercial life of the nation quickened into notable activity. But the revolution of 1910 and the fratricidal strife that accompanied it set back the progress of the republic. Mexican commerce is peculiarly dependent upon the industrial and agricultural life of the nation because this alone makes possible the purchase of a vast number of foreign products. The disruption of the national life through the revolution vastly decreased the purchasing power of the Mexican people, and this, in its turn, very deeply affected its commercial activity. The almost complete destruction of the cattle business helped to still further intensify this arrested development. Along the old lines of its national life the income of the government declined in sympathy with the anarchical conditions existing throughout the country, to such an alarming extent that the most primary needs of the nation would have been lacking were it not for the fact that a new and important factor made itself felt strongly in the national life and largely supplied the lack in the national income by filling in the gaps caused by the lack of commercial activity throughout the nation. This was the rise to sudden importance of the mineral oil industry during the war years of 1914–18. But the storm and stress period through which the country passed from 1910 to 1919 is significantly reflected in the almost total lack of industrial and commercial statistics relative to the activities of the national life since the fiscal year 1912–13, when the last official census

was issued. This latter census represents the more or less normal life of the nation, which has been gradually returning to its pre-revolutionary condition throughout the whole extent of its territory.

From 1874 to 1904 the exports of merchandise from Mexico to the United States increased from $4,346,334 to $43,633,275; and the imports from the United States increased from $5,946,839 to $45,844,720. In the fiscal year 1912–13 the imports from all countries amounted to $195,772,000. Of this sum $16,466,000 consisted of animal substances; $31,285,000 of vegetable substances; $46,711,978 of mineral substances; $21,281,571 of dry goods; $12,074,088 of chemical and pharmaceutical products; $6,744,083 of spirituous liquors and other beverages; $5,120,770 of paper and its applications; $23,383,811 of machinery and its parts; $4,600,890 of vehicles; $5,388,344 of arms and explosives, and $9,604,897 of miscellaneous articles. In the same year the exportation totaled $300,405,000, the principal articles being: gold in various forms, $39,591,000; silver in various forms, $91,293,000; copper, $56,522,000; vegetable products, $85,963,000; animal products, $29,838,000; manufactured products, $3,549,000; miscellaneous, $2,917,410. Increase over the previous year, $2,416,000. Of the total importations $97,287,000 were from the United States; $25,220,000 from Germany; $25,900,000 from Great Britain; $18,338,000 from France; and $10,530,000 from Spain. The henequen exports, in the same period, were $30,134,000; uncured hides, $11,170,000; vanilla, $3,315,000; beans, $1,160,000; cattle, $7,552,000; leaf tobacco, $1,003,000; chicle (chewing gum), $4,342,000; fresh fruits, $1,019,000; zacate, $1,960,000; woods, $3,365,000; sugar, $860,562; Panama hats, $557,423; miscellaneous, $2,471,000. Of the total exportations $232,350,000 were to the United States; $31,147,000 to Great Britain; $16,438,000 to Germany; $7,151,000 to France; $2,182,000 to Spain. In the previous fiscal year the importations were $182,866,000, and the exportations $297,989,000. In the fiscal year 1894–95 the imports were only $66,200,000 and the exports $95,000,000, a remarkable record of progress in the brief period of 18 years.

The following table of exports and imports serves to show the progress of Mexican commerce during a very active decade of its history:

YEAR	Imports	Exports
1903–04	$177,861,000	$210,312,000
1904–05	178,205,000	208,520,000
1905–06	220,005,000	271,139,000
1906–07	232,230,000	248,018,000
1907–08	221,757,000	242,740,000
1908–09	156,533,000	231,101,000
1909–10	194,866,000	260,046,000
1910–11	205,874,000	293,574,000
1911–12	182,662,000	297,989,000
1912–13	195,772,000	300,405,000

In order to show the relative importance of the Mexican custom houses, both maritime and frontier, the following statement of collections of import duties for the fiscal year 1912–13 is given: Vera Cruz, $81,793,000; Tampico, $45,832,000; Laredo, $18,866,000; Juarez, $3,386,000; Progreso, $11,248,000; Ciudad Porfirio Diaz, $4,387,000; Nogales, $1,857,000; Mazatlan, $2,514,000; La Morita, $6,057; Frontera, $1,486,000; Agua Prieta, $1,208,000; Soconusco, $16,061; Guaymas, $2,239,000; Acapulco, $611,342; Isla del Carmen, $264,317; Ensenada, $383,662; Mexicali, $682,788; Chetumal, $480,602; La Paz, $206,722; Tuxpam, $743,322; San Blas, $151,602; Salina Cruz, $624,570; Tijuana, $212,847; Topolobampo, $147,310; La Ascencion, $52,730; Camargo, $5,540; Mier, $9,707; Puerto Angel, $10,827; Manzamillo, $1,486,000; Matamoros, $1,680,000.

In the upbuilding of the foreign commerce of Mexico, the construction of railways made possible the phenomenal results that have been achieved since 1898. The entire foreign trade of the country, practically, has been created since 1876, most of it since 1880. Before competition in the transportation of freight was provided, the rate from Vera Cruz to Mexico City, 264 miles, ranged around $68 per ton, going as high as $330 during the French intervention. Formerly almost all the first-class furniture imported by Mexico came from France, but now much of it is supplied by the United States and some of it is made at home. Most of the importations of agricultural machinery and implements are from the United States. The same is true of food stuffs, lumber, machinery for irrigation works, supplies for mining and for steam and electric railways, unmanufactured leather, vehicles, boots and shoes, canned goods, patent medicines, livestock, cotton, manufactures of steel and iron, sewing machines and typewriters. From Spain and France come most of the wines and cognacs. In normal times Germany and Belgium had, previous to the European War, a monopoly of the hardware trade, England and France of the dry goods trade, and France of the trade in notions, jewelry and fancy goods. Among the leading articles exported by Mexico are coffee, two-thirds of which goes to the United States and the balance to England, Germany and France; vanilla, sugar, tropical fruits, beans, livestock, precious metals, henequen, leaf tobacco, hides, rubber and ixtli.

Mexico has a "commercial code" which dates back to 1887 and which, among other things, provides that foreigners shall be free to engage in commerce, subject to the same conditions and requirements that apply to citizens; that all documents referring to matters of public concern shall be recorded in a public register; that all business correspondence shall be preserved; that notice by circular or through the press shall be given of the character of any business about to be established and of any modifications or other changes subsequently made; that at least three account books,— a general day book, a book of inventories and balances and a ledger,— shall be kept in the Spanish language; that all brokers must be Mexicans by birth or naturalization, have a mercantile education and possess a diploma from the Minister of Fomento or other proper officer; that an unlawful agreement or contract involves no cause of action at law; that mercantile companies may consist either of a partnership under a collective name or with special partners, or may be an anonymous (stock) company, a society with special partners or a co-operative society; that all contracts for the formation of companies must be in writing and very full and explicit; that the consolidation of companies cannot take effect until two months after publication of particulars, except

on payment of all debts; that foreign companies must register in Mexico and publish an annual balance sheet; that there may be "temporary" or "profit-sharing" mercantile associations, the first being without a firm name and making partners jointly liable to third persons, and the last named implying an association under which two or more persons may become interested in operations which one or more may undertake in their own names, but which involve only one legal entity and no responsibility on the part of a partner not joining in a contract with a third party; that the principal of any manufacturing or commercial business shall be responsible for the acts of his managers or employees; that no institution of credit can be established except by authorization of the Minister of Finance and the approval of Congress; that every merchant ceasing to make his payments, whose liabilities are more than 25 per cent in excess of his assets, who has made formal assignment of his goods, or who has absented himself without leaving any person in charge of his business who can pay his debts as they become due, shall be considered a bankrupt.

Foreign commerce for year ending 30 June 1914 (estimate of exports) $176,000,000; (estimate of imports) $65,000,000; total $241,000,000. For the year ending 30 June 1915, the estimate of the value of Mexico's exports was $150,000,000; imports $61,000,000; total foreign commerce $211,000,000. Imports from the United States in the year last mentioned (estimated value) $34,200,000, and exports to the United States $115,000,000. The imports into the United States from Mexico in 1916 totaled $105,000,000 and the exports to that country reached $53,000,000 in the same year. In the nine months ending with March 1917, imports from Mexico were $80,692,000 and exports $47,501,000. In May 1917 the Mexican government prohibited the exportation of food stuffs and food animals to the United States because of the depleted stocks and herds in the country owing to the revolution. See bibliography under article MANUFACTURES.

5. MANUFACTURES. Mexico is a manufacturing country in the very primitive sense of the word; for literally the greater part of her manufactured products are made either wholly by hand, by individual tradesmen each working on his own account, or in small shops where the machinery used is employed simply to aid the cunning of the hand. The field for manufactures of all kinds is most promising, since it offers raw material in great abundance, efficient, intelligent labor and a very considerable home market, with a still larger one in Central and South America.

Manual training has been introduced into the schools of Mexico and several arts and trades colleges are turning out skilled mechanics in all lines of industrial work. Wages are low, much lower even than in Europe, and the native workman in the factories already established throughout the country gives his employer little or no trouble.

Cotton.— In 1912, the last normal year since the outbreak of the revolutionary war that overthrew the autocratic Diaz régime, there were 148 cotton mills in the republic. Of these the largest and most modern were in Puebla, Orizaba and Mexico City. In these factories 32,000 workmen were employed to operate 62,000 spindles and 27,000 looms. The cotton goods they produced during the year were valued at over $50,000,000; and included sheetings, tickings, lining, drills, shirtings, percales, quilts, napkins, table-cloths, woolen-cotton goods, knitted garments and fleece-lined underwear. The Atlixco cotton factory, Puebla, employed, in the same year, about 2,000 hands and is capitalized at $6,000,000; the Compañia Industrial de Orizaba owns four cotton mills, has 4,000 looms and 10 printing machines in commission, is capitalized at $15,000,000 and employs 6,000 mill-hands. The San Antonio Abad, with an invested capital of $3,500,000, also operates four mills, three in the state of Mexico and one in Mexico City. El Porvenir y Anexas, at Villa Santiago, Nuevo León, is capitalized at $2,000,000, and the Veracruzana, of Santa Rosa, in the state of Vera Cruz, near Orizaba, at $3,500,000.

Woolen Goods.— There are a number of woolen factories in Mexico; but they are of less importance than the cotton mills, for the reason that the great mass of the lower classes wear cotton garments, thus creating a strong and constant demand for the latter goods. There are woolen mills in Durango; Aguascalientes, Guanajuato, Hidalgo and Puebla; but the most important establishment is near Tlalnepantla, in the state of Mexico and not far from the federal capital. The woolens made in the republic include suitings, kerseymeres, carpets, blankets, rugs and knit goods. The city of Saltillo, Coahuila, is noted for its handsome serapes (native blankets), for which there is a constantly increasing demand. These serapes, which are made on primitive Indian looms are exceedingly well woven, of fine texture, brilliant colors and pleasing designs. The San Ildefonso factory at Tlalnepantla, with a capital of one and one-half million dollars, is one of the most successful manufacturing enterprises in Mexico and its goods are to be found on sale throughout the republic.

Silk.— Few countries have the natural advantages for raising and manufacturing silk possessed by Mexico. Throughout the greater part of the republic both white and black mulberries grow luxuriantly and require practically no care even in those regions less favorable to their cultivation. So even is the climate in most parts of the country that silk worms can be grown out of doors practically all the year round; and they require but a small part of the care they must necessarily receive in Italy. Labor in Mexico is cheap and the masses of the people, once accustomed to cocoon raising and the cultivation of the mulberry tree, might be expected to thrive at the business as their ancestors did in all the industries, before Europeans came to disturb the current of their national life. The Indian is industrious when he works on his own account.

In Mexico City there is one important silk factory, which is engaged in manufacturing rebosos, the light shawls which the Mexican women of all classes wear almost universally everywhere outside the larger cities. This factory received strong encouragement from the Mexican government which has, for some years, been anxious to establish the silk industry on a firm basis in the republic. Two great nurseries near the capital, one at Coyoacan and

the other at Churubusco, began in 1907 the planting of 6,000,000 mulberry trees, from which it was proposed to send out free propagation slips to all parts of the country wherever people could be induced to plant trees and to go into the business of silk raising.

Textiles and Fibres.— There is perhaps no industry in Mexico that shows more variety in forms of manufacture than that of fibre-plant products. Rope, cordage, thread, packing, carpets, rugs and practically every form into which linen, hemp, jute, ixtli, henequen and other native fibre plants and textiles are made, are manufactured in Mexico. Among the most important textile and fibre goods factories in the republic are La Aurora of Cuautitlán, near Mexico City, which has an invested capital of $1,300,000 and turns out bags and packing of all kinds; La Industrial Manufacturera Company, capitalized at $4,000,000 and operating six factories; the Linera de Mexico Company, capital $600,000; Santa Gertrudis Company, near Orizaba, capital $1,000,000, hands employed in normal times from 1,300 to 1,500. All over the republic, wherever the numerous fibre-plants grow, which is almost everywhere, on highlands and lowlands alike, the natives carry on the manufacture of rope, cord, string, thread and coarse wrapping cloth just as their ancestors did before the Conquest. These products of the country can be found from the Rio Grande to Guatemala. Ixtli (agave rigide), a rather coarse century plant, furnishes a considerable part of the raw material for this industry. The maguey (agave Americana), from which the native pulque is extracted, also supplies raw material for the coarser kinds of rope, cordage and sacking. Even mats and rugs are made from it. In addition to the large and very general consumption of these goods, the exports to foreign countries amounted, in 1912, to $3,792,678.

Among the other fine fibre plants of Mexico are zapupe and pita, both of which furnish long, silky, strong commercial fibre, which is not exported because the home consumption demands more than the output. The best known, commercially, of all the fibres of Mexico is henequen grown in Yucatán and the neighboring states of Campeche and Chiapas, and to a small extent, in other parts of the republic. From the finer fibre of this plant there are manufactured in Mexico many varieties of woven fabric that resemble silk in appearance and softness of texture. In fact there are in Mexico numerous fibre plants that offer more or less acceptable vegetable substitutes for silk. Since time immemorial henequen has been manufactured, in Mexico, into rope and cordage of all kinds; but now it is exported, principally to the United States, for the making of binding twine for reapers. Though no country in the world is richer than Mexico in excellent fibre plants, yet she imports large quantities of linens, hempen fabrics, yarns, laces, handkerchiefs, trimmings, carpets, rugs, curtains, quilts and almost every kind of goods manufactured from the various fibre products, all of which could be made at home from native-grown products at a great saving to the nation. Characteristic products are the huge, highly-adorned, sugar-loaf, native felt sombreros and the so-called Mexican Panama and other straw and reed hats. Most of the latter are made by individuals in their homes. The natives display much taste in this work, which is another of the numerous industries of the country handed down from father to son for hundreds of years. La Abeja (The Bee), in the Federal District, near the capital, with an investment of $500,000, is the most important of the hat factories of the country. In Mexico, Guadalajara Puebla, Vera Cruz and Oaxaca there are from one to a score or more smaller hat factories, each of which has its own wholesale and retail store. In addition to these there are little shops that do a purely local business.

Beer, Wines and Liquors.—There is a large consumption of distilled and fermented liquors in Mexico, a very considerable percentage of which is made in the country. Within the past 10 years beer has come into favor, in the cities and larger towns, and it may be found on sale even in the smaller interior towns and villages, though there the consumption is slight. Its use is confined to the middle and upper classes almost exclusively because its price puts it beyond the use of the laboring class. There are large and well-equipped breweries in Mexico City, Oaxaca, Monterey, Puebla, Vera Cruz, Orizaba, San Luis Potosí and Tampico, while installations of lesser importance exist in several of the smaller cities. In the capital there are several distilleries where whisky, brandies, cognacs and cordials of various kinds are made. In the Parras district of Coahuila and in some other parts of Mexico excellent wines are produced, and wherever sugar is grown, which is pretty general in the low, hot lands of the coast country, aguardiente (native rum) and excellent alcohol are manufactured. Many of the sugar plantations possess the most modern plants for making these products. Much of the Mexican aguardiente is shipped to Europe where it is turned into cognac. Tequila, a strong alcoholic liquor somewhat like Holland gin, is manufactured extensively in Mexico, but most of the output is consumed at home, for its use is general throughout the country. Like pulque, tequila is manufactured from the century plant. The use of pulque is more extensive than that of either tequila or aguardiente; but it is confined to the upland plateaux and the country at an elevation of 4,000 feet or more, because there grows the maguey from which it is manufactured. On the uplands it has been, for many years, the greatest of the industries of the country, after mining, millions of acres being devoted to the growing of the maguey. Another distilled product called mescal is made from another and smaller species of the agave; and it is extensively used in the region where this latter plant thrives.

Soap, Candles and Chemical Products.— A great part of the raw materials used in these industries is still imported though the republic is capable of producing most of them. The Laguna Soap Company, capital $5,000,000, formed by the amalgamation of two large cottonseed-oil companies, produces daily in normal times and conditions, 400 tons of cottonseed oil, 7,500,000 pounds of soap and 2,000 metric tons of glycerine, together with a variety of edible cottonseed-oil products. It employs from 800 to 1,000 men. La Union Soap Factory of Torreón, capital $2,000,000, is engaged principally in the manufacture of soap

and glycerine. The company also has a large refining plant near Torreón. There are a number of smaller soap and many candle factories scattered throughout the republic. Chemicals, paints, varnishes and acids are also manufactured in or near numerous cities and towns. A few years ago all the petroleum and petroleum products used in Mexico were imported and sold in the republic at excessively high prices. Now petroleum, benzine, kerosene, paraffine wax, asphalt and many by-products are manufactured in the country; and native oil has become an important factor in the national life. Whole railway lines use oil burners on their engines and petroleum is employed for producing motive power in many kinds of industrial life. Yet but a very small percentage of the possible native oil sources has been exploited; for the oil belt extends all the way from Texas to Guatemala on the Gulf side and large deposits are known to exist on the Pacific Coast. The refining of crude petroleum has become a business of considerable importance in Mexico and the exploitation of the asphalt deposits has already influenced the pavement of the streets of the cities and larger towns of the republic.

Iron and Steel Products.— No other Mexican industry has grown so fast within the past dozen years as that of the great iron and steel foundries now turning out products equal to those of the steel-producing centres of the world. This output includes smaller agricultural implements, marketable iron and steel, and a constantly increasing number of finished products such as are turned out from the great American and European steel plants. The Monterey Iron and Steel Company, capital $10,000,000, with its great blast furnaces, produces 300 tons of steel per day. It makes steel rails and structural iron and steel in vast quantities and of excellent quality. Monterey is the most important centre of this new industry; and naturally there the business has reached the highest state of perfection in the republic. The steel and iron industries of Richard Honey, in Hidalgo and the Federal District, are next in importance to those of Monterey. Two other important iron foundries in Jalisco rely chiefly upon local trade. One of these at Zapalapa supplies iron to Guadalajara, Aguascalientes, Manzanillo and surrounding country.

Guayule.— In Mexico the production of rubber is a real manufacturing industry in certain parts of the republic where the guayule plant grows in abundance. This plant is a low shrub from two to four feet in height from which crude rubber is extracted by means of specially constructed machinery. The plant is torn out by the roots, is crushed and the sap extracted from it. It then undergoes certain processes before it becomes commercial rubber. The Guayule Rubber Company produced in this way, in the first seven months of 1912, 1,818,880 pounds of rubber. The International Rubber Company of Torreón, which is capitalized at $37,500,000, possesses 2,000,000 acres of land in the state of Zacatecas, on which wild guayule grows abundantly. The company has an extensive factory at Torreón, in which is installed the most modern rubber machinery. The guayule exported from Mexico in the fiscal year 1912–13 was valued at $7,234,000, which was only about $1,000,000 less than the value of the tree rubber grown in the country during the same period. In 1911–12 the guayule exports brought $11,798,800.

Tobacco.— There are many cigar and cigarette factories in Mexico; but the latter far exceed the former in volume of business. The principal tobacco manufacturing centres are Mexico City, Orizaba, Puebla, Jalapa, Vera Cruz, Cuernavaca and Guadalajara. But there is scarcely a city or town in the republic that does not make either cigars or cigarettes or both for local consumption; and each manufacturing district has its own favorite local brands. In the city of Mexico an immense number of cigarettes are made, the Buen Tono Company turning out alone daily about 20,000,000; and the Tabacalera makes about 4,000,000. But these companies are backed by millions of capital. In the Buen Tono's factories (including the Cigarrera Mexicana), 1,700 hands are employed. Certain brands of Mexican cigars are favorably known in Europe and in the United States.

Packing Houses.— There are a number of packing houses in Mexico. Several are on the Pacific Coast where the cattle ranges are more or less isolated from the European and American markets; but the National Packing Company, with a capital of $7,500,000, operating from its headquarters in the capital, is the largest and most important, and does an international business.

Paper.— Paper is made (though not enough for local consumption) by the San Rafael and Anexas Company, situated near the capital. This institution, which is capitalized for $7,000,000, has two factories, a pulp mill and extensive forests from which it draws its raw material. Though the output of San Rafael runs to the commoner grades of paper, including large quantities of newspaper print, yet it also makes high-grade paper of numerous styles and degrees of fineness, among these being calendered and the finer grades of half-tone paper.

Dynamite and Other Explosives.— These, including giant powder, are manufactured in Mexico; and the government has its own ammunition factory at Santa Fé, near the capital. The Mexican National Dynamite and Explosives Company, at Dinamita, Durango, produces over 50,000 pounds of explosives daily. It is capitalized at $3,400,000 and employs from 900 to 1,000 hands.

Flour Mills.— Large flour mills, modern in every respect, and others of smaller capacity and more primitive types, are to be found in Mexico from Monterey to Yucatán. Of these the most modern are: El Hermosillense, Hermosillo; the Chihuahua Flour Company, Chihuahua; the Goleta Mills, Saltillo and Monterey; the Phoenix Mills, Saltillo; the Esmeralda Mills, Monterey and Ramos Arizpe; the Alliance Mills, Torreón; the Diamond Mill, Gómez Palacio; the Gulf Flour Company, San Luis Potosí and Mérida; Aurelio Herrera and Company, Irapuato; the Union Mills, Toluca; the National Flour Manufacturing Company, Mexico City; the Bakers' Mutual Association, Guadalajara; and La Perla Mills, Aguascalientes.

6. TRANSPORTATION AND COMMUNICATION. Before the white man had set foot in Mexico the various nations then occupying what is now the Mexican republic had built many well-paved roads and innumerable mountain trails, in all probability better than the trails of to-day, if we are to judge them by their still existing remains, and by the ruins of the great and populous cities whose arteries they were. Following the Conquests, and as Spain gradually extended her power over her trans-Atlantic domains and as peace became established upon a firm basis, bringing with it an extension of trade, the necessity for an extensive system of highways between the inland cities and the ports and between city and city became apparent. The Spanish government, ever alive to its own interests, began the construction of the *caminos reales,* or king's highways, which, a century after the Conquest, had already connected together all the centres of commercial importance in New Spain.

Transportation Facilities of the Republic. —Throughout the revolutionary period (1810–21) transportation facilities of every kind in Mexico were neglected, on account of the activity of the revolutionists and the exhausted condition of the Spanish treasury after the Napoleonic wars. From 1821 to 1876, the new republic formed upon the ruins of the government of New Spain was so occupied with its own local dissensions that it found little time to give to upbuilding of highways and byways of communication. Yet it was toward the close of this period of unrest that the first railway was built in the republic. In 1854 a line connecting Mexico City and Guadalupe, a distance of three miles, had been constructed; and a year later Vera Cruz was connected with Tejeria (12 miles). These were the two extreme ends of a railway by means of which it was proposed to give the capital an all-rail route to the first port of the republic. But so slow was the work of construction that it was not until 1873 that this comparatively short line (263 miles) was completed. Practically no other railway construction was undertaken in Mexico until after the election of Porfirio Diaz as president in December 1876. In November of the following year, the Secretary of Public Works signed a contract with James Sullivan and his associates for the construction of a railway line from the United States border to Mexico City, and from there to the Pacific Ocean. But Sullivan found difficulty in getting the capital necessary to build the proposed lines. In 1880 a strongly-subsidized concession was granted to the Mexican Central Railway Company, organized in Denver to build a wide-gauge railway from El Paso to the Mexican capital; and about the same time the Sullivan concession was extended and rearranged so as to empower the holders thereof to construct a narrow-gauge railway from Mexico City to Laredo, on the Texas border. Both these lines were eventually built. From 1880 to 1898 hundreds of railway concessions were granted by the Mexican government, most of them accompanied with subventions in cash, government bonds and national lands. Such a very active railway era was inaugurated that, in 1890, the government found it necessary to create the new Department of Communications and Public Works, at the head of which was a minister of the Cabinet. In 1898 Finance Minister Limantour announced that, in the future, the government would give subventions only to roads of great political and financial importance. In the plan for railway extension laid down by Mr. Limantour at this time were included a road to connect the centre of the republic with some Pacific Coast port, Guaymas or Topolobampo preferred; a line from the interior to Mazatlán; another from the interior to Manzanillo and a fourth to Acapulco. The plan also included lines to connect the capital with Acapulco and Tampico. The following year a new general railway law was issued in order to co-ordinate the work of the Minister of Finance and to govern the roads in existence and those being built. The most important railway lines of the country were constructed between 1880 and 1890; after which very little building was done until Mr. Limantour took matters in hand in 1898. By 1902 the following roads had been constructed: The Mexican Railway, connecting Mexico City with Vera Cruz; the Mexican Central, from El Paso to the Capital; the Mexican National, from Laredo to Mexico City; the Sonora Railway, from Nogales to Guaymas; the Interoceanic, from Mexico City to Vera Cruz; the Tehuantepec National, across the Isthmus of Tehuantepec, from Coatzacoalcos. (Puerto Mexico) to Salina Cruz; the Mexican Southern, from Puebla to Oaxaca; the United Railways of Yucatán; and the Pan-American, from San Gerónimo, on the Tehuantepec road, to a point in Mexico close to the border of Guatemala. In 1906 the Mexican government succeeded in uniting the two great railway lines, the Mexican National and the Mexican Central, with the "National Railways of Mexico." By 1908 the Mexican International, the Pan-American, the Vera Cruz and Pacific, the Interoceanic and the Tehuantepec National had been brought under the control of the government and included under the foregoing title of the National Railways of Mexico. During the revolutionary period from 1910 to 1916 the railroads of Mexico suffered very greatly; much of the rolling stock was destroyed and bridges, stations and other buildings were burned or wrecked. In January 1915, according to a statement of the Mexican Minister of Railways, the total monthly income of the Mexican National lines was only 647,000 pesos (paper currency). But in August 1916 the monthly income of these

roads had risen to 25,000,000 pesos (paper currency). At the same time the transportation of freight had become almost normal, notwithstanding the fact that the loss of the National Railways for the fiscal year 1913–14 was $28,835,624, and for the following year $28,909,328. When the Carranza government undertook the management of the railways in June 1915, it had to face a deficit of $41,289,609 United States currency. Since then the railway income has steadily improved. In 1916 there were over 16,000 miles of railway in operation in Mexico. During the fiscal year 1917–18 the total receipts of the Federal Railway was $72,000,000.

Postal Service.— In 1913 there were in Mexico 2,917 post offices, branch post offices and postal agencies. In the postatl service of the republic about 15,260 miles of railway, 300 miles of street railway and 10,000 miles of steamship routes were in use for the distribution of postal matter. During the year domestic postal orders to the amount of $48,771,821, and foreign postal orders valued at $8,886,979 were issued. During the same period the other income of the postal service was $4,914,640. All the railroads of the country disposable were made use of in the postal service; and they were aided in the work of distribution by messengers, horses, mules and automobiles, on land; by river boats of the interior navigation service: and by some 23 steamship companies, among which were The Mexican Navigation Company, the Pacific Navigation Company, F. Leyland and Company, Limited; West Indian and Pacific; Imperial German Mail, the Harrison Line, the New York and Cuban Mail Steamship Company, the Munson Steamship Line, the Atlantic and Mexican Gulf, the Southern Steamship and Banana Company, the Canadian Mexican Atlantic Line, the Kosmos Line, the Chinese Imperial Steamship Company and the Toyo Kisin Kaisha. There were 158 traveling post offices, principally on trains. During the year 26 new post offices were opened to the public. The parcel post service, which was instituted a few years previous, has proved of great value and is, year by year, securing more patronage. The government proposes to extend the scope of this service and to make it of still greater utility. Consult Halsey, F. M., 'Railways of South and Central America' (New York 1914).

7. BANKING AND FINANCE. The Mexican people have long shown a capacity for finance. In pre-Columbian days, the financial arrangements of the Aztec Empire were complicated and extensive; and the keeping of the accounts of the tribute rolls was in itself a matter that required more than ordinary executive ability, in an age when the whole income of an empire several times larger than modern Germany, and densely populated, was paid in produce of various kinds. This required vast storehouses in Mexico City and substations for customs receipts in many parts of the land. The Spaniards, too, are keen financiers and the mingling of the two races has produced a blend and a nation which has made great financial advancement during the past quarter of a century. The revolution of 1910 temporarily checked this financial expansion. The first financial establishment in Mexico that may be dignified by the name of bank, was founded, in 1776, in connection with the charitable organization still known as the Monte de Piedad (National Pawnshop). It handled mortgages, issued loans on landed and other property and circulated notes in commercial transactions, for more than 100 years. Several times it was in difficulties, but so great was the aid it lent to the community in general, that it succeeded, each time, in getting again on its feet. The first real bank organized in Mexico to do business in accordance with modern methods was the Bank of London and Mexico, which was established in the City of Mexico in 1864, with a capital of $500,000. Its reserve was finally raised to $30,000,000 shortly before the revolution of 1910, but was reduced to $10,000,000 in 1913 on account of the unsettled condition of the country. Previous to this date, the paper currency in circulation in the country had been issued by certain banks which had been granted concessions to this end. At first the National Bank of Mexico had a monopoly of this right, or claimed to have; but the government, disregarding it, gave concessions of a like nature to other federal and state banks. Finally an amicable arrangement was made with the National Bank, whereby it waived the rights in this respect which it had claimed. Then began an era of great prosperity in Mexican banking. Modern methods were introduced in the native institutions and foreign banking houses established important branch houses. These represented capital and institutions from nearly every country in Europe and from the United States and Canada. None of these foreign banking houses, however, had concessions to issue paper currency. They formed one of the most powerful factors in the development of the finances and the resources of the country and became the great medium of exchange between Mexico and the outside world.

As the Constitutionalist party began their campaign without money or credit, they were forced to issue paper money of many different kinds, which went as low as 1 per cent of its face value. As the military campaign became more extended and intensive more arms and ammunition were needed, and more paper currency was issued. The Madero revolution had been financed with coin, for Madero, his backers and his family were wealthy; but Carranza was not in this fortunate condition. It was, therefore, after the disappearance of Madero from the political scene, that the finances of Mexico began literally to go to pieces. Carranza had possession, in the beginning of his career, of only two or three minor ports of entry upon which to depend for any financial assistance from export and import duties. Thus the Constitutionalist party piled up obligations to the extent of 700,000,000 pesos Mexican currency back of which there was no assurance of redemption or any substantial backing of any kind. In addition to this, the country was flooded with the currency of other contending parties and with counterfeits of all paper afloat. Thus the amount of paper currency in circulation in the republic in 1916 when the Carranza government began to come on top will probably never be known. After the recognition of the Carranza provisional government by the United States, considerable attention was paid to the solution of the currency question, which had become of urgent importance. It was finally resolved to make a new issue of

500,000,000 pesos at the rate of 10 cents United States currency for one peso. This value was to be maintained by the sale of gold drafts in New York at the rate specified, in exchange for the new paper. It was to be received, at this rate, for duties, by the government. This was known as the Non-counterfeitable Issue, and was to be issued gradually in payment of salaries and other government expenses at the rate of about 50,000,000 pesos a month. However a very considerable part of the taxes imposed by the federal government had to be paid in silver. These included all export and import duties. The greater part of this went to swell the guarantee or reserve fund behind the new paper currency issue. At the same time that this new issue was being put into circulation steps were being taken to retire all the former issues authorized by the Constitutionalist party, whether state or federal. To this end all the bills of 20, 50, 100 pesos were declared (1 June 1916) no longer of compulsory acceptance and the holders thereof were notified to turn them in to the government, upon which they would get receipts promising redemption in specie, beginning 1 October, at the rate of five cents United States money (10 cents Mexican silver) for the peso. As the market value of this currency was only about two cents and as it had previously fallen as low as one-half a cent, the offer was a very liberal one and had the desired effect. In order to further facilitate the retirement of the old paper currency, all railway and telegraph dues were made payable in it up to 1 Jan. 1917. Owing to this clever campaigning on the part of the government, the metal currency, which had gone into hiding shortly after the outbreak of the revolution, began to reappear in 1916, with the increase in confidence in the stability of the Carranza government.

As Mexico had no national paper currency previous to the outbreak of the revolution of 1910, the bills in circulation being all bank issue, were kept at par value by a reserve of 50 per cent of the amount in circulation, exacted and guaranteed by law. During the revolution the banks nearly all violated this provision, issuing notes far in excess of their reserve. The Carranza government, after an investigation, gave the offenders a certain time in which to make good the required deposits under pain of being closed. This caused the rapid decline of the value of banknotes throughout the republic, both state and federal. In order to further guarantee the stability of the Non-counterfeitable Issue, $5,000,000 gold was taken from the national treasury and an additional $5,000,000 gold was obtained as a loan from the Henequen Regulating Committee of Yucatán; and all bank issues of paper currency were ordered withdrawn from circulation, the government thus retaining, in conformity with the provisions of the constitution, a monopoly of the issuing of all money, whether paper or metal, in the republic (15 Sept. 1916). The income from national lands and forests was also ordered paid in gold; and this too went to back up the new paper issue. Over $10,000,000 gold was also obtained from uncultivated parts of great estates which had previously paid little or nothing in the way of either federal or state taxes. At the same time all the banks in the republic were placed under the strictest government supervision, and those which had not complied with the conditions laid down as to currency reserve were permitted to do business only through a government interventor, who was empowered to see to their liquidation. None of these banks could issue any specie without the consent of the government. At the same time the duties were divided into four classes; those payable in metal only; those payable in metal or the equivalent thereof in national paper currency of the new issue; those payable in the new paper issue; and those payable in the new issue or the equivalent thereof in the paper issues of Vera Cruz and the Constitutionalist Army. The new paper currency issue was distributed as follows: 80,000,000 one peso bills, 60,000,000 two peso bills, 75,000,000 five peso bills, 75,000,000 10 peso bills, 70,000,000 20 peso bills, 75,000,000 50 peso bills and 75,000,000 100 peso bills. This work of reorganization of the currency and finances of the nation was placed in the hands of a commission of five members, all of whom had had considerable experience in monetary matters, and who were required to report to the Treasury Department, under whose direction they were working. The principal banks of issue in Mexico had, 30 June 1911, the following paper currency in circulation: National Bank, $54,841,000; London and Mexico, $19,278,000; other banks, $42,535,000; total, $116,654,000. There were issued by the government, in 1910, 6,206,000 silver coins worth $2,927,000; 6,146,250 nickel coins valued at $307,-312; and 19,450,000 bronze coins worth $194,-500. In the fiscal year ending 30 June 1911 the consular fees were $1,163,341; the general stamp tax amounted to $15,271,000; the taxes on mining land to $1,934,000; on ores and metals, $2,365,000; tobacco, $2,760,000; alcohol, $870,000; cotton goods, $2,517,000; explosives, $5,334; direct taxes, $6,295,000; municipal taxes, $5,133,000; postal service, $4,775,000; telegraphs, $2,255,000; and lotteries, $1,255,000. During the same period the importations amounted to $47,500,000; the exportations to $435,000 and the port duties to $1,985,000, making a total income from foreign commerce of $48,985,000, exclusive of export duties. In 1918 the United States took from Mexico goods to the value of $140,800,000 and sent there goods to the value of $106,893,000, a total business of $247,694,000. Owing to the fact that the revolution of 1910 and succeeding years divided the country into several factions, each of which controlled its own section of country and was more interested in maintaining its ground than in furnishing statistics, such as the Mexican government put forth annually previous to 1912, definite information relative to the financial and other conditions of the country from 1913 to 1919 is not available, except in a general way; and even this covers only that part of the republic under the control of the Constitutionalist party, which was able, largely, to finance the administration through the sudden enormous increase of the oil interests of the republic and the rise in the price of oil itself on account of the European War. The finances of Mexico, which were in a deplorably bad condition in 1876, when Gen. Porfirio Díaz assumed the presidency for the first time, continued to steadily improve throughout his seven terms of office until, on his re-election for the eighth time in 1910, they had reached such a

position that the Mexican government had secured a solid standing in the money markets of the world. According to the report of the internal revenue tax office for the fiscal year 1917–18 the total revenue collected was $75,496,360, distributed as follows: Mining, $2,203,353; exportation of metals, $10,003,225; alcohol and other liquors, $4,047,532; textile fabrics and thread, $2,304,050; importation of wines and other beverages, $2,330,584; electric light and power, $800,743; telephones, $201,055; bottled liquors, $900,164; matches, $286,842; advertising, $93,638; pulque, $479,295; petroleum, $7,955,113; patents, $23,449; inheritance tax, $357,577; loans, $92,301; federal taxes, $27,545,390; stamp document tax, $14,376,216. The public debt of Mexico, which has never been large for the potentialities of the nation, began with a 5 per cent loan of £3,200,000 contracted in England in 1824, which was increased by a like amount at 6 per cent the following year. The interest on these two loans was not paid from 1827 to 1831; and even after this latter date it was met only intermittently and was, therefore, the cause of many disagreeable complications which have become part of the history of the Mexican national debt, which itself became mixed up with political events of primary importance. In 1886 these two first foreign debts of the Mexican nation were consolidated with the national debt. Previous to this, however, they and other loans contracted in 1831 were consolidated into one national debt of £9,247,387, in 1837; and this agreement was again ratified in 1839. In 1846, the whole Mexican foreign debt, including interest due and unpaid, together with certain internal bonds and other unfunded liabilities, were again consolidated into one national debt of £10,241,650 in bonds of the 1846 issue, for the payment of which one-fifth of the customs receipts of the ports of Vera Cruz and Tampico, the duty on tobacco in all forms and the silver export duties on ore sent out by way of the Pacific ports were pledged. During the war with the United States the American forces seized and retained Vera Cruz and Tampico and the Mexican government was thus unable to meet its foreign obligations. In 1850 another attempt was made to meet the foreign indebtedness of the nation through its conversion into new bonds bearing 3 per cent and guaranteed by 25 per cent import duties and 5 per cent of the Gulf ports and 75 per cent of the Pacific ports duties, which were to be employed for the payment of interest on the bonds and their redemption. In 1864, by a decree of the imperial government of Maximilian, government stock to the amount of £4,864,800 was issued and was accepted by the original bondholders in payment of arrears of interest. The same year the imperial government secured a second loan of £12,365,000 in Paris and London; and this loan was practically all converted into the Mexican Imperial Lottery Loan with a face value of £20,000,000. Both these transactions were repudiated by the Republican party on the overthrow of the empire in 1867. However, a part of the debt of the empire was subsequently recognized during the Díaz administration. In 1888 a 6 per cent loan of £10,500,000 was contracted in London, Berlin and Amsterdam, 20 per cent of the export and import duties and all the direct taxes on industries and landed property and buildings in the Federal District being pledged to meet the obligation thus contracted. The following year the Tehuantepec 5 per cent railway loan of £2,700,000 was made in London and Berlin and a year later silver currency bonds to the amount of $6,700,000, bearing interest at 6 per cent, were disposed of in London and Amsterdam to meet certain pressing obligations for railway concessions and construction; and the same year another loan of £6,000,000 was made in London, Berlin and Amsterdam for the same purpose. Three years later a 6 per cent loan of £3,000,000, secured by 12 per cent of the import and export duties, was contracted in London. In 1894 the government created the 5 per cent Interior Redeemable Debt, with a view to a single new issue in which all future subventions to railways should be paid. This debt consisted of five series of $20,000,000 each. In 1899 the 5 per cent Internal Consolidated Gold Loan of £22,700,000, redeemable not later than 46 years, was issued to convert the 1888, 1890, 1893 6 per cent loans and 1889 5 per cent Railway Loan. In 1903 the federal government assumed obligation to the extent of £2,400,00 for the payment of the City of Mexico 5 per cent drainage loan, to meet the expenses of the drainage of the capital. The following year a 4 per cent gold bond issue of $40,000,000 was made in London, New York and Amsterdam, partially through banks and partially privately, to meet various pressing obligations of the government. In 1910 the final loan of the Díaz government was made at 4 per cent for £22,200,000, with a view to the conversion of the 5 per cent loan of 1899. Finally, in 1913, a loan of $200,000,000 was authorized, of which $60,000,000 was placed in France, with a guarantee of certain export and import duties. In June 1910, the public debt of Mexico was $300,524,996 (Mexican silver) payable in gold, and $137,850,133 payable in Mexican silver, and an additional debt of $273,398 (Mexican currency), making a total of $438,648,528 in Mexican silver. In 1918 the public debt was over 500,000,000 pesos gold (including interest of about 70,000,000 pesos), the gold peso being nominally worth 49.846 cents. Consult Conant, C. A., 'The Banking System of Mexico' (Washington 1910) and works under section on MANUFACTURES. On the same date there were in Mexico 33 banks, 25 of which were banks of issue; all of which were then doing business on a gold basis which had been introduced into Mexico in 1905 on the basis of a 50 cent dollar. For the fiscal year ending 30 June 1913 the revenue of the Mexican government was $120,958,902 Mexican currency against an expenditure of $110,781,871, a very considerable increase having taken place in five years, when the revenue was only $98,775,510 and the expenditure $92,967,393. It is worthy of note that, even with the revolutionary activity then prevailing, the revenue of the government was, in 1912–13, $15,755,816 greater than that of the preceding year. This income had reached over $150,000,000 (pesos) in 1917. This federal revenue is, for the most part, derived from stamp taxes, direct taxes and import and export duties. Although the finances of the Constitutionalist government had improved consider-

ably in 1919, yet the disorganized condition of the country and of many of the banks, both state and federal, and the loss of credit brought about by the long revolutionary period, made the task of the Constitutionalist party of straightening out the financial affairs of the country very difficult. Money was badly needed; and this the great money centres seemed unwilling to advance until greater opportunities for the exploitation of Mexico's natural resources were granted them. Working under this handicap, the government steadily pursued its ends with as much success as could be well expected under the circumstances.

8. GOVERNMENT. The constitution of Mexico is based upon that of the United States which it very much resembles. The republic is formed of free and sovereign states which, for administrative matters concerning the interests of the nation as a whole, are united under a federal government. In virtue of the constitution of 5 Feb. 1857 the national power resides in the people, who are the source of all public authority. The administration of the affairs of the country is carried on by the national government, for the federation, and by each state government for its own state. But no state law may conflict with the general good as expressed by the laws of the federation. Slavery is prohibited by the constitution and all persons born in the republic are free and equal in the eyes of the law, and every one has a right to freedom of thought, profession and occupation. In so far as it is consistent with private rights and the exigencies of state, the press is free. In Mexico one may publish what he pleases, for there is no press censorship; but the citizen and the government are protected by libel laws. Newspaper, magazine and other presses cannot now, as formerly, be confiscated as instruments of crime. The right to associate together for any lawful undertaking, business or enterprise, and the complete individuality of every law-abiding citizen of the republic or resident therein are recognized and all may leave or enter the country without passport. Mexico being a republic, hereditary honors and titles of nobility are not recognized and no one is permitted to accept or wear them unless by special act of Congress. Arms may be carried for lawful personal defense in certain parts of the country, whereas in others a permit to do so must be obtained; for the law recognizes that in mining camps, wild mountainous regions and unsettled parts of the republic, arms are necessary for self-protection, and here a permit is not exacted. Search without warrant is prohibited, and a policeman may not enter a private house without authorization from the police court, unless it be in pursuit of a well-known criminal or one caught in the act of breaking the law. Privileged tribunals such as were customary during the Spanish occupation of the country are strictly prohibited; and every man, be he priest or layman, citizen or administrative officer of the government, is ruled and governed by one common law. The passage of laws contrary to the interests of the nation is prohibited, and no treaties can be made with foreign countries for the extradition of political offenders. According to the constitution and the law of the land offenses against law and order are divided into two great classes, civil and criminal. No one may be imprisoned for offenses coming under the first of these heads. This provision includes debts and other monetary obligations, provided there is nothing criminal about their contraction. A person once arrested must be brought to trial within three days and just cause shown for his detention, or he must be set free. Whipping, torture, mutilation and other punishments of a like nature, common enough in previous periods of the history of the country, are declared contrary to law. All punishments except those of a correctional nature must be administered by judges of the criminal courts. The death penalty is practically never exacted in Mexico in times of peace. It is stipulated in the constitution, however, that it may be applied in cases of high treason, premeditated murder, parricide and highway robberies; but never for political offenses, except in time of war. In practice, however, about the only cases in which it is exacted, in normal times, are those of offenses of a most serious nature against military authority. In all legal actions one may appeal from a lower to a higher court until the Supreme Court of the nation is reached and gives its decision, which is final. But in cases of the death penalty, an appeal may be made to the clemency of the President of the republic. Once a man has been tried and acquitted he cannot be tried again for the same offense. In conformity with the principles of democratic government no spying upon the privacy of the people of the land is permitted and, on the same principle, all private correspondence is declared inviolable. The quartering of soldiers upon private individuals in time of peace is prohibited, and even in time of war it can be done only in conformity with certain regulations of Congress and through special orders issued to fit the exigencies of the occasion. Patents may be issued for a certain stated time on inventions of use to mankind, although the constitution states that no monopolies shall exist in the country except such as the government may take to itself for the general good of the nation; as, for instance, the coinage of money and the control of the postal system. In the case of serious internal disorder of whatever character, which threatens the safety of state or government, the President has the right to suspend the constitutional guarantees; as he also has in the case of foreign invasion. But this can be done only with the consent of his cabinet and Congress, or of the congressional committee when the Congress is not in session.

All persons acquiring land in Mexico become by virtue of this acquisition Mexican citizens, unless they distinctly state in their deed of acquisition that they reserve their right to the citizenship of their native land. One of the radical changes of the Queretaro convention (31 Jan. 1917) is the provision that only Mexican citizens, by birth or naturalization, may acquire landed properties or water rights or obtain concessions to exploit mines or combustibles; but the state may concede such right to foreigners who appear before the Secretary of Foreign Relations and agree to be considered as Mexicans, in so far as the titles involved are concerned and agree not to invoke, in regard to the same, the protection of their respective governments, under penalty, for violation of these provisions, of losing the titles

thus acquired, which automatically revert to the nation. All Mexican citizens, whether native born or naturalized, are liable to military service. All persons resident within the republic are guaranteed the protection of the laws of the land.

The state government is divided into three branches, executive, legislative and judicial. The chamber of deputies and the senate, constituting the Congress of the union, are the legislative bodies, and by them alone can laws for the government of the country be enacted. Two sessions of Congress are held each year. The first, which begins on the first day of April, lasts from two to two and a half months, and its primary business is to audit all accounts of the previous year and to arrange the estimates for the incoming fiscal year. The second, which begins on 16 September, lasts for from three to four months. The law provides for the election of a President of the republic who shall serve for a term of four years and shall not be re-elected, and a Cabinet composed of the following departments: Fomento (promotion), foreign affairs, interior, justice, finance, communications and public works and war and marine. The Constitutional party, recognizing that the constitution of 1857, with the various amendments thereto, was unsuited, in certain important respects, to the conditions under which the Mexican people live, decided to make such changes in it as seemed necessary for the welfare of the nation. To this end a convention was held in Queretaro (December 1916). After two months' deliberation it closed its labors on 31 Jan. 1917, having reformed, in a radical manner, a number of the most important sections of the basic constitution. According to these changes the office of Vice-President of the nation is done away with and the filling of that of President, in case of the death or absence of the chief executive of the nation, is left in the hands of Congress. The age of compulsory primary education is raised to 15 years and all parents or guardians are under obligation to see to it that their children or wards receive primary, secondary and military education. Instruction in all government schools and in all primary private schools must be laic, and no ministers, priests or officials of religious organizations or societies may establish or own schools or teach in Mexican schools. This abolishes the church schools which, before the revolution of 1910, ministered to fully two-fifths of the educational needs of the country. To make up the deficiencies in educational facilities thus caused the new reforms in the constitution declare it obligatory upon all agricultural, mining and industrial companies, resident outside of towns, to establish and maintain schools for the education of the children of the people in their employ or resident on their property. All schools, whether official or private, must submit to official inspection and follow the government program of studies.

The constitutional amendments of 31 Jan. 1917 provide for the subdivision of large landed estates, aiming in this way to solve the land problem, which formed one of the causes of the revolution of 1910. Each state or territory is empowered to fix the largest amount of land which any person or company may hold, and all landed properties in excess of this amount must be subdivided and sold off within a certain stated time, and in accordance with official regulations, otherwise they are subject to confiscation. One of these conditions provides that at least 20 years shall be allowed the purchaser in which to acquire property rights by making stated yearly payments. During this time no mortgage can be placed on the property thus acquired and the interest charged cannot be greater than 5 per cent. No lien of any kind can be placed upon homestead properties nor can they be seized for debt or other causes. In theory all land, minerals and other resources of the country are the property of the nation, and this position is maintained by the constitutional amendments of 1917, and the theory itself is put forward as a justification for the subdivision, by order of the legislature, of large landed estates and the national control of oil, mineral and water rights, with a view to the more equal distribution of the wealth of the nation and the encouragement of small landed proprietors. To hold mining properties it is necessary to work them; and no company may acquire and retain possession of more land than is actually necessary for the carrying on successfully of the business of the concern, whether it be mining, agricultural or industrial.

As the Constitutionalist party, when it rose in arms against the Díaz government, proclaimed the rights of the Mexican people to govern themselves in a direct and democratic manner and demanded the immediate solution of the agricultural questions facing the nation, proclaiming, at the same time, the rights of the masses, naturally these reforms find a prominent place in the changes made in the constitution by the convention of 1917. These are radical and far-reaching. The new labor laws provide for an eight-hour day with six days' labor a week; while night work is restricted to seven hours and when it is of a dangerous and unhealthy character, it is altogether prohibited for women and children under 16 years of age, while children under 12 may not be employed in any contract work. Commercial establishments may not work their employees after 10 P.M.; and children between 12 and 16 must not be worked for more than six hours a day. Women shall not be required to do hard labor for three months before childbirth and they may not work for one month after, but they shall be paid for this month and they shall retain their positions and all the rights of their contracts. They shall also be allowed two rest periods each day during the time they are nursing. The minimum salary in every district of the country shall be such as to provide for the necessities of life, the education of children and honest amusements. In all farming, commercial, manufacturing and mining enterprises the employees have the right to participate in the profits of the business, and the percentage of such participation shall be fixed, in each community, by a commission acting under the central commission of conciliation which, by law, is established in each state. There shall be no distinction in salary by reason of sex or nationality, for the same work. Farming, mining and industrial companies must provide, outside the cities and larger towns, proper sanitary dwellings, markets, hospitals and other conveniences

necessary to the life of the community, and when the employees number 200 municipal buildings and recreation grounds shall be provided within which no intoxicating liquors shall be sold nor gambling permitted. Employees may lawfully form combinations to protect their interests and the right to strike and to close down is recognized. The workmen must, however, give 10 days' notice to the Commission of Conciliation and Arbitration before striking, and they are not allowed to use violence of any kind in the attempt to enforce their demands. An exception to this rule is, however, made in the case of government employees in ammunition factories, which are under the authority of the army and thus subject to military discipline. A complete close-down shall be legal only when the excess of production makes suspension of work necessary to maintain prices at a reasonable rate, but approval for such close-down must first be obtained from the Committee on Conciliation and Arbitration, which shall be formed of an equal number of representatives of capital and labor together with one additional member representing the government. Any employer refusing to submit his case to the commission or to abide by its decision forfeits all right to any contracts already made with his employees and becomes obligated to pay them three months' salary. Should the workmen refuse the offer of the commission their contracts automatically become void. An employer who discharges an employee because he has joined a union or taken part in a legal strike or without any just cause shall be obliged, at the option of the workman, to pay three months' salary or to continue the contract. The law provides for free municipal employment bureaus and stipulates that, when a Mexican workman contracts to go to work outside Mexico, the contract thus made must be approved by the municipal authorities and viséed by the consul of the country to which he is about to go, and one of its provisions shall be that the employer must provide the means for the return of the workman to his native land. No part of a salary may be retained as a fine, as was formerly the case; no salaries may be paid in a saloon or place of amusement, and no workman may renounce his rights to indemnity for accident. No labor contract can be for more than one year, and in such contracts the laborer cannot renounce any of the rights guaranteed him by law. The only redress for the violation of a contract on the part of the employer or employee is a civil action.

9. ARMY AND NAVY. Owing to the many revolutions and upheavals through which Mexico has passed since it became an independent country in 1821, the armed forces of the republic have been a constantly varying quantity. At the time of the collapse of the Maximilian empire in 1867 there were four great military centres, the north, the west, the centre, and the southeast. When Porfirio Díaz took the city of Mexico in 1867 he had under his command more men than he had in the whole military force of the republic in 1910, when he was faced with an uprising which was destined, in less than a year, to send him into exile from which he never returned. Juarez, who, on the death of Maximilian, was acknowledged everywhere as the legitimate ruler of Mexico, found one of his greatest problems in the reduction of the armed forces which he had inherited from the prolonged conflict against the French, the clericals and the Reactionary party. He proceeded to solve it by dismissing from service hundreds of soldiers and officers, many of whom, being unfitted for civic life and having no means of making a living, became a constant thorn in the already troubled side of the executive. Bandits roamed the country and made so bold as to even invade the capital itself. Robbers, on a less pretentious scale, were everywhere; and most of them had either been formed from or organized by the dismissed soldiers of the republic or the forces of the Reactionary party. Díaz faced the same condition of affairs when he came into power in 1876. But he was wiser in his day than Juárez had been in his, probably because he was a thorough soldier and understood the soldier's point of view. He saw, in the very restless element that had given the Indian President so much trouble, the raw material out of which to create a rampart against the lawlessness that had overrun the land. In the course of a few years he had organized out of this unpromising material the *rurales* (rural guard), which became as famous in Mexico as the Northwest Mounted Police is in Canada. These guardians of the peace, which were to be found in organized groups in the towns, cities and villages throughout the country, were military in every sense except that they were under the jurisdiction of the Department of the Interior (Gobernación) instead of that of War. However, in the last few months of the Diaz administration (1911), the *rurales* were placed under the jurisdiction of the War Department, for strictly military considerations. Throughout the trouble they remained, for the most part, faithful to the government, but becoming later on disorganized through the many political changes that followed one another in rapid succession, they were finally disbanded. Throughout his long term of office, which extended from 1876 to 1880 and from 1884 to 1911, General Diaz gradually reduced the military force of the republic and aimed at increasing its efficiency. In 1910 the standing army of the republic consisted of less than 1,000 commissioned officers of all grades and less than 25,000 non-commissioned officers and men. Thus the government, which had been lulled into fancied security, through the years of peace which had followed the assumption of the presidency by Díaz, found itself unprepared to deal with a revolution like that of Madero, which affected the greater part of the country. The peace standing of the Mexican army was, in 1914: Commissioned officers, 3,112; non-commissioned officers and men, 26,431. The expenses of the maintenance of the armed

forces of the republic, the garrisons, etc., was, in the fiscal year ending 30 June 1914, over $40,000,000 Mexican money, or more than one-third of the whole revenue of the republic. As this amount embraces only the forces of the de facto government, it is probable that nearly as much more was spent in the maintenance of the revolutionary forces then in the field against the former. On 30 June 1916, A. G. Garcia, Mexican inspector of consulates stationed in the United States, gave the strength of the Constitutionalist army as 175,000 officers and men, all of which he claimed were well armed and uniformed. Other authorities place the Constitutionalist forces at between 85,000 and 100,000. This is considerably above the authorized peace strength which is 43,967, commissioned officers, non-commissioned officers and men. During the Díaz régime many new barracks were built and many old ones were reorganized and made modern. A school of *Aspirantes* (officers in training) was opened at Tlalpam, in the Federal District a short distance from the capital for the military instruction of men in all branches of the service who could not afford to go through the longer and more thorough course given in the National Military School in Chapultepec. Owing to the part the pupils of this Tlalpam school took in the uprising under Generals Mondragón, Felix Díaz and Reyes in February 1913, it was closed. The West Point of Mexico, however, is the Chapultepec school, which occupies a part of the famous Chapultepec building, the official residence of the President of Mexico. There are generally in attendance about 300 students all being trained for officers in the Mexican army at the government expense. The school also offers an excellent post-graduate course in advanced engineering, topography, military jurisprudence, ordnance, military history, advanced military tactics and an extensive course in the geography of the country which, from the military point of view, is extremely difficult. The present Constitutionalist government, following in the footsteps of the Díaz administration, is attempting to educate the illiterate soldiers in the ranks of the army, or at least to teach them to read and write. According to the recent amendments to the Mexican constitution, service in the army is obligatory on every citizen of the republic, and in time of war the conscription covers from three to five years; but as a matter of fact only the lower classes are forced into the army. In time of peace the Mexican army now consists of 34 battalions of infantry, 18 regiments of cavalry, one regiment of horse artillery, two regiments of field artillery, one regiment of mountain guns, two battalions of garrison artillery and one battalion of engineers, each battalion consisting of four batteries. On mobilization each four-company battalion (including the engineers) forms a regiment of two battalions while the four-battalion regiments are raised to six battalions and the cavalry regiments to six squadrons.

Owing to the difficulty which the Constitutionalist government has met with in securing arms, the armament of the forces is of different kinds, including various Mauser models for the infantry, and Remington rifles of a date as far back as 1893, the Mauser carbine for the cavalry, and other arms of German and Japanese make. The field and horse artillery have Q. F. guns on the Schneider-Canat system; while the coast defense consists, in so far as it is modern, principally of guns of French make.

The Mexican Navy.— The navy consists of the gunboats *Vera Cruz, Zaragoza, Bravo, General Guerrero* and *Morelos*, and the transports *Progreso* and *Oaxaca*. The *Zaragoza* is 213 feet in length, has a displacement of 1,236 tons and a speed of 13 knots, is built of steel and its armament consists of six Canat guns, two Nordenfeldt rapid fire guns and two Hotchkiss revolving guns. The *Vera Cruz* is 200 feet in length, 1,000 tons displacement, has a speed of 16 knots and is built of steel. It has two Bethlehem rapid fire guns, 6 semi-automatic rapid fire guns and one Whitehead torpedo gun. The *Bravo* and *Morelos* are each 252 feet in length, have 2,500 horse power and a speed of 16 knots. They are built of steel, and each carries two Bethlehem rapid fire guns and six Schneider-Canat rapid-fire guns. The *Progreso* is 230 feet in length, has 1,585 tons displacement, a speed of 12 miles, is built of steel and will carry 250 tons of cargo and 600 men, with the usual complement of officers. The *Oaxaca* is 100 feet in length, its tonnage is 979, its speed 7 knots, and it is built of steel and will carry 300 tons of cargo, 200 cattle and 500 men. Reserves are provided for service in the army in case of war, which can, if needed, be made to swell the entire fighting force to almost 500,000 men.

10. EDUCATION. The early history of education in Mexico is particularly interesting. In 1529, the College of San Juan de Letran was established in the capital and threw its doors open to Spaniards and Indians alike. The first university was opened in 1553 by special permission of the King of Spain. In 1573 two colleges, San Gregorio and San Ildefonso, were opened; and two others and a divinity school were established a few years later. Thus seven institutions of higher education were in operation in Mexico before the close of the 16th century. It was not, however, until 1578 that the science of medicine was recognized as meriting a place among the branches of higher education, the first chair of medicine being established in that year. Twenty-one years later another medical professorship was founded, and in 1681 anatomy and surgery were added. The Royal College of Surgeons, established in the city of Mexico in 1768, still exists as the National School of Medicine, a name adopted in 1845. Its home is the building made famous as the residence of the Spanish Inquisition. The Mining College or School of Engineering, established in 1792, occupies an edifice built by the famous Spanish architect Manuel Tolsa, at a cost of $3,000,000, and is in a most flourishing condition. Although the Spanish conquerors of the Aztecs were largely inspired by avarice, cupidity and brutality in their treatment of them, they were sincerely devoted to the cause of higher education and contributed liberally from public revenues and private fortunes to its advancement. In the city of Mexico there was founded in 1551 by the Spanish Crown, the first university in North America, 200 years before the independency of the United States. The National

Academy of Art occupies a building on the site of which was the home of the first European school of the new world, a school for Indians. The first normal school for males and its companion school for females occupied historic buildings completed respectively in 1678 and 1648; the Jesuit College of San Ildefonso, erected in 1749 at a cost of $400,000, is now the home of the National Preparatory School (a part of the National University of Mexico). The National Library, with its more than 400,000 volumes, was formerly the Convent of San Augustin. The building in which is now located the National Museum dates back to 1731 and cost $1,000,000 and The College for Young Women now occupies a roomy structure completed in 1734 at a cost of $2,000,000. Thus are education and history closely intertwined in Mexico City. In 1824 Humboldt wrote: "No other city of the new continent, not excepting those of the United States, possesses scientific establishments so great and so solid as those of the capital of Mexico." In most of the states, schools for the care and instruction of orphans are maintained at the public expense; in these both sexes are given the advantage of a primary education. Boys are taught the ordinary trades, and girls are instructed in the various occupations pertaining to the sex. In these, as well as throughout the entire educational machinery of the republic, modern methods have been adopted, and system, progress, and thoroughness prevail. Everywhere there is manifested the deepest interest in the uplifting of the masses through the most effective of all agencies — education. When Gen. Porfirio Diaz was first elected President in 1876 there were only about 4,000 public schools in the entire republic. From the coming of the Spaniards the chief interest in education had been confined to the higher branches, to the establishment of seminaries, colleges and universities, and the primary or fundamental branches were neglected. Under Díaz there resulted a noteworthy increase of schools and attendance. In the period between 1876 and 1891 schools of all classes had increased from 4,250 to more than 10,000 and the total attendance from 160,000 to 649,771. The attendance of *mestizos* (half-breeds), from 16,000 to 235,000, and of Indians from about 8,000 to 170,000. In 1891 the entire cost of maintenance of the educational system was $4,068,200, which sum was paid by the federal and state governments, the average cost per capita being $5.63. In 1907, the number of primary schools supported by the federal or state governments was 9,710 and by municipalities, 2,230; total, 11,940; and the attendance was 776,622. There were 34 secondary and preparatory schools supported by the federal and state governments, with an attendance of 4,231; of which 3,793 were males and 438 females. The number of private schools during the same year was 2,499 with 152,917 pupils. In 1913–14, $13,926,000 was spent in education. In 1917 the total school population of the state was 972,600 with a total enrolment of over 700,000, for the teaching of which there were over 22,000 teachers. The number of public libraries in 1913 was 151; number of museums 45, of which 11 were archæological, seven scientific, eight natural history, one geological and metallurgical, five agricultural, one medical and anatomical, one industrial, two commercial and nine miscellaneous. There were 164 scientific and literary societies. A law was enacted in 1888, but not put into force until 1896, making elementary education compulsory and compelling the establishment and maintenance of at least one public school for every 4,000 inhabitants. Under the provisions of this law the advance in education and educational methods throughout the republic was rapid.

The National Library, which has a large and very convenient building and location in the capital, is a noteworthy institution. In its collection of more than 400,000 volumes are many rare books and manuscripts. Among these are works by early Spanish historians and scholars written before the art of printing was known. A very large proportion of the volumes in this library was originally the property of the church or of the priesthood and the books were confiscated by the government during the progress of the war of reform. Naturally many of them deal with religion, literature, language or history. Of similar character are most of the state libraries. While there are some 45 public museums in the republic many of which are quite extensive and all of which are exceedingly interesting and instructive, far greater importance attaches to the National Museum in the city of Mexico, than to all others combined. Although it has occupied its present quarters in the National Palace only since 1865, it was established in 1831, with the collections previously belonging to the Conservatory of Antiquities founded by Emperor Iturbide in 1822, and to the Royal University, to which Viceroy Bucareli y Ursula had in 1775 transferred the remnants of a most valuable collection of maps, hieroglyphs on skins, manuscripts, etc. These were consolidated under the name of the National Museum. Here the student of archæology, of ethnology or of any other department of the ancient history of the American continent, or of the peoples who have at different periods dwelt upon it, may find greater wealth of material for investigation and study than exists in any similar institution in the western world. While there are also a number of very important art collections in the principal state capitals, the National Gallery, in the city of Mexico, holds unquestioned preeminence. Of literary and scientific societies there are many in Mexico. Every considerable community is the home of one or more of these associations, some of which have been in existence many years.

The Revolutionary party of 1910 was unreservedly committed to the education of the masses; but the burden was unloaded upon the individual states and communities over which the federal government retained supervisory rights but with no central control. The Constitutional party has shown itself strongly opposed to church control of schools of any kind, whether public or private. In Mexico the city schools are fairly good, while those of the towns and villages and the country districts are very elementary and poor. This is due to lack of funds for the maintenance of public schools and the difficulty of getting capable teachers for the salaries paid. The plan of organization of the Mexican schools is more French than American. Primary instruction covers four years and the high school course two. Four

years of preparatory school duties lead to the university, which is much more academic in form than in the United States; so much so, in fact, that the work covered by the National University, as it is now constituted, was known, previous to 1913, as "the course of higher studies." But the Revolutionary party did away with the cabinet office of Minister of Public Instruction, giving to the arts department of the university its old name of the National Preparatory School and erecting the post-graduate school into a university. Whereas previous to this all education had been without charge, the new educational law exacts a fee of $5 a month in both the preparatory school and the university, with all their affiliated schools, like those of medicine, law, dentistry, engineering, etc. (17 Jan. 1916). For some years past the tendency of Mexican public education has been toward the practical at the expense of the academic; and this tendency has been accentuated by the changes recently made. Military instruction is made obligatory; French and English have been reduced from a three to a two-year course and much attention is paid to manual training. To the General Direction of Public Instruction of the Department of the Interior, re-established in 1914, is entrusted all educational matters pertaining to the Federation, which were originally handled by the Department of Public Instruction and Fine Arts. The General Direction of Fine Arts of the Department of Fomento (Promotion) has charge of all public libraries, national monuments, historical, archæological, artistic and other remains; the National University, preparatory, normal and primary instruction, including the teaching of agriculture, commerce, industry, geology and manual training in the Federal District and in the territories. Rudimentary education and state colleges and schools are in the hands of the local authorities which have their own governing bodies for this purpose. All companies having charters from either the federal or state authorities are, by virtue of this concession, obligated to provide schools and teachers for the children of the people in their employ. The same law applies to plantations, ranches and agricultural enterprises in general. This new law has worked fairly well and has been instrumental in increasing largely the number of schools throughout the republic. In the state of Yucatán alone there were, in 1917, nearly as many school buildings as there were in all the republic in 1876. In others of the states under the control of the Constitutionalist party, the number had, in 1917, been doubled since 1910.

The National Preparatory School in Mexico City (the old arts department of the National University) is now, what its name indicates, purely a school to prepare pupils to enter upon the study of some one of the professions. It is a little higher than an American college and considerably less than an American university. The National University includes the School of Higher Studies and the institutions of law, medicine, engineering and odontology. It is governed by a university council at the head of which is the rector. Owing to the unsettled condition of the country due to the revolution, definite educational statistics are not available for the past six years; but the general reports issued by the Constitutional government show a steady increase in the efficiency of the public school system and an encouraging decrease in illiteracy in about two-thirds of the states of the union. More and better trained teachers, however, are urgently needed to carry on the work of general national instruction and the fight against illiteracy now under way. For the battle is an uphill one; for the illiterate still count about 70 per cent of the total population of the country.

11. **RELIGION.** There is complete separation of church and state in Mexico (since 1873); and the reforms made in the constitution in 1917 reaffirm with great emphasis the fact that the church, of whatever creed or denomination, is constantly under the most strict government inspection and that all ecclesiastical buildings, lands and other property belonging to the nation, which extends their use to the church. So, therefore, no religious order or denomination can acquire land or other property or mortgages on the same. This prohibition extends to school and college buildings, asylums, charitable institutions and residences of ministers and priests and even to the property collected within the walls of the churches and other ecclesiastical buildings. Gifts of movable property may be made to the church; but even these at once automatically become the property of the nation. Every church or religious society occupying property must elect an official head to represent it before the government and to become responsible for the national property in its possession. All ministers of whatever creed must be Mexican by birth. The provisions of the reforms made in the Constitution in 1917 shut out of Mexican religious institutions all the 2,500 Spanish priests of the Catholic Church alone, hundreds of French priests, employed principally in schools and colleges, and the Protestant ministers, mostly American, who had established numerous churches and operated many schools throughout the land. While all religions not inimical to the interests of good government and the laws of the land are allowed to exist and to exercise their functions in Mexico, yet all public religious observances and ceremonies must be carried on within the church property and are subject to official inspection and regulation. The law does not recognize the personality of any sect. The legislature of each state is empowered to regulate the maximum number of churches and ministers within the state. No minister shall have the right to vote, to hold any public office or to be voted for, nor is he permitted to take part, in any way, in public affairs. The establishment of monasteries and nunneries and the taking of monastic vows are prohibited by the Constitution, which asserts that the state will not permit the fulfillment of any contract, pact or agreement the object of which is the curtailment, loss or irrevocable sacrifice of the liberty of man, whether for the purposes of work, education or religious vows. Marriage is a civil contract and no other marriage ceremony except the civil one is legal. Therefore there are generally two marriage ceremonies performed in Mexico, the civil one by a magistrate appointed for that purpose by the government, and a second by the priest or minister

of the Church of which the contracting parties are adherents.

12. MYTHOLOGY. Prior to the European occupation Mexico and Central America were inhabited by races possessing a long history and a semi-historical mythology, manifold in its ramifications and rich in its internal development. Within this mythology was the very heart of those nations and peoples, for round it clustered their social and political institutions and their industrial life. Though it differed with the different peoples, fundamentally it was everywhere similar. The same thing had taken place in Mexico that had happened to the mythologies of the Indo-European races in Europe. Different tribes of the same great linguistic family had separated from one another and, in their migrations from place to place, during the more or less nomadic stages of their existence, they had, later on, come together again. During these wanderings they had forgotten one another and when they met again it was as alien peoples. Yet so similar were their institutions, languages, religious beliefs and the general course of their existence that they frequently blended and became more or less one people. This happened to the remnant of the Toltecs left on the upland plateaux of Mexico after the overthrow of their empire; to the Chichimecas and to the various other tribes forming the Aztec Empire at the time of the Conquest.

After their long migrations from their primitive home, migrations which covered centuries, the Nahuatl races met as strangers in the valley of Mexico and surrounding country. The blending to which we have just referred was imperfect. Thus among the Toltecs we find the deity to whom most deference was paid was Quetzalcoatl; among the Aztecs it was Huitzilopochtli, god of war; among the Texcocans, Tezcatlipoca, god of the air; among the Tlaxcalans, Camaxtli; among the Otomí, Mixcoatl, god of the chase. Like the Romans, the Greeks and many other civilized peoples of pre-Christian times, the Mexicans were accustomed to adopt the gods of other races with whom they came into contact, more especially if the mythology of these races was closely related to their own. The natural result was the very curious mingling of mythologies. Huitzilopochtli, Quetzalcoatl and Tezcatlipoca were all gods of the air, and they have so many characteristics in common there is little doubt they were originally one tribal divinity common to all the people who spoke the Nahuatl tongue at a time prior to the separation of the tribes. In fact, in Mexican mythology, these three gods are represented as brothers, and in every part of the Aztec Empire where Nahuatl was spoken they were the foremost divinities. In Tenochtitlán (Mexico City), where Huitzilopochtli was all powerful, in his great temple, a statue and an altar had been erected to Quetzalcoatl. At Cholula, the heart of the Aztec empire, stood the greatest of the pyramids of Mexico, with its famous shrine, both erected to the worship of the Feathered-Serpent god of the Toltecs. But its worshippers were not confined to the remnants of the Toltecs who had become incorporated into the Mexican nation. Peoples of various races, Aztecs, Colhuas, Zapotecas, Mixtecas, traveled from the furthest confines of the empire and from beyond it to pay their devotions at the shrine of this once powerful divinity. Yet in Cholula, where the cult of Quetzalcoatl was all powerful, Huitzilopochtli also held a place by the side of the Toltec god himself.

In Texcoco, the reputed centre of the advanced culture of the Mexican Empire, while Tezcatlipoca occupied the place of most importance in the native pantheon, just below him stood Quetzalcoatl and Huitzilopochtli. As the superior culture, refinement and intelligence of the Texcocans gradually came to exert an all-powerful influence over the rest of the Aztec Empire, their chief divinity, little by little, gained more importance in the Nahuatl pantheon, until at last he secured recognition which gave him, among the nobles and cultured class at least, a standing above that of the other tribal gods.

Gods of the Air.— To understand the curious relationship of these Mexican divinities it is necessary to remember that they were all gods of the air and that they had, in general, common functions, attributes and powers. Camaxtli, the war god of the Tlaxcalans, was recognized by the Mexicans as being the equivalent of their own Huitzilopochtli, while the Tlaxcalans held that he was identical with Mixcoatl, the Otomí god of the chase. Among these three peoples this deity was designated by more or less the same insigniæ. But he also wore upon his face and body the colors of the morning star, as did also Quetzalcoatl; he carried the lightning dart, which proclaimed him god of war, and at the same time connected him with the divinities of the wind, the lightning and the thunder. Mixcoatl, who had two temples in Tenochitlán, also wore the symbols of the god of the air.

The same fate befell the mythology of Yucatan. Itzamná, the older culture god of the peninsula, was the popular culture hero of the Itzaes, the first of the historical races who overran Yucatán and the adjacent territory; while Kukulcán was the tribal god of the Mayas. Yet both divinities were recognized by the Mayas and the Itzaes; the shrines of both were to be found in the centres of the religious cult of the peninsula and to them came pilgrims from Chiapas, Guatemala and all southern Mexico, generally over well-paved stone roads which now lie buried in impenetrable forests.

The Kiches of Guatemala called their culture divinity Gucumatz, "Green Feathered Serpent," a name indicative of divine intelligence; and the Mixtecas, hundreds of miles away on the west coast of Mexico, named theirs Yucano, the "Bright Light," a term having practically the same significance. But everywhere in the south, as among the Toltecs and the Aztecs, the traditions and offices of this great intertribal divinity were the same. He was the god of the winds, the thunder and the lightning, of the morning star, of fire and of light, the apostle of culture, the patron of merchants, the inventor of language, literature and art, the special divinity of athletes and sportsmen, artisans and thieves. To him, under one name or other, was erected all that was beautiful in the builder's art. He was the terrestrial representative of the great sun sent to teach the people of the earth the arts and

sciences. He was the originator of the Toltec, Aztec, Kiche, Maya, Zapoteca and Mixteca calendars and systems of hieroglyphic writing, and he is credited with having given names to animals, plants, minerals, places and geographical divisions. He was the great physician and the inventor of medicine; music and poetry, too, were his gifts to humanity. In short, he was a universal culture god whose powers and benefactions were bounded only by the advancement in civilization and the breadth of imagination of each of the many tribes and nations unto whom tradition represents him as ministering.

Creation Myth.— The Nahuatls believed that before the creation of the universe there existed a region inhabited by the creator, Tonacatecutli (Ometecutli), and his consort, Tonacacihuatl (Omecihuatl), who had four sons, Tezcatlipoca, Huitzilopochtli, Quetzalcoatl and Yayauqui. When the youngest of these was 600 years old the gods appointed Quetzalcoatl and Huitzilopochtli as their representatives. The two executors created a fire and a demi-sun, and then two human beings, Oxomoco and his wife, Cipactonatl. To the man they gave the art of cultivating the ground and to the woman those of spinning, weaving and prophecy. They then created Mictlán Tecutli and his wife, Mictlán Cihuatl, Lord and Lady of Mictlán. They divided time into days, months and years; and below the shining residence of Tonaca Tecutli, in the 13th region, they created eight heavens, the first of which was inhabited by two stars, male and female; the second by Tetzahua Cihuatl (woman skeletons), whose business is said to have been to devour humanity at the end of the world. In the third heaven were men of all colors; in the fourth birds which descended to the earth. The fifth was the home and birthplace of fiery serpents, comets and falling stars; the sixth the dwelling place of the wind; the seventh that of dust, and the eighth that of the gods. Tlaloc and his consort, Chalchiutlicue, were also created as masters of the waters in the heavens above and upon the earth below. Tlaloc, in turn, created a great number of little servants, all of whom were known as Tlalocs, while he himself bore the title of Tlalocaltecutli, "Lord of the Tlalocs." His pigmy servants distributed the water wherever Tlaloc ordered them to, and sent it down upon the earth in the shape of rain, where it was again taken in charge by other little Tlalocs. Whenever one of these was unfortunate enough to break the jar in which he carried the water the crash of the fall produced thunder, and when a flying fragment hit some mortal, men said he had been struck by lightning.

The sun created by the gods went half way across the heavens and then returned upon its tracks or, according to another version, it rose only a short distance above the horizon and stopped there, and its rays were very feeble, consequently the earth was dimly lighted. Both it and the moon were accustomed to wander about the heavens; so Tezcatlipoca undertook to create a new sun, and there followed an era of sun-creation resulting in the making of four separate luminaries.

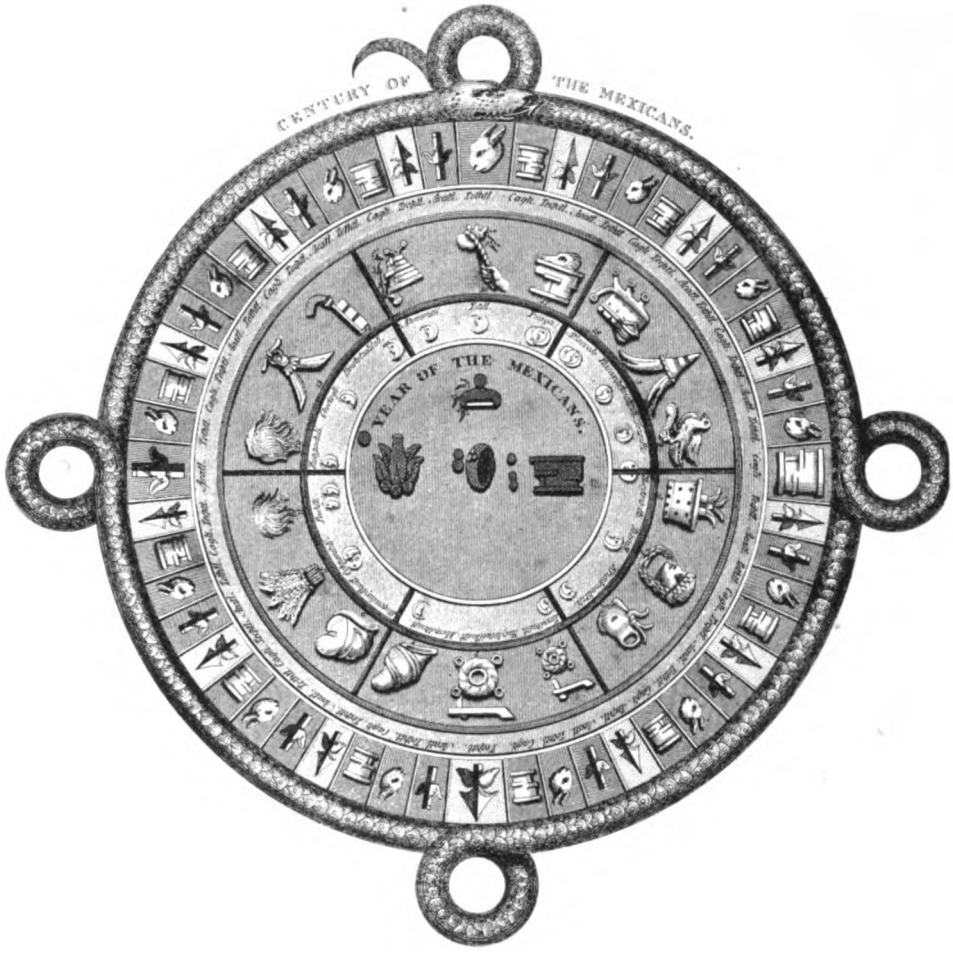
The Deluge.— There are different accounts of the creation of these suns and even the order in which they were created is disputed; but that their periods of existence represent four separate ages of the world is agreed by all. When the first sun, Atonatiuh ("water-sun"), was destroyed a great deluge descended upon the earth; when Ehecatonatiuh ("wind-sun"), met with a like fate, an all-devasating wind was created; and when Tletonatiuh ("fire-sun") ceased to exist, everything upon earth was destroyed by an all-consuming fire. Then followed Tlatonatiuh ("earth-sun"), who created all things as they now exist. Thus, according to Nahua tradition, the human race was swept from the earth three separate times, and people were in constant fear that a fourth destruction was to come, for they believed the four elements, earth, air, fire and water, were in constant conflict, and that for this reason they had already caused previous destructions of the world. After each of these destructions the earth had been repeopled by those who escaped. After the first inhabitants of the earth had disappeared, Coxcox and his wife, Teocipactli, escaped in a boat and landed on Mount Colhuacan. They were the progenitors of many children who were all dumb; but one day a bird, from the top of a tree, taught them to speak. They all spoke different languages, however. Hence the diversity of tongues.

Origin of Mankind.— According to one myth, after the destruction of the earth by fire, by Tezcatlipoca, Camaxtli-Huitzilopochtli sat upon a rock and, striking it with his wand, caused the first race — the Chichimeca-Otomi — to come forth and people the earth.

According to an Aztec myth, the first men emerged from a place called Chicomoztoc (Seven-Caves); and this mythological starting-point figures in all accounts of their wanderings. It was probably the place from which the seven tribes set out on their migrations southward, and at the end of which they arrived at the valley of Mexico.

Mexican Religion.— The Mexican had over 300 deities, some of whom had been borrowed from neighboring tribes and all of whom may properly be classed as nature gods. In addition to these they acknowledged a supreme being, whom they represented as the Lifegiver, Ipalnemoani, "He who gives us life," and Tloquenahuaque, the "All-embracing." This supreme being was never represented by picture or image and no sacrifices of any kind were offered to him. He was known as "Teotl," the god, and seems to have been identified with the Sun, and at times with Tezcatlipoca. The hieroglyphic by which he is represented is the same as that of the Sun. Tlacatecolotl, "Reasoning Owl," the enemy of the human race, seems to have been, in a sense, the force of evil opposed to Teotl.

The Aztecs and Nahuas in general believed in a life hereafter and that the souls of the dead went to one of three regions, the home of the Sun; Tlalocan, the residence of Tlaloc, the god of waters; and the dreary underworld called Mictlán, ruled over by Mictlantecutli and his consort, Mictlancihuatl. Soldiers killed in battle, prisoners sacrificed by the enemy and women who died in child-birth went to the home of the Sun, the men to wait upon him and to accompany him upon his daily journey to the zenith, where he was met by the women who formed his escort for the rest of the way. Those killed by drowning, lightning or any



One of the peculiar devices by which the ancient Mexicans computed time

of the diseases sent upon earth by Tlaloc or his consort, such as tumors and dropsy, and children sacrificed upon the altars of this god were transported, after death, to Tlalocán, a delightful region of mountains, shady trees and running streams. All those not qualified to go to the home of the Sun or the pleasure regions of Tlaloc were sent to Mictlán, situated, according to some authorities, in the cold and dreary north; according to others, in the gloomy "navel of the earth," where they were forced to lead an aimless existence.

By the Nahuas every phase of nature was personified and had its representative guardian spirit to whom offerings and sacrifices of some kind were made daily or periodically. Among these were household duties, of which every home had several, according to its class, condition and position in society. The sacrifices to the national and tribal gods were attended to by a numerous and opulent priesthood, who ruled in an autocratic manner and exacted heavy contributions for the maintenance of religious institutions and schools, the latter being also under their complete control. These sacrifices, generally slaves or captives taken in war, were offered up upon the stone altars of the temples, the victims being thrown upon their backs and held down by attendants while the officiating priest ripped open the breast and tore out the heart of each and offered it, first to the Sun, and then to the particular divinity to whom the sacrifice had been made. The presentation of fruits, flowers, grain, animals and birds to the family gods was generally made by the head of the family or of the community house, when a number of families lived in one large building, as was often the case in Mexico; while sacrifices were made by individuals to those divinities who were believed to work in the interest of individuals. Tezcatlipoca, a purely tribal divinity of the Texcocans, the most civilized and cultured of the Nahua people, had continued to gather to himself the powers of most of the other divinities, until, at the time of the Conquest, he was looked upon as a great divine ruler and creator and had become identified with the Toltec supreme divinity, the "Teotl." But he never ceased to be the tribal deity of the Texcocans. Huitzilopochtli, the tribal deity of the Aztecs, had become the great war-god of all the Nahuas because the military successes of the Aztecs had imposed him upon the other nations forming the confederacy. The large bodies of Toltecs who remained in Mexico after the fall of the Toltec empire formed communities, the principal of which was at Cholula, where the presiding deity was Quetzalcoatl, also the foremost divinity of the Zapotecas and, under the name of Yucano, that of the Mixtecas. The Toltecs who went southward carried the worship of this deity into Yucatan and parts of Chiapas, Tabasco and Campeche, where he disputed sovereignty with the older deities of the native races. In the long ages of mythology, hundreds of races surged to and fro across Mexico and the great isthmus of Central America, leaving behind them remnants of their languages, tribal customs and mythologies. Thus we have a mingling of tongues, creeds and customs which has sorely puzzled the antiquarian, the linguist and the student of mythology. The destruction of the native codexes and the undecipherable character of the remaining records in stone of the Mayas, Kiches and other highly civilized races of southern and eastern Mexico and Guatemala add greatly to the difficulties of understanding mythologies of the various races of Mexico.

Roughly speaking, the Nahua, Maya and Kiche deities may be classed as gods of the air, to whom belong the culture deities, the lightning, the thunder and the storm gods; the sun, the moon and the planet Venus (the Evening Star) and the Supreme Creator; gods of rain, mist, moisture and the running waters of the earth; grain and other plant deities; special patrons of trades, occupations, games, sports, learning of all kinds, including astronomy, astrology, witchcraft, luck in gaming, medicine and the healing art. The functions of many of these seem to be inextricably mingled and confused. This is due partly to our inexact knowledge of the past institutions, history and mythology of the various races who mingled and blended on this great bridge of the continents throughout unknown centuries before history began. But remains enough have been left to show the complicated nature of the religious system of the Nahuas and other cognate races and to prove that they had advanced to a stage wherein ethical considerations played a very considerable part. The prayers addressed to their gods, the speeches to the sovereign and other officials about to take office, the advice of a father to his son and a mother to her daughter; the poetical effusions of the royal poet of Texcoco, Nezahualcoyotl, and many other like documents which have come down to us, are filled with evidence of the high ethical plane of Nahua religious thought at the time of the Conquest; for every occupation of society, all reasoning, every movement of life had their separate being within the shadow of the Nahua religion.

MYTHOLOGICAL CHARACTERS.

In the following account of the more important mythological characters most frequently met with in literature relating to Mexico, the territory in which each plays his part is, unless otherwise stated, the land of the Nahuas.

Bacabs.— In the mythology of Yucatan the Bacabs, the upholders of the heavens, were supposed to have their stand at the four cardinal points. They were called Muluc, Cauac, Kan and Ix, North, South, East and West. They were probably related to the four wind deities and to the four rain Tlalocs. The Bacabs were frequently represented in Maya sculpture.

Bat-God.— The Bat-God, Zotzilaha Chimalman, the "Dweller in the Bat's House"; a primitive divinity of the Mayas, the Zapotecas and the Mixtecas is met with in the Popol-Vuh, under the name of Camazotzo, where he plays a prominent part in the adventures of the hero gods of the underworld. He seems to have been a god of volcanic fire and to have been closely associated with earthquakes and the lower regions.

Centeotl.— A family name given to the maize gods. The female divinity, called Chicomecohuatl, "Seven-serpent," represented water as a fertilizer and was assisted by Chalchiutlicue, the consort of Tlaloc, in fertilizing

the youngest harvest and looking after it. Under the title of Xilenon, "Green-corn-ear," she was the spirit of the green corn. As the earth goddess, she was called Tonacayohua, "She-who-nourishes." In this form she was one of the chief deities of the Totonacas, who erected to her, on the summit of a mountain, a great and imposing temple, to which pilgrims came from far and near. The name Centeotl was also given as a special title to both male and female deities. A summer festival lasting 18 days was held when the maize had attained its full growth. Ceremonial dances formed a part of this celebration at which a female called Xalaquia, who represented Chicomecohuatl, danced with the rest. Her face was painted yellow and red to represent the ripe corn. On the last night of the festival all the women and the head men of the community joined in the "dance of death"; after which the Xalaquia was offered up as a sacrifice to Chicomecohuatl. Not till the conclusion of this festival and its significant closing ceremony was it lawful to partake of the new corn.

Chac was the rain god of Yucatán. He is represented with a long tapir-like snout through which it was believed he blew the rain out over the earth. He corresponds to the Tlaloc of the Mexicans.

Chalchihuitlicue, "the rain goddess," wore a dress of nebulous green, a blue crown decorated with green feathers and a collar of precious stones to which was attached a golden pendant, all emblematic of the varying colors of the water. In her left hand she bore a conventional water-plant, and in her right a vase surmounted by a cross, the sign of the four directions or points from which the wind drove the rain.

Cihuapipiltin, "honored-women," the spirits of women who died in child-birth, were closely related to the Moon Goddess. The moon had two tendencies, one actively beneficent, the other actively malevolent. The Cihuapipiltin partook of this latter tendency. They afflicted infants with certain diseases and they entered the bodies of weakly people, more especially the insane who were popularly supposed to be governed constantly by their influence. Their temples were built at the cross-roads which they were said to haunt.

Citlapol, "the Great Star" (Venus), was the Lord of the Dawn, Tlahuizcalpan Tecutli. This astral deity was thought to influence the events of life very greatly, so whenever the planet was due to rise, the people stopped up their chimneys to prevent the entrance of its harm-bearing light; whenever it reappeared on its circuit, captives were sacrificed to its image or its representation painted upon a column called Ilhuicatlán, "Place in the Sky," erected in the courtyard of the great temple of Tenochtitlán. Owing to the very special importance attached to the movements of this planet by both Mexicans and Mayas, its periods of revolution were carefully watched and recorded with great accuracy. As the evening star, this deity was said to follow the sun on his journey to the underworld. He is represented as having a white body, symbolical of light, which was frequently covered with long, narrow, red stripes and over his eyes was a black mask, sometimes bordered with small white circles.

Coatlicue (Coatlatona), "She with Dress of Serpents," was the Aztec goddess of flowers and probably identical with the fabled mother of the god of war of the Aztecs. She was the patroness of gardeners who, in the early spring-time, offered her garlands of flowers.

Ehchuah, the "Black-God," was the patron divinity of merchants and cacao planters in Yucatán.

Gucumatz, "Green-feathered-serpent," the great Maya-Kiche culture deity, the equivalent of Quetzalcoatl, of which the name is a literal translation.

Huechaana, one of the two Zapoteca creation deities, was the creator of all men and fishes; Cozaana was the creator of all beasts. As the story relating to these two creator divinities is also told in another form by the Mixtecas, and as the eagle and the snake play a prominent part in this latter form of the myth, it is probable these two Zapoteca deities were closely related to the culture gods of other Mexican peoples.

Huehueteotl, "Oldest of the Gods," the fire deity, was also called Xiutecutli, "Lord of the Year," while he was generally addressed as "tata" or our father. He was represented with a black face and a red body, typical of fire. He wore a headdress of green feathers, a sign of royalty or divinity in pre-Columbian Mexico, and on his back he bore a yellow serpent, symbolical of his own special functions and of his relationship to the gods of the air. His connection with the sun, the father of all heat, was shown by a golden mirror. As Xiutecutli, he was a very much revered household god to whom an offering of drink and bread was made by every Mexican on rising in the morning. It was before his idol that the new fire was kindled every year. It was thought to be necessary for the existence of a new-born infant that a fire should be kept burning for four days in honor of its arrival and as a sign of gratitude to the Lord of the Year.

Huitzilopochtli (Mexilli), "Humming-bird's Feathers on the Left (leg)," the tribal deity of the Aztecs and their great god of war. He was the son of the Sun God and of Coatlicue (Coatlatona), "She with dress of serpent," the Aztec goddess of flowers and the reputed mother of the gods. He was born with a shield in one hand and a blue spear in the other, fully armed for war; and he proceeded at once to the extermination of his sister and his brothers, a fabled tribe of demi-gods, who had conspired to kill their mother. He pursued them four times around a mountain, killing many. Others were drowned in a near-by lake, while a few surrendered and made peace. Huitzilopochtli usually wore a headdress of humming-bird's feathers; in his left hand he carried a shield and in his right four darts. On account of his prowess in war and of the prominence of the Aztecs at the front of the Mexican confederacy, he was the religious head of the Mexican priesthood. He had power over all growing things; the feather markings of his shield were in the form of a cross composed of dots, thus connecting him with the Tlalocs; his face and his limbs were marked with stripes of blue, and he was seated on a pedestal of blue, at each of the four corners of which was a serpent. Across his face and his forehead, from ear to ear, was an azure band, all typical of his dominion over the sky.

where, as a tribal deity, he ruled as the god of lightning, of thunder and of terrifying winds.

Huistocihuatl was the protecting goddess of salt and salt-makers throughout the Aztec Empire, where the gathering of salt from the salt deposits along the low coast-lands was a business of great importance.

Hurakán, "He who hurls below," the Maya-Kiche god of the storm, of wind in motion, was accompanied in his work by violent manifestations of nature by three assistant deities, Cakulha-Hurakán (Lightning), Raxa-Cakulha (Lightning-track) and Chipi-Cakulha (Lightning-flash). Hurricane, Spanish huracán, is supposed to be derived from the name of this deity.

Itzamná, "Dew of clouds and heaven," father of gods and men, the tutelar divinity of Yucatán, and more especially of the Itzaes, was credited with possessing most of the powers of Quetzalcoatl, of ruling over more or less the same phase of human life and of performing more or less the same acts in behalf of humanity, and all evidence tends to show that he was but an earlier peninsular form of the great American culture myth. He was the universal life-giver and hence the patron divinity of birth and of growing vegetation. He was also the culture god who was popularly believed to have taught the Itzaes the civilization they had acquired. He was the fabled founder of Itzamal; and in his capital, in semi-historical times, was a magnificent temple dedicated to his worship.

Ixtlilton, "He of the Black Face," the god of medicine and healing, was also addressed as Tlatetecuin, the "earth-digger." He was said to be brother of Macuilxochitl. Sick children were carried to his temple to dance, and recite prayers and incantations, after which the priests gave them a special medicine contained in *tlilatl* "black-water jars." If the patient got better, the image of the god was taken to the house of his residence, where offerings and ceremonial dances were made in his honor.

Kinich-Ahau, "Lord of the Sun's Face," the Sun-god of Yucatán, presided over the North. He was also called Kinich-kakmo, "Sun-bird" and Arara, "Fire-bird." The figure of the Sun is frequently represented upon ancient buildings in Chiapas, Yucatán and Guatemala; and in the latter country certain Indian tribes still wear, on festive occasions, a gala dress with a great, yellow sun depicted on both front and back of the garment. They call themselves "Children of the Sun."

Kukulcán, "Feathered-serpent," a literal translation of Quetzalcoatl, was the great Maya culture god. He is said to have been the first king of Mayapán, just as tradition makes Quetzalcoatl one of the kings of Tula.

Macuilxochitl, "Five-flower," Xochipilli, "Source-of-flowers," was the patron of luck in gambling. His worship was general throughout the Aztec Empire and nations to the south of it; and he was held in high honor among the Zapotecas and Mixtecas. At a yearly festival dedicated to him, offerings of cakes, animals and human beings were made and ceremonial dances performed in which the people, richly dressed, took part.

Metztli, "the Moon goddess," Yohualticitl, "Lady of the night," was patroness of harvest and fertility. The Zapotecas and Nahuas believed that women stood in a very special relationship to this deity.

Mixcoatl, "Cloud-serpent," the Aztec and Otomi god of the chase, was sometimes represented as a deer or a rabbit. He carried a sheaf of arrows to typify his office. On the site of a famous ancient shrine of Mixcoatl stands Mixcoac, the "city of gardens," one of the most popular suburbs of the Mexican capital.

Nanahuatl, "Lord of lepers and those afflicted with skin diseases," is always connected with the moon, and diseased persons under his protection were believed to be sacrifices peculiarly acceptable to her, for whose service they were set apart. The moon goddess was intimately connected with the art of healing and she also took a special interest in lepers.

Napatecutli, "Four-times-lord," protector of mat-makers, one of the numerous rain gods, was one of the ministers of Tlaloc. He presided over the low, swampy lands where the reeds grow from which mats are still extensively made in Mexico.

Omactl, "Two-reeds," Nahua god of festivities and rejoicing, whose image always presided over the feasts of the well-to-do, was cermonially eaten in the form of a great bone of Indian corn meal at every festival. The idol had a recess in the region of the stomach into which provisions were put. The image wore a paper coronet and a cloak fringed with flowers and carried a sword.

Opochtli, "Left-handed," Aztec god of fishing, also called, in Chalco, Amimitl, was said to be the inventor of the fish-hook, line and spear and other means of catching fish. The similarity of his name with that of the Aztec god of war would seem to connect him with the latter, especially when it is remembered that Huitzilopochtli was the tribal god of the Aztecs when they were mainly fishers.

Sun-god, the supreme deity of the Toltecs, played an important part in the mythologies of the Nahuas, Itzaes, Mayas, Zapotecas, Mixtecas and other races of Mexico and Central America. He was called Ipalnemohuani, "He-by-whom-we-live." As the god of warriors the priest and nobles claimed descent from him. His golden image was hung upon the wall of his court where the first rays of the rising sun fell directly upon it. Human sacrifices were offered to the Sun, whose strength was sustained by the blood of these victims, otherwise he would not be able to continue his journey through the sky. Even the hearts of the captives offered to Huitzilopochtli and Tezcatlipoca were first presented to the sun. Some of the most magnificent temples of Mexico, Central America and Peru were erected to the Sun-god.

Tepeyollotl, "Heart-of-the-hills," personification of the echo of the mountains, was one of the nine attendants of the night and lord of the 13 days following the flood, in which no sacrifices were good, and during which the feast of the jaguar was held. He was a southern deity highly honored among the Zapotecas and the Mixtecas and bordering tribes.

Tezcatlipoca, "Fiery-mirror," the tribal deity of the Colhuas, was a god of the winds and the tempest and the giver of breath and hence of life. In the Nahua legend he is the

opponent of Quetzalcoatl whom he deceived and induced to give up his work upon earth and return to the home of the Sun. In the capacity of doomster he was called Yaotzin, "The enemy," and Nezahual pilli, "Hungry-chief." As the spirit of the ever-youthful tempest, he was address d as Telpochtli, "Youthful-warrior"; and as the spirit of the night, he was called Yoalli Ehecatl, "Night-wind." Benches were placed along the highway for him to rest on after his exertions of the night. He was a god of fortune and of fate. As the deity to whom worship was obligatory, he was known as Monenque, "Claimer-of-prayer" and as such he had special power over plague, famine and threatened danger to the people, the state and the human race. He had dominion over life and death. He carried a whistle, symbolical of the noise of the wind; as a warrior god he was armed with dart and shield. To his legs were fastened small bells and in his left hand he held a golden mirror, in which he saw reflected all that passed upon earth.

Tlaelquani, the Mexican deity whose province it was to forgive or eradicate sin possessed a dual nature. She was the patroness of desire and luxury; and the confessions made to her were restricted to sins against morality. She was mediator between the penitent and Texcatlipoca, the "Most Powerful God," the "Protector of All" and the "Searcher-out-of-evil." The penitent, in the presence of the officiating priest, lighted a sacrificial fire and burned incense to the deity to whom he confessed his sins and addressed his prayers for forgiveness.

Tlalocs.— The Tlalocs were masters of the liquid element in all its forms. In the dwelling place of the Tlalocatecutli and Chalchiutlicue, Lord and Mistress of the Tlalocs, there were four ponds of water, the first of which aided germination, the second of which withered the seed, the third of which froze it and the fourth of which ripened it. These two deities were, according to the myth, created after the appearance of the last sun. Tlalocatecutli was called the "Fertilizer of the earth," and the "Protector of Temporal Gods." He and his consort lived on a high mountain among the eternal clouds; and from there he sent his visitations of water, mist and fog. Hence his images were erected on high elevations such as hill tops and mountain summits. The characteristic sign of Tlaloc was the cross, which represented the four points of the heavens from which the winds drove the rains. The representation of Tlaloc in the Mexican manuscripts, is painted green and azure to depict the different shades of water; and he carries a spiral-shaped wand of gold, typical of the lightning.

Tlapotlazenan, the Aztec goddess of healing and the discoverer of turpentine as the base of certain native ointments, popular at the time of the Conquest, is credited with having originated most of the medicines in use throughout the Aztec Empire.

Uayayab, "He by whom the Year is Poisoned," was the Maya deity who presided over the five unlucky days at the end of the year. His image was carried out of every village and town and left outside during the days of his influence in order that he might not poison the new year.

Votán, the fabled civilizer of the ancient people of Chiapas, was closely related to the culture gods of the other races of Mexico and Central America.

Xipe was the god of vegetation and the sowing time and his general characteristics are those of the culture deities. He was considered a tribal equivalent of Tezcatlipoca and, under somewhat varying forms, he was worshipped throughout the Aztec Empire and among the nations bordering upon it to the south. He was connected with the Moon, and the gold and silversmiths regarded him as their tutelar god. He was called the "flayed-one," because at his festival the skin was removed from each human victim sacrificed to him and worn for 20 days by the devotee furnishing the sacrifice. In Tenochtitlán, where his festival was one of the important religious events of the year, he appears to have been looked upon as the god of human sacrifices. The monarchs and chief warriors of the Aztec Empire, when actively engaged in war, frequently donned the classical costume of Xipe.

Xolotl was a southern deity of lightning; and in the Aztec calendar he ruled over the 15th week and the 17th day sign; but as the Mexican calendar was borrowed from southern nations, and as the nature of this exotic deity was not understood by the Aztecs, he always remained to them a strange, mysterious figure. He was the Lightning Beast of the Mayas and cognate tribes, among whom he was a deity of the air and the cardinal points or the four directions of the winds.

Xpiyacoc and **Xmucane,** Father-and-Mother gods, are the Maya-Kiche equivalent of the Nahuatl generators, Ometecutli and Omecihuatl. They were endowed with creative power.

Yacatecutli, "He-who-guides," was the Mexican god of commerce and trade; and the Aztec merchants held in his honor, twice a year, great festivities during which elaborate banquets were held and sacrifices were offered to the god. The traveler's staff was his particular symbol, and to it prayers were made and offerings of flowers and incense proffered.

13. ART. Pre-Columbian Art.— When Cortes first visited the shores of Mexico in 1519, he was surprised at the skill displayed by the Indian artists, who rapidly drew excellent sketches of his ships, his men, with their clothing, their arms and their horses, and forwarded them, by rapid courier service, to Montezuma in Tenochtitlán. This was the first contact of European and Mexican civilizations which was destined, in the near future, to produce the greatest and most characteristic of all the colonial art in the lands under the domination of Spain, during the 16th, 17th and 18th centuries, an art which is neither native American nor Spanish, but a mingling and blending of both in a way that has made it truly Mexican.

Mexican Indian art before the Spanish Conquest was mechanical, industrial, commercial and graphic. It was pictorial in the sense that all hieroglyphs and pictographs are pictorial; but it had not advanced beyond that stage in which it was still almost altogether a useful art. Mexican paintings, drawings and sculpture were the handmaidens of religion, commerce, trade, history, geography, literature and science; and so intimately were they all connected with one another that it is impossible to understand one without comprehending the others. Yet all had their influence upon the new art that sprang from the meeting of the two currents of thought, from the Old World and from the New.

The pre-Columbian inhabitants of Mexico were artistic in varying degrees; and the artistic sense still shows itself strongly in their descendants. Poets, orators, decorators, musicians, literary men, artists, penmen, all bring to their work a depth of feeling, a strong sensitiveness, often a strange vagueness, indicative of the artistic mind. The untutored, uncultured Mexican peasant produces pottery, artistic in form and decorated in pleasing colors and designs. He readily imitates the furniture imported from the best art centres of Europe and the United States; in many parts of the republic his weaving, his designs on woolen wraps and blankets and his pictorial featherwork are the delight of art collectors. This art sense creeps out in the most unexpected places. The rude Indian from the hills surprises us with the artistic way in which he has arranged the flowers he offers us for a few cents; he delights us with the baskets of his own manufacture on which he has depicted, in a really graphic manner, scenes from the national customs; with figures modeled in clay and painted in natural colors, depicting, in a most vivid manner, local types, customs, dress, trades, occupations, sports and pastimes. Generally the humble, diffident, barefooted, brown-faced figure, dressed in wide-cut, cotton pantaloons and shirt of the same material, who offers his wares for sale, is their creator; for there is little retail business among the Indian population of Mexico outside the towns and villages. All this points to an artistic past; for the condition of a given race at a given time is the result of its ethnic development.

Indian Feather-work.— The most characteristic of the pre-Columbian Mexican arts was the native feather-work, which called forth the admiration of the art lovers of Europe. The Mexican artists produced wonderful pictures by matching, with infinite patience and consummate skill, small particles of feathers, which they gummed to a background of woven fabric. An enthusiastic witness, bearing testimony shortly after the Conquest, says: "They (the Aztecs) painted in feathers, producing the living colors of nature"; and one can well believe this statement; for the untutored, ignorant Mexican Indian still handing down the traditions of his fathers imitates in feather mosaics national scenes, customs, occupations and sports, in so realistic a manner that, at a short distance, his work seems painted.

These feather artists were in all their glory at the time of the Conquest and they continued to flourish in Mexico for almost a century afterward. Their art was known to all the Nahuatl peoples; and centuries before the Norman Conquest of England, the Toltecs had developed it to such an extent that immense pieces of feather draperies representing mythological and other scenes were used as hangings with which to cover up completely the walls of certain apartments of the great temple at their capital, Tula, dedicated to Quetzalcoatl, god of the winds. Three different sections of the temple were decorated in this way, in each of which a distinctly different color effect had been produced. Feather tapestries were used as hangings for the palaces of the Aztec emperors and nobles; and they were, competent witnesses assert, the equal of the best woven or painted wall hangings made in Europe during the 16th century. With the boldness born of long practice and acquired skill, Mexican feather artists attempted successfully to produce in feathers the works of the most famous Italian and Spanish artists of the 16th century. The converted Indians "painted" in feather mosaics the favorite saints of the Catholic Church; and their work, which was encouraged by the papal authorities at Rome, became immensely popular in Europe.

The most brilliant plumage of the birds of the tropics were sought out with which to imitate the colors of nature. Shortly after the Conquest a Great Christian-Pagan feather mosaic was sent to Pope Paul III; and so excellent was its workmanship that his Holiness would not believe it had not been painted in oil until he had tested it by examining it closely and carefully. This work so impressed him that he expedited a bull, in 1537, rehabilitating the Indian races of Mexico, the greater part of whom had already been reduced to slavery in the 16 years that had elapsed since the Conquest.

Feather-work mosaics and other forms of ornamentation and decorative feather art entered into the very life of the Mexican people prior to the Conquest. All the land of the Aztecs was searched for artists who showed

special talent in this difficult and exacting kind of work. Children were trained from childhood in special schools of art and their masters were themselves the most skilled artists of the land. Picture-making was, however, but a part of their instruction. They were schooled in the art of making princely garments for the emperor, the princes, the nobles and the priests and the noble ladies of the court: so highly was the art esteemed that the sovereigns themselves considered it high honor to be classed as even passably good feather artists. Clazonzi, king of Michoacán, next to Texcoco, the greatest centre of feather-work, enjoyed the distinction of being the best artist in his kingdom; and he was inordinately proud of his skill, probably more so than of his royal honors.

The Feather Market.—The work of the feather artists developed a great commercial business for the Aztec merchants. The most highly appreciated feathers were bought and sold daily in the market, where they were so esteemed that they brought literally several times their weight in gold. They passed as currency among the Aztecs and neighboring nations; and nothing more valuable with which to pay the ransom of captured princes or conquered kingdoms existed than they. Captives who were good feather artists brought high prices in the market and, for this reason, their lives were spared from the sacrificial altar. Merchants devoted themselves especially to the buying and selling of art feathers; and the chief purchaser for the court held the title of purveyor of feathers to the sovereign. Men of fine artistic tastes were trained to sort feathers and to arrange them into classes according to their color, fineness, merit and market value. They held office under the government and were highly paid officials.

Throughout the Aztec Empire, very stringent laws protected the birds from which the most esteemed feathers were obtained for the work of the artist; and the quetzal, the most highly valued of these favored ones, grew into a sacred bird, and as such his feathers could be worn only by the king and the high priest, both of whom represented their gods upon earth. The Aztec monarchs maintained great aviaries in the capital where birds of rare plumage were reared with the greatest care; and the stealing of feathers from these royal aviaries was punished with death.

Centuries of training in art work of such an exacting nature as feather mosaics developed the artistic sense strongly in the artist caste of the Mexican people; and it is not at all strange that this ability began to show itself in a new way shortly after the Conquest, when Spanish friars and missionaries, many of them no mean artists themselves, began to teach the principles of European art to the pupils of the Mexican convents and schools, nearly all of whom belonged to the native nobility or to families dedicated to trade, to the arts, the crafts or to literature and music, all of which were held just a little lower than noble rank. The merchants who brought the precious feathers to the capital and distributed the manufactured product to the furthermost confines of the empire and to the countries beyond formed a guild unto themselves, over which presided Quetzalcoatl, the first half of whose name is formed from the "quetzal," the sacred bird and the symbol of divinity. It is still preserved upon the coat of arms of Guatemala. But the very enthusiasm with which the natives threw themselves into the new learning caused for the restraining hand of Spain, which gradually shut out from them almost every field of endeavor except that of painting, or so controlled the workmen that the Spaniards got the profits and the glory from every accomplishment.

Hispano-Indian School.—Echoes have come down of a school of Indian painters, who flourished during the first 50 years following the fall of Tenochtitlán, in Texcoco and Cuautitlán, both towns near the capital. Under the Spanish masters they had learned to paint the saints and to represent graphically biblical and religious legendary subjects. They painted the pieces of "escenario" necessary for the production of the miracle plays and other dramatic representations by means of which the Christian Church attempted to teach the natives the principles and dogmas of its faith. Little or none of the art of this period has survived with the exception of one picture of international fame which, on account of the material on which it is painted and the artist's treatment of his subject, almost certainly belongs to this early Ibero-Indian school. This is the famous picture of Our Lady of Guadalupe which made its appearance within eight years after the fall of the City of Mexico, or before 1530. The religious legend asserts that the picture of the patroness of the Mexican people was miraculously made by the tilma or shoulder-covering of a poor Indian named Juan Diego. Historical investigation has shown that it was painted for a miracle play given in one of the new convent schools in the City of Mexico very shortly after the Conquest. This picture shows very considerable artistic talent, which is neither Spanish nor Indian, but a blending of the two. The drawing is bold and free and the coloring anticipates, by three-quarters of a century, the soft, pleasing tone of the artists of the first great Mexican school.

The demands of the ever tireless, ever active church upon the Spanish-born and native artists alike were insistent and persistent and many hundreds of canvases belonging to the first three-quarters of a century following the Conquest were produced at the wave of the miraculous wand, for the churches, schools, convents, monasteries and episcopal palaces that sprang up, phantom-like, throughout the land. Spanish artists of note were brought from old Spain to superintend the work of the native artists in New Spain; and they attested the wonderful aptitude of their pupils.

Early Spanish Masters.—One of the earliest of these masters was Rodrigo de Cifuentes who arrived in Mexico shortly after the Conquest. He appears to have had the patronage of the conqueror, Cortes, of whom he painted several portraits. The picture of the baptism of Magiscatzin in the church of San Francisco, Tlaxcala, is said to be his work. He also painted the portraits of the first audencia and also of Doña Marina, the Indian querida of Cortes, about 1536.

Andrés de Concha, who arrived in Mexico during the time of the first viceroy, and

Indian pupils enjoyed a high reputation as interior decorators of churches and convents and they were often called to interior cities to do decorative work. The group of paintings over the high altar of Santo Domingo Church in Yanhuitlán, Oaxaca, is the work of Concha, whom Padre Burgoaque calls the Apeles of the New World.

Arteaga, another master painter, is said to have reached Mexico City three years after the Conquest and to have been very active in building up the Indian school. There was one of his pictures, 'The Visitation of the Virgin,' in the old church of Santa Teresa about the middle of the 18th century; and it is probably still in existence.

Simón Pereyns, a Flemish artist, painted the pictures for the main altar of La Merced church, and a 'Virgin with a Child' in the National Academy is supposed to be his work. Francisco Zumaya and Francisco Morales were his contemporaries. Alonzo Vázquez, who was somewhat younger than Pereyns, was also active as an artist and a teacher. The 'Assumption' and the 'Redemption,' in the National Academy are credited to him. Juan de Rua, one of Vázquez' pupils, has left a fairly good series of scenes from the life of the Virgin, in the church of San Francisco, Cuautinchán, Puebla.

Pupils of these masters, also famous in their day, have come down to us. Bernal Díaz del Castillo, the first historian of the Conquest and one of the soldiers who took part in it, praises highly three Indian painters and lapidaries, Andrés de Aquino, Juan de la Cruz and El Crespillo whom he likens to the best artists of Italy and Spain in his day. Alonzo Vázquez and his pupil Juan de Rua, already mentioned, are credited with having introduced correct European methods of art into Mexico; and they and their school undoubtedly paved the way for the flourishing and excellent school of artists of the 17th century. In fact we know, by the results already obtained and by the reports that have come down to us, that there had been a wonderful quickening of life in all the arts between 1521 and 1600. This was but a re-echo of the animation in art in Spain herself, in Italy, in the Netherlands and throughout the vast Spanish empire in America. Industries, arts, trades, commerce, mining, agriculture took on a new existence, and Mexico City became the first metropolis of the New World, and the centre of this new-born progress in America. The genius of the Spaniard for organization laid its hand upon the immense domains of the Moctezumas and that hand was never lifted for 300 years, during all of which time the artistic life of the luxurious capital of New Spain was ever in touch with that of the mother country. With the coming of the first viceroy in 1535, his activity of the favorite colony increased. A year later printing was introduced into Mexico City; and the court of Spain began to take a peculiar interest in the educational and artistic development of her favorite colony. To this interest and the strong encouragement which accompanied it is due, in part at least, the eagerness with which the native artists worked. The hundreds of Spanish and Flemish paintings and the thousands of art prints that flooded the land, affording means of study and advancement not before possessed by the natives, made possible the successful school of native art with which the 17th century opened.

Influence of Spanish Art.— The discovery of America and the sudden vast treasures that poured into Spain from over seas, the long struggle with the Moors, of Christianity against Mohammedanism, the rise of the Catholic Church and the birth of the temporal power of the popes and the consequent wars necessary for the maintenance of the powers and conditions thereby engendered, were forces that worked inexorably to the shaping of all Spanish art, which had its origin in the Church and received its inspiration and encouragement constantly from the same source. Italy was the great mistress of Latin art and the teacher of Spain, when she came to lay by her Gothic traditions, but Spanish art traveled a road distinctly different from that of Italy. In Spain art was very largely influenced by the traditions and dogma of the Christian Church, which continued to shape it to its ends and control its execution. In Italy it was classical and it ran after strange gods which also shaped it to their ends. In Italy art was free, unrestrained, licentious the more orthodox Christians contended. In Spain it was bound by the canons of Church law, by the restrictions of ecclesiastical councils and by an intense fanaticism and a devotion to the Christine doctrine and legendary lore unknown in other countries. Upon it rested the heavy hand of asceticism and the sombre shadow of the Inquisition, a peculiarly Spanish institution. Yet the artists of Italy exercised an all-powerful influence upon those of Spain; for more than two centuries of changes varying always within a certain defined and restricted area of activity. The ascetic Spanish taste did not change its Gothic attitude, when under Italian influence it changed its fashion in painting. While the Italian gloried in the nude of Greek and Roman art, the asceticism of Spain covered up the parts of the human body, wrapping them about with draperies, too often much less artistic than the freer treatment of Italy. While the Italian artist boldly attempted to depict the human anatomy in all its nude or semi-nude and almost wholly Pagan attitudes, the Spanish artist was forced to resort to suggestion to convey lasting impressions of what his asceticism had forced him to hide from sight. Thus, while the Italian artist, by his free and unconventional use of the nude, obtained brilliant sculptural effects, the Spanish artist, in his efforts to reach the same ends, while draping his figures, became insensibly a colorist. So Murillo, the greatest of all Spanish colorists, has always been Spain's most popular artist.

It was therefore natural that, of all the Italian schools, the Venetian suited Spanish taste best; and of all the Venetian artists, Titian appealed most to the Spanish attitude of mind toward art. The brilliant coloring of the Venetians, their indistinct drawing and their neglect of the antique appealed to the religious ideas of the Spanish artists. So Titian became the motive spirit in the renaissance movement in Spanish art. A powerful but secondary influence was exercised by the Hollander, Antoine More, who, as a portrait painter, was little inferior to Titian. Vandyck also contributed to the making of Spanish art traditions. But the atmosphere of Spanish life

and the fervid religious spirit of the land twisted all the foreign traditions of art and of schools to their own way of thinking and of viewing life and of acknowledging its obligations, with the result that Spanish art grew to be a thing apart from its own Gothic traditions, from the classical style which it imported from Italy and the rigid Venetian school to which it very strongly inclined. The sombre, ardent, fanatical Spanish mind worked over all these materials and from the working sprang a new art which was peculiarly Spain's. For more than two centuries this strange semi-artistic, semi-ascetic spirit brooded over Spain, producing the magnificent creations of Vargas, Morales, Sanchez, Coello, Joannés, Becerra (the great teacher), Fernández el Mudo (the "Titian of Spain"), Cotán, Zubarán, Pereda, Velázques (the incomparable portrait painter) and Murillo, the superb master of color. And they all had, through their art which found its way across the Atlantic, their influence upon the artists of the colonies in America. Yet we look in vain in treatises on art for any adequate presentation of the work of the American artists or of the vast output of excellent painting by the Spanish colonies in America, all of whom followed the traditions of the mother country, modifying them more or less according to their several environments and local influences. Yet for more than two centuries, the followers of the Spanish masters in America, enthusiastic students of their creations, tireless workers, covered the two continents from San Francisco to Buenos Aires, from Cuba to Chile. In every provincial capital industrious schools of art existed; and all followed the traditions of Spain. At the exhortation of the Church and the insatiable demands of the dealers who made a business of shipping pictures over seas to the colonies, the Spanish artists at home redoubled their efforts; and a constant stream of canvases poured forth from their hives of art industry. No church, convent, college or university in the vast domains of Spain beyond the sea was so poor as not to possess at least one treasure from the art centres of the mother land. When the ecclesiastic dignitaries of Spain wished to show honor to some institution of the colonies, they forwarded to it a painting or other work of some noted Spanish artist. The king, the emperor and the nobles showed their favors in the same manner. New Spain, the favorite namesake of the mother land, became thus a storehouse of Spanish art. These treasures were to the Mexican artists what the pictures of Italy and Holland were to the artists of Spain. They copied them, they imitated them and they built upon them a Mexican art which, while it followed the traditions of the Spanish school, was yet, in many respects, distinctly Mexican, as the character of the Mexican people and their environments are distinct from those of Spain.

For more than 200 years the Spanish artist attended to only one of the manifestations of nature, that is, man and his relation to the deity and to heavenly manifestations. Mountains, streams, oceans, the sun, the moon, the beauty of the night and the glory of the day meant nothing to him except when they helped him to depict his deity, his saints, his religious traditions, his dogmas and his miracles. In all this the Mexican artist followed his masters, faithfully, conscientiously, earnestly. But the spirit with which he executed his tasks was noticeably different from that of his teachers. The stern, harsh character of the Spaniard is depicted in the hard lines of even the best of his artists up to the time he began to leave behind him the vivid memory of the terrific religious wars against the Moors. When the "heathen" of the New World had been conquered and placed beneath his heel and he had filled with churches, shrines and colleges their vast domain; when he had lifted from his shoulders the burden of strife in behalf of altar and hearth, then the Spanish artist began to cover up the harsh lines of Gothic and early Venetian art traditions and feelings, thus engendering an attitude of mind that made possible the wonderful analytical representations of Velázquez and the brilliant coloring and softening effects of Murillo.

But as the Indian character was different from that of the Spaniard, so long before Spain had deserted her ancient Gothic traditions completely, the Mexican artists had become noted for "the gentleness of their art." More than half a century before Murillo produced his best work, which marks the middle and last period in his progressive development, the old Mexican master, Beltásar de Echave, had painted characteristically native pictures which found their way to the foremost shrines of the country and to many of the Spanish colonies in America where, not infrequently, they were represented to be the work of noted Spanish artists. His reputation extended even to Spain where he was praised by the foremost painters of the day, a great distinction for a colonial artist, in an age when Spain was very jealous of all honors given outside her own peninsular domain. But greater honors have come to Mexican artists since Echave's day; for the works of her masters have been gathered in from all over the land and taken to Europe where they have been passed off as original works of Spanish masters of the 16th, 17th and 18th centuries. Thus Mexico has lost countless treasures of native art. Every revolution has helped to deplete her works of her greatest artists. The sacking of cities, the plundering of churches, convents and private houses, the rapacity of native owners of art treasures and foreign speculators and often the wanton ignorance of the revolutionary leaders have conspired to deprive her of the living record of her prominence in art over all the other nations of the American continent. Some of the revolutionary leaders have been accused of cutting from their gilded frames the great old canvases of the churches and convents and turning them with the paint side upward to serve as tents or shelters from the tropical sun for themselves and their brother officers. Valuable pictures of native and foreign artists were not unfrequently slashed with swords, knives or otherwise mutilated or destroyed. But the greatest injury done to native art was the result of the ignorance of the treasures possessed by the nation and the consequent neglect to care for it. Ancient pictures of merit were replaced by others of lesser value or historical interest by some local artist in vogue at the time and the dispossessed pictures were relegated to the garret where they were left to moulder in the damp and darkness and

to become worm-eaten. Guardians of the treasures of the church, tempted by cupidity, often sold their finest pictures, which not infrequently passed to foreign lands there to cease to be Mexican in name at least.

And yet no other country on the American continent continues to possess anything like the amount of really artistic pictures of its ancient artists as that still retained by Mexico. Lovers of art in Mexico have begun to recognize the high standard of excellence attained by their best masters of the 17th and 18th centuries; and the market value of these pictures has risen rapidly during the present century. But this is an added danger to the retention of the native art at home.

The School of Echave.— The founder of the first Mexican school was Beltásar de Echave, the elder, whose first existing picture dates back to 1601. He had already become a famous artist by 1609, years before Velázquez and Murillo flourished in Spain. His drawing and conceptions are very much better than anything produced by his contemporaries; his forms and faces are true to nature and his style is devoid of affectations and conceits. Other Mexican painters have surpassed Echave in execution, in perfection of style, in the observation of the technical laws of art, but none have approached him in fertility of invention and depth of thought. In fact he was philologist, critic and writer as well as artist. His wife, La Sumaya, who was also an artist of no mean merit, is said to have been his teacher in the art of painting; and a meritorious picture of San Sebastian in the cathedral is said to be from her brush. Echave and his wife both belonged to the Spanish school of Joannés, the best artist of his day and superior to all who preceded him in Spain. The work of Echave is unequal, but the best of it shows a genius superior even to that of his master, whose praise all Spain sang in his day. Though his style was finished and somewhat labored, like that of the artists of his epoch, yet his industry and application were so great that he left very many pictures varying from huge canvases to small tablets, which, before the amortization of church property, were to be found in many of the churches of the capital and in many of those in the interior. Among his existing pictures are 'San Cristobal' (1601), which stood over the great door of the Franciscan monastery, 'San Ignacio' (1610), and the 'Martyrdom of the Virgin of Colonia,' both of which were also in the same edifice; 'San Francisco de Paula,' in Guadalupe church; 'Martyrdom of Santa Catarina' (1640), in Santo Domingo, and 'Santa Cecilia,' one of his best, in the Profesa. In 1608 he painted 15 tablets for the altar of the old church of Santiago, Tlaltelolco.

Luis Juárez, a contemporary of Echave, shows, in all his works, strong individuality. His figures are excellent, his exposition strong and true, but his execution is frequently unequal. Many of the heads of his figures, to which he paid much attention, are as fine as anything produced by the Spanish masters of his day. Juárez' style is free and less labored than that of his master, Echave, to whom he is but slightly inferior. He was very prolific and this, coupled with his popularity, made his execution, like that of Echave, very unequal. However, his conception is always bold and his coloring good. His work is more realistic than that of Echave. Most of his known pictures are in the Mexican National Academy.

José Juárez, who was active from 1642 to 1698, followed the traditions of Echave and came the nearest of all the Mexican painters to attaining to the excellencies of his master, to whom he was but slightly inferior in expression and the depicting of religious feeling. He had exceptional talent but, owing to the speed with which he was forced to do the vast amount of work that came to him, he often became careless. Rafael Lucio, an excellent critic, says of Juárez: "I have seen angels of his that seemed to belong to the very best period of Italian art." His style is elevated and even more realistic than that of Luis Juárez; his drawing and execution are good, and in his grave and harmonious coloring there is a noble severity. His figures are free and flexible and show strong individuality, while his canvases are generally lit with the animation of life, partially due to his masterly grouping of figures, his excellent coloring and his decided tendency toward that softness and simplicity which distinguishes the school of Echave. There is a noted depth and contrast in his coloring. A number of his best pictures are in the Mexican National Academy.

Sebastian de Arteaga, a priest and notary for the Inquisition, was another excellent artist belonging to the school of Echave. He displays vigor, power, freedom of movement and a boldness unknown up to his time in the Mexican school. His style is less finished than that of his great contemporaries and his coloring is not so good; but his figures of the Virgin are graceful and beautiful. He is content, too often with carefully executing his central figures and leaving his accessories but poorly done. His style is truer to nature than that of the elder Echave but he lacks the grace of the old master and that simplicity which distinguishes the early Mexican painters. In his work there is a dash and a freedom with the brush that might have made of him a really great artist had he given his whole attention to art; but he had too many other occupations to permit him to work out his own salvation. In the Mexican National Academy there are three notable pictures of his: 'The Betrothal of the Virgin,' 'Saint Thomas Putting his Hand into the Wound of the Christ' and his 'Adoration of the Wise Men.'

Beltásar de Echave (1632-82) the younger, son of the elder artist of the same name, developed a style very different from that of his father. He was bold and vigorous but too impatient to finish his work well. His drawing is frequently faulty and his execution reminds one of Arteaga, of whom he was a contemporary. His compositions, however, show plenty of life and a strong sense of the dramatic. Although he was a follower of Arteaga, he foreshadows the new school which distinguished the following century. His 'Entombment' is one of the most notable works of the old Mexican school. Two other notable pictures of his, 'The Triumph of the Church' and 'The Triumph of Faith,' are both in the Puebla Cathedral, which also possesses several other pictures of his. 'The Savior,' 'The Martyrdom of Saint Peter of Veronica,' 'The Four

Evangelists,' in the Mexican National Academy are also good pictures.

The latter part of the 17th century, which Arteaga and Echave the younger influenced strongly, was very active in art. Juan Correa, whose drawing and coloring are excellent, painted much. His work shows freedom of execution, a firm handling of the subject and an easy swing of the brush, but his tone is often oppressive. Six great paintings of his are in the cathedral. With Correa begins a period of decadence in Mexican art. But he was a great teacher and he introduced new ideas into Mexican art which were destined to become the most noticeable motive power of the new school made famous by Ibarra and Cabrera, his two most noted pupils. He was lavish in his employment of figures, loved immense canvases and aimed at grand and imposing scenes. His grouping is artistic and the general tone of his picture is good. His characters show sincere feeling, and there is a general air of devotedness about his more deeply religious canvases. He has been rather under than over estimated by modern critics. His boldness of conception, freedom of execution and daring inspired to greater attainments his two great pupils. His 'Coronation of the Virgin,' the 'Triumph of Saint Michael' and the 'Entrance of Jesus into Jerusalem' all contain multitudes of figures, but the tone is gloomy and the coloring decidedly opaque.

Nicolás Becerra, who also belongs to the latter half of the 17th century, anticipates the characteristics of the painters of the first half of the 18th century, excellent coloring, boldness of conception and rapidity of execution. Another, Diego de Becerra, a Franciscan monk, of the same period, devoted his energies to depicting scenes and events in the history of the order. Many of his pictures were in the convents of the Franciscans in Mexico City and Puebla. Another priest, Nicolás Rodríguez Juárez, shows good coloring, simplicity of style and studied and well-executed drapery, all characteristically foreshadowing the coming school. He was the best portrait painter of his day. His 'Santa Gertrudis Offering her Heart to the Crucified Christ' (1690) is in the Mexican National Academy. Other pictures of his are in the Profesa and other churches of the capital.

Juan Rodríguez Juárez (1675–1728), nephew of José and brother of Nicolás, enjoyed a very high reputation in his day; and he had a strong influence over the younger artists, who were destined to later establish a new school. He was very prolific and many of his works survive. He painted a series of scenes of the Virgin of Tepozotlán, of which the most realistic and best executed represents the flight into Egypt, 'San Antonio,' 'San Francisco de Querétaro,' 'San Juan de Dios' are in Querétaro; an auto-portrait is in the National Academy. His are the decorative pictures for the altar of Los Reyes in the cathedral. Three paintings in the Profesa suggest Murillo. A colossal San Cristobal and the 'Vision of Santa Gertrudis' were in San Agustin Church. The 'Judgment of Saint Lawrence' (1702) is a notable picture. In the Carmelite churches are a number of his pictures and four large canvases are in the National Academy. He has a vision of the loveliness of color that reminds one of Murillo in no uncertain manner. He preached the doctrine of freedom from restraint and he revolted against the carefully-wrought work of the school of the elder Echave. His touch is light, his color brilliant, but his light and shade are weakly defined. He may be said to have been the father of a school that produced much brilliant work in Mexican art.

Among the other artists of this period are José Torres, Manuel Orellano, Diego Casanova, Juan de la Plaza (extravagant in coloring and execution) and Manuel Luna (coloring and drawing good). So brilliant is the coloring of the latter's work that much of it has been passed off as that of Murillo and his pictures have been gathered up and shipped to Europe where they have been sold as works of the great Spanish master.

Cristóbal Villalpando painted from about 1683 to 1710 in a very unequal manner; but few if any Mexican artists have had freer and bolder imagination than he or greater power of execution. In his imagination there was much of the poet, but he was affected with the Gongorism of his age and exaggeration and complexity mark his best work. His coloring is weak and his larger canvases are in poor taste yet some of his decorative work is excellent.

"Friar Manuel," a Jesuit priest, has been called the Murillo of Mexico on account of the brilliancy of his coloring; but his drawing is careless. His simplicity, boldness and softness of coloring leave no doubt that he had studied Murillo.

José Ibarra (1688?–1756), one of the two best painters of the 18th century, followed Juan Rodríguez Juárez to exaggeration. His figures, perspective and drawing are good and the general tone of his work is pleasing and effective but he shows strongly the mannerisms of his school. He is prodigal of reds and blues, often in masses, in the style of Murillo. He was a finished artist, a tireless worker and possessed of great natural talent. Many of his pictures exist in Mexico though many have been sold abroad. Nicholás Enríquez, an ardent admirer of Ibarra, was a follower of Rodríguez Juárez.

Miguel Cabrera, the close friend and colleague of Ibarra, has maintained, for considerably over a century, his position in the public estimation as the greatest Mexican artist of the 18th century. He was a most prolific worker. Even to-day, after dealers have been collecting his pictures for three-quarters of a century and sending them abroad, there are still scores of Cabreras in Mexico. He lived for his art and he painted pictures as Lope de Vega wrote plays, at a hot heat, with no time to pause. In 14 months (1756–57) he painted 35 pictures representing scenes from the life of San Ignacio for the Jesuit convent, and another series of like nature for Santo Domingo. His drawing is freer and better than that of most Mexican painters and he improved much on his inspirer, Rodríguez Juárez, softening the crude tones and shunning exaggeration. His grouping natural and excellent, his invention pleasing and full of intelligence, his coloring soft yet brilliant cast a certain amount of beauty about all his work. His taste is not so good as that of Echave the elder, his force less than that of Arteaga and his imagination less bold and free than Villalpando's; yet the general

average of his artistic qualities and the tenderness, devotion and mysticism displayed in his characterizations, easily place him in the front row of Mexican artists. His style is easy, light and comparatively free from mannerisms; and his brilliant coloring lacks the solidity of the previous school. Like Shakespeare he laid tribute upon all who preceded him, but upon all he made use of he placed the stamp of his own individuality, in grouping, painting and coloring and idealization. As he was the official painter of the Jesuits, their institutions were filled with his works. So great was his fame in his day that churches, convents, schools, the university and individuals overwhelmed him with orders and forced him to work to the limit of his capacity. With fame all kinds of honors came to him both at home and abroad. He was made official painter to the archbishop of Mexico and the archiepiscopal palace possessed many of his works. Rich churches paid him large sums to paint series of pictures for them. The mining town of Taxco engaged him to do all the decoration of the new church in that rich district and the church remains untouched to this day.

The 18th century witnessed the most active period in Mexican art, and more than 200 artists are said to have flourished during this comparatively short space of time. Francisco Antonio Vallejo, Francisco León, Juan Patrico Morlet, José Paez, Nicolás Enríquez and José Alcíbar, all followers of Cabrera, reflect the characteristics of his style. Alcíbar carried to exaggeration the softness of style of the school. He enjoyed a reputation second only to Cabrera, to whom he was really much inferior in talent, imagination and execution.

After Cabrera no passably good artist appeared for almost 50 years; for the enthusiasm that had built up the power of the Church in Spain declined rapidly even before the close of the 18th century; and with this decline, the erection and adorning of sacred edifices ceased, and good artists became scarce.

The Academy Artists.— For 50 years after the French Revolution the only artists in Mexico were Spanish professors sent over from Spain to the San Carlos Academy of Art and their pupils. Aguirre, one of these professors, painted the vaulting of the parochial baptistery of the Sagrario; and Rafael Ximeno did extensive decorating. His mural work is good but his oil paintings are poor. The 'Assumption of the Virgin' in the dome of the cathedral is by his hand. It is highly imaginative and full of action and possesses the true aerial quality necessary for ceiling decorations. Juan Saens and José M. Vásques, two of his pupils, helped him constantly in his work. Saens took part in the decoration of the cathedral dome and Vásquez painted the 'Annunciation' and 'Jesus with the Children' in Loreto church, and 'Saint Anthony Sustained by the Angels' in the chapel of the Sagrario. José M. Castro, another pupil, has left some fairly good pictures, one of which is in the National Academy. He exhibits considerable originality in his best work.

Francisco Eduardo Tresguerras, a Querétaro artist and architect of note, did considerable interior decoration in which he shows creative power that just falls short of being great.

The Puebla School, in the beginning followed Echave the elder, and in general it reflects the influences at work in Mexico City. Its artists are inferior to those of the capital. García Ferrer painted the six large figures that decorate the altar of Los Reyes in the Puebla Cathedral of which he was the architect. Diego Becerra executed a series of pictures for San Francisco Church, Puebla, 'Saint Francis in the Desert,' 'Saint Francis Accompanied by Angels,' and 'Saint Francis in a Chariot of Fire,' all of which are strong, realistic and well executed. José del Castillo and Miguel de Mendoza, an Indian prince, are two other well-known Puebla artists. Joaquín Magón painted the large mural pictures in the Puebla Cathedral sacristy, 'The Last Supper,' 'The Washing of the Feet,' 'The Protection of the Virgin,' and also a series of the 'Passion' in the Carmelite convent and another series on the same subject in the sacristy of Ocotlán, Tlaxcala. His coloring is too vivid and his work has an unfinished appearance. Miguel Jerónimo Zendéjas (1724–1816) was exceedingly popular. His technique is faulty but his work is pleasing. His best picture is 'Christ Praying in the Garden,' in the Puebla Sagrario. José Luis Rodríguez Alconedo, an artist of much talent, a sculptor and a botanist, expelled to Spain for revolutionary intrigue in 1808, acquired there great facility in pastel, which he introduced into Mexico. Two of his Virgins are in the Puebla Cathedral and two fine portraits are in the Puebla Academy, one of himself and the other of a Spanish lady.

Later Academy School.—Among the painters of the latter half of the last century whose works are represented in the National Academy are José Obregón, whose large painting 'Queen Xochitl,' the discoverer of pulque, the national drink of Mexico, is one of the most popular and best known in Mexico. Xochitl is represented as offering her discovery to King Tecpancaltzín, who is enthroned upon his seat of honor in the midst of his royal attendants. 'Hagar and Ishmael' is perhaps a better picture, though on account of the subject of which it treats it is not so well or popularly known. Rodrigez Gutiérrez' very striking 'Senate of Tlaxcala' represents that body deliberating on the course to be pursued toward the invader Cortés. The invention and grouping are better than the coloring. Pelegrin Clavé's 'Isabel the Catholic Attending her Sick Mother' is one of the best and most attractive pictures of his epoch. The coloring is rich and harmonious, the drawing good and the scene depicted is spirited. Juan Cordero has two pictures in the Academy, one representing 'Columbus and his Little Son at the Gate of Rábida Convent' and the other 'Columbus after the Discovery of America.' Juan Ortega's 'Meeting of Cortés and Montezuma' is full of imagination and fine coloring and is indicative of what the author might have continued to do. Salomé Pina enjoyed considerable reputation among his fellow-artists. Two of his pictures in the Academy, 'Abraham and Isaac' and 'Saint Charles Borromeo' are spirited in conception and execution. Luis Munroy's 'Roman Charity' represents a Roman girl conveying food to her imprisoned father. This and the 'Prodigal Son' and the 'Last Moments of Atala' are good pictures. Manuel Ocaranza has in the Academy two fairly good pictures in the characteristic style of the middle of last century: 'Love's

Wiles' and 'The Faded Flower.' Juan Urruchi reverts to the religious school of art of the 18th century in style and subject in 'Let the Little ones come unto Me,' 'Sor Juana Inez de la Cruz' and 'San Sebastian.' Gonzalo Carrazco is represented by two pictures, 'Job' and 'San Luis Gonzaga.' The latter scene is during the plague in Rome. Juan Manchola has created two fairly good pictures in 'A Miracle of Saint Peter' and the 'Good Samaritan.'

Modern Painters.— There is no school of modern painters in Mexico though there are good artists. This is because the artists have, for the most part, been educated abroad under different influences and environment, and have become neither Mexican nor foreign in sentiment.

José María Velazco, an excellent landscape artist, painted with great care and detail, producing canvases that won for him renown in Europe. His coloring is delicate and true to nature and his cloud effects are especially happy. Many of his best pictures have found their way to European galleries. France conferred upon him the cross of the Legion of Honor and Austria that of Francis Joseph; and other countries have rendered like tribute to his genius.

Félix Parra, best known of modern Mexican painters, does his work with loving care and in good taste. He shows invention, boldness of imagination and excellent grouping. His coloring, too, is good. Three of his pictures, 'Las Casas,' 'Galileo' and the 'Massacre of Cholula' have been photographed times without number and copies of them may be found in every curio store in Mexico. They are all striking pictures of sterling worth, in which the drawing is good, the conception vivid and the coloring in good taste. A smaller picture, the 'Flower Market,' is of greater artistic worth, but it is almost unknown, because it has always been in private possession. The comparatively small canvas is crowded with figures, all different and all true to life.

Herman Gedóvius, who received his art education in German and who reflects German influence, is probably the best portrait painter Mexico has produced. His early work was labored but his latter shows freedom of movement and mastery of color which reminds one of the old Flemish masters. His auto-portrait in the Academy is excellent.

Leandro Izaguirre, who spent 10 years in study in Europe, is the best known of modern Mexican portrait painters, but his imagination, execution and coloring are inferior to those of Gedóvius. Izaguirre once showed signs of possessing daring and inventiveness in his earlier works, especially in his great canvas the 'Torture of Guauhtémoc,' now in the Academy; but his European residence weaned him of things Mexican to the loss of native art.

Gerardo Murillo is perhaps the most characteristic of the younger Mexican artists, especially in Mexican landscape effects, which, on account of the high elevation of the valley of Mexico, are very difficult to analyze and depict. Very often his work is more sketchy than solid and he gains his effects in paint through the methods of the sketch artist. Yet he is generally strikingly effective.

Andrés Rios delights in painting scenes filled with figures. He inclines to historical characters and costume effects of which he has made a deep study. He has imagination, originality and daring in conception, execution and grouping. 'The Orator of the Day,' which represents parishioners complimenting the young parish priest on his sermon, displays Rios' skill in character painting and effective grouping and his love of detail in costumes and salon decorations. 'The Road to the Poor-house' is a powerful picture, well grouped and full of expression in which the same love of carefully-executed details are manifested. Juan M. Pacheco enjoys some reputation as a landscape painter; but his work is uneven, and often descends to the commonplace. Rafael Ponce de León, who died in 1908 while little more than a boy, won for himself a high place as a caricaturist in Paris, where the foremost art critics recognized his talent, his daring, his humanity. He is more than a caricaturist; the artist wells out in all his work. Alfredo Ramos Martínez, who received most of his art education in Europe, has had his pictures hung in the National Salon in Paris, where they attracted the attention of the critics and invited a wordy and prolongued discussion as to their merits, which are out of the ordinary. His most characteristic canvas in oil is 'Springtime,' a large picture representing a group of young women dressed in airy, light-colored costumes, and belonging to different national types, has for its scene a spring garden. The execution is daring, the handling of light effects startling and withal pleasing.

Alberto Feuster is also a young artist of much promise. His drawing is good, his conception bold and his coloring pleasing. He works carefully and loves to make use of all details consistent with his peculiar style of painting.

14. ARCHITECTURE. Pre-Columbian Influence.— Mexico was by far the most important of the Spanish colonies of the mother country, which lavished upon her all the care a mother bestows upon a favorite daughter. The fabulous wealth poured into Spain from over seas she dispensed with a liberal hand in beautifying the home domain and in covering the new land she had discovered with magnificent edifices which, to-day, constitute the chief charm of the Spanish-American countries. The activity of the arts in Spain was coincident with the duration of that vast treasure that kept constantly filled to overflowing her coffers for almost three centuries. Mexico, more than any of the other American colonies, reflected the activity of the mother country. Especially was this so in architecture and its allied arts, painting, decorating and sculpture. A famous art critic has justly said that, during the Spanish régime, there were more monumental buildings erected in Mexico than in all the rest of America. This was due to several causes. The native civilization had already produced magnificent artisans while Europe was still in the dark ages. The existing ruins of the vast, highly ornate edifices erected befor Spain set foot in America compel the admiration of layman and architect alike. Of the skilled native workmen at the time of the Conquest, thousands had labored under the master builders of Montezuma and of the

sovereigns of Michoacán, of Yucatan of the Zapotecas and the Mixtecas. For untold years Mexican artisans had been accustomed to depend very greatly upon themselves in working out their plans and ornamental designs, all of which were controlled by partially conventionalized mythological ideas and Church polity. The European architects who arrived in Mexico from Spain almost immediately after the Conquest found these native artisans wonderfully skilful and resourceful; and they soon came to realize that the surest way to get the best results was to allow them to work out ideas not from a detailed plan but from rough sketches. The result was that, while Mexico adopted Spanish architecture, it did so with modifications introduced, consciously or unconsciously, by the native workmen who brought to their task traditions that, from time immemorial, had governed their plans and the manner of executing them.

Ibero-Indian Transition Period.— The Spanish conquistadores were in spirit much like the Crusaders. They fought the races of America in the name of the cross, and they smote the heathen for the greater glory of God. They demolished temples; they smashed idols throughout the length and breadth of the land with religious frenzy and they leveled gigantic pyramids that had required centuries for their erection. The priests and monks who followed the soldiers continued the demolition of all evidence of the historic past of the native races. But this work of destruction called for a counter work of construction. Missionaries spread all over the land; architects were brought from Spain to the larger cities and towns; while native Indian master-builders were employed in the villages and country places under the direction of the Spanish priests who had generally some knowledge of architecture. Soon the passion for building churches, convents, colleges, schools and priestly residences became as great as that for destruction during the first quarter of a century following the Conquest.

The architecture of this first colonial period was largely affected by native Indian ideas, as all the workmen were natives. As they did not know Spanish, and their masters and overseers were unacquainted with the native tongue, they were left very much to themselves to work out their own ideas of construction, more or less in conformity with the general plan of the architect or master-builder. In beauty of form and grandeur of conception the buildings of this epoch were very much inferior to the native edifices they replaced. But it was an age of reconstruction in which the builders looked more to utilitarian ends than to beauty. While the great, Moorish-like dome was the dominant feature in Spanish architecture, even at this early date, very few churches with handsome domes or vaulted roofs were built in Mexico or in any of the other American colonies in the first half of the 16th century, for these were architectural features unfamiliar to the native artisans. These early Spanish colonial edifices were a curious admixture of Gothic, Renaissance, Moorish and native American styles. In general the plan of the building was Spanish, modified by Moorish. The roof was the flat American structure in use in Mexico and Yucatan before the Conquest, while the ornamentation was a curious intermingling of Christian and Indian ideography and conventional European and American mythological conceptions. Compared with those that followed them, these early Spanish colonial edifices were plain and of unprepossessing appearance. But their study is both interesting and instructive, for they point to the buildings that were to come, with their mingling of the best in the art of Old Spain and of New Spain. Spanish domination brought to Mexico a tranquillity and an undisputed authority lasting three centuries, during which the Spanish court directed the energies of the colony and led the way in that great revival of art such as no other American colony experienced.

Various causes combined to shape the form and character of the public buildings of New Spain. The Aztecs, Mayas and other cultured races, owing to the weakness of their knowledge of scientific construction, had been forced to erect excessively heavy walls to support massive roofs and high ornamental façades, and the builders brought to their work, during the Spanish régime, an ingrained belief in the necessity for and the beauty of sheer massiveness in the construction of walls and façades, a belief which continued throughout the 300 years of Spanish domination. Mexico has always been subject to heavy earthquakes, and these have helped to accentuate this belief in the necessity of massiveness in the construction of the main walls of buildings. The monumental edifices of the country are often more massive in character than those of Spain. The walls of some of the Maya buildings still standing are from 6 to 10 feet thick and these are equalled in massiveness by the walls of the cathedral and other great edifices of the capital.

Building Material.— The more durable building material of Mexico was in no way inferior to that of Spain. A score of different kinds of excellent stone, all workable, much of it handsome and some of it, like the native tezontli (lava-rock), of a character to give a distinctive appearance to edifices constructed of it; marble of a dozen different varieties; and onyx as handsome and as varied as any in the world, were all at the command of the Mexican builder. There was in Mexico for dwellings, no light, durable earthquake-resisting building material such as existed in the forests of the United States and Canada in the early years of colonization and expansion. Adobe (sun-dried earthen bricks) took the place of lumber in the construction of the houses of the lower and middle classes of the upland plateaux; and it has kept its place to the present in the public favor. Owing to the fragile nature of this material, walls constructed of it are necessarily very thick. In country places even churches are frequently constructed of adobe, which, covered with stucco, presents a very pleasing appearance. There are towns of considerable size in the interior of the table lands where practically all the buildings are constructed of adobe, and the plain mud walls of the Indian pueblos are familiar and picturesque parts of the landscape. These are constructed probably as in pre-Columbian days, and villages

themselves, with their irregular, lane-like streets, are like their Aztec progenitors.

But as adobe is not suitable for the lowlands with their torrential rains, it is replaced there by uncut stone, for the town houses; and in the villages and country by primitive thatched huts with walls of bamboo or other poles, through which the air makes its way at will. Owing to the prevailing mildness of climate all the year and the excessive heat in the hot season, these Indian huts, on the whole, meet the requirements of their occupants, who lead lives very near to nature's heart.

The Dome and the Façade.— The architecture of Spain was influenced by the Romans, Goths and Arabs throughout the periods of Romanesque, Gothic and Renaissance supremacy. The Greeks, Phœnicians and Carthaginians, too, have left their impress upon it. It does not, therefore, belong wholly to any one of the recognized styles; but it is, for this reason, none the less interesting. Mexico followed Spanish models more or less closely; but as the Indian mind is prone to florid ornamentation, her architecture departed, in matter of detail, of execution and of adornment, from that of Spain. The Moorish dome, with its striking appearance, its handsome tiles and its frequently elaborate adornment, appealed to the Mexicans. It is, in a sense, related to their elaborately adorned aboriginal façades, towering often from one to two stories above the habitable part of the building. The dome is seen everywhere in Mexico. It peeps out from amid the clumps of trees sheltering the little Indian village; it crowns the summit of a commanding hill; it retreats, almost hidden from sight, to some little valley amid mountain fastnesses. Everywhere majestic, it lends a touch of Orientalism to a landscape for which it is eminently fitted.

Early Spanish colonial architecture in Mexico was largely influenced by the Gothic and the Moorish; but the buildings erected after the close of the 16th century followed some one of the various phases of the Spanish Renaissance. The Mexican and the Spanish mind alike understood the value of contrast and concentration in decoration. In the Maya buildings the elaborate ornamentation which they lavished upon their monumental edifices was confined, for the most part, to the upper stories, the lower having a plain surface of cut stone or stucco. This disposition threw into relief and thus made more effective the ornate superstructure. The Spaniard confined his ornamentation to parts of the façades, to the doors and windows and the parts of the towers above the level of the roof. This had a splendid cumulative effect, which can be seen in [the illustration] the façades of the Sagrario and the cathedral of Mexico City. This ornate style of decoration was especially fortunate in having for its execution such trained workmen as the Mexican Indians, artisans with ancient traditions to work by, the initiative to give individuality to their work and the skill to put it into execution. Side by side in Mexican architecture, often mingling and blending so as to be indistinguishable the one from the other, are evidences of the many-faced traditions of the native dynasties and the influences of Spain. The free hand of the native workman is best seen in the earlier buildings of colonial Spain, for later on he conforms in general to the standards set him by more exacting and better trained architects and master-builders. But this conformation is only outward. In the spirit of execution the attitude of the Indian mind is still strong. He has taken instinctively to the Spanish idea of cumulative effect, which, in another form, was his own; and his inclination in this direction often displays itself in florid ornamentation frequently approaching the uncouth; but it is always effective. In its adherence to Spanish forms, Mexican art is as notorious a disregarder of convention as the Spaniard himself in his adoption of the Renaissance, in building, painting, sculpture and all the arts. It is in this respect that Mexican architecture differs from that of Spain; and it is this very difference that makes it specially interesting; for we see within it the activity of the highly-developed native races of America, these ancient artist artisans, stone-cutters, wood-carvers, metal-workers, tile-makers and designers of all kinds, essentially thinkers, creators, builders, in love with their work of creation.

Styles of Mexican Colonial Architecture. — Of the early colonial edifices of Mexico, more middle-age than Renaissance, one of the best examples is the church of San Francisco at Cholula, about which there still clings that mysterious atmosphere that the Indian workman lent to all he touched in the years following the Conquest, while his ancient traditions were still vividly alive.

The Renaissance soon made itself felt in Mexico as it had already done in Spain. The Moorish dome was its inseparable attendant and New Spain, in a few years, became the centre of tireless building activity which was to cease only when the Spaniards withdrew from the country. This movement was at its height when the cathedrals of Mexico and Puebla were begun, in the latter half of the 16th century, when Mexico was under the Baroque influence; and before they were finished the Churrigueresque had supplanted it. The Puebla edifice was built more in accordance with the original Spanish Renaissance ideas of its architect; but the cathedral of Mexico, especially in its interior decoration, was strongly under the influence of these later two ornate styles, both of which are characterized by the interruption of straight lines, the breaking of entablatures and pediments and an inclination toward unexpected arches and curves. The Baroque retains the original column of the Renaissance, but it takes liberties with it by twisting it out of its primitive shape, running it into panels and stories and decorating it in an unorthodox way.

The Churrigueresque, child of the Baroque, ran to extravagance in its love of the ornate. It made of the column a thing of decoration; it broke it into all kinds of geometrical forms and transformed it into pillars and pilasters which became part of the mass-decoration. It laid its hand, too, upon the sculpture, making of it an integral part of the decoration scheme from whose involved mass it peeped forth just as did the curved and broken lines of the columns.

Both Baroque and Churrigueresque are char-

acteristic styles of architecture, developments of the Renaissance, influenced by Moorish and other ideas dominant in Spain at the time of its introduction. Both are splendid in their general effects, in their monumental façades and in their elaborate stone carving which, at a distance, gives to the façades the appearance of one huge piece carved from the living stone *en bloc*. This is the same impression that the great Maya buildings give. The Baroque in Spain was stamped with a strongly individualistic character; and the Churrigueresque, a very ornate development of it, became in Mexico the most truly expressive medium of the native mind. In the early part of the 18th century Mexico went mad over Churrigueresque, and all the invention, all the grotesqueness, all the fertility of imagination, all the originality of the native mind, were exercised in creating new forms of ornate and intricate adornments for church façades and interiors, which became masses of gold and silver, of richly-adorned columns and pilasters reaching to the lofty ceilings, of elaborate altars, splendid in their intricate carving, their paintings and their dominant tones of the precious metals. Intricate scroll work, fruits and shells proclaimed the influence of the native Mexican workman, while strange mythological designs showed that there still reached him echoes of the creed of his ancestors and of his pre-Columbian art. Yet the sense of proportion is ever there, and this strange mingling of various systems of art gives one the impression of a magnificent and unified ensemble. The touch of the artist is ever perceived in the best of these old colonial buildings; for Catholic mysticism, Moorish mysticism and native Indian mysticism seem to feel the bond that binds all mystics together.

Influence of Tolsa.— Manuel Tolsa, a noted Spanish artist and architect, who came to Mexico as a teacher in the National Academy of Art in the latter part of the 18th century, had been trained in a school that disliked intensely the Churrigueresque and he set about reconstructing the interiors of many of the public buildings of the capital, of Puebla and of other cities of Mexico. Under his direction the magnificent Churrigueresque altars and decorations were torn out of the Mexico City cathedral and replaced by very plain Greco-Roman, so that now only mutilated parts of the grand old decorations remain to give an idea of the magnificence of the interior when the most gorgeous of all the Spanish styles of architecture held supreme rule there. Fortunately, however, the north chapel of the building has been left practically untouched; the colossal façade of the Sagrario could not very well have been altered, and its interior has suffered much less than that of the cathedral. The example set by Tolsa spread rapidly and it became the fashion to decry this most characteristic of Mexican architecture; and untold harm was done to the unity of the old buildings, very few of which remain intact as their builders left them. The parish church of Taxco, the Sagrario and La Santisima in Mexico City, and San Martín Seminary, Tepozotlán, are examples of the magnificence of the old Churrigueresque churches in the days of their glory. But even of these only San Martín and Taxco have escaped the hand of the reformer.

Influence of Puebla.— During the Spanish colonial period there were, in New Spain, two centres of art influence, Puebla and the capital. The former was more directly affected by the spirit of Andalusia and the Moors. Cholula, a suburb of the present city, had been a great centre of art and of building activity prior to the Conquest, and its artisans were noted throughout the Aztec empire. So the Andalusians, who settled in the valley of Puebla, found cunning workmen there to help build up the semi-Spanish, semi-Moorish industries they began establishing in the country. Excellent beds of clay in the neighborhood helped the work along; and Cholula continued, after the Conquest, the industries the skilled Toltecs had established there before the Normans had thought of invading England. Tile-making, polished marbles and onyx, handsome pottery and clay figures instinct with life and depicting the national customs, became characteristic Puebla products. This industry had a strong influence upon the architecture of the city and the surrounding country. Buildings with great Moorish courtyards and exterior and interior decorations in ornate Moresque tile patterns began to make their appearance in Cholula almost immediately after the Conquest and, on the founding of Puebla, the centre of this influence shifted gradually to the new city. Puebla at once began to reflect the thought and manner of life of Seville with which it kept ever in close touch. Cholula became a place of Moorish domes elaborately decorated with tiles. To-day the little town is exhibited as a curiosity to the tourist as much on account of its all-prevailing church domes as its famous pyramid. Towers, interiors, altars and the hitherto undecorated bulk of great buildings were covered with tiles. Private residences and government edifices followed the fashion and Puebla came to reflect more and more the influence of Seville and of Moorish Spain. As Puebla was the one great town on the high-road between the capital and Vera Cruz, it became an important distributing point; and this helped to extend her Moorish influence. Even in the capital this influence is seen in existing buildings and many others of the same style have disappeared. The famous Jockey Club of Mexico City, completely covered with bluish tile, reflects strongly this Puebla style. Some of the Churrigueresque churches, whose ornate exteriors are set against a background of Puebla tile, present a gorgeous and fascinating appearance; but in many others the employment of the Mexican Moresque is not so fortunate, for it was not always applied in good taste. Consult Wilcox, M., 'Certain Phases of Spanish Colonial Architecture' (*Architectural Record*, June 1915).

15. ETHNOLOGY. Ethnologically Mexico is one of the most interesting of the countries of the Western world. Within her boundaries are represented all the really great cultured races of North America. Her territory forms the bridge of the continents over which surged backward and forward for uncounted

centuries untold races, many of whom have disappeared forever, leaving behind them buried remains of their arts, their industries, their tribal customs and remnants of their various languages engrafted upon those of the races who succeeded them.

The historic races of Mexico belong to a score or more of families, which future intenser study and investigation may or may not show to be related. Many of the languages are divided into sub-families and these into dialects, some of which are quite separate, while others blend into one another so that it is hard to determine where one begins and the other ends. But all are indicative of the presence in Mexico of many races of distinct customs, habits and religious beliefs for a long period of time, and of the changes in the distribution of these people which had already taken place, and which were continuing to take place at the time of the Conquest. Mexico, as we see it in the first quarter of the 16th century, presents but one of the many ethnological phases of her kaleidoscopic existence.

Origin of Races.— Beside tradition, there is no guide pointing the way to the penetration of the cloud that hangs over the past of these mysterious races, other than such aids as are lent by linguistic studies, comparative ethnological investigations, archæological remains and such echoes of the past as have come down to us in the complicated mythologies of the various families inhabiting the western hemisphere.

Two great racial traditions in Mexico point to distinctly different origins for the two leading races of the country. Nahua tradition would seem to indicate that they came into Mexico from the north by way of the Pacific coast, while Maya tradition as invariably points to the east and more specifically to the coast of the Gulf of Mexico, as the direction from which they worked southward into their present habitat. And yet, when the great Nahua culture god, Quetzalcoatl, arrived in Mexico, it was by way of the Gulf of Mexico, and when he departed from the scene of his labors, for the unknown land from which he had come, it was by way of Coatzacoalcos (Puerto Mexico) on the Gulf side of the Isthmus of Tehuantepec. This and similar traditions have been used to prove that the Nahua tribes must have come from the east. Much is made of the fact that, while the Nahuas are represented, in their traditions, as coming from the north and west, Quetzalcoatl is as invariably represented as coming from the east, and that, as mythology is always older than tradition, the Nahuas must have come originally from the east and have afterward wandered north and come south again. There is nothing to support this hypothesis. It must be kept in mind that, in these traditions of race migration and in that of the movements of the culture god, there are wrapped up two distinctly different events, which, in all probability, have no relation to one another. Quetzalcoatl's office as messenger of the sun god who sent him on his mission of culture to Mexico necessarily forced him to begin his journey from the direction of the home of the sun which, according to Nahua tradition, was in the east; and the same reason made him sail away again toward the east when his mission on earth had been accomplished. The great prophet who came from the sun and the races that arrived from the west and north are, therefore, distinct in origin. The one is the creation of the imagination, the others bid us listen to the echoes of migration through several centuries of its semi-historic existence.

The origin of the Mexican people has been traced, by over-zealous investigators, to almost every race under the sun. Mongolians, Tartars, Japanese, Hindoos, Malays, Hebrews, Carthaginians, Irish, Welsh, Australasians, Eskimos, Assyrians, Persians, Egyptians and Africans have been successively put forward with elaborate arguments as the original forefathers of the Mexican people. But it is only within the past half century that serious investigation along scientific lines has been undertaken by properly trained workers. The result of this investigation shows conclusively that, whatever may have been the origin of the races of the American continent, that origin is to be sought for so far back in the past that races, customs, mythologies and tongues have had time to blend and to create a vast number of sub-tongues and dialects with their corresponding tribal and clan variations. It also shows that Mexico must have been originally populated before the domestication of wild animals, and even before many of the animals of the present day came into use in the Eastern Hemisphere. The horse, the cow, the sheep, the goat, the elephant, the camel, that had become an integral part of the civilization of the Old World, were unknown in America prior to the Columbian discovery. In general the animal life of the Western Hemisphere is so different from that of the eastern that a separation of many centuries is necessary to account for this diversity. The difference in the plant life of the Eastern and of the Western Worlds is even more noteworthy.

The uses to which the pyramidal structures were put in Mexico were very different from those to which they were put in Egypt and its neighboring civilized nations. If the buildings of Mexico and Central America have any affinity with those of the Old World it is decidedly not with those of the civilization of the Mediterranean. So, after reviewing the evidence which would derive the original races of Mexico from European or African civilizations we are forced to come back to the native traditions, which offer us the only glimmer of light in the darkness. As has already been stated, these traditions point to the north as the original home of the Nahua people; and investigators have taken this to mean somewhere in Arizona, New Mexico, Colorado or California. All these conjectures may be partially true, for it is probable the Nahuas were, at various stages of their exodus, in these several places. But it is still more probable that they came from much farther north and that, in their migrations southward, they followed the Pacific coast for a considerable portion of the way. There is a very suggestive similarity between the customs, culture and mythologies of the Nahuas and those of Kwakiutl people of British Columbia; and between those of the latter and those of the races of northeastern Asia, whom they resemble in appearance. But striking though these similarities are, they go

show, by their several stages of development, that a very considerable space of time must have elapsed since these widely-separated races were in contact with one another.

The similarity of the myths and customs of other western and northern tribes would seem to connect them with the Nahua and with the people of northeastern Asia. As the Nahua and the Maya show affinities in culture, customs and traditions sufficient to suggest that they had a common origin, and as the more recent linguistic and ethnological investigations would seem to confirm this suggestion, the latter probably came from the same original habitat as the Nahua; but in their journey southward, instead of keeping to the coast, they made their migration eastward across the continent.

There are, in Mexico, races much older than the Nahua and the Maya, races that have, undoubtedly, been profoundly influenced by these latter arrivals, but have retained certain characteristics which still proclaim their earlier origin. Of these the Otomí, cojointly with the Chichimeca, are credited, in Nahua mythology, with being the first races created by Camaxtli, the Tlaxcalteca creator. Primitive though these peoples were, it is almost certain, however, that they were not the aboriginal races of Mexico; for in places we meet with strange tongues, curious wrecks upon the strand of time, that seem to have no affinity with those of the races dominant in the days of Moctezuma.

Distribution of Races.—A glance at an ethnological map of Mexico shows that the country is divided into a great number of race areas. One of these, comprising Lower California and a part of Sonora on the Pacific side, was populated, in historical times, by races of a low culture, who had undoubtedly been driven to these confines by the conquering Nahua and other races who swept over the great upland plateaux. Along the Rio Grande, in parts of Sonora, Chihuahua and Coahuila were nomadic Athapascans; while east and southeast of these was a still larger area covered by two great, distantly-related families, the Packawan and the Tamaulipeco, who occupied a part of Coahuila, all of Nuevo León and most of Tamaulipas. The country included between these areas already mentioned. Guanajuato, Michoacán and the Pacific Ocean, was held by the Nahua, a part of whom had migrated southward into Colima, Guerrero, Morelos, Mexico, Puebla, Vera Cruz and parts of the Isthmus of Tehuantepec, of which they held both the north and the south sides. In the heart of their territory, however, were the Tarascans, who occupied the state of Michoacán, and the Otomí who held Hidalgo, Querétaro, Guanajuato and parts of San Luis Potosí and Mexico; while on the Gulf coast, stretching north from the city of Vera Cruz to Tamaulipas, were the Totonaco and the Huasteca, races distantly related to the Maya of Yucatán, Campeche, Tabasco, Chiapas, Guatemala and British Honduras. Across the southern half of the Isthmus of Tehuantepec, stretching like a great blanket into Oaxaca, Vera Cruz, Chiapas and Tabasco, lay the Zoque; and between the latter and the Nahua of Morelos and Guerrero is the home of the great Zapoteca-Mixteca race.

All these separate ethnic divisions show decidedly distinctive racial characteristics. Their languages, industrial arts and mythologies present such variations and dissimilarities as could only come from distinct races or from families separated from one another in the early stages of their tribal life. Therefore Mexican ethnology has to deal with these races as such, and also with their relation to one another and the general influence they have had upon one another ethnically; for the mixing and the blending of the races which have successively appeared in Mexico, have been going on for ages, just as they are going on to-day, with added European and other elements.

But though the native ethnic elements are gradually losing their distinctiveness, or have already lost it, as in Tamaulipas, San Luis Potosí, Nuevo León, Coahuila and northern Chihuahua, yet there are many states, like Michoacán, Guerrero, Oaxaca, Chiapas and Yucatán, where the native languages are still spoken with comparative purity. In these parts of the country racial characteristics persist.

The Nahua is the most important of all the races of Mexico, on account of the vast extent of territory it covered, stretching as it did from the Rio Grande to Guatemala, the number of distinct dialects and tribes included within its racial boundaries, and the influence of its religious, social and industrial customs, its political policy, its vast trade and commerce and its colonizing propensities. The extent, shape and position of the territory occupied by the Nahua to-day, which is practically the same as at the time of the Conquest, would seem to prove the truth of the tradition that they entered Mexico from the north. They drove, like a gigantic wedge, through the barbarous tribes of the great plateaux lands of northern Mexico, forcing the Seri to the mountainous parts of the state of Sonora on the west and splitting apart the Apache and Toboso and crowding them back to the Rio Grande on the north, and driving the Tamaulipecos and the uncivilized tribes of southern Coahuila, Nuevo León and Tamaulipas also in the direction of the Rio Grande and toward the coast of the Gulf of Mexico. Encountering highly civilized peoples in the mountainous and easily-defended states of Guanajuato, Querétaro, Hidalgo and Michoacán, they skirted the latter on the west, making their way through Guerrero, and, pouring over the mountains to the east, overran Morelos, Mexico, Tlaxcala, Puebla, most of Vera Cruz and a part of Tabasco. A wing of the migration, coasting further south along the Pacific, left a strong colony on the southern shore of Guatemala, another in the interior and a third in Salvador, while a fourth settled upon islands in Lake Nicaragua and occupied all the land between that body of water and the southwestern coast. A fifth crossed the isthmus and took possession of territory on the northwestern shore of Panama, near the Costarican boundary line. The Nahuatl confederacy, headed by the Aztecs, extended its territorial dominion, though not successful in forcing its language on the conquered races or in assimilating them to the customs, the culture, or even to the political system of the Nahua; so that the people over whom it gradually extended its sway remain ethnically distinct to-day.

Linguistically the Nahua are divided into a score or more of distinct tribes, all speaking, with variations, the Nahuatl tongue. The Toltecs, who had disappeared as a political entity several centuries before the Conquest, were the most noted of the Nahua. They occupied a considerable part of the territory afterward held by the Aztecs at the time of the Conquest. The following tribes are now recognized as belonging to the Nahua race:

The Acaxee, speaking four closely-related dialects, inhabited the mountainous regions of Durango, between the Tepehuanes and the Aztecs. The Aztecs or Mexicans (including Tlaxcalans) were spread over a vast extent of territory from Tabasco, through southern Vera Cruz and across the state of Puebla, Morelos, Mexico and Guerrero, to the Pacific, and thence up along the coast, through Jalisco and Sinaloa, past the southern end of the Gulf of California. Another group of considerable extent occupies the shores of the Gulf of Tehuantepec. The Yaqui, also known as Hiaqui, Cahita, Cinaloa and Sinaloa, who were divided into three tribes speaking distinct dialects, Yaqui, Mayo and Tehueco, are closely allied to the Aztecs, with whom they have been classed. At one time they occupied considerably more territory than they do to-day. They extended over the middle and lower Yaqui, the Mayo and the Fuerte districts of Sonora. Now, so far as language is concerned at least, they are confined to the Yaqui River district. All the Yaqui tribes were energetic, patriotic and intelligent and they were one of the foremost factors in building up the civilization of Mexico. The Cazcanes occupied the mountainous districts of Jalisco about midway between Guadalajara and Zacatecas. The Conchos, now extinct, but at one time an important tribe, occupied a considerable extent of territory, lying between that of the Tarahumare on the west, the Apache on the east, the Tepehuan on the south and the Rio Grande on the north, their habitat being almost entirely within the boundaries of Chihuahua. The Cora, belonging to the northern or Sonora group of Nahua-speaking tribes, live along the Jesús Mariá River in the state of Jalisco. The Huicholes (Guachichiles, Cuachichiles), according to Orozco y Berra, occupied parts of Cochuila, Nuevo León, San Luis Potosí and Zacatecas. They were between the Laguneros on the north, the Otomí to the southeast and south and the Zapoteca to the west. Catholic missions were early established among them; they were brought under the domination of the Spaniards and their language finally disappeared as a tribal institution. In the heart of the Yaqui country were the Nio, who lived south of the Fuerte River. The Niquirán, one of the Nahua settlements furthest south, form a small community occupying the land between Lake Nicaragua and the Pacific Ocean and also the neighboring islands in the lake. About the headwaters of the Hermosillo and Yaqui rivers, between the Seri on the west, the Apache on the northeast, the Pima on the northwest and south, was the important Opata tribe, which consisted of two sub-tribes speaking distinct dialects, Eudeve (Heve, Dohema) and Joval (Ova). The most northern Nahua family, the Pima, was divided into the following scattered groups: Pima Alta (Upper Pima), situated principally in the United States, but occupying a small part of northern Sonora; Pima Baja (Lower Pima), who lived around the middle part of the Yaqui River, between the Tarahumare to the east, the Yaqui to the south, the Seri to the west and the Opata to the north; Potlapigua, near Babispe, northwest of the Opata country, Pima de Bamoa (Sinaloa), on and around Bamoa, on the lower Sinaloa River south of the Mayo; Tepehuán Pimas, a small group in the western part of the Tepehuan country. In southwestern Salvador are the settlements of Nahua known as Pipil and closely related to the Aztecs, while the Sigua (Serra Xicagua, Shelaba, Chicagua, Chichagua), a small Aztec colony on the northwestern side of Panama, marks the southernmost limit of the Nahua extension. South of the Apache, east of the Concho and north of the Tepehuán, lived the Tarahumare, an extensive division of the Nahua family, covering parts of the states of Sonora, Chihuahua and Durango. They spoke a number of distinct dialects and their territory was divided into Tarahumare Alta and Tarahumare Baja. Tarahumare proper was spoken in the upper country while the tongue of the lower land was known as Chinipa. The Tepecano, closely related to the Tepehuán, occupy the territory between that of the Cazcan and the Guachichil in modern Tepic. The Tepehuan live principally in the state of Durango, south of the Tarahumare, where they are confined, for the most part, to the mountainous region for a distance of about 250 miles.

The Olive (Olivean), a race of lighter colored people than the tribes surrounding them, occupy territory southeast of the Pisone and Janambre, in the state of Tamaulipas. Tradition says they came from Florida, which may mean only the Gulf coast. They were superior in culture to their neighbors, but nevertheless their language has become extinct.

The Pakawán or Coahuilteco is the name given to a number of cognate tribes of southern Texas and northern Mexico. They covered considerable territory east of that occupied by the Toboso. This included, in Mexico, the eastern side of Coahuila, most of Nuevo León and the northern part of Tamaulipas. As these tribes were inclined to be nomadic and were but partially civilized, they rapidly lost their language after their conquest by the Spaniards.

Otomí (Hia-hiu).—The word Otomí is used in two senses. It signifies the race of people speaking the Otomí language; and it was extended to include, in a general way, those races which from time to time formed loose alliances with the Otomí for war or defense. They have been confounded with the so-called Chichimeca, and some authorities claim that they form one of the ethnic divisions of the latter vague indefinite tribal designation. The Otomí, who had distinct customs and a complicated mythology, but were less civilized than the Nahua, occupied a large, somewhat irregular, yet compact portion of central Mexico, where many of their descendants may be found to-day still speaking their ancient tongue. Their territory extended over part of San Luis Potosí, all of Querétaro and most of Guanajuato, reaching into the state of Mexico, a short distance west of Mexico City, and from there westward to Michoacán. On the east were the Huasteca, a

the southeast the Tarascans and along the northwest the Nahua. They were divided into four tribes: Otomí proper, Pirinda, Pame (northwest of the Otomí) and the Mazahua (east of the Tarascan, in the southwestern part of the state of Mexico). In the time of the later Aztec empire the Mazahua occupied the province of Mazahuacán situated in the western mountains of the valley of Mexico. They were subject to Tacuba. The Pirinda territory was principally in the valley of Toluca, and some descendants still live in villages in the land of the Mexicans, others in Tarascan territory. The Otomí were a numerous, industrious and fairly intelligent race.

Under the heading of "Rio Grande tribes," Orozco y Berra groups a number of native communities occupying territory in the state of Tamaulipas at or near the mouth of the Rio Grande River; but he furnishes no further data respecting them with which to classify them; but as the Indians of this district no longer retain their tribal organizations, and as their languages have also disappeared, little is known of their pre-Columbian culture.

The Seri, who occupied a considerable extent of territory on the mainland opposite the peninsula of Lower California, where their language is still spoken to some extent, are classed among the less civilized of the Mexican races. Their territory stretches inland into the mountain region for 150 miles or more from the coast, and includes the island of Tiburón (shark) in the gulf.

Under the head of Tamaulipeco, Orozco y Berra, who has paid more attention than any other investigator to the races of Tamaulipas, where the native languages have all practically disappeared, gives the following tribes: Tamaulipeco proper, Canaynes, Quinicuanes, Borrados, Tedexenos, Pasitas, Tagualilos, Caribayes, Mariguanes, Panguayes, Anacana, Cadinia, Guixolotes, Pintos, Comecrudos, Malinchenos, Ancasiguais and Aretines.

The Tarasco (Michoacano), occupying approximately the state of Michoacán, speaking a distinct language and having customs, myths and traditions different from those of the other races of Mexico, form one of the important racial divisions of the republic. They are a highly cultured people and, in the time of the Aztec empire, they maintained a separate, independent government.

From the city of Vera Cruz northward to the Huasteca and inland to Tlaxcala, lie the Totonaca, almost completely surrounded by the Nahua. They were a cultured race at the time of the Conquest, and it was among them that the conqueror, Cortés, established the first Spanish government and colony on the mainland of the American continent.

Two cognate tribes, the Waïcuri and the Pericu, occupy the southern end of the Isthmus of Lower California. Their languages, which are still spoken, are very badly corrupted.

The Yuma family is represented in Mexico by the Cocopa (Cucapa) and the Cochimi, who occupied all but the southern one-fourth of Lower California. The native tongue is already badly corrupted and is fast disappearing.

The Zoque, stretching over four and one-half degrees of longitude, across the Isthmus of Tehuantepec, from east to west, and occupying parts of the states of Oaxaca, Chiapas and Tabasco, are surrounded by Zapoteca, Chinanteca, Maya and other races. The Zoque family is divided into four branches, Mixe to the north and west of the main territory, Zoque proper, to the south and east, Tapachula, in the southeastern corner of the state of Chiapas, on the Guatemala boundary line, and the Popoloco in the state of Puebla.

The great Athapascan family is represented in Mexico by the Toboso and the Apache. The area and location of land occupied by these two nomad, warlike tribes changed from time to time; but, roughly speaking, the Apache occupied an irregular territory, stretching southward from the Rio Grande and the American boundary line for a distance of five degrees of latitude, from about 105° westward, covering parts of Chihuahua and Sonora. But they often raided over the northern part of the latter state far into the interior. The Toboso also occupied territory stretching from the Rio Grande southward, but their general habitat reached eastward from the western boundary line of Coahuila, within which state they lived in normal times. They often joined hands with the Apache in raids on the more civilized parts of the surrounding country; and they frequently gave the United States and the Mexican governments considerable trouble. Sometimes the depredators took refuge on the American side after a raid on Mexican citizens and vice-versa when they had raided American territory.

In and around the town of Chinantla, south of Vera Cruz, occupying territory about 100 miles in extent, are the Chinanteco, who are probably a survival of one of the ancient races who populated the country before the arrival of the Nahua. The Huave (Huabi, Guavi, Juave, Wabi), another primitive race, occupy the marshes around the great lagoon which forms the northern inlet of the Gulf of Tehuantepec. Tradition says they once possessed all the isthmus country and that they came from the south. The Janambre, a third primitive tribe of a very warlike disposition, who occupied the rugged southwest of Tamaulipas, from a short distance north of Victoria to the southern boundary of the state, about 100 miles, gave the Spaniards much trouble before they were finally conquered toward the close of the 18th century.

To the south and east of the southern Nahua and stretching from Guerrero to the Isthmus of Tehuantepec was the home of the great Mixteca-Zapoteca family, which in culture, intelligence, enterprise and achievement was scarcely inferior to the Nahua and the Maya, between whom they seem to have been the medium of communication and of the distribution of the arts and sciences. They possessed a culture which, while it resembled that of the Maya and Nahua, was nevertheless distinct. The Mixteca whose territory extended into parts of Puebla, Guerrero and a considerable portion of Oaxaca, were surrounded on the north and west by the Nahua, while the Zapoteca were their neighbors on the east. They had an outlet on the Pacific Ocean to the southwest, which they may have possessed for a long time, since it is the boast of one of their oldest legends, that their great culture hero, Yucano, defied the Sun, engaged him in combat and drove him into the ocean. The Mixteca lan-

guage is still spoken over most of the Mixteca country. The traditions of the Mixteca make them an alien race fighting desperately for years for their existence, in the mountains, a part of which they were forced to abandon. The rugged nature of the country in which they lived created, in time, numerous dialects of the Mixteca. To the east and partly to the south of the Mixteca country lay that of the Zapoteca, stretching for a considerable distance along the Pacific Coast and occupying the southern side of the Isthmus of Tehuantepec, reaching north and west of the city of Oaxaca and including the famous valley of Oaxaca, in the mountainous districts of which the native tongue is still spoken with comparative purity. The pottery and the metal work of the Mixteca and the Zapoteca were sought by the Mexican merchants, who distributed them over a wide area of country.

The Maya family, the most highly civilized of all the native races of America, is divided into two great groups, the Maya and the Kiche, to which may be added the Huasteca. The Maya proper, within whose territory were contained most of the semi-historical cities of the more advanced culture of Mexico, were spread over all the peninsula of Yucatán, eastern Tabasco, British Honduras and the island of Carmen. They were divided into Lacandón, Mopán and Itzae or Petén, three tribes speaking slightly different dialects. The Lacandón still inhabit a region near the headwaters of the Usumacinta River, in eastern Chiapas and northern Guatemala. They were once a very extensive and important people; but their ancient greatness has disappeared. They still speak their native tongue. The territory of the Itzae occupied a part of northern Guatemala and eastern Yucatán stretching westward probably to Campeche and southward to Chiapas. The Mopán occupied an undefined territory partially in southern British Honduras, Guatemala and Chiapas. To the south of them were the Chol, also a Maya tribe, to the west the Lacandón and to the east and north the Itzae.

The Huasteca, a tribe situated far from the parent stock, and extending from Tampico southward and westward is wedged in between the Otomí on the west, the Nahua, Totonac and Tamaulipas tribes on the north. It was once a powerful nation and the people of to-day still bear all the racial characteristics of the Mayas.

16. LITERATURE. All the cultured and most of the semi-cultured races of America, including the warlike red-man of the north, had a passion for oratory and story-telling, forebearers of formal literature. The Aztecs, the Mayas and other more civilized nations of Mexico had, years before the Conquest, evolved literatures which had already begun to break down the barriers of conventionality. The these literatures were noble in sentiment, passionate in utterance and beautiful in form the fragments that have come down to us, principally in the shape of translations or transcriptions into some one of the native languages leave no doubt. Mistrust has been cast upon the legitimacy of these fragments by recent critics; but the fact that, after 400 years, they represent, in their utterance, form and spirit the soul of the Indian mind to-day, so distinctly different from the Latin and the Saxon, places upon them the stamp of genuineness. Altamirano, the greatest, the most passionate, the most subtly poetical, the most oratorical of Mexican literary men, was a full-blooded Indian. In him we see reproduced, in the 19th century, the prototype of his Indian forebearers, who were the literary glory of the courts of Netzahualcoyotl and Montezuma II, where oratory and other literary efforts were sedulously cultivated and the successful public speaker was honored almost as a prophet and as the bearer of a message akin to that of the divine oracles.

To the intolerance and unfortunate policy of Spain, who waged a relentless war of destruction upon these written records which kept alive the memory of the past greatness of the native races of Mexico, we owe the annihilation of this literature and the enslavement and debasement of the cultured nations who created it.

According to native Indian writers, the reign of Netzahualcoyotl, king of Texcoco, was the Golden Age of Mexican literature in the pre-Conquest days. The monarch himself, who was the leading spirit in the literary movement of his reign, gave much of his time to literature and the sciences known to his people. Round his romantic career cluster many a legend and story. Early Spanish writers

Mexican subjects and native Indian literary men represent him as a great and inspired poet, which he may well have been, for poetry is the gift of the Mexican people; and the stories and legends still current among the ignorant Indians are often strikingly imaginative, poetical and beautiful. To the literary men of Indian race who learned Spanish shortly after the Conquest and wrote in it, we owe much of the information we possess of the culture and history of the native races of pre-Columbian days. The best of these Indian writers was a direct descendant of the famous Netzahualcoyotl. These Indian literary men of the early days of New Spain formed a promising literary school; but the policy of Spain, which had already led her to destroy the pre-Conquest literature and records of the native races, soon began to show itself in the oppression of the Indians, their nobles and their princes; and the most active and aggressive members of the native literary school, on account of the prestige they had won and the influence they retained, were among those most fiercely persecuted. Broken in spirit, they soon ceased to be active figures in the national life.

Of the post-Conquest literature of the 16th century but a very small part has come down to us; and this is principally in the form of letters, grammars of the native languages, chronicles of the religious orders and information of a like nature. The letters of Cortés, the 'History of the Conquest of New Spain' by Bernal Díaz del Castillo, the works of Las Casas and de Sahagun are invaluable on account of the information they furnish and the light they shed on the customs, habits, government, industries, religion and superstitions of the native races prior to the Conquest. Fernando de Alva Ixtlixochitl, a lineal descendant of the royal house of Texcoco, in his 'History of the Chichimeca,' gives a most intimate picture of the life of the court of Netzahualcoyotl and extensive and interesting information concerning the Nahuatl race at the height of its glory. Acosta's 'History of the Indies' furnishes valuable data about the Spanish colonies at a time when the writer was still in touch with men who had known intimately Cortés, the conquistadores and many of the Indian princes. Toribio de Benevente Motolinia, Geronimo de Mendieta, Agustin Dávila Padilla, Francisco de Aguilar, Juan B. Pomar, Gil González de Ávila, Alonzo de Zurita, Francisco Cervantes de Salazar, Francisco López de Gomara, Fernando Alvarado Tezozomoc, Beltazar Dorantes de Carranza, Juan de Cárdenas, Pietro Martire d'Anghiera, Pedro de Alvarado, Diego de Godoy, Juán de Zumárraga, Antonio de Mendoza, Fernando Alarcón and Antonio Villa-Señor have left us full or partial pictures of life before, during or immediately after the Conquest, or throughout the 16th century, which make our knowledge of early Mexican history more complete than that of any other part of the American continents during this period.

The enthusiasm for literature and, more especially, for poetry in the latter half of the 16th century was one of the distinguishing features of the life of New Spain. For the most part the writers were native-born Mexicans, some of Spanish, others of Mestizo or Indian blood. Balbuena, the garrulous old priestly chronicler, tells us that, during the last quarter of the 16th century, there were numerous literary contests held under different auspices and that, at some of these, so numerous were the candidates, 300 contestants entered for poetic honors alone. He also asserts that as poets they might have compared with the most flowery in the world. It is more than probable that the foremost Mexican critic of his day was mistaken in his estimate of the literary excellence of these contestants, the very names of most of whom have disappeared.

Good poetical form, correct language and the sparing use of poetic adornment characterize this period which is, however, inclined to prosiness and the imitation of Spanish literature. Yet it shows originality enough to redeem it from being the work of pure imitators. Tones of expression, development of subject and the handling of the matters treated of distinguish the Mexican literature of this period, in an interesting manner, from that of Spain. This is all that could be reasonably expected of it in an age when the whole American world, south of Virginia, rotated about the Spanish court.

Among the Mexican literary men of the latter part of the 16th century who have been praised by Lope de Vega and other noted Spanish writers of that age, is Antonio de Saavedra Guzmán, author of 'El Peregrino Indiano' (1599), a 20-canto poem, in which a bold attempt is made to sing the deeds of Cortés and his conquistadores. This poem is true to historical fact, displays careful investigation and reveals a wide knowledge of the subject and close intimacy with Aztec customs; but it is monotonous and prosy. Guzmán was a mestizo whose father was one of the conquistadores and his mother an Indian princess of the royal house of Mexico. He spent seven years in collecting the material for the 'Peregrino' whose dominant characteristics are simplicity and naturalness.

Of the writers of this period, a portion of whose works have come down to us, Fernán González de Eslava is one of the most interesting. He was wonderfully popular in his day as a writer of *autos sacramentales*, a kind of religious drama in high favor for over a century in New Spain. He was so notable a poet as to attract attention in Spain itself. His dramas were long performed and read and they have been presented to appreciative audiences in Mexico within the past 50 years. Francisco Terrazas, who belongs to the same period as Eslava, had the honor of being warmly praised by the great Cervantes. Juán Arista, Pedro Flores, Bernardo Llanos, Francisco Plácido, Eugenio Salazar, Carlos Sámano and Juan Pérez Ramírez, were all poets highly esteemed by their contemporaries. To these we must add the name of Bernardo Balbueno, to whom we are indebted for our information concerning the literary activity of the latter part of the 16th century. Balbueno was a great lover of Mexico whose praises he constantly sings. He branched out into all kinds of literary endeavor and proved himself an excellent and interesting critic. He wrote with great facility and elegance in both Spanish and Latin and is said to have been a master of Aztec. 'Mexican Greatness,' 'The Golden Age in Erifile' and the 'Bernardo' are his best-known works. Juan Pérez Ramírez was a poet of

international reputation and wonderful popularity in his own day, and he and Alarcón, another Mexican writer, have been much written about and praised in Spain. Plácido was a full-blooded Indian of noble Mexican family who first sang the praises of the Virgin of Guadalupe, the patroness of Mexico, who, her critics say, is the ancient mother of the Aztec gods transformed into a Christian saint. However that may be, the Indians of Mexico have shown a wonderful devotion to her; and it was fitting that Plácido, a lineal descendant of the Aztec priests, should have been the first to sing her praises. As the cult of this saint grew in popularity and spread to the ends of the republic, numerous Mexican poets, from time to time, recounted her glories, in from fairly good to indifferent verse.

This cult of the Virgin of Guadalupe by Mexican literary men during the latter part of the 16th and all of the 17th centuries presents two interesting phases. In Guadalupe there was, in pre-Columbian days, one of the most popular of native shrines. This shrine, a few years after the Conquest, was suddenly changed into a Christian sanctuary, on account of the reputed miraculous appearance, near the sacred well of the Aztecs, of the Virgin herself, to Juan Diego, an Indian, whom she commissioned to bear a message to the archbishop of Mexico, stating that she desired erected, on the hill top, above the well, a chapel dedicated to her worship. This chapel was duly built; and, since that day, the thousands of Indians who flock to it annually have made of it a most interesting depository of the mingled faiths of the aboriginal races and their Spanish conquerors. The literature that grew up around this historic shrine was, therefore, further removed in form, spirit and execution from that of Spain than any other class of writing emanating from Mexican sources. Yet whatever may have been the spirit and the influence of this distinctly national literature, its expression and the peculiar form it assumed were directly dependent upon the popular *autos sacramentales* and the encouragement given to them by both church and state and by people otherwise exercising authority throughout the land, all of whom were encouraged to extend their patronage and support, by the court of Spain itself and by the home church.

The *autos* were performed in the presence of vast multitudes, in the day time. They began as a species of miracle play intended to teach the natives what it was considered necessary they should know of the dogmas and history of the Catholic Church. Naturally the priests were the first writers of *autos;* and they continued to be their most prolific producers. But the call for new *autos* daily and their immense popularity with all classes, from courtier to peasant, made the demand much greater than the Church could satisfy; so lay writers soon found a paying field for their literary activities in the production of these primitive religious dramas. Thus the Church became the patron of literature as she became that of art in Mexico. The simple primitive *autos,* intended for the edification of the Indians, with a small admixture of mestizos, were often written in Aztec, and were almost always performed by Indians. Occasionally one may still come across one of these curious old dramas presented by Indians in some little interior Mexican town during Holy Week, and at the beginning of the present century they were still features of the celebration of this festival in many parts of the republic. But the Church authorities set their stamp of disapproval upon them and they rapidly disappeared.

The autos intended for the edification of the vice-regal court and the Spaniards resident in the capital of New Spain, who disdained the amusements of the masses, were of a distinctly higher literary value. For the encouragement of these latter dramas the ecclesiastical cabildo and the city council of the capital offered prizes for the best literary compositions, and more especially for those of a religio-dramatic nature. The coming of a new viceroy, the dedication of a church, the consecration of a bishop, the crowning of a Spanish monarch were taken advantage of for the holding of a literary contest at which, as we have seen, hundreds of candidates for literary honors presented themselves. The plays of the successful competitors were honored by being first presented before the archbishop of Mexico or the viceroy, or both, in the presence of a chosen audience consisting of the notables of church and state of the capital. From the blending of the simple native Indian plays and the efforts of the literary purveyors of the court of the viceroy came the noteworthy dramatic activity which has distinguished Mexican literature almost continuously from the Conquest to the present day.

Another class of early post-Conquest Mexican literature was the *canciones divinas* or sacred songs, which were distinguished for their chaste language, simplicity, naturalness, grace and excellency of metrical form. The best of the Mexican writers in this literary field fell very little below the mystic Spanish poets of their day, if we except the two great leaders of the movement on the peninsula.

17th Century.—With the encouragement given by the ecclesiastical and state authorities in both Mexico and Spain, the 17th century began with a very notable literary activity which continued on into the following century. The names and all or part of the works of scores of writers of this period have come down to us and enable us to judge pretty accurately the literary activity of more than a century of intense devotion to literature in the Aztec capital. Latin verse was sedulously cultivated and its influence upon the literature written in Spanish was very considerable; it helped largely to stamp the characteristics of the period which were marked by increased literary activity in a much broader field than that occupied by the writers of the preceding century, and by a tendency away from the naturalness which distinguishes the early Mexican literary school. This indicates a certain degeneracy which becomes more marked toward the end of the century. But it is a degeneracy which the Mexican writers share with those of the mother country. Yet the period is characterized by strong intellectual activity expressed in an exaggerated style known as Gongorism or culturism, whose distinguishing features are pomposity, grandeur of language and stateliness of versification marching along a broad highway leading directly to extravagance, exaggeration and obscurity of diction. Of the

more than 100 writers who, in a century and a half of activity, attained to more or less literary prominence, there are very few who rise above mediocre. They all worship at the shrine of Gongorism and lay upon its altar involved, obscure constructions and ornate descriptions overloaded with classical references. The literary spirit was all-pervading, far-reaching, yet the age has produced comparatively little that is worthy of preservation for its literary merits alone. "Poets were as plentiful as dirt," one of the critics of that day tells us; they turned their hand to everything; and they treated every subject in very much the same way, religious poetry, lyrical, heroic, amatory, dramatic, epic. Even the prose works, which are the best of the period, are marred by Gongorism.

Among the poets of this period who, following in the footsteps of Plácido, made a literary cult of the Virgin of Guadalupe, were Carlos de Següenza y Góngora, who published three volumes of poems devoted to singing the glories of the Indian saint in excellent verse and lyrical metre; Francisco Bramón, 'Songs of the Virgin' (1620); Luís Sandoval y Zapata, many high-sounding devotional poems in a decidedly Gongoristic vein; José López Avilez, stately Latin poems recounting the glories of Our Lady of Guadalupe; and Antonio Morales Pastrina, fervid religious poems in praise of the patroness of the Mexican people. All these poems, a small part of a somewhat extensive literature, are touched with the strange, passionate longing of the Indian for his vanished past; and one feels in them, at times, the presence of that ancient mother of the gods whose spirit, for the Mexican Indian at least, still hovers about the rocky heights of Guadalupe.

Most of the Mexican poetry of the 17th and 18th centuries is touched with the religious spirit of the age and many poets were professedly devoutly religious. To this class belong Pedro Muñoz de Castro, Juan de Guevara, who wrote religious poems and *autos* which were wonderfully popular; Francisco Ayerra, Juana Inez de la Cruz and Francisco Cochero Carreño. During the 17th century, however, the drama, which, as we have seen, was purely religious, turned to profane subjects, without deserting the autos and miracle plays. Agustín Salazar, who died at the age of 33, had already won for himself the foremost place in Mexico as a dramatist and writer of comedies and *autos*. Eusebio Vela, a very prolific writer, was considered the equal of most of the Spanish writers of his day in conception, execution and management of his plots and characters. Alonzo Ramírez Vargas also wrote a number of excellent dramas, the best of which is 'The Triumph of Diana.'

A favorite occupation of the poets of the 17th century was the writing of history in verse. Of these historical poets Gaspar Villagrá and Pedro Árias Villalobos are the most worthy of note. The former wrote 'The History of New Mexico' and the latter 'History of Mexico,' both of which are prosy and tiresome.

Of the prose writers of this period one of the most noted is Pedro Avendaño, who was one of the first of a long line of illustrious priests to take up the cause of the criollos (people of white blood born in Mexico). In 1692 he preached several sermons in Mexico City in which he warmly expressed the feelings of the oppressed criollos and criticized the pro-Spanish attitude and addresses from the pulpit of the archdeacon of the capital. For this and other similar acts he was expelled from the Jesuit order; but this only increased his popularity with the masses to whom he continued to preach and over whom he exercised a strong influence. He possessed a withering sarcasm, powerful invective and great facility of expression. His keen reasoning powers and his command of imagery make his writings and sermons always vivid and effective.

The 18th Century continued to manifest the same strong interest in literature that distinguished the two preceding centuries, but certain changes had taken place that showed the old influences were passing away. José Abad (1727–79) was the last of the great Latin scholars of Mexico who made a pastime of writing in the cultured tongue of the Cæsars. Francisco Ruís de León goes back to the age of the Conquest for his inspiration in his 'La Hernandia,' a long poem containing many excellent passages and pictures of the various characters who play their several parts therein. Although falling below the level of a great epic, the 'Hernandia' is superior to all previous attempts made to evolve a great poem out of the events of the conquest.

Of the many religious writers of the period José Manuel Sartorio and Francisco Soria are the best. Sartorio, a priest, strongly in favor of the independence of Mexico, was one of the most noted orators of his time; and, like Avendaño, he wielded a powerful influence over all classes. He was a tireless and prolific writer and has left 23 volumes of miscellaneous and devotional works and sermons and seven volumes of sacred and profane poetry. His religious poems, which constitute his best work, are often animated, natural, easy in style and filled with fine imagery.

The most popular dramatist of the 18th century was Arriola, whose best play is 'There's nothing Worse than Jealousy'; but Cayetano Cabrera Quintero was more prolific and possessed of more talent than Arriola. Among his comedies are 'A Disappointed Hope' and 'Iris of Salamanca.' 'A Study of the Coat of Arms of Mexico' is his most noted work. Manuel Soria disputed with Arriola the claim to be the most popular dramatist of the century. One of the best writers of the Calderón school he has left, among others, the following dramas: 'William Duke of Aquitaine,' 'Mexican Magic,' 'The Genoese' and 'Love and Jealousy.' Though strongly Gongoristic, his dramatic situations are excellent, his verse free and natural, the development of his plots always interesting and he is never at a loss to express passion and sentiment in a pleasing and effective manner. Manuel Zumaya was the author of 'Partenópe,' a very successful opera, and 'El Rodrigo,' a popular drama first produced in 1708. He translated into Spanish a number of the most popular Italian operas of his time for the Spanish stage. Another translator of note was José Rafael Larrañaga, who was the first to turn the works of Virgil into excellent Spanish. This translation

is faithful to the text and the spirit of the original.

The greatest poetical genius of the 17th century in Mexico was Sister Juana Inez de la Cruz (1651–94), whose name is a household word in her native land, where every Mexican holds her up as the perfection of literary art. She plays upon all the passions of the human heart and she wanders into many bypaths of literature. Lyrical, amatory and descriptive poetry and the drama she manages with equal skill and facility. In her own day she was looked upon as a paragon of learning and was credited with such superior poetic genius that she was and is still called the 10th muse. Yet she had the defects of her age; and modern literary standards, while admitting her superior talent, find her guilty of Gongorism.

The next most important figure in the literary life of Mexico, after Sister Juana Inez de la Cruz, is Manuel Navarrete (1768–1809), who may be said to have restored lyric and descriptive poetry to his native land. Naturalness and a keen appreciation of the beauties of nature distinguish his work, which is dominated by deep philosophic thought and pitched in an elevated style uncommon in his day. His verse is strong and sonorous and his subjects are presented in a masterly manner. The religious feeling of primitive peoples is strong in him. His god is the god of the storms and winds, the all-powerful, the maker and unmaker of men and nations, who wipes from the earth, when He wills, the mightiest of the works of men. He is the Divine Providence of the world, and all that He does is good because He does it. Through and behind Navarrete's undoubted Christian faith there appears the ever-present glory of his strong conception of ancient paganism. His god is the divinity of the ancient Greeks, Romans and Hebrews who rides upon the clouds and plants His footsteps on the storm. His faith is the simple faith of a primitive age; and his poetry, true to this attitude, creeps ever close to the heart of nature. His language is always simple, clear and correct, his lines harmonious, his taste good and his moderation in the use of poetical and oratorical adornment noticeable in his age. He rose above the prosiness and mediocrity of his time. Zorilla, the Spanish poet, has said of him: «The defects of his works are those of his age; their beauty and excellence are his own.» Navarrete was a close student and a great lover of Greek and Roman mythology; yet such was his natural genius that he was able to hold a steady midway course between the excesses of Gongorism and the barrenness of prosism in an age when both were rampant in Spain and Mexico. His odes and religious poems are his best work. Of the latter his 'Divine Providence' is one of his most characteristic compositions.

Mexican literature has always been noted for the number and excellence of its historians, and three, Gama, Veytia and Clavijero, add lustre to the 18th century. To their industry, clearsightedness, power of discrimination and perspicuity of style we owe much of our knowledge of the history of New Spain.

Nineteenth Century.— José Joaquín Fernández de Lizardi (1771–1817) forms the bridge between the last of the schools that grew up, flourished and declined under the patronage of the Spanish Crown and the new school which came into being with the success of the revolution which made of Mexico an independent nation. He is the most pronounced herald of independence and the keenest thinker of his day. For this reason he is universally known wherever the Spanish language is spoken as «El Pensador Mexicano» (The Mexican Thinker). 'El Periquillo Sarmiento,' his most famous work, is as well known in Spain as in Mexico. It has been published many times and is now looked upon as a classic in the Spanish tongue. In vain the critics have pointed out its many faults in style, its Mexicanisms and its careless use of words. It is so true to nature, so full of compassion and understanding, yet withal so humorous, so sprightly, so convincing, that it appeals directly to the universal human heart. The 'Periquillo' analyzes character and actions and presents the reader with innumerable charming pictures which he instinctively feels are true. Lizardi was a publicist in the broad sense of the word, and he has left innumerable articles of all kinds and treating of a great variety of subjects. Next to 'Periquillo' his most popular works are his 'Fables' and his 'Sad Nights.'

Among the successors of Lizardi are Manuel Carpio (1791–1860) and Manuel Eduardo de Gorostiza (1789–1851), two names which have shed lustre on Mexican literature. Carpio displays a wide range of sympathies; and his descriptive poetry is considered the equal of any written in Mexico. He is the first and best epic poet of his country and his lyrics have the true lyrical swing. Gorostiza led the way to the production of modern drama in Mexico. He was the first to enter the field which was so successfully filled, later on, by the many dramatists who have won laurels for Mexican literature since the overthrow of Spanish domination in 1821. His subjects are always full of interest and wide in range; his plots are skilfully constructed and his dramas have that broad human sympathy which ever appeals to mankind. He has successfully blended popularity of style with depth of thought and keen analysis. Three other dramatists belong to this period, Juan Menceslao Barquera (1779–1840), Anastacio Ochoa (1783–1833) and Francisco Ortega (1793–1849). Of these Ortega is the best. Both he and Barquera were journalists of note and saw many sides of life, which they both reflect in their dramas. Being journalists they were also naturally political writers, both of great power and influence. Ortega wrote heroic odes, love poems, sacred songs, sonnets fables, epigrams and stories of a political cast. His dramatic works are 'Camatzin,' a drama; 'The Mysteries of the Print-shop,' a comedy, and 'Freedom of Mexico,' a melodrama. Among Barquera's successful dramas, all of which were produced in the capital, are 'Polly Baker,' 'The Seducer,' 'Triumph of Education,' 'The Proxy's Love,' 'The Orphan Girl of Tlalnepantla' and 'Don Alfonso.'

Manuel Sánchez de Tagle (1782–1847) shares with Lizardi the honor of forming the connecting link between Mexican literary activity under Spanish rule and the revolutionary literature that followed. He is noted for naturalness, simplicity and regularity of metric forms. He is fond of the ideal, the mystical; he is poetically religious and he looks upon the

actions of men and the deity alike as ruled by an inexorable destiny, which recalls the Latin fates. His plots are simple in construction and development and he is free from affectation and the excessive poetical adornment which distinguish the preceding age. José Joaquín Pesado (1801–61), José M. Heredia (1803–39) and Manuel Alpuche (1804–41), contemporaries of Tagle, and very active during the stirring years that followed the establishment of the republic, paved the way for singers more distinctively Mexican in sentiment, subject and treatment. Of these the greatest is Pesado, who, in his day, enjoyed, in the mother country, the reputation of being "a new star on the horizon of Mexican literature." Among his admirers were the Spanish poets Zorilla, Martínez de la Rosa and Herreras. Purity of language, careful choice of words and expressions, vividness of thought and classical restraint are characteristics of Pesado's work. But it is with Jesús Díaz (1809–46) and Fernando Calderón (1809–45) that the real spirit of Mexico, as a new nation, begins to manifest itself. To Calderón is due the honor of creating for Mexico a national drama. He often went afield for his subjects when he might have found better at home; yet, inasmuch as he pointed out the way which others subsequently followed, his work is of great importance in any review of Mexican literature. Among his dramas are 'Reinaldo and Elina,' 'Zadig-Zeila,' 'Armandina,' 'Modern Politics,' 'Ramiro Count of Lucena,' 'Infigenia,' 'Hersilia and Virginia,' 'None of the Three,' 'The Tournament,' 'Anne Boleyn' and 'Herman.' Ignacio Rodríguez Galván (1816–42), a lyric and dramatic poet of great power, imagination and passionate utterance, has left two dramas distinctly Mexican, 'Muñoz' and 'The Private Secretary to the Viceroy.'

From the days of the revolution against Spain to the present, the literary life of Mexico has been wonderfully active and varied. To the vanguard who breathed the breath of life into this national literary activity belong José M. Esteva (1818–98), Ignacio Ramírez (1818–79), Guillermo Prieto (1818–94), Manuel Payno (1822–89), José T. Cuellar (1823–93). Augustín Rivera (1824–1913), Joaquín García Icazbalceta (1825–94), Antonio García Cubas (1832–96), José M. Vigil (1829–1908), José M. Roa Bárcena (1827–1906), Isabel Prieto de Landazuri (1833–76), Ramón Aldama (1832–92), Ignacio M. Altamirano (1834–93), Eduardo Ruiz (1832–1906), Vicente Riva Palacio (1832–96), Luis G. Ortiz (1835–94), Melisio Morales (1838—) and Rosas Moreno (1838–83). Esteva gave a distinctly national note to his work and painted truthfully and with considerable humor, pathos and vividness, the customs, habits and peculiarities of the Mexican people, with whom he was very popular. Ramírez and Prieto, though very far apart in many respects, may be classed together on account of the unity of their aims and the strong influence they had over the Republican party and democratic Mexico. They were both firebrands of the revolution that finally swept away all the privileges of the Catholic Church, confiscated and nationalized its property and drove the French out of Mexico. Both were noted orators and their poetry takes a decidedly oratorical caste. Ramírez plays so successfully upon all the strings of the human heart that his admiring countrymen call him "The Necromancer." Prieto is the master spirit of republicanism in Mexico. His is the loudest, surest, most-compelling voice crying out in behalf of the people during the long struggle against privileges, entrenched abuses and foreign intervention. He had a way of going right to the hearts of the people whose idol he was; and for whom he was the first to form traditions of national glory. He summoned them out of the darkness of their internecine struggle and bade them listen to the voice of their mother-land. He called up the Mexican heroes of the past and crowned those of his own age with laurels of glory. Possessed of the true poetical fires, he set the nation aflame in an age when the passions of men were easily stirred. He was lyrical poet, romancer, political writer and chronicler. His best-known work is 'El Romancero Nacional.' Payno was political writer, biographer, historian and novelist. He was very prolific. His best novel is 'The Devil's Scarf Pin' and his history of the war between Mexico and the United States is a good presentation of the Mexican side of the question. Cuellar, an excellent comedy writer and novelist, was very successful on the stage. Among his dramatic pieces are 'The Art of Love,' 'Old Man Chacón,' 'Poor Boys,' 'Griefs and Sacrifices' and 'Natural and Figura.' Among his novels and stories are 'Salad and Chicken,' 'Chuchu,' 'Gobina,' 'Old Maids,' 'People who are Just so' and 'Gabriel the Locksmith.' Many of his most successful stories appeared in the 'Magic Lantern Series.' Isabel Prieto and Aldema were also successful and popular dramatists. The latter, who was poet, journalist and political writer, and inclined strongly to the melodramatic, has left numerous dramas, of which the most popular are 'A Noble Heart,' 'Pledged to Vengeance' and 'Head and Heart.' Isabel Prieto is the most noted woman dramatist of Mexico; she is also an excellent lyrical poet. Among her dramas are 'Both are the Worst,' 'Two Flowers,' 'Abnegation,' 'A School for Sisters-in-law,' 'Gold and Tinsel,' 'A Type of the Day,' 'Thorns of Sin,' 'A Woman's Heart,' 'Fairy and Seraphim,' 'Carnival Night,' 'Sin and Penitence,' 'A Lily Among Thorns' and 'The Angel of the Hearth.'

José M. Roa Bárcena is the best short-story writer of Mexico and much of his work has been translated into French, Italian and English. He also wrote several novels. His 'Legends of Mexico' and his 'Recollection of the American Invasion' are well and carefully written. His short stories display a saving sense of humor, keen analysis of character and excellent constructive ability.

Altamirano and Riva Palacio stood beside Prieto and Ramírez in their glorification of republican Mexico. The most popular work of the former, who was a full-blooded Indian, is 'Landscapes and Legends.' Palacio, who was a noted republican general, filled many high public offices. He was a successful dramatist, poet, novelist, critic and writer of short stories, legends and political articles. With Palacio and Altamirano may be classed Peón y Contreras and Juán A. Mateos, who both dug deeply into the rich mine of national life and recounted the glories of Mexico. Novels, lyrics,

narrative poems, dramas poured from the pen of Peón y Contreras as if by magic; for several years he held the centre of the stage in the national capital where his dramas were wonderfully popular; while at the same time his metrical romances were read with avidity throughout the length and breadth of the land. 'Unto Heaven,' a drama produced in 1876, may be said to have made him famous over night. This was followed by many other dramas, which were produced in the capital as fast as the author could turn them out. Several of these were also successfully presented on the Madrid stage. Mateos, who has strong imagination, intensely oratorical, form and wonderful facility of expression, naturally turned to the drama; and the capital welcomed him as it had already welcomed Peón y Contreras; and he wrote at the bidding of the public drama after drama, most of which were successful. Ireneo Paz also wrote successful dramas and comedies and the Mexican capital welcomed him too; and when Chavero came along and repeated the act, he also was received with open arms. Thus Mexico City became the centre of a strong dramatic movement, in some ways superior to the great dramatic movement that produced the *autos* and religious and other dramas of the previous centuries. These 19th century Mexican dramatists were all men of many parts. Mateos was his country's greatest romancer and historical novelist, Chavero was archæologist, epic poet, historian and critic of the first rank, while Paz was journalist, political writer, novelist, historian and humorist. Meliseo Morales wrote good lyrical dramas which were staged in Italy; and he translated popular Italian operas into Spanish for Spanish playhouses. Icazbalceta and Pimentel worked together. The former dug into the countless records of the past of America hidden in the many libraries of the republic and gave to light a long list of valuable documents for the history of Mexico. He also wrote much good original matter along the same line, a 'Political History of the Indies,' 'Mexico in 1554,' 'Mexican Biography of the Sixteenth Century,' 'Zumarraga,' a 'Dictionary of Mexican Provincialisms' and 'Mexican Physicians of the Sixteenth Century.' Pimentel worked in the same library and produced, among other works, the best 'History of Mexican Literature' extant.

Rosas Moreno disputes with Lizardi the honor of being the most successful Mexican writer of fables. His work has become a classic in Spain. Ruiz, an excellent raconteur of legends; Ortiz, a fair poet and novelist, and Rivera, a voluminous historian, may be said to complete this period, though the latter lived on into the 20th century and was the nation's honored guest at the opening of the National University in 1910. His long life of tireless and ceaseless literary activity enabled Rivera to produce over 100 histories, critical works and booklets. Ruiz is best known by his 'Legends of Michoacan' and 'Traditions and Legends.' The connecting link between the literary activity of the Diaz régime (1876–1910) and that of the preceding years of the life of the republic is Manuel Acuña (1849–73) who, notwithstanding his short life and tragic death, exercised a wonderful influence upon the poets who followed him. He was endowed with vivid imagination and a strong literary and poetic sense which reminds one somewhat of Poe. Ignacio Montes de Oca (1840—), Manuel Gutiérrez Nájara (1850–95), Salvador Diaz Mirón (1853—), Juán de Dios Peza (1852–1909), Manuel José Othón (1851–1908), Luis G. Urbina (1868—) and Justo Sierra (1848–1911) are all names that shed lustre on Mexican literature. Flores is an epic bard with strong histrionic and dramatic talent. Gutiérrez, Nájara and Sierra are both excellent poets and writers of talent in other fields, and Othón and Urbina are among the most popular singers of the present century in Mexico. But of the writers of the Diaz régime, Peza is by far the best and most popular. He published three dramas, 'A Love Affair,' 'A Real Home' and 'Columbus' which became popular. But it is his simple, heartfelt, almost homely poems that made him the literary lion of the Mexican capital. Among these are 'Songs of the Hearthstone,' 'The Arrow of Love,' 'Home and Country,' 'Flowers of the Soul,' 'Memories and Hopes,' 'Monologues and Songs of Heroes,' Mexican Traditions,' 'The Mexican Lyre,' 'The Harp of our Native Land' and 'Legends of the Streets of Mexico.' Mirón, who is called the poet of poets, has great breadth of imagination, a deep sense of the beauty of rhythm and imagery and decided lyrical talent. Carlos H. Serán made comedy and native vaudeville popular in Mexico.

Modern Literature.— The period of the Díaz administration was prolific in writers of talent in every line of literary endeavor, to such an extent that even a cursory review of their activities would far overpass the limits of this article. Antonio Zaragoza is the author of several volumes of fervid lyrical poetry. Francisco F. Icaza, whose work is chaste and classical in form, has been welcomed in Spain, as at home. José M. Bustillos has taken up the song of the glories of the Mexican race and has gone back to the days of the Indian empires for many of his subjects, plots and characters. 'Rocks of the Lake' is his best work. Zayas Enriquez, biographer, historian, poet and essayist, is a talented but not over-conscientious writer. Enrique Fernández Granados, correct in style, artistic in temperament and classical in aims, has published two volumes of excellent poetry, 'Myrtles' and 'Daisies' and made excellent translations of Italian poetry into Spanish. Joaquín D. Casasús (1858–1916) and Julio Guerrero are distinguished writers on political and social subjects. Casasús also did other good literary work and translated Longfellow's 'Evangeline' and Horace's 'Odes' into Spanish verse. Guerrero's 'Genesis of Crime in Mexico' is an illuminating analysis of Mexican character, conditions, customs and tendencies. Juán José Tablado, Oriental in the richness of his imagination and the depth of coloring he imparts to his images, has the true lyric ring. He and Jesús Valenzuela and Amado Nervo form a trio of brilliant young newspaper men who have found warm welcome in all Latin-American countries and in Spain herself. Balbino Dávalos has published a book of poems and made excellent translations into Spanish from English and French; but his work has less imagination than that of the trio above mentioned.

Francisco Bulnes and Luís González Obre-

gón are both historical investigators of note and brilliancy. Bulnes is oratorical, passionate, picturesque, vivid. Obregón is cool, collected and severely impartial. He lacks the warmth of imagination of Bulnes and the passion which produces highly-colored pictures; but he sees clearly and illuminatingly into the past and lays it before us in all its nakedness. His published works make a long list, the best known of which is 'Old Mexico.' Bulnes' 'The True Juárez,' convincing though it is, raises a storm of protest from Mexicans all over the land.

The Ishmael of Mexican literature is Antonio Plaza. He has been damned by the educated as vulgar and unchaste; the Church has accused him of paganism and blasphemy and the critics have taken delight in stabbing him; yet, next to Juán de Dios Peza, he has long been the most popular poet of the Mexican middle class. Plaza is a soul in revolt against the world as he found it. He has a wonderful power of invective and the language to fittingly express it; and yet, at times, he reveals a tenderness through which shows the tortured soul behind all his railings.

Among the talented women writers of Mexico are Heraclia Badillio Dolores Guerrero, Teresa Vera and Josefina Letechipia, who have covered practically the whole field of Mexican literature.

Historical investigation has always attracted Mexican literary men. This is due to the romantic interest of the country and its great wealth of material relating to the native races, to the Conquest and to the period of Spanish occupation immediately following. The most noted historical writers of the 17th century are Francisco de Burgoa, 'Account of the Dominicans' (1597); Alonzo Franco y Ortega, Fernando de Alva Ixtlixochitl, Augustín de Vetancurt, 'Teatro Mexicano'; Antonio Tello, 'History of New Galicia' (1650); Antonio de Solís (1610–86), 'History of Mexico'; and J. Villagutierrez Soto-Mayor, 'History of the Conquest of the Mayas.'

The historians of the 18th century have left more pretentious, better arranged and more philosophical histories and pictures of Mexican life than their predecessors. Of these historians the most trustworthy are Francisco Javier Alegre (1729–88), 'History of the Jesuits in New Spain'; Lorenzo Boturini Benaducci (1702–50), 'General History'; Andrés Cavo, 'Spanish Government in Mexico' (1766); Francisco Saverio Clavijero (1731–87), 'Ancient History of Mexico'; Granado y Gálvez, 'Indian History'; Antonio Lorenzana, 'History of New Spain' (1770); José Beristain (1756–1817), 'Biographies' and Mariano Veytia (1718–79), 'Ancient History of Mexico.'

The 19th and 20th centuries of Mexican historians include Lucas Alamán, Marco Aroniz, Carlos M. de Bustamante (1774–1848), Antonio García Cubas (1832–96), Luís González Obregón, Ignacio M. Altamirano, Diego de Landa, Nicolás León, Joaquín García Icazbalceta, Manuel Orozco y Berra (1816–81), Carlos Pereyra, Anselmo de la Portilla (1816–79), Pantaleón Továr, Eufemio Mendoza, Eduardo Gallo, José María Vigil, Augustín Rivera (1824—), Manuel Rivera Cambas, Francisco Sosa (1848—), Justo Sierra, Niceto de Zamacois, Manuel Payno (1810–94), Genaro García, Victorio Salado Álvarez, Edurado Ruíz, Manuel Santibañez, José María Iglésias, Fernando Iglésias Calderón, Vicente García Torres, Antonio de León y Gama, Manuel Revilla and José Victór Martínez (1810–61).

National University of Mexico.

17. HISTORY. Pre-Conquest Period.— The history of Mexico divides itself into three parts: aboriginal Mexico under the domination of its native Indian rulers, from the border land of prehistoric times to 1521; Spanish occupation from 1521 to 1821 and independent Mexico from 1821 to the present.

A score of distinct aboriginal tongues and more than 100 dialects still spoken within the confines of the Mexican Republic are evidence of the presence of numerous races that overran the country at various periods during its prehistoric existence. These early races seem to have had considerable influence upon the traditions, mythology and customs of the people who followed them in the country. From the confused movement of the shadowy peoples of the past stand forth the forms of several more or less distinctly cultured races whose written and traditional records, legends and folklore reach back to the dim border land beyond which all is mythical. During the early semi-historical part of this period the great Nahua race, beginning its many years of wandering from the north, crossed the Mexican boundary in the 6th century and continued southward. These migrations were participated in by numerous tribes or nations. The first of these, the Toltecs, came from the semi-mythical land of Old Tlapallan under the leadership of their high priest and chief, Heumatzin, he of the big hands, and arrived at Tulancingo (a short distance north of Mexico City) in 720, after 176 years of wandering. Soon afterward they established populous centres at Tula, San Juan, Teotihuacán, Cholula and numerous other places and extended their power over a wide reach of country. They are said to have been a highly civilized race, to have been builders of great and handsome cities and to have extended organized commerce for hundreds of miles beyond their own territory which, at the height of their power and prosperity, stretched from the Gulf of Mexico to the Pacific and far southward to the border of the domains of the Maya of Yucatán, Chiapas and Campeche. They had a settled form of government and

complicated, far-reaching codes of law which included military, political, social and religious regulations; and these, in their turn, were supported by racial customs and dogmas. See MEXICO — MYTHOLOGY; MEXICO — LITERATURE.

While the Nahua held the central portion of what is modern Mexico, the Maya and other kindred races occupied the south, stretching from Campeche, Yucatán and Chiapas south and west to the Pacific and into Guatemala, where they established a civilization rivaling that of the Toltecs. Between the Maya on the south and the Toltecs on the north lay the Zapoteca and the Mixteca, almost as far advanced as they in the arts and sciences and the principles of government. All four peoples were skilled workers in metals and excellent makers of pottery and woven fabrics. They recorded their histories, traditions, religious formulas, tribute rolls and important events in complicated hieroglyphics which varied with the different races. They were good agriculturists, excellent builders and organizers and they maintained extensive and well-apportioned armies and systems of public instruction. All education was in the hands of the priests and administered from the temples, thousands of which, rising from high, truncated, pyramidal structures, covered the land. These temples were specially numerous and of notable magnificence in the Aztec land and Yucatán. See MEXICO — ARCHITECTURE; MEXICO — ART.

Civil wars, internal dissensions, famine and plague are given as the causes of the disruption of the Toltec empire which came to an end in 1116, after nearly 400 years of existence. A part of the Toltec population is said to have migrated southward and to have entered the land of the Maya. It is certain, however, that many remained behind and lost their identity in the Chichimeca and other less cultured races who occupied the valley of Mexico and surrounding country. From this union sprang the famous Texcocans, whose capital, Texcoco, on the lake of the same name, preserved the civilization of the early Nahua and finally became the most noted centre of culture in the Mexican empire.

The Aztecs, Texcocans, Tepanecas, Chalcos and Tlaxcalans are the most notable of the Nahuatl tribes who took possession of the country deserted by the Toltecs. Of these the most important are the Aztecs, who began their wanderings from Aztlán, their old home in the north, about a century after the Toltecs. Six hundred years later they arrived in the valley of Mexico, where they eventually, after many struggles and privations, established themselves on two little islands in Lake Texcoco, and founded their capital, Tenochtitlán, the Place of Tenoch, their priestly leader and mighty warrior, or Mexico, the Place of Mexitli, their war god.

The Aztecs prospered, grew in numbers and extended their power over the Chalcos and other tribes bordering on the lakes of the valley of Mexico and, forming an alliance with the Texcocans and the Tepanecas, carried their conquering arms from the Gulf of Mexico to the Pacific and, from some distance north of Mexico City, southward past the Isthmus of Tehuantepec almost to the border of modern Guatemala, where they encroached upon the land of the Maya. The creation of this vast empire which, in extent and power, outrivaled that of the Toltecs, was due to the skill, intelligence, executive ability and warlike prowess of a line of kings which began with Acamapixin, Prince of the Reeds (1376–1404), 50 years after the founding of Tenochtitlán. The other Aztec rulers in succession, up to the arrival of Cortés, were Huitzilihuitl, Hummingbird's Feathers (1404–17), Chimalpopoca, Smoking Shield (1417–27), Ixcoatl, Obsidian Knife (1427–40), Moctezuma I, Wrathy Chief (1440–69), Axayacatl, The Fly (1469–81), Tizoc, Lame Leg (1481–86), Ahuizotl, Water-rat (1486–1502) and Moctezuma II (1502–20), all of whom worked zealously for the upbuilding of the Aztec empire and the beautifying and extension of their capital.

From the beginning of the reign of Moctezuma II, Spanish navigators had been exploring the neighborhood of the Mexican coast and several had touched on the mainland of Yucatán and Campeche. In 1519 Hernán Cortés, inspired by the dream of conquering a great and rich land, of which reports had been brought to Cuba, set out with a small military force on his daring expedition to the uplands of Mexico. On the way he defeated the Tlaxcalans, an independent nation, and the Cholulans, who formed a semi-dependent province of the Aztec empire. From these he recruited a considerable native army, with which he continued his march to Mexico City, where he was reluctantly received by Moctezuma II and quartered in one of the royal palaces. He finally succeeded in making a prisoner of the Aztec ruler, who was killed a short time afterward (30 June 1520) either by the Spaniards or by the Mexicans themselves. The presence of the Spaniards in the city, the death of the emperor and the profanation of the shrines of their deities enraged the Aztecs to such an extent that they rose against Cortés and he was forced to leave the city by night. In the retreat he lost his cavalry, artillery and most of his infantry. After recruiting a new army and obtaining additional war equipment, Cortés returned and laid siege to the City of Mexico which he captured (13 Aug. 1521) and afterward continued the conquest of the domains of the Moctezumas.

Under Spanish Rule.— Immediately after the surrender of Tenochtitlán the government of Mexico fell into the hands of the conquistadores who, being purely military governors, administered the affairs of the land by means of military law. Gradually the large cities were granted local government similar to that of Spain and the province was divided into districts controlled by the central government in Mexico City. In 1528 auditors (*oidores*) were introduced to keep a check on the captain-general, Cortés. They soon succeeded him and continued to govern the country until 1535, when Antonio de Mendoza became the first viceroy. He was a very earnest and capable man and at once proceeded to replace with an orderly and settled form of government the hap-hazard methods of the oidores and military leaders.

Spain monopolized the trade of Mexico, or «New Spain.» Commerce to and from the colony could be carried only in Spanish bottoms; nothing was permitted to be grown in Mexico that might in any way come into com-

petition with products from Spain. Only native-born Spaniards could hold office under the government in New Spain. The establishment of manufactures of all kinds was discouraged or prohibited. Yet Spain gave her colonies a strong government and one that was thoroughly understood by the mass of Indians and mestizos who composed the greater part of the population of Mexico, for it was much like the kind they had been accustomed to for centuries under their native rulers. The encouragement of literature and art, the beautifying of the cities and towns, the extension of great highways of commerce, the improvement of harbors, the establishment of high schools, colleges and a provincial university and the practical eradication of the native religion with its human sacrifices were far-reaching benefits which Spain bestowed upon Mexico. But the evils of her administration outran the good. The establishment of peonage and the concentration of the Indians in centres, towns, camps or ranches under the pretense of civilizing and Christianizing them soon destroyed all the machinery of the native civilization. The masses of the population, their aboriginal laws and codes of morality gone by the board, soon lost their pride of race and descended to a condition of slavery bringing with it debauchery, a loss of interest in life and a consequent loss of ambition. These and scores of other abuses created discontent throughout the viceroyalty, which was destined to show itself in vigorous protests and insurrection against Spanish authority. An unsuccessful revolutionary plot in the capital in 1808 was followed by the uprising of Hidalgo, the patriot priest of Dolores, on 16 Sept. 1810. Hidalgo, after a wonderfully successful initial campaign which brought him, with an army of 100,000, almost to the gates of the capital, was finally defeated, captured and executed the following year. The war of liberation dragged on with varying success until 1821, when the life of independent Mexico began.

Independent Mexico.—The first government of independent Mexico consisted of a council of six, with Gen. Augustín Iturbide, the commander of the revolutionary army, as president. On 19 May 1822 Iturbide was proclaimed emperor, and on 21 July he and his wife were crowned in the cathedral of the capital. But dissensions soon set in and Iturbide was forced to abdicate and to leave the country. On returning to Mexico in 1824 he was arrested, tried and shot as a traitor. Then followed many kaleidoscopic political changes in which the personal ambition of military leaders played the foremost part.

Santa Anna, who became President in 1833, and who was looked upon as a good soldier, took the field against the Texas revolutionists with an army of 6,000 trained men. Successful at first, he was defeated in 1836, captured and taken to the United States, but was allowed to return to Mexico the following year. For more than a generation, from the first days of the republic to the middle of the 19th century, the figure of Santa Anna appears ever in the foreground of the political life of Mexico guiding the destinies of the nation or watching political moves from either voluntary or forced retirement. Shortly after his return from the United States the French government sent a squadron to Vera Cruz to enforce the payment of claims against Mexico held by French citizens. Santa Anna, who had gone into one of his periodical retirements, came forth and placed himself at the head of a force to oppose the French, who finally withdrew. Santa Anna claimed the honor of having driven them from the country. This claim and the fact that he lost a leg in the encounter made him once more a national figure and a popular hero, although Mexico had been forced to comply with the French demands.

Bustamante, recalled from exile, became President in 1837, on the outbreak of the revolution in Texas. The struggle between ambitious military leaders became more intense. Santa Anna, Paredes, Bustamante, Farías, Herrera, Nicolás Bravo and others played their several parts on the constantly changing stage. The admission of Texas to the American Union as a State, 29 Dec. 1845, roused the resentment of Mexico against the United States to a high pitch. James K. Polk, who succeeded Tyler as President of the United States, was an ardent expansionist and included in his plan of expansion the acquisition of California, Arizona and New Mexico, then Mexican territory. Claims amounting to several million dollars were held by American citizens against the Mexican government, which was unable to meet them. Polk proposed to settle these claims in exchange for Mexican territory, paying, in addition, to Mexico $25,000,000 in cash. In November 1845, John Slidell was sent as diplomatic representative to Mexico City, with instructions to press the matter of cession of Mexican territory to the United States. But the Mexican authorities, having learned in advance of Slidell's commission, did not receive him. Polk was ready to ask Congress to declare war against Mexico in May 1846 when the news reached Washington that armed Mexicans had already crossed the border and killed a number of Americans. War was declared against Mexico, 13 May. General Taylor, in command of American forces on the Rio Grande, was ordered into Mexico. In September 1846 he defeated a Mexican army and captured Monterey and, on 22 February, he fought a drawn battle at Buena Vista (Angostura). A month later Gen. Winfield Scott arrived at Vera Cruz, which he captured, 29 March, and began the long and toilsome march toward the upland plateau and the capital of Mexico, which he reached six months later. After the capture of Molino del Rey, Churubusco and Chapultepec, fortresses defending the capital, Scott's army entered the City of Mexico. In the meantime American forces had taken possession of California and New Mexico without opposition. In February 1847 a treaty was signed at Guadalupe Hidalgo, near the Mexican capital, between representatives of Mexico and the United States by the provisions of which California and New Mexico were ceded to the United States.

Santa Anna, who had again become dictator of Mexico while the country was at war with the United States, retired to Jalapa, and General Herrera became President, 3 June 1848. He was succeeded (January 1851) by General Arista, who was forced out of office by Santa Anna.

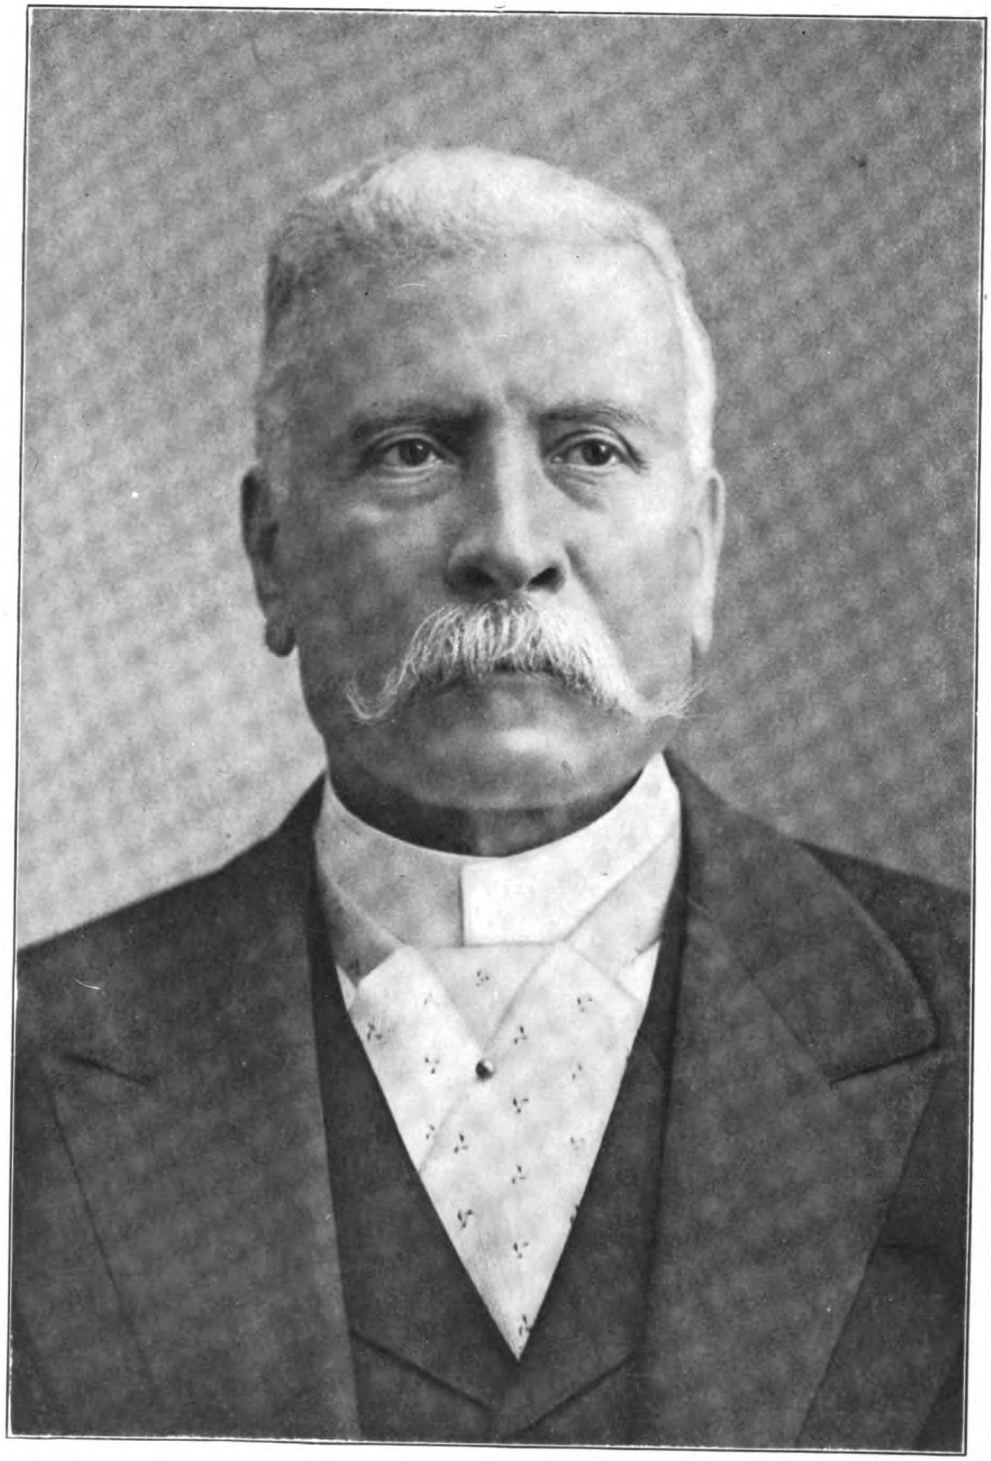
A new constitution for the republic which

became law on 5 Feb. 1857 figured in every Mexican conflict during more than half a century. President Comonfort repudiated it, thus estranging his own following without gaining the support of his opponents. He was forced to flee the country, and his departure gave rise to internal dissensions not finally settled for years. Benito Juárez, president of the Supreme Court, claimed the presidency in accordance with the provisions of the Constitution. War divided the people and devastated the land and the reactionary party forced Juárez from the capital. In the midst of all this civil trouble, a real danger threatened the republic from without. In 1861 England, France and Spain entered into an agreement known as the Treaty of London, by which they were to send a three-fold fleet to Vera Cruz to demand of Mexico guarantees for the payment of her foreign debt and for the safety of their subjects in Mexican territory. This fleet, which appeared at Vera Cruz on 8 Dec. 1861, captured the port and proceeded to Orizaba, where a conference was held with Juárez, who agreed to comply with the demands of the powers. England and Spain at once withdrew their troops from the country. But the French, who had a secret understanding with the Mexican reactionary party, at the head of whom was Miramón, who had disputed the presidency with Juárez, remained in Mexico with the avowed purpose of settling its social and political difficulties. The French army soon began its march toward the uplands, but it was defeated before the walls of Puebla and forced to retreat to Orizaba (1862).

The Archduke, Maximilian of Austria, and his consort, who had been selected by Napoleon III as emperor and empress of Mexico, arrived in Vera Cruz 24 May 1864. In the capital they were welcomed and crowned with great ceremony. The protest of the United States forced the withdrawal of French troops from Mexico, and Maximilian, left to his fate, was compelled to surrender at Queretaro in 1867. He was tried, found guilty of treason to the Mexican people and shot on the Hill of the Bells near Queretaro, together with his two generals, Miramón and Mejia, 19 June 1867. The concerted action of the Army of the North under Escobedo and the Army of the East under Porfirio Díaz defeated the Imperialists; Mexico City surrendered to Díaz 21 June, two days after the execution of Maximilian; and on 15 July Juárez returned to the capital amid the rejoicing of the populace. But opposition to the Juárez government soon developed and his administration was troubled by constant uprisings and disaffection. Juárez died suddenly 19 July 1872, shortly after he had been re-elected President. He was succeeded by Sebastian Lerdo de Tejada, who served one term and was forced out of office shortly after his re-election by Gen. Porfirio Díaz who defeated the Lerdist party at the battle of Tecoac, marched upon the capital and was there proclaimed provisional President, 24 Nov. 1876, and later constitutional President. At the expiration of his term of office, 30 Nov. 1880, he was succeeded by Gen. Manuel González, who continued the Díaz policy of encouraging the construction of railways and increasing the efficiency of the rural police charged with the protection of the country from revolutionary and robber bands.

Díaz succeeded González in the winter of 1884, and, for more than a quarter of a century, he continued to be the one great power in Mexico. He found the country in debt and the income of the administration inadequate to meet the demands on it. He increased the revenue of the nation over 400 per cent; he built railways, highways, roads and harbors; he drained the valley of Mexico and made the pest-ridden coast towns places of resort. He encouraged foreigners to settle in or invest in the country and to contribute their part to his program of expansion and development, and he created a credit for the nation and steadily increased and improved it. He introduced system and encouraged honesty in the public service and prevented, to a very great extent, malversation of public funds, which had been so noticeable during previous administrations, by the introduction of a rigid and modern system of accounting and by holding the heads of the departments accountable for the funds passing through their hands. With Díaz the Indian and mestizo elements, constituting fully 85 per cent of the population, began to come into their own. Thus a new social life was created in Mexico under his régime, and in it the mestizo, for the first time, began to play a prominent part.

Díaz found public instruction neglected and practically non-existent and he set to work to remedy this defect. Training schools for teachers were established and the higher schools and colleges were increased and improved with a view to supplying, through them, the teaching body for new primary and secondary schools. Though lack of funds hampered this work, the results achieved bore fruit in the rapid increase of the standard of intelligence in the larger towns and cities. Under Díaz the resources of the country were developed; commerce threw off its provincialism and became national and international, and new industries sprang up throughout the land. But, with a government which had absolute control of the affairs of the country so long as that of Díaz abuses were bound to creep in. About the President had grown up a strong personal party, the members of which, while professing great admiration for him and his government, succeeded in enriching themselves, their relatives and friends through concessions [illegible] secured through their close connection with the administration. The spread of public instruction and the rise of the Indian and mestizo to public prominence introduced into the [illegible] equation a new and restless element [illegible] had constantly, throughout his long régime, to curb, control and discipline. The discontent increased; Mexican exiles in the United States used every means in their power to hasten the overthrow of the man they characterized as autocratic and tyrannical. Ramón Corral, the Vice-President, who was looked upon as the leader of the sinister influence at work in the party surrounding the President, was singled out as the special object of attack of the anti-government agents. Díaz, in the face of the impending storm, supported Corral, who was re-elected in 1910. During the month of September 1910 the 100th anniversary of the declaration of Mexican independence was celebrated



General Porfirio Diaz

throughout the republic with great pomp and ceremony and special representatives of foreign nations gathered in the capital to lend dignity to the occasion. But scarcely had the month of national rejoicing ended when political unrest began to show renewed activity. Francisco I. Madero, who had presented himself as a candidate for the presidency in opposition to Díaz and had been arrested on the charge of sedition and finally released from prison and ordered to leave the country after the elections had been held, furnished the necessary leader to the Liberals in the United States and their many sympathizers in Mexico. The active revolutionary propaganda already begun was intensified, and agents of the insurgent party spread their doctrines throughout Mexico and induced uprisings in Vera Cruz, Puebla, Chihuahua, Durango and other cities and towns of the republic; and, as Medero crossed the border to head the insurgents, similar outbreaks took place south of Mexico City, while revolutionary bands gathered in force in the north near Torreón, Gómez Palacio and Parral. The inauguration of Díaz as President (1 Dec. 1910) increased the revolutionary centres and quickened their activities, thus compelling the government to weaken its strength by distributing its forces over a large and constantly increasing area of territory. Radical changes were effected in the Díaz Cabinet and attempts were made to meet the demands of the revolutionists, as American troops were ordered concentrated along the Mexican border; for this move was taken in Mexico to mean a threat of intervention. The government offered to enter into peace negotiations with the insurgents, but attempts made to this end proved abortive and were suspended 6 May. Juárez fell to the insurgents 10 May, and Díaz, urged to save the country from further bloodshed and the danger of intervention, resigned, 25 May, and was succeeded in office by Francisco de la Barra, Secretary of Foreign Affairs, as President *ad interim* pending an election. Two weeks later Madero entered the capital where he was enthusiastically received. So powerful was his influence that the de la Barra administration was forced to consult him in every important move made. On 15 ~~November~~ Madero was unanimously elected President of Mexico; but scarcely had he assumed office when opposition began to develop and revolutionary intrigue to show itself within his own party. Zapata revolted in Morelos and Gen. Bernardo Reyes attempted an unsuccessful insurrection. Gen. Pascual Orozco, one of the foremost revolutionary leaders, rebelled and captured Juárez 12 Feb. 1912. Gen. Félix Díaz took Vera Cruz, but was himself captured, tried and condemned to be shot — a sentence which was commuted to confinement in the penitentiary near Mexico City. In the meantime Madero found himself unable to control those who surrounded him, to establish a stable government or to carry out the promised reforms.

General Mondragón, backed by his own troops and the students of the Military Training School at Tlapam, a suburb of the capital, rose against the government, 9 Feb. 1913, marched to the military prison and set free General Reyes, and from there to the penitentiary and liberated Gen. Félix Díaz. Practically unopposed the three generals entered the capital, where Reyes was killed in an attack on the National Palace. The revolutionists seized The Citadel, a strong fortress and ammunition depository, while the Madero forces took possession of the National Palace, Chapultepec and other points in and around the city. Both factions bombarded one another almost continuously for 10 days, when Gen. Victoriano Huerta, commander-in-chief of the government forces, brought the conflict to a dramatic close by the seizure of President Madero and Pino Suárez, the Vice-President, who were forced to resign their respective offices. Pedro Lascurain, Minister of Foreign Relations succeeded to the presidency. He appointed Huerta his minister of foreign relations and resigned in his favor. Thus, in one day Mexico had three Presidents. On the morning of 23 February Madero and Pino Suárez were murdered, presumably by agents of the Huerta government. For this act, Venustiano Carranza, governor of Coahuila, disavowed the new government and issued the Plan of Guadalupe which called for reforms in the administration, equitable taxation, extension of the educational system and the solution of the land problem (March 26). President Wilson dispatched John Lind to Mexico City as his personal representative with a view to bringing the opposing parties together; but Huerta's refusal to be eliminated as a presidential candidate and his arrest and imprisonment of 110 Congressional deputies and the forcible dissolution of Congress (10 and 11 October) made any compromise impossible. A new election held on 26 October, under pressure, resulted in the selection of Huerta as President. The new Congress, which met on 15 November, in view of a protest from Washington, declared void the election of the President and Vice-President but confirmed Huerta in the office of provisional President. The Constitutionalists determined to make no compromise with Huerta, and the war went on. Villa took Juárez 15 November; other important places fell and early in 1914 Villa captured Ojinaga, after the Federal garrison of 4,600 had retreated across the American border. Then turning southward he took Torreón in April, while Mazatlán and Tampico surrendered to the Constitutionalists in May, and Carranza set up his government in Saltillo.

Huerta found himself in constantly increasing difficulties on account of his defiance of the United States. These difficulties had culminated when sailors from the United States steamship *Dolphin* had been arrested in Tampico ~~10~~ April and marched through the city under armed guard. For this insult Admiral Mayo demanded that the Mexican government should order a salute to the American flag. This Huerta refused to concede; and President Wilson laid the matter before Congress 20 April, requesting authority to use the forces of the nation to enforce Mayo's demand. While Congress was debating this request American marines were forcibly landed in Vera Cruz to prevent the entrance at that port of a shipment of arms from the steamer *Ipiranga*. At this juncture Argentina, Brazil and Chile, known as the A B C powers, offered to serve as mediators. The offer was accepted and the diplomatic representatives of these powers at Washington met at Niagara Falls, Canada, 20

May to 24 June, without being able to find a solution for the troubled conditions in Mexico. On the day they adjourned Gonzáles took Zacatecas and, two weeks later, Obregón entered Guadalajara; and in July, San Luís Potosí, Manzanillo and several smaller places fell to the Constitutionalists. Huerta, forced to resign, 15 July, was succeeded by Francisco Carbajal, Minister of Foreign Relations, who at once entered into communication with the Constitutionalists and resigned in favor of Carranza, 13 August. Two days later Obregón took possession of the capital, where Carranza arrived on 20 Aug. 1914.

With the elimination of Huerta and the success of the Constitutionalists, bitter dissensions appeared in the heterogeneous elements composing the party. A convention of generals called to meet in Mexico City on 1 October served only to intensify the trouble and the convention was moved to Aguascalientes, where, dominated by Villa, it disallowed the claims of Carranza and elected General Gutiérrez provisional President. It was also decided to march upon Mexico City and compel Carranza to yield to the will of the Convention. In the face of this threatened danger, the latter went to Puebla and, from there, to Vera Cruz on the withdrawal of the American forces from Mexico 23 November. Zapata and Villa at once occupied the capital and Gutiérrez set up his government there (3 December). In January 1915 the Convention, disowning Gutiérrez, proceeded to govern Mexico City in its own name; but the approach of Obregón with a strong force compelled it to abandon the capital, which was occupied (28 January) by the Carranza commander, who, in turn, was forced to retreat before a Zapatista horde, 10 March. Two weeks later Villa recognized as convention provisional President Gen. Roque González Garza.

One of the dramatic incidents of the year was the siege of Naco, Sonora, by General Mayortena. Five Americans were killed and 50 or more wounded by shots coming across the border. Washington warned both the contending parties to refrain from firing into American territory. Early in January General Scott, representing the American government, and Villa held a conference at which it was agreed to withdraw the contending forces from Naco. In the meantime the Convention party was faring badly in the north. Guadalajara fell to Carranza and Villa was defeated at Celayo in March. Other disasters followed and finally Washington notified the Constitutional and Convention parties, 2 June, that unless peace was restored soon, the United States would be compelled to support some man or group of men capable of bringing order out of chaos. Meanwhile raids were being frequently made across the Texas border by bands from Mexico instigated from without Mexico by certain predatory interests, and finally, on the night of 9 March 1916, an armed band of Villistas attacked Columbus, N. M., killing eight soldiers and a number of civilians. Washington at once acted, 17 March, and sent into Mexico 12,000 troops under General Pershing with orders to take Villa dead or alive. Carranza refused a request from the American government for permission to ship, over the Northwestern Railway, supplies to Pershing's forces which were finally compelled to come to a halt at Parral, where several American soldiers were killed and others wounded in a surprise attack.

In April General Scott, chief of staff, who had been sent to the Mexican border to report to Washington on the situation, held a conference with General Funston, commander of the American forces on the frontier, and General Obregón, Mexican Minister of War. The latter insisted on the withdrawal of the American punitive expedition from Mexico, and this was conditionally agreed to, 2 May. Carranza, charging the American government with bad faith and asserting that the presence of United States troops in Mexico proved a constant source of irritation and weakened the hands of the Mexican authorities, refused to ratify the agreement. Washington replied by reviewing the course of events in Mexico and charging that the Mexican government apparently did not wish to see the border raiders captured. On 18 June the American militia was ordered to the Mexican border two days after General Treviño had been enjoined by Carranza to prevent the movement of the Pershing expedition in any direction except homeward and to oppose the entrance of further American troops into Mexico. In pursuance of this order an American force of some 90 troopers was attacked at Carrizal and a number of officers and troopers killed and 17 taken prisoners. On a peremptory demand from Washington the latter were released, 22 June 1916. Carranza began to show a more friendly front, and proposed the naming of commissioners by the American and Mexican governments to consider the issue between them, 12 July. This proposition was accepted and Luis Cabrera, Minister of Finance, Ignacio Bonillas, Minister of Communications and Alberto Pani, head of the National Railways, representing Mexico, met in New London, Conn., with Franklin K. Lane, Secretary of the Interior, Judge George Gray and Dr. J. R. Mott. After many subjects had been discussed Carranza declined to approve any form of agreement, and finally the troops of the United States were withdrawn from Mexico without having accomplished any definite result.

A constituent assembly whose members were chosen at elections supervised by the Carranza army met at Querétaro. That assembly made radical changes in the constitution of 1857 which were promulgated on 5 Feb. 1917 and went into operation 1 May 1917. This provided for the democratization of the Judiciary, free justice without court costs, and created a labor code providing for a minimum wage, compulsory profit-sharing, a free employment bureau and protection against trusts. It also provided for confiscation by the government of churches, schools and hospitals in the possession of religious bodies; and that all clergy be native born. A congress was elected and began its sessions on 15 April 1917, on which occasion President Carranza declared that the nation would continue to be neutral in the European conflict. During the European War many Germans fled from the United States to Mexico, and these were accused of fomenting trouble for the Entente. General charges were made in the United States and in Britain usually by capitalists interested in Mexican mines or their agents, that Mexico, notwith-

standing her proclaimed neutrality, was secretly encouraging the Germans. However, the connection of the Mexican government, if it ever existed, with this movement, has never been proved. From 1917 to 1919 there was friction between the Mexican government and the foreigners resident in the country over taxes and restrictions placed on mining and oil properties in the Republic, both of which national assets the government rightly aims at nationalizing and protecting from exploitation by predatory foreign corporations. In 1916 the national currency was rehabilitated so as to give it a recognized and regular standard of valuation. In 1919 President Carranza issued a public statement that, in conformity with the provision of the constitution which prohibits re-election for second term of the chief official of the Republic, he would not again be a presidential candidate.

18. DIPLOMATIC RELATIONS OF THE UNITED STATES WITH MEXICO. Early relations were largely determined first by the Mississippi question and later by the failure to define the western limits of Louisiana in the treaty of 1803 and consequent friction with Spain after 1805.

The American government viewed with sympathy the Mexican revolutions, beginning in 1810, and later accorded belligerent rights to the revolutionary government which was aided by filibustering expeditions from the United States; but it endeavored to maintain neutrality until 1822 when, after the final ratification of the Florida Treaty with Spain, it recognized Mexico as an independent state whose government promptly opened Texas to American immigration.

At the close of 1822 José M. Zozaya was accredited first Mexican Minister at Washington, but the real beginning of the Mexican legation dates from the arrival of Pablo Obregon in November 1824. In March 1825, the American government sent Joel R. Poinsett as Minister to Mexico to recover the prestige lost by delay, but his methods aroused increasing distrust and suspicion which postponed the completion of treaty negotiations and finally led to his recall. After successfully opposing the plans of Mexico to unite with Colombia for the liberation of Cuba, he negotiated a Treaty of Commerce of July 1826 and another treaty of February 1828, both of which failed in the Mexican Congress after ratification by the American Senate. He hastily concluded a Boundary Treaty of January 1828 which was lost by delay in the Mexican Congress, but was revived in 1832 and ratified following the ratification of the new Treaty of Amity and Commerce negotiated in April 1831 by Anthony Butler, the successor to Poinsett.

Meantime there arose new sources of friction which produced strained relations after 1829, temporary severance of relations in 1836 and finally (a decade later) resulted in war. In Texas, which the United States unsuccessfully attempted to purchase in 1825, 1827 and 1829, internal troubles arising from differences between the Mexican government and the American colonists, and increasing after the Mexican attempt to prohibit American immigration in 1829 and the Mexican establishment of military posts in 1831, finally resulted in a successful revolution of 1835, in which many Americans participated and also in the American recognition (in 1837) of Texan independence — which, together with other grievances, aroused the hostility of Mexico. Relations temporarily severed in 1836 were again seriously threatened in 1837 by the withdrawal of the Mexican Minister who was not replaced by a successor at Washington until 1842. In 1835 President Jackson, renewing proposals to Mexico for purchase of Texas, authorized negotiations for a boundary on the parallel of 37° westward from the Rio Grande to the Pacific, but in 1837 he declined Texan offers of annexation.

Relations were also endangered by Amer-

ican claims (against Mexico) which in 1837 brought the American government to the verge of reprisals by force. Attempts at adjustment were made by the Convention of 1838 which was not ratified by the American government, and by another Convention which was ratified by both parties in April 1839 and made effective by acts of Congress approved on 12 June 1840 and on 1 Sept. 1841. These claims, allowed by a commission under the Convention of 1839 and a later Convention of 1843, were only partially paid, and later negotiations for another Convention were prevented by war.

Following the American annexation of Texas by joint resolution in March 1845 (after failure of the Senate to ratify an American-Texan Treaty of Annexation), Mexico again severed relations and later refused to receive John Slidell whom President Polk sent to Mexico to re-establish relations and to negotiate for adjustment of claims and for the annexation of California which was the chief aim of his Mexican policy. Finally, in the rich pasture lands of the border territory in dispute between the Rio Grande and the Nueces, the clash of rival military forces precipitated war, recognized as existing by declaration of the American Congress in May 1846.

Peace negotiations following the war were begun by the American government in April 1847 after important victories at Buena Vista and Vera Cruz. Nicholas P. Trist was sent as confidential agent with instructions similar to those of Slidell and with full powers to conclude a treaty of peace at a propitious moment. In November 1847, however, he received instructions to return. Unexpectedly detained, he finally determined to remain; and without the authority of his government, he negotiated the Treaty of Guadalupe Hidalgo of 2 Feb. 1848, by which the Mexican government ceded New Mexico and Upper California for $15,000,000 and the American assumption of all American claims against Mexico. This treaty, including all Polk's *sine qua non* except the right of transit over Tehuantepec (which had become less important by the recent acquisition of rights over a better route by the Treaty with New Granada), on its arrival at Washington was hastily accepted by Polk, who, although he refused to pay the salary of the "impudent" clerk, was anxious for peace.

For over a quarter-century after 1848, relations were disturbed by border turbulence, filibustering expeditions, Mexican internal troubles, questions of new claims and of protection of transit routes and apprehension of European designs or of foreign intervention.

In compliance with a demand for additional territory, James Gadsden concluded with Mexico a Treaty of 30 Dec. 1853, by which the United States for $10,000,000 obtained south of the Gila River a strip of territory including the Mesilla Valley, and also a right of transit across the Isthmus of Tehuantepec where conflicting interests complicated later negotiations and relations.

The Mexican problem, which thrice had been adjusted by change of boundaries, still persisted after the Gadsden Purchase. Complicated with Southern interests, and largely under the influence of Southern statesmen, the remedy most persistently proposed for its solution, in connection with an American transit route across Mexico, was an additional reduction of Mexican territory by a new cession to the United States, or, if that should fail, the establishment of an American protectorate which was expected in time to result in new annexations to the stronger country. The problem, only partially solved by the Pierce administration, was inherited by the Buchanan administration, which continued to negotiate — first, for the acquisition of additional Mexican territory and territorial concessions as long as there was any hope of success, and later for territorial concessions and alliance and direct intervention (to enforce treaty stipulations) until the secession of the Southern States precipitated the beginning of the American Civil War and thereby increased the possibility and probability of the long-predicted intervention of European powers in Mexico, and exposed Mexican territory to the possible designs of Confederate filibusters.

The sequel to the story of persistent negotiations, which terminated in an unratified treaty, may be found in the Confederate policy to form an alliance with Mexico or to absorb it, the French policy of intervention in Mexico, and the American policy under Seward to prevent the execution of both Confederate and French policies and to preserve the integrity and independence of Mexico.

Through the entire period of the Civil War the American government consistently maintained cordial relations with the constitutional Juarez government. In 1861 it obtained through Mr. Corwin a Treaty of Extradition of Criminals and Fugitives from Justice. To guard against the extinction of the Mexican Republic or the danger of European intervention, it authorized the negotiation of a treaty obligating the United States to pay the interest on the Mexican funded debt for five years and to take for security a mortgage or pledge on the public lands and mineral rights of northern Mexico (Lower California, Chihuahua, Sonora and Sinaloa). This plan, however, did not meet the approval of France and England and was also opposed at Washington by senators who feared it might result in annexation.

Against the French invasion and occupation of Mexico and the establishment of the Maximilian government, which was regarded inimical to republic institutions in America, the government at Washington promptly protested and issued discreet warnings. Later it demanded withdrawal of French forces from Mexico, resulting in the fall of Maximilian in 1867 and the restoration of the republican form of government.

The United States concluded with Mexico in 1868, a naturalization convention regulating citizenship of emigrants and a claims commission convention for adjustment of mutual claims. Under the latter a commission was duly organized at Washington 31 July 1869. Its powers were extended by convention of 19 April 1871 and again by a convention of 27 Nov. 1872. A mutual arbitration provided by the treaty gave a balance of about $4,250,000 to American citizens. The famous Pious Fund Case (q.v.), first presented for adjustment to the Mexican Claims Convention in 1870, became a source of a new difference which was finally settled under a protocol of 1902 submitting it to the Permanent Court of The Hague.

For a decade after the withdrawal of the French, Mexico was disturbed by domestic contentions attended with serious border lawlessness which at times impaired good relations and gave rise to troublesome questions and difficulties reaching an acute stage after November 1876, when the constitutional order of Mexico, which the United States had continually recognized for 17 years (since 1859), was overthrown by the successful military revolution of Gen. Porfirio Diaz. The cattle raids from Tamaulipas on the Lower Rio Grande, which had caused trouble since 1848 and had become prominent in the remarkable incident known as the Cortina war in 1859–60, but had declined during the Civil War, were renewed at the close of the campaign against Maximilian, and culminated in the Corpus Christi Raid of 1875 which attracted the attention of the American government to the precarious position of Americans along the border. These raids and depredations were intimately connected with the collateral question of the condition of the free zone along the Mexican side of the Rio Grande and the subject of extradition. Meantime the American government continued a temporizing neglectful policy, but, in 1875, it sent additional troops to the border and finally on 1 June 1877, authorized Federal forces to cross the border in hot pursuit.

The dangerous breach in relations of amity was for a time widened by the delay of the American government under President Hayes to recognize the government of Diaz. Finally the American Minister (John W. Foster), who had advised against the withholding of recognition, received authority by which he promptly placed himself in official relations with the Diaz government on 11 April 1878, nearly a year after it had been recognized by the other powers. Meanwhile, in December 1877, the House of Representatives adopted resolutions looking toward a consideration of the best means of removing the existing and impending causes of difference and of confirming and enlarging commercial relations.

The friendly feeling manifested following recognition of Diaz was of brief duration. Negotiations, which encountered delays, were rendered more difficult by complications resulting from new revolutions and disorders. American forces again crossed the border in hot pursuit of marauders in the spring and summer of 1878. Diaz, induced by Mexican clamor, demanded the withdrawal of the American order for crossing the border. This the administration at Washington declined to do. By October 1878 the situation threatened to result in war. Finally, with the establishment of orderly conditions by co-operative action in 1879, the American government in 1880 withdrew the order for crossing the border.

At the same time by the steady growth of centralized power in Mexico, relations had become increasingly friendly. The danger from Mexican internal disorders had largely disappeared in 1880, when Diaz retired and acquiesced in the election of his lieutenant whom he succeeded by re-election four years later. Border conditions rapidly improved. A reciprocity treaty was signed in 1882 and troublesome questions of the "free zone" and extradition were considered in a friendly spirit. A partial relief from the continuation of border lawlessness was sought in 1882 in the agreement (later renewed yearly for several years) providing for crossing the border by armed forces of either country in pursuit of Indians, and by a convention for the establishment of the international boundary by suitable commissions of survey.

Steady improvement in relations was also greatly aided by extension of railway communication to the frontier by 1881, and to the interior of Mexico by 1883–84, by American capital and also by connecting the telegraph systems of the two countries through the completion of a submarine cable in March 1881. The establishment and multiplication of international railway communications, revolutionizing commercial conditions, largely supplanted the need of reciprocity treaties which, although negotiated in 1882 and 1891, were defeated in the American Congress.

Relations continued to improve in mutual friendliness, although public opinion in Mexico was divided between a policy of isolation and a policy of closer intercourse and concessions for industrial enterprises. In pursuance of the latter policy, the Mexican government by 1889 modified the old Mexican land laws and gave to American citizens liberal railroad, mineral and other grants.

A better understanding followed the establishment of an international water boundary commission in 1889 and the remarking of the southwestern boundary westward from El Paso in 1891–96, as defined by the Treaty of 1848. An unsatisfactory effort was made in 1895 to remedy the abuse of the Mexican free zone by smugglers. In 1896 a copyright treaty was negotiated and in 1899 an extradition treaty (supplemented in 1902). In 1895, through the good offices of the United States, Mexico concluded with Guatemala an arbitration convention for settlement of a long-standing boundary dispute. In 1900 the Mexican Congress appropriated $30,000 for sufferers in the Galveston disaster.

The better understanding was indicated by the reference of the famous Pious Fund controversy to arbitration by The Hague Court (1902), the adjustment of boundary difficulties arising from the shifting of the Rio Grande and Colorado rivers, the negotiation of a convention (of May 1906) for the equitable distribution of the waters of the Rio Grande for irrigation purposes and the negotiation of an arbitration treaty in 1908. It was especially illustrated by the Americo-Mexican co-operation in 1907 in plans tactfully initiated by the United States to maintain order in Central America.

The growing intimacy of relations during the long presidency of Diaz, indicated by many international agreements, culminated in a general treaty of arbitration and the meeting of Taft and Diaz in 1910.

Relations again became strained after 1911 in connection with the collapse of the Diaz government and by conditions of the Maderista revolution, both in Mexico and along the border, which were a source of much concern to the United States.

The American government under President Taft, although it mobilized troops on the frontier, declined to intervene and with difficulty maintained neutrality — both before and after

it recognized the new government of Madero, which was finally overthrown in February 1913 by Felix Diaz and General Huerta. In 1912 the rumor of Japanese plans to secure a harbor at Magdalena Bay caused the Senate to pass an opposing resolution which, however, was not accepted by President Taft.

Under President Wilson's new policy of using non-recognition as a means of discouraging the establishment of governments based on force and violence, the American government refused to recognize Huerta, unsuccessfully urged an early free election in Mexico, warned Americans to leave that country and vigorously demanded both the *de facto* government of Huerta and insurrectionists to respect lives and property of Americans.

In April 1914, after a series of irritations and insults it sought reparation by a naval and military force which occupied Vera Cruz; but, with certain restrictions, it promptly accepted friendly mediation of the A B C powers of South America (Argentine, Brazil and Chile) which in May 1914 considered plans for settlement of the internal and external difficulties of Mexico.

Finally, after the failure of an appeal (by a Latin-American conference at Washington) to the rival factions to settle their differences, the American government, on 19 Oct. 1915, recognized the Carranza government as the *de facto* government of Mexico.

In March 1916 a new trouble arose from an attack of Villistas on the American town of Columbus, N. Mex., instigating the American government to send a punitive American force under General Pershing into Mexico in hot pursuit. Carranza protested and insisted upon withdrawal while the United States, refusing to recede from a settled determination to maintain its national right and its duty to remove the peril, called 150,000 militia to the border. The situation during a period of negotiations was complicated by a new raid of Mexican bandits into Texas. An encounter with Mexican troops, resulting in casualties on both sides and capture of 17 Americans as prisoners, threatened to produce a final crisis which was averted only by Mexican acquiescence in the American demand for immediate release of the prisoners. The strain of the situation continued until complications were solved by agreement upon a joint commission of six members, who, however, could not reach an acceptable plan of action. Early in 1917, the American government, after gradually withdrawing American troops, sent an ambassador to the Mexican government of Carranza under whose auspices preparations for better conditions were begun by the adoption of a new national Constitution.

Later relations were affected by conditions relating to the World War. In February 1917 when the American government was becoming more determined in its resistance to Germany's piratical acts against American rights upon the seas, Mexico proposed to neutrals to invite the European belligerents to terminate the conflict, or, in case of failure, to reduce the conflagration by refusing any kind of implements and by suspending commercial relations. In reply the American government, declining the proposal, exposed a recently discovered plot of the German government to induce Mexico to negotiate an alliance with Japan for war against the United States by offering Mexico as the price of her co-operation with Germany the recovery of territory ceded to the United States in 1848. Although the Mexican government denied any participation in the plot, German influence in Mexico continued inimical to the United States.

MEXICO, a state of the United States of Mexico, in the southeast; bounded by the state of Hidalgo on the north, on the east by Tlaxcala and Puebla, on the south by Morelos and Guerrero, and on the west by Michoacan and Queretaro. Adjoining the state of Morelos is the federal district enclosed by the state of Mexico but outside of its jurisdiction. The area of the state of Mexico is 9,247 square miles and its population about 1,000,900. The capital is Toluca. Several railroads traverse the state and centre in Mexico City.

MEXICO, Mo., city, county-seat of Audrain County, on Salt River and on the Wabash, the Chicago and Alton and the Burlington railroads; about 115 miles northwest of Saint Louis. Mexico was settled in 1833 and in 1857 was incorporated. It is in an agricultural section, the chief products of which are wheat and corn. The manufactures are dressed marble, flour, shoes, cigars, stove lining, fire-brick products. Mexico is the centre of the saddle-horse producing section of the West. It leads also in mules and livestock and has recently completed 18 miles of electric railway north to Santa Fé, Mo. Corn, wheat and blue grass are principal products. Mexico is the seat of the Missouri Military Academy and of the Hardin College for Women, founded in 1873. The charter under which the government is administered was granted in 1893, and provides for a mayor who holds office two years, and a council. Pop. 5,939.
