pose of covering up the real transaction, which was nothing else than a bargain and sale. Marriage by purchase was evolved, almost inevitably, from marriage by capture; the prospective husband paid a price to the family of the prospective wife for the privilege of carrying her off. Sometimes the abduction preceded the payment of the purchase price, the latter being disguised as a fine subsequently amerced to atone the "offense." In some instances, as under the early Roman law, the woman was adopted; she came under the fatherly power of the husband and, theoretically, became his daughter. In other times and places marriage was frankly a sale. In all cases the wife became the property of her husband and, at the worst, she was his drudge or slave. The tutelage, which was exercised over a woman throughout her life (even after her marriage) by the males of the family in which she was born, was intended to be protective of her honor and that of her family, as well as of her share of the patrimony of family property. An instance in point is the Levitical law, which permitted the father of a bride, put aside by her husband on charge of unchastity, to proceed against the accuser, and, the accusation being disproved, compelled the offender to expiate the wrong by keeping the woman as his wife all the days of his life. The actual condition of the wife was not as hard as might be implied from her legal status, or lack of legal status. The injunction to obey the father is coupled with the injunction to honor the mother. In the great Oriental monarchies of antiquity marriages were undisguisedly commercial transactions; the bought wife of a citizen of Babylon, however, was the manager of her husband's house and she was habitually consulted in serious matters of business. She was conferred with even in affairs of state if her husband happened to be a public official. A free woman, though married, might occupy a public position and hold separate property. Primitive communities do not clearly distinguish between custom and law or religion and morals; but in course of time a strictly religious form of marriage might be substituted for contractual marriage in any given community. The contractual or purchase marriage itself has a tendency to become symbolical and dramatic. The pledge given by the wooer to bind the bargain might originally have been a cow (domestic animals were real money, cattle or chattels and *pecunias* were words of identical meaning). This was later on represented by a gift to the bride — a bracelet, jewel or other token. The "giving in marriage," i.e., the consummation of the sale of the woman, would be accompanied by conventional words and gestures, dancing and music. Sometimes a wooer made payment in personal services, as Jacob tended father Laban's sheep seven years for Rachel; and in this, as in other cases without number, the marriage was a matter of mutual inclination. The bride usually received from her father a dowry or *dos*, which passed to the husband and remained under his control during the continuance of the conjugal relation. Among the Jews and Oriental nations in general marriages were terminable by divorce at the will of the husband. Among the Romans they were terminable at the will of the wife's father or by mutual consent of the parties. In either case the bride's dowry was returned. The remarriage of widows was not forbidden, but was disfavored. Under the Babylonian law the consent of the courts had to be obtained and provision made for the care of the children and household of the deceased husband. Monogamy and polygamy often existed side by side, even in highly developed human societies. Of the two great cultural races, the Semites have given distinct legal sanction to plurality of wives. Polygamy was practised by the Hebrews in the patriarchial stage, though the practice fell into abeyance in later times. Aryan institutions seem to be based on monogamous marriages. For obvious reasons monogamy must be the usual state in all communities, whatever may be the law. Relatively few members of a community have the power to gain or the ability to maintain more than one wife. While a man individually might capture a woman of a hostile tribe and make her his lawful wife, captives of war became slaves. Among Oriental nations the children born to free men of their slave women or "hand maidens" were considered legitimate and free. Among the theoretically monogamous Aryans the opposite was the prevalent rule.

The marriage by appropriation and the resulting guardianship — or, more plainly speaking, ownership — of the wife by the husband, does not comport with the sociological thesis that the institution of the patriarchate was preceded by the matriarchate as a form of family organization. The practice of polyandry is rare, even among savages, and where it is observed among people of culturally higher stage it indicates degeneracy more probably than primitiveness. In Tibet polyandry is evidently an outgrowth of the group marriage — the marriage of all the daughters of one family as a group with all the sons of another family. The plural husbands of polyandrous Tibetan women are invariably brothers. A rather frequent form of primitive marriage is that where the husband is adopted into the tribe of the wife. That in such case the patriarchal authority would be less pronounced than otherwise is not evident, however. The male adopted into a tribe would assume the tribal name and be on the same footing with the males born therein. Within a clan blood kinship is traced through females; but it is not necessary to presume the matriarchate as an antecedent social order to account for this. The maternity of a child is determinable with so much greater certitude than its paternity that the tracing of kinship through the mother would commend itself for its convenience. Moreover, in those clans where this method of reckoning is customary the family and tribal organization is invariably patriarchal. Practically without exception the nations which have become the leaders in culture have erected their social structure on a basis of monandrous marriages and agnatic kinship. The wife is taken into the husband's *gens*, clan or house, and her children become members thereof and are given the family name of their father. In the matter of inheritances cognizance was usually taken only of relationship in the male line. A daughter might inherit from her father, but if she died before he did her children would take nothing by

representation; hence the importance of the *dos* or marriage settlement. By neither the Roman nor Teutonic rule of consanguinity was a man's sister's husband of kin to him and the suggestion of a prohibited degree of relationship between himself and a deceased wife's sister would have sounded queer to Cæsar or Cicero. The Levitical law took more account of blood relationship through females and made even a man's stepmother his cognate in blood. Stepbrothers and stepsisters could not intermarry, though they had no parent in common. It also forbade marital communion between certain other persons whose affinity was merely legal — as between a man and his uncle's widow or with his daughter-in-law. It forbade marriages of near relations to the third degree of blood kinship on either the maternal or paternal side — and this rule has prevailed throughout the Christian world. According to the Levitical law a man should not bring his sister-in-law into his house as a rival to his wife, but there was no prohibition with a deceased wife's sister and a man was expected to be a husband to the childless widow of his brother.

In the earlier period of their history the Romans recognized three kinds of formal marriage. The religious form, *confarreatio,* or "marriage with the bread-offering," had to be solemnized by the Pontifex Maximus in the presence of 10 witnesses and was reserved to themselves by the old patrician families. Among the plebians espousals took the form of a purchase, *coemptio,* which is defined by Gaius as a mutual mock sale of the parties, whereby the wife was freed from *tutela legitima* and *sacris familiæ* — tutelage to her male relatives and contributions for the maintenance of certain religious rites in her husband's household. The third form, *usus,* though held in little respect in the earlier period, ultimately became prevalent in all social ranks. Either by confarreation or coemption the woman given in marriage passed *in manum viri,* literally into the hands of the man, her husband, who acquired rights over the person and property of his wife greater, on the whole, than have been, or are, conferred by any modern system of law. He controlled her *dos* and other possessions absolutely during his life and continued his wardship after his death through guardians appointed in his will. The *usus* ripened into a perfect matrimonial bond only by prescription and after continued cohabitation for an entire year. In the meanwhile the husband's marital despotism was in abeyance. By simply absenting herself from the matrimonial domicile for one day in each year the *usus* wife could indefinitely postpone and defeat the acquirement of tutelary and possessory rights by the husband. On the other hand, the later law reduced the tutelage of the male kin over the women of their family to a mere formality. By contracting a usus marriage, therefore, the women of Rome were enabled to evade both the paternal and matrimonial tyranny, under which they had been placed by the earlier law. In fact, at the most splendid period of Roman greatness married women enjoyed a freedom with respect to their persons and property such as they have not enjoyed anywhere since then. Most important of all was the establishment of the principle that marriage rested upon the consent of the parties — *concensus, non concubitas, fecit nuptias* — and might, therefore, be dissolved at the pleasure of either party. While the marital union was admitted to involve a sharing of all for life — *consortium omnis vitæ* — this was declared to mean a voluntary, not a forced, partnership. To hinder a separation when a consensus had ceased to exist was regarded *contra bonos mores,* in plain English, "immoral."

Early Teutonic marriage law did not differ greatly in fundamentals from that of Rome. Though disguised by ceremonials the transaction was essentially a barter. In the original and crudest form the custom was to give the father so much for his daughter, the price being fixed in accordance with the wealth and rank of the families participating in the treaty. The contract was made handfast, just like any other bargain, by a pledge or part payment. In progress of time this pledge, *vadium,* took the form of an ornament of more or less value presented to the bride at the betrothal — in modern practice an engagement ring. In time also the *arrha* (purchase money) became a gift to the bride instead of a payment to her father, though the latter retained it in trust for his daughter. The payment of the marriage settlement — and this the *arrha* was in effect — might be postponed during the lifetime of the husband, on his giving security for the transfer of an equivalent out of his estate to his widow. The purchase price for the bride thus became dower in form as it had always been in essence and in intent. Some early Teutonic laws distinctly sanctioned the "robber-marriage," which was nothing more than an abduction, or, the bride being willing, was simply an elopment. The penalty the abductor was required to pay to the outraged father was usually identical in amount with the prescribed amount of the settlement or dower in the more orderly form of wedding — indicating that barter marriage and robber marriage stood on about an equal footing of respectability. The Teutonic maiden when given in marriage was usually provided with an outfit for housekeeping and a dowry. Possibly an abducted bride would receive neither, which may be the reason why abductions were sometimes accomplished by connivance of the bride's family. In modern days elopments are often similarly motivated. There is nothing new under the sun, even in marriages. Betrothals in a regularly arranged ancient Teutonic marriage were attended by festivities on a scale comparable with those attending the wedding itself. Indeed, some investigators of primitive law insist that the troth-plighting was not a mere promise to marry but was, in verity, the contract of marriage. The giving of a pledge (*vadium*) to bind the bargain would indicate to a person exercising ordinary common sense that the betrothal was no more than an executory contract. It created an obligation to wed but did not actually establish a marital relation. The disputations on the subject have the appearance of mere quibblings with words. To be sure, if one buys a thing to be delivered to-morrow and pays part of the price, a sale has doubtless taken place. Of course, a delivery is necessary to complete the transaction; and, if the thing purchased be a cow, it might be said that she is not under complete dominion

of the new owner until he has put her into his stable and locked the door. Possibly some such mental kinks is responsible for the suggestion of other investigators of ancient Teutonic customs that *concubitus* was a legal essential to the consummation of a marriage. Be that as it may, the idea of a threefold stage in the process of acquiring a wife — the troth-plighting, the wedding and the consummation — has persisted in legal phraseology and has colored even very modern legal conceptions. Early Teutonic law permitted a husband to put aside his wife for adultery or barrenness, and it seems to have countenanced dissolution of the matrimonial bond by mutual consent.

From the very outset Christianity set its face against the looseness of the later Roman law respecting marriage. The legislation of the Christian emperors shows a reaction against the extremely liberal doctrines of the Antonine jurisconsults. The prevalent state of public opinion explains why, in the fusion of patriarchal practices, Roman jurisprudence and barbaric usages, so many retrogressive customs of the latter respecting the position of women should have found their way into the new alloy. The principles of the Roman law prevailed in so far that unmarried women were relieved of bondage to the family after attaining their majority. But the position of married women became fixed in barbaric archaisms and the husband drew to himself all the powers that had belonged to the wife's male kindred. The Church declared marriage to be a sacrament and the consequence was the enunciation of the doctrine of the indissolubility of the matrimonial union except by death. Through the decretals, through its influence on the customary law in the matter of dower and through the assumption of jurisdiction by the ecclesiastical courts over matrimonial questions, the Church established a universal marriage law throughout the Christian world. The canonists accepted the principle of the Roman law that the consent of the parties is essential to the making of a legal contract of marriage, just as it is to the making of any other contract. The lack of free consent, because of a material error in fact or because of physical or moral duress, or because of natural or legal incapacity of one or both of the parties (impotency, insanity or minority) were declared insuperable impediments to the execution of the contract, and grounds for its annulment if executed. From the Roman law also the canonists carried over into their system the age of consent — 14 for males and 12 for females — but they rejected the requirement of parental consent. In seeming contradiction to this, the father still "gives away" the bride in the marriage service. The Roman idea, that betrothal (*sponsalia*) was merely a promise to marry, was modified under the influence of Teutonic usage, by which the troth-plight was considered to have created the relation of husband and wife. Ultimately the canonical law made a distinction between *sponsalia de futuro* and *sponsalia de præsenti*. The former was declared a mere promise; but a present agreement (*accipio*) was held to constitute a valid marriage. Such a marriage if not consummated was dissoluble, however, either by a vow of celibacy taken by one of the parties, or by special dispensation. The troth-plighting in the marriage service and the wedding of the bride with a ring may be reminiscences of the Teutonic hand-fasting and the payment of the *vadium* or pledge, while the marriage settlement looks very much like a modern variation of the transfer to the bride of the *arrha*. Formidable impediments to marriages within the family, even between very distant relations, were created by the canons of consanguinity and affinity. The degrees of kinship were measured from the common male or female ancestor downward in collateral lines of descent. Each successive generation being but one degree further removed from the source of the blood, persons might stand in close relation to each other, though wide apart collaterally. Second cousins, for instance, were akin in the third degree by the canon, though the Levitical and Roman law would both place them in the seventh degree. The earlier Church canon forbade intermarriage down to the seventh degree, so that sixth cousins could not enter into matrimonial relations with one another. In the later Church law the prohibition ended with the third degree canonical, or with second cousins. Relations by affinity or marriage were laid under similar disabilities as blood relations. Sisters-in-law and brothers-in-law were as incapable of contracting marriages as natural brothers and sisters; likewise the children of husbands and wives by former marriages. These prohibitions conform to a sense of delicacy and they accord with a not unreasonable interpretation of the Levitical canon. But a reason for tracing relationship of any person to an uncle by marriage and to his children by a former wife and these children's children is hard to discover. Nevertheless, these canonical restrictions were not without salutary effect. The practice of intermarriage between kindred, in order to keep property within the family, had become prevalent not only among the nobility but in all ranks. Near relationship in blood or by marriage might exist among the entire population of a small commune, and such cases were not exceptional under conditions of life that did not encourage travel or changes of habitation. By compelling men and women to seek mates outside their own little circle, the Church set a wholesome limit to inbreeding. The habitual shifting of population and the great freedom of locomotion in modern times have made the extreme restrictions of the canon law quite dispensable. The Reformation produced important changes in the law of marriage. The Council of Trent pronounced clandestine marriages of minors to be nullities and required the presence of two witnesses in all cases. The Protestant ecclesiastical law denied the indissolubility of the matrimonial bond and regarded all betrothals as, presumably, *sponsalia de præsenti*. The words, "I will," Luther remarked, did not, in the Teutonic language, express a future intention but a present purpose; unless qualified so as to introduce an element of uncertainty any promise to marry, followed by cohabitation, was to be considered a valid marriage. Indeed, cohabitation in conjugal relation was quite generally regarded presumptive evidence of a marriage *per verba de præsenti*, though the presumption was not conclusive. By acts of Parliament passed in the second half of the 18th and the first part of the 19th centuries,

church weddings were required in all cases and all marriages not thus celebrated were declared void. Informal marriages, however, were still good in Scotland; and this circumstance explains how Gretna Green became a Mecca for runaway lovers. The statute of George II also made the parent's or guardian's consent essential to a valid marriage; but this requirement was rescinded later on. A statute of Henry VIII had adopted the Levitical canon as the rule for reckoning degrees of consanguinity in England. This permitted marriages between first cousins and persons of more distant relationship in blood, and it abolished, or was intended to abolish, all disabilities growing out of affinity or relationship by marriage. The Church of England, however, continued to the last in opposition to marriage with a deceased wife's sister, and still insists upon the indissolubility of the matrimonial bond except by the death of one of the parties.

In the eye of the modern law marriage is primarily a civil relation. Most of the European codes and, with one or two exceptions, even those of Catholic countries, make a civil marriage and the registration thereof in the public records indispensable. A religious ceremony may follow at the option of the contractants, but is not legally essential. A relation established by the civil authority can, of course, be dissolved by the same authority. Adherence to the doctrine of the sacramental character of marriage has become a matter of conscience; the law will not force obedience to the same. The modern law has generally raised the age of consent and has made the consent of parents or guardians necessary to the validity of the marriages of minors. All marriages must be publicly contracted. In England the requisite publicity may be obtained either in accordance with the rites of the Established Church or other religious denomination, or in accord with the rules made by the public registrar or by statute. Betrothal almost everywhere is now considered merely a promise to marry, and actions to recover damages for a breach of the promise are permitted in only a few countries. The dissolution of marriages by consent of the parties is, generally speaking, disallowed, but almost everywhere divorces may be obtained by process of law — in Austria only between non-Catholics. The powers of married women to deal with property vary considerably. In some of the French provinces the pre-Revolutionary *coutumes* gave to married women, below the rank of nobility, nearly all the independence which Roman jurisprudence in its final stages had allowed them. These local customs together with parts of the Roman law became the basis of corresponding provisions of the Code Napoleon and through the latter and to some extent the Spanish law have affected the law of Louisiana and a few other States of the Union. Husband and wife by this law acquired no general interest in each other's property on marriage. The only property the wife brought into the matrimonial pot was her *dot*, or dowry, which is in the nature of a wedding gift from her family. While the husband did not become the owner of the *dot*, he had the use of the same during the continuance of the marriage. The husband could even sue the wife if she hindered him in the enjoyment of the usufruct thereof. Every species of property owned by the wife at the time of marriage or subsequent thereto could become the subject of a dotal gift. The most interesting disposition of property permitted to husbands and wives, however, was the creation of a *communio bonorum*. The principle of the *communio bonorum* is that husband and wife shall have no property apart from one another. All that either of them owned at the time of, or before, their marriage, and all that either or both together acquired while living in the marital relation, was included in the communal property. As in the case of a partnership in business, the community property could not be made answerable for the individual obligations of the parties to a *communio bonorum* until all joint obligations had been satisfied out of the same. The husband became the managing partner or curator, however; the wife is excluded from every case in which her acts cannot be referred to an express or implied authority of the husband. The latter incurs all debts or charges for the community. The community ceases on termination of the marriage relation either by agreement, divorce or death; in the latter event the rights of the survivor are fixed by law. The *communio bonorum* is a form of marital partnership recognized not only in Louisiana, but in Texas, Florida, Missouri, California and other States carved out of territory once in French or Spanish possession. The principle has been greatly modified under influence of the common law and the modern statutes respecting the separate property of married women. The *communio bonorum* exists by legal presumption only with respect to property acquired during marriage, or in the name of either husband and wife, including the produce of their reciprocal industry and labor. The presumption may be rebutted by proof that any property so acquired was intended to be acquired as separate estate. Separate property brought into the marriage by either party forms no part of the community, except by express agreement; nor does property acquired after marriage by gift or inheritance.

In the United States a marriage may be either religious, civil or quite informal. Civil marriage was authorized, or required, in all the New England colonies. Milton's tractate on divorce and his denunciation of ecclesiastical "meddling" with marriage had borne fruit in the Civil Marriage Ordinance of Cromwell, passed in 1653. By this ordinance obligatory celebration before a justice of the peace was instituted, and a system of lay notice, certification and record was established. The action of the Puritans and Independents in England found ready followers in America. The States-General of the United Netherlands in 1656 adopted the principle of an older law of the provinces of Holland and Friesland, which had established a permissive form of civil marriage soon after their independence of Spain was achieved, and this naturally passed over into the law administered in New Amsterdam. For years the celebration of a marriage before a clergyman, as such, was illegal. Religious marriages were sanctioned later on throughout New England, and long before the close of the colonial era the dual civil and religious system was established, which has since prevailed. The "common-law" marriage, still recognized in most of the States, is nothing more than the canonical

sponsalia de præsenti under another name. Any agreement to marry *per verba de præsenti*, which is followed by cohabitation as man and wife, constitutes a legal marriage. A presumption of marriage is raised when the parties have lived together in marital relations, have acknowledged themselves (or have been generally reputed) to be husband and wife. This presumption, of course, is not conclusive and may be rebutted. A relation, originally meretricious, will not be transformed into a marriage by a mere informal agreement. This also is in accord with the canonical law. In all the States formalities attending marriage are prescribed by statute. Licenses to marry must be obtained, and the publication of the issuing of a license gives some sort of publicity, as does the requirement of the presence of witnesses and the making of marriages matters of public record. The persons who may perform the ceremony, clergymen or civil officials, are designated. The clerk issuing the license must be satisfied, by affidavit or otherwise, that there are no legal impediments to the marriage, and, in cases of minors, the consent of parents or guardians is usually required. In most of the States, however, the statutory requirements have been held by the courts to be merely "directory" and not mandatory. Non-conformity may involve the non-conformers, and the officials and ministers concerned, in legal penalties; but the marriage is not invalidated. In Massachusetts, however, the courts have always insisted upon the observance of the statutory formalities, declaring such observance to be essential to the validity of a marriage. The Massachusetts rule has been followed in some States and in others the statutes are mandatory. For either of these reasons the "common-law" marriage may be deemed to have been abolished in California, Illinois, Kentucky, Massachusetts, Missouri, Maryland, North Carolina, Vermont and West Virginia. In New York (since 1901) non-ceremonial marriages must be evidenced by a written agreement, signed in the presence of two witnesses and acknowledged in the same manner as a conveyance. The effort to secure the adoption by the States of a uniform marriage law has, thus far, been unsuccessful, and the greatest diversity continues to exist. Moreover, the general rule, that a marriage which is legal in the place where it is established will be regarded as formally perfect everywhere, permits the parties to evade inconvenient requirements of the laws of the place of their domicile by going out of the State to make the contract. The age of consent varies in the States, ranging from 16 to 21 years for males and from 14 to 18 years for females. Where the statutes are silent the canonical prescription of a minimum of 12 years for females and 14 for males still holds good. Infant marriages are voidable at the option of parents or guardians, if contracted without their consent. When any of the essential ingredients of a contract are lacking the marriage agreement, like any other contract, is a nullity. Consent being an essential, when one party or both have insufficient mental capacity to give intelligent assent no valid marriage can result. A misunderstanding as to a vital fact will avoid the contract, but only if the mistake was of such a character that there could have been no real consent. Duress excludes volition, and there is no such thing in law as involuntary consent. Impossibility of performance avoids the contract. Impotence, meaning want of physical capacity, makes marriage a nullity; but sterility does not. The marriage of a person having a living and undivorced former spouse is a nullity. Null and void also are marriages between persons in the prohibited degrees of consanguinity. All States forbid marriages between blood relations in the direct line of descent or ascent and between brothers and sisters of the half blood as well as of the full blood. All States forbid marriage between uncles and nieces or nephews and aunts and in 20 States the prohibition extends to consanguines within the fourth degree, which bars marriage between first cousins. Affinity through marriage among collaterals is usually disregarded, but in the ascending or descending line, as between step-father and step-daughter or between father-in-law and daughter-in-law the prohibition is frequent. In 25 States whites and negroes are forbidden to intermarry, the laws often defining to a nicety the fractional part of African blood which vitiates the marriage. In five States the prohibition extends also to the marriage of whites with Chinese or other Mongolians, and in four States marriages between whites and Indians are forbidden. In recent years legislation on the subject of marriage has been affected greatly by eugenic considerations. In Connecticut and Minnesota epileptics and feeble-minded persons are not permitted to marry and similar statutes have been enacted in other States. Michigan prohibits the marriage of persons afflicted with venereal diseases and the eugenic marriage law of Wisconsin made a physical examination by, and a certificate of health from, a physician a prerequisite to the obtainance of a license to marry. A woman on marriage acquires the nationality of her husband.

STEPHEN PFEIL.

MARRIAGE OF FIGARO, The ('Le Mariage de Figaro'), Beaumarchais' most popular play, possibly the wittiest and politically the most effective of all dramas, was ready for the stage in 1778, three years after the success of 'The Barber of Seville' (q.v.), to which it was a sequel. But even while in manuscript it

became the centre of intensely active and complicated political intrigue. Louis XVI rightly discerned in it danger to his throne, and it was not publicly presented till 1784, when it achieved a success till then unparalleled, being by strange irony most applauded by the aristocratic class whose ruin it portended. To Napoleon, after the event, it seemed "the Revolution already in action," and it certainly contributed greatly to hasten and provoke by its leveling tendencies the disintegration of the conventions and even the foundations of the old social régime, though this seems the result rather of Beaumarchais' delight in his own wit, of mere wantonness, than of a realization whither his work was tending or of any deliberate revolutionary purpose. Figaro in 'The Marriage' is still the light-hearted, versatile, philosophic scapegrace of 'The Barber'; Almaviva and Rosine are what that play would lead one to expect they would be after some matrimonial disillusion. Of the new characters Suzanne, on whom Almaviva has set his vagrant fancy and Figaro his heart, is genially conceived, and Chérubin, the page and disquietingly precocious gallant, was a really daring creation, provoking reprobation and inviting controversy. Figaro is successful in defending his beloved from the wiles of Almaviva, but it has been not unjustly said that if the object of comedy is to make vice ridiculous or odious or contemptible 'The Marriage' can hardly claim to attain it. Universal mockery, supremely vivacious, a wit whose brilliancy puts morality off its guard, mar ethically a drama whose sustained excellence in dialogue had been hardly attained even by Molière. The best edition of 'Le Mariage de Figaro' is in 'Théâtre de Beaumarchias,' edited by d'Heyli and Marescot (Vol. III). For the circumstances of its writing, prohibition, reception and contemporary criticism, consult Loménie, 'Beaumarchais and His Times' (Vols. III and IV), also 'Le Centenaire du Mariage de Figaro,' edited by A. Paër (Brussels 1884). The play furnished the text for 'Le Nozze di Figaro,' a popular opera by Mozart (1786).

MARRIED WOMEN, Legal Status of. See HUSBAND AND WIFE.

MARRIED WOMEN, Right to Conduct Business. See HUSBAND AND WIFE.

MARROW, a substance of soft vascular tissue filling the cells and cavities of the bones of mammals. It contains fat and both red and white blood corpuscles and is a valuable constituent of soups. The bone contents of mammals show wide variation. The largest constituent is usually water, but some marrows, as of the long bones, are mostly a yellow oil. Traces of albumen, fibrin and salts are also found. Red bone-marrow is highly nutritious and is recommended for anæmia. (See BONE). The vegetable marrow is a species of squash (*Cucurbita ovifera*), of oval form, ribbed and greenish-yellow color.

MARRYAT, măr'ĭ-ăt, **Florence,** English novelist, daughter of Frederick Marryat (q.v.): b. Brighton, 9 July 1838; d. London, 27 Oct. 1899. She was successively Mrs. Church (1854–90) and Mrs. Francis Lean. Her many novels, although not at all remarkable, were popular, and were published in various versions throughout Europe. They include 'Nelly Brooke,' 'Fighting the Air,' 'Facing the Footlights' and more than 80 others, many being devoted largely to spiritualism. She published and edited her father's 'Life and Letters' (1872).

MARRYAT, Frederick, English naval officer and novelist: b. London, 10 July 1792; d. Langham, Norfolk, 9 Aug. 1848. In 1806 he entered the navy, served on the coast of North America in 1811 in the *Æolus,* and in 1823 was commander of the *Larne* during the first Burmese War, in 1825 had the naval command of a successful expedition up the Bassein River, and in the same year was made captain of the *Tees.* From 1828 until his resignation in 1830 he commanded the *Ariadne.* He received the gold medal of the Royal Humane Society (1818) for saving life at sea; adapted to the mercantile marine Sir Home Popham's system of signaling; was elected Fellow of the Royal Society in 1819, and was also something of a caricature artist. He is best known, however, for his stories of the sea, beginning in 1829 with 'The Naval Officer.' The most familiar of them is 'Midshipman Easy' (1836), in which his chief characteristics, lifelike and circumstantial narration and a rollicking humor, appear perhaps at their best. Others of the series are 'The King's Own' (1830), probably the best constructed of his works; 'Newton Forster' (1832); 'Peter Simple' (1834); 'Jacob Faithful' (1834); 'The Pacha of Many Tales' (1835); 'The Pirate, and the Three Cutters' (1836); 'Snarleyyow' (1837); 'The Phantom Ship' (1839); 'Poor Jack' (1840); 'The Privateer's Man' (1846). He wrote also a series of juveniles, chief of them 'Masterman Ready' (1841). He visited Canada and the United States in 1837–38; and recorded his impressions in 'A Diary in America' (1839), which gave some offense to the people of the nation, then hypersensitive to foreign criticism. In 1832–35 he edited the *Metropolitan Magazine,* in which he published a review of N. P. Willis' 'Pencilings by the Way,' which the latter, then in England, considered abusive. Willis challenged Marryat, and they exchanged shots at Chatham without injury. (See MIDSHIPMAN EASY, MR.). Consult Marryat, F., 'Life and Correspondence' (1872); Hannay, 'Life' (in 'Great Writers' series).

MARS, Anne Françoise Hippolyte Boutet Monvel, än fräṅ-swäz ē-pō-lēt boo-tā mōṅ-vĕl märs, usually called MADEMOISELLE MARS, French actress: b. Paris, 5 Feb. 1779; d. there, 20 March 1847. As Célimène in Molière's 'Misanthrope,' and Elmira in 'Tartuffe,' as well as in several similar characters in the plays of Marivaux, she was very great. Louis XVIII settled on her, as well as on Talma, a pension of 30,000 francs. She retired in 1841.

MARS, *in astronomy,* the outermost of the four earth-like planets revolving about the sun. Its orbit lies completely outside that of the earth, its mean distance from the sun being 141,500,000 miles, and with the single exception of the orbit of Mercury, it has the most eccentric orbit of the solar system, the greatest distance of the planet from the sun exceeding its least distance by 26,400,000 miles. Mars occupies 687 days in completing the circuit of its path, so that this is the length of the year on this planet. As the orbits of Mars and of the

earth both approximate to circles, having the sun near their centres, it follows that the distance apart of these planets varies enormously. When Mars, the earth and the sun are in one straight line, Mars and the earth being on the same side of the sun, this distance may be so little as 35,500,000 miles, while if the former planet is beyond the sun in the most remote part of its orbit, the distance may be so great as 248,600,000 miles. In the former case Mars is more favorably situated for observation from the earth than any other planet in the solar system; the planet Venus when nearest us is, indeed, much less far away, but at this time it is the dark, or night, side of Venus that is turned toward us, while when we are nearest to Mars it is the fully illuminated, day side of the planet upon which we look. On account of the eccentricity of the orbit of Mars, its distances from the earth differ greatly at different oppositions; if an opposition occurs while Mars occupies that part of its orbit which is nearest the sun, the distance may be so small as 35,500,000 miles, while if at this time Mars is at the point of its orbit most remote from the sun, even at the instant of nearest approach the distance may exceed 61,000,000 miles. The interval between successive close approaches of Mars and the earth is 780 days, much the longest synodical period in the planetary system, — while the usually favorable close approaches occur in groups separated by 15 or 17 years. These favorable oppositions always occur during the months of August or September; the date of the last one was 1909, while the three succeeding ones will be seen in the years 1924, 1939 and 1941. It is at these times that very unusually favorable opportunities are afforded for studying the surface of the planet. The day on Mars is 24 hours, 37 minutes, 22.67 seconds in length, being thus but little longer than our own; the axis of the planet is inclined at an angle of 24° 0′ to the axis of its orbit, so that spring, summer, autumn and winter succeed one another there in almost precisely the same way as with us, but the Martian seasons are each of nearly twice the duration of ours since the year is nearly two of our years in length. (The inclination of the earth's axis is 23° 27′).

In 1877, Asaph Hall, of Washington, discovered that Mars is attended by two minute satellites to which he gave the names Phobos and Deimos. Both of these bodies are very minute objects, and as may be seen from the following table their motions are in many respects unique among the satellites of the solar system.

The distance away of each of the moons from the planet is remarkably small; thus, even Deimos is less than one-seventeenth as far away from Mars as our own moon is from the earth, while Phobos is separated from the planet's surface by less than one diameter of the planet. The latter moon is, in fact, so close to Mars that it would remain forever invisible to any observers on the planet in higher latitudes than 69 degrees, being hidden by the curvature of the planet's surface. But still more striking is the apparent motion of these bodies as it would be witnessed from the surface of Mars itself. As Phobos completes a revolution in 7 hours 39 minutes, which is far less than the time of the rotation of the planet, it follows that this moon would be seen to rise in the west, run rapidly eastward among the stars and finally set in the east. Eleven hours later it would again appear in the west, to repeat the same retrograde motion. Deimos, though rising in the east in the usual way, would mount the sky very slowly: the various constellations would be seen to drift past it and the moon would not finally attain the western horizon until about 66 hours after rising. Both moons would be seen to go through their phases in the course of their peculiar motions. With such minute objects it is impossible for us to discern any measurable discs, but from observations of the amount of light which their surfaces reflect, their diameters can be, at least approximately, determined. The figures of the above table are those found in this way at the Lowell Observatory. These indicate that Phobos, as seen from the nearest point on Mars, would appear somewhat larger than our moon does to us, though its surface would be but one-half as bright, while the apparent diameter of Deimos would be but three minutes of arc. This satellite would therefore only be visible as a disc with difficulty to the naked eye; it would have merely the appearance of a very brilliant star.

In many ways Mars resembles our earth; it has atmosphere, seasons, storms, clouds and mountains. Vast white patches which have the appearance of snow and ice cover both its poles; these are found to vary in size with the seasons, being largest during the Martian winter, and sometimes even completely disappearing during the summer. The "Canalli," or channels, which have become known through the inexact English translation of Canals, were first mapped in large numbers by the Italian astronomer, Schiaparelli, although a few of them had been previously observed by other astronomers. They consist of narrow, dark lines, generally straight, forming a network over the whole surface of the planet. Some of the observers, however, deny the extreme regularity of these curious features, describing them as of varying widths and of a somewhat irregular appearance. At their junctions we often find small dark areas known as oases. Large darkish gray and green areas of the planet have

	Distance in equatorial radii of planet	Distance in miles	Time of revolution	Interval between meridian passage	Diameter in miles
Phobos	2.77	5,850	7h 39m 13.85s	10.9h	36
Deimos	6.92	14,650	30 17 54.87	181.5	10

been named seas, but it is now certain from the amount of permanent detail which is detected in them that they are not bodies of water. In fact, the course of many of the canals can be traced across these greenish areas. It is, indeed, certain that Mars approximates to a desert planet and that there is but little water on its surface. The greater area of the planet is of a yellowish or orange color and these regions are believed to be true deserts. It is thought by some of the students of the planet that the greenish areas are vegetation, that the canals are strips of irrigated country and that the polar caps are true deposits of snow or ice, the melting water of which is artificially led to dryer regions of the planet. To this explanation many astronomers vigorously dissent, their objections being principally based on the extremely light atmosphere of the planet, its probable very low temperature, and especially upon the uncertainties still remaining in our ideas of the appearance of the Martian surface and in the interpretation of what has been seen. It is to be hoped that at the very favorable oppositions of 1924, 1939 and 1941 a more definite basis may be acquired for extending our knowledge in this fascinating field. The reader will find tolerably complete statement of the known and supposed facts and of the various inferences drawn from them among the titles given below. Consult Flammarion, Camille, 'La Planète Mars et ses conditions d'habitilité' (1892); Lowell, Percival, 'Mars and its Canals' (1906), and 'Mars as the Abode of Life' (1909); Wallace, Alfred Russell, 'Is Mars Inhabited?' (1907).

ERIC DOOLITTLE,
Director of Flower Astronomical Observatory, University of Pennsylvania.

MARS, the typical god of war; *in Roman mythology,* contracted from *Mavers* or *Mavors,* in the Sabine or Oscan language *Mamers,* was at an early period identified by the Romans with the Greek *Ares.* As the Italian Mars was originally a divinity of a very different nature, the two conceptions must be treated separately. Originally Mars was an agricultural deity surnamed *Silvanus,* and propitiatory sacrifices were offered to him as the tutelary god of fields and flocks. As the Italian shepherds were familiar with war, the transition from the idea of Mars as an agricultural to that of a warlike deity was natural and easy. He was regarded as the father of the Roman people, for, according to tradition, Romulus and Remus, the founders of Rome, were the fruit of his intercourse with Rhea Sylvia. Several temples in Rome and the Campus Martius were dedicated to him, the most important of which was that outside the Porta Capena, on the Appian Road, and that of Mars Ultor, built by Augustus in the forum. His service was celebrated not only by particular *flamines* devoted to him, but by the College of the Salii, or priests of Mars. The month of March (q.v.), the first month of the Roman year, was sacred to him and his festivals were celebrated every year in the Circus on the 1st of August. The Campus Martius, where the Roman youth engaged in athletic and military exercises, was named after him. (See ARIES). Consult Fairbanks, A., 'Mythology of Greece and Rome'. (1907).

MARSALA, mär-sä'lä, Sicily, a seaport town, near the mouth of a river of the same name, on the low promontory of Cape Boeo, 18 miles southwest of Trapani. It was known as Lilybæum in the time of the Carthaginian supremacy. It obtained its present name from the Saracens, who valued the port so highly that they called it Marsa Alla, or Port of God. It has now excellent schools of technology and agriculture and a large public library. The harbor has been greatly improved. The most important export is Marsala wine, which resembles sherry; grain, soda and salt are also exported. Pop. of commune, 65,451.

MARSDEN, märz'dĕn, **Samuel,** Anglo-Australasian missionary: b. Horsforth, near Leeds, 28 July 1764; d. Windsor, New South Wales, 12 May 1838. After study at Cambridge and ordination in 1793, he went in 1794 as chaplain to the convict settlement at Parramatta, Australia, where his model farm became self-supporting and contributory to the development of local schools and missions. In 1814 he extended his work to New Zealand among the Maoris who through his efforts became Christianized, received a dictionary and grammar of the Maori language and adopted a fixed form of government. Consult Marsden, J. B., 'Life of Samuel Marsden' (London 1859).

MARSEILLAISE, La, the French national anthem, a revolutionary song, composed by an engineer officer, Rouget de Lisle, during the night of 24–25 April 1792 in Strassburg. The song quickly spread. The people of Marseilles adopted it to be sung at the meetings of their clubs. It was they who carried it all over France, and hence from them it received its name. De Lisle was a proscribed royalist at the time. His mother wrote to him in alarm, asking, "What is this revolutionary hymn, sung by bands of brigands who are prowling through France and with which our name is linked?" He had originally given it the name of 'Le chant de guerre pour l'armée du Rhin' ('Battle Song of the Rhine Army'). Lamartine wrote that De Lisle himself was terrified at the tremendous effect of his composition: "It was the fire-water of the Revolution, which instilled into the senses and soul of the people the intoxication of battle." Carlyle describes it as "the luckiest musical composition ever promulgated, the sound of which will make the blood tingle in men's veins; and whole armies and assemblages will sing it, with eyes weeping and burning, with hearts defiant of Death, Despot and Devil." On 8 Jan. 1795 the Directory ordered the air to be played at all theatres. Its inspiring strains are known throughout the world more than perhaps any other melody. During the Empire and the Restoration the Marseillaise was suppressed as a revolutionary demonstration, but was revived with the July Revolution of 1830. The original version consisted of only six couplets; the seventh was added when it was dramatized for the Fête de la Fédération, in order to complete the characters among whom the verses were distributed, namely, an old man, a soldier, a wife and a child. The stanza commencing with "Nous entrerons" is the one added, intended for the child part. It was written by Dubois, editor of the *Journal de la Littérature.* The complete version follows, with a strict translation.

LA MARSEILLAISE.

1

Allons, enfants de la Patrie,
Le jour de gloire est arrivé;
Contre nous de la tyrannie,
L'étendard sanglant est levé.
Entendez – vous dans ces campagnes
Mugir ces féroces soldats?
Ils viennent jusque dans vos bras
Egorger nos fils, nos compagnes!
Aux armes, citoyens! formez vos bataillons!
Marchons, marchons,
Q'un sang impur abreuve nos sillons!

2

Que veut cette horde d'esclaves,
De traîtres, de rois conjurés?
Pour qui ces ignobles entraves,
Ces fers dès longtemps préparés?
Français, pour nous, ah! quel outrage!
Quels transports il doit exciter!
C'est nous qu'on ose méditer
De rendre à l'antique esclavage.
Aux armes, etc.

3

Quoi! ces cohortes étrangères
Feraient la loi dans nos foyers?
Quoi! ces phalanges mercenaires
Terrasseraint nos fiers guerriers?
Grand Dieu! par des mains enchaînées
Nos fronts sous le joug se ploieraient!
De vils despotes deviendraient
Les maîtres de nos destinées.
Aux armes, etc.

4

Tremblez, tyrans, et vous perfides,
L'opprobre de tous les partis,
Tremblez! vos projets parricides
Vont enfin recevoir leur prix!
Tout est soldat pour vous combattre.
S'ils tombent, nos jeunes héros,
La terre en produit de nouveaux
Contre vous tout prêts à se battre!
Aux armes, etc.

5

Français, en guerriers magnanimes,
Portez ou retenez vos coups;
Épargnez ces tristes victimes
A regret s'armant contre nous.
Mais ces despotes sanguinaires,
Mais les complices de Bouillé,
Tous ces tigres qui sans pitié
Dechirent le sein de leurs mères!
Aux armes, etc.

6

Nous entrerons dans la carrière
Quand nos aînés n'y seront plus;
Nous y trouverons leur poussière
Et la trace de leurs vertus!
Bien moins jaloux de leur survivre
Que de partager leur cercueil,
Nous aurons le sublime orgeuil
De les venger ou de les suivre!
Aux armes, etc.

7

Amour sacré de la Patrie,
Conduis, soutiens nos braves vengeurs;
Liberté, Liberté, chérie,
Combats avec tes défenseurs!
Sous nos drapeaux que la Victoire
Accoure à tes mâles accents;
Que tes ennemis expirants
Voient ton triomphe et notre gloire!
Aux armes, etc.

THE MARSEILLAISE.

1

Come, children of the fatherland,
The day of glory now is here;
By tyranny against us
The bloody banner is raised:
Do you hear in the land
Those ferocious soldiers roar?
Up to our arms they come,
Strangling our sons, our women!
To arms, citizens, form your battalions,
Let us march, let us march!
That the foul blood may drench our furrows!

2

What seeks this horde of slaves,
Of traitors and conspiring kings?
For whom these base manacles,
These irons already long prepared?
For us, Frenchmen, ah, such outrage!
What passions it must raise!
'Tis us whom they dare purpose
To restore to former slavery.

3

What! shall these foreign cohorts
Make the law in our homes?
What! shall these hireling phalanxes
Throw our proud warriors down?
Great God! with fettered hands,
Our heads bowed down beneath the yoke!
And despots vile become
The masters of our destinies.

4

Tremble, ye tyrants and traitors,
The shame of every faction,
Tremble! your parricidal projects
Shall at last gain their reward!
Each one is soldier to fight you.
And if our young heroes fall,
The land shall produce them afresh
All ready to struggle against you!

5

Frenchmen, as magnanimous warriors,
Restrain or deal your blows;
Spare those sad victims
Who reluctantly armed against us.
But those bloody despots —
Those accomplices of Bouillé —
All those tigers who pitilessly
Lacerate the bosoms of their mothers!

6

We shall begin our career
When our elders are no more;
Yet we shall find their ashes
And the trace of their virtues!
Less eager to survive them
Than to share their tomb,
It shall be our sublime pride
To avenge or follow them!

7

Sacred love of fatherland,
Guide, sustain our brave avengers;
Liberty, dear Liberty,
Fight with thy defenders!
That victory under our flags
Shall hasten to thy noble call;
And may thy dying enemies
Behold thy triumph and our glory!

MARSEILLES, mär-sālz, or **MARSEILLE,** mär-sā-yĕ, France, the principal commercial seaport of the country, a first-class military and naval station, the second city of France as regards population, and the capital of the department of Bouches-du-Rhône, 508 miles southeast of Paris. It stands on the northeastern shore of the Gulf of Lyons, and on a bay containing a group of islets, one of which, the Château d'If, has world-wide celebrity in connection with the elder Dumas' 'Monte Cristo.' The city is strongly defended by various works, and lies in the form of an amphitheatre round a natural harbor of moderate size (about 70 acres), known as the Old Harbor. From the Old Harbor one of the finest of the city thoroughfares, called the Cannebière, runs inland in a straight line; while at right angles to this another great thoroughfare traverses the city, planted with trees, lined with fine edifices and bearing different names at different points. In the older

part of the town the streets are narrow and irregular, but in general the streets are spacious and regular and lined with handsome houses. Marseilles, however, is not rich in public edifices. The chief are the large cathedral, in the Byzantine style, consecrated in 1893; the church of Notre Dame de la Garde, a modern Romanesque building, on a hill of same name, whence a splendid view is obtained; the church of Saint Victor, a building of great antiquity; the Hôtel de Ville; the Prefecture; the Palais des Arts de Longchamp, containing a picture-gallery and natural history museum; the exchange; the public library (120,000 vols.); the palace of justice or law courts; the episcopal palace, etc. Marseilles is the seat of a bishop and possesses a court of first instance, a mint, an Academy of Sciences, Belles-lettres and Arts, various learned societies and educational institutions.

Marseilles improved greatly in regard to street architecture, sanitary matters, etc., and made great progress in extent, population and commerce, largely owing to the conquest of Algeria and the opening of the Suez Canal. Including Old and New Harbors, the total water area is 414 acres; there are seven wet docks, with depths at ordinary tides ranging from 25 to 66 feet, six dry docks and 13 miles of quayage. Vessels entered in 1913, 4,621, of an aggregate of 8,308,165 tons. The traffic in merchandise has grown from 4,372,000 tons in 1870 to 21,590,000 tons in 1913. From the Durance an abundant water supply has been derived. A canal irrigates the neighboring slopes and plains and has transformed them from arid tracts into fruitful fields. The surrounding districts are now occupied by new population, employed in raising vegetables, fruit, etc., on the reclaimed and improved lands. The Marseilles-Rhone Canal, intended to open up waterways from Marseilles to the interior of France and central Europe, was authorized in 1903, and is expected to be completed in 1919. The canal, which is 50 miles long, has no locks and is at sea-level throughout its entire course, and will, with its tributaries, form a series of waterways 350 miles long, navigable by heavy barges. The most important manufactures are soap, soda and other chemical products; also olive and other oils, sugar, machinery, iron and brass work, matches, candles, glass, earthenware, Oriental hosiery, etc. In the building-docks a great number of war and other vessels are built. The trade consists chiefly of soap, olive-oil, wine, brandy, corn, flour, dried fruits, oranges and other products of the southern departments; salt provisions, tobacco, wool, skins and hides, iron, raw cotton, cotton twist, dye-woods and American novelties. Marseilles is the headquarters of the 15th army corps and is the seat of a United States consulate. During the European War 1914–18 it was a center of great naval activity a chief port of debarkation for the world-converging armies of the Entente Allies.

Marseilles was founded by a colony of Greeks from Asia Minor about 600 years before Christ, the original name being Massalia, and the Greek language is said to have been spoken here for several centuries before Christ. Its progress for centuries was rapid and almost without interruption. Having taken the part of Pompey in the great contest for supremacy between him and Cæsar, it was besieged by the latter and taken in 49 B.C. On the decline of the Roman Empire it became a prey to the Goths, Burgundians and Franks. In 735 it fell into the hands of the Saracens, who completely destroyed all the ancient monuments which the barbarians had spared. In the 10th century it fell under the dominion of the counts of Provence and for some centuries after followed the fortunes of that house. Pop. 550,619.

MARSEILLES, Ill., city in La Salle County, situated on the Illinois River and Michigan Canal and on the Chicago, Rock Island and Pacific and the Chicago, Ottawa and Peoria railroads. It has coal mines and numerous industrial establishments, including paper-box factories, roofing material works, paper-board works, agricultural implement works, concrete block yards and cigar factories. The Illinois River is crossed at this point by a great railroad bridge. The commission form of government was instituted in 1913. Pop. 3,290.

MARSH, George Perkins, American scholar and diplomat: b. Woodstock, Vt., 15 March 1801; d. Vallombrosa, Italy, 23 July 1882. He was graduated at Dartmouth in 1820; studied law at Burlington; was elected to the Supreme Executive Council of Vermont in 1834; sat in Congress from 1842 to 1849, when he went to Constantinople as Minister for four years, and in 1852 was sent on a special mission to Greece. In 1861, after seven years in the United States, he went to Italy as Minister, and held that post until his death. An able English philologist, Marsh wrote 'Lectures on the English Language' (1861); 'The Origin and History of the English Language' (1862); 'Man and Nature,' in which he urged forest planting and forest preservation (1864), etc. He edited Wedgewood's 'Etymology,' and translated Rask's 'Icelandic Grammar.' Consult the 'Life and Letters' edited by his widow (1888).

MARSH, Othniel Charles, American palæontologist: b. Lockport, N. Y., 29 Oct. 1831; d. New Haven, Conn., 18 March 1899. He was graduated from Yale in 1860, studied in 1860–62 at the Yale (now the Sheffield) Scientific School, in 1862–65 at the German universities of Berlin, Heidelberg and Breslau, and from 1866 until his death was the first professor of palæontology at Yale. From 1882 he was vertebrate palæontologist to the United States Geological Survey, his field-work for the survey ceasing in 1892. His investigations in regard to extinct vertebrates are very important and were declared by Charles Darwin to furnish some of the most satisfactory evidence of the evolutionary theory. He made particular study of the Rocky Mountain region, and from 1868 almost annually organized and conducted expeditions into that district. In these explorations he discovered over 1,000 new fossil vertebrates, of which he classified and described more than one-half. Among his discoveries are those of the *Odontormithes,* a subclass of Cretaceous birds, with teeth; the *Dinocerata,* ungulate animals of the Eocene period, elephantine in size; the first known American pterodactyls, or flying lizards, and several new families of dinosaurs. Perhaps he was best known for his study of the primitive horse, the *Eohippus, Orohippus* and *Epihippus.* In 1890–99 he made

researches in the geology of the region between the Appalachian range and the Atlantic. He was curator of the geological collection of the Yale Museum of Natural History in 1867–99, and in 1898 presented to the university his own collections. He was a nephew of George Peabody (q.v.), and it is said to have been at his suggestion that the Peabody Museum at Yale was established. In 1887 he was made honorary curator of vertebrate palæontology in the United States National Museum, and in 1898 received the Cuvier medal of the French Academy of Sciences. He was president of the American Association for the Advancement of Science in 1878 and of the National Academy of Sciences in 1883–95. From a bibliography of 237 titles these works by him may be cited: 'Odontornithes: A Monograph of the Extinct Toothed Birds of North America' (1880); 'Dinocerata: A Monograph of an Extinct Order of Gigantic Mammals' (1884), and 'The Dinosaurs of North America' (1896). Consult memoir by C. E. Beecher in the *American Journal of Science,* June 1899.

MARSH, Sylvester, American engineer: b. Campton, N. H., 30 Sept. 1803; d. Concord, N. H., 30 Dec. 1884. In 1826 he established a provision business in Boston, in 1833 in Chicago and from 1837 was in the grain trade at Chicago. He originated the meat-packing industry and is regarded as one of the founders of Chicago. From 1864 he resided in New Hampshire. On 25 June 1858, he obtained a charter for a railway to the summit of Mount Washington, a project deemed so impossible that he was called "crazy Marsh." The railway, 2.81 miles long, with an ascent of 3,625 feet, was completed in July 1869. The chief feature in the operation of the road is a central cog-rail. The principle proved so practicable that literally hundreds of similar railways have been constructed on the sides of famous mountains all over the world.

MARSH CROCODILE, or **MUGGER,** the common inland crocodile of India, locally venerated by the Hindus, to whom it is known as "Mugger." It inhabits the tanks and marshes of India and Ceylon, and suitable places westward almost to the Persian coast and eastward throughout the Malay Peninsula and islands. It is dark, olive-brown in general color above, lighter on the ventral surface; the young are paler, with black spots. A specimen 12 feet long is considered large, but instances of a length of 18 feet have been recorded. The head is rough-coated, but has no ridges; the snout is broad and the teeth number 76. These crocodiles swarm in river-marshes, weedy ponds and artificial reservoirs, throughout their range, feeding on fish and small animals, and little feared by horses, cattle or human beings, for in general they are cowardly and reluctant to attack men or even to resist injury. In case the water of their home dries away, they migrate to other pools, and in seasons of drought are likely to be met with anywhere wandering in search of water; as a last resort they will bury themselves in the mud and remain in torpor until revived by the coming of rains. These reptiles display considerable cunning in capturing their food and in avoiding harm, feigning death very cleverly. They are kept in a semi-domesticated condition in many parts of India by pious Hindus, whose priests build temples near the great ponds, protect and feed the reptiles and imagine the service pleasing to the gods as well as profitable to themselves. Extensive descriptions of the animal and of its worship may be found in the zoological works of Blanford, Jerdon, Tennent, Gadow and others and in such volumes as Adams, 'Wanderings of a Naturalist in India' (Edinburgh 1867) and Hornaday, 'Two Years in the Jungle' (New York 1885).

MARSH GAS. See METHANE.

MARSH HARE. See HARES.

MARSH HAWK, or **HARRIER,** a migratory hawk (*Circus cyaneus*) of medium size, commonly known in one or another of its varieties throughout the north temperate zone, which frequents marshy meadows, where it makes its nest upon the ground in a tussock of grass, and lays five to seven roundish, dirty white eggs. In such places it finds its food, chiefly mice and frogs, and sails slowly back and forth close to the ground watching keenly for movements in the grass and ready to pounce upon its prey. Its wings are long and its flight may be swift and powerful when occasion demands, but it was accounted "ignoble" among falconers. It rarely seizes birds or even young poultry, although one of its names is "hen-harrier," and should be protected and encouraged by farmers as one of the most useful and persistent mousers. This hawk may be readily recognized by the broad patch of white on the rump displayed by both sexes. The male is dull grayish-blue, in general tint, and the female rusty brown, both streaked with white. The American harrier (*C. hudsonius*) is generally brown, though the adult males are blue-gray on the back; the tail-coverts are white. Consult Coues, 'Birds of the Northwest' (1874).

MARSH-HEN. See MUD-HEN.

MARSH MALLOW, a coarse, large leaved herb (*Althea officinalis*), of the Old World, but naturalized in marshy places along the eastern coast of the United States, which is related to the hollyhocks (q.v.); the flowers are pale rose-color, some in a terminal spike and some axillary. Its root is mucilaginous and of service as a demulcent in medicine, but it is mainly used as a basis for the confection called "marsh mallow." See MALLOW.

MARSH-MARIGOLD. See COWSLIP.

MARSH-WREN, either of two species of American wrens that inhabit reedy marshes. They have the diminutive brown bodies, short wings and tails, the latter often held cocked up over the back, awl-like bills and inquisitive activity characteristic of wren (q.v.) generally. One is the long-billed (*Cistothorus palustris*), most numerous in the salt-marshes along the Atlantic coast; and the other the short-billed, better known about inland lakes and rivers. The former is somewhat the larger, has a decidedly longer bill and lays eggs dark chocolate in color, while the eggs of the short-billed species are pure white. Both make elaborate nests in the form of ball-like baskets, with a little entrance at the side, woven of leaves of wild rice or marsh grasses and fastened to the stems of the reeds. A curious habit of the species is that each pair will make several nests

each season, only one of which serves the purposes of incubation. These wrens give in the spring an exceedingly pretty clattering song and when dozens are singing together in a patch of reeds the effect is most pleasing.

MARSHAL, a Federal officer appointed by the President in each judicial district and corresponding to the sheriff of a county. His duty is to execute all precepts directed to him, issued under the authority of the United States, and is under the jurisdiction of the United States District and Circuit Courts. The United States government maintains marshals in its principal dependencies, as the Philippines, Alaska, Porto Rico, Hawaii, etc. They are appointed by the President for four years, and in addition to serving the courts have certain duties regarding internal revenue, public lands and the postal service. Sometimes the chief of police in American towns is known as marshal. In some European countries the title of marshal confers the highest military distinction, that of Marshal of France being especially prized. The word is derived from the Old High German word *marah,* a horse; and *scalh,* a servant; hence *Marascalh,* a man appointed to take care of horses. The marshal of the German Empire derived his origin from the Frankish monarchs and was equivalent to the *comes stabuli* or *connétable.* He was bound to keep order at the coronation of the emperor, and to provide lodgings for the persons connected with the ceremony. He was called *arch-marshal,* a dignity belonging to the electorate of Saxony. At the coronation it was his duty to bring oats in a silver vessel from a heap in the open marketplace, and to present the vessel to the emperor. His duties were discharged by a hereditary marshal (*Erbmarschall*). In Prussia general field-marshal is the highest military honor. In England field-marshal is given as an honorary rank to general officers who may have no immediate command. Marshal also signifies a person who regulates the ceremonies of certain solemn celebrations or, as in the United States, at parades, street processions, etc.

MARSHAL, Frank, American chess champion: b. Brooklyn, N. Y., 1877. He acquired fame when a mere boy by winning the championship of the famous Brooklyn Chess Club. Next he took the championship of the Manhattan Chess Club. Thereafter he became a professional player and entered in most of the international tournaments. In 1905 he won the International Chess Tourney at Cambridge and challenged Lasher for the World's championship, but was defeated. In all he won first prize in seven international tourneys. He won the Pan-American championship by defeating Copablanca in Cuba in 1912, though he lost a set match to Copablanca a year or two previous. He succeeded Showalter as United States champion.

MARSHALL, mär'shal, **Alfred,** English economist: b. London, 26 July 1842. He was educated at Saint John's College, Cambridge, and in 1877 was principal of University College, Bristol. In 1883–84 he was lecturer at Balliol College, Oxford, from 1885–1908 he was professor of political economy at Cambridge University, and a member of the Royal Commission on Labor in 1891. He has published 'Economics of Industry' (1879); 'Principles of Economics' (1890); 'Elements of Economics' (1891); 'Fiscal Policy of International Trade' (1903), etc.

MARSHALL, (Davis) Edward, American author and journalist: b. Enfield Centre, Tioga County, N. Y., 31 May 1869. He was educated at Benedict's Preparatory School, Rochester; was news editor of the American Press Association at Buffalo and New York in 1885–89; Sunday editor of the New York *Press* 1890–95. In 1897 he was Sunday editor of the New York *Journal* and European correspondent of the New York *World* 1897–98, and in the latter year served as war correspondent of the New York *Journal.* He was correspondent of the First Peace Conference at The Hague 1900. In New York he conducted an editorial crusade against the conditions existing in tenement buildings, was secretary of the New York State Tenement-House Commission 1894, and has lectured on the Spanish-American War, the army, the Latin Quarter of Paris, etc.; was correspondent of the *Columbian Magazine* during the Mexican insurrection of 1911. He has published 'Story of the Rough Riders' (1898); 'Lizette' (1902); 'The Middle Wall' (1904); 'The Writing on the Wall' (1909); 'In Old Kentucky,' with C. T. Dazey; 'Bat: An Idyl of New York' (1912), and novel versions from the following plays: 'The Family'; 'Master of the House' (1912); 'Broadway Jones' (1913), and several short stories.

MARSHALL, Emma Martin, English novelist: b. North Repps, near Cromer, Norfolk, 29 Sept. 1830; d. Clifton, near Bristol, 4 May 1899. She was married to H. G. Marshall in 1851, and her life thereafter was mainly spent in the cathedral cities of Wells, Exeter, Gloucester and Bristol. She wrote more than 200 stories, nearly all of them stories intended mainly, though not entirely, for young people. In spite of their number the even excellence of the tales is remarkable; they possess high moral tone, and they may be called historical pictures rather than historical tales. Her plan was to introduce into each story several historical personages, as secondary characters, the principal figures being imaginary. Her books have had a wide reading in the United States and still continue popular. Among them are 'Life's Aftermath' (1876); 'Under Salisbury Spire' (1889); 'Haunts of Ancient Peace'; 'Penshurst Castle' (1894); 'Under the Dome of St. Paul's' (1898). Consult Marshall, B., 'Life of Emma Marshall' (1900).

MARSHALL, Henry Rutgers, American author and architect: b. New York, 22 July 1852. He was graduated at Columbia in 1873, and in 1878 entered practice as an architect. He was lecturer on æsthetics at Columbia in 1894–95 and at Princeton in 1915–16. He was president of the New York Chapter of the American Institute of Architects 1902–04, and president in 1907 of the American Psychological Association. While eminent as an architect he has become more widely known through his psychological writings. In 1902 he was appointed a member of the Art Commission of the city of New York. Besides contributions to literary, philosophical and psychological periodicals he wrote 'Pain, Pleasure and Æsthetics' (1894); 'Æsthetic Principles' (1895); 'Instinct and Reason' (1898); 'Con-

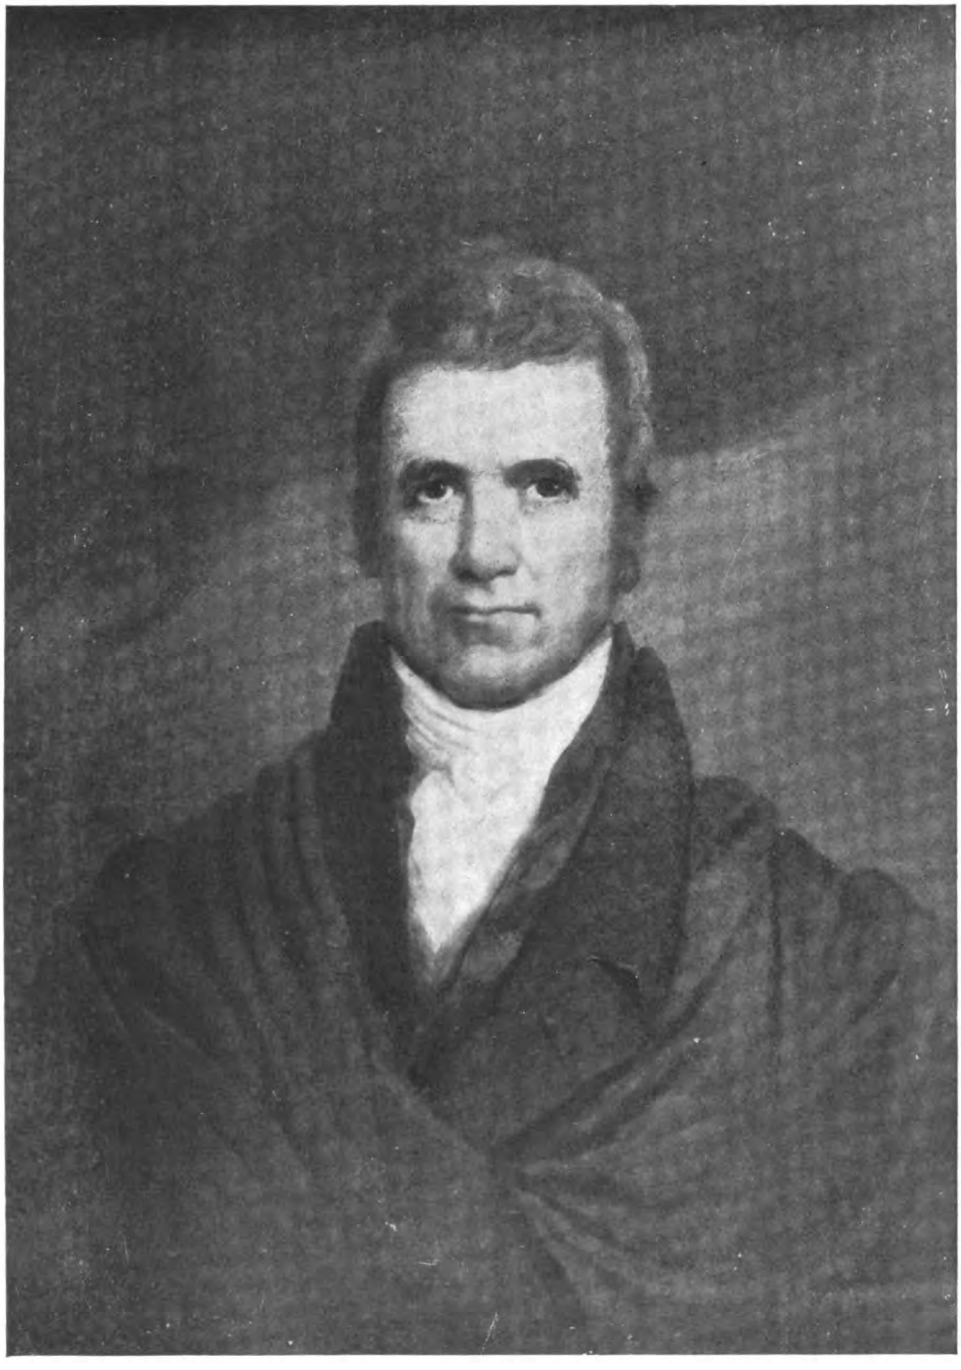
sciousness' (1909), and 'War and the Ideal of Gene' (1915); 'Mind and Conduct' (New York 1919).

MARSHALL, Humphrey, American botanist: b. West Bradford (the present Marshallton), Pa., 10 Oct. 1722; d. there, 5 Nov. 1801. He followed the stonemason's trade, but devoted his leisure to astronomy, building a small private observatory, and to natural history. He began the collection and cultivation of the more interesting indigenous plants, and in 1773 established the Marshallton botanical garden, where were assembled trees and herbaceous plants of the United States. For years he was treasurer of Chester County, Pa., and in 1786 he was elected to the American Philosophical Society. His 'Arboretum Americanum,' described as "an Alphabetical Catalogue of Forest Trees and Shrubs, Natives of the American United States" (1785), was translated into several European languages.

MARSHALL, Humphrey, American politician: b. Westmoreland County, Va., 1756; d. near Frankfort, Ky., 1 July 1841. He joined the Continental army at the outbreak of the Revolution, became captain of Virginia cavalry (1778), in 1780 established himself on a Kentucky plantation, opposed the separation of Kentucky from Virginia, and as a delegate to the Danville convention of 1787 was prominent in defeating the measure. He was also a delegate to the Virginia convention that ratified the Constitution of the United States, and in 1793 was a representative from Woodford County in the Kentucky legislature, where he declared his opposition to the plans for raising in Kentucky troops under Gen. George Rogers Clark for an attack on the Spanish settlements near the mouth of the Mississippi River. From 7 Dec. 1795 to 3 March 1801 he was a Federalist senator in the Congress of the United States, and in 1806 was active in denunciation of Aaron Burr. He represented Franklin County in the Kentucky legislature in 1807–09, and had a dispute with Henry Clay which resulted in a duel in which Clay received a slight wound. He sat again for Franklin County in 1823. He published the first 'History of Kentucky' (1812; rev. ed., 1824).

MARSHALL, Humphrey, American soldier: b. Frankfort, Ky., 13 Jan. 1812; d. Louisville, Ky., 28 March 1872. He was graduated from the United States Military Academy in 1832, entered the mounted rangers, served in the Black Hawk War (1832) and resigned from the army 30 April 1833. Admitted to the bar in 1833, he practised in Frankfort (1833–34) and Louisville (1834–36), became a lieutenant-colonel of Kentucky militia in 1841, and raised for the Mexican War the first regiment of Kentucky cavalry, of which he was made colonel 9 June 1846. He fought at Buena Vista (22–23 Feb. 1847). From 3 Dec. 1849 to 4 Aug. 1852 he served as a Whig in the 31st and 32d Congresses, in 1852–54 was Minister Plenipotentiary to China, and from 3 Dec. 1855 to 3 March 1859 was again in Congress, this time as an American, or Know-Nothing. In 1861 he was commissioned a brigadier-general in the Confederate army, with command of the Army of Eastern Kentucky. On 10 Jan. 1862 he was defeated by General Garfield at Middle Creek (Floyd County) in one of the most important of the minor battles of the Civil War. In May 1862 he surprised Gen. J. D. Cox at Princeton, Va., and was thus of much service to Lee, through the relief of the Lynchburg and Knoxville Railway. Having resigned his commission in 1862 he represented Kentucky in the congress of the Confederate States (1863–65). From 1867 he practised law with much success at Louisville.

MARSHALL, John, chief justice of the United States: b. Germantown (now Midland), Fauquier County, Va., 24 Sept. 1755; d. Philadelphia, 6 July 1835. He was the eldest son of Col. Thomas Marshall of Westmoreland County, Va., a distinguished officer in the French War and in the War of Independence, and of Mary Keith, a member of the well-known Randolph family. Thomas Marshall removed from Westmoreland County to Fauquier soon after his marriage; this community was sparsely settled and the educational advantages which he could give his children were meagre, consequently he became their earliest teacher and succeeded in imbuing them with his own love of literature and of history. For two years John Marshall had, as tutor, James Thompson of Scotland and he was sent for one year to the academy of the Messrs. Campbell of Westmoreland County, where James Monroe was also a pupil. He had no college training except a few lectures on law and natural philosophy at William and Mary in 1779. He was always fond of field sports and excelling in running, leaping and quoit throwing. He loved the free natural life of the country, and his long tramps through the woods around his father's home, Oak Hill, together with his athletic exercises gave him great strength and agility. At 18 he began the study of law, but soon left his studies to enter the Revolutionary army. He was active in endeavoring to enlist men for the service and helped to form and drill a company of volunteers. As a member of his father's regiment he took part in the battle of Great Bridge where he displayed signal valor. In 1776 he became a lieutenant in the 11th Virginia, and the next year was made captain. He served in Virginia, New Jersey, Pennsylvania and New York, always displaying great courage and valor and a cheerful acceptance of hardships and privations. This experience was of untold value to Marshall, it broadened his views and quickened his insight in governmental questions. As he says, he entered the army a Virginian and left it an American. In 1780 during a period of military inactivity he attended a course of law lectures at William and Mary and in 1781, after leaving the army, was granted a license and began the practice of law in Fauquier County. The next year he was elected to the Virginia assembly, and shortly afterward was made a member of the executive council. He served his State as legislator during eight sessions. In 1784, although he had then removed his residence to Richmond, he was again elected delegate from Fauquier County, and in 1787 served as member from the county of Henrico. When the city of Richmond was granted a representative in the legislature Marshall had the honor of this office which he held from 1788 to 1791. He was also a member of the Federal Convention which met in 1788 to discuss the ratification of the Constitution of the United States,



JOHN MARSHALL

Chief Justice United States Supreme Court

and it was largely due to his convincing arguments that ratification was carried, as the question was hotly debated and the anti-Constitution party had able and determined representatives. For several years he held no public office and devoted himself entirely to his extensive law practice, but in 1795 was again elected to the legislature. During this session he defended the unpopular "Jay Treaty" with England, and by his overwhelming arguments completely refuted the theory of his opponents that the executive has no power to negotiate a commercial treaty. Marshall's attitude during his service as legislator toward all questions concerning Federal power demonstrated his increasing belief that a strong central government is necessary to real efficiency. In 1783 he had married Mary Ambler, daughter of Jacqueline Ambler, treasurer of the State, and soon after his marriage made his permanent home in Richmond. The honors bestowed on him testify to the esteem in which he was held by the State and by the nation. He refused the Attorney-Generalship and the Ministry to France, but in 1789 accepted the office of Special Envoy to France with Charles Cotesworth Pinckney and Elbridge Gerry. This mission related to the indignities which the French had offered the American navy and attempted to adjust the commercial relations between the two countries. It failed on account of the arrogant attitude of France, but "Marshall's dignified correspondence added greatly to the prestige of America," and on his return he was welcomed with many evidences of approbation from his grateful countrymen. Yielding to the earnest solicitation of Washington he became a candidate for Congress and was elected a member of that body in 1798. In Congress he was the leader of the Administration party and the greatest debater in the House on all constitutional matters. In one of his most noted speeches he defended the action of President Adams in the case of Jonathan Robbins and proved conclusively that this case was a question of executive and not of judicial cognizance. In 1800 he was made Secretary of State, and in 1801 appointed chief justice of the United States, which office he held until his death in 1835. In 1829 he, like ex-Presidents Madison and James Monroe, was a member of the Virginia convention which met to alter the State constitution, and by his wisdom and moderation did much to prevent radical changes and to thwart the attempts of politicians against the independence of the judiciary. In 1831 his health, hitherto unusually vigorous, began to fail; he underwent a severe surgical operation in Philadelphia and was seemingly restored, but the death of his wife was a great shock and a return of the disease in 1835 proved fatal. He died in Philadelphia, whither he had gone for medical relief, and was buried by the side of his wife in the New-Burying-Ground, now Shockhoe Hill Cemetery, Richmond. The sorrow over the country was deep and widespread; even his bitterest enemies mourned for the kindly, upright man.

Though somewhat ungainly, Marshall was always dignified in appearance; his tall, loosely-jointed figure gave an impression of freedom, while his finely shaped head and strong, penetrating eyes bespoke intelligence and power. Directness and simplicity were his dominant characteristics. He was free from any display of pomp, air of office or studied effect. His unfailing good humor, his benignity, his respect for women, his devotion to wife and family and his well-known reverence for religion made him loved and admired even by those who heartily disliked his political opinions. As chief justice for more than 30 years he rendered numerous decisions which were of prime importance to a nation in process of formation. The faculty which made Marshall invaluable as a jurist was his power of going directly to the core of any matter. No subtleties, no outside issue confused him, his analysis was unerring, his logic incontrovertible; he cared nothing for the graces of rhetoric and made no appeal to the emotions; his power lay in his deep conviction and in his illuminating and progressive argument. At a period when the powers of the Constitution were ill-defined, when our government was experimental, Marshall's decisions in constitutional and international cases were invaluable factors in forming a well-organized Federal government. "He made the Constitution live, he imparted to it the breath of immortality, and its vigorous life at the present hour is due mainly to the wise interpretation he gave to its provisions during his long term of office." Marshall was the author of numerous reports and papers, of a history of the colonies and of a 'Life of Washington,' a book of small literary merit, but containing a mass of valuable authentic information. Consult Cooley, 'Constitutional History of the United States' (1889); Margruder, 'John Marshall' (1885); Thayer, 'John Marshall' (in 'Beacon Biographies' series, 1901); Beveridge, A. J., 'Life of John Marshall' (1916).

EMILIE W. MCVEA,
President of Sweet Briar College.

MARSHALL, Louis, American lawyer: b. Syracuse, N. Y., 14 Dec. 1856. He was educated in the Syracuse public and high schools and at the law school of Columbia University. In 1878 he began practice at Syracuse. He is now member of the firm of Guggenheimer, Untermeyer and Marshall. He has argued many importing causes in the higher courts, specializing especially in constitutional and corporation law. Mr. Marshall was a member of the New York Constitutional conventions of 1890, 1894 and 1915; served on the commission appointed by Mayor Low, in 1902, to investigate East Side conditions; chairman of the State Immigration Commission appointed by Governor Hughes in 1908 and counsel for William Sulzer in his impeachment trial. Mr. Marshall was also counsel for Leo M. Frank in the United States Supreme Court. He was prominent in the movement for the abrogation of the treaty of 1832 with Russia. He was mediator in settling the cloakmakers' strike in 1910, and prepared the protocol of settlement which has since been the basis of numerous strike adjustments. He has taken an active part in Jewish charitable work and has lectured before many learned and philanthropic societies. Mr. Marshall has been a trustee of Syracuse University since 1910.

MARSHALL, Orsamus Holmes, American lawyer and author: b. Franklin, Conn., 1813; d. 1884. In 1831 he was graduated at Union College, studied for the bar, to which he was admitted in 1834. He was one of the founders of the Buffalo Female Academy and

of the Buffalo Historical Society. He also served several years as chancellor of the University of Buffalo. He wrote much in connection with the Iroquois dealings with the whites. Posthumously there appeared a volume entitled 'Historical Writings of Orsamus H. Marshall Relating to the Early History of the West' (1887).

MARSHALL, Thomas Riley, American lawyer and politician: b. North Manchester, Ind., 14 March 1854. He was graduated from Wabash College in 1873 receiving the degree of A.B., and was admitted to the Indiana bar in 1875, practising his profession at Columbia City. In 1908 he was elected governor of Indiana. His administration was progressive, and several laws were sponsored by him, including an employers' liability law, an anti-gambling law and direct nomination of senators. In 1912 he was chosen by the Democratic National Convention at Baltimore as the candidate of the Democratic party for Vice-President of the United States. He was a consistent supporter of the Wilson administration and in 1916 was again nominated and elected Vice-President. Some of his public utterances in 1913, in which he appeared to advocate radical ideas in regard to the inheritance of property, caused much criticism. Wabash, Pennsylvania and Notre Dame universities conferred on him the degree of LL.D.

MARSHALL, William Louis, American soldier: b. Washington, Ky., 11 June 1846. He was educated at Kenyon College in 1859–61; served in the Union army in 1862–63 and in 1868 was graduated at the United States Military Academy. He was promoted through the various grades, reaching that of brigadier-general, chief of engineers of the United States army, 2 July 1908. In 1870–71 he was acting assistant professor of natural and experimental philosophy at West Point and from 1872 to 1876 had charge of the Colorado section of the explorations west of the 100th meridian. He discovered Marshall Pass over the Rockies in 1873, also gold placers of Marshall Basin, San Miguel River, Colo., in 1875. In 1881–84 he was in charge of the construction of levees in Mississippi, Louisiana and Arkansas, and improvement of the Mississippi River, of harbors on Lake Michigan in 1884–1900. He also superintended the construction of the Hennepin Canal 1890–1900 and subsequently was engineer in charge of the construction of fortifications at eastern and western entrances to New York harbor. He constructed the 40-foot Ambrose Channel entrance to New York harbor. As chief of engineers he had charge of river, harbor and fortification works of the United States from 1908 to 1910. In 1914–15 he had charge of the protection of the Imperial Valley, Cal., against the overflow of the Colorado River. General Marshall has invented automatic movable dams, lock gates and valves for canals.

MARSHALL, Ill., city and county-seat of Clark County, on the Vandalia Line and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, 50 miles south of Danville and 17 miles west by south of Terre Haute, Ind. It is in an agricultural and stock-raising region. Pop. 2,569.

MARSHALL, Mich., city and county-seat of Calhoun County, on the Kalamazoo River and on the Michigan Central railroads, about 38 miles southwest of Lansing and 100 miles west of Detroit. The surrounding country is devoted chiefly to agriculture. The principal industries are railway shops, school and church furniture, hot-air furnaces, patent medicines and foods and stove works. The marble and granite works employ a number of men. There are municipal waterworks and a lighting plant. The grounds of the County Agricultural Society are located in Marshall. There are two daily newspapers. Pop. 4,236.

MARSHALL, Minn., city and county-seat of Lyon County on the Redwood River and on the Chicago and North Western and the Great Northern railroads, about 150 miles west by south of Saint Paul. It is in an agricultural section in which wheat is the principal product. The industrial establishments are a flour mill, grain elevators, sash and door factory and a creamery. Municipally owned electric light and water works are established. Pop. 2,800.

MARSHALL, Mo., city and county-seat of Saline County, on the Missouri Pacific and the Chicago and Alton railroads, about 80 miles east of Kansas City and 40 miles west of Shreveport, La. It was settled in 1839 by people from Virginia and Kentucky, and was incorporated as a city in 1866. It is situated in an agricultural region; in the vicinity are valuable deposits of coal and salt, and nearby are stone quarries. The manufactures are lumber, tile and brick, flour, canned goods, creamery products, wagons and carriages. It is the seat of the State Institution for Feeble-Minded and Epileptics, the Missouri Valley College (Cumberland Presbyterian), established in 1889, San Saviour Academy (Roman Catholic). There are eight churches and public and parish schools, a Carnegie library and an opera-house. Marshall has four banks with a combined capital of $300,000. The government is of commission form. It has a daily newspaper and good banking facilities. Pop. 4,869.

MARSHALL, Tex., county-seat of Harrison County, is situated about 14 miles north of Sabine River, 40 miles west of Shreveport and 67 miles south of Texarkana. The city was founded in the year 1840. Marshall is situated in the midst of a fertile agricultural region which has heretofore engaged mostly in cotton raising, but recent developments show that this section is well adapted to truck growing and the raising of fruits, especially peaches, and large orchards are being planted. The city is largely supported also by lumber interests, there being large areas of pine timber contiguous to the city, which is rapidly being marketed. The land from which the timber is taken is quickly occupied for agricultural and orchard purposes, some orchards containing as high as 6,000 acres. Stock raising is also carried on and the city receives considerable support from this source. The Texas and Pacific Railroad runs through the city, west to El Paso, north to Texarkana and southeast to Shreveport and New Orleans. The Texas Southern Railroad has its terminus at present at Marshall, but will be pushed farther south. The shops of the Texas and Pacific Railroad, located at Marshall, are the finest

to be found anywhere in the Southwest. Locomotives and all kinds of rolling-stock are manufactured. These shops have a local payroll of $50,000 a month. The local shops and general offices of the Texas Southern Railroad are also located in Marshall. Marshall has also a 50-ton cotton-seed-oil mill; the Marshall car-wheel and foundry plant, employing 325 men; two wagon factories, a soda-water apparatus factory — 22 factories in all, giving employment to 1,200 people, using a capital of $1,700,000 and producing annually $1,800,000 worth of goods. The city has installed complete sewerage and waterworks plants.

There are excellent churches and schools. The total value of the city school property is $100,000. There are, also, a number of private schools. There are three Catholic schools in the city — one for girls and one for boys, and an industrial school for boys. In the city are also located the Wiley University and Bishop College, institutions for the education of the negroes; the former with 493, and the latter with 500 students annually. The property of the former is valued at $65,000 and the latter at $150,000.

The city has two national banks with a total capital of $200,000, a daily, semi-weekly and weekly newspapers. Marshall and vicinity is noted for the medicinal properties of its many springs and wells, and many people annually, especially during the summer season, visit these places as health resorts. Pop. 13,000.

MARSHALL, College of, Marshall, Tex., The College of Marshall was chartered 22 Oct. 1912 by some citizens of the city of Marshall, whose purpose was to maintain an institution of Christian learning of collegiate grade. There should be 16 trustees, at least 10 of whom should be members of regular Baptist churches. This charter was amended on 14 Nov. 1916, whereby the control and management of the college was transferred to the Baptist General Convention of Texas. It was proposed not to open the institution until an administration building and suitable dormitories could be built. On 4 June 1917 the college opened with a summer session and summer normal. The enrolment before the end of the first year was 553. The College of Marshall meets a long-felt need in East Texas and sections of Oklahoma, Arkansas and Louisiana. There is no educational institution of collegiate grade in a distance of some 200 miles. It already has the most costly plant between Dallas and New Orleans. Its buildings consist of one three-story and basement fireproof administration building, two three-story brick dormitories, a dining-hall, central heating plant and a magnificent campus of 55 acres. The whole plant is worth $300,000. The quota for the student's army training corps was 150 men. After demobilization of the students' army training corps an officers' reserve camp was installed. The institution is coeducational.

MARSHALL ISLANDS, Polynesia, an archipelago in the western Pacific Ocean, belonging to Germany from 1885 until she lost her colonies in the World War, when the Japanese took control. They are situated eastward of the Carolines and northward of the Gilbert Islands, and lie between 5° and 12° N. lat. and 165° and 171° W. long. The group consists of two parallel chains, the Ratak group of 15 islands in the east and the Ralik group of 18 islands in the west; total area, 154 square miles. The islands rise nowhere more than 10 feet above the sea and are not very fertile, the chief vegetable productions being the cocoanut palm, the breadfruit and the pandanus. The natives are Micronesians. They are skilful in weaving mats and in the construction of large canoes. Copra is the only commercial product. Pop. about 16,000, including, in 1913, 179 Europeans.

MARSHALLTOWN, Iowa, city and county-seat of Marshall County, on the main lines of the Chicago and North Western and Chicago, Great Western and Minneapolis and Saint Louis railroads, 68 miles northeast of Des Moines. It was settled in 1859, incorporated in 1863 and received a charter as a city of the second class in 1868. It is located in the heart of a rich agricultural and stock-raising district, in which corn and hogs are the chief farm products. The industrial plants include Minneapolis and Saint Louis shops, packers of grocers' sundries, meat-packing, furnaces, heating specialties, foundry and machine shops, bottling works, agricultural implements, as well as large independent oil jobbing. The Iowa State Soldiers' Home, covering 160 acres of ground, is located here. The city is governed on the commission plan. It operates its own waterworks and electric-light plant. Pop. 16,065.

MARSHALSEA, mär'shal-sē, a jail in London, attached to the Marshalsea Court, originally established under the earl-marshal of England for the trial of servants of the royal household. Later it was used as a prison for debtors and defaulters, as well as persons convicted of piracy on the high seas. It stood near the church of Saint George, Southwark, and existed in the reign of Edward III. It was abolished in 1849. The Marshalsea will be longest remembered as the home of 'Little Dorrit.' Dickens' father was for some time an inmate of the Marshalsea, and in 'Little Dorrit' the novelist has given us a vivid picture of the life of a debtor and his family in this prison.

MARSHBUNKER, MARSBUNKER, Etc. See MOSSBUNKER.

MARSHFIELD, Ore., town in Coos County, on Coos Bay and on the Coos Bay, Roseburg and Eastern Railroad, 10 miles north of Coquille. It contains a Carnegie library, coal mines, lumber yards, pulp and paper mills, veneered wood works, sash and door factories, etc. The harbor has a channel 300 feet wide with a depth of 25 feet. The vessels of the Inter-Ocean Transportation Company, the Northern Pacific Steamship Company and the Southern Pacific Steamship Company call at Marshfield. Pop. 5,780.

MARSHFIELD, Wis., city of Wood County, on the Chicago, Saint Paul and Milwaukee and the Chicago and North Western railroads, almost in the centre of the State, about 160 miles northwest of Milwaukee. It was settled in 1871 by Louis Rivers and was incorporated as a village in 1875, and chartered as a city in 1883. It is situated in an agricultural region and near extensive forests. The industries of the city are chiefly connected with manufacturing and farming. The chief industrial establishments are a furniture factory which employs

300 persons; veneer factory, 125; bed and mattress factory, 40; lumber-mills, 50; brick yards, 25; cooperage and excelsior factory, 40; other establishments employing about 30 persons. The city has a fine city-hall, a public library, seven churches, four newspapers, a high school, four public and two parish schools. The two banks have a combined capital of $800,000. The government is vested in a mayor and 12 aldermen, who are elected every two years. About two-thirds of the inhabitants are of German descent. Pop. 5,783.

MARSHMAN, Joshua, English Baptist missionary and Orientalist: b. Westbury, Leigh, Wiltshire, 20 April 1768; d. Serampore, India, 5 Dec. 1837. He was, like his father, a weaver, but had an insatiable thirst for learning and always kept a book on his loom. Thus he fitted himself to teach in a Baptist school in Bristol; and thence, in 1799, he went to Serampore as a Baptist missionary, and there founded, in 1810, a missionary college. He was an able linguist, and published 'The Works of Confucius, containing the Original Text' (1809); 'Clavis Sinica' (1814); a Chinese version of the Bible, etc. He co-operated with Carey in the preparation of Telegu version of the Bible, a Bengali-English dictionary and a Sanskrit grammar. Consult Carey, 'Marshman and Ward' (1864).

MARSILEACEÆ, a natural order of acotyledonous plants, nearly allied to Lycopodiaceæ, but differing in the lack of a stem, and in the usually stalked leaves. The species all are inhabitants of ditches and pools, chiefly in temperate regions. No species was known to be of any importance till the discovery of the Nardoo of Australia.

MARS-LA-TOUR, France, village in the department of Meurthe-et-Moselle, 15 miles west-southwest of Metz, on the road to Verdun. In the Franco-Prussian War of 1870–71 it was the scene of part of the battle of Gravelotte. The 38th German brigade was annihilated here.

MARSTON MOOR, England, in Yorkshire, is celebrated for the defeat there in 1644 of the royal forces numbering about 18,000 under Prince Rupert by the Parliamentary troops and Scots, totaling about 27,000 under Fairfax (Earl of Manchester) and Cromwell. Rupert escaped with only 6,000 followers into Lancashire and later rejoined King Charles. As a result, the whole north of England was left to the Parliamentary troops. Consult Kennedy, J. W., 'Scottish Borderers at Marston Moor, 1644' (1902).

MARSUPIAL FROG, any of several small tree frogs (*Hylidæ*) of the South American genus *Nototrema,* which incubate their eggs in brood-pouches formed by infoldings of the skin on the back of the female. The eggs are few, of large size and abundantly provided with food-yolk, and the young sometimes remain in the pouches after hatching until they have completed their metamorphosis and attained considerable growth; but the species vary in this respect. In one case the opening is a longitudinal slit along the middle of the back, with a brood-pouch on each side; but in the other species the double pouch opens cross-ways, near the caudal extremity of the body and may be closed by a sphincter muscle. About half a dozen species are catalogued, all natives of the forests of tropical America, and none is common or thoroughly well known. Gadow ('Amphibia and Reptiles,' 1901) concedes that the best account of them is still that of Weinland in 'Archive für Anatomie und Physiologie' for 1854.

MARSUPIAL MOLE, a small burrowing marsupial of southern Australia (*Notoryctes typhlops*), called "urquamata" by the natives, which has a remarkable similarity to a true mole in appearance (except its reddish color), adaptations of structure to an underground life and habits. It feeds upon ants and other insects and often emerges and travels above ground, though the front feet have been so transformed into digging organs as to make them of little service for walking. It represents a family (*Notoryctidæ*) first described by Stirling in the 'Transactions' of the Royal Society of South Australia for 1891.

MARSUPIALIA, the marsupial mammals, a group ranked as an order, yet embracing the whole of the superior group *Metatheria* or *Didelphia,* as it has been variously named. The latest investigations, however, tend to invalidate the distinctions upon which these groups were formerly sharply separated from the higher mammals and to cause the marsupials to be regarded only as an order of *Eutheria* (q.v.), now distinguished chiefly by their extremely local distribution and degenerate non-placental type of reproduction. Their origin was extremely ancient and its sources are not known; but the group appears to have risen to Mesozoic times among the earliest of mammalian forms and to have begun, even before the advent of the Tertiary period, a course of special modification and degeneration, especially in the line which has survived to the present. The former belief that the marsupials stood in the direct line of ancestry of mammals generally, which were thus considered as modified and diversified offshoots from the stock, is no longer held; on the contrary, the marsupials are regarded as a branch from some very early generalized stock, if not a group of independent origin. It is noteworthy, according to Woodward ('Vertebrate Palæontology,' 1898), that the earliest known complete mammalian skeletons, which pass upward by insensible gradations into undoubted *Eutheria,* are scarcely distinguishable from the skeletons of the more generalized existing marsupials (for example, *Thylacinus*). In the later Mesozoic Age the marsupials were apparently scattered over all the land-area of that time, as their remains have been discovered in many parts of both hemispheres; but even previous to the Eocene epoch they had disappeared entirely from north of the equator. From the first they are divisible into the two branches or suborders of *Polyprotodontia* and *Diprotodontia.* The former, characterized by numerous small incisor teeth, includes a majority of the most ancient forms and such modern groups as the opossums and desyures; while the latter, characterized by only abo six upper incisors and two, much enlarged, lower incisors, contain, besides some ancient forms, the majority of modern representations of the order, as the kangaroos, phalangers, wombats, etc.

The marsupials take their name from the ventral pouch of skin, covering the mammary glands, in which the young are nourished or

MARSUPIALS

1 Sugar Squirrel (Belideus sciurues)
2 Mouse-phalanger (Tarsipes rostratus)
3 Wombats (Phascolomys wombat)
4 Tasmanian Wolf (Thylacinus cynocephalus)
5 American Opossum (Didelphys virginiana)
6 Koala (Phascolarctos cinereus)

protected in most families, and which is indicative of the peculiar method of reproduction characteristic of the order, and for the support of which two bones (the epipubic bones), not present in higher mammals, project forward from the pelvis. The internal organs of reproduction are double, the two oviducts not uniting into a single uterus or vagina, although the separation of the two parts is often imperfect; hence the term *Didelphia* (q.v.). The testes of the male are suspended in a scrotum in front of the penis, the *glans* of which is often double. As a rule no allantoic placenta is present, but there is reason to suppose that the primitive marsupials were placental, and rudiments of this structure persist in the existing Australian bandicoots — a fact which invalidates the former prime distinction made between the marsupials and higher *Eutheria*.

The young are dropped from the mother's womb as minute, undeveloped fœtuses, those of the largest kangaroos being not half as large as mice when born. These larvæ (for they are that) are then taken by the lips of the mother and placed, one by one, within her ventral pouch, where each is attached to one of her teats, where it clings by means of its temporary sucking-mouth and is nourished by the milk which oozes or is pressed down its throat. They remain there a length of time varying with the size of the species, until they have grown to an advanced stage of development, when they gradually emerge; but for a long time afterward return to the mother's pouch for refreshment, rest or safety when alarmed. The pouch varies in its capacity and completeness, in some families being quite absent, so that the young are shielded only by the long hair upon the mother's belly.

While this strange method of reproduction is the most prominent peculiarity of the marsupials, they differ from other orders of mammals in several anatomical features, such as the simplicity of the brain, in which the cerebellum is completely exposed, and the tendency to separation of bones of the skeleton, usually solidly anchylosed in other mammals.

Since early Tertiary times marsupials have been confined to South America and the Australasian region, with the single exception of the few North American opossum (q.v.). This family (*Didelphyidæ*) is restricted to the western hemisphere and alone remains of the large number of Tertiary forms once prevalent in South America, save a single Patagonian diprotodont, the opossum-rat (q.v.). The home of the group, then, is Australia, Tasmania and the Papuan group, where about 125 species are known; and the race seems to have survived in that insular region owing to the absence of destructive enemies, for most of them are almost defenseless vegetable feeders. They have, however, developed into a great variety of forms under the influence of varying conditions and long competitions, and present a most curious parallel to the diversities observable among the higher and more widely diffused mammalia. Some have large size, go in herds and occupy grassy plains; others are smaller, more agile and confined to mountainous districts. Others are still smaller, burrow and feed upon roots or resemble little terrestrial rodents in appearance and habits; while many forms dwell altogether in trees and often simulate squirrels of various kinds. In another direction have been evolved a variety of predatory marsupials, whose needs have developed bodies, teeth and powers resembling those of wolves or bears, and which are wholly flesh-eaters. There is, in fact, hardly a group of mammals which does not find a counterpart among the marsupials,—even the moles and shrews.

The classification of the order divides it into 10 or 12 well-defined families, some of which are wholly extinct, as follows:

POLYPROTODONTIA:

Doubtful primitive forms,—*Triconodon*, Amphitherium, etc.

Didelphyidæ.— Opossum (q.v.).

Dasyuridæ.— Dasyures, Thylacines, etc. (qq.v.).

Peramelidæ.— Bandicoots (q.v.).

Notoryctidæ.— Marsupial mole (q.v.).

DIPROTODONTIA:

Epanorthidæ; Abderitidæ, etc.— Fossil in the Miocene strata of Patagonia; but surviving in *Cænolestes*.

Phalangeridæ.— Phalangers (q.v.).

Diprotodontidæ.— Extinct gigantic phalangers.

Phascolomyidæ.— Wombats (q.v.).

Macropodidæ.— Kangaroos (q.v.).

Consult Beddard, 'Mammalia' (1901); Thomas, 'British Museum Catalogue of Marsupialia,' etc. (1888); Gould, 'Mammals of Australia' (1863); and scientific works on Australia, especially those of Waterhouse, Aflalo and Lydekker.

MARSYAS, mär'sĭ-ăs, mythological son of Hyagnis and one of the Sileni of Asia Minor. Athena, having seen the reflection of herself in water, had thrown away the flute which she had invented, displeased because it disfigured the countenance in playing, and had pronounced the severest maledictions against any one who should take it up. Marsyas accidentally found this instrument, on which he soon acquired such skill that he dared to challenge Apollo to a contest, the conditions of which were that the victor should do what he pleased with the vanquished. The Muses, or according to others the Nysæans, were invited to be the umpires. The Muses decided in favor of Apollo, who put to death his rash competitor by binding him to a tree and flaying him alive. In this way was the curse of Athena accomplished. Marsyas' statue was erected in several Roman cities as a symbol of liberty and other statues have been found illustrating his experiences, one by Praxiteles, which has been preserved in the Athens Museum.

MART, Tex., city in McLennan County, situated on the International and Great Northern Railroad, 20 miles east of Waco. The surrounding region is devoted to cotton-growing in which the city has extensive interests. It contains cotton gins, compresses and cotton-seed-oil mills, railroad repair shops and a high school. The commission form of government is in operation. The water supply system is owned by the municipality. Pop. 2,939.

MARTA OF THE LOWLANDS (Terra baixa), the foremost achievement of the Catalan theatre, was written in Catalan by Angel Guimerá for Fernando Díaz de Mendoza and

María Guerrero and performed for the first time by these actors in the Spanish translation by José Echegaray. It is the first Catalan work to obtain general currency beyond the limit of the provincial tongue. During the present century no play has been more popular in the Spanish or Hispano-American countries, where it has maintained itself upon the stage without interruption since 1896, enlisting the talents of all the leading actors. 'Terra baixa' is predominantly social and human in appeal. This is its fundamental quality; but in equal degree it possesses high theatric effectiveness, which is not inferior to the best work of its period in this vein, whether produced in Spain or elsewhere. Simple feeling and torrential passion, in conjunction with sensitive insight and unusual grasp of significant situation, convey an impression of elemental forces operating behind the broad effects of a carefully elaborated theatrical art, happily employed strictly in subservience to the theme. More than any other play, 'Terra baixa' has contributed to fix the general conception of Iberian peasant drama which prevails in Europe and America. A certain idealization may be noted in the rural characters, a reminiscence of the author's apprenticeship in the poetic drama. In objective realistic detail Guimerá is an unequivocal master. 'Terra baixa' has been translated into more than 20 languages. The English version by Wallace Gillpatrick (New York 1914) was acted successfully in England and the United States previous to publication. As 'Tiefland,' the play is favorably known in operatic form, with music by Eugène d'Albert.

JOHN GARRETT UNDERHILL.

MARTEL, Charles. See CHARLES MARTEL.

MARTEL DE JANVILLE, Gabrielle, COMTESSE DE ("Gyp"), French author: b. Coëtsal, Morbihan, 1850. She is a great grandniece of Mirabeau and at the age of 19 was married to Comte Martel de Janville. Her writings deal with types of Parisian life, of which Petit Bob, Loulou and Paulette have become famous. Over 135 volumes in all have issued from her pen. These include 'Petit Bob' (1882); 'Autour du mariage' (1883); 'Un homme délicat' (1884); 'Elle et lui' (1885); 'Autour du divorce' (1886); 'Pour ne pas l'être?' (1887); 'Pauvres petit femmes' (1888); 'Bob au salon' (1888); 'Mademoiselle Eve' (1889); 'Bob à l'Exposition' (1889); 'L'Education d'un prince' (1890); 'Monsieur Fred' (1891); 'Mariage civil' (1892); 'Du haut en bas' (1893); 'Mariage de chiffon' (1894); 'Le cœur d'Ariane' (1895); 'Le bonheur de Ginette' (1896); 'Totote' (1897); 'Israël' (1898); 'L'Entrevue' (1899); 'La pays des champs' (1900); 'Le friquet' (1901); 'Sœurette' (1902; 2d ed., 1910); 'Un ménage dernier cri' (1903); 'Maman' (1904; 2d ed., 1910); 'Le cœur de Pierrette' (1905); 'Ces bons Normands' (1907); 'La paix des champs' (1908); 'Joies d'amour' (1909); 'L'Amoureux de Line' (1910); 'La guingette' (1911); 'Le grand coup' (1912); 'Napoléonnette' (21st ed., 1913).

MARTELLO TOWERS, so called by corruption from *Mortella*, in Corsica, where a strong tower maintained a determined resistance to a superior English force in 1794. In consequence of the great strength exhibited by this fort the British government erected a number of similar towers round the coast of Great Britain, and especially on the Kentish coast, as a defense against the threatened invasion from France. They are circular, with walls of great thickness, and roofs bomb-proof, there are two stories, the lower for the reception of stores and the upper for the casement of troops. One traversing gun was mounted upon each, in working which the men were secured by the lofty parapet. The ordinary guard was from 6 to 12 men. With improved modern artillery Martello towers are useless, and in many places were dismantled, but some have received a new and more powerful armament, or have been adapted to the use of the coast guard, or revenue officers. In some instances they are rented to private individuals. Martello towers are still to be found in New Brunswick and Nova Scotia. There are also several on the Gulf of Mexico and one still remains at Kingston, Canada.

MARTEN, the name of several fur-bearing animals of the weasel family (*Mustelidæ*) that are mainly arboreal in habits, and do not change their color to white in winter. All inhabit the cooler parts of the Northern Hemisphere. The beech or stone marten (*Mustela foina*) is to be found in Europe generally south of the Baltic, although not now a native of Britain. It is about 17 inches long in body, and its tail adds nine inches; its breast is white. It is tractable, and is believed by some to be the animal domesticated by the ancient Greeks as a mouser. The pine, or sweet, marten (*M. martes*) is rather smaller, but with a much longer tail, proportionally, and is more northerly in its distribution, occurring from the British Isles and Norway eastward to Siberia. It has a finer, more valuable fur than the other, and a yellow throat. Very nearly allied to it in size, form and color is the Siberian sable-marten (*M. zibellina*), noted as furnishing in its coat the finest and most expensive of the furs from animals of this group. The demand for this fur can be met only by the most difficult, and often dangerous, exertion in trapping and hunting in remote Asiatic forests; and it has resulted in a steady diminution of the supply and very high prices for the pelts. There is also a native marten in India and another in Japan. North America has two species of the genus — the American pine-marten, or Canadian sable (*M. americana*), and the pekan (*M. pennanti*). The former is hardly distinguishable from the sable of the Old World, and its fur, although regarded as somewhat inferior, is largely used as a substitute for genuine Siberian sable. (See FUR-TRADE). The pekan is very distinct by its greater size (length, 24 inches, plus tail, 13 inches), its long and very dark coat and its dog-like head. Its fur is of great value.

The body in all these martens is elongated and supple, with a long and somewhat bushy tail; the legs short and the toes separate and flexible, with long sharp claws adapted to the life in trees that most of them follow. They are fierce and cunning hunters, pouncing successfully on all sorts of small animals and birds, destroying birds' nets, catching frogs, and in winter pursuing and killing animals as large as hares and porcupines. The pekan, or fisher, is especially bold and voracious, but does not eat fishes in spite of its name. Both the

American species were formerly common in the mountainous parts of the eastern United States, but are now restricted to the remoter woods of Canada. They make their dens, bedded with leaves and grass, in some high hollow of a tree-trunk, as a rule, but frequently choose a crevice among rocks, and there produce annually a litter of from one to seven young. The period of gestation is about three months, and the young begin to leave the nest when two months old.

Breeding for Fur.— These bloodthirsty little carnivores are the very type of savagery, and even the kittens are almost untamable. The high value of their fur (about 75,000 pelts of the sable, and 100,000 of the Canadian marten represented the market-supply just before the Great War) has caused much effort to be expended, especially in Canada, to breed them in confinement, but thus far the results have been small, although encouraging. The general treatment and food seem to be like that for minks. A large pen made of inch-mesh wire and floored with this, or in some way so prepared that the animal cannot dig out, should contain stumps and bushes to give the marten accustomed exercise. Two males cannot be put together. When the female is ready for a mate she is placed in his cage, or vice-versa, and the mating will take place at night, so that the pair must usually be left together several days. Mating occurs naturally in January or February. When the young are about two months old they may be removed from the mother, and should be brought up by hand, if possible, so as to become more gentle. These general directions apply to the pekan, but his quarters should be larger than for the sable.

Consult, besides general natural histories, Coues, 'Fur-bearing Animals' (Washington 1877); Ingersoll, 'Life of Mammals' (New York 1909); Seton, 'Northern Mammals' (New York 1909); Jones, 'Fur-Farming in Canada' (Montreal 1913).

MARTENSITE, a constituent of steel, existing at a high temperature, and which being retained by sudden cooling, confers hardness upon the steel.

MARTHA'S VINEYARD, Mass., an island off the southern coast, in the county of Dukes, about 25 miles southeast of New Bedford. It is separated from the mainland by Nantucket and Vineyard sounds, from Nantucket Island by Hukeget Channel, and from Elizabeth Islands by Vineyard Sound. It is about 21 miles long and 10 miles across the widest part. The northern coast is high and rocky, Prospect Peak being 308 feet; the coast line has few indentations, the largest of which is Vineyard Haven. The southern coast is low and irregular, with sand bars and shallow lagoons. On the southwest is Gay Head, 200 feet above the water. A lighthouse is on Gay Head Point. Edgartown, the county-seat, is the principal town on the island. Bartholomew Gosnold discovered and named the island in 1602. The Indians, who then occupied the place, were quiet and friendly, and all became Christians. They remained loyal to the whites even during King Philip's War. The island is a favorite summer resort; annual camp-meetings and summer schools have been held here for a number of years. Pop. of county 4,504.

MARTI, José Julián, ho-sā' hoo-lē-än' mär'tē, Cuban author and patriot: b. Havana, 28 Jan. 1853; d. Dos Rios, Cuba, 19 May 1895. He studied in Havana, was sent to the quarries while only a boy as a political suspect, then went to Spain, where in Madrid and Saragossa he studied for the bar and made himself famous for his liberal views, and on his return to America was professor in the University of Guatemala, whence he came to New York City as consul for Uruguay, Paraguay and Argentina. In 1894 he attempted to land armed men in Cuba, but was intercepted in Florida; in the next year he succeeded in landing, joined Gomez and was killed in a skirmish with the Spanish at Dos Rios. Marti founded the Cuban organ of independence in New York City, *La Patria*. He was a poet, and wrote a Spanish translation of Helen Hunt Jackson's 'Ramona' (1888).

MARTIAL, mär'chĭ-ąl (MARCUS VALERIUS MARTIALIS), the world's greatest early writer of epigrammatic poetry, was born in Bilbilis, Spain, 1 March of one of the years 39 to 41 A.D., and died probably between 102 and 104 A.D. Like his literary friends, the Senecas, Lucan and Quintilian, who also were of Spanish birth, Martial in his writings was thoroughly Roman, and indeed has left us our most valuable picture of contemporary Rome. A Fronto and Flacilla, whom he mentions, may have been his parents, but we know nothing of their origin or station. The grammatical and rhetorical training which his parents secured for him perhaps at Tarraco or Corduba, he half-seriously disparaged as being of no financial advantage, but it was really to his pen that he owed, at least indirectly, his support through life. For, although he was apparently fully equipped for practice at the bar, the profession of an advocate was too exacting to be attractive. On his arrival in Rome, perhaps in 64 A.D., powerful friends launched him on a literary career which rapidly carried his fame even to the limits of the empire. But success as a poet brought him no contentment, since in return for the money, food, clothing, etc., which by flattery and begging he got from imperial courtiers and other men and women of wealth, he had daily to perform social duties that were highly irksome to his indolent nature. From the patron's reception at dawn to the end of the latest dinner, he had to dance attendance with wit that should never fail. We find him living at first in humble lodgings on the Quirinal, later in a house of his own on the same hill. A barren farm near Nomentum was his usual refuge from the cares and noises of the capital, but he sometimes made long journeys in Italy, often visiting the country houses of his friends. To his poetical and social talents he also owed political favors from Titus and Domitian. A tribuneship gave him membership in the equestrian order, but probably not the fortune of a knight. He likewise received the coveted privileges to which a father of three children was entitled, the *ius trium liberorum*, though unearned; for the references that have given rise to the theories that he was married from one to three times are not of personal application. It is probable that even Marcella was no more than his patroness. When disgust at the client's life in Rome led him in 98 to return to Bilbilis, this Spanish lady gave him a fine estate. A longing soon seized

him, however, to be back in Rome with all its inspirations, a longing never to be gratified; Pliny the Younger, who had helped Martial with a gift of money on his departure from Rome, records the poet's death in Spain. Besides those already named, Juvenal and Silius Italicus should be mentioned as Martial's friends. Noteworthy among contemporaries whose names do not appear in his poems are Tacitus and Statius. The former could have had little sympathy with his character, the latter was no doubt his rival in literary mendicancy. We have 1,575 of Martial's poems. More than half of these are of four lines or less. His earliest book published in 80 contains epigrams describing shows given by the emperor. Then followed books XIII and XIV made up of two-line inscriptions for presents at the Saturnalia. The other books (I–XII), containing many poems which we should not call epigrams at all, appeared at varying intervals in the period 85–101. Martial's influence in his chosen field has never ceased. A remarkable number of the best epigrams in modern languages are merely adaptations or translations of his poems. His personal character has received general condemnation. Obscenity and servile flattery are the main charges. But in judging even the insincere language that he uses in speaking of the tyrant Domitian we must remember that it went only a step beyond the requirements of formal court etiquette. Kindly critics find in Martial some good points, his modest valuation of his own work, his freedom from envy, his scorn of all hypocrisy, his steady resistance to all temptations to use his powerful weapon of satire in either an unjust or unkind spirit, his tender love of children, humane treatment of slaves and above all his deeply affectionate attachment to his friends. See EPIGRAM.

Bibliography.— The best text edition of his poems is that of W. M. Lindsay, Oxford, Clarendon Press. The German annotated edition of Friedlaender is invaluable. The only complete translation in English, is in the Bohn series.

WALTON BROOKS MCDANIEL,
Professor of Latin, University of Pennsylvania.

MARTIAL LAW, government by arbitrary military power; that supersedes municipal law, or State law, yet is not a military law. When in time of extreme peril to the State, either from without or from within, the general safety cannot be trusted to the ordinary administration, or the public welfare demands the adoption and execution of extraordinary measures, it may become necessary to declare the existence of martial law. This is, indeed, no law at all in its ordinary sense; it is in fact the abrogation of it. That which is done under martial law has not an immediate constitutional or legislative sanction, as the military or the statute law, for example, has. Yet remotely and indirectly martial law expresses the will of the people. The Supreme Court of the United States has held that a State legislature may proclaim its existence whenever the public safety demands it; and the Constitution, by implication at least, also permits its proclamation by that clause which provides that the privileges of the writ of *habeas corpus* shall not be suspended, unless when, in cases of rebellion or invasion, their suspension is essential to the general welfare. See also LAW, MILITARY; MILITARY COURTS AND COURT-MARTIAL.

MARTIAL'S EPIGRAMS. Marcus Valerius Martialis, the epigrammatist, was born about 40 A.D. in Bilbilis, Spain, 20 miles west of the present Aragonese city of Saragossa. He went to Rome at the age of 23, and after nearly two score years of residence at the capital returned to his native town, where he died about 104. At the age of 40 he celebrated the dedication of the Coliseum and won the favor of the Emperor Titus by composing the 'Book of Spectacles,' a collection of epigrams on the incidents of the day's sport. Several years later he published two collections of couplets to be used with dinner favors and with presents at the Saturnalia, which afterward took their places in his works as books XIII and XIV. Books I to XII, his really characteristic work, were published at intervals more or less regular from 86 to 102, the last one having been sent from Spain after his return. The total number of pieces in the 15 books is about 1,550, of which three-fourths are in the elegiac couplet, like the verse of Ovid and the great part of Greek epigram.

Though at first glance Martial seems to continue the tradition of the epigram, which had already had long life and great fame in the Greek tongue, he is really to a large extent original and creative, and is of the greatest importance in literary history as being the founder of the epigram as it has been popularly conceived ever since; that is, as a short, highly concentrated poem with a point that is made to appear suddenly or with a surprise.

> "Chloë weeps with one eye. Do you ask how it's done?
> The answer is easy: she has only one."
> (Dimsdale.)

Whether his influence has been the best is sometimes questioned. Those who are familiar with the calm, sunny, contemplative, tripping genius of the Greek Anthology, which, though its epigrams are always neat and concise, and sometimes stinging, has not as a whole the satiric character, will be likely to think Martial somewhat hard and metallic in both form and content. Those who enjoy "verbal exactness and mechanical ingenuity" (Dimsdale), and look to the epigram for the character of stinging, satiric pointedness usually associated with it, will agree with Lessing that he is the world's greatest epigrammatist, and understand his appeal to Dryden, Pope and Johnson.

Martial is not all pungency. A not inconsiderable number of his pieces are epigrammatic rather than epigrams; a few of them might be classed as short poems without reference to epigram. They are nevertheless homogeneous. Even more than perfection of form, the characteristic that gives them all a unity, is their quality as a human document. Martial was right when he said, "My page smacks of human life." Provincially and simply bred, pursuing the existence of a free lance in a great capital in an intense age, gifted with a keen understanding, a quick eye, and a responsive pen, he converted into clear, cameo-like literary pictures for the amusement of his own time, and for the amusement and instruction of all time, innumerable vivid impressions from the fascinating realities among which he moved. To read his epigrams in quantity is like sitting before a cinematograph of the Flavian era. There flash before us lively scenes

of men and things: numerous faces of the known and the nameless, types of men and women from every sphere, the bawling schoolmaster with his noisy pupils, the poetical bore reciting his verses to unwilling ears, the stingy host, the snowstorm in the amphitheatre, the routine of the Roman day, the patron who is never at home, the guest who comes too early, the transparent hypocrite, the slow barber, the waste slopes of recently active Vesuvius, the incident of the circus or theatre or the dinner or the street. In an age of *ennui*, the world is fresh and interesting to Martial. Not only men, but things, find him attentive. Thinking of this and of his facility of expression, Verrall says ('Literary Essays, Classical and Modern,' p. 15) that he is "perhaps the only writer in whom plate and tapestry, earthenware and hardware, beds and sofas, become truly poetic." Dimsdale ('Latin Lit.,' p. 472), commenting on his method of attaining vividness by the use of realistic detail, says that "he uses no general expressions such as rich and poor, but speaks in terms of jewelry, scents, linen, cloaks and boots."

Martial is a satirist, but only by accident. He has no moral indignation such as a few years afterward glows from the page of Juvenal. "A certain intolerance of hypocrisy," says Mackail ('Latin Lit.,' p 194), is the nearest approach Martial ever makes to moral feeling. He does not scold; he does not even preach. He manifests no moral enthusiasms, and almost no malice for anything. He is a wit rather than a humorist, though he is by no means without humor. He merely records, and his quality as a satirist is the outgrowth and accompaniment of epigrammatic expression rather than the result of conscious purpose. To portray freely and realistically was in itself to satirize.

The reader's enjoyment of Martial unexpurgated is interfered with by coarseness in about one in 10 of his pieces. This is hardly higher or lower than the modern European average, though his coarseness is not on this account the more welcome. He is also charged with servility in his attitude toward the emperor and other patrons. It should be said in extenuation that literary patronage has until not long ago been a regular and a recognized relation and has always carried with it a certain amount of purely conventional flattery, and that Martial's servility perhaps did not seem so offensive in his own day as it does now, when the servility of the literary art finds expression in other ways. So clean-hearted and clean-lipped a man as the younger Pliny, in expressing regret at the poet's death, has left the word *candor* as descriptive of him: "he was a man of talent, penetrating, keen, with exceeding wit and satire as a writer, and with no less candor." This is probably a reference to the sincerity and frank straightforwardness of Martial the realist, who saw clearly and took no pains to cover up either other men's failings or his own. Of himself he says, "My page is free, my life upright." Of his work he says:

> "Good, fair, and bad
> May here be had.
> That's no surprise!
> Twere vain to look
> For any book
> That's otherwise."
> (Kirby Smith.)

Lovers of Spanish art in general, and of the present day novel in particular, will find themselves wondering whether Martial is not to be explained as merely an ancient example of the truthfulness and directness which so strongly characterize the Spanish genius. Paul Nixon, in "A Roman Wit," gives a spirited rendering, inevitably lacking in finish, of about 200 epigrams. The Bohn Library Martial contains a greater number of translations in both verse and prose. Kirby Smith, in the *Sewanee Review*, Vol. 26, No. 1, may be consulted for appreciation.

GRANT SHOWERMAN.

MARTIN, Saint, of Tours: b. about 316; d. about 400. He attended the catechetical school at Pavia. His father was a military tribune, and compelled him in his 16th year to take up arms. He is said to have early escaped from his father and received instruction in a Christian church. He served under Constantius and Julian, and went to Gaul, where he appeared as the model of all virtue. Among other acts he divided his cloak with a poor man whom he met at the gates of Amiens (Ambianum). The legend says that Christ appeared to him in the following night covered with the half of this cloak. Soon after this vision Martin was baptized, in 337. After living many years in retirement he made a visit to his native place, during which he converted his mother, and opposed with zeal the Arians who prevailed in Illyria. For this he was scourged from the country, on which occasion he manifested the firmness of a martyr. He now established a monastery in Milan, but when he found himself again exposed to persecution took refuge on the island of Gallinaria, in the Ligurian Sea. He next settled at Poitiers, where he assembled a number of monks, and is said to have wrought many miracles. In the year 375 (according to others 371 or 374) the bishopric of Tours was conferred on him against his will. In order to withdraw himself from the world he built the famous convent of Marmontiers, between the river Loire and a steep rock. This is regarded as the oldest abbey of France.

MARTIN, the name of five popes of the Catholic Church, as follows:

MARTIN I, Saint: b. Todi, Tuscany; d. Chersan, Crimea, 16 Sept. 655. He was elected Pope in 649, succeeding Theodore I. He summoned the first Lateran Council at which he caused the doctrine of two wills and operations in Christ to be affirmed. The Emperor Constans II upholding the doctrine which the Council had condemned, took the Pope prisoner and brought him to Constantinople on a charge of treason and then banished him to the Crimea. On account of his sufferings he is numbered among the saints. His day is 12 November.

MARTIN II, or MARINUS I: b. Montefiascone; d. Rome, 14 Feb. 884. He was elected Pope in 882 after the death of John VIII. While bishop of Caere he had been legate for three popes in their negotiations with the East. To English King Alfred he sent a piece of the wood of the cross.

MARTIN III, or MARINUS II: b. Rome; d. 946. He succeeded Stephen VII in 942 and was greatly esteemed for his learning and nobility of character.

MARTIN IV (SIMON DE BRION, sē-môn dė brē-ôn): b. France; d. Perugia, 28 March 1285. He succeeded Nicholas III in 1281, having previously been canon of Tours, and cardinal from 1262. He owed his election in great measure to the influence of Charles of Anjou, whom he supported thereafter and did all in his power to enable that monarch to retain possession of Sicily. In his pontificate occurred the massacre known as "The Sicilian Vespers."

MARTIN V (ODDONE COLONNA, ŏt-tō'nā kō-lŏn'nä): b. Rome, 1368; d. there, 20 Feb. 1431. He was elected Pope in 1417, after the abdication of Gregory XII, and the deposition of John XXIII and Benedict XIII, during the Council of Constance. His first act was to promulgate a bull against the Hussites, remarkable from the circumstance that in it the Pope seems to recognize the supreme authority of the councils. He was one of the ablest of the popes, and through his efforts unity was finally secured to the Church and peace to Italy. In 1418 he dissolved the Council of Constance, though a number of difficulties were not then adjusted, and dissensions continued in the Church. Benedict XIII still lived; and at his death, in 1424, a new anti-pope was elected in Clement VIII, who renounced his pretensions in 1429, when he received the bishopric of Minorca as an indemnification.

MARTIN, Alexander Carson, American missionary and educator: b. Livonia, Ind., 10 April 1827; d. Peking, China, 18 Dec. 1916. He was educated at the University of Indiana, from which he was graduated in 1846. He later studied at the New Albany Theological Seminary (now the McCormick Theological Seminary), at Chicago, from which he was graduated in 1847. The New York University conferred the degrees of D.D. and LL.D. upon him.

He was appointed a Presbyterian missionary to China in 1849 and left here on 23 November of that year for Canton. For 67 years he worked among the Chinese. It was said of him that probably he knew China and the Chinese language as did no other American. Dr. Martin retired from active missionary work in 1868 to enter the Chinese government service. He was named by the Board of Foreign Missions here as an honorary missionary. He acted as interpreter for the United States Minister to China in the negotiations between the Washington government and the Imperial Government, at Peking, in connection with the United States-Chinese treaty of 1853. He was the organizer and president of the International Law and Language School in Peking which was destroyed in the Boxer rebellion in 1900. He was said to have been the first Western teacher to open the door of English learning to the youth of the Far East. After 30 years as adviser to the Chinese government, Dr. Martin became president of the new Imperial University of China. This movement for the establishment of a great institution of learning there was blighted by the Boxer uprising. Later Dr. Martin took the leadership of the Wu Chany University for a period of three years. He retired from this work in 1905. In the same year, when he was 78 years old, he gave up teaching, but remained in the capacity of adviser for both the government and the Presbyterian mission.

MARTIN, Bradley, American banker, brother of Frederick Townsend Martin: b. Albany, N. Y., 1841; d. 1913. In 1863 he was graduated at Union University, Schenectady, N. Y. He served in the National Guard during the Civil War, attaining the rank of lieutenant. Subsequently he was admitted to the bar. He managed his vast interests in banks, trust companies and the industries, and was one of the most prominent figures in the social life of the East. In 1893 he went abroad and thereafter lived in England and Scotland.

MARTIN, Charles Cyril, American civil engineer: b. Springfield, Pa., 30 Aug. 1831; d. Far Rockaway, N. Y., 11 July 1903. He was educated at Rensselaer Polytechnic, Troy. He was engineer in the Brooklyn navy yard during the Civil War; and afterward chief engineer of Prospect Park, Brooklyn; and was appointed John A. Roebling's second assistant in building the Brooklyn Bridge, of which he became chief engineer after Roebling's retirement.

MARTIN, Edward Sanford, American author: b. Owasco, N. Y., 2 Jan. 1856. In 1877 he was graduated at Harvard University and in 1884 was admitted to the bar at Rochester, N. Y. He is a writer of editorials in *Life* and for other weeklies and magazines. His published works are 'Sly Ballades in Harvard China' (1882); 'A Little Brother of the Rich,' verses (1890); 'Pirated Poems' (1890); 'Windfalls of Observation' (1893); 'Cousin Anthony and I' (1895); 'Lucid Intervals' (1900); 'Poems and Verses' (1902); 'The Luxury of Children, and other Luxuries' (1904); 'The Courtship of a Careful Man' (1905); 'In a New Century' (1908); 'Reflections of a Beginning Husband' (1913); 'Unrest of Women' (1913); 'The War Week by Week' (1914); 'The Diary of a Nation' (1917).

MARTIN, Félix, French-Canadian clergyman and author: b. Auray, Brittany, 1804; d. 1886. He emigrated to Canada in 1842, having previously entered the Society of Jesus. His task in Canada was to aid in re-establishing Jesuit missions. Saint Mary's College, Montreal, was founded by him. Père Martin made diligent search in French and Canadian archives seeking out information regarding the early Jesuit missionaries in Canada. His principal works are 'Manuel du pèlerin de Notre Dame de Bon Secours' (1848); 'Relation des Jesuites,' an enlarged edition of O'Callaghan (1850); 'Mission du Canada, relations inédites' (1861); 'De Montcalm en Canada' (1867); 'Le reverend Père Isaac Jogues' (1873).

MARTIN, François Xavier, American jurist: b. Marseilles, France, 17 March 1764; d. New Orleans, 11 Dec. 1846. He emigrated to Martinique when 18; later removed to New Berne, N. C.; taught French there, and became a printer; studied law, being admitted to the bar about 1789; and in 1792 was requested by the State legislature to compile the British statutes in force before the Revolution. He was himself a member of the assembly in 1806–07; was judge of the Mississippi Territory in 1809; went to Louisiana in the same capacity in 1810; and in 1813 became attorney-general of the new State of Louisiana. From 1815 until just before his death Martin was a member of the Supreme Court of the State. Although blind for the last 10 of these 31 years, his ability was

not impaired, and it is due to him that the law of the State was in some measure evolved from the tangle of French and Spanish statutes in which he found it. He wrote a 'History of North Carolina' (1829); 'History of Louisiana' (1827); and a version of Pothier on Obligations.

MARTIN, Frederick Townsend, American author, brother of Bradley Martin: b. Albany, N. Y., 1849; d. London, 1914. In 1872 he was graduated at the Albany Law School. He became a member of the New York National Guard, in which he was commissioned colonel and served a period as judge-advocate. For many years previous to his death he had lived in Europe. He was prominent in charitable enterprises and a lavish benefactor of the poor. His writings deal with the doings of the wealthy and the so-called social-elect, of which class Martin was well qualified to speak. His works include 'The Passing of the Idle Rich' (1911); 'My Personal Experiences of Meeting Snobs' (1911); 'Reminiscences of My Life' (1911); 'Things I Remember' (1913).

MARTIN, George Madden (MRS. ATTWOOD R. MARTIN), American author: b. Louisville, Ky., 3 May 1866. She was educated in the public schools of Louisville, finishing at home on account of her health. In 1892 she was married to Attwood R. Martin. She became a frequent contributor of short stories to magazines and periodicals and is author of 'Emmy Lou—Her Book and Heart' (1902); 'The House of Fulfilment' (1907); 'Abbie Ann' (1907); 'Letitia—Nursery Corps, U. S. A.' (1907); 'Selina,' (1914); 'Emmy Lou's Road to Grace' (1916); 'Warwickshire Lad' (1916).

MARTIN, Gregory, English translator of the Bible: b. Maxfield, Sussex, date unknown; d. Rheims, France, 28 Oct. 1582. Martin received his education at Saint John's College, Oxford, where he took the degree of B.A. in 1561 and that of M.A. in 1565. He was very well versed in Hebrew, Greek and Latin and was made tutor to Philip Howard. Martin opposed the Established Church; remained a staunch Roman Catholic and exerted a powerful influence on the Howards to remain true to the ancient faith. In 1570 his continued opposition to the new ecclesiastical order of things in England obliged him to seek refuge at Douai, Flanders, where he became professor of Hebrew in the newly-founded English College. He went to Rome in 1577 to aid in founding the English College there. In 1578 Martin went to Rheims, to which city the English College was moved from Douai, and there spent his remaining years in writing the production of the English version known as the Douai Bible. It is the official Bible for English Catholics, was made from the Vulgate of Saint Jerome and collated with the Greek and Hebrew versions. In 1582 the New Testament was issued but not until 1609–10 did the Old Testament appear. English Protestants critized Martin's version, yet the commission of Forty-Seven made extensive use of it in preparing the Authorized Version in the reign of James I.

MARTIN, Helen Faucit, LADY. See FAUCIT, HELEN.

MARTIN, Helen Reimensnyder, American author: b. Lancaster, Pa., 18 Oct. 1868. She made a special study of English subjects at Swarthmore College, Pennsylvania, and Radcliffe College, Cambridge, Mass. In 1889 she married Frederic C. Martin. Mrs. Martin is a contributor of short stories of Pennsylvania Dutch life to *McClure's, Leslie's, the Century, Cosmopolitan* and the *Ladies' Home Journal.* She has published 'Tillie, a Mennonite Maid' (1904); 'Cabina, a Story of the Amish' (1905); 'The Betrothal of Elypholate' (1907); 'Revolt of Anne Royle' (1908); 'The Crossways' (1910); 'When Half-Gods Go' (1911); 'The Fighting Doctor' (1912); 'The Parasite' (1913); 'Barnabetta' (1914); 'Martha of the Mennonite Country' (1915); 'For a Mess of Pottage' (1915).

MARTIN, Henry Austin, American surgeon: b. London, 23 July 1824; d. Boston, 7 Dec. 1884. He came to the United States at an early age and was graduated from the medical school at Harvard in 1845, when he established a practice in Boston. He served as a surgeon until nearly the close of the Civil War, when he resigned and was brevetted lieutenant-colonel for gallant service. He devoted his attention principally to surgery and to the treatment of smallpox, upon which subject he was a generally recognized authority. He was the originator of many important innovations in the field of surgery and published valuable professional articles in periodicals.

MARTIN, Henry Newell, American biologist: b. Newry, Ireland, 1848; d. 1896. He received his education at University College, London, and at Christ's College, Cambridge. He was appointed to the chair of biology at Johns Hopkins University in 1876 and was also made director of the biological laboratory. Dr. Martin carried out important experiments on respiration. He was chosen president of the American Society of Naturalists in 1890. He published 'The Human Body' (1881); 'Observations in Regard to the Supposed Suction-Pump Action of the Mammalian Heart' (1887). Professor Martin assisted Huxley in the latter's 'Practical Biology' (1876) and edited 'Studies from the Biological Laboratory of Johns Hopkins' and the *Journal of Physiology.*

MARTIN, Homer Dodge, American painter: b. Albany, N. Y., 28 Oct. 1836; d. Saint Paul, Minn., 12 Feb. 1897. He was elected a member of the National Academy of Design in 1875; and resided in France in 1882–86. While he was influenced somewhat by the Barbizon School of painters, he developed a style entirely his own, which placed him among the best known of American landscape painters. His works include 'Landscape on the Seine'; 'An Equinoctial Day'; 'Brook in the Woods'; 'In the Adirondacks'; 'Sand Dunes on Lake Ontario'; and 'White Mountains, from Randolph Hill.' Consult for reproductions Carroll, D. H., 'Fifty-Eight Paintings by Homer D. Martin' (1913).

MARTIN, Joseph, Canadian statesman: b. Milton, Ontario, 24 Sept. 1852. He was educated in Canadian and Michigan public schools and at the University of Toronto. He was admitted to the bar in 1882 and from 1882 to 1892

was a member of the Manitoba legislature. From 1888 to 1891 he was attorney-general and minister of education of Manitoba. In the latter capacity he introduced the bill abolishing the separate school system in Manitoba and thus precipitated a memorable crisis in Manitoba and Dominion politics. Martin failed of election to the House of Commons in 1891, but sat for Winnipeg in 1893–96. He removed to British Columbia in 1897 and in the following year became a member of the legislature of that province, sitting until 1903. In 1898–99 he was provincial attorney-general and minister of education and in 1900 was premier of British Columbia. In 1907 Martin was owner and editor of the Vancouver *Guardian*. In 1908 he removed to England, contested Southwest Warwickshire in the Liberal interest in 1909. In Canada he took an active part against the Canadian Pacific Railway monopoly, in the abolition of French as official language and advocated the introduction of the Torrens system of land registry. He is a strong freetrader and advocate of reciprocity between the United States and Canada.

MARTIN, Josiah, English colonial governor in America: b. probably in Antigua, West Indies, 23 April 1737; d. London, England, July 1786. He rose to the rank of lieutenant-colonel in the British army in 1771, and in the same year was appointed to the royal governorship of North Carolina. He was successful in pacifying the "regulators," many of whom remained zealous Tories; and took a firm and energetic attitude in the maintenance of British authority. But on 24 April 1775 he was compelled to escape to the sloop *Cruiser*, from which on 8 August he issued a prodigiously long proclamation which the Whigs ordered burnt by the hangman. He was with Sir Peter Parker at Charleston (June 1776), and accompanied Cornwallis into North Carolina after the British victory over Gates at Camden; but in March 1781 withdrew to Long Island, and thence went to England.

MARTIN, Luther, American lawyer: b. New Brunswick, N. J., 9 Feb. 1748; d. New York, 10 July 1826. He was graduated from the College of New Jersey (Princeton) in 1766; studied law at Queenstown, Md.; was admitted to the Maryland bar in 1771; in 1774 was one of the commissioners appointed to oppose the claims of Great Britain; in 1778 became attorney-general of Maryland; and in 1787 was a delegate from Maryland to the convention that framed the Constitution of the United States. His opposition to the instrument was so strong that, rather than sign it, he left the convention, thus earning from Jefferson the sobriquet of "the Federal bull-dog." In 1804 he defended Samuel Chase (q.v.) in the latter's impeachment trial before the Senate, and in 1805 resigned his attorney-generalship and resumed private practice. He was counsel for Burr in Burr's trial at Richmond in 1807, in 1814–16 was chief judge of the Baltimore Court of Oyer and Terminer, and in 1818–20 was again attorney-general of Maryland. Among his writings was the series of pamphlets, 'Modern Gratitude' (1801–02). Consult Goddard, 'Luther Martin' (1887).

MARTIN, Percy F., English author and journalist: b. 30 March 1861. He received his education at University College, London, served as correspondent in Mexico of the *Times*, the *Tribune* and the Glasgow *Herald;* and in India of the *Times* (Engineering Supplement) and the *Evening Standard*. He also served as special correspondent of the *Financial Times* and *The Engineer* in Central and South America and as contributor to the *Times Trade Supplement*. He has published 'Through Five Republics of South America' (1905); 'Mexico's Treasure House' (1906); 'Mexico of the Twentieth Century' (1907); 'Salvador of the Twentieth Century' (1911); 'Peru of the Twentieth Century' (1911); 'Greece of the Twentieth Century' (1912); 'Maximilian in Mexico' (1913); 'The Sudan in Evolution' (1916). He is a contributor to the *Quarterly, Edinburgh, Fortnightly* and *British Reviews*, and other periodicals.

MARTIN, Sir Theodore, English lawyer and author: b. Edinburgh, 16 Sept. 1816; d. 16 Sept. 1906. He was educated at the University of Edinburgh and became a solicitor in Edinburgh in 1840. In 1846 he became a parliamentary solicitor in London, carried on an important and extensive business and varied professional cares with literary work. With Aytoun he published the once famous 'Bon Gaultier's Ballads' (1845). He married in 1851 Helen Faucit, the celebrated actress. His translations comprise many of the works of Goethe, Schiller, Horace, Catullus, etc., and he has written 'Essays on the Drama'; 'Madonna Pia' (1855); 'Life of Lord Lyndhurst' (1884); 'Life of the Prince Consort' (1875–80); 'Helena Faucit, Lady Martin' (1900). He was created K.C.B. in 1881.

MARTIN, Thomas Commerford, American electrical engineer and author: b. London, England, 22 July 1856. He was educated in an academy at Gravesend, England, by a private tutor and subsequently studied divinity. He was associated with Thomas A. Edison in laboratory work and electrical development in 1877–79 since when he has been engaged in editorial work. From 1883 to 1909 he was editor of the *Electrical World* and since 1909 has been executive secretary of the National Electric Light Association. In 1900–15 Mr. Martin was engaged as special expert of the Census office of the United States. He has lectured at the Royal Institution of Engineers, La Société Internationale des Electricians, Paris, the University of Nebraska, Columbia and Lehigh universities, Delaware College and for the New York Board of Education. He was a member of the conference committee organized by engineering societies to expend the $1,500,000 given by Andrew Carnegie for a united engineering building and the Engineers' Club of New York. Mr. Martin is a member of many scientific societies and has published 'The Electric Motor and Its Applications' (1886); 'Inventions, Researches and Writings of Nikola Tesla' (1893); 'Edison — His Life and Inventions,' with F. L. Dyer (1910), and contributions to reference books, magazines and journals on electrical topics.

MARTIN, Thomas F., Democratic leader in New Jersey: b. in New England, about 1868. He came to Hudson County, N. J., in 1896, and worked as a reporter on the *Hudson Dispatch*. Later he became business manager, and when the publishing company failed bought in the property at auction, re-established the paper and made it a political power. Entering politics, he

was chosen to represent North Hudson in the State legislature. For several terms he was the Democratic leader in the House of Representatives, including the years of Woodrow Wilson's governorship. Since 1916 he has been secretary of state of New Jersey.

MARTIN, Thomas Mower, Canadian artist: b. London, England, 1838. He studied art at the South Kensington Art School; removed to Canada in 1862 and settled in Toronto, Ontario. His best-known pictures are 'The Untamed Wilderness'; 'A Summer Idyl'; 'Sunrise, Muskoka.' He was one of the founders of the Royal Canadian Academy, the Ontario Society of Artists, the Art Union of Ontario and the Ontario School of Art. His publications are 'An Artist's Letters from the Rockies' (1889) and 'Canada from an Artist's Point of View' (1895).

MARTIN, Thomas Staples, American legislator: b. Scottsville, Va., 29 July 1847. Since 1853 he has resided on a farm not far from his birthplace. In 1864–65 he was a cadet at the Virginia Military Institute and for much of that period was actually connected with the army of the Confederate States. In 1865–67 he studied at the University of Virginia and in 1869 was admitted to the practice of law. Since 1895 he has been United States senator from Virginia.

MARTIN, Victoria Claflin Woodhull, Anglo-American financier and reformer: b. Homer, Ohio, 23 Sept. 1838. In 1852 she married Canning Woodhull, from whom she later separated. Her second marriage was to John Biddulph Martin who died in 1897. With her sister, in 1870, Mrs. Woodhull founded a stock brokerage house in New York, from which there was issued *Woodhull and Claflin's Weekly.* For many years she has edited the *Humanitarian Magazine.* In 1870 Mrs. Woodhull memorialized Congress for women's suffrage, and lectured throughout the United States on finance, women's suffrage, religious and scientific improvement of the human race, etc. In 1872 she was nominated for the Presidency of the United States by the Equal Rights party. She has organized conventions for the discussion of social reform, carried on a continuous propaganda work in the interests of the working classes both in America and Europe for over 30 years. Mrs. Martin's publications include 'The Origin, Tendencies, and Principles of Government'; 'Social Freedom'; 'Garden of Eden Stirpiculture'; 'Rapid Multiplication of the Unfit'; 'The Human Body the Temple of God'; 'Argument for Woman's Electoral Rights,' etc.

MARTIN, William Alexander Parsons, American educator: b. Livonia, Ind., 10 April 1827; d. 18 Dec. 1916. He was graduated from the Indiana State University and studied theology. He went to China as a missionary in 1850 and has spent the greater share of his life there engaged in educational and missionary work. He assisted in making the treaty between the United States and China in 1858, and was an authority in China on questions of international law. He was professor and president of Tung Wen College 1868–98, and then president of the New Imperial University until 1900, when it was destroyed in the siege of Peking, in which city he was imprisoned with the American legation. In 1902 he was appointed president of the University of Wuchong. He has edited in Chinese the *Peking Scientific Magazine,* and the *Science Monthly,* and has published 'Siege in Peking' (1900); 'Chinese Legends,' 'The Lore of Cathay' (1901), etc.

MARTIN, Winfred Robert, American librarian: b. Ningpo, China, 22 March 1852; d. 1915. In 1872 he was graduated at Princeton University and three years later received the degree of M.A. at the same institution. In 1878 he was graduated at the law school of New York University. For several years subsequently he studied in Germany, receiving the degree of D.Ph. at Tübingen in 1887. He held the chair of Oriental languages and literatures at Trinity College, Hartford, from 1888 to 1907 and from 1902 to 1907 also taught Sanskrit at the Hartford Theological Seminary. In 1907 Dr. Martin was appointed librarian of the Hispanic Society of America. He received the honorary degree of LL.D from Trinity College in 1907 and four years later King Alfonso of Spain created him knight of Isabella the Catholic.

MARTIN DE MOUSSY, Jean Antoine Victor, French physician: b. Moussy-le-Vieux, 1810; d. 1869. His medical education was obtained in Paris, where he practised in the military hospitals. He removed to Montevideo, Uruguay, in 1841 and in 1843–52 directed the medical service of the French and Italians engaged in the siege of the city. In 1852 Dr. Martin was engaged by the Urquiza government to prepare a work on the geography of Uruguay. In order to prepare himself for the task he traveled up and down the country in the years 1855–59. The work appeared in three volumes under the title 'Description géographique et statistique de la confédération argentine' (1860–64). Another volume was his 'Mémoire historique sur la décadence et la ruine des missions des jésuites dans le basin de la Plata' (1865). Dr. Martin presented his meteorological observatory to the city of Montevideo.

MARTIN, a swallow (q.v.). In the United States the name is restricted to the purple martin (q.v.), several other species of which (genus *Progne*) are familiar garden birds in South America. The bank-swallow (q.v.) is sometimes called sand-martin, especially in England, where the term is more generally used as a synonym of "swallow" than in America.

MARTINE, James Edgar, American legislator: b. New York, N. Y., 25 Aug. 1850. He received a public school education. He engaged in farming near Plainfield, N. J., and also acquired large real estate and building interests. At various times he was candidate for the New Jersey house of representatives, the senate and other offices. When Woodrow Wilson was governor of New Jersey Martine was one of his most ardent supporters and became United States senator for the term 1911–17. In the Senate of the United States he warmly championed the cause of labor in the discussions in regard to working conditions, wages, etc., in the coal mines of West Virginia and Colorado.

MARTINEAU, mär'tĭ-nō, **Harriet,** English author: b. Norwich, 12 June 1802; d. Ambleside, 27 June 1876. She was a sister of James

Martineau (q.v.). Her first work, 'Devotional Exercises for the Use of Young Persons,' appeared in 1823; and in 1830–31 she won three prizes offered by the Central Unitarian Association for as many essays designed to convert respectively the Catholics, the Jews and the Mohammedans. "The essays," observes a biographer, "probably converted nobody, but brought in 45 guineas." Next came several stories, mostly intended to inculcate some useful lesson, such as those having the title, 'Illustrations of Political Economy' (1831–34), which were followed by 'Illustrations of Taxation' (1834), and gained an immediate recognition. After a sojourn in the United States (19 Sept. 1834–1 Aug. 1836), she published 'Society in America' (1837), intended as a comparison of "the existing state of society in America with the principles on which it is proposedly founded," and 'A Retrospect of Western Travels' (1838), including some criticisms of slavery that were not well received in this country. Up to about 1851 Miss Martineau had been known as a Unitarian, but she later showed a decided leaning toward Positivism, and in 1853 published a condensation of Comte's 'Positive Philosophy.' Among her other works of importance may be mentioned her 'History of England during the Thirty Years' Peace' (1849). During the last 20 years of her life her writings consisted mainly of pamphlets and contributions to newspapers and periodicals. A remarkably candid autobiography, which had been written for many years, was published after her death (1877). Consult also Miller, 'Harriet Martineau' (1884).

MARTINEAU, James, English Unitarian clergyman and philosopher: b. Norwich, 21 April 1805; d. London, 11 Jan. 1900. His father, Thomas Martineau, the great-grandson of a Huguenot surgeon who left France after the revocation of the Edict of Nantes, was a manufacturer of bombazines. Harriet Martineau (q.v.) was an elder sister. He was sent to Derby in 1821 to study civil engineering, but in the following year became a student of Manchester College. In 1827 he took charge for a year of Dr. Lant Carpenter's school in Bristol, and in 1828 he accepted a call to the copastorship of Eustace Street Presbyterian Church, Dublin. In 1831 he published 'Hymns for Christian Worship,' and next year resigned his pastorate, but shortly afterward accepted the copastorate of Paradise Street Chapel, Liverpool, of which, in 1835, he became sole pastor. In 1836 appeared his first separate original work, 'The Rationale of Religious Inquiry,' which attracted considerable attention. In 1839 he was associated with J. H. Thom and Henry Giles in the defense of Unitarianism against attacks by orthodox clergymen, and of 13 addresses published in 'Unitarianism Defended' (1839), five were by Martineau. In 1840 he published his collection of 'Hymns for the Christian Church and Home,' and in the same year was appointed professor of mental and moral philosophy and of political economy in his old college, now named Manchester New College. On the removal of the college to London in 1853 he retained his professorship, but did not settle in London till 1857. In 1848–49 he spent 15 months on the Continent, mostly in Germany, during which his philosophical opinions were profoundly influenced by the study of Greek and German philosophy under Trendelenburg. The remaining publications of his first Liverpool period are an essay on 'The Five Points of Christian Faith' (1841), and the well-known collection of sermons entitled 'Endeavors after the Christian Life' (1843–47). During the period 1849–57, when he was pastor of Hope Street Church, Liverpool, he published many articles in reviews, among them that on 'Mesmeric Atheism,' which finally completed his sister Harriet's estrangement from him. In 1859, being now in London, he and J. J. Taylor, principal of Manchester New College, were chosen joint ministers of Little Portland Street Chapel, but from 1860 till his resignation in 1872 Martineau alone supplied the pulpit. On Taylor's death in 1869 he became principal of the college, a post which he held till his resignation in 1885. In 1866 he was a candidate for the chair of logic and mental philosophy in University College, London, but the united opposition of orthodoxy and secularism led by George Grotte managed to defeat him by a single vote. His publications include 'Studies of Christianity' (1869), a volume of sermons; 'Why Dissent?' (1871); 'Hymns of Praise and Prayer' (1873); 'Modern Materialism: Its Attitude towards Theology' (1876), a masterly attack on Tyndall and the scientific materialists; 'Essays, Theological and Philosophical' (1875); 'Hours of Thought on Sacred Things' (1876–80); 'Ideal Substitutes for God Considered' (1880), a criticism of Moral Idealism; 'A Study of Spinoza' (1883), his first great philosophical work; and 'Types of Ethical Theory' (1885), the earlier of his two masterpieces. During the remaining years of his life he published his great defense of the essential principles of religion entitled 'A Study of Religion: Its Source and Contents' (1888); and his freely critical 'Seat of Authority in Religion' (1890). The first academical degree conferred upon him was that of LL.D. by Harvard in 1872, but he received later the degrees of S.T.D. from Leyden (1875), D.D. from Edinburgh (1884), D.C.L. from Oxford (1888), and Litt.D. from Dublin (1892). Martineau was one of the most eminent preachers of his time, but his greatest work was done in the fields of ethics and philosophical theology. At first a necessarian and utilitarian, he was latterly the great modern champion of free-will and intuitionalism. In the development of his Christology from a sort of Arianism to complete Humanitarianism, and in his ever-increasing insistence upon the continuity of revelation and the purely internal character of ultimate religious authority, he sums up more than any other the history of Unitarianism, and indeed of liberal theology generally during the 19th century. He was a powerful and eloquent champion of Theism against scientific agnosticism and materialism. All his works are written in a uniquely rhythmic style, characterized by a profuse and happy use of figurative language. Consult Jackson, 'James Martineau: A Biography and a Study' (1900); Sidgwick, 'Lectures on the Ethics of Green, Spencer and Martineau' (1902); Drummond, 'Life and Letters of James Martineau'; and Upton, 'A Survey of Philosophical Work' (1902).

MARTINELLI, mär-tē-nĕl'lē, **Sebastiano,** Italian prelate: b. Lucca, Tuscany, 20 Aug. 1848; d. 5 July 1918. He was educated at the College of Saint Augustine in Rome, entered the Augustinian Order and was ordained to the priesthood in 1871. He became superior-general of the Augustinian Order throughout the world in 1889 and in 1894 was sent to America to visit the monks of that order and shortly afterward was designated apostolic delegate to the United States. At this time he was consecrated titular bishop of Ephesus. His term as delegate was marked by the statesmanlike solution of several important questions. In 1901 he was made a cardinal, returned to Rome soon afterward and became prefect of the Sacred Congregation of Rites.

MARTINEZ, Enriquez, ĕn-rē'kĕth mär-tē-neth, or **Enrico,** Mexican engineer: b. about 1570; d. in Mexico, 1632. His birthplace is variously given as Germany, Holland, Spain (in Ayamonte, Andalusia) or Mexico. He studied engineering in Spain; went to Mexico as interpreter to the Inquisition and with the title of cosmographer royal; and in 1607 undertook to drain the valley of Mexico, threatened by lakes Zumpango and San Cristobal. His canal was fairly successful but inadequate, and after various experiments on the part of the other engineers, with whose work Martinez was accused of tampering, he was bidden enlarge his tunnel and canal. He died before the work was much more than started. Martinez established a printing-press in the City of Mexico and wrote on the natural history of Mexico, on astronomy and on trigonometry. His works are 'Discurso sobre la magna conjunción de los planetas Júpiter y Saturno, acaecida en 24 Diciembre 1603 en Sagitario' (Mexico 1604); 'Repertorio de los tiempos, é historia natural de Nueva España' (Mexico 1606); 'Tratado de Trigonometria.'

MARTINEZ DE CAMPOS, Arsenio. See CAMPOS, ARSENIO MARTINEZ DE.

MARTINEZ DE ROZAS, Juan, hoo-ān' mär-tē-nĕth dā rō'zäs, Chilean statesman: b. Mendoza, Argentina, 1759; d. there, 3 March 1813. He was educated at Cordova; studied law at Santiago; became professor at San Carlos, Chile, in 1781; in 1787 was made assistant intendant of the province of Concepcion; and in 1796 had risen to the second command in the presidency. He took a prominent part in planning the revolution of 1810; was a member of the governing junta until 1811, when he became its president; and showed himself an able administrator and a brave soldier. Carrera quarreled with him, got the upper hand and banished him to his birthplace, only a few months before his death.

MARTINEZ, mär-tē'nĕz, Cal., town, county-seat of Contra Costa County, on the Strait of Carquines, and on the Southern Pacific Railroad, about 30 miles northeast of San Francisco and 85 miles southwest of Sacramento. It is near valuable mines and also rich farm lands, on which large quantities of wheat, grapes, pears, etc., are raised. A novitiate of the Christian Brothers is here and the Brothers maintain a library which has about 6,000 volumes. It has a high school, city hall and courthouse, oil refineries, copper smelters and fertilizer works. Pop. 2,115.

MARTINI, mär-tē'nē, **Simone,** Italian painter, sometimes mistakenly called Simone Memmi: b. Siena, about 1284; d. Avignon, 1344. He was the founder of the Sienese school of painting and executed frescoes in the churches of Siena, Assisi, Naples and Orvieto. At the invitation of Pope Benedict XII he went to Avignon and in collaboration with his brother, Donato, decorated the papal palace. He seems to have aimed at flat decorative effect rather than artistic boldness and originality in his wall painting and his color is harmonious and fresh, though his faces are conventional. The large painting of the Madonna on the walls of the Palazzo Pubblico is his most important work at Siena (1315); at Florence is to be seen an 'Annunciation' of his in the Uffizi, and fragments of his work also survive at Avignon. His other more important pictures are 'The Way to Golgotha' (1333) in the Louvre; 'The Blessing of Christ' in the Vatican; 'Christ as a Child with His Parents' in the Royal Institution, Liverpool; 'Saint Louis of Toulouse' in San Lorenzo, Naples; fragments at Pisa, Arvieto. Fenway Court, Boston, contains some examples of his work. Consult Berenson, Bernhard, 'Central Italian Painters of the Renaissance' (New York 1897).

MARTINIQUE, mär-tī-nēk', West Indies, an island of the Lesser Antilles and, except Guadeloupe, the largest in the Caribbean chain. Area, 381 square miles. It is very mountainous (Mount Pelée, in the northwest, 4,900 feet; Mount Carbet but a little lower, while a peak near the southern coast rises to the height of 3,950 feet. The thermometer ranges between 76° and 88° F., the summers being hot and dry, autumn and a part of winter hot and rainy, and spring comparatively cool. The inhabitants number about 185,000. About 3 per cent are Caucasians, who reside chiefly in Saint Pierre; the balance of the population — those who, in the main, suffered least from the disaster of 1902 — are described as negroes, mulattoes, "copre, chabin and matés" — that is, blends of the African, Carib Indian (q.v.), Mongolian and French races. A large part of the surface is covered with forests of silk-cotton, species of mahogany, etc. The flora is closely related to that of South America; the fauna abound in minor reptiles and insects. Of the snake kind the most dreaded is the fer-de-lance, whose bite is fatal. The mongoose has practically exterminated this serpent within recent years. Sugar and cocoa are the chief productions, followed by coffee, tobacco and cotton. There are over 40,000 acres under cultivation and tobacco-growing is subject to special regulation. There are 45 sugar mills and many distilleries. In 1916 sugar to the value of $5,300,000, rum to the value of $5,600,000 and cocoa to the value of $150,000 were exported. In the same year the total of all imports was $6,770,000 and of exports $12,195,000. There entered that year 557 vessels of 465,502 tons.

Martinique is a colony of France, sending one senator and one deputy (two deputies until 1903) to the French legislature. Its affairs are administered by a governor, general council and elective municipal councils. Educational institutions are a law school at Fort-de-France, with 56 students; several secondary or normal schools and about 100 primary schools with

18,000 pupils. The island was acquired by the French in 1635. Toward the close of the 18th and beginning of the 19th centuries it was temporarily held by the British. In May 1902 volcanic eruptions from Mount Pelée destroyed Saint Pierre, which was the largest city on the island, with a population of 26,011, and the residents of that place perished, almost without exception; but the statement commonly made, that "a great part of the island was overwhelmed," is incorrect. The scope of Pelée's work was limited. (See PELÉE, MONT). About 10,000 persons besides those in Saint Pierre lost their lives (in all, 20 per cent of the total population); the best agricultural regions, however, in the south and along the eastern coast were uninjured. The capital, Fort-de-France (pop. 26,399), is situated in the southwest and is important as being the military and naval headquarters and rendezvous in the French Antilles; the terminus of the French transatlantic steamers and West Indian cable system. For local traffic there are mail coaches and motor-cars, which receive a subsidy from the government, and subsidized steamers ply on the coast. The Bank of Martinique, situated at Fort-de-France, has a capital of $600,000. A statue of the Empress Josephine, who was born in Martinique, is one of the ornaments of the public gardens of Fort-de-France. In 1918 the military force consisted of 39 officers and 2,255 men. The capital has had its share of misfortunes in the past: it was nearly consumed by fire in 1890 and partially destroyed by an earthquake in 1839.

MARTIN'S FERRY, Ohio, city, in Belmont County, on the Ohio River and on the Pennsylvania, the Baltimore and Ohio and the Wheeling and Lake Erie railroads, almost opposite Wheeling, W. Va. The first settlement was made in 1769 and in 1865, nearly a century later, it was incorporated as a village. The charter under which it is now governed was granted in 1885. It is situated in a region noted for its abundance of bituminous coal, iron and limestone. The chief manufactures are iron, steel, stoves, shovels, nails, glass, tin, machine-shop products, lumber, barrels and boxes. The city owns and operates the electric-light plant and the waterworks. Pop. 9,178.

MARTINSBURG, mär'tinz-bĕrg, W. Va., city, county-seat of Berkeley County, on the Cumberland Valley and the Baltimore and Ohio railroads, about 65 miles northwest of Washington, D. C. It is in the vicinity of valuable stone quarries and forests which furnish timber for many mills. The chief manufactures are hosiery, woolen goods, lime, wagons, lumber and canned goods. The repair shops of the Baltimore and Ohio Railroad and slate and limestone quarries furnish employment for a number of people. The chief buildings are the government building, the Berkeley Female Seminary, the Berkeley Female Institute and the King's Daughters' Hospital. The waterworks are owned and operated by the municipality. The government is vested in a mayor and council, chosen biennially. It was incorporated in 1778. Pop. 12,032. Martinsburg, as the chief city of the lower Shenandoah Valley, on the main road leading across the Potomac, the converging point of several roads, with the Baltimore and Ohio Railroad running through it, was an important point in the military operations of the valley. Early in July 1861 General Patterson, after a slight skirmish, occupied the place, the Confederates falling back to Winchester. Patterson soon abandoned it, and it was reoccupied by the Confederates. Early in March 1862 it was again occupied by the Union forces under General Banks, the Confederates falling back up the valley. It was abandoned 25 May 1862, after Banks' defeat at Winchester, but soon reoccupied by Banks. On 8 Sept. 1862 Gen. Julius White was in command of the place with about 2,500 men of all arms. At this time General Lee had crossed the Potomac and was at Frederick, Md. On the 10th Jackson led a column from Frederick, crossed the Potomac at Williamsport and moved on Martinsburg. White retreated during the night of the 11th to Harper's Ferry. In June 1863, when Ewell's corps moved down the valley in the Gettysburg campaign the place was held by Col. B. F. Smith with 1,200 infantry and a battery. On 13 June, Ewell, at Cedarville, detached Jenkins' cavalry brigade and Rodes' infantry division to surround and capture the Union forces at Berryville and Martinsburg. Both garrisons escaped, Smith, with the greater part of his infantry, crossed the Potomac at Shepherdstown and making his way to Maryland Heights. The battery retreated by the Williamsport road, was pursued and lost five of its six guns, with 200 infantry accompanying it. On 1 July 1864 the place was held by General Sigel with about 3,200 infantry and dismounted cavalry and a battery. On the 2d, Early arrived at Winchester on his campaign to menace Washington and, under General Lee's instructions, to clear out the lower valley and wreck the Baltimore and Ohio Railroad. Parties were sent north and west against the railroad, and on the 3d Bradley T. Johnson, with a cavalry brigade, was ordered to move through Smithfield and Lee Town, cross the railroad at Kearnysville, east of Martinsburg, and, pushing north, unite with McCausland at Hainesville beyond Martinsburg. Johnson arrived at Lee Town early in the morning, where he was met by Col. J. A. Mulligan with about 2,000 men and a battery, and after a hard fight was driven back on the divisions of Rodes and Ramseur, which were supporting him. Breckinridge's division, which marched on the main road to Martinsburg, drove before it Stahel's cavalry, on outpost at Darkesville. Sigel, warned of approaching danger, burned his stores, collected his command, and, leaving Martinsburg on the night of the 3d, crossed the Potomac at Shepherdstown and occupied Maryland Heights. Early cleared the valley and advanced on Washington, and on the 11th Martinsburg was occupied by Sullivan's division of Hunter's command, and remained in Union occupation until the 25th, when Crook, being defeated by Early at Kernstown, was driven through Winchester, made a short stand at Martinsburg and recrossed the Potomac at Williamsport, Early again occupying the town and destroying the railroad on either side of it, and continuing in possession until 10 August, when, upon Sheridan's advance to Halltown, he abandoned Martinsburg and Winchester and fell back to Strasburg. He advanced from Strasburg on the 17th and reoccupied Martinsburg

on the 19th with his cavalry. From this time until 17 September the place was held alternately by Union and Confederate cavalry, on the 17th by Averell's Union division. On that day Early left Winchester with a heavy force of infantry, cavalry and artillery, and on the 18th attacked and drove Averell from Martinsburg across the Opequon. Sheridan defeated Early on the Opequon on the 19th, and drove him up the valley, and Martinsburg was again occupied by Union troops, to remain in their possession until the close of the war.

MARTINSVILLE, Ind., city, of Morgan County, situated on White River, the Cleveland, Cincinnati, Chicago and Saint Louis and the Vandalia railroads, 30 miles southwest of Indianapolis. It enjoys considerable reputation as a health resort, having several artesian mineral wells and modern sanatoria. It contains flour mills, planing and saw mills, brick yards, chair works and a woodenware factory. The city owns the electric-lighting plant and the water-supply system. Pop. 4,529.

MARTINSVILLE, Va., town and county-seat of Henry County, situated on the Danville and Western and the Norfolk and Western railroads, 40 miles northwest of Danville. It contains several fine public buildings, including the town-hall, courthouse, post office and high school. Its industrial establishments include cotton mills, tobacco warehouses, furniture and spoke factories. It has large farming interests, and the Roundabout stock farm is a show place. The electric-lighting, telephone and water-supply plants are the property of the municipality. Pop. 3,368.

MARTINY, Philip, American sculptor: b. Alsace, 19 May 1858. His boyhood was spent in France working in various studios. Early in the 80's he came to America and made further studies under the direction of Saint-Gaudens. Martiny's efforts in decorative sculpture have been conspicuously successful and his work has improved this branch of art in the United States. Among his best-known works are the sculpture on the grand staircase of the Congressional Library, Washington; the Carnegie Library, Washington; the New York Hall of Records; Chamber of Commerce groups, New York; bronze doors of Saint Bartholomew's, New York; a fountain and figures in the Clark residence, New York; Soldiers' and Sailors' Monument, Jersey City; McKinley Monument, Springfield, Mass.; statue of Vice-President Hobart at Paterson, N. J., and the de Gernay Monument at Newport, R. I.

MARTY, Martin, Roman Catholic bishop: b. Schwyz, Switzerland, 12 Jan. 1834; d. Saint Cloud, Minn., 19 Sept. 1896. He received a collegiate education in Switzerland and Austria, was ordained to the priesthood in 1856 and in 1860 came to the United States. He assisted in the founding of a priory at Saint Meinrad's, Ind., and was its first superior; through his efforts the priory became an abbey in 1870 and Marty was raised to the rank of mitred abbot. He resigned his office several years later in order to perform mission work among the Indians of Dakota, over whom he gained a wide influence. He mastered their language and wrote a Sioux grammar and dictionary. In 1880 he became the first bishop of Sioux Falls, and in 1894 was transferred to Saint Cloud, Minn.

MARTYN, mär'tin, **Henry,** English missionary to India: b. Truro, Cornwall, 18 Feb. 1781; d. Tokat, Asia Minor, 16 Oct. 1812. He was graduated from Saint John's College, Cambridge, in 1801; became a Fellow of the same college in the next year, and, turning from the law, took orders, and landed in India in 1806. After three years at Dinapore he was transfered to Cawnpore, where he opened a church in 1810, in spite of violent opposition, and where he completed a Hindustani version of the New Testament. To perfect a translation of the New Testament into Persian and to recover his health in 1811 he traveled into Persia. In Tabriz he was taken ill with a fever, and on his hurried journey home was compelled to stop at the plague-stricken town of Tokat, where he died. In 1856 a monument to his memory was erected there. He was the great missionary hero of the Church of England up to the early part of the 19th century. Martyn's works include 'Controversial Tracts on Christianity and Mohammedanism' (1824), and versions of various parts of the Bible into Hindustani, Persian and Judæo-Persic. Consult Bell, C. D., 'Henry Martyn' (New York 1881); Smith, George, 'Henry Martyn, Saint and Scholar, First Modern Missionary to the Mohammedans, 1781–1812' (London 1892); Wilberforce, Samuel (ed.), 'Journals and Letters of the Reverend Henry Martyn' (2 vols., London 1837).

MARTYN, William Carlos, American Presbyterian clergyman, historical writer and lecturer: b. New York City, 15 Dec. 1841; d. 4 Aug. 1917. He studied law at Columbia under Prof. Theodore Dwight, 1859–60, and was graduated from Union Theological Seminary in 1869 and ordained to the Congregational ministry. He held important charges in Saint Louis, Chicago and New York; 1897–1902 was literary director in a New York publishing house, and has contributed largely to magazines and periodicals. His historical and biographical works cover a wide circle and include 'Martin Luther' (1866); 'John Milton' (1866); 'Pilgrim Fathers of New England' (1870); 'The Puritans' (1867); 'The Huguenots' (1867); 'The Dutch Reformation' (1868) 'John B. Gough' (1893); 'William E. Dodge' (1891), and 'Wendell Phillips' (1890), this last having an enormous circulation. In other veins were a work on 'Christian Citizenship' (1896), and a novel, 'Sour Saints and Sweet Sinners' (1898). Since 1905 Dr. Martyn has resided in Noroton, Conn., and has served the Presbyterian church there. At various times and places literary honors and dignities have come to him.

MARTYNIA, a genus of annual and perennial herb of the family *Martyniaceæ*. The 10 species have thick sub-erect stems, opposite or alternate heart-shaped leaves, showy catalpa-like flowers in short terminal racemes, and horned capsules which suggest the names unicorn plant and proboscis-flower. When ripe the capsules split and expose numerous black wrinkled seeds. The stems and foliage are clammy and malodorous, but the flowers of some species not unpleasantly perfumed. The species are all natives of warm parts of America. They are often planted for ornaments, as curiosities and for their capsules, which while

young and tender are used as material for pickles. *M. louisiana,* to which the popular names are generally applied, is the most commonly grown.

MARTYR (Greek for «witness»), a designation applied by the Christian Church to those persons in particular who, in the early ages of Christianity, suffered death rather than renounce their faith, and thus testified their confidence in the truth of the new doctrines. Martyrs are sometimes classified as of three classes: martyrs in will and deed, like Saint Stephen; those in will, but not in deed, like Saint John, who escaped from the death ordained for him by Domitian; and those in deed but not in will, like the Holy Innocents. An account of the life, persecutions and death of the Christian martyrs is called a martyrology (q.v.). A tomb or oratory erected on the spot where a martyr suffered was called martyrium, martyry. Festivals in honor of the martyrs seem to have been observed as early as the 2d century. The Christians offered prayers at the martyry and thanked God for the example which they had given to the world. The rite was concluded with the sacrament of the Lord's supper and the distribution of alms. Eulogies were also delivered and accounts of the lives and actions of the deceased read. These festivals were called the birthdays of the martyrs, because on the day of their death they were born to eternal life. There are 14,000 martyrs commemorated in the Roman martyrology. In the early centuries of Christianity the bishop of the locality certified the names of those who were deemed worthy of the title of martyr, but after 1100 this designation became more and more reserved to the Pope, especially since 1636.

MARTYR, mär'ter, **Peter.** See PETER MARTYR.

MARTYRE DE SAINT SEBASTIAN, Le (The Martyrdom of Saint Sebastian), an oratorio by Debussy which had its first performance at Paris on 22 May 1911.

MARTYROLOGY, called also calendar of the saints, the acts of the saints, menology, anology, synaxary, a list of martyrs and other saints, in which was sometimes noted the character of their lives, and in the case of a martyr the place and date of his martyrdom and the nature of the sufferings which he underwent. Baronius, an ecclesiastical historian of the 16th century, attributes to Saint Clement of Rome, almost contemporary with the apostles, the first idea of collecting the acts of the martyrs. In the time of Gregory the Great (end of the 6th century) the Church possessed a general martyrology, the author of which is said to have been Saint Jerome, who made use of materials collected by Eusebius of Cæsarea. The only part of it now extant is a catalogue of the martyrs who suffered in Palestine during the last eight years of the persecution of Diocletian. There is a martyrology attributed to Bede (beginning of 8th century), but if not altogether spurious it is at least interpolated. Numerous martyrologies were produced in the next century and subsequently. In 1586, under the auspices of Sixtus V, a martyrology was printed at Rome, with notes by Baronius, with the title of 'Martyrologium Universale.' Ruinart's 'Acta Primorum Martyrum Sincera' appeared at Paris in 1689, and a new edition of it was published in 1859. The 'Acta Sanctorum' (q.v.) of the Bollandists comprises over 60 volumes issued at various times from 1643, but the work is still incomplete. The well-known English work of John Foxe, 'The Book of Martyrs' (Protestant), may also be mentioned. Consult Achelis, 'Die Martyrologien, ihre Geschichte und ihr Wert' (Berlin 1900); Lämmer, 'De Martyrologio Romano, Parergon Historico-criticum' (Regensburg 1878); 'Martyrologium Sancti Hieronymi' (in 'Acta Sanctorum' for November, Paris 1894); Kenrick, Francis P. (ed.), 'The Roman Martyrology' (Baltimore 1907); Delhaye, 'Le témoignage des martyrologes' (in 'Analecta Bollandiana,' Vol. XXVI, Paris 1907).

MARULIC, Marko, a Croatian poet and historian: b. Spalato in 1450; d. 1524. After studying at Padua he entered a monastery in Spalato, where he wrote most of the works which stamped him as the foremost of Croatian authors and rendered his name one of the greatest in the literature of Ragusa. Among his works the most noted was 'De Institutione Bene Vivendi,' published in 1511. It was translated several times. In his native tongue he wrote mystery plays, the first of their kind in the Croatian language, and several poems, best of which is 'The History of Judith.' His poems were republished with a biography (Agram 1869).

MARVEL, Ik. See MITCHELL, DONALD GRANT.

MARVELL, Andrew, English poet and satirist: b. Winestead, Holderness, Yorkshire, 31 March 1621; d. London, 18 Aug. 1678. He was graduated from Trinity College, Cambridge, in 1638; after activity as poet and tutor became colleague of Milton in the Latin secretaryship in 1637; was three times elected to Parliament for Hull, and under the Restoration attacked Charles II and advocated a republic. While a true literary genius most of Marvell's work has little appeal to moderns, because it deals with persons and incidents long since passed away and forgotten. His lyrics, however, are immortal, and through them his place in English literature is assured for all time. His chief poem is the 'Horatian Ode Upon Cromwell's Return from Ireland' (written 1650; first printed 1776). The shorter poem, 'The Bermudas,' is also well known. Consult his 'Works,' edited by T. Cooke (2 vols., London 1726); 'Works,' edited by E. Thompson (3 vols., London 1776); 'Poems and Satires,' edited by G. A. Aitken (2 vols., ib. 1892); 'Poems and Satires,' edited by E. Wright (ib. 1904); Birrell, Augustine, 'Life of Andrew Marvell' (in 'English Men of Letters Series,' London 1905); Brown, John, 'Andrew Marvell' (in 'Cambridge History of English Literature,' Vol. VII, Cambridge 1911); Dove, 'Life of Andrew Marvell' (London 1832).

MARVIN, Charles Frederick, American meteorologist: b. Putnam, Ohio, 7 Oct. 1858. He was graduated as a mechanical engineer from the Ohio State University in 1883, where he had been instructor in mechanical drawing and laboratory practice since 1879. In 1884 he was appointed to the United States Signal Service and later was made professor of me-

teorology in the weather bureau, of which he became chief in 1913. He has made many important investigations and discoveries in connection with the weather bureau, and has written quite extensively concerning them.

MARVIN, Enoch Mather, American Methodist Episcopal clergyman: b. Warren County, Mo., 1823; d. 1877. He was self-educated; became a minister of the Methodist Episcopal Church in 1841 as member of the Missouri Conference. Upon the division of the Methodist body in 1844 he cast his lot with the Methodist Church South. In the Civil War he was for two years a chaplain in the Confederate army. He was chosen bishop of his Church in 1866 and at the time of his death had just returned from a missionary tour which took him all around the world. He published 'Errors of the Papacy and Transubstantiation' (1860); 'The Life of William Goff Caples' (1871); 'Sermons' (1876); 'The Doctrinal Integrity of Methodism' (1878); 'To the East by Way of the West' (1879); 'The Methodist Episcopal Churches, North and South.' Consult Finney, T. M., 'The Life and Labors of Enoch Mather Marvin' (Saint Louis 1880).

MARVIN, Frederic Rowland, American clergyman, essayist and poet: b. Troy, N. Y., 23 Sept. 1847; d. 22 July 1918. Son of Rev. Uriah and Margaret Jane (Stevens) Marvin; educated at Lafayette and Union colleges, College of Physicians and Surgeons, New Brunswick Seminary; sometime professor in New York Free Medical College for Women; pastor of Congregational churches in Middletown, N. Y., Portland, Ore., Great Barrington, Mass., retiring in 1895 for study and travel in Europe; settled at Albany, N. Y., since 1900. Among his works are 'Literature of the Insane'; 'Epidemic Delusions'; 'Last Words of Distinguished Men and Women'; 'Book of Quatrains'; 'Excursions of a Book-Lover'; 'Poems and Translations'; 'Companionship of Books'; 'Christ Among the Cattle'; 'Flowers of Song from Many Lands'; 'Love and Letters'; 'Fireside Papers.' Consult also 'The Top of the Wine-Jar,' a volume of selections from the author's 10 works, with a literary estimate by Livingston Stebbins.

MARX, märks, **Karl,** German Socialist: b. Trèves, 5 May 1818; d. London, 14 March 1883. He was educated at the universities of Bonn and Berlin, and in 1842 took up journalism, becoming editor of the *Rheinische Zeitung,* a Democratic journal; his socialistic articles in this paper caused its suppression in 1843. Marx then proceeded to Paris, where he became one of the editors of the *Deutsch-Französische Jahrbücher,* to which he contributed articles on the "Hegelian Philosophy of Right." He was expelled from France in 1845, and retired to Brussels, where he assisted in organizing the German Workingmen's Association, was also active in the organization of the Communist League, and with Engels issued the famous Communist Manifesto in 1847, which was the first public declaration of international Socialism. In 1848 Marx returned to Germany, started the *Neue Rheinische Zeitung,* and was active in the revolutionary movements of that year. Banished from Germany in 1849, he went first to Paris, then to London, where he lived till the time of his death. He devoted himself largely to the study of economic questions, and was correspondent of the New York *Tribune* and other papers. In 1864 he took a leading part in the organization of the International Workingmen's Association (q.v.), was selected to formulate its program and practically shaped its policy for a number of years; he was also interested in the organization of the German Social Democrats who united with the International in 1869. After 1873 he took no active part in politics, but devoted his time to the completion of his work on capitalism, 'Das Kapital' ('Capital'), the first volume of which had been published in 1867 (English trans. 1886); the second and third volumes were left in manuscripts, and volume II was published in 1885; volume III in 1894, under the editorship of Engel. He also wrote 'Zur Kritik der Politischen Oekonomie' (1859); 'Lohnarbeit und Kapital' (English trans., 'Wage Labor and Capital'); 'Misère de la Philosophie' (1847); 'The 18th Brumaire of Louis Bonaparte' (1852); 'Life of Lord Palmerston' (1850), and 'Revolution and Counter-Revolution,' a reprint of a series of letters in the New York *Tribune,* in regard to the Revolution of 1848 in Germany.

Marx was undoubtedly the founder of the modern socialistic school, in that he first gave definite scientific statement to the principles of modern Socialism. His greatest and best-known work, 'Das Kapital,' is a monument of acute reasoning, extensive reading and knowledge, though excessively long, obscure and tortuous in its meanings. In this he analyzes carefully his theory of value, which is that the measure of the value of a commodity is the amount of labor "socially necessary" to produce it, and shows how under the capitalistic system the laborers are exploited of what they produce over and above their wages (surplus value). These theories were by no means new, though Marx rather confused than elucidated them. He also traces the development of capitalistic production, the growth of the working class or proletariat which is finally to transform or revolutionize society, and lays down the principle that the fundamental factor in the development of society is the method of production and exchange; hence the Socialist movement must simply assist and hasten the changes in progress. Marx was not only a scholar and thinker, but an organizer and agitator of unusual power. (See SOCIALISM). Consult Aveling, 'The Student's Marx' (London 1892); Deville, 'The People's Marx,' for epitomes of 'Capital.' Consult also Böhm-Bawerk, 'Karl Marx and the Close of His System' (New York 1898); Boudin, L. B., 'Theoretical System of Karl Marx in Light of Recent Criticism' (Chicago 1907); Croce, B., 'Historical Materialism and the Economics of Karl Marx' (New York 1914); Spargo, John, 'Karl Marx, His Life and Work' (ib. 1910); id., 'Sidelight on Contemporary Socialism' (ib. 1911).

MARY, the mother of Jesus, is known in the Catholic Church as the Blessed Virgin Mary. The name is from the Gr. *Μαριάμ* (Mariam) or *Μαρία* (Maria), which in turn is from the Heb. Miryām, a word of uncertain meaning. The New Testament narrative is silent as to her parentage and the place and date of her birth. From tradition and other sources we

learn that her father was Joachim and her mother Anne, that by them she was presented in the temple at Jerusalem when she was three years old, and that in the temple she remained until the age of 12 or thereabouts. Her birthplace is variously stated as being Nazareth, Sephoris (Diocæsarea), or Jerusalem. In early youth she was betrothed to Joseph, a carpenter, a scion of the house of David. She probably belonged herself to the same royal lineage. At all events, she was a cousin of Elizabeth, wife of the priest Zachary and mother of John the Baptist. While Mary was betrothed to Joseph, and before her marriage, she was visited at Nazareth, a city of Galilee, by the angel Gabriel, who announced to her that, by the operation of the Holy Ghost, she should conceive and bring forth a son, to whom was to be given the name Jesus, who should be called the son of the Most High, and who should reign over the house of Jacob forever. The angel also said that her cousin Elizabeth had conceived a son in her old age, and was then in the sixth month of her pregnancy. Mary thereupon visited Elizabeth in the hill country of Judah, and, in response to Elizabeth's salutation, "Blessed art thou among women, and blessed is the fruit of thy womb," she uttered under divine inspiration the glorious canticle of praise known as the 'Magnificat.' The visit lasted about three months. On her return to Nazareth, Mary "was found with child of the Holy Ghost." Joseph, however, was in a dream told by an angel of the true condition of affairs, and, instead of putting her away privately, as was his first impulse, he concluded the ritual marriage with her. Some few months later, in obedience to a decree of Cæsar Augustus prescribing a general enrolment, Joseph went from Nazareth in Galilee to the city of David, Bethlehem in Judæa, because he was of the house and family of David, to enrol himself with Mary, who was then great with child. There was no room for them in the inn, and so in a grotto, which served as a shelter for animals, Mary gave birth to her son. On the eighth day afterward the child was circumcised, and was called Jesus, in accordance with the instruction previously given by the angel Gabriel. Thirty-three days later Mary complied with the law of Moses (Lev. xii, 2–8) by offering herself in the temple at Jerusalem for legal purification, and at the same time she presented her child to the Lord in accordance with Ex. xiii, 2, 12 and Num. xviii, 15. On this occasion Simeon pronounced the canticle of joy known as 'Nunc dimittis.' He told Mary that her child was set for the fall and for the resurrection of many in Israel and for a sign that should be contradicted, and that her own soul a sword should pierce. Anna the prophetess, on the same occasion, confessed to the Lord, and spoke of the child to all that looked for the redemption of Israel. A great danger threatened the life of Mary's son. Herod the Great, king of Judæa, having seen and questioned the Wise Men who had come from afar to pay homage to the newly-born King of the Jews, whose star they had seen in the East, concealed the alarm which these strange tidings caused him, directed the strangers to Bethlehem as the city indicated by prophecies for the birth of Christ, and adjured them to let him know, on their return to Jerusalem, where the young king was to be found, so that he too might come and pay him homage. The Wise Men, after offering to the infant Jesus their gifts of gold, frankincense and myrrh, were warned by God in a dream not to go back to Herod, and accordingly they departed by another way into their own country. Herod, not hearing from them, was enraged, and issued an order that every male child two years of age and under in Bethlehem and its borders should be put to death. In the meantime, Joseph, being warned by an angel, had taken the child and his mother and fled into Egypt, and thus the infant Jesus escaped the Slaughter of the Innocents. How long the sojourn in Egypt lasted we do not know. What we are told is that Joseph, advised by an angel of the death of Herod, returned to the land of Israel, but, learning that Archelaus was reigning in Judæa in the room of Herod his father, he decided to go, not to Bethlehem, but to Nazareth, and in the latter city the Holy Family took up their abode.

The chronology of Matthew and the chronology of Luke, the only evangelists who give an account of the events immediately preceding and immediately following the birth of Christ, are at first sight somewhat confusing, but they are not conflicting, and are quite capable of reconcilement, although in this case, as in so many others, the reconcilement will not wholly square with the popular belief.

After the return to Nazareth, Mary makes but few appearances in the Gospel narrative. We learn that she and Joseph went every year to Jerusalem at the solemn day of the pasch, and that on one of those occasions they lost Jesus, who was then 12 years old, and did not find him until after a three days' search. We next find her at the marriage feast at Cana in Galilee, where Jesus, at her request, performed his first public miracle by changing water into wine. After this she accompanied Jesus to Capharnaum. Once the mother and brethren of Jesus sought to speak to him, but could not reach him for the crowd. During the passion, Mary stood by the cross of Jesus on Calvary, and from the cross Jesus commended her to John, who from that hour took her to his own. The last mention of her in the New Testament occurs in the Acts of the Apostles i, 14, where it is written that, between Ascension and Pentecost, the apostles were in an upper room in Jerusalem persevering with one mind in prayer with the women, and Mary the mother of Jesus, and with his brethren. After that time we have no certain information as to where she lived, nor do we know when and where she died. One tradition says that she lived with Saint John at Ephesus and died there; another, that she lived and died at Jerusalem. Baronius, in his 'Annals,' gives the date of her death as A.D. 48. In fixing that year he relied on a passage in the 'Chronicon' of Eusebius; but there is grave doubt as to the genuineness of that passage in the 'Chronicon,' and the present tendency is to regard it as a later interpolation. The general, perhaps even universal, belief among Catholics is that after her death Mary's body, as well as her soul, was assumed into heaven; but this bodily assumption has not yet been made a matter of faith. The Catholic Church teaches that Mary was conceived without original, or racial, sin; that she never com-

mitted actual, or personal, sin; that she was truly the mother of God; and that she always remained a virgin. The doctrine of the Immaculate Conception (q.v.) was not explicitly discussed until the 12th century; but it is claimed that it is implicitly contained in the teachings of the early Fathers of the Church. The festival of the Conception of the Blessed Virgin was certainly celebrated in the Greek Church in the 7th century. It was possibly kept in Spain in the same century. It was observed in Ireland as early as 900, in parts of Italy before 1000, and in England, France and Germany in the 12th century. Saint Bernard, himself a devout client of Mary, upbraided the canons of Lyons for instituting (1140) such a festival without the sanction of the Holy See. He himself did not admit that her conception was sinless. Saint Thomas Aquinas, the Dominican, and Saint Bonaventura, the Franciscan, hesitated to accept the doctrine of the Immaculate Conception on the ground that, unless Mary had been at some time one of the sinful, she could not truly be said to have been redeemed by Christ. John Duns Scotus, the Franciscan, put forward, on the other hand, the doctrine of preredemption. He held that it was as high a tribute to the merits of Christ to assert that Mary was by Him kept free from all taint of original sin, as to say that she first contracted sin and was subsequently delivered from it. This view, at first seriously and even angrily contested, gradually spread, and gathered force and momentum with the progress of time. The Council of Trent declared that in its decrees on original sin it did not include "the blessed and immaculate Virgin Mary, Mother of God." At length Pope Pius IX, on 8 Dec. 1854, promulgated the Bull, *Ineffabilis Deus*, in which is given the authoritative definition, as follows. "We define that the doctrine which holds that the Blessed Virgin Mary, from the first instant of her conception, was, by a singular grace and privilege of Almighty God, in view of the merits of Jesus Christ, the Redeemer of the human race, preserved from all stain of original sin, is a doctrine revealed by God, and therefore to be firmly and steadfastly believed by all the faithful." The dogma of the Immaculate Conception is rejected by the general body of Protestantism, by many schismatics, and by the sect known as Old Catholics.

Scripture and tradition agree in attributing to Mary the greatest personal sanctity, and there is no dispute that the Church has always held her to be free from the commission of actual, or personal, sin. Saint Augustine crystallizes this view when he says ('De natura et gratia,' c. 36) that, out of honor to the Lord, he wishes no question to be made of the holy Virgin Mary when sin is treated of. Her complete freedom from actual sin is confirmed by the Council of Trent (Sess. VI, can. 23): "If any one say that man, once justified, can during his whole life avoid all sins, even venial sins, unless by a special divine privilege, as the Church holds in regard to the Blessed Virgin, let him be anathema."

In the New Testament Mary is called "the mother of Jesus" (John ii, 1, xix, 25, 26; Acts i, 14) and "mother of my Lord" (Luke i, 43), and there are attributed to her the usual functions of motherhood, namely, conception, gestation, parturition, and giving suck; but she is not specifically designated "mother of God." The belief that that title was properly her due prevailed, however, in the Church from the beginning. The term Θεοτόκος (Lat. *Deipara* = mother of God) was probably first formally applied to her toward the end of the 3d century by theologians of Alexandria. It occurs, for example, in the works of Origen. It came into common use in the 4th century, being found in the writings of Eusebius, Athanasius, Didymus, and Gregory of Nazianzus. As Saint Cyril of Alexandria put it (*De Recta Fide ad Regin.*, c. 9), "This name Θεοτόκος was perfectly familiar to the ancient Fathers." Nestorius, however, contended that Mary was not rightfully called mother of God, as she was the mother, not of God, but of a mere man. Thereupon the Council of Ephesus (431) laid it down as an article of faith that Mary is really and truly the mother of God. The words of the decree are: "If any one does not confess that Emmanuel is truly God and consequently that the holy Virgin is the mother of God (Θεοτόκον, *Dei genitricem*) — inasmuch as she gave birth in the flesh to the Word of God made flesh, according to what is written: 'The word was made flesh' — let him be anathema." This decree was confirmed by several later Councils, e.g., Chalcedon (451) and Constantinople (553). It may be added that this teaching was sanctioned in the English Church, for in the first Book of Common Prayer (1549) Mary is called "mother of Thy Son Jesus Christ our Lord and God," and it is still accepted by many, perhaps most, Anglican divines.

The title ἀειὶ παρθένος (Lat. *semper virgo*, ever virgin, always a virgin), which represents a very early belief in the Church, was incorporated in the Creed by the Fifth Ecumenical Council of Constantinople in 553 — "qui de coelis descendit et incarnatus de sancta gloriosa Dei genitrice et semper virgine Maria (ἐκ τῆς ἁγίας ενδόξου Θεοτόκου καὶ ἀειπαρθένου Μαρίας) natus est ex ea." The doctrine of Mary's perpetual virginity, that is, that she remained a virgin before, during, and after parturition, was further emphasized by the Lateran Council in 649 and by the Sixth Ecumenical Council of Constantinople in 680. It is indisputably orthodox both in the Eastern and the Western Church. It is not accepted by Protestants in general, and has been the object of severe attack by modern Rationalists and infidel Bible critics.

The principal feasts held in honor of the Blessed Virgin are the Purification, 2 February (14 February in the Armenian Church); the Annunciation, 25 March; the Visitation, 2 July; the Assumption, 15 August; the Nativity of Mary, 8 September; the Presentation of Mary in the Temple, 21 November; and the Immaculate Conception, 8 December (9 December in the Eastern Church). There are, besides, many minor feasts, some locally celebrated, and others general.

Devotion to the Blessed Virgin has been prevalent in the Church from very early times. It received a fresh impetus from the above-mentioned decree of the Council of Ephesus. The relationship of motherhood in which Mary had been declared to stand to God, stamping as authoritative the already existing popular

belief, made invocation of her as a powerful intercessor with her divine Son a natural corollary, and devotion to her grew apace. In the Middle Ages it was widespread. In England it was so common and entered to such an extent into practical life that that country was long known as Mary's Dowry. The prominence which Mary had thus attained in Roman Catholic devotions and in popular estimation produced a reaction among the Reformers. They believed indeed in the birth of Christ from a pure virgin, who was consequently to be honored as His mother; but their fundamental position, that the justification and salvation of sinful man are accomplished through faith in Christ alone, caused them to repudiate the idea of a mediator with *the* mediator, of any creature coming as intermediary between the soul and Christ. The inevitable result, among Protestants, was an immediate dethronement of the mother from her high place as intercessor with her Son, and the immediate or later denial and striking away of some of her proudest prerogatives. This change of attitude is made evident, for example, in the first Book of Common Prayer (1549) of the English Church, in which the words of the Sarum rite, "glorious and ever Virgin Mary," are changed to "glorious and most blessed Virgin Mary," and still more evident in the second Book (1552) and in the 15th and 22d Articles of Religion (1553). In some sections the Puritan element in Protestantism carried its feeling against Mary so far as to scruple the singing of the 'Magnificat,' and to abandon the public use of the Apostles' Creed because her name occurs in it. Even as recently as 1898 this spirit of opposition to any honor or invocation of Mary succeeded in securing the rejection of the 'Stabat Mater' from the 'Church Hymnary' and the removal of the words, "Son of Mary," from one of the hymns. Such extremes, however, brought about another reaction. In the 18th century even the Scottish Church introduced the Virgin into the public services in one of its "Paraphrases," in another restored the use of the 'Magnificat' in metre, and in recent years authorized the singing of it in prose and the recital of the Nicene and Apostles' Creeds. The English liturgy never abandoned these. Further, it retained, and still retains, in its Calendar, among the "Feasts to be observed," several festivals of the Blessed Virgin. Many Scottish and English divines have written of Mary in terms of great reverence, tenderness, and beauty.

It may be fairly stated that at no time in the history of the Catholic Church have love of Mary and devotion to her been purer or more extensive and intensive than they are at the present day (1919). The Ave Maria is second only to the Lord's Prayer in frequency of use. The Rosary and the Litany of the Blessed Virgin are recited publicly and privately by millions of persons every day. Special hymns composed in her honor, like the 'Ave, maris stella,' the 'Stabat Mater,' the 'Alma Redemptoris Mater,' and the English 'Daily, daily sing to Mary,' are frequently said or sung. At the end of every low Mass three Ave Marias and the 'Salve Regina,' as well as other prayers, are publicly recited in the vernacular by the priest and the congregation. The month of May is dedicated to Mary, and devotions in her honor are publicly conducted every day during that month. Every day in October the Rosary of the Blessed Virgin is publicly recited. Every Saturday in the year is specially dedicated to her. Sodalities established in her honor exist in every land. In all this the Church, following the teaching of the Fathers and the Councils and especially of the Council of Trent (1545–63), always carefully distinguishes between the adoration or supreme homage due to God alone and the reverence that may properly be shown to any of His creatures. Epiphanius long ago laid down the rule: "Let Mary be held in honor. Let the Father, Son, and Holy Ghost be adored, but let no one adore Mary (*τὴν Μαρίαν μηδεὶς προσκυνείτω*)." *Latria* is the name given to the adoration of God; *dulia* is the name given to the honor shown to the saints or to angels. As Mary is above all saints and angels — "Queen of angels" and "Queen of all saints" she is entitled in her Litany — the degree of veneration shown to her is called *hyperdulia*, which, while it is greater in degree than *dulia*, is infinitely below *latria* and differs in essence from it. Not every Catholic knows those words; but every Catholic, no matter how ignorant otherwise, feels and knows the distinction which they connote.

What Christian art owes to Mary it would be well nigh impossible to tell. Painters, sculptors, architects, musicians, and poets have outdone themselves in celebrating her praise. (See MADONNA IN ART). Shrines in her honor sprang up everywhere. In pre-Reformation England the country was studded with such shrines, the most celebrated being our Lady of Walsingham, in Norfolk. Among modern shrines the famous ones of the Holy House of Loreto in Italy, Einsiedeln in Switzerland, Lourdes in France, and Guadalupe in Mexico may be singled out for special mention.

It is of interest to note that, by decree of the Sixth Provincial Council of Baltimore (1846, confirmed 1847), the Blessed Virgin Mary, conceived without sin, was chosen as the patron of the United States of America.

Bibliography.— The amount of reading matter on this subject is, as might be expected, immense both in quantity and range. The following books may with advantage be consulted on the points with which they deal: Locrius, 'Maria augusta Virgo Deipara' (Atrebati 1608); Dudinck, 'Mundus Marianus' (Coloniæ 1644); Riccardi, 'Storia de' Santuarii più celebri di Maria Santissima sparsi nel mondo cristiano' (4 vols., Milano 1840–44); Newman, 'Development of Christian Doctrine' (London 1845); Passaglia, 'De immaculato Deiparæ semper Virginis conceptu . . . commentarius' (3 vols., Romæ 1854–55); Gousset, 'La Croyance générale et constante de l'Église touchant l'immaculée conception de la bienheureuse Vierge Marie' (Paris 1855); Pusey, 'Eirenicon' (Oxford 1865–69); Bourassé, 'Summa Aurea de Laudibus Beatæ Mariæ Virginis' (13 vols., Paris 1866 et seq.); 'Hymns to the Virgin and Child' (E. E. T. S., ed. Furnivall, 1867); Northcote, 'The Celebrated Sanctuaries of the Madonna' (London 1868); 'Mirror of Our Lady' (E. E. T. S. 1873); La Fuente, 'Vida de la Virgen María con la historia de su culto en España' (2 vols., Barcelona 1879); Waterton, 'Pietas Mariana Britannica' (London 1879); Jameson, 'Legends of the Madonna' (Boston 1881); Kurz, 'Mariologie' (Ratisbon

1881); Northcote, 'Mary in the Gospels' (London 1885); Lehner, 'Die Marienverehrung in den ersten Jahrhunderten' (2d ed., Stuttgart 1886); Bridgett, 'Our Lady's Dowry' (4th ed., London n.d.); Schaff, 'Creeds of Christendom' (New York 1890); Rudniki, 'Die berühmtesten Wallsfahrtsorte der Erde' (Paderborn 1891); Lee, 'The Sinless Conception of the Mother of God: a Theological Essay' (London 1891); Hurll, 'The Madonna in Art' (Boston 1897); Venturi, 'La Madonna' (Milan 1900); Pimentel, 'Historia do culto de Nossa Senhora em Portugal' (Lisbõa 1900); Terrien, 'La Mère de Dieu et la mère des hommes d'après les Pères et la théologie' (4 vols., Paris 1900-02); Ullathorne, 'The Immaculate Conception of the Mother of God' (2d ed., London 1904); Manresa, 'La Virgen Maria en la litteratura Hispaña' (Rome 1905); Kronenburg, 'Maria's Heerlijkheid in Nederland' (Amsterdam 1905-10); Neubert, 'Marie dans l'Église anténicéenne' (Paris 1908); Hartwell Jones, 'Celtic Britain and the Pilgrim Movement' (London 1912); Beissel, 'Wallfahrten zu unserer Lieben Frau in Legende und Geschichte' (Freiburg im Bresgau 1913); Pohle-Preuss, 'Mariology' (Saint Louis 1916).

The principal apocryphal writings relating to Mary are 'Evangelium Jacobi'; 'Liber de infantia Mariæ et Christi Salvatoris'; 'De nativitate Mariæ'; 'Evangelium Ps.—Matthaei'; 'Historia Josephi fabri lignarii'; 'Evangelium Mariæ'; *Ἰωάννου τοῦ θεολόγου λόγος εἰς τὴν κοίμησιν τῆς θεοτόκου*, 'Transitus Mariæ.'

P. J. LENNOX,
Professor of English Language and Literature, The Catholic University of America.

MARY I, queen of England, known popularly as "Bloody Queen Mary": b. London, 18 Feb. 1516; d. there, 17 Nov. 1558. She was a daughter of Henry VIII. After the death of her mother, Catharine of Aragon, she was declared illegitimate; but was restored to the succession in 1544. She was bred by her mother in the Roman Catholic faith, on which account she was treated with rigor under Edward VI. She ascended the throne 16 July 1553, after an abortive attempt to set her aside in favor of Lady Jane Grey (q.v.). One of her first measures was the reinstatement of the Roman Catholic prelates superseded in the late reign. Her marriage to Philip II of Spain, united as it was with a complete restoration of the Catholic worship, produced much discontent. Insurrections broke out under Cave in Devonshire, and Sir Thomas Wyatt in Kent, which although suppressed, formed sufficient excuses for the imprisonment of the Princess Elizabeth in the Tower and the execution of Lady Jane Grey and her husband, Lord Guilford Dudley. England was now formally declared to be reconciled to the Pope; the original laws against heretics were revived, and about 200 perished at the stake, including Cranmer, Latimer and Ridley (qq.v.). Under Philip's influence a war began with France, which ended in the loss of Calais in 1558, after it had been in the hands of the English for above 200 years. This disgrace told acutely upon Mary's already disordered health, and she died after a reign of five years. Consult the 'Life' by Strickland in 'Lives of the Queens of England' (new ed., 1864-65); Lingard, John, 'History of England' (6th ed., London 1855); Froude, 'History of England'; id., 'The Reign of Mary Tudor' (New York 1910); Stone, J., 'Mary I, Queen of England'; Mullinger, J. B., 'Philip and Mary' (in 'Cambridge Modern History,' Vol. II, Cambridge 1904); Hume, Martin, 'Two English Queens and Philip' (New York 1908).

MARY II, queen of England: b. London, 30 April 1662; d. there, 28 Dec. 1694. She was the daughter of James, Duke of York, afterward James II. She was married in 1677 to William, Prince of Orange, and when the Revolution was effected which dethroned her father, Mary was declared joint-possessor of the throne with her husband, King William, on whom the administration of the government devolved. During the absence of William in Ireland in 1690-91, Mary managed parties at home with extreme prudence, and acted with equal ability as regent in 1693 and 1694. She was strongly attached to the Protestant religion and the Church of England. She endowed William and Mary College, Virginia, originally intended for the training of missionaries. See WILLIAM III, and consult Burnet, Gilbert, 'Essay upon the Life of Queen Mary' (London 1695); Doebner, 'Memoirs and Letters of Mary II, Queen of England' (Leipzig 1886); Marshall, 'Kensington Palace in the Days of Queen Mary'; Morris, M., 'Reign of William and Mary' (New York 1910); Grew, E. and M. S., 'The Court of William III' (Boston 1910); Rait, R. S., 'Five Stuart Princesses' (ib. 1908).

MARY OF THE INCARNATION, French-Canadian Ursuline nun and educator: b. Tours, France, 1599; d. Quebec, 1672. Her maiden name was Guyard and in her 18th year she became the wife of M. Martin, but was left a widow with an infant son at 19. She eventually took the veil in the Ursuline Convent at Tours, and in 1639 went to Canada as superior of the convent established at Quebec by Madame de la Peltrie. She was extremely successful in administering the school for girls which the Ursulines opened, impressed all with her strong and beautiful personality, which was emphasized by her fine manners and tall stature, and she is one of the most stately and interesting figures in early Canadian history. She wrote an autobiography. Consult 'Lettres de la vénérable Mère Marie de l'Incarnation' (Paris 1681); Casgrain, 'Life of Mary of the Incarnation' (Montreal 1886); Charlevoix, 'La vie de la Mère Marie de l'Incarnation' (Paris 1724), and her son's life, 'La vie de la vénérable Mère Marie de l'Incarnation' (Paris 1677).

MARY MAGDALEN. See MAGDALEN; also MARY.

MARY STUART (MARY, QUEEN OF SCOTS), queen of Scotland: b. Linlithgow Palace, 8 Dec. 1542; d. 8 Feb. 1587 at Fotheringay Castle. The only child of James V of Scotland and Mary of Guise, she was proclaimed queen upon his death, 14 Dec. 1542, and was crowned 9 Sept. 1543 at Stirling Castle. Negotiations for her hand by the future Edward VI of England came to nothing in spite of the attempt to effect the betrothal by force of arms. In 1548, having been betrothed to the French Dauphin, she was sent to Paris, where 10 years

later she married the Dauphin, who died in 1560 soon after coming to the throne. Mary returned to Scotland, where her French Catholic training and the new Scottish Reformation made her position a hard one. She diplomatically yielded to the force of circumstances and surrounded herself with Protestant advisers. A match between the Scottish queen and Don Carlos of Spain, heir of Philip II, was all but arranged when Mary, in 1565, met Lord Darnley, her cousin, whom she married 29 July 1565. She had hoped to win by this marriage the English Catholics, with whom Darnley had great influence, and to unite all Catholic claims to the English throne, Darnley (see MARGARET TUDOR) being next in succession to Mary; but her husband's weak ambition made him the tool of the Protestant plot against Rizzio, an Italian favorite of the queen, who was killed 9 March 1566, being brutally dragged from Mary's dining-room. Three months later Mary gave birth to a son (later James I of England). She was temporarily reconciled to Darnley; but on 10 Feb. 1567, Darnley's house was blown up and he was killed. Mary had been in the house late the evening before, and the murder was laid to the Earl of Bothwell, whom Mary married 15 May 1567. This act turned all the nobles against her; she was forced to surrender to her enemies and on 24 July 1567 to abdicate the crown. She was imprisoned in Loch Leven Castle; escaped thence in May 1568; was unsuccessful in her attempt to raise an army; crossed into England, entrusting herself to Elizabeth; and was almost immediately imprisoned. Elizabeth wished to put Mary out of the way, seeing in her a dangerous rival for the English crown, but fear of France and Spain held her back until 1585, while Mary was imprisoned at Tutbury and entrapped into the Babington conspiracy against Elizabeth. Although her complicity was not clearly proved she was beheaded at Fotheringay. The moot point in Mary's tragic history is whether she was a party to Bothwell's assassination of Darnley. That she was is apparently proved by letters from her to Bothwell, which the Scottish nobles declared they found in Bothwell's jewel-case but the originals of these letters are not to be found, and their authenticity is doubtful. The matter is ably discussed in Cowan's 'Mary, Queen of Scots' (1901), and Lang's 'The Mystery of Mary Stuart' (1901). The point at issue is, however, confused by making it depend on the authenticity of these letters, for Mary's guilty knowledge of the plot against Darnley seems indubitable. But her career had more than a personal significance since in her person were combined the last hopes of Catholic rule in England and an intense devotion to Catholicism. Personally she was of a dazzling complexion, apparently her main claim to beauty, marvelously winning, as her early career shows, and clever in argument, as was evidenced nowhere more plainly than in her trial for treason.

MARYBOROUGH. (1) An Australian town in Talbot County, Victoria, about 100 miles north of Melbourne. It contains several factories, machine works and gold mines. Its railroads are of considerable importance on account of its central geographical position. Pop. 5,675. (2) Another Australian town in March County, Queensland, about 180 miles north of Brisbane. It is also a railroad centre and a gold mining region. The other industries are timber, coal, sugar and sugar refineries, foundries, boot and shoe factories, soap works, saw mills, fisheries, ship yards, etc. Pop. 11,626.

MARYLAND, one of the 13 original States, was seventh to ratify the United States Constitution (25 April 1788). Situated on the Atlantic Coast, it extends from lat. 37° 53′ to 39° 43′ N. and from long. 75° 4′ to 79° 33′ W. It is bounded on the north by Pennsylvania and Delaware, on the east by Delaware and the Atlantic Ocean, on the south by Virginia and West Virginia and on the west by West Virginia. The entire course of the Potomac River lies in Maryland. The extreme length of the State from east to west is 240 miles and its extreme width from north to south is 125 miles. At its narrowest point near Hancock, the width is only about three miles. The State's shape is roughly that of two triangles meeting at this narrow point. The total area is 12,210 square miles, of which 2,350 square miles are covered by water, leaving 9,880 square miles of land. Annapolis is the capital and Baltimore is the chief commercial, financial and industrial centre. The State is subdivided into 23 counties, in addition to Baltimore city. For polling purposes the counties are subdivided into election districts, and there are about 100 incorporated municipalities, the largest of which are Cumberland, Hagerstown and Frederick.

Topography.— Maryland possesses great variety of physiographic features. The State is divided by the Chesapeake Bay into two parts, known as the Eastern and Western Shores. The Eastern Shore is the smaller division and is a level region, forming a part of the Coastal Plain, the land rising toward the north, in Cecil County, to the height of about 100 feet, while in Worcester County, at the south, the highest elevation is only about 25 feet. The land is broken by rivers which are navigable, as far as tidewater extends, for they are really tidal estuaries, rather than rivers.

MARYLAND.

Steamboats ply upon some of these streams, such as the Elk, the Sassafras, the Chester, the Choptank, the Nanticoke, the Wicomico and the Pocomoke, and the rivers frequently serve as county boundaries.

At the head of the Chesapeake Bay, the Susquehanna River enters it, after draining a large section of New York and Pennsylvania; but owing to rapids, the stream is not navigable. The counties bordering upon the western shore of the bay are also for the most part in the Coastal Plain and have similar characteristics to those of the Eastern Shore, although the river banks are higher and often comprise "cliffs" of earth, and the land is of slightly greater elevation and is more rolling. The average elevation is about 125 feet. The bay exercises a genial influence upon the climate of the surrounding region. The winters are usually neither long nor severe. The part of the State lying between the bay and the Potomac River is known as southern Maryland. The Western Shore is also divided by rivers: the Gunpowder, the Patapsco, the Magothy, the South, the Patuxent and the Potomac. These rivers differ from those of the Eastern Shore only in that most of their upper courses run into hilly country. The soil on both sides of the bay is either sandy or a light loam, which is favorable to the production of cereals and tobacco, and in which all kinds of fruits and vegetables thrive.

From the Coastal Plain the land rises into the Piedmont region to a height of from 300 to 700 feet toward the Blue Ridge. This Piedmont region is undulating in its surface and is well watered by streams which provide considerable water power. Some of these streams empty into the bay, such as the Gunpowder, the Patapsco, the Patuxent; and some are tributaries of the Potomac, such as the Monocacy, the Great Pipe Creek, the Antietam and the Conococheague. Some of the smaller streams, such as Jones' Falls, were called Falls by the early settlers, because of their rapid descent from the uplands. Several ridges, with an elevation of about 800 feet, cross this section, the most important of these being Parr's Ridge, and they divide the country into valleys which are rich and fertile. Beyond the Blue Ridge, the western part of Maryland forms a part of the Appalachian Mountain region, and is traversed by the Allegheny Mountains in Allegany and Garrett counties. Some of the peaks of the Blue Ridge are from 2,000 to 2,400 feet high, and the summits of the Alleghanies vary from 1,500 to 3,500 feet above sea-level. The highest point in the State is Backbone Mountain in Garrett County.

The mean temperature for eastern Maryland for spring is 51.7° F.; for summer, 74.5° F.; for autumn, 55.8° F; for winter, 36.1° F.; for the year, 54.5° F.; for southern Maryland, 53.1°; 75.5°; 57.2°; 36.9°; 55.6°; for northern central Maryland, 50.6°; 73.6°; 54.3°; 33.1°; 53°; for western Maryland, 49.4°; 72.7°; 52.7°; 31.7°; 52°.

Geology.— Maryland displays a remarkably complete sequence of all the geological foundations. The most ancient rocks are here to be found, as well as those still in the process of deposition, and, between these wide limits, almost every important geological epoch is represented. In the Coastal Plain, a predominance of tertiary foundations is found on the Eastern Shore, and, of Mesozoic and Tertiary beds, on the Western Shore. There are few rocks, the country being overlaid with deposits of sand and gravel. In the Piedmont region, on the eastern side of Parr's Ridge (its central watershed), there is a sequence of highly crystalline rocks, in large part, igneous in their origin. On the western side of the ridge, the rocks are only partly crystalline and represent the early Paleozoic time. The rocks of the Frederick Valley are composed of blue Paleozoic limestone, in part overlaid by red sandstone. The Blue Ridge is made up of Cambrian and Lower Silurian beds, in places so eroded and displaced as to disclose the Archæan floor upon which they rest. The Appalachians proper are made up of sharply folded Upper Silurian and Devonian strata, and the Allegheny Plateau is mainly composed of late Devonian and Carboniferous deposits, containing the coal seams of the Cumberland Basin.

Mineral Resources.— Maryland is rich in mineral resources. Iron ore is extensively distributed throughout the Western Shore and in the northern part of the Eastern Shore, and is of good quality for casting and other purposes. The iron industry is of early origin. Forges and furnaces were in operation in the province as early as 1649, and the industry continued, until a recent date, to be an important factor in the prosperity of the State. Most of the old furnaces now have been extinguished, being unable to compete with the great iron and steel plants, using ores produced in foreign countries or in distant parts of the United States. The seat of the steel industry of the State is at Sparrow's Point, in the great works begun in 1887, where Cuban ores are chiefly used, mixed with those from Spain and Algeria. The first Bessemer steel ever produced in Maryland was made there 1 Aug. 1891.

The coal deposits of Maryland belong to the Allegheny field and are semi-bituminous, superior to any other for generating steam. The portion of this field lying in Maryland is of comparatively small size, but constitutes by far the most important of the State's mineral resources. It is called the Cumberland, Frostburg or George's Creek Basin. Situated in an elevated trough, west of the city of Cumberland, and between Dan's and Savage mountains, it is about 20 miles long and 4 miles wide. The principal coal bed is known as the Big, or 14-foot, Vein, and has been the chief one worked. Nearly 100,000,000 tons of coal have been shipped from this vein. The coal contains from 72 to 83 per cent of carbon, and its discovery, about 1804, gave a strong stimulus to the movement for the construction of the Chesapeake and Ohio Canal and the Baltimore and Ohio Railroad.

Three veins of copper are found in Maryland and, before the opening of the Western copper mines, they made it a copper-producing State. Chrome deposits were discovered in Baltimore County in 1827 and have been extensively worked. Some gold has been mined in Montgomery County.

Extensive areas of granite have been quarried for building stone, especially at Port Deposit, in Cecil County; near Woodstock in Baltimore County (much used in the public buildings in Washington city); and near Ellicott

unty. Gneiss has been quar-
County. The sandstone

important and their prod-
much used in Washington city.
best-known districts in the United
for the production of roofing slate is
Peach Bottom region in Harford County,
near the Pennsylvania line. These slates were worked as early as the American Revolution. The most valuable limestone deposits are the highly crystalline marbles at Baltimore County, lying in a bed extending from Lake Roland through Texas to Cockeysville. These quarries produce the white steps for which the Baltimore houses are noted. The Washington Monument in the District of Columbia was built of stone from the Cockeysville quarries. Some of the Maryland marbles have decorative possibilities, and the "Potomac marble" or "Calico rock" of Frederick County is used in the old House of Representatives in the National Capitol. Maryland limestone is used as flux for blast furnaces and is largely quarried and burnt to produce quick lime for commercial and agricultural purposes.

Hydraulic cement is manufactured near Cumberland and Hagerstown, and at Union Bridge, in Carroll County. Serpentine stones are quarried on Broad Creek in Harford County. Clays constitute an important feature of the economic geology of Maryland and are used in the manufacture of building brick, terra cotta and tile work, fire brick and pottery. The workable areas of clay suitable for building brick cover a large area of the State, and the Baltimore pressed bricks have been very extensively used. In Harford County there are produced large quantities of flint, which is used in the manufacture of porcelain. Kaolin and feldspar of fine quality are found in Cecil County, and glass sand is used from Anne Arundel County.

Agriculture.— In the provincial period, after a few years in which the fur trade was important, agriculture became the principal employment of the people. The settlers lived on large plantations along the shores of the Chesapeake and its tributary streams and cultivated tobacco, with the assistance of indentured white servants and later with negro slaves. There was an active demand for the staple crop in European markets, and an extensive commerce resulted, which brought wealth to the planters. Tobacco became the currency of the province, and, for a long time, debts and public dues were paid therein. In the early 18th century, the cultivation of grain gradually supplanted that of tobacco, on the Eastern Shore, and, since that time, tobacco growing lands have been limited to the southern part of the Western Shore below the Severn River. For about 175 years there has been a State inspection of tobacco, and the hogsheads containing it are brought to large State warehouses in Baltimore. Indian corn, or maize, was grown by the aborigines and has always been largely produced in the State. Wheat finds a congenial soil and climate, and the grain trade of Baltimore has long been great. The fertile soils of Frederick, Carroll and Washington counties contain some of the best farming land in the United States, and large quantities of grain are also grown in Queen Anne's County on the Eastern Shore.

The sandy soil of Anne Arundel County is well adapted to early vegetables and to small fruits, such as strawberries. Large quantities of tomatoes are grown there, as also in Frederick and Harford counties. The neighborhood of Baltimore and Washington city has caused large numbers of men to raise vegetables for market in Prince George's, Montgomery, Anne Arundel, Baltimore and Harford counties. Dairy farming is also widely practised in Carroll, Baltimore, Harford and Montgomery counties. There is very little vacant land in the State, except some in the swamps of Dorchester County or in the mountains of Garrett County. The value of farm land has considerably increased of recent years on account of greater accessibility to markets, and runs now from $20 to $150 per acre. The unoccupied land belongs to the State, which maintains a land office in Annapolis.

There is an important trade from the Eastern Shore in sweet potatoes, melons and small fruits, to the markets of Baltimore, Philadelphia and New York. For nearly 50 years large orchards of peaches have been grown on the Eastern Shore and in southern Maryland, and there are now considerable areas of ground in Carroll, Frederick and Washington counties devoted to similar orchards; while many apple orchards have been planted along the mountain sides in the two latter counties. In 1910 there were 48,719 farms in Maryland, of which 33,408 were cultivated by their owners. The value of the buildings was $72,751,000, of the farm animals, $30,649,961, of the grain crops of that year, $21,918,730, of the fruits and vegetables then raised, $15,195,629.

Forestry.— The forest trees are principally pine, chestnut, oak (in three varieties, white, black and red), hickory and walnut. A deadly blight has destroyed a large part of the chestnut trees in the past few years. A State department of forestry was organized in 1906, and has done much toward producing proper methods of forest management throughout the State. The trade in lumber for pipe staves was one of the very first industries of the province.

Game and Fisheries.—The Allegheny Mountains still contain deer; wild geese and ducks may be found on the bay; woodcock, grouse and partridges exist in considerable number. The waters of the Chesapeake Bay and its tributaries abound in fish, crabs and oysters, and terrapin were formerly commonly found. The annual value of the food produced by these waters is very great. Oysters, both fresh and canned, and fish are sent to other States, and Crisfield in Somerset County is one of the greatest crab markets in the world. Of recent years, the State has paid especial attention to the conservation of life in the waters, and has encouraged the cultivation of oysters.

Manufactures.— The first manufactures in Maryland, outside of the products of household industry, were those of iron, and the Principio Furnace in Cecil County has been in operation for over 150 years. The country adjacent to the Chesapeake possesses neither coal nor water power. The central portion of the State is well provided with water power, and the far western portion with coal. Maryland enjoys a strategic position from her nearness also to the sources of production of raw material. From her great facilities in water carriage, and from her good

railroad connection with every part of the continent, she possesses a very favorable position in regard to manufactures. The factories are mostly established in Baltimore, Cumberland, Hagerstown and Frederick, and in the vicinity of these cities. Large quantities of flour are ground in mills along the Patapsco River, and in Frederick and Carroll counties, and there is much canning of oysters and fish, fruit and vegetables, in Baltimore, and, indeed, throughout the State. Textile fabrics, especially cotton duck, are manufactured near Baltimore, and ready-made clothing is extensively made in that city. Bricks, lumber, straw hats, shoes, shirts, cement, copper manufactures, glass, etc., are manufactured there. Large quantities of munitions of war have recently been made in Baltimore, in establishments which had previously made articles of iron and steel for peaceful purposes. Cigars, smoking tobacco, chewing gum and snuff are also largely manufactured in that city. The Bromo Seltzer Company and the Crown Cork and Seal Company have large factories in Baltimore. This city is the leading market of the South for the manufacture and distribution of fertilizers, of drugs and of chemicals. Large breweries and potteries are also located there.

Ship-building.— The Marylanders of provincial times built small sailing vessels, the most interesting types of which were the bugeye and five log canoes, which are still used in the oyster trade on the Chesapeake. After Baltimore was founded, it became a centre of ship-building, and the clipper ships which came from its shipyards were famous around the world for their beauty and speed. They carried on trade with South America, and made voyages to the Pacific, as well as to Europe. When steel ships succeeded wooden, there was established by the Pennsylvania Steel Company, about 1888, an important ship-building plant at Sparrow's Point, near the mouth of the Patapsco River, 12 miles below Baltimore. This plant has recently been bought by the Bethlehem Steel Company, and has been very much enlarged during the Great War. Another important ship-building corporation is the Baltimore Dry Dock Company, located at Baltimore, on Whetstone Point near Fort McHenry. There are several lesser shipyards, and the output of Baltimore in the way of ships is quite important.

Communication.— The Baltimore and Ohio Railroad,— the oldest one in America,— was chartered in 1827, and is still operated under its original charter. In 1830, the first locomotive in the United States was run over this road between Baltimore and Ellicott City. Originally intended to extend to the Ohio River, it now runs to Philadelphia, to Chicago and to Saint Louis. A branch line runs from Cumberland to Pittsburgh. The Philadelphia, Wilmington and Baltimore Railroad, chartered in 1836, and the Baltimore and Potomac Railroad, chartered in 1853, now form part of the Pennsylvania Railroad, as do the Northern Central, running from Baltimore through Harrisburg to Rochester, which was chartered in 1854, and the Frederick and Pennsylvania Line Railroad, chartered in 1867. Another series of branches of the Pennsylvania system permeate the Eastern Shore. A third important railroad, the Western Maryland, was chartered in 1852, and now runs from Baltimore to Hagerstown, to Cumberland, whence it goes by two branches into West Virginia and to Pittsburgh. The Maryland and Pennsylvania Railroad runs from Baltimore to Delta. Electric roads lead from Baltimore to Washington and to Annapolis, and another electric road runs from Frederick to Hagerstown, and also to Thurmont. The city of Baltimore has an extensive trolley system, which also serves the suburbs. The first electric railway in the United States, was constructed in Baltimore in 1885. Horse cars had been introduced there in 1860, and they were superseded by cable cars (beginning in 1889), and trolley cars beginning in 1892. James Rumsey made experiments in the propulsion of boats by steam, in the latter part of the 18th century, upon the Potomac River. The bay and its rivers were the first highways, and several lines of steamboats run from Baltimore to the heads of navigation of these rivers, while ocean-going vessels ply regularly, northward and southward, along the coast and to foreign lands. In 1844 the first line of telegraph constructed in the world was operated between Baltimore and Washington, and telegraph and telephone lines now reach every part of the State. The roads were poor unt'l about 1800, when an era set in of very considerable construction of macadamized turnpike in the western part of the State. Most of the turnpikes have now become part of an excellent system of State roads constructed between 1905 and 1915, which links together every county in Maryland. The desire for the improvement of the Potomac River, so as to render it navigable, a project in which George Washington took great interest, led to the beginning of the Chesapeake and Ohio Canal in 1826. Designed to cross the Allegheny Mountains, it was never completed further than from Georgetown, D. C., to Cumberland, and it is now chiefly used for the transportation of coal from the mines to tidewater. A canal along the Susquehanna has long been abandoned, but one for ships across the Eastern Shore, extending from the head of the Elk River to the Delaware River, is still used by daily trips of steamboats from Baltimore to Philadelphia, and is expected soon under Federal ownership to be much increased in draft.

Commerce.— Baltimore is practically the only port of entry in the State. In 1916 the imports of merchandise at this port were valued at $8,414,193 of dutiable articles and at $30,527,473 of articles free of duty, and in 1917 at $7,958,139 of dutiable articles and at $29,005,646 of articles free of duty. The greatest value of any article imported on the free list was manganese ore ($6,910,396), next came wood pulp ($6,834,157), nitrate of soda ($3,180,545), pig iron ($2,192,609), crude mineral oil ($1,887,734), copper ($1,716,672), iron ore ($1,392,559). Molasses came first among dutiable articles, with a value of $2,957,060; corks second, with a value of $923,128. The total value of exports for 1917 was $377,623,300, compared with $290,312,216 for 1916, an increase of more than 30 per cent. Copper stood first among exports in 1917, with a value of $84,341,482, and was followed by iron and steel ($73,790,708), wheat ($45,806,823), Indian corn ($22,047,886), flour ($19,532,954), raw cotton ($17,696,807), rye ($15,961,340), oats

($14,407,329), brass ($14,093,614), tobacco ($12,113,711), chemicals ($9,094,384). During 1917, Canadian articles (valued at $12,992,-021) were exported from Baltimore, in transit, the chief articles being wheat ($10,903,879), oats ($893,871) and wheat flour ($686,465). The city has an important coastwise trade.

State Finances.— The gross amount of the State's debt is $27,448,880, and after deducting productive stocks and the sinking fund, the net debt amounts to $18,655,983. The total assessed value of property in 1916 was $1,182,-456,531, of which the valuation of Baltimore city property amounts to $646,493,644 and that of the counties to $535,962,867. The city pays 54.67 per cent of the direct State taxes. The real estate in the counties is assessed at $422,-292,436. The State tax rate in 1910 is 36¼ cents on each $100, and the tax is chiefly levied to pay for the public schools and for the State debt. The tax rate in Baltimore city is usually in the neighborhood of $2 per $100 of valuation, and the assessment is little below the full value of property. Tax rates in the counties vary from about $0.90 to $1.40, and in the municipalities, from $0.50 to $1.28.

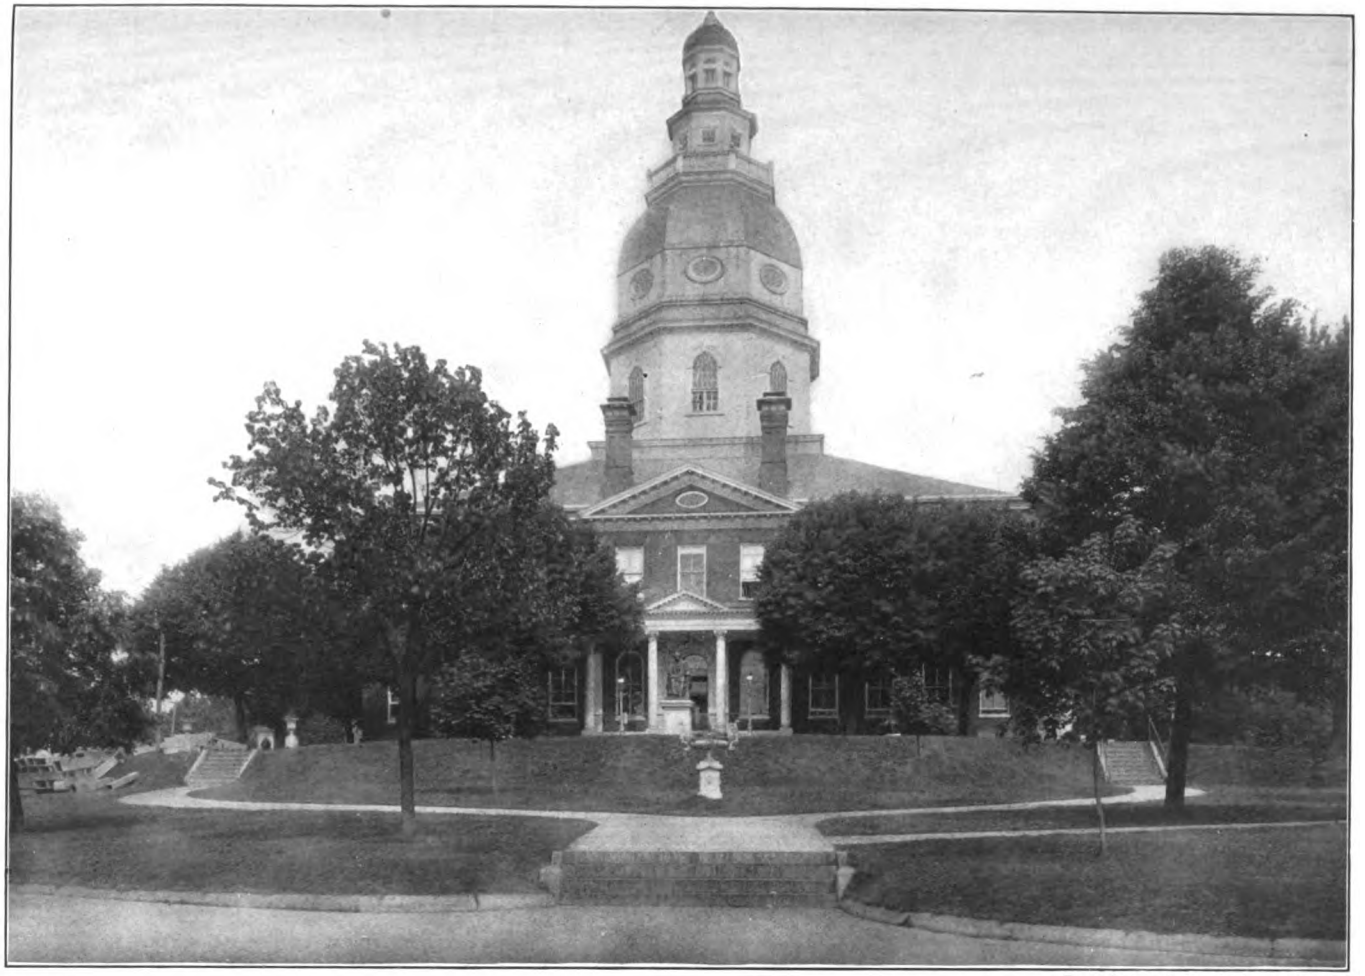
The receipts of the State for the fiscal year ending 30 Sept. 1917, amounted to $11,676,471, and the balance in the treasury at the beginning of the year was $1,624,095. The disbursements for the year were $11,450,622, leaving a balance of $1,849,904. To this should be added a balance in funds account of $423,715, and deducted on account of dedicated funds, $1,633,-200, leaving $640,420 as the balance of general funds. Taxes on gross receipts of corporations brought in $1,029,090; on collateral inheritances, $300,254; on insurance companies' licenses, $412,205; on motor-vehicle licenses, $733,858; on liquor licenses, $1,324,015. For the general government there were expended $499,384; for protection of persons and property, $671,164; for promotion of agriculture, $402,378; for conservation of natural resources, $156,094; for conservation of health, $132,470; for maintenance of highways, $2,664,-470; for maintenance of hospitals, homes and asylums, $1,448,274; for maintenance of correctional institutions, $157,750; for education, $1,907,025, and for interest on the public debt, $1,042,195.

Government.— The legislature consists of two houses: a senate of 27 members (one senator from each county and from each of four districts into which Baltimore city is divided), and a house of delegates of 101 members (each county sending from two to six delegates, and Baltimore city ranking as four of the largest counties). Regular legislative sessions are held biennially in the even years, beginning on the first Wednesday in January and may not exceed 90 days. Members receive $5 per day during the session. Extra sessions are held at the call of the governor and may not exceed 30 days. There are six representatives of the State in Congress: one from the Eastern Shore, a second from Harford, Baltimore and Carroll counties and a part of Baltimore city, a third and a fourth from districts entirely in the city, a fifth from southern Maryland and a part of Baltimore city and a sixth from western Maryland. The Democratic party usually has a majority in the general assembly. Senators are elected for four and delegates for two years. The executive department has at its head the governor, elected in 1919 and at four-year intervals thereafter. He receives a salary of $4,500 a year, the use of an executive mansion and an allowance for expenses. The administration is more unified than in many States, as the governor has extensive powers of appointment. His financial control is very great. All bills are submitted to him after passage by the general assembly for approval and veto. For some years he has possessed the power of vetoing separate items of appropriation bills, and it was even held that this power included that of diminishing the amount of appropriations voted by the legislature. In 1916 the people adopted a constitutional amendment which has placed an autocratic power of budget making in his hands. He now prepares and submits to the general assembly a proposed budget of appropriations, which they may diminish, but not increase, from which they may strike out items, but to which they can add none.

The judicial system of the State consists of three parts. The highest tribunal is a Court of Appeals of eight judges, seven of whom are the chief judges of the circuits into which the counties are grouped, and the eighth is chosen from Baltimore city. The governor designates one of these judges as chief judge. A Circuit Court is held in each county, and in each circuit there are two judges (in the circuit composed of Baltimore and Harford counties there are three judges), in addition to the chief judge. In Baltimore city there are 10 judges who sit together as the supreme bench of the city and assign themselves, from time to time, to sit separately in the several city courts. All these previously-named judges are elected for 15 years by popular vote at elections in odd years. A judge who has reached the age of 70 years may not complete his term, unless a special vote in his behalf is passed by the general assembly. Vacancies in judgeships are filled by the governor, whose appointees hold office until the next election.

Petty cases are heard before justices of the peace, who are appointed by the governor for the term of four years. In the counties, these officers are generally paid by fees. In Baltimore, such cases are brought before salaried officials serving in regular tribunals, as police courts (criminal), people's courts (civil) or juvenile courts.

Religion.— The first settlers were Roman Catholics and Anglicans. The first Protestant services were held by the Rev. Richard James, on Kent Island in 1632, and the first Roman Catholic services, by Rev. Andrew White, S.J., and Rev. John Altham, S.J., at Saint Mary's in 1634. A considerable settlement of Puritans from Virginia came into Anne Arundel County about 1650, and were largely induced to become Quakers when George Fox came to Maryland about 1670. He also established meetings on the Eastern Shore, one of which Third Haven, near Easton in Talbot County, possesses a house of worship over 200 years old. Presbyterians, under Rev. Francis Makemie, established churches on the lower Eastern Shore about 1690. Baptist churches were organized in the 18th century. The German-speaking settlers of the years 1730–50 brought the Reformed and Lutheran faiths into the



State Capitol at Annapolis

province. Rev. Philip William Otterbein, pastor of a Reformed church still standing on Sharpe and Conway streets in Baltimore, founded the United Brethren Church in Frederick County in 1800. Robert Strawbridge, one of Wesley's local preachers, held the first Methodist services in the United States in Carroll County in 1761, and, through the labors of Francis Asbury and other devoted men, the Church spread rapidly. At the Christmas Conference held on Lovely lane (Redwood street), Baltimore, in 1784, the Methodist Episcopal Church was organized, and its first bishops, Francis Asbury and Thomas Coke, elected. Right Rev. John Carroll, of an old provincial family, was consecrated as bishop of Baltimore in the Roman Catholic Church in 1789; and his see was raised to an archbishopric in 1808. He was the first man to hold episcopal office in that Church in the United States. Right Rev. Samuel Claggett was consecrated bishop of Maryland in the Protestant Episcopal Church in 1789, being the first man to receive such consecration in the United States. In 1830 a desire for a greater participation of the laity in the government of the Methodist denomination led to a division and to the organization in Baltimore of the Methodist Protestant Church. Colored churches were organized under some of the above-named denominations during the 19th century, most of the churches being either Methodist or Baptist. The Roman Catholic Church is the largest denomination in its membership, and among the Protestant denominations, the Methodist, Episcopalian, Lutheran, Baptist, Reformed, Presbyterian and United Brethren, in the order named, lead in their membership. Sunday schools were first instituted in Baltimore about 1815. There are over 2,500 Sunday schools now in the State.

Charities and Corrections.—A Board of State Aid and Charities was established in 1900. The policy of the State has been to subsidize private institutions more than has been the case in most other portions of the Union. For the insane, there are three State-owned asylums: for whites at Catonsville (Spring Grove) in Baltimore County, at Sykesville, in Carroll County at Springfield, and at Cambridge in Dorchester County, and one for colored persons at Crownsville in Anne Arundel County. There are several private hospitals for the insane, the most important of which is the Sheppard and Enoch Pratt Hospital, which has a large endowment and is located near Towson, in Baltimore County. The State penitentiary is located in Baltimore city; the house of correction, for minor offenses, is located near Jessups, in Anne Arundel County. A reformatory school for white boys is found at Loch Raven, in Baltimore County, and one for colored boys at Cheltenham, in Prince George's County. A similar school for white girls is in Baltimore County, and one for colored girls at Melvale, in Baltimore city. Saint Mary's Industrial School for Boys, in Baltimore city, is an important reformatory for boys under the control of the Roman Catholic Church. Each county, as well as Baltimore city, possesses a jail. There is an almshouse for each county and for Baltimore city. The Baltimore city hospitals are paid to provide beds for the indigent sick. For tubercular patients there is a private sanitarium at Eudowood, in Baltimore County, and one owned by the State at Sabillasville, in Frederick County. The Federated Charities of Baltimore city are very efficient, and the Henry Watson's Aid Society does an important work. There are also many lesser benevolent institutions.

Education.— During the first 60 years of the history of the province there were almost no schools, because there were no towns, each family living upon its own plantation. Governor Francis Nicholson was an ardent friend of education and under his influence the assembly, in 1694, passed an act for the maintenance of free schools by duties laid on exported furs, which then formed a large part of Maryland's trade. In 1696, King William School at Annapolis was founded, as the first of these schools, and continued in existence until 1784, when it was merged in Saint John's College. Under Governor Nicholson's administration, also, the Anglican Church was established in the province, and the Rev. Thomas Bray, D.D., was sent over as the commissary, or representative, of the bishop of London, within whose diocese the province was considered to lie. He wished to induce worthy clergymen to come to Maryland and, as an inducement to them, set about establishing a parochial library in each parish for the use of the minister, and a provincial or lending library at Annapolis for the use of the clergy and gentry. He succeeded in this plan and the provincial library of 1,100 volumes was the largest collection of books then in the English colonies. Dr. Bray came to Maryland in 1700 for a few months and after his return the libraries languished and few books were sent them. The first printing press in the province was established about 1690, and the earliest extant imprint is one of Dr. Bray's sermons. The children of the well-to-do planters were often sent to Europe to complete an education begun on the plantation under private tutors, who were often indentured servants — the Protestant children going to Great Britain, the Roman Catholics to institutions on the Continent.

In 1723 an act was passed looking to the establishment of a grammar school in each county. These schools were the only ones supported by Maryland authorities, until well into the 19th century. Jesuits conducted two schools for boys — one at Whitemarsh, in Charles County, and one at Bohemia Manor in Cecil County. In 1726 the first newspaper in the province was begun, at Annapolis. Negro education and industrial education likewise found their beginning in Rev. Thomas Bacon's charity school in Talbot County about 1750. Toward the end of the provincial period, Charlotte Hall Academy was founded by the union of the county schools in southern Maryland, and Upper Nottingham Academy, in Cecil County, was begun. Rev. Samuel Knox, who was principal of the Frederick County Academy, in 1796 published a remarkable book on the 'Principles of Education,' outlining a complete educational system for the State. Thomas Jefferson derived many of the ideas which he carried out in the University of Virginia from this book, and Knox was the first man invited to a professorship there. Through Knox's efforts the State diverted to the county academies the funds it had begun ap-

propriating to the nascent colleges and these appropriations to the academies lasted until these institutions were absorbed into the public school system, a process not completed until the 20th century. A considerable agitation for public schools about the year 1825 led to the organization of such schools for Baltimore city in 1829. This city has always managed its schools independently of the subsequently established State system and in 1917 had 112 schools, with 2,139 teachers and 79,599 pupils. The expenditures for these schools for 1919 amounted to $3,217,554. In addition to primary and grammar schools, there are included in the city system for white children a high school for boys (called the Polytechnic Institute), two high schools for girls and a teachers' training school; and for colored children a high school and a teachers' training school. Although some counties had begun a partial school system, the State had no uniform public schools until the constitution of 1864 was adopted which contained a provision for such a State system, through the efforts of Joseph M. Cushing, Esq., a member of the constitutional convention, and Rev. Libertus Van Bokkelen, D.D., who was made first State superintendent of schools. Dr. Van Bokkelen was soon succeeded by M. A. Newell, who continued in office, both as superintendent and as principal of the State Normal School, established in Baltimore, for over 20 years. This school has been transferred to fine new buildings near Towson, in Baltimore County. Rev. E. B. Prettyman succeeded Mr. Newell, and was succeeded nearly 20 years ago by Dr. M. Bates Stephens, during whose incumbency of the office great advances have been made in the county schools. Since his taking of office, there has been a separate principal of the normal school. A second normal school has been established at Frostburg in Allegany County. High schools have recently been formed in many places.

Teaching colored children was unlawful during the times of slavery. In 1865 a society was formed in Baltimore for negro education. It speedily established schools throughout the State, supported by the generous contributions of individuals, many of whom were members of the Society of Friends. When the State assumed the task of educating negroes, in 1872, the society closed all its schools, except one in Baltimore, which was incorporated as the Colored Normal School. In 1908 the State took over this school also and removing it to Bowie, in Prince George's County, maintained it as Normal School No. 3, adding certain agricultural and industrial features to the course of study. In addition to the expenditure of the State for schools from taxation, the proceeds of which are quarterly distributed to the counties and Baltimore city, according to population, each county raises large sums yearly by local taxation for support of schools. There are 2,605 schools, 6,560 teachers and 246,045 pupils recorded in the report for the year 1917. The State school board consists of six members appointed by the governor for a period of six years. The governor also appoints a school board of three members for each county for a like term. The mayor of Baltimore city appoints the school board therefor, composed of nine commissioners, each to serve for six years. An extensive system of parochial schools is also maintained in connection with the Roman Catholic churches in Baltimore and in some of the smaller towns in the State.

Mrs. Eliza Seton, foundress of the Sisters of Charity in the United States, established a school at Emmitsburg for the education of girls in 1809. The Order of the Visitation conducts schools for girls in Baltimore and Frederick, the Carmelites in Baltimore and the Sisters of Notre Dame also in Baltimore.

Among the important private secondary schools in Maryland are: For boys, the Gilman County School, the Boys' Latin School and Marston's School in Baltimore city; the McDonough Institute and Farm School for needy orphans in Baltimore County, and the Jacob Tome Institute, a largely endowed boarding-school with fine buildings, at Port Deposit in Cecil County. The Hannah More Academy at Reisterstown in Baltimore County, the Frederick Seminary in Frederick County and Saint Mary's Female Seminary in Saint Mary's County, are the more important boarding-schools for girls, and in Baltimore city the Bryn Mawr School and the Girls' Latin School are day schools of high standard.

The Maryland Institute for the Promotion of the Mechanic Arts was established in Baltimore, in 1847. It formerly conducted exhibitions and gave courses of lectures in its long building upon Market space, which was the scene of several Presidential nominating conventions. After this building was consumed in the fire of 1904, a new building was erected on Mount Royal avenue for the Day Schools of Art and Design, and a building on the old site is used for the night school of mechanical drawing. George Peabody spent part of his early life in Baltimore, and in recognition of that fact he established in 1857 the Peabody Institute, which contains a very fine reference library, a lecture hall, an art gallery and a largely attended conservatory of music.

A school district library law was passed in 1873. In Baltimore the generous gift of about $1,200,000 to the city by Enoch Pratt in 1882 secured the establishment of the free library which bears his name and which was opened in January 1886, with Dr. Lewis H. Steiner as its librarian. This institution, the public library of the city, from its inception was planned to contain a central building and branches in different parts of the city of Baltimore. These branches have increased from 4 to 18 and several more will soon be built. In February 1919 the library possessed 363,646 volumes, and in the previous year it cirulated 586,645 books.

The Washington County Free Library at Hagerstown was established by the generosity of B. F. Newcomer in 1899, and has been conspicuously successful, being one of the first county libraries in the country. The other public libraries are small and are not as numerous as in many other States. In 1902 the legislature passed a law establishing a State Library Commission. The Public Library Commission now has its office at the State Normal School at Towson and receives $2,000 a year from the State. It circulates traveling libraries and gives advice and counsel to public libraries and to places desiring to establish them. In Baltimore city, there are also to be found the libraries of the various educational institutions of

the diocese of Maryland, of the Baltimore bar and of the Maryland Historical Society which are valuable special collections. The New Mercantile Library, a subscription one, containing about 35,000 volumes, should also be mentioned. In 1854 there was established in Baltimore the Maryland School for the Blind, a private corporation largely supported by the State. The school has removed, in recent years, to fine new buildings, on the cottage plan, in the suburb of Overlea, where about 100 children are instructed, coming from all parts of Maryland and the District of Columbia. A school for the colored deaf and blind, situated at a little distance but on the same grounds and under the same superintendent, instructs about 70 children. The Maryland State School for the Deaf, incorporated in 1867, is attended by about 120 pupils, and is situated at Frederick City, on the site of the barracks built during the Revolutionary War and occupied by prisoners from Burgoyne's army.

Higher Education.— The Rev. William Smith, D.D., who had been head of the College of Philadelphia from the beginning, was forced by the British occupation of that city to remove to Chestertown, where he became rector of the Protestant Episcopal church. He also took the principalship of the Kent County school and so developed it that he secured a college charter for the institution under the name of Washington College in 1782. It was the first institution named for General Washington, and the first collegiate institution in Maryland. Its history has been full of vicissitudes, but the college has continued its work with fair measure of success, and is still the only institution conferring degrees, situated upon the Eastern Shore. Since 1890, women have been admitted to its courses.

The Western Shore obtained its first institution of higher learning, when Saint John's College was chartered at Annapolis in 1784. For its site, the State gave the unfinished governor's mansion and its grounds. According to its charter, it was united with the Washington College into a University of Maryland, but this union was merely nominal. The State appropriation was withdrawn in 1805, and the college languished for a time. From 1837, for 20 years, Rev. Hector Humphreys, the principal, labored faithfully for its interests. The college was suspended and the buildings were used as a hospital during the Civil War. Reorganized by Henry Barnard, LL.D., Saint John's College has been under the principalship of Thomas Fell, LL.D., since 1887. The students are organized in a cadet corps and receive military training. It has been recognized as the faculty of arts of the University of Maryland for the past few years.

The French Revolution drove from Europe a large number of ecclesiastics of the Roman Catholic faith. The Right Rev. John Carroll, in his desire to provide educational opportunities for the youth of Maryland, especially for those of his Church, invited some of these teachers to settle in Maryland. Consequently, the Sulpicians began instruction in Baltimore in 1791. Their institution was called Saint Mary's College, and its title was afterward changed to Saint Mary's University. It gave regular academic instruction until 1852, when the college was closed, in order that the clergy might devote their entire attention to the theological training of young men for the priesthood in Saint Mary's Seminary of Saint Sulpice, which had been maintained by them as a part of their institution from its beginning, and which is the oldest Roman Catholic theological school in the United States. Cardinal Gibbons is its most distinguished graduate. In 1808, near Emmittsburg, in Frederick County, Rev. John Dubois, a Sulpician priest, founded Mount Saint Mary's College. This institution is now governed by the secular clergy, and in addition to the preparatory and collegiate courses, maintains a seminary preparatory to the priesthood. A third institution, which owes its origin to the Sulpicians, and which is still controlled by them, is Saint Charles' College founded in 1830, and endowed by Charles Carroll of Carrollton. It was formerly situated in Howard County, but is now located near Catonsville in Baltimore County. It gives the collegiate courses preparatory to Saint Mary's Seminary. In 1802 Dr. John B. Davidge opened a medical class in Baltimore, from which developed the College of Medicine of Maryland, chartered in 1807, and the University of Maryland, chartered in 1812. The university was planned to contain four faculties. That of medicine has always been the strongest, and is the only one which has enjoyed a continuous existence, always maintaining a course of medical instruction which ranked well among similar institutions. It has recently united to itself the College of Physicians and Surgeons (founded in 1872 and which had itself absorbed the Washington Medical College) and the Baltimore Medical College (founded in 1883) and is fulfilling the instructional requirements of the American Medical Association. The Maryland College of Pharmacy (founded in 1856) has recently been annexed, and the department of dentistry was opened in 1882. No school of divinity was ever organized. The school of arts had a troubled existence, and finally died, but has recently been revived by the union of Saint John's College with the university. The school of law was maintained for a few years, about 1840, with David Hoffman as professor, and was revived in 1869. Since that time, it has maintained high standards, and is the only law school in the State, having absorbed the Baltimore Law School (founded in 1900), and the Baltimore University School of Law (founded in 1890).

Several colleges and professional schools founded in Maryland at different times no longer exist. Among these are Cokesbury College (1784–96) at Abingdon in Harford County, the first Methodist institution of higher education in the world; Baltimore College (1803–30); Asbury College (1816–30) in Baltimore city; the College of Saint James (1843–63) in Washington County; Newton University in Baltimore city (1844–59); New Windsor College (1843–50, 1874–1910); and Calvert College (1852–73); both at New Windsor, Carroll County; the Baltimore Female College (1849–90); and the Mount Washington Female College (1856–61). Loyola College in Baltimore was founded in 1852 by the Jesuits and continues to educate boys according to their system, without dormitories. The Maryland Agricultural College, at College Park in Prince George's County, was chartered in 1856 by a private cor-

poration, and is in age the second such institution in the country. It early recognized agricultural experimentation as an important part of its operations. The State Agricultural Experiment Station, conducted in connection with the college, was organized in 1887. The students are trained in military drill, and the ownership of the college has lately been transferred to the State, which is largely increasing appropriations to it and widening its curruculum.

The Brothers of Christian Schools, a Roman Catholic fraternity, purchased the Rock Hill Academy at Ellicott City, Howard County, in 1857, and after conducting it for several years procured a charter for Rock Hill College in 1865. The Western Maryland College, a co-educational institution, at Westminster, in Carroll County, under the auspices of the Methodist Protestant denomination was chartered in 1868, and under the long presidency of Rev. Thomas H. Lewis, D.D., has firmly established itself. Goucher College for Women was founded by the Methodist Episcopal Church in 1884, and was opened in 1888, graduating its first class in 1892. It was first called the Woman's College of Baltimore; but, about 1910, the name was changed, so as to honor Rev. John F. Goucher, D.D., one of its principal founders and long its president. It ranks among the best institutions for the higher instruction of women. Hood College for young women, beautifully situated near Frederick City, has been conducted successfully for 25 years by its president, Dr. Joseph H. Apple, and gives a good course of instruction, emphasizing domestic science. The Maryland College for Women at Lutherville in Baltimore County is a long established institution. Morgan College, in Baltimore city, incorporated in 1889 under the auspices of the Methodist Episcopal Church, is the only collegiate institution for the education of the colored youth in Maryland. It expects soon to remove to a suburban location. A branch, Princess Anne Academy in Somerset County, is recognized as the State Agricultural College for colored youth.

The Johns Hopkins University at Baltimore city, incorporated in 1867, was founded by a bequest of about $3,500,000 from the man whose name it bears. It was notably a large endowment, and the trustees had an unusual opportunity to establish a distinctive institution. They made the best possible use of this opportunity by calling Daniel C. Gilman, LL.D., to become its first president and giving him free hand as to the places of organization. The university opened its collegiate and graduate philosophical departments in 1876. President Gilman won an instant success and a world-wide reputation for the institution. Among the leading ideas were these: (1) organization of graduate study into systematic training for the degree of doctor of philosophy, including a dissertation on some point embraced in the student's major subject and showing evidence of research; (2) provision for a university press to publish the results of the investigations of faculty and students; (3) a great use of popular lecture courses; (4) a body of instructors of originality of mind who were carefully selected, with an unerring view to their future eminence; (5) a body of young men connected with the graduate school, who should receive a stipend from the university, have time for original work and be known as fellows. (Among the early fellows was President Woodrow Wilson); and (6) an undergraduate department, arranged on the group system, with which President Gilman had become acquainted through experiments with it at the Sheffield Scientific School and the University of California, with which institutions he was formerly connected. The undergraduate department was never large, and was largely a local college; but the graduate department speedily enrolled an unusually eminent body of men from all parts of the United States, from Canada and from Japan. Many of these graduate students became teachers and spread the influence of the Hopkins far and wide. President Gilman's policy was to spend little money on buildings, and the quarters of the university were inconspicuous throughout the 25 years of his administration. Mr. Hopkins left another bequest, of about the same size as that of the university, to found a hospital which should bear his name, and which should be associated with the medical school of the university. The hospital buildings were completed in 1889, and steps were immediately taken to organize the medical school, whose first class graduated in 1898. It was the first of American medical schools to require a college degree as a prerequisite for admission, and it has done much to advance medical educational standards. Its reputation has become even greater than that of the philosophical department, and very recently the Rockefeller Foundation, through the efforts of Prof. William H. Welch, first dean of the medical school, has founded a school of public hygiene in connection with the university.

About the time of the close of President Gilman's administration, the philosophical department of the university was given, by public-spirited Baltimoreans, a new site, comprising about 100 acres in the northern suburbs, and the work of the institution was removed thither in 1914. The second president of the university was Ira Remsen, a distinguished chemist, and he in turn was succeeded by the present president, Frank J. Goodnow, an eminent student of public law.

Professional schools not previously named are the Woodstock College, in Baltimore County, founded in 1867, by the Society of Jesus, as a theological seminary; the House of Studies of the Congregation of the Most Holy Redeemer, Mount Saint Clement, at Ilchester, Howard County, established also in 1867, as a school to prepare members of the Redemptorist order for the priesthood; Saint Joseph's Seminary in Baltimore city to educate men for the Roman Catholic priesthood to labor among the colored people of the South; the Westminster (Carroll County) Theological Seminary under the auspices of the Methodist Protestant Church; and the Baltimore College of Dental Surgery, the oldest dental school in the world, chartered in 1839.

Proyincial History.— Verazzano in 1524 may have looked into the Chesapeake and landed on the Atlantic seaboard of Maryland, but the continuous history of this territory began, when Capt. John Smith, with 14 men in an open barge of three tons burden, left Jamestown in 1608, and spent several weeks in exploring the bay. On his return he drew a remarkably good map of the shores, so that they became well known. He found the aborigines of the Algonquin stock dwelling in small brick-bark

villages in the midst of forest clearings, in which they cultivated maize, potatoes and tobacco. On the Western Shore, the Piscataways and the Nanjemoys were the important tribes, and on the Eastern Shore dwelt the Nanticokes. These Indians possessed stores of furs which they had obtained in hunting and they, willingly, bartered them with the English for manufactured wares. In general, the Indians of the province received fair treatment from the colonists. Around the head of the bay, near the Susquehanna River, which bears their name, dwelt the fierce Susquehannocks, of Iroquoian stock, who were subjugated and incorporated with the Five Nations about 1670. After that time, the Senecas frequently came down to raid the frontier settlements, and to despoil the peaceful Patuxents and Piscataways of the Western Shore. Gradually the Indian inhabitants of Maryland disappeared, and the Nanticokes, in their migration to the Wyoming Valley in Pennsylvania about 1750, left but few of their race in the province.

After Smith's expedition, other Virginians sailed into the Chesapeake and the northern fur trade became a well-established enterprise. The Indians also sold maize to the Virginians, and timber was cut for pipe-staves. Chief among these Virginia traders was William Claiborne. He associated himself with the London mercantile firm of Cloberry and Company, and in May 1631 obtained, from the Secretary of State for Scotland, a commission, authorizing him and his associates to trade in all parts of New England and Nova Scotia, wherein no trading monopoly had been granted. With this commission, he sailed up the Chesapeake, and in 17 Aug. 1631 established a trading factory on Kent Island, with about 20 or 30 men. From Chisquack in the Northern Neck of Virginia and Kent Island, a delegate sat in the Virginia house of burgesses and Claiborne was a member of the Virginia council.

Sir George Calvert, first Lord Baltimore and formerly Secretary of State for England, retired from office because he had become a Roman Catholic. He had long been interested in colonial projects, and had received a grant of land and jurisdiction in Avalon, the southeastern peninsula of Newfoundland. He went there to live, but found the country so barren and the climate so severe that he determined to settle further to the south. Coming to Virginia, the colonists refused to admit him unless he should take the oaths of allegiance and supremacy, which his religious belief would not permit him to do. He was so delighted with the country, however, that he returned to England and successfully requested from the Crown a grant of the lands about the Chesapeake. To his possession, which was created a palatinate in which the proprietary should have as wide powers as the bishop of Durham in that county, he gave a name, in the courtier fashion, from that of the queen of Charles I, Henrietta Maria, daughter of Henry IV of Navarre. In the Latin of the Charter, the province was called Terra Mariæ, or, in English, Maryland. The limits of the grant were much wider than were ever reduced to possession, chiefly because of encroachments of the Duke of York on the Delaware and of William Penn on the north. Those limits were from Watkins Point on the Chesapeake, due east to the Atlantic Ocean, then along the seashore and Delaware Bay to the 40th parallel of north latitude, and along that parallel westward to the meridian of longitude, which passed through the first fountain of the Potomac River, then along the south, or far bank of that river, the boundary ran to Cinquack, near the river's mouth, whence a straight line should run to Watkins Point. The province was to be held in free and common socage upon a yearly payment of two Indian arrowheads to the Crown. All Englishmen might emigrate to Maryland, and, having arrived there, they and their descendants should enjoy all of the privileges of Englishmen. The proprietary was given power to make laws, "with the advice, assent, and approbation of the freemen, or of their delegates." He tried to use this power literally at first by submitting the draft of laws to a mass meeting of freemen, gathering in person or by proxy; but, gradually, the freemen grew too numerous, too widely dispersed and too powerful for this arrangement to continue. They successfully asserted for themselves the right of initiating laws as early as 1638, and from about 1650 a representative body of freemen sat as a House of Delegates, and there was formed a bicameral legislature, upon whose acts the proprietary had a veto. He was not obliged to submit these acts to the Crown. It is not surprising that the Virginians opposed this charter, which gave a Roman Catholic two-thirds of their noble bay, and cut them off from the profitable northern fur trade.

Before the charter had passed the seals, the first Lord Baltimore died, and it was issued, on 20 June 1632, to his son Cecil Calvert, second Lord Baltimore, a namesake of the great Lord Burghley, under whom the father's official career had begun. By the charter this first lord proprietary was granted a large country hitherto uncultivated, in the parts of America partly occupied by savages. He was destined never to see his province, but he took watchful care over it for nearly 45 years. After some months preparation his first colonial expedition sailed from England, on 22 Nov. 1633, under the command of his younger brother, Leonard Calvert, in two vessels of well-omened name — the *Ark* and the *Dove*. Leonard Calvert, commissioned as lieutenant-general and governor of the province, was only 28 years old, and was a sincere straightforward man, but had the fatal failing of his family, in being unable to read men and to choose the proper agents to carry out his purposes. With him went several gentlemen, most of whom were Roman Catholics, while the majority of the yeomen and servants were Protestants. It is probable that from the beginning the majority of the Maryland settlers paid no religious allegiance to the Pope of Rome. The voyage from England to America consumed from one to three months at that period, and as Leonard Calvert sailed by the southern route, stopping at the West Indies, he did not arrive in Virginia until 24 Feb. 1634.

The governor there was friendly, but the settlers were so hostile that they soon afterward revolted, seized him and sent him to England, largely because of his friendliness to Calvert. Lord Baltimore had wisely enjoined his brother to have as little to do as possible with the Virginians during the first year, and heed-

ing that advice, the settlers soon sailed up the bay and entered the Potomac River. They landed on Saint Clements' (now called Blackiston's) Island on "Our Blessed Lady's Day in Lent," 25 March 1634, on the first day of the year, according to their calendar, and in the beginning of spring, and "took solemn possession of the country, for our Saviour and our Sovereign Lord, the King of England." From the enthusiastic reports of the country sent him, Baltimore prepared and printed in England, in 1634 and 1635, two pamphlets called *Relations*, which were in the nature of prospectuses to invite colonists and are the earliest printed accounts of the province. The fears of the aborigines were pacified, and through the advice of Capt. Henry Fleet, an old Indian trader, Calvert bought from them their town of Yaocomico, which was renamed Saint Mary's. Claiborne's factory was the only other settlement of Europeans within the province at the time. Calvert had instructions to use Claiborne courteously and permit him to proceed in his plantation if he would acknowledge Baltimore as his overlord; but this acknowledgment was steadily refused, and a petty warfare arose between the settlers on Kent Island and those at Saint Mary's, which led to a naval combat on the Pocomoke River in 1635. Claiborne's difficulties increased, through differences with his London partners, and he went to England in 1637, leaving the factory in charge of Capt. George Evelin, who was friendly to Baltimore. He vainly endeavored to induce the settlers on the island to accept Baltimore as their ruler, and finally, in February 1638, Calvert led an expedition in person against the factory and overcame the opposition there, while Claiborne failed in England in an appeal to the Lords' Commissioners of Plantations. He never lost his animosity toward Lord Baltimore, and continued to the end of a long life his struggle against proprietary rule. Both in England and in America the Virginians tried to prevent Baltimore from taking possession of the province which had been granted him. The expense of his expeditions and of the litigation in England nearly impoverished him; but neither then nor, when later deprived of the province by force, did Cecil Calvert deviate from his persistent effort to secure himself and his descendants so valuable a possession. Remaining in England, he warded off one threatened danger after another, and his policy, as his letters disclose it, was that of a calm, shrewd, unenthusiastic, fair-minded, far-seeing man. He was a faithful member of the Roman Catholic Church, and wished to provide an asylum for his fellow-believers within his palatinate; but he wisely foresaw that any grant of especial privileges to the Roman Catholics — still more an establishment of that Church in the province — would lead to a speedy forfeiture of his patent. He clearly wished the establishment of no other church. Consequently, from the beginning of his settlement of Maryland, he set an example of a ruler who separated church from state, who directed his colonists to show toleration to all Christians and who allowed freedom of worship in any Christian form. Jews were tacitly permitted to dwell in the province. In his first expedition he sent two Jesuit priests, that the colonists might have religious counsel and guidance. One of the Jesuits, Father Andrew White, a man of marked devotion to his work, wrote an account of the voyage, in Latin and in English, to which we owe valuable information. The Jesuit order continued to be the chief religious agency of the Roman Catholic Church in Maryland throughout the whole of the provincial period, and their conscientious zeal and faithfulness deserve high praise. They reared from the provincial families a good many Jesuit priests who were very influential in the organization of their Church in the United States and were largely responsible for its American character.

Nearly a year after the landing of the colonists, Governor Calvert called an assembly of the people, which met in February 1635, but its proceedings are lost, and the proprietary vetoed its acts. The second assembly, held in January 1638, failed to place any acts upon the statute books, except one for Claiborne's attainder. Acting also as a court of law, the assembly tried and condemned to death for piracy, Thomas Smith, one of Claiborne's followers. During the year 1638 Lord Baltimore yielded his claim to the initiation of bills and a representative assembly of one house, meeting in February 1639, adopted a comprehensive temporary act to "endure to the end of the next General Assembly, or for three years, if there be no assembly within that time." From that date to the present practically all of the statutes of Maryland are preserved, and have been printed, in the series of the Archives of Maryland. The policy of passing temporary statutes was followed throughout the provincial period, and, although it involved much expenditure of time and produced a bulky statute book, it ensured fairly frequent sessions of the legislature, and also a readjustment, from time to time, in the rates of fees, in which shape the remuneration of many of the officers was received.

From Saint Mary's the settlers spread out along the rivers, some of the larger tracts of land being erected into manors. Indentured white servants cultivated most of the land, granted by the conditions of plantation to the settlers, on payment of an annual quitrent. Negro slaves were being introduced, and the colonists gradually ceased to be dependent upon the Indians for maize, which was beginning to be raised in considerable quantity by the English. The fur trade slowly lost its importance, and the cultivation of tobacco flourished until it became the staple product of the province and the medium of exchange in all transactions among the planters. The predominance of tobacco lasted throughout the provincial history; but, during the 18th century, the cereals — wheat and corn — were gradually displacing its prominence in agriculture on the Eastern Shore. The upland country of western Maryland never grew tobacco. A few iron furnaces were established late in the provincial times, but the main industry was agriculture. Transportation was at first by water or along the Indian foot trails. Gradually roads were laid out, along which hogsheads of tobacco, drawn by oxen or horses, were rolled to the water side.

The Jesuits vainly claimed from the proprietary the same liberty of being governed by canon law only, which they possessed in other lands having Roman Catholic lords, and of being freed from taxes. These claims led Balti-

more to send out secular priests for a time and to insist upon the supremacy of common law and of the civil power in the state. Leonard Calvert returned to England in 1642, leaving Giles Brent as his deputy, and came back two years later with the king's commission empowering him to seize ships owned by London merchants who adhered to the Parliamentary side in the English Civil War. He seems not to have used the commission, but it gave an excuse for action to those opposed to proprietary rule. Claiborne came back in the attempt to recover Kent Island. Richard Ingle, a pronounced Parliamentarian, who had previously made several voyages to the province, came to Virginia, with his ship, in February 1645, seized a Dutch merchantman in the Chesapeake, and with the two vessels terrorized the province. Calvert fled to Virginia, and Ingle ranged the province, during this "plundering year," seized the Jesuits' property and carried them to England. Calvert recovered control of Saint Mary's in the autumn of 1646 and of Kent Island in April 1647. Shortly afterward Leonard Calvert died, naming Thomas Greene as governor. A year later, the proprietary substituted William Stone, a Protestant, who brought into Maryland as immigrants a considerable number of Puritans from Virginia, where they had failed to find religious freedom. The Puritans made their settlements about the banks of the Severn, near the site of Annapolis, and a third county was erected for them, bearing the name of Anne Arundel, the wife of Cecil Calvert. With Stone's commission Baltimore sent a draft of a brief code of 16 laws, which he desired the general assembly to enact. The most famous of these, the "Act concerning religion," was amended and passed in April 1649. This notable act was well summarized, in its purpose and content, by Charles, third Lord Baltimore, as passed that the province might "have a general toleration settled there by a law, by which, all of all sorts, who professed Christianity in general, might be at liberty to worship God in such manner as was most agreeable to their respective judgments and consciences, without being subject to any penalties whatsoever for their doing so, provided the civil peace were preserved. And, that for the securing the civil peace and preventing all heats and feuds which were, generally, observed to happen amongst such as differ in opinions upon occasion of reproachful nicknames and reflecting upon each other's opinions, it might, by the same law, be made penal to give any offense in that kind." The credit for this act belongs in the first instance to Cecil, Lord Baltimore, and, secondly, to the assembly which adopted it. The coming of the Brooke family into Maryland led to the formation, in 1654, of a fourth county, bearing the name of Calvert, and situated on the north side of the Patuxent River.

When the Commonwealth had been established in England, five Parliamentary commissioners were appointed to reduce Virginia from her allegiance to the Crown and their commission, by craft or accident, was extended to "all the plantations within Chesapeake Bay." Two of these commissioners were Claiborne and Bennett, the head of the Puritan party in Virginia; the other three were Englishmen, but only one of these arrived in America. He acted with the two Virginians, and they seized the government of Maryland in 1652. Baltimore's hostility to Claiborne had been so great that he had exempted him and Ingle from a general pardon. Claiborne's counter-influence may doubtless be seen in the commissioner's illegal order, that writs should henceforth run in the name of the keepers of the liberty of England, instead of the proprietary, as provided by the provincial charter. Governor Stone refused to obey this order and was removed from office. Three months later he yielded and was restored, but after two years of compliance he again ordered writs to run in the proprietary's name. The Puritans of Providence, as they called their settlement on the Severn, promptly rose in revolt and compelled Stone to resign his office. When Baltimore rebuked him for yielding so easily, Stone gathered an armed force and a battle took place near Annapolis in March 1655 between the two parties, in which conflict the proprietary's party was routed and Stone was taken prisoner. From July 1654 to 1657 the provincial government was in the hands of a body of commissioners, appointed by Bennett and Claiborne, and serving as executive, provincial court and upper house of assembly. The Toleration Act was repealed. Cromwell, however, confirmed Baltimore's title to the province in 1656, and in March 1657 his authority was restored, a general amnesty being proclaimed and the Toleration Act confirmed. So complete was the pacification that some of the Puritan commissioners sat in the General Assembly of 1659.

A new county, Charles, named for the proprietary's heir, was organized in 1658 from the western part of Saint Mary's County. The restored proprietary government had as its governor Capt. Josias Fendall, an energetic man, who organized the militia and then came into conflict with the Quakers, a growing body in the province. When Fendall had been governor for two years he proved himself faithless to the proprietary, surrendered his commission as governor and accepted a new one from the assembly, which claimed the right to make laws without Baltimore's consent. When news of these disloyal acts reached England, Baltimore sent out with an amnesty his half-brother, Philip Calvert, as governor in Fendall's place. As soon as Calvert arrived in Maryland, the rebellion collapsed, and the lenient governor was content with inflicting fines as punishment, together with perpetual disfranchisement for a few leaders. Shortly afterward the proprietor substituted his only son, Charles Calvert, for his brother, Philip, who was given the chancellorship of Maryland as a solace. Leonard Calvert's son was soon made provincial secretary, and for 30 years a period of family government continued.

The Dutch had unsuccessfully attempted a settlement upon the Delaware in 1631, and the Swedes had been more successful in 1638. New Sweden had been reduced by the Dutch of New Netherland in 1655. Maryland's representative was sent to notify the Dutch that they were within the provincial boundaries and must acknowledge her jurisdiction or depart. Governor Stuyvesant, on his part, sent two envoys to Saint Mary's, one of whom was a Bohemian, Augustine Herman, who was so charmed by the land through which he traveled, that he removed into it and took up a tract in Cecil

County — Bohemia Manor — for which he paid by executing the first good map of Maryland. A brisk trade sprang up between the English settlers on the Chesapeake and the Dutch and Swedes on the Delaware. This lucrative trade was illicit, under the navigation laws which dated from about 1650, and was partly the reason why the provincial authorities hesitated to take decided action against the Dutch, until it was too late to do so; for the Delaware settlements were seized by the English fleet in 1664, and granted by the king to his brother, the Duke of York, as part of his province of New York. For several years there was friction between the two governments, and Calvert sent officers, from time to time, to summon the Delawareans to admit his overlordship, while he also granted lands in that region.

Cecil Calvert, first lord proprietary, died in 1675, and was succeeded by his son, Charles. During the years preceding this event, the boundary between Maryland and Virginia on the Eastern Shore was run, with some loss to the province through imperfect surveying; the tobacco trade flourished, and the settlements spread down the Eastern Shore, so that Talbot, Somerset and Dorchester counties were organized, and along the head of the Chesapeake, so that Baltimore and Cecil counties were established.

The second lord proprietary had as stormy an experience as his father. Indian troubles led to a joint expedition with the Virginians against the Susquehannocks in 1675. In shameful violation of a safe conduct, the Maryland commander weakly yielded to the Virginians' clamor, and five of the chiefs were wickedly put to death. After a month's siege of their fort, the Indians fled; some of them fleeing southward began that course of rapine which led to Bacon's Rebellion (q.v.) in Virginia, while others went northward to unite themselves to their Iroquois kindred, bringing down with them, from time to time, Senecas and Onondagas in hostile incursions against the English settlers and the friendly Indian tribes in Maryland.

In 1680 a disturbance arose, headed by Fendall and John Coode, a renegade Anglican clergyman. It failed, and Fendall was banished, but the discontent increased, and the «Popish Plot» in England, with the fear shown there for the overthrow of the Protestant religion, found reflection in Maryland, in the suspicion felt by many toward the Roman Catholic proprietary.

A worse danger for Maryland arose in 1681, when William Penn obtained a patent from the Crown for a large tract of land, bounded on the south by a «circle drawn at 12 miles distance from New Castle, northward and westward to the beginning of the 40th degree of north latitude and thence by the straight line westward.» Penn also obtained from the Duke of York a grant of New Castle, with a territory of 12 miles around it, and the lands bounding thence on the Delaware southward to Cape Henlopen. Penn began at once to colonize both his province, which took the name of Pennsylvania, and his territories on the Delaware, and endeavored to gain over the frontier inhabitants of Maryland, his great object being to gain access to the waters of the Upper Chesapeake. Baltimore strove to keep his province and wished to fix the 40th parallel at once. The two proprietors met several times, but Penn would not make direct observations of latitude. On the other hand, he suggested that measurement be made from the capes of the Chesapeake, by which means, he said, Baltimore might gain from Virginia as much as he would lose to the north.

While Penn delayed the decision as to the location of the 40th parallel, and placed his city of Philadelphia just south of it, so as to obtain the advantage of possession and to manifest his brotherly love for the rightful owner of the land by wresting his territory from him, he pressed hard for a determination of his claim to Delaware. The death of Charles II placed Penn's patron, the Duke of York, upon the throne, as James II, so that it is not surprising that the English Privy Council, on 7 Nov. 1685, decided that the peninsula should be divided between the claimants by a meridian line running from the latitude of Cape Henlopen north, until it was tangent to the circumference of the circle with a radius of 12 miles from Newcastle. This decision was based on a mistaken and highly technical application of the clause in the Maryland charter, by which the territory «hitherto uncultivated» was granted Baltimore. These words were, in any case, words of description and not limitation. Furthermore, at the time the charter was granted, the only Europeans within the province were fur traders, whose claim had been disallowed.

James II talked of having the Maryland charter forfeited, as a part of his general policy of colonial administration. The proprietary's position was weakened by the unfortunate killing of an obnoxious revenue officer, by a hot-headed Irish relative of Baltimore, Col. George Talbot. In 1684 Baltimore went to England to look after his affairs there, leaving the council in charge in Maryland. Four years later, he sent out to act as executive, a conceited, wordy lawyer, who was a strong partisan of King James, and who had high notions of prerogatives. Indian troubles occurred. Rumors arose of strange alliances between the Roman Catholics in Maryland and those in Canada. The messenger sent by Baltimore to order the proclamation of William and Mary died on the way, and the council refused to proclaim the new sovereigns, without orders from the proprietary. In July 1689, Nehemiah Blackistone, collector of royal customs, and an old enemy of Baltimore, rose in revolt, together with Coode and other Protestants. The agitators were so determined, and Baltimore's supporters were so lukewarm, that their «Protestant Association» was supreme within a month, and the proprietary government was overthrown. The new rulers asked the Crown to administer Maryland as a royal province, and their request was granted, the first royal governor coming in 1692. The charter was not forfeited, however, and the title to land and other private rights was left to Baltimore.

The royal governor brought a greater regularity and formality into the proceedings of the government. We find the development of a highly trained and able body of lawyers, who gave the Maryland bar its earliest renown. Francis Nicholson, as governor, saw the establishment of the Church of England in the province, and a levy made for its support of tobacco from every taxable person, a tax which continued until Maryland ceased to be a province.

About this time came the beginning of education and libraries in Maryland, and the first Presbyterian churches on the Eastern Shore were founded by Rev. Francis Makemie. The capital was removed from Saint Mary's City to a site on the Severn River, more centrally located, where the new town of Annapolis was founded, and named in honor of Queen Anne, who, with her husband, Prince George, are commemorated in the names of two counties — the latter being the first inland one on the Western Shore. Annapolis was the first town of any importance to be founded in the province. Nearly every planter's wharf could be reached by shipping, which carried away his tobacco or wheat, so that towns were the less necessary, and the frequent attempts to establish them during the provincial period were almost always fruitless. Annapolis, itself, though it boasted of a remarkably cultivated and charming society, and possessed some fine town houses of wealthy planters, yet had but little trade. After the Treaty of Utrecht placed an important part of the African slave trade in English vessels, the negro slaves rapidly increased in numbers throughout Maryland.

Charles, Lord Baltimore, died in 1715, and his son and heir, Benedict Leonard Calvert, had become a Protestant, so that the government was restored to him, as there was no longer any pretext remaining that it was unsafe to permit the proprietary to administer it. He did not long enjoy the restored palatinate, but survived his father for only two months, and was succeeded by his eldest son, Charles, fifth Lord Baltimore and fourth lord proprietary, who was still a minor. He was a skilful yachtsman, a dissolute, unlovely man, a friend and admirer of Frederick, the Prince of Wales, after whom he named his only son. This son was the last and the worst of the Lords Baltimore, and was proprietary from 1751 to 1771. Charles, Lord Baltimore, was the last one bearing that title to visit the province, where he spent the years 1732–33. While the province was under royal rule, the proprietary had an agent in Maryland to attend to his private affairs, and to watch that the government did not encroach upon his lands and revenues. He sent over from Europe, to fill that post, Charles Carroll, an Irish Roman Catholic, and the founder of an important family. At the time of the proprietary's restoration, the governor of Maryland was Capt. John Hart, a hot-blooded, capable Protestant-Irishman, a man of infirm health, who was continued in office by the guardian of the proprietary. Theoretically, the second Charles, Lord Baltimore, had the same position as his grandfather; but, practically, the 25 years of royal rule had made a vast difference. The people seemed to have cared but little for the change, and the proprietary was regarded as an absentee landlord, making little use of his power except as a means of appointing relatives and friends to office. In 1715 a comprehensive code was prepared by a committee of the assembly whose chairman was Andrew Hamilton. Shortly afterward he removed to Philadelphia where he was the first American lawyer to gain a continental reputation. From Philadelphia he was called to New York to defend John Peter Zenger in a famous libel case, having known Zenger long before, when both were neighbors in Chestertown in Kent County.

The Protestants soon found that there were no grounds for apprehension lest the Calvert family should lean too much toward the adherents of their ancestors' religion. The Roman Catholics were soon rudely disillusioned of their hope that they might regain, at least, a part of their old influence and position. They were even disfranchised, as a result of a violent contention between Carroll, on the one side, and Hart and the assembly on the other. Some little suspicion of Jacobitism made the Roman Catholics still more unpopular, and repressive laws against them continued in force throughout the whole of the provincial period.

Charles Calvert, a relative of the proprietary, was governor from 1720 to 1727. During this time the general assembly passed in 1723 a law for the establishment of a free school in each county, and a notable controversy arose between the proprietary and the legislature as to whether the English statutes extended to Maryland. This controversy lasted for several years, before the victory of the provincials whose bold resolutions were long remembered: "that this Province hath always hitherto had the Common Law, and such general statutes of England, as are not restrained by words of local limitation, and such acts of the Assembly as were made in the Province, to suit its particular constitution, as the rule and the standard of its government and judicature." Those who maintained the contrary, "intend to infringe our English liberties, and to frustrate the intent of the Crown" in the original grant of this province.

Benedict Leonard Calvert, younger brother of Lord Baltimore, came out to Maryland as governor in 1727, and died of consumption on his way home, in 1731. The promise of his high-minded, scholarly, lovable nature had not time for fulfilment. He had studied at Oxford, had made the "Grand Tour" on the continent of Europe and was a friend of Hearne, the antiquary. While he was governor, William Parks began at Annapolis the first newspaper in the province, though there had been a printing press there as early as 1690. Ebenezer Cook, who called himself "Laureate of Maryland," in his vigorous Hudibrastic satire, "The Sot Weed Factor," gave a lively picture of social life in Maryland and R. Lewis, master in King William's school, wrote poetry and edited a Latin poem, printed in Annapolis. During Calvert's administration occurred two important events which changed Maryland from a rural plantation province to a commercial and agricultural border state. In 1729 Baltimore town was laid out, at the head of navigation on the Patapsco, and grew to a great city, being near to the fertile western country. About this time, along the valleys of the Blue Ridge, from Pennsylvania down toward Georgia, came the sturdy, God-fearing, hardworking, German-speaking immigrants from the Rhineland, who came to Philadelphia, and so had their ties with the Pennsylvanians, rather than with the Virginians. This opening of the back country started that struggle between Philadelphia and Baltimore to obtain trade, which led Braddock, influenced by the colonists in Maryland and Virginia, to make his way westward through Maryland; but Forbes, influenced by the Pennsylvanians, to make his road toward Fort Du Quesne, through

their colony. The Germans in Maryland were not slaveholders, and devoted their attention to the growth of cereals rather than tobacco. They also began manufactures on a small scale, and thus diversified the industry of the palatinate. Charles, Lord Baltimore, came to Maryland in 1732, in an attempt to settle the boundary dispute with Penn's sons and heirs. He yielded to them all that they demanded, for some inexplicable reason, and presented them several million acres of land to which they had no right. Pennsylvanians had settled Philadelphia south of the 40th parallel, but they had no settlements west of the Susquehanna River. Beyond it Marylanders were already building their cabins near the north boundary of the province, and, under Capt. Thomas Cresap, they even fought for their rights. Baltimore agreed, nevertheless, to accept a line run due west on a parallel 15 miles south of Philadelphia, so far as the provinces had a common boundary. When he realized what he had done, he refused to run this boundary and applied to the English courts. The case dragged on until 1760, when the line of 1732 was finally accepted, and was surveyed between 1762 and 1767 by Charles Mason and Jeremiah Dixon, two excellent English surveyors. During the long governorships of William Bladen and Samuel Ogle, the province grew in population and wealth. Worcester County, on the Atlantic seaboard, was organized in 1742, and Frederick County, in the extreme west, in 1748. The *Annapolis Gazette,* established in 1752, published graceful and correct poems written by colonial gentlemen. The English magazines printed the results of the scientific observations in southern Maryland of Dr. Richard Brooke, physician and politician. In 1753, Horatio Sharpe came out as governor, and continued in that office until relieved in 1768 by the last proprietary governor, Sir Robert Eden, the brother-in-law of the last Lord Baltimore. Sharpe was a wise and popular man, who had a difficult position to fill during the French and Indian War, in which Fort Cumberland and other garrisons were placed in the west of the province; but in which Maryland played a discreditable part, owing to a niggardly proprietary and a narrow-minded, unpatriotic legislature.

Maryland joined with the other colonies in repudiating the Stamp Act, and forced the stamp distributor to resign his office and flee from the province. The general assembly passed bold resolves, refusing to admit taxation without representation, and claiming that the provincial legislature had the "sole right to lay taxes, or impositions, on the inhabitants of their province, or their property or effects." When the day arrived on which the Stamp Act should go into operation there was no stamped paper in the province. How could business be transacted, if unstamped paper was illegal? The Frederick County Court took a bold but sensible course, and declared that its business should be carried on without stamps, and the other courts of the province followed it in that course. Maryland was represented in the Continental Stamp Act Congress and took part in the non-importation agreement and in the correspondence with the other colonies, so as to present an united front against the British acts. The people of Annapolis burnt a vessel, *The Peggy Stewart,* laden with tea. Yet the province was conservative, and, in Sharpe and Eden, had two governors of unusual popularity. In 1774 Eden went to England for a few months. In June, during his absence, there met at Annapolis a "general congress of deputies from all the counties," to consider measures of opposition to England. This body was the first of a series of conventions, which chose delegates to continental congresses and appointed a Committee of Safety to act as an executive committee during the intervals between conventions; which enlisted troops and sent them to fight the British in Massachusetts; which directed the choice by each county of a Committee of Observation to care for local matters; and which, by the *Association,* a document offered in 1775 for subscription by the freemen of the province, expressed approval of the measures adopted by the Continental Congress in opposition to Great Britain, and united the people "in maintenance of good order and the public peace."

Eden had not only difficulties to contend with in connection with the British revenue acts, but also had to meet two local troubles. A strong party declared that the act, which provided for the support of the clergy, had not been properly passed, and so was void. A struggle over officers' fees caused great excitement. The acts fixing these fees were temporary, so that the legislature might readjust their rates every few years. The councillors held the chief offices and naturally desired large fees. When the fee act expired in 1770 all attempts to pass a new law failed, because of dissensions between the two houses of the assembly. What should be done in this emergency? Eden issued a proclamation forbidding any officer to take fees greater than those allowed in the old law. Of course, he was thereby virtually authorized to take fees at the old rate, and so the proclamation fixed the fees. A fierce controversy followed over the governor's right to do this; in which controversy, Daniel Dulany, the younger, who had attacked the Stamp Act, defended the governor, and Charles Carroll of Carrollton, a young Roman Catholic, who was the wealthiest landowner in the province, attacked him. The majority of the people undoubtedly agreed with Carroll, but the governor held the whip hand and fees were collected at the old rate, until British rule was overthrown.

In 1771 Frederick, sixth and last Lord Baltimore, died, and the title became extinct. He left the province to his illegitimate son, Henry Harford, the sixth and last lord proprietary. In his honor, Harford County, on the west side of the Susquehanna, was named, and, at the same time, Caroline County, the only inland one on the Eastern Shore, was created and named in honor of Lady Eden.

Eden's influence could not prevent acts of lawlessness from time to time, but his tact and good-fellowship with the colonial leaders, and the conservatism which had always showed itself in Maryland, kept the "ostensible form of government" intact, so that on 17 May 1776, the Provincial Convention denied that it was necessary to suppress the royal government, and, on 21 May, expressed the hope for a "re-

union with Great Britain on constitutional principles." Eden saw that the provincials would "not long be able to stem the torrents which, in several provinces," ran "strongly toward independence." He declined to accept the proposition of the convention that he remain as governor of Maryland, promising to take "no active hostile part, nor to correspond with the British government." Instead, he embarked on a British man-of-war on 23 June 1776, and sailed for England, where, in August, he was created Baronet of Maryland, an honor still worn by his descendants, in return for his skilful administration of the affairs of the province. Baltimore town and Frederick County eagerly sought independence. Samuel Chase, like a flame of fire, preached it throughout Maryland, Matthew Tilghman, William Paca, Charles Carroll the barrister and Charles Carroll of Carrollton urged it. So the convention voted on 21 June, to allow its deputies in the Continental Congress to unite with delegates from other colonies, in declaring independence and forming a confederation. On 3 July, the convention adopted her own declaration of independence, and, thereafter, began to prepare a permanent written constitution for the new State.

State History.— Maryland was equal to any other of the 13 original States in her zeal and fidelity to the common cause. On 2 Aug. 1776, her delegates to the Continental Congress signed the Declaration of Independence, and, in November, elections were held for officers in the new government, which was finally instituted, when the convention adjourned *sine die* in March 1777, and Thomas Johnson was inaugurated as the first governor. The State constitution was not submitted to the people. It provided for changes by passage of the amendment at two successive assembly sessions. The constitution contained a bill of rights and a frame of government, consisting of a governor, chosen annually by the legislature, and a general assembly of two chambers; a House of Delegates, elected annually, consisting of four Delegates from each of the 19 counties and two each from Annapolis and Baltimore; and a Senate of 15 members, chosen quinquennially by an electoral college, consisting of two members from each county and one from Annapolis and Baltimore. A governor's council was also provided, to be chosen annually by the legislature and to act upon his nominations. The judiciary was to be appointed by the governor. Suffrage was based upon the possession of property, and so there were a few negro voters.

Maryland entered into the Revolutionary War with zeal, and her troops were the only ones which were found in every campaign. At the battle of Long Island, on 27 Aug. 1776, the Maryland line won its first renown, and that renown was heightened in the Southern campaigns by its bravery in the battles of Camden, 16 Aug. 1780; the Cowpens, 11 Jan. 1781; Guilford Court House, 15 March 1781; and Eutaw Spring, 8 Sept. 1781. General William Smallwood, their commander, Gen. Mordecai Gist, and Col. John Eager Howard especially distinguished themselves. Tench Tilghman, a Marylander, bore the news of the surrender of Cornwallis and his army at Yorktown, on 19 Oct. 1781, from General Washington to the Congress at Philadelphia, and Dr. James McHenry of Baltimore, afterward Washington's Secretary of War, was one of the general's aides, or military family.

While Maryland was full of alacrity for the common cause, for a long time she refused to sign the Articles of Confederation, fearing danger from the claims of the great States, notably Virginia, to vast tracts of land west of the Allegheny Mountains. Maryland proposed to the Continental Congress that this far-extending territory be granted to the Union, and held as the common property of all the States, and refused to accede to the articles until this proposal was adopted, and Virginia, the most important of the claimants and the only one who had reduced her claims into possession, had made such a cession. This perseverance won, the desired cessions were made, the Western lands became the nation's domain and Maryland entered the Confederation as the 13th State on 1 March 1781. One of her delegates, John Hanson of Frederick County, was the first presiding officer of Congress under the new government. During the war, the State had confiscated the proprietary's lands and those of some of the Tories, who had among their number some men of wealth and some of the yeomen, especially on the lower Eastern Shore. In 1776 Frederick County was divided, the middle portion keeping the old name, the eastern one becoming Montgomery County, named after Gen. Richard Montgomery of the Revolutionary army, who was killed at Quebec, and the western portion becoming Washington County.

In November 1783, by invitation of Maryland, the Congress met in her State House at Annapolis, and in the senate chamber there General Washington resigned his commission on 23 Dec. 1783.

Maryland and Virginia had a common interest in the commerce of the Chesapeake and the Potomac, and, to arrange for its regulation, commissioners were appointed, who met at Alexandria and Mount Vernon in 1785. At that meeting, the desirability of uniform commercial regulations throughout the Union was considered and a convention for the discussion of such questions was called to meet at Annapolis in 1786. Only five States were then represented, and, through dissensions in the Maryland legislature, there were no Maryland delegates. Alexander Hamilton was a delegate, and, through his efforts, a second convention was summoned to meet in Philadelphia in 1787, which gathering drafted the Federal Constitution. Maryland's delegation to the convention divided, Luther Martin (an able lawyer and subsequently an ardent Federalist) and John Francis Mercer refusing to sign the document; while James McHenry, Daniel Carroll and Daniel of Saint Thomas Jenifer, did so. The people of the State elected delegates of strong Federal inclination to the convention called to consider the constitution, which ratified it 28 April 1788, by a large majority,—a vote which was considered to have had a considerable effect in Virginia.

In 1791 Maryland ceded to the Federal government, as a site for the seat of government, about 61 square miles on the north bank of the Potomac River at the head of navigation, and this, with a cession from Virginia, formed the District of Columbia. The portion taken from Virginia was later retroceded to her, so

that the territory of the present district was once entirely a part of Maryland. In 1796 Allegany County was formed from the western part of Washington County. During the early part of the 19th century, the Jeffersonian party in the State became organized, its leaders being two brothers: Gen. Samuel Smith, who sat in the United States Senate, and Robert Smith, who became Secretary of State.

When war was declared between the United States and Great Britain in 1812, Baltimore sent forth about 60 fast sailing vessels, which preyed as privateers on British commerce. In return, Admiral Cockburn sailed into the Chesapeake with a British fleet. He made a number of landings, and had skirmishes with the people. The Federal authorities were inefficient. Finally, in August 1814, a reinforcement of British troops having arrived under command of General Ross, the British fleet sailed up the Patuxent River and disembarked a considerable expedition. The British forces were met by the Americans near Bladensburg, and the latter were shamefully defeated. The British advanced and took the Federal capital — Washington. After a short time, they retired, reembarked on the fleet and sailed up the bay to attack Baltimore. The army under General Ross landed at North Point, and attacked the Maryland militia, driving them back several miles upon the defenses of the city. In the attack, General Ross was killed. A landing party to the southwest of the city was unsuccessful. Fort McHenry, on the end of a peninsula at the mouth of the harbor, was bombarded by the fleet. During the night of the bombardment, Francis Scott Key, a lawyer of fine ability, who was detained on a British ship, whither he had gone to endeavor to effect the release of a prisoner, wrote the "Star Spangled Banner." Having failed to take the city, the British withdrew. After the conclusion of peace, the farseeing merchants of Baltimore planned Western routes to secure trade for their city, and the Baltimore and Ohio Railroad came into being.

Maryland was a close State politically, and was so conservative that the Federalist party lingered there for years after it had gone out of existence elsewhere. In 1806 the property qualification for voters was abolished, a racial one being substituted. The growth of Baltimore city and the larger counties rendered the people therein discontented with the constitutional rules of equality of representation in the legislature. In 1837 the Democratic electors for the senate of the State, who numbered 19 out of 40 (the quorum being 24), refused to go into the body, in the hope of accomplishing constitutional revision. They failed to prevent the election of a senate, and the party was repudiated by the voters at the ensuing election, but the constitutional amendments desired were speedily achieved, and, in 1838, the governor's council was abolished; the governor's election made by the people for a three-year term; and the senate made also a body elected by the people, one member coming from each county and one from Baltimore city. Annapolis lost its representation in the general assembly. In 1836 Carroll County was established out of parts of Frederick and Baltimore, and took its name from the venerable Charles Carroll of Carrollton, who had been the last survivor of the signers of the Declaration of Independence, and had died in 1832. William Wirt, an eminent lawyer and a resident of Baltimore city, was nominated for the Presidency by the anti-Masonic party, and received the electoral vote of Vermont at the election of 1832. From that time, for 30 years, Baltimore was the place at which many National political conventions were held.

At this time, in Maryland, as in other States, large amounts had been borrowed to aid works of communication, such as railroads and canals. A financial crisis came upon the country, after the failure of the Bank of the United States to obtain a recharter, and Maryland was in danger of bankruptcy. That this evil was averted and the State's credit maintained was due to the high integrity of Thomas G. Pratt, then governor, and to the great helpfulness of George Peabody, then a London banker, but formerly in business in Baltimore. The failure to recharter the United States Bank was mainly due to two men, President Andrew Jackson and Roger B. Taney, a Maryland lawyer, who had been called to the President's Cabinet as Attorney-General, and, having already conceived a distrust for that bank, had not only agreed with the President in his opposition to it, but had increased his hostility. Taney was transferred to the Treasury Department, so as to accomplish more against the bank, by removing the Federal government deposits from it. The Senate refused to confirm the appointment — an unprecedented act. Jackson nominated Taney again to a seat on the Supreme Court bench, and the nomination was rejected. A vacancy in the chief justiceship gave Jackson a third opportunity to honor Taney, and a change in the membership of the Senate secured his confirmation, so that he presided over that august tribunal from 1838 to 1864. The Maryland bar was a famous body of men. William Pinkney, who served as Minister to England and won laurels as an orator in the United States Senate, was considered the leader of the American bar, until he died, and after Daniel Webster died, for 20 years, Reverdy Johnson was the most prominent American lawyer. Johnson was a Whig, served as Attorney-General in Taylor's administration, was twice senator from Maryland and was Minister to England.

Troops from Maryland played a gallant part in the Mexican War. The agitation for rotation in office and for a greater number of elective offices was so strongly felt in Maryland that a new constitution was adopted in 1851. The term of the governor was increased to four years, at which it has remained. At this time, Howard County was created out of part of Anne Arundel, and Baltimore city was made independent of Baltimore County. To use the English phrase, it was created a county borough. Maryland had given considerable support to the colonization of negroes in Liberia, and John H. B. Latrobe, an eminent lawyer, was for many years president of the Colonization Society, but there was little abolition sentiment in the State. The Republican party was not organized in Maryland until 1866, but there was very conservative Union sentiment in the State, and the Whigs had been powerful there. There was also a strong nativist element, which was brought into politics by a considerable foreign immigration to Baltimore about 1850, and by the

fact that these immigrants usually voted the Democratic ticket. As a result of the combination of these elements, Fillmore carried the State (the only one he did carry) as the native American (or "Know Nothing") candidate for the Presidency in 1856, and Thomas H. Hicks, the candidate of the same party, was chosen governor in 1857. Baltimore city, about that time, was characterized by election riots and disturbances between mobs, composed of partisans of "Know-Nothings" and of Democrats, and also between mobs, composed of adherents of rival volunteer fire companies. The police force there was inefficient, and, as a result, in 1860 it was placed under State control, under which it still remains. When the Presidential election of 1860 came, Breckenridge, the candidate of the Southern Democracy, carried the State by a narrow plurality, over Bell, the Conservative Union candidate, supported by the Old Line Whigs. As soon as Lincoln's election was announced, the Gulf States began to secede. Maryland was in a difficult situation. She was a border State, slaveholding, conservative, Union loving, having ties both to North and to South. Governor Hicks was a Union man, but not a man of strong personality. Lincoln called for troops. On the 19th of April, the Sixth Massachusetts regiment reached Baltimore. Locomotives were not then allowed to draw trains through the city, but mules pulled the cars from one station to the other along Pratt street. The commander of the regiment permitted his men to remain in the cars, and the crowd, seeing them so transported, became menacing. Stones were thrown, shots were fired and several men were killed on either side — the first bloodshed of the Civil War. Governor Hicks promptly called a session of the legislature to meet in Frederick, the centre of the Unionist part of the State, where the local influences overawed the Secessionists in the legislature, so that the question of disunion was never brought to a vote. Later, the Federal officers arrested some prominent disunionists and confined them for several months. Baltimore was reduced to quiet and obedience to Federal law, when Gen. Benjamin F. Butler, with Union troops, took post in May on Federal Hill, overlooking the city. There was some friction with Federal authorities during the remainder of the conflict but the question was settled that Maryland would continue loyal to the National government. The credit for saving Maryland to the Union is, in large measure, due to the efforts of Reverdy Johnson and Henry Winter Davis, an eloquent orator and congressman. Some Marylanders crossed the Potomac, and, enlisting in the Confederate army, fought bravely. Gen. Bradley T. Johnson was the most important of their officers. The Union army also contained a large number of Maryland soldiers, the chief officers being Gen. John R. Kenly and Gen. Charles E. Phelps. Union troops were stationed along the Potomac, and three important campaigns took place wholly or partly in the State. In the autumn of 1862, General Lee came into the State with the Army of Northern Virginia, and met General McClellan and the Army of the Potomac, near the village of Sharpsburg, on Antietam Creek, in Washington County, fighting there a bloody battle, after which Lee was forced to retire into Virginia. This Maryland campaign had, as one of its incidents, the occupation of Frederick by Stonewall Jackson, which gave rise to the poem of "Barbara Frietchie." In 1863 Lee crossed the State twice on his way to and from Gettysburg, and, in 1864, Gen. Jubal A. Early entered Maryland, and fought the battle of the Monocacy near Frederick against Union forces under Gen. Lew Wallace. They were defeated, but the delay they caused the Confederate army, together with a second delay, occasioned by Early's stopping to collect a ransom of $200,000 from Frederick, gave the Federal authorities time to bring troops to Washington and avert danger of the capital's falling into the Confederate's hands. A raiding party came within five miles of Baltimore at this time. During the war, James R. Randall wrote the song, "Maryland, my Maryland," to encourage the secession element in the State.

Augustus W. Bradford, a Union man, was chosen governor in 1861, and, under his administration, was held the Constitutional Convention of 1864, the result of whose deliberations was declared adopted in October, by a very small majority, made up by the soldiers' vote. This constitution abolished slavery, increased the representation of Baltimore, making it equivalent to three counties, provided for a lieutenant-governor, instituted registration of voters and established a State system of public education. It also prohibited, in the strictest terms, any persons who had sympathized with the Confederate States from holding office or voting, and provided that all voters must take an oath that they "have been truly and loyally on the side of the United States."

Thomas Swann was elected governor, and C. C. Cox, lieutenant-governor, on the Union ticket in November 1864. When the Civil War ended in 1865, the Union party, which had been a coalition one, fell into pieces. Governor Swann became a Democrat, while Lieutenant-Governor Cox and Henry Winter Davis organized the Republican party, which was a minority one for 30 years. Reaction from the extreme loyal position of the constitution of 1864 led to the assembling of another Constitutional Convention in 1867, which drafted the constitution under which the State is still governed, the people having declined in 1887 and 1907 to call a Constitutional Convention — a proposition which the constitution directed to be laid before them every 20 years. This constitution abolished the office of lieutenant-governor and the "iron clad oath" of loyalty, and rearranged the judiciary. By this constitution, Wicomico County was established on the Eastern Shore, out of Dorchester and Somerset. In 1872 the western part of Allegany County was created into Garrett County, named for John W. Garrett, president of the Baltimore and Ohio Railroad. This is the last county to be organized.

Oden Bowie was the first governor under the new constitution, and he was succeeded in 1872 by William Pinkney Whyte, a lawyer of marked ability, who held, at one time or another, nearly every elective office in the gift of the people, and who was the head of the Democratic organization until about 1880. Then Arthur P. Gorman, who had been a prominent member of the legislature, succeeded him as the director of Democratic politics, and continued to keep the organization in the hands of himself and his friends until his death in 1906. During

most of that quarter of a century, he was a member of the United States Senate. The legislatures of 1868 and 1870 were unanimously Democratic, but, in that of 1872, a small Republican minority appeared, under the leadership of Dr. Lewis H. Steiner of Frederick County.

A one-party State is apt to find that abuses creep in, and such became the condition in Maryland. An independent reform movement in the Democratic party led to refusal on the part of many to accept the nomination of John Lee Carroll of Howard County for governor in 1875. A reform ticket was nominated, headed by J. Morrison Harris, a Republican, and containing the name of S. Teackle Wallis, a Democrat and the leader of the Baltimore bar, as candidate for the attorney-generalship. This ticket carried the counties, but gross frauds in Baltimore city were sufficient to show Carroll's election on the face of the returns. The Court of Appeals, in a decision welcomed as a precedent by Republicans in the Presidential contest of the succeeding year, decided that it could not go back of the returns, and Carroll became governor. The reform Democrats and independent Republicans then organized the Baltimore Reform League, and for 30 years waged an unparalleled conflict against the dominant party organization. Gradually, the independent voters came to hold the balance of power, especially in Baltimore. No independent ticket was nominated, but the League steadily continued for good election laws, honestly administered and from time to time supported such Republican candidates as stood for the same purposes as the League. This policy led both parties to nominate better men and much improved political conditions.

In 1877 the most terrible strike of working men occurred, which Maryland has yet known, when a reduction in wages of the employees of the Baltimore and Ohio Railroad led to such rioting that the National Guard was insufficient to quell it, and the assistance of Federal soldiers was requested. The efforts of the reform element led to the nomination, by the Democratic party in 1879, of William T. Hamilton of Washington County, for the governorship. He was elected by a large majority, and, though hampered by an unfriendly legislature, accomplished some reform. In 1882, the Reform League achieved its first victory in Baltimore, electing "new judges," in coalition with the Republicans, over the old judges, who had been renominated by the Democrats.

Robert M. McLane was elected governor, in 1885, but, being appointed Minister to France, he did not complete his term. In 1887 the Baltimore and Ohio Railroad ceased to pay dividends, and many citizens who were stockholders suffered severe losses. The road struggled along until 1896, when it went into the hands of the receivers, John K. Cowen and Oscar G. Murray. They were two remarkable men; the one, an able lawyer; the other, a skilled railroad operator, and, by the daring issue of receiver's certificates, and by extensive reconstruction of the road, they were able, after a little more than three years, to return it to its stockholders under the original charter. Cowen became the first president of the reorganized road. A tunnel was dug under Baltimore, in order to secure direct connection between the lines on the east and those on the west of the city.

In 1887 Elihu E. Jackson was elected governor. In 1889 disastrous floods in western Maryland so damaged the Chesapeake and Ohio Canal that it was never afterward successfully operated. Fifteen years later, it was sold to the Western Maryland Railroad. In 1890 the financial interests of the State suffered a great shock, by the discovery of the misappropriation of over $100,000 of the State's funds by the State treasurer, a man who had been universally trusted. The loss to his bondsmen was heavy, and the incident gave an especial incentive to the founding of bonding companies in Baltimore. The long-continued complaint of intimidation and fraud at elections, especially in Baltimore city, led to the passage of an Australian Ballot Law in 1890. This statute much improved the conditions, but was a measure which needed much later amendment.

Frank Brown, of Carroll County, was chosen governor in 1891, and in 1894 he found it necessary to call out the National Guard to preserve order in consequence of a miners' strike in Allegany County. In that year's Congressional elections, the Republican party, for the first time, had a majority in the State. This fact gave the party fresh courage, and, in 1895, it nominated a strong candidate for governor, Lloyd Lowndes of Allegany County. The Reform League supported him, as did ex-Governor Whyte, and many other Democrats, who had become dissatisfied with conditions in their party and in the State. Especial efforts were exerted to prevent intimidation or fraud in Baltimore city. The election resulted in a Republican legislature and a large popular majority for Lowndes. For many years, one United States senator had been chosen from either shore of the bay, but now that rule was broken, and a Republican, George L. Wellington of Allegany County, was chosen senator, the other senator being Arthur P. Gorman of Howard County. The same session saw the passage of an excellent ballot law, prepared by the Reform League (which did away with all riot and intimidation, and almost all fraud at the polls), and the establishment of the State Geological Survey, whose achievements have been very extensive, and of a remarkable scientific character.

In 1896 William J. Bryan was nominated for the Presidency, by the Democratic party, and this choice was not received with favor in Maryland, where the sentiment in favor of a gold standard was strong, and where the party had always called itself the Democratic-Conservative party. The Prohibitionists nominated Joshua Levering of Baltimore, but his vote was small. William McKinley, the Republican nominee, carried the State by 32,000 plurality, and every Republican candidate for Congress was elected. President McKinley called to his Cabinet, as Postmaster-General, James A. Gary, of Baltimore, a prominent manufacturer. In 1897 a general assembly was chosen, Republican in both branches, the only time such has been elected. They adopted a new city charter for Baltimore, by which a board of estimates was established, and empowered to prepare an annual budget for the city. Louis E. McComas of Hagerstown, an experienced jurist, was elected to the United States Senate. In the Spanish

War, which occurred during that year, Maryland troops did not have the opportunity of service outside of the country, but two natives of the State gained renown: Adm. Winfield Scott Schley and Gen. Harrison G. Otis, both of whom were born in Frederick.

The Democratic party won the gubernatorial election of 1899, owing in part to dissensions among the Republicans, and John Walter Smith of Worcester County defeated Governor Lowndes, who sought re-election. Governor Smith succeeded to the leadership of the Democratic State party organization, when Senator Gorman died. Four years after the close of his term as governor he was elected to the United States Senate. In 1900 the State cast its electoral vote for McKinley, by nearly 14,000 majority. Governor Smith called the legislature in extra session in 1901 to amend the ballot law and to provide for a State census, since certain frauds, which were afterward corrected by the Federal officials, had been discovered in the National Census of 1900. The Democratic party now entered upon a continuous policy for suppressing the votes of negroes and the election law adopted in 1901 abolished party emblems and columns from the ballot, and included other provisions, making it easy for election officials to throw out ballots. The election of 1901 turned upon the question of approving, or condemning, this election law, under which so-called trick ballots, difficult to vote, were used in certain counties. A Democratic legislature was chosen, but, of the two State officials elected by small majorities, one was a Republican. In 1902 the Republicans carried the State on the Congressional vote; but, in 1903, Edwin Warfield of Howard County, head of one of the Baltimore bonding companies, was elected governor on the Democratic ticket. About this time, an era of construction of public buildings occurred at Annapolis. The state house, erected in Governor Eden's administration, was enlarged; a building was erected for the Court of Appeals and the State Library; and the United States Naval Academy, established during the administration of President Polk, when George Bancroft was Secretary of the Navy, was rebuilt. On 7 Feb. 1904 occurred the great fire in Baltimore, which burnt over about 160 acres of ground in the centre of the city, and destroyed nearly $100,000,000 worth of property. A Burnt District Commission with created to deal with the emergency, streets were widened and new piers built. An adequate sewer system, at a cost of about $25,000,000, was installed about the same time, and the city entered upon a new era of progress. In the autumn of 1906 the erection of a new Young Men's Christian Association building was made possible in Baltimore, by the raising of over $400,000, through the first of those intensive canvasses which have since been so often resorted to in the city.

The legislature of 1904 proposed to the voters a constitutional amendment relating to the suffrage, usually known as the Poe Amendment, from the name of John P. Poe, Esq., a prominent lawyer who drafted it. It included the so-called "grandfather clause," and gave officers of registration considerable power, the object being to prevent most of the negroes from voting, and so render the success of that party certain. However, the amendment was opposed by the governor, the attorney-general and many other prominent Democrats, as well as by the united body of Republicans, and was defeated at the polls in the election of 1905, by a majority of 35,000, although a Democratic majority was chosen in the general assembly then selected. Twice subsequently, a futile attempt was made to have a similar amendment incorporated in the State constitution, before the effort was finally relinquished. In the Presidential elections of 1904 and 1908 the electoral vote of the State was divided, so close was the result.

In President Roosevelt's Cabinet, Charles J. Bonaparte, Esq., of Baltimore, who had been prominent in reform movements, served as Secretary of the Navy and as Attorney-General. In 1906 the legislature passed the bill for oyster culture, usually known by the name of B. Howard Haman, a Baltimore attorney who drafted it, and this was the commencement of the conservation movement. Shortly afterward a State Forestry Commission was appointed, which has done good work.

In 1904 the movement for good roads began, which had such remarkable development during the gubernatorial term of Austin L. Crothers, of Elkton, Cecil County, which lasted from 1908 to 1912. Isidor Rayner, Esq., an eloquent man, was elected to the United States Senate, in 1904, by the Democrats.

Phillips Lee Goldsborough, of Cambridge, Dorchester County, who was chosen governor in 1911 was the second Republican to attain that office. His administration was efficient and characterized by progress. He was succeeded by Governor Emerson C. Harrington, also of Cambridge, a Democrat, who was chosen in a close election. The enactment of the budget amendment to the constitution occurred during his administration. The first popular election of a United States senator resulted in the election of Dr. Joseph I. France, the Republican nominee. The electoral vote in 1912 and 1916 was cast for the Democratic candidate. Governor Harrington appointed a Council of Defense which rendered valuable service during the Great War. Maryland contributed nearly 50,000 soldiers to the United States army,—the 115th and 313th regiments, especially, being almost entirely composed of Maryland men, and they gave a good account of themselves on the battlefield. Several army camps, etc., were located in the State, the most important ones being Camp Meade at Admiral, in Anne Arundel County, Camp Holabird, in Baltimore County, and the Edgewood Proving Grounds in Harford County.

Population.—Maryland had a population in 1790 of 319,728; in 1850, 583,034; in 1870, 780,844; in 1890, 1,042,300; in 1900, 1,188,044; in 1910, 1,295,346; in 1917 (estimated) 1,373,673. The principal cities are Baltimore (558,485 in 1910, large district annexed in 1917, now estimated, 669,891); Cumberland (21,859); Hagerstown (16,507); Frederick (10,411); and Annapolis (8,609).

The Press.—There are three morning daily papers published in Baltimore: the *American* (Republican), established in 1774, the *Sun* (Democratic), established in 1837, and the *Daily Record* (legal); and there are three afternoon papers: the *News*, *Evening Sun* and *Star*. Several weekly and monthly religious

and trade magazines are published in Baltimore, as are the magazines issued by the Johns Hopkins Press, the oldest of American university presses. In each county-seat there are usually two newspapers printed, and in the smaller cities there is generally found a daily newspaper.

The following is a list of the governors of the State:

LORDS PROPRIETARY OF MARYLAND.

1632–1675. Cecilius Calvert, Second Lord Baltimore.
1675–1715. Charles Calvert, Third Lord Baltimore.
1715. Benedict Leonard Calvert, Fourth Lord Baltimore.
1715–1751. Charles Calvert, Fifth Lord Baltimore.
1751–1771. Frederick Calvert, Sixth Lord Baltimore.
1771–1776. Henry Harford.

PROPRIETARY GOVERNORS OF MARYLAND.

Leonard Calvert 1634–47
In absence in Virginia in 1638, he left John Lewyer and Thomas Cornwalleys in charge of the province. In 1641 he left Cornwalleys again in charge for two months. From June 1643, to September 1644, he was in England, leaving Giles Brent as acting governor. In October 1644, William Brainthwayt was acting governor. In February 1645, Edward Ingle usurped the province. Anarchy prevailed from the middle of 1645 to July 1646, when Edward Hill was chosen governor by the council and confirmed by Calvert, from Virginia. Calvert resumed rule in the fall of 1646.
Thomas Greene 1647–49
William Stone 1649–54
During Stone's absence from the province in 1649 and 1650, Thomas Greene and Thomas Hatton acted as governor. In March 1652, Richard Bennett, Edmund Curtis and William Claiborne took possession of the government. In June, Stone was restored.
Commissioners. Settlers appointed by Parliamentary Commissioners or by Provincial Court 1654–58
Josias Fendall 1658–60
Philip Calvert 1660–61
Charles Calvert (became Lord Baltimore 1675. 1669–1670 Philip Calvert, acting governor) ... 1661–76
Cecilius Calvert 1676
Nominal governor. Deputy governor Jesse Wharton actually carried out duties.
Thomas Notley 1676–79
Charles, Third Lord Baltimore 1679–84
Benedict Leonard Calvert (nominal governor. Council exercised power. Vincent Lowe, president) 1684–88
William Joseph (President of Council) 1688–89
Protestant Associators 1689
Convention of Freemen and John Coode, commander-in-chief 1689–90
Nehemiah Blakistone 1690–92

ROYAL GOVERNORS

Sir Lionel Copley 1692–93
Sir Thomas Lawrence (President of Council) ... 1693
Sir Edmund Andros 1693–94
Col. Nicholas Greenbury (President of Council) .. 1694
Sir Thomas Lawrence (President of Council) 1694
Francis Nicholson 1694–99
Nathaniel Blakistone 1699–1702
Thomas Tench (President of Council) 1702–04
John Seymour 1704–09
Edward Lloyd (President of Council) 1709–14
John Hart 1714–15

PROPRIETARY GOVERNORS (RESTORED)

John Hart 1715–20
Charles Calvert 1720–27
Benedict Leonard Calvert 1727–31
Samuel Ogle 1731–32
Charles, Fifth Lord Baltimore 1732–33
Samuel Ogle 1733–42
Thomas Bladen 1742–47
Samuel Ogle 1747–52
Benjamin Tasker 1752–53
Horatio Sharpe 1753–69
Robert Eden 1769–76
(Richard Lee, President of Council, acting governor 1774)
The Convention and Council of Safety 1776–77

STATE GOVERNORS OF MARYLAND.

Thomas Johnson		1777–79
Thomas Sim Lee		1779–82
William Paca		1782–85
William Smallwood		1785–88
John E. Howard	Federalist	1788–91
George Plater	"	1791–92
James Brice	"	1792
Thomas Sim Lee	Federalist	1792–94
John H. Stone	"	1794–97
John Henry	"	1797–98
Benjamin Ogle	"	1798–1801

BERNARD C. STEINER,
Librarian of The Enoch Pratt Free Library, Baltimore.

MARYLAND AGRICULTURAL COLLEGE, a State institution founded in 1856 at College Park, Md., for education in agriculture and its ancillary sciences. At present it has the following departments: agriculture, horticulture, biology, chemistry, mechanical engineering, civil engineering, electrical engineering, canning and preserving, also training courses in agriculture for teachers and a summer school. A great part of the college plant was destroyed by fire 29 Nov. 1912. The college was housed for a time in temporary structures, but new buildings have since been erected, of which the principal are Calvert and Morrill Halls. The college plant is valued at $525,000 and the annual income is about $170,000. There are 10,000 volumes in the library. The faculty numbers 40 and the student body about 500.

MARYLAND CAMPAIGN OF SEPTEMBER 1862. The Union army under General Pope having been defeated and driven to

the defenses of Washington, General Lee, 3 Sept. 1862, marched from Chantilly for Leesburg. At the end of the first day's march Lee wrote to Jefferson Davis that the time seemed propritious "for the Confederate army to enter Maryland" and give her material aid in the recovery of her liberties. The next day he reached Leesburg, and again wrote that he was fully persuaded of the benefit that would result from an expedition into Maryland, and should proceed at once to make the movement, unless it was disapproved; also that he proposed to enter Pennsylvania, unless it should be deemed unadvisable upon political or other grounds. Without waiting for a reply to his two communications he crossed the Potomac at White's Ford, near Leesburg, on the 4th, 5th and 6th, with an army of over 60,000 men, and marched to Frederick, Md., where, on the 8th, he suggested to President Davis that the position of affairs "placed it in the power of the government of the Confederate States to propose with propriety to that of the United States the recognition of our independence." On the same day he issued an address to the people of Maryland, stating his mission among them and that he was prepared to assist them in regaining the rights of which they had been despoiled. When Lee entered Maryland east of the Blue Ridge he took it for granted that the Union garrison at Harper's Ferry would be withdrawn, thus opening his line of communication through the Shenandoah Valley. This was not done, and it became necessary to dislodge the garrison from that post before concentrating the Confederate army west of the Blue Ridge, and Lee came to the decision to divide his army and capture the Union forces at Martinsburg and Harper's Ferry. On the morning of the 10th his army was put in motion from Frederick. Walker's division of two brigades crossed the Potomac at Point of Rocks, south of Harper's Ferry, and on the morning of the 13th established itself on Loudoun Heights; Jackson, with 14 brigades, marched over South Mountain at Turner's Gap, crossed the Potomac at Williamsport on the 11th, drove General White from Martinsburg into Harper's Ferry (q.v.), and at noon of the 13th appeared before Bolivar Heights and invested Harper's Ferry from the Virginia side of the Potomac. McLaws, with 10 brigades, marched over Brownsville Gap of the South Mountain, crossed Pleasant Valley and on the evening of the 13th was in full possession of Maryland Heights (q.v.), thus completing the investment of Harper's Ferry and its garrison of over 12,000 men. General Lee, with nine brigades of Longstreet's command and D. H. Hill's division of five brigades, followed Jackson over South Mountain, leaving Hill near Boonsboro to support Stuart's cavalry, which had been left east of the Blue Ridge. Lee, with Longstreet, moved to Hagerstown, there to await the capture of Harper's Ferry, and then to concentrate his army for a movement into Pennsylvania, the capture of Harrisburg and the destruction of the long railroad bridge over the Susquehanna. Meanwhile General McClellan, who had been placed in command of the Union troops for the defense of Washington, took the field at the head of over 87,000 men, and marched against Lee. His army, spread out like a great fan, its left on the Potomac and its right on the Baltimore and Ohio Railroad, cautiously advanced on Frederick, which was occupied on the 12th, and here McClellan found a copy of Lee's orders showing the disposition of his scattered command. Tardy pursuit began; on the morning of the 13th Franklin's Sixth corps and Couch's division were put in motion to carry Crampton's Gap, in South Mountain, and relieve the garrison in Harper's Ferry, while McClellan, with the rest of the army, marched for Turner's Gap, six miles north of Crampton's, to cross the South Mountain and attack Lee. Franklin defeated the Confederates at Crampton's Gap on the 14th and, passing into Pleasant Valley, interposed between McLaws and Lee. Burnside, with the First and Ninth corps, attacked D. H. Hill at Turner's Gap and Fox's Gap the same day, Lee retraced his steps from Hagerstown to reinforce Hill, but when night came Lee had suffered defeat. He now abandoned his intention of invading Pennsylvania, ordered McLaws to elude Franklin and recross the Potomac somewhere south of Shepherdstown Ford, and at 10 o'clock that night put his own command in motion to recross the Potomac at Shepherdstown Ford, at the same time sending an order to Jackson to march from his investment of Harper's Ferry up the south side of the Potomac to Shepherdstown and cover the crossing. He crossed the Antietam in the morning of the 15th, where he hoped that McLaws might join him, but Franklin confined McLaws in Pleasant Valley. At noon he heard that Jackson had captured Harper's Ferry, whereupon he concluded not to retreat across the Potomac, but to give battle to McClellan on the heights and banks of the Antietam, and ordered Jackson to join him as soon as possible. McClellan followed Lee on the morning of the 15th, defeated Fitzhugh Lee's cavalry brigade in the streets of Boonsboro, and in the evening reached the banks of the Antietam to see Lee's army drawn up on the heights beyond. Franklin was left in Pleasant Valley to watch McLaws and relieve Harper's Ferry. Jackson joined Lee on the morning of the 16th, bringing Walker's division with him; McLaws eluded Franklin, passed out of Pleasant Valley and through Harper's Ferry, and joined Lee very early in the morning of the 17th. The battle of Antietam (q.v.) or Sharpsburg, the bloodiest one-day battle of the war, was fought on the 17th; both armies remained inactive on the 18th, and that night Lee recrossed the Potomac at Shepherdstown Ford. McClellan followed on the morning of the 19th to the banks of the Potomac. On the 20th a part of Fitz-John Potter's Fifth corps crossed the Potomac at Shepherdstown Ford (q.v.), and was attacked and driven back across the river with great loss. This ended the campaign. From the beginning of the campaign to its close, 5–20 September, the Union losses, including Harper's Ferry and Maryland Heights, were 2,671 killed, 11,766 wounded and 13,542 captured or missing, an aggregate of 27,979. The Confederate losses were 1,979 killed, 9,607 wounded and 2,336 captured or missing, an aggregate of 13,922. The results of the campaign were momentous and far-reaching; the Confederate cause lost prestige and the National cause brightened. Recognition of Confederate independence by Great Britain and France, about to be granted, was withheld, and 22 September Abraham Lincoln issued his preliminary proclamation of emanci-

pation. Consult 'Official Records' (Vol. XIX); 'McClellan's Own Story'; Michie, 'Life of Gen. McClellan'; Palfrey, 'The Antietam and Fredericksburg'; Allan, 'History of the Army of Northern Virginia'; Walker, 'History of the Second Army Corps'; Long, 'Life of General Lee'; Fitzhugh Lee, 'Life of General Lee'; Cooke, 'Life of Stonewall Jackson'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. II).

E. A. CARMAN.

MARYLAND HEIGHTS, a bold, wooded elevation in Maryland, rising 1,000 feet above the Potomac opposite Harper's Ferry (q.v.), W. Va. In these heights, Elk Ridge, lying west of South Mountain, from which it is separated by the narrow Pleasant Valley, terminates. The heights are almost inaccessible, capable of strong defense, and completely command Harper's Ferry, which lies below it in the angle formed by the junction of the Potomac and Shenandoah rivers. When Harper's Ferry was seized by the Virginia forces in April 1861, Col. T. J. ("Stonewall") Jackson promptly occupied Maryland Heights, and they continued in Confederate possession until June of that year, when Gen. J. E. Johnston withdrew from the line of the Potomac and fell back to Winchester. The heights were then occupied by Union troops, and 5 Sept. 1862, when Lee crossed into Maryland, they were held by Col. T. H. Ford with about 2,000 men and some heavy siege and field artillery. When Lee, at Frederick, Md., found that Harper's Ferry and the heights were still held by the Union troops he sent three columns to surround and capture the garrison of more than 12,000 men. Jackson moved from Frederick on the morning of 10 September, crossed South Mountain and the Potomac, and, driving everything before him, bivouacked on the 13th near Bolivar Heights. Walker crossed the Potomac south of Harper's Ferry and seized Loudoun Heights. McLaws, with 10 brigades, marched from Frederick late on the 10th, camped that night near Brownsville Gap, crossed the gap next day, and on the 12th crossed Pleasant Valley, ascended Maryland Heights, with Kershaw's and Barksdale's brigades, at Solomon's Gap, five miles north of Harper's Ferry, drove in some skirmishers and, marching southward on the crest of the mountain, was checked near nightfall by Ford's men behind a barricade of logs. In the morning of the 13th he renewed his attack, which was stoutly resisted by Ford's men, who meanwhile had been reinforced by troops from Harper's Ferry. The Union troops were finally driven from the heights into Harper's Ferry, abandoning four guns, and at 4.30 P.M. McLaws was in complete possession, and put guns in position commanding Harper's Ferry, whose garrison surrendered on the 15th. The Union loss on Maryland Heights was about 150 killed and wounded; the Confederate loss was 35 killed and 178 wounded. After Lee had been driven across the Potomac the heights were occupied 20 September by troops of the 12th corps. The position was strongly fortified, and when, 15 June 1863, Milroy was defeated and driven from Winchester, General French moved his garrison from Harper's Ferry to the heights. Under General Meade's order French abandoned the position and distributed his troops at Frederick and on the line of the Baltimore and Ohio Railroad. When Lee was defeated at Gettysburg the heights were reoccupied, 7 July, by the Union forces, and continued in their possession until the close of the war. On 2 July 1864 General Early reached Winchester on his way to menace Washington; General Sigel, who was commanding the Union forces in and around Martinsburg, abandoned his position on the night of the 3d, crossed the Potomac at Shepherdstown, and on the night of the 5th established himself on Maryland Heights, with six regiments of infantry, 2,500 dismounted cavalry, two batteries of heavy artillery and 26 field-guns, while General Stahel was at Weverton and in Pleasant Valley, with 1,200 to 1,500 cavalry and four guns. Early followed Sigel across the river at Shepherdstown Ford, drove Stahel back and confined Sigel within his works; a heavy cannonade was kept up all night of the 6th, and there was sharp fighting next day; but, making no impression, and unable to manœuver Sigel out of his position, Early drew off and crossed the South Mountain toward Frederick.

E. A. CARMAN.

MARYLAND HISTORICAL SOCIETY, The, was first proposed as a project by John H. B. Latrobe in 1835, and was organized in his law office on 27 Jan. 1844, largely "through the zeal and execution" of Brantz Mayer. It was incorporated in 1845, and, joining with the Baltimore Library Company, a proprietary library founded in 1796, solicited gifts for a building to be called the Athenæum, a solicitation so successful that the organizations removed to permanent quarters therein on 23 Oct. 1848. In 1852 the Baltimore Library Company disbanded, giving its books and its share in the building to the Society. The Mercantile Library Company occupied a part of the Athenæum on a lease from the beginning until about 1880. In 1916 Mrs. H. Irvine Keyser gave the Society, as a memorial to her husband, the former residence of the late Enoch Pratt, at the corner of Monument and Park streets in Baltimore, and erected on the rear of the lot a fireproof library and art gallery. The buildings were opened with suitable exercises 18 Feb. 1919. The Society has about 800 members. Its presidents have been Gen. John Spear Smith, 1844 to 1866; Col. Brantz Mayer, 1866 to 1871; John H. B. Latrobe, Esq., 1871 to 1891; Severn Teackle Wallis, Esq., 1892 to 1894; Rev. John G. Morris, D.D., 1895; Albert Ritchie, Esq., 1896 to 1904; Mendes Cohen, Esq., 1905 to 1914, and Hon. Edwin Warfield, 1914 to the present. The Society possesses a valuable collection of books and manuscripts, including the Calvert Papers, purchased from a descendant of the last Lord Baltimore. It has published a series of publications from a fund given by George Peabody, and now prints the quarterly *Maryland Historical Magazine*. As agent for the State it has supervised the printing of 38 volumes of Maryland archives, dealing with the Provincial and Revolutionary periods of the State's history, most of which volumes were edited by the late Dr. William Hand Browne.

MARYLAND YELLOWTHROAT, one of the most familiar of North American warblers (*Geothlypis trichas*). It is about 5.5 inches

in length, migratory, makes a neatly concealed nest on the ground, almost always in a swamp or near a stream, and lays pink-white eggs delicately dotted with red. The plumage is bright yellow above, duller toward the tail; wings and tail greenish; under parts nearly white; and a characteristic jet-black mask across the face and on the sides of the head. The summer cry is a sharp questioning "*What of it? Where'd ye get it?*" The genus contains several related and similar species, but the Kentucky warbler (*Opornornis*) is no longer included.

MARYLEBONE, mā'rĭ-lĕ-bōn or mār'lĭ-bŭn, a metropolitan borough of London, England, in the northwest quarter. It contains the Coliseum, Middlesex Hospital, University College, Bedford College, Regent's Park and several railroad terminals. Among its famous residents have been Edward Gibbon, Michael Faraday, Charles Dickens and Turner. Its population is 117,184. See LONDON.

MARYSVILLE, mā'rĭz-vĭl, Cal., city, county-seat of Yuba County, at the junction of the Yuba and the Feather rivers and on the Northern Electric, the Southern Pacific and Western Pacific railroads, 52 miles by rail north of Sacramento.

Charles Covilland, a Frenchman, founded Marysville in 1849, after the discovery of gold in California. A trading-post named New Mecklenburg had been established some years before. Covilland called the place Yubaville, which name it retained until 1850, when Marysville was adopted, and the following year it was chartered as a city. Its location at the head of navigation and proximity to valuable mines contributed to its growth, so that in 1860 it was the third city in size in the State. Since 1865 it has declined in importance and population. The chief manufactures are dried and canned fruits, olive oil, flour, cigars, woolen goods and foundry products. It has considerable trade in the products of the surrounding farms, especially in grains, fruits, olives, rice, prunes, raisins, sheep, wool and cattle. The mines of the vicinity contribute to its industrial wealth. The city is the seat of the College of Notre Dame (Roman Catholic) for women, public and parish high schools, and it has a fine public library. The city hall and courthouse are handsome, well-built edifices. Levees costing $2,000,000 protect it from floods which occur periodically. Pop. 5,430.

MARYSVILLE, Kan., city, county-seat of Marshall County, on the Big Blue River, and on the Union Pacific, the Saint Joseph and Grand Island and the Topeka and Northwestern railroads, about 80 miles in direct line northwest of Topeka. The manufactures are flour, cigars, furniture, foundry and machine-shop products. The city has the largest cigar factory in the State, considerable trade in wheat, corn, fruit and livestock. Pop. 2,260.

MARYSVILLE, Ohio, village, county-seat of Union County, on Mill Creek, and on the Cleveland, Cincinnati, Chicago and Saint Louis and the Toledo and Ohio Central railroads, about 30 miles northwest of Columbus. It is situated in an agricultural, livestock and dairy region, in which the farm products are mostly wheat, corn and oats; also wool, sheep, horses. The chief manufactures are dairy products, wagons, carriages, cooperage products, lumber, plumber's supplies, brass stamping, silos, cigars, evaporated milk, etc. Among the important buildings are the State Reformatory for Women, State Armory and Carnegie Public Library. Pop. 3,576.

MARYVILLE, Mo., city, county-seat of Nodaway County, on the Omaha and Saint Louis line of the Wabash, and Creston and Saint Joseph line of the Burlington railroads, 46 miles north of Saint Joseph and 90 miles southeast of Omaha. It is in a rich agricultural region and is an important centre for the raising of fine livestock and poultry. The manufactures are cigars, lightning-rods, acetylene, generators, harness, cement blocks, work garments, sheet metal products. It is in an important banking and retail trading centre. There are two daily and two weekly newspapers. It is the home of the Fifth District State Normal School and the Maryville Business College. It has an active Commercial Club. There is a well-equipped Catholic hospital. Other important buildings are post office, high school, county courthouse and seven churches. Pop. 6,720.

MARYVILLE, Tenn., village, county-seat of Blount County, on the Knoxville and Arkansas Railroad, about 16 miles south of Knoxville. It was settled as early at 1795. It is in an agricultural and stock-raising region and near valuable marble quarries. Coal is found in the vicinity. The chief manufactures are flour, lumber, woolen goods and dairy products. It is the seat of the Maryville College (Presbyterian), founded in 1819; the Freedmen's Normal Institute (Friends); and a normal school. Maryville has a fine courthouse and some good church buildings. The Aluminum Company of America has located one of its plants here and employs several hundred men. The present population is about 7,500.

MARYVILLE COLLEGE, an institution in Maryville, Tenn., founded in 1819 under the auspices of the Presbyterian Church. The school is coeducational, and in 1915 had over $900,000 property and endowment, 55 instructors, 771 students and about 15,000 volumes in the library. It has a four-year preparatory department and the college course leads to the degree of A.B.

MARZIALS, Theophile, or Theophilus, English musician: b. Brussels, Belgium, 21 Dec. 1850. He was a pupil of music at London of M. L. Lawson and studied also at Paris and Milan. From 1870 he was employed in the British Museum, where he became superintendent of the department of music. He is best known as a vocal composer ('Twickenham Ferry'; 'Three Sailor Boys'; 'Wait till you Come to Forty Years'; 'Ask Nothing More'); and he also published 'A Gallery of Pigeons and Other Poems; 'Pan Pipes' (1904), etc.

MASACCIO, mä-sät'chō, **Tommaso**, properly **Guidi**, gwē'dē, Italian painter: b. San Giovanni, Tuscany, 24 Dec. 1402; d. Rome, about 1428. He went while very young to Rome, where he painted in the church of Saint Clemente a series of frescoes, the finest of which represents Saint Catherine and the doctors before Maxentius. In 1421 he was admitted into the guild of the Speziali at Florence. Among the works of Masaccio are the frescoes in the Brancacci Chapel of the Carmine, the 'Expulsion from Paradise'; 'Saint Peter's Sermon';

the 'Tribute'; 'Saint Peter Baptizing'; and the 'Raising of the King's Son,' the last of which was partly painted by Filippino. Consult Knudtzon, 'Masaccio og den florentiniske malerkonst' (Copenhagen 1875); Delaborde, 'Les œuvres et la manière de Masaccio' (Paris 1876); Schmarsow, 'Masaccio Studien' (Cassel 1895).

MASAI, mä-sī, an East African race, speaking the Hamitic language and occupying the Lake Kenia district. The Masais are men of large stature and magnificent physique. They are a warlike people and live mostly in military kraals, eating nothing but beef and drinking nothing but milk. The labor is done by slaves, women and children. They are to a certain degree nomadic, live in huts constructed of boughs and enclose their villages with huge thorn fences. Because of the climate they are better clothed than tribes of the warmer regions. Consult Hollis, A. C., 'The Masai: Their Language and Folklore' (Oxford 1905); Merker, M., 'Die Masai' (2d ed., Berlin 1910); Thomson, 'Through Masai Land' (London 1885).

MASAMPO, Korea (Chosen) treaty port on the south coast opened to foreign trade 1 May 1899. It has a good harbor, with steamer connection with Fusan. Since the advent of the Japanese a naval station has been constructed and a Japanese city is being erected. The commercial greatness of Fusan has eclipsed somewhat that of Masampo, which, nevertheless, is forging ahead as the leading commercial and industrial centre of southern Korea. Pop. about 35,000.

MASANIELLO, mä-sä-nē-ĕl'ō, the commonly received name of TOMMASO ANIELLO, Italian revolutionist: b. Amalfi, 1623; d. Naples, 16 July 1647. He was a fisherman at Sorrento, and in 1647 roused and led an insurrection against the Spanish viceroy, the Duke of Arcos. He was successful and obtained the abolition of unjust taxes and the revocation of an order to establish the Inquisition at Naples. The fruit taxes were abolished and the old civic rights restored. But the people soon rose against him, too, and he was assassinated. An opera, music by Auber, libretto by Scribe and Delavigne, based on his career, was presented in 1828 in Paris as 'La Moette di Portici,' and in 1829 in England in English as 'Masaniello.' Consult Saavedra, 'La insurrección de Napoli en 1647' (Madrid 1849).

MASARYK, Thomas (Tomáš) **Garrigue,** author and first president of the Czecho-Slovak Republic: b. Göding, Moravia, 7 March 1850. A Slovak by race and the son of poor parents, young Masaryk was apprenticed to a blacksmith after receiving an elementary education. He soon forsook the stithy and studied philosophy at Vienna and Leipzig. Appointed lecturer on that subject at Vienna in 1879, he made his mark by a study on "Suicide" as a pathological symptom of the condition of contemporary Europe, attributing its chief cause to the decline of religious sentiment. He became professor of philosophy in 1882 at the new Czech University in Prague, where he distinguished himself as an interpreter of modern political and social tendencies to a growing body of students drawn from all branches of the Slav family. Commenting on the movement for reunion and reconciliation among the Serbs and Croats already in 1909, Hermann Bahr (q.v.) wrote: "So strong has been the influence of the lonely Slovak at Prague" that his pupils had "inspired their shattered country with belief in the future." Elected to the Austrian Parliament in 1891, Masaryk boldly criticized the bureaucratic policy of Austria in Bosnia-Herzegovina and resigned his seat in 1893 as a protest against the negative policy of Czech Nationalists. For a number of years he edited the critical review *Athenæum,* which he founded in 1883, and later *Nashe Doba* (*Our Epoch*), dealing with religious criticism and Church history. He exposed as modern forgeries two manuscripts (of Gruenberg and Königinhof) which had long been treasured as national heirlooms, while later, in a famous "blood ritual" trial, he demonstrated the absurdity of the ritual murder charge brought against a Jew. Professor Masaryk married an American and as a political economist is well known in the United States through his lectures at the University of Chicago and other American institutions. He himself has been strongly influenced by the teachings of Comte, Spencer, Tolstoy and Dostoyevsky. His works were mostly written in German, but subsequently translated into Czech. He has published 'Ueber den Hypnotismus' (Vienna 1881); 'Der Selbstmord als Soziale Massenerscheinung der modernen Zivilisation,' the most important of his works (Leipzig 1887); 'Ueber das Studium der Dichter Werke' (2 vols., Leipzig 1884–86); 'Grundzüge einer konkreten Logik' (1885); 'Unsere heutige Krisis' (1895); 'Die Moderne Evolutions — Philosophie' (1896); 'La Question bohémienne' (1895); 'Die philosophische und sozialistische Grundlagen des Marxismus' (Vienna 1898); 'Die Stellungnahme der Sozialistenpartei zur Ethik' (1896); 'Ideale der Humität' (1902); 'Intelligenz und Religion' (1907); 'Freie wissenschaftliche und kirchlich — gebundene Weltanschauung' (Vienna 1908); 'Russland und Europe: Soziale Skizzen' (1913).

Among these historical and philosophical writings, his powerful criticism of Marxian Socialism and the great work on "Russia and Europe" stand foremost. He rendered great service in spreading translations from English literature in Bohemia, where his influence also permeated the entire younger generation, as it did among the Southern Slavs and among the Ruthenes. In 1907 he was re-elected to the Austrian Parliament. During the Friedjung trial in 1909 (see AUSTRIA-HUNGARY AND THE WAR, Vol. II, p. 637) he helped to expose the forgeries upon which Count Aehrenthal based his annexation of Bosnia and Herzegovina. When the European War broke out he remained in Prague till December 1914, when he escaped to Italy and thence to England in time to avoid arrest. He then became lecturer in the School of Slavonic Studies at the University of London. On 6 Dec. 1916 the Austrian Clerical organ, *Reichspost,* announced that Professor Masaryk had been sentenced to death *in contumaciam* for high treason. Meanwhile, the "condemned" man was rapidly gaining wide recognition among the Allies as the leader of the national struggle for Czecho-Slovak independence. Together with Dr. Benes and Colonel Stefanik, he formed the triumvirate which was ultimately

recognized by the Allied governments as the trustee for the future government of Bohemia. In the spring of 1917 Professor Masaryk was called to Russia by Professor Milyukoff, but soon realized the hopelessness of the Russian situation and devoted strenuous efforts to organize the Czecho-Slovak army. He preceded this force to Vladivostok and went on to Tokio and Washington. He had several audiences of President Wilson and addressed many public meetings. The republic of Czechoslovakia was recognized by Great Britain on 3 Aug. 1918; by the United States on 2 Sept. 1918; by Japan 9 Sept. 1918 and by Italy on 23 April 1918. The Declaration of Independence was formally published in Paris on 18 Oct. 1918 and the republic was formally proclaimed at Prague on 29 October. The Constitution was drafted in Geneva by 2 Nov. 1918, when the government was chosen. On 21 Dec. 1918 President Masaryk made a triumphal entry into Prague and then took oath to the new republic. In his first message to the members of the National Assembly delivered on 26 Dec. 1918 in the presence of representatives of the Allied governments, the President sketched the policies and principles of the two opposing groups in the great conflict and expressed the "gratitude and unshakable fidelity" of the republic toward the Allies. See CZECHO-SLOVAKS; SLAVS; WAR, EUROPEAN.

MASAYA, mä-sī'ä, Nicaragua, town, in the western part, about 12 miles north of Lake Nicaragua and near Masaya volcano, which is 3,000 feet in height. The town is connected by railroad with the cities of Leon, Managua and Granada. Masaya is situated in an agricultural region, of which tobacco is one of the principal productions. Coffee, sugar and rice are also grown in the vicinity. The inhabitants are mostly Indians. Pop. 13,000.

MASBATE, mäs-bä'tā, Philippines, an island of the Philippines in the eastern part of the Visayan Sea, south of Luzon and northwest of Samar; greatest length, 82 miles northwest to southeast; width, 45 miles; area, 1,236 square miles. It is very mountainous, the central chain being semi-circular in shape, extending from southwest to southeast, and there are several rivers of considerable size. Communication between towns and villages is mostly by water, as there are few roads or even trails. The staple products are sugarcane, cotton, chocolate and hemp; tobacco of a strong quality is also raised. One of the chief industries is that of stock-raising (cattle, horses and hogs); over 1,000 head of cattle are ordinarily shipped monthly to other parts of the Philippines, mostly to Manila. This industry has been menaced in recent years by the rinderpest. Other important industries are the manufacture of sugar sacks from the buri palm, the manufacture of palm mats of superior workmanship and coloring, weaving, lumbering and fishing; there is also an active trade with Manila. In March 1901 the island was united with Ticao (140 square miles), Burias (258 square miles) and the small adjacent islands, to form the province of Masbate; area of the whole province 1,732 square miles. Civil government was inaugurated in 1901. The inhabitants are nearly all Visayans, but there are over 2,000 Bicols and about 580 Tagalogs. Pop. of province 43,000; Masbate and Ticao (q.v.) 30,000.

MASBATE, Philippines, a pueblo and the capital of Masbate province, situated in the northeastern part of the island of Masbate on a peninsula dividing Palánog Port from Mobô Bay. It is a port of entry, and has a considerable trade. It has a church, a school and some well-constructed buildings. Pop. 2,900.

MASCAGNI, Pietro, pē'ā-trō mäs-kän'yē, Italian composer: b. Leghorn, Tuscany, 7 Dec. 1863. He was educated at the Milan Conservatoire and in 1890 his opera 'Cavalleria Rusticana' brought him immediate recognition in the musical world. From 1895 to 1903 he was director of the Rossini Lyceum at Pesaro. His songs and ballads are popular and his successful career as a composer has been further aided by his operas 'L'Amico Fritz' (1891); 'Les Rantzau' (1893); 'Iris' (1898); 'Le Maschere' (1901); 'Amica' (1905); 'Isobel' (1911); 'Parisina' (1913); 'L'Alodoletta' (1915), etc. In 1902 he visited the United States on an operatic tour. Consult Bastianelli, G., 'Pietro Mascagni' (Naples 1910), and Pompei, E., 'Mascagni nella vita e nel arte' (Rome 1912).

MASCAGNITE, mäs-kän'yīt, or **MASCAGNINE,** a native sulphate of ammonium, occurring notably at Sasso in Tuscany, where it was discovered by Mascagni, from whom it was named.

MASCARA, Algeria, fortified town and capital of an arrondissement in the province of Oran, 45 miles southeast of the city of that name, at the base of the Little Atlas Range. The town stands on the site of a Roman colony, is surrounded by walls, but has few ancient remains. It is purely of the French colonial type. For two centuries down to 1800 it was the capital of a Turkish beylik; in 1832 it became the capital of Abd-el-Kader; in 1835 it was ravaged by the French, but was reoccupied by Abd-el-Kader in 1838 only to fall finally to the French in 1841. Wine, cereals and oil are the principal items of trade. Pop. 24,250.

MASCARENE (mäs-kạ-rēn') **ISLANDS,** a collective name for the islands of Bourbon, Mauritius and Rodriguez, named after Mascarenhas, a Portuguese navigator, who discovered Bourbon in 1545.

MASCARON, Jules, French preacher: b. Marseilles, 1634; d. Agen, 1703. He became a member of the Congregation of the Oratory and soon established a great reputation as a preacher in the provincial cities. He preached at court in 1666 and thereafter he was a favorite of Louis XIV. Mascaron was consecrated bishop of Tulle in 1671 and eight years later was translated to the more important diocese of Agan. He still continued to preach at court and in 1675 delivered his greatest oration at the funeral of Marshal Turenne. His principal sermons were edited by a member of the congregation, Father Borde, in 1704. Consult 'Œuvres de Mascaron' (Paris 1828).

MASCART, Eleuthère Elie Nicolas, French physicist: b. Quarouble, Nord, 1837; d. 1908. He received his education at the École Normale Supérieure and in 1872 became professor at the Collège de France. From 1878 to 1907 he was director of the Government Central

Meteorological Bureau. He was also member of the International Bureau of Weights and Measures; was elected to the Academy of Sciences in 1884 and became its president in 1904. He was made commander of the Legion of Honor in 1889. Mascart's investigations were mainly confined to spectroscopy, electricity and terrestrial magnetism. He published 'Eléments de mécanique' (1866); 'Traité d'électricité statique' (1876); 'Leçons sur l'electricité et le magnétisme,' with Joubert (1882); 'Méthode de mesures et applications' (1882); 'Traité d'optique' (1889); 'Traité de magnétisme terrestre' (1900).

MASCHERONIANA. The 'Mascheroniana' of Vincenzo Monti (1754–1826) is an unfinished epic "vision" in five cantos of *terza rima.* It represents the third of four periods into which Monti's intellectual and artistic life may be divided. The first is the period of the Arcadian lyrics and the tragedies; the second that of the 'Bassvilliana' (1793), a diatribe against the French Terror; the third, that of the Napoleonic poems, the 'Prometeo' (1797), the 'Mascheroniana' (1801) and the 'Bard of the Black Forest' (1806); the fourth (1815–19) that of the "Austrian" poems, the 'Mystic May,' the 'Return of Astrea', the 'Invitation to Pallas,' the classic translations and the critical works.

Monti's permanent and most interesting distinction is that, as a man thoroughly permeated with the culture and mental traits of the Old Régime, he lived through the Revolutionary period without understanding any aspect of it. In the course of his life he assumed with equal sincerity the position of each dominant party. He assailed the Revolution and then accepted it. He hailed Napoleon the liberator, and then Napoleon the despot. Italians like to find in all these gyrations a thread of consistency: the concept of resurrected Italy. Unfortunately, however, Monti also embraced and sang the Austrian restoration.

This mental confusion, not to say moral perversity, has its counterpart in Monti's poetry. He is fundamentally an Arcadian, who vaguely perceives the emotions and the character of a new age, without visualizing them clearly as an artist and without finding for them an appropriate formal expression. In a sense this makes his poems extremely interesting; for wholly in the Arcadian manner, they are admirably calculated to show the limitations of that manner. The 'Mascheroniana,' which owes its popularity in Italy to its nationalistic spirit, aims to project the miserable Italy of the revolution upon the great Italy of the past and a greater Italy of the future, of which to be sure Napoleon is to be the artisan. Here is a trite theme but one of potentiality. Monti, however, being Monti, transports it into the Arcadian world, a world by itself, apart from, perhaps superior to, any real world. It becomes "literature" through "plot" and "form." As regards plot, Monti invents a vision of the Dante series: to commemorate a friend, he narrates the passing of the soul of Lorenzo Mascheroni, an eminent mathematician, from earth to heaven, bringing him, en route, in touch with the souls of Parini, Beccaria and others. These great Italians discourse on contemporary and past Italian conditions. Critics who like "literature" find, in the elaborate descriptions here, distinguished merits of vivacity and coloring. Then, as we pass to "form," we get a wealth of allusion, classic and Italian; but especially great ingeniousness of metaphor, and a truly remarkable success in epigram and sententiousness. Here, indeed, we find those traits which give Monti kinship with the greatest writers and which by themselves give the 'Mascheroniana' a place in literary history. But that is all. Monti cannot solve the neo-classic paradox: he cannot bring his virtual poetic theme (nationalism or patriotism) into contact with his "plot" and his "form." The theme remains undeveloped, and the plot and the form without poetic life. When Monti, for instance, wishes to denounce Robespierre, he pictures God shuddering on his throne and the angels gracefully hiding very beautiful heads under very beautiful wings. All this has nothing to do with Robespierre. The vice of neo-classicism is that it works on three parallel lines, one for the "plot," another for the "form" (figure, allusion, episode, metaphor); and another for the animating poetic emotion. And the lines never meet. The 'Mascheroniana' is a classic poem; and it died, as a poem, with the school it represents, retaining an historical interest, for its characteristic defects, and as one of the records of Monti's intellectual reversals.

ARTHUR LIVINGSTON.

MASCOTS AND HOODOOS, a mascot is a person or thing supposed to bring good luck, while a hoodoo is an influence of evil. Another name for the hoodoo is Jonah, a term originating with superstitious sailors. The word mascot was first introduced into literature by means of the comic opera 'La Mascotte' written by Audran, but in France it appears to have been in common use for a long time previously among gamesters and sporting characters. It was used to signify some object, animate or inanimate, which like the luck-penny brought good fortune to its possessor. The word is traced back to the *patois* of Provence and Gascony, where a mascot is something which brings luck to a household. Etymologically the word is derived from masque (masked or concealed), which in provincial French is applied — as *né coiffé* is in more polished French — to a child born with a caul. Such a child was believed to be destined, not only to be lucky himself, but to be the source of luck to others. In most European countries there is a large trade in charms and talismans to bring good fortune.

The term hoodoo is a manifest corruption of African voodooism and is a modified superstition of the system of terrorism which has been cultivated for years by the voodoo priesthood with remarkable success. There is, however, no scientific foundation for belief in either hoodoos or mascots, any more than there is in a reliance upon dreams and visions. Natural laws are not to be set aside by touching a hunchback or carrying a rabbit's foot in one's pocket. It is a fact, however, that in every age of the world the goddess of chance has been worshipped under one name or another, and modern civilization has not destroyed this cult. The belief in the mascot for luck, or the hoodoo for ill-luck, is an indication of weakness and lack of decision. In the 'Iliad,' when Hector is told that "the birds are against him," and all the omens unlucky, the Trojan hero makes answer:

«Without a bird his sword the true man draws; and asks no omen but his country's cause.» See also OMEN; SUPERSTITION.

MASCOUTEN, a belligerent tribe of Algonquians, the French *Nation du Feu,* «Fire Nation,» dwelling along the Illinois River. They were at constant warfare with their neighbors, and are first mentioned by the earliest French missionaries as inhabiting southern Michigan, whence, according to the traditions of the Ojibwas and Ottawas, they had been driven by the latter from the region around modern Mackinaw. In 1712, united with the Foxes and Kickapoo, they were almost exterminated, first by the French and afterward by the Pottawattomi and their allies. The remnants migrated westward and are last mentioned in 1779 as living with the Piankishaws and Kickapoos on the Wabash River. The name is derived from Mashkodainsug, «little prairie people,» a title now borne by a tribe of Pottawattomi Indians resident in Kansas.

MASEFIELD, John, English poet and dramatist: b. 1875. In his youth he shipped before the mast on the *Conway,* in which he made several voyages. For a time also he was engaged as a farm laborer and in the 90's spent a short time as attendant in a Sixth avenue saloon in New York. These early experiences he later turned to account in his literary work. After his wanderings Masefield settled near London and became a regular contributor of prose and verse to the periodicals of the metropolis. He was awarded the Edmond de Polignac prize for poetry in 1912 by the Royal Society of Literature. Masefield won literary fame mainly through his sea ballads and the narrative poems, 'The Everlasting Mercy' and 'The Widow in the Bye Street.' His verse is intensely realistic, full of pathos, although the verse form is often crude. His stories for boys represent his best efforts in prose and are reminiscent of Marryat at his best. His plays lack technique and are little suited to stage presentation, but give evidence of growing power. His works, in addition to those already mentioned, are 'Salt Water Ballads' (1902); 'A Mainsail Haul' (1905; 1913); 'A Tarpaulin Master'; 'Ballads'; 'Captain Margaret'; 'The Tragedy of Nan and other Plays' (1910); 'The Tragedy of Pompey the Great' (1910); 'Multitude and Solitude'; 'The Street of To-day'; 'Poems and Ballads'; 'William Shakespeare'; 'Dauber'; 'The Daffodil Fields'; 'Philip the King' (1914); 'Personal Recollections of John M. Synge'; 'The Faithful'; 'Sonnets and Poems'; 'The Locked Chest'; 'The Sweeps of Ninety-Eight'; 'Good Friday'; 'Gallipoli'; 'Lollingdon Downs,' etc. Masefield edited 'The Voyages of Captain William Dampier' (1906); and wrote introductions to 'Hakluyt's Voyages' and 'The Voyages of Marco Polo.' The following plays have been produced: 'The Campden Wonder'; 'Nan'; 'Pompey the Great'; 'Sweeps of Ninety-Eight'; 'Philip the King'; 'The Faithful'; 'Mrs. Harrison'; 'Good Friday.'

MASHAM, Abigail Hill, LADY, confidante and favorite of Queen Anne of England: b. London, 1670; d. 6 Dec. 1734. A cousin of Sarah Jennings, Duchess of Marlborough, and also related to Robert Harley, Earl of Oxford, she passed from the service of Lady Rivers, thanks to the influence of the Duchess of Marlborough, into that of Queen Anne, in whose favor she soon displaced her cousin, making every effort to turn the queen from the Marlboroughs and Whiggery to Toryism and even Jacobitism. She was married to Samuel Masham in 1707; had him made a baron in 1712; brought her kinsman Oxford into power, but soon turned him out; and, in short, was the power behind the throne, succeeding her cousin Marlborough. She retired after Queen Anne's death. She was a plain, homely, red-nosed woman, much bepraised by Swift and accused of vulgarity, meanness and covetousness by the Whigs. See ANNE, QUEEN OF ENGLAND.

MASHAM, Samuel Cunliffe Lister, 1ST BARON, English inventor: b. Calverly Hall, near Bradford, 1 Jan. 1815; d. Swinton Park, York, 2 Feb. 1906. In 1838 his father started Samuel and his brother John as worsted manufacturers in a mill at Manningham. About 1845 he perfected a wool-combing machine which revolutionized textile processes and made the inventor wealthy. He secured a profit of $5,000 on every machine sold. From 1855 to 1864 he spent huge sums in perfecting a silk-combing machine and at one time was perilously near bankruptcy. The machine was brought out in 1864 and enabled him to produce valuable yarn from the hitherto useless silk waste. Masham also perfected a velvet loom for piled fabrics, and after 1878 his income from his inventions exceeded $1,000,000 annually. He opposed free-trade because the American protective tariff seriously limited his business. He was created 1st Baron Masham in 1891. He wrote 'Lord Masham's Inventions' (1905).

MASHKODAINSUG. See MASCOUTEN.

MASHONALAND, mą-shō'ną-länd, South Africa, a province forming the northeastern portion of South Rhodesia, between the Zambesi and Matabeleland. It consists largely of open plains and table-lands, is well watered by the Umniate and other feeders of the Zambesi and is very fertile. The Mashonas belong to the Kaffir race and were formerly masters of the whole territory between the Limpopo and the Zambesi, but were cooped up within their present territory by the powerful Matabele, whom they were unable successfully to resist. They are a peaceful people, clever as smiths and as weavers of cotton fabrics. The country came under the management of the British South Africa Company in 1890. It is rich in gold, which has been mined here at some remote and unknown period, old workings being still visible, and Mashonaland is with some degree of probability identified with the biblical Land of Ophir. Salisbury is the chief town. The population of Mashonaland is estimated at 12,600 whites and 495,450 natives. Other towns are Hartley, Gatuma, Umtali and Victoria. Salisbury is connected with Beira, Portuguese East Africa, by a railroad. From Salisbury north another railroad extends 580 miles through Buluwayo to the Victoria Falls, where there is a new bridge over the Zambesi. This road is a section of the Cape to Cairo Railway. For the antiquities, anthropology, history, etc., of Mashonaland, consult Bent, J. T., 'Ruined Cities of Mashonaland' (London 1892); Hall, R. N., 'Prehistoric Rhodesia' (Chicago 1910); id., 'Great Zimbabwe' (London 1905); Darter, A., 'Pioneers of Ma-

shonaland' (ib. 1914); Randall-MacIver, D., 'Mediæval Rhodesia' (ib. 1906); Selous, F. C., 'Travel and Adventure in South-East Africa' (London 1893); Waal, D. C., 'With Rhodes in Mashonaland' (Cape Town 1896).

MASHPEE, a New England Indian group, originally located in Barnstable County, Mass. They were placed on a reservation as early as 1660. At present there are about 200 individuals of pure Indian descent and many more of mixed negro, white and Indian blood.

MASINISSA, măs-ĭ-nĭs'ą, or **MASSINISSA,** king of Numidia: b. 238 B.C.; d. 148 B.C. He was at first ruler only of the east portion of the country, but latterly of the whole, having, by the help of the Romans during the Second Punic War, defeated Syphax, king of Western Numidia, taking him prisoner with his wife, Sophonisba, whose hand had formerly been promised to Masinissa. Masinissa now made her his wife, but Scipio Africanus, fearful of her influence, claimed her as a prisoner of Rome. Unable to resist, Masinissa sent her a poisoned chalice, of which she voluntarily drank. Masinissa commanded the Roman cavalry on the right wing at the battle of Zama, which ended the Second Punic War (201 B.C.). As a reward the Romans gave him the territory formerly held by Syphax. In peace he proved himself an efficient administrator and did much to civilize his people. His army and fleet attained large proportions and he made raids into Carthaginian territory. In 150 B.C. Carthage made war on him, but with the Romans as his allies, Carthage fell to rise no more. Consult Meltzer-Kahrstedt, 'Geschichte der Karthager' (Vol. III, Berlin 1913).

MASK, a covering for the face, often shaped so as to form a rude representation of human or animal features. They have been in use from the most ancient times. Among the Greeks they were used, particularly in the processions and ceremonies attending the orgies of Dionysus. Some ancient masks seem to have been, like the modern ones, merely coverings for the face, but it was more usual for them to cover the whole head, and represent, with the features, the head, hair and eyes. They were at first made of the bark of trees, then of leather, afterward of wood, which the artist fashioned according to the design of the poet. The comic masks were distinguished by a grotesque, laughing countenance; the tragic ones had more dignity, but were sometimes frightful. There were also satyr masks and orchestric, or those with regular features, for dancers. They had mostly very large open mouths, within which were metallic bars or other sounding bodies to strengthen the voice of the speaker — a contrivance which was required by the construction and immense size of the old theatres. The mask used at modern masked balls or masquerades is a covering for the head and face made from a light stuff, with which a person may disguise himself and remain unknown, or perhaps represent some other character. There are whole and half masks — for example, masks for the nose and the eyes. A death mask is one of plaster made of the face after death. See also CARNIVAL; MASQUERADE, and consult Dall, 'Masks, Labrets and Certain Aboriginal Customs' (Washington 1885); Hart, C. H. (ed.), 'Brouwere's Life Masks of Great Americans' (New York 1899); Fichorini, 'Le maschere sceniche e le figure comiche d' antichi Romani' (Rome 1736).

MASKEGON (swamp people), a remnant of a tribe of Indians, part of the old Algonquin stock, who formerly lived by hunting and fishing. They are now in the "swamp region" of Canada, between Hudson Bay and Lake Winnipeg, and are classed with the Cree and Ojibwa people. To some extent they are now engaged in lumbering and a few do some farming. The estimated number of Maskegons is 2,000.

MASKELL, William, English theologian: b. Bath, about 1814; d. Penzance, 12 April 1890. In 1836 he was graduated at University College, Oxford, and in 1837 took holy orders. He was named rector of Corscombe, Dorset, in 1842. During his five-year incumbency he made researches in Anglican Church history, the results of which he embodied in 'Ancient Liturgy of the Church of England' (1844); 'History of the Martin Marprelate Controversy' (1845) and 'Monumenta Ritualia Ecclesiæ Anglicanæ' (1846). In 1847 Dr. Maskell was appointed vicar of Saint Mary's, near Torquay, and domestic chaplain to the bishop of Exeter. About this time appeared his 'Holy Baptism' (1848) and 'Enquiry into the Doctrine of the Church of England upon Absolution' (1849). Maskell took part with his bishop in the Gorham controversy, and disgusted at the vacillation of the bishops and their attitude on the question of the sacramental grace of baptism, with Manning he went over to the Roman Catholic Church. In 1850 he issued two letters to the Privy Council on 'The Present Position of the High Church Party.' Other works by him are 'Protestant Ritualists' (1872) and 'Ivories, Ancient and Mediæval' (1875). He never took orders in the Catholic Church but lived in retirement pursuing his historical researches.

MASKELYNE, măs'kĕ-lin, **Nevil,** English astronomer and mathematician: b. London, 6 Oct. 1732; d. Greenwich, 9 Feb. 1811. He was educated at Westminster School and at Trinity College, Cambridge; devoted himself to astronomy; and in 1765 was appointed astronomer royal and director of Greenwich Observatory. He made careful studies of terrestrial density, introduced into navigation the method of taking longitudes by lunar distances and made many improvements in astronomical apparatus. In 1767 he founded the *Nautical Almanac.* He wrote 'British Mariner's Guide' (1763) and 'Astronomical Observations' (1765).

MASKINONGE, or **MUSKELLUNGE,** the giant pike (*Esox nobilior*) belonging to the Esocidæ or pike family. It is found in the Saint Lawrence River, Lake Champlain, the Great Lakes and in the waters of western Canada. This fish is the largest of the pike family and, being predaceous, is not favored in most localities, as other fish soon disappear after its introduction. The name is applied to smaller but closely related species, of which the lake pickerel is one of the most common. The maskinonge reaches a length of from four to eight feet and a weight of from 40 to 100 pounds. It is caught with a hook and being swift and strong and a redoubtable fighter it is highly prized by anglers. Its color is a

dark gray, sides of a silver gray with black spots of unequal size and spotted fins.

MASÓ Y MARQUEZ, Bartolomé, Cuban patriot: b. near Manzanillo, 1834; d. 1907. His education was received in France and on his return to Cuba he became a planter, in which avocation he amassed considerable wealth. In the Ten Years' War (1868–78), he espoused the patriot cause and became colonel in the Cuban patriot army. He was made superintendent-general of the treasury and rendered efficient service under the Palma régime. He was imprisoned by the Spaniards after the war, but in 1883 returned to his plantation where he remained until the Insurrection of 1895. In September he became vice-president of the insurrectionary government and two years later became its president. In 1901 he was considered again for the Presidency and opposed Palma. Masó y Marquez opposed the Platt amendment as a denial of Cuban sovereignty and went before the electorate on this platform, but withdrew before the day of election because of alleged fraud in Palma's campaign.

MASOCHISM, a term used in analytic psychology to denote a tendency, usual in infancy and early childhood but outgrown or sublimated in later life, to take pleasure in having pain inflicted upon oneself. The term is derived from von Sacher-*Masoch,* an Austrian novelist, in whose stories many of the main characters exhibited this trait in an excessive degree. A mild degree of masochism is evinced by many average men and women, particularly those who spend much of their time complaining about wrongs, injuries, pains, etc., suffered by themselves, the inference being that their unconscious masochism drives them to be occupied mentally with pain and the details of its effect upon themselves. Many of the temperamental pessimists of the world afford examples of an imperfectly sublimated masochism (see SUBLIMATION), and if preponderating in the characterological make-up of the individual suggests a certain degree of disease, which it would be most advisable for such persons to get rid of.

MASON, mā'sŏn, **Alfred Edward Woodley,** English novelist: b. 7 May 1865. He was educated at Oxford and among his works, the majority of which have been reprinted in the United States, are 'A Romance of Wastdale' (1895); 'The Courtship of Morrice Buckler' (1896, dramatized 1897); 'The Philanderers' (1897); 'Lawrence Clavering' (1897); 'Miranda of the Balcony' (1899, dramatized in New York 1901); 'The Watchers' (1899); 'Clementina' (1901); 'The Four Feathers' (1902); 'The Truants' (1904); 'Running Water' (1907); 'The Broken Road' (1907); 'At the Villa Rose' (1910); 'The Turnstile' (1912). His plays include 'Colonel Smith' (1909); 'The Witness for the Defense' (1911); 'Open Windows' (1913).

MASON, Charles, English astronomer and surveyor: b. England, about 1730; d. Philadelphia, February 1787. He was for years assistant astronomer at the Greenwich Observatory and was sent on various expeditions in the service of science. In 1763 he was employed with Jeremiah Dixon to survey the boundary line between Maryland and Pennsylvania and they were engaged in this undertaking until 1767, the line established becoming famous in American history as the "Mason and Dixon's Line". They returned to England and Mason was thereafter engaged in astronomical observations and researches until the time, the precise date of which is not known, when he returned to America. His work upon the lunar tables of Tobias Mayer which were published in London in 1787 under the title 'Mayer's Lunar Tables Improved by Charles Mason,' enjoyed a high reputation for reliability. In 1860 many of his papers were accidentally discovered at Halifax, N. S. Consult Bliss, Porter C. (in *Historical Magazine* July 1861).

MASON, Daniel Gregory, American composer and writer on music: b. Brookline, Mass., 20 Nov. 1873. In 1895 he was graduated at Harvard University; he studied music in Boston, New York and Paris. He is assistant professor of music at Columbia University and is well known as a lecturer on music. His compositions include an elegy for piano (1901); sonata for violin and piano (1912); pastorale for violin, clarinet and piano (1913); and 'Country Pictures' for piano (1913); quartet for piano and strings (1914); symphony (1915). He has published 'From Grieg to Brahms' (1902); 'Beethoven and his Forerunners' (1904); 'The Romantic Composers' (1906); 'Students' Guide to Music' (1909); 'A Neglected Sense in Piano Playing' (1912); 'Music as an International Language' (1913); 'Guide to Music' (1914).

MASON, Francis, American missionary and Orientalist: b. York, England, 2 April 1799; d. Rangoon, Burma, 3 March 1874. He was the son of a shoemaker; studied by himself; came to the United States in 1818; worked as a shoemaker through Massachusetts; prepared for the ministry at Newton Theological Seminary; joined the Baptist Church in 1825; and in 1827 was licensed to preach; sailed for Burma in 1830; and settled in Tavoy, where he worked for 22 years. He was a brilliant linguist; reduced two Karen dialects to writing; and in 1853, upon his removal to Toungoo, published a Karen version of the Bible. He made special study of Pali literature and of physical and ethnical peculiarities of Burma, publishing in 1852 'Tenasserim, or the Fauna, Flora, Minerals and Nations of British Burma and Pegu' (revised 1860; 3d ed., 2 vols., by Theobald 1883). His other works include 'Life of the Karen Apostle,' a memoir of his wife (1847); 'Memoir of San Quala' (1850); 'Pali Grammar' (1868); and 'The Story of a Workingman's Life, with Sketches of Travel,' an autobiography (1870).

MASON, George, American statesman: b. Stafford (now Fairfax) County, in the "Northern Neck" of Virginia, 1725; d. 7 Oct. 1792. He spent his early life on a typical plantation. The same region produced his coworkers in the cause of the American Revolution, Richard Henry Lee and George Washington (qq.v.). Mason seems to have been tutored at home, being grounded in a knowledge of the classics, both Latin and English. His younger brother, Thomas, was sent to London to study law at the Middle Temple. George Mason was married in 1750 to Ann Eilbeck, who died in 1773. Of this union there were several children. He was married again in 1780 to Sarah

Brent. The family, after 1758, resided at "Gunston Hall," in Stafford County, a famous seat still standing on the banks of the Potomac. His energies were given to extensive planting interests.

As a member of the Ohio company, he was identified with his neighbor, George Washington, in the initial stages of the French and Indian War, growing out of the concerns of that company. In 1759 he entered the Virginia house of burgesses, at the same time with Washington. He early protested against slavery. In 1765 he wrote: "The policy of encouraging the importation of free people and discouraging that of slaves has never been duly considered in this colony, or we should not at this day see one-half of our best lands in most parts of the country remain unsettled and the other cultivated with slaves; not to mention the ill effects such a practice has upon the morals and the manners of our people." He drafted the "Non-Importation Association," which George Washington presented in 1769 in Williamsburg, and the "Resolves" adopted at a general meeting of the freeholders of Fairfax County, 18 July 1774. These "Resolves" urged "that a Congress should be appointed to consist of deputies from all the colonies, to concert a general and uniform plan for the defense and preservation of our common rights"; and "that during our present difficulties and distress, no slaves ought to be imported into any of the British colonies on this continent; and we take this opportunity of declaring our most earnest wishes to see an entire stop forever put to such a wicked, cruel and unnatural trade." Sparks says of these Fairfax resolves that "they constitute one of the ablest and most luminous expositions of the points at issue between Great Britain and the colonies which are to be found among the public documents of that period. Embracing the great principles and facts, clothed in a nervous and appropriate style, they are equally marked with dignity, firmness, intelligence and wisdom." These "Resolves" served as the basis of the association formed by the Virginia Convention of August 1774 and that of the general Congress at its first session the following September.

He was a member of the Virginia Convention held in Richmond, July 1775, which took measures to arm the colony and appointed a committee of safety. He declined appointment in Congress as Virginia's representative in the seat made vacant by Washington's acceptance of the command of the American forces. The mind of Mason was dominant in the Virginia Convention of 1776, so creative in State and National policies. He was the author of the Virginia Declaration of Rights, adopted by the convention on 12 June 1776. (See VIRGINIA CONVENTION OF THE REVOLUTION). A copy of the first draft of this historic paper, in the handwriting of George Mason, is to be seen in the Virginia State Library. At the foot of the manuscript the author added these words: "This Declaration of Rights was the first in America; it received few alterations or additions in the Virginia Convention (some of them not for the better), and was afterward closely imitated by the other United States." The small table upon which it is believed Mason wrote this "Declaration" is preserved at the Virginia Historical Society in Richmond. Mason's chaste and concise statement of the fundamental principles of free government deserves to rank with the foremost political charters of the English-speaking world. James Madison styles him "the master-builder of the Constitution" of Virginia, adopted 29 June 1776, the natal day of the commonwealth.

Mason was a member of the Virginia assembly from 1776 to 1780, and from 1786 to 1788. He was one of the committee to revise the laws of Virginia, in accordance with the changed political conditions. The other members of this committee were Thomas Jefferson, Edmund Pendleton, George Wythe and Thomas Ludwell Lee. Mason again declined a seat in Congress, to which he was elected by the Virginia assembly on 22 May 1777.

Mason took an active part in the Constitutional Convention of 1787, reaching Philadelphia 17 May. He urged that the President be elected by Congress, and that he be ineligible for a second term; that the States should have equal representation in the Senate; that the Supreme Court should be joined with the Executive in the exercise of the veto power; that Congress be empowered to enact sumptuary laws; "that no law in the nature of a Navigation Act be passed before the year 1808, without the consent of two-thirds of each branch of the Legislature"; and, finally, that Congress should be given the control of slavery. Madison reports Mason's speech in favor of giving Congress the control of slavery as follows: "This infernal traffic originated in the avarice of British merchants. The British government constantly checked the attempts of Virginia to put a stop to it. The present question concerns not the importing States alone, but the whole Union. . . . Slavery discourages arts and manufactures. The poor depise labor when performed by slaves. They prevent the emigration of whites, who really enrich and strengthen a country. They produce the most pernicious effect on manners. Every master of slaves is born a petty tyrant. They bring the judgment of heaven on a country. As nations cannot be rewarded or punished in the next world, they must be in this. By an inevitable chain of causes and effects, Providence punishes national sins by national calamities. He lamented that some of our eastern brethren had, from a lust of gain, embarked in this nefarious traffic . . . He held it essential in every point of view, that the General Government should have power to prevent the increase of slavery."

It was chiefly the failure to insert his views as to Congressional control of slavery and Navigation Acts which led Mason to reject the Constitution. Shortly before his death he told Thomas Jefferson that "the Constitution as agreed to for a fortnight before the Convention rose was such a one as he would have set his hand and heart to. . . . With respect to the importation of slaves, it was left to Congress. This disturbed the two southernmost States who knew that Congress would immediately suppress the importation of slaves. Those two States, therefore, struck up a bargain with the three New England States, that if they would join to admit slaves for some years, the two southernmost States would join in changing the clause which required two-thirds of the Legislature in any vote. It was done.

. . . Under the coalition, the great principles of the Constitution were changed in the last days of the Convention.» Such was Mason's own explanation of his refusal to sign the instrument in Philadelphia and for his stalwart opposition to its ratification in the Virginia Convention, which met at Richmond in 1788. Two years later he declined an appointment to a vacancy in the United States Senate. He died at «Gunston Hall,» where he lies buried. Mason's statue forms one of the circle of the Revolutionary fathers surrounding the equestrian monument of Washington at Richmond.

Thomas Jefferson described George Mason as «a man of the first order of wisdom among those who acted on the theatre of the Revolution, of expansive mind, profound judgment, cogent in argument, learned in the lore of our former Constitution, and earnest for the Republican change on Democratic principles. His elocution was neither flowing nor smooth, but his language was strong, his manner most impressive and strengthened by a dash of biting cynicism when provocation made it seasonable.» Consult Rowland, 'Life and Writings of George Mason' (2 vols., New York 1892).

MASON, James Murray, American legislator: b. Mason's Island, Fairfax County, Va., 3 Nov. 1798; d. near Alexandria, Va., 28 April 1871. He was graduated from the University of Pennsylvania in 1818, studied law and upon being admitted to the bar established a practice at Winchester, Va. He was in public office much of the time and in 1847 was elected to the United States Senate, representing Virginia, where he proved a consistent and strong adherent to the policies favored by his State. He was the author of the Fugitive Slave Law of 1850 and at the outbreak of the Civil War he resigned his seat in the Senate to enter the service of the Confederacy. He was sent to England with Slidell as Confederate commissioner, but was captured on the steamer *Trent* (see TRENT AFFAIR, THE) and taken to Boston where he was confined in Fort Warren until 1862 when he sailed for Europe and until the end of the war endeavored to secure recognition of the Confederacy. After the war Mason lived in Canada until 1868, being in fear of the Federal government, but returned to Virginia some years before his death.

MASON, Jeremiah, American lawyer and politician: b. Lebanon, Conn., 27 April 1768; d. Boston, 14 Oct. 1848. He was graduated at Yale in 1788, admitted to the bar in 1791, and began to practise law at Westmoreland, N. H. In 1794 he removed to Walpole, N. H., and in 1797 settled at Portsmouth, where he lived for 35 years. At the New Hampshire bar, then the most famous in the country, Mason soon reached pre-eminence, among his fellow members being Daniel Webster and Jeremiah Smith. In 1802 Mason was appointed attorney-general of New Hampshire and in 1813 became a United States senator. He was a strong Federalist and took a leading part in the senatorial debates on matters relating to the War of 1812, his speech on the Embargo, delivered in 1814, and that on the Conscription Bill, 1815, being notable among public utterances of the time. In 1817 he resigned his seat to resume his practice, but afterward served for several terms as a member of the New Hampshire legislature and rendered great assistance in the codification of the State laws. He removed to Boston in 1832 and practised in the courts until he reached 70, when he retired, with reputation fully maintained, to the more private work of his profession.

MASON, John, American colonist, founder of New Hampshire: b. King's Lynn, Norfolk, England, 1586; d. London, December 1635. In 1610 he served in the navy against insurgents in the Hebrides; in 1616 went as governor to Newfoundland, of which, in 1620, he published a description and in 1626 a map. In 1617 he explored the coast of New England; obtained in 1622 a grant of region called Mariana (northeastern Massachusetts); in the same year, with Sir Ferdinando Gorges, procured a patent for the province of Maine; and in 1623 sent a colony to the Piscataqua River. In 1629 he obtained a patent for the New Hampshire colony, also taking one with Gorges for Laconia, a tract including Lake Champlain. Among various prominent positions which Mason held in England was that of judge in Hampshire 1635, and in the same year he was appointed vice-admiral of New England. In 1691 his rights in New England were sold to Gov. Samuel Allen. Mason was buried in Westminster Abbey. New Hampshire became a royal province 44 years after Mason's death. Consult Tuttle, 'Memoir of Captain John Mason, the Founder of New Hampshire,' in an edition of Mason's description of Newfoundland (Boston 1887).

MASON, John, American colonial commander: b. in England, about 1600; d. Norwich, Conn., 1672. Under Sir Thomas Fairfax he served in the Netherlands; in 1630 settled at Dorchester, Mass.; in 1633 was appointed to a military command at Boston; and two years later joined with others in founding Windsor, Conn. In 1637 he was given command of an expedition of English and Indians against the Pequots (q.v.), whom he almost annihilated, completing their destruction in a second movement a little later. He removed first to Saybrook, and afterward to Norwich. For 30 years he was a major of the Connecticut forces, was a magistrate for many years and deputy governor 1660–70. From 1642 to 1668 he served as judge of the colonial court. His 'Brief History of the Pequot War,' written at the request of the General Court, was reprinted by Increase Mather in his 'Relation of Trouble by the Indians' (1677, republished by Prince, Boston 1736). Consult Ellis, G. E., 'Life of John Mason of Connecticut' (in Sparks' 'Library of American Biography,' Vol. XIII, Boston 1864).

MASON, John Mitchell, American divine: b. New York, 19 March 1770; d. there, 26 Dec. 1829. His father was pastor of an Associate Reformed Church, and the son was graduated at Columbia College in 1789, and after studying theology under his father's care for one year went in 1791 to the University of Edinburgh. He was recalled in 1792 by intelligence of his father's death, and became his successor in his pastoral charge in 1793. He planned a theological seminary to be under the authority of his denomination, and visited Great Britain for the purpose of obtaining contributions; his pulpit efforts abroad gaining him repute there as one

of the first preachers of the time. The seminary being established in New York City in 1804, he was appointed its first professor of theology. In 1806 he projected the *Christian's Magazine*, which he conducted for several years, and in which he carried on a controversy with Bishop Hobart. In 1811 he became provost of Columbia College, and by his talents and energy raised that institution to a higher character than it had ever before possessed. In 1821 he exchanged his pastorate for the presidency of Dickinson College, Carlisle, Pa., and the next year entered the Presbyterian ministry. He was one of the great pulpit orators of his day and his discourses on the deaths of Washington (1800) and Hamilton (1804) are masterpieces of their kind. Consult the 'Life,' by Van Vechten (New York 1856).

MASON, John Young, American politician: b. Greensville, Sussex County, Va., 18 April 1799; d. Paris, 3 Oct. 1859. He was educated at the University of North Carolina; was admitted to the bar in 1819; became a judge in State and Federal courts; served several terms in the Virginia assembly; and from 1831 to 1837 was a member of Congress. Then till 1844 he was judge of the United States court for the district of Virginia, and in that year became Secretary of the Navy in the Cabinet of President Tyler. Although he served temporarily as Attorney-General under Polk, he re-entered the Navy Department. President Pierce, in 1853, appointed him Minister to France, and until his death he continued to fill this diplomatic position. With James Buchanan and Pierce Soulé (qq.v.) he signed the Ostend Manifesto (q.v.).

MASON, Sir Josiah, English pen manufacturer: b. Kidderminster, 23 Feb. 1795; d. 16 June 1881. He was the son of a carpet-weaver and at an early age began to earn his livelihood by hawking cakes and fruits in the streets. At Kidderminster he successively tried his hand at shoemaking, baking, carpentering, smithing, painting and weaving. In the midst of his avocations he taught himself to read and write. He removed to Birmingham in 1814 where he became a toymaker. He set up a shop of his own in 1824, turning out split key rings by machinery invented by himself; prospering in this venture he added the manufacture of steel pens in 1829. In the latter branch of industry he became the largest producer in England. In 1874 he transferred his interest to a limited liability company. Mason was also interested in electro-plating, copper smelting and india rubber ring manufacture with George R. Elkington. In 1860 he established a great orphanage at Erdington, upon which he expended $1,500,000. He was knighted in 1872. Mason College, now part of the University of Birmingham, was founded by him with an endowment of $1,000,000. Consult Bunce, J. T., 'Sir Josiah Mason: A Biography' (London 1882).

MASON, Lowell, American musician: b. Medfield, Norfolk County, Mass., 8 Jan. 1792; d. Orange, N. J., 11 Aug. 1872. His general education was small; in music he was self-instructed and wonderfully adept even when a boy, being choir leader in Medfield when 16, and a teacher in Savannah, where he removed in 1812. He came to Boston in 1827, was president of the Handel and Haydn Society there, and in 1832 founded the Boston Academy of Music. He visited Germany in 1837 in order to acquaint himself with improved methods in teaching music. In 1821 he published a collection of psalm tunes based on Gardiner's 'Sacred Melodies,' but including some of Mason's own compositions. He is best known for his hymn tunes, notably Cowper "There is a Fountain," and missionary hymn "From Greenland's Icy Mountains". Mason's more important publications were: 'Juvenile Psalmist' (1829); 'Lyra Sacra' (1837); 'The Psaltery' (1845); 'Carmina Sacra' (1841; new series 1852); 'Musical Letters from Abroad' (1853); 'Sabbath Hymn and Tune Book' (1859). Mason's musical library is now the property of Yale University.

MASON, Otis Tufton, American ethnologist: b. Eastport, Me., 10 April 1838; d. Washington, D. C., 5 Nov. 1908. He was graduated from Columbia University in 1861 and from 1861–84 was at the head of its preparatory school. From 1884–1908 he was curator of ethnology at the United States National Museum. He was a member of various scientific societies and published 'Cradles of the American Aborigines' (1889); 'Woman's Share in Primitive Culture' (1894); 'The Origin of Inventions' (1895); 'Indian Basketry' (2 vols., 1904). He was coeditor of the 'Standard Dictionary' and edited the anthropological department of the *American Naturalist*.

MASON, Rufus Ogden, American physician: b. Sullivan, N. H., 22 Jan. 1830; d. New York, 1903. He was graduated from Dartmouth College in 1854 and from the College of Physicians and Surgeons in New York in 1859. During the Civil War he was an acting assistant surgeon. He was almost as well known as an author as he was a physician and among his books are 'Sketches and Impressions, Musical, Theatrical and Social, Including a Sketch of the Philharmonic Society of New York' (1887); 'Telepathy and the Subliminal Self' (1897); 'Hypnotism and Suggestion in Therapeutics' (1901).

MASON, Stevens Thomson, American politician: b. Leesburg, Va., 27 Oct. 1811; d. New York City, 4 Jan. 1843. He was the son of Gen. John T. Mason of the noted Mason family of that State. He received his education at Transylvania University, Lexington, Ky., to which place his father had removed in 1814. On 12 July 1831, when not 20 years of age, he was appointed secretary and acting governor of the Territory of Michigan, a position he continued to occupy until 8 Sept. 1835. The death of George B. Porter, the territorial governor during his term, left Mason for several years the actual governor. Although vigorously opposed by the people of the Territory at the time of his appointment on account of his minority, his stand in the controversy with Ohio, known as the Toledo War, brought him such popularity that he was unanimously chosen governor by the people upon the adoption of the constitution by the State on 2 Nov. 1835, a position to which he was re-elected in November 1837. In 1840 he removed to New York City to take up the practice of law. On 4 June 1905, under the authority of the Michigan legislature, his remains were transported from New York

and reinterred in Capitol Park, Detroit, the site of the first capitol of the State.

He is known in the history of Michigan as the "Boy Governor," as he was the youngest person ever appointed to so important an executive position in the history of the nation.

MASON, William, English poet: b. Hull, 12 Feb. 1724; d. York, 7 April 1797. He was educated at Cambridge and his first publication was 'Isis,' a poem, satirizing the Jacobitism and High Church principles which prevailed in the University of Oxford. In 1752 he published 'Elfrida,' a tragedy, with choral odes, on the ancient Greek model. Having taken orders in the Church he obtained the living of Aston, in Yorkshire, and was appointed one of the royal chaplains. In 1759 appeared 'Caractacus,' a drama. Some years after Mason was made precentor and residentiary canon at York. One of his principal works, the 'English Garden,' a poem, appeared between 1772 and 1782, and was translated into French and German. In 1775 he published the poems of his friend Thomas Gray (q.v.) with memoirs of his life. His principal subsequent publications are 'Odes'; 'Life of William Whitehead,' with his poems (1788); 'Essay on Church Music' (1795). There is a tablet to his memory in the Poets' Corner, Westminster Abbey. In 1811 a complete edition of his works appeared.

MASON, William, American musician: b. Boston, 24 Jan. 1829; d. New York, 14 July 1908. He studied music in Germany under Moscheles, Hauptmann, Moritz, Dreyschock and Liszt; made tours as a pianist in Europe and the United States. In the year 1855, with Theodore Thomas and others, he established the Mason and Thomas recitals of chamber music, which were continued until 1868. His compositions, many in number, are mainly for the piano. He published 'Two Pianoforte Methods' (with E. S. Hoadley); 'Pianoforte Technics' (with W. S. B. Matthews); 'System for Beginners' (1871); 'Touch and Technics' (1878); 'Primer of Music' (1894); 'Memories of a Musical Life' (1901), etc.

MASON, William Ernest, American legislator: b. Franklinville, N. Y., 7 July 1850. He removed with his parents to Bentonsport, Iowa, in 1858, and after teaching school, 1866–70, was admitted to the bar and began practice in Chicago, Ill., in 1872. He was a member of the Illinois general assembly in 1879, of the State senate in 1881–85 and of Congress 1887–91. In 1897 he was elected United States senator, in which capacity he warmly advocated the cause of Cuban independence. He was elected to the 65th Congress (1917–19) and is senior member of the law firm of Mason and Mason, Chicago. He has published 'John the Unafraid' (1910).

MASON, Mich., city, county-seat of Ingham County, on the Michigan Central (Saginaw Branch) Railroad and the Michigan United Interurban, 12 miles south by east of Lansing. It was settled in 1839, in 1865 incorporated as a village and in 1875 chartered as a city. It is a residence city with good streets and pavements, cement walks and curbing, situated in a rich farming region. The grain elevators, cold storage, beanery, hay barns, cream and poultry stations, stockyards, lumber-yard and gravel pits are important resources. It is the home of several prize winners in Holstein exhibits and excels in fine horses. The principal buildings are the courthouse, schools with an annex, churches and fine homes. The city owns and operates the electric light and waterworks. Pop. 1,742.

MASON-BEES, a name given to the small wild bees of the genera *Osmia, Ceratosmia* and *Chalcidoma,* which construct their nests with sand or gravel, agglutinated together by means of a viscid saliva, and fix them on the side of walls, under stones, within the hollows of plant stems whence the pith has been removed, or avail themselves of some other cavity for that purpose. The mason-bees, like the carpenter-bees, leaf-cutters and other allied forms of the family *Megachilidæ,* are solitary in habits, not living in communities, although groups of cells are usually found near together, made by the same mother-bee, and each containing a single egg and food — a mixture of honey and pollen. Consult Howard, L. O., 'The Insect Book' (latest ed., New York 1914), which contains an extensive bibliography of the subject; id., 'Standard Natural History' (Vol. II, Boston 1884); Fabre, Henri, 'Insect Life' (English trans., London 1901); id., 'Mason Bees' (New York 1914).

MASON CITY, Iowa, city, county-seat of Cerro Gordo County, on the Chicago, Milwaukee and Saint Paul, the Chicago and Northwestern, the Minneapolis and Saint Louis and the Chicago, Rock Island and Pacific, also Mason City and Clear Lake Railway (Interurban) and the Chicago Greatwestern railroads, about 115 miles in direct line north by east of Des Moines. It was settled in 1855 and its present charter was granted in 1870. It is an agricultural and stock-raising region; fire-clay and valuable sandstone quarries are in the vicinity. Its chief industrial interests are connected with the manufacturing of sash and doors, brick and tile, cement — two large cement mills with a capacity of 11,000 barrels daily and lime, and the quarrying of sandstone. It has a large foundry and considerable trade in livestock and grain. The city is a trade centre and distributing point for a large section of country, and has several wholesale establishments. The government is on the commission plan and consists of three commissioners. The waterworks are owned and operated by the city. Pop. 17,221.

MASON AND DIXON LINE. See BOUNDARIES OF THE UNITED STATES.

MASONIC FRATERNITY, The, an organization of associated societies to which, by common consent, has been accorded the primacy among fraternal orders. Divided into groups of degrees, overlying one another like the foundation and superstructure of a symmetrical building, these constitute the three great rites of universal recognition, namely, English, American and Scottish Masonry. The first and second are acknowledged to compose the great Masonic institution as it exists in Great Britain and dependencies, and in the United States; while the elaborate Scottish Rite of 33 degrees, comprising a more limited membership therein, is the one most widely disseminated in other portions of the world. Each rite is complex in its inter-dependent system of government, and is essentially cosmopolitan, bearing upon its rolls the names of emperors, kings, princes,

presidents and governors, together with scholars, statesmen and men of affairs, as well as those of lesser stations in church and state. The full legal title is, "The Ancient and Honorable Fraternity of Free and Accepted Masons and Concordant Orders."

The Appeal to Antiquity.— During the 18th and first half of the 19th century Masonic writers laid great stress upon the possible origin of the society in the remote ages of the past. Absolutely without any historical basis of record as were most of these theories, yet men of learning loaned their influence to perpetuate the fables extant concerning the fraternity. Some asserted (*a*) that the history of the race was the story of Masonry, beginning with the migration from the Garden of Eden; others (*b*) that it sprang from the Patriarchal period; and still others contended (*c*) that the society was the successor of the ancient mysteries of the Orient; (*d*) that the Temple of Solomon was its cradle; (*e*) that the Crusaders and the Knights Templars carried it forward from their times; (*f*) that the Roman colleges of artificers and builders of the Middle Ages handed down the craft to posterity; (*g*) that the civil strifes in Great Britain of the 15th and 16th centuries, and subsequent political events, made the institution possible; (*h*) and a later class of writers placed its origin to the credit of the Rev. James Anderson, D.D., and the Rev. John Theophilus Desaguliers, LL.D., F.R.S., and their compeers of "The Revival of 1717 A.D." Several of these authors changed their views later in life; and, during the past 50 years, the intelligent Masons of Great Britain and the United States have attempted to build up from the broken fragments of the past,— contained in fugitive lodge records extending back nearly three centuries,— a reasonable history of the "operative" Masonry of the British Isles and the continent of Europe, as well as that of the present "speculative craft." In this effort assistance has been rendered by scholars not connected with the fraternity. The critical reader will note, in the enumeration above, that many plausible theories might be founded both on history and legend, but the strongest factor in the appeal to antiquity, nevertheless, is the "Legend of the Third Degree." In one form or another the allegory of the fall of man, the sacrificial redemption of the race, the doctrines of the resurrection and immortal life, permeated the peoples of every age and became the motive of many migrations. This fact is likewise of record,— established by the discoveries made in Bible lands during the 19th century,— dating four millenaries B.C. When, therefore, a society arose which claimed to solve some of these mysteries,— nay, even to have descended from those periods,— it is not singular that the cult should have attracted disciples; especially when shielded from public gaze by a veil of secrecy, the universality of the printed page not having yet been established!

In Great Britain and on the Continent.— The consensus of reliable historical opinion affirms that the premier Grand Lodge of England, organized 24 June 1717 A.D., is the mother of all regular Masonic lodges of the three craft degrees, and, therefore, peculiar interest centres in the landmarks, legends and authentic narratives pertaining to the English rite itself, as well as in the American rite, the daughter thereof, so to speak. The apocryphal history of Masonry recites that it was introduced into England by Prince Edwin, 926 A.D., and that lodges were "warranted at York," by King Athelstan. This "Legend of the Guild" and much other traditional story is based upon curious manuscripts called "Old Constitutions," or "Old Charges of British Freemasons." The oldest of these is dated, by English antiquaries, 1390 A.D., and is registered as the "Regius MS., or Halliwell Poem." The next in age,— beginning of the 15th century,— is called the "Matthew Cooke MS."— both in the British Museum. In that century, also, Henry VI asked, "Where did Masonry begin?" On being told that it began in the East, his next inquiry was, "Who did bring it westerly?"— and he received for answer, "the Phœnicians." These answers were predicated on the traditions of the order, as they had been transmitted from generation to generation. Many Freemasons believe this to be the true origin of their institution. Within recent years many more documents have been discovered and published in facsimile, so that the catalogue contains about 75 entries. These manuscripts have been grouped into families, because of certain characteristics common to two or more,— the whole forming a valuable collection of ancient Masonic remains. Each manuscript consists of three parts: (*a*) the introductory prayer, declaration or invocation; (*b*) the alleged history of the order, or the "Legend of the Guild"; (*c*) the peculiar statutes and duties, the regulations and observations, which Masons in general, or the craft as a unit, were bound carefully to uphold and inviolably to maintain. The precise value of the "Old Charges" lies in the fact that they were the formulas used in the ceremonies of initiation by our Masonic ancestors of from two to five centuries antecedent. All known copies are of English origin, even those used in Scotland; and, being of a distinctly Christian character, it has been thought they indicate ecclesiastical supervision and composition. A manuscript version of 1583 A.D., in possession of the United Grand Lodge of England, has the following "introductory prayer," and is quoted as an example:

> The mighte of the Father of Heaven and ye wysdome of ye glorious Soonne through ye grace & ye goodnes of ye holly ghoste, yt bee three psons & one God, be wh vs at or beginning and give vs grace so to govrne vs here in or lyving that wee maye come to his blisse that nevr shall have ending. AMEN.

Signs, tokens and words, by which the Masonic craft became differentiated from all other trades than builders, do not appear in the earlier forms. In time, however, this initiation was exclusively its own; and in the Melrose manuscript 1581 A.D. (known to posterity by the transcript of 1674), reference is made to "Ye privilidge of ye compass, square, levell, and ye plum-rule." The early records show that the lodge system was used from the first as a bond to preserve the art of building as a monopoly. The secret of the organization was then,— in contradistinction to all others,— "the way to build"; and tyled lodges contributed best toward this end. But, in spite of every precaution, another body of operatives arose,— called "Cowans" by the regulars,— which in spite of its lack of prestige, not being in possession of "Old

Charges» and the «mason's word,» contrived to prosper, eventually breaking down the monopoly and prepared the way for the «speculative» society of modern times. The term «speculative» has reference to a class of members who were not operatives and had no intention of becoming artisans, but were denominated «accepted» Masons. The admission of this element proved the wisdom of the fathers, and to it is probably due the permanency of the institution and its continuity to succeeding ages. By its influences the Masonic fraternity secured governmental favor and became «free of the guilds,» that is, free of the restrictive laws, which even now, regulate the «Friendly Societies» of the British Empire,—enjoying a liberty which did not inhere in the organization of exclusively operative masons who were not *Free*-Masons, the so-called «Cowans.» (Free + Mason, originally written as two words, not mentioned prior to the 14th century). Just what proportion of the membership was speculative during the earlier or operative period unfortunately is not known, the first lodge record preserved being of a meeting held «Vltimo, July 1599,» but of its mixed character there is no doubt. Old records, recently discovered, and examined in the light of present-day research, have led Masonic writers to revise the usually accepted assertion that the cathedrals and other public edifices in Great Britain, erected during the Middle Ages, were planned by Church dignitaries. The opinion now obtains that the architects thereof were the Master Masons of that period,—the divisions among the builders of the operative era being apprentices, journeymen (Fellow Crafts), and Master Masons. Each man's work bore a distinguishing mark by which the piece could be identified, and the wage scale regulated.

The Masonic «reformation» originated in London. By the dawn of the 18th century the decadence of the society had become so serious that four of the surviving lodges proceeded to a reorganization in 1717, and this movement is known in history as «The Revival.» These four lodges were probably joined by others, though the records do not exist. Two clergymen, James Anderson (b. Edinburgh, 5 Aug. 1684) and John Theophilus Desaguliers (b. France, 12 March 1683) became the architects and authors of the new régime. A distinguished gentleman named Anthony Sayer was installed as grand master. He was of the «speculative» and «accepted» class. The Grand Lodge instituted was a *governing* body, and in no wise a successor of the «General Assemblies» of the operative or legendary period. To Dr. Anderson was entrusted the duty of compiling the «general records and faithful traditions from the beginning of time,» and to enable him to do so all the available documents were collected for his use. These were afterward destroyed,—an irreparable loss. In 1723 the «New Constitutions» were published, when it was discovered that Drs. Anderson and Desaguliers had completely changed the theory of the institution,—from Christian to the adoption of a universal creed based on the Fatherhood of God and the Brotherhood of Man,—so as to admit men of all religions, nationalities and stations in life. These authors included likewise all that is now known of the transactions of the craft from 1717 to 1722 A.D., when the official records commence. The second edition of the «New Constitutions» was published in 1738, with «New Regulations» added, which became the basis of the Freemasonry of the present day. From 1717 the evolution of the society made rapid progress, both as to the increasing area of its operations, and in the multiplicity of its degrees. But the Masons of «the revival» and their immediate successors did not long dwell together in unity. Those at York organized a «Grand Lodge of All England» in 1725, and kept it alive for some 20 years. A reorganization took place in 1761, and the body ceased to exist in 1792, never having chartered lodges outside of England. In 1751 a great schism occurred, whereby a part of the premier Grand Lodge withdrew and instituted a rival. In common parlance the latter body became known as «ancients,» the former as «moderns,» a transposition which is firmly settled in history. A deputation from the Grand Lodge of All England, dated 29 March 1779, created still another body called the «Grand Lodge of England South of the River Trent,» and this survived until 2 May 1790. The two rival Grand Lodges,—«Moderns» and «Ancients,»—happily entered into a concordat on Saint John's Day, 27 Dec. 1813 A.D., constituting the present United Grand Lodge of England, declaring that the English Rite of Freemasonry «Consists of three degrees and no more, namely: those of the Entered Apprentice, the Fellow Craft, and the Master Mason, including the Supreme Order of the Holy Royal Arch.»

Scotland enjoys the honor of «Mother Kilwinning Lodge, No. 0,» universally recognized as the oldest in existence. Its records comprise a minute of 1599, and others ranging from 20 Dec. 1642 to 5 Dec. 1758, A.D., and these communications were held in Kilwinning. Traditional history ascribes to the architects of the abbey of Kilwinning the preeminence which inhered to the Masons of York, in England. A dozen other old lodges are of record, possessing fragmentary minutes and «Old Charges» of rare Masonic value, but the Scottish Craftsmen did not follow the examples set by England and Ireland until Saint Andrew's Day, 30 Nov. 1736 A.D., when Baron William St. Clair of Roslin (Earl of Orkney and Caithness), was chosen Grand Master. The following year he was succeeded by George, the third and last Earl of Cromarty. It will be noted that in Scotland, as well as in England and Ireland, the craft was patronized by those of exalted civil rank and station. Scotland's «Masonic gem» is the «Prentice's Pillar,» standing in the chancel of Roslin Chapel, Edinburgh.

In Ireland no Grand Lodge records are extant of date prior to 24 June 1780 A.D. It is known that there was a lodge at Cork, the first minute of which is dated «December ye 8th, 1726.» The city archives refer to a charter for a «Society of Freemasons,» and a «Grand Lodge of Munster»; and it is known that other lodges existed prior to 1726. There was also a Grand Lodge of Cork, and one at Dublin. The last named was of record in 1728–29; reorganized 1731 A.D., electing Lord Kingston, who is described as «Grand Master of all the lodges of Free Masons in the Kingdom of Ireland.» Irish Masons possessed «Old Charges,» and like their English brethern propagated the order far and wide. It was in Lodge No. 44, of Irish register,—warranted in 1735,—that the Hon. Mrs. Richard Aldworth (Eliza-

beth St. Leger), was initiated, and became the celebrated and only "Female Freemason" of history. She only received the first degree.

An attempt has been made to connect, historically, the building crafts of Continental Europe with the operative masons of Britain and Scotland. But, in Germany, in pre-Reformation times, the "Independent Stonemasons" arose, coming out from the monastic orders as the zeal for building magnificent edifices, under ecclesiastical patronage, declined. These "lay brothers" were possessed of "Old Charges," but no authentic documents remain which refer to their most flourishing period of existence. Within the short space, however, of from 10 to 20 years, following the revival in England, Masonry of the British type had obtained a foothold in all the countries of Europe. It had crossed the sea to America, and in a list of lodges published in 1734, No. 126, of English register, is shown as located at "Boston, in New England,"—known since 5 March 1792 as Saint John's Lodge. "England became the great central point of Masonry for the whole world," said Charles W. Moore, Grand Secretary of the Grand Lodge of Massachusetts, in an oration on 29 Dec. 1856 at Boston: "From this source have lodges, grand and subordinate, at various times, been established, and still exist and flourish—in France and Switzerland; in all the German states, save Austria (and there . . . for short seasons); all up and down the shores of the Rhine . . . Sweden, Denmark, Russia; in Italy and Spain (under cover of secrecy); in various parts of Asia; in Turkey; in Syria (as at Aleppo, where an English lodge was established more than a century ago); in all the East India settlements . . . in China . . . Africa; . . . in all the larger islands of the Pacific and Indian Oceans . . . Saint Helena, Mauritius, . . . Madagascar . . . Australia . . . New Zealand; in Greece . . . in Algeria, Tunis, Morocco—and wherever else in the Old World the genius of civilization has obtained a standpoint, or Christianity has erected the Banner of the Cross." The speaker further enumerated the spread of the order in the West Indies, South America, Canada and the United States. In the 63 years which have elapsed since these words were uttered, the growth of Freemasonry has been still more extraordinary.

In France, Masonry has drifted away from the tenets preached and practised among the fraternity in other lands. All Masonic lodges throughout the world except the Grand Orient of France do homage to a Divine Being, symbolized as Horani, the Great Architect of the universe, and in the beginning the French lodge also recognized the designer of the Temple. But in 1877 the Grand Orient formally repudiated the Great Architect and atheism was made a condition of membership. The "Frères Trois Points," as they are commonly called in France, the Brothers of the Three Dots (∴) were credited with all the revolutions of modern times. Petty ambitions and political intrigues made their homes in the lodges, and gradually it became impossible to succeed in business or public life without being affiliated, and everybody wished to join the omnipotent occult ring. The Grand Orient was threatened with losing its character of being a "serious" institution, and it was thoroughly defeated when it massed all its forces to oppose the election of General Boulanger in 1888. The Confédération Générale du Travail, the great Socialist machine, rose up against the Grand Orient, and latterly all the better feeling of France revolted against it. Notwithstanding the allegations made against French Freemasonry, that body includes all shades of political and religious opinions. For many years there had been no communication between the Grand Lodge of England and the Grand Orient; British Freemasons were prohibited from entering any lodge under the jurisdiction of the latter. A reconciliation appears to have been effected about five years ago when Lord Ampthill, the English Pro Grand Master under the Duke of Connaught (Grand Master), paid a visit to France. It may be remarked that political and religious topics are strictly prohibited in all the other Masonic lodges. Consult *New York Times* on French Masons, 24 Feb., 12 and 14 May 1918).

In Russia Freemasonry first appeared toward the end of the 18th century. Then its activities were mainly of a mystical religious value. The body of its membership was composed of the leading aristocracy of that time. Its rites and influence are vividly set forth in Tolstoy's famous novel, 'War and Peace,' which deals with the War of 1812. It was during the reign of the stern, reactionary Tsar Nicholas I (1825–55) that Masonry began to occupy itself with strictly religious and political questions. After the mutiny in 1825 of the officers of the Guards, known as the Decembrists, in which many prominent Masons took an active part, the lodges of the latter were declared to be political, guilty of political sedition against the Tsar and were but under the ban. Hundreds of Masons were sent to Siberia, most of them dying there in the convict mines. After this Masonry existed in Russia as an "underground" organization, in frank rebellion against the secret police. In the '60's it succumbed, from lack of fresh recruits to keep the movement going. Since that time no evidence has been obtainable that the organization has come to life again anywhere in Russia, although government officials have often announced that lodges had been discovered. In 1913 the party of the Extreme Right in the Duma asserted that Masonry had broken out in the empire again and should be ruthlessly exterminated. Among all the real and imaginary foes of autocracy in Russia none were more feared or more relentlessly suppressed than the so-called "Massonisti." In Saint Petersburg (Petrograd) a non-political American religious society, known as the "Miyak" or "Lighthouse Society" was almost suppressed because the young men in its gymnasium had begun to wear the Y. M. C. A. symbol of the triangle on their costumes. They were declared to be Masons secretly organized.

Introduction and Early History in America.—It is a well-settled opinion that very early in the settlement of North America Masons of the three classes,—operative, speculative and the irregulars,—met in lodges, without much regard to warrants or charters, and these organizations continued until long after the revival in 1717, especially in the British colonies. Indeed, these assemblies of the craft were

quite apart from regularity and the sanction of Grand Lodges. This was the fact in Philadelphia, in 1730–31; and, again, in New Hampshire soon afterward (the last named apparently having "Old Charges"), though nothing has yet been discovered to connect such meetings with the working of the "historic three degrees" of 18th century notation, and post-Grand Lodge era. This raises the mooted question as to priority in the United States. On 5 June 1730, Daniel Coxe of Burlington, N. J., was appointed Provincial Grand Master of the "provinces of New York, New Jersey and Pennsylvania, in America," by the Duke of Norfolk, Grand Master of the Premier Grand Lodge of England. On 30 April 1733, Lord Viscount Montague, Grand Master, issued a like deputation to Henry Price of Boston, appointing him "Provincial Grand Master of the province of New England, the dominions and territories thereto belonging." Masonic history is obscure as to the part Coxe took in establishing the society, but there is a complete record of the acts of Price. Because of this Massachusetts was acknowledged to be the "mother jurisdiction" for nearly 150 years; while documents now in the archives of the Grand Lodge of Pennsylvania, and "Libre B," of the Historical Society of that Commonwealth, appear to give the primacy to the Keystone State. In support of this contention evidence discovered during the last half of the 19th century goes to show that on 29 Jan. 1731, Coxe visited his Grand Lodge at London, and that a toast was there drunk in his honor, as "Provincial Grand Master of North America"; that from 1732, and for several years, a list of Grand Lodge officers was regularly printed in the *Pennsylvania Gazette,* published in Philadelphia; that, in 1734, Benjamin Franklin being elected Grand Master thereof, wrote to Provincial Grand Master Price in Boston, as to the status of Masonry in Pennsylvania; that in June of that year Franklin met Price in Boston and was *recognized* to the extent of being "further instructed in the Royal Art," by the Provincial Grand Master; and that Grand Master Franklin himself *visited* the Grand Lodge of England, 17 Nov. 1760 A.D.

The rival Grand Lodges in England, together with those of Ireland and Scotland, chartered lodges everywhere, at home and abroad. Patronized by the royal family and nobility of Great Britain the craft acquired greater prestige than history records of any other society, and a system of "military lodges" fostered expansion. The roll of warrants issued during the 18th century and subsequent to 1730 would make a large volume. From these beginnings Grand Lodges were formed in America, composed of lodges of English ("ancients" and "moderns"), Irish, Scottish and "Army" register, increased in number by those holding Provincial Grand Masters' warrants, together with lodges chartered by the earlier American Grand Lodges in the United States and Canada, until regular governing bodies existed in every State, province and Territory. Thus the craft has "followed the flag," wherever unfurled. Unfortunately the early records of many of the lodges existing in the American colonies previous to the Revolution are lost to history. In the royal forces at Louisburg, Crown Point and Lake George were lodges in which many of the king's soldiers (who were Americans) were initiated. Among the many prominent Americans who belonged to the fraternity besides Franklin were Washington, who was made a Mason while in the service of the Crown, under Gen. William Braddock, and became master of a lodge in Alexandria, Va.; Presidents Jefferson, Monroe, Adams, Jackson, Polk, Fillmore, Harrison, Buchanan, Johnson, Garfield and McKinley. Jackson was a Grand Master and McKinley a Knight Templar. Some historians claim Presidents Madison, Taylor and Pierce as Freemasons, but owing to the political disputes of 1826–30 they made no statement as to their connection with the craft. Mr. Taft and Colonel Roosevelt both became Masons after they became President. Other members were Lafayette, Fulton, Montgomery, Sherman, Burr, Rush, Whipple, Paine, Hamilton, Gerry, Steuben, Stark, Livingstone, DeKalb, Warren, Paul Jones, Witherspoon, Revere and Hancock.

Knights Templars and Masonry.—The tradition that the "Baldwin Encampment," which, up to the middle of the 19th century, had been conceded to be the witness that Masonic Knights Templars were descendants of the Knights of the Crusades, is not now accepted. Its earliest accredited document bears date 20 Dec. 1780. The first reference to the Knights Templars as allied to Masonry is contained in the (lodge warrant) minutes of Saint Andrew's Royal Arch Chapter, Boston, Mass., dated 28 Aug. 1769; the earliest in England is that of Phœnix Lodge, No. 257, Portsmouth, 21 Oct. 1778. Kilwinning Lodge of Scotland, on 8 Oct. 1779, by its master, Earl Eglinton, warranted the "High Knights Templars of Ireland," at Dublin. The Grand Lodge at York sanctioned the degree of "Knight Templar" in 1780. Similar references,—at dates between the Saint Andrew's Chapter's record and the institution of the Grand Encampment, Knights Templars, U. S. A., 11 June 1816—may be found scattered throughout the fugitive minutes of lodges and chapters wherever the British army had been stationed. Whence, then, came the modern "Order of the Temple"? An answer, founded upon historical facts, has never been made. Two theories have been advanced: (*a*) It is within the range of possibility that a connection existed between the chivalric order of Knights Templars and the fraternity of Operative Masons of mediæval times, because bodies of skilled workmen erected Templar strongholds in the Holy Land, and built their preceptories, priories and round churches in Europe. The famous Temple Church, London, is an example. What, then, was more natural than that the Knights Templars in the 14th century, proscribed, persecuted and despoiled of all things, should seek their perpetuation among the affiliated bodies of mechanics of whose universality and antiquity they had abundant evidence? (*b*) On the other hand no historical doubt exists that every Freemason living since the revival of 1717 can trace his pedigree only to Great Britain. No other association, guild or otherwise ever grew into a society of Freemasons, nor was any connection with the building trades of the Continent ever claimed by the first Freemasons of Europe. The craft there

was a direct importation from England, and in its infancy and for many years was confined to the upper classes, without the least admixture of the artisan. This was true in Germany, where the French language, that of the court and diplomacy, was the one used in keeping minutes, and the early lodges bore French names. In 1740, however, in contradistinction to English, a Scottish Masonry arose,—reputed to hail from Scotland, but having no real connection with the regular society; and from this source have emanated most of the traditions relative to the alleged transmission of the chivalric degrees from the Knights Templars, of whom Jacques de Molai,—executed 11 March 1314 A.D.,—was the last Grand Master. In order to prove the Templar succession, and the legend of Scottish Masonry, it becomes necessary to account for an interregnum between the year 1309, when Walter de Clifton, Preceptor of the Scottish Knights Templars, admitted the dispersion of his brethren, and the date when modern Templary appears of record, during the 18th century at Boston, manifestly a historical impossibility. Nevertheless, "history fails to record much that actually occurs; much that subsequent ages would gladly know." Notwithstanding, as late as 1854 an authorized edition of "The Templars' Chart," by Jeremy L. Cross, published in New York, gave a succession of Grand Masters from Jacques de Molai—based on a clumsy forgery of the Swedish Templars,—to the year 1838 A.D. Like many another ingenious theory framed to connect the "old" with the "new" dispensations, tradition may be true, but it is unsupported by documentary evidence.

The Secret Monitor.—In Freemasonry there are, in addition to what is known as Craft Masonry, which in England and Wales and the Overseas Empire is under the jurisdiction of the Grand Lodge of England, of which the Duke of Connaught is Grand Master, certain extraneous Masonic associations to which only regularly initiated Freemasons can belong, but which are not recognized by the Grand Lodge. For example, in England Mark Masonry is not recognized by the Grand Lodge of England, although the Duke is also the Grand Master of the Mark Master Masons. Royal Arch Masonry is, however, officially recognized by the Grand Lodge of England. The reverse is the case under the Grand Lodge of Scotland, which recognizes the Mark but not the Royal Arch Masonry, while in Ireland both are recognized by the Grand Lodge of Ireland. One of the associations outside of "official" Freemasonry is the "Order of the Secret Monitor." It is claimed that the "Brotherhood of David and Jonathan," from which this Order developed, is as old as Freemasonry itself. The earliest existing records of an organized system of the Brotherhood are found in Holland, where it is said to have been founded in 1773. It was carried by Dutch emigrants to America, where it spread rapidly. In 1845 the Order was established in Malta, in the following year in the West Indies, in 1848 in Jerusalem and in 1865 it became known to English Freemasons. It was not till 1887 that a definite attempt was made to organize the Order in England by the Bon Accord Lodge of Mark Master Masons. A Grand Council was formed and four conclaves (or lodges) came into being. Seven more conclaves were formed in 1888, and there are now about 45 under the jurisdiction of the Grand Conclave of the United Kingdom. Some of these conclaves are held in India, Burma, South Africa and other parts of the empire.

Masonic Unity.—At the outbreak of the war in 1914 there were six "foreign" lodges in London under the jurisdiction of the Grand Lodge of England. Two of these—La France and L'Entente Cordiale have only Frenchmen as members; two—Deutschland and Der Pilger were German lodges; one—Loggia Italia—is composed of Italians; and one—America Lodge—is limited to Freemasons born in the United States. Each year a united festival of these lodges was held. For some years prominent Masons in Great Britain expressed a desire that there should be an extension of this international ideal. In March 1913 Lord Amphill said at Birmingham: "I may be a dreamer, but I consider that there is great scope in Freemasonry for improving the relationship among nations." A society was formed in June to advance simple Masonic truths and principles; to promote the practice of the ritual in English, French, German and Italian; the study of English, American and European Continental Masonic history, so that members might become more familiarized with the original aims of Freemasonry; and the arrangement of international tours. In short, the object was to weld together into one associated body the Freemasons of the world. The occurrence of the war will undoubtedly retard that movement for many years. It is a remarkable fact that none of the rulers or statesmen connected with the outbreak of the war was a Freemason. Among the military there were many, of whom the principal were General Joffre and Lord Kitchener. In February 1919 Grand Master W. S. Farmer of the Grand Lodge of the State of New York issued an edict abolishing the use of foreign languages in ritual and proceedings in the lodges of the State from 1 July 1919. This order affected 48 lodges in which languages other than English were spoken.

Organization and Degrees.—Craft Masonry was universally organized on the basis that within itself was conserved all the powers of the entire institution. A Grand Lodge once duly established must *sui generis* be sovereign in its jurisdiction, the bounds of which soon became restricted to a state, province or other recognized political division. The territorial limits of a Grand Lodge being sacred from invasion, and this principle enforced, Masonry has escaped the successful competition of alleged rival rites purporting to be the craft itself, and also has been secure in its privileges from any and all plans to confederate these bodies into one centralized government,—a guaranty of the perpetuation of the democracy inherent therein. But the symbolism of "Solomon's Temple" as the most glorious edifice of ancient times, probably introduced by Drs. Anderson and Desaguliers (whether from the lost manuscripts, or otherwise, is not essential), required a more ornate adornment and furniture than a foundation and the bare superstructure upon which Operative Masons had wrought,—hence, naturally, suggested degrees above the original three of the Revival, *et seq.* For more than a

century men toiled to perfect the society,— often building better than they knew,— until the three Rites became settled as at present established. The best minds contributed toward this end. As in the Old World, so in the New, the institution had attracted to itself men of high character and standing in the governments thereof, and men of letters contributed their full quota to develop the fraternity, which was expected to endure, as these promoters believe it had already existed, for ages. France, in particular, was prolific in the "fabrication" of degrees and rites, the great volume of which survive only in the musty tomes of 18th century literature. As before inferred, the so-called Scottish Masonry became the forerunner of a rite that, perfected by scholarly Masons, ultimately became the Ancient and Accepted Scottish Rite. This title is now applied to a system which was first definitely organized at Charleston, S. C., 31 May 1801. The rite in several of its degrees can boast of a very respectable antiquity, having descended from a "Council of Emperors of the East and the West," at Paris in 1758. It is also based on the three craft degrees, and its postulants must be Master Masons in good standing, in whatever other regular rite they may hold membership. The original Supreme Council in America passed through an experience similar to that of the premier Grand Lodge of England before its authority as "Mother of the Rite" was fully established in the Masonic world; but peace came finally, and two recognized bodies exist in the United States: the primate, as the "Southern Jurisdiction," and the present "Northern Jurisdiction," established by a concordat, signed at Boston, Mass., by several rival Supreme Councils, 17 May 1867. This rite was introduced into England in 1845; and other Supreme Councils of this obedience exist in Scotland, Ireland, Canada, Egypt and colonies of Great Britain; in France and dependencies, and in other countries of Europe, excepting Russia; in South and Central America; and in the West Indies. As before stated, the Masonic government is complex, no two rites — nor even Grand jurisdictions of the same rite,— being alike, owing to variances in the sequence of their degrees. The English and American are substantially in unison as to chronological order: Craft, Capitular, Cryptic and Chivalric degrees. In the American Rite its degrees follow this notation exactly, being the Royal Arch Chapter, Council and Templar systems, respectively. England, Scotland and Ireland, working the English Rite, are not altogether in accord,— additional degrees and orders being incorporated,— but eventually all arrive at practical universality, nevertheless. The A.·.A.·.S.·.R is divided into grades or degrees: symbolic (the three Craft degrees, which are not conferred, however, in jurisdictions of the English and American Rites), Ineffable, Historical, Philosophical, Historical and Philosophical, Chivalric, Official and Executive, — conferred in lodges, councils, chapters, consistories and supreme councils.

The Ancient Arabic Order of Nobles of the Mystic Shrine (q.v.) has fostered and developed the social side of Freemasonry, in its "higher degrees," principally in America.

The Order of the Eastern Star is not a Masonic organization, but a secret sisterhood to which only Freemasons and certain female relatives can belong.

It is estimated that there are considerably over 2,000,000 Freemasons in the world, of which by far the majority are in the United States.

MASONRY (Fraternity). See Masonic Fraternity.

MASONRY AND BUILDING. Masonry, from the French, *maçonnerie,* meaning stone or brick work, derived from the Latin, *maceria,* a wall, is the operation of laying up natural or artificial stones, generally held together or made a single mass by mortar, plaster or earth. It is the most important part of stone and brick structures, and a mason frequently becomes the general contractor for a whole building of this class. The different trades required in mason building begin with building movers or the workmen who raze or demolish old buildings; then come the excavating, drainage, grading, paving, piling, foundations, rubble, cut stone, including cut moldings, modeling and stonecarving, brick masonry, concrete work, fireproofing, terra-cotta work. After this heavier construction follows lighter mason work: plastering on metal or wood lathing, and stucco. The ideal of good masonry is a structure of natural or artificial stone that shall stand as the permanent skeleton of the building,

firm and enduring; its great first cost shall mean no further care or expense.

History.— The Egyptian stonework that has survived the centuries is generally of enormous blocks jointed with astonishing accuracy, so as not to mar the effect of the bas-reliefs which covered several courses. Assyrian walls were laid up with bricks forming the exterior surface and the interior was filled with rubble and earth. The *Opus reticulatum* and *opus incertum* were later Roman forms where small blocks of tufa or triangular brick were used for the exterior surface and the interior was filled with concrete. The characteristic of Greek masonry was to use local stone, accurately cut and jointed if the stone would bear it; otherwise covered with stucco. From the lintel or beam architecture of the Greeks to the arch construction of the Romans was an advance in the possibility of size of construction, but a change from a system of making the constructive forms visible and decorative to a custom of covering rough walls with a decorative shell not expressing the supporting masonry work behind. This method of building gave the Romans an opportunity to make their enormous structures at a low cost, because unskilled labor could be employed to much better advantage, needing only a small number of foremen. Romanesque masonry was very crude and the thrusts of the arches were taken care of by a mass of abutments which were practically monolithic. In Byzantine work the arches and domes were made from small blocks of stone and the thrusts were studied with much greater care. In Gothic work the arch became "alive," carrying the weights and thrusts of the upper parts of the building on slender shafts, and through flying buttresses with the utmost skill to the outer walls and buttresses. Modern work has come to partake of the character of the ancient Roman construction, that is, a veneer on interior supporting masonry of a different character. In our time, however, instead of the huge concrete monolithic buildings, an iron skeleton is used, and a thin shell often not more than four inches in thickness covers a frame work of steel beams that in a high building is little more than an iron bridge on end. The old Roman flat arch construction of thin bricks or tiles held together by strong cement forming domes not over six inches thick and easily spanning 15 feet or 20 feet is also used.

Men and Material.— The workmen employed on masonry are stonecutters, who generally work in stone yards away from the building, except for such trimming as may be necessary in setting the stone; stonemasons who work on the building, setting the stone; bricklayers who work on platforms continually raising and placing the brick accurately; and laborers for delivering the stone, mortar, etc., and for mixing mortar and concrete. The materials used are stone, cement blocks, brick, terra-cotta, broken stone, cinders; and adhesive materials: limes and cements, which are used with sand to make a mortar for binding the materials together. In very crude construction, mud and clay are used for a binding material. Foundation walls may be of stone laid dry; of concrete; of stone laid in Portland cement mortar or half-cement mortar, the latter consisting of sand, cement, lime, with cement and lime in equal proportions. In case of the soil under the building not being sufficiently firm, it is necessary either to drive wooden piles or to spread the foundation so far that the pressure per square foot on the soil will not be sufficient to cause the building to settle. In Chicago the footings are very large, of steel beams and concrete, making what is practically a raft so that the building really floats on a soft soil. Where the foundations are under water, as under a bridge pier, it i necessary to adopt special methods, generally sinking caissons so that workmen may go down and work under water.

The outer row of stones of a wall are termed the *facing;* those within the *filling;* those at the rear the *backing.* A horizontal laying of either stone or bricks is a *course;* a sloped surface of a well is a *batter;* a protecting often projecting course on top is a *coping.* A *bond* is a stone going through two or more courses to bind them together; a *quoin* is a squared stone at a corner; a *stretcher* is greatest in horizontal length, a *header* shortest, the latter being a bond. A *cramp* is a bar of iron or steel let into a wall to brace it. *Ashlar* are squared stone; *rubble* irregularly shaped stone. A *corbel* is a stone projecting as a balance-weight; a *sill,* a broad stone at the base of an opening; a *template,* a large stout stone for supporting the end of a girder or beam.

Ashlar Facing.— The stonework of the outer face of a wall when it is cut and differs in character from the back of the wall is called *ashlar.* The coursing of ashlar is done in different ways. The simplest form is when it is laid out in continued courses. In this case it is caller "regular coursed ashlar." Ashlar is also laid without long horizontal joints. In this case it is called "broken ashlar." This is generally used when stone cannot be easily obtained of equal heights. It takes longer to lay this up, which makes it cost more than the regular courses, but makes a very attractive looking wall, having more freedom and texture. It is customary to cut the stone at the stone yard certain heights; for example, two, four, six and eight inches, so that they can be laid up without cutting any joint except the end joint, at the building. From three to six different heights are generally used, the larger number giving more variety than when the smaller number of sizes is used.

Coursed random ashlar has horizontal joints one-half to two feet apart, continuous. Between these joints the stone is laid up irregularly. The other stone on the walls of a building are called trimmings, which include the molded work, the window sills, jambs and the quoins, which are the cornerstones of the building. The quoins and jamb stones, if of the same material, may be included with the rest of the ashlar. The part of the wall back of the ashlar (called the backing) is of cheaper stone or brick. It is never under eight inches thick when of brick, and if of stone the backing is thicker. This should be built and bonded in at the same time as the ashlar in order to make a solid wall. If the stones are not high, the thickness of the ashlar should vary so that the backing can bond in and it is generally specified that the ashlar should include one through bond stone in every 10 square feet of wall. If

the facing is thin (two inches to four inches), the pieces are clamped back into the backing by iron clamps. Random rubble is where untrimmed stones are used, and selected to fit as well as possible.

In public work and important buildings, every stone should be shown on the drawings, except when random ashlar is employed. In this case the arrangement of the stone is made by the foreman on the building, to follow a sample piece of ashlar set up and approved by the architect. Ashlar is usually from four inches to eight inches thick. In figuring the quantity an average of six inches in thickness is generally taken. The heights vary from 10 inches to 14 inches. For exterior work the ashlar should not be under four inches thick. The ashlar may be laid with V joints, or with rustication. In the latter case the face is generally rock-face or pointed and a draftline an inch wide is carried around the edge of the stone.

Bond stones are stones that go into the wall to hold the wall together. If there are many small stones these should be frequent. In laying out ashlar the bond should be arranged to give effective stone jointing. Sometimes the Flemish bond arrangement is used as in brickwork. Bond stones the full size of a pier are frequently used for caps and also placed at intervals through the pier.

Brickwork.—Bricks are laid so as to distribute the load and tie the different portions of the wall together. Stretchers are brick which are laid showing their long side. Headers show the end of the bricks. Common bond is to lay the brick with stretchers for five courses and then lay headers for the sixth course. Face brick bond is as a rule laid of stretchers and bonded either by clipping the corners of the bricks, which tie the face of the wall to the backing, or with metal wall ties, which are made of wire, crimped metal or of tin fastened to steel wire. Flemish bond is the bond which is most frequently used to give an interesting wall surface, more pleasing than what is obtained with common bond. It is laid up with alternate headers and stretchers. The small piece inserted at the corners is called a closer. English bond consists of courses of headers and stretchers alternating. A variety of this, called English cross bond, has the alternate courses of stretchers arranged with the joints below the middle of the bricks above, making a figure resembling a cross. Sometimes every fifth course of brick is laid Flemish bond with the others straight bond. Every fifth course may be set in or back an inch, forming rusticated work. When walls have hollow or "vaulted" spaces not over two inches wide in the centre the bond is made by bricks laid across the space and cut in diagonally, or by the use of metal ties every four to eight courses. In arches, the face of the arch is made with the same bond as that shown on the wall. Common arches are made with successive rings or rowlocks, of headers.

Bricks.—Despite the great increase of concrete and steel construction, brick seems to be used as much as ever, as they are not affected by the weather, fire or city atmosphere. which affects the softer building stones seriously. They are cheaper than stone and can be used with cut stone or terra-cotta trimmings. Hard burned bricks are used for piers, though not so good for this purpose as stone work, and in very dry soils are sometimes used for foundation walls. If there is any dampness of the soil, the outside of brick foundation walls is sometimes painted with water-proof paint. Bricks are made from sand and clay, the clay in different localities making bricks of different characteristics. A sandy clay is most desirable. For the better kinds of brick, clay is often chosen from different places and combined with the greatest care. (See BRICK-MAKING MACHINERY). Terra-cotta and pottery are burned in kilns which are arranged to let in heat half way up the kiln so that it will be drawn down on to the pile of terra-cotta and through the floor of the kiln into the chimney. This is said to give a more even heat. If there is iron in the clay the color of the brick will be red; the ordinary white bricks are generally due to lime. The proportion of iron makes the red of various shades, according to the amount. Lime and iron make a cream-colored brick. Brown bricks are due to the presence of magnesia; and magnesia and iron make a yellow brick. Different clays give varying color effects, and the mixture of clays with mortar colors, or painting the exposed surfaces, gives desired effects. Bricks should not absorb more than from one-twentieth to one-tenth of their weight of water. This is a test that can be easily applied. Soft bricks may absorb as much as a quarter of their weight. Bricks should ring when struck, as cracked or soft bricks will give a dull sound. They should not have any cracks or large lumps or foreign substance, such as lime or coarse gravel. They should run all the same dimensions with true surfaces, though for rustic work rough bricks are often desired. The approximate size of a brick is 2 inches × 4 inches × 8 inches. In the Eastern States 7¾ inches × 3¾ inches × 2¼ inches; but in the Western States the dimensions are slightly larger. In every case where brick work has to be figured for cutting stone trimmings, the brick should be laid up and measured. Pressed brick are generally 8⅛ inches × 4⅛ inches × 2⅛ inches in size. Roman brick is 12 inches long and 1½ inches thick. Norman brick is 12 inches long and 2 inches thick. Bricks weigh four or five pounds apiece.

MASOOLA, mą-soo'lą, a boat common on the east coast of India, adapted to be beached on the surf-beaten shore. The planks are sewed together with coir, over wads of the same material, which press upon the seams. The boats are 30 to 35 feet long, 10 to 11 feet beam, 7 to 8 feet deep, and are rowed by 12 men, oars double banked, and a steersman with an oar at the stern.

MASORA, măs'ō-rą, or **MASSORAH,** MASSORETH, a Hebrew word signifying "tradition," the name of a collection of notes referring to the Hebrew text of the Old Testament, and written in Chaldee chiefly on the margin of Hebrew manuscript. These notes

are various in their character, critical, grammatical and explanatory. Since in early Hebrew writing no vowel signs appeared, great confusion arose in time from the many modes of reading and supplying vowels to the consonants. The Masora set a fixed reading to each word and thus put an end to the multiplicity of readings. At what time the accumulation of these notes was commenced cannot be ascertained. According to some Jewish writers the notes are in some cases as old as the time of Moses; according to others they were begun in the time of Ezra. It is more likely that they are the result not of one period but of many centuries of compilation and emendation. A useful edition of the Masora is the translation of Dr. Ginsburg (3 vols., London 1880–87). See JUDAISM — *The Massorah*. Consult Cornely, 'Introductio in V. T. Libros Sacros' (Vol. I, Paris 1894); Ginsburg, C. T., 'Introduction to the Hebrew Bible' (London 1899); Driver, S. R., 'Notes on Hebrew Text of the Books of Samuel, with Introduction to Hebrew Palæography' (2d ed., Oxford 1913); Harris, 'Rise and Development of the Massorah' (in *Jewish Quarterly Review*, Vol. I, London 1889).

MASPERO, Sir Gaston Camille Charles, gäs-tôn kä-mēl shärl mäs-pĕ-rō, French Egyptologist: b. Paris, 23 June 1846; d. 30 June 1916. He studied in the Lycée Louis-le-Grand, 1853–65, and before entering the École Normale in 1865 had already made considerable progress in the study of Egyptology. He remained in the latter college two years and attracted the attention of Mariette, the distinguished Egyptologist. In 1867 he published in the *Revue Archéologique* an Egyptian text and translation under the title 'Stèle du Songe,' and in the same year appeared separately his 'Mémoire sur la grande Inscription d'Abydos et la Jeunesse de Sésostris.' On leaving the École Normale he went to South America to carry out researches in the Quichua language. Further memoirs on ancient Egypt extended his reputation and secured his appointment in 1869 as professor of the Egyptian language and archæology at the École des Hautes Etudes. In 1871 he issued an important essay, 'Des Formes de la conjugaison en Egyptien ancien, en démotique et en copte'; and in 1873 'De Carchemis Oppidi Situ et Historia antiquissima' and 'Du genre epistolaire chez les anciens Egyptiens.' In 1874 he succeeded Rougé as professor of Egyptian philology and archæology at the Collège de France. Sent to Egypt in 1880 as head of a government archæological mission, he succeeded Mariette in the following year in the directorship of excavations and antiquities. He founded and directed an archæological institute at Cairo, had charge of the museum at Bulak, now in Gizeh, carried out many excavations, with important results, and in 1886 returned to France to resume his duties at the college. In 1899 he again went to Egypt as director of excavations and antiquities. In 1914 he left Egypt and became permanent secretary of the Academy of Inscriptions and Belles-Lettres. Maspero's great work is his 'Histoire ancienne des Peuples de l'Orient' (1875), which has been republished in an enlarged and revised form (1894–99). The three volumes of the later edition have been translated into English under the titles 'The Dawn of Civilization' (1894), 'The Struggle of the Nations' (1896) and 'The Passing of the Empires' (1900). His other works comprise the following: 'Contes populaires de l'Egypte ancienne' (1883), translated by him; 'Etudes Egyptiennes' (1886-91); 'Archéologie Egyptienne' (1887; Eng. trans. 'Egyptian Archæology,' 1888); 'Lectures historiques' (1890; Eng. trans., 'Life in Ancient Egypt and Assyria,' 1892); 'Etudes de Mythologie et d'Archéologie Egyptiennes' (1893), invaluable to the student of the religion of ancient Egypt; besides contributions to the 'Mémoires' of the French Archæological Mission at Cairo; 'Les momies royales de Dêir-el-Bahari' (1889); 'Causeries d'Egypte' (1907; Eng. trans., as 'New Light on Ancient Egypt,' 1909); 'Egypt, Ancient Sites and Modern Scenes' (1911); 'Art in Egypt' (1912), and text and translations of the inscriptions upon the pyramids of the fifth and sixth dynasties in *Recueil de travaux relatifs à la philologie et parchéologie égyptiennes et assyriennes* (Vols. I–XIV), etc. In 1879 Maspero was made a knight of the Legion of Honor, and in 1895 commander. In 1883 he became a member of the Académie des Inscriptions, and in 1887 an honorary Fellow of Queen's College, Oxford, and an honorary D.C.L. of that university. In 1909 he was made knight commander of Saints Michael and George. See EGYPTOLOGY.

MASQUERADE, măs-kē-rād', a popular amusement, in which persons of both sexes mask or disguise themsevles and engage in dancing or festivities. Masquerades date from a very early period in which they were connected with religious ceremonials and observances. We find traces of the masque in the Bacchanalia of Greece, the Saturnalia of Rome and in the Purim of the Hebrews. In the Middle Ages they were at times held in the churches, for instance the ceremony of the boy bishop, the feast of fools, etc. The clergy succeeded in putting a stop to these relics of paganism in connection with Christian worship in the 16th century. Masquerades of the modern purely secular type are said to have been the invention of Granacci, an Italian, who lived in the beginning of the 16th century. See CARNIVAL; FESTIVAL.

MASQUERAY, Emmanuel Louis, American architect: b. Dieppe, France, 10 Sept. 1861; d. Saint Paul, Minn., 26 May 1917. He was educated at Rouen and Paris. Having decided to become an architect he studied at the École des Beaux Arts, Paris, and in 1879 was awarded the Deschaumes prize by the Institute of France. He also received the Chandesaigues prize in 1883. While in Paris he was also an attaché of the Commission des Monuments Historiques. Mr. Masqueray came to New York in 1887, and was at first connected with the office of Carrere and Hastings and later in the office of William M. Hunt. He opened an office here in 1893 and founded the Atelier Masqueray for the study of architecture according to French methods. This was the first wholly independent atelier opened in this country. His reputation became international in 1901 when the commissioner of architects of the Saint Louis Exposition selected him to be chief of design or consulting architect. This monumental undertaking included the Trans-

portation Palace, the Agricultural, Horticultural, Fisheries and Forestry buildings, the Cascades, the Colonnade of States, pavilions, the Louisiana Purchase monument, 12 bridges, music stands and all the decorative architecture in the grounds. Mr. Masqueray was the architect of the famous cathedral of Saint Paul in Saint Paul, Minn., and the pro-cathedral of the Immaculate Conception in Minneapolis, Minn. He was a charter member of the Society of Beaux Arts Architects and the Architectural League of New York, the New York Chapter of the American Institute of Architects, as well as the national organization.

MASQUES. The old masques, fashionable in England in the 17th century, were in reality the kind of private theatricals that then generally prevailed at the courts of Europe. Their name is understood to have originated from the use of the head masque, representing either romantic, historical or allegorical types on occasions of festivity or solemnity. The first of these masques (or ballets, as they were called in Italy and France) that we find recorded was that given by Bergonzio di Botta, at Tortona, to celebrate the marriage of the Duke of Milan in 1489. It was the talk of all the élite of the Western World. Originally a parade or festival, a form of dramatic masque quickly developed in England under the wits of men as deft as Ben Jonson and Fletcher, aided and abetted by the master-designer, Inigo Jones (q.v.), reaching a height of tawdry theatrical beauty that died out almost as quickly as it had flamed. At Versailles and other courts the masque or ballet survived for over a century longer. The masque of to-day is philosophical in character. It is the drama of personified ideas. It is akin to allegory. Its dramatic purpose is the presentation of universal truths; and in this indirect way to bring their lessons home to the mind and heart alike. The pageant and masque are distinctly antithetical in character. The one is essentially concrete, the other is essentially abstract. The one depends on realism to tell its story, the other depends on symbolism, though either may make use of the elements of the other in subordination. Mr. Percy Mackaye's 'Masque of St. Louis,' performed in that city in 1914, was perhaps the soundest achievement of the American poet in this new form which has yet to find its authentic masters. During the Shakespearean tercentenary celebrations of 1916 many commemorative masques were written and performed. For these and sundry lists of "Masques and Festivals" lately held in the United States consult the bulletins of the American Pageant Association. See FESTIVAL; PAGEANT. The standard authorities on the English masques are Evans, H. A., 'English Masques' (London 1898); Reyher, Paul, 'Les Masques Anglais: étude sur les ballets et, la vie de cour en Angleterre, 1512–1640' (Paris 1909); Brotenak, Rudolf, 'Die Englischen Maskenspiele' (Vienna 1902).

MASS, *in physics,* the quantity of matter in a body. The mass of a body is the same wherever the body may be in the universe. Two bodies have equal masses if the gravitating forces with which another body acts upon them are exactly equal at equal distances. (See GRAVITATION). Hence two bodies have equal masses if their weights are the same at the same place on the earth; so that if the metallic "weight" used by a grocer is carried from place to place, the quantities of sugar and tea balanced by it in a good pair of scales will always be the same, for the mass of tea or sugar is in every case equal to the mass of the metalic "weight." It is to be clearly understood that as the force of gravity is different at different places on the earth, the weight of any body is different at different places. To distinguish between the mass (or quantity of matter) and the weight (or force which tends to move it downward) of a body is very important in beginning the study of physics.

MASS, The. According to the teaching of the Catholic Church, the Eucharist is the Sacrament which contains the body and blood, soul and divinity, of Jesus Christ under the appearances of bread and wine. At the Last Supper (see LORD'S SUPPER), the night before He died, Christ, in the presence of the 12 apostles, instituted the Eucharist (q.v.) by taking bread, giving thanks, blessing the bread, breaking it, and giving it to the apostles, saying, "Take ye and eat. This is my body," and then by taking the cup of wine, giving thanks, blessing the wine, and giving it to them, saying, "Drink ye all of this. This is my blood which shall be shed for the remission of sins. Do this for a commemoration of me." The Church teaches that, when Christ said "This is my body," the substance of the bread was, by His almighty power, changed into the substance of His body, and that, when He said "This is my blood," the substance of the wine was similarly changed into the substance of His blood, while the appearances of bread and wine remained. The Church further teaches that the change of bread and wine into the body and blood of Christ, called Transubstantiation (q.v.), continues to be made by Jesus through the ministry of His priests, to whom through the apostles and their successors, He gave this miraculous power when He said, "Do this for a commemoration of me." The priests exercise this power of Transubstantiation through the words of consecration in the Mass. What, then, is the Mass? The Mass is the solemn memory, with a narrative, of Christ's passion and death. It is the perpetual sacrifice of the New Covenant. In the catechism it is described as the unbloody sacrifice of the body and blood of Christ. It is, specifically, a sacrifice of adoration, thanksgiving, propitiation, and impetration. As, in the offering of this sacrifice, certain words and actions in fixed form are used, the Mass may be defined as the aggregate of prayers and ceremonies which constitute the service of the Eucharist in the Latin, that is, the Roman and Gallican, rites.

This service was known at first by many names: *Εὐχαριστία*, gratiarum actio, thanksgiving; *Λειτουργία*, liturgy, rite; *προσφορά*, oblatio, offering; *κλάσις ἄρτου*, fractio panis, breaking of bread; *κυριακὸν δεῖπνον*, cœna Domini, the Lord's supper; *κοινωνία*, communio, communion; *σύναξις, συνέλευσις*, meeting; solemnia; dominica solemnia; dominica passio; spirituale ac cœleste sacramentum; Dominicum; passio; sacrificium. *Λειτουργία* still survives in the Eastern Church, and "holy liturgy" corresponds exactly to the word Mass. This latter

term has become the recognized and almost exclusive technical name for the liturgy of the West. Its derivation is even yet not quite certain; but it is generally said to be a late Latin verbal noun for *missio* (=*dimissio*), from the verb *mittere,* to send, send away. Primarily, *missa* was used in the sense of "dismissal" with reference to the concluding part of the service, and then, by a gradual process well known to linguists as well as to students of liturgy, it was extended to the whole rite. The first time we know for certain that it was employed in its present sense was in the 4th century, about 385 or 386, in a letter of Saint Ambrose to his sister, in which occurs the statement, *missam facere cœpi* (=I begin to say Mass). A 2d century instance of the use of the word *missa* in this sense is of doubtful authenticity. From the 4th century onward it becomes more and more frequent, until in the 'Sacramentarium Leonianum' (Leonine Sacramentary), of the 5th or 6th century, it is understood throughout (*Item alia=Item alia missa*), and in the 'Liber Sacramentorum Romanæ Ecclesiæ,' usually known as "The Gelasian Sacramentary," of the 6th or 7th century, it is constantly expressed. Thereafter, while Eucharist remains the normal name for the sacrament, *Missa,* or one of its derivatives in other languages like Mass in English or Messe in French, has been the regular title given to the Eucharistic sacrifice in the Roman and Gallican rites.

So much for the word, which is clearly much later than what it denotes. The history of the Mass itself has its origin in the New Testament in the four accounts of the Last Supper found in Matthew xxvi, 26–28; Mark xiv, 22–24; Luke xxii, 19–20; and Paul, 1 Cor. xi, 23–26. What Christ then did is the foundation of the Mass. It is because He told the apostles to do, in memory of Him, what He himself on that occasion had done, that the liturgy of the Mass came into being and has continued through the ages. That liturgy, fluid and variable in detail, but uniform in outline and in many formulas, always the same in essentials, and from constant repetition tending ever to become fixed, is traceable with more or less certainty through the 1st century in different parts of the New Testament, in the 'Didache' or "Teaching of the Twelve Apostles" (c. 80–100), in the 'First Epistle of Saint Clement of Rome to the Corinthians' (c. 90–100), in the 'Epistle of Barnabas' (c. 96–98), and in the letters of Saint Ignatius, bishop of Antioch (d. 107). In the 2d century there is very probably an interesting allusion to the Mass from the outside, in a letter written by the pagan, Pliny the Younger (C. Plinius Cæcilius), governor of Bithynia, to the Emperor Trajan about 111–113. The eucharistic service, mentioned by Saint Polycarp, bishop of Smyrna (martyred c. 155), by Athenagoras of Athens (c. 177), and by Theophilus, bishop of Antioch (c. 180), is set out in considerable descriptive detail by Saint Justin Martyr (put to death, c. 165) in his 'First Apology' addressed to Antoninus Pius (138–161), and is also treated of by Saint Irenæus, bishop of Lyons (d. c. 202). In the 3d century we already see traces of those different practices in different countries which led to the different liturgies. For the rite followed in Alexandria and Egypt, we have as spokesmen Clement of Alexandria (d. c. 215), Origen (d. 251), and Dionysius of Alexandria (d. 264); for that of Antioch and Syria we have the fragmentary outline given in the second book of the 'Apostolic Constitutions' (which, however, was not written down until the 5th century as the *Διαταγαὶ τῶν ἁγίων ἀποστόλων*), as well as the complete text of a liturgy in the eighth book of the same work; for Rome and the West we have vague allusions in the writings of Hippolytus (d. 235) and Novatian (c. 250); and for the African Church or Church of Carthage we have Tertullian (d. c. 220) and Saint Cyprian, bishop of Carthage (d. 258). The liturgy given in the eighth book of the 'Apostolic Constitutions,' as well as being an early form of the rite of Antioch, is also possibly an example of an early type of the rite of the whole Church. When we reach the 4th century we have much fuller liturgical information, at least for the East, not only in the writings of Saint Athanasius (d. 373), Saint Basil (d. 379), Saint Cyril of Jerusalem (d. 386), and Saint John Chrysostom (d. 407), but also in the *εὐχολόγια,* or service books, which from about the end of this period began to be compiled for Church use. From this time, too, we have the specifically different rites which were already foreshadowed in the 3d century. It is generally accepted that the fairly uniform type of liturgy previously used everywhere developed into four great parent-rites, from which all others now in use in Christendom are derived. These four are the liturgies of Antioch, Alexandria, Gaul, and Rome.

I. The rite of Antioch, found pure in the Greek 'Apostolic Constitutions,' was modified at Jerusalem into the Liturgy of Saint James, which itself took the place of the older liturgy at Antioch, and was used throughout the whole patriarchate, embracing all western Syria. This modified liturgy is found in (1) the Greek Saint James, now used only once a year at Zacynthus on 23 October, the feast of that saint, and at Jerusalem on 31 December; (2) the Saint James in Syriac, used by the Syrian Jacobites and Uniates; and (3) the Maronite rite, used in Syriac and also in Karshuni, that is, Arabic written in Syrian characters. The second rite derived from the primitive one of Antioch is the East-Syrian or Chaldean, which is found in two forms, (1) that used, in Syriac, by Nestorians and Chaldean Uniates, and (2) the Malabar rite, which is used, also in Syriac, by Malabar Uniates. The third derivative of Antioch is the Byzantine rite, used in Greek, Arabic, Old Slavonic, Rumanian, and many other languages, by all the Orthodox and by Melchites and other Byzantine Uniates. Next to the Roman Mass, this is the most widespread Christian liturgy. The fourth and last rite derived from Antioch is the Armenian, which is used, in classical Armenian, by Armenians, whether Gregorian (i.e., schismatical) or Uniate. II. The second eastern rite, the Alexandrian, gives us (1) the Greek Liturgy of Saint Mark, which is now no longer used; (2) the Saint Mark in Coptic, used by the Copts, both Monophysite and Uniate; and (3) the Ethiopic liturgy, used by the Monophysite Church of Abyssinia. The two great western parent liturgies are the Gallican and the Roman. III. The Gallican rite, in Latin, was used in

North Italy, Gaul, Germany, Spain, Britain, and Ireland. It was imported about the 4th century from the East, probably from Antioch. From about the 8th century it began to be gradually supplanted by the Roman rite, which became itself considerably Gallicanized in the process. By the 10th or 11th century the Gallican had entirely given way to the Roman rite, except in one or two places. It still survives under the title Ambrosian at Milan, in Italy, and under the title Mozarabic at Toledo, in Spain. In each case it is greatly Romanized, particularly so at Milan. IV. Finally, we have the liturgy of Rome. The original pure Roman rite is now no longer used, nor is the African rite, which belonged to the same family and had many features in common with the present Roman Mass, not the least being that its language was Latin even at a time when Greek was still employed at Rome and elsewhere. The present Roman rite, by far the most widespread of all, is used, in Latin, by nearly the whole Roman patriarchate. It occurs, however, in a Slav dialect in parts of Dalmatia and occasionally in Greek at Rome. In parts of southern Italy, Sicily, and Corsica, although they belong to the Roman patriarchate, the Byzantine rite is used. There are various mediæval modifications of the Roman rite peculiar to the religious orders of the Dominicans, Carthusians, and Carmelites. There were also modifications adopted in certain dioceses, and a few of them, Lyons for example, still keep these local forms; but in most cases the local usage has been abolished.

In the early period the liturgical language used at Rome was Greek, for Greek was spoken by the Roman Christians as well as by those of other centres of Christianity, such as Alexandria, Antioch, and Jerusalem. For example, Pope Clement I (c. 91–104) uses Greek in that famous 'First Epistle to the Corinthians,' to which reference has been already made, and the earliest inscriptions in the Roman catacombs are certainly in Greek. As far as is known, the first Christians to use Latin were those of Africa (Carthage). Pope Victor I (190–202), who was born in Africa, is often said to have been the first Roman pontiff to use it; but this has been disputed. The question turns on whether Victor or Saint Cyprian was the author of the treatise 'De Aleatoribus.' The 3d century popes, Cornelius (251–53) and Stephen (254–57), write in Latin. It may perhaps be fairly said that from about the 3d century Latin became the customary language spoken by Christians at Rome, and gradually from that time onward the only one. It is difficult to say when Latin replaced Greek for Church use. Some authorities place the change at as early a date as the second half of the 3d century; others are of opinion that Greek remained the liturgical language until the end of the 4th century. At all events, in Pseudo-Ambrose 'De Sacramentis' (c. 400) and in a letter of Pope Innocent I (401–17) to Decentius of Eugubium (c. 416) we find that the Mass was then said in Latin. It is probable that there was a transition period, during which the two languages were employed side by side. We know from the first Roman Ordo (c. 770) that as late as the 8th century lessons were read and psalms were sung in Greek. As a matter of fact, Greek has not, even now, entirely disappeared. We still have the Kyrie Eleison in every Mass and the Trisagion, Agios O Theos (O Holy God), Agios ischyros (O Holy Strong One), Agios athanatos, eleison imas (O Holy Immortal One, have mercy on us), in the Mass of the Presanctified on Good Friday.

The development of the Roman Mass into its present form is also difficult to trace, at least in some of its earlier stages. Clement I of Rome, Justin Martyr, Hippolytus, and Novatian are in substantial agreement as to the liturgies which they describe or mention; but our information as to the developments of the Roman rite during the latter half of the 3d and nearly the whole of the 4th century is extremely scanty. What we find is that between the 2d and the 5th century certain important changes were made. When we reach the 5th century we are on surer ground, for the 'De Sacramentis' and Innocent the First's letter to Decentius prove not only that the Mass was then said in Latin but also that it is in essence the rite still in use. In the 'Gelasian Sacramentary,' of the 6th or 7th century, showing the service considerably shortened, we have what is practically the present Roman Mass. Pope Saint Gregory I (590–604) made certain modifications, and left the Roman liturgy largely in the state in which it exists to-day. He it was, in particular, who gave the final touches to the Canon. "No pope," says Benedict XIV (1740–58), "has added to or changed the Canon since Saint Gregory." The Council of Trent (1545–63), wishing uniformity everywhere in the celebration of the Roman Mass, appointed a commission to examine and revise the Missal and restore it to its earlier form, "according to the custom and rite of the holy Fathers." This commission, named on 16 Feb. 1562, had not finished its labors at the close of the Council, 4 Dec. 1563, and its authority was continued and action on its report left to the Pope, Pius IV (1559–65). It was not, however, until the reign of his successor, Pius V (1566–72), that the revision was completed. On 14 July 1570 the reformed Missal — 'Missale Romanum ex decreto ss. Concilii Tridentini restitutum' — was published by the Bull, *Quo Primum*, commanding that that Missal alone should be used wherever the Roman rite is followed. That command put an end to most of the mediæval derived rites. There was, however, an exception. Any liturgy that could prove a prescriptive right by an existence of not less than two centuries was allowed. It is by virtue of this exception that the independent Gallican liturgies at Milan and Toledo, as well as the modified rites of certain religious orders and the local usages of some dioceses, were preserved. This Missal of Pius V is the one still in use. It has, however, since undergone various corrections in non-essentials. A second revised Missal was published by Clement VIII (1592–1605) by the Bull, *Cum Sanctissimum*, of 7 July 1604. Again on 2 Sept. 1634 Urban VIII (1623–44) by the Bull, *Si quid est*, published yet another revision. The last revision of the text, with a correction of the rubrics, was made by Leo XIII (1878–1903). His missal — 'Missale Romanum ex decreto ss. Concilii Tridentini restitutum, S. Pii V Pont. Max. iussu editum, Clementis VIII, Urbani VIII et Leonis XIII auctoritate recognitum' — was published in 1884. The

changes effected by Pius X (1903–14) have reference to the music.

Of the Mass, so instituted, developed, reformed, authorized, and promulgated, it remains to say a few words. It is, indeed, not within the scope of the present article to give in detail the many complicated rules and the minute rubrics that are to be observed in the celebration of Mass. These things, which must be mastered before ordination by every aspirant to the priesthood, are to be found fully set forth in books on ceremonial. All that can be given here is a general outline of the prayers and of some of the ceremonies used. The norm is Missa Solemnis, or High Mass, sung by celebrant, deacon, subdeacon, and choir. The following sketch therefore refers to High Mass and, further, to High Mass as celebrated on an ordinary Sunday. The procession, consisting of thurifer, acolytes, master of ceremonies, subdeacon, deacon, and celebrant, all appropriately vested in accordance with the rubrics, having reached the foot of the altar, the celebrant makes the sign of the cross, and he and his assistants say certain preparatory prayers, including the 42d [43d in Rev. vers.] Psalm and the Confiteor or General Confession. Going up to the altar, the celebrant says silently two short prayers asking forgiveness of his sins. Then, having blessed the incense and incensed the altar, he reads the Introit, consisting of an antiphon, a verse of a psalm, and the little doxology, Gloria Patri, etc. The Introit has previously been sung by the choir. The Kyrie Eleison follows, said by the celebrant and the assistant ministers, and sung by the choir. The celebrant then intones the first words of the great doxology, Gloria in Excelsis Deo, and he and the ministers say the remainder of it together, while the choir sings it. Turning to the congregation, the celebrant greets them, in his singing voice, with the salutation, Dominus vobiscum (The Lord be with you), to which the choir answers, Et cum spiritu tuo (And with thy spirit). He then sings the word, Oremus (Let us pray), and, turning his face to the altar, he sings the prayers known as the Collects, which are different every day. These are followed by the Epistle, which the celebrant reads while the subdeacon chants it. After the Epistle comes the Gradual, consisting of two separate chants, of which the first is the Gradual proper and the second is the Alleluia or, in Lent and on certain fast days, the Tract. Five times in the year, as well as in all Requiem Masses, the Gradual chants are followed by a canticle known as the Sequence. The celebrant then says silently the prayers, Munda cor meum, etc. (Cleanse my heart, etc.), and Dominus sit, etc. (May the Lord be in my heart and on my lips, etc.), reads a selection from one of the four Gospels, and blesses the incense. The subdeacon then holds the Gospel-book and the deacon incenses it, and then sings the Gospel as previously read by the celebrant. At the end the response, Laus tibi, Christe (Praise to thee, Christ), is said. At this point, a sermon, if there is one, is preached, in the vernacular of course. After the sermon, the celebrant intones the first words of the Nicene Creed, Credo in unum Deum (I believe in one God), and says the remainder, which is sung by the choir. When the singing of the Creed is finished, the celebrant sings Dominus vobiscum and, after the response as before, he sings the word Oremus (Let us pray). Then follow in order the three principal parts of the Mass, namely, the Offertory, the Consecration, and the Communion. The Offertory is the beginning of the action of sacrifice. While the choir sings the Offertory antiphon, the celebrant offers the bread, wheaten and unleavened, with the prayer, Suscipe, sancte pater, etc. (Accept, holy father, etc.). Then, blessing the water and mixing a little of the water with the wine in the chalice, he says the prayer, Deus, qui humanæ, etc. (God, who didst wonderfully create, and still more wonderfully renew, the dignity of man's nature, etc.). Next, offering the chalice, he and the deacon say, Offerimus tibi, Domine, calicem salutaris, etc. (We offer unto thee, Lord, the chalice of salvation, etc.). Bowing before the altar, the celebrant says the prayer, In spiritu humilitatis, etc. (In the spirit of humility, etc.), and then blesses the bread and wine with the prayer, Veni, sanctificator, etc. (Come, Sanctifier, etc.). He then blesses the incense and incenses first the bread and wine with the prayer, Incensum istud, etc. (May this incense, etc.), and then the altar with the prayer, Dirigatur, Domine, oratio mea, etc. (Let my prayer, Lord, be directed, etc.). Handing back the censer to the deacon, he says, Accendat in nobis Dominus, etc. (May the Lord enkindle in us, etc.). Here the celebrant, the ministers, the clergy present, and the congregation are all incensed. Washing his fingers at the side of the altar, the celebrant recites the Lavabo, that is, the last seven verses of Psalm 25 [26], concluding with the little doxology. Then, bowing before the middle of the altar, he says the prayer, Suscipe, Sancta Trinitas, hanc oblationem, etc. (Receive, holy Trinity, this oblation, etc.). He then turns to the congregation and gives the exhortation, Orate, fratres, etc. (Pray, brethren, etc.), to which the ministers make answer, Suscipiat Dominus sacrificium, etc. (May the Lord receive the sacrifice, etc.). Next follow the Secreta, or secret prayers, which, like the Collects, vary every day, but are said, not sung, by the celebrant. The last Secret, which ends the Offertory act, he brings to a close with the Ecphonesis, Per omnia sæcula sæculorum, sung aloud, to which the choir responds, Amen. There follow three short chants sung dialogue-wise by the celebrant and the choir. The celebrant then sings the Preface, which ends with the Sanctus, etc., said by him and sung by the choir. At the Sanctus a bell is rung thrice. The Canon, which is the fundamental part of the Mass, follows. Its form never varies, except for slight changes (1) when the Roman See is vacant, (2) when the Episcopal See is vacant, (3) when the Mass is celebrated (a) in Rome and (b) in some French churches, (4) when it is celebrated by (a) a Pope or (b) a bishop, (5) when a bishop is being consecrated, (6) on Maundy Thursday, and (7) at the time of the five chief feasts of the year, namely, Christmas, Epiphany, Easter, Ascension, and Pentecost. The Canon is said in a low tone (secreto) by the celebrant. He beseeches God to accept and bless the sacrifice, and to guard and protect the Church, the Pope, and the bishop; he prays for the living, present and absent; he commemorates the saints; he again

begs the acceptance of the sacrifice; he asks for peace and for deliverance from eternal damnation; he once more implores God to bless, approve, and ratify the oblation, so that it may become the body and blood of Jesus Christ. Then, reciting what Christ did with the bread the day before He suffered, he consecrates the Host by saying, secretly, plainly, and attentively, the words, Hoc est enim corpus meum (For this is my body). Immediately he genuflects on one knee and adores and elevates the Host, to show it to the people. Next, reciting what Christ did with the cup of wine, he consecrates the wine by saying the words, Hic est enim calix sanguinis mei, novi et æterni testamenti: mysterium fidei: qui pro vobis et pro multis effundetur in remissionem peccatorum (For this is the chalice of my Blood, of the new and eternal testament: the mystery of faith: which shall be shed for you and for many, for the remission of sins). Adding the words, Hæc quotiescumque feceritis, in mei memoriam facietis (As often as ye do these things, ye shall do them in remembrance of me), he again genuflects on one knee and adores the precious Blood and elevates the chalice containing it. During each elevation, a bell is rung thrice, additional lighted candles are borne by the acolytes, and the thurifer incenses thrice the consecrated bread and thrice the consecrated wine. Proceeding with the Canon, the celebrant says the Anamnesis prayer, in which a solemn commemoration is made of Christ's passion, resurrection, and ascension, and offers to the Lord the victim now on the altar, asking the Almighty Father to accept the offerings, and to command them to be carried by the hands of the holy angel to the altar on high, so that those who receive the most sacred Body and Blood of His Son may be filled with all heavenly blessing and grace. He next prays for the dead, prays again for the living, and makes a further commemoration of the saints, closing with the second Ecphonesis, Per omnia sæcula sæculorum. The answer, Amen, sung by the choir, brings the Canon to an end. Here follows that part of the Mass known as the Communion. The celebrant sings a short exhortation and clause, and then sings the Pater Noster as far as the word, tentationem. The choir sings the last petition, Sed libera nos a malo (But deliver us from evil). After this comes an Embolism, containing a further prayer for deliverance from evil and for peace, said by the celebrant, and ended by the third Ecphonesis, the words of which are the same as those of the two former ones. During the last part of the Embolism, he breaks the Host in the middle, over the chalice. Following the Ecphonesis and its response, he sings the greeting, Pax Domini sit semper vobiscum (May the peace of the Lord be always with you), to which the choir replies, Et cum spiritu tuo. Putting a particle of the Host into the chalice, with the prayer, Hæc commixtio et consecratio, etc. (May this mingling and consecration, etc.), he genuflects, bows down, strikes his breast thrice, and says the Agnus Dei, etc. (Lamb of God, etc.), which contains two petitions for mercy and one for peace. The choir sings the Agnus Dei. The celebrant, having made a further prayer for the peace and unity of the Church, gives the kiss of peace to the deacon, who in turn gives it to the subdeacon, and he in turn to the clergy present. The celebrant then prays for deliverance from his iniquities and from all evils, and asks that the participation of Christ's body may not turn to his judgment and condemnation, but may profit him to the safety and health of soul and body. Having said the words, Panem cœlestem accipiam, et nomen Domini invocabo (I will take the Bread of heaven, and will call upon the name of the Lord), he recites three times the Domine, non sum dignus, etc. (Lord, I am not worthy, etc.), a bell being rung each time, and, with specified and appropriate short prayers, he eats the consecrated bread and drinks the consecrated wine. During the two ablutions, that is, of the chalice and of his fingers, which follow, he says two other short prayers. While the choir sings the antiphon known as the Communion, the celebrant reads it, and this ends the Communion act. The last division of the Mass now begins. The celebrant, having sung the Post-Communion prayers, sings also the Dominus vobiscum, to which the choir gives the customary response. Then the deacon sings, Ite, missa est (Go, the Mass is ended), or, in penitential seasons, Benedicamus Domino (Let us bless the Lord), and the choir answers, Deo gratias (Thanks be to God). The celebrant says a final prayer, Placeat tibi, Sancta Trinitas, obsequium servitutis meæ, etc. (Holy Trinity, may the performance of my homage be pleasing to thee, etc.), and blesses the congregation. He then reads the last Gospel, which is normally the beginning of the first chapter of the Gospel of Saint John (vv. 1–14), and, when he finishes, the ministers respond, Deo gratias. So ends the Mass.

Low Mass (Missa privata), in which the celebrant supplies the part of the absent ministers and uses the speaking instead of the singing voice, is a late abridgment. It became a necessity when, in the early Middle Ages, the pious custom grew up for practically every priest to say Mass once a day. By the 9th century we find that many priests were in the habit of saying Mass several times the same day. By the 13th century this multiplication of Masses began to be forbidden. By special indult (1746) of Pope Benedict XIV, priests in Spain and Portugal were permitted to celebrate three Masses on All Souls' Day (2 November), a privilege extended quite recently to all other countries. The rule now is that, except on that day and on the feast of Christmas (25 December), when three Masses are also allowed, and on Sundays and certain holy days when, in case of necessity, authorization for two Masses is given, a priest may say only one Mass a day. Pius the Fifth's Missal (1570) recognized Low Mass and specifically arranged its order. By direction of Pope Leo XIII certain prayers in the vernacular, in which the congregation participates with the celebrant, are recited after every Low Mass. In some countries (e.g., Ireland) the 129th [130th] Psalm (De Profundis) is said after the Low Mass and before the vernacular prayers. There are special rites for a Pontifical Mass, high or low, and additional special rites for a Papal Mass. A Missa Cantata, without deacon and subdeacon, but with celebrant, choir, and singing as at High Mass, is a compromise. The Mass of the

Presanctified (Missa præsanctificatorum, λειτουργία τῶν προηγιασμένων), which is really not a Mass at all but a service of Communion from an oblation consecrated and reserved at a previous celebration, was once common in both the Eastern and the Western Church. In the Byzantine rite such a service still occurs several times in the year, but in the Roman rite it is now used only on Good Friday. Conventual or Chapter Mass (Missa conventualis or capitularis) is an official Mass celebrated in such churches as are bound to have the whole office every day. A Missa solitaria is a Mass said without an assistant. Such Masses, forbidden by many synods, may nevertheless be celebrated by dispensation given under special circumstances. Missa sicca, or dry Mass, was used on occasions when a real Mass could not be said, as, for example, at a wedding or a funeral in the afternoon. It consisted of the prayers of the Mass with the essential parts — offertory, consecration, communion — omitted. Varieties of the dry Mass were Missa nautica, said at sea when the rolling of the ship rendered a real Mass dangerous or impossible, and Missa venatoria, said for hunters. The dry Mass was in vogue from at least the 14th century, but by the end of the 17th century it was nearly entirely abolished. Requiem Mass is said for the dead, and Nuptial Mass (pro sponso et sponsa) for a marriage.

In the early ages the Mass was divided into two distinct parts, the Mass of the Catechumens (Missa catechumenorum) and the Mass of the Faithful (Missa fidelium). This distinction, at one time fundamental, gradually disappeared as the discipline of the catechumenate fell into disuse. It has now long been lost, and the division is so hidden in the present rite that but few people advert to it. The *Dominus vobiscum* and the *Oremus*, following the Gospel (or the Creed, when it is said) and preceding the Offertory Act, show the line of demarcation.

The celebrant of Mass must be in priest's orders and free of irregularity and censure. He must also be in the state of grace, and be fasting from at least the previous midnight. He is bound to observe the rubrics and the laws concerning the matter (azyme bread and pure wine), the vestments, the vessels, and the ceremonies. Mass should be celebrated in a consecrated or blessed church and on a consecrated altar or altar-stone. In special cases, however, it may be said in a private oratory or even in an ordinary room. It is offered in the morning, though, for good and sufficient cause, the time may be extended to a limited period after mid-day.

The two great distinguishing marks of the Roman Mass are (1) that it is a sacrifice and (2) that it supposes Transubstantiation. These were the two features to which the Reformers particularly objected. They took the position that "the Eucharist and Holy Supper of the Lord" was a remembrance of Christ and a solemn setting forth of his death, and not a sacrifice, and that Transubstantiation did not take place. They were anxious, indeed, to retain a Eucharistic service, but one stripped of what to them appeared to be its objectionable parts. They were also insistent that the service should be in the vernacular, and that communion, when administered to the faithful, should be administered under both kinds, that is, in the form of bread and wine, and not of bread alone as was the practice of the Catholic Church. At first they repelled the charge that they were opposed to the Mass, and the Augsburg Confession "protests against any notion that it abolishes Mass"; but the logic of events was too strong for this contention, and ultimately the Reformation, as far as it could, did away with the Mass. In his Latin Mass (1523) and his German Mass (1526) Luther put forth the basis of the numerous liturgies promulgated by his followers in the 16th century. In the former he laid down the principle that "we cannot deny that Mass and the communion of bread and wine is a rite divinely instituted by Christ." He therefore allows the Mass, as it stood in the ancient missals, to be consonant with primitive purity, except the Offertory and the Canon, that is, everything that savored of oblation. He did not recognize Transubstantiation. He developed instead the theory of Consubstantiation, according to which Christ's body and blood are really and corporeally present, during the celebration of the Lord's Supper, in, with, and under the substance of bread and wine, in a union not hypostatic, not of mixture, not of local inclusion, but wholly transcendent and mysterious, so that the elements may with propriety be termed either bread and wine or the body and blood of Christ. Zwinglius and Oecolampadius, and with them the main body of Helvetian Protestantism, went farther. They rejected all notion of a real presence, and recognized only figurative symbols in the elements which Christ had appointed as a commemoration of his death. Bullinger modified Zwinglius's doctrine without changing its essentials, and, by divesting it of its merely commemorative character and admitting the presence in the communion, gave it the form in which it was adopted by the Helvetic churches. Bucer did not acknowledge the local or real presence of Christ's body and blood in the bread and wine after consecration, but contended that the body and blood were really, and without figure, received by the worthy communicant, through faith. Calvin taught that the body of Christ is present in the Eucharist, but "dynamically," not objectively; that the believer partakes of it, but spiritually and by faith; that the elements are unchanged; and that therefore the Catholic Mass is idolatry. In England the Reformers maintained that in the Lord's Supper there is no Transubstantiation and no other oblation than a giving of thanks and a commemoration of the death of the Lord: in other words, that, as Cranmer phrased it, the Roman Mass is "heinous and abominable idolatry." These views found practical expression in the Book of Common Prayer, the first vernacular liturgy of the Church of England, published in the reign of Edward VI, and effective on Whitsunday, 9 June 1549. The Eucharistic part of the service was indeed named "The Supper of the Lorde and holy Communion, commonly called the Masse," but the whole of the oblation and offertory prayers were swept away and the former Canon changed in many of its most material parts. In the second Book of Edward VI, which went into force on 1 Nov. 1552, the word Mass was omitted, and any language in the Canon that might imply either the doctrine

of Transubstantiation or of sacrifice also disappeared. The attitude of the Anglican Church on this subject is crystallized in the 31st of the Articles of Religion: "Wherefore the sacrifices of the Masses, in which it was commonly said, that the Priest did offer Christ for the quick and the dead, to have remission of pain or guilt, were blasphemous fables, and dangerous deceits." Laws were enacted containing severe penalties for saying or hearing Mass. So important did it seem to condemn the Roman sacrifice that, for centuries, the occupant of the English throne was bound by the oath taken at coronation to repudiate the doctrine of Transubstantiation and of the Mass. It was not until 1910 that, by the Accession Declaration Act, the oath was purged of its objectionable clauses.

Modern unbelief, which denies the divinity of Christ and rejects every supernatural institution, does not of course recognize the sacred character of the Mass. Using the so-called historico-religious method, it accounts for the Eucharist and the Eucharistic sacrifice as a result of a spontaneous development in the religion founded by Christ; but this line of argumentation neither explains nor explains away the Mass, and succeeds only in raising still more difficult problems for solution.

Despite all the attacks to which it has been subjected, the Mass remains the great central act of sacrifice in the Catholic Church, the distinctive feature of the Catholic religion, the everlasting witness and guarantee of the bond which unites all Catholics with the Roman See. Catholics are required, under pain of grievous sin, to attend Mass on Sundays and holy days of obligation, unless prevented from doing so on reasonable grounds, such as sickness or too great distance from a church. Some lax Catholics, it is true, shirk their duty in this respect; but the crowded condition of the churches both in town and country in every land during the hours of celebration shows how generally and how generously the law is observed. In practice, multitudes of Catholics hear Mass and receive holy Communion every day.

Bibliography.— The bibliography on this subject is enormous. The following books are tentatively suggested for further study: Bona, 'Rerum liturgicarum libri duo' (Paris 1672); Martène, 'De antiquis ecclesiæ ritibus' (3 vols., Rouen 1700–02); Lebrun, 'L'Explication littérale, historique et dogmatique des prières et des cérémonies de la messe' (Paris 1716–26); Pope Benedict XIV (1740–58), 'De sacrosancto sacrificio missæ libri tres' (ed. Schneider, Mainz 1879); Rock, 'Hierurgia, or the Holy Sacrifice of the Mass' (2 vols., London 1840); Daniel, 'Codex liturgicus ecclesiæ universæ' (4 vols., Leipzig 1847); Probst, 'Liturgie der drei ersten christlichen Jahrhunderte' (Tübingen 1870); 'Die ältesten römischen Sacramentarien und Ordines erklärt' (Münster 1892); 'Die Liturgie des vierten Jahrhunderts und deren Reform' (Münster 1893); 'Die abendländische Messe vom fünften bis zum achten Jahrhundert' (Münster 1896); de Fleury, 'La Messe: études archéologiques sur ses monuments' (8 vols., Paris 1884–89); Gasquet and Bishop, 'Edward VI and the Book of Common Prayer' (London 1890); Gihr, 'Das heilige Messopfer dogmatisch, liturgisch und ascetisch erklärt' (6th ed., Freiburg i. Br. 1897); Magani, 'L'antica liturgia romana' (3 vols., Milan 1897–99); Rietschel, 'Lehrbuch der Liturgik' (2 vols., Berlin 1900); Gee, 'The Elizabethan Prayer-book and Ornaments' (London 1902); Duchesne, 'Origines du Culte chrétien' (3d ed., Paris 1903); Bishop, 'Genius of the Roman Rite' (London 1904); Baumstark, 'Liturgia romana e liturgia dell' Esarcato' (Rome 1904); Warren, 'Liturgy of the Ante-Nicene Church' (New York 1906); Cabrol, 'Les origines liturgiques' (Paris 1906); Yorke, 'The Roman Liturgy' (San Francisco 1906); Nieuwbarn, 'The Holy Sacrifice and Its Ceremonies' (trans. from the Dutch by Bouman, New York 1909); Le Vavasseur, 'Manuel de Liturgie' (10th ed., 2 vols., Paris 1910); Fortescue, 'The Mass: A Study of the Roman Liturgy' (New York 1912).

P. J. LENNOX,
Professor of English Language and Literature, The Catholic University of America.

MASSA, mäs'sä, or **MASSA DI CARRARA,** Italy, the capital of the province of Massa e Carrara, situated on a hill three miles from the Gulf of Genoa, 25 miles north of Pisa and 20 miles by rail southeast of Spezia. It is an episcopal see, has a cathedral, public library, and academy of arts and sciences, and an ancient ducal palace now used as the prefectual building. The chief industry is the quarrying of the superior white marble in the vicinity; tobacco, silk, cotton, paper and oil are manufactured. Massa was once the capital of the principality of Massa and later capital of the duchy of the same name. In 1829 it was annexed to Modena. Pop. 30,830.

MASSACHUSET, măs-ą-choo'sĕt, a tribe of North American Indians of the Algonquian stock, formerly living in the neighborhood of Massachusetts Bay, between Salem and Plymouth. Their capital, Massachuset, was where Quincy now stands. A pestilence in 1617 greatly reduced their number and on the arrival of the white settlers the tribe numbered but a fraction of its former hosts, about 500. In 1633 this number was further depleted by the ravages of smallpox. They were placed by the whites in the missions of Natick, Nonantum and Ponkapog in 1646 and gradually disappeared. See ALGONQUIN; INDIANS.

MASSACHUSETTS, one of the 13 original States of the Union, and the most populous of the New England States; between lat. 41° 14′ and 42° 53′ N., and between long. 69° 55′ and 73° 32′ W. from Greenwich. Its greatest length is 184 miles and greatest breadth 113¾ miles, the average breadth being 47¾ miles. Capital, Boston. Population State census, 1915, 3,693,310, as compared with 3,666,416 shown in the National census of 1910. Its familiar name "The Old Bay State" is due to its location upon Massachusetts Bay, an inlet of the Atlantic Ocean which forms the eastern boundary of the State. It is bounded on the north by the States of New Hampshire and Vermont; on the west by the State of New York; on the south by the States of Rhode Island and Connecticut, together with the Atlantic which, skirting the southeastern coast, forms between the outlying islands of Martha's Vineyard and Nantucket, belonging to the State, a broad waterway known

as Nantucket Sound and an inlet called Buzzard's Bay, beyond the eastern extremity of Long Island Sound. The name "Massachusetts" is compounded from Indian words meaning "Great Hills Place," alluding probably to heights of land near the coast in the vicinity of Boston. The present State seal, adopted in 1780 in place of other devices previously in use, shows an Indian holding in his right hand a bow and in his left an arrow pointing downward, all of gold, displayed upon a blue shield, and in the upper corner, above the right arm of the Indian, a silver star having five points. The motto, adopted for Massachusetts by the Provincial Congress in 1775, is, in Latin, "*Ense petit placidam sub liberate quietem,*" or in English, "With the sword she seeks quiet peace under liberty."

Topography.— The area of the State comprises 8,315 square miles, 8,040 square miles being land surface, and 275 water. A portion of the Appalachian Mountain system forms two distinct ranges crossing the western part of the State from north to south. Of these, the Taconic range on the extreme western border has as its highest elevation Mount Greylock (3,535 feet) in the northwestern corner of the State, which is also the highest elevation found within Massachusetts. Thence the range falls to an elevation of 2,624 feet near the southwestern corner. The other or Hoosac range farther east has, as its highest peak, Spruce Hill (2,588 feet), its general height ranging, however, from 1,200 to 1,600 feet. Mount Tom (1,214 feet) and Mount Holyoke (955 feet) are conspicuous elevations rising above the valley of the Connecticut River. Mount Wachusett (2,108 feet) and Mount Watatic (1,847 feet) in the north central part of the State are also noteworthy. An elevated plateau, 1,100 feet high at its greatest elevation, forms the central portion of the State and slopes gradually toward the east, the highest point near the coast being the Great Blue Hill of Milton (620 feet). The sandy peninsula or arm of land known as Cape Cod is a distinguishing feature of the topography of the State, enclosing between the bend and the main coast the considerable body of water known as Cape Cod Bay. The arm of the cape is now penetrated by a ship canal shortening the route between the port of Boston and southern waters. The main coast line of the State, some 300 miles in extent, affords excellent harbors, especially at Boston, New Bedford, Gloucester and Salem. See BOUNDARIES OF THE UNITED STATES.

Rivers and Lakes.— The principal rivers are the Connecticut, crossing the State from north to south, approximately 40 miles east from the western boundary; the Housatonic, flowing south, and the Hoosac, north, between the Taconic and Hoosac ranges; and the Merrimac, in the northeastern part of the State, having its source in New Hampshire and flowing into the Atlantic on the eastern coast. These rivers, except the Merrimac for some 15 miles from its mouth, are not navigable for shipping; but together with the Deerfield, Westfield, Chicopee and Miller's River, branches of the Connecticut, the Nashua and Concord, branches of the Merrimac, the Blackstone flowing from the centre of the State southerly across the Rhode Island boundary, and numerous other small streams, afford water power of the highest efficiency which has been fully utilized in the industrial development of the State and contributed largely to the extension and growth of manufacturing, the chief source of the wealth of its people. The Mystic and Charles rivers, flowing into Boston Harbor, and the Taunton, entering the bay at Fall River, are tidal streams each navigable for a short distance inland. There are numerous small lakes or ponds throughout the State, adding much to the beauty of the landscape, and, in many cases, utilized as sources of water supply for the inhabitants.

Geology.— The rocks are principally metamorphic of the Archæan and Palæozoic systems. In the river valleys and elsewhere there are masses of glacial drift, including sand and boulders, some of the latter being of large size. No mineral deposits of great value exist, except stone for building purposes, limestone and sandstone of the highest quality being quarried in the Connecticut Valley and west of the Connecticut, and granite of several varieties and superior character at Cape Ann, Quincy, and to a lesser extent in other eastern sections. The elevations of the lower Connecticut Valley are composed of bolerites, feldspathic and calcareous gneiss. There are extensive Mesozoic sandstone beds and shales in the Connecticut Valley, with small areas of syenite on each side, and an area of gneiss extending easterly from the Connecticut to the central part of the State. Syenite and porphyry are found in the east; feldspathic gneiss and granite in Plymouth and Bristol counties; gneiss and hornblende schist in Middlesex County; syenite in Essex and Norfolk counties; carboniferous deposits in Bristol and Plymouth counties, and Cambrian, Silurian and Devonian limestones, quartzites, schists and slates west of the Connecticut.

Climate and Scenery.— The temperature is variable and, especially in the eastern parts of the State, subject to frequent and wide fluctuations. In the early spring easterly winds prevail upon the coast, which are peculiarly trying to persons of delicate constitution. The winters are moderately severe, although near the sea there is much milder weather, during the winter months, and the fall of snow is not excessive. The summers are frequently marked by periods of excessive heat and sometimes by prolonged drought. The mean average rainfall for the State is about 48 inches. The normal temperature rises above the freezing point at Boston about 7 March and the normal temperature of 60° for the day reaches Boston about 24 May. It falls to 60° about 25 September. Observations extending over 25 years show that upon the average experience the warmest week at Boston follows 13 July. On the other hand, the coldest week follows 24 February.

The scenery in the western counties is exceedingly picturesque, notably in the valleys of the Connecticut, Hoosac, Deerfield and Housatonic rivers. Here are found the noted Berkshire Hills. The northeastern coast line extending southerly from Cape Ann is bold and rocky, while the southern and southeastern shores of Cape Cod and Buzzard's Bay are low and sandy. The islands of Martha's Vineyard and Nantucket and the group known as the Elizabeth Islands partake of the characteristics of the neighboring mainland.

History.— The native inhabitants of Massachusetts were Algonquins of various tribes, each having its distinguishing name. The Indian nomenclature of hills, rivers, lakes and local districts is still preserved in many cases. The first fully authenticated visit of a European explorer is that of Bartholomew Gosnold in 1602, although there are traditional accounts of the visits of others, particularly of Northmen under Lief Erikson, some 600 years earlier, with subsequent settlements maintained during three centuries, of which, however, no undisputed traces exist, although a commemorative tower erected on the Charles near Boston is claimed to mark the site of a Norwegian settlement named Norembega. Gosnold skirted the coast from Salem southward, named Cape Cod and discovered the neighboring islands. A settlement made upon one of these was soon abandoned. Subsequent attempts at settlement by Prynne (1603) and Waymouth (1605) also failed. The Pilgrim Fathers, so-called, a company of English separatists who, seeking religious freedom, had, under the guidance of their pastor, John Robinson, left England for Leyden in Holland in 1607–08, sailed from Delfthaven in 1620, and soon afterward, 102 in number, from Plymouth, England, in the *Mayflower* (q.v.), with the intention of forming a settlement south of the Hudson River. Under stress of weather, however, they were forced to land in Provincetown Harbor 11 Nov. 1620, and finally upon the mainland at Plymouth 11 December (old style), where a settlement was established under a constitution or compact signed by all before leaving the ship, John Carver being chosen governor for one year. Despite much hardship this settlement was never abandoned and formed the basis of the Plymouth Colony.

A settlement made at Cape Ann in 1623 by English fishermen was in 1626 abandoned in favor of a location at Salem. A company of English Puritans under John Endicott, having obtained a grant of land on Massachusetts Bay, joined them in 1628. Under a charter granted the following year the colony of Massachusetts Bay was firmly established. In 1630 the colony received large accessions under John Winthrop, and the seat of administration was soon transferred, first to Charlestown and finally to Boston. These two colonies, Plymouth and Massachusetts Bay, advanced side by side, the last named growing in importance by constant accessions, although less tolerant than the former in religious matters. The original government was indeed theocratic, based upon the Congregational form of church government, which was established by law in 1651. A confederacy including the two colonies and that of Connecticut was formed in 1643, followed by one upon a somewhat broader basis in 1663.

In the Massachusetts Bay Colony religious intolerance was frequently exhibited during the early years. Roger Williams and others whose opinions were thought to be dangerous to the community were banished.

Troubles with the Indians, the original inhabitants of the country, involved both colonies, the more important being the Pequot War (1636–37). and the war with King Philip (1675–76). Gradually relations with the mother country became strained. After the restoration of Charles II a royal commission was appointed to administer the government, but was prevented from exercising its powers by the colonial authorities. The English High Court of Chancery in 1684 declared the charter of Massachusetts forfeited; and a succession of governors appointed by the Crown administered the colonial government, generally with much friction engendered by an adverse public opinion. Plymouth and Massachusetts Bay colonies were consolidated under a new charter in 1692. The territory of Maine, New Hampshire and Vermont formed part of the original province, separation being progressively accomplished and finally completed by the creation of the independent State of Maine in 1820.

In the colonial wars between France and England, and in difficulties with the Indians prompted by French influence adverse to the English colonies, Massachusetts was largely involved. Especially in the French and English wars (1744–48 and 1758), the colony took an important part, contributing in great measure to the success of the expedition against Louisburg and other Canadian campaigns. In these military operations, the colonists learned to estimate their strength justly and acquired experience which was of great value in the final struggle which resulted in independence.

Measures of taxation devised by the home government and restrictions upon the growing commerce of the colony led to a constantly increasing spirit of resistance and, finally, to riots in Boston (1765–68) against the enforcement of the Stamp Act (q.v.). In 1770 three citizens of Boston were shot by British soldiers, part of a garrison quartered upon the town without consent of the people. In December 1773 a cargo of tea, subject to a duty disliked by the colonists, was destroyed by being thrown into the harbor of Boston by a company of townspeople disguised as Indians. This episode is now widely known as "The Boston Tea Party" (q.v.). The port of Boston was closed in retaliation. The meeting of the General Court at Boston being postponed indefinitely, its members assembled at Salem. On 19 April 1775 the first blood of the Revolution was shed at Lexington not far from Boston, followed by the fight at Concord Bridge. On 17 June occurred the battle of Bunker Hill at Charlestown, which, although counted as a British victory, exhibited the effective strength and stubborn power of resistance of the colonial forces, who, about 1,200 in number, resisted more than 3,000 British regulars, only giving way when after the third assault their ammunition failed. Throughout the war Massachusetts took a prominent part, notwithstanding the emigration of a considerable number of loyalists to the eastern British provinces. She provided 67,907 troops and $820,000 in revenue. At the close of the war, Massachusetts entered the Union, its State constitution being adopted in 1780 and the Constitution of the United States ratified January 1788. In the naval operations incident to the war with England in 1812, the seamen from Massachusetts won especial credit.

The State was closely identified with the anti-slavery movement by the growth within her borders of a strong popular sentiment in favor of abolition. William Lloyd Garrison (q.v.), Wendell Phillips and many other prominent men were influential in this movement.

In the War of the Rebellion the State furnished 159,165 men to the Union army and navy, paying in bounties and interest on bounty loans more than $26,000,000, besides large sums in State and military aid. At the close of the war, the war debt of the State approximated $15,000,000. In the late war with Spain also, the quota from Massachusetts was promptly furnished, the men being among those first in the field. And in the great European conflict the State acted in conformity with its honorable traditions.

Population.— The yearly rate of increase in the population of the State is about 2 per cent. The industrial development of the last 40 years has stimulated the growth of factory towns and the population is now more than three-fourths urban, that is, concentrated in cities and towns having 8,000 population or more. Since there were, in 1910, upon the average, 418.8 persons per square mile of land surface the population is more dense than in any other State except Rhode Island. Although many persons born in Massachusetts have emigrated to other States, 356,337 such persons having been found in other parts of the country in 1910, nevertheless the loss has been more than compensated by accessions from abroad, from Canada and indeed from adjacent States of the Union. By the State census of 1915, the native born in the population numbered 2,541,265, and of foreign born, 1,152,045. The increase in the native born in 1915 as compared with 1905 amounted to 21.4 per cent as against 26.4 per cent increase in the foreign born.

The number of foreign born does not of itself fully indicate the effect of immigration upon the population. This is more clearly shown by the number of persons of foreign parentage, which in 1910 aggregated 2,221,497, white persons only being considered. Less than a half of the inhabitants therefore are now of wholly native parentage.

The following table (derived from the United States census of 1910, the latest date for which such a comparison is possible) shows the place of nativity of the more numerous classes among the foreign born, and also the number of persons in the population having one or both parents born in the countries named:

PLACE OF BIRTH	U. S. Census — 1910	
	Foreign born persons	Persons having one or both parents foreign born
All countries	1,051,050	2,221,497
Ireland	222,862	633,022
Canada (French)	134,659	295,282
Canada (other than French)	160,972	308,487
England	92,465	184,347
Sweden	39,560	68,468
Germany	30,554	77,728
Italy	85,056	130,577
Russia	117,260	176,499
Scotland	28,411	55,482
Portugal	25,445	41,431

Of the entire population 98.8 per cent was white in 1910, the remainder being persons of negro descent, Chinese, Japanese and Indians. The growth of population and its concentration have led to the incorporation of numerous cities, of which there are now 37 as against 317 towns. Although the towns numerically preponderate, nevertheless more than 70 per cent of the entire population is now under city government. Dense as the population is when considered in the aggregate this density is confined to the cities and towns engaged in manufacturing, or which share in the residential growth promoted by the metropolitan city of Boston, which of itself has extensive miscellaneous industries. The area of the cities and towns having a population in excess of 2,500 is, approximately, 3,395 square miles, and the population within such places shows a density of about 756.14 persons per square mile. Outside of these places there is in the Commonwealth an aggregate area of approximately 4,645 square miles of land surface, more than a half of the entire area of the State, containing a population of but 238,248, or an average of about 51.29 persons per square mile. Every census since 1875 has shown a considerable increase in population upon the territory occupied by towns above the 2,500 limit in 1900, and, conversely, an almost constant decline in the towns outside this area. The towns which have lost are the smaller agricultural towns of the State, and while the increase in the percentage of foreign born, proportionately to the total population, has been greater in these places than in the other cities and towns, nevertheless the population in them remains to-day as in 1875 largely native born. The persons of foreign birth rapidly become assimilated and take their place in the social and political as well as in the industrial life of the State. The presence of this element has been due very largely to the industrial development of the Commonwealth, but that part of it which appears in the smaller towns is due to the taking up of agricultural land by persons of foreign birth.

Incorporated Cities.— The table (page 403) shows the cities of the State, arranged in order of size, with the population, from the censuses of 1900 and 1910, and the State census of 1915. Boston, the capital, is the chief city of the Commonwealth and in the census of 1910 ranked fifth among the great cities of the Union. Identified with the growth of the State from its beginning its historical landmarks are of profound interest to the visitor, and the traditions of the city, its development in modern times, its unrivaled suburbs distinguished by large numbers of tasteful and well-kept residences, its beautiful parks, public buildings and points of literary and artistic interest, give it an important and in many respects a unique place among American cities. Other cities closely connected with the early history of the Commonwealth are Salem and Newburyport, located on the eastern coast in Essex County. Cambridge, near Boston, with which it is connected by several bridges spanning the Charles River, is the seat of Harvard University, and the former home of Longfellow and Lowell. Lowell and Lawrence upon the Merrimac, Fall River and New Bedford in Bristol County, and Holyoke in Hampden County, are all extensively engaged in textile manufacturing. Holyoke also, with Springfield, is especially inter-

ested in the production of paper of all grades. New Bedford was formerly the seat of the whaling industry now almost entirely abandoned. Lynn and Haverhill in Essex County and Brockton, in Plymouth, are the centres of the boot and shoe industry. Worcester, the second city in point of size, well located near the centre of the State, is an educational centre as well, the seat of Clarke University and Holy Cross College, and is largely interested in high-class metal industries and the manufacture of machinery. Waltham, in Middlesex County, is the site of a large watchmaking establishment and has extensive textile factories. Northampton, in Hampshire, is the seat of Smith College for women. Woburn, in Middlesex, has large establishments for the production of leather. Gloucester, a seaport upon Cape Ann, is largely engaged in the fisheries. Quincy, in Norfolk County near Boston, has noted granite quarries. Fitchburg in Worcester County, Taunton in Bristol, North Adams and Pittsfield in Berkshire, Chicopee in Hampden, Beverly in Essex, and Marlborough in Middlesex, are all thriving cities with important industries; and Chelsea and Revere in Suffolk County, Everett, Somerville, Newton, Melrose, Medford and Malden in Middlesex, are rapidly growing municipalities, largely residential and closely connected with Boston within the metropolitan district.

Religion.— Originally, as elsewhere stated, Orthodox Congregationalism was the form of Church polity recognized by law. To-day all the principal denominations are represented. In respect to population, the Roman Catholics lead all others, more than 900,000 persons in the Commonwealth being of that faith. In church membership, the Orthodox Congregationalists rank next to the Roman Catholics, with approximately 115,000 members; followed by the Baptists (of whom there are several different bodies), with about 70,000; the Methodists (of different bodies), with about 60,000; the Unitarians, about 35,000; the Protestant Episcopalians, 30,000; and many other lesser bodies, of whom few, if any, exceed the limit of 10,000 in membership. These figures must all be regarded as below the actual, although relatively the bodies stand as stated. In the value of church property, although recent exact statistics are not available, and conclusions must therefore be based upon estimates, the rank of the several denominations is the same except that possibly the Roman Catholics change place with the Orthodox Congregationalists.

Government.—Originally based upon church membership, the conditions surrounding the suffrage have been subject to successive modifications. Dissenters from the Established Church were released from paying taxes for church purposes in 1815, and in 1833 all denominations were given equal standing before the law. Since the adoption of the original State constitution (1780) it has been three times revised by constitutional conventions held in 1820, 1853 and 1917–19. Numerous amendments to the original articles have been made and new articles adopted from time to time. All male persons, 21 years of age and upward, able to read and write in the English language, and neither paupers, imbeciles or convicts are entitled to vote. The State legislature, called the General Court, consists of the senate, 40 members, and the house of representatives, 240 members, elected in senatorial and representative districts respectively. Annual sessions are held beginning on the first Wednesday of January and continuing until prorogation after the completion of the business of the session. One of the most important articles in the recently revised Constitution provides for legislation subject to popular initiative and referendum, so that a specified number of voters by petition may initiate constitutional amendments and laws, or may require laws enacted by the General Court to be referred to the people for ratification or rejection.

The executive branch of the State government consists of a governor, lieutenant-governor, eight councillors who are the governor's constitutional advisers in the matter of appointments and other minor executive duties, and who are chosen in councillor districts, a secretary of the Commonwealth, treasurer and receiver-general, auditor of accounts and attorney-general. Beginning with the election to be held November 1920 these state officers and the members of the legislature, all of whom have heretofore been elected annually, will be chosen biennially; but annual sessions of the legislature will be continued as in the past. The governor is by virtue of his office commander-in-chief of the military forces of the State. He has a constitutional power of veto over the acts passed by the legislature, but, notwithstanding this, vetoed bills may be passed over the veto by a two-thirds vote of both branches. Important executive functions are

exercised by commissions of from one to three or more members, appointed by the governor, including among others the boards of agriculture; education; charity; conciliation and arbitration (dealing with labor disputes); the industrial accident board; the board of labor and industry; the commissioners of insurance; banks; waterways and public lands; the public service commissioners; the commission on mental diseases (lunacy); the bureau of prisons; the department of health; and the director of the bureau of statistics (controlling the census, social and industrial statistics), etc. The recently revised Constitution requires that. on or before 1 Jan. 1921, these commissions and boards, and all other executive and administrative work of the Commonwealth shall be organized in not more than 20 departments in which every executive and administrative office shall be placed, except those directly controlled by the governor and council. All judges are appointed by the governor and hold offices during good behavior. The judicial system comprises police, district and municipal courts, having original jurisdiction in minor civil and criminal cases, sometimes exclusive of the Superior Court and sometimes concurrent therewith; a Superior Court with original jurisdiction in higher cases, and original and concurrent jurisdiction with the Supreme Judicial Court; and a Supreme Judicial Court, which has general supervision over all courts of inferior jurisdiction, hears appeals, decides questions of law, etc. This court has also original jurisdiction in certain cases, and original and concurrent jurisdiction with the Superior Court in others. The Superior and Supreme Judicial Courts hold regular term sittings in the several counties. The judicial system also includes courts of probate and insolvency in each county, and there are trial justices and justices of the peace, with limited jurisdiction.

Cities are incorporated by special legislative charter, the minimum population required being 12,000. City governments are administered by a mayor and city council. Towns are independent municipal bodies other than cities, the chief executive officers being the board of selectmen, elected in town meeting by those entitled to vote. The town meetings also make appropriations and decide, by vote, other important matters relating to the affairs of the towns.

The cities and towns are grouped into counties, 14 in number, namely, Barnstable, Berkshire, Bristol, Dukes, Essex, Franklin, Hampden, Hampshire, Middlesex, Nantucket, Norfolk, Plymouth, Suffolk and Worcester. The chief executive officers in the counties are county commissioners, elected annually.

Militia.— All able-bodied male citizens between the ages of 18 and 45 are in emergency liable to perform military duty. The ordinary State militia force consisted in 1916 (including officers) of land forces numbering 9,649 men, and a naval force of 842 men. These were organized in five regiments of infantry (in two brigades), one squadron of cavalry, one regiment of field artillery, one corps of coast artillery, one field battalion of signal troops, one corps of cadets, one naval brigade and a department of sanitary troops comprising one ambulance company, one field hospital company and sanitary detachments for the various regiments. During the late war, by special legislation, the land forces were much enlarged by a so-called home guard, recruited by voluntary enlistment.

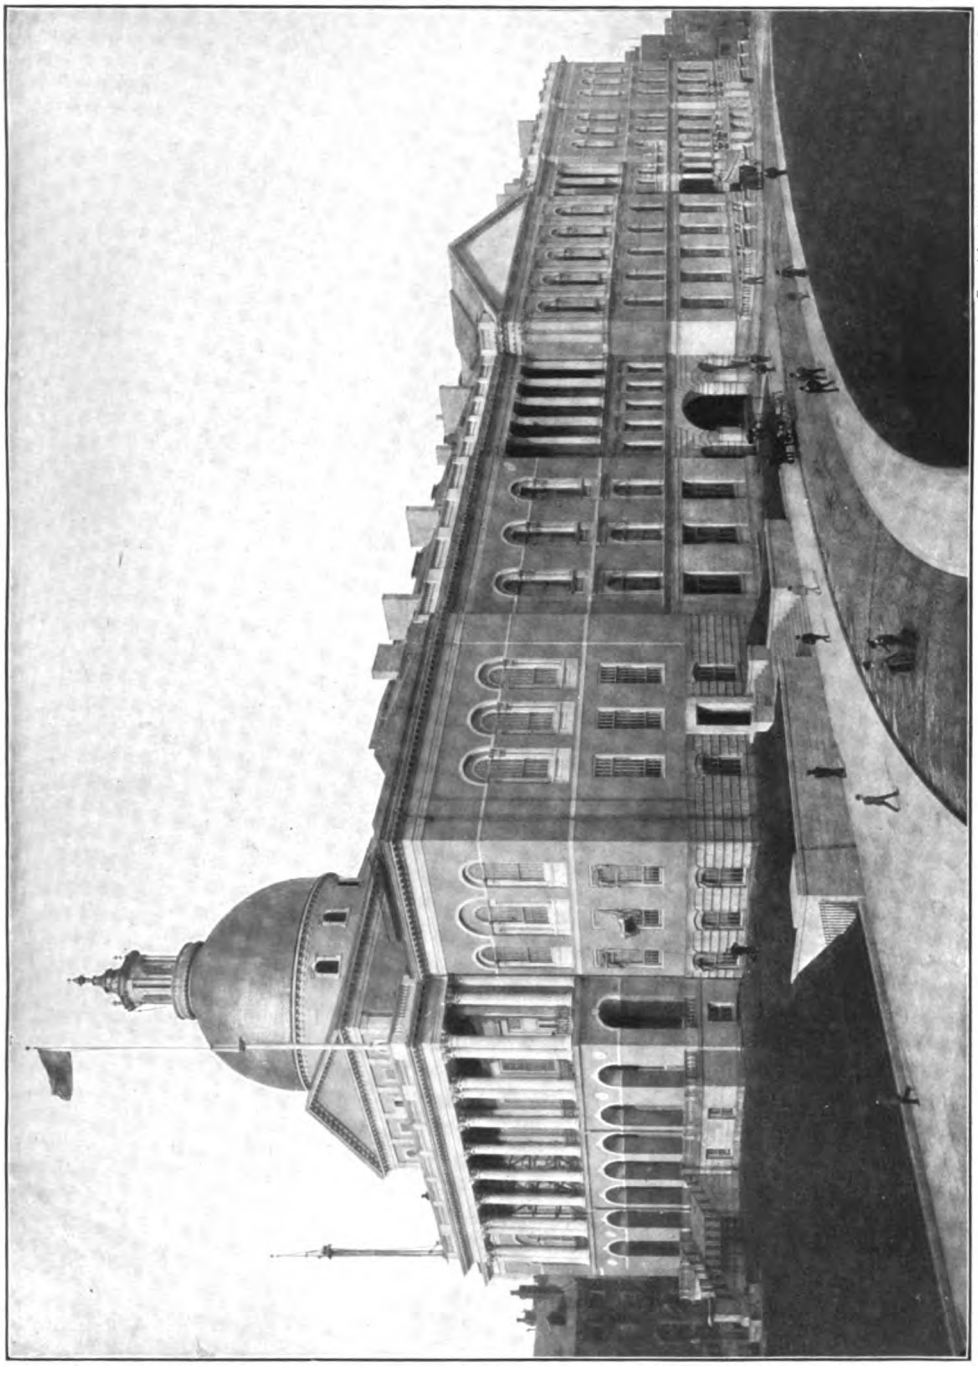
Wealth, Debt and Taxation.— Massachusetts is one of the wealthiest States of the Union. Much of the capital of its citizens is invested in enterprises out of the State. The value of real estate as fixed by the assessors of the various cities and towns for purposes of taxation was for the year 1918, $3,884,193,442. The total personal estate returned from the same sources was $850,260,497, bringing the aggregate to $4,734,453,939, and even this is probably an underestimate.

The aggregated tax levy for State, county and municipal purposes, for the year covered by the latest report, amounts to $95,138,742. Of this $2,087,046 is a poll tax assessed under a provision of law requiring the payment of such a tax, limited to $2 per capita, by every male inhabitant of the Commonwealth above the age of 20 years, whether a citizen of the United States or an alien. The rate of local taxation in the different cities and towns, per $1,000 of valuation, real and personal, varies from $2.50 to $42; rates from $2.50 to $9.80 being assessed in 11 towns; $10 to $14.60 in 52 towns; $15 to $19.80 in 6 cities and 122 towns; $20 to $24.70 in 26 cities and 107 towns; and $25 to $42 in 6 cities and 24 towns.

Under the tax system of the State real estate is taxed to the owner wherever residing, the tax being payable in the city or town where the estate is located. Taxes on tangible personal property are payable in the city or town where the holder resides, *but* a new statute in operation since 1917 taxes the income only of intangible personalty, and also income in excess of $2,000 from business, trade or profession, through the office of the State commissioner of taxation, the proceeds being distributed to the municipalities wherein the person taxed resides. Sworn returns are required under penalty.

Corporations are subject to a tax upon their capital stock, assessed and payable through the office of the State commissioner of taxation, the proceeds being distributed to the municipalities wherein the stockholders reside, in proportion to the amount of shares held by them respectively. Shares in such corporations are therefore exempted from local taxation. Real estate and tangible personal property in general is, on the other hand, subject entirely to local assessment, and, theoretically, at its full value. Property held solely for religious, charitable or educational purposes is exempt from taxation.

The State's bonded debt, less the amount of sinking fund applicable to its reduction, contracted for State purposes only, namely, loans for the construction of hospitals and other public buildings, the abolition of railway grade crossings, unpaid remainders of war debt, etc., amounted to $32,058,102 as reported 30 Nov. 1918. The Commonwealth carries temporarily an indirect indebtedness which, less sinking fund accumulation, amounted at the same date to $53,001,804, this representing loans contracted for the benefit of certain municipalities and metropolitan districts, within which the credit of the State was pledged to aid the development of parks, water systems, sewerage construction and armory construction, the com-



State Capitol at Boston

munities benefited being assessed annually for the payment of interest, and finally for the payment of the principal. The net debt of the State, direct and contingent, was then $85,059,906, although, as will be seen, the larger part of this was contingent municipal indebtedness supported by the State credit.

Banks.— The report of the Comptroller of the Currency to September 1916 reports the number of national banks in the State as 155; 12 being in Boston. The total capital of the national banks in the State was $52,143,000, with $40,361,000 surplus, $707,823,000 total assets and $432,333,000 deposits. The total capital of the Boston national banks was $25,300,000, the surplus $23,950,000 and the deposits $199,095,000. This is a leading "reserve city." Trust companies doing a banking business in the State numbered 91, with $30,575,000 aggregate capital and $436,031,581 in deposits.

The banks for savings are governed by a carefully guarded statute, and these institutions as well as co-operative banks (co-operative savings and loan associations) and trust companies are under the supervision of the State commissioner of savings banks. The savings banks, at the close of the year covered by the latest published return (1917), numbered 196, the number of deposit accounts being 2,491,646; the amount of deposits, $1,022,342,583; the increase over the previous year being $24,647,765. The average amount to each account was $410.31, the deposits amounting on the average to about $263 to each person of the population. The savings banks throughout the State have been managed conservatively and very few losses have occurred; but the expense of management is remarkably low, the percentage of expense to total assets being but .287. The co-operative savings banks, which are really building associations, receiving deposits from their members in regular monthly payments, accumulating interest thereon, and loaning the amounts received to members only, principally upon first mortgages on real estate, have been uniformly successful and numbered (in 1917) 184, the shareholders numbering 247,725 and the assets amounting to $126,695,037.

The Massachusetts statute governing these institutions is a model in legislation of this kind, carefully protecting the interests of the members, who, by the method of regular savings inherent in the system, are gradually accumulating considerable sums in cash, or acquiring home ownership.

In their relation to commerce the financial interests of the State are largely centred in Boston. The first bank in this city, one of the earliest institutions of the kind in the country, was established in 1784 and still continues. Banking operations here have generally been conducted with conservatism and prudence. Since 1898 the aggregate banking capital invested in the city has been much reduced, and weak banks eliminated or strengthened by consolidation.

Education.— From the earliest years the education of the people has been a vital subject of public concern. Harvard College at Cambridge was founded in 1636, and as early as 1647 it was provided in the colonial laws "to the end that learning may not be buried in the graves of our forefathers" . . . "that every township after the Lord hath increased them to the number of fifty households, shall appoint one to teach all children to write and read; and when any town shall increase to the number of one hundred families they shall set up a grammar school, the master thereof to be able to instruct youth so far as they may be fitted for the University; provided that if any town neglect the performance hereof above one year, that every such town shall pay five pounds to the next school, till they shall perform the order." The spirit of this early law still continues. It has always been the policy of the Commonwealth to preserve the principle of local control of the schools, thus promoting the direct interest of the taxpayers in the several municipalities. Hence while the State law provides under penalty that schools shall be maintained in every city and town, these are administered by local boards termed school committees, elected by the people and clothed with broad general authority. Women, as well as male voters, may vote for the election of these officers. The State Board of Education, appointed by the governor, has advisory powers, intended to foster and promote the highest efficiency of the public schools, but no direct control of local schools, except in certain matters of general concern, such as the distribution of the income of the State school fund in aid of the schools in the poorer towns. This board through its agents exercises limited supervisory authority wherever aid is thus furnished. The board also directly administers the State normal schools established for training teachers. Such schools exist at Framingham, Westfield, Bridgewater, Salem, Worcester, Fitchburg, North Adams, Hyannis and Lowell, besides a State Normal Art School at Boston, expressly devoted to the training of teachers in drawing and the arts of design. The buildings provided by the State for normal instruction are of the highest character, of modern construction and all fully equipped. The number of pupils in attendance approximates 2,900.

School attendance is compulsory between the ages of 7 and 14, or if under 16 if certain educational standards have not been reached and specified requirements concerning education complied with. Public schools must be maintained at least 30 weeks in each year, providing instruction in specified subjects, except that in towns in which the taxable valuation of property is under $200,000, the time may be reduced to 28 weeks. Cities and towns containing 500 families must maintain high schools for at least 40 weeks annually, unless exempted by the State Board of Education for valid reasons, and under conditions fixed by the board. Towns not subject to this must pay for tuition of their children in the high school of some other municipality, but sums so paid are reimbursed by the State to towns wherein the valuation does not exceed $1,000,000, or if the valuation exceeds this amount but if the town contains less than 500 families, 50 per cent is reimbursed. If a town containing less than 500 families, nevertheless, maintains a high school of its own, the State grants to it $500 annually under certain conditions. Cities having 20,000 inhabitants must provide manual training. Cities and towns may establish industrial schools, and any city or town may, or under

certain industrial conditions affecting illiteracy, must maintain evening schools for instruction of persons over 14 years of age, and cities of 50,000 inhabitants must maintain evening high schools. Cities and towns may provide free lecture courses of educational value, and vacation schools are authorized, also nautical schools on shore or shipboard, and provision is made for State-aid vocational instruction, including agriculture, trades, crafts and manufacturing industries. A system of continuation schools provides for the education of illiterate minors between the ages of 14 and 16 who are at work. Municipalities must employ superintendents of schools, and provision is made for the joint employment of such superintendents by the smaller towns grouped in superintendentcy unions, aided by the State under certain conditions.

Children under 14 are not to be employed for wages while the public schools are in session, and unless certain educational requirements are complied with employment under 16 is prohibited in factories, workshops or mercantile establishments. There are also stringent provisions as to the employment of minors between 16 and 21, intended to prevent illiteracy. Indeed the educational requirements are so correlated with provisions as to employment and such effective means are provided for enforcement of the laws that the intellectual, moral and physical status of minors of either sex is carefully guarded. In every respect the legislation of Massachusetts of this character is upon a high plane.

There is a provision for the certification of the qualifications of high school teachers by the board of education, and a State-wide retirement system for teachers in the public schools, with annuities and pensions.

A department of university extension, under direction of the State Board of Education, organizes and maintains a comprehensive system of extension teaching designed to supplement, or to fill gaps in, other established educational agencies, by means of vocational and cultural classes conducted by part-time teachers or by correspondence courses. Many such courses are offered for classes when they do not duplicate educational opportunities given at nominal fees by other institutions. There are no fees for instruction in such classes. Twenty students must enroll in order to form a class.

The number of children attending the public schools during the year ending 30 June 1918, covered by the latest published returns, was 604,023; the average membership, 547,288, and the average attendance, 506,474, or 93 per cent of the average membership. At the same time there were 464,621 children in the State between the ages of 7 and 14. The law requiring school attendance is well enforced.

The total annual expenditure for public school support and outlay for the same year was $30,600,088, of which $3,929,213 was for new buildings, alterations and permanent repairs. Of the whole amount required for annual support about 97 per cent was derived from local taxation. The average cost to the towns in taxation was $48.73 for the school support of each child in the average membership, (not including outlay for new buildings) requiring an expenditure of $5.45 for each $1,000 of the State's valuation, or about 27 per cent of the average tax for all purposes.

The effective ventilation of school buildings is required under definite provisions of law enforced by the State inspector of factories and public buildings, and in the larger towns and cities these buildings are generally of the highest types of such edifices in this and in all other respects, large numbers having been erected within recent years.

The higher educational institutions within the State include the following: Harvard College (q.v.) at Cambridge, founded 1636; Williams College (q.v.) at Williamstown, 1793; Amherst College (q.v.) at Amherst, 1825; Mount Holyoke College (q.v.), for women, at South Hadley, 1837; College of the Holy Cross at Worcester, 1843; Tufts College (q.v.) at Medford, 1850; Massachusetts Institute of Technology at Boston, 1861; Boston College at Boston, 1863; Massachusetts Agricultural College at Amherst, 1863; Worcester Polytechnic Institute at Worcester, 1865; Boston University at Boston, 1869; Wellesley College (q.v.), for women, at Wellesley, 1870; Smith College (q.v.), for women, at Northampton, 1871; Clark University and Clark College at Worcester, 1887–1902; Simmons College at Boston, 1899; Massachusett College of Pharmacy at Boston, founded 1823, incorporated 1852; Middlesex College of Medicine and Surgery at Cambridge, founded 1846, incorporated 1850; Massachusetts College of Osteopathy at Cambridge, established 1897, incorporated 1898; Wheaton College at Norton, founded 1834, incorporated 1912, and Northeastern College at Boston, 1916. Radcliffe College at Cambridge and Jackson College at Medford having certain affiliations with Harvard and Tufts, respectively, but no legal connection with them, are devoted to the collegiate education of women, and there are also many seminaries and private schools of various grades in the State.

Libraries.— Free public libraries form an important element in the educational equipment of the State. These institutions, free to all the citizens in the various cities and towns, are practically universal, only a fractional percentage of the population being without such privileges. The establishment of such libraries has in recent years been fostered by grants of money from the State treasury, and by the creation of a Free Public Library commission, appointed by the governor, established to promote public library usefulness and to aid in founding such institutions where not then existing. This commission makes annual reports to the legislature upon matters within its jurisdiction. There are also numerous circulating and association libraries, not free to the public. The latest returns from the public libraries within the State show more than 400 such libraries, containing about 6,700,000 bound volumes and having a circulation for home use of more than 14,033,000 volumes. The annual appropriation from taxes for such libraries by the various cities and towns totaled about $1,355,600. The Boston Public Library, housed in a building which is one of the most noteworthy architectural monuments in the United States, is (except New York) the largest free public circulating library in the country, and contains about 1,175,000 volumes; the Harvard University Library has more than 1,230,000; the Bos-

ton Athenæum, 265,000; and the public libraries at Springfield and Worcester; the State Library in the State House at Boston, and that of the American Antiquarian Society at Worcester, each exceed 200,000 volumes. (See LIBRARIES).

Charitable and Penal Institutions.— The State institutions dealing with the defective classes include hospitals for the insane at Worcester, Taunton, Northampton, Danvers, Westborough, Medfield, Monson, Boston, Foxborough and Grafton; a State colony at Gardner, the Massachusetts School for Feeble-Minded at Waltham and the State school at Wrentham. These institutions are under the general supervision of the State Board of Insanity and directly controlled in each case by a board of seven trustees, of whom five must be men and two women, one to be appointed annually by the governor and council, the place of the senior member being vacated each year.

General remedial institutions include a State hospital at Pondville for inebriates and victims of drug habits, seven trustees; the hospital cottages for children at Baldwinsville, with five trustees; the Massachusetts Charitable Eye and Ear Infirmary at Boston, two trustees on behalf of the State; the Massachusetts General Hospital, four trustees on behalf of the State; the Massachusetts Homœopathic Hospital at Boston, five trustees on behalf of the State; the Peter Bent Brigham Hospital at Boston, two trustees on behalf of the State. There are several sanitariums for consumptives under a State board of seven trustees. All the State trustees are appointed for fixed terms by the governor. The Perkins Institution and Massachusetts School for the Blind at Watertown has four trustees on behalf of the State, similarly appointed; and the Soldiers' Home at Chelsea, three. There are special educational institutions for the deaf in which the State is interested and to which educable children of this class may be sent, in accordance with the policy of the Commonwealth which makes schooling free for all its children even when physical defects of this nature forbid their attendance upon the public day school. These comprise the American School for the Deaf at Hartford, Conn.; the Clarke School for the Deaf, Northampton; the Horace Mann School for the Deaf, Boston; the Sarah Fuller Home for Little Deaf Children, Medford; the New England Industrial School for Deaf Mutes, Beverly, and the Boston School for the Deaf. The Massachusetts Hospital School at Canton provides for the care and education of crippled and deformed children. The penal and reformatory institutions include the Lyman School for Boys at Westborough; the State Industrial School for Girls at Lancaster, and an Industrial School for Boys at Shirley, all controlled by the trustees of training schools, appointed by the governor; the State Prison at Boston (Charlestown district); the Massachusetts Reformatory at Concord; the Reformatory Prison for Women at Sherborn, and a prison camp and hospital at Rutland, all under the general supervision of the State director of prisons.

The State institutions for paupers include the State Infirmary at Tewksbury and the State Farm at Bridgewater.

The local poor, having settlements under the law in the cities and towns, are cared for in local almshouses maintained by the municipalities. There are jails, houses of correction and truant schools in the counties. The charitable institutions established and maintained by religious bodies or other private agencies are widely distributed; and, especially, hospitals for the treatment of accidents and disease, and homes for the aged have, in recent years, been numerously established throughout the Commonwealth.

By the latest returns covering the year ending April 1918, the total number of persons receiving public charity relief, of all grades (i.e., supported or relieved in institutions, in families or in their own homes, but not including vagrants and wayfarers), was 83,562. The paupers in State institutions numbered 10,626, and the city and town poor in local almshouses, 7,451. The total net cost of pauper relief for the year was $5,168,294, or about $1.34 to each inhabitant of the State. For the year ending 1 Feb. 1919 the whole number of insane persons in the State in care of the State Commission on Mental Diseases was 15,231, besides 3,953 other mental defectives, chiefly feeble-minded. (See PAUPERISM).

The total prison population 1 March 1919 aggregated 4,031; of whom about one-half were confined in county jails and houses of correction and the rest in the State prisons.

Vital Statistics.— Upon the estimated population of the State, the birth rate per 1,000 of persons living, for the year 1916 the latest for which complete figures are available, was 24.8; the marriage rate 18.2, and the death rate 14.9, the excess of births over deaths per 1,000 of persons living being 9.9. The death rate is slightly higher in the cities than in the towns. The total number of deaths for the year was 56,366, the number under each of the principal classified causes being as follows: From general diseases, 14,111; diseases of the nervous system and organs of special sense, 5,774; of the respiratory system, 7,859, and of the digestive system, 5,071.

Manufactures.— The State is largely devoted to manufacturing, the energies of its people having been early turned in this direction, and developed by more than a century of industrial training. No special advantages exist based upon the possession of raw material, or due to natural resources, except water power, which, although changes in the methods of developing power render this less essential than formerly, is still an important factor. The climate of the southeastern part of the State is especially favorable to cotton spinning. In colonial days much was done to foster manufactures, invention has been promoted and improved craftsmanship stimulated, and the effect has been significant throughout the industrial history of the State. The power loom, first constructed by Francis C. Lowell of Boston and Paul Moody of Amesbury, and put in operation at Waltham in 1814, revolutionized the cotton industry in the United States. The first cotton mill in the country was built at Beverly in 1788. As early as 1815 there were 57 cotton mills in the State with 46,650 spindles. The first attempt at woolen goods manufacture was at Rowley, in Essex County, in 1643, followed by more or less successful efforts in the same direction elsewhere in the State in the 17th and 18th centuries. The industrial his-

tory of Lowell, Lawrence and Fall River is, in effect, the history of the growth of the factory system as applied to textiles in America. The boot and shoe industry, developing from crude hand process of early times to the perfected factory operations of to-day, is interwoven with the story of the growth of Lynn, Haverhill, Brockton and many smaller municipalities. The first printing done in the American colonies was at Cambridge in 1639; and from this small beginning onward the printing and publishing business has been important in the State. Much of the history of paper-making in the United States is the history of the industry of Massachusetts. The manufacture of india rubber goods in this country originated at Roxbury, now part of Boston, in 1833. Manufactures of metal, machinery of all kinds, wooden goods, jewelry, clothing, cordage, rattan and other furniture have always been important.

The following table shows the returns, according to the census of 1915, covering the returns of the previous year, of all industries in the aggregate and of the principal industries in detail:

INDUSTRIES	Number of establishments	Capital	Wage earners		Value of product
			Average number	Total wages	
All industries	12,013	$1,548,960,733	606,698	$341,309,517	$1,641,373,041
Boots and shoes, including cut stock and findings	884	116,037,821	85,114	51,006,829	255,188,013
Boots and shoes (rubber)	9	23,027,061	8,087	4,468,411	23,788,788
Carriages and wagons	149	2,866,562	1,245	709,379	2,627,575
Clothing	418	12,141,437	11,840	16,697,908	30,206,346
Confectionery (and ice cream)	276	11,640,834	7,262	3,041,509	22,934,744

Textiles*	537	487,043,677	201,939	94,225,033	394,525,236

* Embracing the following with product as specified: Cotton goods, $195,481,626; woolen and worsted goods, $127,351,434; wool scouring, $1,406,674; hosiery and knit goods, $17,357,319; silk and silk goods, $10,676,681; wool shoddy, $1,903,016; dyeing and finishing textiles, $22,455,086; hats, fur, felt, $864,722; carpets, other than rag, $10,981,344; linen goods, $3,050,254; felt goods, $2,997,080.

In textiles, the most important industrial group shown in this table, the cotton industry leads with a product value of $195,481,626. The spindles employed in this industry numbered, in 1900, 7,784,687, increasing 1,960,169, or 33.7 per cent since 1890, being 40.6 per cent of the total increase in the country. In 1910 Massachusetts had 9,375,004 cotton spindles, and its spindles and looms in the industry approximated one-half of those in the country, and the State is first in rank among the States in the manufacture of cotton goods. The State led all others in the manufacture of woolen and worsted goods, the annual product in 1915 reaching $127,351,434. It also holds first place in the boot and shoe industry, the figures being shown in the table. It has long been first in the manufacture of fine writing papers, the value of this product approximating three-fourths of the total produced in the United States. The paper used by the national government for currency and bonds is produced within the borders of Pittsfield, but near the Dalton line, in a mill especially devoted to its manufacture. In the production of rubber boots and shoes the State ranks first, and in the manufacture of jewelry is preceded only by Rhode Island and New York. The labor employed in the factories of the State is highly skilled, its operations well organized and its productive capacity correspondingly high. Labor difficulties have not been numerous nor protracted. The factory legislation, as a whole, is in advance of other States, and is well enforced, being supported by an effective public opinion. The laws against the employment of children (referred to under *Education*) are especially stringent, and such employment is reduced to small proportions. There is provision for efficient factory inspection under the State Board of Labor and Industries, with a corps of inspectors covering all parts of the Commonwealth.

Agriculture.— The agriculture of the State, as compared with that of the great farming States of the West, is not important. The industry has always been secondary to manufacturing. Following the lines of least resistance, it has turned chiefly to the production of milk, eggs, poultry and such vegetables as find a ready market in the growing factory towns and cities almost at the farmer's door. Considered from this standpoint and measured by the value of the product annually sold, no decline is shown in recent as compared with earlier years. For example, the total value of product for the year covered by the United States census of 1910 was $42,298,274 as against $28,072,900 returned 10 years previously. The returns in the State census are more favorable than those secured in the national enumeration, since taken in the autumn and possibly with greater care; but inasmuch as comparisons with other States can only be made by using the national figures,

they will be relied on here. The total number of farms (1910) was 36,917; and the total acreage, 2,875,941, of which 1,164,501 was improved. The farm property was valued as follows: Land and improvements, except buildings, $105,532,216; buildings, $88,636,149; implements and machinery, $11,563,894; live-stock, $20,741,366. The animals upon the farms in the State, 15 April 1910, included 252,416 neat cattle; 64,283 horses; 10,009 lambs (under one year); 32,708 sheep (one year and over); 103,018 swine, and poultry valued at $1,492,961. The total value of domestic animals on farms was $19,208,712. The persons, 10 years of age and over, engaged in agriculture, forestry and animal husbandry numbered 74,666, and the agricultural laborers (working out) 4,515. The farms operated by owners, part owners or managers constituted 91.9 per cent of the whole number, only 8.1 per cent being carried on by tenant farmers. The State ranked twelfth among the States with respect to the number of farms which derive their principal income from dairy produce, and the total dairy product for the year amounted to $15,187,774, the amount sold being $14,840,927, the remainder being consumed on the farms. The value of milk sold was $13,297,634; cream, $475,824; butter and butter fat, $1,063,859; and of cheese, $3,610. The total value of poultry raised and sold during the year was $1,287,829; and the egg product aggregated 13,305,540 dozen. About 55,000 acres were devoted to cereals, the product in 1910 being valued at but $1,617,131, only a small per cent of the total crop value. Of the principal cereals the acreage and bushels produced in 1910 are corn, 41,755 acres, 2,029,381 bushels; oats, 7,927 acres, 268,500 bushels; rye, 3,474 acres, 59,183 bushels; barley, 349 acres, 9,021 bushels; buckwheat, 1,630 acres, 32,926 bushels; wheat, 109 acres, 2,404 bushels. The acreage devoted to hay and forage crops, exclusive of cornstalks, was 519,503, and the value of the crop, $11,280,989. Certain sections of the State are devoted to special products of considerable importance. Among these are tobacco raised in the Connecticut Valley, cranberries in Barnstable County and general market produce in parts of Middlesex County near Boston.

The Fisheries.— The fishing industry has, from the earliest years, been an important element in the prosperity of the coast towns and the hardy seamen of Gloucester and Marblehead, engaged in this industry in times of peace, have won renown in the naval operations of the country in times of war. The latest complete returns relating to the fisheries of the State show 8,780 vessels engaged valued at $3,680,163, with apparatus valued at $891,213, and the following annual product: Food fish, $7,580,789; mollusks, $1,509,200; crustaceans, $447,167; aggregating $9,537,156. The total number of persons engaged in the fisheries was 11,814. Of the value of the vessels, 39.51 per cent; of apparatus, 27.21 per cent; and of food fish product, 44.69 per cent are credited to the city of Gloucester; New Bedford having 8.42 per cent of the value of vessels, 7.06 per cent of the value of apparatus and 2.35 per cent of the food fish product, besides $217,987 product of the whale fishery. Provincetown had 5.41 per cent of the value of vessels, 13.07 per cent of apparatus and 8.96 per cent of food fish, besides $4,500 product of the whale fishery. Boston had 24.11 per cent of the value of vessels, 13.67 per cent of apparatus and 33.88 per cent of the food fish product.

Commerce.— By the statistics of 1916, fairly reflecting normal conditions preceding the late war, the total imports of the Massachusetts Customs District amounted to $210,900,943, or 9.60 per cent of all imports to the country. The exports amounted to $131,221,946, or 3.03 per cent of all exports. There were entered during the year 146 sailing and 240 steam vessels (American), having 439,484 total tonnage; and 269 sailing and 839 steam vessels (foreign), having 1,981,163 total tonnage. The vessels cleared numbered 129 sailing, 175 steam (American), total tonnage 322,085; and 272 sailing, 561 steam (foreign), total tonnage, 1,267,436.

Boston, of course, is the chief port of entry, and in the aggregate value of investments and earnings derived from ocean commerce exceeds all others. The city is extensively engaged in European commerce, much of which is conducted under foreign flags. Lines of passenger and freight steamers regularly ply between Boston and European ports, and the coastwise passenger and freight traffic to the east and south is important.

Railroads.— Transportation facilities have kept pace with the industrial development of the State. Boston, the metropolis, is connected with the West by two railway systems, and these communicate either directly or by branches with all the leading industrial centres. One general system, with its various divisions, communicates with the South by way of New York, uniting important manufacturing cities and towns, while a network of main and branch lines connects the northern and eastern factory centres of the State with each other, with the seaboard and with the railway systems leading south and west. There are in the State 2,141 miles of main and branch railroad line, besides 1,072 miles of second, third and fourth main track, and 1,755 miles of side track, making the total length of railroad track within the State 4,968.

Various companies as originally chartered are now operated (under leases) in three general systems, the Boston and Albany, Boston and Maine and the New York, New Haven and Hartford. The Boston and Maine system, after receivership, has recently (1919) undergone reorganization. The gross assets of the companies, 31 Dec. 1916, aggregated $863,525,164, and the gross liabilities $833,908,990. The total gross revenue from operation for the year was $163,463,010; and the total expense of operation, $110,802,255; yielding $52,660,755 net. Electrical street railways have multiplied until they now connect all of the principal cities and towns. In the city of Boston subway and elevated railway construction of the highest class, completed and in process, has already transformed the methods of street transit, and will finally solve the problem of rapid communication between different parts of the city and its suburbs. The Massachusetts street railway companies now own, according to the returns, year ending 31 Dec. 1916, 2,357 miles of main track, 529 miles of second main track and 196 miles of side track, these aggregating 3,082 miles. The gross assets of these companies aggregate $229,308,549. The total operating revenue for the year amounted to $43,150,201, and the total expense

of operation to $30,753,333. In recent years the prosperity of both steam and street railroads has been curtailed by causes which it is hoped are temporary. The street railways have especially felt the increase in operating expenses due to advancing wages and cost of supplies, without proportionate increase in revenue, since to a large extent they have been confined to fixed rates of fare. And the principal systems are now (1919) operating under remedial legislation, involving the principal of service at cost, with State control and, to a certain extent, guaranteed returns upon invested capital.

GOVERNORS OF MASSACHUSETTS.

GOVERNORS OF PLYMOUTH COLONY

Chosen annually by the People

1620 Nov. 11, John Carver.
1621 April —, William Bradford.
1633 Jan. 1, Edward Winslow.
1634 Mar. 27, Thomas Prence.
1635 Mar. 3, William Bradford.
1636 Mar. 1, Edward Winslow.
1637 Mar. 7, William Bradford.
1638 June 5, Thomas Prence.
1639 June 3, William Bradford.
1644 June 5, Edward Winslow.
1645 June 4, William Bradford.
1657 June 3, Thomas Prence.
1673 June 3, Josiah Winslow.
1680 Dec. 18, Thomas Hinckley.*

GOVERNORS OF MASSACHUSETTS BAY COLONY

Chosen annually under the First Charter

1629 Mar. 4, Matthew Cradock.†
1629 April 30, John Endicott.†
1629 Oct. 20, John Winthrop.†
1634 May 14, Thomas Dudley.
1635 May 6, John Haynes.
1636 May 25, Henry Vane.
1637 May 17, John Winthrop.
1640 May 13, Thomas Dudley.
1641 June 2, Richard Bellingham.
1642 May 18, John Winthrop.
1644 May 29, John Endicott.
1645 May 14, Thomas Dudley.
1646 May 6, John Winthrop.
1649 May 2, John Endicott.
1650 May 22, Thomas Dudley.
1651 May 7, John Endicott.
1654 May 3, Richard Bellingham.
1655 May 23, John Endicott.
1665 May 3, Richard Bellingham.
1672 Dec. 12, John Leverett (acting).
1673 May 7, John Leverett.
1679 May 28, Simon Bradstreet (to May 20, 1686).

THE INTER-CHARTER PERIOD.

May 25, 1686, Joseph Dudley became president of New England under royal commission, holding the office until 20 December, the same year, when Sir Edmund Andros became governor of New England, appointed by King James II. On 18 April 1689, Governor Andros was deposed by a revolution of the people. After the dissolution of the first charter, Simon Bradstreet was governor from 7 June 1689 to 16 May 1692.

GOVERNORS OF THE PROVINCE OF MASSACHUSETTS BAY

Appointed by the King under the Second Charter

1692 May 16, Sir William Phips.
1694 Dec. 4, William Stoughton (acting).
1699 May 26, Richard Coote (Earl of Bellomont).
1700 July 17, William Stoughton (acting).
1701 July 7, The Council.
1702 June 11, Joseph Dudley.
1715 Feb. 4, The Council.
1715 Mar. 21, Joseph Dudley.
1715 Nov. 9, William Tailer (acting ‡).
1716 Oct. 5, Samuel Shute.
1723 Jan. 1, William Dummer (acting).
1728 July 19, William Burnett.
1729 Sept. 7, William Dummer (acting).
1730 June 11, William Tailer (acting).
1730 Aug. 10, Jonathan Belcher.
1741 Aug. 14, William Shirley.
1749 Sept. 11, Spencer Phips (acting).
1753 Aug. 7, William Shirley.
1756 Sept. 25, Spencer Phips (acting).
1757 April 4, The Council.
1757 Aug. 3, Thomas Pownal.
1760 June 3, Thomas Hutchinson (acting).
1760 Aug. 2, Francis Bernard.
1769 Aug. 2, Thomas Hutchinson (acting).
1771 Mar. 14, Thomas Hutchinson.
1774 May 17, Thomas Gage.

UNTIL THE CONSTITUTION

1774 Oct., A Provincial Congress.
1775 July, The Council

UNDER THE CONSTITUTION

Governors elected annually

1780–85, John Hancock.
1785–87, James Bowdoin.
1787 (to Oct. 8, 1793), John Hancock.§
1793 (from Oct. 8), Samuel Adams (acting)¶.
1794–97, Samuel Adams.
1797 (to June 7, 1799), Increase Sumner¶ (Federalist).
1799 (from June 7 to May 20, 1800), Moses Gill (acting),¶ (Federalist).
1800–07, Caleb Strong (Federalist).
1807 (to Dec. 10, 1808), James Sullivan,§ (Dem.-Rep.).
1808 (from Dec. 10), Levi Lincoln (acting),¶ (Dem.-Rep.).
1809–10, Christopher Gore (Federalist).
1810–12, Elbridge Gerry (Democratic-Republican).
1812–16, Caleb Strong (Federalist).
1816–23, John Brooks (Federalist).
1823 (to Feb. 6, 1825), William Eustis,§ (Dem.-Repub.).
1825 (from Feb. 6), Marcus Morton (acting)¶ (Dem.-Repub.).
1825–34, Levi Lincoln (Democrat-Federalist).
1834 (to Mar. 1, 1835), John Davis,|| (Whig).
1835 (from Mar. 1), Samuel T. Armstrong (acting),¶ (Whig)
1836–40, Edward Everett (Whig).
1840–41, Marcus Morton (Democrat).
1841–43, John Davis (Whig).
1843–44, Marcus Morton (Democrat).
1844–51, George N. Briggs (Whig).
1851–53, George S. Boutwell (Democrat and Free-Soil).
1853–54, John H. Clifford (Whig).
1854–55, Emory Washburn (Whig).
1855–58, Henry J. Gardner (American).
1858–61, Nathaniel P. Banks (Republican).
1861–66, John A. Andrew (Republican).
1866–69, Alex. H. Bullock (Republican).
1869–72, William Claflin (Republican).
1872 (to May 1, 1874), Wm. B. Washburn, || (Republican).
1874 (from May 1), Thomas Talbot (acting),¶ (Republican).
1875–76, William Gaston (Democrat).

---

* Mr. Hinckley was governor till the union of the colonies in 1692, except during the administration of Sir Edmund Andros.

† A royal patent (3 Nov. 1620) created the Council for New England with definitions of territory. 19 March 1628, the council granted to Sir Henry Rosewell and others the territory afterward confirmed by royal charter to the "Governor and Company of the Mattachusetts Bay in Newe England." This charter which passed the seals 4 March 1629, designated Matthew Cradock as the first governor of the company. On 13 May 1629, Cradock was rechosen by the company, but never came to New England. 20 Oct. 1629, John Winthrop was chosen governor by the company. John Endicott had been sent over as their agent by the grantees under the instrument of 19 March 1628. While Cradock was the nominal governor a commission was sent out, dated 30 April 1629, to Endicott at Salem appointing him "Governor of London's Plantation in the Mattachusetts Bay in Newe England." In the exercise of his duties he was subordinate to the governor in London. Cradock and Endicott were thus chief governor and local governor, respectively, until 20 Oct. 1629, the date of the commission of Winthrop (who had not then arrived); and Winthrop and Endicott were chief and local governors, respectively, until the arrival of Winthrop at Salem, with charter, 12, June 1630; when Endicott's powers were merged in the general authority of Winthrop.

‡ On 9 Nov. 1715, Elizeus Burgess was proclaimed governor, he having been commissioned 17 March 1715, but he never came over to perform his duties, and resigned in April 1716.

§ Died in office.

¶ Lieutenant-governor, acting governor during a vacancy. One of these, Moses Gill, died while so acting, 20 May 1800, and the Commonwealth, for the only time under the constitution, was without a governor or lieutenant-governor. The council, Hon. Thomas Dawes, president, officiated until the 30th of the month, when Caleb Strong was inaugurated governor.

|| Resigned upon election to the Senate of the United States.

1876–79, Alex. H. Rice (Republican).
1879–80, Thomas Talbot (Republican).
1880–83, John D. Long (Republican).
1883–84, Benjamin F. Butler (Democrat and Independent).
1884–87, George D. Robinson (Republican).
1887–90, Oliver Ames (Republican).
1890–91, John Q. A. Brackett (Republican).
1891–94, William E. Russell (Democrat).
1894 (to Mar. 5, 1896), Frederic T. Greenhalge* (Republican).
1896 (from Mar. 5), Roger Wolcott (acting),† (Republican).
1897–1900, Roger Wolcott (Republican).
1900–03, W. Murray Crane (Republican).
1903–05, John L. Bates (Republican).
1905–06, William L. Douglas (Democrat).
1906–09, Curtis Guild, Jr. (Republican).
1909–11, Eben S. Draper (Republican).
1911–14, Eugene N. Foss (Progressive-Democrat).
1914–16, David I. Walsh (Democrat).
1916–18, Samuel W. McCall (Republican).
1919– Calvin Coolidge Republican.

Bibliography.— *Historical:* Hutchinson, 'History of Massachusetts' (1764–67); Barry, 'History of Massachusetts' (1855–57); Savage, 'Winthrop's History of New England' (1825–26); Young, 'Chronicles of the Pilgrim Fathers' (1841), and 'Chronicles of Massachusetts,' (1846); Schouler, 'Massachusetts in the Civil War' (1868–71); Drake, 'The French and Indian War' (1870); Adams, 'The Emancipation of Massachusetts' (1887); Goodwin, 'The Pilgrim Republic' (1888); Ellis, 'The Puritan Age and Rule in the Colony of the Massachusetts Bay' (1888); Fiske, 'The Beginnings of New England' (1889); Adams, 'Three Episodes of Massachusetts History' (1892), and 'Massachusetts: Its Historians and Its History' (1893); Byington, 'The Puritan in England and New England' (1896); Howe, 'The Puritan Republic (1899). There are numerous local, town and county histories, among them, Holland, 'The History of Western Massachusetts' (1855), and Winsor, ed., 'The Memorial History of Boston' (1880). Among popular compendiums consult Powell, 'Historic Towns of New England' (1901), and Bacon, 'Historic Pilgrimages in New England' (1898). The published collections of the Massachusetts Historical Society contain invaluable material not otherwise readily accessible, relating to the early history of the Commonwealth. *Scientific:* Hitchcock, 'Report on the Geology, Mineralogy, Botany and Zoology of Massachusetts' (1833); 'Final Report on the Geology of Massachusetts' (1841); 'Ichnology of New England' (1858); and supplement to the same (1865). The following are official reports: 'Fishes, Reptiles and Birds of Massachusetts' (1839); 'Herbaceous Flowering Plants of Massachusetts' (1840); 'Invertebrata of Massachusetts' (1841), and Emerson, 'Trees and Shrubs of Massachusetts' (1875). *Public Documents:* The census reports of the United States; reports of the decennial State census; annual State reports on the statistics of manufactures and on the statistics of labor bulletins, etc., issued by the State Bureau of Statistics; annual State reports of the board of education on railroads, savings banks, lunacy, charity, prisons, agriculture, etc.; reports of the treasurer and receiver-general, the auditor and reports upon vital statistics, and upon polls, property and taxes, issued by the secretary of the Commonwealth.

HORACE G. WADLIN,
Librarian Emeritus, Boston Public Library.

MASSACHUSETTS AGRICULTURAL COLLEGE, at Amherst, Mass., a coeducational institution, chartered in 1863 and opened in 1867 by the State. The college farm is 660 acres in extent, about 175 acres of which are devoted to the campus, 75 to the experiment station, 100 to horticulture and 250 to farming. The work is experimental on the part of the students. The regular course extends over four years, but special courses are given for women desiring to study dairying, market gardening and some other subjects. Winter courses are provided for those unable to take the four years' work. The regular courses lead to the degrees B.S., M.S., M.Agr. and Ph.D. In 1918 the number of instructors was 60 and the students in attendance about 570. The library had about 45,000 volumes; the buildings and grounds were valued at $850,000 and the equipment at $450,000.

MASSACHUSETTS BALLOT. See BALLOT.

MASSACHUSETTS BAY, an arm of the Atlantic indenting the eastern shore of Massachusetts and extending from Plymouth Harbor on the south to Cape Ann on the north, a distance of 42 miles. It is triangular in shape, the north and south shores inclining toward each other until at the entrance to Boston Harbor they are about five miles apart. The depth from the base of the triangle to Boston Harbor is about 21 miles. The northern shore is rocky and irregular, the southern low and sandy. The principal inlets are: on the north coast, Gloucester and Nahant bays and Salem, Marblehead and Lynn harbors, and on the west Boston Harbor. Along the shores are a number of capes and headlands, and off the coast a number of small islands. At the entrance to Boston Harbor there are several islands, on some of which are fortifications. Cape Cod Bay on the southeast is sometimes included in Massachusetts Bay.

MASSACHUSETTS BAY COLONY. See MASSACHUSETTS, *History.*

MASSACHUSETTS HISTORICAL SOCIETY. An association founded at Boston in 1791 and incorporated three years later, for the purpose of collecting and preserving early Americana and documents relative to the early history of the Massachusetts Bay Colony. Since 1792, 70 volumes of 'Collections' and 50 volumes of 'Proceedings' have been printed. It supports a museum of relics and a library containing 60,000 volumes and over 120 brochures, etc. Its prize collections are the Winthrop manuscripts on the early settlement of New England and the Parkman manuscripts dealing with French Canada.

MASSACHUSETTS INSTITUTE OF TECHNOLOGY, The, was founded in 1865, at the close of the Civil War, when the need was beginning to be felt for schools which should train men to deal with the new industrial problems. It was the plan of President Rogers, and of his coworkers, to establish a school which should give a thoroughly practical training in the application of scientific princi-

* Died in office.

† Lieutenant-governor, acting governor during a vacancy. One of these, Moses Gill, died while so acting, 20 May 1800, and the Commonwealth, for the only time under the constitution, was without a governor or lieutenant-governor. The council, Hon. Thomas Dawes, president, officiated until the 30th of the month, when Caleb Strong was inaugurated governor.

ples to practice in the arts, but not primarily training in mere technics, in the narrow sense. Accordingly they planned that each of its courses should embrace enough general studies to impart the elements, at least, of a liberal education; and, above all, they laid down that the most truly practical training, even in an industrial sense, must be grounded in a thorough knowledge of scientific laws.

Founded on these principles, the Institute of Technology began a career of steady development. To-day it is the largest school of its class in the United States, the widest in scope of instruction and in many respects the best equipped. The total number of its students in 1916 was 1,900, the total number of instructors 300. The number of volumes in the library was 100,000. Though 60 per cent of the students come from Massachusetts, among the remainder are found residents of 46 States of the Union, and of 28 foreign countries. In all 48 classes have graduated, aggregating over 6,000 persons. Except in seasons of financial depression, the demand for these graduates is always in excess of the supply.

The undergraduate studies of the school are divided into 15 distinct courses, each of four years' duration, and leading to the degree of bachelor of science. These courses are as follows: Civil engineering, mechanical engineering, mining engineering and metallurgy, electrical engineering, chemical engineering, sanitary engineering, naval architecture and marine engineering, engineering administration, chemistry, electrochemistry, biology and public health, physics, geology, general science and architecture. Between the departments which maintain these several courses there is the closest connection and mutual support. Consequently the instruction is specialized to a degree which would be impossible in a smaller college, with a less numerous staff of instructors. Again, the instructors, though connected in a special sense with one department, are giving instruction, it may be, to students from many others. This mutual helpfulness of the departments is seen first in the fundamental subjects, such as chemistry in the first year and physics in the second, which are given to several courses or to all. It is seen again in the large number of optional lines of work offered. Within most of the regular courses the student is allowed considerable latitude of choice, in the later years of his study, and many thus select that group of studies which is best adapted to the particular branch of his profession for which he is preparing.

For 50 years from its establishment the institute occupied buildings on or near Boylston street in Boston. From the first structure built by President Rogers the number increased to nine, eight of which were devoted to technical instruction. The most interesting aspect of the equipment were the extensive laboratories. Many of them when first instituted represented an attempt to apply the laboratory method in a way up to that time unknown in the history of scientific instruction in this country. The laboratories of physics and of chemistry were the first to offer laboratory instruction in these subjects to students in large classes; and the mining and metallurgical laboratories, the steam laboratory and the laboratory for testing the strength of materials also represent a marked advance over previous methods, either in the subjects taught or in the scale on which the work is done.

Lack of space in which to expand in the congested business and residential section which grew up around it forced the Institute to seek a location adequate to its needs for constantly growing activities. It purchased in 1912 a plot of 50 acres in Cambridge, on the bank of the Charles River Basin facing Boston, and on 14 June 1916 the new Technology was dedicated. Ten acres are devoted to the educational buildings with an available floor space of 730,000 square feet. This easily doubles the area of the old buildings and still leaves room for growth to twice the present size.

The laboratories which were so excellent have been rearranged with greater space and some of them are the most remarkable in the country.

The boiler plant is itself a laboratory, with a capacity of 2,000 horse power, the boilers being of standard type with newest appliances. They are especially adapted to experiment. This powerhouse will care for the heating, lighting and motor force of the great buildings and is built on the lines of a big central station.

Steam is conveyed from the boilers to the steam laboratory in mechanical engineering through a subway seven feet square in section and the supply is carried in 20 and 10-inch pipes. The electrical equipment at the boilers includes three turbines directly connected to generators of 750 kilowatts, 500 kilowatts and 150 kilowatts, respectively, furnishing three phase current at 2,300 volts. In addition there are one 150-kilowatt turbine, two 150-kilowatt motor-generators furnishing direct current at 110 and 220 volts and two 35-kilowatt exciters.

The steam laboratory equipment includes a Curtis turbine of about 75 kilowatts capacity, a 38 horse-power Corliss with dynamometer, a 225 horse-power McEwan tandem compound, a compound and generator of the same make of 250 horse power, and a triple expansion Corliss, especially adapted for experimental purposes.

In the same laboratory there is a Brown engine driving a three-stage compressor which will work up to 2,500 pounds per square inch. There are other compressors and a great many small engines and models of different types.

The hydraulic laboratory is fitted with 700 feet of canals, some of them 40 feet cross section, with reservoirs, weirs, tanks and all kinds of measuring devices. Two pump wells 26 feet deep will serve for the testing of large pumps on a commercial scale. A pump of the capacity of 22,000 gallons a minute lifts water to the second floor above which is discharged through a canal of 25 feet cross section into a penstock for the testing of water wheels. Natural heads up to 35 feet and artificial heads of some hundreds of feet may here be used. The battery of pumps includes a Douglass triplex, a Gould triplex and a Davis triplex, a 150 horse-power turbine with direct connected centrifugal pump, a 100 horse-power Terry turbine, a three-phase Jeansville pump, two duplex pumps each of the capacity of an ordinary steam fire engine, and the great pump which is

driven by an angle compound engine of 325 horse power.

The chemical laboratory is fitted with a central storage for rarer substances, special elevators for quick service within the department, electrical heating devices for the various processes and three systems of ventilation, the regular house system, the hood and a mushroom ventilator applied to every table. The laboratory has its electrical supply independent of the lighting or power systems of the buildings.

The aerodynamical laboratory is equipped with a four-foot blowing tunnel and an aerodynamical balance, a replica of that at Teddington, England. The electrical laboratory is somewhat better than the old Lowell laboratory, but the improvement has been of necessity in details and convenience.

The transmission laboratory is of unusual excellence. The equipment includes a 2,500 nautical mile, artificial cable, corresponding to a regular ocean cable; a 2,500-mile long-distance artificial aerial line corresponding to a long-distance trans-continental telephone line, two artificial power transmission lines of 800 miles and an artificial telephone subterranean line of 35 miles. Besides these items there is a span of power transmission, 150,000-volt capacity. For experiments with this a special laboratory has been built at the foot of one of the towers.

These are some of the new special equipments, but the other laboratories, notably those for testing materials, for industrial chemistry, for biology, etc., find themselves newly placed in improved surroundings with increased facilities and apparatus. The sewage laboratory, being located near one of the great outlets of the principal drainage of the metropolis, will not be moved.

With this unusual laboratory equipment, it has been possible for the Institute to do much of its experimental work on a scale approaching that of industrial operations. The laboratories of mining and metallurgy, for instance, are designed to treat ores in quantities approximating those used in actual practice, and ranging from 500 pounds to 3 tons, and the contributions to the literature of ore-dressing and metallurgy from this laboratory are well known. In the laboratory for testing the strength of materials, again, were conducted the first systematic and extended tests of beams of commercial size.

Throughout all the work of the Institute the aim of instruction is so to adjust the theoretical and experimental work that the acquirement of principles in the classroom shall prepare the student for his laboratory exercises, and that these in turn shall fix methods and results in his memory, and give him capacity for new experimentation. Throughout it is intended to guide the student rather than to instruct him, and, whether in the four-year courses above described or in the graduate courses with which these may be supplemented, he is trained to work with less and less dependence upon his teachers. This training should result in a considerable increase in his powers of ascertaining facts and overcoming difficulties, and so should increase his capacity for research.

MASSACHUSETTS MEDICAL SOCIETY, an association incorporated at Boston, Mass., 1 Nov. 1781, and holding regular sessions from that date to the present. Its charter was signed by John Hancock, first State governor of Massachusetts. Physicians and surgeons, who have made their medical studies in colleges approved by the society and who have been examined by its censors and are of known probity, are eligible to membership. Women were first admitted in 1884. Since 1790 it has regularly issued its 'Medical Communications.' It also issues a 'Pharmacopœia' and 'Publications,' various reports and essays, an annual directory, and, since 1789, a triennial catalogue. The society is a potent force in maintaining a high standard in the medical profession. It has about 3,500 members.

MASSACRE (French, *massacre*, slaughter, probably connected with Latin, *macellum*, a meat-market), the indiscriminate and unnecessary slaughter of human beings, and, in a transferred sense, of animals. In the case of human beings it implies the absence of all forms of law or of sufficient grounds.

MASSACRE OF THE INNOCENTS, the slaughter of the children in and about Bethlehem by the soldiers of Herod, whose superstitious fears caused him to see a rival in the babe of whose birth he was apprised by the wise men (Matthew II, 1–16). The story has been for centuries a favorite subject with artists, especially those of the Flemish and Italian schools. Interise realism is usually injected into the scene and also a wealth of detail. Among the greatest examples are those by Tintoretto in the Scuola di San Rocco, Venice; Reni in the Gallery, of Bologna; Daniele da Volterra in the Uffizi Gallery, Florence; Rubens in the Pinakothek of Munich and Breughel in the Gallery of Vienna.

MASSAGE, a procedure, usually performed by the hands, such as friction, kneading, rolling and percussion of the external tissues of the body, either to relieve pain or to assist a cure, or with some hygienic object in view. A male massagist is known as a masseur, a female as a masseuse. Massage in some crude form has always been used by savages as well as by the civilized. It was mentioned by Homer and Hippocrates, having been one of the luxuries of the ancient Greeks and, among the Romans, was largely used by gladiators, and to make slaves more comely by filling out their tissues. Sometimes it was done by medical practitioners, often by slaves and priests and those appointed to anoint the wrestlers before and after they exercised. Hippocrates says that "rubbing can bind and loosen, can make flesh and cause parts to waste; hard rubbing binds; soft rubbing loosens; much rubbing causes parts to waste; moderate rubbing makes them grow." Manual treatment of the body was long ago practised by the Chinese, and the Japanese, Turks, Egyptians and people of various nationalities have employed it in some form from early times.

Often the use of massage is associated with that of certain active and passive movements known as the Swedish movement-cure (q.v.), established by Pehr Henrik Ling. His system of gymnastics became popular in spite of opposition and of the fact that it was largely a revival of old methods of treat-

ment. In 1873 Mezger, of Amsterdam, and in 1877 S. Weir Mitchell of Philadelphia pushed forward the cause of massage. To-day it is considered by physicians as a branch of medical treatment, useful in certain cases if rightly administered, but capable of doing harm when improperly applied. Unfortunately the laity frequently look upon it as a sole means of relief or cure. Much depends upon the judgment and skill of the masseur, as the special reaction of the individual patient has to be considered and, on the other hand, a skilful operator can accomplish more in a quarter of an hour than an ignorant one can in an hour. The procedures in massage may be placed under four heads: stroking (the *effleurage* of the French), kneading (malaxation), friction and percussion. Stroking is performed over surfaces with the palm of the hand or its radial border, or with the pulps of the fingers, or the sides of the knuckles. Kneading is the grasping of muscles, etc., with both hands or between the thumb and fingers of one hand, and rolling and squeezing them. Friction is a peculiar and forcible circular rubbing. Percussion is the striking or beating of a part, either with the hand or an instrument called a percussor or muscle-beater. A special technique of massaging the face, and particularly the ears and eyes, has had surprisingly gratifying results in preventing deafness and curing certain types of blindness, for instance, where an embolism of a central artery of the retina has been removed by massage. It is claimed that the modern system of massage makes the blood circulate more freely, strengthens muscle-fibres, causes effusions and exudations to be absorbed, improves secretory and excretory action, and invigorates the whole system. It is frequently used with good results to stimulate assimilation and invigorate digestion, to soothe nervous irritability, relieve pain and arouse nerve-force, to equalize the circulation, to remove morbid deposits from around joints, to restore mobility, and for the correction of obstinate constipation and other disordered conditions.

From the point of view of the modern study of unconscious mentality it will be seen that those persons who are the greatest advocates of massage will be the ones who are unconsciously satisfying a desire for stroking, kneading, friction and percussion. Such a method of curing their ills will make an immediate and a strong appeal to their instincts. This presupposes a physical and mental make up, predisposed by early development, to seek and get satisfactions from the skin and muscle sensations derived from manipulation at the hands of another. This mental disposition is in modern times well recognized in psychoanalysis (q.v.), which, however, goes at the treatment in another way. For any diseases which may be helped by massage, there is a cause in the way in which the mind unconsciously regards the pleasures derived from the manipulation of the skin and muscles. If, for instance, the individual is of such a mental constitution that, because of early environment, he has been led to derive more than ordinary pleasure from being stroked, kneaded, rubbed or even beaten (and the history of the development of massage shows that such persons are quite numerous); such an individual will be the more likely to contract diseases of the type which are on record as having been remedied or cured by massage. He will develop those diseases instinctively without knowing the connection between them and the unconscious wish which is the cause of the specific incidence of the symptoms. This practically amounts to saying that the diseases which are enumerated as having been cured by massage are diseases which are virtually selected by the unconscious because of the fact that their treatment will involve the gratification of wishes for just such specific stimulation of the muscular, tendonous and cutaneous end organs. The patient will do well under such a treatment, at least, partly because a source of unconscious gratification closed to him possibly since early childhood has been through massage reopened to him.

MASSAGETÆ, mą-săj'ĕ-tē, in ancient history, a name given to nomadic tribes of northern Asia who dwelt to the east and south of the Caspian Sea. Herodotus says they worshiped and offered horses to the sun, had a community of wives, killed and ate their aged people, lived chiefly on the milk and flesh of their herds and on fish, and fought on foot and on horseback with lance, bow and double-edged axe. They are chiefly mentioned in connection with Persian history. Cyrus the Great perished in war with the Massagetæ, 529 B.C. According to some they belonged to the Mongolian stock, according to others to the Aryan.

MASSASOIT, măs'ą-soit, American Indian chief, sachem of the Wampanoags: b. Massachusetts, 1580; d. 1661. His dominion extended over nearly all the southern part of Massachusetts, from Cape Cod to Narragansett Bay; but his tribe, once estimated at 30,000 in number, had shortly before the landing of the Pilgrims at Plymouth been reduced by a disease, supposed to have been yellow fever, to barely 300. On 22 March 1621, a little more than three months after the founding of Plymouth, he appeared before the infant settlement with 60 of his warriors, armed and painted, for the purpose of forming a friendly league with the white men. Although the tribe were reputed to be cruel and treacherous, the open and friendly greeting of Massasoit so favorably impressed Governor Carver, that after the necessary formalities were concluded, he formed in behalf of the colony a treaty of peace and mutual protection with the Wampanoags, which for 50 years was sacredly kept by both parties. The friendly disposition of Massasoit toward the colonists never relaxed. He lived within the limits of what is now the town of Warren, R. I., near an abundant spring which yet bears his name, where he often entertained wandering pilgrims or administered to their necessities. Roger Williams, while on his way to Providence, was for several weeks his guest at this place. Massasoit was just, humane and honest, never violating his word and constantly endeavoring to imbue his people with a love of peace. In person, Morton says, in his 'Memorial,' he was "a portly man in his best years, grave of countenance, spare of speech." His second son, Pometacom, called by the colonists King Philip, who ultimately became sachem of the Wampanoags, was of a less placable disposition, and allowed the encroachments of the colonists to hurry him into the bloody contest known as King Philip's War. Consult

Baker, Virginia, 'Massasoits' Town Sowams in Pokanoket' (Warren, R. I., 1904).

MASSASSAUGA, măs-ą-sâ'ga, the ground rattlesnake of the central United States. See RATTLESNAKE.

MASSÉNA, André, äṅ-drā mā-sā-nä, marshal of France: b. Leven near Nice, France, 6 May 1758; d. 4 April 1817. In 1775 he entered the French army and after 14 years' service left the army and returned to Nice, where he married. During the Revolution he entered a battalion of volunteers, and in 1793 was made general of brigade. In 1794 he took command of the right wing of the French army in Italy, where, at Rivoli and elsewhere, he highly distinguished himself. In 1799 he defeated the Austrian and Russian forces at Zürich, and in 1800, by his defense of Genoa for three months, gave Bonaparte time to strike successfully at Marengo. In 1804 he was created marshal of the empire. In 1805 he received the chief command in Italy, where after the Peace of Presburg he occupied the kingdom of Naples. In 1807 he was given the command of the right wing of the French army in Poland, and soon after received the title of Duke of Rivoli. In 1809 he distinguished himself against the Austrians, and at Esslingen his constancy and firmness saved the French army from total destruction. Napoleon rewarded him with the dignity of Prince of Esslingen. In 1810 he took command of the army in Portugal, and forced Wellington within the lines of Torres Vedras, till want of provisions compelled Masséna to retire. In 1814 he was made a peer by Louis XVIII, and though on the return of the emperor he acknowledged his authority, took no active part in the events of the Hundred Days. Consult his 'Mémoires,' edited by Koch (7 vols., Paris 1848–50); Fitzmaurice, G., 'Massena' (in *Royal United Service Association Journal*, Vol. LVII, London 1913); Gachat, Edouard, 'Histoire militaire de Masséna' (Paris 1908); Toselli, 'Notice biographique sur Masséna' (Nice 1869).

MASSENA, mā-sē'nạ, N. Y., village, in Saint Lawrence County, on the Grasse River, and on the New York Central and Hudson River and the Grand Trunk railroads, about 35 miles northeast of Ogdensburg. It was settled by people from Vermont, about 1802, and was incorporated as a village in 1886. It is situated in a rich agricultural region, in which the chief products are hay, potatoes, dairy products and apples. Massena Springs, just outside the village limits, is one with the village in commercial and industrial interests, and is a famous resort on account of its medicinal springs. Great opportunities for manufacturing are afforded by the plant of the Saint Lawrence River Power Company, which has a capacity of 40,000 horse power, and which can easily be increased. This power has been secured by diverting a small portion of the waters of the Saint Lawrence River through a canal, three miles long, into turbines, which have direct connection with electric generators, and thence into the Grasse River. The canal starts at the head of the Long Sault rapids in the Saint Lawrence, and is 200 feet wide and 18 feet in depth. Owing to the peculiar formation of the country here, the point at the head of the rapids is 45 feet higher than the point where the canal enters the Grasse River, which is a tributary of the Saint Lawrence. The Grasse acts as a tail race, carrying the water back into the Saint Lawrence. Two bridges span the canal. By using the Grasse River and the canal there is now a passage wholly within the United States for steamers around the unnavigable rapids. The power plant at Massena is second only to Niagara as a centralized power supply station. The chief industrial establishments are reduction works, veneering works, mineral filler works, sash and door works, aluminum factory and dairies. There are several churches, banks, a high school and public schools. Massena is the business centre for a population of 60,000. Pop. 2,951.

MASSENET, Jules Emile Frédéric, zhül ā-mēl frā-dā-rēk mäs-nā', French composer: b. Montaud, France, 12 May 1842; d. Paris, 13 Aug. 1912. He was the youngest of 21 children; his father, a blacksmith, had served in the engineers under Napoleon. After studying at the Paris Conservatoire under Reber, Laurent, Thomas and Savard, he gained the first prize for pianoforte in 1859, the first for fugue, and the Prix de Rome for his cantata, 'David Rizzio,' in 1863. He had done some traveling in Italy and Germany before he made his *début* in Paris at the Opéra Comique in 1868 with 'La Grand-Tante.' He was appointed professor of composition at the Conservatoire in 1878 and made a member of the Académie des Beaux Arts. Among his earlier works are 'Poème du Souvenir' (1860); 'Poème d'Avril' and 'Suite d'Orchestre' (1868). His first important work was the opera, 'Don César de Bazan' (1872), followed in the same year by 'Les Erinnyes' (a tragedy by Leconte de Lisle) and a sacred drama, 'Marie-Madeleine.' An oratorio, 'Eve,' was performed in 1874; the opera, 'Le Roi de Lahore' in 1877; a sacred legend, 'The Virgin' in 1880; 'Herodiade' (an opera) in Brussels, 1881. 'Manon' appeared in 1883; 'Le Cid' in 1885; 'Esclarmonde,' a romantic opera in 1889; also a large number of popular melodies, pianoforte pieces, and a series of seven 'Suites d'Orchestre,' including 'Scènes Pittoresques,' 'Scènes Alsaciennes,' 'Scènes Hongroises,' 'Scènes Napolitaines' and 'Scènes de Féerie,' as well as two cantatas, 'Narcisse' and 'Biblis.' He also wrote some entr'actes and stage music for Sardou's dramas the 'Crocodile' and 'Theodora.' His opera 'Le Mage' (words by Jean Richepin) and a drame lyrique, adapted from Goethe's 'Werther,' were performed in 1891. 'Thaïs' was first produced at the Paris Opera 16 March 1894, the libretto having been adapted from the novel by Anatole France; a short one-act piece, 'Le Portrait de Manon,' was performed at the Opéra Comique in the same year, and in 1895 he wrote the music for Jules Claretie's 'La Navarraise.' Of his latest works, the opera 'Don Quichotte' was produced in London in May 1912, and his last opera, 'Panurge,' was completed just before his death. His music, always melodious, has been described by critics as being excessively "sugary."

MASSEY, mąs'ī, **Gerald**, English poet: b. Gamble Wharf, near Tring, Hertfordshire, 29 May 1828; d. 29 Oct. 1907. He received but little education, and at eight was employed in a silk factory. Going to London about 1843, he

became an errand boy, and in 1849 editor of *The Spirit of Freedom,* a Radical paper, becoming at the same time associated with Kingsley, Maurice and other Christian Socialists. In 1854 he published 'Ballad of Babe Christabel,' and other poems. The volume attracted the notice of Landor, and the poems issued in succession to it met with no little popularity. Other books of his are 'The Secrêt Drama of Shakspere's Sonnets' (1864–72); 'Havelock's March, and Other Poems' (1861); 'A Tale of Eternity and other Poems' (1869); 'Concerning Spiritualism' (1872); 'A Book of the Beginnings' (1882); 'The Natural Genesis' (1883); 'My Lyrical Life,' a collection of poems (1889). For some years he lectured at home and in the United States and Australia on spiritualism and various social and socialistic subjects.

MASSEY, Hart Almerni, Canadian inventor: b. Haldimand, Northumberland County, Ontario, 1823; d. 1897. He received his education at Watertown, N. Y., and Victoria College, Cobourg, Ontario. He assisted in managing his father's farms and while thus engaged set about improving the agricultural implements then in use. His father established a factory at Newcastle of which Hart became sole owner in 1855. He perfected mowing and reaping machines, the first of their kind in Canada, and introduced improvements in many other farm implements. In 1879 the factory was removed to Toronto. Massey received awards at Paris in 1878, Philadelphia 1876 and at Antwerp in 1885. He was also a noted philanthropist.

MASSICOT. A mineral consisting of monoxide of lead, PbO, containing about 92.8 per cent of that metal and an ore in many mines in Colorado and Idaho.

MASSILLON, Jean Baptiste, zhŏn ba-têst ma-sē-yôn, French preacher: b. Hyères, Provence, 24 June 1663; d. Clermont, 18 Sept. 1742. In 1681 he entered the Congregation of the Oratory; then taught theology at Montbrison and Vienne; went to Paris in 1696 as director of the Seminary of Saint Magloire, and won great favor, even at court, by his eloquent and searching sermons. His funeral orations are particularly famous. In 1718 he was appointed preacher to Louis XV, then only nine years old, and for him composed the 'Petite Carême,' a notable series of sermons. Massillon was elected to the French Academy in 1719; in the same year he retired from Paris to Clermont, where he died of apoplexy. His works were edited in 1828 by Guillon and in 1886 by Blampiguan, whose biographical sketch, 'Massillon d'après des Documents inédits' (Paris 1879), should be consulted. Consult also de Julleville, Louis Petit, 'Histoire de la langue et de la littérature française' (Paris 1898).

MASSILLON, măs'il-ŏn, Ohio, city, in Stark County, on the Tuscarawas River, the Ohio Canal, and on the Wheeling and Lake Erie, the Pennsylvania and the Baltimore and Ohio railroads, about 100 miles in direct line northeast of Columbus and eight miles west of Canton. Massillon was established in 1825, and in 1853 was incorporated as a village; the city charter was granted in 1868. It is situated in the Tuscarawas Valley, noted for its large bituminous coal fields and for its excellent farm lands. In the vicinity of the city are quarries of white sandstone. Some of the industrial establishments are foundries, rolling-mills, machine-shops, bridge works, potteries, fire brick, enameled ware, paper, glass-works, steel tubing, furnaces, flour-mills and creameries. In addition to the manufactures of the city there is a large trade in coal, sand-stone, grain and livestock. The State Hospital and Asylum for the Insane is in Massillon. The city has a number of fine buildings; chief among them are the churches and schools. The government is administered under the charter of 1868, its first charter, and is vested in a mayor, who holds office two years, and a council. The board of education is chosen by popular vote; the boards of health and equalization are elected by the council. Other administrative officials are appointed by the board subject to the approval of the council. Pop. 14,912.

MASSINGBERD, Francis Charles, English clergyman: b. Lincolnshire, 1800; d. 1872. He received his education at Rugby and at Oxford; took orders, and was appointed rector of South Ormsby in 1825. In 1847 he became prebendary of Lincoln Cathedral, and was made chancellor in 1862. He published 'Reasons for a Session of Convocation' (1833); 'Church Reform' (1837); 'The Educational and Missionary Work of the Church in the Eighteenth Century' (1857); 'History of the Leaders of the English Reformation' (4th ed., 1866); 'The Law of the Church and the Law of the State' (1859); 'Lectures on the Prayer-Book' (1864); 'Sermons on Unity, with an Essay on Religious Societies' (1868).

MASSINGER, măs'in-jėr, **Philip,** English dramatist: b. Salisbury, November 1583; d. Southwark, London, March 1640. He studied at Saint Alban Hall, Oxford, went to London in 1606, and soon became a well-known playwright. He collaborated with Nathaniel Field, Thomas Dekker, Cyril Tourneur and Robert Daborne, and regularly with Fletcher in 1613–25. Independently, he wrote 15 plays, including comedies, tragedies and tragi-comedies. They are frequently based closely on Italian and Spanish originals, but show much skilfulness in the development of plot, and a knowledge of the requirements imposed by stage presentation. 'Henry VIII' in its present form was probably written by him with Fletcher. Among the plays wholly by him are 'The Bondman' (1624); 'The Roman Actor' (1629); 'A New Way to Pay Old Debts' (1632); 'The Guardian' (1655). 'A New Way to Pay Old Debts' kept the stage in England to the end of the 19th century. There is an edition of his plays by Cunningham (1867); and of 'Selections' by Symon (1887–89). (See NEW WAY TO PAY OLD DEBTS). Consult Coleridge, Hartley, 'Dramatic Works of Massinger and Ford' (rev. ed., 1883); Symons, A. (ed.), 'Selected Plays' (London 1887–89); 'Transactions of the New Shakespeare Society' (ib. 1880–86); Fleay, 'Biographical History of the English Drama' (London 1891); 'Cambridge History of English Literature' (Vol. VI, Cambridge 1910); Ward, A. W., 'History of English Dramatic Literature to the Death of Queen Anne' (New York 1899).

MASSON, măs'on, **David,** Scottish critic: b. Aberdeen, 2 Dec. 1822; d. Edinburgh, 7 Oct.

1907. He was educated at Marischal College and Edinburgh University; in 1852 was appointed to succeed Clough in the chair of English language and literature at University College, London. He was editor of *Macmillan's Magazine* 1859–68, and was professor of rhetoric and English literature in the University of Edinburgh 1865–95. He is best known for his elaborate and comprehensive study of Milton's life and times (3 vols., 1858–80) — a work valuable alike as a contribution to English history and to the history of English literature. Other works by him are 'British Novelists and their Styles' (1859); 'Recent British Philosophy' (1865); 'Drummond of Hawthornden' (1873); 'The Three Devils — Luther's, Milton's and Goethe's' (1874). He also published the Cambridge edition of Milton's Poems with introductions, notes, and an essay on Milton's English (3 vols., 1877); the Golden Treasury edition (2 vols., 1874); the Cabinet edition (1890) and the Globe edition (1871); 'De Quincey' in 'English Men of Letters' series (1878); an edition of De Quincey's works (14 vols., 1889–91), and 'Edinburgh Sketches and Memories' (1892). In 1893 he was appointed Historiographer-Royal for Scotland. He also wrote 'Carlyle Personally and in his Writings' (1885); 'Edinburgh Sketches and Memories' (1892).

MASSON, Frédéric, frā-dā-rēk mā-sôn, French historian: b. Asnières, 1847. He was librarian in the archives of the Foreign Office, and after the overthrow of the empire became secretary to Prince Napoleon, and was entrusted with the arrangement of the Prince's papers and collections. He is known as the author of nearly 20 volumes in a still incomplete series of works on Napoleon I. His method is anecdotic, and he has based his statements on original documents,— correspondence, account- and note-books, and the like, many of which he himself owns in his large collection of Napoleonic material. Among the titles of his studies are 'La Révolte de Toulon en prairial an III' (1875); 'L'Impératrice' (1877); 'Le Marquis de Grignan' (1881; 3d ed., 1908): 'Les diplomates de la Révolution' (1884); 'Napoléon et les femmes' (21st ed., 1897); 'Napoléon chez lui' (1894); 'Les cavaliers de Napoléon'; 'Napoléon inconnu' (1895); 'Marie Walewska' (1897); 'Joséphine de Beauharnais, 1763–96' (1899); 'Joséphine, impératrice et reine' (1898); 'Joséphine répudiée 1809–14' (1901); 'L'Impératrice Marie-Louise' (1902); 'Napoléon et son fils' (1904); 'Napoléon et sa famille' (9 vols., 1897–1907); 'Le sacre et le couronnement de Napoléon'; 'Autour de Sainte-Hélène' (1908); 'Sur Napoléon' (1909); 'Napoléon à Sainte-Hélène, 1815–21' (1912); 'L'Académie-Française, 1629–1793' (1912); 'Pour l'Empéreur' (1913). In 1903 he was elected to the Académie Française to succeed Gaston Paris.

MASSON, Louis François Rodrigue, Canadian statesman: b. Terrebonne, Quebec, 1833; d. 1903. He received his education at the College of Saint Hyacinthe, province of Quebec, and at Georgetown College, District of Columbia. He was admitted to practise law in 1859. In 1867 Mr. Masson was elected to Parliament as a Conservative member from Terrebonne and continued to hold his seat until 1882. He served as Minister of Militia and Defense in 1878–80; became president of the council in the latter year; and in 1884–87 served as lieutenant-governor of Quebec province. He was called to the Senate in 1882 and a second time in 1892. He published 'Le bourgeois de la compagnie du Nord-Ouest' (1889).

MASSON, Thomas Lansing, (Tom Masson), American editor: b. Essex, Conn., 21 July 1866. He received his education in the New Haven public schools; entered journalism in New York and since 1893 has been literary and managing editor of *Life*. He published 'Yankee Navy' (1899); 'A Corner in Women' (1905); 'The Von Blumers' (1906); 'A Bachelor's Baby and Some Grown-Ups' (1907); 'Best Stories in the World' (1914). He edited 'Humorous Masterpieces of American Literature' (1904); 'In Merry Measure' (1905); 'Humor of Love in Verse and Prose' (1907).

MASSOWAH, mās-sow'ā, or **MASSAWA,** northeast Africa, a seaport and the principal town of the Italian colony of Eritrea, on a small coral island in the Red Sea, at the northern end of Arkeeko Bay, connected with the mainland by a causeway. The town is built of stone, is defended by several forts, and is supplied with water from the neighboring M'Kulu heights. The town is hot and unhealthful, but the M'Kulu hills have a much better climate. A railway 17 miles long connects with Saati inland and continues to Asmara, the capital 60 miles further inland. The chief imports are grain and flour, cotton manufactures, glass-wares, arms, cutlery, spices, wines and spirits; principal exports, rhinoceros-horns, gold, ivory, honey, pearls, gums, ostrich feathers, skins and wax, brought by caravans from the interior. In normal years the total commerce is valued at about $3,750,000. Formerly dependent on Egypt, the town and strip of coast were ceded to Italy in 1885. Pop. about 2,275, including 524 Europeans and about 500 Asiatics.

MASSYS, mās-sīs'. See Matsys, Quentin.

MASTABA, an Arabic word meaning bench, applied by Egyptologists to certain Egyptian tombs which were common under the Memphite dynasties. Remains of hundreds of these tombs still exist. They are in size from 18 by 26 feet to 85 by 172 feet. They are oblong, bench-like structures, with flat roofs of stone slabs. Consult 'Bulletin of the Metropolitan Museum of Art' (Vol. VIII, New York 1913); Erman, Adolph, 'Life in Ancient Egypt' (New York 1894) and Mariette, A. E., 'Les mastabas de l'ancien empire' (Paris 1881–87).

MASTER OF ARTS (M.A. or A.M., *artium magister*), an academical honor conferred by universities of the United States, Great Britain and other countries, upon students after a course of study and a previous examination in the chief branches of a liberal education, particularly philosophy, philology, mathematics, physics and history. The word *magister*, connected with a qualifying phrase, was used among the Romans as a title of honor; but its present meaning must be traced to the time of the establishment of the oldest universities. Regularly organized faculties were not then known as they now exist in the universities. The whole circle of academic activity

was limited to the seven liberal arts (see ART); and they who received public honors on the completion of their course of studies, for their diligence and knowledge, and had already received the degree of *baccalaureus* (bachelor), were called *magistri artium* (masters of the liberal arts). In American and English universities this degree follows that of bachelor. The degree of master of arts is inferior to that of doctor of letters (D.Litt.). In the German universities the title was formerly conferred, but has been superseded by that of doctor of philosophy (Ph.D.), which practically corresponds to the degree of M.A. in other universities. This title is an indispensable preliminary to the attainment of the position of *docent* in the German universities, that is, one who has obtained the right to deliver academical lectures. See CADEMIC DEGREES; COSTUME, ACADEMIC; UNIVERSITY.

MASTER OF BALLANTRAE, băl-ăn-trā, **The,** a novel by Robert Louis Stevenson, published in 1889. It is a Scottish romance of the 18th century, beginning with the Stuart uprising of 1745. It is a sombre tragedy of the enmity of two brothers, of whom the elder, James Durrie the Master, takes the side of the Stuarts, the younger, Henry, that of King George.

MASTER BUILDER, The. The tendency toward symbolism, to be observed in the early romantic works of Ibsen, and occasionally in his dramas of social awakening, becomes dominant in 'The Master Builder' ('Bygmester Solness'), published in 1892 and played the next season. Already in 'The Wild Duck' and 'The Lady from the Sea,' Ibsen had mingled symbolism with naturalism; but only in 'The Master Builder' does the hidden allegory threaten to warp his surface story out of consistency. The piece, which begins with matter-of-fact scenes and situations from middle-class life, ere long develops into a tenuous fable that suggests much more than it presents.

As a drama of ideas 'The Master Builder' emphasizes two notions: the peril of selfish individualism, already shown in 'Rosmersholm' and 'Hedda Gabler'; and the struggle of age against youth. Ibsen, conscious of his advancing years, felt the inevitable passing of power from the older to the younger generation. He felt, also, not only the fear of youth, but its fascination, especially in his innocent affair with Emilie Bardach, a girl of 18 whom he, at the age of 61, had met in the Tyrol during the summer of 1889, and with whom he later corresponded. He has universalized these merely personal sentiments, setting forth the problem of every man who lives long enough to regret what is gone and to strive desperately to hold what is slipping from him. This particular conflict Ibsen associates with the still larger conflict between individualism and altruism.

Solness, the master builder, has achieved success at the expense of his wife and his business associates. He has checked the rise of old Knut Brovik, and refused to young Ragnar Brovik permission to build independently. He has employed the latter's sweetheart and captured her affections only as a ruse by which to retain Ragnar's services. Obsessed, as he admits, with dread of the younger generation, yet thinking himself at last secure from it, he succumbs when the younger generation knocks at his door in the person of Hilda Wangel. Hilda, who had already appeared in a minor rôle in 'The Lady from the Sea,' is a strange and wilful maiden who induces Solness to relax his selfish schemes, and, at the same time, to attempt to mount, as he once was wont, to the top of a lofty tower. He can no longer safely climb to such heights, and yet, inspired by Hilda's faith, he makes the attempt, only to fall. Though he forfeits life, Hilda professes satisfaction, inasmuch as, when he stood at the dizzy summit, she has heard 'harps in the air.' Hilda is the puzzle of the play, an influence for both good and evil, a symbol of youthful aspiration, or perhaps of youth as the enemy of age and of woman as the enemy of man. The charm of the drama lies in its tantalizing hints of concealed significances; its defect lies in its lack of proper correspondence between the human action and the allegory. Much in the later portions of the work is scarcely intelligible as a natural representation of life. 'The Master Builder' has been translated by Edmund Gosse and William Archer (1893). It is discussed in the monographs on Ibsen by Otto Heller (1912), Jennette B. Lee (1907), M. J. Moses (1908), and Henry Rose (1908), and, by P. H. Grummann, in 'Nebraska University Studies' (1910).

FRANK W. CHANDLER.

MASTER OF THE HORSE, an official having charge of the horses, hounds, etc., of a sovereign, as of England. He is there a member of the ministry and the third dignitary of the court. The office is appointive, and he has the use of the royal horses and servants. The office exists to-day in Germany and formerly also in France.

MASTER OF THE ROLLS, a member of the Supreme Court of Judicature in England, who presides with the lords justices in the Court of Appeals, and ranks next to the Lord Chief Justice. He is the keeper of all records of the Court of Chancery and of the rolls of all grants and patents that pass under the Great Seal. By the Supreme Court of Judicature Act of 1873, he was denied the privilege he formerly had of a seat in the House of Commons.

MASTER AND SERVANT. See FAMILY LAW.

MASTER SINGERS. See MEISTERSINGERS.

MASTERS, Edgar Lee, American lawyer and writer: b. Garnett, Kan., 23 Aug. 1868. He studied at Knox College, Illinois, and was admitted to the bar in 1891. His publications include 'A Book of Verses' (1898); 'Maximilian,' a drama in blank verse (1902); 'The New Star Chamber and Other Essays' (1904); 'Blood of the Prophets' (1905); 'Althea,' a play (1907); 'The Trifler,' a play (1908); 'The Spoon River Anthology' (1915); 'The Great Valley' (1916). Mr. Masters writes his poems both in vers libre and in rhymed verse. His 'Spoon River Anthology' is the best known of his works. It is a unique collection of truthful epitaphs on the inhabitants of a middle Western village. It is marked by a biting vigorous satirical style, and is pervaded by a materialism

that shocks and surprises. Despite its obvious limitations, its naïve force has won many readers and much favorable comment. Consult Lowell, Amy, 'Tendencies in Modern American Poetry' (New York 1917).

MASTERWORT, the rustic name of several umbelliferous plants, as those of the genus *Anethum* (see DILL), formerly much cultivated as pot-herbs, and held in great repute as a stomachic, sudorific, diuretic, etc.

MASTIC GUM, or **MASTICHE,** a resinous substance flowing from deep incisions made in the branches of the *Pistachia lentiscus,* a shrub of the terebinth family growing in the countries bordering on the eastern Mediterranean. This tree attains the height of 15 or 20 feet; the leaves are alternate and pinnate; the flowers are small, inconspicuous, disposed in axillary racemes, and are succeeded by an ovoid drupe containing an osseous nut. It forms one of the most important products of Scio, and other Ægean islands, where it has been cultivated from remote antiquity. Heat seems to exercise a great influence on the resinous product. Mastic is consumed as a chewing-gum in vast quantities throughout the Turkish Empire by women of all classes, for the purpose of cleansing the teeth and imparting an agreeable odor to the breath. It is related to myrrh, frankincense, etc., and was formely in repute as a medicine throughout Europe, but at the present time is chiefly useful in the arts as a varnish for maps, drawings, etc. Dentists employ it as a filler for cavities.

MASTICATION, or CHEWING, the thorough subdivision of food in the mouth so that it can be readily acted upon by the gastric juice and other digestive secretions. The tongue, cheeks and lips push the food material between the teeth, and by the lateral and up-and-down motions of the lower jaw it is cut and torn by the incisor, canine and bicuspid teeth and bruised by the molar or grinding teeth. During these actions the food is softened by the saliva (insalivation), which exudes abundantly from the salivary glands by the act of mastication. Typical mastication is seen only in the higher vertebra. "The amphibian bolts its fly, the bird its grain, and the fish its brother without the ceremony of chewing," but in man and the higher animals mastication is necessary for complete and comfortable digestion. Thorough comminution of food by mastication is analogous to the pulverizing process employed by the chemist, but associated with mastication is insalivation, as it is almost impossible to swallow substances which are very dry. Imperfect mastication of food, either by reason of rapid swallowing (bolting), or because of the absence of sound and serviceable teeth, is very frequently the cause of the numerous ailments classified under the term indigestion. Exaggerated mastication which has been so highly recommended by certain persons as almost to constitute a panacea or complete prophylaxis is known to lessen the secretion of gastric juices which is started by sensations of taste, to protract beyond desirable limits the time required for proper gastric digestion, to develop the salivary deposit in a proportion relatively too great when compared with the secretion of the pancreas. It is moreover known that the teeth are likely to wear out too soon, if mastication is carried beyond a reasonable time.

Exaggerated mastication and the fancied advantages accruing from it are an illustration of an indulgence in a form of securing the gratification of an unconscious desire. In infancy a great pleasure is derived merely from mouthing different objects, a pleasure originating in the mode of absorbing the early meals at the mother's breast. It has been discovered by studying the unconscious wishes of mankind that the sexual desire in the adult is a synthesis of different partial desires which in the infant are satisfied in different parts of the body, now here, now there, but which in the adult are assembled in the genital organs or are at least unified under the supremacy of the genitals. But it has been definitely proven that in some individuals this synthesis has never been successfully accomplished. Either the mouth pleasure zones or the anal or the skin or some other zone which gave in infancy a quite absorbing sense of gratification has failed of appropriate subordination, and has persisted into adult life, with some individuals, as a source of extraordinary pleasure. To this class of partially undeveloped minds belong not only the advocates of exaggerated mastication but all other persons who develop any other form of activity as a fad such that they are noticeably peculiar in that respect.

MASTIFF, a breed of dogs of great size, recognized by the large head, the dependent lips, the broad, hanging ears, and by the general muscularity of the form. The mastiff in general disposition is affectionate and gentle, extremely faithful and vigilant. In Rome and in classical ages these dogs were held in high estimation for their strength and courage. The most valued breeds were obtained from Great Britain, where these dogs originated, and were used to guard flocks and herds; and watching has become instinctive with them. Roman officers were appointed to breed them and to transmit them periodically to Rome, where they fought lions, etc., in the arenas of the Roman amphitheatres and were otherwise favorites. The dog now is highly valued, both as a watch-dog, and as a domestic companion. Fawn is the prevalent color, and the weight should be about 165 pounds.

MASTIGOPHORA, a class of Protozoa "in which the flagellate form is prominent although the amœboid and encysted conditions frequently occur." Typical forms are contained in the order *Flagellata* (q.v.).

MASTODON, a genius of fossil proboscidians of the elephant family, whose remains are found in all parts of the world in Tertiary formations from Miocene time onward to the dawn of the present era. Although in size and external appearance the larger mastodons much resembled modern elephants, save that, like the mammoths, the northern species were probably clothed with long hair, they differed widely from other genera of the family in details of structure, especially those affecting dentition. Thus milk-molars were present, and sometimes were persistent; and in their structure the fossil molar teeth are not penetrated by deep partitions of cement, and their crowns are marked by few (3 to 5) transverse ridges,

which are often broken into nipple-like protuberances. This is, in short, the simplest form of tooth-structure in the family, of which the mastodons are the oldest and most primitive type, and nearest to the earlier Dinotheria. The tusks curved upward only slightly; and their length in *Mastodon americanus,* whose remains have been obtained nearly entire from bog-deposits in various parts of the United States, was about nine feet, indicating, as do the measurements of the skeleton, an animal about equal in average height to the modern Indian elephant, but with a rather more bulky body and a flatter forehead. Of this species, which was a belated survival of an ancient Old World type that became extinct in the Pliocene, several good skeletons are preserved in the museums of the United States and Canada, and certain European species are also well known. About 30 different kinds of mastodons have been described from bones found in almost every country in the world. In the Pliocene works of Texas, Nebraska and Idaho are found remains of a proboscidian (*Stegodon*) which was a connecting link between the mastodons and the elephants. What brought this widespread group to an end is not clear. There was no diminution in their food, which consisted of herbage, bark and leaves, as is known from undigested stomach-contents found within the skeletons; and they survived the historic vicissitudes of climates until subsequently the present settled conditions arrived. There is good reason to believe that they lasted in America, at least, until after the advent of mankind, but indisputable evidence of this is lacking. See ELEPHANTS; FOSSIL.

Consult Woodward, 'Vertebrate Palæontology' (1898); Lucas, 'Animals before Man in North America' (1902); Scott, 'Land Mammals of the Western Hemisphere' (New York 1913).

MASTODONSAURUS, a fossil labyrinthodont batrachian found in the Triassic formations of England, Württemberg and India. It is the largest type known, the head having a length of four feet with a body extending to a length of 10 feet.

MASTURBATION. The limited, restricted dictionary definition is self-abuse, that is, genital manipulation by the hands, clothing, bed clothes, by riding, by hard objects and by pressure of things against the genitals, etc. Regarded in its broader aspect of an autoerotic reaction to external reality it covers a multitude of activities not ordinarily realized as masturbatory in nature and is one of the most important topics in the whole realm of psychopathology. Thus broadly defined it is any erogenous satisfaction through any and all modes of gratification carried on for their own pleasure and includes both somatic and psychic masturbation. Not regarded in antiquity as of very vital importance it was brought into prominence and called deleterious principally by Tissot, who wrote early in the 19th century, and is the sponsor of all the lurid literature which has spread over two continents since his time. He taught that masturbation was a very serious weakness and that it led to various forms of illness and insanity, statements for which modern medical science can find no satisfactory proofs. The most modern attitude toward masturbation is that the deleterious effects so often observed in those who practise it come not from any injury to the body but from the guilty feelings of those who abuse themselves and from the tendency it has to remove them from the true relations with their fellows. That is, when the individual satisfies his fantasy sense of potency by any form of masturbation, the personality will regress to more and more infantile levels and the discrepancy between the social value of the autoerotic behavior and the true adult behavior which is called for by the environment will result in some form of mental or bodily illness. The fate of Sodom and Gomorrah revealed its dangers, and the Greeks gave it a poetical conception in the myth of Narcissus (see NARCISSISM), the youth who fell in love with his image in a pool, a story which represents external reality reduced by autoerotism to a mere reflection of self. Thus the forms of physical activity which may be regarded as essentially masturbatory in character are very numerous.

Any act which satisfies the unconscious desires through producing an effect upon the body instead of on the world of external reality is of this nature. And the body has various zones other than the genital in which this self-gratification is practised unconsciously through multifarious forms of activity, the most prominent being the mouth, the intestines and different parts of the skin. The infant naturally puts everything into its mouth, and this habit is continued into adult life by persons who put things into their mouths for other reasons than merely masticating them and swallowing them as food. In fact all objects, not food, that are mouthed serve this purpose, including tobacco, chewing gum, toothpicks, etc., and therefore are subject to the same reproach as any other use of any part of the body through which no change, having a social value, is effected upon external reality. The skin as well as the muscles are used as sources of self-gratification, too, in massage; and such acts as stroking the skin, running fingers through the hair, scratching, tickling, etc., are other examples.

Constipation of the spastic type is the most common form of unconscious masturbation of the anal-erotic zone. Bodily masturbation, conscious as well as unconscious, is paralleled by a form of thinking that may be called mental masturbation, in which the individual, male or female, has acquired the habit, whether or not from practising physical masturbation, of seeking pleasure from his own states of mind. Excessive day-dreaming, reading of light literature and attendance on light drama or moving picture shows, aimless driving about in automobiles and most other forms of solitary or unproductive mental activity may be classed as types of mental masturbation, and when carried beyond a certain degree generally result in a species of mental impotence, in which the individual is unable to carry out any activity to a productive conclusion. The treatment of both mental and physical masturbation is mental. The patient is to be shown through self-analysis just what he is doing, both in its physical and psychical aspects, and that his action is essentially infantile, representing an arrest of development at a very early level, which thus never permits him to act the true adult part in

lite. Various wholesome and truly social activities should be encouraged, and the patient instructed how to enlist his entire libido (q.v.) in them, and the desire for solitary pleasure will gradually disappear.

SMITH ELY JELLIFFE.

MASUDI (Abu-l Hasan 'Ali ibn Husain ibn 'Ali ul-Mas'udi), Arabic geographer and historian: b. Bagdad, near the close of the 9th century; d. Fostat, about 956 A.D. Receiving a good education he set out to study the history, manner of life, customs, etc., of every land at first hand. This quest took him to Persia and Kerman, in 915 to Istakhr, to Multan and Mansura in 916. From there he journeyed to Cambay, Saimur and Ceylon, to Madagascar and back via Oman. He also visited the shores of the Caspian; journeyed to Tiberias in Palestine. He visited Antioch in 943 and Damascus in 945. The last decade of his life was spent in Egypt and Syria. Of the Mo'tazilite sect, he was free from bigotry, studied Christianity and Judaism and was well versed in the history of the principal nations of both Orient and Occident. He wrote a universal history in 30 volumes, entitled 'Kitab akhbar uz-Zaman,' followed by a supplement in 'Kitab ul-Ausat,' a chronology of general history. The two works were combined by the author in 'Muruj udh-Dhahab wa ma'adin ul-Jawahir' ('Meadows of Gold and Mines of Precious Stones') in 947. Editions have been published at Bulak (1866) and at Cairo (1886). The original with French translation by C. B. de Maynard and P. de Courteille has appeared (9 vols., Paris 1861–77; Vol. I, in English by A. Sprenger, London 1841). An enlarged edition of this work finished by Masudi in 956 appears to be now lost. Another work, written in 956, is 'Kitab ut-Tanbih wal Ishraf' ('Book of Indication and Revision') is a summary with corrections of his other writings. It was edited by M. J. de Goeje (Leyden 1894) and there is a French translation by Carra de Vaux (Paris 1896) and a partial translation in De Saaj's memoir to Meynard's edition of 'Muruj.' Consult Brockelmann, Karl, 'Geschichte der arabischen Literatur' (Vol. I, Weimar 1899); Field, C., 'Tales of the Caliphs' (1909); Nicholson, R. A., 'Literary History of the Arabs' (Cambridge 1907).

MASULIPATAM, or **BANDAR,** British India, capital of the district of Kistna, Madras, situated at the mouth of the Kistna, on the Bay of Bengal. It was the earliest English settlement on the Coromandel coast, an agency being established there in 1611. Subsequently the town was held for some years by the French; it was taken by storm by Forde in 1759. A storm-wave inundated the town in 1864, and about 30,000 lives were lost. Weaving, bleaching and cloth printing are the principal industries, but do not enjoy their former importance. Noble College is the chief educational institution. The port is merely a roadstead in which vessels anchor five miles off shore. Masulipatam is reached by a branch of the Southern Mahratta Railway from Bezwada. Pop. 42,100.

MASURENLAND, East Prussia, a lake-dotted district around Lyck, Lötzen, Sensburg, Ortelsburg, Neidenburg, Oletzka, Osterode, Rössel and Allanstein. It is marked by rolling hills, divided by hundreds of lakes, many of which are joined together by long narrow channels. Mauer and Spirding are the most important and largest of these bodies of water. A few years ago the imperial government entered into negotiations with a company which proposed to drain the greater part of the Masuren region and sell the reclaimed land to settlers. Negotiations were proceeding apace when von Hindenburg heard of the project. For many years he had studied the region and was convinced that the lakes and surrounding marshes were the equivalent of several army corps in defending Germany against an invasion by Russia. He opposed the drainage scheme, went to Berlin, interviewed the emperor and as a result the project was abandoned. The view of Hindenburg was vindicated in 1914–15 after the battle of Tannenberg, when the aged general partly encircled the Russians with the lakes in their rear. Whole regiments were lost in the quagmires, and great quantities of stores fell to the Germans. See WAR, EUROPEAN — EASTERN FRONT.

MA'T, the Egyptian goddess of justice and truth. She was usually represented as wearing an ostrich feather on her head, with eyes bandaged as a sign of her impartiality. Judges and kings were at all periods her professed worshippers. The father of the goddess was Rê, the sun god. Her Greek compeer was Themis. Consult Budge, A. E. T. W., 'The Gods of the Egyptians' (Vol. I, London 1904) and Wiedemann, Alfred, 'Religion of the Ancient Egyptians' (New York 1897).

MATABELELAND, mă-tă-bē'lē-länd, South Africa, the southeastern district of Rhodesia (q.v.) between the Limpopo and Zambesi, north of the Transvaal. In 1889 it came under the administration of the British South Africa Company, against whom the natives unsuccessfully rebelled in 1893 and 1896. The Matabeli are a war-like Kaffir race, who migrated from Natal in 1827 under their chief, Umsilikatse. The country is traversed by ranges of hills,—the Matoppo Hills being the chief—is watered by numerous streams, has good pasture and is believed to be rich in gold. It is now being rapidly settled and developed. Buluwayo is the capital. Other towns are Girelo and Selukwe. There are 11,000 whites and 249,000 natives. The Cape to Cairo Railroad passes through Buluwayo, which is 1,360 miles distant from Cape Town. Consult Baden-Powell, 'The Matabele Campaign' (2d ed., London 1901); Montague, 'Interior of Central Africa' (ib. 1886); Norris, 'Matabeleland' (ib. 1895); Oates, Frank, 'Matabele Land and the Victoria Falls' (ib. 1881); Wills and Collingridge, 'The Downfall of Lobengula' (ib. 1894).

MATACHIN, măt ą chēn', or **MATACHINE,** "the dance of fools," a former well-known comic dance performed by maskers in mock-military guise. It was common in France and Italy. The dance itself was merely a display of tumbling or acrobatic feats.

MATACO, a South American Indian stock, including several tribes, whose habitat is in the Vermejo River Valley in the Gran Chaco, in northern Argentina. They are of medium size with wavy hair and subsist by hunting, fishing and cattle-raising. Their dress is made

of skins and they dwell in huts of brush. Consult 'Anales de la Sociedad Científica Argentina' (Buenos Aires 1904); Brinton, D. G., 'Linguistic Cartography of the Chaco Region' (Philadelphia 1898); Schuller, 'Sobre el orígen de los charruás' (Santiago 1906).

MATADOR, in Spanish bullfights the man appointed to administer the fatal stroke to the bull. See BULL-FIGHT.

MATAGALPA, mä-tä-gäl'pä, Nicaragua, town, capital of the department of Matagalpa, north of the central part of Nicaragua. It is situated in a fertile agricultural region, in which the chief products are tobacco, coffee and sugar. The lack of railroads has been a hindrance to the growth of the town, but plans are formed for connecting it with the Pacific and with Managua, the capital, and other cities. The inhabitants are mostly Indians. Pop. about 15,000.

MATAMATA, a large fresh-water turtle (*Chelys fimbriata*) of the Amazon and Orinoco valleys, which has a flat, weak, but heavily embossed shell, and lies in concealment among the weeds. Its neck is very long, the head is small, the nose is extended into a flat tubular proboscis and the jaws are so weak and soft that it is evident nothing can be forcibly seized with them. Hence it is believed that the frogs, small fishes and the like, upon which this turtle feeds, are sucked into the throat rather than bitten. To facilitate its concealment against both enemies and expected prey, the head and neck of this remarkable creature are covered with an outgrowth of fleshy fringes, which float about in the water, like tangled weeds, hiding its identity most effectively. Consult Gadow, Hans, 'Amphibia and Reptiles' (London 1901).

MATAMOROS, Mariano, mä-rē-ä'nō mä-tä-mō'rōs, Mexican patriot: b. Mexico, about 1770; d. Valladolid, 3 Feb. 1814. He first appears in 1810 as substitute priest of the parish in Jantelolco, a village south of Mexico City. In 1811 he identified himself with the revolt of Hidalgo (q.v.), and became the principal commander under Morelos (q.v.). He attained the rank of lieutenant-general on 19 April 1813. On 14 Oct. 1813 he gained the victory of San Agustin del Palmar, and on 5 Jan. 1814 was captured at the defeat of Puruarán. He was executed in Valladolid market-place. The town of Matamoros, on the United States frontier, was named in memory of this sterling patriot.

MATAMOROS, Mexico, a frontier town and river port opposite Brownsville, Tex., in Tamaulipas, on the right bank of the Rio Grande del Norte, about 30 miles above its mouth in the Gulf of Mexico. It consists chiefly of brick houses; around the public square stand the church, town-house, custom-house and a number of elegant private dwellings. A considerable trade is carried on with the United States; horses, hides, wool, cotton-seeds, etc., are exported, and manufactured goods imported. In normal years its commerce is valued at about $4,000,000. During the Mexican War in 1846 the town was occupied by American troops under General Taylor, on 18 May. Pop. 10,000.

MATANE, ma'tán, Canada, town in Rimouski County, province of Quebec, on the Canada and Gulf Terminal and the Intercolonial railroads. Steamers ply between it and Montreal and Gaspé. The town has large saw mills and extensive lumber interests. Pop. 2,056.

MATANUSKA RIVER, an affluent of Knik Arm, Cook Inlet, Alaska. The valley of this stream has extensive coal deposits which have been the subject of Federal legislation in recent years. See ALASKA, and consult Martin, 'Matanuska Coal Field' (in 'United States Geological Survey, Bulletin 239'), and 'Railway Routes in Alaska' (in 'Document 1346, House of Representatives, 62d Congress, 3d Session').

MATANZAS, mä-tän'zas (Sp. mä-tän'thäs). Cuba, a seaport city on the north coast, capital of Matanzas province, 52 miles by rail east of Havana. It is situated on Matanzas Bay, one of the largest, safest and most convenient harbors of the western hemisphere. The city is well-built with wide, regular and paved streets, handsome plazas and public buildings and good railway communications. The caves of Bellamar and Yumuri Valley, in the neighborhood, are two popular natural resorts. Matanzas ranks in importance next to Havana in the export of sugar, molasses, rum and coffee, the exports of sugar alone averaging annually about $15,000,000. It has sugar mills, distilleries, oil refineries, tanneries, shoe factories, machine shops, etc. It was founded in 1693, and suffered from piractical incursions during the first century of its existence. The city was bombarded by the United States warships during the Spanish-American War in 1898, the only casualty, widely telegraphed, being an injury to a "Matanzas mule," which made the animal famous. Pop. 39,000.

MATAPAN, mä-tä-pän', **Cape.** See CAPE MATAPAN.

MATAS, Rudolph, American surgeon: b. Bonne Carre, near New Orleans, La., 12 Sept. 1860. He was educated at Barcelona, Spain; Paris, France; Brownville, Tex.; Soule's College, New Orleans; Saint John's Literary Institute, Matamoros, Mex., and at Tulane University. Since his graduation he has practised in New Orleans, where since 1895 he has specialized in surgery. In the latter year also he was appointed to the chair of surgery at Tulane University. Dr. Matas is senior surgeon of Touro Infirmary and senior visiting surgeon at the Charity Hospital. In 1917 he was commissioned major in the medical reserve corps of the United States army, was president of the American Surgical Association in 1910; of the Southern Surgical and Gynecological Association in 1911, and vice-president of the American Society of Clinical Surgery in 1908–10 and of the American College of Surgeons in 1913. From 1883 to 1895 he edited the New Orleans *Medical and Surgical Journal.* He is the author of many treatises and monographs on surgical subjects and a frequent contributor to medical journals and textbooks.

MATCH INDUSTRY. It was nearly 800 years after the discovery of phosphorus by an Arab, named Bechel, that it was found possible to obtain a light in a short time by the friction of phosphorus and sulphur. This discovery was

made and first applied commercially in the latter part of the 17th century by Godfrey Haukwitz, of London, and, although the feasibility of producing a substance which, with a little rubbing, would ignite, was at once demonstrated, and, although it was proven that such a substance would be of immense commercial value, yet it was nearly a century and a quarter before a friction match was invented and successfully put on the market. The method employed by Haukwitz consisted of rubbing small particles of phosphorus between folds of brown paper and the flame produced lighted a sulphur match, but, as the phosphorus at that time was costly and considered dangerous, the match was not a success.

Among the earliest inventions was the "phosphorus bottle," containing a piece of phosphorus, stirred about by a hot wire, in order to coat the bottle with oxide of phosphorus, and when a light was desired a sulphur match was thrust into the bottle and thus ignited. This "phosphorus bottle" was followed in 1805 by the "oxymuriate match," the invention of Chancel, of Paris. These matches were, however, considered dangerous, and in 1809 a mixture of phosphorus and magnesia was invented by Derepos, which was designed to do away with the danger attendant upon the use of the others.

One of the first forms of matches used was the brimstone match, and this consisted of small strips of resinous or very dry pine wood dipped in melted sulphur and lighted by means of a spark dropped from a flint and steel. This brimstone match was in almost universal use, despite the fact of later inventions, till the first part of the 19th century, and even as late as 1825, but with the general awakening at that time in all branches of industry the same progress was manifest in the invention of matches and of more ingenious machinery for making them. The first invention along this line came in shape of the "Instantaneous-Light Boxes," called the Eupyrions and Prometheans, the invention of a Mr. Jones of London. These light boxes retailed at a very high price and were made of small sticks of dry wood tipped with a mixture of chlorate of potash and sulphur, which, when dipped into sulphuric acid, ignited. These were dangerous because of the acid and because of the liability of harm from the explosion when ignited and the cost was prohibitive to general use. This was followed in 1827 by the Congreve match, invented by a chemist, named Walker, of Stockton-on-Tees. This match was similar to the "Instantaneous-Light Box," but the mixture on the end consisted of gum, chlorate of potash and sulphide of antimony, placed over a coat of sulphur. They were drawn between a fold of sandpaper to ignite them. These sold for a shilling per box, containing 84 matches. They did not become generally used because they did not readily ignite and the fumes created by the burning substances were very offensive.

In 1833 the lucifer friction match, the progenitor of the modern match, was put on the market and this differed materially from the "Instantaneous-Light Box," at first being tipped substantially the same as the Congreve, but later having phosphorus as one of the ingredients of the mixture. The manufacture of these phosphorus matches was commenced on a large scale in 1833 at Vienna, by an Austrian named Treschel, and gradually several factories began to produce matches of various kinds, Austria and southern Germany taking the lead in production. Red or amorphous phosphorus was discovered by Prof. Anton von Schrötter, a German, in 1845, and was used as early as 1855 by Lundstrom, of Jönköping, the first manufacturer of the well-known "safety-match." In these matches the phosphorus is omitted from the composition placed on the tip of the match, but is placed on the side of the box, and thus the match will only ignite when rubbed on the box. On 24 Oct. 1836, Alonzo D. Phillips, of Springfield, Mass., was granted the first patent on friction matches given in the United States.

In the early days the greater portion of the matches made came from the poorer sections of London and various other large cities, and of course were made for the greater part in cellars and badly ventilated places. This often led to disease called necrosis of the bone, caused by the handling of phosphorus, or by inhaling its fumes. This disease in time became so prevalent among the match-makers that, for fear it would be carried along and spread by the manufactured articles itself, the local governments took a hand in the matter and forced the owners of these "cellars" to provide well-aired, ventilated and well-lighted places for the employees. With the improvement in surroundings also came improvements in the methods of manufacture. Until about 1842 the splints or sticks of wood used were whittled out by hand entirely, but in that year a machine for cutting these splints was invented by Reuben Partridge and this practically revolutionized the trade by reducing the number of employees, producing a much better article in a shorter time and materially reducing the cost of manufacture. This will be seen to be true when it is stated that in the year 1856 there were but 40,000,000 matches made in England, while at the present time one factory alone in this country has facilities for making 100,000,000 matches per day.

The general size of the match now made is from one and seven-eighths to two and a half inches in length, the wood used being pine, thoroughly dried. After discarding the knots and cross-grained parts, the blocks of pine are placed in the automatic feeder of a machine, run through and cut into splints. These splints are cut by knives or dies so arranged that when cut they are separated about a quarter of an inch and then set into cast-iron plates made into an endless chain by link attachments. The speed of this machine may be set according to the needs, from 175 to 250 revolutions per minute and as it cuts 44 matches at each revolution it is very rapid. After the splints have been cut the endless chain attachment carries them from the cutting end of the machine over a block which heats the heads to a temperature great enough to melt paraffine. After they have passed over the heating block the chain carries them along to the receptacle containing the paraffine and composition forming the head. The reason why the match is heated before reaching these composition rollers is that the paraffine may not be chilled by coming into contact with a cold substance and also the match takes more readily to the composition when heated. Having passed the composition rollers and received its head, the match is cooled off

by blasts of cold dry air for an hour and a half and then pushed off the iron plates or endless chain by a mechanical device into small paper or strawboard boxes. These boxes, containing 65 to 500 matches, are automatically fed into the machine and, after having received their quota of matches, are placed on a rotary table, covered and packed into cases. The greater portion of the material used for the composition placed on the head of the match is imported from foreign countries, due probably to the fact that the articles may be more cheaply produced in foreign countries owing to the cheapness of labor.

With the advances made in the methods of manufacturing matches, of necessity the machinery for making the boxes made a corresponding advance, and has practically kept astride of the times. The majority of the inventions made in the strawboard box machinery were made by Mr. E. B. Beecher, of Westville, Conn., while the improvement of the match-making machinery is mainly due to McClintock Young, of Frederick, Md., J. P. Wright, of New Haven, Conn.; Charles Palmer, John W. Denmead and Joseph Baughman, of Akron, Ohio. The operation of the machinery for making the paper and strawboard boxes used in the match business is as follows: After having placed a roll of strawboard, cut to the proper width and lined either with pink or white paper, in the machine, the board is scored for the corners; it is then glued by an automatic device, folded into an endless tube and passed on through the printing presses in that form and are printed on three sides. After being cut into proper sizes, the boxes are passed further along by the machine to a compartment where they receive a coat of sand on the fourth side, thus making a striking or rubbing surface for the ignition of the match. Thus the cover is completed and the box proper is made in substantially the same way, with the exception of the printing and sanding, and the entire box is turned out from the machine at the rate of over 400 per minute.

The immense saving accruing from these improved devices has steadily reduced the cost of manufacture, and the rapidity with which the entire operation of match-making is conducted has tended to reduce the number of companies operating factories, and also to greatly reduce the number of people employed in the industry.

The effect of the automatic boxmakers on the number of people employed has been wonderful. To have constructed the 2,000,000 boxes now made in a single day, 40 years ago, would have taken the combined labor of 1,500 persons, whereas it now takes but 75 people to operate the machines which turn out the same work in a more satisfactory manner. Books or cards of matches are formed by another class of automatic machines, that cut the wood into combs, which are dipped, dried, packed and marketed in that form, for convenient carrying in the pocket. In the number of establishments making matches the effect of the modern machinery has made itself apparent also.

The statistics of the industry follows:

	1880	1890	1905	1909	1914
Number of establishments	37	27	23	26	20
Capital	$2,714,850	$1,941,092	$5,334,035	$11,953,000	$11,736,000
Wage earners	2,219	1,696	3,185	3,631	3,800
Wages	$535,910	$473,556	$1,100,890	$1,389,719	$1,758,000
Cost of materials used	$3,298,562	$935,008	$3,284,855	$4,598,878	$5,202,000
Value of product	$4,668,446	$2,193,638	$5,646,741	$11,353,138	$12,556,000

The importation is about 10 per cent of the manufacture, adding that much to the United States consumption. The match-making industry has assumed considerable proportions in Norway, Sweden, Germany, France and the United States; in France the industry being a government monopoly, in the United States being largely controlled by one corporation, the Diamond Match Company, which is credited with over 75 per cent of the production, having four very large factories. It is also an interesting fact for sociologists that in this industry the wage earners receive less than one-fourth of the value of the goods they produce, first deducting the cost of materials.

MATE, an officer in the mercantile marine who acts as the assistant of the captain or master. There are four grades — first, second, third and fourth mate. The junior mate has usually the superintendence of the stowing of the vessel. The law recognizes only two classes of persons in charge of a trading vessel — the master and the mariners, the mates being included in the latter. In the navy, the term mate is now limited to the assistants of certain warrant officers, as boatswain's mate, gunner's mate, etc. See PETTY OFFICER.

MATÉ (Port., *herva matté;* Sp., *yerba maté*), or **PARAGUAY TEA,** a beverage in general use in Brazil and also in general favor throughout South America, prepared from the leaves and shoots of *Ilex Paraguayensis.* The chief maté-producing state is that of Paraná, from which are exported many million pounds of this Brazilian "tea" annually. The maté tree (in appearance not unlike a small evergreen oak or ilex with a heavy and fleshy leaf) grows freely in the forest, entirely without cultivation; and in the forest the leaves undergo, as soon as they are plucked, a first preparation which both diminishes their weight before transportation and also keeps them from fermenting. They are dried at a fire, and then packed in sacks which are sent to the mills at Curitiba which reduce the leaves to powder and separate the various qualities. Aromatic properties retained in the dried and powdered leaves are extracted by means of infusion. As a stimulating and wholesome beverage habitually used throughout a large part — especially the southern part of the continent, maté might well be called, not by the competing names Brazilian or Paraguayan, but more simply the South American tea. The exportation of maté

is to Paraná what the exportation of coffee is to the neighbor state of São Paulo: the basis, practically, of economic achievement. In a recent year maté was exported to the extent of 75,885 metric tons.

MATEHUALA, mä-tä-wä'lä, Mexico, a southern town of the state of Nuevo Léon, with silver-melting establishments and important silver mines in the vicinity. Gold and copper are also found nearby in paying quantities. The city is well built, has several plazas and wide streets. Pop. 12,000.

MATERIA MEDICA (Lat. "medical matter"), that division or branch of medical science which treats of drugs, their origin, classification as natural products, preparation, purification, action on the animal economy, together with the mode of administering them for the relief and cure of disease. The action of the various agents in the materia medica upon the human family has been ascertained by experience, sometimes by experiment, especially by administering various drugs to some of the lower order of animals such as dogs, cats, rabbits, guinea pigs, rats and mice. Perhaps the best general classification of medicine is as stimulants, sedatives, narcotics, emetics, alteratives, tonics, anæsthetics, antispasmodics, astringents, spinants, cathartics, diaphoretics, diuretics, blennorrhetics, emmenagogues, hæmatinics, antacids, irritants, demulcents, coloring agents and anthelmintics. This classification is based upon the direct effect of the different drugs upon the tissues of the human economy under the various headlings which drugs may be conveniently grouped under four general sections, namely: 1. Those which have a special action on the brain, spinal cord and the general nervous system. 2. Those which have a special action on the secretions. 3. Those which change the blood. 4. Those which act locally, when applied to the surface of the body. Section (1) includes antispasmodics, anæsthetics, astringents, narcotics, tonics, sedatives, spinants and stimulants. Section (2) includes the emetics, emmenagogues, blennorrhetics, diuretics, diaphoretics and cathartics. Section (3) includes alteratives, antacids and hæmatinics. Section (4) includes anthelmintics, coloring agents, demulcents and irritants. See PHARMACOPŒIA; THERAPEUTICS.

MATERIALISM, the philosophical theory that everything which exists is ultimately material in nature, or that whatever is real can be derived and explained in accordance with the laws of material phenomena. This, of course, carries with it a denial of the reality of any finite or infinite spirit as an immaterial substance and a repudiation of all forms of idealism, which uses thought or intelligence as a principle of explanation. Materialism, however, may be more or less explicit and may maintain either absolutely, or with various modifications, the primary and all-embracing character of matter. Thorough-going materialism asserts that nothing exists but physical bodies and physical processes. What are called immaterial substances and processes it either declares to be unreal, or explains away as ultimately not different in nature from physical substances and processes. Moreover, for materialism of this consistent and uncompromising type, matter is dead and moved only by mechanical forces. It has no "psychic side," and the laws which it obeys are the expressions of a blind physical necessity. This extreme view is perhaps no longer maintained by any philosophical thinker of reputation, but in various modified forms it still exists as a tendency to subordinate mental phenomena to physical processes. The more important of these modifications and limitations may be brought under the following heads. (1) The subordination of mental phenomena, while still acknowledging more or less explicitly their distinctive character, to physical, and especially to physiological processes as their determining causes. This position does not usually avoid any of the practical consequences of materialism, and always tends, when thought out, to revert to the strict ontological form of the theory. For it is an easy transition from the view that physical processes are able to cause mental modifications to the opinion that the mind is not fundamentally different in character from the matter which affects it. (2) The view that matter is not a dead lump or mass that moves only when acted upon by some external body, as the older theories assumed, but that every particle of matter—every atom, or it may be every cell—is "conjoined with a soul," or has a "psychical side," or "contains a certain element of mind-stuff." By thus introducing an element which is different in character and in mode of operation from matter, this theory seems to differentiate itself in principle from materialism. Nevertheless, it is usually assumed tacitly by representatives of this modern Hylozoism that within the atom or cell the material side is the primary and determining element, while the physical is secondary and subordinate. Moreover, the whole mode of conception usually remains at the mechanical stage, since the immaterial element never comes to its rights as an ideal principle, but is conceived as a mere moving force or instinct, and also since it is assumed that the complex mental life can be built up by the composition of psychic elements just as a material body is constituted by the combination of its parts. (3) The position of energism. Recently an attempt has been made to find in energy an ultimate reality in terms of which both mental and material phenomena may be expressed. It cannot be maintained, however, that the conception of energy has yet been clearly defined, nor is everyone prepared to accept the assurance of Professor Ostwald, the chief representative of the theory, that energy is the concrete reality which we directly experience. To many it may appear to be merely an abstract conception built out of the data of experience. Apart from this difficulty, however, energism does not avoid materialism merely by dematerializing its fundamental principle. In Professor Ostwald's hands, it appears to remain essentially materialistic; since the conceptions employed and the laws which the transformations of energy obey are those of physical science.

If the period of the Middle Ages is excepted, when philosophical thought was determined mainly by theological conceptions, materialism may be said to have held a place throughout the whole history of philosophy. We have already noticed some of the forms in which this

mode of thought continues to appear at the present day, and may now refer briefly to its more important historical representatives. The systems of the early Greek philosophers who found the fundamental principle of things in some physical substance, such as water, air or fire, cannot properly be classed as materialism. For as yet there was no opposition between the material and the spiritual. Neither the conception of matter as lifeless and unintelligent substance, nor of mind as an immaterial directing principle, had yet been formed. Atomism, as developed by Democritus of Abdera, is the first thoroughgoing system of materialism. Democritus taught that the soul, like everything else, is an aggregate composed of atoms. The soul-atoms differ from all the others in being the finest, smoothest and most mobile. When they are in isolation, they are insensible, but from their union sensation arises. From sensation all the other processes of the mental life originate. The same conclusions were maintained by the Epicureans, who adopted without any essential modification the theory of atomism. In spite of the statement of the Stoics that whatever exists is corporeal, their system cannot properly be described as materialism. For the human soul and God, the all-embracing Logos of which the human reason is a spark of emanation, though constantly described in materialistic terms, yet function ideally as rational directing forces.

Materialism was revived in modern times by Gassendi (1592–1655) (q.v.) under the form of atomism. Modern materialism was, however, first worked out by Thomas Hobbes (q.v.), who based it upon the mechanical conceptions which in his day were being made the basis of all physical science. He did not deny the existence of immaterial things — God, angels, pure spirits — but shrewdly contented himself with showing that only that which is composed of parts, that is, bodies, can be the object of thought and so be known. All real phenomena must therefore be explained in accordance with the mechanical theory and in terms of the movement of bodies. Under the influence of the developing physical sciences and especially of the dominant conception of mechanism, materialistic tendencies played an important part in the thought of the 18th century. David Hartley (1704–57) and Joseph Priestley (1733–1804) (q.v.) definitely subordinated the mental life to the bodily processes, though the latter attempts to reconcile his materialism with Christianity and even to support it by appealing to the Bible. It is in France, however, in the systems of La Mettrie (1709–51), Baron d'Holbach (1723–89), and Cabanis (1757–1808) (q.v.) that we find in this century representatives of materialism who do not hesitate to draw the most extreme consequences of their doctrine, to deny the existence of God and to reduce man to a mere piece of physical mechanism. Again, in the middle of the 19th century, a revival of materialism occurred in Germany which had an important popular influence. The most important names connected with this movement are Carl Vogt, J. Moleschott, H. Czolbe and Louis Büchner (whose book, 'Kraft und Stoff'—'Force and Matter'— has been called the Bible of German materialism, and has passed through numerous editions in its English translation). The general adoption of the evolutionary point of view was in the beginning at least favorable to materialism. The philosophical problem seemed to be to derive from some primitive form of matter all the various modes of existence in accordance with the established laws of physical evolution. To this task Herbert Spencer (q.v.) devoted his life with a result that is variously estimated in different quarters. It can at least be said that at present thinkers are more inclined than formerly to question the adequacy of physical science to furnish a complete and final explanation of the nature of the evolutionary process.

Professor of Logic and Metaphysics, Cornell University.

MATHEMATICAL INDUCTION. See INDUCTION, MATHEMATICAL.

MATHEMATICAL SIGNS AND SYMBOLS, *in mathematics,* a symbol employed to denote an operation to be performed, to show the nature of a result of some previous operation, or to indicate the sense in which an indicated quantity is to be considered. The present mathematical symbolism is due to the labors of many men — men having different habits of thought, men living in different ages, men speaking different languages. A physicist will employ sine *a* and sine *b* to calculate the angle of refraction of light. Now certainly there is neither sine *a* nor sine *b* in reality; yet there are most certainly *relations of reality* which are accurately described in these expressions, sine *a* and sine *b*. Such is the function of all signs, symbols or characters. Whenever the eye can be brought to the aid of one's imaging faculty, a success in grasping a thought may often be gained which would otherwise be a failure. This is in particular true in mathematics where the subject matter, while objective, is non-sensible. In this way signs, and symbols, stand for the emphatic presentation of mathematical ideas, often very subtle even when symbolized; and with such signs these ideas become, as it were, easy to exhibit, that is, in thought; and the relations of these ideas become thinkable, even very often to the whole complex train of ideas in which they occur.

One very important property for symbolism to possess is that it should be concise, so as to be visible at a glance of the eye and to be rapidly written. A sign should if possible always represent the same object, and the same object should always be represented by the same sign. If a new sign be advisable, permanently or even temporarily, it should carry with it always some mark of distinction from that which is already in use, unless it be a demonstrable extension of the latter (De Morgan). The importance of notation is recognized when it is remembered, for example, how great an advance toward the solution of the famous problem of the three bodies was made when special attention was given to it, and a special symbolism chosen for it. And the invention of the symbol $\equiv$ by Gauss affords

a fine example of the advantage which may be derived from a good notation; it, without exaggeration, marks an epoch in the development of the science of arithmetic. The language of analysis, says Laplace, being in itself a powerful instrument of discoveries, its notations, especially when they are necessarily and happily conceived, are so many germs of new calculi.

Nowadays we have a symbol for each mathematical operation. Sometimes, even a choice of symbols. And most of the letters of the English alphabet are now engaged for special mathematical purposes. Thus:

a signifies sometimes a finite quantity; at other times a known number, the side of a triangle opposite A; also an intercept on the axis of x, and, finally, altitude.

b like a signifies a known number, and also a side of a triangle, the one opposite B; it also stands for base; and lastly, for an intercept on the axis of y.

c signifies constant.

e signifies the base of the Napierian logarithms.

A considerable inroad has been made, also, into the Greek alphabet:

γ signifies the inclination of the axis of x;

π stands for the ratio 3.14159;

ϵ is used for sum of tens similarly obtained; and

σ indicates the standard deviation in the theory of measurements.

Some examples of reading notation may be given:

$a+b$, $a-b$, $a+b$, $a \times b$, and $a \sim b$ are read a plus b, a minus b, a divided by b, a multiplied by b, and the difference between a and b.

Further:—$a > b$, $a < b$, $a = b$, $a \sim b$, and $a \equiv b$ are to be read a greater than b, a less than b, a approximating to b, and (Gauss' symbol) a identical with b.

Our present day symbols of operation, + (plus) and — (minus), appear to be among the oldest. Both are found in Widmann's arithmetic published in 1489, at Leipzig. In the time of Widmann, the symbols ( ), ×, ÷, > and < were unknown. Rudolff had already begun to employ the radical sign. But = had not yet appeared. In those days almost everything was expressed by words, or mere abbreviations. Yet even then both cubic and biquadratic equations had already been solved; the methods even were published. Oughtred used the term "separatrix" in sense of a mark between the integral and fractional parts of a number written decimally. His symbol for a separatrix was L. Stevens had already used a figure a circle over or under each decimal place to indicate its order. And of the various separatrixes that have been employed by mathematicians, four are still employed: (a) A *vertical line* is still employed to separate cents from dollars in ledgers, etc. Such a separatrix appears already in 1613, employed in a work by Richard Witt. Napier also used a vertical line for the same purpose in his 'Rabdologia,' in 1617; (b) a *period*, still employed as a separatrix, is so used as early as 1612 in the trigonometry of Pitiscus, a German. Napier, in his 'Rabdologia,' speaks of so employing a period or comma. The period has always been the prevailing form of the decimal point in America; (c) the Greek colon, a dot above the line, was advocated as a separatrix by no one less than Sir Isaac Newton. His desire was to prevent it from being confounded with a period used as a mark of punctuation. This form of the decimal point is now commonly used in England; (d) Pitiscus is the author of an Italian work on trigonometry. He, in this work, published in 1608, uses a comma as a decimal point. Kepler, in 1616, seems to have introduced this mark, the comma, into Germany for the same purpose. Briggs likewise used a comma in his logarithmic tables, in 1624; and several other early English writers generally employed the comma as a decimal point. But to-day the comma is customary form of the decimal point, *not* in England, but in countries upon the mainland of the European continent.

For example: $1\frac{50}{100}$ would in America be written decimally as 1.50; in England as 1·50; and in Germany, France and in Italy as 1,50.

Symbols in general may now be mentioned: The sign of cancellation is simply drawn across the factors cancelled, like the one drawn across the zeros above. These with the ordinary Arabic and Roman numerals and the abbreviations for the names of things, like £, s, d, $, ¢, °, ′, ″, constitute the main symbols of ordinary arithmetic. In algebra there are four kinds of symbols: symbols of quantity, of operation, of relation and of abbreviation. Known quantities are represented by the first letters of the alphabet; or by the final letters with one or more accents, as x', y'', z'''. Besides letters of Greek and even of the Hebrew alphabet are employed. Thus M stands for "modulus" of any system of logarithms. π has been spoken of.

Of symbols of operation, multiplication may be indicated by placing a point between the factors when both are expressed by letters, as $a \,.\, b$. In a series multiplication between factors expressed even by numbers, may be expressed by a point between such factors. When $\sim$ is used between two quantities, it denotes difference, but not which quantity is to be subtracted from the other. Division has been sometimes indicated thus: $a \mid b$. The radical sign, $\sqrt{\ }$, when placed over a quantity indicates that its root is to be taken. Thus $\sqrt{a}$ denotes the square root of a. In the same manner $\sqrt[3]{a}$ and $\sqrt[n]{a}$ are read the *cube root* and the *n*th *root* of a, respectively. Here ^{3} and n give the *index* of the radical. A vinculum, ———, a bar |, brackets [ ], and parentheses ( ) all indicate that the quantities enclosed by them are to be regarded together as wholes. In algebra, Σ denotes that the algebraic sum of several quantities of the same nature as that to which the sign is prefixed is to be taken. The letter f, F and ϕ, written before any quantity, or quantities, separated by commas, as

$$F(x),\ f(x,y),\ \phi(x,y,z),\ \text{et cetera,}$$

denote quantities depending upon the quantities, or the quantity, within the parenthesis, without designating the nature of the relation. The signs of proportion, : :: :, when placed between quantities show them to be in proportion. R, r and ρ, and other symbols, denote *radii* of circles. L, l and λ may denote latitude. The leading letters of the Greek alphabet are also

sometimes used to denote known angles; and the final letters of the same alphabet to denote unknown angles. And when several quantities of the same kind are involved in an investigation, they may be designated by the same letter differently accented; thus: a' a'' a'''; a_1 a_2 and a_3. An older usage of o denotes an infinitely small quantity; and only sometimes absolute zero. Clearer thinking has impelled moderns to use ι (iota) or i for an infinitesimal, and to denote by o, *absolute zero*, and that only. The symbol ∞, first employed by Wallis in the 17th century, has long been used both for a *variable increasing without limit* and for *absolute infinity*. Taylor, in 1898, introduced the symbol $\aleph_0$, a contraction of $\frac{\infty}{1}$ for an *infinite*, the reciprocal of an infinitesimal. The sign $\therefore$ denotes *then* or *therefore;* and the sign $\because$, *since* or *because*. The $y = f(x)$ is a general sign, indicating that there is a *general relation* between y and x — that is, y and x are so connected that x cannot change without y changing at the same time. The symbol $F(x, y, z,) = 0$ implies that there is a general relation between x, y and z, without specifying the relation. The symbols *sin, cos, tan, co-tan, sec, co-sec, ver-sin, co-ver-sin,* are abbreviations used, respectively, for the words "sine," "cosine," "tangent," "cotangent," "secant," "co-secant," "versed-sine" and "co-versed-sine." When the arc is supposed, as in trigonometry, to depend for its value upon any of the trigonometric lines, the function is called the inverse trigonometric function. The following symbols are used to denote this kind of a relation:

$$sin^{-1}y,\ cos^{-1}y,\ tan^{-1}y,\ cot^{-1}y,\ sec^{-1}y,\ co\text{-}sec^{-1}y,\ ver\text{-}sin^{-1}y,\ co\text{-}ver\text{-}sin^{-1}y.$$

These stand, respectively, for the arc upon the sine, cosine, tangent, co-tangent, secant, co-secant, versed-sine and co-versed-sine,— is y. The principle of notation has been extended to all inverse functions; thus:

$$\log^{-1}y,\ d^{-1}(x\,dx),\ \text{etc.}$$

These stand, respectively, for the quantity whose logarithm is y^1, and the quantity whose differential is $x\,d\,x$, etc. The differential of a function, or independent variable, is denoted by d, thus:

$$d(y^2) = 2ydy.$$

If we suppose the form of a function to vary, the symbol employed to denote the variable is δ, thus:

$$\delta u,\ \delta y,\ \delta x.$$

If both the form of the function and the independent variable of the function vary together, the resulting variation is denoted by the symbol D, thus:

$$D f(x,y) \ldots\ldots$$

The differential is the difference between two consecutive states of the quantity differentiated. If it is desired to represent the difference between two states of a function which are not consecutive, the symbol Δ is employed. Successive finite differences are represented by the symbols:

$$\Delta u,\ \Delta^2 u,\ \Delta^3 u,\ \Delta^4 u,\ \text{etc.}$$

We have already spoken of Σ as used in algebra, where it denotes an algebraical sum. Its use in the calculus is principally restricted to the denotation of the *sum of the finite differences of a function*. The symbol $\int$ denotes an integration to be performed; while the symbol $\int_a^b$ is used to denote *a definite integral* taken between the limits a and b. The symbol $\Gamma(x+1)$ stands for the integral $\int e^{-x} x^{x-1} dx$. The vector sign is U. $\Gamma\beta$, in quaternions, should be read tensor of B.

In the foregoing list nearly all the symbols, commonly employed by American mathematicians, have been enumerated; as well as some used abroad.

MATHEMATICAL SOCIETIES AND JOURNALS. The oldest of the sciences, mathematics has always been cultivated and fostered, often with a degree of preferment over the later branches of the tree of knowledge, by the universities, the great academies and the other scientific bodies of a general scope throughout the civilized world. The indispensable condition for satisfactory progress, facility of publication, has been provided for mathematicians in a very large degree by the 'Transactions' and 'Proceedings' of learned societies representing a wide scientific field. The specialist will usually prefer the mathematical journals proper, which indeed send out in a steady flow the finest product of the mathematical genius of the age. Theirs is the post of honor; it lies with them, by critical encouragement or repression, to maintain the standard of excellence of a great profession.

But there remains another set of functions, which to-day are more and more efficiently performed by the mathematical societies. These include in their membership nearly every mathematician of standing in the four quarters of the globe. They provide a professional forum for the discussion of mathematical questions and of mathematical interests, and furnish the powerful stimulus of association and solidarity. Their activities cover a wide range, including the presentation and publication of papers and memoirs, the encouragement of bibliographic and encyclopedic undertakings, the organization of international congresses, special conferences and lectures, the exercise of a beneficial advisory influence on the mathematical curricula and equipment of the schools and universities, the diffusion of a better understanding of the science in the educated world, the formation of libraries, collections of models, etc., and the promotion of agreeable social and personal relations among mathematicians.

The following list comprises the principal mathematical societies of the world, arranged in chronological order of foundation, with mention of their several publications:

1690. Mathematische Gesellschaft in Hamburg. Mitteilungen, 1881—.
1778. Wiskundig Genootschap te Amsterdam. Wiskundige Opgaven mit de Oplossingen, 1855—; Nieuw Archief voor Wiskunde, 1875—; Revue Semestrielle des Publications Mathématiques, 1892—.
1866. London Mathematical Society, Proceedings, 1865—.
1866. Moscow Mathematical Society, Transactions, 1869—.
1873. Société Mathématique de France, Bulletin, 1873—.
1883. Mathematical Society of Edinburgh, Proceedings, 1884—.
1884. Circolo Matematico di Palermo, Rendiconti, 1884—.
1886. Mathematical Society of Charkow, Bulletin, 1879.
1888. American Mathematical Society, Bulletin, 1891—; Transactions, 1900—; Mathematical Papers of the Chicago Congress, 1896; Colloquium Lectures on Mathematics, 1905, 1910, 1913, 1914.
1890. Deutsche Mathematiker-Vereinigung, Jahresbericht, 1892—.

1895. British Mathematical Association, Mathematical Gazette, 1894—.
1909. Indian Mathematical Society, Journal, 1909—.
1909. Calcutta Mathematical Society, Bulletin, 1909—.
1911. Sociedad Matematica Española, Revista, 1911—.
1915. Mathematical Association of America, American Mathematical Monthly, 1894—.

A history of the Hamburg Society, prepared in connection with the celebration in 1890 of its 200th anniversary, may be found in volume II of the 'Mitteilungen.'

The 'Wiskundig Genootschap' renders an especially valuable service in the mathematical world by the publication of the 'Revue Semestrielle,' a condensed abstract of all the mathematical papers published in the various journals, constantly brought up to within a few months of the current date. The value to a productive mathematician of this great labor-saving device is quite inestimable.

The first president of the London Mathematical Society was the illustrious De Morgan, and the roll of members has included the names of Cayley, Sylvester, H. J. S. Smith, Clifford, Salmon, Stokes, Kelvin and most of the other eminent British mathematicians of the time. The secretary's office was efficiently filled for the long period of 34 years (1867–1901) by the late Robert Tucker. The 'Proceedings,' which is the leading British mathematical journal, has recently been enlarged in size. The membership of the society is about 300.

The Société Mathématique de France has about the same membership. The meetings are held twice a month at the Sorbonne. The president of the society for 1916 is M. Fouché, the secretaries are MM. Lévy and Montel. The council includes Appell, Borel, Jordan, Painlevé and Picard. The 'Bulletin' is issued quarterly.

The Deutsche Mathematiker-Vereinigung represents in full measure the fruitfulness and vigor of German mathematics. Its organization had been foreshadowed for many years, but was actually brought about in 1890 by the initiative of members of the mathematical-astronomical section of the older Society of German Natural Scientists and Physicians, in affiliation with which the Vereinigung still continues to hold its annual meetings. The appearance of the 'Jahresbericht,' whose volumes were originally issued in parts of book form, signalized the beginning of a series of invaluable reports on various branches of mathematics, beginning with the celebrated report by W. F. Meyer on 'The Present Status of the Theory of Invariants' (Vol. I, 1892). These reports and other undertakings of a bibliographical, critical and statistical character ultimately led to the plan of the 'Encyclopedia of Mathematics,' now in course of publication by Teubner, under the auspices of academies of science of Munich, Vienna and Göttingen. The Vereinigung has also played an active part in the organization of the international congresses of mathematicians, notably those of Zürich (1897) and Heidelberg (1904). It has interested itself effectively in the questions concerning the teaching of mathematics in the schools, universities and technical institutes, the training of teachers, the correlation of instruction in pure and applied mathematics and other matters of reorganization and progress in education, some of which are phases of an international reform movement. A history of the Vereinigung by the former secretary and present editor of the 'Jahresbericht,' Prof. A. Gutzmer of Jena, was issued on the occasion of the Heidelberg congress. The society has at present about 650 members. Meetings are held annually. It recently received from B. G. Teubner the gift of a complete set of his extensive mathematical publications as the nucleus of a library. The 'Jahresbericht,' now published monthly with occasional double bimonthly numbers, contains, beside the earlier reports mentioned above and a record of the society's activities, addresses, biographies and necrologies, original papers, criticisms, discussions and reviews and notes on current events. More extensive papers are published as separate volumes.

The American Mathematical Society was originally organized as the New York Mathematical Society in 1888 and was reorganized under its present national title in 1894. Sylvester's work at Baltimore (1877–84) and the influence of young mathematicians returning from study in Germany had produced a tidal movement of which the society has since its early days been the forefront and exemplar. Its membership, now about 740, includes practically every mathematician in the United States, and a considerable number of foreign representatives. The 'Bulletin,' published since 1891 in monthly numbers from October to July, is of the type later adopted by the 'Jahresbericht,' but contains also the official reports of the frequent meetings of the society, with abstracts of the papers presented and a complete bibliography of recent mathematical publications. Another special feature of the 'Bulletin' is the extensive "Notes" on current events in the mathematical world. The 'Transactions,' founded in 1900, is the official organ of the society for the publication of the more important papers read before it. The library of the society, now including 5,000 bound volumes, is deposited in the Columbia University Library.

Regular meetings are held four times a year in New York and twice a year in Chicago. Officers are elected at the annual meeting in December. A summer meeting is also held each year at some specially chosen place. At intervals of two or three years the summer meetings are reinforced by colloquia, or courses of lectures by specialists on recent advances in their particular lines of work. The rapid growth of mathematical interest in the Central and Western sections of the country have led to the organization of a Chicago Section (1898), a San Francisco Section (1902) and a Southwestern Section (1907). The sections meet once or twice each year.

The presidents of the society have been J. H. Van Amringe, 1888–90; Emory McClintock, 1890–94; G. W. Hill, 1894–96; Simon Newcomb, 1896–98; R. S. Woodward, 1898–1900; E. H. Moore, 1900–02; Thomas S. Fiske, 1902–04; W. F. Osgood, 1904–06; Henry S. White, 1906–08; Maxime Bocher, 1908–10; H. B. Fine, 1910–12; E. B. Van Vleck, 1912–14; E. W. Brown, 1914–16; L. E. Dickson, 1916–. The secretaries have been Thomas S. Fiske, 1888–95, and F. N. Cole, 1895–. The business of the society is transacted by a council composed of the officers, ex-presidents, editorial committee of the

'Transactions,' secretary of the Chicago Section and 12 other members elected for a term of three years.

While the society is more especially devoted to the advancement of the higher branches of mathematics, it exerts a considerable influence both directly and through its members on the teaching of the subject in the schools and universities. The report of a committee of the society on college entrance requirements in mathematics has been adopted by the College Entrance Examination Board. A report on the requirements for the master's degree, presented to the Chicago Section, has been favorably recognized by several of the Western universities. The society has also contributed materially to bring about the organization of associations of teachers of mathematics throughout the country, a movement especially stimulated by Professor Moore's presidential address in 1902.

Historical notices of the society may be found in the presidential addresses of Dr. McClintock ('Bulletin,' January 1895) and Professor Fiske (ib., February 1905). Other notices are scattered through the secretary's reports. The society, which has increased its membership by 50 per cent in the last 12 years, serves to-day to bring together in a harmonious whole all the mathematical activities of America. It is a centre not only of scientific activity but also of professional good feeling and agreeable personal relations.

The British Mathematical Association, formerly known as the Association for the Improvement of Geometrical Teaching, is devoted to improved instruction in elementary mathematics.

The Mathematical Association of America, organized in 1915 to represent the field of collegiate mathematics, has now over 1,100 members. It has adopted as its official organ the *American Mathematical Monthly*. The presidents of the Association have been E. R. Hedrick, 1915–17, and Florian Cajori, 1917–). The secretary-treasurer is W. D. Cairns. Meetings are held twice a year, usually in connection with those of the American Mathematical Society. Nine local societies have thus far been organized, holding meetings usually twice a year.

The international congresses of mathematicians have been mentioned above. While these are individually but temporary gatherings, they had come, before the war, to be an established institution of great and permanent value. Their sequence of time and place is: Paris, 1889; Chicago, 1893; Zürich, 1897; Paris, 1900; Heidelberg, 1904; Rome, 1908; Cambridge, 1912.

The exchanges of the American Mathematical Society include about 140 journals which regularly publish mathematical papers of appreciable value. In the notices appended to his collection of abbreviated titles of journals ('Jahresbericht der Deutschen Mathematiker-Vereinigung,' Vol. XII, 1903, pp. 426–444) Felix Müller sets the grand total ever published of all journals of a fairly mathematical complexion at about 1,200, of which over 600 now survive. More than 300 journals are cited in the references of the early numbers of the 'Encyclopedia of Mathematics.' The 'Revue Semestrielle' reports the contents of some 250 journals; the 'Fortschritte' list is about 170.

The oldest journals in Müller's list are the 'Philosophical Transactions' and the 'Journal des Savants,' both dating from the year 1665. Following these are the publications of the academies of Paris (1666) and Bologna (1690). From the 18th century there still survive, beside the journals of the academies (Berlin 1700; Petersburg, 1724; Göttingen, 1751; and others), also the 'Memorie di Matematica e di Fisica' (1782) of the Società Italiana, the 'Bulletin' (1789) of the Société Philomatique of Paris, and the 'Journal de l'Ecole Polytechnique' (1794). Among the extinct journals may be mentioned the 'Ladies' Diary' (1704), 'Gentlemen's Diary' (1741), these two uniting in the 'Lady's and Gentlemens Diary' (1841–71); the 'Cambridge Mathematical Journal' (1839–45), the forerunner of 'Sylvester's Quarterly Journal'; Gergonne's 'Annales de Mathématique' (1810–31); Tortolini's 'Annali' (1850–57), superseded by the present 'Annali di Mathematica'; and the various journals (1786–1825) of Hindenburg, Breithaupt, Bessel, Kretschmar. In America the ephemeral existences are chronicled of the 'Mathematical Correspondent' (1804–06), 'Adrain's Analyst' (1808) and 'Mathematical Diary' (1825–32), 'Mathematical Companion' (1828–31), 'Mathematical Miscellany' (1836–39), 'Cambridge Miscellany of Mathematics, Physics and Astronomy' (1842–43), 'Runkle's Mathematical Monthly' (1858–61). The publication of the 'Analyst' (1874–83) marked a substantial advance. Martin's 'Mathematical Visitor' (1877) and 'Mathematical Magazine' (1882), the 'Mathematical Magazine' (1882) and 'Mathematical Messenger' (1884) are extinct.

The following list gives the date of foundation, the title and the present place of publication of the strictly mathematical journals now in existence and not already cited in connection with the list of mathematical societies above:

1826. 'Crelle's Journal für die reine und angewandte Mathematik,' Berlin.
1836. 'Liouville's Journal de Mathématiques pures et appliquées,' Paris.
1842. 'Nouvelles Annales de Mathématiques.'
1855. 'Quarterly Journal of Pure and Applied Mathematics,' London.
1858. 'Annali di Matematica pure ed applicata,' Milan.
1863. 'Giornale di Matematiche di Battaglini,' Naples.
1868. 'Mathematische Annalen,' Leipsic.
1870. 'Bulletin des Sciences Mathématiques,' Paris.
1871. 'Jahrbuch über die Fortschritte der Mathematik,' Berlin.
1872. 'Messenger of Mathematics,' London.
1878. 'American Journal of Mathematics,' Baltimore.
1881. 'Mathesis,' Ghent.
1882. 'Acta Mathematica,' Stockholm.
1884. 'Annals of Mathematics,' Cambridge, Mass.
1884. 'Bibliotheca Mathematica,' Leipsic.
1886. 'Periodico di Mathematica' (Supplemento 1896), Leghorn.
1890. 'Nyt Tidsskrift for Matematik,' Copenhagen.
1891. 'Revue de Mathématiques speciales,' Paris.
1894. 'American Mathematical Monthly,' Springfield, Mo.
1894. 'L'Intermédiaire des Mathématiciens,' Paris.
1895. 'Gazeta Matematica,' Bucharest.
1896. 'Il Pitagora,' Palermo.
1896. 'Revue de Mathématiques,' Turin.
1897. 'Wiadomosci Matematyczne,' Warsaw.
1898. 'Formulaire Mathématique,' Turin.
1898. 'L' Education Mathématique,' Paris.
1898. 'Bolletino di Bibliografia e Storia delle Scienze Matematiche,' Turin.
1899. 'L' Enseignment Mathématique,' Paris.
1900. 'Bolletino di Matematica,' Bologna.
1906. Sphinx Oedipe, Nancy.
1909. Mathematics Teacher, Syracuse, N. Y.
1912. Tohokn Mathematical Journal, Sondai, Japan.

MATHEMATICAL SOCIETY, The American. See AMERICAN MATHEMATICAL SOCIETY, THE.

MATHEMATICAL SOCIETY, The London, an association formed in the English capital in 1865 by a number of English professors of mathematics for the promotion of that science. It was incorporated in 1894. Since its formation it has regularly published 'Proceedings' and papers on mathematical subjects. It has an excellent library of scientific works. The Society meets monthly from November to June, the anniversary meeting being held in November.

MATHEMATICS. The science of mathematics — what shall it be said to be? A question much discussed by philosophers and mathematicians in the course of more than 2,000 years, and especially with deepened interest and insight in our own times. Many have been the answers, but none has approved itself as final. All of them, by nature belonging to the «literature of knowledge,» fall under its law and tend to «perish by supersession.» Naturally enough conception of the science has had to grow with the growth of the science itself. For it must not be inferred that mathematics, because it is so old, is dead. Old it is indeed, classic already in Euclid's day, being surpassed in point of antiquity by but one of the fine arts and by none of the «natural» sciences; but it is not only the oldest science, it is also as new as any, living and flourishing to-day as never before, advancing in a thousand directions by leaps and bounds. It is not merely as a giant tree throwing out and aloft myriad branching arms in the upper regions of clearer light and plunging deeper and deeper root in the darker soil beneath. Rather is it an immense forest of such oaks, which, however, literally grow into each other, so that, by the junction and intercrescence of limb with limb and root with root and trunk with trunk, the manifold wood becomes a single living organic growing whole. A vast complex of interpenetrating theories — such the science now actually is, but it is more wondrous still potentially, component theories continuing more and more to grow and multiply beyond all imagination and beyond the compass of any single genius, however gifted. What is this thing so marvelously vital? What does it undertake? What is its motive? How is it related to other modes and interests of the human spirit?

One of the oldest, at the same time the most familiar, of the definitions conceived mathematics to be the science of magnitude, where magnitude, including multitude as a special kind, signified whatever was «capable of increase and decrease and measurement.» Capability of measurement was the essential thing. That was a most natural definition of the science, for magnitude is a singularly fundamental notion, not only inviting but demanding consideration at every stage and turn of life. The necessity of finding out how many and how much was the mother of counting and measurement and mathematics, first from necessity and then from joy, so busied itself with these things that they came to seem its whole employment. But now the ordinary notion of measurement as the repeated application of a constant finite unit has been so refined and generalized, on the one hand through the creation of the so-called irrational and imaginary numbers (see ALGEBRA; COMPLEX VARIABLE), and on the other by use of a scale, as in non-Euclidean geometry (see NON-EUCLIDEAN GEOMETRY; ANALYTICAL METRICS), where the unit appears to suffer lawful change from step to step of its application, that to retain the old words and call mathematics the science of measurement seems quite inept as no longer telling either what the science has actually become or what its spirit is bent upon.

Moreover, the most striking measurements, as of the volume of a planet, the valency of atoms, the velocity of light or the distance of star from star, are not done by *direct* repeated application of a unit. They are all accomplished by indirection. Perception of this fact it was which led to the famous definition by the philosopher and mathematician, Auguste Comte, that mathematics is the «science of *indirect* measurement.» Here doubtless we are in presence of a finer insight and a larger view, but the thought is not yet either wide enough or deep enough.

For it is obvious that there is much admittedly mathematical activity that is not in the least concerned with measurement whether direct or indirect. In projective geometry (which see), for example, it was observed that *metric* considerations were either absent or subordinate. The fact, to take a simplest example, that the two points determine a line uniquely, or that the intersection of a sphere and a plane is a circle, is not a metric fact: it is not a fact about size or quantity or magnitude. In this field it was *position* rather than size that to some seemed the centre of interest, and so it was proposed to call mathematics the science of magnitude or measurement and position.

Even as thus expanded, the definition yet excludes many a mathematical realm of vast, nay, infinite extent. Consider, for example, that immense class of things known as *operations*. These are limitless alike in number and in kind. Now it so happens that there are systems of operations such that any two operations of a given system, if thought as following one another, together thus produce the same effect as some other single operation of the system. For an illustration, think of all possible straight motions in space. The operation of going from a point A to a point B, followed by the operation of going from B to a point C, is equivalent to the single operation of going from A to C. Thus the system of such operations is a closed system: combination of any two operations yields a third not without but within the system. Now the theory of such closed systems — called groups (see GROUPS) of operations — is a mathematical theory of colossal proportions. But it is obvious that an abstract operation, though a very real thing, is neither a position nor a magnitude.

This way of trying to come at an adequate conception of mathematics, viz., by attempting to characterize in succession its distinct domains, or varieties of content, or modes of activity, is not likely to prove successful. For it demands an exhaustive enumeration, not only of the fields now occupied by the science, but also of those destined to be conquered by

it in the future, and such an achievement would require a prevision that none may claim.

Fortunately there are other paths of approach that seem more promising. Every one has observed that mathematics, whatever it may be, possesses a certain mark, namely, a degree of certainty not found elsewhere. So it is, proverbially, the exact science par excellence. Exact, no doubt, but in what sense? To this an excellent answer is found in a definition of the science given about one generation ago by a distinguished American mathematician, Prof. Benjamin Pierce: mathematics is the science which draws necessary conclusions — a formulation of like significance with the fine *mot* by Prof. William Benjamin Smith, to wit: mathematics is the universal art apodictic. These statements, though neither of them may be entirely adequate, are, both of them, telling approximations, at once foreshadowing and neatly summarizing for popular use the conclusion reached by the creators of modern logic (see SYMBOLIC LOGIC), that mathematics is included in, and, in a profound sense, may be said to be identical with, symbolic logic. Observe that the emphasis falls on the equality of being "necessary," or logically *correct.* Naught is said about the conclusions being true. That is another matter for subsequent consideration.

But why are mathematical conclusions correct? Is it that the mathematician has a reasoning faculty essentially different in kind from that of other men? By no means. What, then, is the secret? Reflect that conclusion implies premises, that premises involve terms, that terms stand for ideas or concepts or notions, and that these latter are the ultimate material with which the spiritual architect, called the reason, designs and builds. Here, then, one may expect to find light. The apodictic quality of mathematical thought, the correctness of its conclusions, are due, not to any special mode of ratiocination, but to the character of the concepts with which it deals. What is that distinctive characteristic? The answer is: precision, sharpness, completeness of determination. But how comes the mathematician by such completeness? There is no mysterious trick involved: some ideas admit of such precision and completeness of determination, others do not; and the mathematician is one who deals with those that do. Law, says Blackstone, is a rule of action prescribed by the supreme power of a state commanding what is right and prohibiting what is wrong. But what are a state, and supreme power, and right and wrong? If all such terms admitted of complete determination as do, for example, such terms as triangle and circle, then the science of law would be a branch of pure mathematics. And such, too, to take another example, would be psychology, were consciousness, mind, perception, imagination, and all kindred terms, as completely determinable as the notion sphere. It will be asked, does not the lawyer sometimes arrive at correct conclusions? It may be admitted that he does sometimes, and so, too, of the psychologist or historian or sociologist. When this happens, however, when these students arrive, it is not meant at truth, for that may be by happy chance or by intuition, but when, strictly speaking, they arrive at conclusions that are correct, at conclusions, i.e., that follow logically from completely ascertained data or premises, then that is because they have been for the time acting in all literalness the part of mathematician. That is not to aggrandize the science of mathematics. Rather is it for credit to all serious thinking that, in any considerable garment of thought, one may find here and there, rarely enough sometimes, a mathetic fiber, woven in some perhaps exceptional moment of precise conception and rigorous reason. To think aright is no characteristic striving of a class of men. It is a common aspiration. Only, as before said, the stuff of thought is mostly intractable, formless, nebulous, like some milky way awaiting analysis into distinct star forms of completely determinate ideas.

The mentioned aspiration and the tendence of all thought, of all science, to assume the character of mathematics admit of many illustrations, which at the same time serve to show clearly the ultimate distinction between that thought which is mathematical and that which is not. One or two such illustrations must suffice.

There is no more common or more important scientific notion than that of function. The term is applied to either of two variable things (including constants conceived as special variables, whose variation is zero in amount) so related that to any value or state of either there corresponds one (or more) value (values) or state (states) of the other. Any two corresponding values or states are said to constitute a pair of values or states, and any two functionally related variables may be called a function-pair. Examples of such function-pairs abound on every hand, as the radius and the area of a circle; the corresponding values of x and y in an equation, $2x-3y+5=0$; elasticity of medium and velocity of sound or other undulation; the amount of sodium chloride formed and the time occupied by the reaction that generates it; the prosperity of a given community and, *ceteris paribus,* the intelligence of its patriotism. Indeed it may be that there is no thing which is not in some sense a function of every other. Be this as it may, one thing is very certain, namely, a very great part, if not the whole, of our thinking is primarily concerned with functional relationships, deals, that is, immediately or mediately with pairs or systems of corresponding values or states or changes. Behold, for example, how the parallelistic psychology searches for correlations between psychical and physical phenomena. Witness, too, the sociologist seeking to determine a law of correspondence between the homogeneity of a population and its peacefulness; the anthropologist attempting to find a formula correlating mental power and brain-weight; the physicist's determinations of dependence between pressure and volume of a gas; and so on and so on. It is, then, here, in the immense and wondrously diversified domain of correspondence, the answering of value to value, of change to change, of condition to condition, of state to state, that the knowing activity, the intellect, finds its field.

What is it precisely that we seek to do by means of a correlation? The answer is: when one or more facts are given or known, to pass with absolute certainty to the correlative fact or

facts. For example, if $y = \sin x$, then, if a value be assigned to x or y, the corresponding value or values of y or x are determined by the equation, or definition, of the functional correspondence between the assemblage of values which x may take and the assemblage that y may assume. To effect the desired transition from the given or known to the dependent ungiven or unknown obviously requires one or more formulæ or equations which shall serve to define precisely the manner of correspondence, the law of dependence. Where do such defining formulæ or equations come from? Strictly speaking, they are never *found*, they are always *assumed*, assumed immediately or else mediately, that is, in the latter case, derived by assumed logical processes from such as belong to the former case. This statement is valid in every field of logical thought. In every field it is true that from nothing assumed nothing can be derived. Now, nothing is easier than to write down a perfectly definite formula that does not tell how cheerfulness depends on climate or retentiveness on interest or the volume of a cube on its dimensions. The mentioned inapplicability or "inutility" does not, however, at all tend to invalidate the formula regarded as defining a certain law of correlation. Indeed a given formula may be perfectly intelligible in itself; it, alone or joined with others in similar case, may state a perfectly intelligible law of correspondence, which, nevertheless, may have no validity whatever in the physical or in the sensuous universe. What is it, then, that guides in the choice of formulæ? For such determination or choice seems hardly referable to chance alone. The answer is that, broadly speaking, choice is determined by curiosity, and curiosity is itself not determined by choice, but is rather matter of native gift or predilection.

Just here we are in position where we have only to look steadily a little in order to perceive clearly the sharp and ultimate distinction between mathematics, on the one hand, and physical or other science, on the other. These are discriminated according to the kind of curiosity whence they spring. The mathematician is curious about definite abstract relationships, about logically possible modes of order, about varieties of abstract implications, about completely determined or determinable functional relationships considered solely in and of themselves, that is, without the slightest concern about the question whether or no they have external or sensuous or other sort of validity than that of being logically thinkable. It is the aggregate of logically thinkable relationships that constitutes the mathematician's universe, an indefinitely infinite universe, worlds in worlds of worlds in worlds of wonders, inconceivably richer in mathetic content than can be any outer world of sense. Immense indeed and marvelous is our own world of sense with its rolling seas and stellar fields and undulating ether. But compared, one need not say with the entire world of mathesis, but only with the hyperspaces (see HYPERSPACES) explored by the geometrician, the whole vast region of the sensuous universe is literally as a merest point of light in a shining sky.

Now this mere speck of a physical universe, in which the chemist, the physicist, the astronomer, the biologist, the sociologist, and the rest of nature students, find their great fields, may be, as it somewhat seems to be, a realm of invariant uniformities or laws; it may be a mechanically organic aggregate, connected into an order whole by a tissue of completely definable functional relationships; and it may not. In other words, it may be that the universe eternally has been and is a genuine cosmos, that the external sea of things immersing us, although it is ever changing infinitely, changes only lawfully, in accordance with a system of immutable laws, constituting an *invariant* (see INVARIANTS AND COVARIANTS) at once underived and indestructible and securing everlasting harmony through and through; and it may not be such. The student of nature assumes, he rightly assumes, that it is, and, moved and sustained by appropriate curiosity, he endeavors to find in the outer world what are the elements and relationships assumed to be valid there. "Natural science," said Bernhard Riemann, "is the attempt to comprehend nature by means of exact concepts." The mathematician, as such, does not make that assumption and does not seek for relationships in the outer world.

Is the assumption correct? Undoubtedly it is admissible, and as a working hypothesis it is undoubtedly very useful or even indispensable to the student of external nature; but is it true? The mathematician, as man, does not know although he greatly cares. Man, as mathematician, neither knows nor cares. The mathematician does know, however, that, if the assumption be correct, every relationship that is valid in nature is, *in abstractu*, an element in his domain, a subject for his study. He knows, too, at least he strongly suspects, that, if the assumption be not correct, his domain remains the same absolutely. The two realms, of mathematics, of natural science, like the two attitudes, the mathematician's and that of the nature student, are fundamentally distinct and disparate. To think logically the logically thinkable — that is the mathematician's aim. To assume that nature is thus thinkable, an embodied rational logos, and to discover the thought supposed incarnate there — these are at once the principle and the hope of the student of nature.

Suppose the latter student is right, suppose the outer universe really is an embodied logos of reason, an infinitely intricate garment ever weaving and ever woven, warp and weft, of logically determinate relationships, does that imply that all of the logically thinkable is incorporated in it? It seems not. A cosmos, a harmoniously ordered universe, one that through and through is self-compatible, can hardly be the whole of reason materialized and objectified. There appears to be many a rational logos. At any rate the mathematician has delight in the construction and contemplation of divers systems that are inconsistent with one another, though each is composed of consistent relationships. He constructs in thought, as witness the geometry of hyperspaces, ordered worlds, worlds that are possible and logically actual, and he is content not to know if any of them be otherwise actual or actualized. There is, for example, a Euclidean geometry and there are infinitely many kinds of non-Euclidean (see NON-EUCLIDEAN GEOMETRY). These theories

regarded as «applied» mathematics, regarded, that is, as *true* descriptions of some one actual space, are incompatible. In our universe, to be specific, if it be, as Plato thought and nature science takes for granted, a geometrized or geometrizable affair, then one of these geometries may be objectively valid in it. But in the vaster world of thought, in the world of pure mathesis, all of them are valid; there they coexist, and interlace among themselves and others as differing strains of a hypercosmic harmony.

A geometry, indeed any mathematical theory, consists of a definite system of determinate compatible principles or assumptions or hypotheses or postulates (commonly called axioms) together with their implications, their logically deducible consequences. Accordingly, natural science, the term being broadly employed to signify knowledge that is ultimately dependent upon «observation and experiment,» cannot be or become strictly mathematical. It aspires to the *character*, and approximates and imitates the *form*, of mathematics, but it can never really attain either. Mathematics is concerned with implications, not applications. Such terms as «applied mathematics,» «mathematical physics,» and the like, are indeed in common use, but the signification, rightly understood, is always that of a mixed doctrine, a doctrine that is thoroughly analyzable into two disparate parts: one of these consists of determinate concepts formally combined in accordance with the established canons of ratiocination, i.e., it is pure mathematics and not natural science; the other is matter of observation and experiment, i.e., it is natural science and not mathematics. No fibre of either component is a filament of the other. Whether the behavior of natural phenomena is or is not exactly descriptible by mathematical formulæ can never be ascertained, for the means to «natural knowledge,» viz., observation and experiment, are fallible by nature, and, however refined or prolonged, are incapable of yielding absolute exactness or certainty. Of any so-called law of nature, «the most, the last, the best that can be said» is that its agreement with the facts is so nearly perfect that every discrepance, if any there be, has escaped detection.

Cannot the like be said of mathematics? In the foregoing conception of mathematics it has indeed been tactily assumed that some ideas are completely determinable, that there are possible systems of postulates absolutely free alike from obscurity and from interior contradiction, that the postulates of such a system import a perfectly definite body of ascertainable implications, and that there is a perfect standard of logic quite independent of time and place and of the defects and idiosyncrasies of individual reasoners. May not these assumptions, some or all of them, be incorrect? There are some grounds, historical and biological, for suspecting that such may be the case. Such an admission, however, whether tentative or unconditioned, has by no means the effect of undefining mathematics or of dethroning the science from its commanding position among the knowledges. It would indeed leave man without the possession, even without the hope, of *absolute* knowledge, but, among all the forms of actual or potential proximate knowledge, mathematics would still rightly rank as highest. It would indeed be marked by a degree of uncertainty or indeterminateness or relativity or inexactness, viz., that degree of inexactness which by supposition would belong to *all* meanings and standards. Hence it would not be peculiar to mathematics, but would be common to it and every other science. But every such «other science» has an *additional* mark of indeterminateness, the characteristic inexactness of all possible observation and experiment. In any case, then, the observational and experimental sciences are, in respect to certainty and exactness, hopelessly inferior to mathematics.

But in all ages it has been the faith of the mathematician that complete determination of concepts and absolute rigor of demonstration are in fact attainable, not, however, in the realm of observation and experiment, but in the world of pure thought. It is, then, in that world, where all *entia* dwell, where is every type of order and every manner of correlation and every variety of relationship and every form of implication, it is in this infinite ensemble of eternal verities whence, if there be one cosmos or many of them, each derives its character and mode of being,— it is there that the spirit of mathesis has its home and its life.

Is it a restricted home, a narrow life, static and cold and gray with logic, without artistic interest, devoid of emotion and mood and sentiment?

That world, it is true, is not a world of solar light, it is not clad in the colors that glorify the things of sense, but it is an illuminated world, and over it all and everywhere throughout are hues and tints transcending sense, painted there by radiant pencils of psychic light, the radiance in which it lies.

It is a silent world. Nevertheless, in respect to the highest principle of art — the interpenetration of content and form, the perfect fusion of mode and meaning — it even rivals music.

In a sense, it is a static world, like those of the sculptor and the architect. The figures, however, which reason constructs and the mathetic vision beholds, transcend the temple and the statue, alike in simplicity and in intricacy, in delicacy and in grace, in symmetry and in poise.

Not only are this home and this life, thus rich in æsthetic interests, really controlled and sustained by motives of a sublimed and supersensuous art, but the religious aspiration, too, finds there, especially in the beautiful doctrine of invariants, the most perfect symbols of what it seeks — the changeless in the midst of change, abiding things in a world of flux, configurations that remain the same despite the swirl and stress of countless hosts of curious transformations.

Literature.— The literature having for its object the exposition of the nature and principles of mathematics is extensive. By far the most important recent contribution, which at the same time serves to introduce the reader to the chief memoirs in the field, is B. Russell's 'The Principles of Mathematics,' Vol. I. For an excellent critical review of the principal modern attempts to define mathematics, the reader may be referred to Prof. M. Bôcher's 'The Fundamental Conceptions and Methods of Mathematics' ('Bull. of the American Math. Soc.,' Vol. XI). Consult also Whitehead,

A. N., and Russell, B. A. W., 'Principia Mathematica' (Cambridge 1910–); Whitehead, A. N., 'Introduction to Mathematics' (Home University Library).

CASSIUS J. KEYSER,
Adrain Professor of Mathematics, Columbia University.

MATHER, măt'h'ér, Cotton, American colonial clergyman, son of Increase Mather (q.v.): b. Boston, 12 Feb. 1663; d. there, 13 Feb. 1728. He entered Harvard College at 11, and at his graduation in 1678 President Oakes expressed his expectation that he would resemble his venerable grandfathers, John Cotton and Richard Mather, who should be united and flourish again in him. He was early distinguished for piety, and in his 14th year began a system of rigid and regular fasting and vigils which he continued through life. He was occupied after leaving college with teaching, in 1680 became the assistant of his father in the pastorate of the North Church, Boston, and in 1684 was ordained as his colleague. When, at the report of the landing of the Prince of Orange in England, Governor Andros was seized and imprisoned in Boston, Cotton Mather prepared the public declaration justifying the measure. But it is in connection with proceedings concerning witchcraft that he is most generally known. In 1685 he published his 'Memorable Providences relating to Witchcraft and Possessions,' narrating cases which had occurred at intervals in different parts of the country; and during the witchcraft excitement in Salem in 1692 was a prejudiced investigator in the matter, publishing the next year his 'Wonders of the Invisible World,' in order to confirm believers in that kind of demoniac possession. In 1702 appeared his greatest work, 'Magnalia Christi Americana,' an ecclesiastical history of New England concerning which he was admitted to know more particulars than any other man. Though strongly marked by his partialities and prejudices, its somewhat quaint and grotesque character, its admixture of superstition, learning and ingenuity, make it still interesting. In 1713 his 'Curiosa Americana' was read before the Royal Society of London, and he was elected a member of that body, being the first American to receive this distinction. In its 'Transactions' in 1721 appeared an account of the practice of inoculation for the smallpox, introduced by Lady Mary Wortley Montagu; and it was by the efforts of Mather in connection with Dr. Boylston, against both professional and popular prejudice, that the operation was first performed in Boston. His 'Essays to Do Good' (1710) was admitted by Dr. Franklin to have influenced some of the principal events of his life; and his 'Christian Philosopher' and 'Directions for a Candidate of the Ministry' enjoyed high repute. His 'Parentator' (1724) is a life of his father, Increase. Vain and pedantic as he was and narrow and credulous as he showed himself to be in regard to witchcraft and other topics of his time, he was in many directions a useful, public-spirited citizen who deserves to be regarded more leniently by posterity than has sometimes been the case. Consult 'Life' by Samuel Mather (Boston 1729); Pond, Enoch, 'The Mather Family' (ib. 1844); Marvin, A. B., 'Life and Times of Cotton Mather' (ib. 1892); Wendell, Barrett, 'Cotton Mather' (1891); Tyler, 'History of American Literature' (Vol. II, New York 1881).

MATHER, Frank Jewett, Jr., American professor of art: b. Deep River, Conn., 6 July 1868. In 1889 he was graduated at Williams College, and subsequently studied at Johns Hopkins (Ph.D. 1892), the University of Berlin and L'École des Hautes Études, Paris. From 1893 to 1900 Dr. Mather was instructor and assistant professor of English and Romance languages at Williams College; was editorial writer on the New York *Evening Post*, assistant editor of *The Nation* in 1901–06; art critic of the *Evening Post* in 1905–06 and again in 1910–11 and American editor of the *Burlington Magazine* in 1904–06. In 1910 Dr. Mather became Marquand professor of art and archæology at Princeton University. He is the author of 'Homer Martin, Poet in Landscape' (1912); 'The Collectors,' short stories (1912); 'Estimates in Art' (1916), also several literary and philological monographs. He is a contributor, chiefly on art, to *The Nation*, and other periodicals. In 1917 he served as chief boatswain's mate in the United States Naval Reserve Fleet (coast patrol).

MATHER, Increase, American colonial divine, son of Richard Mather (q.v.): b. Dorchester, Mass., 21 June 1639; d. Boston, 23 Aug. 1723. He was graduated at Harvard College in 1656, and in 1658 at Trinity College, Dublin. He afterward preached in Devonshire and the island of Guernsey, and on the Restoration was urged to conform and settle in England; but he refused, and on his return to Boston was invited to preach to the North Church, of which he was ordained pastor in 1661. This office he held for 62 years. He was a member of the synod of 1679, and drew up the propositions which were adopted concerning the proper subjects of baptism. In 1681 he was elected president of Harvard College, but the reluctance of his church to relinquish him induced him to decline the position. In 1684 the office was again offered him, and he accepted it with a stipulation that he should retain his relation to his people. He continued in this station till 1701, when he retired in consequence of an act of the general court requiring the president to reside in Cambridge. He received the first diploma for the degree of D.D. that was granted in America. When in 1683 Charles II demanded that the charter of Massachusetts should be resigned into his hands, Mather was foremost in opposing the measure; and when that monarch annulled the charter in 1685, he was sent to England as agent for the colonies. He was in England during the revolution of 1688, and, having found it impossible to obtain a restoration of the old charter, accepted a new one, under which the appointment to all the offices reserved to the Crown was confided to him. He returned in 1692, when the general court appointed a day of thanksgiving for his safety and for the settlement of the dispute. He is stated to have condemned the violent proceedings which followed relating to witchcraft. He was accustomed to spend 16 hours every day in his study, and always committed his sermons to memory. One-tenth part of all his income was devoted to purposes of charity. He was the author of 92 distinct publications. His 'Remarkable

Providences' was republished in the 'Library of Old Authors' (1856), and other works by him are 'A Brief History of the War with the Indians in New England' (1676); 'Relation of Troubles of New England from the Indians' (1677; 1864); 'Cases of Conscience Concerning Witchcraft' (1693; 1862); 'Cometographia, or a Discourse Concerning Comets' (1683). Consult Pond, Enoch, 'The Mather Family' (Boston 1844); Walker, Williston, 'Ten New England Leaders' (New York 1901); Tyler, M. C., 'History of American Literature' (Vol. II, New York 1881); Sibley, 'Harvard Graduates' (Vol. I, Cambridge 1873).

MATHER, Richard, American colonial divine: b. Lowton, Lancashire, England, 1596; d. Dorchester, Mass., 22 April 1669. He became a schoolmaster at Toxteth Park, near Liverpool, at the age of 15; studied at Brazenose College, Oxford, in 1618; was ordained in the English Church soon after, and became the minister of Toxteth, in which position he remained 15 years. He was suspended for non-conformity to the ceremonies of the Established Church in 1633, and though soon restored by the influence of friends was again silenced in the following year. He therefore decided to emigrate to New England, arriving in Boston in August 1635. The next year he became pastor of the church in Dorchester, and held that position till his death. He was one of the compilers of the 'Bay Psalm Books' and assisted to frame in 1648 a model of discipline known as the Cambridge Platform. He married for his second wife the widow of John Cotton (q.v.). His 'Journal, Life and Death' was issued by the Dorchester Historical Society in 1850. See CONGREGATIONALISM and consult Mather, Increase, 'Life and Death of Richard Mather' (Cambridge 1670); Tyler, M. C., 'History of American Literature' (Vol. II, New York 1881).

MATHER, Robert, American lawyer and railroad official: b. Salt Lake City, 1859; d. 1911. In 1882 he was graduated at Knox College, Illinois, and four years later was admitted to the bar at Chicago. He practised in that city in 1886–89; was local attorney in 1889–94, assistant general and general attorney in 1894–1902, and general counsel in 1902–09 of the Chicago, Rock Island and Pacific Railroad. In 1909 he was elected chairman of the board of the Westinghouse Electric Company. Mr. Mather was interested, as officer or director, in several railroad and industrial companies.

MATHER, William Williams, American geologist: b. Brooklyn, Conn., 24 May 1804; d. Columbus, Ohio, 26 Feb. 1859. He was graduated from West Point in 1828 and was an assistant professor of chemistry and geology there, 1829–35. After a short period spent as professor of chemistry at the University of Louisiana (1836), he undertook the superintendence of a geological survey of the 1st district of New York State which included the Hudson River counties, a labor which lasted from 1836 to 1844. He was also State geologist of Ohio 1837–40, and of Kentucky 1838–39, and from 1842–45, and 1847–50, professor of natural science in the Ohio University at Athens. He made a collection of about 22,000 mineralogical specimens. He contributed frequently to scientific journals, edited the *Western Agriculturist* for a time and published 'Geology of the 1st Geological District' (in 'Natural History of New York,' 1843); and 'Elements of Geology.'

MATHESON, măth'ĕ-sŏn, **Arthur James,** Canadian statesman: b. Perth, Ontario, 1842; d. 1913. He received his education at Upper Canada College and Trinity College, Toronto; was called to the bar in 1870 and established a practice in his native town of which he was mayor in 1883–84. From 1894 to 1913 he was a member of the Conservative party in the Ontario legislature and served as provincial treasurer in 1905–13 under Premier Sir James P. Whitney. In 1906 he was a member of the Ottawa Inter-provincial Conference and in the following year of the National Conference on Taxation. In 1910 he served as vice-president of the International Commission. Mr. Matheson was made K.C. in 1908. He served in the militia after 1866, saw service during the Fenian raids and in 1900 attained the rank of brigadier-general.

MATHESON, George, Scottish Presbyterian clergyman: b. Glasgow, 27 March 1842; d. 28 Aug. 1906. He was educated at Glasgow University and although he had lost his sight in boyhood he entered the ministry of the Kirk of Scotland and was ordained in 1868. He was minister of Innellan on the Firth of Clyde 1868–86; and of Saint Bernard's Parish, Edinburgh (1886–97). He was the author of the famous hymn, 'O Love that Will Not Let Me Go,' which finds a place in nearly every modern hymnal. Among his many published books are 'Aids to the Study of German Theology' (1874); 'Natural Elements of Revealed Theology' (1881); 'The Psalmist and the Scientist' (1887); 'Sidelights from Patmos' (1897); 'The Sceptre Without a Sword' (1901); 'Representative Men of the Bible' (three series); and 'Representative Women of the Bible' (1907).

MATHESON, Samuel Pritchard, Canadian clergyman: b. Manitoba (then the Red River Settlement), 20 Sept. 1852. He received his education at Saint Johns' College School and Saint John's College, Winnipeg. He received deacon's orders in the Anglican Church in 1875 and those of priest in 1876. He became master at Saint John's College School; subsequently served as professor of exegetical theology at Saint John's College, canon and dean of Saint John's Cathedral, deputy headmaster and headmaster of Saint John's College School. Subsequently he was warden and chancellor of Saint John's College. He became secretary of the Provincial Synod of Rupert's Land, and prolocutor of same and in 1902 became prolocutor of the General Synod of Canada. In 1903 he became coadjutor bishop of Rupert's Land, in 1905 he became archbishop and in 1909 was made Primate of all Canada.

MATHEW, Theobald, known as "FATHER MATHEW," Irish temperance reformer: b. Thomastown Castle, County Tipperary, Ireland, 10 Oct. 1790; d. Queenstown, Ireland, 8 Dec. 1856. He was educated at Maynooth College and the Capuchin Convent, Cork, and was ordained to the Roman Catholic priesthood in 1814. In 1838 he inaugurated a temperance crusade and his labors in Great Britain and Ireland induced hundreds of thousands to sign the total abstinence pledge. The most conclusive evidence of the benefit of his preaching

was the reduction of nearly £600,000 on the duties of spirits imported in Ireland in five years. He made a tour of the United States in 1849–51 and was very successful. Though pensioned by the queen he was never entirely relieved from the burden of debt with which his extended tours had burdened him, and which caused his imprisonment for a time in 1847. Consult 'Life' by J. F. Maguire (London 1863; abridged ed., 1890); Matthew, F., 'Father Mathew: his Life and Times' (London 1890); Tynan, K., 'Father Mathew' (ib. 1908).

MATHEWS, măth'ūz, **Abert,** «PAUL SIEGVOLK,» American lawyer and author: b. New York, 8 Sept. 1820; d. there, October 1903. He was graduated from Yale in 1842 and after studying law was admitted to the New York bar in 1845. He soon acquired an extensive practice and was especially skilled in chancery practice. He found time for literary work despite the claims of his profession, and under the pseudonym «Paul Siegvolk» published 'Walter Ashwood,' a once popular love story (1860); 'A Bundle of Papers' (1879); 'Thoughts on Codification of the Common Law' (1881); 'Ruminations: The Ideal American Lady and Other Essays' (1892); 'A Few Verses' (1893), etc. In the early part of his career he was a close friend of N. P. Willis, whom he aided in establishing *The Home Journal.*

MATHEWS, Charles, English actor: b. London, 28 June 1776; d. Plymouth, England, 28 June 1835. He made his début as an actor in Richmond in 1793 and was subsequently engaged for some years in Dublin and London. In 1818 he made a hit as a professional entertainer in his 'At Home.' He continued in this class of work, making two successful trips to the United States and, returning, presented in England with great success 'A Trip to America.' In 1828 he became joint proprietor of the Adelphi Theatre, London. Consult Baker, 'Our Old Actors' (London 1881); Mrs. Mathews, 'Memoirs of Charles Mathews, Comedian' (London 1839).

MATHEWS, Charles James, English actor: b. Liverpool, 26 Dec. 1803; d. Manchester, England, 24 June 1878. He was the son of Charles Mathews (q.v.) and was educated as an architect, but abandoned that calling for the stage. As a light comedian he was very successful, but his attempts at managing Covent Garden and the Lyceum Theatre in London were failures. He made several trips to the United States, Paris and Australia, presenting an entertainment similar to his father's famous 'At Home.' Consult Dickens, Charles, 'Life of Charles James Mathews' (London 1879).

MATHEWS, Edward Bennett, American geologist: b. Portland, Me., 16 Aug. 1869. In 1891 he was graduated at Colby College and in 1894 received the degree of D.Ph. at the University of Johns Hopkins. In 1891–94 he was field assistant of the United States Geological Survey; in 1894–95 was instructor in mineralogy and petrography, in 1895–99 associate, in 1899–1904 associate professor and since 1904 professor of geology at Johns Hopkins. Since 1917 he has served as chairman of the geological department. From 1898 to 1917 Dr. Mathews was assistant State geologist of Maryland and after 1917 was State geologist. He published 'Bibliography and Cartography of Maryland' (1897); 'Maps and Map-Makers of Maryland' (1898); 'Building Stones of Maryland' (1898); 'Limestones of Maryland' (1910); 'History of the Mason-Dixon Line'; 'Physical Features of Maryland'; 'Water Resources of Maryland,' and numerous geological and historical papers.

MATHEWS, Ferdinand Schuyler, American artist and author: b. New Brighton, N. Y., 30 May 1854. He was educated at Cooper Institute, studied art in Italy and has made a specialty of decorative designing. He has contributed extensively to the magazines both as illustrator and writer, in the latter field dealing chiefly with subjects which come within his own profession and also those which belong to natural science. He has published 'The Writing Table of the 20th Century' (1900); 'The Field-Book of American Wild Flowers' (1902); 'Field-Book of Wild Birds and their Music' (1904); 'Field-Book of American Trees and Shrubs' (1915), etc.

MATHEWS, Joseph McDowell, American surgeon: b. Newcastle, Ky., May 1847. He was educated at the Newcastle Academy and at the University of Louisville. He practised in Louisville and was appointed professor of surgery at the Louisville Hospital College of Medicine. He is president of the Kentucky State Board of Health and in 1898–99 was president of the American Medical Association. He published 'Diseases of the Rectum, Anus and Sigmoid Flexure' (1893; 3d ed., 1903); and 'How to Succeed in the Practice of Medicine' (1902).

MATHEWS, Shailer, American educator: b. Portland, Me., 26 May 1863. He was graduated from Newton Theological Institution in 1887 and studied in Berlin. In 1887 he was appointed assistant professor of rhetoric at Colby University and in 1889 accepted the chair of history and political economy, which he occupied until 1894, when he was made associate professor of New Testament history in the University of Chicago. In 1897 he was made professor, in 1899 junior dean, in 1905 professor of systematic theology, in 1906 professor of history and comparative theology and in 1908 dean of the Divinity School. In 1911 he was elected president of the Western Economic Society, in 1908 president of the Co-operative Council of City Missions, in 1910 president of the Chicago Baptist Executive Council, in 1912 president of the Federal Council of the Churches of Christ in America and in 1915 president of the Northern Baptist Convention. He is director of religious work in Chautauqua Institution, New York, and one of the trustees of the Church Peace Union founded by Andrew Carnegie. In 1915 he visited Japan as a representative of the Federal Council of the Churches of Christ in America. He gave the Haverford Library Foundation Lectures in 1907, the Earle Lectures, Berkeley, Cal., in 1913, and the Merriam Lectures, Worcester, Mass., in 1914. He was editor of the *World To-day* from 1903 to 1911 and has been editor of *The Biblical World* since 1913. He is also editor of New Testament handbooks, 'The Bible for Home and School,' 'Social Betterment,' handbooks of ethics and religion, Women Citizen's Library and associate editor of the 'Dictionary

of the Bible,' *American Journal of Theology, Constructive Quarterly*. He is the author of 'Select Mediæval Documents' (1891; 1900); 'The Social Teaching of Jesus' (1897); 'A History of New Testament Times in Palestine' (1899); 'Constructive Studies in the Life of Christ,' with E. D. Burton (1901); 'The French Revolution — A Sketch' (1901); 'Principles and Ideals for the Sunday School,' with E. D. Burton (1903); 'The Messianic Hope in the New Testament' (1905); 'The Church and the Changing Order' (1907); 'The Social Gospel' (1909); 'The Gospel and the Modern Man' (1909); 'Scientific Management in the Churches' (1911); 'The Making of Tomorrow' (1913); 'The Individual and the Social Gospel' (1915); 'The Spiritual Interpretation of Modern History' (1916).

MATHEWS, William, American author: b. Waterville, Me., 28 July 1818; d. Boston, Mass., 14 Feb. 1909. He studied law at Harvard and was admitted to the bar in 1838, practising for a time in Waterville, but abandoned law for journalism, establishing the *Watervillonian* in 1841, which later he named the *Yankee Blade*. In 1859–62 he was engaged in journalism in Chicago. In 1862 he was appointed professor of English and rhetoric at the University of Chicago, but in 1875 resigned in order to devote himself exclusively to literature. Among his books are 'Getting on in the World' (1873); 'The Great Conversers' (1874); 'Words: Their Use and Abuse' (1876); 'Oratory and Orators' (1870); 'Literary Style' (1881); 'Men, Places and Things' (1888); 'Wit and Humor: Their Use and Abuse' (1888); 'Nugæ Literariæ' (1896); 'Conquering Success' (1903), etc.

MATHEWS, William Smythe Babcock, American musical writer and editor: b. Loudon, N. H., 8 May 1837; d. 1912. He obtained his musical education in Boston and became a teacher in 1853; he was for a time engaged at the Wesleyan Female Seminary in Georgia, but in 1867 he removed to Chicago, where he was prominent as an organist and engaged in editorial work and criticism of music on the leading Chicago papers. In 1891 he established the magazine, *Music*, and edited it until 1903, when it became a part of the *Philharmonic*. He is the author of 'Outlines of Musical Form' (1867); 'Emerson Organ Method' (1870); 'How to Understand Music' (1880–88); 'Music and Its Ideals' (1897); 'Dictionary of Musical Terms' (1895); 'Popular History of Music' (1901); 'The Great in Music' (1900–03), etc.

MATICO (*piper angustifolium*), a shrub of the natural order Piperaceæ, native of Peru; remarkable for the styptic property of its leaves and unripe fruit, used for stanching wounds.

MATIN, a large hound-like French dog, resembling the Great Dane, but having a rough coat. The head is elongated, the forehead flat, the ears pendulous toward the tips; color, yellowish-fawn or whitish. It is commonly employed in France as a sheep-dog and watchdog.

MATINS, the daily office of morning prayer in the Anglican communion. It is composed in part of the pre-Reformation offices of Matins and Lauds. In the Roman Catholic Church, the first portion of the Divine Office, with which Lauds are usually associated. On Sundays and double feasts matins have three nocturns; on simple feasts and week-days, one nocturn. Easter and Pentecost have each only one nocturn, with three psalms. After private prayer versicles and responses are recited; the invitatory psalm follows. In the first nocturn are said three psalms on feast days, 12 when the office is of the Sunday and three lessons from Scripture; the second and third nocturns have each three psalms and the lessons are chosen from the patristic writings for the second, and from some commentary on the Gospel of the day of the third nocturn.

MATRIARCHATE, position or power of a matriarch, a name formerly given to the wife of a patriarch. Among the Indians the mother is considered of superior importance in families, clans or tribes. Job's wife, Xantippe, and others in history have been called matriarchs. In certain primitive tribes the mother, in line of descent and inheritance, takes precedence of the father. Consult Bachofen, J. J., 'Das Mutterrecht' (2d ed., Basel 1897); Dargan, 'Mutterrecht und Raubehe' (Breslau 1883); Westermarck, E. A., 'History of Human Marriage' (3d ed., London 1903).

MATRIMONY VINE. See LYCIUM.

MATRONALIA, the 1st of March, the New Year's day of the Roman religious calendar, sacred to Juno, the deity of matrons. On this festival day wives expected presents from their husbands, and themselves gave an entertainment to the household slaves. Consult Fowler, W. W., 'Roman Festivals' (London 1899).

MATSUDAIRA, mah-tsu-digh'rah, the generic name of 52 families of territorial nobles in feudal Japan, mostly, although not all, descended from an ancestor Minamoto Chikauji of the 14th century, 11th in generation from Yoshiiyé who, in the village of Matsudaira, in Mikawa, espoused the daughter of Matsudaira Nobushige and took his wife's name. When, in Yedo in 1604, the Tokugawa line of showguns was established, permission was given to the heads of allied or loyal clans to bear this name. Among the hundreds of feudal barons and others thus favored have been many of the most illustrious in the period 1604–1868. After this date, the name, with the privilege of bearing the ancestral coat of arms, was restricted to 27 families, which now comprise a marquis, 3 counts, 22 viscounts and 1 baron. Their heraldic crest consists of three mallow leaves within a circle. With the exception of Fujiyama, this is the most characteristic decoration seen on the older Japanese art products. It is said to have been selected by Iyeyasu, when by a loyal vassal three cakes, laid over as many mallow leaves, on a plate, were presented for the conqueror's refreshment. Consult Dixon, 'Japan' (1869); Griffis, 'Th Mikado's Empire' (1912), and La Tourette, 'The Development of Japan' (1918).

MATSUDAIRA SHUNGAKU, mah-tsu-digh-rah shoon'gah-ku, champion, during Jajan's hermit days, of Western civilization and of friendship with the United States: b. Yedo, 11 Oct. 1828; d. Tokio, 1880. Adopted at 10 years of age by Matsudaira, baron of Echizen, at 21 he began sweeping and con-

structive reforms, introducing modern military, economic and hygienic methods, abolishing archery in favor of fire arms, establishing cannon and rifle factories, sending young men as students to the Dutch at Nagasaki, establishing lectures on the Oyoméi (q.v.) philosophy and writing manifestoes. He combatted popular prejudices, showed the superiority of Western civilization and the reasonableness of Christianity, compelled the use by doctors of the Western methods of medical practice, opened a dispensary and organized a foreign literature department in the excellent clan school in Fukui. Opposed to opening the country prematurely, on unequal terms, as was done by Ii Naosuké, he suffered domiciliary confinement but was later called to be virtual premier of the empire. With the assistance of Yokoi Héishiro he abolished the century-old custom of compelling the feudal barons to live half the year in Yedo, leaving their families as hostages when away. This made Kioto the centre of affairs. He later brought the first of the yatio in his domain, and here the first public schools beyond the treaty ports were organized, and one of the very first of the new regiments of the peasant national army was raised. Out of this region, chiefly, was raised the famous Ninth Division that took Port Arthur. High posthumous honors were awarded this pioneer of Western civilization. His biography and writings have been compiled by his son the marquis. Consult Griffis, 'The Mikado: Institution and Person' (1915), and 'The Mikado's Empire' (1912).

MATSUKATA, Masayoshi, mā-sī-ō'shē mät-soo-kā'tä, MARQUIS, Japanese statesman: b. Satsuma 1835. He was son of a Samurai, but fell in with the Radical party; was made head of the prefecture (or *ken*) of Hida after the revolution; was prominent in the tax reform of 1875; represented Japan in several industrial exhibitions; was a member of the Cabinet, in 1880 as Minister of Commerce, in 1881 as Minister of Finance, and, with the same portfolio, as Prime Minister from 1891 to 1893. His great work was in 1896–97, when he formed a new cabinet, carried through the gold standard, set Japanese credit on its feet, but he was forced to retire because of the ill-success of his scheme of taxation. He was Minister of Finance a second time in 1898–1900, became Privy Councillor in 1903, and received the title of marquis in 1906. He was also president of the Japanese section of the Red Cross.

MATSUMOTO, Japan, town, in the district of Nagano, in the island of Hondo, 100 miles north by west of Tokio. The town manufactures baskets, preserved fruits and silks and has an old daimyo castle. Pop. 35,000.

MATSUMURA, Ninzo, Japanese botanist: b. Ibaraki-Ken, 1856. In 1886–88 he studied at the universities of Würzburg and Heidelberg, meanwhile holding the assistant professorship of botany in the University of Tokio to which he had been appointed in 1883. He became full professor in 1890 and seven years later was appointed director of the Botanical Gardens. He collaborated in Brinkley's 'Japanese-English Dictionary' (1896) and published 'Nomenclature of Japanese Plants in Latin, Japanese and Chinese' (1884); 'Names of Plants and their Products in English, Japanese and Chinese' (1892); 'Conspectus of Leguminosæ' (1902); 'Index Plantarum Japonicarum: Cryptogamæ' (1904); 'Phanerogamæ' (1905); 'Tentamen Floræ Lutchuensis,' with Ito (1899); 'Revisio Alni Specierum Japonicarum' (1902); 'Enumeratio Plantarum in Insula Formosa Sponte Crescentium' (1906); 'Chinese Names of Plants' (1915); 'Classified Etymological Vocabulary of the Japanese Language Ancient and Modern' (1915).

MATSUSHIMA, Japan, village on the northeast coast of the island of Hondo, situated on the Bay of Sendai. In a lagoon opposite the village are 808 islets ranging in elevation from 30 to 300 feet and covered with pines. This beautiful natural garden is one of the wonders of Japan.

MATSUYAMA, Japan, town and capital of the district of Ehime, on the island of Shikoku, five miles from Mitsu. It contains a great feudal castle, one of the few perfect specimens of its period in modern Japan. Pop. 44,166.

MATSUYE, or **MATSUE,** Japan, town and capital of the district of Shimane, on the island of Hondo, 140 miles north by west of Kioto. It has large paper manufactories and agate-polishing establishments and has numerous temples. It is well built and is one of the cleanest towns in Japan. Pop. 36,209.

MATSYS, mät-sīs', or **MASSYS, Quentin,** Flemish painter: b. Antwerp or Louvain, about 1460; d. there, between 13 July and 16 Sept. 1530. A blacksmith until he was 20, legend says that he turned artist to win the love of a painter's daughter. He was acquainted with many of the notables of the day, including Dürer, Erasmus and Sir Thomas More. Much of his present fame is due to genre pictures, especially of misers and money-changers, which are not his work, but that of his school, among them his son Jan, whose 'Misers' is at Windsor Castle. Matsys' own work is styled a connecting link between Van Eyck and the latter Dutch realists; apart from such excellent portraits as those of Maximilian of Austria and Petrus Aegidius, it is mostly religious in theme. The 'Burial of Christ,' an altarpiece for the Antwerp Cathedral, now in the Antwerp Museum, and the 'Story of Saint Anne,' now in the Brussels Gallery, are the best examples of his work. The Metropolitan Museum, New York, contains his 'Adoration of the Kings.' Consult Cohen, Walter, 'Studien zur Quentin Metsys' (Bonn 1904) and de Bosschère, Jean, 'Quentin Metsys' (Brussels 1907).

MATTAWA, or **MATTAWAN,** Canada, town in the Nipissing district of Ontario province, situated at the confluence of the Mattawa and Ottawa rivers at the east end of Lake Timiskaming, on the Canadian Pacific Railroad, 45 miles east of North Bay. Great quantities of mica are obtained in the neighborhood. The town has extensive lumber interests and is a distributing point for several great lumber companies. It is also famous as the starting-point of hunters and anglers. Pop. 1,524.

MATTAWA, a river of Ontario, the source of which is Trout Lake, east of Lake Nipissing. It flows east a distance of about 45 miles and enters the Ottawa River at Mattawa, 308 miles from Montreal. This river forms part of an almost continuous water-way from the Ottawa

River to Lake Huron, and before the Canadian Pacific Railroad was built this water route was much used for transportation and travel.

MATTEAWAN, măt-tẹ-ą-wŏn', N. Y. See BEACON, N. Y.

MATTEI, mät-tā'ē, **Tito,** Italian musician and composer: b. Naples, 1841; d. 30 March 1914. He was educated in Naples. He received the degree of professor in Saint Cecelia's Academy at Rome when he was 11 and was also elected a member of the Philharmonic Society in Florence and other cities. He gave his first concert when 15 and afterward made tours of Europe, but in 1863 settled in London, where he lived for 50 years, confining his concert tours to Great Britain, and in 1870 he conducted an Italian opera at the Lyceum Theatre. He was the composer of hundreds of songs and pianoforte pieces, many of which have become widely popular, and the operas 'Maria di Gand,' 'La Prima Donna,' etc.

MATTER, *in physics, mechanics and chemistry,* the tangible substance of which the world external to our minds is composed and which is characterized by the resistance which it opposes to muscular efforts exerted upon it. Since we can know it only through the mediation of our senses, its actual objective reality has often been questioned by philosophers and metaphysicians; and in order to avoid doubtful points of this sort it is frequently defined merely as a "physical concept," without making any hypothesis as to its objective existence. (Consult Pearson, 'The Grammar of Science'). In physics and chemistry we think and speak of it as having a real existence, however, just as we do in common life. For scientific purposes it is highly important to be able to accurately compare the quantities of matter in two bodies; but the phrase "quantity of matter" is not commonly used in science, the word "mass" (or inertia) being substituted for it. The term "mass" is synonymous with "quantity of matter" so long as the bodies compared are identical in composition and in physical state; but by its use we avoid the uncertainty in the meaning of the longer phrase, when it is applied to bodies of dissimilar composition. Two bodies are said to have "equal masses" under the following conditions: Let the two bodies be conceived to be initially at rest, and free from the action of any external forces whatsoever. Let them then be exposed to the action of equal forces for an equal length of time. If, under these circumstances, the velocities that are produced in the two bodies are equal, the masses of the bodies are also equal, *by definition.* But if the velocities that are produced are unequal, then the masses are also unequal, and are (by definition) proportional to these velocities; the body which is moving the faster being the one whose mass is the less. It would be impossible to carry out an elaborate experiment of this kind every time we wished to compare the masses of a pair of bodies, and it fortunately happens that masses can be compared with great accuracy by merely weighing the bodies against each other in a balance. For equality of weight means that the earth's attractive force is the same upon both; and if (as we know to be the case, by experiment,) the two bodies would fall with the same speed in a vacuum, it follows that equal forces acting upon the two bodies for equal times communicate to them equal velocities; and hence, by the definition of "mass," the mass of the two bodies are equal. It will be noted that mass and weight are two essentially different things, although they are very commonly confused, because they are strictly proportional to each other, according to the most accurate experiments that have yet been made. Yet it is not at all impossible to imagine a state of things in which mass and weight would not be strictly proportional. It is only by experiment, for example, that we know that the earth attracts a body with precisely the same force, whether the body is hot or cold. The attraction between two permanent magnets varies with the temperature, and it may yet be found that gravitative attraction varies in the same way, though to a much smaller extent. Numerous experimenters have in fact fancied that they could detect an effect of this kind, though its reality is not yet admitted. But we can hardly admit that the mass of a body is a function of the temperature; and so we see that the apparently strict proportionality between mass and weight is not at all a necessity of thought, but merely an experimental fact, which may any day be shown to be nothing but a close approximation to the actual truth.

So far as we know, matter can neither be destroyed nor created by any experimental means at our command, nor by any process now operative in nature. This great fact is often called the "law of the conservation of matter," and it appears to be rigorously true. As has been pointed out above, future experiment may show that the weight of a body depends to a slight extent upon its temperature, and it may also be found that the weight of a chemical compound is not always precisely equal to the sum of the weights of its constituents; but it is believed that any irregularities of this sort that may be discovered will hold true to the weight only, and will not affect the mass; and that the weight will also return to its original value when the substance that is weighed is brought back to the same chemical and physical condition again. The gravitative action of matter is one of its most singular attributes, and one which we are still far from understanding. It is apparently true that every particle of matter attracts every other particle with a force which is directly proportional to the product of the masses of the two particles and inversely proportional to the square of the distance between them, and independent of every other circumstance. It is not certain that this law holds true, nor that the attraction exists at all, at distances comparable with the distance from the earth to the fixed stars, but it appears to hold rigorously at distances commensurate with the dimensions of the solar system. Electric and magnetic forces may be either attractive or repulsive; but gravitative action is probably always attractive, the only phenomena which would countenance the opposite view being the apparent repulsion that the sun exerts upon the tails of comets and upon the coronal streamers that are seen at the time of a total solar eclipse.

Matter exists in three (or perhaps four) physical states. All ordinary bodies, for example, may be classified, roughly, either as solids or fluids; fluids being further subdivided into liquids and gases. This classification is not all

that could be desired, since there are certain bodies (such as wax) which have certain characteristics of the solids and certain others of the liquids. A more complete and systematic classification is hardly practicable, however, in the present article. A solid body may be defined as a body capable of resisting a considerable shearing stress. (See ELASTICITY). Solid bodies usually have a considerable tensile strength also. A solid does not yield continuously to a small deforming force; it resists deformation, and its resistance increases as the deformation increases. A fluid, on the other hand, is a substance having almost no shearing strength, and offering very little resistance to forces that tend to change its shape. A fluid yields continuously to a deforming force, and a force that will deform it at all will deform it indefinitely, so long as it is allowed to act. Considering the subdivision of fluids into gases and liquids, we may say that a gas is a fluid that presses continuously and in every direction upon the walls of the vessel containing it and which follows them indefinitely if they retreat. A gas, if left to itself, tends to expand infinitely in all directions. A liquid is a fluid which does not follow the walls of the containing vessel if they retreat and which has no tendency to expand indefinitely if left to itself. (For the prevalent theories regarding the constitution of matter, see GASES, KINETIC THEORY OF; MOLECULAR THEORY).

When a gas is rarefied very highly by a mercury vacuum pump, it exhibits properties which are different in many respects from those manifested by gases in the ordinary state of density. The pressure in such a rarefied gas, for example, may be different in different directions; so that in this respect, at least, the rarefied medium resembles a solid rather than a gas or liquid. Mechanical and electrical properties are also observed at high exhaustions which cannot be reproduced at ordinary pressures; and for these and other reasons Crookes considered that a gas, when under only (say) the millionth or ten millionth of an atmosphere of pressure, may be fairly said to constitute a "fourth state of matter," which he considered to be as different from the gaseous state as the gaseous state is from the liquid state. At first thought this appears to be an extreme and hardly a justifiable view; but it must be remembered that Andrews showed that the distinction between a liquid and the gas or vapor obtained from it by evaporation ceases to exist at temperatures higher than a certain critical value peculiar to each substance. (See CRITICAL POINT). This temperature is about 88° F. for carbon dioxide, and at temperatures progressively higher than this the isothermals of carbon dioxide approximate with increasing closeness to the hyperbolas of a perfect gas. It might be thought that a critical state exists with reference to the solid and liquid states; but this is still somewhat doubtful. It appears probable that no such state exists between a solid and its liquid, unless the solid is crystalline; and its existence has not been established even for this case.

See MOLECULAR THEORY; LIQUEFIED AND COMPRESSED GASES; ELECTRON THEORY; SOLUTIONS; ETHER; VACUUM, etc. Consult, also, Tait, 'Properties of Matter'; Kimball, 'Physical Properties of Gases'; Poynting and Thomson, 'Properties of Matter'; Risteen, 'Molecules and the Molecular Theory of Matter'; Lehmann, 'Molekularphysik.'

MATTERHORN, măt'tĕr-hôrn, **Mount.** See CERVIN, MONT.

MATTESON, măt'ĕ-sŏn, **Tompkins Harrison,** American artist: b. Poughkeepsie, N. Y., 9 May 1813; d. Sherbourne, N. Y., 2 Feb. 1884. His early lessons in art were from an Indian; otherwise he was mostly self-taught until after the success of his 'Spirit of '76,' when he settled in New York and studied in the National Academy. From 1851 until his death his home was Sherbourne. For a time he was a member of the New York legislature. His themes were historical or from American country life, and his best-known pictures are 'The First Sabbath of the Pilgrims,' 'Examination of a Witch,' 'Eliot Preaching to the Indians,' 'Rip Van Winkle's Return from the Mountains,' 'At the Stile' and 'Foddering Cattle.'

MATTHEW. Matthew, the apostle of Jesus Christ, is with sufficient certainty identified with Levi, the son of Alphæus, whose call by Jesus to discipleship is described in Mark and Luke in terms practically identical with a story of the call of Matthew in Matthew. It was not uncommon among the Jews for a man to have two names and sometimes both names were of Hebrew, or Aramaic origin. The derivation and consequently the meaning of the name Matthew is uncertain, though it is commonly interpreted to mean "Gift of God." The mere mention of his father's name does not identify his family to us. He is first spoken of as being in his office as a "publican," or collector of taxes, presumably near Capernaum on the great highway between Damascus and the Mediterranean. While as such officer he would be in the service of the Tetrarch Herod, and not directly in Roman employ, yet he must have shared the obloquy which attached to this office among strict Jews, and it has accordingly been reckoned a mark of his humility that we find him designated as "the publican" in the Gospel which bears his name. After his call to discipleship he made a great feast of farewell, gathering his former friends and business associates to meet his new-found Master and the disciples attending him. The name of Matthew stands in all the lists of apostles, always the seventh or eighth in order, but of his activities as an apostle we have no record. No other name than his has ever been associated with the authorship of the first Gospel, and while this view has been discredited by many critics, because of the difficulty of considering the Gospel in its present form the work of an apostolic eyewitness, it is possible to conserve the historical value of this strongly confirmed tradition by holding that he was the author of the Discourse Document which constitutes such an important and characteristic element in Matthew. (See article MATTHEW, GOSPEL ACCORDING TO). There are many variant traditions as to the missionary labors of Matthew, Macedonia, Egypt, Ethiopia and Parthia having been named as places where he worked. There is no sufficient reason for accepting any of these traditions, though perhaps the last is the most probable. Some traditions assert that he died as martyr and this has been accepted in the Western Church, but according to other

traditions perhaps no less reliable he died a natural death.

DAVID FOSTER ESTES,
Professor of New Testament Interpretation, Colgate University.

MATTHEW, George Frederick, Canadian geologist: b. Saint John, New Brunswick, 1837. He received his education at the University of New Brunswick; secured a civil service post in 1853 and in 1879 was appointed chief clerk of customs. He was made surveyor of customs in 1893. He collaborated with Bailey, in 1872, in preparing a report on the geology of southern New Brunswick and in the following year prepared a report on the Carboniferous system of that province. Subsequently he made several geological tours of exploration in the Maritime Provinces. He was a Fellow of the Royal Society of Canada and member of the New Brunswick Natural History Society. He published geological papers in various technical and scientific periodicals.

MATTHEW, Gospel According to. The Gospel with which the name of Matthew has uniformly been associated has with almost equal uniformity stood first in the gospel canon. It received this place both because it is the longest of the Gospels and because of the apostolic authority which the name of Matthew gave to it, but the place is fitting also because it relates itself more closely to the Old Testament than does any other gospel.

Contents.—As respects the events recorded, they are much the same as those given in Mark and Luke, and are arranged in substantially the same order. The book may be briefly analyzed somewhat as follows: Introductory, genealogy, birth and infancy of Jesus, ministry of John the Baptist, baptism and temptation of Jesus, i, 1–iv, 11. I. Early Galilean ministry (iv. 12–xii, 50). II. Later ministry in Galilee and neighborhood, and the Perean journey (xiii, 1–xx, 34). III. Entry of Jesus into Jerusalem and his teaching there, mainly controversial (xxi, 1–xxiii, 39). IV. Eschatological discourse (xxiv, 1–xxv, 46). V. Closing scenes, anointing at Bethany, last supper, agony in Gethsemane, trial, crucifixion, death and resurrection (xxvi, 1-xxviii, 20). In addition to the story of events and many brief reports of sayings of Jesus, this Gospel is marked by a cycle of five long discourses, each followed by a uniform formula, "It came to pass when Jesus finished." These discourses are "The Sermon on the Mount" (v, 1–vii, 27); the "Address to the Apostles" (x, 5–42); the collection of "Kingdom Parables" (xiii, 1–52); the "Discourse on Humility and Forgiveness" (xviii, 1–35); and the "Apocalyptic Discourse" (xxiv, 4–xxv, 46). While it need not be doubted that Jesus spoke at length on each of the occasions with which these discourses are connected, it is commonly held, especially in view of the somewhat parallel reports in Luke, that the author has gathered sayings spoken at various times and grouped them into what may be called "bouquets" of discourse, uniting them, not on the ground that all were spoken on the same occasion, but rather according to a logical association of ideas. This Gospel is also characterized by an arrangement of material in groups of threes, fives or sevens, presumably to aid the memory. Some 40 triplets have been named, e.g., the genealogy is arranged in three groups of 14 generations each, in chapters viii and ix there are three miracles of power, followed by three of restoration, there are given three prayers in Gethsemane, etc. Groupings by five and seven are not so common but occur often enough to deserve note as a striking characteristic of this book.

Purpose.— The purpose of the author plainly was to confirm Jewish Christians in their belief that Jesus of Nazareth was the Messiah long foretold by the prophets and expected by his nation. This is strikingly shown by the many references to the Old Testament which is cited no less than 40 times, often with the formal statement "that it might be fulfilled." The frequent use of the title "Son of David," as well as the genealogy which is traced back to Abraham through the royal line of David, the declaration in the Sermon on the Mount of his right to legislate parallel to the original gift of the Divine law through Moses, the assertion that the kingdom would be taken from the Jews and given to others and the grief over Jerusalem, the picture of himself as the judge at the Final Judgment, these claims in addition to the claims of Messiahship found in the other Gospels and culminating in the declaration of the Risen Christ that all authority in heaven and earth alike is his, all this abundantly proves that the object of the author was to show that Jesus of Nazareth was the promised Messiah and that all the Divine promises were to be fulfilled, not for the nation at large which had rejected him, but for his followers, because they had accepted him.

Sources.— Careful comparison of the first Gospel with the second shows that the order of events is substantially the same in both and that almost every paragraph of Mark is reproduced in Matthew, the exceptions being only seven brief paragraphs of at most less than 35 verses. As the theory that Mark is an abbreviation of Matthew has proved untenable, it follows that Matthew must be in some way dependent on the material of Mark: the resemblance is too close to permit the supposition that both drew from some independent document. But while the source of Matthew must have corresponded in general very closely to the present form of our Mark, yet this contains so much of picturesque detail which is not reproduced in Matthew that it cannot reasonably be held that Mark as we now have it was the source in question. How to account for this difference is still a problem of criticism. It is generally held that there may also be traced in Matthew a second main source, sometimes called the "Logia" document, sometimes "Q." (See article GOSPELS). In addition, there is some material which cannot reasonably be traced to either of the two main sources, as the genealogy and the infancy narratives, but it is impossible now to trace the origin and extent of these special sources. This fact need not, however, impair our sense of their trustworthiness. It may also be noted that it is not reasonable to hold that the author of this book was a mere copyist who kept slavishly to the exact form of any written sources which lay before him.

Authorship.— The author of this Gospel for Jewish readers must of course have been himself of Jewish descent. Nor is his use of the

Greek language inconsistent with this, since the use of Greek was so widespread that in the 1st century Palestine must have been largely bilingual. That he was a Palestinian Jew is manifest from the whole tone of his work. The tone of his work is also such as to make it doubtful whether the author of the book as it now stands was himself an associate of Jesus in his ministry. While much of the material must go back to eyewitnesses, the author himself seems more remote. Accordingly the difficulty in the way of accepting the early and uniform tradition that the Apostle Matthew was the responsible author is increasingly felt. It is also generally recognized that the book does not have the unavoidable marks of being a translation, but shows that it must have been originally composed in Greek, while the early tradition was that Matthew composed his work in the "Hebrew language," by which of course the Aramaic was meant, which had long before replaced Hebrew in common use. It will retain the substantial value of the tradition if it is held that Matthew was the author of "Q." When the Marcan source was reworked to include the collection of discourses and other material which was due to Matthew, it would not be surprising to find his name attached to the whole work. Accordingly, while the direct authorship by Matthew of the book in its present form is still very commonly held, there is a perhaps increasing tendency among critics to connect only the "Logia" document with the Apostle himself.

Date and Place of Composition.— There is little dissent at present from the view that this Gospel was composed late in the seventh decade of the 1st century, presumably 65–68. As to the place of composition there is less agreement. The material is Palestinian, but many feel a certain sense of detachment as if the author was not when he wrote amid the scenes which he describes. Of course this might be true if written in some place in Palestine remote from both Capernaum and Jerusalem; some Syrian city has been suggested, and even Alexandria has been thought not too remote, especially in view of its large Jewish and Jewish-Christian population.

Authenticity and Value.— If the common view of Matthew's direct authorship is still to be accepted, then this Gospel as the work of an apostolic associate of Jesus must be trustworthy and valuable in the highest degree. If, on the other hand, the book is referred to an unnamed author who worked mainly on the basis of the Marcan and Logia documents, its trustworthiness and value will be impaired less than might at first be supposed. We must assume the honesty of the compiler and editor, which indeed is everywhere manifest, and according to the theory he was working on documents which embodied the common Christian tradition approved by the many disciples who had seen Jesus face to face or which even had full apostolic authority. Such were presumably the Marcan source and most probably the Matthæan Logia, while the genealogy could have been drawn from public sources, and the tone of the infancy narratives is such as conclusively to guarantee their very early date. When all these facts are taken into account, it will appear that the latest criticism really confirms the often quoted saying of Renan: "The Gospel of Matthew, all things considered, is the most important book of Christianity — the most important book that has ever been written."

Bibliography.— McNeile, A. H., 'Gospel According to St. Matthew' (1915); Moffatt, James, 'Introduction to the Literature of the New Testament' (1911); Plummer, Alfred, 'Exegetical Commentary on the Gospel According to St. Matthew' (1910); Zahn, Theodor, 'Introduction to the New Testament' (E. T., Vol. III, 1909).

DAVID FOSTER ESTES,
Professor of New Testament Interpretation, Colgate University.

MATTHEW TOWN. See INAGUA, GREAT.

MATTHEWS, (James) Brander, American author: b. New Orleans, La., 21 Feb. 1852. He was graduated from Columbia in 1871 and from the Columbia Law School in 1873, he was admitted to the New York bar (1873), began to contribute to the magazines in 1873, later turned wholly to literature and in 1892 was appointed professor of literature in Columbia. In 1899 he became professor of dramatic literature. He was a founder of The Players and Authors clubs, of the Dunlap Society and the American Copyright League, and of the Columbia University Press. In 1889–91 he was president of the 19th Century Club. He was appointed to French Legion of Honor in 1907. Elected to American Academy of Arts in 1908. President of Modern Language Association in 1910 and of National Institute of Arts and Letters in 1913–14. He wrote several dramatic works, among them 'This Picture and That'; 'A Gold Mine' (with G. H. Jessop); 'On Probation' (also with Jessop); and 'Peter Stuyvesant' (with Bronson Howard). His published volumes include, from an extensive list, the following: 'French Dramatists of the Nineteenth Century' (1881); 'In Partnership' (with H. C. Bunner, 1884); 'A Secret of the Sea, and Other Stories' (1886); 'Pen and Ink' (1888); 'American Literature' (1896); 'A Confident To-morrow' (1898); 'The Action and the Word' (1900); 'Parts of Speech: Essays in English' (1901); 'The Development of the Drama' (1902); 'Molière: His Life and His Works' (1910); 'Shakspere as a Playwright' (1913); 'On Acting' (1914); 'The Oxford Book of American Essays' (1914). He is perhaps best known for his critical papers, marked by keen analysis and a style of much distinction. Some of his earlier writings appeared over the signature "Arthur Penn."

MATTHEWS, Edmund Orville, American naval officer: b. Baltimore, 24 Oct. 1836; d. 30 Jan. 1911. He was graduated from the United States Naval Academy in 1855 and served in the navy before the outbreak of the Civil War, in which he served with distinction. In 1869–73 he was in command of the torpedo boat corps at Goat Island, Newport Harbor, and he commanded the *Brooklyn* in the Asiatic squadron in 1885–87; he was a member of the Board of Inspection and Survey in 1891–94 and in 1897 was raised to the rank of rear-admiral. He was appointed president of the Examining Board in 1898 and served until he was retired in that year.

MATTHEWS, Franklin, American journalist: b. Saint Joseph, Mich., 14 May 1858.

He was graduated from Cornell University in 1883, was reporter and editor on the Philadelphia *Press*, 1886–90, reporter, editor, correspondent of the New York *Sun*, 1890–1912. He was assistant Sunday editor and night city editor of the New York *Times*, 1912–15. He is now associate professor of journalism, Columbia University, 1914. He is a trustee of Cornell University, 1913–18, and also president of the Cornellian Council, 1915. He has published 'Our Navy in Time of War' (1899); 'The Newborn Cuba' (1899); 'With the Battle Fleet' (1909); 'Back to Hampton Roads' (1909).

MATTHEWS, John Hobson, English archivist: b. Croydon, near London, 1858; d. Ealing, 23 Jan. 1914. He was educated at the Proprietary School of Blackheath and at The Leys, Cambridge. In 1877 he entered the Roman Catholic Church and two years later was made a solicitor. From 1894 to 1903 he was employed as archivist to the corporation of Cardiff, Wales, and was also archivist to the county and urban councils of Monmouthshire. His various avocations included those of expert archivist, record searcher, genealogist, journalist and legal antiquary. In 1895 he discovered the text of the grant of Cardiff lands to Sir William Herbert, in 1550, the document being almost illegible. In the following year he brought to light the text of a charter to the borough of Newport. In 1903 and 1911 he was called as expert before the Royal Historical Manuscripts Commission. He published 'History of St. Ives, Cornwall'; 'History of the Hundred of Wormelow'; 'The Vaughans of Courtfield'; 'The Old Faith and the New'; 'Life and Memorials of St. Teilo'; 'The Mass and its Folklore'; 'Continuity Reconsidered.' He continued Duncumb's 'Herefordshire,' edited 'Cardiff Records' (1898–1905) and contributed to 'The Catholic Encyclopedia,' the *Tablet, Athenæum,* etc.

MATTHEWS, Marmaduke Matthews, Canadian artist: b. Warwickshire, England, 1839; d. 1913. He received his education in Oxford and London; removed to Toronto in 1860 and resided in New York from 1864 to 1869. In the latter year he returned to Toronto, was one of the founders of the Ontario Society of Artists, of which he was president in 1894. He excelled in woodland studies. His best-known works are 'The Canadian Wonderland' and 'The Conquered Portal.'

MATTHEWS, Paul, American Protestant clergyman: b. Glendale, Ohio, 25 Dec. 1866. In 1887 he was graduated at Princeton University and three years later at the General Theological Seminary, New York. In 1891 he was ordained to the ministry of the Protestant Episcopal Church; served as assistant at the church of the Advent, Walnut Hills, Cincinnati, 1890–91; entered the Associate Mission, Omaha, and had charge of Saint Paul's and Saint John's churches in 1891–95. From 1896 to 1904 Dr. Matthews was rector of Saint Luke's, Cincinnati, and from 1904 to 1913 was dean of Saint Paul's Cathedral of the same city. In 1913–15 he was dean of the cathedral at Faribault, Minn., and professor at Seabury Divinity School. On 25 Jan. 1915 he was consecrated bishop of New Jersey.

MATTHEWS, Stanley, American jurist: b. Cincinnati, Ohio, 21 July 1824; d. Washington, D. C., 22 March 1889. He was graduated from Kenyon College in 1840, studied law and was admitted to the bar in 1842, when he established a practice in Maury County, Tenn., but returned to Cincinnati in 1844 and engaged in practice there. He was editor of the Cincinnati *Herald*, an anti-slavery journal, in 1846–49, and held various political offices, and in 1855–56 was a State senator. In 1858 he was appointed United States district attorney for the southern district of Ohio, but at the outbreak of the Civil War in 1861 entered the volunteer service and was commissioned lieutenant-colonel and was a colonel when in 1863 he resigned to accept the seat of judge of the Superior Court of Cincinnati. He was elected United States senator in 1877 after having acted as counsel before the Electoral Commission, and in 1881 he was appointed a justice of the Supreme Court of the United States.

MATTHEWS, Washington, American physician and ethnologist: b. Killiney, Dublin County, Ireland, 1843; d. 1905. In 1864 he was graduated at the medical school of the University of Iowa. He was commissioned assistant surgeon in the United States army, from which he retired as surgeon in 1895. He made several anthropological studies of the Indians of North America. His published works include 'Dictionary of the Language of the Hidatsa' (1873); 'Navaho Silversmiths' (1883); 'Navaho Weavers' (1884); 'The Mountain Chant, a Navaho Ceremony' (1887); 'Navaho Legends' (1897); 'The Mystic Chant, a Navaho Ceremony' (1902); 'Navaho Myths, Prayers and Songs' (1907).

MATTHIAS, mą-thī'ąs, a disciple of Jesus, probably one of the 70, who was chosen by lot to take Judas Iscariot's place among the 12. Little is known of him. Even early legend confused him with Matthew, and an apocryphal gospel was attributed to him. In the Roman Catholic Church 24 February, in the Greek 9 August, is sacred to him. The 'Acts of Andrew and Matthias' make him a missionary in Africa. Consult Eusebiús, 'Ecclesiastical History' (Vol. I, 12; II, 1).

MATTHIAS (Ger. mät-tē'ās), emperor of Germany: b. Vienna, 24 Feb. 1557; d. 20 March 1619. He was a younger son of Maximilian II. He was made governor of Austria in 1593 and two years later became heir to the imperial throne. He fought in the war against the Turks and in 1606 was made head of the House of Hapsburg. He became king of Bohemia in 1611 and had annexed Hungary and Moravia before the death of Rudolf II. In 1612–19 he was emperor of the Holy Roman Empire, having been elected on the death of his brother, Rudolf II (q.v.). His reign was an unsuccessful one owing to the religious dissensions among the constituent parts of his empire. He attempted in vain to suppress by decree the Catholic League and Protestant Union. Consult Gindely, A., 'Rudolf II und seine Zeit' (Prague 1868) and Heling, J., 'Die Wahl des römischen Königs Matthias' (Belgrade 1892).

MATTHIAS I, Hunyadi ("Corvinus"), kŏr-vē'noos, THE GREAT, king of Hungary: b. Klausenburg, Transylvania, 23 Feb. 1440; d.

Vienna, 4 April 1490. The second son of John Hunyady, he was imprisoned in Bohemia by his father's enemies, who strongly but unsuccessfully opposed his candidacy for the crown of Hungary in 1458. Another party of opposition attempted to make the Emperor Frederick III king of Hungary; but Matthias brought them to terms and in 1463 made peace with Frederick. By the Peace of Olmütz, 22 July 1479, he gained Silesia, Moravia and Lausitz, and the succession to the crown of Bohemia. In his wars with the Turks he was equally successful and a part of Bosnia was ceded to him by the Porte. War broke out again with the Austrian emperor; Matthias invaded his territory and captured and held Vienna. His court was a centre of scholarly men and his library, called the Corvina, a famous collection. The internal administration of Hungary was greatly improved under Matthias. Consult Fraknói, Vilmós, 'King Matthias Hunyadi' (Budapest 1890; German trans., Freiburg 1891) and Galeotti, Marzio, 'De egregie sapienter et jocose dictis ac factis Matthiæ regis' (Vienna 1746).

MATTING. While this term is usually employed to designate floor coverings made from reeds and fibrous grasses, it is a generic term which includes not only the commercial mattings for house floors, which are made in Eastern countries, but a much wider range of articles useful in the domestic economy and in other employments, such as screens and tatties, sleeping mats (used in India and the East), the matting employed by nurserymen for protecting hotbeds and cold frames, and even some forms of thatch. For the most part mattings are hand-woven, in the finer varieties the warp being cotton or other yarns and the filling the culms of various sedges, reeds and grasses, an example being the familiar Japanese mattings of the house-furnishing stores. In the Russian bast mattings for nurserymen's use, bast of the linden tree is employed for both warp and filling, very coarsely woven or plaited. The roots of the Khus-Khus (*Andropogon squarrosus*), a perennial grass of India, are woven into fragrant screens for open windows and also made into awnings. The Taika rush mats of Formosa are famous as sleeping mats, and the best grades are said to be as fine and soft as cloth, resembling the best Panama hat weaving. Consul Davidson states that a mat of the highest grade, measuring 5 x 6 feet, requires the labor of a girl weaver 120 days, and such mats have sold for 60 to 70 yen (or about $40). The rush is an unidentified species, but sleeping mats are made from several species of *Cyperus* and *Scirpus* found in Asia, Africa and other countries.

The commercial mattings used for house decorations are for the most part of Chinese and Japanese manufacture. In Japan two species are employed, *Juncus effusus*, the Bingo-i mat rush, which is always manufactured into the costly mats used by the higher classes (and known as Tatamiomote) and *Cyperus unitans*, which is employed for the cheaper grades. The largest importer of these mats is the United States, England, Austria and Germany, following in the order named. The qualities of the Bingo-i are named as follows: Kinkwanyen, manufactured at Okayama; first quality Aya-mushiro, second quality Aya-mushiro, Damask Aya-mushiro, common Aya-mushiro, manufactured at Bittiro. First quality Somewake-mushiro, common Somewake-mushiro, Damask Hana-mushiro, common Hana-mushiro, manufactured at Bingo; ordinary Hana-mushiro (best quality), manufactured at Chikugo. *Cyperus unitans* produces the Shichito-i mats which are chiefly manufactured in the Oita prefecture. The plant is cultivated both upon upland and irrigated lands. The varieties of mats from this species are known by names as follows: Kikaiori Hana-mushiro, Damask Hana-mushiro, common Hana-mushiro (two forms). Seidaka Hana-mushiro, manufactured at Bungo. Mattings made from the two species above have been exported in a single year to the value of 650,000 yen, or over $400,000.

The Chinese and Korean mat rush is *Cyperus tegetiformis*, this species also being used for the manufacture of cuffs and sandals. The India commercial mattings are made chiefly from *Cyperus corymbosus* and *tegetum;* the latter being known as the Calcutta mat rush, while the former is used for the Tinnerelly mats which are the finest made in India. They are also made at Palghat, but these are not so fine. In the manufacture of the India mattings the culms are split into two or three parts and then woven into mats upon a warp of threads previously stretched across the floor of a room. The operator passes the culms with the hand alternately over and under the successive threads of the warp and presses them home.

It would be difficult to enumerate all of the mattings made in different countries, though mention should be made of the fine and highly prized Niihau mats of Hawaii, produced from *Cyperus levigatus*. Matting is made in Spain and Morocco from *Juncus maritimus*, and in Italy from *Juncus acutus*. Two species of sword rush, *Lepidosperma gladiatum* and *L. flexuosum*, are used by the natives of Australia not only for mats, but for baskets and other articles, and *Lepironica mucronata*, found in Asia, Africa and Polynesia, supplies the fibre for the mats with which Chinese boatmen cover their cargoes.

In the United States, a handsome and utilitarian form of floor matting is largely manufactured from Slough grass, *Carex filiformis*. In normal years the imports of mattings to the United States reach a total of $3,250,000.

The University of California has recently been experimenting with several species of matting rushes, chiefly *Juncus effusus*, and *J. robustus*, from which a fine sample of matting has been manufactured at a factory in Maine. There is a possibility therefore that rush matting may be produced in the United States, commercially, in the near future.

For matting fibres consult 'Dictionary Economic Products of India,' 'Descriptive Catalogue of Useful Fiber Plants of the World,' and 'The Island of Formosa,' by Jas. W. Davidson. Consult also 'History and Manufacture of Floor Coverings' (New York 1898). The leaves of many species of palm, in different parts of the world, are used for native mats and mattings, though few of these ever reach commercial importance. See PALMS.

CHARLES RICHARDS DODGE.

MATTING FIBRES. See FIBRE.

MATTIPI, or **FROG SNAKE,** serpent (*Xenodon severus*) of northeastern South America. While a poisonous variety, it is slow to bite. Its posterior teeth serve as fangs, but it has no venom sacks. The bite causes temporary swelling and soreness, but is seldom fatal.

MATTISON, Hiram, American Methodist Episcopal clergyman: b. Norway, Herkimer County, N. Y., 1811; d. 1868. After holding pastorates at Watertown and Rome, N. Y., he became pastor of the John Street Church, New York, in 1852. Subsequently he was made pastor of Trinity Methodist Episcopal Church in the same city. In the General Conference of 1860 Mattison tried to have action taken against all slave-holding members in the Church, and piqued at his failure he withdrew from the Church in 1861 and was made pastor of Saint John's Independent Methodist Church. Four years later he returned to his old denomination and was appointed to the pastorate of Trinity Methodist Episcopal Church, Jersey City. In 1868 Mr. Mattison was district secretary of the American and Foreign Christian Union. His published works include 'Tracts for the Times' (1843); an edition of Burritt's 'Geography of the Heavens' (1850); 'Spirit-Rapping Unveiled' (1854); 'Sacred Melodies' (1859); 'Impending Crisis' (1859); 'Immortality of the Soul' (1866); 'Resurrection of the Body' (1866); 'Defense of American Methodism' (1866); 'Popular Amusements' (1867). Consult Vansant, 'Life of Hiram Mattison' (New York 1870).

MATTO GROSSO, mä'tō grō'sō, Brazil, a western central state bordering on Bolivia and Paraguay. It has an area of 532,683 square miles and an estimated population in 1917 of only 142,000 or 143,000, of whom 30,000 were in or near Corumbá (q.v.) and 20,000 were citizens of the capital, Cuyabá (q.v.). It appears, therefore, that in this vast political division of Brazil there is an average of only one person to each three and two-thirds square miles, the estimates being based upon those given in the Pan-American Union handbook 'Brazil.' The only Brazilian state exceeding this in size is Amazonas (q.v.). The best recent descriptions of a portion of the interior from Paraguay up to the Amazon River are in the following books: Roosevelt, T., 'Through the Brazilian Wilderness' (New York 1914); Zahn, J. A. (H. J. Mozans), 'Through South America's Southland' (New York and London 1916). The ex-President writes (p. 100): "It is certain that this inland region of Brazil, including the state of Matto Grosso, which we were traversing, is a healthy region, excellently adapted to settlement; railroads will speedily penetrate it, and then it will witness an astonishing development."

MATTOON, mą-toon', Ill., city, in Coles County, on the Illinois Central and the Cleveland, Cincinnati, Chicago and Saint Louis railroads, about 75 miles east by south of Springfield. It was settled and incorporated in the year 1855. It is situated in an agricultural region in which broom corn is one of the principal products. Grain, fruit and livestock are also produced in large quantities. The chief manufacturing establishments are broom factories, flour mills, grain elevators, wagon and carriage factories, brick and tile yards, foundries, machine shops and repair shops for several railroads. It has a large trade in its manufactured articles, grain, fruit and livestock. Some of the prominent buildings are the Old Folks' Home (I. O. O. F.), the public and parish schools, the public library and reading-room and the churches. The electric-light plant is owned and operated by the city. The government is vested in a mayor, chosen for two years, and a council. Pop. 12,218.

MATURIN, Charles Robert, Irish dramatist and novelist: b. Dublin, 1782; d. 30 Oct. 1824. He received his education at Trinity College, Dublin, entered the ministry of the Church of Ireland and served successively as curate at Loughrea, County Galway, and at Saint Peter's, Dublin. He wrote the novels 'The Fatal Revenge; or, the Family of Montorio' (1807); 'The Wild Irish Boy' (1808); 'The Milesian Chief' (1812), under the pseudonym of "Dennis Jasper Murphy." The novels were ridiculed by the critics, but attracted favorable attention from Sir Walter Scott, who introduced Maturin to Lord Byron. These powerful friends secured the production of Maturin's tragedy 'Bertram' at Drury Lane in 1816, with Kean in the leading rôle. It ran for 22 nights, and a French version was produced soon afterward at the Théâtre Favart, Paris. His other tragedies 'Manuel' (1817) and 'Fredolfo' (1819) failed totally. Among his other works were the novels 'Women' (1818); 'Melmoth the Wanderer' (1820), and 'The Albigenses' (1824). 'Melmoth' is his greatest work and was most successful in its day. Balzac wrote a sequel to it entitled 'Melmoth Reconciled to the Church' (1835). Consult 'Melmoth,' edited with memoir of the author and bibliography (London 1892).

MATURIN, mä-too-rēn', Venezuela, a town in the state of Monagas, formerly the capital of the state of Maturin. It is on the Guarapiche branch of the Orinoco Delta, 25 miles by rail above its port, Colorado, and 40 miles from the sea. A considerable trade with the West Indies, principally in cattle and hides, is carried on. In the neighborhood are extensive plantations of cacao, sugar cane, fruits and cereals. Its industrial establishments turn out cigars, hammocks, boots, shoes and soaps. Pop. 4,400.

MATZOON, a milk food used in Armenia; prepared by exposing milk in open vessels to a heat of 90° F., and when coagulation takes place the curd is broken up by a churning process and a little salt is added. See KUMISS.

MATZOTH, the Hebrew name for a kind of unleavened bread or biscuit eaten by the Jews during the feast of the Passover.

MAUBEUGE, mo'bezh, France, fortress and manufacturing town in the department du Nord, occupying both banks of the Sambre, 140 miles by rail northeast from Paris, within two miles of the Belgian frontier. The origin of Maubeuge was in a double monastery for monks and nuns founded in the 7th century. Destroyed successively by the Normans, by Louis XI, by Francis I and by Henry II, it finally fell to France by the Treaty of Nimeguen in 1678, and was fortified by Vauban. Pre-

vious to 1914 it was defended by nine forts. Besides its arsenal and several old convents Maubeuge has a variety of important industries, as iron foundries, tanneries and manufactories of firearms and iron and steel goods. It has also an active trade in coal, marble, slate, saltpetre, sugar and oil. In the Great War of 1914–18 Maubeuge and its forts held out almost a month against a heavy bombardment from German siege artillery. On 9 Sept. 1914 the Germans claimed the capture of the town, but the French on the 11th denied that it had fallen. On 18 September it became known that the town and forts had definitely fallen to the Germans. Pop. 23,200.

MAUCH CHUNK, mâk chŭnk, Pa., a town and county-seat of Carbon County, on the Lehigh River, the Lehigh Coal and Navigation Company's Canal and on the Central of New Jersey and the Lehigh Valley railroads, 46 miles west by north of Easton. The town is picturesquely built on the side of a mountain rising 1,500 feet from the river, here winding through a narrow, deep ravine, and each summer is visited by thousands of tourists, attracted by the beauty of the surrounding natural scenery. The town has a county building, Young Men's Christian Association building, the Dimmick Memorial Library, the Asa Parker Park, is electrically lighted and has electric street railways. It has a number of foundries, shoe factories, car shops, silk mills, etc., but is best known as an important coal centre, marking the extreme boundary of the anthracite coal region of Pennsylvania; it was established by the Lehigh Coal and Navigation Company in 1818. The Summit Hill coal mines, nine miles southwest of the town, are among the best in the State. The coal is now carried through a tunnel, but was formerly transported to Mauch Chunk by a gravity railroad known as the Switchback, which has became famous as an exciting pleasure route for tourists. Mounts Pisgah and Jefferson, the summits of which are reached by the Switchback railroad; Prospect Rock, Flagstaff Peak and Glen Onoko are points of considerable interest, commanding splendid views of the Lehigh Valley. The government is vested in a burgess and council, elected for terms of four years. Pop. 4,400.

MAUD. Tennyson called 'Maud' a "monodrama," a drama told in a series of lyric soliloquies. His explanation of its unique form is this: "The peculiarity of this poem is that different phases of passion in one person take the place of different characters." To tell the story of 'Maud' is to follow these phases of passion. The beginning shows the hero cut off from life by his heritage of hate and wrong, crying for war to kill the greed and cruelty of peace. With the coming of Maud, the child of his enemies, begins his new life of love that embraces mankind. His joy is shattered at its climax; a hopeless exile, he seeks only escape from the phantoms of the past. From this death in life, he is saved by the outbreak of war "in defence of the right." The ending, written to the sound of cannon booming from British battleships before the Crimean War, is a pæan of battle. It was this militant strain in 'Maud' that shocked Tennyson's admirers and still provokes criticism. Yet read, not as a defence of any one war, but as an indictment of the materialistic peace that is war and that causes war, the poem shows something of that larger vision that is prophetic.

As a monodrama, 'Maud' fails to achieve dramatic unity. Many of the separate lyrics are genuine bits of inner action, of soul-drama, set forth with keen psychological analysis, with skilful variation of meter to express fluctuation of feeling. But sequence of action, the law of drama, is sacrificed to singleness of mood, the essence of the lyric. In 'Maud,' as in 'The Princess,' Tennyson's attempt to fuse the lyric and the dramatic moods fails. To think of 'Maud' is to think first of those songs that have become part of the vocabulary of passion and of longing. Consult Tennyson, Hallam, 'Alfred, Lord Tennyson: a Memoir' (2 vols., 1897); Grierson, H. (in 'Cambridge History of English Literature,' Vol. XIII, ch. 2, and bibliography).

FRANCES W. CUTLER.

MAUD MULLER, a poem by J. G. Whittier, first published in the *National Era,* December 1854. It is a ballad reciting a romantic passage in the lives of a susceptible judge and a country girl.

MAUDE, SIR **Stanley,** English soldier, commander of the British Expeditionary Force in Mesopotamia 1916–17. He was born in 1864, entered the army at the age of 20 and saw his first active service in the Egyptian campaign of 1885. He fought in several battles in the South African war and later served as military secretary to the governor-general of Canada, 1901–04. He next became private secretary to the Minister for War in London, and was subsequently connected with the organization of the newly-formed Territorial Army. He was on the General Staff of the 5th Division when the European War broke out, and took part in all the early operations of the campaign. While in command of the 14th Infantry Brigade he was severely wounded. On his recovery he was promoted major-general in 1915, and transferred to the Dardanelles, thence to Egypt and afterward to Mesopotamia, where he took over the chief command in succession to General Sir Percy Lake in August 1916. The military situation in that theatre of war was critical. On 29 April General Townshend had been forced to surrender at Kut with 8,000 men owing to lack of resources. It was the task of General Maude to retrieve the disaster. After some months of preparation and reorganization he marched out with all his forces in December and pushed right up to Kut, where the Turks were strongly entrenched on both banks of the Tigris. With hard fighting he dislodged the enemy, drove him back into Kut, and launched his main attack across the river at Shumran. The Turks broke and fled; Kut fell again to the British, and Maude pursued with such vigor that he entered Bagdad on 11 March 1917. Another long period of preparation followed, and on 28 Sept. 1917 General Maude attacked the Turks at Ramadie, carried the advanced positions and encircled them with his cavalry, compelling the whole division to surrender. On 6 November he captured Tekrit, the riverhead on the Tigris, and the whole of the Turkish forces withdrew from 30 to 50

miles northward. Before he was able to achieve anything further, General Maude died, after a very brief sickness, at Bagdad on 18 Nov. 1917.

MAUDSLEY, mâdz'li, **Henry,** English alienist: b. near Settle, Yorkshire, 6 Feb. 1835; d. 23 Jan. 1918. He was graduated in medicine from the University of London in 1857, was editor of the *Journal of Mental Science* in 1862–78, in 1869–79 was professor of medical jurisprudence in University College, London. In 1913 he presented $150,000 to the London County Council for the erection of a Maudsley Hospital for the Insane. His works include 'Responsibility in Mental Disease' (1874); 'Physiology of Mind' (1876); 'Pathology of Mind' (1879); 'Natural Causes and Supernatural Seemings' (1886); 'Life in Mind and Conduct' (1902); 'Heredity, Variation and Genius' (1908).

MAULE, mow'lā, Chile, a maritime province bounded north by the province of Talcá, east by Linares and Nuble, south by Concepción and west by the Pacific Ocean. Area, 2,812 square miles. It takes its name from its principal river. The well-wooded Coast Range, nearly 3,000 feet high, occupies the great portion of the surface. Agriculture and its allied occupations constitute the principal industries. Cattle, hides, wheat and lumber are exported. The Maule and Stata are navigable and afford good means of communication. There is a branch of the government railroad from Cauquenes to Parral. Another line connects Constitución with Talcá. Capital, Cauquenes (9,895); chief port, Constitución. Pop. of province 122,754.

MAULE, Chile, a river rising in the Andes and after a westerly course of about 150 miles, 52 of which are navigable for small vessels, flowing into the Pacific Ocean near the village of Constitución, 99 miles northeast of Concepcion. The Maule River is supposed to have been the southern boundary of the empire of the Incas. In its upper courses its waters supply extensive irrigation systems.

MAULMAIN, mâl-mān', or **MOULMEIN,** mowl-mīn', Burma, the capital of the Tenasserim division, and a seaport near the mouth of the Salwin River, on the Gulf of Martaban 30 miles from the Bay of Bengal. The town, comparatively modern, dating from 1826, is regularly built on level ground between the river and a range of wooded hills, on whose heights are the gilded spires of numerous pagodas and elegant residences, commanding fine views of beautiful scenery. Maulmain has numerous public buildings, churches, chapels and missionary establishments, several charitable and educational institutions, barracks, a hospital, jail, etc. A considerable trade is carried on with Indian ports, the chief exports being teak-wood and rice, cotton, hides, horns, gums, ivory, copper, lead, wax, the imports, piece goods, hardware, provisions and general merchandise. Shipbuilding is a thriving industry because of the available supply of teakwood. The water supply system, gas plant and sewage system are the property of the municipality. Pop. about 60,000, besides native Burmese, comprising Hindus, Eurasians, Armenians, Chinese, Malays, Jews and Europeans.

MAUMEE, mâ-mē', a river formed by the junction of Saint Mary's and Saint Joseph's rivers at Fort Wayne, Ind. It flows northeast across the northwest corner of the State of Ohio, and enters Lake Erie through Maumee Bay. Its affluents are the Auglaize and the Tiffin. Its basin is 6,700 square miles in extent. The river is 150 miles long and navigable 12 miles from its mouth to the Maumee Rapids. The Miami and Erie Canal, which connects Lake Erie with the Ohio River, begins at the head of navigation on the Maumee, and follows the course of the river to Defiance, then turns south. The Maumee Bay, a shallow body of water, has been improved by deepening and straightening the channel. Toledo is at the mouth of the Maumee. The Maumee River was a part of one of the water routes much used by the early missionaries and explorers. The distance from the head waters of the Maumee to the Wabash River is only about 25 miles.

MAUNA KEA, mow'nā kā'ā, Hawaii, an extinct volcano, the highest peak in the Pacific, 13,805 feet in altitude. Snow covers its upper slopes for the greater part of the year, and its sides are wooded. Coffee is cultivated on the lower slopes. See HAWAII.

MAUNA LOA, mow'nā lō'ā, Hawaii, a volcano 13,760 feet high, with a crater nearly five miles in circumference, and vertical precipices on the inner side 500 to 600 feet high. Mauna Loa is situated in the central southern portion of Hawaii, and on its eastern slope is the still larger crater of Kilauea, about nine miles in circumference, but apparently having no communication with Mauna Loa, their periods of activity being independent of each other. Mauna Loa's last period of great activity was in 1881. See HAWAII; KILAUEA.

MAUNDY (mân'di) THURSDAY, is the Thursday in the Passion week. Another popular old name of the day is Shere Thursday, from the custom of shearing the hair which the priesthood used to observe. It used to be the custom in England and other countries, and still is in Austria, for the sovereign to wash the feet of a certain number of poor persons, and to send them away with presents in the shape of food, clothing and money. This ceremony is in commemoration of the act of Christ, who washed his apostles' feet on the occasion of the last supper.

MAUNOURY, Michel Joseph, French soldier: b. Maintenon, Eure-et-Loir, 17 Dec. 1847. He received his education at the École Polytechnique, Paris; first saw active service as second lieutenant in the Franco-Prussian War of 1870–71. In that conflict he was wounded at Champigny. His professional studies were pursued at the École Supérieure de Guerre. From 1886 to 1888 Maunoury was artillery instructor at the famous military academy of Saint-Cyr. In 1897 he attained the rank of colonel, was made brigadier-general four years later and a general of division in 1905. In 1905 he had charge of the artillery of the Paris forts and soon after was made president of the commission of military schools. General Maunoury was commandant of the École Supérieure de Guerre in 1907; the following year of the 15th Army corps with headquarters at Marseilles, and in 1909 of the 20th corps at Nancy.

He was made military governor of Paris in 1910 and a member of the Superior Council of War. In the War of 1914–18 Maunoury was placed in charge of the army of manœuver and was rushed north in an effort to turn the flank of Von Kluck's army then driving toward Paris. When the latter discovered Maunoury on his right the drive was stopped and in the battle of the Marne the invader was driven back. Subsequently after the beginning of trench warfare Maunoury held a command at Soissons. He was severely wounded in March 1915 and in the same year received at the hands of the President of the Republic the *médaille militaire*, the highest military honor in the gift of France. He is also an officer of the Legion of Honor. In November 1915 Maunoury succeeded Gallieni as military governor of Paris. Consult Blanchon, G., 'Le général Maunoury' (Paris 1916). See WAR, EUROPEAN.

MAUPASSANT, Henri René Albert Guy de, ŏñ-rē rė-nā äl-bār gē dė mō-pä-säñ, French novelist: b. Chateau Miromesnil, Seine-Inferieure, France, 5 Aug. 1850; d. Paris, 6 July 1893. He began his career as a clerk in the Navy Department in Paris and also served for a time in the French army during the Franco-Prussian War. The novelist Flaubert, a friend of his mother's, was his godfather, and the youth took him as his model in the art of composition. After years of practice, during which he wrote and destroyed a great number of manuscripts, he allowed a short story, 'Boule de Suif,' to appear in 1880, a work which displayed the greatest finish and at the same time allied him to the naturalistic school of fiction. In the same year he published a book of verse, 'Des Vers,' and a drama, 'Histoire du vieux Temps.' After this he continued to cultivate the short story and was very soon recognized as one of the greatest writers of short stories the 19th century had seen. In spite of the perfection of art displayed in their construction neither his brief tales nor his novels form pleasant reading. They compel admiration, but they are dominated by pessimism and in his later work the traces of an unbalanced mind may be plainly seen. In 1890 De Maupassant's mental malady occasioned the cessation of literary occupation, two years later he became wholly insane and he died the next year in an asylum. His collections of short stories include 'La Maison Tellier' (1881); 'Mlle. Fifi' (1883); 'Les Sœurs Rondoli' (1884); 'Yvette' (1884); 'Contes du Jour et de la Nuit' (1885); 'Contes et Nouvelles' (1885); 'La Horla' (1887); 'La petite Roque' (1888); 'La Main gauche' (1889); 'Le Père Milon'; 'L'inutile Beauté' (1890), etc. The finest of his six novels is 'Pierre et Jean' (1888); the others are 'Une Vie' (1883; 'Bel Ami' (1885); 'Mont Oriol' (1887); 'Fort comme la Mort' (1889); 'Notre Cœur' (1890). He also published several collections of travel sketches, such as 'Au Soleil' (1884); 'Sur l'Eau' (1888); 'La Vie errante' (1890). A collection of 13 of his short stories published in English with the title, 'The Odd Number,' represents him at his best, both in point of art and as regards the stories themselves. The absence of a moral sense is less apparent here than elsewhere and there is less of gloom and animalism perceptible. Consult 'Œuvres complètes de Guy de Maupassant' (29 vols., Paris 1908–10); 'Works of Guy de Maupassant' (9 vols., New York 1910); Brunetière, Ferdinand, 'Le roman naturaliste' (Paris 1883); Doumic, René, 'Ecrivains d'aujourd'hui' (ib. 1894); Bashkirtseff, Marie, 'Further Memoirs' (London 1901); Symons, Arthur, 'Studies in Prose and Verse' (New York 1904); Mahn, P., 'Guy de Maupassant, sein Leben und seine Werke' (Berlin 1908); Matthews, Brander, 'Inquiries and Opinions' (New York 1907).

MAUPERTUIS, Pierre Louis Moreau de, pē-ār loo-ē mō-rō dė mō-pĕr-tü-ē, French mathematician and philosopher: b. Saint Malo, France, 28 Sept. 1698; d. Basel, Switzerland, 27 July 1759. He was educated at the College of La Marche, Paris; entered the army in 1718 and after five years' service resigned in order to become instructor in mathematics in the Academy of Sciences. He went to England in 1728, where he was made a member of the Royal Society and became a pupil of Newton. In 1736 he conducted a scientific expedition to Lapland for the purpose of measuring an arc of the meridian, the result of which was confirmation of Newton's theory of the flattening of the globe at the poles. In 1743 he was elected to the French Academy, in 1744 was summoned to Prussia by Frederick the Great and in 1746 was declared president of the Academy of Sciences at Berlin. A dispute with the philosopher, Kŏnig, regarding the discovery of the infinitesimal calculus shortened his days. Among his works are 'Sur la figure de la terre' (1738); 'Discours sur la figure des astres' (1742); 'Lettre sur la comète de 1742' (1742); 'Astronomie nautique' (1745; 1756); 'Essai de cosmologie' (1750); Maupertiana ou divers ecrits' (1753). Consult De la Baumelle, 'Vie de Maupertuis' (Paris 1856); Damiron, J. P., 'Memoires sur Maupertius' (ib. 1858); id., 'Mémoires pour servir à l'histoire de la philosophie du XVIIIe siècle' (Vol. III, ib. 1864).

MAUREL, mō-rĕl, Victor, French singer: b. Marseilles, 1848. He was educated at the Paris Conservatoire and made his début in Paris in 1869. His first appearance in Royal Italian Grand Opera was in 1873 and he achieved a signal success. He created Iago in Verdi's 'Otello,' Falstaff in the opera of that name, and has appeared in many operatic rôles in Europe and United States, being generally recognized as the leading acting baritone actor on the Italian stage. He has published 'L'Art du chant'; 'Le chant renové par la science'; 'Dix ans de carrière,' etc.

MAUREPAS, Jean Frédéric, zhŏñ frā-dā-rēk mō-rė-pā, **Phélypeaux,** COMTE DE, French statesman: b. Versailles, 9 July 1701; d. there, 21 Nov. 1781. At 14 he succeeded to the office of Minister of State held by his father. In 1725 he became administrator of the navy, in which post he used the best knowledge then available to bring the navy to a high standard of perfection. He became Minister of State under Louis XV in 1738, but in 1749 was banished the court for an attack on Mme. Pompadour. In 1774 he was made Prime Minister by Louis XVI and became his principal adviser. The chief events of his administration were the restoration of the Parliament of Paris (12 Nov. 1774), and the alliance with and assistance of the American colonies in their struggle against Great Britain. He gathered

to the service of the state such men as Lamoignon-Malesherbes, Vergennes and Turgot. He intrigued against the latter and replaced him as Minister of Finance by Necker in 1776. Five years later Necker experienced the same fate. Consult Guyot, 'Eloge historique de M. de Maurepas' (1782); the apocryphal 'Mémoirs' edited by J. L. C. Soulavie (4 vols., Paris 1792) and 'Lettres de M. de Maurepas' (Paris 1896).

MAURICE, mâ'ris **(John), Frederic Denison**, English Anglican theologian and author, one of the leaders of the Broad Church movement: b. Normanston, Suffolk, 29 Aug. 1805; d. Cambridge, 1 April 1872. He was son of a Unitarian clergyman; was educated at Trinity Hall, Cambridge; settled in London, where he was editor of the *Athenæum* for several years; and having decided to take holy orders entered Exeter College, Oxford. In 1834 he became curate of Bubbenhall, and two years later chaplain to Guy's Hospital. He became professor of history in King's College, London, in 1840, and of divinity as well in 1846, but was deprived of both chairs in 1853 because of the liberal tenor of his 'Theological Essays.' Up to 1860 he was chaplain of Lincoln's Inn, and from 1860 to 1869 incumbent of Saint Peter's, Vere street, London. In 1866 he was elected professor of moral philosophy at Cambridge. During his life in London Maurice founded the Working Men's College and Queen's College (for women), took a prominent part in various practical philanthropies and was a leader of the Christian Socialists. He was a man of wonderfully sweet and beautiful character; a fervent preacher, who made much of the fatherhood of God; and a social reformer, whose lack of success was due to the fact that he was before his time. Among Maurice's works are 'Eustace Conway,' a novel (1834); 'The Epistle to the Hebrews'; 'Warburtonian Lectures' (1846); 'The Religions of the World'; 'Boyle Lectures' (1847); 'The Lord's Prayer,' sermons (1848); 'History of Moral and Metaphysical Philosophy' (1850–60); 'Ecclesiastical History of the First and Second Centuries' (1854); 'The World "Eternal,"' urging that "eternal punishment" is not "everlasting punishment" (1863); 'Casuistry, Moral Philosophy, and Moral Theology' (1866); 'The Conscience' (1868); 'The Lord's Prayer, A Manual' (1870). Consult the 'Life, chiefly told in his own Letters,' by his son (2 vols., London 1884); Collins, W. E., 'Typical English Churchmen' (London 1902); Hughes, T., 'The Friendship of Books' (ib. 1873); Rogers, 'Men and Movements in the English Church' (ib. 1898).

MAURICE, Sir **Frederick Barton**, Major-General, English soldier: b. 19 Jan. 1871. He entered the army in 1892, rose to captain in 1899 and brevet-major in 1900. He served in the Tirah campaign 1897–98 and in the South African War, 1899–1900. He accompanied the first British Expeditionary Force in the European War, landing in France on 11 Aug. 1914, was "mentioned in despatches" and created K. C. M. A. During 1915–16 he served as Director of Military Operations on the Imperial General Staff, was awarded the French Croix de Guerre and made a commander of the Legion of Honor. On 7 May 1918 he published a letter in *The Times* contradicting certain statements made in Parliament by the Premier (Mr. Asquith) and other ministers with regard to what had passed at the Allied War Council at Versailles. The matter concerned the disposition of British troops and the strength of the army. The letter caused a great sensation and led to a "censure debate" in the House of Commons on 9 May 1914, in which the House rejected the Premier's motion for the appointment of a select committee to investigate the matter. On 14 May the Army Council placed Major-General Maurice on "retired pay." Though the letter had not been submitted to the Press Bureau before publication, in accordance with war-time regulations, no further steps were taken by the government. On his retirement General Maurice became military correspondent for the *Daily Chronicle*. His writings are marked by lucidity and keen penetration. In a remarkable book, 'Forty Days in 1914' (London and New York 1919), he traces the complicated and momentous campaign to the end of the battle of the Marne. His other publications include 'The Russo-Turkish War 1877–78,' a biography of his father, 'Sir Frederick Maurice: A Record,' and contributions to the 'Cambridge Modern History.'

MAURICE OF NASSAU, Prince of Orange and Count of Nassau: b. Dillenburg, Nassau, 13 Nov. 1567; d. The Hague, 23 April 1625. His father, William the Silent, was assassinated in 1584, and the 18-year-old boy was chosen stadtholder by the provinces of Holland and Zealand, and later by the other provinces, the command of the army being entrusted to him in 1587 by the States-General. He captured Breda, Zutphen and Nimeguen in 1590–91, and by 1597 had wrested the principal towns of the Netherlands from the Spanish. But Ostend was lost in 1604 and in 1609 a truce was made with Spain for 12 years. In 1618 he became Prince of Orange on the death of his brother Philip William. Internal dissensions followed and Olden Barneveldt, leader of the aristocratic republicans and of the party of religious tolerance, was condemned to death (1619) on the charge of high treason, but actually because of his opposition to Maurice. The stadtholder renewed the war with Spain in 1621, immediately upon the expiration of the truce, and died at the very time he was negotiating an alliance with France and with England. The greatest general of his day he was personally cold and unscrupulous. See Holland and consult Kemp, C. M., 'Maurits v. Nassau, prins v. Orange in zijn leven en verdiensten' (4 vols., Rotterdam 1843); Nutting, M. O., 'The Days of Prince Maurice' (Boston 1894); van Prinsterer, G. Groen, 'Archives ou correspondence de la maison d'Orange-Nassau' (1 series, 9 vols., Leiden 1841–61).

MAURICE OF SAXONY, Duke and Elector of Saxony, German soldier: b. Freiberg, 21 March 1521; d. near Sievershausen, 11 July 1553. He succeeded his father, Henry the Pious, as Duke of Saxony, in 1541; and although a Protestant refused to join the Schmalkald League. In 1548, two years after a secret treaty with the Emperor Charles, Maurice was made Elector of Saxony. But he soon broke with the emperor, fathoming his purpose of crushing the German princes, and by a sudden show of force made Charles sign the Treaty of Passau, 31 July 1552. On the 9th of

July in the following year he defeated Albert of Brandenburg-Kulmbach, who had refused to accede to the Treaty of Passau, in the battle of Sievershausen, but died two days later of his wounds. Maurice was the foremost general and diplomat of his day in Germany, but he was entirely without scruple or principle, and played off one party against another until he was little trusted by either. Consult Brandenburg, E. (ed.), 'Politische Korrespondenz' of the Elector Maurice (Leipzig 1904); id., 'Moritz von Sachsen' (Leipzig 1898); von Ranke, L., 'Deutsche Geschichte im Zeitalter der Reformation' (ib. 1882); 'The Cambridge Modern History' (Vol. II, Cambridge 1903).

MAURICIUS, mâ-rish'ĭ-ŭs, **Flavius Tiberius,** emperor of the East, 582–602 A.D.: b. Arabissus, Cappadocia, about 539 A.D.; d. Chalcedon, 27 Nov. 602 A.D. He served with distinction against the Persians, and for his abilities and character was made successor to Tiberius II by that emperor, whose daughter, Constantina, he had married. His reign was filled with wars. In 591 he restored Chosroes II to the throne of Persia, thus bringing to a close the long campaign against that country. He was, however, one of the greatest and best of the Eastern emperors, a patron of the arts and sciences, and himself considerably learned. Phocas, one of his generals, commanding the army operating against the Avars, led a revolt against him, and he fled to Chalcedon, where he was murdered by Phocas' order. The *Στρατηγικά*, a work on military affairs, published in a Latin version by Scheffer at Upsala in 1664 was long attributed to him, but is really by some unknown contemporary. Consult Bury, J. B., 'The Later Roman Empire' (London 1889); Finlay, G., 'History of Greece' (Oxford 1877); Gibbon, E., 'Decline and Fall of the Roman Empire' (London 1896).

MAURISTS, mâ'rists, the members of the Congregation of Saint Maur, to whom literature owes the stately tomes known as "Benedictine Editions." The Congregation had its origin in a reform of the Benedictines in the early part of the 17th century; it was supported by De Retz and afterward by Richelieu, and in 1720 possessed in France six provinces, containing 180 abbeys and priories, of which the principal was that of Saint-Germain-des-Prés, Paris. Among the most celebrated of the Maurists are Mabillon, Martene, Montfaucon, the founder of the science of archæology, Ruinart, Lami, Le Nourri and Martianay. Jansenism seems to have affected some of the convents, and, according to Badiche, a Masonic lodge was established at Glanfeuil in 1755, over which the prior of the monastery in that place presided. The Congregation was suppressed in 1792. The last superior-general with 40 members of his order perished by the guillotine. In their literary work they produced a great number of works of permanent value. Their complete bibliography comprises over 700 works by 220 authors. The Revolution put an end to the work, for which hundreds of volumes and literary documents had been collected. The Bibliothèque Nationale de Paris contains most of this material. Consult Helyot, 'Histoire des ordres religieux' (1718); McCarthy, 'Principal Writers of the Congregation of Saint Maur' (1868); Tassin, 'Histoire littéraire de la congregation de Saint-Maur' (Paris 1770); de Lama, 'Bibliothèque des écrivains de la congregation de Saint-Maur' (ib. 1882).

MAURITANIA, mâ-rĭ-tā'nĭ-ą, West Africa, colony in the government-general of French West Africa. It consists of the districts of Trarza, Brakna, Gorgol, Guidimaka, Levrier Bay and Tagant. The total area is 344,967 square miles. The population in 1912 was about 222,051, of whom 221,897 were nomad Moors. In 1909 the French protectorate was extended over these districts; a provisional government with civil and military functionaries was formed under the name of Mauritania. Early in 1916 the region of Tibesti, recently occupied by the French, was attached administratively to French West Africa. The budget of Mauritania for 1916 was $334,000.

MAURITIUS, mâ-rish'ĭ-ŭs, or **ISLE OF FRANCE,** an island colony of Great Britain, in the Indian Ocean, 500 miles east of Madagascar and 9,500 miles from England. It is of an oval form, about 40 miles in length from northeast to southwest, and 25 miles in breadth; area, 720 square miles. There are numerous capes and bays along the shore and the island is surrounded by coral reefs. It is composed chiefly of rugged and irregular mountains, rising into points of considerable height; the highest are the Montagne de la Rivière Noire, 2,730 feet, and the singular isolated rock Peter Botte, 2,700 feet. Between the mountains, and along the coast, there are large and fertile plains and valleys, having a rich soil of black vegetable mold or stiff clay, watered by numerous streamlets, many of which become periodically dry. The climate is pleasant during the cool season, but oppressively hot in summer, and the island is occasionally visited by severe epidemics of fever. The rainy season is from January to April; between December and March the island is subject to hurricanes, occasionally of extraordinary violence. When discovered in 1505 the island was almost entirely covered with wood, the greater part of which has now been cut down, although some extensive forests still remain. The fauna then included the dodo, but otherwise was in no way remarkable. Some of the trees are valuable, particularly the black ebony. The indigenous vegetation includes orchids, screw-pines, the traveler's-tree, bamboo, etc. Many plants introduced from Europe, Africa, Madagascar and India thrive well, and nearly every beautiful tropical tree or delicious fruit is met with. The principal item of cultivation is sugar-cane, and to a limited extent rice, maize, manioc, vanilla, coffee, spices, fruits and tea, the last introduced recently. The value of the exports of unrefined sugar, which is the staple, amounted in 1916 to $23,103,320. Other exports are rum, vanilla, cocoanut oil, aloe-fibre, spice. The total value of exports in 1916 was $24,770,-015; of imports, $17,988,970. The imports consist of rice, wheat, cottons, haberdashery, machinery, manures, carriages and parts, coal, iron and steel, etc. Letters patent of 1885, 1901, 1904 and 1912 have established a partially representative form of government. The government of the island, with its dependencies, Diego Garcia, Rodrigues, etc., is vested in a governor, an executive council, comprising the commander of the forces, the colonial secretary, procurator-

general, receiver-general and other persons in the public service, whom the governor may designate as members of the council. The council of government consists of the governor and 27 members, nine of whom are named by the governor, eight are ex officio members and 10 are elected under a restricted franchise. The Indians are nearly all Hindus. The churches receive government aid—$50,880 in 1915–16.

The shipping on 1 Jan. 1916 comprised three steamers aggregating 1,080 tons and 28 sailing vessels aggregating 4,440 tons. In 1916 199 vessels of 438,960 tons entered and 197 vessels of 418,898 tons cleared the harbors of Mauritius. About 76 per cent of this tonnage was of British register. There are 621 miles of telegraph and 140 miles of telephone wires installed. Mauritius has cable connection with Australia, Madagascar, Reunion and Zanzibar. Consult the 'Mauritius Blue Book' (annual); Anderson, J. F., 'The Sugar Industry of Mauritius' (London 1899); Decotter, N., 'Géographie de Maurice et de ses Dépendances' (Mauritius 1891); Keller, C., 'Madagascar, Mauritius and other East African Islands' (London 1900); 'Oxford Survey of the British Empire' (Vol. III, London 1914); Rae, W. C., 'Handbook on the Constitution, Practice and Proceedings of the Council of Government' (Mauritius 1901); Walter, A., 'The Sugar Industry of Mauritius' (London 1909). The revenue for 1915–16 was $4,325,015, and the expenditure $3,830,315. The chief sources of revenue are the customs, licenses and permits, and the railways; the expenditure is chiefly on the civil service and on the railways, which have a total length of 120 miles. The currency is in rupees and cents. Schools are kept up partly by government, partly by private agencies. In 1917 there were 49 government and 91 aided schools. The average attendance at government schools was 6,670 and 8,991 in aided schools. The highest institution is the Royal College, a school affiliated to London University. In 1915–16 the government expended $209,765 on education. The French language and French law prevail in the colony, and the majority of the white inhabitants are of French origin. Mauritius was discovered in 1505 by the Portuguese. The Dutch took possession of it in 1598, and named it Mauritius in honor of Prince Maurice. It eventually fell into the hands of the French, from whom it was captured by the British in 1810, and it was definitely ceded to them in 1815. Principal towns, Port Louis, the capital, Curepipe and Mahébourg. Rodrigues, Diego Garcia, the Seychelles and some other islands of the Indian Ocean are dependencies of Mauritius. The scene of Bernardin de Saint Pierre's celebrated 'Paul et Virginie' is laid in this island. In 1911 the population of the island, including dependencies (6,690) and military (1,602), was 377,083, consisting of the general population of 115,146, the Indian population of 258,251, and 3,686 Chinese. There were in the same year 122,424 Roman Catholics and 6,946 Protestants.

MAUROCORDATOS. See MAVROCORDATOS.

MAURY, mâ'ri, **Dabney Herndon,** American military officer and engineer: b. Fredericksburg, Va., 21 May 1822; d. Peoria, Ill., 11 Jan. 1900. He was graduated from West Point in 1846 and served in the Mexican War. He was brevetted 1st lieutenant in 1847 for "gallant and meritorious conduct" at Cerro Gordo, and served in the United States Military Academy as instructor, 1847–52. In 1858 he was engaged as superintendent of cavalry instruction at Carlisle Barracks. At the beginning of the Civil War he was brevet-captain, but resigned to enter the Confederate army, where he attained the rank of department commander of the Army of the Gulf. At Vicksburg in 1862 he was Sherman's opponent and subsequently had charge of the Department of Tennessee with the rank of major-general. He again served the United States government when under President Cleveland's first administration he was Minister to Colombia. He published 'Skirmish Drill for Mounted Troops' (1859); 'Recollections of a Virginian in the Mexican, Indian and Civil Wars' (1894); 'Young People's History of Virginia and Virginians' (1904).

MAURY, Matthew Fontaine, American naval officer and hydrographer: b. in Spottsylvania County, Va., 14 Jan. 1806; d. Lexington, Va., 1 Feb. 1873. He studied at the Harpeth Academy in Tennessee, and entered the United States navy in 1825. During a voyage around the world in the *Vincennes* he began a treatise on navigation, long used as a textbook in the navy. He was made lieutenant in 1836. In 1839, when he was lamed by an accident, he quitted active sea-service for scientific work at the Naval Observatory. His powers of application were combined with rare gifts of imagination, and an elevated style. His 'Physical Geography of the Sea and Its Meteorology' (1855) has been considered a book of fascinating interest. In 1844 he published his views on the Gulf Stream, ocean currents and great-circle sailing. His 'Wind and Current Charts' have been of immense benefit to navigation. In 1853 he reached the rank of commander, and in that year projected the maritime conference at Brussels, and also published 'Letters on the Amazon and the Atlantic Slopes of South America.' In 1861, when the Southern States seceded, he gave his services to the Confederate cause. For some time he attached himself to the fortunes of the Emperor Maximilian in Mexico; but for the last few years of his life was professor of physics at the Virginia Military Institute. He was among the first to turn fresh attention to a branch of scientific inquiry which had been previously much neglected, the investigation of the depths of the sea, its currents, temperature, etc. He also published 'Lanes for Steamers Crossing the Atlantic' (1854). Consult Corbin, 'Life of Matthew Fontaine Maury' (London 1888).

MAUSER, Paul von, powl mow'zĕr, German inventor and gun-maker: b. 1838; d. 29 May 1914. He worked as a boy in the royal armory at Oberndorf, and there with his brother Wilhelm (d. 13 Jan. 1882) patented several improvements on the small arms then in use, both new needle-guns and a model replacing the "needle" powerful percussion-pin. The introduction of the Prussian needle-gun into Würtemberg after the Austro-Prussian War deprived the brothers of the patronage of the

4 By Shiekel & Ditmars, architects

government, and in 1867 he settled in Liége, where he was financed by an American capitalist. Paul invented the Mauser revolver in 1879 and the "Mauser" in 1882. He made the Turkish model in 1887, the Belgian repeating rifle in 1889, the Argentine model in 1891, the Spanish model in 1893 (adopted with slight change throughout South and Central America), and in 1896 a rifle for the Swedish army. Typical of his rifles are the Belgian model of 1889 and the Argentine of 1891, both magazine rifles with no cut-off, but capable of single fire by replacing the top cartridge in the magazine after each discharge. The magazine holds five cartridges, lies in front of the trigger guard and under the receiver, is fixed in type but easily cleaned. See SMALL ARMS.

MAUSOLEUM (Greek, *mausoleion*), a tomb or burial place, the name of which is derived from Mausolus, a king of Caria, to whom a sumptuous sepulchre was raised by his wife, Artemisia, at Halicarnassus. King Mausolus died 353 B.C.; and his wife was so disconsolate that she perpetuated his memory by the erection of this magnificent monument which became so famous as to be esteemed the seventh wonder of the world, and to give a generic name to all superb sepulchres. Its entire height was 140 feet, and the entire circuit 411 feet. It was overthrown, probably by an earthquake, between the 12th and 15th centuries; and when the Knights of Rhodes took possession of Halicarnassus in 1404 they availed themselves of the materials of the mausoleum to erect the fortress of San Pietro. Parts of the frieze were transported to the British Museum in 1846. Other famous mausoleums are that erected at Babylon by Alexander the Great in honor of Hephæstion, equally magnificent with that of Mausolus, though less refined; and the mausoleum of Augustus, built by him in the sixth consulate on the Campus Martius, between the Via Flaminia and the Tiber, the ruins of which are still seen near the church of Saint Roque. One of the obelisks which stood before this superb building was found in the reign of Pope Sixtus V. This mausoleum contained the ashes of Augustus, Marcellus, Agrippa, Germanicus and of some later emperors. The mausoleum of Hadrian at Rome is now the Castle of San Angelo. Consult Adler, 'Das Mausoleum zu Halikarnas' (Berlin 1900); Newton, 'History of Discoveries at Halicarnassus, Cnidus and Branchidæ' (London 1863); id., 'Travels and Discoveries in the Levant' (ib. 1865); Smith, A. H., 'Catalogue of Sculptures in the British Museum' (Vol. II, ib. 1900).

MAUSTON, mâs'tŏn, Wis., city, county-seat of Juneau County, on the Lemonweir River, and on the Chicago, Milwaukee and Saint Paul Railroad, about 130 miles northwest of Milwaukee. The chief manufacturing establishments are lumber mills, machine shops and flour mills. Pop. 1,701.

MAUTHNER, mout'nĕr, **Fritz**, German novelist and philologist: b. Horzitz, Bohemia, 29 Nov. 1849 of well-to-do Jewish family; went to Prague at an early age, studied law there and became a contributor (1876) of the *Berliner Tageblatt* for which he continued writing in various departments (particularly dramatic criticism) until 1905, when he retired from newspaper work and moved from Berlin (where most of his active life was spent) to Freiburg im Breisgau; he lived at Meersburg on Lake Constance from 1909. While he has written novels and satiric romances, his greatest work is in the field of philosophical criticism of language as a means of expression; his position on this matter is best expressed in a large book: 'Beiträge zu einer Kritik der Sprache' (Vol. I, 'Sprache und Psychologie,' 1901; Vol. II, 'Zur Sprachwissenschaft,' 1901; Vol. III, 'Zur Grammatik und Logik,' 1902); and in an alphabetically arranged summary of the contents of this work, in dictionary form: 'Wörterbuch der Philosophie' (Munich and Leipzig 1910). His criticism is poetic and destructive rather than social in its import; his style smooth and brilliant. His most famous work before he undertook scholarly production was 'Nach verühmten Mustern' (Stuttgart 1878; 30th ed., 1902), a set of parodies of well-known German and foreign writers, in the manner of Bret Harte. In 1914 he published a collection of newspaper articles that had appeared in previous years, under the title, 'Gespräche im Himmel,' and in 1918 began the publication of an autobiographical work, the first volume of which deals with his school-days in Bohemia and is a rather bitter attack upon the educational system of the time. Among other works are 'Vom armen Franischko' (Dresden 1879); 'Die Sonntage der Baronin' (Dresden 1881); 'Der neue Ahasver' (Dresden 1881); 'Xanthippe' (Dresden 1884); 'Aturenbriefe' (Dresden 1885); 'Berlin W.' (a cycle of three novels, Dresden 1886–90); 'Die bunte Reihe' (Munich 1896). There may be had, in English translation, 'Aristotle, an Unhistorical Essay' (New York 1906). On Mauthner's philosophical doctrine, consult Wells, H. G., 'A Criticism of the Instrument' (appendix to 'A Modern Utopia' 1905).

MAUVE, mōv, an aniline purple coloring matter. See DYES.

MAVERICK, Peter, American engraver: b. New York, 22 Oct. 1780; d. there, 7 June 1831. He studied engraving under his father, worked especially on bank-note designs and made famous engravings of Charles King's portrait of Henry Clay, of Waldo's portrait of Andrew Jackson and of Dunlap's portrait of Benjamin Moore. Maverick was one of the founders of the National Academy of Design in 1826. His most celebrated pupil was Asher B. Durand.

MAVERICK, an unbranded steer, especially one appropriated by a chance finder. This term, in common use in the cattle country of the United States, is said to be derived from the name of Samuel Maverick, a Texas lawyer and politician, who, having accepted a herd of 400 head of cattle in payment of a debt, left them in charge of one of his men. They were neglected and allowed to run wild and when the calves were born they were of course appropriated by other ranchers and branded with their marks, and so passed to their undisputable ownership. As the ownership of the cattle was determined by the brand, it may easily be seen why the name "Maverick's" was given to all calves caught straying from the herd. From

this use of the word grew a wider application to anything dishonestly come by.

MAVIS, the Scottish name for the British songthrush or throstle (q.v.), one of the favorite song-birds of western Europe.

MAVOR, James, English political economist: b. Stranraer, Scotland, 8 Dec. 1854. He was graduated from the University of Glasgow. He was for a time editor of the *Scottish Art Review;* in 1888 became professor of political economy at Saint Mungo's College, Glasgow, and in 1892 professor of political economy at the University of Toronto, Canada. He has written 'Wages Theories and Statistics' (1888); 'Economic Theory and History Tables and Diagrams' (1890); 'Currency Reform' (1891); 'Economic Study and Public and Private Charity' (1892); 'English Railway Rate Question' (1894); 'Railway Transportation in America' (1909); 'Economic Survey of Canada' (1914); 'Applied Economics' (1914); 'A Short Economic History of Canada' (1915).

MAVROCORDATOS, mäv''-rō-kŏr-dä'-tŏs, or **MAUROCORDATOS, Alexander,** modern Greek soldier and statesman: b. Constantinople, Turkey, 15 Feb. 1791; d. Ægina, 18 Aug. 1865. He was a skilful linguist and early schooled in diplomacy. On the outbreak of the Greek war for independence (1821), he devoted his entire fortune to the equipment of a ship and the arming of volunteers. He organized the insurrection in Ætolia and Acarnania, was made president of the National Assembly at Epidaurus, drew up the provisional constitution and signed the proclamation of independence (January 1822). He also became president of the executive council, but resigned in what he believed to be the interests of harmony. In 1833–34, 1841–43, 1844 and 1854–56, he was at the head of the Cabinet and in 1850–54 was Ambassador at Paris. He promoted public education and was a Liberal in politics, being of the British party and opposed to the Russian policy of Giovanni and Augustin Capo d'Istria. He is generally considered the most important leader in the Greek Revolution. Consult Browning, Oscar, 'History of the Modern World' (Vol. I, New York 1912).

MAWSON, Sir Douglas, Australian geographer: b. Bradford, Yorkshire, 1882. He was educated at Sydney University, where he was graduated bachelor of mining engineer in 1901. In the following year he was demonstrator in chemistry there. In 1903 he made a geological exploration of the New Hebrides and lectured at Adelaide University in 1905. In 1908 he became a member of the scientific staff of Sir Ernest Shackleton's Antarctic Expedition and determined the position of the south magnetic pole on Victoria Land. In 1911–14 he was leader of the Australasian Antarctic Expedition to explore Antarctic lands and establish stations for scientific purposes. His discoveries were among the most important made so far in the 20th century. In 1915 he was awarded the founder's medal of the Royal Geographical Society and was knighted in 1914. He has published 'The Home of the Blizzard' (2 vols., Philadelphia 1915) and scientific papers in the transactions of learned societies. For a detailed account of the explorations directed by Mawson see Antarctic Regions.

MAX, mäks, **Gabriel von,** German painter: b. Prague, 23 Aug. 1840. The son of a sculptor, with whom he studied for a time, he soon devoted himself to painting, then went to the Prague Academy under Engerth's teaching, and, after several years at Vienna, became a pupil of Piloty in Munich, where he was professor in the Academy from 1879 to 1883. His work is largely fantastic; he aims to interpret music, especially that of Beethoven, Mendelssohn and Liszt; and is fond of psychic themes, although occasionally, as in his famous pictures of monkeys, going to an extreme of realism, explained by his earnest belief in Darwin and Haeckel. But he is best known for his historical and figure paintings, which usually show a female figure of some beauty and ethereal charm, with dreamy, longing, sentimental eyes. In such pictures as these the flesh tones are particularly remarkable, being sometimes styled marble-like and due to his early training as a sculptor and again described as a twilight of sentiment, typifying the spiritual. To this class belong 'Spirit Greetings' (1879); 'The Last Token,' now in the Metropolitan Museum, New York (1874); 'Nydia' (1874); 'Veil of Saint Veronica' (1874); 'The Lion's Bride,' in the Museum of Manchester (1875), and many book illustrations, notably those for Schiller's and for Lenau's poems, for Goethe's 'Faust' (the 'Marguerite before the Mater Dolorosa' being especially well known), for Wieland's 'Oberon' and for Uhland's works. Max was ennobled in 1900. Consult Klemt, 'Gabriel Max und seine Werke' (Vienna 1887); Mann, N., 'Gabriel Max, Kunst und seine Werke' (Leipzig 1888); and Meissner (in 'Die Kunst unserer Zeit,' Munich 1899).

MAXENTIUS, mak-sen'shi-us, **Marcus Aurelius Valerius,** Roman emperor: d. 27 Oct. 312. He was the son of Maximianus, and in 306 A.D. was proclaimed Augustus by the prætorians and acknowledged by the people and Senate of Rome, to whom Galerius had become hateful. Severus, sent by Galerius against him and his father, was compelled by Maximianus to retreat to Ravenna and was put to death in 307. Galerius was likewise compelled to retreat and Maxentius, availing himself of an insurrection of the Africans under a certain Alexander, in 311 declared war against Constantine the Great. While Constantine pressed forward into Italy, Maxentius himself remained inactive at Rome and did not go out to meet Constantine till he had passed unopposed across the Apennines. At the great battle fought shortly after, at Saxa Rubra near Rome, Maxentius was defeated and perished in the Tiber as he tried to escape over the Mulvian Bridge. See Constantine; Rome — *History.*

MAXEY, Samuel Bell, American soldier: b. Tompkinsville, Ky., 30 March 1825; d. Texas, 16 Aug. 1895. When Maxey was a child his parents removed to Paris, Tex., where the son was educated until prepared to enter West Point, from which he was graduated in 1846, assigned to the infantry and at once sent to Mexico. He took part in the campaign from Vera Cruz to the City of Mexico and was brevetted for bravery at Contreras. As soon as the war was ended Maxey resigned to begin the practice of law. For 12 years he practised

in Kentucky and Texas. He entered the Confederate service as colonel of the 9th Texas Infantry and was engaged in the campaigns east of the Mississippi River under A. S. Johnston, Bragg and Joseph E. Johnston. In 1862 he was made brigadier-general. In 1863 he was sent to command the Indian Territory. He raised and equipped numbers of troops, kept the Indians friendly to the Confederacy and in 1864 he drove back the Federal general, Steele, who was endeavoring to effect a junction with Banks in the Red River Valley. For this he was made major-general. After the war he was offered a Supreme Court judgeship in Texas but declined. From 1875 to 1887 he was in the United States Senate. Maxey was an able senator, a member of the prominent committees and an efficient advocate of Western interests.

MAXIM, Sir **Hiram Stevens,** Anglo-American inventor: b. Sangerville, Me., 5 Feb. 1840; d. London, England, 24 Nov. 1916. As a boy he received his early education in the country schools of Maine. What little spare time he had after attending to his work on the farm and in his father's workshop was spent in the pursuit of scientific knowledge. When he was 14 years old he was sent as an apprentice to a carriage builder at East Corinth, Me. Later, while employed in a laboratory in Boston, he perfected his first invention, a method of carbureting air and gas for lighting purposes. His invention was used in many New York hotels. Others of his inventions included electrical devices, improvements on incandescent lamps, self-registering current machines and other similar contrivances. When he was 28 years old he was employed as a draughtsman in a shipbuilding firm in New York City. While there he invented a locomotive headlight, which was used generally. In 1884 Maxim perfected the automatic rifle, or machine gun, in which the recoil due to the explosion of one cartridge was utilized to eject the empty shell and at the same time reload the weapon. The inventor was then in England. The government, interested at once in the possibilities presented by the rifle, adopted it. It was the Maxim gun that was an important factor in winning the Egyptian campaign for the English. It is now used by the armies throughout the world. Closely following came the "disappearing gun," cordite and other smokeless powders, a gun for hurling aerial torpedoes and the "delayed action" fuse. For many years Sir Hiram experimented with aeronautics. In 1894 he succeeded in building a heavier-than-air machine. At that time when aeroplanes were only thought possible, Sir Hiram Maxim criticised the British nation for lack of interest in aeronautics and predicted that a bombardment of the island from airships was possible. Sir Hiram held membership in the American Society of Civil Engineers, the Royal Society of Arts, the British Association for the Advancement of Science and many other bodies. He became a naturalized citizen of Great Britain because of alleged unfair treatment of his inventions by the American government. Sir Hiram Stevens Maxim will be remembered as one of the foremost inventors of his day. In 1881 President Grevy of France made him a Chevalier of the Legion of Honor. This decoration was followed in 1901 by recognition by the British government, Queen Victoria elevating him to the knighthood.

MAXIM, Hudson, American inventor and engineer: b. Orneville, Me., 3 Feb. 1853. He received an academic education with especial reference to the natural sciences and engineering, then took up the study of medicine; entered the printing and subscription book publishing business at Pittsfield, Mass., in 1883, but gave up the publishing business in 1888 to take up business of ordnance and explosives. He was the first to make smokeless gunpowder in the United States and was the first to submit samples to the government for trial. In 1890 he built a dynamite factory and smokeless powder mill at Maxim, N. J., named for him. It was there that the multi-perforated smokeless powder was developed and perfected under his inventions and patents, which was adopted by the United States government. These patents were purchased by the E. I. du Pont de Nemours Powder Company, of Wilmington, Del., in 1897. He invented the process of making calcium carbide by incandescence of molten carbide conductor, now in general use. In 1901 he sold United States government the secret of the high explosive Maximite invented by him (see Explosives); invented United States service detonating fuse for high explosive projectiles. He invented the system of driving torpedoes by steam and products of combustion of a self-combustive compound called motorite, the steam being generated by the motorite. This system was purchased by the United States navy. Since 1898 he has been consulting engineer for E. I. du Pont de Nemours Powder Company. He invented stabillite (q.v.), a smokeless powder made without volatile solvent, which consequently requires no drying. He received the degree of D.Sc. from Heidelberg University, Ohio, in 1913. He is member of consulting board of United States navy; of Albany Burgesses Corps (rank, captain); of Military Service Institution; of Society of Chemical Industry; of Chemists Club; of Aeronautical Society; Fellow A. A. A. S., of Society of Applied Psychology. He is author of 'The Science of Poetry and the Philosophy of Language' (1910); 'Defenseless America' (1915).

MAXIMA AND MINIMA. The maxima and minima of a function $f(x)$ are the points of the curve $y=f(x)$ where y is larger or smaller, respectively, than for any value of x differing from the value at that point by less than some finite number. According to this definition, a curve may have several maxima or minima, and a maximum or minimum need not be a point where y assumes the greatest or least value, respectively, throughout the entire curve. It is easy to see that a maximum is a point where the curve ceases to go up and begins to go down. At such a point, the slope of the curve, or the differential coefficient $\frac{dy}{dx}$, changes sign. If $\frac{dy}{dx}$ is continuous at a maximum, it can only be 0, and at any rate, on an algebraic curve, it can only be 0 or ∞. Thus the maxima — likewise the minima — are all to be found among the points where $\frac{dy}{dx}=0$ or ∞.

If $\frac{d^2y}{dx^2} > 0$, we have a minimum, of $\frac{d^2y}{dx^2} < 0$, a maximum. However $\frac{dy}{dx}$ may be 0 or ∞ without their being a maximum or minimum at the point. In this case $\frac{d^2y}{dx^2}$ will be 0. To determine whether we have a maximum, a minimum or neither when $\frac{d^2y}{dx^2}=0$, higher derivatives must be considered.

The definition of the maxima and minima of a function of two variables is obvious. It is clear that a necessary condition for a maximum or minimum of $f(x, y)$, at a point where its partial derivatives are continuous, is that $\frac{\partial f}{\partial x} = \frac{\partial f}{\partial y} = 0$. A sufficient condition for a maximum is $\left(\frac{\partial^2 f}{\partial x \partial y}\right)^2 < \left(\frac{\partial^2 f}{\partial x^2}\right)\left(\frac{\partial^2 f}{\partial y^2}\right)$ and $\frac{\partial^2 f}{\partial x^2} < 0$. A sufficient condition for a minimum is $\left(\frac{\partial^2 f}{\partial x \partial y}\right)^2 < \left(\frac{\partial^2 f}{\partial x^2}\right)\left(\frac{\partial^2 f}{\partial y^2}\right)$ and $\frac{\partial^2 f}{\partial x^2} > 0$.

Some important theorems in plane geometry having to do with maxima and minima are that of all polygons having a given perimeter and a given number of sides the regular one has the greatest area; that a circle has a greater area than any other figure with the same perimeter; that a right triangle is larger than any other with two sides equal to its legs, and that of all triangles with a given perimeter and a given base, the isosceles is the greatest. See CALCULUS, THE INFINITESIMAL; CALCULUS OF VARIATIONS.

MAXIMALISTS, or BOLSHEVIKI, the name applied to the adherents of the extreme Socialist party which, headed by Lenine and Trotzky, overthrew the provisional government and the Soviet leaders in Russia on 7 Nov. 1917. The words "Bolshevik" (sing.), "Bolsheviki" (plural) and "Bolshevism" are not explanatory terms and have nothing to do with the policy or aims of the party. Their origin dates from the second conference of the Russian Social-Democratic party in 1903, at which the methods to be adopted in regard to revolutionary activity were under discussion. A sharp line of cleavage made itself evident; and when voting on the resolutions took place there was naturally a majority (bolshinstvó) and a minority (menshinstvó). From that moment the groups were called Bolsheki and Menshiviki (maximalists and minimalists). The majority represented the extremists, the "whole-hoggers" of Socialism (bólshĕ — more), or those who go for the biggest things; while the minority represented the "moderates" or "thin-end-of-wedge" theorists (ménshi — less, smaller), or those whose aims are of smaller intent. There appears to be no evidence that the terms existed or were current before 1903, though the Russian Social-Democratic party was founded by Plekhanov and others in Switzerland in 1884. The abortive revolutionary movement of 1905–06, which opened with the Putilov ironworks strike and the Father Gapon episode, served to widen the breach between the two factions to the extent that in 1907 the party was definitely split into two independent groups — Bolsheviki and Menshiviki. The former, following in part the teachings of Karl Marx, were led by Lenine. The Marxian revolution was essentially a class revolution, to the realization of which nationalism was regarded as an obstacle. The European War and the aftermath of the Revolution of March 1917 revealed the wide divergence existing between the aims and methods of the two groups. The Bolsheviki contracted the class distinction to narrower dimensions and looked upon the educated classes, the *bourgeoisie*, and even the peasants as enemies. Their aim was radical internationalism; they sought not the re-creation of Russia, but the triumph of one class throughout the world — the proletariat; in other words, mob-rule. For the most part they were bitter and arid doctrinaires, reeling off strings of long, high-sounding words and phrases which few understood, and clinging to a vague and abstract creed with fanatical devotion. Every problem was met by a reference to the letter of their law and interpreted accordingly. But whatever political, social or economic creed the Bolsheviki professed on paper, their activity — and by that alone can they be judged — consisted merely of a wild orgy of crime, plunder and treason. No trace of practical ability was revealed by any of their leaders, but they had the driving force which even the shallowest fanaticism can give. They were opposed to the war, which they declared to be "imperialistic" and "bourgeoise." They were opposed (on principle) as much to a German peace as to a peace dictated by the Allies: "No indemnity, no reparation and no annexation" became their ideal. The Menshiviki were of a saner type; while claiming for the working classes the importance due to their numbers, they did not ignore other classes. Holding in view definite practical reforms, they were willing to utilize the existing machinery of the state for their purpose. They accepted the war and its vigorous prosecution as a part of their program and realized that nationalism must precede internationalism. They recognized that the cause of the Allies was also their cause, and in this belief they were undoubtedly supported by the more intelligent Russian Social-Democrats. To the Bolsheviki the fate of their country mattered nothing, provided only that their own crude ideas of social reconstruction survived the ordeal. They were eager for peace on any terms in order that they might proceed with their own program, that class war which recognized no political frontiers nor national consciousness. After the fall of Kerensky the Bolsheviki began their career as rulers by the wilful and systematic destruction of the Russian army and navy. Their leaders posed before the world as the elect champions of a new idealism which was to redeem mankind. They proposed to teach other democracies the true and saving doctrine of the real revolutionary creed. Of exercising government, as that term is understood among civilized peoples, they proved themselves utterly incapable; government, in fact, holds no place in their system, of which the sole principle is civil war or, as they term it, "class war." Though it owes its genesis to Socialism (from which it is really far removed), Bolshevism may be described as a com-

pound of anarchism, syndicalism, hatred and blind fanaticism. Needless to say, ingredients of this type cannot fail to attract all the purely criminal elements which, in normal times, are held in check by the forces of law and order. With the removal or breakdown of that salutary check and the absence of an efficient substitute, a free rein is given to unbridled passions by which a political movement is converted into a mere carnival of terrorism. This was what happened in Russia in 1917. The Bolsheviki had nothing whatever to do with bringing about the revolution which swept away the autocracy in March of that year. That revolution was neither engineered nor organized; it sprang not from the burning inspiration of a new faith, but succeeded almost automatically from sheer weariness: tired in mind and body, Russia had lost nerve and heart. The provisional government that was formed on 16 March consisted of honest, patriotic and intelligent men — Prince Lvov, Guchkov, Milyukov, Terestchenko, Nekrasov, Shingarev and Kerensky, who was the only Socialist in the group. Of all these, Kerensky proved to be the only "man of destiny" with sufficient magnetism to compel a following. Their first energies were devoted to maintaining discipline in the army and to carry the war to a successful conclusion. But already in September 1915 Lenine had issued the Zimmerwald manifesto, signed by himself and the Swiss Socialist, Robert Grimm, calling for "peace without annexations or indemnities." German agents had sedulously spread this doctrine among the Russian rank and file. with the result that the idea of a peace so easily to be gained soon won a large number of converts. It was easy for German propagandists to convert the working classes to this view. The people were told what they wanted to hear — that it was folly to fight longer and that their Western Allies were the true foes of Russia, since they sought to force her to remain in the war. Not only did demoralization of the army set in, but there also grew up a spirit of hostility against the Allies, especially Great Britain. Thus, while the provisional government and later Kerensky alone struggled to maintain order and national unity, Bolsheviki and German agents were undermining the structure with glowing promises and sedition. On 16 July 1917 the Bolsheviki in Petrograd, led by Lenine and Trotzky, attempted to seize the reins of government and failed. Lenine disappeared when warrants were issued for the arrest of the Bolshevist leaders. At the last moment Kerensky weakened; regarding the Bolsheviki as "political opponents," he countermanded the order for their arrest.

Up to this time the Russian armies were still fighting in the field; their offensive in Galicia was nearing its disastrous climax and Bolshevism — the foe of the revolution and an enemy of the people — was growing in momentum. Confusion spread; Kerensky denounced the counter-revolutionists and those who unwittingly encouraged anarchy (Moscow, 25 Aug. 1917), which caused a wider split among his uneasy team. General Korniloff arrived from the front and stated that the military disasters were due not to the revolution but to the follies of the revolutionaries; that discipline must be maintained both at the front and in the rear. His gloomy picture of a degraded and defeated Russia had no terrors for the Bolsheviki. After three days of palaver the conference talked itself to a standstill with no result. Meanwhile, the German armies found no difficulties in overrunning northern Russia and seizing Riga. Kerensky again wavered. His fatal error in the Korniloff affair drove the few remaining moderates out of his Cabinet and gave the Bolsheviki their opportunity. The retreating Russian armies gave themselves up to pillaging their own people and the sailors of the Baltic fleet murdered their own officers. Lenine crept out of hiding and raised his voice afresh in Kronstadt — the worst nest of anarchy. Kerensky once more fulminated against the Bolsheviki and then informed the United States that Russia was worn out. The dark forces waiting in the shadows quickly observed the change and made their preparations. The apathy and despair of Russia made her an easy victim to a body of determined men. Trotzky, then president of the Petrograd Soviet, summoned the proletariat of all nations to do what had been done in Russia; he decided to make peace with a willing Germany and to raise his party to the supreme power. On 5 Nov. 1917 the Military Revolutionary Committee ordered the Petrograd garrison to place itself under their instructions. Kerensky suppressed the chief Bolshevist paper and called on the loyal troops to defend the government. On the 6th the military cadets occupied stations, bridges and telegraph offices and threw a cordon around Kerensky's residence, the Winter Palace. Lenine arrived the following day with his leading spirits and made the Smolny Institute (a girls' school) the Bolshevist headquarters. He issued a proclamation announcing the fall of the government. The majority of the troops went over to the Bolsheviki. Kerensky fled on the 7th, leaving a guard of cadets and some women at the Palace. The Bolshevist troops (Red Guards) captured the palace, committed many brutalities on the inmates and in a few hours the whole of Petrograd was in their hands. The "new government" was placed in the control of a "Council of People's Commissioners," of which Lenine was appointed president, Trotzky Foreign Minister and Ensign Krylenko as commander-in-chief of what was left of the army.

The comparative ease with which the Bolsheviki overturned the provisional government was due mainly to the passive attitude of the troops. Had Kerensky had at his disposal a few brigades of reliable troops he might as easily have crushed Bolshevism on the same day. On 8 November Lenine telegraphed to all the belligerent governments a proposal for a three months' armistice. On the 10th a series of decrees began to emanate from the Smolny Institute, their principal features being the spoliation of one class and the transference of its property to another. Municipalities were empowered to sequestrate all houses, whether inhabited or not, and to instal in them citizens possessing no abode or occupying crowded or insanitary dwellings. All factories were passed to the possession of the operatives (syndicalism), and a moratorium was proclaimed for the payment of rent for small houses and lodgings. The most important decree threatened civil war in the rural districts by declaring all private ownership in land to be annulled without com-

pensation to the owners. The land was to be nationalized and handed over to the cultivators, while for the present all lands belonging to the state, to the Church and to monasteries, etc., with all appurtenances — flocks, herds, machines, etc., were to be placed at the disposal of the local agrarian committees until the meeting of the Constituent Assembly. The local soviets were authorized to preserve order during the process of confiscation. All mines, forests and waterways were acquired by the state, and the smaller woods, rivers and lakes were to be the property of the village communes. The gloom of Bolshevism had settled over Russia. Missionaries of that cult were dispatched to all European countries and to the United States to spread the faith and incite proletariat uprisings, though with negligible success. During 1918 the dread of "Bolshevism" became a haunting spectre to not a few governments. Everywhere outside of Russia it was denounced by public men and its slightest symptoms rigorously suppressed. It is a remarkable fact that, while Jews formed a large percentage of the leading Bolsheviki, over 90 per cent of Russian Jews were hostile to them. Many of them had lived in America, Switzerland, Great Britain, France, Germany and the Scandinavian countries. They returned to Russia after the Revolution, where their ranks were swelled by large numbers of exiles from Siberia — not all political offenders, but also some of the most dangerous criminals. (The further adventures of the Bolsheviki régime are told under RUSSIA — HISTORY; see also RUSSIAN REVOLUTION OF 1917; WAR, EUROPEAN; KERENSKY; KORNILOFF; TROTZKY; LENINE). Consult Trotzky, L., 'The Bolsheviki and World Peace' (New York 1918); *The World's Work* (New York, October 1918); *Current History* (New York, November–December 1918).

MAXIMIANUS I, măk-sĭm-ĭ-ā'nŭs, **Marcus Aurelius Valerius,** Roman emperor: d. February 310 A. D. He so approved himself by his services in the army that Diocletian selected him for his colleague, creating him first Cæsar (285), then Augustus (286) and at the same time conferred on him the honorary appellation of Herculius. Maximianus had the care of the Western Empire, while Diocletian undertook that of the Eastern. In 287 he was consul with Diocletian, and in the same year conducted a campaign in Gaul. After conducting several wars, in 303–304 he was for the seventh time made consul, having for his colleague Diocletian for the fifth time, with whom he abdicated 1 May 305. In the following year he was again invested with the imperial title by his son Maxentius, to whom his services against Severus and Galerius were of the most important kind. His son shortly after expelled him from Rome, and repairing to Gaul, in 308 caused himself to be proclaimed Augustus at Marseilles, but Constantine easily deposed him. See CONSTANTINE; DIOCLETIAN.

MAXIMILIAN I, măk-sĭ-mĭl'ĭ-ăn (Ger. măks-ē-mē'lē-ān), emperor of Germany: b. Neustadt, near Vienna, 22 March 1459; d. Wels, in Upper Austria, 12 Jan. 1519. He first became an independent prince by his marriage with Mary of Burgundy, the daughter of Charles the Bold, who died in 1477. This match involved him in a war with Louis XI, King of France, in which he was successful, though he was defeated at a later period by the Milanese. At Frankfort in 1486 he was chosen king of the Romans and two years later was imprisoned by the Flemings at Bruges. He secured the Tyrol in 1490 and in the same year made war against Charles VIII of France. In 1493 he became Holy Roman emperor on the death of his father. He was involved in war with Venice, France and Switzerland for the greater part of his reign. He was succeeded by his grandson, Charles V. Consult 'Cambridge Modern History' (Vol. I, 1903), and Heyck, 'Kaiser Maximilian I' (Bielefeld 1898).

MAXIMILIAN, emperor of Mexico, known in earlier life as Ferdinand Maximilian Joseph, Archduke of Austria: b. Vienna, 6 July 1832; d. Queretaro, Mexico, 19 June 1867. He was the younger brother of Francis Joseph I, emperor of Austria (q.v.). He entered the Austrian navy in 1846, and in 1854 obtained the rank of rear-admiral and was placed at the head of the Austrian marine. He was viceroy of the Lombardo-Venetian kingdom in 1857–59, and in 1857 married Princess Charlotte of Belgium, daughter of King Leopold I. On his return from a voyage made to Brazil for scientific purposes he fixed his residence at Miramar in the vicinity of Trieste, and there, 3 Oct. 1863, received a deputation from the Mexican Assembly of Notables, who offered him the crown of their country. He officially announced his acceptance 10 April 1864. He landed at Vera Cruz on 28 May and entered Mexico on 12 June. He set himself energetically to consolidate and develop his dominions, granted an amnesty to political offenders and exhibited great interest in religious worship and education. But he failed to conciliate the Republican party, and as he did not restore to the clergy their confiscated estates they pronounced him a traitor. Meanwhile there were incessant conflicts between the partisans of President Juarez and the allied French and imperial troops; and the decree of 2 Oct. 1865, by which the members of the Juarist bands and those who abetted them were to be regarded as bandits and shot, alienated the party of the Liberals. Juarez raised the standard of independence. Complications and misfortunes thickening around Maximilian rendered his position critical in the extreme. The empress in vain undertook a mission to Europe to enlist support for her husband, and grief and disappointment overthrew her reason. The French troops, largely by reason of the representations of the United States government, were withdrawn by Napoleon in March 1867; but Maximilian decided to remain in the hope of being able to maintain the empire. While bravely defending Queretaro against a Liberal force under Escobedo, he was betrayed by General Lopez on the night of 14 May 1867. Tried by court-martial, he was sentenced, with his principal officers, to be shot. The sentence was carried into effect on the morning of 19 July. Maximilian's body was after some delay surrendered to his relatives, and his funeral was celebrated with great pomp in the cathedral of Vienna on 18 Jan. 1868. Maximilian was a man of eminent abilities and high and varied culture. His collected writings are contained in a posthumous publication entitled

'Aus meinem Leben: Reiseskizzen, Aphorismen, Marinebilder' (1867), which gives ample testimony to the vigor of his intellect and the variety of his attainments. (See MEXICO, *History*). Consult Bancroft, H. H., 'History of Mexico' (6 vols., San Francisco 1883–88); 'Cambridge Modern History' (Vol. II, New York 1909); Kemper, J., 'Maximilian in Mexico' (Chicago 1911); Martin, P. F., 'Maximilian in Mexico' (London 1914).

MAXIMILIAN, Joseph, 1st king of Bavaria: b. Schwetzingen, Baden, 27 May 1756; d. Nymprenburg, near Munich, 13 Oct. 1825. He succeeded his uncle, Charles Theodore, as elector in 1799. He was a supporter of Napoleon, and gave his daughter in marriage to Eugene Beauharnais in 1806. In the same year his duchy was erected into a kingdom. In 1813, however, he was member of the league against the emperor, and thus retained his throne after the fall of Napoleon. His reign was distinguished by the introduction of many administrative reforms, especially the constitution of 1818.

MAXIMINUS, măk-sĭ-mī'nŭs, **Caius Julius Verus,** Roman emperor: d. Aquileia, 238 A.D. He was at first a shepherd in Thrace and when about 20 years of age became a soldier in the Roman armies, where he was distinguished by his gigantic stature. His capacity for fighting procured him rapid advancement, and under Alexander Severus he had the command of a legion on the Rhine. In 235 A.D. he took part in a conspiracy against Alexander, and after his murder of the latter by the soldiers was proclaimed emperor. The Gordiani having been proclaimed in Africa, Maximinus hastened to Italy and laid siege to Aquileia. He was there murdered by his soldiers.

MAXIMITE, a high explosive employed as a bursting charge for projectiles, invented by Hudson Maxim (q.v.) of New York City. The secret of the invention and the exclusive right to the use of the explosive was purchased by the United States government in 1901, after very exhaustive trials at Sandy Hook proving grounds. Maximite was the first high explosive to be successfully employed as a bursting charge for armor-piercing projectiles. This explosive, while it is claimed to be 50 per cent more powerful than ordinary dynamite, is so insensitive that it will not only safely withstand the shock of discharge from the gun, but will also stand the far greater shock of penetrating armor-plate as thick as the projectile containing it is capable of passing through, the projectile being then exploded immediately behind the plate with a delay action detonating fuse.

Ignited in the open, maximite simply burns like pitch. Projectiles are charged with it by the simple process of melting and pouring, the explosive solidifying on cooling, and adhering firmly to the walls of the shell. Maximite is known to be a picric acid compound. See EXPLOSIVES; PROJECTILES.

MAXIMS. The 'Maxims' of La Rochefoucauld furnish the most famous body of examples of that polished and studied condensation of expression to epigrammatic sparkle and brilliance in which the French so delight and so excel, and of which the 'Pensées' of Pascal, the 'Caractères' of La Bruyère and the 'Reflexions' of Vauvenargues are other specimens. They are precisely what their fuller official title proclaims them: Reflections, or Sentences and Moral Maxims ('Réflexions, ou Sentences et Maximes morales'). They are moral in the sense that they are concerned with the facts of human conduct and motive, but not at all in the sense of serving a didactic purpose or in proposing an incentive or a guide to virtuous living; and they are reflections rather than maxims in the ordinary meaning of the word, since what they give us is not practical precept and counsel, but an analysis of moral facts. In this analysis the sharp distinction and opposition between vice and virtue disappears. His moral philosophy is summed up in the maxim that stands as epigraph at the head of the collection: "Our virtues are most frequently but vices disguised." The idea is restated a little more specifically in the first reflection: "What we term virtue is often but a mass of various actions and divers interests which fortune, or our own industry, manage to arrange, and it is not always from valor or from chastity that men are brave, and women chaste." The root of all our actions, mask it as we will, is selfishness. This view of virtue and vice may owe something of its bitterness and pessimism to the personal temper of La Rochefoucauld, soured by disappointment after playing a restless and unsuccessful part in political and private intrigue. But it owed much also to his penetrating observation of the life of court and salon, and even those who wanted to think more generously of human nature admitted sadly the accuracy of his analysis, while all were captivated by the concision and elegance of his style. To this he gave unending care, polishing and refining his sentences, rejecting some and adding others in successive editions (1665, 1666, 1675, 1678). The standard edition is that prepared by M. Gilbert (Paris 1868). The Maxims have had many admirers among English writers, as Addison, Swift, Dr. Johnson and Lord Chesterfield. They have often tempted to translation. A late and complete English version is by J. W. Willis Bund and J. Hain Friswell (London 1871).

ARTHUR G. CANFIELD.

MAXIMS, Legal, epigrammatic statements of established principles in law, as "Ignorance of the law excuses no one" (*Ignorantia legis neminem excusat*). They are of historic and practical value, and are common in both law and equity. Usually they are given in Latin or in English, but occasionally they appear in French. The following are some of the most important which appear generally in English: "Equity treats that as done which ought to be done"; 'He who comes into equity must come with clean hands"; "Who seeks equity must do equity"; 'Acts indicate the intention"; "Where there is equal equity, the law must prevail." The following usually appear in Latin: *Qui facit per alium facit per se* ("He who acts through another acts himself"—important in the law of agency); *Affirmantis est probare* ("He who affirms must prove"); *Causa proxima non remota spectatur* ("The immediate and not the remote cause is to be considered"—important in the law of torts). While maxims are of importance in the law to-day, it is nevertheless true that some of them, through legal changes, are practically obsolete. Due

allowance also must be made for the fact that they do not contain exceptions and amplifications of the principles they state; otherwise they are very likely at times to be misleading.

MAXIMUM DUTIES. See DUTY.

MAXIMUS MAGNUS, Roman emperor: b. in Spain; d. 388. In 383, while commanding the Roman army in Britain, he proclaimed himself emperor. Gratian marched against him, but was defeated and assassinated, and Maximus, having made himself master of Gaul, Britain and Spain, fixed the seat of his empire at Treves. He then advanced into Italy and was besieged in Aquileia by the Emperor Theodosius, who caused him to be beheaded.

MAXWELL, SIR Herbert Eustace, 7th Baronet of Monreith, Scottish author: b. Edinburgh, 8 Jan. 1845. He was educated at Oxford, was Conservative member of Parliament for Wigtownshire, 1880–1906, and president of the Society of Antiquaries of Scotland, 1900–13. Among his many publications are 'Noontide Essays' (1892); 'Scottish Land Names' (1894); 'Rainy Days in a Library' (1896); 'Life of the Duke of Wellington' (1899); 'Memories of the Month's' five series (1900–09); 'The House of Douglas' (1901); 'Memoirs of George Romney' (1902); 'The Creevy Papers' (1903); 'A Century of Empire' (1909–11); 'The Making of Scotland' (1911); 'Fishing at Home and Abroad' (1914); 'Trees, A Woodland Notebook' (1914).

MAXWELL, James Clerk-, Scottish natural philosopher: b. Edinburgh, 13 Nov. 1831; d. Cambridge, England, 5 Nov. 1879. He was educated at Edinburgh and at Trinity College, Cambridge, and in 1856 was appointed professor of natural philosophy in the Marischal College, Aberdeen, and held that office till its amalgamation with King's College to form the University of Aberdeen in 1860, when he was appointed to a similar chair in King's College, London. In 1857 he obtained the Adams prize at Cambridge for an essay 'On the Stability of Motion of Saturn's Rings.' From 1855 to 1872 he published his investigations on 'Perception of Color, and Color Blindness,' which obtained for him the Rumford medal and his election as F.R.S. He resigned his chair in 1865 and in 1871 was elected unopposed to the newly-founded chair of experimental physics at Cambridge. He directed the formation of the Cavendish laboratory founded by the Duke of Devonshire and opened in 1874. In 1871 he published his 'Theory of Heat,' which has gone through several editions. In 1873 appeared his great work, 'Electricity and Magnetism.' Maxwell's fame will rest on his being the one who took the first grand step toward the discovery of the true nature of electrical phenomena. He rejected the theory of electrical "action at a distance," and sought to explain all electrical and magnetic phenomena as the results of local strains and motions in a medium whose contiguous parts only act on one another by pressure and tension. His scientific papers have been collected by W. D. Niven (1890). Consult Campbell and Garnett, 'James Clerk Maxwell' (London 1882); Glazebrook, R. T., 'James Clerk Maxwell and Modern Physics' (ib. 1896).

MAXWELL, William Henry, Irish-American educator: b. Stewartstown, Tyrone, Ireland, 5 March 1852. He was graduated at Galway Queen's College in 1872, and two years later received the degree of A.M. In 1874 he came to the United States. After eight years as teacher in Brooklyn he became assistant superintendent of schools in that city in 1882 and superintendent from 1887 to 1898. Since 1898 Dr. Maxwell has been superintendent of public schools of Greater New York. In this position he often came into conflict with members of the board of education. He advocated a college training for teachers and raised the requirements for teachers' examinations in New York. He was president of the National Education Association in 1905. Dr. Maxwell has always been deeply interested in the promotion of the study of English. He published 'Elementary English Grammar'; 'School Grammar' and other educational works.

MAY, Phil, English illustrator: b. Leeds, 22 April 1864; d. Saint John's Wood, London, 5 Aug. 1903. He was son of an engineer; had his schooling in Leeds; was apprenticed there to a lawyer, whom he soon left to join a company of players; for them he designed posters; married at the age of 19; and in 1884 and 1885 began drawing for *Society* and *Saint Stephen's Review*. He went out to Sydney, Australia, in 1885, where he gained some fame as artist of the *Bulletin*, and was forced by the exigencies of newspaper illustration to a very scanty use of line and a complete omission of anything else; went to Paris; returned to his work on *Saint Stephen's Review;* then began to draw for the *Daily Graphic;* in 1888 returned to England; thereafter traveling through America; and shortly after Du Maurier's death was taken on the staff of *Punch*. He must rank with Leech, Tenniel and the other great British caricaturists. His art was remarkably simple and telling, his method, it is said, being to reduce an elaborate and detailed drawing to the fewest possible lines. He was particularly happy in his portrayals of London street-life, which are full of humor and sympathy; his Parliament sketches are less felicitous and a misapplication of his talent. His own hatchet face, "banged" hair and ever-present cigar figure in many of his sketches. From 1892 to his death he published 'Phil May's Annual.' His other collections of drawings are 'Parson and Painter' (1891); 'Phil May's Sketch Book' (1895) and 'Phil May's Gutter-Snipes' (1896); 'Phil May's Graphic Pictures' (1897).

MAY, Samuel Joseph, American reformer and abolitionist: b. Boston, Mass., 12 Sept. 1797; d. Syracuse, N. Y., 1 July 1871. He was graduated at Harvard in the class of 1817, and after studying theology under Dr. Ware at the Harvard Divinity School became a Unitarian clergyman and in 1822 accepted a call to a church at Brooklyn, Conn. He was interested in the anti-slavery cause and preached as well as wrote in favor of it, advocating immediate emancipation, for which he was mobbed and burned in effigy at Syracuse in 1830. He was a member of the first New England Anti-Slavery Society, formed in Boston in 1832, and eagerly championed Prudence Crandall, when she was persecuted and arrested for receiving colored girls into her school at Canterbury, Conn. Mr. May was also a member of the Philadelphia convention of 1833 which formed the American

Anti-Slavery Society, and was one of the signers of the «Declaration of Sentiments,» the author of which was William Lloyd Garrison. For 18 years he was the general agent of the Massachusetts Anti-Slavery Society, and as such lectured and traveled extensively. He was five times mobbed while on a lecture tour in Vermont, in 1835, once while lecturing in the capitol at Montpelier. He had charge of the Unitarian church at South Scituate, Mass., from 1836 to 1842, becoming in the latter year, at the request of Horace Mann, the principal of the Girls' Normal School at Lexington, Mass. In 1845 he became pastor of the Unitarian Society at Syracuse, N. Y., which position he retained until 1868. Mr. May assisted in the rescue of Jerry, the slave, in 1851, and with several others was arrested for this offense against the Fugitive Slave Law. May and his associates issued a declaration in which they admitted the fact of their being implicated in the rescue, but claimed that the Fugitive Slave Law was unconstitutional and wicked. Realizing the changing sentiment in the North the authorities never brought the case to trial. May's life, like that of many another Abolitionist, was often in danger. He was among the most conservative anti-slavery leaders in his methods and was prominent also in many educational and charitable enterprises, and did a great deal toward improving the public-school system of Syracuse. By his associates May was termed the Saint John Apostle of the Gospel of Freedom, on account of his gentle voice and manner. He was both gentle and firm, courageous, unwearied and unselfish in the anti-slavery cause. He published 'Education of the Faculties' (1846); 'Revival of Education' (1855); 'Recollections of the Anti-Slavery Conflict' (1868). Consult Mulford, 'Memoir of Samuel Joseph May' (Boston 1873; new ed., 1882).

MAY, Thomas, English dramatist and historian: b. Mayfield, Sussex, 1594; d. London, 13 Nov. 1650. He was educated at Cambridge, became a member of Gray's Inn, but never practised, and figured brilliantly at court. He published 'Antigone,' 'Cleopatra,' 'Agrippina' and other dramas and translations of the 'Georgics' and Lucan's 'Pharsalia.' He was an intimate of Charles I and at the latter's behest wrote histories of Edward III and Henry II in verse. He espoused the cause of Parliament in the Civil War, was made secretary and historiographer to Parliament and wrote 'History of the Parliament of England, 1640–43' (1650; several times republished), and a 'Breviary' of the same history (1650). Until the Restoration his body reposed in Westminster Abbey, but as in the case of other Parliamentarians, it was then dishonored and thrown into a neighboring pit.

MAY, Thomas Erskine, Baron Farnborough, English historian: b. London, 8 Feb. 1815; d. Westminster, 17 May 1886. He was educated at Bedford Grammar School, became assistant librarian to the House of Commons in 1831 and was called to the bar in 1838. He was appointed examiner of petitions for private bills in 1846 and clerk to the House of Commons in 1871. He was knighted in 1866, and just prior to his retirement from office in 1886 was raised to the peerage. He is best known as an antiquarian and historian. His chief works are 'A Practical Treatise on the Law, Privileges, Proceedings, and Usages of Parliament' (1844; 10th ed., much enlarged, 1893), a model of its kind, which has been translated into most modern languages; 'Constitutional History of England since the Accession of George III, 1760–1860' (1861–63; republished with supplementary chapter, 1871); 'Democracy in Europe: a History' (1877). In 1854 he collected and reduced to writing the 'Rules, Orders, and Forms of Procedure of the House of Commons.'

MAY, the fifth month of the year, having 31 days. It was second in the old Alban calendar, third in that of Romulus and fifth in that of Numa Pompilius. The etymology of the word is doubtful. It was called Maius by Romulus, in respect to the senators and nobles of his city, who were called Majores, as the month following was called Junius, in honor of the youth of Rome who served him in war and were named Juniares. Some etymologists are of opinion that it was called Maia, from the goddess of that name, the mother of Mercury, to whom they offered sacrifices on the first day of the month. The sun enters Gemini during May and the plants of the earth generally begin to flower. See Calendar.

MAY APPLE. See Mandrake.

MAY BEETLE, or **JUNE BUG,** popular names for the clumsy brown beetles of the genus *Lachnosterna* (family *Scarabæidæ*) common throughout the United States. The adults fly by night during late spring and often are troublesome upon the young foliage of trees and shrubs. They are attracted by light and may be trapped in this way. The larvæ are large, brown-headed, white-bodied grubs which feed upon the roots of grass, etc., passing one or more years in the ground. For this reason strawberries and other crops which they attack should not be planted upon freshly-turned sod land. Late fall plowing is often practised to destroy them.

MAY-BIRD, a gunner's name for various shore birds which return from the South in the month of May, especially the knot (q.v.). In New England the black-bellied plover, and in the South a curlew, are called May-birds or May-cocks.

MAY CHERRY, a local name for the service-berry bush. See Amelanchier.

MAY DAY, popular name of the first day of the month of May, on which from a very early period general festivities took place. May has generally been regarded as a time for gladness. The outbreak into new life and beauty which marks nature instinctively excites. The first emotion is a desire to seize some part of that profusion of flower or blossom which spreads around, to set it up in decorative fashion and to let the pleasure which it excites find expression in dance and song; and among pagans the tendency has been to render to this vegetative trophy a sort of homage. Among the Romans, the feeling of the time found vent in their *Floralia,* or Floral Games, which began on 28 April and lasted to 3 May. Among the old Celtic peoples, a festival called *Beltein* (Baal's fire) also was held on this day, but it does not seem to have been connected with flowers, but rather with sun-worship. In Christian times in the Celtic countries the Church

Christianized this celebration by transferring it to 24 June, the feast of Saint John, which is still celebrated with bonfires. In England, as we learn from Chaucer and other writers, it was customary, during the Middle Ages, for all, both high and low — even the court itself — to go on the first May morning at an early hour "to fetch the flowers fresh." Hawthorn branches also were gathered; these were brought home about sunrise, with accompaniments of horn and tabor, and all possible signs of joy and merriment. The people then proceeded to decorate the doors and windows of their houses with the spoils. By a natural transition of ideas, they gave the hawthorn bloom the name "the May"; they called the ceremony "the bringing home the May"; they spoke of the expedition to the woods as "going a-Maying." The fairest maid of the village was crowned with flowers as the "Queen of the May"; placed in a little bower or arbor, where she sat in state, receiving the homage and admiration of the youthful revellers, who danced and sang around her. This custom of having a May queen seems a relic of the old Roman celebration of the day when the goddess Flora was specially worshiped. How thoroughly recognized the custom had become in England may be illustrated by the fact that in the reign of Henry VIII the heads of the corporation of London went out into the high grounds of Kent to gather the May — the king and his queen, Catharine of Aragon, coming from their palace of Greenwich, and meeting these respected dignitaries on Shooter's Hill. But perhaps the most conspicuous feature of these festive proceedings was the erection in every town and village of a fixed pole — the May-pole — as high as the mast of a vessel of 100 tons, on which, on May morning, they suspended wreaths of flowers, and round which the people danced in rings nearly the whole day. A severe blow was given to these merry and often wild revels, by the Puritans, who, in their campaign of taking the joy out of life, caused May-poles to be uprooted and a stop put to all their jollities. They were, however, revived after the Restoration and long held their ground, but the celebration is now confined to school children, their elders not taking part, so much has our modern industrial feudalism absorbed the leisure time of all but the parasite classes. In France, Germany and other countries, May-poles were common and festive sports are even yet observed. The Roman Catholic Church, in order to counteract the evils too often incident to the celebration of May Day, appears to have instituted the feast known in France as *La Fête-Dieu*, celebrated with processions and flowers. In America May Day celebrations have come into favor in the present century and in nearly all public parks of great cities games and processions are held. Consult Strutt, J., 'Sports and Pastimes of the People of England' (London 1801).

MAY-FLY, SHAD-FLY, or **DAY-FLY,** members of the order *Ephemeridæ*. The species, of which about 300 have been described nearly one-third of which are North American, are fragile insects with large fore-wings, small or wanting hind-wings, short antennæ, atrophied mouth parts and two or three thread-like abdominal filaments. Being greatly attracted to lights, the adults are often a source of annoyance in lakeside and riverside towns, and are sometimes especially troublesome in obscuring the lights from lighthouses. The eggs are laid in fresh water either upon the surface or upon the bottom, the female diving for this purpose. The larvæ, which feed mainly upon vegetable matter, are active creatures with strong legs, abdominal tracheal gills and anal appendages. They live upon the bottom, under stones, covered with mud, or in burrows. After moulting about 10 times wing pads appear, and these increase with each moult until the last, which may be number 20. This occurs in the open air, the one previous to which occurs at the surface of the water, the insect escaping from its subimago skin rather suddenly. One striking difference the adults exhibit is the development of paired sexual organs, which do not appear in other orders of insects. The larvæ may take three years to develop; the adults live only a few days, lay their eggs and die. Both adults and larvæ are important food for fishes, and consequently they form a favorite bait with anglers, and are imitated in making artificial flies.

MAYA, mā' ya", the ruling race of Yucatan at the time of the discovery of America and for many years previous. Where they came from is uncertain; but that they invaded the peninsula from two different directions is asserted in various of their traditions. This probably means that the people are of distinct races, one of which came by way of the Gulf of Mexico and the other from the west or southwest by land. The first influx of inhabitants to Yucatan recorded in the traditions was led by the great culture hero Zamná (q.v.) who became the first temporal and ecclesiastical ruler of the land, a sort of Moses, a giver of laws and a solidifier of traditions. Tradition says he lived to be quite old and that he divided the country into districts which he gave to his followers of noble birth. At the time of his death the Mayas were in secure and peaceable possession of the peninsula of Yucatan, throughout the length and breadth of which they had extended their culture. These early Mayas seem to have been closely connected with the other great cultured peoples of Chiapas, Honduras and Guatemala, in language, customs and religious institutions.

The second inroad of foreigners into Yucatan was, according to traditions, headed by Quetzalcoatl. This probably means that the newcomers were followers of the Toltec religion and probably possessors of Nahuan culture. Whether, on their arrival in Yucatan, they spoke the same language as the first Mayas is not known; but it seems probable that they did, since they are called, by various early writers, "the Itzas," a name generally conceded to mean the followers of Zamná or Itzamná, the culture god of the early Mayas. Yucatan now had two governing races which seem to have lived on more or less friendly terms with one another, and to have had no trouble in communicating with one another. It is certain that, at the time of the conquest of Yucatan, which took place about 500 years later, only one language existed in the country. Yet the style of the various ruins of Yucatan show that there must have been a blending of cultures and religious ideas, and indicates the

influence of Nahuan civilization in the peninsula. It is probable and there are intimations in the Maya and Quiché traditions, that not only one but numerous migrations took place over considerable periods of time from the southwest into Yucatan.

Both the original followers of Zamná and the immigrants from the southwest, Chiapas and Guatemala, must have been, as tradition pictures them, great builders for Yucatan is literally covered with ruins whose forms, decorations and peculiar characteristics show that at least two races of considerably different cultures built them. Yet however different may have been the cultures of these two peoples they appear to have become pretty well blended by the time of the conquest, and the two races had merged into one, which the Spaniard named Maya or sometimes Itza. Under the Tutul Xius at Uxmal (q.v.) the Mayas built a civilization noted for its splendor among all the neighboring nations. Uxmal became the greatest, most powerful, wealthy and artistic city in Yucatan and as such flourished for many years; but it was finally conquered; and Maya power was transferred to Mayapán, which in its turn fell into the hands of people from the mountains near the end of the 13th century. This was followed by a century and a half of civil war in the peninsula, which led finally to the destruction of Mayapán (q.v.) about 1460. In this war the Tutul Xius found their power greatly reduced and themselves driven to take refuge in Mani, a city which they still inhabited at the time of the Spanish conquest during the first half of the 16th century. With all these influxes of foreigners who evidently remained in the country, into which they appear to have continued to flood up to the time of the discovery of America, the language of Yucatan remained a unit, in which the dialects were so slightly marked that the people of the whole peninsula conversed with one another without any difficulty. This would seem to indicate that the Maya race was fundamentally the same as that which erected the great historic buildings now in ruins throughout the Quiché country, part of Honduras and the Mexican state of Chiapas. Their culture seems also to have been related to that of Oaxaca, Tabasco, Campeche and Guerrero. The territory of the Maya race proper stretched southward covering all the peninsula of Yucatan and reaching to the Pacific Ocean.

The Mayas had made a very great advance in civilization at the time of the discovery of America; though, owing to the long and bloody civil wars through which they had just passed, this civilization had lost much of its splendor. This was completely destroyed during the Spanish conquest, which lasted 16 years. Then many of the Mayas retreated to the hilly country and the deeply-wooded coast-land to the west where they continued to maintain their independence during the 300 years of Spanish rule. Numerous military expeditions were sent against them and it was not until the administration of Porfirio Diaz that they were reduced to comparative quiet, from which they have again more or less freed themselves. The Maya tongue is still spoken by about 300,000 persons, of whom about 100,000 are of mixed descent. See MEXICAN MYTHOLOGY and ETHNOLOGY, CHICHEN-ITZÁ. See also bibliography under YUCATÁN.

MAYAGUEZ, mä-yä-gwas', Porto Rico, a seaport city on the Mayaguez River near the west coast, the capital of Mayaguez department and third city of the island in size, 72 miles southwest of San Juan. The city was founded in 1752 and has a modern appearance, with wide streets, public plazas, fine buildings, electric lights and a street railway. A railway brings it into communication with the interior. It has a large but shallow harbor, and its port is three miles distant at Mayaguez Playa, where a considerable export trade in coffee, sugar and oranges is carried on chiefly with the United States. In the vicinity is the Porto Rico Agricultural Experiment Station, which dates from 1902. Pop. about 20,000.

MAYAPÁN, the ancient capital of the Maya kingdom in Yucatán. According to tradition it was founded by Zamná, the ancient highpriest, ruler and culture deity of the Mayas. Zamná divided the Maya kingdom among his leaders whose descendants formed the Maya nobility of Yucatán. In later days the Tutul Xiu, high nobles, became the ruling power under the sovereign, who was chosen from among them. Many years later Kukulcán, another traditional demi-god, according to traditional history, became king and high priest of Mayapán. As this name is a literal translation of the word Quetzalcoatl (q.v.), the name of the Nahuatl god of culture, and as the story of the latter and that told of Kukulcán are almost identical, it is probable that this tradition records the conquest of Mayapán by the Toltecs or some Nahuatl race who introduced into Yucatán the worship of Quetzalcoatl. According to the Maya traditional history this Kukulcán formed a confederacy of the rulers of Mayapán and Chichen Itzá, the latter the ruling party among the Itzas. Of this confederacy he seems to have been the pontifical head and the ruling spirit, though with him the other two sovereigns were legally joint rulers with equal powers. On his departure from Mayapán, which seems to be mythical, Kukulcán left the kingdom to princes known afterward as the Cocomes, under whose seven successive rulers Mayapán enjoyed a period of wonderful prosperity during which many cities throughout the country subject to this capital are supposed to have been built. The ruins of these ancient cities are still found in the vicinity of Mayapán.

In the meantime, the city of Uxmal (q.v.) rose to power in another part of the isthmus. In a sanguinary war with this latter Mayapán was finally defeated and destroyed. Uxmal became the head of a new confederacy, with the Tutul Xiu the ruling royal family. The latter ruled wisely and well at first and rebuilt Mayapán, which continued to flourish for several centuries. It was, however, finally razed to the ground about the middle of the 15th century, or shortly before the discovery of America, in a civil war in which the vassal lords fought against and finally overthrew the power of the Tutul Xiu dynasty. Thus finally disappeared Mayapán, the first of the known great and populous cities of ancient Yucatán.

The ruins of the city of Mayapán are situated about 25 miles south of Merida. The condition of these ruins to-day seems to bear

out the traditional history that this old capital of the Mayas was completely destroyed, for little of its past magnificence now remains standing. But numerous mounds, terraces and pyramids, badly ruined edifices and huge quantities of stone, sculptured blocks and foundations of buildings scattered over a considerable extent of territory are evidence of the existence of a great centre of population and a place of some magnificence. One great mound or pyramid over 69 feet high has a stairway 20 feet wide on each of its sides leading from the ground to the truncated summit, a stone-paved platform considerably wider than the stairway. Sculptured stone blocks lie scattered over an area of three miles, attesting the great extent of this ancient Maya capital which tradition says was once surrounded by a thick and high stone wall, but that this wall was razed to the ground at the time of the final destruction of the city about 100 years before the conquest of Yucatán by the Spaniards. Along the line of this wall runs an old ditch, now filled up with débris, and on both sides of this are vast quantities of stone supposed to have once formed part of this ancient rampart. See UXMAL; CHICHEN ITZÁ; YUCATAN.

JOHN HUBERT CORNYN.

MAYBRICK, Michael ("STEPHEN ADAMS"), English composer: b. Liverpool, about 1845; d. 26 Aug. 1913. He studied music in Italy and Germany and was for many years a leading baritone vocalist in concerts and English opera. As a writer of songs over the signature "Stephen Adams," he was widely popular in this country and England. Among the best known of his many songs are 'The Midshipmite'; 'Nancy Lee'; 'Alsatian Mountains'; 'The Holy City'; 'A Warrior Bold.'

MAYENCE, mā-yŏns. See MAINZ.

MAYER, Alfred Goldsborough, American zoologist: b. Frederick, Md., 16 April 1868. In 1889 he was graduated at the Stevens Institute of Technology and at Harvard in 1897. From 1892 to 1900 he was assistant to Dr. Alexander Agassiz and had charge of radiates in the Harvard Museum of Comparative Zoology from 1895 to 1900. In 1900–04 Dr. Mayer was curator of natural sciences and curator-in-chief of the Brooklyn Institute Museum; in 1904–05 he was director of the marine laboratory of the Carnegie Institution, Tortugas, Fla., and since 1905 has been director of the department of marine biology at the Carnegie Institution, Washington. Dr. Mayer took part in several scientific expeditions in many parts of the world. Since 1913 he has been lecturer in biology at Princeton. He has published 'Medusæ of the World' (3 vols., 1910); and contributions to zoological publications, especially on the insects and medusæ and on chemical causes of animal movements; effects of ions upon rate of nerve conduction; studies of coral reefs of Samoa, etc.

MAYER, mā'ĕr, **Alfred Marshall,** American physicist: b. Baltimore, 13 Nov. 1836; d. Maplewood, N. J., 13 July 1897. He studied at Saint Mary's College, Baltimore; spent two years in a machine-shop and draughting-room; specialized in chemistry and physics; became professor of these branches in the University of Maryland (1856) and in Westminster College, Fulton, Mo. (1859); after two years of study in Paris was appointed to a chair in Pennsylvania College, Gettysburg (1865); went thence to Lehigh University in 1867; and from 1871 to his death was professor of physics in Stevens Institute, Hoboken, N. J. There he made important researches in acoustics; invented the topophone, an apparatus to detect the phases of sound vibration; discovered five methods of analysis of compound sounds into their elementary tones; and stated the law of tuning-fork vibration. He became a member of the National Academy of Sciences in 1872. He wrote many papers for the *American Journal of Science,* notably a series entitled 'Researches in Acoustics' and was at one time a member of the editorial staff; several contributions to the *Scientific American Supplement;* 'Lecture Notes on Physics' (1868); 'The Earth a Great Magnet' (1872); 'Light' (1877); and 'Sound' (1878). Consult *Science* (issue of 20 Aug. 1897).

MAYER, Brantz, American author: b. Baltimore, 27 Sept. 1809; d. there, 21 March 1879. He was educated at Saint Mary's College, Baltimore, studied law by himself during an Oriental voyage in 1827–28 and then at the University of Maryland; was admitted to the bar in 1829; and after a year in Mexico as secretary of legation wrote 'Mexico as it Was, and as it Is' (1844). In the same year he founded the Maryland Historical Society. In the Civil War he sympathized with the Union was president of the Union State General Committee, and from 1863 to 1871 paymaster in the United States army. His best book was 'Captain Canot,' a story of the slave trade founded on fact. He wrote also 'Mexico, Aztec, Spanish, and Republican' (1851); 'Observations of Mexican History and Archæology' (1856); 'Mexican Antiquities' (1858); 'Memoir of Jared Sparks' (1867); and 'Baltimore as it Was, and as it Is' (1871).

MAYER, Constant, American artist: b. Besançon, France, 4 Oct. 1832; d. 1901. A student at the School of Fine Arts in Paris, he left his studies in 1857 and settled in New York, where his sketches and portraits won immediate success. His portraits of Grant and Sherman and his life-sized genre paintings, such as 'Maud Müller'; 'The Song of the Shirt'; 'Evangeline,' gained favor. From 1866 he was an associate of the National Academy of Design and exhibited frequently at the Salon.

MAYER, Frank Blackwell, American artist, brother of Alfred Marshall Mayer (q.v.) and nephew of Brantz Mayer (q.v.): b. Baltimore, 27 Dec. 1827; d. 1908. He studied art there under A. J. Müller, and under Gleyre and Brion in Paris and then settled in Annapolis. He made a special study of Dakota Indian types; contributed to *Harper's* and *Century* various articles with his own illustrations; and exhibited in the Paris Salon and at the Centennial Exhibition of 1876, where he received a medal for two pictures, 'The Continentals' and 'Attic Philosopher.'. Among his other canvases are 'Feast of Mondawmin'; 'The King's Fool'; 'The Trappist'; 'Maryland in 1750'; 'Crowning a Troubadour,' 'The Treaty of Traverse des Sioux,' 'Minnesota' (1886); 'The Washington Cockade,' 'Founders of the Baltimore and Ohio Railroad' (1891; and 'The Burning of the Peggy Stuart.'

MAYER, Henry, American caricaturist: b. Worms, Germany, 18 July 1868. Educated in Germany and England, he at first followed a business career in the latter country, but emigrating to the United States in 1887 soon won for himself a distinct place as caricaturist, by his designs and illustrations for American and European papers. Since 1893 he has resided in New York. His works are 'Autobiography of a Monkey' (1896); 'In Laughland' (1899); 'Fantasies in Ha-Ha' (1899); 'A Trip to Toyland' (1900); 'Adventures of a Japanese Doll' (1901); 'Alphabet of Little People' (1901). He is the creator of 'Impressions of the Passing Show' for 10 years in the New York *Times*. He received a personal gift of two cloissonné vases with imperial crest from the late Mikado for his cartoons during the Russo-Japanese War. He is editor of *Puck* since 1914.

MAYER, mī'ĕr, **Julius Robert von,** German physicist: b. Heilbronn, Würtemberg, 25 Nov. 1814; d. there, 20 March 1878. He was educated at the gymnasium in Heilbronn, studied medicine at Tübingen and finished his university studies at Munich and Paris. In 1840 he went to Java as a ship's surgeon, and while there turned his attention to studies of the blood, extending his work to exhaustive investigations of animal heat, to which he applied the mechanical theory. Returning in 1841 to Heilbronn, where for some years he practised his profession, he became deeply engrossed with his scientific labors, and in 1842 published in Liebig's *Annalen der Chemie und Pharmacie* a preliminary statement of his revolutionary theory of heat, together with his views on the conservation and correlation of energy. Three years later he restated his results in 'Die organische Bewegung in ihrem Zusammenhange mit dem Stoffwechsel,' at the same time giving a forecast of his theory of the meteoric origin of the sun's heat. Contemporaneously with Mayer the mechanical theory of heat was worked out independently by J. P. Joule (q.v.) in England, and a controversy arose regarding the priority of discovery. The Royal Society gave Mayer the Copley medal in 1871, and two years before his death he was ennobled by the king of Würtemberg. His collected works appeared in 1867 under the title 'Die Mechanik der Wärme' (3d ed., by J. S. Weyrauch 1893). Consult Weyrauch, 'Robert Mayer' (Stuttgart 1890); id., 'Kleinere Schriften und Briefe von Robert Mayer' (Stuttgart 1893); Gross, 'Robert Mayer and Hermann von Helmholtz' (Berlin 1898); Jeutsch, E., 'Julius Robert Mayer; seine Krankheitgeschichte und die Geschichte seiner Entdeckung' (Berlin 1914).

MAYFAIR, London, England, a fashionable neighborhood in the «West End» adjoining Belgravia, east of Hyde Park, and bounded by Park lane and Bond street. See LONDON.

MAYFIELD, Ky., city, county-seat of Graves County, on the Illinois Central Railroad, about 30 miles from the Mississippi River and 25 miles from the Ohio at the mouth of the Tennessee. It was settled about 1820 and incorporated in 1850. It is in a fertile agricultural region in which the chief product is tobacco and in which the city has extensive interests. Mayfield has large tobacco warehouses and factories, clothing factories, woolen mills, fire-clay works, flour and lumber mills. It has an extensive trade in tobacco. The mayor is elected once in four years; the council acts upon the appointments of the executive. Pop. 5,916.

MAYFIELD, Pa., borough of Lackawanna County, 15 miles northeast of Scranton, on the New York, Ontario and Western and the Delaware and Hudson railroads. It has extensive interests in coal, the mining of which is the leading industry. There is also a silk mill. Pop. 3,660.

MAYFLOWER, The, the name of the vessel in which the Pilgrim Fathers, or first colonists in New England, sailed to this country in 1620. The *Mayflower* was a vessel of 180 tons. She set sail from Southampton, England, on 5 Aug. 1620, in company with her sister ship, the *Speedwell,* but the courage of the captain and the crew of the latter vessel failing, both ships put back to port. Finally on 6/17 September the *Mayflower* again spread her sails from Plymouth, having on board as passengers 41 men and their families, 102 persons in all. They succeeded in crossing the Atlantic after a stormy voyage of 63 days. They intended to go to the mouth of the Hudson River but the captain of the *Mayflower* took them to Cape Cod. They landed at Plymouth, Mass., at a point where Plymouth Rock, a huge granite boulder, stands at the water's edge. A complete and authentic list of the male passengers who landed from the *Mayflower* is as follows:

THE MAYFLOWER PASSENGERS.

Allerton, Isaac	Hopkins, Stephen
Allerton, John	Howland, John
Billington, John	Leister, Edward
Bradford, Wm.	Margeson, Edward
Brewster, Wm.	Martin, Christopher
Britterage, Richard	Mullins, William
Brown, Peter	Priest, Degony
Carver, John	Rigdale, John
Chilton, James	Rogers, Thomas
Clarke, Richard	Soule, George
Cook, Francis	Standish, Miles
Crackston, John	Tilly, Edward
Dotey, Edward	Tilly, John
Eaton, Francis	Tinker, Thomas
English, Thos.	Turner, John
Fletcher, Moses	Warren, Richard
Fuller, Edward	White, William
Fuller, Samuel	Williams, Thomas
Gardiner, Richard	Winslow, Edward
Goodman, John	Winslow, Gilbert

With these 41 male passengers and heads of families came 15 male servants, whose names were as follows:

SERVANTS ON THE MAYFLOWER.

Carter,	Langemore,	Sampson,
Coper,	Latham,	Story,
Ely,	Minter,	Thompson,
Holbeek,	Moore,	Trevore,
Hooke,	Prower,	Wilder.

The following is a copy of the covenant agreed upon by these first settlers of Massachusetts, signed and subscribed on board the *Mayflower* at Cape Cod, 10/21 Nov. 1620, two days after the ship came to anchor.

THE MAYFLOWER COMPACT.

In the name of God Amen! We whose names are underwritten, the loyal subjects of our dread sovereign Lord, King James, by the grace of God, of Great Britain, France and Ireland, King, Defender of the Faith, etc., have undertaken for the glory of God and the advancement of the Christian faith, and honor of our King and Country, a voyage to plant the first colony in the northern parts of Virginia; do by these presents, solemnly and mutually, in the presence of God and of one another covenant and combine ourselves together into a civil body politic for our better ordering and preservation, and furthermore of the ends aforesaid; and by virtue hereof to enact, constitute and frame just and equal laws, ordinances, acts, constitutions, and offices from time to time, as shall be thought most mete and convenient for the general good of the colony; unto which we promise all due submission and obedience. In witness whereof we have hereunto subscribed our names, at Cape Cod, the 11th of November, in the year of the reign of our sovereign Lord, King James of England, France and Ireland, the Eighteenth, and of Scotland the Fifty-fourth, Anno Domini 1620.

Whittier, Lowell, Holmes and other poets have immortalized the *Mayflower* in well-known poems. Consult Carpenter, E. J., 'The Mayflower Pilgrims' (New York 1918); Usher, R. G., 'The Pilgrims and Their History' (New York 1918).

MAYFLOWER. See ARBUTUS, TRAILING.

MAYFLOWER DESCENDANTS, Society of, an American patriotic society founded in New York City, 22 Dec. 1894. Its membership is confined to lineal descendants of any passengers on the *Mayflower*, the voyage of which terminated at Plymouth Rock, Mass., in November 1620. There are also numerous State societies of a similar character. There are more than 2,000 members of the society.

MAYHEM, *in law,* the maiming of one person by another, the destroying or disabling of an arm, leg, hand or foot, putting out an eye, etc. Mayhem renders the perpetrator liable to a civil action for damages, and also to a criminal prosecution.

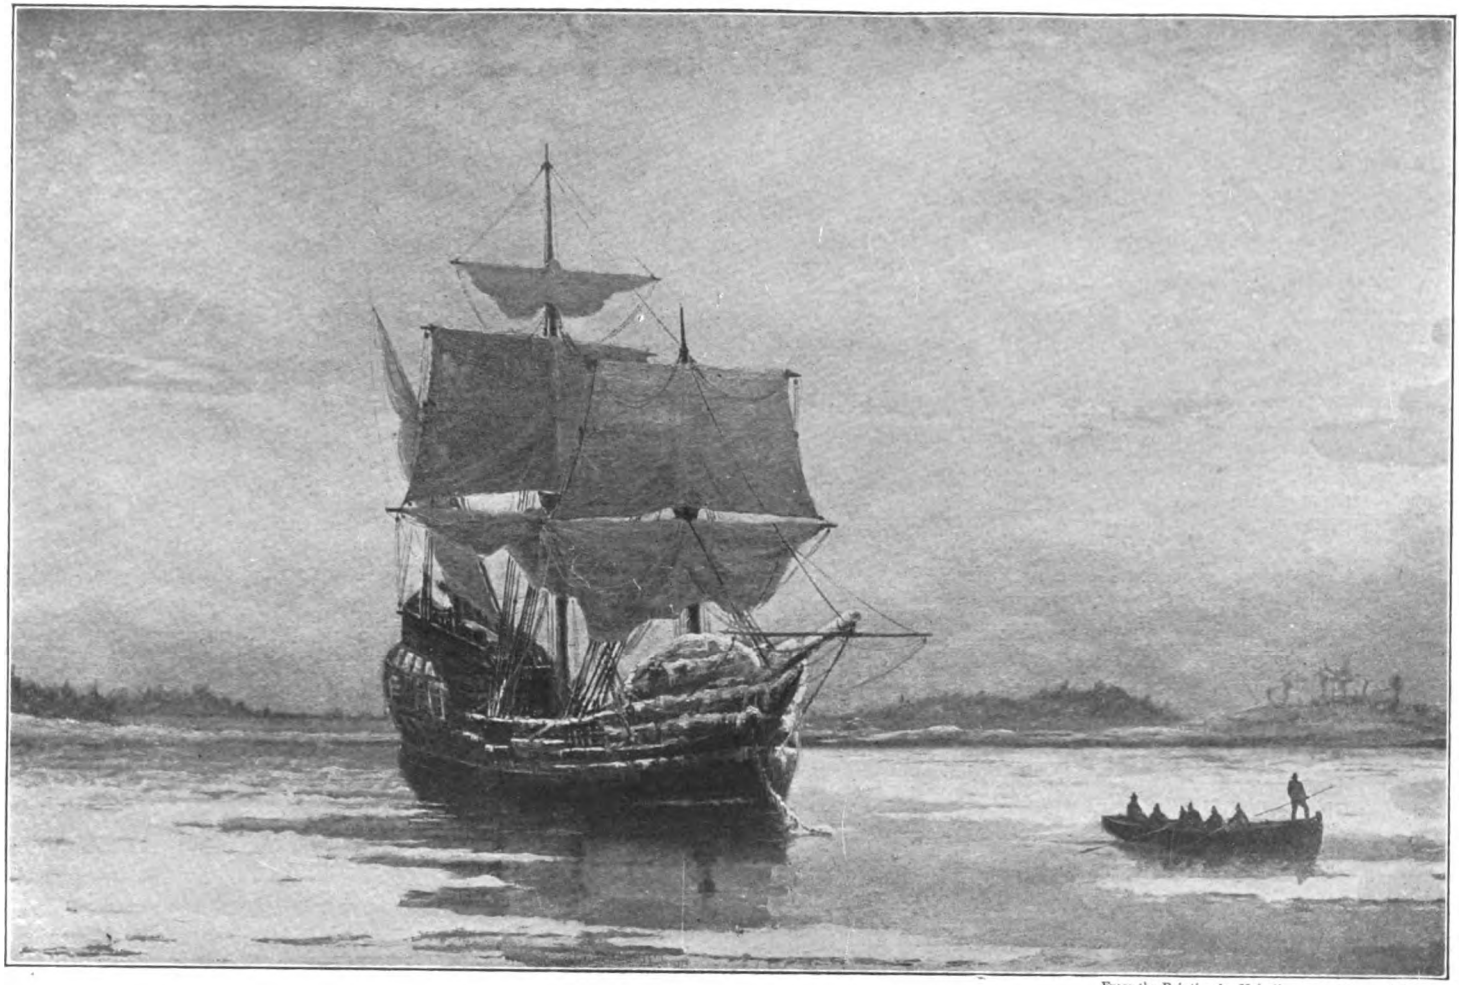
MAYHEW, mā'hū, **Experience,** American missionary: b. Martha's Vineyard, Mass., 27 Jan. 1673; d. there, 29 Nov. 1758. He took charge of a half-dozen congregations of Indians, and in 1709 executed for the Society for the Propagation of the Gospel in New England a translation of the Psalms and of the Gospel according to Saint John into the Indian tongue. His principal writing is 'Indian Converts' (1727), containing accounts of 30 Indian ministers and 80 other Indian Christians.

MAYHEW, Henry, English journalist and author: b. London, 25 Nov. 1812; d. 25 July 1887. In 1831 he started, with Gilbert A'Beckett, a periodical called *Figaro in London*; in 1841 produced, with A'Beckett, the farce of the 'Wondering Minstrel'; and not long after formed a literary partnership with his brother Augustus, the "Brothers Mayhew," as they came to be familiarly known, turning out a number of most successful works of amusing fiction. Among these may be mentioned 'The Greatest Plague of Life, or the Adventures of a Lady in Search of a Good Servant' (1847); 'The Image of His Father, or One Boy is More Trouble than a Dozen Girls' (1850); 'Living for Appearances' (1855). In 1851 appeared the first volume of his most important work, 'London Labor and the London Poor.' He was one of the founders of *Punch* (1841) and its first editor. Other works of his are 'The Wonders of Science, or Young Humphry Davy'; 'Young Benjamin Franklin'; 'The Boyhood of Martin Luther'; 'German Life and Manners, as Seen in Saxony at the Present Day'; 'The Criminal Prisons of London and Scenes of Prison Life' with Binny. His brothers Horace, Thomas and Edward also assisted Henry and Augustus in their enterprises, beside publishing independently.

MAYHEW, Jonathan, American clergyman: b. Martha's Vineyard, Mass., 8 Oct. 1720; d. Boston, 9 July 1766. He was graduated from Harvard in 1744, and from 1747 until his death was minister of the West Church in Boston. In a day of theological controversy he was prominent for his tracts. His views were so liberal as to exclude him from the Boston Association of Congregational Ministers. He opposed the measures of the British society for the propogation of the Gospel in foreign parts, and got into a dispute about it with Secker, archbishop of Canterbury. In both pulpit and press he was an earnest patriot, being of much assistance to Otis and other early leaders. By the Tories he was considered to have brought about the Stamp Act riots because of a sermon in which he pleaded for the repeal of the act. From him came the suggestion of uniting the colonies in opposition to England. Among his writings are 'Seven Sermons' (1749); 'Discourse concerning Unlimited Submission and Non-resistance to the Higher Powers' (1750), and 'Sermons' (1756). Consult the 'Memoir' by Bradford (Boston 1838); Tyler, 'History of American Literature.'

MAYHEW, Thomas, American colonial governor: b. England, 1592; d. Martha's Vineyard, Mass., 25 March 1682. Prior to his emigration to New England in 1631 he had been a merchant in Southampton. He settled first at Watertown, Mass., and in 1641 secured from the agent of Lord Stirling a grant of the larger part of the island of Martha's Vineyard and the title of governor. With his son Thomas he labored to convert the Indians of the island so successfully that during King Philip's War the island Indians protected the white settlers. He founded Edgartown in 1647, and after the death of his son and grandson continued their ministry and organized an Indian church. Consult Banks, C. E., 'The History of Martha's Vineyard' (Boston 1911).

MAYNARD, mā'nard, **Charles Johnson,** American naturalist: b. West Newton, Mass., 6 May 1845. He had a common school education, worked on a farm and devoted himself to natural history as a boy. He is well known as an ornithologist, discovered the bittern's vocal organs and in 1875 was elected vice-president of the Nuttall Ornithological Club, in connec-



From the Painting by Halsell, now in Plymouth Hall

THE MAYFLOWER IN PLYMOUTH HARBOR

tion with which he founded and edited *The Nuttall Bulletin*. As a conchologist he studied the genus *Cerion* of West Indian shells. He also made important additions to the knowledge of American butterflies. Maynard wrote 'Naturalists' Guide'; 'Butterflies of New England'; 'Birds of Eastern North America'; 'Butterflies of New England'; 'Eggs of North American Birds'; 'Contributions to Science' (3 vols.); 'Bahama Fruit Finch'; 'Manual of North American Butterflies'; 'Sparrows and Finches of New England'; 'Nature Studies' (No. 2, "Sponges"); 'Warblers of New England'; 'Monograph of the Genus Cerion'; 'Manual of Taxidermy'; 'Methods in Moss Study'; 'Birds of Eastern Massachusetts'; 'Field Dictionary to the Birds of Eastern North America'; 'Atlas to the Directory of the Birds of Eastern North America'; 'Dawn in New England'; 'Records of Walks and Talks with Nature' (8 vols.); 'Field Ornithology'; 'Plates to Field Ornithology'; 'Migration of Birds and other Animals,' and scattering articles in various magazines, etc.

MAYNARD, Edward, American inventor: b. Madison, N. J., 26 April 1813; d. Washington, D. C., 4 May 1891. He entered West Point in 1831; resigned because of ill-health in 1832; studied dentistry and practised in Washington from 1836 to 1890. He invented new dental tools, discovered in 1846 the diversity of the maxillary antra, introduced the method of filling cavities with gold foil, taught dentistry in the Baltimore College of Dental Surgery and in the National University at Washington, and practised successfully in Europe. His great fame was due to his invention of small arms and new priming methods which superseded percussion caps. He patented a breech-loading rifle in 1851; a method of converting muzzle-loaders to breech-loaders in 1860; a plan to join two barrels so that contraction and expansion in either would be independent of the other, in 1868, and in 1886 a registering device showing the number of cartridges in a magazine rifle. His rifle was adopted by the United States, and brought him decorations from the governments of Belgium, Prussia and Sweden.

MAYNARD, George Willoughby, American artist: b. Washington, D. C., 5 March 1843. He studied at the New York Academy of Design and later became a pupil of Van Terins and De Keyser at the Belgian Royal Academy, Antwerp. He had a studio in Paris in 1878, but later located in New York. He is a National Academician and librarian of the National Academy of Design, member of the Society of American Artists, the American Water Color Society and ex-president and honorary member of the Salmagundi Club. Maynard's decorative work may be seen in the Congressional Library, Washington, D. C., the Bijou Theatre, Boston, the ceiling of the Metropolitan Opera House, New York, the Essex County Courthouse, Newark, N. J., and the Appellate Court, New York. His principal canvases are 'Vespers at Antwerp'; '1776'; 'Venetian Court'; 'Ancient Mariner' (1883); 'Strange Gods' (1904); 'Old and Rare'; 'Grandfatherly Advice'; 'A Musician'; 'Rocks at Ogunquit' (1912); 'Flood Tide' (1912). He is represented in the Metropolitan Museum, New York, the Providence Museum, the Corcoran Gallery, Washington, and the Pennsylvania Academy.

MAYNARD, Horace, American politician: b. Westboro, Mass., 30 Aug. 1815; d. Knoxville, Tenn., 3 May 1882. He was graduated from Amherst College in 1838; and became instructor, and later professor, in East Tennessee College, Knoxville, Tenn. He studied law, was admitted to the bar in 1844 and built up a successful practice. In 1857 he was nominated for member of Congress by the Know-Nothing party, and elected. On the outbreak of the Civil War he declared his loyalty to the Union and took an active part in the unsuccessful attempt to keep Tennessee from seceding; on this account he suffered persecution and heavy loss of property during the war. When the Union forces occupied his State in 1864 he was made attorney-general. In 1866–75 he was again member of Congress, being representative-at-large for his State in the last two years. In 1875–80 he was appointed Minister to Turkey, and in 1880 Postmaster-General in President Hayes' Cabinet, holding the office till 4 March 1881.

MAYNARD, Mass., town of Middlesex County, 25 miles northwest of Boston, on the Boston and Maine Railroad and the Assabet River. It contains woolen mills. The town owns the water-supply system. Pop. 6,390.

MAYNOOTH, mā-nōoth', Ireland, a market-town of County Kildare, 15 miles west by north of Dublin. Its modern celebrity is derived from the well-known Roman Catholic college of Saint Patrick (q.v.). Maynooth is of historic interest as the seat of the powerful Geraldines, and has ruins of their castle, built 1176 and enlarged in 1426. Several battles with the English occurred here, including the rebellion of Silken Thomas in the reign of Henry VIII, and the war of the Confederates (1641–50). Pop. about 886.

MAYNOOTH COLLEGE. See SAINT PATRICK'S COLLEGE.

MAYO, mā'ō, **Amory Dwight,** American Unitarian clergyman and educator: b. Warwick, Franklin County, Mass., 31 Jan. 1823; d. 8 April 1907. He was graduated from Amherst, and taught in the public schools in Massachusetts 1839–44. In 1846 he became the minister of the Universalist Church at Gloucester, Mass., and later held Universalist pastorates at Cleveland, Ohio (1854–56), and at Albany, N. Y. (1856–63). He then entered the Unitarian ministry, and was pastor at Cincinnati, Ohio (1863–72), and at Springfield, Mass. (1872–80). He was long prominent as an educator, was an efficient and active member of the boards of education, in Cincinnati and Springfield, and was connected with the Meadville (Pa.) Theological School as lecturer and professor from 1868–98. After 1880 he devoted his attention chiefly to the advancement of education in the South, lecturing frequently in many different States. He was the chief editorial writer for the *New England and National Journal of Education*, and published 'The Moral Argument for Universalism'; 'Graces and Powers of the Christian Life' (1852); 'Biography and Collected Writings of Mrs. S. C. E. Mayo'; 'Symbols of the Capitol, of Civilization in New York' (1859); 'Talks with Teachers' (1885); 'Southern Women in the Recent Educational Move-

ment in the South' (1892), and 'History of the American Common School.'

MAYO, Charles Horace, American surgeon: b. Rochester, Minn., 19 July 1865. He was educated at the Rochester High School, Northwestern University, and in 1888 was graduated in medicine at the Chicago Medical College. In the same year he entered on the practice of medicine at Rochester, where he has since resided. He has received the following honorary degrees: A.M., Northwestern University, 1902; LL.D., University of Maryland, 1909; F.A.C.S., American College of Surgeons, 1913; LL.D., Kenyon College, 1916; D.Sc., Princeton University, 1917. Dr. Mayo is surgeon to the Mayo Clinic of Saint Mary's Hospital, Rochester, Minn.; to the Mayo Foundation, University of Minnesota, where he has been professor of surgery since 1915. In 1913 he was commissioned first lieutenant in the Medical Reserve Corps, United States Army; was appointed major in 1917, and colonel in the same corps in 1918. In the same year he was made associate chief consultant of the United States Army Medical Department for Surgical Services. He is also consulting surgeon of the Chicago and Northwestern Railway and of the Chicago Great Western Railway. Dr. Mayo is a member of the American Medical Association, of which he was president in 1916–17 and chairman of the section on surgery in 1910; of the American Surgical Association; of the Association of Military Surgeons of the United States; of the Clinical Congress of the American College of Surgeons (president in 1914–15); of the Minnesota State Medical Society, of which he was president in 1905; of the Society of Clinical Surgery; of the Southern Surgical and Gynecological Society; of the Western Surgical and Gynecological Society, of which he was president in 1904–05; of the Council of National Defense Medical Board; of the National Medical Museum; of the Minnesota Pathological Society; of the American Association of Railway Surgeons; of the American Association for the Advancement of Science; etc.; etc. In 1908–09 he was president of the section on surgery of the International Congress on Tuberculosis. In 1915, with his brother, W. J. Mayo (q.v.), he donated $1,500,000 to establish the Mayo Foundation for Medical Education and Research at Rochester, in affiliation with the University of Minnesota.

MAYO, Frank, American actor: b. Boston, 19 April 1839; d. 8 June 1896. His first appearance on the stage was at the American Theatre in San Francisco, and he was for several years the leading actor on the Pacific coast. In August 1865 he appeared in Boston as Badger in 'The Streets of New York' with great success, and though he played Shakespearian and other rôles acceptably, notably Othello, Hamlet and Ferdinand, became best known in his character of Davy Crockett, first played by him in Rochester, N. Y., in 1872, and thereafter almost exclusively by him till 1884. In later years he played in his own drama of 'Nordeck' and in a stage version of 'Pudd'nhead Wilson.'

MAYO, Henry Thomas, American naval officer: b. Burlington, Vt., 8 Dec. 1856. In 1876 he was graduated at the United States Naval Academy; was advanced through various grades and promoted rear-admiral 15 June 1913. In 1915 he was made vice-admiral and in 1917 was promoted admiral. He served on various vessels of the United States navy, also on both naval and coast survey; was commandant of the Mare Island navy yard in 1911–13; served as aide for *personnel* at the Navy Department, Washington, in 1913, and on 18 December of that year was made commander of the fourth division of the Atlantic fleet. In 1915 he commanded the battleship squadrons of the Atlantic fleet and two years later became commander-in-chief of that fleet and hoisted his flag on the *Pennsylvania*. Admiral Mayo demanded an apology from the Mexican commander at Tampico and the firing of a national salute of 21 guns to the United States flag, to make amends for arrest of paymaster and crew of the dispatch boat *Dolphin* at a wharf while loading gasoline into whaleboat on 9 April 1914. The admiral's action was commended and approved by the government at Washington, and the occupation of Vera Cruz later in the same month was one result of the flag incident. See MEXICO, DIPLOMATIC RELATIONS WITH.

MAYO, William James, American surgeon: b. Le Sueur, Minn., 29 June 1861. He is a brother of Charles Horace Mayo (q.v.), was educated at Rochester High School and Niles Academy and received his professional training at the University of Michigan, where he was graduated in 1883. Thereafter he practised in Rochester, Minn., as surgeon to Saint Mary's Hospital. He became first lieutenant of the Medical Reserve Corps of the United States army in 1913. With his brother he established the Mayo Foundation for Medical Education and Research at Rochester in 1915. He is regent to the University of Minnesota, was president of the State Medical Society in 1895–96, of the American Medical Association in 1905–06, of the American Surgical Association in 1913–14, and of the Society of Clinical Surgery, 1911–12. He is also a member of the American College of Surgeons, of the Clinical Congress of Surgeons of North America, of the Academie de Medicine de Paris (corresponding secretary), of the Société de Chirurgie de Paris, of the Royal College of England and Scotland. He has received honors from all the principal universities as follows: M.D., University of Michigan, 1883; A.M., University of Michigan, 1889; LL.D., University of Toronto (1906), University of Maryland (1907), University of Pennsylvania (1912); D.Sc., University of Michigan (1908) and Columbia University (1910). He is a Fellow of the Royal College of Surgeons of England since 1913, of Scotland since 1905 and of the American College of Surgeons since 1913. He is widely known for his numerous successful operations in cases of gallstones, cancer and diseases of the intestinal tract.

MAYO, William Starbuck, American novelist: b. Ogdensburg, N. Y., 20 April 1812; d. New York, 22 Nov. 1895. His parents had removed to Ogdensburg in the year of his birth. He studied in his native place and in Potsdam Academy and in 1833 was graduated at the College of Physicians and Surgeons, New York. After practising his profession for several years in Ogdensburg he was forced to abandon it owing to ill health. He visited Spain, made a tour in the Barbary States and

then took up his residence in New York City, where he gave his entire attention to literature. He is the author of 'Flood and Field, or Tales of Battles on Sea and Land' (1844); 'Kaloolah, or Journeys to the Djebel Kumri,' purporting to be the autobiography of Jonathan Romer and describing his marvelous adventures in Africa (1849); 'The Berber, or the Mountaineer of the Atlas,' similar to the preceding (1850); 'Romance Dust from the Historic Places,' a collection of short tales, founded on historical incidents (1851); 'Never Again,' a novel (1872).

MAYO, mī'ō, a tribe of Mexican Indians of the Piman family, located on the banks of the Mayo River in southern Sonora. Their allies and northern neighbors are the Yaquis and their habits and language, the latter known as Cahita, are almost identical. They are a peaceful, agricultural people and are thoroughly Mexicanized. They number perhaps 6,000.

MAYO-SMITH, mā'ō-smith', **Richmond,** American political economist: b. Troy, Ohio, 9 Feb. 1854; d. New York City, 11 Nov. 1901. He was graduated from Amherst College in 1875 and studied in Germany for two years at the universities of Berlin and Heidelberg. From 1877 he was connected with Columbia University, first as assistant in history and political science, then as adjunct professor (1878–83) and professor of political economy and social science (1883–1901). He was also one of the faculty of the graduate School of Political Science, established in 1880, and his chief work as teacher was done in this school. His specialty was statistics, on which he was a recognized authority. He was an honorary Fellow of the Royal Statistical Society of Great Britain, a member of the International Statistical Institution and of the American Statistical Association, being vice-president of the latter; he was also a member of the National Academy of Science and of the American Economic Association, of which he was one of the founders. He was editor of the *Political Science Quarterly* from 1886, and published 'Emigration and Immigration' (1890); 'Statistics and Sociology' (1895); and 'Statistics and Economics' (1899).

MAYON, mā-yōn', a volcano of the Philippines situated in the northern part of the province of Albay, Luzon, height, 8,274 feet. It rises from a broad plain about six miles from Albay Gulf and forms a perfect cone; its summit is surrounded by vapor, which at night has a fiery glow. Its sides, almost at the top, are covered with grass or moss, and the ascent, though it has been made, is difficult. Near the summit there are fissures which emit sulphurous gases and steam, and there were several eruptions during the 19th century, the town of Cagsaua at the foot of the mountain being entirely destroyed in 1814. Great quantities of lava and ashes were belched forth in the last eruption (1897).

MAYONNAISE, mā-ŏn-āz', a thick cold dressing for salads, cold meat, poultry, fish, vegetables, etc., made of the yolks of eggs, salad oil and vinegar, with a little salt and pepper; it is sometimes colored red with powdered lobster shell or green with spinach or parsley.

MAYOR. See CITIES, AMERICAN, GOVERNMENT OF; CITY MANAGER PLAN OF GOVERNMENT; EXECUTIVE.

MAYOR OF ZALAMEA, The ('El Alcalde de Zalamea'). Two Spanish plays bear this title, the first by Lope de Vega (1562–1635), the second, an adaptation, by Calderón de la Barca (1600–81). The superiority of the adaptation over the original is admitted by all critics. A comparison of the two works is somewhat unfair to Lope de Vega, because his play is one of his least worthy productions. He reveals, indeed, his characteristic spontaneity, but fails to seize resolutely upon the dramatic possibilities of his story, preferring for some reason to narrate events in their chronological sequence. Calderón studies the dramatic situations more carefully and by discarding irrelevancies, reducing the number of personages and sharpening the features of those retained, produces a masterpiece. To his predecessor he owes his plot, the dramatic conflict, the principal personages and a few lines which he transfers to his play unaltered. The most striking difference between the two pieces is the character of Isabella, daughter of the mayor (or magistrate). In Lope's play there are two daughters, both flirtatious to the last degree. So little control has the father over them, that when he is appointed magistrate, he asks pathetically, "How can a father who fails to rule at home, govern a town?" The fate of the daughters at the hands of dissolute soldiers does not surprise the spectator, and the penalty of death imposed upon the seducers hardly seems justified. Calderón corrects this defect, and in Isabella, who replaces Leonora and Agnes, he presents a modest young woman, the unhappy victim of a crime which she strives in vain to prevent. Her soliloquy after she has been wronged is pathetic and poignant, and is one of the best passages in the play (Act II, scene i). Among other excellent scenes may be noted the magistrate's farewell to his son, in which shrewd advice and good feeling are happily blended (Act II, scene xxi), and the prolonged struggle between the magistrate and the gouty, blustering, irascible, old soldier, Lope de Figueroa (Act III, scene xv). King Philip II, who appears suddenly at the close of the play, sets his seal of approval upon the action of the father-magistrate in avenging the wrong done to his daughter and thus vindicates the triumph of justice and local autonomy (a precious privilege to Spaniards) over the lawlessness of undisciplined soldiery. The events narrated by the two dramatists are so circumstantial that it is assumed that they are based on a real incident in the march of Philip II into Portugal (1580), when the Tercio de Flandes, a famous regiment commanded by Lope de Figueroa, passed through Zalamea, a small town in Estremadura. Krenkel published both plays with valuable notes in 'Klassische Bühnendichtungen der Spanier' (Vol. III, Leipzig 1887). Consult also Menéndez y Pelayo's edition in 'Obras de Lope de Vega' (Vol. XII, 1902), and 'Select Plays of Calderón' (ed. Maccoll, London and New York 1888).

MILTON A. BUCHANAN.

MAYORUNA, South American Indian tribe of Panoan stock. Their country lies south of the Marañon and between the Ucoyali and

Javari rivers, in eastern Peru. They are nomadic, are tall and well formed, go entirely naked and live by hunting. The hair is cut away from the forehead but is allowed to fall down the back. Some have fair skin and beard attributed with some degree of probability to an admixture of white blood through Spanish captives. The tribe is savage and wages constant war with the whites and with other Indian tribes. Spears, clubs and blowpipes are their war weapons. The blowpipe, from which a poisoned dart is thrown a considerable distance, is their most formidable and dangerous weapons.

MAYOTTA, mā-yŏt'tä, or **MAYOTTE,** mä-yŏt'. See COMORO ISLANDS.

MAYOW, mā'ō, or **MAYO, John,** English physiologist and chemist, the first to attack the theory of phlogiston: b. London, May 1643; d. there, October 1679. He was of a Cornish family; entered Wadham College, Oxford, in 1658; became a scholar there in 1659; and was elected a Fellow of All Souls in 1660. He was graduated in 1665; studied medicine; practised in Bath; and in 1678 was elected to the Royal Society. His Latin tract on the respiration appeared in 1668; it urged that the heart was a mere muscle, that breathing is simply to give the nitroaerian constituent (oxygen) to the blood and that this constituent is necessary to life. In 1674 he published 'Tractatus Quinque,' summarizing and completing his theory; in this work he showed that «fire-air,» «nitre air» or «aerial spirit,» as he styled oxygen, is contained in all acids and is necessary to combustion and respiration, which are therefore analogous. The 'Tractatus Quinque' was republished in 1681 as 'Opera Omnia Medica Physica.' In 1684 a Dutch translation appeared; in 1799 a German, and French and English translations in 1840 and 1907, respectively.

MAYOYAOS, mā-yō-yä'ō, a native tribe of the island of Luzon, Philippines, living in the southwestern part of the province of Isabela and in the northwestern angle of the province of Nueva Vizcaya. They are a head-hunting tribe of Malay race; and of the Ifugao linguistic stock.

MAYSVILLE, māz'vĭl, Ky., city and county-seat of Mason County, on the Ohio River and on the Louisville and Nashville and the Chesapeake and Ohio railroads, about 63 miles southeast of Cincinnati. The first settlement was made about 1782, and in 1787 it was incorporated by the legislature of Virginia. In 1833 it was granted a city charter and in 1848 became the county-seat. It is in a rich agricultural region and its facilities for transportation give it considerable commercial importance. Its chief manufacturing establishments are flour and lumber mills, foundries, distilleries, cotton mills, plow and pulley works, boot and shoe factories, tobacco, furniture and pressed brick. Some of the prominent buildings are the Masonic Temple, the Odd Fellows' Temple, the post office, Wilson Memorial Hospital, the County Historical Association Building and the Maysville and Mason County Public Library. The library organization was established in 1878. The government of the city is vested in a mayor, who holds office four years, and a council. Pop. 6,141.

MAYWOOD, Ill., village in Cook County, 10 miles west of Chicago, situated on the Des Plaines River and on the Chicago Great Western, the Chicago and Northwestern and other railroads. It is the seat of the Chicago Theological Seminary, the German Lutheran Theological Seminary, the Logan Home, the Baptist Old People's Home, the Kittie Smith Home for Crippled Children and Library Hall. Maywood's industrial establishments manufacture tin plate, cans, etc., and lithograph products. The village owns the water-supply system. Pop. 9,780.

MAZARIN, Jules, or **GIULIO MAZARINI,** French cardinal and minister of Louis XIII, Anne of Austria and Louis XIV: b. Piscina, in the Abruzzi, Italy, 14 July 1602; d. Vincennes, 9 March 1661. He came of a Sicilian family, his father being intendant of Philip Colonna. The first part of his life was spent in reaching out for power and the second part in maintaining that power. Young Mazarin first attempted fortune in a military career. After brilliant studies under the direction of the Jesuits at Rome and afterward at the universities of Alcala and Madrid, he entered the papal military service as captain of infantry in 1625. His talents, however, lay in diplomacy to which he soon turned and wherein he distinguished himself by his ability. He was rewarded for his services by being made vice-legate to Avignon, in 1634, and as nuncio at Paris, in 1634–36. At Paris he gained the favor of Richelieu, who persuaded him to enter the service of France, which he did in 1640. He became a naturalized citizen of France; was made a cardinal (although not a priest) in recognition of his diplomatic services in Savoy; and in 1642 was designated by Richelieu as his successor. On the death of Louis XIII the queen, Anne of Austria, became regent for her young son, Louis XIV, and it was thought that Mazarin would be dismissed, but instead he gained over the queen-regent, to whom he became bound by mutual ties of affection, and perhaps by a secret marriage. By her he was confirmed in the office of Prime Minister, in May 1643, and this office he continued to occupy, with the exception of two brief periods of exile, until his death. His activities were first directed toward the *Cabale des Importants,* which he soon suppressed, and to the prosecution of the Thirty Years' War. The war was carried on with success due mostly to the soldierly qualities and ability of Turenne and Condé. The victories of Rocroi, Fribourg, Nordlingen and Lens and the revolt at Naples forced the German emperor to terms and obliged him to cede Alsace to France by the Treaty of Westphalia, in 1648. While prosecuting these enterprises abroad, Mazarin had unfortunately neglected home affairs and financial embarrassments resulted in a general revolt and civil war known to history as the Fronde. The Parliament of Paris denounced the increasing taxation, while the nobility dreaded the supremacy of Mazarin. As the immediate result of the conflict Mazarin quitted Paris with the court and took up his residence at Saint-Germain, in January 1649. In April he concluded an amnesty with the Parliament, but further opposition developed from the younger members of the aristocracy (*petits-maîtres*) and in

particular from Condé, who had hitherto remained faithful to the royal authority. With the support of the parliamentarians, Mazarin was enabled to put down the *Fronde des princes*, imprisoned Condé at Vincennes and crushed the revolt of the latter's friends at Rethel and Guyenne, in 1650. Mazarin's ingratitude to his late allies, the parliamentarians, caused all his adversaries to unite against him and in February 1851 he was obliged to go into exile near Cologne. His activity, however, was nowise at an end. He continued to direct the policy of Anne of Austria from his exile and, in September, rejoined the court at Poitiers, and soon afterward was about to enter Paris with it when he saw that his presence was an obstacle to the young king's entry to the capital. He again went into exile, in October 1652, but returned to Paris on 13 Feb. 1653, and through means of intrigue formed a powerful royal party in the state, gained General Turenne to his cause and returned to his position at court.

Untroubled now with troubles from within, Mazarin set about winding up the war with Spain. The outcome of this conflict remained in doubt until 1655, when French victory became assured through the alliance with Cromwell and the help of English soldiers. The Spaniards, beaten at the Dunes, at Dunkirk, threatened in the Netherlands and menaced at home by the capture of Barcelona, were obliged to sue for peace. By the Treaty of the Pyrénées (1658) the Spaniards lost to France, Roussillon, Artois and parts of the duchy of Luxembourg and of Hainaut. Not satisfied with this splendid result, Mazarin formed, in 1658, the League of the Rhine against Austria and diverted the succession to the throne of Spain by bringing about the marriage of Louis XIV with the Infanta Maria Theresa. With the completion of these projects his career ended. Mazarin was very avaricious, and through every kind of financial dealing amassed the huge fortune of over 50,000,000 livres. To the Royal Library he bequeathed his magnificent collection of books. He founded the Collège de Quatre-Nations, later known by his name as the Collège Mazarin. He has been blamed for the favors shown his family and the project, once entertained by him, of marrying his niece, Maria Mancini, to Louis XIV. These, however, are but the smaller side of a great character. They cannot make one forget the great political genius who extended the territory of France from the Pyrénées to the Rhine and which extricated her from a dangerous internal crisis. Consult Chéruel, 'Lettres du cardinal Mazarin pendant son ministère' (in 'Collection de documents inédits sur l'histoire de France,' Paris 1872–94); id., 'Histoire de France pendant la minorité de Louis XIV' (1879–80); id., 'Histoire de France sous le ministère de Mazarin' (1883); Chantelauze, 'Portraits historiques' (1886); Cousin, V., 'La jeunesse de Mazarin' (1865); Hassell, A., 'Mazarin' (1903); Perkins, J. B., 'France under Mazarin' (New York 1915).

MAZARRÓN, Spain, town, in the province of Murcia, 18 miles west of Cartagena and about three miles from the Mediterranean coast, with which it is connected by rail. It has flouring mills, soap works and metallurgic factories, and there are copper, iron and lead mines in the nearby mountains. A customhouse, barracks, lighthouse and lead works are situated on the coast. The town has a large trade in coal, lead and other ores. Pop. 22,660.

MAZATLAN, mä-sät-län', Mexico, a town and seaport of Sinaloa, about 183 miles southeast of the city of Sinaloa, at the entrance to the Gulf of California, on the Mexican Southern Pacific Railroad. It is built on a hilly crest and has a pleasing appearance. It has a municipal gas system and a street railway. Mazatlan is the chief Pacific port of Mexico and the outlet for the products of the mining district of Saint Sebastian; it has a considerable import and export trade. Silver, copper, lead, pearls and hides are exported. In 1914 the town was besieged by the Constitutionalists and taken after many months. A consul of the United States is located here. In normal times the exports amount annually to about $4,250,000 and the imports to $2,500,000.

MAZDAK, mäz'däk, Persian religious leader: b. Persepolis, about 470 A.D.; d. Nahrvan, between 530 and 540. He was a chief priest at Nishapur, and in 500 proclaimed himself a prophet. He preached the equality of man, the abolition of property rights and free love, abstinence from animal foods and the simple life generally. He converted King Kobad to his views, which forthwith became law, but a rising of the nobles ousted Kobad for three years, and on his return he abjured Mazdak and his doctrine. Khosru Nashirvan put him to death. Consult Browne, E. G., 'Literary History of Persia' (London 1909).

MAZE, Hippolyte, ē-pō-lēt mäz, French historian: b. Arras, 5 Nov. 1839; d. Paris, 25 Oct. 1891. He studied at the Ecole Normale Supérieure; taught there and at the Lycée Fontanes; was elected prefect of Landes in 1870, deputy in 1879 and 1881 and senator in 1886. He wrote 'The Republic of the United States: Its Foundation' (1869); 'The End of the Revolution' (1872); 'Hoche in Vendée' (1882); 'The Struggle against Want' (1883); 'General Marceau' (1889), and 'The Generals of the Republic' (1889).

MAZEPPA, mä-zĕp'ä, Ivan Stepanovitch, or John, hetman of the Cossacks: b. Podolia, about 1645; d. Bender, Bessarabia, 1710. He was page to John Casimir, king of Poland, who was a patron of the arts and of literature, and he had therefore an opportunity of acquiring various useful accomplishments. A Polish nobleman having surprised Mazeppa with his wife bound him naked upon his own horse and committed him to his fate. The horse carried him to his own residence. Shame made him flee to the Ukraine and join the Cossacks, whose warlike roving life suited his disposition. He made himself conspicuous by his dexterity, bodily strength and courage. His knowledge and sagacity procured him the post of secretary to the hetman Samilovitch, and in 1689 he overthrew Samilovitch and himself became hetman. He gained the confidence of Peter the Great, who loaded him with honors and he was finally made Prince of the Ukraine. In 1706 he opened negotiations with Charles XII (q.v.) of Sweden for the purpose of freeing himself from Russian dominion, but his treachery was finally revealed to Peter, and he was obliged openly to declare for Charles. After the defeat of Pultowa in 1709 Mazeppa

fled to Bender. Peter tried to have the sultan extradite him, but failed despite an offer of 300,000 ducats for the favor. Lord Byron has made Mazeppa the hero of a poem (1818) and Liszt of a symphony.

MAZURKA, a lively Polish national dance, popular also in the United States. The movements are of a grotesque character. The term is also applied to the music which accompanies the dance, sometimes in three-eighths time, but for the most part in three-fourths. The mazurka is danced by four or eight couples. Augustus III brought the mazurka to Germany, whence it was learned by the French and finally about the middle of the 19th century it acquired considerable popularity in England. The music of the dance has taken its modern form from Chopin.

MAZZINI, Giuseppe, Italian patriot: b. Genoa, 22 June 1805; d. Pisa, 10 March 1872. He studied law at the University of Genoa and practised his profession for a time, but the strong Liberal opinions he had imbibed as a child and his conviction that the oppressed condition of his country under Austrian rule called for men of action and public spirit, and that a noble course lay open before anyone who would give himself up, heart and soul, to the work of reforming her, led him to devote himself to a political career. In his ardent aspirations for the national unity of Italy, it seemed to him that her deliverance from foreign tyranny was to be achieved only by a return to the republican glories of ancient times. His patriotic enthusiasm in this direction was fostered by his early studies, which developed in him a passionate idea of the glories of a republic, and by the success which he had achieved in literature while still little more than a youth. In 1827 appeared his maiden essay, 'Dell' Amor Patrio di Dante,' which was published in a Liberal journal, the *Subalpino.* This led him to contribute under the mask of literary critiques other historical, philosophical and critical papers to the *Antologia* of Florence and the *Indicatore Genovese.* But the authorities, perceiving that the periodical literature of Italy was becoming far too strongly tainted with advanced Liberal opinions, suppressed these journals, and hoped, no doubt, thereby to have silenced their writers also. About 1830 Mazzini became an active member of the Carbonari, and this affiliation was the introductory step to his subsequent political life; he was active, able, bold and impetuous, and he soon rose into a position which gave him great influence in the councils of that secret society. While on a mission for the society he was betrayed by a Piedmontese spy, arrested and detained for six months as a prisoner in the fortress of Savona. On his release he went to Marseilles, France, to escape the police surveillance imposed on him in Italy. Here he organized the society of La Giovine Italia (Young Italy), and established under that same title a journal to advocate his views; the purpose of the society was to liberate Italy and establish a national government, Mazzini desiring a republic. It was about this time, too, that he addressed to Charles Albert of Sardinia the celebrated letter which drew down on him a sentence of perpetual banishment from his native country. He took active part in the organization of an insurrection of which Genoa was to be the centre, but the plot was discovered and failed. For his share in it Mazzini was sentenced to death in the Sardinian courts. He then went to Switzerland, where he organized another conspiracy for the invasion of Savoy (1834), which also failed. In 1837 he quitted Switzerland and took up his abode in London, where he kept in correspondence with the revolutionary leaders on the Continent, was recognized as the head of the Young Italy party, and instigated several insurrections, which were unsuccessful. After the insurrection in Milan in 1848 he again went to Italy, was chosen a member of the Tuscan provisional government in February 1849, and in the following month, when Rome was proclaimed a republic, he was chosen first of the triumvirs. He was the mainspring of the defense of Rome against the French, and on the surrender of that city in June Mazzini escaped to Lausanne, Switzerland. At this time he addressed to M. de Tocqueville and other French statesmen some most bitter and reproachful letters on the high-handed policy pursued by France. Finding his continental residence too hot for him he returned to London, not, however, with any idea of abandoning his long-cherished hopes for Italian unity. Later he had a hand in the unsuccessful uprisings at Mantua (1852), in Milan (1853) and in Piedmont (1857), being in Italy for a short time in 1857. He assisted also in organizing the expeditions led by Garibaldi in 1860, 1862 and 1867. An ardent Republican, he refused to take his seat in the Italian Parliament under the monarchy, though repeatedly elected from Messina, as a protest against the uncanceled sentence of death against him. In 1866 this sentence was formally rescinded; in 1868 he suffered from a serious illness, the effects of which left him in impaired health. In 1870 he was arrested at Gaeta under charge of conspiracy with Garibaldi and imprisoned for two months, being released after the occupation of Rome by the Italians. He was accorded a public funeral by the Italian government.

Mazzini was a copious writer. A perfect master not only of Italian, but of French and of English literature; he was an able commentator of Dante, the author of works on philosophy and a constant contributor to some of the most delightful periodical literature in Paris and in London. He would turn from the warfare of politics to write in his *Apostolato Popolari* for the benefit of Italian workmen sermons 'On the Duties of Man.' He analyzed in masterly fashion the faults and shortcomings of the economic and socialist schools. Though his actions were sometimes politically indiscreet, he was a man of attractive character and strong personal magnetism, distinguished throughout his career for disinterested patriotism and the highest moral standards of conduct. He was interested in the labor movement, organized a workingmen's association in London in 1840 and was for a time connected with the International Workingmen's Association (q.v.), but withdrew from that society when it declared for Socialism. During his later life especially his efforts were directed toward separating republicanism from both Socialism and atheism. No man won so many admirers as Mazzini and yet secured so

few friends. There was hardly a human being whom long familiarity had not estranged from Mazzini. With manners consummately affable and courteous he combined an overweening conceit and a narrowness and bigotry of view which hardly tolerated independent minds. He was a lonely genius, all apart from the common ways of other mortals, spurning the suggestions of the plainest common sense, professing to do all for his fellow-beings, yet nothing with them or by their aid. He gave up the idea of ever being a prophet in his own country in his own age; his only trust was in a coming generation, where the germ of his idea could alone attain full development. The best edition of his works is 'Scritti Editi ed Inediti' (18 vols., Milan 1861–91); a partial collection is published under the title 'Life and Writings of Joseph Mazzini' (1891). His letters have been published in English (6 vols., London 1890–91). Consult 'Memoir of Joseph Mazzini' (1877), containing his two essays 'Thoughts on Democracy in Europe,' and 'On the Duties of Man'; Linton, W. J., 'Recollections of Mazzini' (1892); Marriott, 'Makers of Modern Italy' (1889); MacCunn, J., 'Six Radical Thinkers' (London 1907); Holland, R. MAZZOLA, mat-so'la, or **MAZZUOLI,** mat-soo-ō'lā, **Francesco,** Italian painter, known from his birthplace as IL PARMIGIANO: b. Parma, 11 Jan. 1503; d. Casalmaggiore, 24 Aug. 1540. His father and two uncles were painters, and to them and to Correggio, who was in Parma in 1521, he owed his earlier training. Correggio's manner he caught so well that his 'Cupid Fashioning a Bow' was long and generally attributed to Correggio. When 20 he went to Rome and there imitated Raphael and Michelangelo. In 1527, upon the capture of Rome by Charles V, his losses were great and he had to escape from the city. He returned to Parma, lost his health, was imprisoned by the city authorities for failure to complete a commission which had been paid for in advance, and upon his release fled to Casalmaggiore, failing to live up to his promise to repay. His paintings are to be found in most of the galleries of Europe; mention should be made of the 'Madonna with St. Margaret,' in the Bologna Gallery; 'Madonna del Collo Lungo,' Pitti Palace, Florence; 'Annunciation,' Ambrosian Library, Milan; various portraits in the Naples Museum; several sacred subjects, notably 'Madonne' in the Dresden Gallery and in the Louvre; and the great frescoes in the church of Saint John, Parma. More important, though less well known, are Mazzola's etchings, since he introduced etching into Italy. His drawing is correct, and his work bold, fiery and graceful.

MAZZONI, Guido, gwē'dō mat-so'ne, Italian scholar and poet: b. Florence, 12 June 1859. He was educated at Florence, Leghorn and Bologna, in 1881 became instructor in Italian literature in secondary schools and in 1887 professor of Italian literature at Padua. After 1894 he was professor of the Italian language and literature at the Institute of Florence. His poetic work has been to some extent influenced by his familiarity with English literature and largely by his countryman Carducci. Besides contributions to reviews, he wrote 'Epigrammi di Meleagro da Cadora' (1880); 'In Biblioteca' (1882); 'Esperimenti metrici' (1882); 'Un Ritratto di Gesū' (1887); 'Rassegne litterarie' (1887); 'Fra Libri et Carte' (1887), and other works, including a scholarly history of Italian literature in the last century.

MEAD, Edwin Doak, American author and lecturer: b. Chesterfield, N. H., 29 Sept. 1849. His early life was spent on his father's farm, and in 1866 he entered the publishing house of Ticknor and Fields, Boston. He studied in English and German universities 1875–79, and has since engaged in lecturing and writing. In 1889 he was associate editor of the *New England Magazine* with Edward Everett Hale, the chief editor, 1890–1901. He is connected with numerous historical and social clubs. For 25 years he was director of The Old South Historical Works; edited 200 Old South leaflets widely used in schools and colleges, and annually arranged courses of lectures. For several years he was president of the Massachusetts Good Citizenship Association and Free Religious Association, and for 10 years president of the Twentieth Century Club. He has labored earnestly in the cause of international peace. He is a trustee of the Church Peace Union, endowed by Mr. Carnegie, and was delegate to international peace congresses at Glasgow, Rouen, Lucerne, Munich and London. He has published 'The Philosophy of Carlyle' (1881); 'Martin Luther: A Study of the Reformation' (1884); 'A More Beautiful Public Life'; 'Organize the World'; 'The Principles of the Founders'; 'The Influence of Emerson.'

MEAD, Larkin Goldsmith, American sculptor: b. Chesterfield, N. H., 3 Jan. 1835; d. 15 Oct. 1910. He was educated in the public schools and studied art in Italy, where in Venice he was a member of the United States consulate. His first work was an ideal figure, 'The Recording Angel,' executed in 1855. He served for a time in the Civil War as illustrator for *Harper's Weekly,* and after the war his work as a sculptor gave him national prominence. The statue of Lincoln on the monument at Springfield, Ill., is his work, as are the bronze statues of Ethan Allen at the Capitol at Washington and in Montpelier, Vt. The latter city has also his heroic figure 'Vermont' on the State Capitol. He also executed the soldiers' monument at Saint Johnsbury, Vt.; the Stanford family group for Stanford University; 'The Mississippi River,' Minneapolis; portraits of W. D Howells, John Hay and Henry James. His work includes many ideal pieces: 'The Returned Soldier'; 'The Return of Proserpine from the Realm of Pluto' (exhibited at the World's Columbian Exposition), etc.

MEAD, William Rutherford, American architect: b. Brattleboro, Vt., 20 Aug. 1846. He was graduated from Amherst College in 1867, studied architecture in New York under Rus-

sell Sturgis and in Europe, and upon his return to the United States became a member of the prominent New York firm of McKim, Mead and White, which has had charge of many of the most important public and private buildings in the country. In 1902 he was made a Fellow of the American Institute of Architects, and is a member of the American Academy of Arts and Letters and president of the American Academy, Rome. In 1910 he was chosen member of the National Academy of Design and was awarded a gold medal of honor by the National Institute of Arts and Letters. He is a brother of L. G. Mead (q.v.).

MEAD, or **METH,** a vinous liquor, used in northern Europe and made of honey and water by means of digestion and fermentation. It also receives an addition of fruit, spices and simples to give it a richer flavor. When new, mead has always a strong taste of honey, but this diminishes as it becomes older. Mead is mixed with the must of apples or with wine, beer and even vinegar, and then takes the name of wine-mead, beer-mead, etc. It is one of the oldest of beverages, being known all over Europe within historic times.

MEADE, George Gordon, American soldier: b. Cadiz, Spain, 31 Dec. 1815; d. Philadelphia, 6 Nov. 1872. In 1835 he was graduated from the United States Military Academy and assigned to the 3d Artillery, in 1835–36 served in the Seminole War in Florida, on 26 Oct. 1836 resigned from the army, and in 1836–37 was assistant engineer in the construction of the Alabama, Florida and Georgia Railway. He was later employed in various works of engineering, including surveys of the mouths of the Mississippi and of the northeast boundary between the United States and British North America. On 19 May 1842 re-entered the army as second lieutenant of topographical engineers. He joined Scott's staff at Corpus Christi, Tex., 14 Sept. 1845, and during the Mexican War participated in the battles of Palo Alto, Monterey, Resaca de la Palma and the siege of Vera Cruz. After the war he was occupied in lighthouse construction and in the geodetic survey of the Great Lakes (1857–61). He became captain in the corps of engineers in 1856. On 31 Aug. 1861 he was commissioner brigadier-general of volunteers and assigned to the command of the 2d brigade of the Pennsylvania reserve corps of the Army of the Potomac, stationed on the right of the lines before Washington. He served in the Virginia peninsula campaign and took part in the actions at Mechanicsville (26 June), Gaines' Mill (27 June) and Frayser's Farm (30 June). On 18 June he was promoted major of engineers. At Manassas (second Bull Run) he commanded the 1st brigade of Reynold's division, and later he took a distinguished part at South Mountain (14 September) and Antietam (17 September). In the latter battle, when Hooker was wounded, he was placed in command of the First Corps. For his services he was promoted major-general of volunteers 29 Nov. 1862; and at Fredericksburg (13 December) commanded the 3d division of the First Corps, with which he broke through Lee's right and penetrated to the position occupied by the Confederate reserves, but for want of support was compelled to fall back. At Chancellorsville (2–4 May 1863) he commanded the Fifth Corps. On 28 June 1863 he was appointed commander of the Army of the Potomac, to succeed Hooker. His command was then scattered, and on the march through Pennsylvania in pursuit of the Confederate invaders, Meade had everything yet to learn of both his own force and the enemy. At Gettysburg on 1–3 July he won the great and decisive battle with which his name is generally associated. (See GETTYSBURG, BATTLE OF). He received the thanks of Congress and was made brigadier-general, United States army, 3 July 1863. During the remainder of the war he commanded the Army of the Potomac with conspicuous ability, and on 18 Aug. 1864 became major-general in the regular army. From 1 July 1865 until his death he was commander of the military division of the Atlantic, with the exception of the period January 1868–March 1869, when he was in command successively of the Third Military District and the Department of the South. He was a Fellow of the American Academy of Arts and Sciences. A residence was purchased for him by the citizens of Philadelphia, and after his death $100,000 were collected and given to his heirs. There is an equestrian statue of him by Calden in Fairmount Park, Philadelphia, and one by Bush-Brown on the field of Gettysburg. Consult Bache, R. M., 'Life of General G. G. Meade' (Philadelphia 1897); Pennypacker, I. R., 'General Meade' (New York 1901).

MEADE, Richard Kidder, American soldier: b. Nansemond County, Va., 14 July 1746; d. Frederic, now Clarke, County, after 1800. He was educated in England at Harrow and in private schools. He had returned from England some years before the outbreak of the Revolution, and in 1775 entered the service of the struggling colonies, and distinguished himself in his first battle, that of Great Ridge. Recognition came speedily with an appointment to the staff of General Washington, with whom he remained until the close of the war. The supervision of the execution of Major André fell to his lot, a duty which while recognizing the necessity for it, he performed with deep regret. At the conclusion of the war he returned to Virginia to engage in the quiet life of the plantation.

MEADE, Richard Worsam, American naval officer: b. New York, 9 Oct. 1837; d. Washington, D. C., 4 May 1897. He was a nephew of Gen. G. G. Meade (q.v.). He entered the navy as midshipman 2 Oct. 1850. His promotions were lieutenant, 23 Jan. 1858; lieutenant-commander, 16 July 1862; commander, 20 Sept. 1868; captain, 13 March 1880; commodore, 5 May 1892, and rear-admiral, 7 Sept. 1894. On 20 May 1895 he was retired from the service. In 1862–63 as commander of a division he co-operated with the land forces of Sherman in subduing the Confederates on the Mississippi. In 1863 he was in command of the marines during the Draft Riots in New York. For a time he was in charge of a department at the naval academy; in 1868 was sent to Alaska and in 1871–73 commanded the *Narragansett* on the Pacific station. In 1894 he was placed in command of the North Atlantic squadron. He was naval representative of the United States at the World's Columbian Exposition, Chicago,

1893. He published 'A Treatise on Naval Architecture and Ship-building' (1869).

MEADE, William, American Protestant Episcopal bishop: b. near Millwood, Va., 11 Nov. 1789; d. Richmond, Va., 14 March 1862. He was a son of R. K. Meade (q.v.), and was graduated from Princeton College in 1808, studied theology and took orders in the Episcopal ministry in 1811. His first charge was his home parish, which he served gratuitously, and in 1829 he was elected assistant to Bishop Moore. He was in charge of Christ Church in Norfolk, Va., in 1834–36, and in 1841 succeeded Bishop Moore as head of the diocese of Virginia. He was one of the founders in 1847 of the 'Evangelical Knowledge Society.' He tried to keep Virginia in the Union in 1861, but later entered into the spirit and aims of the Confederacy. He was the author of several works, among which are 'Family Prayers' (1834); 'Reasons for Loving the Episcopal Church' (1852); 'Old Churches, Ministers and Families of Virginia' (1857); 'The Bible and the Classics' (1861). Consult the memoir by his coadjutor, John Johns (Baltimore 1867).

MEADOW, Making and Care of. Meadows may be divided into general groups which will depend upon location, duration and purpose, and their treatment will vary with each of these factors. Meadows located upon low ground, which may be inundated, or which is constantly moist, usually consist of grasses and other plants which do not thrive so well upon upland fields. Because of their dampness they cannot be treated like dry soils and they are therefore more frequently permanent than temporary. Further, they are generally better adapted for haying than for grazing, because the grasses that naturally grow upon them are ranker, taller growing species and generally have grown to a considerable height before the land becomes dry enough to turn stock upon it. Except as to season the preparation of lowland meadows is not necessarily different from that of upland.

For best results the land should be deeply plowed as early in the season as soil conditions will permit, and harrowed at intervals of 10 days and after each rain that forms a crust until late summer. The practice will not only destroy weeds and weed seeds, but ensure the quick germination of grass seed sown even in dry weather, the soil being moist close to the surface. The soil may be anything, but preferably not sand or clay. If mucky, as in a reclaimed swamp, rolling is frequently advisable, otherwise generally not. Prior to plowing liberal applications of good manure or commercial fertilizers should be made and light annual dressings should also be given, preferably in autumn or early spring. Temporary pastures which are intended to last only three or four years should constitute part of a general rotation scheme (see ROTATION OF CROPS) and should be followed by some crop such as corn or potatoes, which can best utilize their products of decomposition. Permanent meadows should be inspected each spring and the spots which appear to be failing given special attention, such as fertilizing, liming, seeding, etc., to maintain a general good average. When the annual yield of hay falls below two tons the meadow may be considered unprofitable and should be plowed up and given a change of crop for three or four years.

In general, timothy or "herd's-grass" is the most popular grass in America, because it is hardy, long-lived, large, easily cured and its seed inexpensive and likely to be free from weed seed. Orchard grass, tall meadow fescue, red-top, rye-grass and cat-grass are also often used, but are secondary. Blue-grass, which generally appears as a volunteer grass in permanent meadows, is rarely profitable as a hay grass, but is unequaled in the north as a pasture grass. These grasses may all be sown with a sparsely planted cereal which acts as a "nurse crop." But this practice is generally considered inexpedient. The admixture of clover, however, is generally highly desirable, since the clovers supply nitrogenous food to the grasses. Alsike clover is considered best for mixing with timothy since it is somewhat later in ripening than the other large clovers, which mature before the timothy can be profitably cut. Consult Wing, Joseph E., 'Meadows and Pastures' (Chicago 1911).

MEADOW-BEAUTY. See DEER-GRASS.

MEADOW FESCUE, a fescue-grass (*Festuca*). See GRASSES IN THE UNITED STATES.

MEADOW-GRASS. See BLUE-GRASS.

MEADOW-HEN, the American coot. See COOT.

MEADOW-LARK, or **MEDLARK,** a beautiful American starling (*Sturnella magna*), numerous in eastern United States as far west as the high central plains, where it is replaced by a variety (*S. neglecta*) remarkably different in song and some habits. It is about 11 inches long and tail five inches. The body is thick and stout, the legs large, the bill long and straight and the flight powerful. The upper parts are brown, marked with brownish-white, and the exposed portions of the wings and tail with transverse dark-brown bars; the under parts yellow, with a black crescent upon the breast, which is very distinctive as well as a handsome ornament. These birds receive their popular name "lark" from their terrestrial habits and way of singing in the air, uttering a loud sweet double call while circling upon fluttering wings above the meadow or grain-field where the nest is carefully concealed among the roots of the grasses. The eggs are white, profusely speckled with light red. The western variety has a longer, more vivacious and tuneful song than the eastern bird, and is justly accounted the finest songster of the open regions of the interior. These birds are migratory in the northern parts of their range, but most of them remain during the winter in the middle parts of the United States and southward, and in the autumn are often shot for market, although in most States such shooting is now prohibited by law. In the Southern States it is commonly called "old-field lark." The meadow-lark subsists both on insects and on seeds. In winter they often form groups, but in the fine seasons seldom more than two are seen together. Consult Coues, 'Birds of the Northwest' (Washington 1874).

MEADOW-MOUSE. See FIELD-MICE.

MEADOW-PINK, or **MEADOW-CAMPION**, the common cuckoo-flower (q.v.), or ragged robin (*Lychnis flos-cuculi*). See LYCHNIS.

MEADOW-RUE, a plant of the crowfoot family and of the genus *Thalictrum*. These rues are erect perennial herbs, with much divided leaves and small flowers, usually in loose panicles. The genus contains about 75 species, scattered about the north temperate zone, of which the United States and Canada possess about 15 species. The early meadow-rue (*T. dioicum*) is a slender, leafy species, of rocky woods, a foot or two in height, whose flowers, purplish and greenish with yellowish anthers, appear in April or May. The purple meadow-rue (*T. dasycarpum*), common in New England woods, is distinguishable by its size (two to four feet tall), large bright-green, waxy leaves and purplish stem; the flowers form a greenish fleecy bloom. A third large species is the thick-leaved (*T. coriaceum*) of the Southern States, whose flowers are of different hues, the staminate flowers being white and showy, while the pistillate flowers, borne on separate plants, are purplish. The tall meadow-rue (*T. polygamum*) towers to a height of 10 feet in favorable situations. All are fertilized mainly by the wind.

MEADOW-SNIPE. See JACK-SNIPES.

MEADOWSWEET, a well-known handsome European plant (*Ulmaria ulmaria*) of the rose family. It grows by the sides of streams and in damp places, has pinnate leaves and stems two feet high bearing corymbs of white fragrant flowers. A decoction of it with copperas is used for dyeing black, and the root has been used as a tonic. It is also called queen of the meadow.

MEADVILLE, mĕd'vil, Pa., city and county-seat of Crawford County, on French Creek and on the Erie and a branch of the Pittsburgh, Bessemer and Lake Erie railroads, about 90 miles north of Pittsburgh and 30 miles south of Erie. The first settlement was made in May 1788 by David Mead and others. It became a borough in 1823 and in 1866 was chartered as a city. It is in a fertile agricultural region, in the vicinity of extensive oil fields and in the part of the State noted for its iron and steel industries. The chief manufacturing establishments are the Erie Railroad shops, the Phœnix iron works and the Meadville malleable iron works, the Keystone vise works, chocolate chips factory, Barbour silk mills, shoe-button fastener works, silk mills, printing works, confectionery factories, engine works, tool, casting and brass works, chemical works, corset factories and other manufactories. The city has many churches, an academy of music, courthouse, three parks, the county fair grounds, a race-track, iron bridges and several fine wholesale and retail buildings. Its educational institutions are the public and parish schools, a high school, the Meadville Theological School, opened in 1844 by the Unitarians; Allegheny College, opened in 1815 by the Methodist Episcopals; Pennsylvania College of Music, Meadville Business College and a public library. There are the City Hospital and Saint Joseph's Hospital. The three banks have a combined capital of over $350,000. The government, according to the commission plan adopted in 1913, is vested in a mayor and four councilmen. The electric-light plant and the waterworks are owned and operated by the city. Pop. 12,780.

MEAFORD, Canada, lake port in Gray County, Ontario, situated on an inlet of Georgian Bay, Lake Huron, on the Grand Trunk Railway, 20 miles west-northwest of Collingwood. It has brick yards, grain elevators, fruit evaporating works, flouring mills, tannery, furniture factory, textile works, foundries, box works, etc. It has a good harbor with a depth of 20 feet. Pop. 3,200.

MEAGHER, mā'hĕr, **Thomas Francis**, Irish-American soldier: b. Waterford, Ireland, 3 Aug. 1823; d. near Fort Benton, Mont., 1 July 1867. He was educated at the Jesuit College, Clongowes Wood, Kildare, and at Stonyhurst College (near Preston), England; became one of the principal orators of the Young Ireland party, which aimed at independence through armed revolution; in 1848 was sent on a mission by the Irish Confederation to the French provisional government; and on 21 March was arrested on a charge of sedition. He was bailed but on the passage of the Treason-Felony Act rearrested; and in October sentenced to death for treason. The sentence having been commuted to life banishment, he was removed to Tasmania (9 July 1849); but in 1852 escaped to the United States, where he was admitted to the bar in 1856 and practised in New York in 1856–61. For some time also after 1856 he edited the *Irish News* of New York. In 1861 he organized a company of zouaves for the Federal army, with which he joined the 69th New York Volunteers, under command of Col. Michael Corcoran. After three months' service, he recruited the "Irish brigade" (1861–62), and was elected colonel of the 1st regiment. On 3 Feb. 1862 he became brigadier-general and took command of the brigade. He fought bravely at Richmond, the second Bull Run, Fredericksburg and Antietam and after Chancellorsville found his command so reduced in numbers that he resigned. Early in 1864 he was reappointed brigadier-general of volunteers and was assigned to the command of the military district of Etowah. He resigned 15 May 1865, was appointed secretary of Montana Territory and in the following year acted at one time as governor *pro tem*. At Fort Benton, Mont., on 1 July 1867 he boarded a steamer for a trip down the Missouri and thereafter was never seen. It is supposed that he fell overboard unperceived during the night. He wrote 'Speeches on the Legislative Independence of Ireland' (1852). Consult Cavanagh, 'Life, Writings and Speeches' (Worcester, Mass., 1892).

MEAGRE. A fish. See MAIGRE.

MEAKIN, mē'kĭn, **Budgett**, English author and writer: b. Ealing Park, England, 8 Aug. 1866; d. London, 26 June 1906. He was educated at the Reigate Grammar School, became associate editor of *Times* of Morocco and was editor 1884–93. He lectured extensively on industrial questions and on Oriental subjects. Among his works are 'The Moorish Empire' (1899); 'The Land of the Moors' (1901); 'The Moors' (1902); 'Model Factories and Villages,' etc.

MEAL-MOTH, or **MEAL-WORM.** See FLOUR AND MEAL INSECTS.

MEAL-TUB PLOT, *in English history,* an alleged conspiracy, concocted in 1679 by an informer, Dangerfield, with the view of cutting off those who were opposed to the succession of James II after he had embraced Roman Catholicism. The false charges to which Dangerfield was prepared to swear were found in the meal-tub belonging to a Mrs. Cellier, one of his friends. Ultimately he confessed his crime, was whipped and condemned to stand in the pillory.

MEALY-BUG, a scaleless scale insect of the genus *Dactylopius* and family *Coccidæ.* These insects are covered with a mealy or waxy substance which they secrete for protective purposes. Like their relatives, the true scale insects, they also secrete honey-dew and are attended and transported by ants; unlike these relatives they do not lose the power of locomotion. The species are most numerous in tropical and sub-tropical countries; one species (*D. citri*) being the best-known outdoor species in the United States, feeding upon citrus trees in Florida. In greenhouses another species (*D. destructor*) is often troublesome. Owing to the protective covering difficulty has been met in ridding plants of these creatures, but fumigation and caustic solutions have been tried with most satisfactory results, a kerosene and soap emulsion being particularly effective in destroying them. (See INSECTICIDE). Consult Comstock, J. H. and A. B., 'Manual for the Study of Insects' (8th ed., New York 1909); Comstock, J. H., 'Report of the United States Department of Agriculture' (Washington 1880).

MEALY WING, a minute bug of the family *Aleyrodidæ,* whose species (about 150 in number) have the wings covered with a white meal-like secretion. They are allied to the coccids, but differ in development and structural peculiarities; and throng upon the leaves of plants which they injure by sucking away the sap and also by attracting a growth of smut-fungus by their secretion of honey-dew. In this manner they blacken and harm orange and lemon trees in parts of Florida and Louisiana, where they are prevalent. Consult Howard, 'Insect Book' (1901).

MEAN VALUE. If n quantities are commensurable, the sum of their units divided by n, the number of the quantities, is the *arithmetical mean* and is the *mean value* of the n quantities when their number is finite. For example, if the number of units in three quantities are respectively 4, 8 and 15, the mean value is $\frac{4+8+15}{3}=9$; and in general, if the number of units in n quantities is denoted by $X_1, X_2, X_3, \ldots . X_n$, the mean value is

$$M=\frac{1}{n}(X_1+X_2+X_3+ \ldots . +X_n).$$

But if a quantity vary continuously in accordance with some law, thereby assuming every possible value between two extremes, the number of different quantities is infinite, and the mean value in such a case requires a new definition. For example, assume that at every point in the diameter of a semi-circle a perpendicular to the diameter is drawn to meet the semi-circle. The lengths of these lines form a continuous series of values represented by every number from zero to r, where r is the length of the radius. In such a case if n values of the perpendiculars are obtained and their sum is divided by n, the ratio should approximate to the mean value. It is easy to see, however, that this ratio will approximate to $\frac{2}{\pi}$ of the radius of the circle if the n perpendiculars are evenly spaced on the circle, to $\frac{\pi}{4}$ of the radius if they are evenly spaced on the diameter. It follows that the mean value of a continuously varying quantity is not definite until the law is known by which the "weight" of each portion of the scope of variation is determined.

The several forms of the theorem that pass under the name of the mean value theorem involve the principles of the infinitesimal calculus. The *first theorem of the mean value* is the following: Let $f(x)$ denote any finite and continuous function of x in the interval between $x=x_0$ and $x=X$; let dx denote the increment and retain the same sign in this interval; and assume that m and M are respectively the least and the greatest values of $f(x)$ in this interval: then the definite integral $\int_{x_0}^{X} f(x)dx$ has a definite value that is greater than $m(X-x_0)$ and less than $M(X-x_0)$; that is,

$$m\int_{x_0}^{X}dx<\int_{x_0}^{X}f(x)dx<M\int_{x_0}^{X}dx.$$

Since $f(x)$ is continuous in the interval $X-x_0$, there must be a value $x=\xi$, where $x_0<\xi<X$ such that $\int_{x_0}^{X} f(x)dx=(X-x_0)f(\xi)$, $m<f(\xi)<M$. The value, $f(\xi)=\frac{1}{X_0-x}\int_{x_0}^{X} f(x)dx$, is called the *mean value* of $f(x)$ in the interval $X-x_0$. If we assume $F(x)$ to be the primitive or indefinite integral of $f(x)$, then $F(X)-F(x_0)=(X-x_0)f(\xi)=(X-x_0)F(\xi)$ which is the familiar form of the law of the mean in the differential calculus.

The theorem of mean value is of importance in establishing Taylor's series. It follows immediately from the theorem of mean value that if $F(X)=F(x_0)=0$, for some ξ between X and x_0. $F'(\xi)=0$, if F is continuous between X and x_0. Let ϕ be a function of X with derivatives of every order at every point between $x=a$ and $x=b$. Construct the function

$$\psi(z)=\phi(X)-\phi(z)-(X-z)\phi'(z)-\frac{(x-z)^2}{a!}\phi''(z)$$
$$-\ldots .-\frac{(x-z)^n}{n!}\phi^{(n)}(z)-\frac{(x-z)^{n+1}}{n+1}p,$$

where X is of the form x_0+h, and X and x_0 lie between a and b. ψ' will be of the form $-\phi'(z)+\phi'(z)-(X-z)\phi''(z)+(X-z)\phi''(z)-\ldots-\frac{(X-z)^n}{n!}\phi^{(n+1)}z+\frac{(X-z)^n}{n!}p$, or

$$\frac{(X-z)^n}{n!}[p-\phi^{(n+1)}(z)].$$

Furthermore, $\psi(X)$ is identically 0, and by properly choosing P, $\psi(x_0)$ can be made 0.

Therefore, by the theorem just stated $\psi'(z) = \frac{(X-z)^n}{n!}[p-\phi^{(n+1)}(z)]$ vanishes for some value of z between x_0 and x. As it can be shown that this value need not be X itself, we have $p-\phi^{(n+1)}(z)=0$ for some value of z between x_0 and X, and since $\psi(X)=0$, if we let $X=x_0+h$, we have $\phi(x_0+h)=\phi(x_0)+\phi'(x_0)h+\ldots.+\frac{\phi^{(n)}(x_0)}{n!}h^n+\frac{\phi^{(n+1)}(x_0+\vartheta h)}{(n+1)!}h^{n+1}$, where $0<\vartheta<1$. Therefore, if $\frac{\phi^{(n+1)}(x_0+\vartheta h)}{(n+1)!}h^{n+1}$ can be made as small as you please by increasing n, we have $\phi(x_0+h)=\sum_0^{\infty}\frac{\phi^{(n)}(x_0)h^n}{n!}$, which is Taylor's theorem. See SERIES. Consult Osgood, 'Differential and Integral Calculus' (rev. ed., New York 1914).

MEANDER, mē-ăn'dẽr, *in art,* an ornamental design, in which the lines interlace; it is often used in decorating vases. The lines usually advance in one direction and pass one another at right angles. The design is so named from the river Meander, well known for its numerous windings.

MEANDERS, broad swinging curves made by a river on its flood plain. A river in its early history may have accidental curves, but it is only when it has cut its course as deeply as it can, and has begun to widen its valley notably, in other words when it has passed its maturity and is progressing toward old age, that it characteristically develops meanders. These frequently become almost perfect loops many miles around and but a few rods across the neck. When a meander cuts off and is occupied by stagnant water only, ox-bow lakes are formed. If a region in this stage is uplifted the river will again begin to deepen its valley, and the meander curves will cut down anew, forming deep valleys or gorges. They are then said to be entrenched or incised meanders. Sometimes the neck of an incised meander may be cut through at river level, by undermining the rock, leaving a natural bridge. See NATURAL BRIDGES, and the section on *Work of Running Water* in the article on GEOLOGY.

MEANING, the object of a symbolization, considered from the standpoint of the symbol. Thus the meaning of the figure 2 is the number two, the meaning of the formula $(x+y)^2=x^2+2xy+y^2$ is the law that formula represents, and so on indefinitely. The experiences which we undergo possess besides their presented content a represented content, and this represented content bears toward them the relation of meaning. One of the cardinal problems of modern psychology is the determination of the psychical concomitants of this meaning. In accordance with the general nominalistic and associationalistic trend of experimental psychology, those who approach the question of meaning from this angle have usually considered that the meaning of an image is conveyed in consciousness by a group of such accompanying substantive states as images, sensations and feelings. They held, that is, that the meaning of "bear" read into a noise in the woods is "carried by a verbal image and an organic shudder," and that every experience is surrounded by a fringe of vaguer meaningful states. They would consider that the vehicle of the law of universal gravitation is a visual or auditory verbal image, together with certain organic and kinæsthetic sensations.

All this psychology of meaning suffers from the lack of an antecedent logical analysis. The logical situation best adapted to this analysis is that of the relation of a set of mathematical symbols to the theory they represent. The theory is obviously the meaning of the symbols, but it is only to the very slightest extent carried by the individual symbols themselves. Only the elementary constituents of the system, together with certain of the simpler general notions, are represented by special characters. The structural relations are signified, and must be signified, by the arrangement — that is, the structural relations of the symbolism on the paper. The essence of the conventional system of algebraic notation lies, not in the use of letters for numbers, not in the symbolizing of addition by + and of multiplication by ×, but in the agreement between the laws of the manipulation of the symbols and the laws of number. Symbolization is primarily the relation toward a system of entities of a similarly order system of arbitrary marks, and only in a derived sense the relation between a mark and the corresponding entity. The symbol is a symbol only within a symbolism. It is precisely as a symbolism that our verbal images, kinæsthetic sensations and other mental states convey a meaning. When the mathematician is developing a new theorem, his mental content may be inventoried as a verbal image or two, his sensation of the paper and pencil in front of him, and a few organic sensations. Somehow or other he puts these into an entirely extraneous correlation with the entities which he is examining. This strain behind the eyeballs acquires a temporary association with the unknown function for which he is seeking; that fragmentary visual image of a formula represents a mathematical law; and so on. In his trained mind, the symbolism of his states shapes itself into the desired conclusion, which he symbolizes anew in the conventional algebraic notation on the paper lying before him. No enumeration of his substantive states can ever disclose how the meaning of the conclusion and the premises is carried in his mind, for it is not these states themselves, but their arrangements, that are the vehicles of meaning.

This structural nature of the vehicle of meaning is intimately connected with our power to communicate with others. My sensation of red is something that as far as I know may be peculiarly mine. If there were a man who from his birth had seen red where I see green and green where I see red, it would be a matter of the utmost difficulty for me to detect his anomaly. He would learn the name "red" from hearing it applied to the things which appear red to me but green to him, so that his speech would not disclose his peculiarity. It is only by observing that green objects excite in him the expression of the emotions which we consider appropriate to red, or by some similar peculiarity in the associations of his experience of red and green objects, that the interchange of his red and green sensations could even be sus-

pected. If the interchange were his sole peculiarity, he would always consider himself, and be considered by others, in the light of a normal human being. Accordingly, we have no reason to believe that the sensory qualities or sense-data of normal human beings agree with our own sensory qualities and sense-data, and there is no way of conveying these qualities and data by language. On the other hand, language is the vehicle of meaning and of nothing else. This alone is enough to prove that the meanings do not reside in any special data or qualities in our minds. What language does is to order the mind of the hearer or reader in a manner similar to that of the speaker or writer. In reading a story we pass through a sequence of mental states which has been designed for us by the author, though our individual states are beyond his knowledge. When he uses the word "green," we interpret it in our own way, but we put it in the same sort of relational context — complementary color of red, intermediate between yellow and blue, etc.— as that which it occupies in his mind. It, therefore, follows that this relational context, which is all that language can convey, is identically the meaning conveyed by language.

The situation when we hear a noise in the bushes and interpret it as "bear" can now be analyzed. The meaning is not carried in the first instance by the verbal image and the shudder. It is true that there is a possible state of consciousness in which the rustle in the bushes, the verbal image, and the shudder are all that is present, but at this stage meaning has not yet appeared. Meaning first appears when we think, not "bear," but "That's a bear." In this case, the rustle in the bushes stands for "that," the shudder or verbal image for "bear" and the juxtaposition of the shudder or image with the sound impression for the relation expressed in the sentence. The meaning of "bear" is derived from the meaning of the sentence. In other words, the meaning of the sound in the bushes resides, not in its correlates, but in its correlation. (See THOUGHT). Consult James, W., 'Principles of Psychology' (New York 1899); Stout, G. F., 'Manual of Psychology' (London 1913); Titchener, E. B., 'Experimental Psychology of the Thought Processes' (New York 1909).

NORBERT WIENER.

MEANS, mēnz, **David MacGregor**, American lawyer and author: b. Groton, Mass., 1 May 1847. He was graduated from Yale in 1868, studied theology at Andover and New Haven, was professor of economics in Middlebury (Vt.) College in 1877–80, and in 1881 was admitted to the bar and entered the practice of law. He contributed to periodicals, and wrote 'The Boss' (1894); 'Industrial Freedom' (1897); 'The Methods of Taxation' (1909).

MEANS GRASS. See GRASSES IN THE UNITED STATES.

MEANTONE, or MESOTONIC TEMPERAMENT, *in music,* the system or principle of tuning voices or instruments in vogue up to the middle of the 19th century, when it was superseded by the system of equal or even temperament. In the meantone temperament, tuning was based on the use of a standard whole step or mean tone, which is an interval between a greater and a less major second. See MODE; WELL-TEMPERED CLAVIER.

MEARES, mērz, **John,** English navigator: b. England, 1756; d. London, 1809. He entered upon a seafaring life at an early age and in 1771 he entered the navy and served in the war with the French until peace was declared in 1783, when he became a captain in the merchant service. In 1786 he explored the coast of Alaska and made in 1789 a second tour of exploration on the discoveries of which the British government based its claim to the possession of British Columbia and Oregon. Three ships sent by him to Nootka Sound in 1789 were captured by the Spaniards and this act caused England to fit out an expedition in the following year, upon which reparation was made by Spain. He was the author of 'Voyages in the Years 1788–89, from China to the Northwest Coast of America' (1790).

MEARIM RIVER, Brazil, rises in the Sierra do Negro, and after a northerly course of about 360 miles in the state of Maranhão flows into the Bay of São Marcos near the city of Maranhão. It has numerous affluents and is navigable, but the sudden tidal bores are dangerous.

MEARS, Helen Farnsworth, American sculptor: b. Oshkosh, Wis., 1878; d. 17 Feb. 1916. Her early years were passed in Oshkosh, Wis., where she began her art work as a child by carving a life-size portrait of her sister from a block of solid plaster. She studied under Saint-Gaudens, who recommended her as one of the strongest pupils he ever had when he sent her to Frederick Macmonnies in Paris. She was particularly known for her portrait busts. Her memorial statue to Frances E. Willard in the capitol at Washington (1905) was the first statue of a woman by a woman placed in that building. In 1911 her design was accepted for a statue for the new Wisconsin State house. Before that she had done much work of note, including the MacDowell basreliefs, familiar to visitors at the Metropolitan Museum, New York, and at the MacDowell Club; a 'Fountain of Life,' which won a prize at the Saint Louis exposition. Other works are the portrait relief of Augustus Saint-Gaudens and the portrait busts of George Rogers Clark and William L. G. Morton, M.D., in the Smithsonian Institution, Washington.

MEARS, James Ewing, American surgeon: b. Indianapolis, Ind., 1838. He was graduated at Trinity College, Conn., in 1864, and at Jefferson Medical College, Philadelphia, in 1865. He served in the Civil War and in 1865 established his practice in Philadelphia. He held the chair of anatomy and surgery at the Pennsylvania College of Dental Surgery from 1870 to 1898 and for many years was surgeon-in-chief of the Pennsylvania National Guard. He published 'Practical Surgery' (1878; 2d ed., 1885), and numerous contributions to surgical journals.

MEASLES (also called RUBEOLA and MORBILLI), a highly contagious eruptive disease, frequently epidemic, and sometimes dangerous because of its debilitating effects and tendency to end in inflammation of mucous membranes, such as pneumonia and enteritis. So-called black or malignant measles, occurring mostly in persons

of very poor health, is usually fatal. Where frequently epidemic it is less likely to be severe, and where it attacks a community for the first time it has a high mortality. For instance, it was taken to the Fiji Islands by a British ship from Australia and swept away 40,000 out of 150,000 inhabitants. Although measles is a disease of childhood, adults are not exempt from it. As a rule it attacks an individual but once. The contagious principle exists in the breath and in exhalations from the skin, the tears, the nasal and bronchial secretions and the excretions. Clothing which has been in an infected atmosphere is liable to spread the disease. How long the contagium remains in infected articles is not known. The disease may be divided into four stages, beginning with the stage of incubation, or the interval (varying from 7 to 21 days) between the date of infection and the outbreak of symptoms, that is, the stage of invasion. The symptoms are chilliness, fever, pain in head, back and limbs, bloodshot eyes, with intolerance of light, running of the eyes and nose, sneezing and a troublesome cough. About the fourth day an eruption or rash appears (stage of eruption), first in the throat, then upon the face, trunk and extremities, as minute pinkish red spots, which coalesce into blotches more or less crescentic in shape, raised above the surface of the skin. The eruption usually last about three or four days. Gradually disappearing (stage of decline), fever and catarrhal symptoms abate, and appetite returns. The cough may remain for days. The patient should be kept in a warm, well-ventilated and fairly lighted room, should be given easily digested food and plenty of water. Treatment should also regulate the bowels with saline medicines, and allay the severity of the cough with simple remedies. Severe symptoms require the attendance of the physician. Complications may ensue in the shape of chronic inflammation of the tonsils, of laryngitis, of chronic Bright's disease and of otitis; but the most serious complication is that of bronchopneumonia, which occurs in about 25 per cent of cases of measles. Measles is contagious until the eruption has disappeared and all dead particles of skin have come away of themselves or have been washed off by tepid baths.

MEASURE, a definite unit of capacity or extent, fixed by law or custom, by which relative sizes and capacities are ascertained and expressed; as, a yard, a measure of length; a gallon, a measure of capacity; a square foot, a measure of area; a cubic foot, a measure of volume, etc. See WEIGHTS AND MEASURES.

Lineal Measure.— The measure of lines or distances; the standard unit of lineal measure in the United States is the yard. The system is based on the law of nature that the force of gravity is constant at the same point of the earth's surface, and, consequently, that the length of a pendulum which oscillates a certain number of times in a given period is also constant.

Unit of Measure.—A given quantity, used as a standard of comparison in measuring a quantity of the same kind. Every kind of quantity has its own unit of measure, and under different circumstances the same kind of quantity may have different units of measure.

Line of Measures.— The line of intersection of the primitive plane, with a plane passing through the axis of the primitive circle and the axis of the circle to be projected.

Measure of Angles.— The right angle being taken as the angular unit, its subdivisions are degrees, minutes and seconds. The right angle contains 90 degrees, the degree 60 minutes and the minutes 60 seconds. All smaller fractions are expressed decimally in terms of the second.

Measure of Magnification.— The measure of magnification, or magnifving power of any optical instrument, is the ratio of the magnitude of the image to the magnitude of the object, or, more precisely, the ratio of the apparent diameter of the image to that of the object.

Measure of a Ratio.— Its logarithm, in any system of logarithms, or the exponent of the power to which the ratio is equal, the exponent of some given ratio being assumed as unity.

In Music.— The quantity of notes which are placed in the bar, and which is generally called the time, of which there are but two kinds, namely, common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time which are marked $\frac{2}{2}$, $\frac{4}{4}$, $\frac{8}{8}$. Triple time is marked $\frac{3}{2}$, $\frac{3}{4}$, $\frac{3}{8}$, $\frac{3}{16}$, $\frac{3}{32}$.

MEASURE FOR MEASURE is the most characteristic of the group of so-called «dark comedies» produced in Shakespeare's middle period. Modern critics are agreed that 'Measure for Measure,' first printed in the 1623 folio, must have been composed about 1603; and the critics' opinion, based almost solely upon evidence of style, can now be confidently supported by a piece of external evidence lately redeemed from suspicion of forgery; namely, a memorandum in the accounts of the royal Revels Office which records that 'Measure for Measure' by «Shaxberd» was performed before King James by His Majesty's Players on Saint Stephen's night, 26 Dec. 1604. Few of Shakespeare's greater works are so unequal in quality or have evoked such diverse opinions. In certain details of form it is one of the most careless of the plays. The subject is intrinsically displeasing to modern taste (though vastly more refined here than in the original story); several of the characters (notably the goody-goody Duke and the unmanly Claudio) repel the reader; and many of the devices of plot, especially in the perfunctory closing act, are frank clap-trap. On the other hand, Shakespeare's moral beauty and dramatic brilliance are nowhere more loftily exemplified than in the best scenes — those, namely, in which Isabella's gracious figure appears. In a word, this play marks, and is the first to mark, the complete ascendency of spirit over form so notable in the last plays of 8 or 10 years later; it is the earliest to make conspicuous Shakespeare's utter heedlessness of rules and details and his uncanny splendor in silhouetting moral beauty against an all-encompassing mundane vileness. «This is a play as full of genius as it is of wisdom,» says Hazlitt, and Masefield in a notable appreciation calls it «one of the greatest works of the greatest English mind.» There is no evidence that 'Measure for Measure' has ever been much performed (except in Germany), though an injudicious attempt to blend it with 'Much Ado about Nothing' ('The

Law against Lovers,' by Sir William Davenant) was popular in the latter half of the 17th century. Yet two English revivals in 1907 and 1908 (one by the company of Oscar Ashe and Lily Brayton, the other by the Oxford University Dramatic Society, supported by actresses) proved marvelously impressive. They fully established both the serene morality of the piece when honestly presented and also the genuine effectiveness of the usually slighted comic scenes. Shakespeare's source was a long, flashy play in two parts (10 acts), 'Promos and Cassandra,' by George Whetstone (1578), which in its turn is derived from an Italian tale in Cinthio's 'Hecatommithi.'

TUCKER BROOKE.

MEASUREMENT OF SHIPS FOR TONNAGE, or BUILDER'S MEASUREMENT, a method of computing the tonnage of merchant vessels, in use among shipbuilders. Its results are nearly double the legal or registered tonnage. See TONNAGE.

MEASUREMENT OF STREAMS. One of the many useful classes of work conducted by the United States Geological Survey; the measurement of streams having an industrial value. Wherever water is likely to be employed for power or irrigation the amount available is ascertained by that bureau. The volume varies greatly from season to season, and sometimes from year to year. Any calculation by the manufacturer or farmer which does not take this variability into account would be misleading. Moreover, streams differ among themselves in straightness, the character of their beds and other particulars. Accurate measurement is still further complicated by the lack of uniformity in the movement in a given cross section. What might be true for one point would not be true for other points to the right or left of it, or at a higher or lower level.

The first step in the work is to place a gauge in a permanent position, and employ a suitable observer to read it every day. The gauge is graduated to feet and tenths. Usually it is upright. It may be laid over slanting, however. In that case, the spacing is widened, so as to give accurate results. One observation a day is made, and its results transmitted on a postal card to Washington. The second factor in the hydrographer's computation is the velocity of the stream, at different heights. To ascertain this only occasional measurements are necessary. These are made by experts, but with their aid it is possible to prepare tables showing the total discharge of that particular stream for all the different gauge readings. After such tabulation is effected the maximum, minimum and mean flow for any month in the year can be told at a glance.

Velocity is ascertained with a meter lowered into the water. The instrument contains a tiny screw propeller, the number of whose rotations under the pressure of the fluid is automatically registered. Many types of meter have been devised. The kind which the bureau prefers has an electric wire leading up to a buzzer in the operator's pocket. There a click or other audible sound indicates to him the speed of the screw. He counts the number of revolutions for some definite period, usually fifty seconds, records it in his notebook and moves along a short distance to make another observation.

If measurements are made at various depths along a vertical line, the results will not be equal. For this reason hydrographers have studied to find, if possible, a level that would fairly represent the average velocity for any vertical. In this way they can simplify the labor. It has been found that such an average can be secured by taking the speed at a depth of from six-tenths to two-thirds of the way down from the surface. To obtain a correct idea for the whole stream, though, these tests must be made at a number of places between one shore and the other. No measurement at a single point can be trusted to be fairly representative.

MEASURING WORM, INCH WORM, LOOPER, or SPAN-WORM, a caterpillar of any species of moth of the superfamily *Geometridæ.* The creatures are characterized by the presence of only two pairs of abdominal legs, one upon the ninth, the other upon the anal segment, and by their peculiar form of locomotion, the rear of the body being brought forward toward the front legs and the body forming a loop at right angles to the surface upon which the insects walk. Nearly all the numerous species feed upon foliage, a few upon seeds in which they bore. Some are considered serious pests in orchards and upon shade trees; for instance, the canker worms (see APPLE, *Insects*), the lime-tree moth (*Hybernia tiliaria*), and *Cymatophora pampinaria,* which sometimes devastates cranberry plantations. The duration of the larva state is variable; from their great voracity they grow rapidly and shed their skins several times before attaining maturity; when arrived at this state they seek some sheltered spot in which to undergo the change to pupa form, some clinging to the lower surfaces of leaves while others bury themselves in the earth, those remaining in the air suspending themselves in various ways by means of their silky secretions, others enclosing themselves in silky cocoons. Those burying themselves also build cocoons around them, but many of these only line their cavity with enough silken threads to keep the wall from falling in. One of the European species, *Fidonia Plumistaria,* is distinguished by curious feathery antennæ. The caterpillars of this species are very injurious to fruit trees, especially those of the European magpie moth, *Abraxas grossulariata,* which inhabit gooseberry bushes, often entirely stripping them of their foliage. The caterpillar of the American canker worm moth, *A. nisopteryx pometaria,* also belongs to this species of worm, the eggs being hatched in the spring; when grown they are about an inch long and of various colors, and are also dangerous to orchards. Most of the species, however, are of small economic importance. The caterpillars usually resemble twigs when at rest, their protective coloring and their attitudes serving to deceive their enemies. The caterpillars of a few species of the owlet moths, family *Noctuidæ,* walk in this way, since they also lack prolegs upon the middle abdominal segments. They are not, however, considered true measuring worms. The geometrid moths are usually of small size and inconspicuous but delicate and beautiful coloration. Consult Holland, 'The Moth Book' (New York 1903); and Packard's 'Monograph of the Geometridæ,' with colored plates, published by the United States Geological Survey (Washing-

ton 1876); 'Cambridge Natural History' (Vol. VI, London 1899); Comstock, J. H. and A. B., 'Manual for the Study of Insects' (8th ed., Ithaca, N. Y., 1909).

MEAT, Inspection of. The purpose of meat inspection is to eliminate diseased or otherwise bad meat from the general food supply, to see that the preparation of the meats and products passed for human consumption is cleanly; to guard against the use of harmful dyes, preservatives, chemicals or other deleterious ingredients; and to prevent the use of false or misleading names or statements on labels, in short to protect the rights and health of the consumers of meat and meat food products to the fullest extent possible. In the United States the meat inspection service is administered through the Bureau of Animal Industry of the Department of Agriculture.

In 1890, 1891 and 1895 Congress passed legislation empowering the Secretary of Agriculture to take measures to ensure a wholesome quality in all meats in the export trade and to protect the home consumer against diseased or unsound meat. Under the provisions of these laws great dependence was placed on the ante-mortem examination of all animals for export or for interstate commerce, but the provisions for the post-mortem examination of carcasses were inadequate. The great defect of this early legislation was that it did not make a ruling for the disposal of carcasses and animal products which upon examination had been found unfit for use as food. During the war with Spain in 1898 the prevalence of sickness among the enlisted men drew the attention of the public to the laws relating to meat inspection. A report was made that "embalmed beef" was being supplied the army by the great packing-houses. Investigation failed to establish this, however, and the public was apathetic in the matter until the publication of Sinclair's 'The Jungle,' in 1906, in which it was charged that the condition of the slaughter-houses in Chicago, the packing centre of the country, was filthy and that the menace to the public health as a result was very great. The nation was aroused and the Pure Food and Drugs Act of 30 June 1906 was enacted after the investigations of government and other committees had disclosed the astonishing fact that a large part of the meat placed upon the market was far from clean; and that, in fact, the methods of handling and preparing these food products were dangerous to health.

Federal inspection is now maintained under the act of 30 June 1906, and supplementary legislation in the Tariff Act of 3 Oct. 1913. The food animals to which the act refers are cattle, sheep, swine and goats. The slaughtering, packing, rendering and meat-preparing establishments to which it applies are those which sell or ship their products in whole or in part in interstate or foreign commerce. The Meat-Inspection Law does not apply to those establishments the meats and products of which are neither sold nor shipped outside the confines of the State in which the plant is operated. A qualified exemption from inspection is granted under the law to retail dealers supplying their customers, and a similar exemption is granted in the case of meat from farm-slaughtered animals. The legislation of 1913 provided for the inspection of imported meats and products.

The requirements as to sanitation in the establishments that operate under inspection occupy an important place in the meat-inspection regulations. Prior to 1906 the Secretary of Agriculture was without authority to fix and enforce such requirements but when it was conferred in the act of that year the department proceeded to enforce sanitation in all establishments operated under Federal inspection. The first step taken was to require strict cleanliness as regards the rooms and equipment and in respect to the conduct of operations and the handling of products, and the second was to adopt rules governing plant and equipment construction.

In new plants the use of non-absorbent materials was demanded and natural light supplanted artificial as far as possible. Improved drainage, plumbing and sanitation were demanded as also proper facilities for the conduct of inspection.

Each establishment is given an official number, which must appear in every instance as a part of the mark of inspection, that is, the mark or statement used on meats and products or the containers thereof, to show that they have been inspected and passed under the Federal regulations.

Ante-Mortem Inspection.— Under the Federal system not less than two examinations are made of the animals slaughtered in official establishments. The first is the ante-mortem inspection or examination of the live animal, the second the post-mortem examination of the carcass and the various organs and parts at the time of slaughter. The post-mortem is the more valuable of the two inspections, but both are necessary if it is to be determined with certainty in every instance that the flesh of the animal is sound, wholesome and fit for human food. The ante-mortem examination is performed in the pens and alleys of the establishments, except that at most of the large slaughtering centres it is found more convenient to conduct it in the public stockyards. The animals are carefully observed for evidence of disease or abnormal condition while at rest in the pens or as they move from the scales after weighing. If any of a lot show symptoms, then the entire lot is subjected to further and individual inspection. If the animals are swine and the symptoms indicate cholera, they are driven to a special pen for further examination and in certain cases to ascertain their temperatures and to make a record of the same. Other diseases or conditions in which the question of temperature is important are Texas fever, anthrax, blackleg, pneumonia, septicemia and severe injuries. When its appearance is such as to lead the inspector to suspect that an animal is affected with a disease or condition that may cause its condemnation in whole or in part on the post-mortem inspection, it is marked for identification by means of a serially numbered metal tag bearing the phrase "U. S. Suspect" affixed to the ear. A record of the case is made and sent to the inspector who is to conduct the post-mortem examination. Such suspect animals are kept apart and slaughtered separately from those which were passed on the ante-mortem inspection.

Animals which show symptoms of rabies, tetanus, milk fever or railroad sickness, and hogs which are plainly sick with hog cholera,

INSPECTION OF MEAT

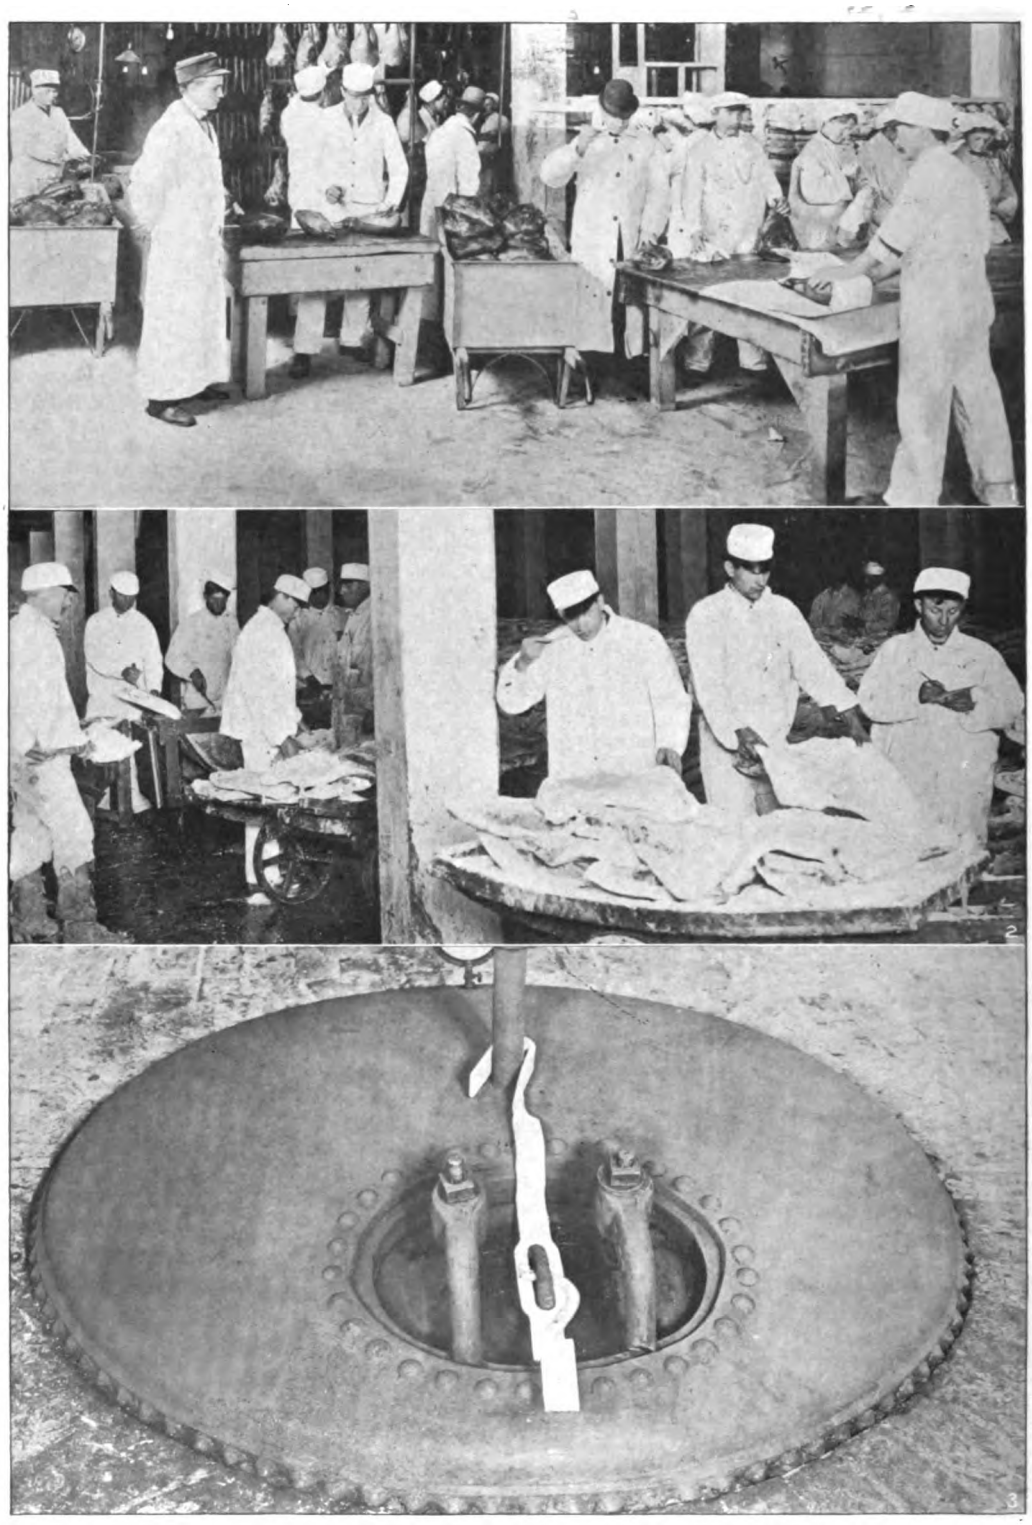
INSPECTION OF MEAT



1 Products Inspection

2 Dry Salt Curing Cellar

3 Sealed Rendering Tank

are condemned on the ante-mortem inspection. Such animals are marked by means of a serially numbered "U. S. Condemned" metal tag affixed to the ear. Animals so tagged may not be taken into the slaughter-room, but must be destroyed and disposed of as required for condemned carcasses to prevent their use for food. Animals found dead or in a dying condition on the premises are condemned and disposed of in the same manner.

Post-Mortem Inspection.— The post-mortem inspection is made at the time of slaughter and includes a careful examination of the carcass and all its parts. Where the number of animals dressed per hour does not exceed a certain general limit, one inspector, constantly present, performs all the inspections. Where the number of inspections per hour exceeds certain general limits, the inspectors are increased accordingly and the work so arranged and coordinated that each inspector gives his entire attention to some particular part of it. Thus the work is in a sense specialized with the result that a high individual and collective proficiency is attained and efficient inspection assured regardless of the rate of slaughter. An important requirement in the conduct of this inspection is that the identity of the carcass and of each of its severed parts be carefully maintained until the inspection is completed, so that if there is a disease in any one organ or part, all the other parts and the carcass may be brought together for additional examination. Facilities for maintaining such identity are provided in the slaughter departments.

The different steps of the post-mortem inspection are: Head inspection, viscera inspectin, carcass inspection, final inspection, disposition and marking. In cattle heads the different pairs of lymphatic glands are cut into and examined, particularly for tuberculosis. The tongue is also examined. The presence in the flesh of cattle of a certain cyst capable of producing tapeworm in man can usually be determined by examining the inner and outer cheek muscles. A careful survey is made of the head as a whole for actinomycosis, deformities, etc. In the heads of swine certain lymphatic glands, which are favorite seats of tuberculosis, are incised and examined.

In the inspection of viscera, the several organs as they are removed from the carcass are placed before the inspector, on a table, in pans or other suitable metal receptacles for examination. Facilities for promptly cleansing such equipment in the event of contamination through the contact of diseased viscera are at hand. The various organs and parts are carefully viewed and certain of them cut into while others are subjected to manual as well as visual examination.

The carcass inspection embraces a careful viewing of all surfaces and parts of the carcass, with particular attention given to the condition of the serous membranes of the thoracic and abdominal cavities. Further, certain parts which more frequently than others are seats of disease are subjected to a manual as well as a visual examination. The head, viscera and carcass examinations together constitute the regular post-mortem inspection. The animals found to be free from disease or any doubtful condition are marked "Inspected and Passed," while those in which any disease or doubtful condition is found are retained for the final inspection, which takes place in a special room, where another inspector with special facilities at his command subjects them to a searching examination. Since the animals held for final inspection are tagged or retained for cause, only veterinary inspectors who have become skilled through training and experience in the work are detailed to make such examinations and to determine the final dispositions.

As soon as the several examinations have been made and the dispositions determined, there remain two important acts to complete the post-mortem inspection. They are the marking of each carcass to show plainly to every beholder the disposition made of it and to see that those carcasses and parts which are condemned are disposed of as required by the regulations to prevent the sale or use of the same as human food. In regard to the disposal of condemned articles it is required that every condemned carcass, part of carcass, meat or product be plainly marked to show that it is condemned, and that parts or products too small to be so marked be placed in appropriately marked containers. All condemned articles remain in the custody of an inspector from the time they are condemned until properly disposed of, and if not disposed of on the day they are condemned they are locked in the "U. S. Condemned" compartments, the locks of which are selected and supplied by the department and the keys of which remain in the custody of the inspector. The required destruction or denaturing of the condemned articles must be done in the presence of an inspector, who renders a report on the transaction. The usual method is to convert condemned parts into grease and fertilizer by rendering in a steam-pressure tank.

Inspection of Products.— Because meat or other edible portion of an animal which was entirely sound at the time of slaughter may become unsound or contaminated through improper care or handling, and because healthful products may be made unwholesome through adulteration or the addition of deleterious ingredients, and for the purpose of protecting the purchaser against false and misleading labels, a proper measure of control of the various operations of processing, preparing and labeling meats and products becomes necessary and such control is exercised by the Federal Inspection Service. All meats and products, therefore, notwithstanding that they were previously inspected and passed, are reinspected as often as may be necessary to ascertain whether they remain sound and wholesome. The materials added to products are examined to see that the regulations relating to prohibited ingredients are absorbed and that the requirements as to correctness of labeling are complied with. Samples of the different kinds of products are taken and referred to the meat inspection laboratories for chemical or other technical examination. If upon reinspection of an article it is found to have become unfit for food from any cause, the original inspection mark or label thereon is removed or defaced and the article condemned.

Imported Meats and Meat Food Products. — The regulations governing the admission of meat and meat food products from foreign countries require that every importation shall

be accompanied by a certificate signed by an official of the national government of the country of origin; stating that the animals from which the meat or meat food product was derived received an ante-mortem and a post-mortem veterinary inspection, and that at the time of slaughter the meats and products were sound, healthful, wholesome and otherwise fit for human food. Further, that they had not been treated with and contain no ingredient prohibited by the regulations of the United States Department of Agriculture. Meat or meat food product not accompanied by the required certificate is refused entry, and that from a country which does not maintain a system of meat inspection satisfactory to the Secretary of Agriculture is also refused.

Upon arrival every consignment of imported meat or product is checked with the foreign inspection certificate and is subjected to a thorough physical examination, and in most cases samples thereof undergo a laboratory examination. The meat or product is then admitted, refused entry or condemned according to the findings.

Statistics.— The Federal system of meat inspection reaches about 60 per cent of the animals slaughtered in the United States and all imported meats. This leaves approximately 40 per cent of the domestic meat supply outside of Federal control. Much of the latter, it is known, receives no adequate inspection. The number of establishments at which inspection is regularly maintained varies somewhat; however, for several years it has approximated 850. The total of cattle, sheep, swine and goats given both the ante-mortem and post-mortem inspections is in excess of an average of 58,500,000 per year. The average number of whole carcasses of such animals condemned during that period was more than 262,000 per year, while the number of parts of carcasses condemned per year was very much greater. The records of the inspection and reinspections of meats and products subsequent to the slaughter inspection show totals running into billions of pounds annually, while the amount condemned on reinspection on account of having become tainted, rancid or otherwise unfit for human food approximates 18,000,000 pounds per year. In 1915 Congress appropriated $3,375,000 for meat inspection. Thus the cost was less than six cents for each of the 58,500,000 animals slaughtered. Consult Ditewig, George, 'The Meat-Inspection Service of the United States Department of Agriculture' (in the 'Yearbook for 1916' of the Department, Washington 1917).

MEAT, Market Classes and Grades.— The kinds of meat considered in this article are beef, veal, pork, mutton and lamb. Each kind is classified according to certain general distinctions, such as the sex of the carcass or the part from which the cut is taken. The classes, in turn, are graded with respect to quality, covering, weight or other factors which determine the value of the individual cut or carcass.

Beef.

Beef products are marketed either chilled, frozen or cured. Fresh chilled and fresh frozen beef include the carcasses, quarters and the various commercial cuts of beef. Cured beef includes pickled or corned beef, dried or smoked beef and canned beef. About one-half of the fresh beef sold on wholesale markets consists of carcass beef. (The carcass is split into halves or sides; each side in turn is divided into fore and hind quarters). The rest is sold in the form of commercial cuts such as ribs, loins, rounds, chucks, plates, briskets, flanks, shanks and suet. "Block" beef refers to all side beef which is sufficiently thick fleshed and fat to be sold readily over the butcher's block. "Cutters" are the carcasses of thinly fleshed or poorly finished cattle from which only certain commercial cuts such as loins and ribs are suitable for block purposes, the other portions being adapted only to conversion into boneless cuts and cured meat products. "Canners" are those carcasses of beef no portion of which is suitable for block purposes. Such carcasses generally are divided into smaller cuts, such as boneless fresh meats, sausage trimmings, canned and cured beef products.

Classes and Grades of Carcass Beef.— The classes of carcass beef are steers, heifers, cows, bulls and stags. This classification is based not merely upon difference in sex, but also upon the general uses to which the different classes are adapted. Steer carcasses are identified by the cod fat and generally by their full, fleshy rounds and loins, heavier, coarser bones and short, thick necks as compared with cows. They show more quality and finish and are sold as carcass beef more extensively than any other class. The grades are prime, choice, good, medium and common. Heifer carcasses are distinguished from steers by the udder which also should show no evidence of lactation or a development of the sinuses usual in the udders of cows. As a rule they have smaller bones, slightly more angular rumps, less development of lean flesh and are of an average lighter weight than steers. The grades are prime, choice, good, medium and common. The angular form, long neck, hard white bones, more cavernous interior and lack of thickness of the flesh of the majority of cow carcasses make them easy to distinguish from other classes of beef. The vertebræ do not split as smoothly as in heifers or young steers. The flesh is seldom as well marbled by fat deposits between the muscle structure as in heifer or steer carcasses. A large percentage of the carcasses of this class are cutters and canners with a correspondingly smaller proportion suitable for "block beef." The grades are choice, good, medium, common and canners.

Dressed bulls are easily recognized by the short and thickly muscled, prominent neck, heavy shoulders, thick rounds, dark and coarse-grained flesh and the absence of cod fat. Rough conformation and hard bones are also common characteristics of bull sides. Many stags approach steers in form, quality and finish, while others are difficult to distinguish from bulls. "Yearlings" are carcasses of young steers and heifers with sufficient quality and finish to be used as block beef. "Butcher" cattle, as the term is applied to carcass beef, are those which are suited to the cheaper "butcher shop" trade. They include the medium and common grades of all classes of beef cattles. "Kosher" cattle are dressed beeves that have been slaughtered, inspected, cleansed and labeled in accordance with Jewish rites; "Kosher" being the Hebrew word for "clean."

They include all classes and grades of beef cattle. "Distillers" are steers, bulls and stags that have been fed on distillery wastes and have soft, "puffy," "washy" flesh together with the "high color" that is characteristic of cattle fattened on such feed.

Beef Cuts.— Beef cuts are sold both as "straight cuts" and as subdivisions thereof. The method of dividing carcasses into cuts differs, in the various cities and sections of the country. The straight cuts handled in Chicago markets are loins, ribs, rounds, chucks, plates, flanks and shanks. The standard grades of straight cuts are No. 1, No. 2 and No. 3, according to their weight, quality and thickness. Cuts that are too deficient in thickness and quality to be used on the butcher's block, and which consequently are made into boneless cuts, cured beef products, sausage, etc., are called "strippers."

Cured Beef Products.— The plates, flanks and rumps of all grades of cattle are, at times, used in making cured beef, and in the lower grades of beef the rounds and chucks are quite commonly cut up and cured before marketing. Barreled or corned beef is packed in brine. The standard barreled beef products are extra India mess beef, extra plate or extra family beef, regular plate or family beef, packet beef, common plate beef, rolled boneless beef, prime mess beef, extra mess beef, rump butt beef, mess chuck beef, beef hams and Scotch buttocks. Smoked or dried beef consists almost entirely of beef hams, made from the rounds which, after curing in sweet pickle, are dried and smoked. Canned beef is hermetically sealed in tins or glass jars, usually after curing and processing. It consists principally of chipped beef, beef loaf, corned beef and roast beef. Roast beef is not cured but is cooked and processed in about the same manner as corned beef products.

Factors in Grading Beef.— The grade to which a carcass, side or quarter belongs depends upon its form, thickness, finish, quality, soundness and weight. The factors that determine the grade of a wholesale cut of beef are its thickness, covering, quality and weight. By "form" is meant the shape or "build" of the side, its general outlines and the proportions of its different parts. Thickness of a carcass or cut refers to the amount and depth of lean flesh it carries. It is a factor of self-evident importance in selecting wholesale cuts. "Finish" refers to the amount and distribution of fat with reference to the covering of the carcass or cut, to the fat deposits around the muscle structure and to the quality of the flesh in so far as it depends upon the degree of fatness. Quality in beef is so closely associated with form, thickness and finish that the term often is used loosely to cover all three points. It refers more particularly to size, color and softness of bone, smoothness and grain of flesh, color and general appearance of the carcass or cut and an absence of coarseness in general. Soundness refers to freedom from disease and bruises, and from any other conditions which injure the appearance or keeping qualities of the meat. Weight is of importance in grading beef to the extent that the heavier carcasses generally are better in form, thickness, finish and quality than lighter ones; but weight has lost much of its former significance as a grade factor owing to the development of earlier maturing beef types, the increasing practice of finishing and marketing beef cattle as yearlings and two-year olds, and the growing tendency of the consumer to prefer steaks, roasts and other cuts from relatively lighter weight carcasses of good quality and finish.

Veal.

Calf carcasses weighing less than 300 pounds with comparatively light-colored, fine grained flesh are classed as veal, and the trade is essentially a fresh meat trade. In dressing calves the skin generally is left on in order to preserve the color and moisture of the flesh. The carcasses from heavy or yearling calves are skinned and split and are known as "split veal."

Carcass Veal.— The grade and value of a calf carcass depend upon its form, quality, finish and weight. The weights of dressed veal vary greatly with the season, being lightest in April and May and gradually becoming heavier until the next annual veal season. The grades of carcass veal, the extreme weights and the usual weights of each grade are as follows:

Grades	Extreme Weights	Weight of Bulk
Choice	80–120 lbs.	90–100 lbs.
Good	70–130 "	75–95 "
Medium	60–160 "	65–80 "
Light and Common	40–75 "	50–65 "
Heavy and Split	150–350 "	160–200 "

Veal Cuts.— Only 10 to 20 per cent of the supply of dressed calves are cut up in the wholesale trade, and this is done largely to supply a few retail markets with choice cuts and to take care of the Kosher trade which uses only the forequarters. The cuts usually made are saddles and racks, both of which grade choice, good, medium and common.

Pork Products.

Hog products may be described under two heads: dressed hogs and pork cuts.

Dressed Hogs.— The classification of hog carcasses is based on the uses to which they are adapted, or the products into which they may be converted. Smooth heavy or heavy loin hogs are prime smooth hogs, either barrows or good, clear (not seedy) sows, weighing 240 to 400 pounds dressed. Butcher or light loin hogs are composed of barrows and smooth, clear sows, weighing from 200 to 220 pounds dressed. Packing hogs include mixed hogs of all weights which are too coarse in quality, rough in shape or soft and uneven in finish to be suitable primarily for fresh pork products or smoked meats, and which therefore are packed principally in such forms as barreled and dry-salt pork. The grading of this class of hogs is based on weight, the grades being heavy, medium and light. Bacon hogs are those which are suitable primarily for sugar-cured breakfast bacon and "English" meats. The hams from this class of hogs are preferred by the trade to the heavier varieties. The grades are choice, good and common and are determined by the degree of quality and finish. "Shippers" are similar to butcher hogs in shape and quality but are lighter in weight and generally are not as highly finished, having only a moderate covering of fat and a comparatively small amount of leaf fat. Pigs are carcasses of light, young swine that are comparatively lean and light-colored in

flesh, with thin, soft skin, soft, red bones, weighing from 20 to 100 pounds.

Pork Cuts.— The various cuts made from dressed hogs may be divided into the following general classes: hams, sides, bellies, backs, loins, shoulders, butts, plates and miscellaneous. These products are referred to according to the manner in which they are handled, prepared or packed; viz., fresh pork cuts, dry-salt and bacon meats, barreled or plain-pickled pork, sweet-pickled meats, smoked meats, "English" meats and boiled meats. Fresh pork cuts are sold either chilled or frozen. The bulk of the uncured product is disposed of within a few days after slaughter, during which time it is chilled at temperatures slightly above the freezing point. Fresh pork cuts are taken more or less from all classes of hogs, but light loin hogs are used more extensively for fresh pork than any other class. The loin is the leading fresh pork cut. Tenderloins and spareribs also are used primarily as fresh cuts. Shoulders, plain and skinned, shoulder butts, hams, bellies, fat backs and raw leaf fat are sold fresh to a small extent.

Dry salt meats are domestic cuts made from heavy, fat packing and loin hogs, cured and shipped in coarse salt. They generally are pumped with a strong brine to hasten the cure and make it more certain. The cuts which are sold in this form are heavy sides, bellies, shoulders, fat backs, plates and jowls. Barreled or plain pickled pork is packed in plain salt brine in tight barrels, and is made largely from sides of packing and heavy loin hogs. It consists principally of mess, fat back and belly pork of various grades. A much smaller proportion of the pork supply is barreled than formerly. Sweet-pickled meats are cured in brine, to which sugar or molasses has been added to aid in curing, to improve the taste and to give the product a better color effect when smoked. Most of these products are smoked before they reach the consumer. The cuts which are quoted as sweet-pickled meats are hams, picnics, New York style and skinned shoulders, boneless butts and light bellies. This class of meats is cut principally from butcher hogs and from medium and light packing hogs. Hams and picnics from all classes of hogs generally are sweet-pickled. Smoked meats are pork products which have been cured in brine, sweet pickle or dry salt before smoking. "English" meats is a term applied to cuts that are dry-cured in English salt and saltpetre; borax being added when required by the foreign purchaser. They are primarily adapted to English trade, being given a milder cure than domestic meats. The leading cuts of this class are "English" bacon sides, long-cut hams, clear backs and bellies and square-cut shoulders. Boiled and cooked meats consist of boneless hams, picnic shoulders and loins which have been cured in sweet pickle and cooked by steam or in water. They sometimes are given a light smoke.

Hams are of two general kinds, short-cut and long-cut. The former are made from comparatively fat, plump hams, trimmed short and round at the butt, with the foot cut off generally above the hock joint. Long-cut hams are lean, long hams, with the butt left full and the foot taken off at the first joint below the hook. Sides include various grades and cuts of short ribs, short clears and "English" bacon sides. Short rib sides include regular short ribs, jobbing or rough short ribs, hard short ribs, extra short ribs or "extra ribs," and square cut or "English" short ribs. Short clear sides include regular short clear sides and extra short clear sides or "extra clears." "English" bacon sides, comprising both the side and shoulder, and in one instance the ham also, include Wiltshire, Cumberland, Dublin, long rib, long clear, Yorkshire and Staffordshire sides.

Bellies include dry-salt, sweet-pickle, breakfast bacon and English bellies. Backs include the short rib backs, short clear backs, short fat backs and long fat backs. Loins consisting of the back with the fat trimmed off are sold either as regular pork loins or as loin rolls.

The standard grades of shoulders are rough, regular, picnic, New York style, skinned, square, New Orleans style and boneless rolled shoulders. Shoulder butts are cut from muscular parts of the ends of tops of the shoulders. Jowl butts are made from the jowl (neck and face). The various grades of shoulder butts are boneless Boston style, Milwaukee style, Buffalo style, New York style, picnic, dry-salt and square-cut butts. Plates are made from the heavy fat which covers the ends or tops of the shoulders. They are known to the trade as regular plates and clear plates. The so-called back plates are made from fat backs.

Miscellaneous Cuts.— The miscellaneous cuts of pork may be grouped as mess pork, belly pork, shoulder pork, spareribs and trimmings. Mess pork includes regular mess pork, light mess pork, prime mess pork, extra clear pork and loin clear pork. Belly pork includes regular belly pork, brisket pork and rib and lean belly pork. Back pork includes regular back pork (short cut mess or family back pork), clear back pork, fat back and short cut clear pork and ham butt pork (loin end or rump pork).

Shoulder pork consists of extra prime pork and Boston style butt pork. Bean pork or clear-butt pork is made from the jowl. Spareribs are termed "full-sheet," "half-sheet" and "backbone" spare ribs. Neck bones including the shoulder ribs come within this general class. Trimmings are of two grades: special lean or "A" and regular or "B" grade. The standard grades of lard are kettle rendered, neutral, prime steam, refined and compound lard. They differ as to the kinds of fats from which they are made, methods of rendering, color, flavor and grain. Lard compounds are composed of a mixture of pork fats with other animal or vegetable fats or oils. Lard substitutes or vegetable shortening contain no pork fats or oils, being composed wholly of vegetable fats, or of vegetable fats with beef fats added.

Mutton and Lamb.

Mutton and lamb are sold almost entirely in a fresh or frozen state. The bulk of supplies, except those frozen, are disposed of within a week or 10 days after slaughter. Approximately two-thirds to three-fourths of the wholesale supply of mutton and lamb consists of lamb.

Classes and Grades of Carcass Mutton and Lamb.— The classes of dressed sheep and lamb are wethers, ewes, bucks, yearlings and lambs. This classification is based on differences

in sex and degree of maturity. The grades of carcasses in the different classes are designated by the terms choice, good, medium, common and culls or canners. The grade and value of a lamb or mutton carcass depend chiefly upon its form, quality, covering and weight. The method of grading is the same in principle as the grading of beef.

Wether carcasses are distinguished from ewes by the cod fat; from bucks by their smaller necks and shoulders and finer quality, and from yearlings and wether lambs by "round" joints on the fore-legs. The "bag" (udder) and a comparatively large "bung" (pelvic cavity) are characteristic of ewe carcasses. They also are distinguished from wethers as a rule by their more angular forms, longer necks, smaller bones and less abundant flesh, especially over the loin, back and ribs. Bucks constitute only a very small percentage of the dressed mutton supply. They may be identified by their thick, heavy necks, shoulders and briskets, large bones, coarse, dark colored flesh and fat and thick, oily "skin" or "fell." Yearlings may be defined as carcasses that show by their general development and by the "break-joint" that they are not mature sheep, but are too old and generally too heavy to be classed as lambs. Carcasses of sheep that are more immature than yearlings are classed as lambs. Like yearlings, they have the fore-legs removed at the "break-joint" or "lamb-joint," which has a tooth-shaped surface.

Mutton Cuts.—About one-half the supply of dressed wethers, ewes and yearlings in large wholesale markets is sold as mutton cuts. The two major cuts are known as racks or fores and saddles or hinds. The racks are made into stews and short racks. The short rack includes two-fifths and the stew three-fifths the weight of the rack. The cuts derived from the saddle are the leg and the loin.

The grades of mutton cuts are choice, good, medium and common. Cuts of these grades correspond in shape, quality, covering and relative weight to the same grades of carcass mutton.

Lamb Cuts.— Lambs are more largely sold in the carcass than sheep. It is estimated that one-fourth to one-third of the wholesale lamb trade consists of cuts. The methods of cutting and the proportions of the various cuts are identical with those of mutton. The grading of lamb cuts also is similar in general to that of mutton cuts.

Retail Cuts of Meat.

Retail cuts of meat are classified according to several different standards. Some are satisfied to group them simply as tender and tough meats. Others grade the different cuts as first, second, third and fourth quality, according to their degree of general excellence. Likewise, taking the market price as a basis, the classes may be designated as high, medium or low priced, as the case may be. The location of the cuts in the carcass is another means of fixing their names in mind, learning them in consecutive order from neck to hind shank. Aside from the quality consideration involved in selecting retail cuts of meats, the selections are influenced chiefly by the following:

1. The cuts which are best suited to one's cooking facilities.
2. The time and trouble which one desires to take in preparing the meats for the table.
3. The amount of meat required for the meal or meals in question.

Classifying retail cuts according to the methods of preparation, we have the following general division:

1. Frying or sauteing.
2. Roasting.
3. Boiling.
4. Stewing.
5. Soups and broth.

The purpose for which each retail cut from beef, veal, lamb and mutton, and pork may be used is indicated below. The number of pounds usually found in such cuts is shown by the figures opposite the cuts named.

	Weight — Pounds
Frying:	
Porterhouse steak	1½ to 3
Club steak	1 to 2
Sirloin steak	2 to 5
Round steak	2 to 5
Top round steak	1½ to 3
Chuck steak	2 to 4
Flank steak	1 to 2
Veal steak	1 to 2
Pork steak	1 to 1½
Mutton chops	½ to ¾
Lamb chops	½ to ¾
Veal chops	½ to ¾
Veal cutlets	½ to 1½
Pork chops	½ to ¾
Salt pork	1 to 3
Fancy breakfast bacon	½ to ¾
Medium to fat bacon	½ to ¾
Roasting:	
Prime ribs of beef (first cut)	4 to 12
Prime ribs of beef (last cut)	4 to 12
Shoulder block roast	4 to 8
Chuck rib roast	4 to 10
Beef rump	4 to 12
Beef tenderloin (fillet)	2 to 6
Leg of mutton	6 to 9
Loin of mutton	3 to 6
Shoulder of mutton	3 to 6
Leg of lamb	3½ to 6
Loin of lamb	2 to 4
Shoulder of lamb	3 to 4
Crown lamb roast	3½ to 6
Hindquarter (spring lamb)	5 to 8
Forequarter (spring lamb)	5 to 8
Pork loin	2 to 8
Leg of pork	3 to 12
Ham (smoked)	3 to 12
Pork tenderloin	½ to ¾
Pork shoulder	2 to 5
Spare ribs	½ to 1
Veal loin	3 to 6
Veal leg (fillet)	3 to 12
Veal shoulder	3 to 8
Boiling:	
Beef horseshoe piece (end round)	4 to 8
Beef shoulder clod	3 to 6
Rib end of beef	2 to 6
Cross-ribs of beef	2 to 5
Beef brisket	3 to 8
Corned beef, rump, flank, plate or brisket	2 to 8
Beef tongue, fresh	3 to 5
Beef tongue, smoked	2 to 3
Leg of mutton	6 to 9
Shoulder of mutton	3 to 6
Shoulder of lamb	3 to 4
Leg of pork	3 to 12
Ham, smoked	3 to 12
Pork, shoulder, fresh	3 to 8
Pork hocks	1½ to 2½
Back-bones and neck bones	2 to 8
Stewing:	
Beef plate	3 to 6
Beef flank	2 to 6
Drop tenderloin	1 to 2
Beef skirts	1 to 2
Beef neck	1 to 3
Beef skin	2 to 5
Breast of mutton	2 to 4
Breast of lamb	1 to 2½
Veal breast	2 to 5
Veal neck	1 to 2

Soup and broth:	Weight—Pounds
Shin soup bones	1 to 4
Hind shank soup bones	1 to 5
Knuckle soup bones	3 to 7
Ox tail	1 to 2
Beef neck	1 to 3
Beef shoulder clod	1 to 2
Beef round	1 to 2
Mutton shoulder	1 to 2
Mutton neck	1 to 2
Mutton shanks	1 to 1½

LOUIS D. HALL,
Specialist in Marketing Livestock and Meats, Bureau of Markets, United States Department of Agriculture.

MEAT EXTRACT, or juice of meat, has become since its introduction by Liebig (q.v.), a subject of great importance in medicine, dietetics and commerce. The chemical constituents of meat juice are not clearly established, although creatine, sarcine and inosinic acid are among the substances intelligently investigated. Phosphoric and hydrochloric acids and inorganic salts, with some coagulable ingredients are among the constituents. Beef tea while of value does not furnish complete food either for sickness or health. Other preparations under this name are now on the market. Some are merely the juice of meat pressed out or dried pulverized meat; others are the so-called predigested foods. In the true extract of meat fats and albumens are absent; therefore, while of use as a stimulant, such a preparation is not a true food and cannot take the place of meat in this respect.

MEAT INSPECTION ACTS. See PURE FOOD ACTS.

MEAT-PACKING. Meat-packing may appropriately be considered under three heads, namely, preparation and disposal of fresh (unsalted) meats; curing and preservation of meats by salting, smoking and the like, as is usually practised with hog hams, bacon, etc., and preservation of meats by hermetically sealing in tin cans, glass jars, etc., including the final sterilization necessary to complete the process.

Fresh Meats.—The preparation and disposal of fresh meats is perhaps the most important branch of the packing industry and in its development is the newest. Fresh meat has been, of course, an article of commerce from the earliest times; but it is only within recent years that the art of refrigeration has been perfected to an extent enabling fresh meat to be shipped thousands of miles and its condition and quality so conserved that it is more desirable and palatable after arrival at destination than when first slaughtered. Fresh beef, particularly, is much more juicy and tender if well refrigerated and kept two weeks or more after slaughter. Fresh meats will keep best if held in a temperature slightly above the freezing point, but in practice a temperature of 35° F. gives good results, except for long shipments such as from United States ports to Europe, in which cases approximately the freezing point should be maintained; and it may here be observed that lean meat freezes at about 1½° lower temperature than water.

Freezing is slightly injurious to the palatable quality of fresh meat, but by freezing hard and holding at a temperature of 10° F. it may be kept without taint for many months. When beeves are in good supply and cheap, the choice cuts, such as ribs and loins, are frozen and held in large quantities until the winter and spring season, when they usually meet with a more favorable market. Fresh pork and mutton are sometimes frozen and carried from season of surplus to season of scarcity, but the volume of this trade in the United States is not great, comparatively. This carrying from the season of over-supply to the season of under-supply by means of freezing has a doubly beneficial effect on the market, increasing the demand for live stock during time of glut, and increasing the supply during the time of scarcity.

The dressed carcasses are, immediately after slaughter, still being suspended from the trolley hooks on which the latter part of the dressing operation is done, run into refrigerated rooms and chilled, usually for two days. The cattle carcasses, and usually the hog carcasses, are split through the back bone into "sides." After chilling, the sides are cut, the beef usually into quarters and the pork into smaller pieces. The quarters of beef are shipped hanging on hooks in refrigerator cars, and the smaller pieces intended for sale fresh are usually boxed and shipped also in refrigerator cars. Mutton and lamb are shipped in the same way, usually in whole carcasses. The refrigerator cars used depend upon ice for their temperatures, and the most successful cars use the ice crushed and with from 6 to 12 per cent of rock salt intermingled.

The development of the fresh meat branch of the packing industry received its first important impulse from George H. Hammond, who, in the summer of 1869, began at Hammond, Ind. (a suburb of Chicago), the business of shipping fresh beef in refrigerator cars to Boston. The first year the business was not successful, but it was courageously continued, the difficulties were gradually overcome, and the second year found it more satisfactory, and the volume amounted to about 600 quarters per week. During the following two years this volume was doubled and it continued to grow moderately until, in 1877, Gustavus F. Swift established at the Union Stock Yards, Chicago, a similar business. Under the stimulus of this competition the trade increased rapidly, consignments were made to other cities in New England and New York, other houses entered the trade, and by 1885 it became apparent that this new method of slaughtering cattle near their native pastures and shipping the fresh meat was destined to supersede, largely, the older method of shipping them on

the hoof and slaughtering near the place of consumption. To-day a large portion of the fresh beef used in the principal cities east of Chicago, and out of the cattle raising belt, arrives at destination in refrigerator cars. What is true of fresh beef is true also of fresh mutton and pork.

In the early days of the fresh meat branch of the packing industry, it became apparent that new methods of handling and disposal at destination were necessary; obviously, *fresh* meat could not be received in carloads and distributed to the retail dealer, through an ordinary, unrefrigerated warehouse, as had been the custom with cured meats. To meet the necessities of the case, refrigerated rooms were built, with systems of overhead tracking, on which quarters of beef and carcasses of small stock were stored and handled, suspended from trolley hooks. In connection with these refrigerated rooms, or *beef coolers,* as they came to be known in the trade, there were built suitable shipping rooms, offices, etc. These distributing houses were, as a rule, built adjacent to railroad tracks, enabling the direct discharge of meats from the cars. As the business began to assume some magnitude, it became evident to the packers that great care in the construction, maintenance and operation of these distributing houses was of the utmost importance; it was therefore desirable that a packer own houses for distributing his fresh meat, thus being in position to control, absolutely, conditions of cleanliness and temperature. The earliest fresh-meat packers did not engage in the other branches of meat-packing; but as soon as it became apparent to the older packers, who had previously confined their fresh-meat business to the locality of their packing houses, that the new method of distribution was successful, they began to enter the fresh-meat business aggressively, which in turn forced the pioneers of fresh-meat packing to add the other branches to their business, because a packer having all kinds of meat product to offer to the retailer had an obvious advantage. This diversification caused, in turn, the development of the distributing house, the addition of smoke-houses for smoking hams and bacon, store-rooms for canned meats, lard, etc., until to-day the leading packers own, in the principal cities of the country, their distributing houses, where the retailer may obtain any form of animal food-product, including many by-products. There are more than two thousand such houses scattered throughout the United States. This branch house system of distribution, by its economy and thoroughness, and its adaptability to supply a wide variety suited to all the local needs, has been one of the prime factors in the growth of the meat-packing industry.

The beginning of this branch of the packing industry was coincident with the successful application in a large way of refrigeration to railroad cars. The first cars were, however, comparatively crude, and the modern refrigerator car, as used to-day by practically all of the packing companies, has reached its present state of development by a steady growth of improvements made from time to time. This matter of perfection of the refrigerator car has been one in which there has been great rivalry among the various packers, and to this competition is due the high efficiency of the present refrigerator car for carrying fresh meat. The building, maintenance and care of these refrigerator cars is the field of one of the most important departments in connection with the various packing companies. The cars must not only be kept in first-class running order so as to make them suitable for operating on fast trains, but they must be kept in a high state of cleanliness. The icing of the cars is also a very important feature and has to be done with the utmost care. Before loading, the cars must be iced at least 24 hours in advance, so as to be thoroughly cooled. They are then re-iced at the time of shipment and are re-iced in transit as necessary, depending upon the length of the journey. Immediately after unloading, the car is scrubbed with soap and hot water, all hooks are wiped clean and the car is ventilated so that it will return home in a sweet, clean condition.

Curing and Preservation by Salting, Smoking, etc.— The preservation of meat by salting, smoking, etc., was the first method extensively practised, and the term "packing," now applied to the whole business, formerly had a narrower meaning and was used in connection with this branch exclusively. In fact this was, in the early days, the only branch.

From the earliest times meats have been cured by salting and smoking and in principle there is nothing essentially different in the practice of the modern packing plant from the curing processes used by the packers of earliest days. The business is now conducted on a much larger scale, and with more care as to conditions, particularly as to refrigeration and sterilization, so that meats are now cured with less salt than formerly, or to use the trade expression, *mild cured.*

The two methods of curing with salt are known as "pickling" and "dry salting," and these terms are relatively descriptive. In pickling, the meat, after being cut into hams, shoulders, etc., is submerged in pickle or brine and kept under the surface with weights or other devices, so the salt in the pickle is diffused through the meat. This causes the strength of the pickle to decline and the meat must occasionally be removed, and placed in a fresh hogshead with restrengthened pickle. The usual time of cure varies with the size of the joints or pieces of meat, but ranges usually between 30 and 45 days. The pickle is made of various strengths for various cuts of meats, but is generally 40° to 50° salometer, and for hams, bacon and the finer cuts of meat contains sugar as well as salt and a small percentage of saltpetre. Meats for consumption in the United States are generally cured in sweet pickle.

The process of dry-salting is to pile the joints or cuts of meat closely in layers on the curing floor, first rubbing them thoroughly with salt, and sprinkling salt freely between the layers and on top. The piles are made three or more feet in height, and the meat is left for 10 days, when it is overhauled, rubbed again with salt and repiled; and this overhauling is repeated again in another 10 days. The time necessary for the curing by the dry-salt method is substantially the same as by the pickling method. The dry-salting method is used for most meats for exportation to Great Britain, and the method is frequently spoken of as "English cure," being the standard method in England.

Hams, shoulders, bacon and side meats are, after curing, generally smoked. The process of smoking is also quite old and its origin unknown. The meats are hung in brick houses or compartments in tiers, as closely together as practicable without touching, a slow fire of wood is built beneath, and the meats kept in the resulting smoke for 12 to 48 hours. They are then cooled, wrapped, boxed and made ready for shipment. Hams and bacon, also shoulders, generally have a brand burned in the skin before wrapping. For shipment to hot climates the pieces, after wrapping in paper, are also "canvased," or sewn up in cotton sheeting, and coated with a thick pasty solution of China clay, barytes or the like, and then dried: This forms an air-tight, vermin-proof covering. Hickory and sugar maple are the best woods for smoking.

The preceding paragraphs relating to the curing of meats by salting, smoking, etc., describe the process as applied to meats of the hog. Beef is cured in like manner by pickling and is generally shipped to destination and kept in the pickle until removed for consumption. An exception is "dried beef," being the suitable lean pieces, which, after curing in pickle, are smoked slowly for several days so as to dry them to a firm condition.

Preservation by Hermetically Sealed Cans, etc.— The method of preserving meat by packing in hermetically sealed tin cans and the like was introduced commercially into the United States about the year 1873 at Chicago, Ill., by William Wilson and John Wilson. In the following year Libby, McNeil and Libby also entered this trade, and during succeeding years other houses followed. The business grew rapidly from the beginning, and has reached great magnitude.

The process in brief is as follows: The meat after being trimmed from the bones and cut into small pieces is put into a curing pickle composed of common salt and a little sugar in solution. It is left in this pickle any length of time from a few days to 20 days, depending upon the degree of saltiness desired. It is then taken out of the pickle and cooked in hot water until thoroughly done. After this the gristle is trimmed out, the surplus fat is removed, and the pieces are cut into small and comparatively even sized bits, usually not exceeding four cubic inches. In this condition, and while still hot, it is stuffed by an automatic machine into tin cans which have previously been prepared and thoroughly washed. Each can is then weighed so as to get the correct quantity of meat in it, and is "capped," that is, a small tin disc is soldered over the hole through which the meat is introduced into the can. The further steps of the process embrace the sterilization, or so-called "processing," which consists in heating the cans for a number of hours up to a temperature of 250° to 350° F., depending upon the size of the can and the kind of meat. The object in heating is sterilization, being the same process as is pursued by the housewife in canning fruit, etc. The cans are then washed, cooled, labeled and the exposed surfaces are coated with a varnish to prevent rust. They are then ready to be packed and shipped to all parts of the world, and will keep for years without deterioration.

By-products.— The business of meat packing as practised in Chicago and the other large packing centres of the United States involves not alone meat preserving, but the entire range of slaughtering, preparation of the fleshy and other edible parts, and preparation of the by-products, such as hides, hoofs, horns, bones, hair, fats, intestines, blood and viscera. In many of the most prominent establishments these by-products are manufactured into glue, buttons, combs, curled hair, soap, candles, oils, glycerin, etc. All the modern establishments manufacture the blood and residual solids from their fat rendering apparatus into fertilizers, in some cases the blood-albumen being first separated and dried independently.

The accompanying diagram will illustrate graphically the disposition usually made of the different parts of beef cattle.

Corresponding parts of other animals are put to similar uses. The stomachs of hogs are utilized for pepsin manufacture. Some of the glands of hogs, sheep and cattle, notably the thyroid and pancreatic, are used in the production of pharmaceutical preparations. Sheep skins first have the wool pulled from them and are then utilized for leather, the cuttings being made into glue. Hog hair and bristles are made into curled hair and brushes. Curled hair is sold for mattress making. All scraps and parts, not put to some other important use, are cooked, desiccated and used in many valuable products and as fertilizing material, the chief property of which is nitrogen.

General.— By the careful study of economy in utilization of by-products large values are now derived from parts formerly wasted. Today there is practically nothing wasted. This close study of economy in saving everything enables the packing business to be done on an unprecedently small margin of profit. For a series of years, including 1915, the fiscal reports, made by some of the largest and most successful packing corporations to their stockholders, show that their profits ranged from 2 to 2½ per cent of their distributive sales.

It must occur to all thoughtful persons that in a business of such large volume the securing of steady and sufficient supplies of fat animals is of prime importance, and the query naturally comes as to how this is done. Almost the entire supply of live stock is purchased from day to day, as needed by the various packing companies, at central markets in the large cities, such as the Union Stock Yards of Chicago, Kansas City Stock Yards of Kansas City, National Stock Yards of East Saint Louis, South Omaha, Neb., South Saint Joseph, Mo., South Saint Paul, Minn., National Stock Yards, Ill., Fort Worth, Tex., Sioux City, Iowa, Oklahoma City, Okla., Denver, Colo., Milwaukee, Wis. These stock yards are equipped to receive live stock in train loads — unload, pen, feed, water, and otherwise care for the comfort and health of the animals.

Live stock raisers most frequently sell their animals at home to a dealer, who, in turn, consigns to a commission salesman at some central market, where the buyers for the various packing companies meet in competition and bid for each lot or carload. The bidding is not by public outcry or auction, but by each buyer independently. There is no public system of grading, but each purchase is made on individual inspection and judgment of the buyer and salesman.

The development of these stock yards has

kept pace with the growth of the packing industry. Indeed, these large central markets for live stock and the packing plants are interdependent and mutually helpful. Together they constitute one of the modern wonders of our commercial development. The benefits to the raiser of live stock, the live stock dealer, the transportation companies, the retail dealer, and to the consumer, of an organized business that affords the producer an every-day cash market for any number of animals, the carrier a reliable and steady freight volume, and the retailer — and through him the consumer — a constant supply of the widest variety of kind and quality of animal food products, can hardly be exaggerated. To appreciate these benefits, let the reader try to imagine a return to the conditions of a generation ago. Within the memory of many still engaged in the business, the farmer had only a local and very uncertain market for his live stock. He could sell in limited numbers, must find his customer by inquiry and frequently had to wait for weeks after his stock was ready and ripe for slaughter. The butcher also depended on local supply, and must needs ride through the countryside and inquire, and frequently felt compelled to buy and use stock of a quality not suited to the demands of his business. He had to drive the animals to his little, unsanitary abattoir, slaughter them himself in the cool hours of the night, and hurry the sale of the fresh meat before incipient decomposition. He was constantly oversupplied or undersupplied, had too much of one grade and too little of another, and so frequently met with losses that his margin of profit must needs be large. The consumer, of course, could fare but ill under these conditions. He might whet his appetite with the thoughts of a juicy porterhouse or a prime rib roast, and find his butcher could furnish only veal or pork chops, and was compelled constantly to choose from a narrow and unattractive variety, and to pay an excessive price. Values were unstable and varied greatly, and producer, dealer and consumer alike suffered.

To-day the modern packing-house, with the central market for live stock which it has built upon one hand, and its system of refrigeration and distribution on the other hand, brings the producer and consumer into such near touch that the one can market his animals in any numbers any day, and the other can buy in any town or village of the country having railroad connections, any desired quantity and quality of so wide a variety of animal food products that his slightest whim or necessity can be satisfied.

This bringing together of the producer and the consumer the modern packer, with the aid of our railroads, stock yards and refrigeration, has accomplished, to the enormous benefit of both; and to-day the actual producer gets a much larger part of the total price paid by the actual consumer than ever before. Investigation by the United States Department of Agriculture showed that the producer received about two-thirds of the price paid by the consumer for meat and by-products.

In this age of engineering and mechanical advancement, the use of machinery has, of course, played a prominent part in the development of the business of meat-packing. The modern packing plant is divided into many departments, so related with reference to each other that the whole, in reality, constitutes a vast machine. The invention and perfection of machines to do the various kinds of work has been given a great deal of attention, and the practical men in connection with the different packing companies have vied with each other so that improvement has followed improvement, in many cases one machine being improved by another before fairly having the newness worn off. To-day, in the most up-to-date packing plants, the vast majority of the operations carried on are done by machines. Such plants are operated entirely by electric power, are lighted by electricity, supplied with water by electric pumps, refrigerated with cold brine circulated by electric pumps, and in some cases even the live animals themselves are hoisted from the ground to the top floor of the slaughter-house by enormous electric elevators, carrying a carload at a time. They are hoisted by means of electrically-driven hoists. Hogs are scalded, scraped, cleaned and delivered to the chill-rooms by machinery, hand work being reduced to less than half what it formerly was. The meats are cut by machinery, also sprinkled and rubbed with salt and packed. Hams are branded by machinery, and are carried by mechanical means to the loading platforms, ready to go into the cars.

In the handling of by-products, various machines do all of the most important work. Fertilizing materials are cooked, pressed, dried, ground, sifted and packed in bags and weighed by machines. Bones are dried, sawn, made into knife handles, buttons, crochet hooks, etc., largely by automatic machinery. Glue is evaporated, jelly sliced, jarred, broken, ground, bolted and packed into barrels by machinery. Soap is cut into bars, stamped, wrapped, packed into boxes, and the boxes nailed and printed by machinery. Soap powder is mixed, ground, sifted, packed into cartons, labeled, pasted and delivered to the boxes by machinery. So on, throughout the various departments, great attention has been given to the introduction and perfection of machines, so that the modern packing plant, volume considered, uses no more than half the hand labor that would have been required 20 years ago to do the same amount and variety of work.

The packing business is one of the largest industries of the country in the value of its output. For 1910 the census report shows 1,641 establishments employing 108,716 persons, with a capital of $383,249,000; value of output $1,370,568,101. This industry returns to the producers of the raw material 87.8 per cent of the total value of the products. Statistics of slaughter for the year 1909, are as follows:

ANIMALS SLAUGHTERED FOR FOOD.

Kind	Total	In slaughtering and meat-packing establishments	In retail slaughter-houses	On farms
Beeves	13,611,422	8,114,860	4,087,922	1,408,640
Calves	6,515,976	2,504,728	2,879,648	1,131,600
Sheep and lambs	14,724,699	12,255,501	1,939,672	529,526
Hogs	53,219,568	33,870,616	3,970,435	15,378,517
Goats and kids	285,553	33,224	133,340	118,989
All other animals	1,597	.....	1,597	.....
Total number	88,358,815	56,778,929	13,012,614	18,567,272

The packing business is notable for furnishing a spot cash market for any quantity of live stock that the producer chooses to send to the market. It is notable for its ability to distribute products of live stock throughout the world, where the demand is greatest, for the enormous volume of business done by the large firms and for their very small margin of profit per cent of sales.

LOUIS F. SWIFT,
President, Swift and Company, Chicago.

MEATS AND MEAT PRODUCTION. The discussion of the subject will be confined to a consideration of the properties, use and production of the flesh of cattle, sheep and swine for human food. All animal tissues are made up of dry substance, or solid material, and water. The per cent of water in meats varies from 10 to 78. The two things which appear to have the greatest influence upon the percentage of water in meat are the age and condition, or degree of fatness, of the animal. Other things being equal, the younger the animal the more water its flesh as well as other tissues contains, while the higher the percentage of fat in meat the lower the percentage of water. The extreme variation in the water content of different cuts and varieties of meats is due largely to an extreme variation in fat content. Thus all lean meat consists approximately of 75 per cent of water and 25 per cent of solid material. While the water in meats aids in their digestion and absorption in the alimentary tract, the nutritive value of meats rests largely on the quantity and character of the dry substance or solid material they contain. From 50 to 65 per cent of the fat steer is meat. In other words, the dressed carcass of a steer represents from 50 to 65 per cent of the weight of the live animal. The remainder is made up of by-products, in general, such as hides, fat, offal, etc., less valuable than beef. A physical examination of meats shows them to be made up of muscular tissue or lean meat, fatty tissue or fats, cartilaginous tissue or the gristle, and bone. From the standpoint of the nutritive value of meat, gristle and bone are practically refuse.

Composition.— Chemically, meat is composed of protein, fats, water, ash and carbohydrates, which are the necessary food constituents for the production of energy and repair of the animal body. The amount of carbohydrates is so small as to make it almost a negligible factor. Extractives are also present in meats which are believed to be responsible for meat flavors. While differences in the chemical composition of two cuts of meat are not necessarily an indication of their relative food value, yet the composition of meats in general is important as indicating their place in the diet of man. Lean meat contains from 15 to 21 per cent protein; whole eggs, 12.5 per cent; fresh, whole milk, 3.4, and cheese from 25 to 30 per cent. Fresh vegetables, other than peas and beans, contain 0.5 to 3 per cent protein; fresh peas and beans, 2 to 7 per cent; wheat flour, 10 to 12 per cent; and dry peas and beans, 18 to 25 per cent.

Thus it will be seen that meat contains a relatively high per cent of protein as compared with other staple foods. The mineral matter comprising the ash of meats is made up chiefly of potassium phosphate, with small amounts of magnesium, sodium, calcium, phosphates and chlorides. The percentage of ash in fresh edible meats varies from 0.5 to 1.5 per cent. The organic extractives of meat consist mainly of creatine, certain basic nitrogenous substances including the purine bases, and small amounts of lactic acid, glycogen or animal starch and glucose in traces. Glycogen and glucose are the only carbohydrates in meat and occur normally in very small quantities. The percentage of organic extractives in meat varies widely with the kind of meat and the location of the cut, from 0.7 to 2 or 3 per cent.

Dietetic Value.— Meat is a staple food in the American dietary, chiefly as a source of protein and fat. In the average American dietary, 28 per cent of the protein and 58 per cent of the fat is represented by the consumption of meat from cattle, sheep and swine. Protein is essential for the growth and repair of body tissue, and while the actual bodily requirement for protein may be relatively small, it seems probable that a fairly liberal protein intake is essential for optimum conditions of health and vigor. Meat is an especially satisfactory source of protein in the diet, first, because it is so readily and completely digestible as compared with the vegetable proteins, and, second, because it is better adapted to the body's requirements and thus possesses a higher physiological value. Illustrative of the latter point, in a recent experiment on a human subject it was shown that the following minimal amounts of the various proteins indicated were required to cover the protein requirements of the body and to protect body protein from loss:

Meat protein	.....	30	grams per day.
Milk "	.....	31	" "
Rice "	.....	34	" "
Potato "	.....	38	" "
Bean "	.....	54	" "
Bread "	.....	76	" "
Corn "	.....	102	" "

The value of meat as a food is also enhanced by its content of organic extractives. These substances are among the water-soluble constituents of meat and give to meat its characteristic flavor. Thus, it may be shown that the greater palatability of the higher priced cuts of beef is associated with a higher percentage of organic extractives in the lean meat. While the organic extractives have practically no food value, as the term is ordinarily used, yielding but little energy or structural material to the body, they are known to be potent in stimulating the digestive glands, especially the gastric glands, and thus probably play an important rôle in digestion.

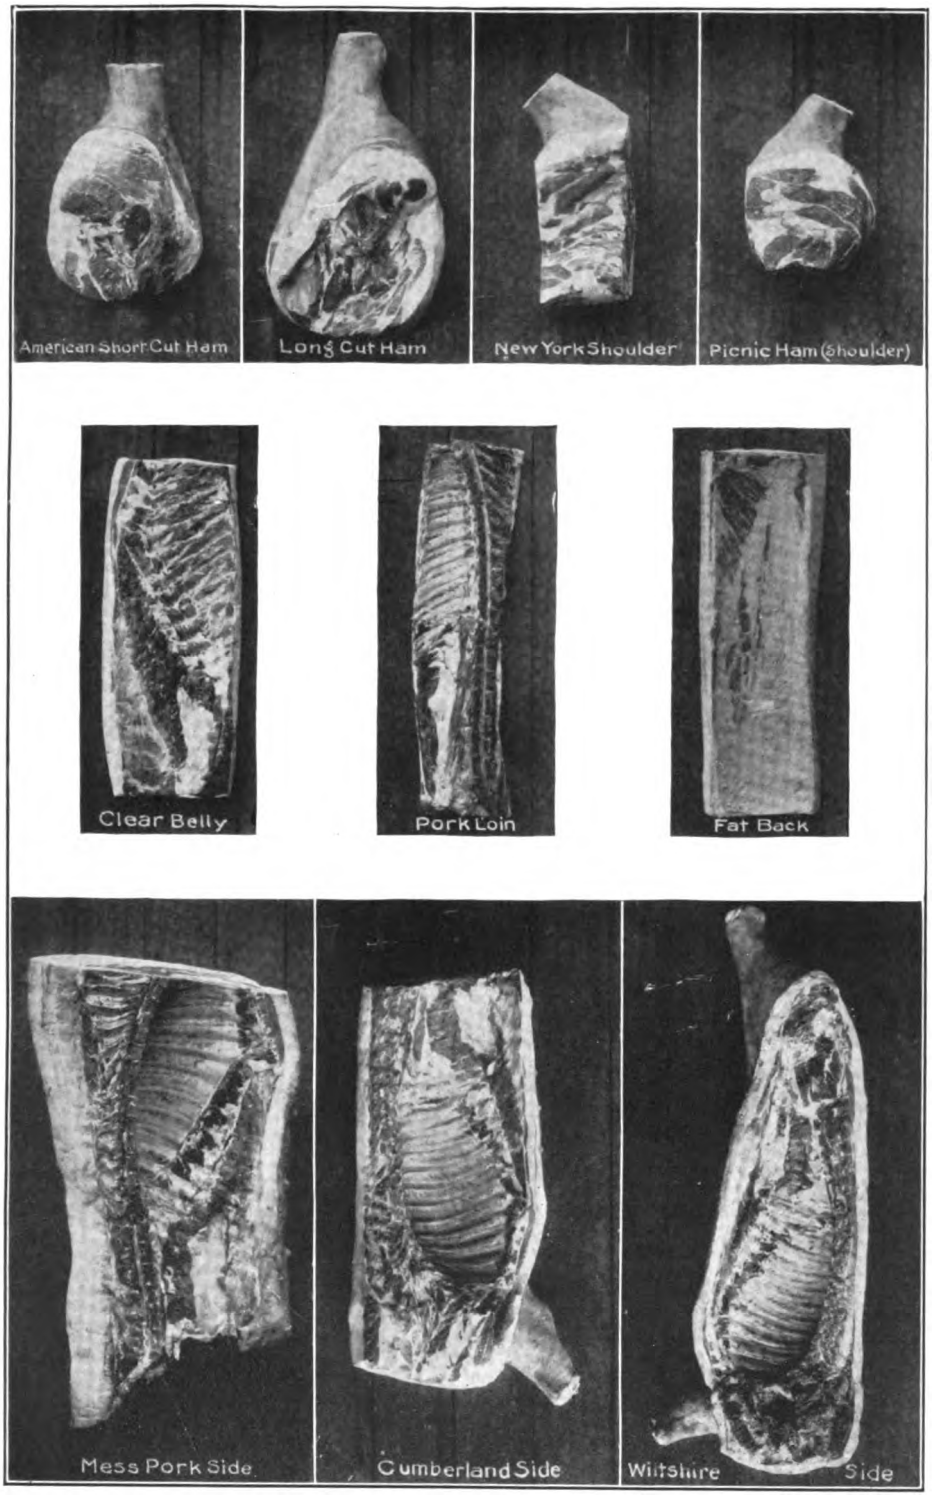
From one-tenth to one-third the cost of food in the average family is paid out for meats. Some facts are given therefore which throw some light on the question as to the desirable qualities of beef. Beef is used to illustrate the matter of quality because it is pre-eminently the most popular flesh food and because quality means more in beef than in mutton or pork, especially the latter. If all the desirable qualities of beef could be secured in one cut it would be palatable, nutritious and economical. This is practically impossible, however; there are wider differences in cuts of meat as to palatability and cost than as to food value, while the less ex-

pensive cuts may be rendered more palatable by proper methods of cooking. Palatability of beef depends upon tenderness, juiciness, quality and flavor. Tenderness, juiciness, quality and flavor depend upon the age of the animal, the location of the cut, the condition of the animal as to ripeness, the degree of ripeness of the meat and the method of cooking. As a rule the younger the animal the more tender the meat. Perhaps nothing, however, has more influence upon tenderness than cooking,—different cuts requiring different treatment. The flesh of young animals invariably lacks that fine marbled appearance, or distribution of fat throughout the muscular tissue that is so characteristic of beef of high quality taken from mature bullocks that are in a finished or well-fatted condition. The beef of young cattle is also more or less lacking in flavor. Satisfactory flavor in beef is of course largely a matter of individual preference, but a reasonable state of maturity and development is required to give beef its most characteristic flavor. It is significant that the more tender cuts of beef, such as the tenderloin, lack noticeably in flavor. Good judges agree that the best flavored beef comes from muscles which are frequently used during the life of the animal. This exercise renders these muscles tougher, but of distinctly higher flavor. Beef cut from cattle of rather advanced age, or for that matter from cattle of any age, is rendered relatively more tender by the ripening process. Fresh beef that has not hung in the cooler for 10 days to two weeks lacks both in tenderness and flavor. Even a longer time in cold storage is desirable with the highest grade of beef. The beef cut from well-fattened steers of good quality or containing a high percentage of beef blood can be much more satisfactorily ripened in cold storage than that cut from mongrel bred steers which have been slaughtered in an indifferent condition. Carcasses of prime steers possess a characteristic coating of surface fat which protects the lean beef from too much exposure and gives it an opportunity to fully ripen. In the case of the carcass from the medium and common grades the beef frequently lacks that surface fat which seems to serve such a useful office during the ripening process. Low grade beef will literally rot before it will ripen. Juiciness in beef is largely dependent upon the percentage and distribution of fat, and the method of cooking. While an abundance of fat anywhere on a cut of beef adds materially to its apparent juiciness, an even distribution of fat throughout the muscular tissue, a condition which gives to the meat when carved (especially when cold) that beautifully marbled appearance, is the leading factor in contributing ideal juiciness to the beef. Juiciness may be easily destroyed by too prolonged roasting or broiling. The marbled quality in beef is seldom seen except in reasonably mature well-fatted cattle.

Prime condition in the live animal is essential for producing high quality in beef and other meats as well. In order to secure the highest quality in meats the consumer must pay a relatively high price for the cuts of meat or buy considerably more fat than can be agreeably eaten along with the lean of the cut, thus making it necessary to utilize the superfluous fat for other purposes or consider it as waste or refuse. In either instance it renders the edible meat of high quality relatively high priced as compared with low grade meat. On the other hand, meat of high quality need not necessarily be the most expensive for the consumer to purchase, for, when properly cooked, it is so delightfully tender and juicy that all of it is edible, save possibly a small amount of superfluous fat. However, this extra fat is of such quality that it can be readily rendered and used for cooking purposes to supplement or in some instances satisfactorily take the place of more expensive shortening. Another fact which should not be overlooked is that the cheaper, and as generally considered, less palatable cuts taken from a carcass of beef possessing high quality are often fully as desirable as the best cuts from low grade carcasses.

Packing.—The packer or slaughterer of meats is willing to pay a premium for animals in prime or well-fatted condition because when slaughtered they yield a higher percentage of dressed meat, fat, and, in the case of cattle, hides. Not only is this true, but the packer understands that prime condition in the live animal is a strong indication of high quality in the carcass. In fact, it may be said that condition is a prime requisite for producing high quality. It has a greater influence undoubtedly than high breeding. Again, the packer pays a premium for cattle prime in condition and prime in quality, or good breeding, because in well-bred animals the percentage of high priced cuts is greater than in mongrel or indifferently bred stock. Undoubtedly, the tendency of the meat trade for several years has been to concentrate a large part of the slaughtering of the country at leading market centres like Chicago. In other words, gigantic and powerful packing companies have developed from small beginnings until they have within their combined power the ability to practically regulate the market for live cattle, hogs and sheep and meats the world over. Chicago is the greatest live stock and meat market in the world. A large majority of local meat markets in the cities and villages throughout the United States are supplied through the medium of the packing-houses located at our leading livestock markets. Packing-houses can furnish any grade of meat desired. For example, in beef they can supply all grades from No. 1 to canning stock at prices corresponding with the quality. So economically is the business of the packing-houses administered and so well organized are the various industries growing out of the wholesale slaughter of meats that it is possible for them to sell practically all grades of beef in cities and villages remote from their central plant at prices which successfully compete with local competition. The local purveyor of meats can buy whatever grade of meat he can dispose of to advantage. As a rule in the smaller cities and villages the retailer buys a medium to low grade carcass, because his trade is not willing to pay prices which of necessity must be paid to secure meat of high quality. It is safe to say that the beef offered at such markets is seldom above No. 2 in grade, no matter whether the market is supplied by packers or local slaughterers.

It is impossible to predict the ultimate effect upon the meat trade of the change from local to packing-house slaughtering. On the one hand a packing-house trust can control the price of



American Short Cut Ham

Wiltshire Side

live cattle, sheep and swine in such a manner as to reduce, temporarily if not permanently, or in some instances, destroy entirely the profits of the meat producing industry; on the other hand, such a trust can control the price of meat in the carcass to such an extent as seriously to discourage the consumption of meat by raising the price to such a degree that it will become one of the most expensive articles of diet. This power is not likely to be permanently exercised to the disadvantage of the public good, for it should be borne in mind that the very life of the packing business depends upon an active demand for meats by the consuming public. This demand will not exist when prices of meats are too high as compared with other foodstuffs. Producers will cease to prepare livestock for the block when the business becomes clearly unprofitable. In other words meat is not an absolutely necessary part of the diet of the masses, nor is the permanency of agriculture dependent upon continuous livestock production.

Consumption and Production.— Notwithstanding improved methods for meat production the actual cost of cattle, sheep and swine as put upon the market by producers the world over is steadily on the increase. Nowhere is this increased cost any more manifest than in the United States. Changes already referred to in the methods of slaughtering and increased cost of production of meats have not lessened the gross or even the per capita consumption of meats in the United States or Great Britain. The per capita consumption of beef in the United States has increased in the last few years, while it is probable, although statistics are wanting to substantiate the statement, that the per capita consumption of other meats has increased still more.

The following table shows the annual per capita consumption of meat, including beef, mutton and pork, for different countries:

ANNUAL PER CAPITA CONSUMPTION OF MEATS.*

* Includes milch cows. † Other cattle. ‡ Includes small buffaloes. § 1910. ¶ Includes goats.

Per capita consumption of meat in all countries for which the information is obtainable, probably of dressed weight is expressed in pounds, unless otherwise stated. For Germany, some parts are included in addition to dressed weight in the preceding table.

From this table it is evident that the per capita meat consumption for the different countries reported varies within wide limits, Italy ranking lowest and the Australian Commonwealth highest. The high figure for the latter country is largely fictitious, due to the excessive waste of meat and meat products for which the Australian is noted. The low figure of 46.5 pounds of meat as the per capita consumption in Italy is the result of a thorough investigation of the slaughter of meat animals in every commune in Italy, made by the Director-General of Public Health. The per capita figure for the United States ranks third in the list. Of the estimates given in the table of the meat consumption in this country, those of the Bureau of Statistics are undoubtedly the most accurate; and of the three figures given, the last, representing the per capita consumption of edible dressed meat and of other edible portions of the carcass, is undoubtedly the most significant as indicative of the actual consumption of meat.

As a nation the United States leads all others in the production of meat. The table presented on p. 495 shows that the United States produces one-third of the world's supply of beef. The United States also produces more than one-half the pork and one-seventh of the mutton of the world.

The accompanying tables are interesting as showing the relative amounts of beef, mutton and pork consumed in a few of the principal countries:

AVERAGE PER CAPITA AND PER FAMILY CONSUMPTION OF MEAT PER YEAR IN THE UNITED STATES.*

CLASS OF MEAT	Consumption of edible dressed meat and of extra edible parts combined: Per capita pounds	Per private family of 4.6 persons pounds	In per cent of total consumption per cent
Veal	7.7	35	4.20
Beef, except veal	75.3	346	41.23
Total beef	83.0	382	45.43
Lamb	5.0	23	2.72
Mutton, except lamb	6.3	29	3.46
Total mutton	11.3	52	6.18
Pork, including lard	88.4	407	48.39
Total	182.7	841	100.00

* Bulletin 55, U. S. Dept. Agr. Bur. of Stat. "Meat Supply and Surplus, with Consideration of Consumption and Exports." 1907.

The table clearly indicates the preponderate and almost equal importance of beef and pork in the American dietary. Of beef, mutton and pork alone, the estimates point to a yearly consumption, by the average American family of 4.6 persons, of a little over half a ton of dressed meat (1,014 pounds) or of a little over two-fifths of a ton of edible meat.

CONSUMPTION OF MEAT IN GERMANY FOR 1904-06, INCLUSIVE.

(Bulletin 55 Bureau of Statistics)

Results expressed in pounds per capita per annum and in per cent of total meat consumption.

KIND OF MEAT	1904: Pounds per capita	1904: Per cent of total	1905: Pounds per capita	1905: Per cent of total	1906: Pounds per capita	1906: Per cent of total

* Vols. 65 and 67, Royal Statistical Society.

Williams has conclusively shown that the importation of American and other foreign beef and mutton has materially reduced the London wholesale price of these meats. His statement is here reproduced:

Average wholesale price of beef in London markets:

1876-80 from 5½d. to 8 d. per pound.
1895 from 2½d. to 6½d. per pound.

Average wholesale price of mutton in London markets:

1876-80 from 7½d. to 9 d. per pound.
1895 from 2½d. to 7½d. per pound.

The total amount of meat products exported from the United States in 1915 was 75,243,690 pounds, valued at over $900,000,000. In 1916 50,416,690 pounds valued at $780,000,000 were exported. Meat production is one of the leading industries of the farms in Iowa, Illinois, Missouri, Indiana and Ohio. In fact wherever corn thrives there we find meat production an important industry. Corn is undoubtedly more largely used in meat production than any other feed. The problem of economic meat production in the United States is largely a question of the best method of utilizing corn and its by-products. There is a gradual and apparently necessary and certain change, just beginning, which will have an important bearing upon beef production in the United States. With the closing of many ranges in the range country which have hitherto furnished a high percentage of stockers and feeders which have been finished on the corn belt, or at any rate upon corn grown in the corn belt, the problem presents itself, where are cattle feeders to look for their future supply of feeding cattle? Everything points to the conclusion that ultimately more of the cattle fatted for the market on the high-priced lands in the corn belt will be bred and reared there. In other words the entire process of beef production will necessarily be

carried on by the majority of cattle men. As it is, about 85 per cent of the native beef cattle marketed in Chicago have been previously bought as feeders and finished by cattle feeders who do not breed or rear the cattle they feed. The tendency in meat production at present is to put livestock in marketable condition and market them at an earlier age. This system involves better bred animals, more liberal feeding and a large use of nitrogenous feeds.

MECCA, mĕk'ą, or **MAKKA,** Arabia, the holiest city of Islam, the capital of the province of Hedjaz, about 49 miles due east of Jiddah, its port on the Red Sea, with which it has telegraphic communication. The Mohammedans call it Umm-al-Kora, "Mother of Cities," and it derives its sanctity from having been the birthplace of Mohammed. The city stands in a narrow, sandy valley, enclosed by barren hills from 200 to 500 feet high, and is supplied with water from the mountains to the east by an aqueduct built in the 9th century, by Zubaidah, wife of Haroun-al-Raschid. The great mosque Beitu 'llah (House of God) or El-Haram (The Inviolable), enclosing the Kaaba (q.v.), the Moslem "holy of holies," occupies a central square which divides the city into the northern upper and the southern lower towns. The unpaved streets are wider than is usual in Oriental towns, and the houses of stone, often three stories high, are lighted with windows looking on the street, giving them an Occidental appearance. The stationary population is about 60,000, but the city is large enough for more than three times that number, and is annually filled at the time of the Hadj or pilgrimage to the Kaaba, when apartments in almost every house are rented to strangers. This pilgrimage customary among the Arabs in early and idolatrous ages, and subsequently enjoined by Mohammed on all his followers, is the foundation of Mecca's fame, and the only source of the inhabitants' wealth and occupation.

The Meccáwi, or inhabitants of Mecca, are, with the exception of a few Hedjázi Bedouins, all strangers by birth or parentage. They are, in fact, settlers or children of settlers, attracted hither by the love of gain, and as they care nothing for learning, the colleges of Mecca have fallen to decay, and the libraries, once rich, have disappeared. Mecca during the pilgrimage becomes for three or four months in the year the greatest market in the East.

The pilgrims converge upon the holy city from three directions; those coming from the south are Mohammedans from Oceanica, Java, Sumatra, Indo-China, India, Turkestan and southern Persia, who pass into the Red Sea through the Strait of Bab-el-Mandeb and on to Jiddah, the port of Mecca; the northern branch of the pilgrims, north Persians, Turcomans and people from Asia Minor and European Turkey, go southward to the holy city both by the land and sea routes; the third stream is from the west, Egyptians, Moroccans, Algerians, Tunisians and Turks, who reach Jiddah through the Suez Canal. For years past the average number of pilgrims passing through the Suez Canal to Jiddah has been 16,000, but this number is sometimes greatly exceeded; the number in 1901 was 26,000, and in 1902 was over 40,000. The northern pilgrims, however, are only a small part of those who annually convene at Mecca. The total number every year exceeds 100,000, practically all of whom are present at the fête of Bairam. The Sherifs of Mecca, direct descendants of Mohammed, are now a numerous and widely spread body. They all wear the same costume, priding themselves on the green robe which marks their descent. These nobles, as they may be called, elect the Sherif of Mecca, and their choice is formally confirmed by the Ottoman sultan. Ptolemy mentions Mecca under the designation of Macoraba. Mecca has had a chequered history. According to Arab legend Ishmael dwelt there, and his descendants were driven out by the Banu Jurhum, who were themselves ousted in turn by the Khuza'a about 210 A.D. Mohammed was born here, but for eight years was opposed by the city's nobles. In 692 Al Hajjaj laid siege to the city and on taking it slew the pretender Abdullah Ben Zobeir. From 1517 to 1916 the Sherifs of Mecca derived their authority from the Sultan of Turkey. The Wahabees took it in 1803; but in 1833 it was given up to Mehemet Ali, whose son Ibrahim was made Sheik el Haram. Upon the establishment of the kingdom of Hedjaz in 1916 Mecca came under the new régime. Consult Kahn and Sparroy, 'With the Pilgrims to Mecca' (New York 1905) and Wavell, A. J. B., 'Modern Pilgrim in Mecca' (1912).

MÉCHAIN, Pierre François André, pē-ār frăn swă, mā-shăn, French astronomer: b. Laon, France, 16 Aug. 1744; d. Castellon, Spain, 20 Sept. 1805. He became a mathematical tutor and devoted himself to the study of astronomy in his spare moments. In Paris he gained the interest of the astronomer Lalande who assisted him to a governmental position, in which he was engaged in the survey of the French coast and in astronomical observations. The Academy of Sciences elected him a member in 1782, and in 1785 he was editor of *Connaissances des Temps,* in which appear some of his most valuable scientific papers. He was commissioned by the National Convention in 1791, in company with Delambre, to measure the arc of the meridian between Dunkirk and Barcelona. The results of the calculations made failed to satisfy him because of a slight discrepancy and though now appointed a director of the conservatory at Paris he persuaded the board of longitude to commission him to measure the arc between Dunkirk and the Balearic Isles, but died of fever in Spain while on his mission. Consult Delambre, 'Histoire de l'Astronomie au dix-huitième Siècle.'

MECHANICAL DRAWING. See DRAWING, MECHANICAL.

MECHANICAL ENGINEERING is that branch of the science and art of engineering which relates specially to machinery. It is closely allied to all other classes of engineering, inasmuch as there is hardly an occupation or industry in which machines of some sort are not directly or indirectly concerned, and it is often, for this reason, difficult to draw the line clearly between one class and the other. The civil engineer who plans and supervises the building of a railroad calls to his aid the machinery used in excavating, blasting, building masonry and numberless other mechanical processes required in the work, all of which are the result of mechanical engineering. Electrical engineering would accomplish comparatively little in the production of light and transmission of power were it not for the dynamo and other machinery on which dependence is placed for the manufacture and use of electric current. Mining engineering would be of little use in devising means for extracting the coal and mineral treasures buried in the earth if suitable machinery planned by mechanical engineers could not be employed to assist the labor of men. In marine engineering it is the mechanical engineer who designs the steam plant which produces the motive power for the propulsion of the steamship, and without his assistance there would be no such a thing as a steamship. In dealing with problems relating to waterworks, the hydraulic engineer would be powerless if he could not make use of the pumps and hydraulic machinery which the mechanical engineer has devised. In every kind of industry where power is required, whether it be connected with engineering, architecture, chemistry, agriculture or any other subject, the mechanical operations involved are based on the continuous operation of the machine constituting the motive power, whether it be a steam engine or water wheel or other motor, and these are the products of mechanical engineering. When we come to fully analyze the subject, therefore, it appears that mechanical engineering so far underlies engineering of every class, and all kinds of industrial operations, that it can almost be said to sustain the whole fabric of modern civilization.

Mechanical engineering, in its strictest sense, relates simply to the design of machines. In its broad sense it covers not only their design but all matters relating to their proper construction and operation. In its common application it has for its scope both the design and construction of machines required for performing certain desired operations, and in addition the design and operation of the complete industrial plant, of which the individual machines form a part, and the construction of the plant in such a manner as to secure a successfully working whole for whatever purposes the plant is built. A large part of the mechanical engineering required at the present day consists in the assembling of machinery to produce certain desired ends, rather than in the design of the machinery itself. In many cases, the machinery has already been designed and constructed by engineers of the past and the perfected machines can be had by purchase in the market. This class of mechanical engineering covers a wide field. Perhaps its scope in this field can best be shown by referring in some detail to a familiar example. Take the case of the engineering required in a large modern hotel. The mechanical plant of such an establishment embraces a great variety of machinery, among the most important of which are the machines and appliances required for power, heating, ventilation, lighting, elevator service, distribution of hot and cold water, fire protection, refrigeration, ice-making, laundry work and cooking. The work of the engineer, although confined mainly to the mechanical plant, must, at the very outset, be directed to the building itself. The building, no doubt, accords with the modern ideas of construction which call for a framework made of iron, in the design and construction of which the architect must have the assistance of the mechanical engineer. Not only this, but there must be, at the outset, a careful consideration of the required location of the various mechanical appliances, so that in working out the details of design relating to the building the architect may provide the necessary amount of room. He must leave a place for the boilers, engines, steam turbines, dynamos, pumps, etc., which make up the steam plant, and room also for the supply and storage of fuel. Provision must be made for the reception of flues, ducts, pipes and wiring, which pass up through the building and which are distributed here and there to the different rooms. The character of the structures which may be needed for supporting the machinery, and the location of such structures, must also be planned at the outset so that the building may be prepared for them before it is too late. In the design of the mechanical apparatus, one of the first questions for the engineer to consider is the size and character of the steam plant. In dealing with this matter he ascertains all the uses to which steam is applied, embracing the generation of power, the pumping of water, the supply of steam for all kinds of heating and cooking, and that required for ventilation. With the data thus obtained he determines the total amount of steam required for all purposes and then calculates the boiler capacity needed to furnish the steam. For the next step he decides upon the type of boiler best suited for the purpose, whether fire-tube or water-tube, horizontal or vertical, or whether internally or externally fired, and fixes upon the number and size of the units as well as their location. He then makes a plan showing the location of the boilers in the building; the style of the brick setting, if externally fired; the arrangement and location of the smoke flues and of the stack or chimney to which they connect. Having done this and settled all matters relating to the accessories which form a part of the boiler plant, he takes up, in due course of time, the remaining portion of the work relating to the boiler plant, which may be described at this point because it is representative of much of the work which requires to be done in relation to the other departments of the plant. He draws up specifications describing in full detail the character of the boiler plant desired and what is expected of it as regards capacity and economy. These specifications are submitted to boiler manufacturers who are asked to furnish proposals for the construction of the plant in the manner described. When the proposals of the different

bidders have all been received, the engineer examines them, and after consulting with the owner of the property, selects one of the parties with whom to contract for doing the work. Next follows the inspection of the boilers in process of construction in the shop and erection in the building, the object in view being to determine if all the terms of the specifications are complied with. Finally, when the plant is completed and the contractor sets it to work, the engineer submits it to whatever tests may be required, and thereby determines whether the guarantees which have been made regarding the capacity and economy are fulfilled, and whether the plant performs its work with that degree of success and satisfaction that is called for by the specifications. Referring now to the construction of the remaining departments of the mechanical plant, the next thing considered is the motive power. The greater part of the power in such a plant is likely to be transmitted by electricity, and, consequently, the motive power is that required for generating electricity. (See ELECTRICAL ENGINEERING). After deciding on the number, size and type of the generator units, he must then locate them, and make a plan showing their respective locations with reference to the boiler plant and other parts of the building. At the same time there must be laid out on the plan a system of steam-piping connecting the boiler to the engines or turbines, and this must be arranged with a view to supplying steam to all other points of use, including the heating of the building. Next in order, the pumping machinery requires attention. This embraces the boiler feed pump, the various pumps used for the different classes of hotel work, the elevator pump, if the hydraulic system is employed, and the fire pump. The engineer must determine the proper size of each one according to the amount of water to be pumped, and he must select the type of pump, fix its location, show it on the plan and extend the system of steam-piping to furnish each with the proper supply. He must also plan the exhaust piping required for each engine, turbine and pump, the necessary vent pipe for carrying the waste steam to the atmosphere, and, if exhaust steam is used for heating, the required connection of the exhaust pipe to the main supply of the building. There must be a heater provided in the exhaust pipe system for heating the feed water before it is pumped to the boilers, and another heater for the supply of hot water to the building, and both of these, in their selection, location and connection, require the careful attention of the engineer. They must be properly laid out and shown on the plan. A complete system of water piping is required, connecting boilers, pumps, hydrants and elevators, to say nothing of the hot and cold water supply pipes which extend to the various rooms of the hotel, and the location of these must likewise be shown by means of a suitable plan. Not the least important part of the mechanical engineering for the building is the design and construction of the heating and ventilating apparatus. Calculations of the amount of heat and radiating surface needed, the quantity of air required to be changed in a given time and the sizes of the mains and returns are involved in this work. Here, also, the kind of the system to be employed, the location and type of the heating and ventilating apparatus, including all the necessary details, are questions which the engineer must consider and decide, and the results must be indicated by proper plans. These various parts of the work are made the subject of detailed specifications, in the manner already referred to, and, likewise, proposals for the installation of the work are obtained, contracts awarded, inspection carried on during construction and the work tested for acceptance when it is completed, all of which is done under the jurisdiction of the mechanical engineer. In much the same manner, the selection, location, construction and installation of the remaining parts of the mechanical plant, embracing elevator machinery, laundry machinery, refrigerating machinery, ice-making machines and the many other appliances concerned in the work of the hotel are carried out under his supervision.

The same class of mechanical engineering as that referred to in the above example is that involved in the design and construction of industrial plants of various kinds, such as cotton- and woolen-mills, bleacheries, paper-mills, rubber-mills, machinery and other manufactories, this branch of the profession being commonly known as mill engineering. In all of these cases the elementary parts consist of the power plant, which is sometimes operated by steam, sometimes by water and often by both, the machines in the mill or manufactory and the pulleys, shafting and belting required to transmit the power from the one to the other. The work of the mechanical engineer in these plants consists in properly assembling the various machines so as to perform their functions, the selection of an appropriate power plant and the proper design and arrangement of the transmitting apparatus required for operating them.

The work of the mechanical engineer is of paramount importance in the construction of steamships. Not only does the design of the boilers and engines on which the whole operation of the ship depends originate with him, but he is also concerned in the design, location and connection of the multitude of auxiliary steam appliances which abound throughout the vessel and which contribute so much to the comfort of the passengers. The modern steamship is required to contain all the appointments of a first-class hotel. The services of a mechanical engineer are many times more needed in its design and construction than in that of a hotel, for the reason of the contracted space in which the machinery is necessarily enclosed.

One of the most important industries in which the mechanical engineer is a leading figure is that of the steel-rail-mill. Here the plant, which is distributed over many acres of land, embraces immense blast furnaces where the pig iron is made, elevators by which the raw material is lifted to the top of the furnaces, blowing engines which produce the air-blast required at the base of the furnace, converters in which the iron is changed to steel, hydraulic lifts by which the converters are manipulated and the steel blooms moved to cars, trains of rolls with their powerful direct-connected driving engines where the rails are rolled from the masses of white-hot metal,

together with their reheating furnaces and, in addition to all these, the extensive boiler plants and the system of piping and other apparatus required for conveying and supplying the boilers with waste furnace gases, on which they largely depend for fuel. The mechanical engineer who lays out and assembles the parts of which such a plant is composed has a task the magnitude of which is commensurate only with the importance of the interests involved.

Since mechanical engineering includes in its scope not only the proper design and construction of machinery, but also its satisfactory performance, one branch of the profession relates to the determination, by means of suitable tests, whether the desired performance has been realized. This has especially to do with boilers, engines, turbo-generators and other apparatus using steam, which the engineer requires to be installed under specific guarantees of performance. The performance of boilers in the matter of economy may be specified in terms of the number of pounds of water evaporated per pound of coal, and, in that of capacity, in terms of the number of horse power developed, while that of the engine or turbo-generator may be specified as the number of pounds of feed water or dry steam consumed per unit of power per hour. The performance tests require the determination of the quantities stipulated, by actual measurement of the coal, water, steam and power under working conditions. Another branch of mechanical engineering, in a similar line, relates to the testing of materials used in construction, the object being to determine whether they have the requisite strength and physical characteristics. A sample or specimen of the material is placed in a testing machine and submitted to an actual breaking force and the amount of strain ascertained by measurement.

Having now given some explanation regarding the character of the profession of mechanical engineering, the question naturally arises as to the qualifications needed to make a success of such a profession. It hardly needs to be said of this profession more than of another that the one who adopts it should do so not merely as a means of livelihood, but because his tastes lie in the direction of mechanical pursuits, if, indeed, he does not love the profession for its own sake. No one should enter the profession who is not fond of machinery, who is not a "born mechanic" as the saying is, or who is not deeply interested, to say the least, in every kind of machine. But apart from natural inclinations there are qualifications that especially fit one for the work of a mechanical engineer. He should have a technical education so as to be thoroughly grounded in the principles of mechanics. He should not only understand these principles but he should know them by heart. He may or he may not remember the formula derived from the principle, but the principle itself should ever be at his finger's end. He should be familiar with mathematics, geometry and trigonometry. He should know the strength of materials and be able to calculate the strains occurring in structures and in machines, both at rest and in motion, so that he may design them with the proper amount of strength, or, if already designed, that he may be able to prove that they are of sufficient strength for any purpose he may desire to use them. He should know their behavior under varying conditions and should be able to detect their points of weakness and know the best methods of strengthening them when they fail. He should be a draughtsman and, what is the draughtsman's next neighbor, an inventor. He should know the processes involved in the work of the patternmaker, founder, blacksmith and machinist. He should know how to erect machinery and how to operate it after erection. He should know the practices of the trade and he should know the various articles concerned in mechanical operations which can be bought in the market, and, in a general way, their cost. He should be familiar with the different kinds of boilers, engines, turbines, pumps, water wheels, etc., in the market and their relative advantages. Not the least in importance should he be grounded in the principles of steam engineering and the laws which pertain to the generation and use of steam, not only for the operation of engines of various kinds, but for the various kinds of steam heating. He should be familiar with the steam engine indicator and be able to test a boiler or engine for capacity and economy. He should be well versed in hydraulic, pneumatic and electrical machinery. He should know about the construction and operation of the various machines of the plant he has assembled, so as to be able to judge of the correctness of their design and construction and whether they perform their functions in a proper manner and according to the specified requirements. He should be able to prepare detailed specifications of the work he plans, and he should possess sufficient literary ability to draw up a suitable report upon any question that may arise regarding the work he is called upon to perform and pass judgment upon the comparative merits of different makes of machines required for a given purpose or of the different modes of carrying on given processes. In a word, the mechanical engineer must be skilled by observation, by study and by experience in the science and art of the profession from beginning to end.

One of the leading problems confronting the mechanical engineer, whatever the special line in which he is engaged, is the reduction in the cost of production, and, what is allied to it, the attainment of the maximum result from machinery with the least expenditure of money, time and labor. As machines and processes are in a continual state of improvement, and almost all lines of business are in a continual state of growth, it does not require many years to elapse after a piece of engineering work has been completed before it must be remodeled or enlarged to meet the demands of the times. This problem of reducing the cost of production is, therefore, one which is continually before him. In the design of an individual machine, the highest aim is to reduce the number of parts and quantity of material used to the smallest amount consistent with proper operation, and to run it at the highest speed which can be safely and successfully maintained. In arranging a plant for carrying on some industrial process, the aim must be to employ machinery wherever it is possible to save the labor of men, and assemble the machines so that the least number of hands and

the least expense is required to change the raw material into the finished product. Following in the same direction is the aim to save all unnecessary waste of fuel or energy required in operating the machinery, whatever the class of work and in whatever department of the work such waste may occur.

There are many notable problems of a more specific nature than the one just named which absorb the attention of mechanical engineers and await their solution. One of these is the reduction in cost of steam power. Owing to the great amount of heat which passes to waste through the escape of exhaust steam to the atmosphere or to the condenser, amounting in the most economical engines to some three-fourths of that required in the original generation of the steam, there is a wide field for improvement in steam engine economy. Efforts have been made to reduce this waste by employing a part of the heat thus lost for evaporating some other liquid having a sufficiently low temperature of evaporation, and using the vapor thus formed to generate power in an auxiliary cylinder, thereby adding to the total power developed by the engine, and reducing in a corresponding degree the cost of the power per horse power. Another problem of the same kind is the substitution of some other motive power for the steam plant with the object of reducing its cost. Gas, oil and other forms of internal combustion engines are being widely developed for this purpose. In the conversion of coal into gas by the employment of a gas producer, and the subsequent use of the gas in the cylinder for developing power, the cost has already been reduced below that of steam power, and even better results may be expected.

The development of the steam turbine and its substitution for reciprocating engines is one of the recent problems which mechanical engineers have worked out with most efficient results. One of the most notable features in this work has been the enormous capacity of single units which have been installed in electric power plants, which would be practically impossible if reciprocating engines were used.

Another problem of mechanical engineering which is important to all business interests is that of rapid transportation by railroad. The great increase in speed on street car lines which has been produced by the adoption of electricity for driving power and the results obtained by the introduction of electric locomotives for hauling trains on certain railroads of considerable length are familiar to every one. The success already obtained makes it seem probable that the further adaptation of electricity in railroad work, not only on short lines, but on trunk lines, will meet all the requirements.

The great problem of aerial navigation, which naturally lies in the domain of mechanical engineering, seems in a fair way to be solved. Aeroplanes of sufficient power to carry the operator and one or two passengers are in successful use by expert aviators, and long flights are made with aeroplane in the air a number of hours at a stretch. The utility of the aeroplane in connection with operations of war has been demonstrated beyond question, and government provision of aeroplane fleets has become a recognized necessity the same as that of armies and navies. That part of the problem which remains to be solved is the adaptation of the aeroplane, and of the airship as well, to the transportation of passengers and freight on a commercial scale and in such a manner as to be safe and reliable, whatever the condition of air currents or state of weather.

There are other great problems of mechanical engineering, yet unsolved, which relate to the production of power by the employment of the forces of nature not heretofore utilized. One of these has for its object the utilization of the sun's heat. It has been worked out in a small way in California. A concave mirror having 1,000 square feet of surface has been employed for converging the rays of the sun upon a steam boiler which lies at its focus, and suitable mechanism is arranged for keeping the mirror always turned in the proper direction toward the sun. It is said that in full sunshine this apparatus has developed 10 horse power. Wind power is widely and successfully employed on a small scale, but there remains the problem of overcoming its variable nature by providing means for storing it, and of applying the power thus obtained without limitations. The development of tidal power, like that of wind power, is largely a problem of the storage of energy, and no success in this field has been realized.

What the future offers to a young man choosing the profession of mechanical engineering depends very much upon the ability of the man himself. The broad scope of the profession, already referred to, furnishes ample indication that there is a wide field of work for him. That there are positions awaiting the young engineer may be seen by examining the catalogues of prominent technical colleges, which record the names of graduates and their occupations. For example, in one of these catalogues the class graduated last had a total of 44 men in the department of mechanical engineering. Of this number only three are put down without employment, and one of the three is in reality employed, being a graduate student. Of the 41 holding positions, 18 are engaged in various engineering occupations connected with the manufacture of machinery, three are employed in textile mills, eight are engaged in steel works, three are connected with railroads and the remaining nine are variously occupied in engineering pursuits. If the young engineer becomes connected with an industrial business of sufficient size and importance to warrant the steady employment of a mechanical engineer, and he shows the necessary ability, the prospect is that he will in time push forward to a position of responsibility which will command a good salary and satisfy any ordinary ambition. If his desire is to establish an engineering business of his own, he can make the emoluments greater than in a salaried position, provided he is able to secure the necessary clientage, and conduct such a business to advantage. If this is his choice, the most promising course for him to pursue is to first enter the office of a successful engineer, and spend a few years in learning the business. Then, if he has the acquaintance and aptitude necessary for attracting business for himself, he can set up his own establishment, and by careful attention to the execution of his work strive for the success he seeks. In mechanical engineering, as in other professions, large emoluments await the men who rise to the top, for these are the engineers who are called

upon by individuals and corporations for consultation.

The profession of mechanical engineering offers as many attractions to those entering it as any other profession, for in this, as in others, there is always room for those who excel, and no professional man meets with success unless his work commands it.

GEORGE H. BARRUS,

Expert and Consulting Steam Engineer, Boston.

MECHANICAL MOVEMENTS, POWERS AND APPLIANCES. The primary, fundamental mechanical contrivances are termed the mechanical powers, seven in number and all based on the principles of either the lever or the inclined plane. The common classification is the lever, wheel and axle, cord and pulley, toothed wheels (these four operating on the lever principle), and the inclined plane, wedge and screw (operating on the principle of the inclined plane). What are known as the mechanical movements (sometimes called mechanical motions) include about 750 of the more or less simple and common combinations, covering practically all the fundamental arrangements of the mechanical powers for machine building and engineering work. They constitute the groundwork which the machinist or student of engineering must master before he can make much headway in understanding the complex problems which arise in practice.

Taking first the simple lever, it is found to be of three classes: (1) those in which the fulcrum is situated between the power and the weight; (2) those in which the fulcrum is at one end of the lever arm with the weight nearer to it than the power; and (3) those in which the fulcrum is at the end with the power nearer to it than the weight.

In the first, if the weight W is nearer to the fulcrum, there is a mechanical advantage —illustrated by the crowbar, which on account of the great difference in the length of its arms is advantageously used to overcome great resistance. Scissors and nippers are double levers of this class. If the power P is nearer to the fulcrum, there is a mechanical disadvantage, and if the weight and the power are at an equal distance on either side of the fulcrum, the power is equal to the weight and gives an arrangement similar to the ordinary balance.

The distinction between the gain of power

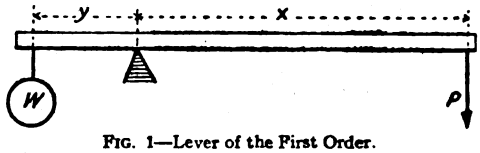

FIG. 1—Lever of the First Order.

and the loss of velocity, and the reverse of these conditions, as depending upon the position of the fulcrum, is exemplified by the shears used for cutting metal and those used for cutting cloth, respectively. In the former, short blades with long handles overcome a great resistance slowly; while in the latter, long blades operated by short handles, move quickly.

In the second class there is always a mechanical advantage. The wheelbarrow is an example of the simple lever. The fulcrum is at

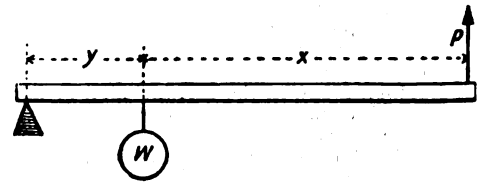

FIG. 2—Lever of the Second Order.

the centre of the wheel, the weight acts downward at the centre of gravity of the load and the power is applied at the ends of the handles. A hinged nut-cracker is an example of a double level of this kind.

In the third class there is always a mechanical disadvantage; but great rapidity of movement is obtained. The human forearm is an example of a simple lever of this class. The fulcrum is at the elbow-joint, the weight acts downward at the hand and the power is applied

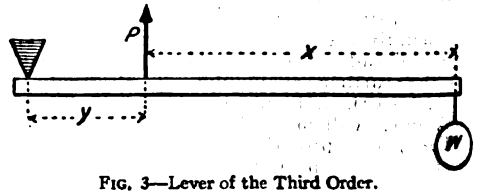

FIG. 3—Lever of the Third Order.

obliquely by a tendon from the biceps muscle attached near the elbow. A pair of tongs is an example of a double lever of this class.

The wheel and axle consists of two cylinders of different sizes rigidly connected together and turning about a common axis. The larger cylinder is called the wheel and the smaller the axle. The power is applied to the end of a rope wound around the wheel and the weight is raised by a rope wound around the axle;

see Fig. 4. The diameter of the larger cylinder or wheel being twice that of the smaller cylinder, or axle, a power of one pound at *P* will balance a weight of two pounds at *W*. This is essentially a form of lever, and "the power is to the weight lifted as the radius of the axle is to the radius of the wheel." The principle is applicable to all forms of hoisting machines, steering gear of ships, fusee clock

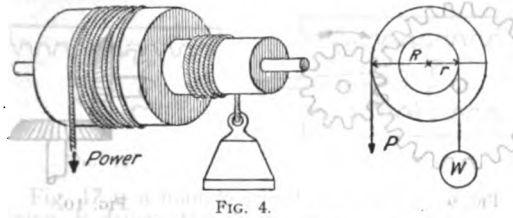

FIG. 4.

and watch movements, etc. If the axle be fixed and the wheel be loosely mounted to revolve on it, we have the ordinary machinist's loose pulley and a variety of uses suggest themselves. If the axle be fixed to the body of a carriage and the wheel allowed to rest on level ground, we find that the carriage can be drawn along with slight effort, requiring a push or pull representing only a small fraction of its weight.

The cord and pulley shows the further uses of the wheel as a lever. In the arrangement shown in Fig. 5 the upper points *F* are fixed, being virtually fulcrums; a downward pull of one pound one foot on the cord *P* will raise the weight *W*, which may weigh nearly two pounds, a half foot; it would balance two pounds but for the loss by friction.

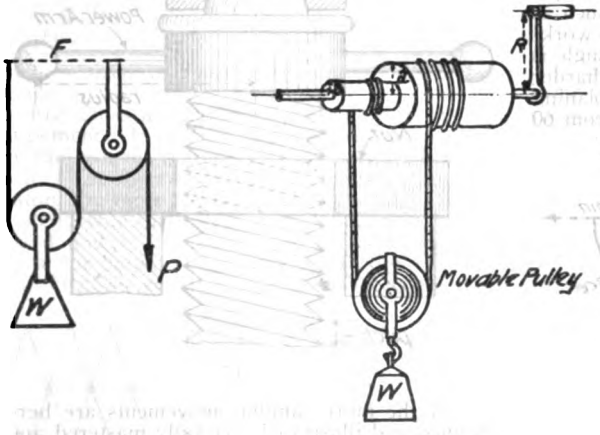

FIG. 5.

FIG. 6.

In Fig. 6 a movable pulley is shown in combination with the wheel *a* and axle *b* and a crank *R* is added. If the crank is one foot long, the wheel one foot in diameter and the axle six inches in diameter, one turn of the crank may draw up the right hand cord about three feet, and lengthen the left hand cord about 18 inches, resulting in raising the pulley and attached weight *W* 9 inches. As the crank handle has traveled about six feet, or eight times as far as the weight is raised, the leverage is 8 to 1, and a boy who can put 50 pounds of effort on the crank can raise nearly 400 pounds at every turn, and in eight turns he will raise it six feet, the distance of travel of the crank at one turn.

A very common arrangement of pulleys, called stepped pulleys, is shown in Fig. 7, as positioned for driving a lathe. The steps of the pulleys on the lathe are supposed to be 3, 6, 9 and 12 inches diameter, respectively. The belt is shown on the 12-inch power pulley and 3-inch lathe pulley, and obviously, if the power shaft is making 100 revolutions per minute, the lathe-shaft will make 400. If the belt be shifted to the next step, where the proportions are 9 to 6, the 100 revolutions of the power shaft will give 150 revolutions of the lathe shaft. On the third step 6 to 9 is the proportion and the lathe will rotate at a speed of 66⅔ revolutions; on the fourth step it is 3 to 12, and the 100 revolutions of the power shaft will give but 25 of the lathe shaft. See PULLEY.

Toothed wheels, now commonly called gear-wheels, illustrate another type of wheel leverage. Spur gears are shown in Fig. 8; here the smaller gear-wheel rotates twice to cause one revolution of the large wheel; thus a small wheel secures increased power at reduced speed.

In Fig. 9, the large wheel, being the driver, turns both the small wheels in the same direction, but oppositely to itself, and gives the shafts of the small wheels two revolutions to one of the large wheel. In Fig. 10 are shown bevel gears, which coact at right angles. It is apparent that almost infinite combinations of such gears are possible. See WHEEL GEARING.

The inclined plane is simply a rigid fixed

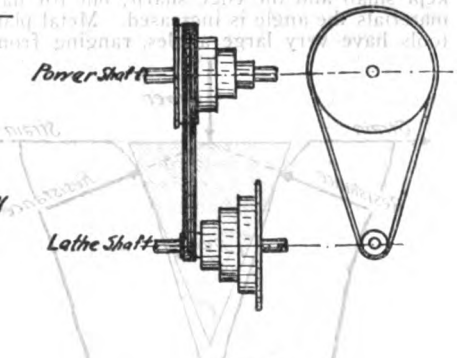

FIG. 7.

plane inclined to the horizon at an angle, and upon which a weight tends to slide down by gravity, or up the slope of which a weight may be pushed or rolled by a force usually horizontal in its action. In Fig. 11 the sliding weight would fall back if the power was withdrawn; it also shows power applied horizontally to move a rolling weight up the plane. In this latter case a continuing power of less than a pound will push a pound roller up the incline because the power has a distance greater than the height overcome in which to exert itself.

The inclined plane principle is used in rolling barrels up on a wagon, in loading logs on a sled, in the operation of a mountain railway and in the cam, which is described later. The employment of the principle does not reduce the work of lifting to the top of the plane, but extends the time of the lift, so that a smaller force used for a longer time does the work.

The screw is essentially an inclined plane wound spirally around a cylinder, in the form of an advancing groove, known as the screw-thread. A cylinder having such grooves cut interiorly like the inside of a nut is termed a female screw. The screw shown in Fig. 12 has two grooves spiraling around and is therefore double-threaded. There being eight threads to

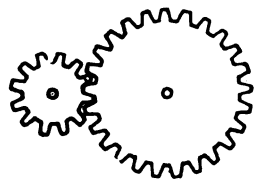

FIG. 8.

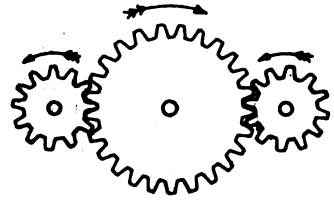

FIG. 9.

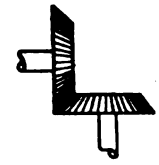

FIG. 10.

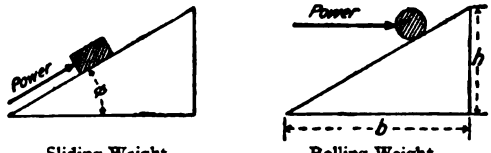
The wedge (Fig. 11a) is a double plane and gives power at the expense of speed. It is sometimes considered as a combination of two inclined planes placed base to base. The mechanical advantage increases as the angle of the wedge decreases — "the power being equal to twice the resistance into the sine of the angle of the wedge." The relation, however,



Sliding Weight. Rolling Weight.

FIG. 11.

has but little practical value since the resistance due to the friction is very great. The principle is used in many forms of cutting tools such as the knife, the chisel, axe and plane. For working in comparatively soft materials, the angle is kept small and the edge sharp; but for harder materials the angle is increased. Metal planing tools have very large angles, ranging from 60

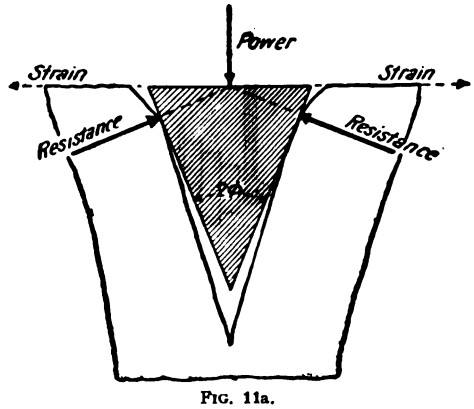


FIG. 11a.

degrees to 80 degrees. When the wedge is employed for cleaving wood, the cohesion and friction combined produces so great a resistance that the force is applied in the form of a blow from a heavy body, and the resulting strain is equal to the force of the blow multiplied by the length of the wedge divided by its width. See WEDGE.

the inch, the pitch of this screw may be regarded as one-eighth of an inch, the distance between threads; or as one-fourth of an inch, the distance between one spiral and the next turn of the same spiral. The principle of the screw is used in the screw propeller (q.v.), and the lifting jack or jackscrew. See SCREW.

A mechanical movement is some simple combination of the elementary powers described above. Perhaps the simplest are the familiar crank (q.v.), cam (q.v.) and cylinder and piston. (See STEAM AND STEAM-ENGINES). A

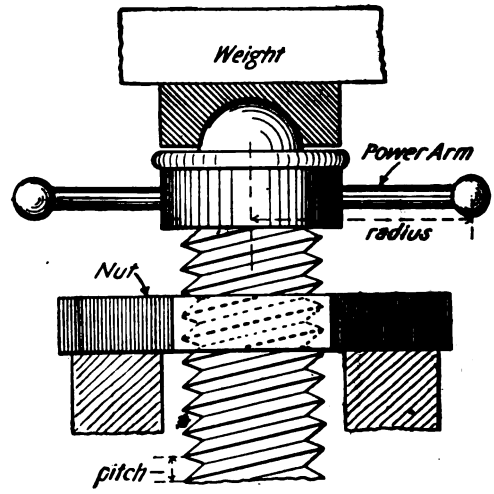

FIG. 12.

few of the more familiar movements are here grouped and illustrated. If fully mastered and understood they will be of great assistance to the student of mechanics in understanding the more difficult and complicated descriptions and drawings of modern machinery.

Fig. 13 is a rack and pinion, for converting rotary motion into linear motion, or the reverse, according to whether the rack or pinion is the driver.

Fig. 14 shows a pinion between two racks. If the lower rack be fixed and the pinion rolled one foot the upper rack will move two feet. In this way the stroke of a piston can be doubled.

Fig. 15 is a gear-wheel and worm, for changing a rapid rotary motion into a very slow rotary motion. One rotation of the worm turns the gear-wheel the distance of one tooth.

Fig. 16 is a group of bevel gears, positioned as in the differential on the rear axle of an automobile. Either of the large bevel-gears may drive the other through the small bevel-gear.

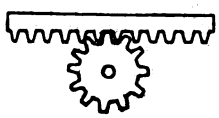

FIG. 13.

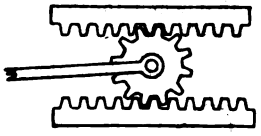

FIG. 14.

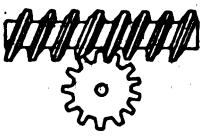

FIG. 15.

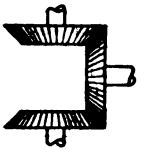

FIG. 16.

Fig. 17 is a mangle wheel and pinion. The pinion *P* drives, traveling around the long C-shaped rack, rotating the mangle first into one direction then in the reverse direction.

Fig. 18 is a pair of eccentric gear-wheels, either of which may be the driver. The rotation of the driven wheel is alternately slow and rapid.

Fig. 19 shows a couple of pump-cams. As they touch at every point of their rotation they

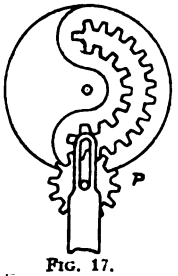

FIG. 17.

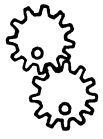

FIG. 18.

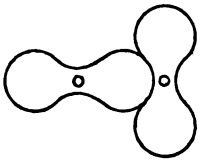

FIG. 19.

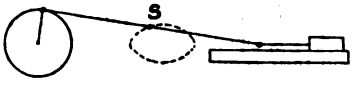

FIG. 20.

may be used to raise a column of water by lifting.

Fig. 20 is a diagram of a crank and piston movement. It will be noticed that the spot *s* on the centre of the piston rod describes an oval. The nearer this spot is placed to the piston the more elongated is the oval. If the student will make a pattern of this in cardboard and test it in various positions he will get a far better understanding of why a crank motion is so generally preferred in machinery

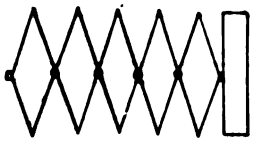

FIG 21.

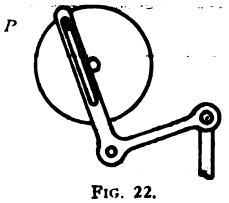

FIG. 22.

for altering rotary into reciprocating motion — the change is so gradual that jar is obviated.

Fig. 21 is a lazy tongs or combination of levers which support each other and permit rapid change of position.

Fig. 22 is a combined bell-crank and wheel-crank for altering rotary motion into reciprocating. The wheel drives and as the pin *p* travels in the slot it raises and lowers the rod *r*, rapidly in one direction, more slowly in the other.

Fig. 23 is a parallel motion. To whatever distance the bars are moved they are held parallel by the slanting connections.

Fig. 24 is a shears for cutting metal. The wheel *w* and pin operate the upper blade, giving a long leverage for increased shearing power.

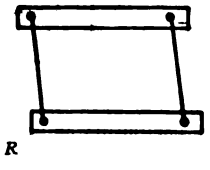

FIG. 23.

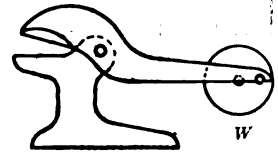

FIG. 24.

Fig. 25 is a toggle joint. Only a slight force is required to throw the two levers into line exerting a vastly multiplied energy over a short distance. It is used in many machines to apply a sudden pressure.

Fig. 26 is a universal joint, permitting a rotating shaft to be bent to a slight angle as necessary, without interfering with its working.

Fig. 27 is a three-throw cam. The three-pointed wheel measures the same at every point of its diameter, and as it rotates gives a reciprocating motion to the rod, moving it back and forth three times to each revolution.

Fig. 28 is a heart-cam for giving irregular reciprocation to the rod.

Fig. 29 is an ore-stamp. The cam shaped like a long *s* raises the stamp twice during each revolution and leaves it free to drop by gravity.

Fig. 30 shows a drum-shaped cam *C* whose groove moves the shaft *S* of the large wheel *W* alternately to the right and left.

Fig. 31 is an eccentric, or wheel mounted out of centre, so that through the encircling straps it gives a reciprocating motion to the rod. It is much used on steam-engines.

Fig. 32 is a pair of pulleys connected by a twisted belt for reversing the direction of rotation of one of the shafts.

Fig. 33 is a two-speed gear. The pulley *a*

being the driver, the upper large pulley is driven on one speed; when the belt is shifted to *b*, which is a loose pulley there is no driving; when the belt is shifted to *c* the other drive at a different speed is effective.

Fig. 34 is the steering gear of a sailing vessel, showing how the turning of the hand-wheel *w* is made to shift the ropes *rr* and throw the tiller *t* of the rudder to right or left.

Fig. 35 is a positive "silent" chain drive. Either the chain or gear-wheel may drive. It is used on auto-trucks and a variety of heavy machinery where belts are inadequate.

Fig. 36 is an intermittent motion given the

FIG. 25.

FIG. 26.

toothed wheel by the rotation of the notched pinion. Every time the notch comes around it advances the wheel one tooth.

Fig. 37 is an escapement. The levers are connected with a pendulum or the like and at every swing allow the wheel to turn one notch.

Fig. 38 is a ball governor as used on steam-engines. When a certain speed is exceeded the balls are thrown out by centrifugal force, and rise, opening a valve or adjusting a cut-off and thus reducing the speed back to the normal.

"Compound motions" are obtained by combining any two or more of the simple motions, and machines are built up by combining the simple motions harmoniously.

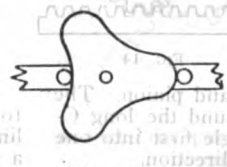

FIG. 27.

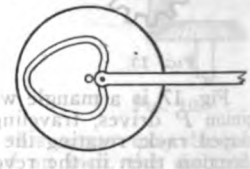

FIG. 28.

"Pendulum motion" is the oscillatory motion of a body in the arc of a circle, the body being attached to a rod which vibrates to and fro from a fixed axis. In the ideal simple pendulum, consisting of a body attached to a string without weight and vibrating from the point of suspension without resistance of any kind whatever, a material body once set in motion would continue to swing to and fro forever.

Under these conditions it has been noted (1) that the time of vibrations of a pendulum through short arcs is independent of the lengths of the arcs and that when the length of the arc is constant, as in the case of clock devices, the times of vibration are equal; (2) that when the force of gravity is constant, as is the case of any given point on the surface of the earth, the time of vibration varies directly as the square root of the length of the pendulum, so that, if a pendulum of a given length vibrates in one second, a pendulum one-quarter as long will vibrate in one-half of a second, and one four times as long will vibrate in two seconds; (3) that when the length of the pendulum is constant, the time of a vibration varies inversely as the square root of the force of gravity; and (4) that when the time of vibration of two pendulums at different points on the surface of the earth is equal, their lengths vary directly as the force of gravity. See PENDULUM.

"Perpetual motion" is a continuous or incessant motion supposed to be attainable by a mechanical device with inherent motive energy, and, therefore, which when once set in motion is capable of continuing that motion indefinitely or perpetually. Such a device or machine, if practicable, might be termed a "perpetual movement."

The various forms of mechanical movements embodying the principles of one or more of the mechanical powers already described are so innumerable that a detailed description of them is impracticable within the scope of this article; but they are classified as follows into several important groups according to the general purposes for which they are used.

"Transmission of power appliances," consisting of ropes, belts and various forms of gears, pulleys, etc.

"Measurement of power appliances and devices," used for determining velocities, pressures, weights, number and quantities, such as brakes, counters, dynamometers, gauges, indicators, meters, planimeters, testing machines and weighting machines.

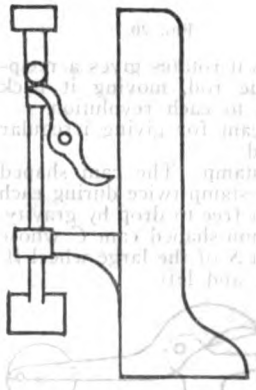

FIG. 29.

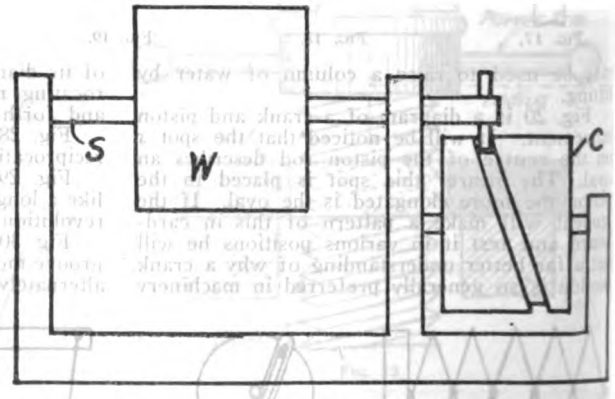

FIG. 30.

"Steam power appliances," comprising boilers, locomotives, locomotive engines, oscillating engines, rotary engines, steam-engines, steam turbines, valves and valve-gears, parallel motion gears, governors and other engine devices.

"Steam appliances," such as injectors, steam pumps, condensers, separators, traps and valves.

"Motive power machines," such as gas-engines, internal-combustion engines, heat-engines, solar engines, etc.

"Hydraulic power appliances and devices," consisting of various forms of waterwheels, water-motors, turbines, pumps, syphons, water-lifts, ejectors, hydraulic or water rams, meters, indicators, pressure regulators, valves, pipe joints, filters, hydraulic presses and hydraulic

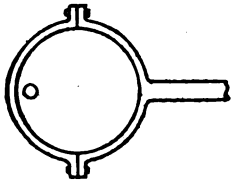

FIG. 31.

FIG. 32.

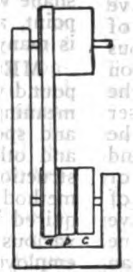

FIG. 33.

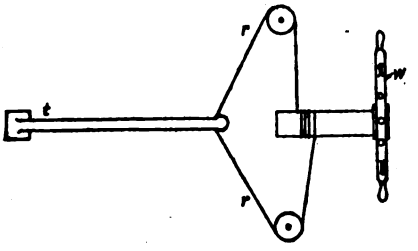

FIG. 34.

metal-working machinery such as riveters, rail-benders and punches.

"Air power appliances," devices and apparatus consisting of air compressors, air pumps, air water-lifts, barometers, bellows, blowers, blowpipes and compressed-air tools such as pneumatic drills, hammers, riveters and shearing machines. Also, gauges, ventilators and musical instruments.

"Electrical power and construction appliances" such as generators, motors, wiring devices, controlling and measuring devices, lighting arrangements, electric furnaces, heaters, fans, searchlights and drilling machines.

"Navigation appliances" used for operating steamships, sailing vessels and yachts, such as sails, rope knots, block and tackle, paddle wheels, screw propellers, steering gear, anchors, windlasses, capstans, cranes, etc.

"Road appliances," used in the construction of roads, highways and railroads, such as scrapers, rollers, excavators, vehicles, automobiles, bicycles, motor adjuncts, wheels, road gates, lamps, etc.

"Gearing," consisting of rack and pinion devices, spiral, elliptical and worm gears, differential and stop-motion gears, and epicyclical and planetary trains.

"Motion and controlling devices," consisting of rachets and pawls, cams and volute cams, cranks and variable cranks, intermittent and stop motions, wipers, shafts, couplings and gyroscopes.

"Horological apparatus and devices," mainly used for measuring time, such as spring and pendulum clocks, watch and chronometer movements, electric clocks and sundials.

"Mining machinery and appliances," such as quarrying and cutting machines, borers, drills, valves, blowers, ventilators, safety lamps, hoisting drums, conveyors, crushers, pulverizers, hydraulic nozzles, presses, air-blast and magnetic separators, steam shovels, dredges, haulage appliances, furnaces and automatic dumps.

"Mill and factory appliances," such as hangers, shaft bearings, ball bearings, steps, couplings, universal and flexible couplings, speed gears, shop tools, screw threads, hoists, stamp-mills, saws, punches, shears, bending machines, grinding machine, cotton presses, looms, knitting machines, etc.

"Engineering construction appliances," such as mixing machines, testing machines, stump and pile pulling machines, blocks and tackle, hoisting machines, tackles hooks, pile drivers, automatic dumps and dumping cars, stone grips, derricks, conveyors, timber splicers, metal welding devices, tools, wood-preserving apparatus, cable carriers, dams and embankment escalators and moving platforms, "Ferris" wheels, high structures and buildings, roof and bridge trusses, trestles and bridges.

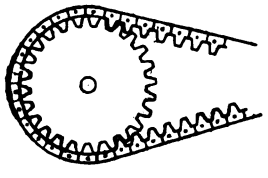

FIG. 35.

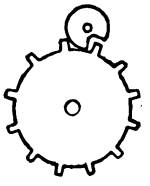

FIG. 36.

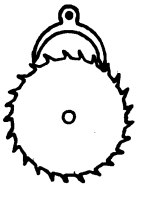

FIG 37.

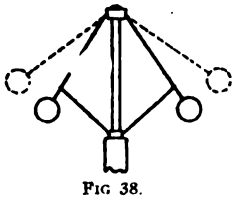

FIG 38.

"Agricultural machines and implements," such as plows, tethering hooks, wash boilers, washing machines, mowers, grain harvesters, threshing machines, cream separators, refrigerating machinery, cold storage houses, refuse crematories, silos, kilns, ovens and furnaces.

"Draughting devices," such as dividers, dotting pens, parallel rules, curve delineators, trammels, ellipsographs, pantographs, etc.

"Tools," hand and machine, such as saws, chisels, mallets, planes, borers, etc.

"Perpetual motion devices," consisting of various forms of hydraulic, hydrostatic and magneto-electric apparatus.

Bibliography.— For descriptions of a great variety of special movements, appliances and

devices, consult the works on the subject by Hiscox, Rheile, Ruleau and Spon, also the special articles on the various forms of appliances enumerated under the general classes stated in this article.

CHARLES H. COCHRANE,
Author of 'Wonders of Modern Mechanism.'

MECHANICAL SIZING. Classification of Dry Granular Material.— The mechanical classification of dry granular material is the result of the action of several natural laws operating in conjunction with a mechanical device so arranged as to permit the balancing of the action of one law with another. The combined motion places the relative action of the dry granular material completely under control of the mechanical device. The first active law in mechanical sizing is termed the laws of selectiveness. When mixed particles of various sizes of granular material are under agitation upon a level plane, the finer particles sink to the bottom and engage the surface while the coarser particles rise to the top without regard to the specific gravity of such particles. The second active law is called the law of displacement or the displacement of the centres of gravity of particles upon an inclined plane. The relative difference in the tendency of coarse and fine material of granular shape to move down an inclined plane is due to the difference in the displacement of their centres of gravity upon the same angle of plane. The third active law is the law of friction of mass or the "coefficient of friction."

Close observation of the action of these laws as well as the influence of other forces led to the design of a "mechanical sizer" simply arranged to best meet the requirements of these laws. In order to assist the law of selective action on an inclined plane, a series of several hundred tapered riffles or grooves are placed on the inclined surface of what is termed the deck of the device. This permits the "fines" to sink to the bottom of these grooves and forces the discharge of larger particles over the top of the riffle, in accordance with the action of the law of displacement of centres of gravity. This is accomplished by the feeding of dry material to the inclined deck while the same is being agitated forward and backward by a specially designed head motion, which pushes the deck forward at one speed and causes it to return at a higher speed. This sets up what is termed a progressive action of material on the deck or causes the granular particles to travel in a forward direction, under the government, however, of the law of selective action and the law of displacement aided by the law of friction of mass. Under operation, the device is fed with dry ore, sand, grain or the like, the feed engaging a feed board where a preliminary rough separation is accomplished by a modified application of tapered riffles. The feed then engages the table deck at the head of its proper zone and here, because of the length and the great number of riffles, almost any esired number of carefully sized products may be taken off by placing receptacles at the bottom and far edges of the deck, from which falls, when in action, a constant sheet of granular material graded carefully from coarse particles to fine dust.

Mechanical sizing is applicable to every form of dry granular material such as crushed ore, salt, coal, sand, emery, cereals, unbroken or crushed, or, in fact, there is no field in dry sizing now filled by metallic screen devices that cannot be filled by a mechanical sizer and often with greater economy and efficiency. This is proved by the fact that metallic screens blind and lose their efficiency while the mechanical device cannot clog or blind and automatically cleans itself. Specific gravity has practically no effect upon mechanical sizing for the reason that granular particles of the same contour and volume, when placed upon an inclined plane, have the same displacement of their centres of gravity with the result that a particle of lead and a particle of sawdust of the same size and shape will discharge from the table at the same point, although the specific gravity of the one is many times that of the other.

MECHANICAL TERMS. Words, compound words and short phrases, having definite meanings other than those of ordinary usage and specifically applicable to the use of tools and other mechanical appliances; to the construction and operation of machines, and to the methods employed and the manipulations required in the working and manufacture of the various kinds of materials used and the articles employed for engineering, structural and other industrial purposes.

A great many of these terms have been in use from the very beginning of the present period of industrial and manufacturing development, and are satisfactorily employed at the present time according to their original significance; but the creative mechanical effort of the last 40 years has either developed or produced so great a variety of mechanical devices and machines that the mechanical terminology has been expanded to include a much greater number of terms, which are more or less familiar to every one excepting those by whom they are habitually used in the execution of the particular line of work to which they are applicable.

Furthermore, the specializing methods of modern manufacturing systems, involving the restricted use of special terms, has not only tended to develop a class of one-sided workmen who are unquestionably skilful in their special lines of work and deplorably poor if not absolutely deficient in all other lines; but, the use of such methods has tended to increase the ever-widening gulf which separates any one class of workmen from the rest, by eliminating the necessity of a mutual knowledge of the special terms used in allied processes, by the special classes of workmen employed therein.

At the present time the number of mechanical terms amounts to several thousands. Eliminating those of a more or less fanciful character, and also those employed in individual shops, the terms having definite meanings capable of universal or wide application probably exceed 12,000 in number, the great majority of which are employed in the metal manufacturing and metal working industries.

A superficial examination of this terminology conveys the impression that a definite classification of the various terms would be either impossible or quite difficult, but a closer inspection shows that they may be very conveniently divided into several general classes

according to the character of the work, machines and structures to which they are applicable, as follows: (1) Terms applicable to the processes and methods employed in the production of raw materials and rough work, and in the preparation of rough work for subsequent finishing operations; (2) terms applicable to the methods, processes and machines employed in the working of suitably prepared raw material into the form of simple articles, into the parts of complex machines and into structural shapes in general; (3) terms employed in the work connected with the preliminary and final erection of machines, engines and structures; (4) terms used for the purpose of describing special forms of mechanical appliances and mechanical movements according to their field of application; (5) terms employed in operating the various classes of engines and machines; (6) general terms employed in connection with the execution of mechanical and structural engineering work; and (7) terms employed in connection with the use of the tools and appliances, and the application of the various methods and processes, in the reproductive arts.

In considering the matter of the application of technical terminology it is well to prescribe marked lines of demarcation between the terms employed in connection with the different kinds of work, as for example — between the terms applicable to mechanical work and those employed in connection with electrical work. As a rule, the distinction is quite clear, but when the terms are used for the purpose of describing appliances, devices and apparatus the line of demarcation becomes somewhat indistinct, and the precise meanings of the terms require careful consideration.

One of the most interesting examples of the varied technical application of a common term is that afforded by the use of the word "damper." It is familiarly known as a plate, valve, cover or other suitable contrivance for regulating the amount of draught in the flues of a furnace or boiler. As a specific mechanical term it is applied to the "dash-pot" or small cylinder which forms a portion of the engines of the Corliss type, in which they act as a "buffer-case" and prevent the too sudden closing of the steam and exhaust valves. As an electrical term it is applied to a metallic cylinder which is placed in such a manner that it nearly or entirely encompasses the iron core of an induction coil for the purpose of effecting a variation in the intensity of the current produced in the secondary battery. As a term employed in musical construction and operation it is applied to the strip of felt or other soft material employed in a piano-forte for the purpose of modulating the vibration of the strings.

A more varied technical application obtains in the case of the common word "pitch." As used in connection with mechanical work it refers to the distance between the centres of two adjacent teeth on a gear-wheel, to the distances between bolts, rivets and boiler stays or similar parts arranged equidistantly. Also to the inclination or rake of the teeth of saws, to the angle at which a plane-iron is set on its stock and to the height or angle of a roof-truss. As an electrical term it refers to the successive corresponding conductors on the armature of a dynamo and the number of coils advanced in making end-connections between the coils of an armature winding divided into segments. It is also applied to designate the frequency of a tone vibration produced electrically. As a musical term it refers to a succession of tone vibrations.

The character of a technical term or the class of work to which it belongs is usually very clearly indicated by the textual matter on any particular subject, but in the case of mechanical and electrical terms when the distinction is not obvious, the special character of a term may be ascertained only by the nature of the power generated, controlled or applied.

MECHANICS (*μηχανή*, a machine), or DYNAMICS, the science that treats of forces (*δύναμις*, force), and of the motions produced by them. The notion of a force, as evinced to the senses as a push or pull, is common to all, but the notion of force as that which produces or destroys motion, which is the proper definition of force, is modern, and is to be ascribed to Newton, the chief founder of the science. It is a familiar fact that two opposite pushes or pulls may neutralize each other's effects, and thus fail to produce motion; we then speak of them as forces in *equilibrium*. The portion of Mechanics that treats of forces in equilibrium is denoted by the term *Statics* (root *στα*, stand), contrasted with which we have the subject of *Kinetics* (*κινέω*, to set moving), which deals with the effects of forces in acting to produce motion in bodies. Since we can distinguish motion only in matter, the laws of motion involve the essential properties of matter, so that Dynamics is a branch of Physics — indeed, its most fundamental branch, for, until recently, it was the effort of physicists to reduce all explanations of physical phenomena to descriptions of matter in motion.* Nowadays the tendency of interpreting mechanics in electromagnetic terms is making itself felt. As in geometry, instead of dealing with actual substance, we make abstraction and conceive of points, lines and surfaces apart from the substance in which they lie, so we may make abstraction and consider the motion of points, lines or geometrical configurations, quite apart from any matter or physical properties. This geometry of moving configurations or geometry of space and time is generally distinguished by the name of *Kinematics* (*κίνημα*, motion), and is included under treatments of Dynamics only for convenience, as it is impossible to make dynamical investigations except in kinematical terms.

The ancients knew but little of Mechanics, and what they did know belonged exclusively to Statics. Archimedes was familiar with the principles of the lever and of the pulley. Leonardo da Vinci generalized the principle of the lever, and Stevinus (1548–1620) demonstrated the principle of the inclined plane and of the composition of forces. Varignon clearly enunciated the principle of moments, and also of the

* *Utinam cætera naturæ phænomena ex principiis mechanicis eodem argumentandi genere derivare liceret.* Newton 'Preface to Principia.'

composition of forces. Galileo, in the course of his investigations on the inclined plane, came to a recognition of a particular case of the Principle of Virtual Work, which was made general by Daniel Bernoulli. These are the chief names in the development of Statics. The beginnings of Kinematics were made by Galileo, who determined the laws of falling bodies, and introduced the fundamental idea of acceleration. Huygens, in his 'Horologium Oscillatorium,' published in 1673, examined in detail the laws of the pendulum, introduced the ideas of moment of inertia, of the centre of oscillation and of kinetic energy. Most important of all was the work of Newton, who in his 'Principia Philosophiæ Naturalis' (1687), not only universalized the idea of force, and introduced the notion of *mass*, but laid down the exact definitions and principles from which it has never been necessary to depart. Since the work of Newton the chief names have been d'Alembert, Lagrange and Hamilton, who have given us methods of great generality and convenience, but without changing in any essential the principles laid down by Newton.

1. STATICS.—Although the principles of Statics may be logically deduced from those of Kinetics by assuming all velocities to be zero, it is simpler to follow the historical method and treat statics first, since we may dispense with the idea of time, and thus with the preliminary study of kinematics. We begin by assuming the identical nature of all forces. For instance, the effect of any force may be neutralized by a pull on a string fastened to the point at which the force is applied. The tension on a string is produced by equal and opposite pulls on its two ends, and it may be cut anywhere, if at the cut end is applied a force equal to the one previously applied to the end. Such a force may be produced by the weight of any body hanging from the end of the string. But as a weight always acts vertically downward, while forces may act in any direction, we may suppose the string carried over a smooth pulley with horizontal axis, whose effect is assumed to be merely to change the direction of the string without changing its tension. Thus any force in any direction may be equilibrated by the tension of a string produced by a certain weight. Two forces are equal when they are equilibrated by the same weight. Two weights found to be equal (by equilibration), when hung from the same string, produce double the tension produced by one, and thus forces may be measured in terms of a single weight. A force having magnitude and direction may be geometrically represented by a line parallel to it, and of a length proportional to its magnitude. To this line an arrow-head may be attached to indicate the sense of the direction of

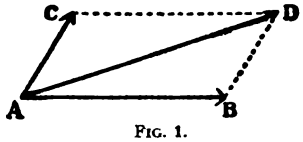

FIG. 1.

the force. We may now enunciate the principle, capable of experimental verification, that when two forces, represented by AB, AC, Fig. 1, are applied at the same material point A, they may be replaced by a single force whose direction and magnitude are represented by the diagonal AD of the parallelogram formed on the sides AB, AC. (The direction of the arrows must be observed). This is the principle of the *Parallelogram of Forces*. Obviously it may be replaced by the equivalent statement that if we form a triangle by placing at the extremity B of one of the lines representing the forces the initial point of the line representing the other force, BD, and complete the triangle, the line drawn from the initial point of the first to the terminal point of the second line will represent the *resultant* of the two forces, that being the term applied to the single force which replaces their effect. The original forces AB, AC, are said to be the *components* of AD. From the properties of the parallelogram, $AB \sin (BAD) = AC \sin (CAD)$, so that the magnitudes of the components are inversely proportional to the sines of the angles they make with the resultant. Obviously the two forces may be equilibrated by a force equal but opposite to the resultant, so that if we draw AE equal and opposite to AD (Fig. 2) the three

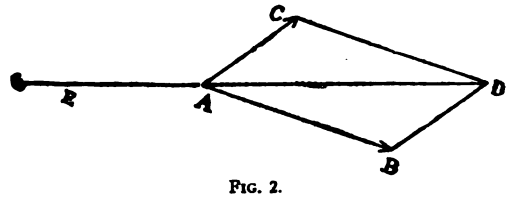

FIG. 2.

forces AB, AC, AE will be in equilibrium. As the angles BAD and BAE are supplementary, their sines are equal, similarly DAC and CAE; consequently we have $\frac{AB}{\sin (CAE)} = \frac{AC}{\sin (BAE)}$, and in turn considering each of the three forces as equilibrating the other two we get the theorem that the magnitudes of three forces in equilibrium are proportional to the sines of the angles lying opposite them respectively. This may be experimentally verified as in Fig. 3, where weights P, Q are hung

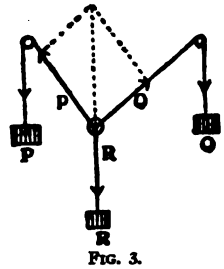

FIG. 3.

from strings passing over pulleys, and united at O to a string carrying a weight R. If a parallelogram be drawn on lengths proportional to P, Q, its diagonal will be vertical, and proportional to the weight R. A convenient form of the experiment is one in which the three strings are horizontal, and O is the centre of a horizontal circular table, on whose rim the three pulleys may be placed, their relative positions being read off on a graduation of the edge of the table.

Obviously, by a reversal of the previous process, a given force may be resolved into components in any two given directions, as only one parallelogram can be drawn on a given diagonal, whose sides have given directions. If these directions are at right angles to each

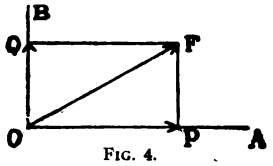

FIG. 4.

other, as in Fig. 4, OP is the *component* of OF in the direction OA and OQ the component in the direction perpendicular thereto. The length OP is called the *projection* of OF in the direction OA, and we have $OP = OF \cos (POF)$. Having found the resultant of two forces applied at a common point, we may compound this resultant with another force, and so on, the simplest rule of procedure being by an extension of the triangle method above, that is, apply the initial point of each line representing a force to the terminal point of the preceding line; then the line drawn from the first initial point to the last terminal point will represent the resultant. The slightest consideration will show that the resultant is independent of the order in which the forces are compounded. This construction is known as the polygon of forces (Fig. 5). It is ob-

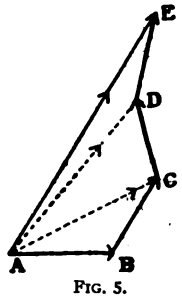

FIG. 5.

viously not restricted to forces lying in the same plane.

In order to deal analytically with the composition of forces, it is convenient to assume three rectangular axes of co-ordinates, OX, OY, OZ (Fig. 6), and to resolve every force

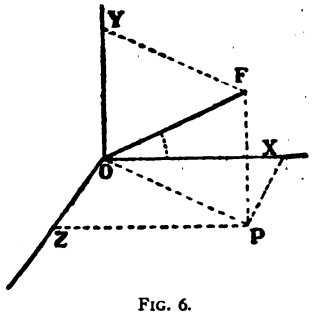

FIG. 6.

into three components along each. Thus OF may be resolved into the mutually perpendicular components OY and OP, and OP may be resolved into OX and OZ. Calling the resultant F, the components respectively X, Y, Z, we have

$$(1)\qquad \begin{aligned} X &= F\cos(Fx),\\ Y &= F\cos(Fy),\\ Z &= F\cos(Fz); \end{aligned}$$

$$(2)\qquad X^2+Y^2+Z^2 = F^2[\cos^2(Fx)+\cos^2(Fy)+\cos^2(Fz)] = F^2,$$

since the sum of the squares of the direction cosines of any line is identically equal to unity. Since the projection in any direction of any broken line is the same as that of a straight line with the same ends, it is evident that the projection of any resultant is the same as the algebraic sum of the projections of all its components. Thus the analytical expression of the principle of the parallelogram or polygon of forces is, if F is the resultant, X, Y, Z its components along the axes,

$$(3)\qquad \begin{aligned} X &= X_1 + X_2 + \ldots X_n = \Sigma X,\\ Y &= Y_1 + Y_2 + \ldots Y_n = \Sigma Y,\\ Z &= Z_1 + Z_2 + \ldots Z_n = \Sigma Z. \end{aligned}$$

Any geometrical or physical quantity which possesses direction as well as magnitude, and is compounded according to the parallelogram law, and to which the whole of the above exposition applies, is called a *vector*, and the preceding process is called the *composition of vectors*.

2. A body so small that we may neglect the differences of position of its different points is called a *material particle*. The only principle necessary for the treatment of forces acting on such a particle is that for equilibrium the resultant of all the forces applied to it must vanish. The particle may be free or it may be subject to certain geometrical constraints, for instance, it may be obliged to move on a certain surface. Then there will be certain forces acting between the particle and the bodies causing the constraint, these forces being known as *reactions* due to the constraint. A surface is said to be smooth if the reaction between it and a particle at rest is normal to the surface. Thus let F, Fig. 7, represent a

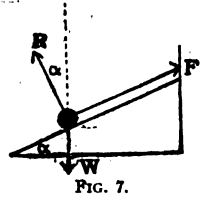

FIG. 7.

force applied to a particle of weight W, resting on an inclined plane making an angle α with the horizontal. Let F be parallel to the inclined plane. Then the three forces, W. F. and R, the reaction, normal to the plane, are in equilibrium. Writing these proportional to the opposite angles, as above, we obtain

$$(4)\qquad \frac{F}{\sin\alpha} = \frac{R}{\cos\alpha} = \frac{W}{1},$$

which determine F and R in terms of W. The same equations are obtained by resolving in the direction of the tangent and of the normal to the plane. The equation $F = W \sin\alpha$ shows that the force required to sustain a particle on a smooth plane is to the weight of the particle in the same ratio as the height of the plane to its length, as was shown by Stevinus and Galileo.

In the problem just treated, it is evident that the resultant of the applied forces W and F is opposite to R, that is, is normal to the plane. Similarly for equilibrium on any smooth surface, it is necessary that the resultant of all the applied forces shall be normal to the surface, for if it had any component parallel to the tangent plane this component would move the particle along the surface. Since the particle is constrained to move on a surface, there will be a relation between x, y, z, the co-ordinates of the particles, $\phi(x, y, z) = 0$, which is the equation of the surface; and since the direction cosines of the normal n are given by the equations

$$\cos(nx) : \cos(ny) : \cos(nz) = \frac{\partial\phi}{\partial x} \cdot \frac{\partial\phi}{\partial y} \cdot \frac{\partial\phi}{\partial z},$$

if X, Y, Z are the components of the resultant of the applied forces, we have as the condition for equilibrium

$$\cos(Fx) = \frac{X}{F} = \cos(nx), \text{ etc.},$$

or

$$\frac{X}{\frac{\partial\phi}{\partial x}} = \frac{Y}{\frac{\partial\phi}{\partial y}} = \frac{Z}{\frac{\partial\phi}{\partial z}}. \tag{5}$$

If the surface is not smooth, the reaction between the particle and the surface is not normal, but there is a tangential component which is called *friction*. The force of friction is peculiar in that it cannot produce but only hinder motion, and in having its direction determined as opposite to the direction in which the other forces tend to make the particle move. The law usually assumed governing friction is that when motion is just about to take place the friction, or tangential component of the reaction, is proportional to the normal component, the factor of proportionality being a constant for two given substances, such as those composing the particle and plane, as above. Suppose that in the problem of the inclined plane the force F is the force of friction. Then we have $F = \mu R$, where μ is a constant for the given particle and plane called the coefficient of friction. Equations (4) then give

$$F = R \tan \alpha = \mu R, \quad \mu = \tan \alpha,$$

when the particle is just about to slide down. If the plane is any steeper than the value of α thus given, equilibrium is not possible. This angle is called the *angle of friction*.

3. Let us now consider a *rigid* body, that is, one composed of a continuous distribution of matter having the property that the distance between any two of its points is invariable, no matter to what forces it is subjected. It is evident that if equal and opposite forces, P and Q, Fig. 8, be applied to such a body at

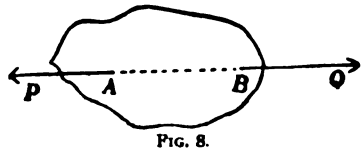

FIG. 8.

two points A and B such that the line AB has the direction of the forces, no motion will be produced, for reasons of symmetry with respect to AB. Equilibrium is also independent of the position of B on the line AB. Consequently the force Q might be applied at A, where it might be compounded with P, giving a vanishing resultant. The principle that any force applied to a rigid body may be considered as applied at any other point in its line of direction is known as that of the *transmissibility of force*. As an application, if the lines of direction of three forces, P, Q, R (Fig. 9), intersect in a common point O, they

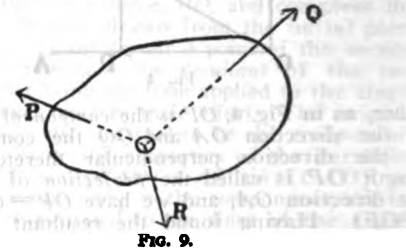

FIG. 9.

may be transferred to that point, and if they satisfy the conditions for the equilibrium of forces applied to a material particle, they will produce equilibrium of the rigid body.

Suppose we have two parallel forces P and Q applied at any points A, B, of a rigid body, (Fig. 10). If we apply at A and B any two

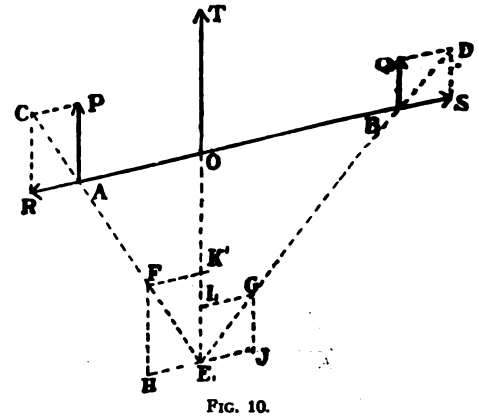

FIG. 10.

equal and opposite forces AR, BS, in the direction of AB, equilibrium will not be affected. Compound these respectively with AP, BQ, and transfer the resultants AC, BD, to the intersection of their lines of direction E and there resolve them into components in the original directions. From the equality of the parallelograms $EKFH$ and $APCR$, $ELGJ$ and $BQDS$, the components EJ and EH are equal and opposite, so that there remain only the components EK and EL, in the same direction, equal to the given forces AP, BQ, respectively. Thus the resultant of two parallel forces in the same direction applied to a rigid body is a force in the same direction equal to their sum. Obviously it may be considered as applied at any point O in the line EK. Suppose O to lie on AB. By similar triangles $\frac{AP}{AR} = \frac{OE}{AO}$, $\frac{BQ}{BS} = \frac{OE}{BO}$, and by division, since $AR = BS$, $\frac{AP}{BQ} = \frac{BO}{AO}$. Thus the distance of the intersection of the line of direction of the re-

sultant with AB from A and B is inversely proportional to the forces applied at those points. This is the principle of the lever, as known to Archimedes.

If the forces P and Q are the weights w_1, w_2, of two particles, placed at AB, the point O is called the *centre of gravity* of the two particles. It is also called the weighted mean point of points AB with the weights w_1, w_2. If we project the points A, B, O upon the co-ordinate axes, the projections of AO, BO, are in the same ratios as the lengths themselves; consequently if their co-ordinates are respectively x_1, y_1, z_1, x_2, y_2, z_2, $\bar{x}$, $\bar{y}$, $\bar{z}$,

$$\frac{\bar{x}-x_1}{x_2-\bar{x}}=\frac{\bar{y}-y_1}{y_2-\bar{y}}=\frac{\bar{z}-z_1}{z_2-\bar{z}}=\frac{m_2}{m_1},$$

or

$$(6)\qquad \bar{x}=\frac{m_1x_1+m_2x_2}{m_1+m_2},\ \bar{y}=\frac{m_1y_1+m_2y_2}{m_1+m_2},$$

$$\bar{z}=\frac{m_1z_1+m_2z_2}{m_1+m_2}.$$

By a generalization, we obtain for the centre of gravity of any number of points, or the resultant of any number of parallel forces,

$$(7)\qquad \bar{x}=\frac{\Sigma mx}{\Sigma m},\ \bar{y}=\frac{\Sigma my}{\Sigma m},\ \bar{z}=\frac{\Sigma mz}{\Sigma m}.$$

If the two forces AP, BQ, are in opposite directions, instead of Fig. 10 we have the construction of Fig. 11, and the resultant is evi-

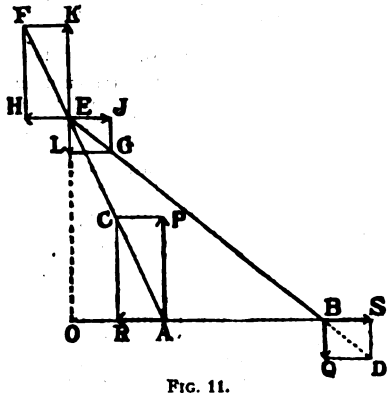

FIG. 11.

dently equal to the *difference* of the two components, while the point O lies outside the segment AB. We may say that in general the resultant is equal to the *algebraic* sum of the components. In Fig. 11, if AP and BQ are made more nearly equal, the point O recedes to a greater distance, and in the case of equality, when we have AC parallel to BD, O must be infinitely distant. The same result is given by the formulæ (6), putting $m_1+m_2=0$. In other words, two equal, parallel and *oppositely* directed forces applied to a rigid body cannot be replaced by a single resultant. Such a pair of forces is called a *couple*. The perpendicular distance between the two lines of direction of the members of the couple is called its *arm*. The product of the magnitude of either force by the arm of the couple is called the *moment* of the couple. The plane of the couple is the plane containing both

forces. We have shown that a couple cannot be equilibrated by any single force, but it may be by another couple. This couple may be chosen in an infinite variety of ways. It may easily be shown by drawing the members of the second couple as about to be prescribed, and compounding the forces two and two, by the rules already given, that the equilibrating couple may be equilibrated by any of the following, and that the given couple may accordingly be replaced by: 1° An equal and parallel couple in any plane parallel to its own; 2° An equal couple in its plane turned about its point of symmetry; 3° A couple in the same place having different arm and forces but the same moment. Thus all that characterizes a couple is the magnitude of its moment and the direction of the normal to the plane of the couple. The couple then behaves like a directed quantity, and may be symbolized by a line in the direction of the normal to its plane, whose length gives the magnitude of the moment. That couples are also compounded by the vector law is easily seen, for consider for forces of the two couples to be applied at two points AB in the line of intersection of their two planes. This can be done by bringing the couples to have the same arm. Let P_1 P_2 (Fig. 12) be the members of one couple, Q_1Q_2 those

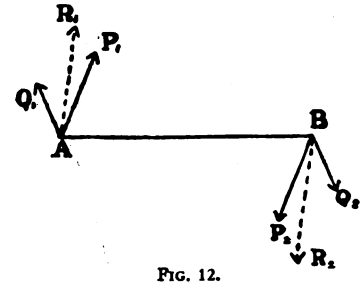

FIG. 12.

of the other. Compound P_1Q_1 by the parallelogram law to R_1, P_2Q_2 to R_2. These being equal, parallel and oppositely directed, form a couple which, having the same arm as the original couples, has its moment proportional to R, that is, found by the parallelogram construction. If lines are laid off perpendicular to the three planes of AB and P, Q, R, respectively, and proportional to the three moments, they will also follow the parallelogram law. Thus a couple may be represented by a vector perpendicular to its plane. This vector we shall speak of as *the couple*, and shall disregard the resolution into two separate forces.

Let us now consider the effect of any number of forces applied at various points of a rigid body. At any point O (Fig. 13) apply two equal and opposite forces $P'P''$ equal and parallel to a force P applied at A. We thus have the force P' equal to P applied at O instead of at A, together with the couple PP''. Similarly all the forces applied at other points may be considered applied at O, by introducing in each case a couple. All the forces at O may be compounded into a single resultant, and all the couples into a single couple. Thus the resultant of any number of forces applied to a rigid body is a single force together with a single couple. Evidently the resultant force does not depend upon the position of the

point O, while the resultant couple does. In order to have equilibrium, both the resultant force and the resultant couple must vanish.

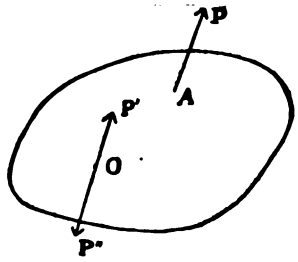

FIG. 13.

In order to express these conditions analytically, we must find an expression for the moment of a vector about a given point, that is, the product of the magnitude of the vector by the length of the perpendicular dropped upon it from the given point. This moment is thus numerically equal to the area of the parallelogram formed with the given point as one corner and the given vector as one side. As plane areas may be projected on other planes by multiplying by the cosine of the dihedral angle between them, which is equal to the angle between their normals, it is evident that the area of the parallelogram, and hence the moment, may be represented by a vector perpendicular to its plane, as already shown for the moment of a couple. Thus it is only necessary to find expressions for the three projections of a moment. Let the vector F (Fig.

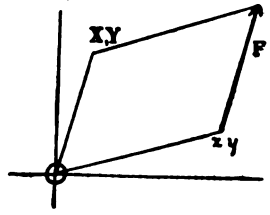

FIG. 14.

14), with components X, Y, be applied at a point having the co-ordinates x, y. Its moment about the origin is equal to the area of a parallelogram having as adjacent sides lines drawn from the origin to points x, y and X, Y. This area is equal to $xY-yX$. But this is the projection in the XY-plane of the area of the parallelogram on the lines from O to points x, y, z, and X, Y, Z. It therefore represents the Z-component of the required moment. Similarly the three components are obtained.

(8) $L=yZ-zY$, $M=zX-xZ$, $N=xY-yX$.

The moment of a couple is the sum of the moments of its two members, and if X, Y is applied at $x_1, y_1, -X, -Y$ at x_2, y_2, we obtain for the moment of the couple

$$x_1Y-y_1X-x_2Y+y_2X=(x_1-x_2)Y-(y_1-y_2)X,$$

which evidently does not depend on the choice of the origin, but only on the vector F and the *relative* position of the two points of application, since only differences of x_1x_2, y_1y_2 appear.

The analytical statement of the conditions for equilibrium of a rigid body is then

(9) $$\Sigma X=0,\quad \Sigma Y=0,\quad \Sigma Z=0;$$
$$\Sigma(yZ-zY)=0,\quad \Sigma(zX-xZ)=0,$$
$$\Sigma(xY-yX)=0,$$

the first three expressing the vanishing of the resultant force, the last three the vanishing of the resultant couple. These principles suffice for the treatment of all problems concerning the equilibrium of a rigid body. For example, the extended principle of the lever follows from the theory of moments. Consider now the problem of a ladder standing on a smooth floor and leaning against a smooth wall (Fig. 15). The resultant of the weights

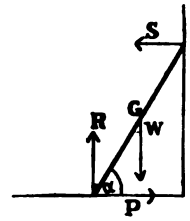

FIG. 15.

of all the parts of the ladder is a single force W applied at the centre of gravity G. Besides this we have to consider the normal reactions R and S. Resolving vertically we find for equilibrium $W-R=0$. Resolving horizontally there must be a force to balance S. Let this be P, applied at the lower end of the ladder. Then $P-S=0$. This does not determine the value of P or S, but we may do this by taking moments about any point in the plane of the figure. If we choose the lower end of the ladder, P and R will have zero moment, and if l is the length of the ladder, α the inclination,

$$Sl\sin\alpha-(Wl\cos\alpha)/2=0,\quad S=\tfrac{1}{2}W\cot\alpha.$$

If the floor is rough, and P the friction, $P=\mu R=\mu W=S=\tfrac{1}{2}W\cot\alpha$, $\mu=\tfrac{1}{2}\cot\alpha$, and if α is less than the angle determined by this equation, the ladder will slip down.

4. All the principles of statics are comprised in the Principle of Virtual Work. The conception of work is equally important with that of force. Work is done when the point of application of a force moves, the amount of work being defined as the product of the magnitudes of the force and the distance moved by the cosine of the angle included by them. If F denote the force, D the displacement, the work is $FD\cos(FD)$. This *geometric* or *scalar product* of two vectors (not a vector, since it is not associated with direction, but merely with a number, or scalar) defined as the product of either by the projection on it of the other, is of much importance in our whole subject. The cosine of the angle between two directions is given by the symmetric function of their direction cosines

$$\cos(FD)=\cos(Fx)\cos(Dx)+\cos(Fy)\cos(Dy)+\cos(Fz)\cos(Dz).$$

Now if the projections on the axes of co-ordinates of the two vectors are

(10) $$F_x=F\cos(Fx),\quad F_y=F\cos(Fy),\quad F_z=F\cos(Fz),$$
$$D_x=D\cos(Dx),\quad D_y=D\cos(Dy),\quad D_z=D\cos(Dz),$$

we have

(11) $$FD\cos(FD)=F_xD_x+F_yD_y+F_zD_z$$

as the analytic expression for the scalar product. If one of the vectors is taken as of unit length,

the expression (11) gives us the value of the projection F_s of any vector F on any direction s,

$$(12)\quad F_s = F\cos(Fs) = F_x\cos(sx) + F_y\cos(sy) + F_z\cos(sz).$$

It is easily proved that the work of the resultant of two forces in a displacement is the sum of the works of the components.

In the case of an infinitely small displacement dx, dy, dz, the work is

$$(13)\quad dW = F_x dx + F_y dy + F_z dz,$$

and if the point is moved along a curve the whole work is

$$(14)\quad W = \int (F_x dx + F_y dy + F_z dz),$$

where x, y, z, F_x, F_y, F_z, are supposed given in terms of some parameter, so that the integration along the curve can be performed.

If some of the points of a system are not free, but constrained, a *virtual* displacement is one that is consistent with the constraints. Virtual work is work done in a virtual displacement. The *Principle of Virtual Work* states that in a system of forces in equilibrium the work done in an infinitesimal *arbitrary* virtual displacement vanishes. Let us apply this principle to a number of simple cases. First, two equal weights P hanging from a string over a fixed pulley are in equilibrium. If the system is displaced one weight falls as much as the other rises. For the one that falls the displacement is in the direction of the force, and the work is positive and equal to PD. For the one that rises the displacement is opposite to the direction of the force, and the work is negative and equal to $-PD$. The sum of these two quantities thus vanishes. In the case of a weight hanging from a movable pulley (Fig. 16), if the string on the left is

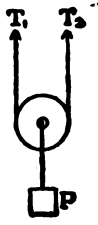

FIG. 16.

pulled up a distance D, the force T_1 does the positive work T_1D; but from the geometry of the case the weight P rises a distance of $D/2$ and the weight W accordingly does the negative work $-PD/2$. The whole work is zero, if $T=P/2$. But this is the condition of equi-

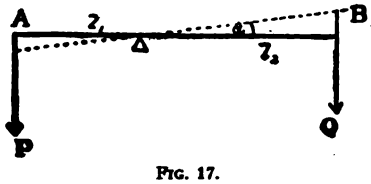

FIG. 17.

librium as found by resolution, since the tensions T_1 and T_2 are equal and we must have $T_1+T_2-P=0$. Consider a lever (Fig. 17) carrying the weights P, Q at distances l_1, l_2 from the fulcrum. Then for equilibrium the principle of moments gives $Pl_1=Ql_2$. But if the lever be turned through an infinitesimal angle α, the end A moves a distance downward $D_1=l_1\alpha$ and the weight does the positive work $Pl_1\alpha$, while the end B rises a distance $D_2=l_2\alpha$, and Q does the negative work $-Ql_2\alpha$. The whole work is zero if $Pl_1=Ql_2$, which is the condition for equilibrum. In the case of the inclined plane (Fig. 7), if the particle is displaced a small distance d up the plane, the force F does the work Fd. The weight W does the negative work $-Wd\sin\alpha$, since its direction makes an obtuse angle with the displacement. The reaction does no work, since it is perpendicular to the displacement. The whole work is therefore zero if $F=W\sin\alpha$. But this is the condition of equilibrium. The principle of virtual work is particularly convenient, since it enables us to leave the reactions out of account, since they do no work when the displacements are virtual. As a further example let us consider the equilibrium of a particle whose co-ordinates are x, y, z on a surface $\phi(x, y, z)=0$, under the action of forces whose resultant is X, Y, Z, omitting the reaction. Since the displacement is virtual, we must have $\phi=0$ during the displacement, so that

$$(15)\quad d\phi = \frac{\partial\phi}{\partial x}dx + \frac{\partial\phi}{\partial y}dy + \frac{\partial\phi}{\partial z}dz = 0.$$

The principle of virtual work says that for equilibrium

$$(16)\quad Xdx + Ydy + Zdz = 0$$

for any virtual displacement, that is, one in which dx, dy, dz are not independent, but satisfy (15). Multiplying (15) by an undetermined factor λ and adding to (16), we have

$$(17)\quad \left(X + \lambda\frac{\partial\phi}{\partial x}\right)dx + \left(Y + \lambda\frac{\partial\phi}{\partial y}\right)dy + \left(Z + \lambda\frac{\partial\phi}{\partial z}\right)dz = 0.$$

Both conditions are satisfied if we determine λ so that

$$(18)\quad X + \lambda\frac{\partial\phi}{\partial x} = Y + \lambda\frac{\partial\phi}{\partial y} = Z + \lambda\frac{\partial\phi}{\partial z} = 0,$$

or eliminating λ,

$$(19)\quad \frac{X}{\frac{\partial\phi}{\partial x}} = \frac{Y}{\frac{\partial\phi}{\partial y}} = \frac{Z}{\frac{\partial\phi}{\partial z}}.$$

But this is the condition (5) that the resultant is normal to the surface, and in fact only in this way can there be equilibrium, according to the definition of a smooth surface.

For a rigid body, a possible displacement is one in which all the points receive equal and parallel displacements, so that dx, dy, dz are the same for all. We then have

$$(20)\quad \Sigma(Xdx + Ydy + Zdz) = dx\Sigma X + dy\Sigma Y + dz\Sigma Z = 0.$$

If this is to be true for arbitrary values of dx, dy, dz we must have

$$\Sigma X = \Sigma Y = \Sigma Z = 0, \tag{21}$$

which are three of the conditions for equilibrium already found. A second possible displacement of a rigid body is one in which it is turned through an angle $d\theta$ about the Z-axis. Let us introduce polar co-ordinates, so that

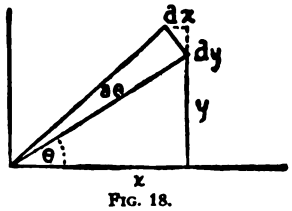

FIG. 18.

$x = r\cos\theta$, $y = r\sin\theta$. Then in the rotation, r being constant,

$$dx = -r\sin\theta\, d\theta = -y\, d\theta,\ dy = r\cos\theta\, d\theta = x\, d\theta,\ dz = 0.$$

Consequently the virtual work is

$$\Sigma(X dx + Y dy + Z dz) = d\theta\,\Sigma(xY - yX). \tag{22}$$

If this is to vanish whatever $d\theta$ we must have

$$\Sigma(xY - yX) = 0. \tag{23}$$

But this is one of the conditions for equilibrium (9) already found, and the two others are similarly found by rotating about the other axes.

Suppose now that we have any number of points $x_1, y_1, z_1, \ldots x_n, y_n, z_n$, acted on by any forces, $X_1, Y_1, Z_1, \ldots X_n, Y_n, Z_n$, and subject to any number of constraints,

$$\begin{aligned} &\phi_1(x_1, y_1, z_1, \ldots x_n, y_n, z_n) = 0, \\ &\phi_2(x_1, y_1, z_1, \ldots x_n, y_n, z_n) = 0, \\ &\quad\ldots\ldots\ldots\ldots\ldots \\ &\phi_k(x_1, y_1, z_1, \ldots x_n, y_n, z_n) = 0. \end{aligned} \tag{24}$$

Then the equation of virtual work,

$$\sum_{r=1}^{r=n} (X_r dx_r + Y_r dy_r + Z_r dz_r) = 0, \tag{25}$$

must hold for any changes of the co-ordinates which satisfy the conditions,

$$d\phi_1 = \sum_{r=1}^{r=n} \left(\frac{\partial\phi_1}{\partial x_r} dx_r + \frac{\partial\phi_1}{\partial y_r} dy_r + \frac{\partial\phi_1}{\partial z_r} dz_r\right) = 0.$$

$$\ldots\ldots\ldots\ldots \tag{26}$$

$$d\phi_k = \sum_{r=1}^{r=n} \left(\frac{\partial\phi_k}{\partial x_r} dx_r + \frac{\partial\phi_k}{\partial y_r} dy_r + \frac{\partial\phi_k}{\partial z_r} dz_r\right) = 0.$$

Multiplying these equations in turn by multipliers $\lambda_1, \ldots \lambda_k$, and adding to (25),

$$\begin{aligned} \sum_{r=1}^{r=n} \Bigg[&\left(X_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial x_r}\right) dx_r \\ &+ \left(Y_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial y_r}\right) dy_r \\ &+ \left(Z_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial z_r}\right) dz_r \Bigg] = 0, \end{aligned} \tag{27}$$

which is satisfied for all virtual values of $dx_1, \ldots dz_n$, if we take

$$\begin{aligned} X_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial x_r} &= 0, \\ Y_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial y_r} &= 0, \quad r = 1, 2, \ldots n. \\ Z_r + \sum_{s=1}^{s=k} \lambda_s \frac{\partial\phi_s}{\partial z_r} &= 0. \end{aligned} \tag{28}$$

From these equations, eliminating the k multipliers $\lambda_1, \ldots \lambda_k$, we have $3n - k$ equations of equilibrium.

5. KINEMATICS.— Let us now consider questions of motion. The velocity of a point is defined as the limit of the space Δs described by it to the time of description Δt, when both decrease indefinitely.

$$v = \lim_{\Delta t = 0} \frac{\Delta s}{\Delta t} = \frac{ds}{dt}. \tag{29}$$

Since displacements are compounded as vectors, the resultant of a displacement AB (Fig. 1), and another BD being AD, if the two displacements take place in the same time, the velocities are also proportional to the three lines, so that velocities are vectors, compounded by the parallelogram. Accordingly a velocity may be represented by its components along the co-ordinates axes. Its direction being that of the tangent to the path, its direction cosines are those of the tangent, $\frac{dx}{ds}, \frac{dy}{ds}, \frac{dz}{ds}$. Consequently, its components are

$$v_x = v\frac{dx}{ds} = \frac{ds}{dt}\frac{dx}{ds} = \frac{dx}{dt}, \tag{30}$$

$$v_y = v\frac{dy}{ds} = \frac{ds}{dt}\frac{dy}{ds} = \frac{dy}{dt}, \quad v_z = v\frac{dz}{ds} = \frac{ds}{dt}\frac{dz}{ds} = \frac{dz}{dt}$$

Also,

$$\begin{aligned} v^2 &= v_x^2 + v_y^2 + v_z^2 \\ &= \left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2 = \left(\frac{ds}{dt}\right)^2. \end{aligned} \tag{31}$$

Similarly, the projection of a velocity in any direction is the velocity of the projection of the point on a line having that direction.

If a point moves in a plane it may be convenient to introduce polar co-ordinates r, ϕ.

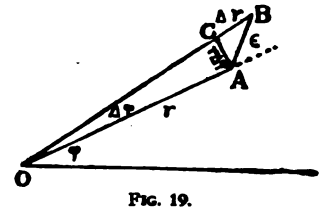

FIG. 19.

If the point moves from A to B (Fig. 19), a distance Δs in the time Δt, dropping a perpendicular AC upon the radius OB, the displace-

ment may be resolved into AC and CD, equal to $r\Delta\phi$ and Δr respectively, and accordingly the velocity may be resolved into the components in those directions.

$$(32)\qquad v_\phi = \lim_{\Delta t=0} \frac{r\Delta\phi}{\Delta t} = r\frac{d\phi}{dt},\ v_r = \lim_{\Delta t=0} \frac{\Delta r}{\Delta t} = \frac{dr}{dt}.$$

Also,

$$(33)\qquad v^2 = v_\phi^2 + v_r^2 = r^2\left(\frac{d\phi}{dt}\right)^2 + \left(\frac{dr}{dt}\right)^2 = \left(\frac{ds}{dt}\right)^2,$$

as may also be seen from the expression for the arc in polar co-ordinates. The components v_r and v_ϕ are called the radial and tangential components of the velocity respectively, while $\frac{d\phi}{dt}$ is called the angular velocity of the radius.

The area of the triangle OAB being $\frac{1}{2}r\cdot d\phi$, the radius vector sweeps over area at the rate $\frac{dS}{dt} = \frac{1}{2}r^2\frac{d\phi}{dt}$, but since the area is also equal to one-half the product of AB by the perpendicular on it from O, then we find this rate of area description to be equal to one-half the *moment of the velocity* about O. Using the formula (8) for moment of a vector we have

$$(34)\qquad \frac{dS}{dt} = \frac{1}{2}r^2\frac{d\phi}{dt} = \frac{1}{2}(xv_y - yv_x) = \frac{1}{2}\left(x\frac{dy}{dt} - y\frac{dx}{dt}\right),$$

which may be easily verified by passing directly from rectangular to polar co-ordinates.

6. If the velocity of a point varies we define the *acceleration* as the limit of the increment of velocity to the time in which it takes place. We may consider the numerical change,

$$(35)\qquad \lim_{\Delta t=0} \frac{\Delta v}{\Delta t} = \frac{dv}{dt} = \frac{d^2s}{dt^2},$$

or the vector change. If AB (Fig. 20) denote the velocity at a time t, AC the velocity at

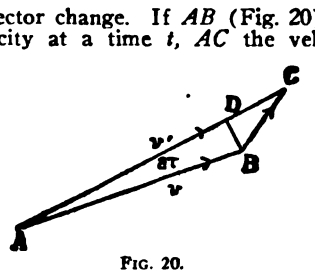

FIG. 20.

the time $t+\Delta t$, the vector increase of velocity is BC, and the acceleration is the limit of the ratio of BC to Δt. Obviously it may be resolved into any components, which are the corresponding components of BC each divided by Δt. In the triangle ABC, since the velocities AB and AC have the directions of the tangents to the path at the respective instants the angle between them is the angle $d\tau$ between the two consecutive tangents. It is obvious that the direction of the infinitesimal side BC may be anything whatever, and that accordingly the direction of the acceleration is totally unrelated to that of the velocity, that is of the tangent to the path. Resolving along the axes, we find for the components of the accelerations

$$(36)\qquad a_x = \frac{dv_x}{dt} = \frac{d^2x}{dt^2},\ a_y = \frac{dv_y}{dt} = \frac{d^2y}{dt^2},$$

$$a_z = \frac{dv_z}{dt} = \frac{d^2z}{dt^2},$$

from which

$$(37)\qquad a^2 = \left(\frac{d^2x}{dt^2}\right)^2 + \left(\frac{d^2y}{dt^2}\right)^2 + \left(\frac{d^2z}{dt^2}\right)^2.$$

Since the direction cosines of the tangent are the same as those of the velocity, v_x/v, v_y/v, v_z/v, we may use the formula (12) to resolve the acceleration along the tangent.

$$(38)\qquad a_\tau = (a_xv_x + a_yv_y + a_zv_z)/v$$

$$= \left(\frac{d^2x}{dt^2}\frac{dx}{dt} + \frac{d^2y}{dt^2}\frac{dy}{dt} + \frac{d^2z}{dt^2}\frac{dz}{dt}\right) \Big/ \frac{ds}{dt}.$$

But differentiating equation (31) and comparing with (38), we find

$$(39)\qquad a_\tau = \frac{d^2s}{dt^2}.$$

Thus the rate of increase of the numerical velocity is equal, not to the whole acceleration, but to its tangential component. This we call the tangential acceleration, and it is equal to the limit of DC (Fig. 20), divided by Δt. The normal acceleration is easily obtained from the figure as the limit of BD divided by Δt. But in the figure we have $BD = AB\cdot d\tau = v\,d\tau$, so that the normal acceleration,

$$(40)\qquad a_\nu = v\frac{d\tau}{dt}.$$

Also, if ρ is the radius of curvature of the path, $ds = \rho\, d\tau$.

$$(41)\qquad a_\nu = \frac{v}{\rho}\frac{ds}{dt} = \frac{v^2}{\rho}.$$

The normal acceleration is always directed toward the *concave* side of the path, and is called the *centripetal acceleration*.

We will now consider some of the most important cases of acceleration. If the motion is rectilinear, the velocity and the acceleration have always the same direction, but may vary in magnitude and in sign. After uniform motion, in which the velocity is constant and the acceleration zero, so that equal spaces are described in equal times, the simplest case is that of constant acceleration,

$$(42)\qquad \frac{d^2s}{dt^2} = a = \text{const.}$$

Integrating we obtain

$$(43)\qquad \frac{ds}{dt} = at + b,$$

where b is a constant representing the velocity when $t=0$. Integrating again,

$$(44)\qquad s = \tfrac{1}{2}at^2 + bt,$$

where s denotes the space described since $t=0$. Thus if the particle start from rest ($b=0$), it describes spaces proportional to the *squares* of the times of description. It was found by Galileo that bodies fall toward the earth according to such a law, and that in a given locality the value of the acceleration is the same for all bodies. The value of this acceleration of gravity is generally denoted by g. Comparing the velocity attained by a body

falling from rest with the height, we obtain, by (43) and (44),

(45) $v = gt,\ h = \frac{1}{2}gt^2,\ v^2 = 2gh.$

Conversely, if a body be thrown upwards with a velocity v, it will reach the height h.

If we consider the motion of a body under gravity, but possessing a horizontal velocity as well as a vertical component, since there is no horizontal acceleration the horizontal velocity v_x is constant. Calling the vertical distance fallen z, the horizontal distance traversed x, we have

$$z = \tfrac{1}{2}gt^2,\ x = v_x t,$$

and eliminating t we have the equation of the path, $z = \frac{1}{2}\frac{g}{v_x^2}x^2$, representing a parabola with the axis vertical. The velocity at any point and its inclination to the horizontal are found from

$$v_z = gt = \sqrt{2gz},\ v^2 = v_x^2 + v_z^2,\ \tan\alpha = v_z/v_x.$$

If, on the other hand, the particle be projected upward with velocity v at an angle α with the horizontal, it will describe the same parabola, rising to the vertex in the time t and falling on the symmetrical half. This problem was also solved by Galileo.

Consider a particle revolving with constant velocity v in a circular path of radius r. Then since $s = vt$, by (39) we find that the tangential component of the acceleration vanishes. The normal component is given by (41) as v^2/r. Thus the acceleration is constant in amount and always directed toward the centre. It is to be observed that although the numerical velocity is constant, the vector velocity is constantly changing its direction, hence the acceleration is not zero, but is perpendicular to the velocity. If we resolve the uniform circular motion into components parallel to given directions, for instance, if P (Fig. 21) is projected into Q and R lying on the axes OX, OY, and if P revolves with constant angular velocity $\omega = \frac{d\phi}{dt}$, we have $\phi = \omega t$, $OQ = r\cos\phi = r\cos\omega t$, $OR = r\sin\phi = r\sin\omega t$. The rectilinear motion of either Q or R is called *simple harmonic motion*, or a *simple vibration*. It is evidently periodic, that is, it repeats after the interval $T = \frac{2\pi}{\omega}$. The number of vibrations in unit of time, or the *frequency*, is $\frac{1}{T} = \frac{\omega}{2\pi}$. Since the acceleration of P is constant in magnitude,

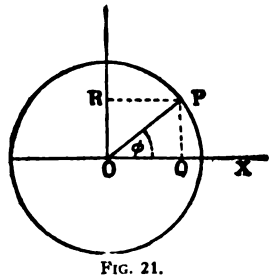

FIG. 21.

and always in the direction PO, its component along OX varies as $\cos\phi$, that is, as the distance OQ. In other words, a point describing a simple harmonic motion has an acceleration proportional to its displacement from the centre of symmetry, and directed toward it. We may also consider harmonic motion analytically. If the acceleration is proportional to the displacement but opposite in direction, we shall have

(46) $$\frac{d^2s}{dt^2} = -\omega^2 s,$$

where ω is a constant. The integral of this differential equation is

(47) $s = A\cos\omega t + B\sin\omega t = a\cos(\omega t - \alpha),$

where A and B are arbitrary constants and $A = a\cos\alpha$, $B = a\sin\alpha$. The constant a is called the *amplitude*, while the angle α, called the *phase*, depends simply upon the instant adopted from which to count the time. By taking for α the values 0° or 90° we obtain either $a\cos\omega t$ or $a\sin\omega t$.

If we compound two simple harmonic motions in lines at right angles to each other, if the amplitudes and periods are the same and the phases differ by a right angle, the previous construction shows that we obtain uniform circular motion. If the amplitudes and phases do not have this relation, we have

(48) $$\begin{aligned} x &= a\sin(\omega t - \alpha) \\ &= a(\sin\omega t\cos\alpha - \cos\omega t\sin\alpha), \\ y &= b\sin(\omega t - \beta) \\ &= b(\sin\omega t\cos\beta - \cos\omega t\sin\beta). \end{aligned}$$

Solving for $\sin\omega t$ and $\cos\omega t$

(49) $$\sin\omega t = \left(\frac{x}{a}\sin\beta - \frac{y}{b}\sin\alpha\right) \Big/ \sin(\beta - \alpha),$$

$$\cos\omega t = \left(\frac{x}{a}\cos\beta - \frac{y}{b}\cos\alpha\right) \Big/ \sin(\beta - \alpha).$$

Squaring and adding we eliminate t and obtain the equation of the path,

(50) $$\frac{x^2}{a^2} + \frac{y^2}{b^2} - 2\frac{x}{a}\frac{y}{b} = \sin^2(\alpha - \beta),$$

which represents an ellipse. The motion is called *elliptic harmonic motion*. The ellipse is evidently inscribed in a rectangle of sides $2a$, $2b$ (Fig. 22), and according to the values of $\alpha - \beta$ may have any shape, reducing to a straight line when $\alpha - \beta$ is zero or 180°. If the two harmonic vibrations are not of the same period, the resulting path belongs to a system of curves associated with the name of Lissajous. They may be easily constructed point by point, but the elimination of t will be possible only if the periods have a common measure.

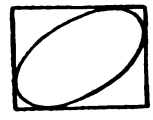

FIG. 22.

Suppose a particle subject to the constant acceleration of gravity to be constrained to

move in a vertical circle of radius l (Fig. 23). The component of the acceleration g in the direction of the tangent is $-g \sin\theta$, while the distance moved from the bottom of the circle

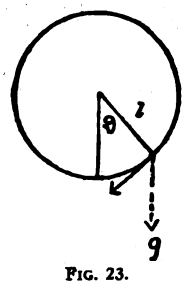

FIG. 23.

is $l\theta$. We thus have the differential equation

$$\frac{d^2s}{dt^2} = l\frac{d^2\theta}{dt^2} = -g\sin\theta. \tag{51}$$

The solution of this equation requires elliptic functions, but if θ is small enough we may neglect the difference between the angle θ and its sine, so that the equation of motion is

$$\frac{d^2\theta}{dt^2} = -\frac{g}{l}\theta, \tag{52}$$

which is the same as the equation (46) of harmonic motion with $\omega^2 = g/l$. Accordingly the small vibrations of a pendulum are harmonic, of the period $T = 2\pi\sqrt{\frac{l}{g}}$, which is independent of the amplitude of oscillation. The fact of this *isochronism* of the pendulum, or independence of the period from the amplitude, was discovered by Galileo, while the laws of uniform circular and of harmonic motion, and of the pendulum, were found by Huygens. The latter also used the formula $g = \frac{4\pi^2 l}{T^2}$ to determine the value of g.

Let us now examine the consequences of the celebrated laws discovered by Kepler as governing the motion of the planets about the sun. The first law states that the areas swept over by the radius vector from the sun to a planet in equal times are equal. Calling the area S, $\frac{dS}{dt} = \text{const.}$ But differentiating the value of $\frac{dS}{dt}$ given in (34), we find

$$2\frac{d^2S}{dt^2} = x\frac{d^2y}{dt^2} - y\frac{d^2x}{dt^2} = xa_y - ya_x. \tag{53}$$

But this is the *moment* of the acceleration with respect to the origin, and if it vanishes, the acceleration must be directed toward the origin. The kinematical interpretation of the first law is then that the planets are accelerated toward the sun. The second law states that the planets describe ellipses about the sun as a focus. The equation of a conic section referred to its focus is

$$r = \frac{p}{1 + e\cos\phi}, \quad p = a(1 - e^2),$$

where a is the major axis, e the eccentricity. Now to resolve the acceleration along the radius vector, we multiply its components a_x, a_y, respectively, by the direction cosines of the radius vector, which are $\cos\phi$, $\sin\phi$. Differentiating the equations for change of co-ordinates $x = r\cos\phi$, $y = r\sin\phi$, twice, we have

$$a_x = \frac{d^2x}{dt^2} = \frac{d^2r}{dt^2}\cos\phi - 2\sin\phi\frac{d\phi}{dt}\frac{dr}{dt} - r\sin\phi\frac{d^2\phi}{dt^2} - r\cos\phi\left(\frac{d\phi}{dt}\right)^2,$$

$$a_y = \frac{d^2y}{dt^2} = \frac{d^2r}{dt^2}\sin\phi + 2\cos\phi\frac{d\phi}{dt}\frac{dr}{dt} + r\cos\phi\frac{d^2\phi}{dt^2} - r\sin\phi\left(\frac{d\phi}{dt}\right)^2,$$

from which

$$a_r = a_x\cos\phi + a_y\sin\phi = \frac{d^2r}{dt^2} - r\left(\frac{d\phi}{dt}\right)^2. \tag{54}$$

Now by Kepler's first law,

$$2\frac{dS}{dt} = r^2\frac{d\phi}{dt} = \text{const.} = h, \quad \frac{d\phi}{dt} = \frac{h}{r^2}.$$

Changing the variable from t to ϕ,

$$\frac{dr}{dt} = \frac{dr}{d\phi}\frac{d\phi}{dt} = \frac{h}{r^2}\frac{dr}{d\phi} = -h\frac{d}{d\phi}\left(\frac{1}{r}\right).$$

Differentiating by t,

$$\frac{d^2r}{dt^2} = -h\frac{d^2}{d\phi^2}\left(\frac{1}{r}\right)\frac{d\phi}{dt} = -\frac{h^2}{r^2}\frac{d^2}{d\phi^2}\left(\frac{1}{r}\right).$$

From the equation of the path we obtain

$$\frac{1}{r} = \frac{1}{p} + \frac{e}{p}\cos\phi, \quad \frac{d^2}{d\phi^2}\left(\frac{1}{r}\right) = -\frac{e}{p}\cos\phi = \frac{1}{p} - \frac{1}{r},$$

from which

$$\frac{d^2r}{dt^2} = -\frac{h^2}{pr^2} + \frac{h^2}{r^3}, \quad a_r = -\frac{h^2}{pr^2}.$$

Thus the fact that the path is a conic section shows that the acceleration is inversely as the square of the distance from the focus. The negative sign shows that it is *toward* the sun.

The third law states that for different planets the squares of the times of description of the orbits are proportional to the cubes of the major axes. Since $2dS/dt = h$, if T is the time of a complete period hT is twice the area of the orbit.

$$hT = 2\pi ab = 2\pi a^2\sqrt{1-e^2}, \quad h^2 = \frac{4\pi^2a^4}{T^2}(1-e^2),$$

$$a_r = -\frac{h^2}{pr^2} = -\frac{h^2}{a(1-e^2)}\frac{1}{r^2} = \frac{4\pi^2a^3}{T^2}\frac{1}{r^2}. \tag{55}$$

Now since a^3/T^2 is the same for all the planets, we see that the factor of $1/r^2$ in the acceleration is the same for all the planets. These kinematical interpretations of Kepler's laws in terms of acceleration were given by Newton.

6. KINETICS.— The whole of our experience of dynamical phenomena was summed up by Newton in his *Axioms or Laws of Motion*, which are as follows:

I. *Every body persists in its state of rest or of uniform motion in a straight line, except in so far as it is compelled by impressed forces to change that state.*

The property of persistence thus defined is called *Inertia*. The law of inertia was recognized in a less definite way by Galileo, but Newton makes of it a criterion for the existence of force, and in fact implies that if a body is moving in any other way than uniformly in a

straight line, that is, without acceleration, it is acted on by a force. The second law gives a positive definition of force.

II. *Change of motion is proportional to the moving force applied, and takes place in the direction of the straight line in which the force acts.*

In the explanation of this law, and in a corollary appended, Newton makes clear that it is intended to include the independence of effect of two simultaneous forces, and their composition by the parallelogram.

In his introductory definitions, Newton states what he means by quantity of motion, to which force is proportional, namely, the product of velocity by mass, or what is now called *momentum*, but the motion of mass is best introduced by the third law, which is perhaps the most important, as well as original, of the three.

III. *To every action there is always an equal and contrary reaction; or, the mutual actions of any two bodies are always equal and oppositely directed.*

If the force were measured by the acceleration alone, the accelerations of the two interacting bodies would be *equal* and opposite; that is not the case, but they are found to be proportional, with a factor of proportionality which is found to be always the same for two given bodies, no matter how they act on each other. For example, let them be connected by a string, and act on each other through its tension, or by an elastic cord whose length may vary. If for symmetry we write a factor for each acceleration,

$$(56)\quad m_1\frac{d^2x_1}{dt^2}=-m_2\frac{d^2x_2}{dt^2},\quad m_1\frac{d^2y_1}{dt^2}=-m_2\frac{d^2y_2}{dt^2},$$
$$m_1\frac{d^2z_1}{dt^2}=-m_2\frac{d^2z_2}{dt^2},$$

the factors m_1, m_2 are called the *masses* of the bodies, and their ratio is determined by the ratio of the accelerations. Thus we may compare the mass of any body with that of a given body taken as a unit. The usual unit of mass is the pound or the gram.

By the introduction of the conception of mass and of momentum we pass from kinematics to kinetics, or dynamics proper. As long as we were concerned with one body at a time, like Galileo and Huygens, the notion of acceleration was sufficient, but when we deal with a number of bodies with mutual actions, the notion of force is necessary. The terms on either side of equations (56) represent the forces, and the equations express the third law. The second law may now be stated by saying that force is the rate of change of *momentum*. The forces generally are known in terms of the positions of the bodies, and perhaps of their velocities, and when given by their components X, Y, Z as functions of these quantities, the equations

$$(57)\qquad m\frac{d^2x}{dt^2}=X,\quad m\frac{d^2y}{dt^2}=Y,\quad m\frac{d^2z}{dt^2}=Z$$

are called the differential equations of motion.

Our kinematical examples of the previous section may now be dynamically interpreted. The fact that bodies fall with a common acceleration g shows that the forces with which they are moved toward the earth, or their weights, $W=mg$, are proportional to their masses. The unit of force, namely, that force which produces in a pound an acceleration corresponding to an increase of velocity of one foot per second in each second, has received the name of *poundal*. The weight of each pound is accordingly g poundals. The unit generally used by scientists is the force which produces in a gram the acceleration corresponding to an increase of velocity of one centimeter per second in each second. This force is called a *dyne*, and the weight of a gram is g dynes. These units are called *absolute* units, as they do not depend on accidental circumstances of time or place, but are referred to three fundamental units, of time, length and mass, the latter two of which are preserved in concrete standards, the former is preserved in the rotation of the earth. The more familiar *gravitation unit*, which we have used in the section on statics, and which is the *weight* of the pound or gram, is not absolute, since g varies at different parts of the earth, according to the formula

$$(58)\quad g=980.62-2.6\cos 2\lambda-.000003h,$$

where λ is the latitude, h the height above sea-level, and the units are the centimeter and the second. The weight of a body is accordingly variable, but its mass is invariable. For $\lambda=45°$, at sea-level we have

Weight of pound = 32.17 *poundals*,
Weight of gram = 980.62 *dynes*.

The popular usage of the term pound or gram to denote both a mass and a force is unfortunate, and should be avoided.

The fact that the weights of bodies are proportional to their masses was carefully tested by Newton by constructing pendulums of different materials, and finding that the acceleration, as determined by the time of oscillation, was independent of the substance.

The fact that a body moving uniformly in a circle has a centripetal acceleration v^2/r shows that it is acted on by a force toward the centre (centripetal force) equal to mv^2/r. If the body, for instance, be revolved in a horizontal orbit on a whirling machine, and be held in place by a string, this string may be passed over a pulley and support a weight, so that we may thus make a comparison between the absolute dynamical measure of force and the gravitational statical one previously used. By repeating the experiment with another revolving mass, we may compare the masses of two bodies, by the process of comparing both with the same weight. This illustrates the dynamical comparison of masses. The usual statical method of comparison by a balance is actually a comparison of *weights*, and gives a correct comparison of masses because the value of g is the same at each pan. If we used a balance-beam so long that g differed sensibly at its two ends, equality of weights would not mean equality of masses.

Another simple illustration of the dynamical method of comparison of masses is furnished by Atwood's machine, by which the laws of falling bodies may be studied. Two masses, m_1, m_2, Fig. 24, are hung from a string passage over a frictionless pulley. Since the distance moved up by one mass is equal to that moved down by the other, the velocities and accelerations of the two are equal and opposite. Each

mass is acted upon by two forces, the tension of the string upwards and its own weight downwards. The tension is the same for both. Consequently we have for the acceleration a,

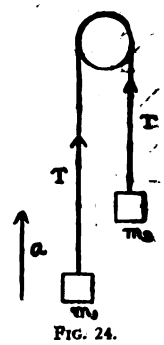

FIG. 24.

$$m_1a_1 = \quad m_1a = T - m_1g,$$
$$m_2a_2 = -m_2a = T - m_2g,$$

from which we obtain

$$a = \frac{m_2 - m_1}{m_2 + m_1}g;$$

that is, the acceleration is to that of a body falling freely as the difference to the sum of the masses. Thus by observing the acceleration the masses may be compared. In the usual use of Atwood's machine that difference of masses is produced by an extra weight, which is taken off at a certain height by a fixed ring, after which the two remaining equal masses travel with uniform velocity, and by the velocity generated the acceleration is determined.

The properties of harmonic motion show that a body acted upon by a force proportional to its displacement from a fixed point will execute a harmonic vibration. When a point has a position of equilibrium and is displaced therefrom, forces will in general be brought into play tending to restore it to its position, and these forces will depend upon the displacement. If the displacement be small enough, the forces will be approximately proportional to the displacement, hence the frequency of harmonic vibrations in nature. The vibration of the pendulum or of a tuning-fork are examples.

From the generalization that all the planets are accelerated toward the sun with an acceleration $a = c/r^2$, where c is constant for all, Newton, putting the force equal to cm/r^2, and seeing that the masses of the two interacting bodies, the sun and planet, must enter symmetrically, was led to assume $F = \gamma Mm/r^2$, and from the law of reaction this would also be the force urging the sun toward the earth. Thus he was led to the generalization of universal gravitation, namely, the statement that every mass in the universe attracts every other with a force proportional to the product of both their masses, and inversely to the square of the distance apart. (The number γ is the same for all, depending only on the units used).

Newton tested this by comparing the acceleration of the moon due to the earth's attraction with the acceleration of a body at the earth's surface. Supposing the moon's orbit to be circular, of radius r and period T, its acceleration will be by (55) $a_m = 4\pi^2 r/T^2$. If the acceleration varies inversely as the square of the distance, at the surface of the earth, it will be

$$a_s = a_m \frac{r^2}{R^2} = \frac{4\pi^2 r^3}{R^2 T^2},$$

where R is the earth's radius.

Now we have

$$T = 27d\cdot 43\text{ m.} = 39{,}343\text{ m.}, \quad 2\pi R = 4 \times 10^7 \text{ meters}, \quad r = 60R,$$

from which

$$a_s = \frac{2\pi \cdot 60^3 \cdot 4 \cdot 10^7 \text{ meters}}{(39{,}343 \cdot 60 \text{ sec})^2}$$

$$= 9{\cdot}74 \frac{\text{meters}}{\text{sec}^2} = 974 \frac{\text{cm.}}{\text{sec}^2}.$$

This agrees well with the value of g from terrestrial observations, while more exact calculations give a still better agreement.

The value of the Newtonian constant, γ, or the number of dynes of attraction of two masses each of one gram, one centimeter apart, is $\gamma = 6.6576.10^{-8}$.

A highly important contribution was made by d'Alembert, who made it possible to reduce every problem of dynamics to one of statics. If a system of particles be not free, they cannot move under the influence of given applied forces as they would if not constrained, but the reactions will cause them to move otherwise, as in the case of the masses in Atwood's machine. For another instance, consider two bullets fastened together by a string and thrown at random into the air. If free each would describe plane curves, namely, vertical parabolas. Under the influence of the tensions of the string which causes the constraint, they describe looped or tortuous paths. If we knew the actual paths and motions, we could find forces which would produce the same motions if the particles were free. These d'Alembert calls the effective forces and they are given by

$$X' = m\frac{d^2x}{dt^2}, \quad Y' = m\frac{d^2y}{dt^2}, \quad Z' = m\frac{d^2z}{dt^2}.$$

D'Alembert's principle states that the actual applied forces, together with the *reversed* effective sources, would form a system in equilibrium. If we express the equilibrium by means of the equation of virtual work, (25), we obtain

$$\sum_r \{(X_r - X'_r)\delta x_r + (Y_r - Y'_r)\delta y_r + (Z_r - Z_r')\delta z_r = 0,$$

or

$$(58) \quad \sum_r \left\{\left(m_r\frac{d^2x_r}{dt^2} - X_r\right)\delta x_r + \left(m_r\frac{d^2y_r}{dt^2} - Y_r\right)\delta y_r + \left(m_r\frac{d^2z_r}{dt^2} - Z_r\right)\delta z_r\right\} = 0.$$

This equation, given by Lagrange, was made by him the basis of all dynamics. Since the reactions would of themselves form a system of forces in equilibrium, they may be left out of the equation (58) of d'Alembert's Principle.

From the equation (58) we can deduce all the principles of dynamics. Suppose every particle is free, then all the virtual displacements, δx_r, δy_r, δz_r, are independent, and in

order that the equation may hold for arbitrary displacements, we must have

$$(59)\qquad m_r\frac{d^2x_r}{dt^2}=X_r,\quad m_r\frac{d^2y_r}{dt^2}=Y_r,\quad m_r\frac{d^2z_r}{dt^2}=Z_r$$

for every r. But these are Newton's equations of motion.

If the particles be free or form a rigid system, a virtual displacement will be given when δx_r, δy_r, δz_r, have the same values for all the particles. We may then remove these factors from the summation.

$$(60)\qquad \delta x\left(\sum_r m_r\frac{d^2x_r}{dt^2}-\sum_r X_r\right)+\delta y\left(\sum_r m_r\frac{d^2y_r}{dt^2}-\sum_r Y_r\right)+\delta z\left(\sum_r m_r\frac{d^2z_r}{dt^2}-\sum_r Z_r\right)=0,$$

and if δx, δy, δz, are arbitrary, this requires

$$(61)\qquad \sum_r m_r\frac{d^2x_r}{dt^2}=\sum_r X_r,\ \sum_r m_r\frac{d^2y_r}{dt^2}=\sum_r Y_r,\ \sum_r m_r\frac{d^2z_r}{dt^2}=\sum_r Z_r.$$

Now we have

$$(62)\qquad \sum_r m_r\frac{d^2x_r}{dt^2}=\frac{d^2}{dt^2}\sum_r m_r x_r=\left(\sum_r m_r\right)\frac{d^2\bar{x}}{dt^2},$$
$$\sum_r m_r\frac{d^2y_r}{dt^2}=\frac{d^2}{dt^2}\sum_r m_r y_r=\left(\sum_r m_r\right)\frac{d^2\bar{y}}{dt^2},$$
$$\sum_r m_r\frac{d^2z_r}{dt^2}=\frac{d^2}{dt^2}\sum_r m_r z_r=\left(\sum_r m_r\right)\frac{d^2\bar{z}}{dt^2},$$

where $\bar{x}$, $\bar{y}$, $\bar{z}$ are the co-ordinates of the centre of mass, which obviously coincides with what in the treatment of statics has been called the centre of gravity. We thus find that the centre of mass of a free system, or of a rigid body, moves as if all the forces of the system were applied at that point and all the mass were concentrated there. In particular if the system is exposed to no external forces, but only to its mutual actions, since these are equal and opposite in pairs, they destroy each other. Consequently the centre of mass of such a system moves uniformly in a straight line. This applies to the solar system.

Under the same conditions, a rotation about an axis is a virtual displacement. Putting as in (22) $\delta x=-y\delta\theta$, $\delta y=x\delta\theta$, $\delta z=0$, and dividing out $\delta\theta$ we have

$$(63)\qquad \sum_r m_r\left(x_r\frac{d^2y}{dt^2}-y_r\frac{d^2x}{dt^2}\right)=\sum_r(x_rY_r-y_rX_r).$$

The quantity on the right is the z-component of the resultant moment of all the impressed forces, as in (9), (23), which will be denoted by the components L, M, N.

The quantity on the left may be written

$$\frac{d}{dt}\sum_r m_r\left(x_r\frac{dy_r}{dt}-y_r\frac{dx_r}{dt}\right).$$

The quantity whose derivative appears,

$$(64)\qquad H_z=\sum_r\left(x_rm_r\frac{dy}{dt}-y_rm_r\frac{dx_r}{dt}\right)=\sum_r(x_rm_rv_{yr}-y_rm_rv_{xr}),$$

is evidently the z-component of the resultant *moment of momentum* of all of the particles of which the system is composed. We thus have the principle that if we construct a vector H having the components H_x, H_y, H_z, where

$$(64)\qquad H_x=\sum_r(y_rm_rv_{zr}-z_rm_rv_{yr}),$$
$$H_y=\sum_r(z_rm_rv_{xr}-x_rm_rv_{zr}),$$
$$H_z=\sum_r(x_rm_rv_{yr}-y_rm_rv_{xr}),$$

in virtue of the equations

$$(65)\qquad \frac{dH_x}{dt}=L,\quad \frac{dH_y}{dt}=M,\quad \frac{dH_z}{dt}=N,$$

the velocity of the extremity of the vector H, representing the moment of momentum of the system, is equal and parallel to the resultant moment of the impressed forces about the same point. This principle, with that of equations (61), suffices for the treatment of the motion of a rigid body. By putting all velocities equal to zero we obtain the conditions of equilibrium as in (9).

If in equation (58) we put for δx_r, δy_r, δz_r, the distance actually traversed by the various points in the actual motion in the interval dt,

$$\delta x_r=\frac{dx_r}{dt}dt,\quad \delta y_r=\frac{dy_r}{dt}dt,\quad \delta z_r=\frac{dz_r}{dt}dt,$$

we obtain

$$(66)\qquad \sum_r m_r\left(\frac{d^2x_r}{dt^2}\frac{dx_r}{dt}+\frac{d^2y_r}{dt^2}\frac{dy_r}{dt}+\frac{d^2z_r}{dt^2}\frac{dz_r}{dt}\right)dt-\sum_r\left(X_r\frac{dx_r}{dt}+Y_r\frac{dy_r}{dt}+Z_r\frac{dz_r}{dt}\right)dt=0,$$

and we may write the sum of terms containing the accelerations as an exact derivative,

$$\frac{d}{dt}\frac{1}{2}\sum_r m_r\left[\left(\frac{dx_r}{dt}\right)^2+\left(\frac{dy_r}{dt}\right)^2+\left(\frac{dz_r}{dt}\right)^2\right]=\frac{dT}{dt}.$$

The quantity T whose derivative appears, which is one-half the sum of the products of the mass of each particle by the square of its velocity, is the very important quantity called the *kinetic energy*. Integrating equation (66) between the limits t_0 and t_1,

$$(67)\qquad T_1-T_0=\sum_r\int_{t_0}^{t_1}(X_rdx_r+Y_rdy_r+Z_rdz_r),$$

where T_0 and T_1 denote the values of T at the respective instants t_0 and t_1.

The integral on the right is the work (14) done by all the applied forces during the motion. We thus obtain the principle that *the increase of kinetic energy of a system is equal to the work done by the forces.* Suppose now that the system be taken from one given configuration, where all the co-ordinates have given values, to a second, where they have other given values, the particles describing given paths, and they then be taken from the same initial configuration to the same terminal one, but by other paths. Two cases are to be considered. Either the work done by the forces depends upon the paths, or it is independent of the paths, depending only on the terminal configurations. If the integral

$$\int_{t_0}^{t_1}(X_rdx_r+Y_rdy_r+Z_rdz_r)$$

does not depend upon the path, it can be shown

that every component of every force is the partial derivative of a single function $-W$ of all the co-ordinates, by the corresponding co-ordinates.

$$(68) \qquad X_r=-\frac{\partial W}{\partial x_r},\quad Y_r=-\frac{\partial W}{\partial y_r},\quad Z_r=-\frac{\partial W}{\partial z_r}.$$

We then have

$$\sum_r\int_{t_0}^{t_1}(X_r dx_r+Y_r dy_r+Z_r dz_r)=W_0-W_1,$$

and the equation (67) becomes

$$T_1-T_0=W_0-W_1,$$

or

$$(69) \qquad T_1+W_1=T_0+W_0.$$

The sum of the two functions $T+W$ is then constant during the motion. As T is called the kinetic, W is called the *potenial energy* of the system. Such systems are called *conservative systems,* and the above principle is called the principle of the *Conservation of Energy.* The motion of energy is of the greatest importance in dynamics. The principle was first used by Huygens and was generally stated by John and Daniel Bernoulli.

As an example of a conservative force we may take gravity. For a single particle we have $W=mgz$ (z being measured upward), so that the equation of energy is

$$\tfrac{1}{2}mv^2+mgz=\text{const.}=\tfrac{1}{2}mv_0^2+mgz_0,$$

$$v^2-v_0^2=2g(z_0-z)=2gh.$$

Accordingly the velocity attained by a falling particle does not depend on the form of the path, but only on the height fallen. This was known to Galileo, for bodies falling along the inclined plane or the arc of a circle. All forces acting according to the Newtonian law are also conservative.

We have now stated in summary fashion the principal theorems of *Mechanics.* The scope of this article does not permit us to enter into the details of the various methods which arise for treating the more complicated problems, say of the motion of a rigid body. By means of the equations (65), however, we may form an idea of some of the properties of such motions. We have seen that the centre of mass moves as if the whole body were concentrated and all the forces applied there. To find the motion of rotation we have to investigate the moment of momentum of a rigid body. If the body rotate about an axis with angular velocity $d\theta$, we obtain the velocity of a point at a distance r from the axis by differentiating the equations $x=r\cos\theta$, $y=r\sin\theta$,

$$v_x=-r\sin\theta\frac{d\theta}{dt}=-y\frac{d\theta}{dt},\qquad v_y=r\cos\theta\frac{d\theta}{dt}=x\frac{d\theta}{dt},$$

and the moment of momentum is

$$H_z=\sum_r m_r(x_r v_{yr}-y_r v_{xr})=\frac{d\theta}{dt}\sum_r m_r(x_r^2+y_r^2).$$

The quantity $K=\Sigma_r m_r(x_r^2+y_r^2)=\Sigma_r m_r r_r^2$ is called the *moment of inertia* of the body with respect to the axis. Suppose the axis is horizontal, and the body influenced only by gravity. The resultant of the weights of all the particles of the body is a force $W=Mg$ applied at the centre of mass, which is, say, at a distance h from the axis, the plane through it and the axis making an angle θ with the vertical. Then the moment of all these forces about the axis is $N=Mgh\sin\theta$, and we have the equation of motion

$$(70) \qquad \frac{dH_z}{dt}=K\frac{d^2\theta}{dt^2}=-Mgh\sin\theta.$$

This is the same as that of a simple pendulum of length $l=K/Mh$, which is called the length of the equivalent simple pendulum. A point at a distance l from the axis and in line with it and the centre of mass is called the *centre of oscillation.* This problem of the so-called compound pendulum was solved by Huygens, who also showed that if the body be suspended from a parallel axis through the centre of oscillation the period would be the same.

If a rigid body move in any manner with one point fixed, it may be shown that its motion at any instant may be described as a rotation with a certain angular velocity about a certain axis. All the particles of the body are then moving in various directions tangent to circles with planes parallel to each other, but owing to lack of symmetry the direction of the resultant moment of momentum has no simple relation to the direction of the axis.

FIG. 25.

As the motion goes on the direction of the axis changes in the body, and so does the direction of the moment of momentum. Thus the phenomenon is a complicated one, and can be dealt with only by lengthy analysis. If, however, the axis of rotation is an axis of symmetry, as in the case of the axis of a symmetrical top, Fig. 25, it is evident that the particles may be grouped in symmetrical pairs, m_1, m_2, Fig. 26, so that the moments of momentum H_1, H_2 about the fixed point O will be symmetrical with respect to the axis, and the resultant moment will be in the direction of the axis. If then we apply to the axis a force F (Fig. 25),

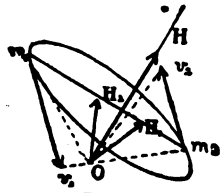

FIG. 26.

it will have a moment M (Fig. 27), perpendicular to the plane of F and the fixed point, and according to equations (65) this will be the direction in which the vector H will move toward H'. The end of the axis will, therefore, move at right angles to the direction in which it is pulled. This is the basis of the explanation of the curious phenomena of all tops and gyroscopes. In the ordinary top, the weight

acting downwards at the centre of mass produces a horizontal moment; the point of the top accordingly begins to move horizontally, causing a movement of *precession*. When the precession begins, the rotation is no longer

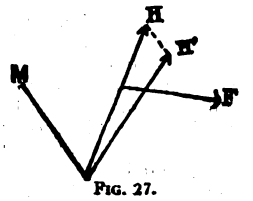

FIG. 27.

about the axis of symmetry, and the vector H no longer coincides with the geometrical axis of the top, but the end of the vector H always travels in a horizontal plane, and the axis of the top moves about it in a motion of so-called nutation. The rotary motions of the planets are explained in a similar manner. It has recently been demonstrated by Einstein that the classical, Newtonian mechanics presented here is only a first approximation to the facts. The discrepancies between the Newtonian and the Einsteinian mechanics are due to the fact that time and space, as ordinarily conceived, are not independent dimensions of being. See RELATIVITY, PRINCIPLE OF.

MECHANICS OF DEVELOPMENT OR EVOLUTION. A term applied by German embryologists and biologists to the changes coincident with the reproduction, fertilization and later growth of organisms. In the organic world, living bodies are constantly undergoing changes of state, these changes being most conspicuous during the period of embryonic development. The changes in the conditions of life together with heredity and selection have caused the evolution of the world of plants and animals. These changes have been complex, and yet in every way have been made with exactness, order and regularity, and the larger knowledge of development mechanics has in a great measure been due to the researches of Pander, Lotz, Born, Wilson, Loew, Ryder, Wyman, Driesch and others. Probably the most noteworthy treatments, though of opposing schools, are those of Von Wilhelm Roux, 'Programm und Forschungsmethoden der Entwichlungsmechanik der Organismen leichverständlich dargestellt' (Leipzig 1897), and of Dr. Oscar Hertwig, 'Zeit- und Streitfragen der Biologie: Mechanik und Biologie' (Jena 1897). Nature does for man in the organic what he has to effect in the inorganic world, and it is only necessary that he observe these changes to be able to state a series of relations of antecedent and consequent. See LIFE; GROWTH; KINETOGENESIS.

MECHANICS' INSTITUTES. The establishment of mechanics' institutes marks the struggle of the artisan to provide for his own education. Denied a technical education, unable to take advantage of college and university education because of financial and economic stress, the artisan nevertheless demands for himself such educational opportunities as he can use during his free hours. His needs are peculiar. His range of interests is prescribed by his trade or vocation, his time is limited, his preparation is likewise limited and variable. His demands cannot be satisfied, therefore, by conventional methods and equipments. A special organization must be set up. Mechanics' institutes are a distinctive product of England, no other country having developed an equal number of such organizations. Nor are such institutions characteristic of any other national educational scheme. The reason for this is the conservatism of English universities and higher educational institutions generally. The artisan was not provided with a systematic training beyond the fundamentals of his trade as given by a more or less definite apprentice system. Industrial education and manual training were not made a part of public education until late in the 19th century. Hence the necessity for the artisan to devise a scheme for educational extension into his adult years, an education that would meet his specific needs. Birmingham and Glasgow were the pioneers in developing educational opportunities for mechanics. In Birmingham Sunday lectures in mechanics and in the physical sciences were given as early as 1789. An "Artisan Library" was maintained. Glasgow organized its Mechanics' Institute in 1823. This is probably the first use of the term. The London Mechanics' Institution was founded in the same year and was under the leadership of Dr. Birkbeck, who had been instrumental in the maintenance of the work in Birmingham. Liverpool followed with its Mechanics' and Apprentices' Library in 1825. Other cities followed and in 1839 a Metropolitan Association of Mechanic's Institutions were formed; in 1848 a similar association known as the Yorkshire Union was formed with 86 institutions as members.

The range of work became wider as the movement grew. The Manchester Mechanics' Institute announced its purpose to be "to enable artisans of whatever trade to become acquainted with such branches of science and art as are of practical application in their trade." The subjects offered either by lecture or class instruction were as follows: natural philosophy, science, natural history, literature, writing, grammar, composition, algebra, geometry, drawing, music, French, German, Latin. This is indicative of the scope of the work attempted.

The aim of the mechanics' institutes was to bring education within reach of the middle and lower classes in England. The programs show that it was an effort to give as much of the traditional content of education as these classes could assimilate. It was education given to mechanics, but much of it was not about mechanics nor yet about industry or closely re-

lated matters. Herein lies the explanation for the decline of the movement. The institutes failed to hold their clientèle as the artisans lacked the necessary educational background. But out of and on these foundations have grown the highly efficient technical schools which are in successful operation to-day.

Mechanics' institutes were also established in the United States, notably in Boston, Philadelphia, New York and Rochester, N. Y. A few are still in successful operation. It is notable that they are taking an important part in the development of vocational and industrial education (q.v.) in the United States. With free public schools, especially free State colleges and State universities, giving extensive courses in the mechanic arts and in the sciences, there is less demand for these private institutions with their special appeal to the mechanics' interests. Their function has been that of the pioneer. They have blazed the way for engineering and technical schools and are now doing the same for vocational and trade schools. See EDUCATION, INDUSTRIAL; EDUCATION, TECHNICAL; MANUAL TRAINING; COOPER UNION; VOCATIONAL EDUCATION.

A. R. BRUBACHER,
President, State College for Teachers, Albany, N. Y.

MECHANICS' LIENS, *in statute law,* a lien or claim upon real estate to secure payment for work or labor performed on, or materials furnished for, buildings or other improvements thereon; which labor or material has been furnished at the request or with the consent, express or implied, of the owner of such real estate or other property. In early English law lands were charged with liens by express agreement of the owner and were generally covered by mortgages. Courts of equity also recognized mortgage agreements. By statute other liens were created, including judgment liens and liens for taxes and assessments. In the United States the increasing number of independent contractors who constructed buildings on contract, and of dealers in building material, resulted in the enactment of numerous mechanic lien laws. Such laws have also been enacted in Canada, but not in Great Britain. The statutes hold that the value of real estate is increased by the addition of improvements and that the property should accordingly be held subject to such claims. Mechanics' liens are valid prior liens over all other claims, such as mortgages, judgments or taxes, and the term covers all claims for labor, whether skilled or unskilled, and for all building materials furnished. But liens are held against the property and not personally against the owner. The lien only attaches to the very property upon which the work was done, and has no effect on other pieces of real estate of the owner. In most States the law provides that the work to which the owner is entitled under a contract must be entirely performed before the contractor can file a lien, but where owners' payments are made in instalments, some codes permit the filing of a lien when the owner defaults in the payment of an instalment. Liens usually take precedence according to the time of their filing in the county clerk's office. In some States subcontractors, who have not had direct dealings with the owner, may nevertheless file liens against the property for the work performed by them. The statutes of mechanics' liens vary in the different States in the manner of details, time of filing, method of procedure, etc., and State statutes should be consulted. See LIEN; MORTGAGES.

MECHANICSBURG, mē-kăn'iks-bĕrg, Pa., borough, in Cumberland County, on the Cumberland Valley Railroad, eight miles west by south of Harrisburg. It was settled in 1806 and in 1828 was incorporated as a borough. It is situated in a rich agricultural region. The chief manufactures are drop forgings for automobiles and carriage hardware, spokes, wheels and wheel materials. The borough is a distributing centre for the surrounding region and a shipping point for a large quantity of agricultural products. Irving College for Young Women is located here. Pop. 4,469.

MECHANICSVILLE, Battle of (also called battle of Beaver Dam Creek). After the battle of Oak Grove (q.v.), 25 June 1862, the Army of the Potomac was thrown upon the defensive by the sudden appearance of "Stonewall" Jackson on its right. North of the Chickahominy McClellan had but one corps in position, that of Fitz-John Porter, temporarily strengthened by McCall's division of Pennsylvania reserves. McCall held the extreme right of the line at Mechanicsville and Beaver Dam Creek, with three brigades and five batteries of 26 guns. His main position was along the east bank of the creek, a tributary of the Chickahominy, and was very strong, his left resting on the Chickahominy, his right and advance extending to a body of woods near and overlooking Mechanicsville, held by a regiment and a battery. Rifle-pits had been constructed for the infantry, epaulments had been thrown up to cover the guns and a strong picket-line was in front from Mechanicsville Bridge to Meadow Bridge along the Chickahominy. A. P. Hill's Confederate division and Cobb's Legion were in plain view from the left, intrenched on the opposite side of the Chickahominy. About noon of the 26th Hill's men were seen in motion. At 12.30 the Union pickets at Meadow Bridge were driven in, and McCall formed line; Reynolds' brigade on the right, covering the crossing of the road from Mechanicsville to Bethesda Church; Seymour on the left, covering at Ellerson's Mill the crossing of the road from Mechanicsville to Gaines' Mill; and Meade's brigade, with two batteries, in reserve. A. P. Hill had 14,000 men in his division, which he had concentrated near Meadow Bridge, under orders from General Lee to co-operate with Jackson, who was marching from Ashland to turn McClellan's right. Hill sent Branch's brigade and a battery to cross the Chickahominy seven miles above Meadow Bridge and communicate with Jackson's advance, and when Jackson had crossed the Virginia Central Railroad, Branch was to cross the Chickahominy, push down the river and uncover Meadow Bridge, which Hill was to cross at once and then sweep down to Mechanicsville, uncovering in turn the Mechanicsville Bridge, which Longstreet's and D. H. Hill's divisions were to cross, when all were to push down the left bank of the Chickahominy and cut off McClellan's communications with his base at White House on the Pamunkey, and thus force him to abandon his operations against Richmond and

retreat down the Peninsula. Jackson was behind his appointed time, and it was 10 o'clock before Branch opened communication with him. Hill grew impatient as the hours went by and nothing was heard from Branch or Jackson, and at 3 P.M. put his five brigades and six batteries in motion. Field's brigade seized Meadow Bridge and crossed, closely followed by the brigades of J. R. Anderson and Archer. The brigades of Gregg and Pender then crossed and marched across the country to support the right of the attacking column. Field's advance was met by a severe artillery fire; but, forming line, with Pegram's battery in the centre, it forced the Union advance of a regiment and battery from Mechanicsville back to the main line beyond Beaver Dam Creek. It had not been General Lee's intention to attack McCall in position, but to have Jackson turn it. Jackson was not up in time; McClellan would doubtless penetrate his design and make a counter-attack against Richmond; time was everything; the day was declining, and Lee ordered A. P. Hill to attack. The brigades of Field, Archer and Anderson were ordered to advance on the Mechanicsville road against Reynolds. They were met by a withering fire of artillery and musketry and were bloodily repulsed, though one of Anderson's regiments on the left succeeded in making a temporary lodgment beyond the creek. Parts of Porter's CORPS now came up and strengthened Reynolds' right. Following the repulse on the left, Pender's brigade and Ripley's of D. H. Hill's division made a most determined attack upon Seymour at Ellerson's Mill, but a mill-race, swampy ground and other obstacles were in their way, and Seymour's direct and Reynolds' flank fire checked and then repulsed them with great loss. The attack was renewed, and a still more bloody repulse was the result, some of the regiments losing all their field officers and half their men. It was now sunset, and no further effort was made to assault the position, but the firing was kept up until 9 P.M. On the next morning McCall was ordered to fall back to Gaines' Mill (q.v.). The Union loss was 49 killed, 207 wounded and 105 missing. The Confederate loss, killed and wounded, was over 1,500; Longstreet says between 3,000 and 4,000 killed, wounded and missing, which is probably excessive. Longstreet further says: "Next to Malvern Hill, the [Confederate] sacrifice at Beaver Dam was unequaled in demoralization during the entire summer." Consult Alexander, 'Memoirs of a Confederate' (New York 1907); Ropes, 'Story of the Civil War' (ib. 1907); Steele, 'American Campaigns' (Washington 1909); 'Official Records' (Vol. XI); 'McClellan's Own Story'; Webb, 'The Peninsula'; Allan, 'History of the Army of Northern Virginia'; The Century Company's 'Battles and Leaders of the Civil War' (Vol. II).

E. A. CARMAN.

MECHANICVILLE, mę-kan'iks-vĭl, N. Y., village, in Saratoga County, on the Hudson River and the Champlain Canal, and on the Delaware and Hudson and Boston and Maine railroads, about 20 miles north of Albany. The water power is extensive. Power is transmitted from Mechanicville to manufacturing establishments in Schenectady. Some of the manufacturing establishments of Mechanicville are knitting mills, collar and shirt factories, mattress factories, iron bed works, sash and blind factories, paper and pulp mills and machine shops. It contains a fine city hall, a new high school and a public school library. The village owns and operates the waterworks. The commission form of government is in operation. Pop. 6,634.

MECHANISM, or the MECHANICAL THEORY, in its most general significance, means the relation of a limited number of invariable substances to each other in such a way that they vary in their relations according to invariable laws. More specifically it means the explanation of phenomena by the universal laws of matter in motion. It is closely connected with the attempt to resolve bodies into their simplest elements and to explain their qualities as due to uniform laws of connection and interaction among these elements. The mechanical theory has usually been held in connection with some form of atomism. Since the aim of this kind of explanation is to reduce qualitative determinations to quantitative and mechanical relations of elements, these elements have usually been conceived to possess only such qualities as were necessary to explain the empirical qualities, the ideal being to find a single homogeneous element possessing only the characteristics essential to corporeity. The term mechanical is also used in a looser sense, though still within the limits of the general definition given above, to describe any explanation which regards all the qualities of a body as due to the mere summation of the qualities of its parts; e.g., a mechanical theory of society.

Mechanism as a Theory of the World.— As a philosophical theory, mechanism is the attempt to regard the entire universe as a closed system of causes and effects in which every change is ultimately reducible to a change of motion. In this sense, therefore, it is practically synonymous with materialism (q.v.).

Mechanism as a Method of Explanation. — After the Middle Ages the development of the new science, at the hands of Copernicus, Kepler and Galileo (qq.v.), and many of their contemporaries, depended very largely on the application to nature of the method of mechanical explanation. Francis Bacon (1561–1626) (q.v.), by his opposition to the use of teleology in scientific explanation, did much to bring about the acceptance of mechanism, and it was firmly established as the true scientific method of dealing with nature by Descartes (1596–1650) (q.v.), who, though not an atomist, still denied to matter all but quantitative characteristics and defined the method of science as strictly mechanical. Even the physical phenomena of living bodies (everything in the world, in fact, except the *res cogitans* in man) he regarded as capable of a purely mechanical explanation. From this time on mechanism became the recognized method for natural science, and consequently it soon became an urgent philosophical problem to discover a satisfactory way of reconciling the mechanical conception of nature with a teleological and idealistic conception of the universe. Thus Leibniz (1646–1716) (q.v.), while admitting the necessity of reducing all natural phenomena to motion, held that ultimate reality consists of an infinity of centres of force (monads), which he conceives as in some sense analogous to minds. Accord-

ingly, metaphysical explanation must be in terms of teleology, though mechanism is the sole valid explanation of the phenomenal manifestation of reality in nature. A similar conception, having its historical origin in Leibniz, was held in the 19th century by Lotze (1817–81) (q.v.), who proclaims the purpose of his philosophy to be "to show how absolutely universal is the range of mechanism, and at the same time how completely subordinate the significance of the function which it has to fulfil in the structure of the world" ('Microcosmus,' Introduction). Kant also regards the mechanical categories as the sole valid means of scientific explanation. The causal category is, for him, rigorously constitutive of our experience and hence is determinant of our conception of all objects in the world of experience; teleology, on the other hand, though a necessary means of regulating our investigations of organized matter, remains a merely subjective principle which can give no insight into the origin of any being. When we deal with objects which "cannot be thought by us, as regards their possibility, according to the principle of mechanism," we may treat them "as if" they were teleologically ordered; but "nothing is gained for the theory of nature or the mechanical explanation of its phenomena by means of its effective causes, by considering them as connected according to the relation of purposes." The phenomena of the moral life, according to Kant, lie outside the realm of scientific experience and hence are not subject to mechanical explanation. Since Kant's time, many thinkers, perhaps the majority, have followed him in regarding mechanism as the ultimate principle of explanation for science; thus Helmholtz, F. A. Lange, Dubois-Reymond, Clausius, Thomson, Maxwell, etc. Wundt attempts to find for it a logical justification as the only theory which can afford an adequate conception of natural causality. On the other hand, more recent writers, especially among physicists, have taken the opposite view. According to them, the pre-eminence of mechanical explanation is merely a dogma based on its successful use in science. E. Mach, Stallo, Helm and H. Cornelius take this position. These thinkers maintain that the purpose of scientific explanation is to condense into a single compact statement (e.g., a mathematical formula) a large mass of empirical data. A scientific law is merely a short-hand statement of the facts, and its value is purely economic. So long as the mechanical theory affords useful analogues for the formulation of other phenomena, it is a valid scientific method. Whenever this ceases to be the case, mechanism must be superseded by a more economical theory. Kant's conception of mechanism as a mode of dealing with experience has been developed by contemporary English idealism. The general problem of all rational knowledge is conceived to be the construction and maintenance of a coherent and systematic experience. In all thought, therefore, there is implied a totality which constitutes the truth. But this totality manifests itself in different categories of thought and in varying degrees of perfection. "Matter and motion are the abstractions in which the sensuous world is reduced to homogeneity in order to be susceptible of quantitative treatment, and in this treatment they are able to a large extent to represent genuine and actual relations of that world" (Bosanquet, 'Logic,' Vol. I, p. 200). Mechanical explanation, therefore, is one form in which the unity of thought may be manifested; it is "that form of identity and difference in which an identity is regarded as the sum of the difference in which it is presented" (ib., p. 201). Its value for knowledge is therefore said to be instrumental or methodological, because it is a method which thought uses in its effort to construct a rational experience. It possesses ultimate truth just in proportion to the degree of rational unity which it achieves in experience as a whole.

In psychology the term mechanism is sometimes used to describe a theory which seeks to explain mental phenomena as due to the combination or interaction of simply psychic elements. This usage is an analogy with the atomic theory of matter. The classical example is Herbart (q.v.), who gave the term currency. According to his theory every representation has a constant quality and a variable force. These forces stand in relations of greater or less opposition and the whole state of consciousness is conceived as a resultant of all the forces involved in it. Consult Th. Ribot's 'German Psychology of To-day' (Eng. trans. by J. M. Baldwin, pp. 24 ff.). For mechanism in biology see MECHANISM AND VITALISM.

GEORGE H. SABINE,
Leland Stanford University.

MECHANISM AND VITALISM. The Newtonian mechanics has long constituted an ideal for all the natural sciences on account of the elegance of its form and the clearness of its definitions. There has consequently been a tendency to reduce biology as well as chemistry, astronomy, optics, etc., to a mechanical basis and to explain all biological phenomena in terms of motions of particles. This tendency is known as *mechanism*, and those who follow it are called *mechanists*. Now, a living oganism, even from the purely mechanical side, is of the greatest complexity and intricacy of structure. Practically all organic tissues are colloidal in nature, and the physics and chemistry of even a simple colloid are as yet very imperfectly understood. Furthermore, the most minute observable portion of living tissue is far from being a simple colloid, but manifests a distinct and highly complicated structure. As a consequence, all mechanical explanations of living processes are bound to be of an extremely sketchy nature. Now, the actions of animals and plants are subject to fairly simple descriptions in terms derived from our own consciousness. When a spider catches a fly, we seem to render that fact intelligible to ourselves by saying that it wants to eat the fly. As a consequence, our biology as it exists is permeated through and through by anthropomorphic con-

cepts, such as purpose, desire, sensation, etc. While the mechanists claim that, as far as the scientist is concerned, all the facts ordinarily described through the mediation of these concepts are susceptible to a correlation in a fashion which, though purely mechanical, is too complicated for our own human faculties to grasp, there are others, the so-called *vitalists*, who deny this possibility.

The vitalists may either discover a peculiar purposive, anthropomorphic force active in biological matters alone, as does Driesch, or they may, like Bergson, regard the purposive account of the world as everywhere prior to the mechanical account. They draw their arguments from certain processes which, like the regeneration of lost parts, or the adaptation of the individual to the environment by mutation, appear peculiarly fitted for purposive explanations involving some prevision of the future. These processes they regard as not merely non-mechanical, but counter to the current of mechanism, involving either indeterminism, or determination through factors which have no mechanical correlates.

The paucity of the fruits of purely mechanical research in biology is obvious; on the other hand, the methods of the vitalist are generally so crude and his definitions so vague that there is no great body of biological knowledge which has been gained from the vitalistic standpoint. The terminology of vitalism abounds in such expressions as *élan vital*, or "entelechny," which are only defined *per ignotius*. In short, whether a complete mechanization of biology be possible or not, biological investigation has been fertile precisely in so far as it has subjected itself to the norms, if not to the concepts, of physical science. It would consequently seem that mechanism is methodologically correct, even if it be metaphysically wrong. See also MATERIALISM; MECHANISM.

Consult Bergson, Henri, 'Creative Evolution' (New York 1911); Driesch, Hans, 'The History and Theory of Vitalism' (London 1914); Mack, Ernst, 'Popular Scientific Lectures' (Eng. trans., Chicago 1895).

NORBERT WIENER.

MECHANISMS, Mental, are modes of thought obtaining both in the unconscious and in conscious mental activity, the most important of which are identification, compensation, projection, introjection and rationalization. In the earliest infancy the individual gradually makes a distinction between self and external reality, tending to regard as *himself* those parts of his experience which give him pleasure and as *external* those parts which give him pain. He thus very early unconsciously identifies himself with certain portions of his environment. This unconscious habit of thought continues throughout life. All persons constantly identify themselves with persons and things surrounding them or which come within their mental purview. This has the very important result of making them regard those external persons or things as having an influence over themselves and their acts and their emotions. Thus a man who defended the actions of a celebrated physician who was condemned and executed for murdering his wife was giving, in his defense, an illustration of identification of himself with the murderer, as was shown later to some extent by his confession that he lived very unhappily with his wife and sympathized with the criminal who had succeeded in getting rid of his partner in that way. Two varieties of identification are distinguished, namely, the subjective form or introjection, and the objective or projection. In introjection the subject accepts an idea which really has an external origin, and identifies it with some portion of his own mind, as for instance when one reads a description of some disease and infers that one has that disease oneself. This is a characteristic of impressionable and hypersensitive natures who feel an excessive sympathy for other people. It leads to various forms of introversion in which the individual tends more and more to live a life within himself and to become more and more unable to achieve objective success in the world. Projection, on the other hand, is that objective form of identification which takes an idea which has had actually an internal origin and believes that it has an external origin. Examples of this mechanism in an excessive degree are found in the mental malady known as paranoia (q.v.), in which the suspicions of the individual, having a purely subjective origin, are projected upon the external social environment. The paranoiac believes that he is a great man, taking his belief from the grandiose thoughts which occur to him as a compensation [see below] for an unconscious feeling of *inferiority*, and he views external reality more and more as conspiring against him to prevent the realization of his wishes for superiority. It is true that all individuals give evidence in thought and act of both introjection and projection, but it is only when these mechanisms are unduly developed that the discrepancy between the unconscious wish and the actuality become such as to render the individual obnoxious. All normal adults identify themselves with parts of their environment to some extent, as with their possessions and with the members of their family and of their social milieu, but such identification is productive of good both in action and in thought. It should not, however, be allowed to go too far, and a rigorous critique should be exercised by comparison with real things in order to prevent excess.

Compensation is that mechanism of the unconscious which secures an activity sometimes quite the opposite from that found to be the goal of the unconscious wish. For example when a person shows an extraordinary interest in antivivisectionism or the prevention of cruelty to children or to animals, it is frequently discovered upon analysis that this form of activity is a compensation for an unconscious sadism or desire to inflict cruelty. Lynching, which ostensibly aims at the punishment of an offender, is in reality mediated through an unconscious desire to inflict cruelty or to see it inflicted. Much of the action of extravagant chivalry is also an illustration of an unconscious desire to indulge in acts of cruelty. This is an apparent contradiction, but numerous analyses have shown the truth of this statement. The fact that a conscious and an opposing unconscious wish are satisfied both at the same time makes the compensation all the more ambiguous. That is, the individual consciously believes that he is satisfying only the wish to *right* a wrong, not being conscious of the fact

that in taking especial pleasure in righting a wrong, he is unconsciously satisfying a wish to occupy his mind with the *wrong* itself. It is not known to the militant suffragette that her conscious desire to arrogate to herself the privileges of *men* is a compensation for an unconscious desire to be dominated by a *man*. Compensation is a physiological mechanism, too, by virtue of which the function of one organ, say the kidneys, is taken over at times by that of another, for instance the skin, in excreting certain waste products. An aim is sought by nature and failing in attaining this aim through one avenue, she tries another. Similarly in the mental processes, the psyche is aiming constantly at the satisfaction of desire, and if it fails to get it consciously, it will get it unconsciously by compensation, that is, the desire of which the individual is not aware, though it may be fundamental in his psyche, will nevertheless gain its satisfaction in some substitutive form, through something which symbolizes in conscious life the object of the unconscious craving. A very infantile partial trend (q.v.) of the libido, namely, the child's desire to be looked at, is gratified by the actor in a domestic performance where he may be utterly unconscious of the fact that his primary desire is to exhibit his body but unconscious only of the fact that he wishes to represent a character for the edification of the public.

Rationalization is the constant tendency on the part of all people to give an *ex post facto* reason for their thoughts or acts. This is why "a man convinced against his will is of the same opinion still." The term rationalization was introduced into analytic psychology by Dr. Ernest Jones. If a person is hypnotized and during the hypnotic sleep is told by the hypnotizer to do something when he wakes up, such for instance as putting a chair on a table, he will do so, and when he is asked to give a reason for this act, he will fabricate a wrong one, because he does not know the right cause. The cause of his act was the hypnotic suggestion, and is perfectly well known to the hypnotizer. But to the hypnotized subject the cause is unknown as it is contained in his unconscious, and, having been given to him in his unconscious state, it does not emerge into consciousness. This is paralleled by almost every instance in which a reason is given for doing anything. The entire cause in the case of some persons is, as with the hypnotized person, in the unconscious, while with the majority of people a large proportion of the causes of all their actions is in their unconscious and is unknown to them. The reasons which people then give for their actions are termed rationalizations and the tendency of all persons to feel that they have to give reasons when they are asked for them is what is meant by rationalization. See also SYMBOLISM and consult Frink, H. W., 'Morbid Fears and Compulsions' (1918) and Jones, Ernest, 'Papers on Psychoanalysis' (2d ed., 1918).

SMITH ELY JELLIFFE, M.D.

MECHANOTHERAPY, the healing of disease by mechanical means, which includes all systems of physical therapeutics, such as massage, baths, electricity, vibration. It is really nothing more than forms of exercise adapted to the special needs of the patient. See MASSAGE and consult Grafstrom, 'Mechano-Therapy' (2d ed., Philadelphia 1904).

MECHITARISTS, měk-i-tär'ists, a sect of Armenian Christians acknowledging the authority of the Pope, but retaining their own ritual. The name originated from Mechitar Da Petro (1676–1749), who in 1701 founded a religious society at Constantinople for disseminating a knowledge of Armenian literature. They soon removed to the Morea, whence in 1715 they went to Venice, and later to the island of San Lazzaro. There are branches of the sect in Vienna and elsewhere. At Venice its printing presses have turned out the best works in Armenian literature, and a periodical which has a large circulation. Consult Boré, 'Le couvent de Saint Lazare à Venise, etc.' (Paris 1837); Scherer, 'Die Mechitaristen in Wien' (5th ed., Vienna 1892); and 'La vie du serviteur de Dieu, Mechitar' (Venice 1901).

MECHLIN, měk'lin (Dutch, měh'lĭn), or **MALINES**, mä-lēn, Belgium, a city on the Dyle, 14 miles southeast of Antwerp. The ancient walls and moat have been replaced by a wide boulevard and canal, the streets are wide and regular and it has fine squares and public buildings. It is the see of the primate of Belgium and has numerous churches. The present primate is the illustrious Cardinal Mercier (q.v.). Saint Rombold's Cathedral, a vast building covering nearly two acres, was built in 1437–52; the clock-tower, however, 324 feet high, remains unfinished; the cathedral contains Van Dyck's 'Crucifixion.' The churches of Saint John and Our Lady contain works by Rubens; the town hall dates from the 15th century; the Cloth Hall, now used as a guardhouse, from 1340, while also noteworthy are the modern archiepiscopal palace, the Beguinage and the Salm Inn (1534). The manufacture of pillow lace and of cloth, so famous in the 15th, 16th and 17th centuries, has been largely transferred to Brussels; the chief industries now are carpentry, caps and woolens, candles, starch, bells, tobacco, cabinet-making, brewing, horticulture and agriculture; extensive railway works have been established here. In 1914 the city was occupied by the Germans, who were later driven out by the garrison troops of Antwerp. The Germans retook the city after a violent bombardment, during which most of the city was laid in ruins. Pop. 59,000.

MECKLENBURG, měk'lĕn-boorg, Germany, a territory on the Baltic Sea, a former Saxon province, now divided into the grand-duchies of MECKLENBURG-SCHWERIN and MECKLENBURG-STRELITZ.

(1) Mecklenburg-Schwerin, bounded on the north by the Baltic Sea, elsewhere chiefly by Prussia and Mecklenburg-Strelitz, has an area of 5,135 square miles. The capital is Schwerin. Mecklenburg-Schwerin is watered by several rivers, most important of which are the Elbe and its tributaries, the New Elde and the Sude, on the southern border, the Warnow, the Recknitz and the Stepenitz, which flow toward the Baltic. There are many lakes and ponds, the largest of which are the Müritz See (51 square miles), the Schweriner See (23 square miles), the Kölpiner and the Plauer See. The country is generally flat, though here and there intersected by low ranges of hills, and its surface is extensively covered with wood. Near the sea

are large tracts of sand and morass. The climate, though raw, is mild and healthful; the average temperature throughout the year is 46° and the precipitation is 21 inches.

The principal industries are agriculture, dairying and stock-raising. About 50 per cent of the population are tillers of the soil. The landholders are hereditary tenants of the peasant class, title being vested in the upper classes, as the emperor, the aristocracy, clergy, etc. The chief crops are wheat, rye, oats, barley, corn, pease, beans, beets, turnips and potatoes, and tobacco is cultivated to some extent. The principal manufacturing industries are foundries, machine shops, brick yards, tanneries, paper mills, sugar refineries, breweries, distilleries, tobacco factories, etc. There is considerable commerce through Warnemünde (Rostock) and Wismar. The railway mileage is 1,094 miles. The predominating form of religion is the Lutheran. Besides the university at Rostock there are several gymnasia and numerous burgher, parochial and other schools. The two Mecklenburg duchies have a common assembly or Landesunion, consisting of the representatives of the landed aristocracy or Ritterschaft and the burgomasters of 49 towns; the tenants of the royal domains have no representation. The assembly meets once a year, alternately at Malchin and Sternberg. The executive authority in Mecklenburg-Schwerin is vested in a cabinet of four ministers; there are also a permanent committee consisting of nine members at Rostock, who represent the two estates when the assembly is not in session, and deputation and convocation diets, which may be assembled upon special occasions and for special purposes. Mecklenburg-Schwerin has two votes in the federal council and six representatives in the Reichstag, the only elective offices. Each duchy has a separate system of lower courts but they have a Supreme Court at Rostock in common. There is no general financial budget for Mecklenburg-Schwerin; there are three entirely distinct systems of finance. The budget of the first system is called the administration of the sovereign; the second, the states administration and the third the ordinary budget of the common administration. In 1913 the public debt amounted to $32,717,025. Technical education is well advanced and higher education is provided for by the University of Rostock. Pop. 639,958.

(2) Mecklenburg-Strelitz, divided by Mecklenburg-Schwerin into two large districts, the circle or lordship of Stargard, and the principality of Ratzeburg, both on the east, and on the west in several smaller districts, existing in separate patches, has an area of 1,131 square miles. Pop. 106,347, capital Neustrelitz. The country is flat and similar in physical characteristics to Schwerin. Strelitz has one joint representative chamber with Schwerin, but Ratzeburg is not included in these estates and is governed directly by the grand duke. The grand duke gave Ratzeburg a representative constitution 1869. Mecklenburg-Strelitz has one vote in the federal council of the empire and one representative in the diet. Consult Raabe, W., 'Mecklenburgische Vaterlandskunde' (3 vols., Wismar 1896).

MECKLENBURG (měk'lĕn-bĕrg) **DECLARATION,** in American history, a series of rebellious resolutions adopted 20 May 1775, at Charlotte, Mecklenburg County, N. C., by a convention held at midnight and representing each militia company in the county. The resolutions declared that the people of Mecklenburg County were free and independent of the British Crown, and not only was the general tenor that of the Declaration of Independence, but many phrases in the resolutions are word for word as they appear in that document. The minutes of the midnight meeting are said to have been destroyed by fire in 1800. Whether the Declaration of Independence followed the words of the Mecklenburg Declaration, or whether the latter, having probably been replaced from memory, was tinctured with the former, is a disputed question. In 1831, the day of 20 May was made a legal holiday in North Carolina. Consult Cooke, 'Revolutionary History of North Carolina' (1853); Draper, 'The Mecklenburg Declaration' (1874); Graham, G. W., 'The Mecklenburg Declaration of Independence, May 20 1775,' and 'Lives of its Signers' (New York 1905); Hoyt, W. M., 'The Mecklenburg Declaration of Independence' (ib., 1907); Moore, J. H., 'Defense of the Mecklenburg Declaration of Independence' (Raleigh 1908).

MECONIC ACID, an organic acid occurring in opium and having the formula $C_5HO(OH)(COOH)_2$. In preparing it, the opium is exhausted with water at 100° F., the infusion is neutralized with calcium carbonate and evaporated to a syrup, and calcium meconate is precipitated by adding a concentrated solution of calcium chloride. Two crystallizations from hot dilute hydrochloric acid follow, and the free acid is then deposited in the form of small scales, containing three molecules of water. Upon heating to 212° F. the hydrated crystals lose their water, and become white. Meconic acid is readily soluble in alcohol, but only slightly so in ether and in cold water. It has a sour taste and a pronounced acid reaction, and its solutions are turned red by ferric chloride, $FeCl_3$. Meconic acid forms numerous salts ("meconates"), as well as various organic derivatives; but none of these is of importance in the arts.

MEDAL, a piece of metal in the form of a coin, stamped with a figure or device to preserve the portrait of some eminent person, or the memory of some illustrious action or event, and not to be circulated as money. Medals belong to two periods, ancient and modern, separated by a wide interval. Early Greek and Roman medals were struck for prizes in athletic games, or in commemoration of great events. The Roman series of medals or medallions is very extensive in gold, silver and brass or copper. The gold medals begin with Constantine and continue to the fall of the empire; the silver begin under Gallienus and continue as long; the copper from Augustus to Alexander Severus.

In more modern times the art of medal-making has been brought to great perfection, and most of the principal nations have adopted the plan of preserving their history by these durable monuments. The French series is deserving of special mention as the most perfect and complete in the world. It commences under Louis XI and continues to the present date, illustrat-

ing every important event in the history of France. The English series commences under Henry VIII, but as works of art the medals have not high rank. The British battle medals, however, form an admirable series.. The Italian and German medals of modern date are very fine. The mediæval are interesting and bold in design, but rude in execution. The papal series, commencing with Paul II, are worthy of attention.

One of the earliest American medals is that presented to Gen. John Armstrong for his successful attack in 1756 on the Indians at Kittanning. Most of those struck during the Revolution were made in France. The next American medal of which there appears to be any record is that which was presented to General Gates after the surrender of Burgoyne, 17 Oct. 1777. On 25 March 1776, when news of the British evacuation of Boston reached Congress, that body resolved that its thanks be presented to the Commander-in-Chief, and that a gold medal be struck in commemoration of the event. This medal was nearly two and three-quarters inches in diameter. On one side was a profile head of Washington, with the legend in Latin: "The American Congress to George Washington, the Commander-in-Chief of its armies, the asserter of freedom." On the reverse the device showed troops advancing toward a town, others marching toward the water, ships in view, General Washington in front, mounted, with his staff, whose attention he is directing to the embarking enemy. The legend is: "The enemy for the first time put to flight." Then, too, at the time of his death, among minor honors paid to the great general's memory, was the publishing of a silver commemorative medal.

There is the record of one medal only granted by Congress in commemoration of any naval victory during the War of the Revolution, and that was a gold one presented to Paul Jones for his defeat of the British frigate *Serapis* when commanding the *Bonhomme Richard,* 23 Sept. 1779. Other gold medals were those presented to Commodore Perry and Lieutenant Jesse D. Elliot for the part which they took in the battle of Lake Erie, 8 Oct. 1812; to Captain Lawrence, who, in command of the *Hornet,* 24 Feb. 1813, captured the British brig *Peacock*; to Captain Warrington of the *Peacock* — then under the Stars and Stripes — for the capture of the *Epervier,* 20 April 1814; to Capt. Thomas Macdonough, who commanded the American squadron in Plattsburg Bay, August 1814; to Captain Decatur, who, in command of the *United States,* captured the British frigate *Macedonian,* 25 Oct. 1812; and to Captain Jones and Captain Blakely, who, when commanding the *Wasp* — the one, 12 Oct. 1812, and the other 28 June 1814 — captured respectively the *Frolic* and the *Reindeer* from the British navy.

The giving of medals went out of fashion after the second war with Great Britain, and but little was done by the government during the War of the Rebellion. Maj. Robert Anderson received two medals for his gallant defense of Fort Sumter, but one was presented by the citizens of New York and the second by the Chamber of Commerce of the same city. After the successful operations by Grant in East Tennessee and at Chattanooga, Congress voted him thanks and a gold medal with suitable emblems, devices and inscriptions. It is worthy of remark that no less than 189 medals were struck in honor of Abraham Lincoln, and later medals have been issued in memory of Garfield and McKinley, and in honor of Sampson, Schley, Dewey and others in the Spanish-American War. (See also COINAGE; NUMISMATICS; TOKEN MONEY). Consult Hawkins, 'Medallic Illustration of the History of Great Britain and Ireland' (London 1885); Loubat, J. F., 'Medallic History of the United States' (New York 1878); Leduc, 'Histoire des décorations en France' (Le Mans 1890); Hill, G. F., 'Portrait Medals of Italian Artists of the Renaissance' (New York 1912).

MEDAL OF HONOR, United States Military, an honor bestowed upon army and navy officers and men for specific services; regarded as a higher token of the war hero than the Victoria Cross of England, the medal of the Legion of Honor of France, or the Iron Cross of Germany. It is given not for the sheer performance of duty, no matter how hazardous that duty may be, but for some voluntary act of valor, beyond the bounds of mere obedience to orders. Out of the millions of men who have battled for the United States in the different wars this country has had, the vast majority, as history shows, performed their duty. Of these, however, have been about 2,000 men who have done more, who have braved dangers when they were not expected to brave them, overcome difficulties that were regarded by the rest as insurmountable, and faced death when it seemed it meant the sacrifice of their own lives. Many are the ways these medals have been won. By the Act of 12 July 1862 the United States government authorized the striking of 2,000 medals to be given to non-commissioned officers and privates for gallantry in action and soldier-like qualities. On 3 March 1863 the sum of $20,000 was appropriated for making the medals, and officers were made eligible to receive them. Medals were also authorized by Congress in recognition of acts of bravery performed (during the war with Spain in 1898) in the naval battles of Manila and Santiago, the Manila medals bearing the portrait of Admiral Dewey, and the Santiago medals a portrait of Rear-Admiral Sampson. The medal is a bronze five-pointed star within a circle of stars, suspended by a trophy of two crossed cannons surmounted by an eagle, united by a ribbon of 13 stripes of red, white and blue. Consult Rodenbough, 'Uncle Sam's Medal of Honor' (New York 1886), and 'United States Army Regulations' (latest issue).

MEDAL OF HONOR LEGION, an association of officers and enlisted men of the United States army, who were awarded medals of honor for special acts of bravery and devotion. At first limited to participants in the Civil War, it was subsequently extended to all medal holders. The association has altogether about 400 members among the army veterans and among naval veterans. The meetings are held annually.

MEDALLION, mē-dăl'yŏn. (1) The term medallion in numismatics is applied to those productions of the mint of ancient Rome, or struck in the provinces under the empire, which, if gold, exceed the *aureus* in size; if silver, the *denarius;* and if copper, the first or large brass. Medallions are not numerous. Those struck in

the Greek provinces are more common than the Roman, but of inferior workmanship. A beautiful and famous gold medallion exists of Augustus, and one of Domitian, but few, in any metal, are found prior to the reigns of Hadrian and Antoninus; those in brass are the largest, many of them being several inches in diameter, and for the most part of admirable workmanship. (See MEDAL).

(2) In architecture, an oval panel carved in bas-relief, usually carrying a head or figure. The same term is used for a color design.

MEDANO, mā-dä'nō, the Spanish name for peculiar moving sand-hills in Peru. They are seen on the plain of Islay near Arequipa, and are crescent-shaped bodies of white sand, which move across the desert in the direction of the winds which blow from sunrise to sunset. The sand composing the *medano* seems different from the desert sands over which the moving mass is blown or carried.

MEDARY, Samuel, American editor and politician: b. Montgomery Square, Montgomery County, Pa., 25 Feb. 1801; d. Columbus, Ohio, 7 Nov. 1864. In 1825 he settled at Batavia, Clermont County, Ohio, and in 1828 established the *Ohio Sun* in support of Jackson's candidacy for the presidency. He sat for Clermont County in the State house of representatives in 1834–35 and was a member of the State senate in 1835–37. In 1837 he purchased at Columbus the *Western Hemisphere,* later the *Ohio Statesman,* which he edited until 1857. In 1857–58 he was governor of Minnesota Territory and in 1858–59 of Kansas Territory. He was named Minister to Chile in 1853 but declined. He established the *Crisis* at Columbus in 1860, and was its editor until his death. He gave active aid to Morse in the promotion of the electric telegraph, was a firm supporter of the measures of Jackson and Douglas; is said to have originated the battle-cry "Fifty-four forty, or fight!" in connection with the Oregon boundary dispute, and was often called the "old wheel-horse of Democracy." There is a monument to his memory at Columbus, Ohio.

MEDEA, mẹ-dē'ą, a powerful sorceress of the Greek heroic age, daughter of Æetes, king of Colchis. By some her mother is said to have been Idyia, daughter of Oceanus; by others Hecate or Neæra. By her profound knowledge of the magical virtues of plants she practised witchcraft. She became the wife of Jason (q.v.), the leader of the Argonauts. For 10 years she lived with him after having supported him in every danger, till the charms of Glauce, or Creusa, the daughter of King Creon, kindled a new passion in him, and he discarded Medea, who brooded on revenge. With this purpose she sent the bride, as a wedding gift, a poisoned garment, also a poisoned crown of gold, which Glauce put on and died in agony. The sorceress reduced Creon's palace to ashes by a shower of fire, murdered her two children by Jason and then mounted her dragon chariot and escaped. Some say that she went to Hercules, others to Athens, to King Ægeus, by whom she had Medus. From Athens also she was banished as a sorceress. She finally returned to her home, where her son Medus reinstated her father, who had been dethroned by his brother Perses, after which she died. The story of Medea has often been a subject of tragic poetry ancient and modern. The tragedies of this name, by Æschylus and Ennius, have perished, as well as the Colchides of Sophocles. The Medeas of Euripides and Seneca are alone extant. The story has also been dramatized by Corneille and Grillparzer. Cherubini made this myth the subject of an opera. Consult Lübker, F., 'Reallexikon des plassischen Altertums' (8th ed., Leipzig 1914), and Mallinger, Léon, 'Médée étude sur la litterature comparée' (Paris 1898).

MEDEA, The, a play of jealousy and revenge, in which the interest is sustained from the beginning to the very end, and is artistically almost without a flaw, was brought out by Euripides in 431 B.C. Few tragedies of ancient or modern times are more dramatic. None exhibit the working of a fiercer and more intense passion. With the 'Hippolytus' it forms the double summit of the poet's works, and probably no Greek tragedy has been more famous in the modern world. The great enchantress, who fell in love with Jason when he came to Colchis in quest of the Golden Fleece, escapes with Jason to Greece, and lives happily with him for many years. Later Jason and his barbarian princess are obliged to flee to Corinth. In this city the scene of our play is laid. The old nurse speaks the prologue: Jason has deserted his wife for the daughter of Creon, king of Corinth. Dishonored, forsaken, the hapless woman sits brooding. The pædagogus enters and reports a conversation he has just overheard: Creon proposes to banish Medea. Medea is heard bemoaning her fate: oh, that she had never listened to the smoothing words of the deceitful Greek. Embittered, she imprecates curses on Jason and her children and prays that the whole house may be blasted to naught. Then she comes out and explains her position to the Corinthian women, who form the chorus. Creon enters and orders Medea to get her gone. She dissembles: the king is mistaken in believing that she is dangerous — she is simply hot with hate against Jason. "Let me remain — I shall yield to the stronger hand and hold my peace." The king reluctantly consents for her to remain one day. A great change comes over the woman scorned after Creon's departure: "I would not have groveled so before him except to get revenge. I shall bide my time, find first a safe refuge, then compass their destruction in secrecy by craft. Till then, my soul, sit still. By the Queen of Night that habits my hearth's dark shrine, no one shall ever vex my soul with impunity."

The chorus sing: "the old order is upturned; piety and fear, religion, justice, truth, loyalty all decline to their contraries, and naught but confusion lives." Jason appears and upbraids his wife for her froward spirit; she may rail at him, but not against the king. He had tried to appease the incensed ruler, but she persisted in her folly. But he will not desert her even in this dire extremity. "O most pernicious and perfidious man! You front me, you, the most hateful, insolent wretch on earth? But I am glad you came, for I shall tell you what you are, that you may chafe and wince.— I saved you, slaying the dragon and delivering you from death. I abandoned my home and followed you. Yet now you forsake me, the mother of your children. A loyal

spouse I have in you! I, a poor lorn woman, with her two babes, a fine reproach for our newly wedded prince!» Jason feels that he must be a skilful pilot to run before the wind of her loud words; but he declares that she received more than she gave, for she lives in a good Greek land, where law and justice reign — she is no longer an obscure barbarian. He had her welfare at heart when he contracted the new alliance. Women are so unreasoning that they know not where their fortunes lie. Jason withdraws and the chorus sing a song on the power of love. King Ægeus of Athens enters. He promises to protect Medea, if she comes to his city seeking refuge. Then she sends for Jason and asks his forgiveness for the rash words spoken in angry mood: «Ho, children, come forth and welcome your father with me.» But the thought of their impending death, when she beholds her babes, is too much even for Medea's iron courage. The tears force themselves to her pitying eyes. In explanation of her weakness she tells Jason that she is a woman, naturally born to tears, prone to weep, subject to fears: her heart melted at the thought of reconciliation. Jason has naught but praise for her altered mood; may his children grow to manhood triumphant o'er his foes. Medea weeps. Jason asks her why she turns her face away and hears not with joy his benisons. «'Tis nothing — I bare them, bred them, loved them, and when you prayed that they might live, I wondered whether this would come to pass.» She begs Jason to intercede for her children and allow them to remain in Corinth — she will send his bride royal gifts. The children carry the presents in a casket to the palace. The chorus sing an ode and the pædagogus enters to inform Medea that the children may remain. «Be of good comfort, thy children will yet bring thee back home.» «Nay, I shall first send others home. Alas! O children, you have a home, but I go to another land, just when I begin to feel that I am blest in you. Out upon my daring! 'Twas all for naught I toiled for you, my children. Ah, the fond hopes that your dear hands would minister to my wants and when I die put the shroud around me. Oh, why do you look at me thus? My heart is unequal to the task. My babes' bright morning faces unnerve my arm. I *cannot* do it. I will take my children with me. Why, to wring their father's heart, give my own a double pain? But am I to be mocked? Shall I let my foes go unpunished? I *must* do it. Out upon my cowardice! Go in, children. Nay, my heart, let them live; spare the tender babes, my unblown flowers, my life, my joy, my all the world. No, by the avenging deities, I will not give up my children to my foes. But I must see them before I go. O my darlings! O sweet mouth and form and face, sweet kiss, sweet embrace! O balmy breath and tender touch of your delicate cheeks! Go in, go in. I can look no longer, I faint.» The chorus sing an ode on the comparative benefits of having children and having no children. A messenger enters: «when your children entered the palace we were all glad. The rumor spread that you were reconciled.» One kissed the hands of the children, the other their flaxen hair. The princess sat with fond look on Jason; but when she espied the pair, she pulled down her veil and turned away in scorn. Jason entreated her to allay her wrath: «Accept these gifts and ask your father to remit the doom of exile, for my sake.» And when she saw the splendid gifts, she granted her lord's desire. Then she took up the robe — after they had gone — and tried it on. The golden crown she placed upon her head and arranged her hair before a mirror. Then she rose and walked about the room, stepping lightly with delicate foot and glancing oft toward the lowest folds around her ankle. Suddenly a ghastly spectacle presented itself. A pallor spread o'er her face. Back she tottered all a-tremble, and barely reached her couch before she fell, frothing foam around her lips, her eyeballs rolling wildly. One servant darted to her father's chamber, another flew to call the bridegroom. The hapless girl lay full a minute speechless. Then she roused and gave forth a scream, for a double agony had charged upon her: from the inclusive verge of golden metal around her brow a marvelous stream of fire shot forth, while the robes began to eat her delicate flesh. Up she started and sped across the room, a pillar of fire, shaking hair and head in vain endeavor to cast off the crown. But firm it held. Whene'er she shook her locks the flames started up twice as high and fierce. O'erwhelmed she sank upon the floor, past recognition save to a parent's eye: the clear calm look was gone, the comely features marred, drops of intermingling fire and blood dripped from her head, while gobbets and flakes of flesh dropped from her bones, like tears of resin from the pine, as those unseen jaws of the poisonous drug fed on her form. All feared to touch the corpse. Suddenly her father entered. He knelt and clasped her in his arms: «Oh, my poor child, what god brought thee to this cruel death?» At last he stayed his tears and tried to raise his old bent form, but the robes did cling to him as the ivy to the laurel. He writhed upon his knees and tried to wrench himself away, but only pulled the flesh from off his bones. At last the ill-starred sire gave up the ghost. Now their corpses lie side by side, a spectacle to draw tears of pity from the eye. Medea informs the chorus that she must slay her children and hasten away: «Now, my heart, put on thy armor for the deed. Shrink not. Think not on the happy days agone. For this one brief day forget thy children — e'en if thou dost slay them, they are most dear, and I the most unhappy woman in the world.» Medea enters the house and soon the screams of the children are heard within. Jason enters and asks for Medea; he feels anxious for his children — the king's relatives may do them hurt. «Wretched man, your children are dead, slain by their mother's hand.» Jason is overwhelmed. He orders the gates to be unbarred. Medea appears aloft in a chariot. Jason asks for the bodies; but she refuses to give them up: she will take them and bury them herself, that her foes may not demolish the grave. She intends to go to the land of Erechtheus to live with Ægeus. She prophesies that Jason will die most miserably, struck on the head by a piece of fallen timber from the Argo. She soars away, and Jason calls on Zeus to witness the treatment he has received at the hands of the tigress. Thus the play, in which we see the perfection of Euripides' art,

ends. The fury of her vengeance is as the love of Phædra in the 'Hippolytus'; but instead of overwhelming her soul, it excites to action, arms it against the deepest instincts of mother-love and makes it triumph over everything in a kind of grandiose and savage egoism. The more impetuous the fury, the more pathetic the struggle of feminine instincts. In no other play is there anything more characteristically Euripidean than Medea's celebrated monologue. Next to the human passions it is the natural affections, the tenderness of parents for their children, the love of brothers and sisters, of husband and wife, that Euripides portrays best.

JOSEPH E. HARRY,
Author of 'The Greek Tragic Poets,' etc.

MEDELLIN, mā-dĕl-yēn', Colombia, a city, the capital of the department of Antioquia, and an episcopal see, picturesquely situated in a mountain valley 4,850 feet above sea-level on the Porce, an affluent of the Canca, 150 miles northwest of Bogotá. It was founded in 1674 and has a cathedral, college, seminary, technical school, mint, hospital and other public buildings. The development of the gold and silver mines in the region has contributed largely to its modern progress. It has manufactures of pottery, porcelain ware, cloth, candies, cigarettes, clocks, shoes, paper and jewelry and has a considerable trade, exporting gold, silver, coffee and hides. Pop. 70,547. Consult 'Censo general de la república de Colombia' (Bogotá 1912).

MEDFIELD, Mass., town, in Norfolk County, 20 miles south of Boston; on the New York, New Haven and Hartford Railroad. The town is the seat of Medford State Hospital. Bricks and straw hats are manufactured. Hannah Adams, the historian, was born in Medfield. Pop. 3,466.

MEDFORD, mĕd'fŏrd, Mass., city, in Middlesex County; on the Mystic River and on the Boston and Maine Railroad, five miles northwest of Boston. The area is about 10 square miles. It was founded in 1630 by people from Salem who called the place Meadford. In 1892 it was chartered as a city, having within its limits the villages of South Medford, West Medford, Hillside, Glenwood and Wellington. It is a residential suburb of Boston, but it has some important industrial interests, chief of which are the manufacturing of machinery, cotton goods, dyes, chemicals, carriages, brick and novelties. It is the seat of Tufts College (q.v.), and has the city and the college libraries. The Cradock House, built in 1634, is one of the oldest, if not the oldest building in the United States which retains its original form. The city has four large and several small parks, many miles of boulevard (Metropolitan Parkways) and includes many acres of State reservation (called Middlesex Falls) where game is protected and the public allowed to enjoy the natural beauties of the country. "The Royal House" is also located in this city and is of historic (Colonial) interest and is preserved by the Royal House Association, it is of the finest type of Colonial design. Oak Grove, the largest of its three cemeteries, has an area of 34 acres. The charter granted in 1892 is still in force and provides for the administration of the municipality by a mayor, who holds office two years, and a board of aldermen composed of 21 members. The administrative officials are appointed by the mayor or elected by the council. The board of education is chosen by popular vote. Pop. 23,150. Consult Usher, 'History of the Town of Medford, Mass.'

MEDFORD, Ore., city, in Jackson County; on the Pacific and Eastern, the Southern Pacific and the Rogue River Valley railroads, five miles east of Jacksonville. In the neighborhood are Crater Lake, National Park and Sugar Pine forests. The city has a high school, post-office building, Carnegie Library, Sacred Heart Hospital, Saint Mary's Academy and a station of the United States Weather Bureau. It has a large trade in apples and pears, for which it is an important shipping point. The municipality owns the water-supply system which was constructed at an expenditure of $350,000. Pop. 12,490.

MEDFORD, Wis., city, county-seat of Taylor County; on the Black River and on the Wisconsin Central Railroad; about 60 miles northeast of Eau Claire. It is in an agricultural and lumbering region. The chief manufactures are cheese, foundry products, lumber and leather. It has considerable trade in lumber, leather and cheese. Pop. 1,846.

MEDHURST, mĕd'hėrst, **Walter Henry,** English oriental scholar and missionary: b. London, 1796; d. there, 24 Jan. 1857. He was educated for the ministry and in 1816 made a missionary tour through India and Malacca, establishing himself in 1822 in the island of Java, where he remained eight years. During this interval and for several years afterward he pursued his missionary labors also in Borneo and on the coasts of China. In 1843 he settled in Shanghai and subsequently passed six years in the interior of China. He was an intelligent student of the languages and literatures of eastern Asia, being well versed in the Chinese, Japanese, Javanese and other dialects, besides Dutch, French and English, in all of which he wrote. Beside a Chinese version of the Bible, he published 'Chinese Repository' (20 vols., 1838–51); 'Chinese and English Dictionary' (1842–43); 'English and Chinese Dictionary' (1847–48); 'English and Japanese Vocabulary' (1830); 'Dictionary of the Hokkien Dialect' (1832–39); 'Translation of a Comparative Vocabulary of the Languages of China, Corea and Japan' (1835); 'Notes on Chinese Grammar' (1842); 'Chinese Dialogues' (1844); 'China in its State and Prospects' (1838); 'Dissertation on the Theology of the Chinese' (1847); etc.

MEDIA, mē'di-ą, Asia, an ancient kingdom and country of considerable extent, now comprised in the provinces of northwest Persia. It was originally inhabited by a Turanian race, who are called Medes by ancient writers; but this name properly belongs to an Aryan race, who had spread themselves widely in the high regions of Western Asia and ultimately established their ascendency in Media. They have been traced both by Persian and Indian traditions to the countries beyond the Indus. The history of Media is involved in considerable obscurity, but careful modern investigations have made the main outlines fairly clear. The Medes are first mentioned in connection with some of the kings of Assyria from the 9th

century B.C. Rammân-nirari II of Assyria, who reigned about 810 B.C., led expeditions into Media and in 713 the great King Sargon conquered the country and made the Median princes tributary to the Assyrian monarchy. According to the Assyrian inscriptions, one of the Median rulers named Dajaukku was carried off as a prisoner in 715 B.C.; this Dajaukku is the same as the Deioces who, according to Herodotus, founded the Median kingdom on an independent basis and fixed his capital at Ecbatana (now Hamadan). Deioces was followed by three kings in succession, bearing the names (in Greek) of Phraortes, Cyaxares and Astyages. Phraortes, to whom the Greek historian assigns a reign of 22 years (647–625 B.C.), began the extension of the Median empire by the subjugation of the mountainous region of Persis, to the southeast of Media. He then conquered other parts of Asia, and at length ventured to take the aggressive against the Assyrians and attack Nineveh. In this attempt he failed and lost his life. Cyaxares succeeded him on the Median throne, and during a reign of 40 years raised his kingdom to the greatest power and importance it was destined to achieve. He thoroughly reorganized the army and advanced against Nineveh. He gained several successes, but before he could take the Assyrian capital he had to return to defend his kingdom against the inroads of Scythians. At first the Scythians carried all before them and became virtually masters of Media, but Cyaxares temporarily secured his position by negotiating with them, and finally slew all their chiefs when they were overpowered by wine at a feast. Thus rid of Scythian authority, Cyaxares again advanced against the Assyrians. In conjunction with Nabopolassar, founder of the Neo-Babylonian empire, he captured Nineveh about the year 606 B.C. After this event the Assyrian dominions were partitioned between the two conquerors, the northern parts falling to Media and the southern portions to Nabopolassar. Nebuchadnezzar, son and successor of Nabopolassar, married a daughter of Cyaxares. Cyaxares carried his arms into Asia Minor and waged war for five years against Alyattes, king of Lydia. On 28 May 585, the Median and Lydian forces were engaged in battle when a total eclipse of the sun took place and struck terror into the soldiers on both sides. This event disposed both sides to enter into peace negotiations, which were successfully carried through by the agency of Nebuchadnezzar and Syennesis, prince of Cilicia. Cyaxares probably died very shortly after this event, and left to his successor a greatly extended empire. Astyages was the last independent king of Media, and from 550 B.C., when he was conquered by Cyrus the Persian, Media formed part of the Persian empire. See PERSIA and consult Delattre, A. L., 'Le peuple et l'empire des mèdes jusqu'à la fin du règne de Cyaxare' (Brussels 1883); Oppert, Jules, 'Le peuple et la langue des Mèdes' (Paris 1879); Prášek, 'Medien und das Haus des Kyaxares' (Berlin 1890); id., 'Geschichte der meder und Perser bis zur makedonischen Eroberung' (Gotha 1906); Ragozin, Z. A., 'Media, Babylon and Persia' (New York 1888).

MEDIA, Pa., borough, county-seat of Delaware County; on the Philadelphia, Baltimore and Washington Railroad, about 15 miles west of Philadelphia. It is a well-built, well-kept residential suburb of Philadelphia, and is situated in a fertile agricultural region. It is the headquarters for the Delaware County Institute of Science, established in 1833. The Institute has a library of about 5,500 volumes, and the borough library has about 3,500 volumes. The street-lighting plant and the waterworks are owned and operated by the borough. The borough was incorporated in 1850; its government is vested in a burgess and council. Pop. 3,562.

MEDIAL MORAINE. See MORAINE.

MEDIATION, *in international law,* is the friendly intercession of a third power or powers with a view to bringing about the settlement of a controversy between two or more states, to avert threatened hostilities between them or to bring to a close a war in which they are engaged. Most writers on international law make a distinction between "good offices" and "mediation." The employment of good offices by a third power consists in the tendering of friendly advice or the offering of suggestions to the disputing parties with a view to bringing about the settlement of a dispute or the conclusion of peace, if they are engaged in war. A government which tenders its good offices is understood to be willing to suggest a compromise as a common basis of agreement between the contending parties, to arrange preliminaries for the negotiation of a treaty of peace and to do anything else that may serve the parties in settling their controversy or in ending their hostilities.

Mediation, on the other hand, has more of the character of friendly intervention. A mediator assumes the rôle not merely of adviser or conciliator but takes the part of a middleman,—usually the leading part,—in the conduct of the negotiations between the disputants. He is not, however, a judge, for mediation is not arbitration, nor is he an advocate for either side but, to use the language of Sir James Mackintosh, he is "a common friend, who counsels both parties with a weight proportioned to their belief in his integrity and their respect for his power." With a view to encouraging a more frequent recourse to mediation as a means of settling international controversies and in order to define the rôle of the mediator the Hague Peace Conferences of 1899 and 1907 adopted the following rules which were embodied in a convention which was ratified by practically all the powers of the world.

"In case of serious disagreement or dispute, before an appeal to arms, the Contracting Powers agree to have recourse, as far as circumstances allow, to the good offices or mediation of one or more friendly Powers (Art. 2).

"Independently of this recourse, the Contracting Powers deem it expedient *and desirable* (the italicized words were added in 1907) that one or more Powers, strangers to the dispute, should, on their own initiative and as far as circumstances may allow, offer their good offices or mediation to the States at variance.

"Powers, strangers to the dispute, have the right to offer good offices or mediation, even during the course of hostilities.

"The exercise of this right can never be regarded by either of the parties at variance as an unfriendly act (Art. 3).

"The part of the mediator consists in reconciling the opposing claims and appeasing the feelings of resentment which may have arisen between the States at variance (Art. 4).

"The duties of the mediator are at an end when once it is declared, either by one of the contending parties, or by the mediator himself, that the means of reconciliation proposed by him are not accepted (Art. 5).

"Good offices and mediation, undertaken at the request of the contending parties or on the initiative of Powers strangers to the dispute, have exclusively the character of advice, and never have binding force (Art. 6).

"The acceptance of mediation cannot, in default of agreement to the contrary, have the effect of interrupting, delaying or hindering mobilization or other measures of preparation for war.

"If mediation takes place after the commencement of hostilities, the military operations in progress are not interrupted, in default of agreement to the contrary (Art. 7)."

It will be seen that the tender of good offices or mediation by third powers prior to or during hostilities is declared to be a legal right, though not an obligation. The Convention, however, imposes on the disputants an obligation to have recourse to this mode of settling their controversies *so far as circumstances allow.* Each disputant is therefore the judge as to whether the circumstances in a particular case create an obligation to accept the offer tendered. At the outbreak of the European War the President of the United States made known his willingness to serve as a mediator whenever he should receive assurances that an offer would be acceptable by the warring powers. Again in 1916 when war between the United States and Mexico seemed imminent the governments of several of the Latin American republics made known their willingness to offer their good offices in bringing about a settlement of the dispute but the American government declared that the circumstances were not such as to make recourse to this form of sentiment expedient. The express declaration of The Hague Convention that the exercise of the right of mediation by third powers shall never be regarded by either of the disputing parties as an unfriendly act was designed to remove all possibility that an offer of mediation might be construed as an act of gratuitous interference rather than the act of a disinterested friend of both parties. The rôle of the mediator is defined in article 4 as that of reconciliation and article 5 lays down the circumstances when his mission is terminated. Article 6 which declared that mediation has no binding effect on the parties but is entirely advisory in character removes the possibility of further misunderstanding concerning its purpose and effect.

The historical instances of recourse to good offices and mediation are numerous. A few of these may be mentioned as illustrations. During the war of 1812 between Great Britain and the United States, the Tsar of Russia offered to act as a mediator with a view to bringing about a termination of hostilities. The offer was accepted by the government of the United States and to avoid delays plenipotentiaries were at once appointed by the President to conclude a treaty of peace but the offer was refused by the British government and nothing further came of the Russian proposal.

Early in 1861 several Latin American republics tendered their good offices to avert the civil war then imminent; after the outbreak of hostilities the British and French governments through their ministers at Washington expressed a willingness "to undertake the kindly duty of mediation" if the President should desire it. President Lincoln expressed appreciation for "this generous and friendly demonstration" but stated "that we cannot solicit or accept mediation from any, even the most friendly quarter." On various occasions during wars in South and Central America the President of the United States tendered his good offices to bring about the adjustment of difficulties or to terminate hostilities already existing. One of the most remarkable of such examples of mediation on the part of the United States was that which was begun in 1866 and concluded in 1872 for the purpose of terminating the war between Spain on the one hand, and the allied republics of Peru, Chili, Bolivia and Ecuador on the other. During the Franco-German War of 1870–71 France requested the United States "to join other powers" in an effort to bring about peace. President Grant replied that he anxiously desired to see the war ended and peace restored and that he would be glad to use his efforts in bringing about peace if Germany also desired the employment of his good offices. At the same time the French government was informed that it was the uniform policy of the United States not to act jointly with European powers in interference in European questions. During the Chino-Japanese War of 1894 the government of the United States made known to both belligerents its willingness "to contribute its kindly offices toward the restoration of peace" but when an inquiry was made asking whether the United States would be willing to join England, Germany, France and Russia in an intervention between China and Japan the President replied that the United States could not join the powers mentioned in such an intervention. During the Boer War of 1899–1902 the government of the United States alone of all the governments approached by the South African republics tendered its good offices but the offer was not acceptable to the government of Great Britain.

A remarkable recent example of the employment of good offices by the President of the United States to bring about the termination of war was the intervention of President Roosevelt in 1905 which resulted in the conclusion of peace between Japan and Russia. On 8 June 1905 the President caused identical notes to be sent to the governments of both belligerents expressing his wish that "the terrible and lamentable conflict now being waged" might be brought to an end and urging them "not only for their own sakes but in the interest of the whole civilized world to open direct negotiations with one another." He also expressed his entire willingness to do what he properly could if the two powers felt that his services would be of any aid in arranging the preliminaries as to the time and place of meeting of the plenipotentiaries which they might appoint. The suggestion of the President was promptly acted upon and plenipotentiaries were appointed to negotiate

a treaty of peace. They met at Portsmouth, New Hampshire, and a treaty of peace was signed on 23 Sept. 1905.

A still more recent example of successful mediation was that of 1914, which resulted in the temporary termination of an existing conflict between the United States and Mexico. On 25 April, the diplomatic representatives of Brazil, Argentina and Chile addressed a communication to the Secretary of State tendering the good offices of their governments for "the peaceful and friendly settlement" of the controversy. The offer was promptly accepted both by the President of the United States and General Huerta, President of Mexico, and both parties agreed to a mutual suspension of hostilities at the request of the mediators.

At the suggestion of the mediators commissioners representing both parties were appointed and they met at Niagara Falls, Ontario, in May 1914. The mediating plenipotentiaries in turn presided over the conferences. On 24 June a protocol embodying the terms of agreement was signed and it was duly ratified by both governments. See also ARBITRATION, INTERNATIONAL.

JAMES W. GARNER,
Professor of Political Science, University of Illinois.

MEDICAGO, genus of leguminous plants common throughout the greater part of the globe and including such forage plants as alfalfa, medic and bur and mail clovers. Some species are annual, others perennial. In all there are about 50 species, of which about six are native to the United States. These include *M. sativa, M. lupulina, M. denticulata, M. Arabica.* In general the perennial species have violet flowers, the annuals small bright yellow flowers. The pods are single-seeded, curved and spineless in some, while in others it is spirally twisted, has spines on the edges and contains several seeds. Medicago sativa is the most important species, since it includes the valuable alfalfa and lucerne.

MEDICAL ASSOCIATION, American. See AMERICAN MEDICAL ASSOCIATION.

MEDICAL CODE, a set of regulations adopted by a medical association outlining the conduct of members of the profession. The various codes prohibit advertising in public prints, as well as the endorsement of proprietary or secret remedies. The ethics of both "regular" and homœopathic schools define the relations of patient and physician and of attending and consulting physician, and provide that a physician shall attend the immediate family of a brother physician without charge, except when unusual labor, expense or exposure is involved. The medical code in this country was founded on the English code of medical ethics prepared by Thomas Percival in 1803. In 1847 the American Medical Association adopted a general code which superseded codes existing in several States, and which was unopposed till 1882. In the latter year a majority of the members of the New York County Medical Society voted to disobey the provision of the code which forbade them to consult with any but "regular" physicians, claiming the right to consult with any physicians that the legislature of each State decided to be legally qualified. Similar action was taken by a majority of the members of the New York Academy of Medicine. This antagonism affected the whole profession in this country, and the immediate result was the formation of New York County and State associations, whose delegates were received by the American Medical Association to the exclusion of those from the old societies. In 1903 steps were taken to heal their differences and unite the rivals into one body, with the code so modified in effect as to allow individual liberty in the matter of consultation. Consult Flint, 'Medical Ethics and Etiquette' (New York 1883) and 'Principles of Medical Ethics' (Chicago 1912), the official work of the American Medical Association.

MEDICAL COLLEGES FOR WOMEN. See EDUCATION, PROFESSIONAL; MEDICAL EDUCATION IN THE UNITED STATES.

MEDICAL CORPS. The Medical Department includes the Medical Corps, Dental Corps, Medical Reserve Corps, Hospital Corps and Nurse Corps. The Medical Corps consists of one surgeon-general, with rank of brigadier-general, who is chief of the medical department, 14 colonels, 24 lieutenant-colonels, 105 majors and 300 captains or first lieutenants, who have rank, pay and allowances of officers of corresponding grades in the cavalry and of the service. An applicant for appointment in the medical corps of the army must be between 22 and 30 years of age, at the time of taking the preliminary examination, must be a citizen of the United States, must have a satisfactory general education, must be a graduate of a reputable medical school legally authorized to confer the degree of doctor of medicine, and must have had at least one year's hospital training, including practical experience in the practice of medicine, surgery and obstetrics. The appointments are made by the President, upon the recommendation of the surgeon-general, after the applicants have passed the prescribed examination, consisting of two parts — a preliminary examination, and a final or qualifying examination, with a course of instruction at the Army Medical School intervening. Qualified applicants are appointed to the medical reserve corps with the rank of first lieutenant, and upon pledging themselves to accept a commission in the medical corps, if found qualified in the final examination, and to serve at least five years thereunder, unless sooner discharged, are ordered to the Army Medical School, Washington, D. C., for instruction as candidates for admission to the medical corps of the army; if, however, a greater number of applicants qualify than can be accommodated at the School, the requisite number are selected according to their relative standing as marked by the Army Medical Board. Graduate candi-

dates who are found physically qualified and who obtain a general average of 80 per cent in their preliminary professional examination, in their course at the Army Medical School, in their clinical examination and in their general aptitude, are eligible for appointment in the medical corps. Eligible candidates may, if they so desire, take a special examination in ancient or modern languages, higher mathematics, or scientific branches other than medical. Proficiency therein is rated by the board conformably to instructions from the surgeon-general. The relative standing for appointment of eligible candidates is determined by the total number of points obtained in the preliminary professional examination, in the School, in the clinical examination, in general aptitude, and in the special examination, if one is taken. See ARMY MEDICAL SCHOOL; HOSPITAL CORPS; MEDICAL ORGANIZATION IN THE ARMY.

MEDICAL EDUCATION, Colleges and Schools, Legal Supervision, etc. Before the establishment of medical schools in this country medical students either went abroad to study or served an apprenticeship with some practising physician. The latter custom was common in view of the expense incident to work abroad, and continued till very recently. As a rule the apprentice had little opportunity for study, but was forced to depend on what he could absorb by contact with his preceptor. The physicians of the 17th and 18th centuries who had studied abroad were usually classical students and in their preliminary training set an example that it would have been wise to follow. The first public lectures on anatomy before a class of students in this country are said to have been delivered by Dr. William Hunter of Newport, R. I., in 1752. It seems, however, that Dr. Giles Firmin as early as 1647 delivered readings on human osteology in New England; that Dr. Thomas Cadwallader of Philadelphia gave instruction to students in anatomy between 1745 and 1751; and that Drs. John Bard and Peter Middleton dissected the human body in New York City in 1750 for purposes of medical instruction. 1762 Dr. William Shippen of Philadelphia gave a course of lectures on anatomy, illustrated by actual dissections. These lectures were continued till the organization of the Medical College of Philadelphia (now the medical department of the University of Pennsylvania) in 1765. Dissections were rarely performed prior to 1760 and even autopsies were seldom permitted. At the time of the American Revolution, with a population of 3,000,000, there were probably about 3,500 physicians in the colonies, of whom it is estimated that not more than 400 had received medical degrees. In New England the clergyman was often the only available physician. Two medical schools were organized in the colonies, the Medical College of Philadelphia (now a department of the University of Pennsylvania) in 1765, and the medical department of King's (now Columbia) College, in 1768. The first medical degree conferred in this country, that of bachelor of medicine, was granted to 10 men by the Medical College of Philadelphia in 1768. The degree of doctor of medicine was first conferred in 1770 by the medical school of King's College on two students who had taken the bachelor's degree in 1769. Fifty-one medical degrees had been conferred by these institutions before 1776, when operations were suspended by the war. In the colonial period two medical societies (the State Medical Society of New Jersey, in 1766, and the Delaware State Medical Society, in 1776) and one permanent general hospital were organized. Harvard University Medical School was organized in 1782, Dartmouth Medical College in 1797, the School of Medicine of the University of Maryland and the College of Physicians and Surgeons of New York in 1807. In 1813 the medical department of Columbia College was finally discontinued; the College of Physicians and Surgeons took its place in 1860. Of the 148 medical schools now existing in the United States and registered by the University of the State of New York three were established between 1765 and 1800, 12 between 1801 and 1825, 19 between 1826 and 1850, 29 between 1851 and 1875, 80 between 1876 and 1900, 5 between 1901 and 1904.

At the time of the organization of the early medical schools the practice of obstetrics was relegated as a rule to ignorant midwives; physiology, histology, organic chemistry, pathology, and surgery, as now recognized, were hardly known. The schools at first conferred the degree of bachelor of medicine on those who had studied two years with a preceptor and attended one course of lectures, the degree of doctor of medicine after three years of study and two courses of lectures. The bachelor's degree was abandoned in 1813. At first the Medical College of Philadelphia required for admission some knowledge of Greek and Latin, physics, natural history and botany, but the requirement was abandoned about the time of the reorganization of the University of Pennsylvania in 1792. For a century there were as a rule practically no requirements in preliminary general education for admission to medical schools, and even to-day this is their greatest defect.

In 1839 the New York State Medical Society resolved that teaching and licensing ought to be separated as far as possible. Further discussion of this question led to a convention of delegates from all medical schools and societies in the United States, held in New York in 1846; from it sprang the American Medical Association. This national organization, thoroughly representative in character, gave a new impetus to medical societies. The following societies have exercised an important influence in promoting higher standards: Association of American Medical Colleges (1890); American Institute of Homœopathy (1844); National Confederation of Eclectic Medical Colleges (1871); Southern Medical College Association (1892). These prescribe for admission to medical schools a preliminary general education equivalent to one year in a high school. All prescribe four courses of lectures in different years as a condition for an M.D. degree, though they give an allowance of one year to graduates of reputable literary colleges and of other professional schools. All tend to improve facilities for teaching, dissections and clinics. The schools registered by these societies are 72, 19, 7 and 13 respectively.

In 1859 the Chicago Medical College, now the medical department of Northwestern University, was established to test the practicability of a thorough graded system of instruction. Students were divided into three classes, and each class was examined at the close of the

year. Each of the three courses was six months in duration. Attendance on hospital clinical instruction and practical work in the chemical, anatomic and microscopic, or histologic laboratories were required for graduation. In 1871 the Harvard Medical School adopted a similar plan. The Syracuse Medical School followed, and to-day the graded system of consecutive lectures is the rule. In 1896 President Eliot wrote substantially as follows: Within 25 years the whole method of teaching medicine has been revolutionized throughout the United States. The old medical teaching was largely exposition; it gave information at long range about things and processes which were not within reach or sight at the moment. The main means of instruction were lectures, surgical exhibitions in large rooms, appropriately called theatres, rude dissecting rooms with scanty supervision, and clinical visits in large groups. The lectures were repeated year after year with little change, and no graded course was laid down. There was little opportunity for laboratory work. The new medical education aims at imparting manual and ocular skill, and cultivating the mental powers of close attention through prolonged investigations at close quarters with the facts and of just reasoning on the evidence. The subjects of instruction are arranged, as at the Harvard Medical School, in a carefully graded course, which carries the student forward in an orderly and logical way from year to year. Laboratory work in anatomy, medical chemistry, physiology, histology, embryology, pathology and bacteriology demands a large part of the student's attention. In clinical teaching, also, the change is great. Formerly a large group of students accompanied a visiting physician on his rounds, and saw what they could under very disadvantageous conditions. Now instruction has become, in many clinical departments, absolutely individual, the instructor dealing with one student at a time, and personally showing him how to see, hear and touch for himself in all sorts of difficult observation and manipulation. Much instruction is given to small groups of students, three or four at a time — no more than can actually see and touch for themselves.

In 1918 there were, excluding graduate schools, 95 medical schools in the United States with 13,630 students. The growth in medical students in 32 years up to 1910 was 333 per cent. In the last 15 years, however, there has been a radical change in medical education in the United States which has had the effect, as will be shown in the following table, of improving the quality of the education, while at the same time reducing the number of those granted medical degrees. Acting upon the recommendation of the American Medical Association, a committee has made a division of medical schools into three classes, A, B and C, the first containing those medical schools which fulfilled the highest requirements. The annexed table shows the results of the reconstruction which followed the classification:

Year	Colleges	Students	Women	Graduates	Women
1904.....	160	28,142	1,129	5,747	.....
1914.....	102	16,502	631	3,594	.....
1915.....	96	14,891	592	3,536	.....
1916.....	95	14,022	566	3,578	134
1917.....	96	13,764	610	3,379	153
1918.....	95	13,630	581	2,807	106

While the actual number of physicians graduated is half that of 1904, the number per thousand of population is still twice as great as it is in Europe. The diminution in number of medical students was not affected by the European War nor was the actual number of medical students and teachers affected by the selective draft, for the Medical Officers' Reserve Corps and the Enlisted Medical Reserve Corps provided against that contingency.

Class A colleges require a four-year high school course and two years of work in a college of arts and sciences approved by the council on education of the American Medical Association. The council also specifies what is required in the studies both in high school and college, and also what is to be expected of the medical schools themselves, both in supervision, equipment, teachers, clinical facilities [including, for instance, daily dispensary cases, at least six maternity cases for each senior student and 30 necropsies for each senior class of 100 students or less], medical library, museum, dissect material, etc. In 1918 there were 69 medical colleges of Class A in the United States and two in Canada.

Medical schools of Class B are those which under the present organization give promise of being made acceptable by general improvements. Of these there are 14 in the United States and six in Canada. Class C contains those which require complete reorganization, do not keep satisfactory records, or enforce entrance requirements or give a major portion of their instruction after 4 P.M., or are privately owned and conducted for profit. Of these there are 12 in the United States.

The comparative value of the work done now and 14 years ago is realized when it is known that in 1904 only 2.5 per cent of medical schools required college work as an entrance requirement, while in 1918 92.2 per cent did, and that in 1904 only 6.2 per cent of the medical students of the country were in the high grade medical schools, while in 1918 there were 95.3 per cent in the better schools, and that in 1904 but 6.4 per cent of the graduates in medicine came from the high grade colleges, while in 1918 the latter graduated 90.3 per cent.

In 1915 a national board of medical examiners was inaugurated with funds from the Carnegie Foundation. The board consists of six representatives from the government [two from the army, two from the navy and two from the public health service], three members of State licensing boards and seven other physicians appointed at large.

Of the 82 medical colleges in the United States in 1914–15 the most highly endowed had an income of $411,570, and the lowest $6,080.

About 1903 a rapid improvement in medical education began in the United States, resulting in a very great decrease in the number of medical colleges and it was thought that a dearth of physicians would follow. Fears were also expressed that the medical education, the cost of which was thus greatly increased, would be the privilege of the rich, and that it would undemocratically exclude the poor boy, a fear which has not been justified. Apprehensions were also felt that the raising of the standard of medical education would have the effect of decreasing the supply of physicians for

rural communities. This, however, has been obviated by the improvement of facilities in communication — automobiles, better roads, etc.

Out of 90 medical schools, 60 are now coeducational, although 16 out of the medical colleges admitting women have no women students. Out of seven medical schools for negroes, in 1910 only two were efficient.

More attention should be paid in the United States to instruction in hygiene and state medicine. In Great Britain no one can be appointed a medical officer unless he has a special diploma in public health. In this country little opportunity is afforded for general or special sanitary work on broad lines. This subject is now under discussion and doubtless progressive States will soon provide places where medical officers of health or other persons engaged in sanitary work can obtain practical and scientific training. The scientific investigations which would be made in the laboratories of such schools would be of great value to the public.

The earliest law relating exclusively to physicians was passed by Virginia in 1639, but like the later act of 1736 it was designed mainly to regulate their fees. The act of 1736 made concessions to physicians who held university degrees. In only two of the 13 colonies were well-considered laws enacted to define the qualifications of physicians. The general assembly of New York in 1760 decreed that no person should practise as physician or surgeon in the city of New York till examined in physic and surgery and admitted by one of his majesty's council, the judges of the supreme court, the king's attorney-general and the mayor of the city of New York. Such candidates as were approved received certificates conferring the right to practise throughout the whole province, and a penalty of £5 was prescribed for all violations of this law. A similar act was passed by the general assembly of New Jersey in 1772. In 1840 laws had been enacted by the legislatures of nearly all the States to protect citizens from the impositions of quacks. Between 1840 and 1850, however, most of these laws were either repealed or not enforced as a result of the cry that restrictions against unlicensed practitioners were designed only to create a monopoly.

State Supervision.— Careful attention needs to be given to the difference between a license and a degree, the one carrying with it the right to assume a title which is evidence of scholastic ability, the other the right to enter on the practice of a profession or a pursuit, both emanating from the same authority, the State, either directly or through intervening mediums. As foreigners are often puzzled to account for the diversity in our legislation, the fact is again emphasized that all matters of internal police control are left exclusively to the several States, and that national laws regulating professional practice cannot be enacted. Hence the laws of the United States will be silent concerning licenses and degrees except in so far as they may apply to the District of Columbia and certain recent political dependencies.

Licensing.— The requirements for admission to practise a profession in the 54 political divisions of the United States vary as greatly in the various professions as the political divisions differ in area, extent, population and importance. However, two general items appear in full or in part in the various statutory requirements for licensing; namely, (1) the general preliminary education requirements; (2) the professional preparation. The general preliminary are given uniformly under the synopsis of requirements.

Supervision.— In medicine all political divisions except Alaska now have examining and licensing boards. In some States the stringent laws against non-medical practitioners are enforced; in others quackery receives such legal protection that any person may treat "the sick or suffering by mental or spiritual means without the use of any drug or material remedy." This is due largely to the fact that so many statutes lack specific definitions as to what constitutes the practice of medicine, and without these definitions the conviction of such practitioners cannot be secured through the courts. There is much misunderstanding in this country regarding the duty of the State in relation to the health of the people. It does not consist in discriminating between schools or systems of medicine, but in requiring without prejudice or partiality of all who seek a license to practise for gain on the lives of fellow beings a minimum preliminary and professional training.

Medical Sects.—As commonly understood, regular physicians have no distinctive theory or practice; homœopaths treat diseases with drugs that excite in healthy persons symptoms similar to the morbid condition treated; eclectics make use of what they regard as specific remedies, chiefly botanic; physiomedicalists use only botanical remedies, discarding those which are poisonous. In practice these distinctions are not always observed. The following political divisions specify homœopaths, eclectics or osteopaths as constituting part of their examining boards or have other than regulars on them: Arizona, Arkansas, California, Colorado, Georgia, Hawaii, Idaho, Illinois, Indian Territory, Indiana, Iowa, Kansas, Kentucky, Michigan, Minnesota, Missouri, Nebraska, Nevada, New Jersey, North Dakota, Ohio, Oklahoma, Oregon, Pennsylvania, Rhode Island, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, Washington, Wisconsin, Wyoming.

Philippines and Porto Rico have examining boards, the former of three appointed by the director of health for the Philippines, the latter of five appointed by the governor.

The following have separate examining boards for each recognized school of medicine: Arkansas, Connecticut, Delaware, District of Columbia, Florida, Louisiana, Maryland.

Midwifery.— Special fees for certificates of registration as midwives are required in California, Illinois, Iowa and Texas. In the following political divisions the provisions of the medical practice acts do not apply to women engaged in the practice of midwifery: Arkansas, Colorado, Florida, Georgia, Idaho, Kentucky, Louisiana, Maryland, Mississippi, Montana, New Mexico, North Carolina, South Carolina, Tennessee, Washington. In other political divisions, though there are some special provisions for certain localities, the general acts regulating the practice of medicine make no reference whatever to the practice of midwifery by women. It would seem, therefore, that these laws restrict the practice of midwifery to licensed physicians. Practically the conditions

in political divisions where the laws seem to restrict the practice of midwifery to licensed physicians are little better than in political divisions where the practice of midwifery by women without a license is authorized by statute. There will probably be little change for the better till the midwife receives legal recognition, and the practice of midwifery is regulated by definite statutory provisions.

The following States have reciprocity clauses in the law, but they are operative in few cases only, namely: Alabama, Arizona, Arkansas, California, Delaware, District of Columbia, Georgia, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Louisiana, Maine, Maryland, Michigan, Minnesota, Mississippi, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, Pennsylvania, South Carolina, South Dakota, Tennessee, Texas, Utah, Vermont, Virginia, West Virginia, Wisconsin, Wyoming.

The law provides for a preliminary education in all the political divisions except the Canal Zone, the District of Columbia, Hawaii, Massachusetts, Porto Rico and Wyoming.

The law provides for four years of high school in all political divisions except the Canal Zone, the District of Columbia, Idaho, Illinois, Massachusetts, Nebraska, Philippine Islands, Porto Rico, South Carolina and Wyoming, and for an academic college course in the following States, the number of years of such course required being given in parentheses after each: Alabama (2), Alaska (2), Arizona (2), Arkansas (2), California (1), Colorado (2), Connecticut (1), Florida (2), Illinois (1), Indiana (2), Iowa (2), Kansas (2), Kentucky (1), Louisiana (2), Maryland (2), Michigan (2), Minnesota (2), Mississippi (2), Montana (2), New Hampshire (2), New Jersey (2), New Mexico (2), New York (2), North Carolina (1), North Dakota (2), Oklahoma (2), Pennsylvania (1), Rhode Island (2), South Carolina (2), South Dakota (2), Tennessee (1), Texas (1), Utah (1), Vermont (2), Virginia (2), Washington (2), West Virginia (1), Wisconsin (2). A four years medical course is required in all the political divisions except the Canal Zone, the District of Columbia, Idaho, Massachusetts, the Philippines, Porto Rico, West Virginia and Wyoming. The number of hours of the medical course is specified as 3,000 in Colorado, and in Indiana and New Mexico, 3,200 in Illinois, 3,600 in Michigan, North Dakota, Texas and Vermont, 3,744 in Connecticut and 4,000 in California and 5,120 in Georgia.

Registration of Nurses.— See NURSE, TRAINED.

Dentistry.— See DENTISTRY.

Revised by SMITH ELY JELLIFFE, M.D.

MEDICAL EDUCATION IN THE UNITED STATES. In the colonies until about the middle of the 18th century there was no formal medical teaching. The apprentice system prevailed and young men took service with a physician and after some years went into practice for themselves. Usually this was not far from their preceptor and they could recur to him for consultation. Sons of the better-to-do colonists desirous of studying medicine crossed to Europe and received the advantage of medical training in Edinburgh, London, Paris or the Netherlands. Considering the long, difficult, dangerous voyage, the surprise is how many young Colonials secured a European medical education. Manifestly medicine was taken very seriously. The preliminary education was excellent and the medical training thorough. Dr. Morton ('History of Pennsylvania Hospital') does not hesitate to say: "We find that the professional men of the seventeenth and eighteenth centuries were generally much better educated than most of their successors of the present time. Almost without exception they were classical scholars, their graduating theses must be written in Latin."

The ideals in medical education were high. Dr. Thomas Bond's essay on 'The Utility of Clinical Lectures' (Philadelphia 1766) insists that the student "must Join Examples with Study before he can be sufficiently qualified to prescribe for the sick, for Language and Books alone can never give him Adequate Ideas of Diseases, and the best methods of Treating them." Bond argued that clinical teaching was absolutely necessary and even suggested that the teaching should be by what we call the ward class method with questions to bring out the knowledge of the disease and parts affected. He even recognized and proclaimed that the only policy that would lead to real advance in medicine was to follow up clinical observation in fatal cases by a post mortem and acknowledge mistakes in the hope to be able to avoid them in other cases. His words deserve to be publicly posted in every hospital and medical school of the country. "If the Disease baffles the power of Art and the Patient falls a Sacrifice to it, he then brings his Knowledge to the Test, and fixes Honour or discredit on his Reputation by exposing all the Morbid parts to View, and Demonstrates by what means it produced Death, and if perchance he finds something unexpected, which Betrays an Error in Judgment, he like a great and good man immediately acknowledges the mistake, and, for the benefit of survivors, points out other methods by which it might have been more happily treated."

About 1750 there are indications of waking up to the need of formal medical teaching. William Hunter, a relative of John Hunter of London in Rhode Island, Cadwalader in Philadelphia, and John Bard and Peter Middleton in New York did some anatomical teaching with dissections in this decade. In 1762 Dr. William Shippen, Jr., recently returned from London and Edinburgh, commenced a course of anatomical lectures with dissections at his father's residence in Philadelphia and this was attended by 12 students. This led to the organization of our first medical school as the Medical Department of the Philadelphia College in 1765. Shippen's principal auxiliary was Dr. John Morgan, who had been with him in London and Edinburgh, where they agreed to found a medical school in America. The second medical school was the Medical Department of King's College, New York, established in 1768. New York anticipated Philadelphia in the giving of the degree of Doctor in Medicine, the first being conferred on Robert Tucker in 1770. Philadelphia gave the first Bachelor in Medicine in 1768, but did not confer its first degree of Doctor in Medicine until June 1771. Though medical teaching had not been organized physicians abounded. It was

calculated just before the Revolution that there were some 3,500 physicians practising in the Colonies, of whom less than 400 had degrees. New York City, containing about 10,000 inhabitants, "could boast of more than forty gentlemen of the faculty, the greatest part of whom were mere pretenders to a profession of which they were entirely ignorant." (*Independent Reflector,* New York 1753).

Medical education received an almost complete setback everywhere throughout the Colonies by the Revolution, though in New York the practice of the surgeons who accompanied the British army proved instructive for the physicians who remained in the city, and courses in anatomy and some other medical subjects were given. Immediately after the Revolution steps were taken to restore the medical schools, Philadelphia indeed granting degrees at a commencement held June 1780, but personal and professional jealousies led to trouble about the charter of the college of Philadelphia and it was not until this was reorganized that the medical schools settled to work. Over 100 medical students were in attendance there in 1790. Medical teaching in New York suffered from a similar friction of personalities, but it lasted much longer. The Medical Department of King's College, changed after the Revolution to Columbia, was reorganized, but there was a hitch with the educational authorities of the State. An independent medical school was organized mainly through the influence of Dr. Nicholas Romayne and when this was refused recognition by the Regents he appealed to Queen's College (now Rutgers), at New Brunswick, N. J., for authority to confer degrees. This appeal to outside institutions came to be a favorite device of medical faculties throughout the country who had severed their connection with regularly incorporated medical institutions. No less than three times in the first half century Rutgers was thus appealed to, again in 1811 and 1826, and then a Geneva Medical Faculty was organized in New York City, until the practice was declared illegal.

After the Revolution other medical schools soon began to make their appearance. Harvard organized its medical faculty in 1783. Dartmouth established a medical department in 1797. The medical department of the University of Maryland in Baltimore was founded in 1807 and continued under that name though there was no university, and that of Yale University in 1810. Unfortunately anatomical teaching was very much hampered by popular prejudice. There was no legislation permitting the use of or providing bodies for dissection purposes. The bodies of those killed in duels were by law devoted to anatomical purposes, but resurrectionism had to supply the rest. As a result of popular suspicions there were attacks on dissecting rooms in many places. New York had its Doctors' Riot in 1789, Philadelphia, Baltimore, New Haven and Saint Louis had theirs much later, well on in the 19th century, the last actually as late as 1844. This was not a mediæval reversion as it is often called, for dissection had been very freely permitted in many places, in the Middle Ages, but a modern intolerance not unlike that which now hampers animal experimentation in this country.

The early medical schools in this country, as pointed out by Dr. Nathan S. Davis, although originating in different States wholly independent of each other and in direct rivalry for patronage, were remarkably similar in their organization and requirements. At first the number of professors in each school was small and the college term eight or nine months. The bachelor's degree in medicine was conferred after three years of study with a preceptor followed by one college term, and the doctor's degree after one or two added years of practice and a second course of college attendance. The degree of Bachelor of Medicine was abandoned by the College of Philadelphia in 1789, by the University of Pennsylvania in 1791 and by all the medical colleges in this country in 1813.

Medical schools soon began to multiply. In 1810 there were the six schools already mentioned. In the 30 years down to 1840, 26 medical colleges were added. They were in the order of their foundation. The College of Physicians and Surgeons of the Western District of the State of New York at Fairfield, Herkimer County, founded in 1812. Though in rural surroundings this did excellent work, had some noteworthy men on its faculty and up to 1840 about 3,000 students on its rolls. In 1817 Transylvania University, Lexington, Ky., finally succeeded in organizing a medical department. There had been chairs of medicine before. Samuel Brown, M.D., was appointed in 1799 to the professorship of anatomy, surgery and chemistry. In 1801 Frederick Ridgley, M.D., was elected professor of medicine. In 1805 James Fishback, M.D., was appointed to the chair of theory and practice. Twenty students attended the first full course of medical lectures in 1817–18. One of them received the degree of M.D., the first degree conferred west of the mountains. In 1818 the Castleton Medical School, afterward named the Vermont Academy of Medicine, was founded, the degree of Doctor of Medicine being conferred under the authority of Middlebury College until 1827, after which it was conferred directly by the medical faculty under its amended charter.

Dr. Daniel Drake resigned from Transylvania University in 1818 and organized the Medical College of Ohio at Cincinnati which held its first course of lectures in 1820. Altogether he held 11 chairs at six different medical schools at various times. The Medical School of Maine was organized in 1820 also as a department of Bowdoin College at Brunswick with Dr. Nathan Smith as the faculty. In 1821 a medical school developed at Brown University, Providence, but did not continue long. The Medical School of the University of Vermont was organized at Burlington in 1822. In 1823 The Berkshire Medical Institution was organized at Pittsfield, Mass., under the charter of Williams College. In 1824 the Medical College of South Carolina was organized at Charleston. In 1825 the medical department of Columbian College, District of Columbia, was organized. This school suspended 1834–35 but resumed in the latter year under the name of the National Medical College, now as the medical department of Columbian University. In 1825 Jefferson Medical College, Philadelphia, was chartered. The charter was granted to Dr. Barton in 1819 after an unsuccessful attempt in 1816. Jefferson owes its name to its connection with Jefferson College, Cannons-

burg, Pa., through which its degrees were granted. In 1825 the medical department of the University of Virginia, charter 1819, was organized. In 1826 the Medical School of the Valley of Virginia, familiarly called The Winchester Medical College, was organized at Winchester, Va. Both of these Virginia colleges prosposed to have terms of nine months instead of the shorter terms in vogue and the method of teaching was by recitations and demonstrations as in other departments of scientific and literary study and not merely by lectures. About the middle of the 19th century the University of Virginia was graduating men after two courses of four and a half months each given in the same calendar year, but its examination standards were high and its graduates were taking the best places in the army and navy service. In 1827 the Washington Medical College, so-called because its degrees for the first six years were conferred by Washington College, Pennsylvania, was organized in Baltimore. Afterward a charter was granted by Maryland. In 1831 the Medical College of Georgia was chartered and the first course of instruction given the following year. An Academy of Medicine preliminary to this had been organized in 1827 at Augusta by Dr. Milton M. Anthony, the founder of the *Southern Medical and Surgical Journal*, the first medical periodical published in the South. It was from him that came the suggestion of a convention of the faculties of the medical colleges of the United States for the regulation of medical education and the improvement of the professional status of physicians. The movement thus initiated ripened into the organization of the American Medical Association. After this the medical schools multiplied rapidly. In 1834 the Medical School of Willoughby University, Willoughby, Lake County, Ohio, was chartered and its first course of instruction commenced in 1835. In 1835 the medical institute at Geneva College at Geneva, N. Y., the medical department of Cincinnati College at Cincinnati, Ohio; the Vermont Medical School at Woodstock, Vt., and the medical department of the University of Louisiana at New Orleans were chartered by the respective legislatures. In 1837 the medical departments of the University of Louisville, Ky., and of the University of the City of New York were organized, and in 1838 the medical department of Hampden Sydney College at Richmond and in 1839 the Albany Medical College at Albany, N. Y., and the medical department of the Pennsylvania College at Philadelphia. Philadelphia continued to be for long as it had been from the beginning of the nation's history the principal centre for medical education. It was our largest city in the early days and New York's development was hampered by professional bickerings.

In the 35 years following down to the completion of the first hundred years of our history in 1876, 47 new medical schools were created, not including five or six abortive attempts so transient as to leave a record difficult to trace. This made 80 altogether established during the first 100 years, 16 of which had been discontinued, leaving 64 medical colleges in active operation in the United States. Of these Maine had two; New Hampshire one; Vermont three; Massachusetts one; Connecticut one; New York nine; Pennsylvania four; Maryland three; Virginia two; South Carolina one; Georgia three; Alabama one; Louisiana two; Texas one; Tennessee one; Kentucky three; Missouri three; California two; Oregon one; Iowa two; Illinois three; Indiana three; Ohio seven; Michigan two; and the District of Columbia three; leaving 13 States without any medical college. Of these, four, two in New York City, one in Philadelphia and one in Chicago, were devoted to the education of women in medicine. The whole number of students attending the five medical colleges in 1810, for Yale though chartered was not yet receiving students, was about 650, of whom about 100 were graduated that year. The population of the United States was about 7,250,000. In 1840, with the population two and a half times as numerous the medical students numbered 2,500, nearly four times as many, and about 800 graduated that year, eight times as many. In 1875–76 the population of the United States was over 40,000,000. It had multiplied once more two and a half times, but the medical students now numbered 6,650, having again increased faster than the population, and that year 2,200 were graduated. With this great increase of medical colleges far beyond the medical needs of the population, the inevitable struggle for existence led to the lowering of standards. The temptation to concentrate the teaching into as brief a space as possible, partly because of competition for students but mainly to secure more profit for and less call upon the time of professors who were engaged in active practice, gradually compressed the time required for study. At the same time preliminary requirements lessened and anyone who could write his name, and he did not have to write it very plainly, could take up the study of medicine. The preceptor was practically superseded and the college terms shortened to four months each with the lectures not graded, the students listening to the same course two years in succession. The degeneration of medical education was brought about by the faculty using the medical schools for money-making purposes, neglecting scientific development. Even when the medical schools bore the names of well-known universities, as Harvard, Pennsylvania or Columbia, the university administration had practically nothing to do with the medical school curriculum or management and the fees were divided among the historic septenate of professors who became firmly entrenched everywhere and refused to permit of reforms until their hands were actually forced by certain reforming elements, mainly younger members of the medical profession.

There were vigorous protests against this unfortunate degradation of medical education which all could not but acknowledge and the American Medical Association was organized on the initiative of the New York State Medical Society with one of its main purposes the reform of medical education. An attempt was made to sidetrack the organizing convention by the delegates from the faculty of the Medical Department of New York University in whose halls the preliminary meeting was held. This failed and the national organization became a fact, but was able to accomplish little in the reform of medical education for a generation. Numerous discussions were of no avail. All were ready to admit that medical students should

have better preliminary education and that the lecture courses should be graded and that there should be a systematic division of the branches taught into groups appropriate for each year of study, and that there should be at least three terms of six or better still eight or nine months, each year. The faculty of each school frankly acknowledged the defects of the system in vogue, but "each waited for the other to move first lest by placing higher requirements upon the time and resources of the student it should cause its own halls to be deserted for those of its less exacting neighbor" (Davis). Some very praiseworthy attempts were made, however, to get away from the current unfortunate state of affairs. The New York Medical College was established in 1850 with a three-year graded course and the beginnings of clinical instruction. Unfortunately the Civil War proved fatal to it, but not before it had demonstrated the possibility of raising standards in medical education. In 1859 the Chicago Medical College was organized for the express purpose of testing the practicability of establishing a school with a thoroughly graded and consecutive system of instruction. In 1871 Harvard through the influence of President Eliot adopted a fully graded system of instruction, dividing her classes and extending the courses throughout the collegiate year. The new medical school of Syracuse University adopted the same policy about the same time.

In the 35 years after 1876 the number of medical schools doubled. The great majority of the new schools were of the same low standards as so many of their precedessors and indeed were founded with the idea not of fostering medicine but of producing revenue for the professors directly or indirectly. In the meantime in 1878 Dr. Francis Delafield established the first laboratory in this country in connection with the College of Physicians and Surgeons in New York. Later that same year Dr. William H. Welch opened the pathological laboratory of Bellevue. By degrees the better schools followed these examples and many other schools found themselves compelled to take up this development of medical education or lose in attendance. It was not until 1893 that a definite advance in medical education was made by the foundation of Johns Hopkins Medical School, Baltimore. This required a bachelor's degree from every student and required four years medical study. The better known schools were now stimulated to follow the example of Hopkins. Above all the special feature of clinical instruction worked out there gradually spread to the great benefit of medical education.

At the beginning of the 20th century the Council on Education of the American Medical Association began its work of registering medical schools after examination according to the grades which they deserved. In order to secure a class A rating the medical school had to have six full time professors, at least $100,000 investment, be provided with laboratories properly equipped, require four years of medical study and at least one year of preliminary college work. It was not long then before the number of medical colleges began to drop off. At the end of the first decade of the century the investigation of medical education in the United States by the Carnegie Foundation for the Advancement of Teaching revealed the defects in many existing schools and called attention to what should be the absolute requirements for medical teaching in our day.

As a result we have nearly 100 fewer medical schools, but most of them doing serious work and 10,000 fewer medical students getting a better education. The medical schools which bear the names of universities are now actually under a university administration as a rule. Increased interest in medical education has brought about the enactment of a legal regulation in many States requiring a fifth year of preparation for the practice of medicine which is to be passed in a hospital. The entrance requirements are constantly growing higher and now two years of college work are required as a preliminary to medical study in most places and a number of schools have adopted or are about to adopt the bachelor's degree as a prerequisite. Curiously enough this modern standard is nearly a replica of the old mediæval requirement that there should be three years of preliminary study at the university before taking up medicine, four years at medicine and then a year of practice with a physician before the medical neophyte might practice for himself. Fortunately our scientific developments in medical education were completed just in time to enable us to be independent of foreign medical teaching during the war and the magnificent development of American surgery put us in a position to offer excellent opportunities for the higher study of medical and surgical problems from a thoroughly scientific standpoint to students from Europe who after the war will find it impossible to go on with university studies under favorable circumstances over there because of the destruction wrought by the war and the sad gaps in teaching staffs due to war losses involving so many of the progressive younger men.

Medical Education of Women.— The development of medical education for women in America gave back to the world the opportunity for feminine medical study which had been freely granted in the Middle Ages and then with so many other privileges was denied in modern times. The first woman student of medicine was Dr. Elizabeth Blackwell who after being refused permission to study at most of the medical colleges in the country finally secured the privilege at Geneva, N. Y., when the faculty feeling sure that her application would be rejected put it before the students and they voted unanimously to allow it. She was graduated in 1849. Her sister Emily was refused two years later at Geneva and Rush Medical College, Chicago, was censured by the State Medical Society for receiving her for a term. She was graduated at Western Reserve, Cleveland. The women resolved to found medical colleges of their own. The first of these the Women's Medical College of Pennsylvania was founded in 1850. It had a quasi predecessor in the Gregory School of Medicine established to train women as midwives, founded in Boston in 1848 and lasting until 1874. The Woman's College of the New York Infirmary was opened in 1865 and closed in 1899 when Cornell opened its medical course to women students. The Women's Medical College of Baltimore was founded in 1882, that of Cincinnati in 1886 and that of Kansas City in 1895.

The University of California was a pioneer

in opening its courses to women in 1869 and was followed in this policy by all the universities of Western States. This development also included medicine so that the special need of medical colleges for women ceased in the West. When Johns Hopkins, Baltimore, opened its medical school in 1893 women were accorded the same privileges as men. Gradually prejudices disappeared and other medical schools opened their doors to women, but it was not until the great war brought home the need for physicians during and after the war that Harvard and Columbia removed the restrictions against women in their medical schools. No barriers to the medical education of women in the United States either in undergraduate or post-graduate work will remain after the war.

JAMES J. WALSH, M.D.

MEDICAL ELECTRICITY. See ELECTROTHERAPEUTICS.

MEDICAL JOURNALISM. One of the earliest newspapers on record, the *Gazette de France,* was issued by a physician, Renaudot (Paris 1631). He had been appointed Commissioner-General of the Poor of France when poverty was rife, just after the religious wars, and created a Bureau of Addresses where those out of work might learn of chances for employment. He established the *Gazette* to give publicity to his scheme for bringing employers and employees together. The *Gazette* was a quarto sheet, printed in four columns on one side. Medical matters were not treated directly in the *Gazette,* but its purpose was the prevention of disease and suffering by lessening poverty. With the origin of scientific societies in Italy at the time of the Renaissance, these published journals which sometimes contained articles of medical interest. The first journal paying considerable attention to medicine was *Le Journal des Scavans.* This was published every Monday for three months at Paris, at the beginning of 1665, the next year it continued longer, and then every two weeks rather regularly. It lasted some 10 years, and altogether some 700 pages were printed. Early issues, contained reviews of Willis' 'Cerebri Anatome,' and Steno's 'De Musculis et Glandulis,' and other medical reviews of current interest. The German Society of Naturalist Physicians (Gesellschaft Naturforschender Aerzte), founded in 1652, began to publish in 1670, after coming under Imperial protection, its 'Transactions' monthly under the name *Ephemeridæ.* A more purely medical periodical was the *Acta Medica Hafiensia,* edited by Thomas Bartholin at Copenhagen in 1671. The Royal Society chartered by Charles II began to publish its well-known philosophical 'Transactions' in 1665. Included among its publications were the works of Malpighi and Leeuwenhoek in the 17th century and those of Galvani in the 18th.

All these were in Latin. The first medical periodical in the vernacular was the *Nouvelles Découvertes sur toutes les Parties de la Médecine,* issued monthly (Paris 1679–81). It was published by Nicholas de Blagny, a somewhat irregular medical practitioner of the time who realized the value of publicity. He met with decided opposition from the medical profession, who deprecated not only his methods but above all the publication of medical matters in the language of the people. He waked the French medical profession, however, to the value of a medical publication and not long after, a *Journal de Médecine* was published by the Abbé de la Roque and continued by Claude Brunet, who established a monthly, *Progrès de la Médecine* (1695–1709). French medical journalism then went to sleep, to use the expressive phrase of Südhoff, for some 50 years. Formal German medical journalism began with the *Acta Medicorum Berolinensium,* founded in 1717. This appeared twice a year at first, and then annually until 1730. In 1717, there began at Leipzig a quarterly publication called the *Collection of Natural History and Medical Information.* This continued for many years. The second half of the 18th century saw a thorough waking up to the advantage of medical journalism. At Hamburg in 1759 the weekly, *Der Artz,* began. In various German cities, a series of medical Bibliotheks, that is, regularly issued reviews of medical books, made their appearance. In 1767, the German medical journal, *Neue Arzneien* (New Remedies) was founded. Most of these journals lasted only a few years until their founder became occupied with other things or his enthusiasm evaporated.

Eighteenth century medical journalism or its equivalent, at the time, consisted to a great extent of the transactions of various medical societies. A number of very important contributions to medicine were published originally in these and they have a distinct bibliographic value. Südhoff suggests that the material for the cultural history of medicine in this century lies buried in the files of its forgotten medical periodicals. These were very numerous and Garrison has given a check list in chronological order of some hundred of them.

Toward the end of the 18th century, the special journals of the scientific departments of medicine began to make their appearance. Probably the most important of these was

Reil's *Archiv für die Physiologie* (1795), which was the incentive for the foundation of Johannes Müller's *Archiv für Anatomie, Physiologie und wissenschaftliche médicin* (Berlin and Leipzig, 1834–57), continued by Reichert and Du Bois Reymond and still published at the present time. Siebold's *Lucina* (Leipzig 1802–11), Langenbeck's *Bibliothek für die Chirurgie* (Göttingen 1805–13), Grafe's and Walther's *Journal der Chirurgie und Augen-Heilkunde* (Berlin 1820–50), Magendie's *Journal de physiologie expérimentale* (Paris 1821–31), Malgaigne's *Journal de Chirurgie* (Paris 1843–46), *Bulletin de la Société anatomique de Paris* (founded in 1826 and still current), and the *Mémoires* and *Bulletin de l'Académie de medecine* are typical examples.

About the middle of the 19th century, yearbooks began to be regularly published. About the same time Virchow's *Archiv für Pathologische Anatomie* and the *Comptes rendus* of the *Société de Biologie* of Paris began publication. There are now literally hundreds of such journals published in the various countries and languages. The tendency to extreme specialization in medical journalism became marked in the last quarter of the century when special journals for narrow interests were published. *Mind* (1876), *Brain* (1879), and *La Cellule* (1884), are typical examples. Garrison notes that the contribution of the 20th century to medical journalism is the large number of recent periodicals devoted to the psychological and sociological aspects of the sexual instinct.

In Italy medical journalism developed rather slowly, Italian professors being inclined rather to write books than the shorter articles. Certain special subjects like electrotherapeutics, because of Galvani's and Volta's discoveries, were covered early. *Il Galvani*, with the subtitle *Giornale di Elettro-Idro-ed Aero-Terapia*, was published at Milan at the beginning of the 19th century. All medical therapeutics was reduced to electrical terms by it. Since then the Italians have the habit of calling their medical journals after their great physicians, and have had journals named for Cesalpino, Malpighi, Spallanzani and a number of other distinguished medical discoverers.

A very early attempt at the publication of a medical journal in America was made through a translation of the French *Journal of the Military Hospitals*, under the title of *A Journal of the Practice of Medicine, Surgery and Pharmacy in the Military Hospitals of France* (Vol. I, No. 1, New York 1790). This contained some 120 pages but is the only number that has come down to us.

The first medical journal published in America was the *Medical Repository*, a quarterly, under the editorship of Samuel L. Mitchill, Edward Miller and Elihu Smith. It was founded in 1797, and the interest which it aroused can be best appreciated from the fact that of volumes I and II, a second edition was printed in 1800 and exhausted, and a third edition issued in 1804. This is the only time in the history of American medical journalism that this has happened. The *Medical Repository* continued publication until 1824. Its success led after a few years to the almost simultaneous foundation at Philadelphia of two medical journals, *The Medical Museum* (1804–11) and the *Philadelphia Medical and Physical Journal* (1804–09). Though neither of these lasted long, the establishment of other medical journals went on apace. In Boston, the *Medical and Agricultural Register* was published for two years (1806–07), the *Baltimore Medical and Physical Recorder* for a similar period (1808–09). An effort was made to attract additional readers in these journals by including subjects of cognate interest. This was also the case with regard to the *American Medical and Philosophical Register* (New York), which lasted, however, only some five years (1810–14). *The New England Journal of Medicine and Surgery* had a happier fate, enduring some 15 years (Boston 1812–28). Philadelphia had by this time, owing to professional jealousies and politics and the mismanagement of medical schools in New York, come to be the centre of medical education in the United States and the medical journalism of the country focussed there. The *American Medical Recorder* (1813) lasted more than 10 years and was followed by the *Philadelphia Journal of the Medical and Physical Sciences*, founded in 1820 by Nathaniel Chapman. In 1825, the title of this journal became the *American Journal of the Medical Sciences*, still with us. Under the editorship of Dr. Isaac Hays and his son, this came to be the representative American medical journal long known as *Hays' Journal*. The oldest American medical weekly in existence is the *Boston Medical and Surgical Journal*, founded in 1828, whose editors have been some of the most distinguished physicians of Boston. The *Medical News*, founded in Philadelphia by the younger Dr. Hays in 1843, was transferred to New York (1896) and combined with the *New York Medical Journal* (1905). This latter was founded in 1865, followed almost immediately by the *Medical Record* (1866), both still in existence.

The first medical journal issued west of the Alleghanies was the quarterly *Reporter of Medicine, Surgery and Natural Sciences*, issued at Cincinnati, 1822. The first Canadian medical periodical was the *Journal de Médecine de Quebec*, issued in 1826.

The founder of medical journalism in its modern sense, as not only a carrier of news and information for physicians but also as a force for the uplift of the profession, the regulation of the practice of medicine, the direction of medical legislation, and the exposure of abuses, was Thomas Wakley, an Englishman who in 1823 founded *The Lancet* in London. When this appeared there were a great many abuses, especially in hospital practice and medical education needing correction. Hospital posts and even sometimes medical professorships had become family matters, subjects of inheritance. Hospital instruction was so given that it reached but a very limited number. Wakley began by publishing the hospital lectures of professors for the benefit of the profession. When Abernethy, the distinguished London surgeon of the time, applied for an injunction against the publication of his lectures without his permission, Lord Eldon decided that lectures delivered in hospitals were public property. The trial proved a good advertisement for Wakley and his work, and after a time he was elected to Parliament and he became the most important factor in England for the correction of social abuses by legislation. *The*

Lancet has always continued the work of its founder in this regard, and has been noted for its crusades against food and drug adulterations, its campaigns for the correction of medical abuses, and its leadership of the medical profession of England generally for the amelioration of medical social conditions. The work of *The Lancet* was not only supplemented but extended in England, when the *British Medical Journal,* representing the British Medical Association, was founded in 1857. The association, organized in 1832, published yearly 'Transactions' until 1853, and then the *Association Medical Journal,* which was succeeded by the *British Medical Journal* after some five years. The *British Medical Journal* has come to be a most powerful factor for the correction of medical abuses and the exposition of impositions of various kinds upon the profession as well as the public. The American Medical Association, founded in 1847, did not establish its journal until 1883. This was scarcely more than a weekly 'Transactions' until under the management of Dr. George Simmons, at the beginning of the present century, it began to be thoroughly representative of the best interests of the medical profession in America and of the genuine medical interests of the public, taking its place worthily beside the *British Medical Journal.* The *Journal A. M. A.* initiated the reform of medical education by securing four-year courses and full-time professorships in the medical schools, and thus has secured a noteworthy reduction in the number of schools of medicine in the country, decidedly to the advantage of medical teaching generally. It was enabled to do this through its reorganization of the American Medical Association which strengthened State and county medical organizations and brought a reform of their medical journals. The advertising abuses of medical journals were emphatically pointed out and an initiation of reform secured. The *Journal A. M. A.* has done extremely valuable work for the medical profession and the public in the exposure of quacks, the regulation of physicians' registration and, above all, the analysis and exposure of so-called patent medicines, many of which selling in very large quantities, at expensive prices and bought particularly by the poor, were shown to contain either such harmful materials as alcohol or cocaine as their chief ingredient, or else to be made up of absolutely inert materials like salt or sugar and water, slightly colored.

The success of the London *Lancet* led to the foundation of the *Lancette Française* in 1828, which followed the plan of reporting hospital lectures and afterward became the *Gazette des Hopitaux,* which still continues. The *Gazette Médicale de Paris* was founded in 1830. Other French journals in large numbers were founded in the second half of the 19th century and the weekly newspapers were supplemented by the *Progrès Médicale,* paying attention particularly to current medical items, Paris, 1873. In the last quarter of the 19th century a whole series of such weekly journals meant to carry medical news and represent the medical profession as well as organize the correction of abuses, were founded in various parts of the world. The *Deutsche Medizin, Wochenschrift* in 1875, *Vrach* in Saint Petersburg in 1880, and Geneva, Munich, Prague, Rome, Vienna and many other cities came to be represented in this way.

At the beginning of the European War, there were some 1,700 medical journals published in the various languages. Their distribution was as follows: the United States had 630; Germany, that is, the German-speaking countries, 451; the French, 268; the British, 152; the Italian, 75; the Spanish, 29. This was entirely too many for the maintenance of such proper standards as would make them seriously valuable and prevent abuses. Many of them were published almost entirely as a means of propagating information for business purposes with regard to various drugs and preparations, the journals being established for this purpose, or the proprietors allowing their columns to be used for such exploitation because of the money paid for advertising. The more medical journals the lower the standards. The war, with its scarcity of paper, has brought an end to a great many of the proprietory medical journals and undoubtedly will in its course do much to purify the field of medical journalism.

Wochenschrift, 1903).

JAMES J. WALSH, M.D.

MEDICAL JURISPRUDENCE, the science of applying medical knowledge to the purposes of legal investigation; the application of the principles and practice of various branches of medicine in judicial proceedings requiring the explanation of doubtful questions, such as those relating to conception and birth, time and cause of death, physical and mental diseases, etc. Medical jurisprudence is often spoken of as forensic medicine, that is, the medicine of the forum. It embraces subjects both purely medical and purely legal, and covers a very wide range. These questions have usually been considered under five divisions: (1) Such as arise out of the relation of sex, including impotency, pregnancy, legitimacy and rape; (2) injuries to persons, as wounds, death from violence, poisoning and abortion; (3) disqualification by different forms of mental diseases; (4) feigned disability or disease; (5) questions as to age, identity and life insurance. The major part of what is known as medical jurisprudence relates to evidence given in courts, even if the whole subject is not properly embraced within the subject of judicial evidence. As medical books can be used only in a very restricted sense in judicial proceedings, the testimony of medical experts has become very important. Our laws do not give recognized preference to any particular class or school of medical practitioners as qualified for expert witnesses. Knowledge is the test of qualification to give such evidence. The presiding judge passes, as a preliminary, upon the question of qualification and determines whether the witness shall be permitted to testify. The opinion of a medical expert is never conclusive but is simply to be regarded by the judge or jury in the same manner as other evidence given to assist in establishing a fact. The medical expert is fre-

quently called upon to state facts, as well as to give his opinion based upon facts shown by other testimony to exist. He may testify as to the health of a patient whom he had treated, of his habits and mental traits. He may testify that he found poison in the stomach of a person found dead and give an opinion as to whether the poison caused death. He may give an opinion as to how long a person has been dead, from the condition of the body when found; whether a certain wound would produce death; and his opinion as to the instrument used to inflict the wound.

In all of these subjects of investigation the evidence of a medical expert is almost indispensable. In matters of life insurance, where the insured dies shortly after a policy has been issued to him, medical expert examination and evidence are often of great importance, bearing upon the condition of the insured at the time of insurance and upon the question of representations. In suits for injuries to persons through the fault of others the question of the extent and probable continuance of disability are to be investigated with the aid of expert evidence. Many questions of supposed crime could not be properly determined without the knowledge and skill of the physician, applied as science directs. In cases involving sanity and mental capacity medical jurisprudence reaches the zenith of its importance. The untrained non-scientific mind cannot measure the status and capacity of other minds. If it is difficult, sometimes nearly impossible, for the best informed to determine accurately the physical condition of a person, none but those eminent for knowledge of and experience in matters of the mind ought to judge of its condition and hazard opinions as to its peculiarities and capacity. Insanity is a disease of the mind which assumes many forms — almost as many as there are different phases in the human mind. Many definitions are given of insanity, one of which is that it is a physical disease located in the brain, which deranges the mental and moral faculties to a greater or less degree. This definition is not quoted in preference to any other for the purpose of approval, but because it differs so radically from others, and to show the difficulty of comprehending the nature of this dread malady. The general term insanity comprehends all shades of mental diseases, from the slightest abnormal condition to that of the wildest maniac. The expert alienist is called upon to testify as to a person's ability to make a will, a contract or to transact any kind of business. He is asked to decide whether a person is bereft of his normal reason to the extent that prudence requires his confinement; and when he has been confined, whether it would be safe or prudent to let him have his liberty. The questions upon which the expert's opinion with regard to the insane, or those supposed to be insane, are asked can hardly be enumerated. The importance of the subject cannot be overestimated, and new and earnest efforts are being constantly exerted by the medical profession to render its information upon this difficult subject as full and complete as possible. Many works upon medical jurisprudence have been published and in all of them insanity, in its various forms, has had a prominent place, while quite a number of authors have produced commendable works devoted entirely to the subject of the medical jurisprudence of insanity. Consult Brothers, 'A Statement of the Law of Forensic Medicine' (Saint Louis 1914); Reese, J. J., 'Textbook of Medical Jurisprudence and Toxicology' (8th ed., Philadelphia 1911); Robertson, 'Manual of Medical Jurisprudence, Toxicology and Public Health' (2d ed., London 1913), and 'Medical Serials, with Bibliography of Medical Jurisprudence' (2d ed., New York State Library, Albany 1910).

MEDICAL ORGANIZATION IN THE UNITED STATES ARMY. The Medical Department of the Army, of which the surgeon-general is chief, aims: 1. To conserve the strength of men and officers — (a) Through prompt attention to disease and disabilities revealed by physical examination; (b) through supervision of sanitary conditions.

2. To move non-effectives to the rear without using effective fighting men for such service and without in any way obstructing military operations.

3. To provide medical and surgical care for the sick and wounded (including control and management of military hospitals), restoring the disabled to active military service or to useful and remunerative places in civil life.

The service of the medical man is constant. Every recruit must be examined, because the army must be without weaklings and without disease. Health must be maintained. Prophylactic measures must be instituted and insisted upon and remedial measures applied both for illnesses in camp and as a result of battle casualties. It is the doctor's job to make and keep the soldier fit to fight. His work is to a tremendous degree effective in preserving the morale of the army. It is the task of the medical department to succor the wounded so swiftly that their comrades may know that, should their turn come, they will be cared for as expeditiously and efficiently as is possible. Thus the medical men directly heighten the morale of troops.

The army doctor used to be one who could do a little of everything in an emergency — he was pretty much in the same class with the country doctor of 30 years ago. Major-General Gorgas once said: "I do not think we have a more useful man in the army than the medical man who can pull a tooth, bind a finger, or take charge of the casualties that occur in a moving command, and do all these things equally well."

The medical department consists of the medical corps, medical reserve corps, contract surgeons, dental corps, dental reserve corps, veterinary corps, veterinary reserve corps, nurse corps, sanitary corps, ambulance corps and enlisted (formerly hospital corps) men.

The insignia of the medical department is a caduceus of bronze metal one inch high; the letters D., S. A., and C.S. in gilt metal superimposed, designating, respectively, Dental, Sanitary and Ambulance Corps and Contract Surgeons. Also, all persons belonging to the sanitary service, and chaplains, wear on the left arm a brassard bearing a red cross on white ground — the emblem of the sanitary service

of armies — and all sanitary formations display the Red Cross flag with the National flag. All sanitary service material is marked with the Red Cross emblem. Green lanterns distinguish sanitary units at night.

Expansion of the Medical Organization during the Great War.— In the Army Appropriation Bill of 29 June 1918 (H. R. 12281), provision for an increase in the number of officers in the higher commissioned grades of the medical department was made as follows:

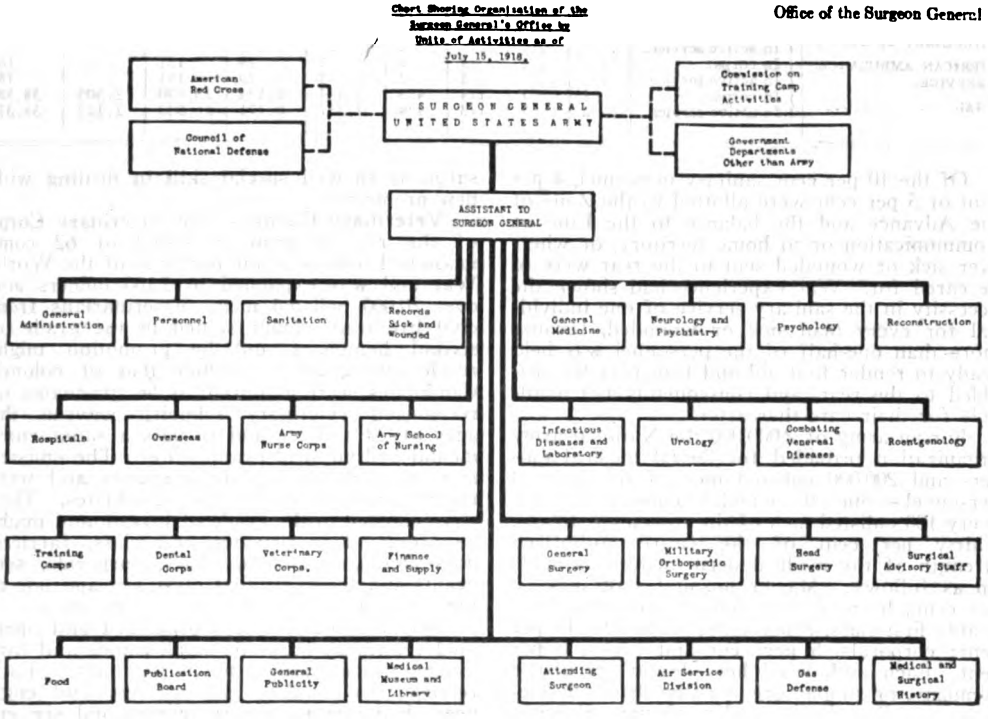
"*Increase in medical department.*— That the medical department of the regular army be, and is hereby, increased by one assistant surgeon-general, for service abroad during the present war, who shall have the rank of major-general, and two assistant surgeons-general, who shall have the rank of brigadier-general, all of whom shall be appointed from the Medical Corps of the regular army.

"That the President may nominate and appoint in the medical department of the National army, by and with the advice and consent of the Senate, from the Medical Reserve Corps of the regular army not to exceed two major-generals and four brigadier-generals.

"That the commissioned officers of the Medical Corps of the regular army, none of whom shall have rank above that of colonel, shall be proportionately distributed in the several grades as now provided by law.

"That the commissioned officers of the Medical Reserve Corps of the regular army, none of whom shall have rank above that of colonel, shall be proportionately distributed in the several grades as now provided by law for the Medical Corps of the regular army: Provided, That nothing in this act shall be held or construed so as to discharge any officer of the regular army or deprive him of a commission which he now holds therein."

The proportion of commissioned medical officers in the regular army is not to exceed seven for every thousand of the total enlisted strength of the regular army. They must be citizens of the United States. The relative rank percentages of the commissioned officers below brigadier-general is as follows: colonel, 3.16; lieutenant-colonel, 5.42; major, 23.70; captain and lieutenant, 67.72.



At the entrance of the United States into the World War (April 1917) the Medical Corps comprised 452 officers, and there were 2,600 members of the Medical Reserve Corps enrolled but inactive. Officers commissioned in the medical department for the week ended 4 Oct. 1918 totaled 35,374, the distribution being as shown in table on following page.

An applicant for appointment in the Medical Reserve Corps was required to be between 22 and 55 years of age, and to be qualified to practise medicine in the State or Territory in which he resided. In general, the personnel of the Medical Reserve Corps were successful physicians and surgeons in private practice. To join, one had to apply to the adjutant-general of the army for examination; then followed successively, preliminary examination, physical and mental. After qualifying as to physical stamina, clinical skill and aptitude for the mili-

tary service, the applicant was recommended for a commission by the surgeon-general, and appointment by the President followed.

The provision that a major might not be appointed after 45 was changed when the need for medical officers for the Great War became acute.

Of the 10 per cent sanitary personnel, 4 per cent or 5 per cent were allotted to the Zone of the Advance and the balance to the Line of Communication or to home territory, or wherever sick or wounded sent to the rear were to be cared for. War experience had shown the necessity in the sanitary service of one individual for every man sick or wounded, because more than one-half of the personnel was held ready to render first aid and transport the disabled to the rear, and consequently not available for their care thereafter.

For an army of 2,000,000 the National army organization provided for 20,000 medical officers and 200,000 enlisted men of the medical personnel — one officer and 10 enlisted men for every 100 enlisted men of the combatant forces. Thirty per cent of the entire authorized strength of the medical department was made up as follows: Master hospital sergeants, ½ per cent; hospital sergeants, ½ per cent; sergeants first-class, 7 per cent; sergeants, 11 per cent; corporals, 5 per cent and cooks, 6 per cent. Each authorized horsedrawn ambulance company, or similar organization, had a horseshoer, saddler, farrier and mechanic. Privates first-class were eligible for ratings for additional monthly pay as follows: As dispensary assistant, $2; as nurse, $3; as surgical assistant, $5.

Dental Corps.— The Dental Corps comprised commissioned officers of the same grades and proportionately distributed among such grades as were provided for the Medical Corps. There was one dental officer for every thousand of the total strength of the army. The dentists of the country were particularly alert during the war with Germany, and the profession was mobilized to such a degree that there were sufficient dentists available for an army of 5,000,000 men. In the examination of recruits dental defects were remedied by the gratuitous performance of hundreds of thousands of operations. The Dental Corps division of the surgeons-general's staff enrolled dental officers, recommended them for assignment and promotion, appointed examining and review boards and developed plans for service in the United States and abroad. The examining and review boards consisted of an officer from the Medical Corps and two officers from the Dental Corps. Mobile operating dental units in the shape of motors equipped as dental offices on wheels were in use at camps in the United States and with the army in France. Dental officers were assigned to base and general hospitals, and the dental surgeons showed special skill in dealing with new problems.

Veterinary Corps.— The Veterinary Corps of the regular army consisted of 62 commissioned officers at the outbreak of the World War and was expanded to 2,100 officers and over 20,000 enlisted men. Veterinarians from civil life were commissioned in the grade of second lieutenant and by promotion might reach any grade to include that of colonel. Candidates were required to be graduates of recognized veterinary schools, between the ages of 22 and 55, and to pass a satisfactory mental and physical examination. The enlisted men assisted the veterinary officers and were not required to be veterinary graduates. They were enlisted in the grade of private and might be promoted to privates first class, farriers, horseshoers, wagoners, cooks, corporals, sergeants and sergeants first class, for aptitude in the duties required in these various grades.

The Veterinary Corps organized and operated veterinary hospitals at all camps and cantonments possessing public animals. Each regiment of cavalry, field artillery and engineers had two veterinary officers and six enlisted men attached to it for the care of sick and the preservation of the health of well animals. Each division had a division veterinarian who supervised the veterinary service of the division. All animals purchased by the government had first to be passed on, as to soundness, by an army veterinarian. Shipments of animals by rail and all boats for transporting them overseas were accompanied by veterinary officers and enlisted men. Veterinary laboratories were maintained to aid in the detection and elimination of communicable animal diseases. The Veterinary Corps was also responsible for recommendations pertaining to veterinary sanitation wherever there were public animals. The meat inspection service of the Veterinary Corps covered the inspection of all meats and meat food products used by the entire army at the time of purchase and when issued to troops. All meats bought for shipment overseas were inspected by veterinary officers to make sure they were fit for human consumption and that they complied with govern-

ment specifications. Animals slaughtered in the field for food purposes were also subject to inspection as were dairies and milk herds supplying milk to the army.

Veterinary hospital units were organized and operated by the Veterinary Corps for use in the theatre of operations. Some of these were established as hospitals on the line of communication and at the base, and others operated from the front to collect sick and injured animals and evacuate them to these hospitals in the rear. Animals able to walk were led to the point where they could be loaded into railroad cars, while the more seriously injured ones were conveyed in motor ambulances. The hospitals were equipped with operating tables and complete outfits of instruments so that any necessary surgical measure might be carried out. Special hospitals for communicable diseases were also established where infected animals were isolated for the protection of others. By these means it was possible to restore to usefulness many thousands of animals which would otherwise have been lost.

Army Nurse Corps.— The Army Nurse Corps recruits nurses for the service, enrolls them and controls their movements. There is one superintendent appointed by the Secretary of War, and chief nurses and reserve nurses are appointed and removed by the surgeon-general with the approval of the Secretary of War. The Army Nurse Corps consists of trained nurses. The Red Cross as the reserve of the Army and Navy Nurse Corps has supplied many nurses for the Army Nurse Corps. When once assigned to the Army Nurse Corps the nurse is subject to the rules of the army as administered by the surgeon-general's office.

At the entrance of the United States into the war with Germany there were about 400 nurses and 7,000 enlisted men in the medical department. Less than a year later there were 7,000 nurses, and in September 1918 there were more than 16,000 on the rolls of the Army Nurse Corps, of which number (from April 1917 to 1 Aug. 1918) the Red Cross had placed 13,111 nurses, the rate of assignment of nurses to the military authorities by the Red Cross having been 55 per day from the beginning of 1918. The total Red Cross enrollment of graduate nurses eligible for the Army Nurse Corps (as of 2 July 1918) was 22,736, including those serving in the Army Nurse Corps. It was estimated that 50,000 nurses would be required for an army of 2,000,000 (one nurse for 10 beds if 25 per cent were hospitalized, the maximum provided for, based on British experience, or with a minimum hospitalization of 17 per cent, 51,000 nurses for an army of 3,000,000). Emphasizing the need for nurses, the acting surgeon-general of the army stated on 17 Sept. 1918 that not only must 25,000 nurses be obtained before 1 Jan. 1919 (9,000 in addition to the 16,000 then in service), but (if the war continued) that by 1 July 1919, 50,000 would be required — thus indicating that in less than a year 34,000 would have to come forward to meet the need. To increase the number of nurses there was established on 25 May 1918, under the surgeon-general, an Army School of Nursing, which gave immediate opportunity for service, providing an adequate course of training for young women between the ages of 21 and 35, who had a high school education or its equivalent; it at the same time made possible the release of a large number of graduate nurses eligible for service in the Army Nurse Corps. Under date of 13 Sept. 1918, the surgeon-general announced that the 50 American hospitals which organized base hospital units for service in France had been notified that they might invite a limited number of their student nurses to go to France, where they would have the privilege of rendering service and, at the same time, complete their training under representatives of their own schools in base hospitals abroad. These were mostly seniors, and those who went across included the young women who were first to be enrolled in the Army School of Nursing. Each unit of 25 was in charge of a graduate nurse. Student nurses not so far advanced were placed in base hospitals in the United States. Women called "hospital assistants"— a position created by the surgeon-general for women offering to nurse wounded soldiers — were enrolled through the Red Cross and assigned to convalescent hospitals in the United States, where training units were not established. These hospital assistants were married women between 21 and 40, whose husbands were overseas, and single women between the ages of 35 and 45. They were high school graduates or had present educational equivalents.

At the request of the surgeon-general certain well-known medical colleges allied with hospitals gave special three months' courses for nurses' aids. These young women were to serve as anesthetists, laboratory assistants, nurses' helpers and, in emergency, ward nurses. There were, on 1 July 1918, 48,000 in training schools for nurses, and a campaign to recruit 25,000 student nurses was launched (July 1918), conducted under the auspices of the committee on nursing and women's committee of the Council of National Defense, with the cooperation of the surgeon-general's office and the American Red Cross.

Ambulance Corps.— The Ambulance Corps, which had in August 1918, 9,000 or 10,000 men with 80 sections serving behind the French, English and Belgian lines and 30 sections behind the Italian trenches, with additional units in training at Allentown, Pa., was started at Allentown in May 1917, to meet the emergency needs of the French in response to an appeal by Marshal Joffre. One hundred sections were trained in driving ambulances, carrying litters and in first-aid treatment. Forty colleges sent men, and there were soon 4,500 on hand. The service abroad absorbed the privately raised and financed automobile ambulance units manned by American volunteers. An ambulance section consisted of a captain or lieutenant commanding and 45 enlisted men. An officer of the Motor Transport Corps checked up on operation and maintenance. Hospital units of various kinds came to Allentown for training prior to departure abroad. The camp became strictly medical, with men in training for all branches in this service, the men for the laboratory units, field hospital units and organization to conduct base hospitals being obtained principally from the medical training camps at Fort Oglethorpe and Fort Riley.

Hospital Corps.— The men of the Hospital Corps available for service with line

organizations and with the sanitary train are designated in time of peace, and at the time of mobilization for war they are ready to join their respective commands. Each has the proper personal equipment and has been instructed as to first-aid treatment. Field equipment is maintained at designated stations ready for use.

Sanitary Officers.— Medical officers in command of sanitary units attached to units of the line smaller than a division (the sanitary units being temporarily separated from direct headquarters control) report these units to the senior line officer in command.

The department surgeon is chiefly an advisory officer, but in matters relating to activities of the sanitary service within his department he acts in an administrative capacity, supervising the work of the department and examining and passing on reports. His watchfulness over sanitary conditions is constant and he immediately reports orally to the commanding officer as to remediable defects, with recommendations. In mobilization camps physical examinations are made and recorded by the department surgeon and sanitary inspector and their assistants, who also vaccinate against smallpox and typhoid fever, and report the sick list to the company commander, making appropriate records. Each mobilization camp for State National Guard troops was in charge of an officer of the regular army. He had on his staff a camp surgeon, usually a medical officer of the regular army. Surgeons at ports of embarkation and at rest stations were the sanitary advisers of the commanding line officers in all matters pertaining to the Medical Department. The Medical Department sees to it that all individuals and organizations in the army are furnished such equipment as pertains to the Medical Department, and such training in sanitary matters is given to both line troops and sanitary troops as is possible and as is appropriate to each.

The regulations defining duties of medical officers contain the following: "While officers acting as technical advisers of their commanders are responsible for pointing out insanitary conditions and making proper recommendations for their correction, the direct responsibility rests with the commander. If, however, the commander authorizes the medical adviser to give orders in his name for the correction of defects, then the duties and responsibilities of the latter are correspondingly increased."

Contract Surgeons.— Contract surgeons are not given commissions, but they wear the uniform when on active duty. They are expected to give their entire time to the public service. Short-term contracts are made with graduates of reputable medical schools and long-term contracts with graduates and qualified practitioners after examination. There are two forms of contract: standard, $1,800 a year, and substandard, $75 a month with subsistence, mileage, etc. Of the 151 contract surgeons in the service (in September 1918) 34 were women.

Civilian Personnel.— In administrative offices, supply depots and hospitals, there are civilian employees including clerks, messengers, watchmen, contract nurses, cooks, packers and laborers, those other than unskilled laborers being subject to civil service rules. Service volunteered in emergency by individual civilian physicians, nurses, litter bearers, cooks et al., is often accepted by the surgeon of any organization operating independently, or by the commanding officer of a general hospital, with the consent of his commanding officer and under the authority of the surgeon-general.

The personnel of the Medical Department, and all other persons assigned to duty with that department, are collectively called sanitary troops. In time of war the Sanitary Service includes (a) all persons serving in or employed by the Medical Department, including officers and men temporarily or permanently detailed therein; (b) individuals whose voluntary service with the Medical Department is duly authorized, and (c) members of the Red Cross assigned to duty in the Medical Department. The American Red Cross, of which the President of the United States is head, aids under an act of Congress, approved 24 April 1912. This organization is, as per its charter (Act of 5 April 1905), "a medium of communication between the people of the United States and their Army." The Red Cross has its own organization, acting under the direction of the ranking medical officer of the unit.

Co-operating Agencies.— Other auxiliary and co-operative aids of the Medical Department, with which the office of the surgeon-general is in communication but does not control, include the War Department and Navy Department Commissions on Training Camp Activities (having supervision of regulations dealing with the suppression of the sale of alcoholic liquors within the five-mile zones around camps and cantonments and of prostitution within 10 miles), United States Public Health Service of the Treasury Department (which has recently taken over the work for civilian co-operation in combating venereal diseases), the Chemical Warfare Service of the War Department (which now has charge of gas defense activities), and the General Medical Board of the Council of National Defense.

General Medical Board.— The last-named body worked in close co-operation, and aided in the expansion of the nation's medical program during the war through co-ordinating the civilian resources with those of the government. It stimulated enrollment of physicians in the Medical Reserve Corps, and organized the Volunteer Medical Service Corps, aimed to enlist the services of all physicians, both men and women, during the emergency, who were not already in the government service. In November 1917 the provost marshal-general requested the Council of National Defense to nominate a man in each State as medical aide to advise the governor as to medical questions which would arise in connection with the operation of the Selective Service Law. The chairman of the General Medical Board appointed a committee on medical advisory boards, which met and selected a representative from each State. These were called to Washington and received their instructions. The committee on medical advisory boards formulated a plan, outlining the duties of these aides, in the selection of the personnel of medical advisory and local boards and organization of medical activities under the Selective Service Act. Rules of procedure were prepared and approved by the provost

marshal-general. It was announced, 28 Sept. 1918, that medical aides in States having a population of more than 500,000 had been commissioned in the army with the rank of major, and in other States with the grade of captain.

The General Medical Board has committees on child welfare, civilian co-operation for combating venereal diseases, dentistry, editorial, hospitals, hygiene and sanitation, industrial medicine and surgery, legislation, medical advisory boards, medical schools, nursing, publicity, research, States' activities, surgery, volunteer medical service corps and women physicians.

Surgeon-General's Office.— The office of surgeon-general, as the heart of the Medical Department of the army, during the war had a great administrative group, with the immediate office management in charge of chief clerk and civilian employees, the several divisions being in charge of army officers of special experience and qualifications.

The enormous expansion in the work of the surgeon-general's office is indicated by a few comparisons. Just prior to the declaration by the United States (6 April 1917) that a state of war existed between the United States and Germany, the surgeon-general's office staff comprised six officers, including Surgeon-General Gorgas, and 20 clerks, and occupied three rooms in the State, War and Navy Building. By 1 Dec. 1917, 165 officers were detailed here, there were 535 clerks, 300 office rooms were required, five whole buildings and parts of 20 others were being occupied, and more space was needed. There were 14 divisions and 13 special sections comprising 27 units of activity. Within a year after the war began the whole administrative force comprised 359 officers and 1,008 clerical employees, including enlisted men, and 150,000 mail items and 9,500 telegrams were being handled monthly. These figures do not include the gas defense service, which later became the Chemical Warfare Service of the War Department, and attached to which there were 2,364 commissioned officers and 20,344 enlisted men. In the year ended 31 March 1918, the department personnel increased from 8,000 to 106,000; 900 officers to 18,000; 375 nurses to 7,000, and an ambulance service of 6,000 men was entirely created. The seven hospitals in the United States were increased to 63, with more to come; their bed capacity of 5,000 was increased to 58,400, and provision of bed capacity in France was made for 20 to 25 per cent of the strength of the American Expeditionary Forces. Whereas the appropriation for the Medical Department in peace times was about $1,000,000 a year, appropriations for the fiscal year ended 30 June 1918, totaled $130,000,000, of which there had been expended up to 1 April 1918, $95,000,000, and the current annual outlay was at the rate of $160,000,000.

The Finance and Supply Division, in charge of medical supply and disbursing officers, purchases, stores and transports all supplies and material for the Medical Department and disburses and accounts for its moneys. Medical supplies are issued in definite units and amounts, the supplies to the various units of the medical service and the sizes of original packages being fixed by definite supply tables.

In addition to vehicular units for the transportation of supplies, other units of transportation in the Medical Department during the war included mobile hospitals, wards and operating rooms, motor dental units which were offices on wheels, x-ray motor outfits — the modern substitute for the probing methods of old-time military surgery — lorries bearing steam delousing apparatus or disinfectors and laundries. Each regiment had three medical carts. Pack mules carry fixed quantities of supplies. An officer of the newly-created Motor Transport Corps was stationed with each command to check up on operation and maintenance.

As the functions of the department were and are preventive and curative, the Division of Field Sanitation was of great importance, for it recommended sites for camps, looked after mosquito prevention, drainage, water supply, ventilation, the disposal of waste and the elimination of flies. Spots near camps where mosquitoes and flies breed were cleaned up. Each camp had a division or camp surgeon, and, as assistant, a sanitary inspector who had the assistance of a sanitary engineer and from 100 to 200 enlisted men employed in work designed to protect the health of soldiers. The sanitary engineering section of the surgeon-general's office and sanitary engineers of the construction division of the army co-operated in inspections as to the need of increased sanitary facilities and sewage disposal plants. Ditching and oiling still bodies of water and daily spraying with oil of breeding spots were among the duties performed. Much of this work was done in co-operation with the United States Public Health Service within a radius of a mile outside the camps. Buildings where food was prepared or stored were screened, and a report in the late summer of 1918 stated that 22,700,000 square feet of screen had been placed in all the camps and 6,000 fly-traps placed in each camp. This work was largely responsible for the prevention and control of epidemic diseases.

Hygienic standards, collective and individual, of troops in camp and in transport on land and sea, were being constantly improved. Hygiene is taught West Point cadets and all commissioned officers, so that they were enabled to teach the enlisted men; moreover, the latter were given instruction by their company officers in first-aid hospital training and field hospital work, this instruction being supplemented by drills of sanitary units in the presence of the enlisted men. Pamphlets and moving pictures were further aids in instructing in hygiene and in the reduction of venereal diseases. In addition to thorough physical examination, all officers and enlisted men of the army under 45 years of age were required to be immunized against typhoid fever. All recruits and all the personnel of a military command were vaccinated against smallpox when the surgeon responsible deemed it necessary. Special units were provided for men with remediable physical defects, specialists aiding the surgeons in charge. Tests also were made to detect malingering.

The precautions and supervision in the camps for the young men taken from civil life into the army resulted in the showing for the week ended 9 March 1918 of an annual death rate from disease of 6.6 per 1,000, a figure below that of men in civil life ranging from 20

to 39 years of age, the census bureau giving the rate for this class as 6.7. Steady reduction of the disease rate continued in the succeeding months and for the week ended 26 July it was reported that the annual death rate from disease, based on combined reports of the American Expeditionary Forces and of troops stationed in the United States, was 1.9 per 1,000 — less than two men per 1,000 per year. The average annual death rate from disease during the two months ending 26 July was 2.8 per 1,000. For the sake of comparison, in the Crimean War the English and French lost 350 of every 1,000 men through disease; in the Mexican War in the 40's the annual death rate from disease of United States troops was 100 per 1,000; in the Civil War, 40 per 1,000 in 1862 and 60 per 1,000 in 1863; in the Spanish War, 25 per 1,000; and in the Russo-Japanese War, 20 per 1,000, this being the lowest previous annual death rate from disease. From statistics of the executive division of the general staff of the army, it appears that, in the Mexican War, seven men died from disease to one killed in battle; in the Civil War the disease mortality, though greatly reduced, was still nearly double the battle mortality; and in the Spanish War there were more than five deaths from disease to one in battle; and in the first 10 months of American participation in the World War the records of the American Expeditionary Forces show an exact parity between battle mortality and disease mortality, but this is little more than half of the battle mortality and less than a third the disease mortality of the Civil War.

Particular attention was paid to empyema and to pneumonia epidemics. A special commission of physicians and pathologists studied the problem, aided by special teams of physicians and pathologists in each camp. The division of surgery perfected arrangements, in accordance with the system recommended by the commission, for quarantine and isolation and prophylaxis. The methods employed were necessary on account of the gatherings of large bodies of recruits. If, despite precautions, empyema did result, the surgeons adopted the policy of treating by operation for drainage of the chest.

The division of food and nutrition placed nutrition officers in every camp and cantonment where at least 10,000 were in training, in the United States and abroad. Nutritional surveys were conducted for the purpose of investigating food in storage, in transit and in preparation; cooking and wastage were studied in all the camps, methods improved, economies instituted, and dietetics taught. Studies as to the exact amount of food consumed and percentage of waste in more than 100 messes in 40 camps were made and instructions given to mess officers. The bill of fare was carefully balanced for wheat, starch, fat, protein, minerals and vitamine, and for sugar. The soldiers under General Pershing received 3,500 to 4,200 calories of heat units daily as compared with the 2,500 calories deemed sufficient for the ordinary citizen. All nutrition officers were food specialists, mainly men and women who had been connected with colleges and public bodies as physiologists, chemists and food inspectors. As a concrete result of a two-day survey of seven companies (1,135 men), the average edible waste was found to be 1.12 pounds per man per day. Appropriate instructions as to food and mess economy were given to mess sergeants and cooks, and a second survey of the same companies showed waste of .43 pounds per man per day — a saving of .69 pounds, which was equal to $61.75 per day for the seven messes, $22,542 per year. If this ratio prevailed throughout the camp of 15,000 men, the total saving would be about $300,000 per year.

A statistical bureau attended to the collection and co-ordination of memoranda and records of sick and wounded, from the time of injury until discharge from the hospital. These records were kept in the most approved way in the surgeon-general's office with the aid of punching, tabulating and sorting machines.

Deaths of officers and men of the military personnel were immediately reported in writing by the senior medical officer present to the commanding officer. Deaths of medical officers were reported by the attending surgeon or the nearest medical officer to the department surgeon, a duplicate being sent to the surgeon-general.

Medical and dental students in civil life, whose age placed them within the jurisdiction of the selective service law, were permitted to enlist in the Enlisted Reserve Corps and placed on inactive duty so that they might continue their college courses while subject to call to active service. The Army Medical School in Washington gave instruction to junior medical officers who had passed their examinations for entrance into the regular army. The faculty, comprising commandant, professor and assistant professors, were detailed by the War Department from among the officers of the Medical Corps. Special professors were nominated by the faculty with the approval of the surgeon-general from among distinguished members of the Medical Reserve Corps. As instructors, there were officers of other branches of the army detailed by the War Department to give special courses. Officers of the Medical Reserve Corps who were candidates for appointment in the Medical Corps attended as students; also, such officers of the army and organized militia as might have been ordered or authorized to attend; also enlisted men of the Hospital Corps. The equipment included library, laboratories and all the other usual appointments of a medical college. Important in the system of training was the training school at Camp Greenleaf, Fort Oglethorpe, Georgia, where 2,500 physicians from civil life entering the Medical Reserve Corps as officers and 6,000 enlisted men of the medical department (Hospital Corpsmen) were constanly undergoing an intensive three months' course in training for all phases and branches of military medicine and sanitation, including physical instruction and administrative duties. The physicians could here study branches for which they might never have opportunity in their civilian practice. Special opportunity for instruction in surgery was afforded by three schools in New York City, and one each in Philadelphia, Rochester, Minn., New Orleans, Chicago, Saint Louis and Cleveland. A medical and surgical school in Paris for surgeons of the American Expeditionary Forces afforded an intensive course of one month in administration, surgery and sanitation,

with lectures by experienced surgeons; and young American surgeons had an opportunity of observing methods at French and British casualty clearing stations before being placed in base hospitals for their initial war work. The next step of the young surgeon was as head of an operating surgical "team" manning an evacuation hospital.

The Division of Internal Medicine, Tuberculosis and Cardio-Vascular Diseases selected expert examiners to eliminate the physically unfit and to guide defective men to treatment calculated to restore them to future efficiency in military and civil life. Hundreds of thousands of examinations for tuberculosis and diseases of the heart were made. This division provided hospitals for incipient cases of tuberculosis as well as for advanced cases. It also provided for examinations of gastro-intestinal diseases.

The Division of Infectious Diseases cooperated with the Division of Sanitation by selecting bacteriologists, pathologists and other laboratory men, establishing and fitting out laboratories for army posts and mobile units for general, special and research work, a laboratory being attached to every army post, mobilized division and army corps. Tests of blood specimens and analyses of stomach contents and water analyses were made in these laboratories. The medical officer is held responsible for the application of approved methods for preventing the spread of infectious diseases, the three infections most dangerous to armies being venereal, the pneumonias and cerebrospinal meningitis. Typhoid and paratyphoid are controlled at the start by vaccines, the efficacy of which was first developed by Sir Almroth Wright. Quarantine guards against measles, diphtheria and influenza; diarrhœa and dysentery are kept to the minimum by pure water, pure food and reduction of the fly nuisance. Modern medical science keeps away the old plagues of army camps — cholera by isolation, disinfection and vaccine; and spotted typhus by delousing and hot shower baths. Such cases of gout, rheumatism and Bright's disease as occur were brought into the army when the patient enlisted.

In the early stages of the World War, tetanus was common in the European armies, but it has now been practically eliminated. Research into causes of trench fever and tests in which the famous 66 volunteers from among the Americal soldiers played an important part, have led to the discovery that its transmission was due to the bites of body lice. An appropriation of $100,000 and co-operation and research with French and British surgeons are to be credited for this achievement. Trench fever had been incapacitating 8 to 10 per cent of the British troops during 1916–17 for periods of from two to three months. The importance of eliminating body-lice or "cooties" led to provision for delousing apparatus, with twin disinfecting chambers mounted on a five-ton lorry so that operation could be carried on near the trenches. Steam at five pounds pressure was passed through the air-tight chamber containing clothing to be treated, killing all living matter. Eggs remaining in seams after the disinfecting operation were removed by stiff wire brushes.

The Division of Urology (genito-urinary diseases) looked after the prevention of venereal diseases by employing prophylactic, sociological and educational measures — through the enforcement of public health and vice laws, recreation for the soldier, educational measures such as lectures, moving pictures, exhibits and literature, and also through thorough prophylactic treatment and segregation. It published a manual on venereal disease, in co-operation with the Council of National Defense Committee for Civilian Co-operation in Combating Venereal Diseases, and with the War Department and Navy Department Commissions on Training Camp Activities. There was strict enforcement of the provisions against alcohol in the five-mile zones surrounding camps and cantonments and against prostitution within ten-mile zones. This work in the civilian territory adjacent to the camps and cantonments was placed under the United States Public Health Service of the Treasury Department in the summer of 1918.

The Division of Psychology sought to eliminate the mentally unfit and to make possible the placing of men according to ability. All company officers and enlisted men were examined and the mentally superior encouraged by assignment to duties for which they were evidently fitted. Of the 150,000 examined by this division, more than 1 per cent were rejected as mentally unfit for military service. The Division of Neurology and Psychiatry was organized because it was the experience in the Allied armies that a large number of neurotic, mental and other defectives were found, who soon became useless for field service. While physically sound, they were incapable of becoming soldiers because of insanity, mental defect, epilepsy, drug habit or other nervous disorders. This division took special charge of victims of the varieties of "shell shock," who are cared for in a base hospital specially set aside for such cases, and it also had charge of asylums for insane and of the men in the nervous and mental wards in the military hospitals.

The Division of Surgery classified the surgeons in the Medical Reserve Corps — continuing the code card system begun by the General Medical Board of the Council of National Defense — trained them in special schools, assigned them to posts and distributed instruments and supplies at such posts. Military surgery was largely revolutionized during the war. Wounds were thoroughly operated upon as soon as possible after a man was hit, all lacerations and surrounding flesh being cut away and the danger of infection by tetanus or gas gangrene bacilli reduced to a minimum. Owing to modern methods of sterilizing infected wounds, of the wounded who survived six hours, 90 per cent recovered; of those who reached field hospitals 95 per cent recovered; and of those who arrived at base hospitals 98 per cent recovered. Paraffin compounds found favor with many surgeons as dressings for burns and scalds. The subdivision of military orthopedic surgery dealt with the correction of deformities resulting from wounds and injuries, and supplied standardized splints, artificial limbs and similar appliances. This section paid particular attention to soldiers' feet and the shoes they wore and took measures to prevent and cure "trench feet," insisting upon properly drained trenches and prescribing loose, comfortable foot

and leg wear and nightly washing and greasing the feet (clean socks in abundance). Under its supervision were orthopedic work-shops for making plaster casts, artificial limbs, splints and other supplies incident to the correction of deformities.

The Division of Special Hospitals and Physical Reconstruction became of greater and greater importance as the war progressed. In addition to the separate hospitals for the tuberculous and insane, special provision was made for groups of medical and surgical injuries, the blind and the deaf.

The Division of Surgery of the Head included four sections: ophthalmology, otolaryngology, plastic and oral surgery, and brain surgery. This division supervised the selection, classification and intensive training of medical reserve officers in brain surgery, specialized surgery of the mouth and jaw, and eye and throat. It standardized instruments and material and selected optical equipment for use at the front. Those in charge of this division were instrumental in perfecting methods for making artificial eyes to take the place of those previously made in Germany and were also responsible for devising excellent types of goggles for aviators. This division published a monthly magazine, *Survey of Head Surgery*, containing articles and abstracts of articles calculated to be of value and interest to military surgeons. Through the close teamwork of the oral surgeon, dental surgeon and dentist comprising each unit at the front, many unusual operations were performed during the war, in the repairing of portions of the face and jaw of men injured in battle, new features and jaws being supplied by the experts in plastic and dental surgery.

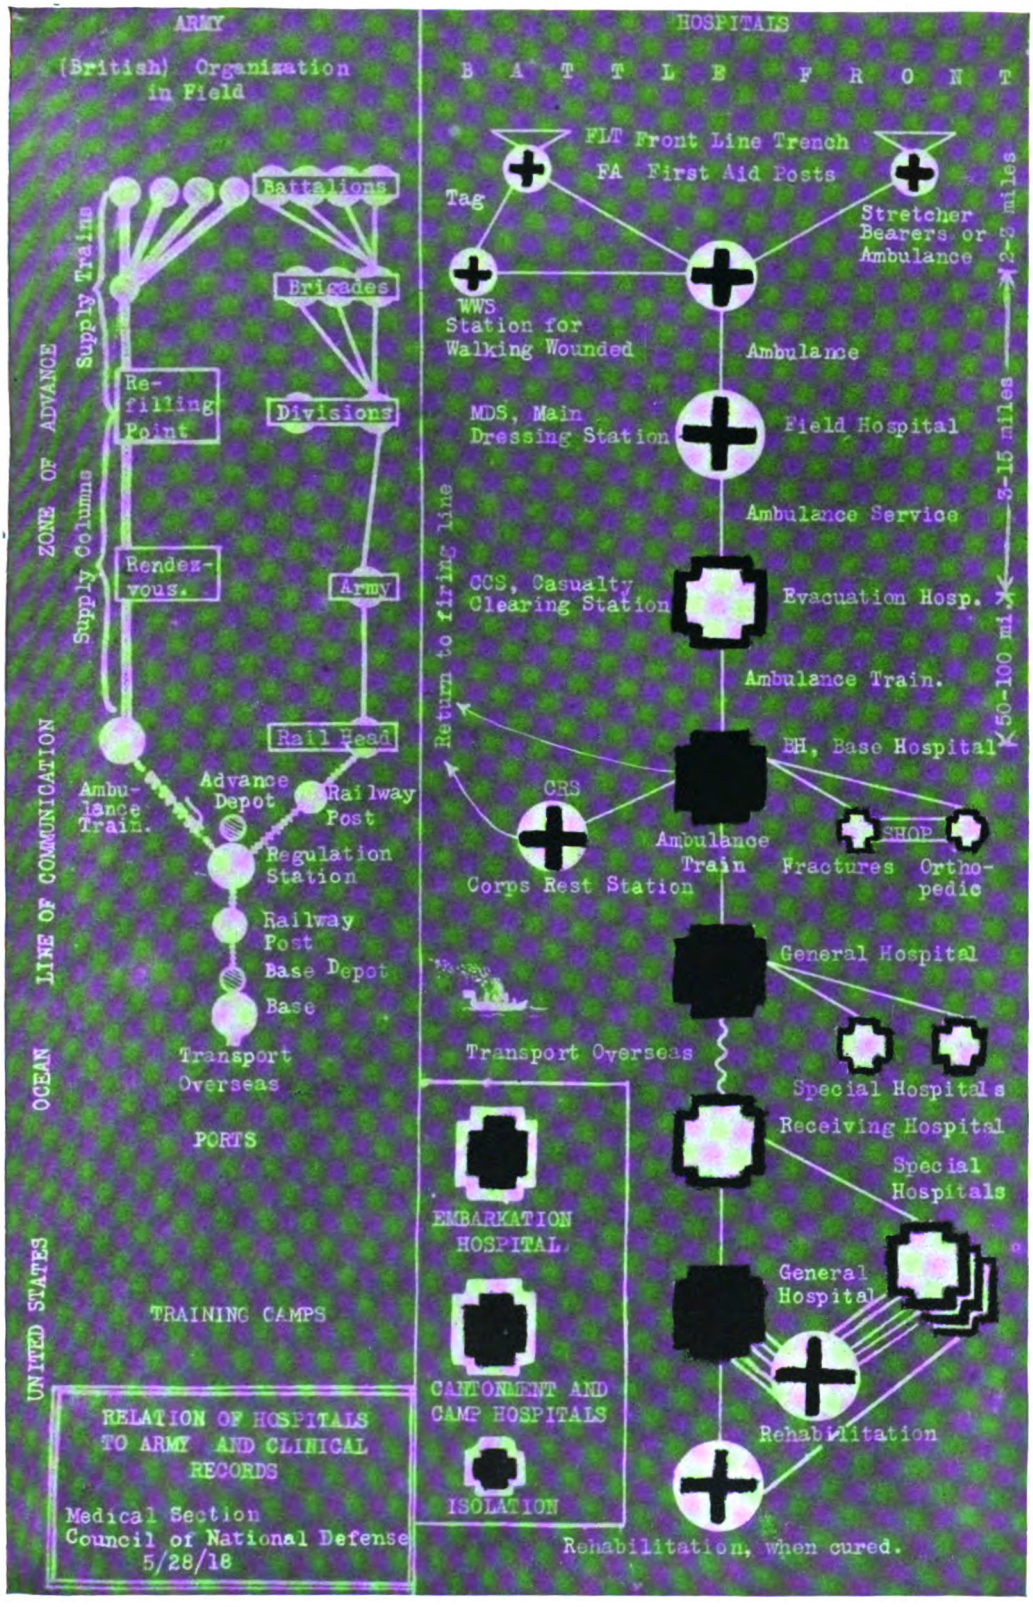
In general, the purpose of reconstruction was to return the injured man to complete or partial military duty or to his former occupation in civil life, or to train him anew in a curative workshop. This work of reconstruction in the American army was on a comprehensive scale. Individual study of each injured soldier was made and his repair attempted according to his best "social worth." No man was discharged from the army until every possibility had been exhausted to put him back in the best physical condition. Massage and various electrical appliances and mechanical devices were used in convalescence, to restore muscular movement in limbs and extremities, and artificial limbs were employed enabling the mutilated man to use all manner of tools and implements and to perform the daily functions of civilized life. The Division of Physical Reconstruction edited and the American Red Cross published a monthly magazine, *Carry On*, relating to phases of this important work.

The Division of Hospitals planned and organized all army hospitals, convalescent camps, depots and hospital trains, supplying all their personnel including specialists in surgery, medicine, bacteriology, epidemics, heart, head, nerves, feet and the more prevalent and dangerous diseases. Up to the entrance of the United States into the war, there were only seven army hospitals aside from post hospitals, these seven having a bed capacity of 3,843. Including the army post hospitals, the bed capacity was about 5,000. A survey of prospective needs led to requests for 86,472 beds and of these there were ready in March 1918, 48,632, and hospitals with capacity of 29,140 were under construction. Hospital requirements in the United States when 4,000,000 soldiers were expected in France were estimated at 200,000 beds by then Brig. Gen. Robert E. Noble of the surgeon-general's staff in late September.

The hospitals in the United States were of three types: (a) receiving hospitals at ports of debarkation, which are filled and emptied rapidly; (b) base hospitals, of which there were 44, including 32 at National Army and National Guard camps; and (c) general hospitals. Of the total of 79 hospitals established, 29 were equipped to care for more than 1,000 patients each, and 17 to accommodate 2,000 each.

The sending of large forces to France necessitated the establishment of a great medical and hospital organization under the medical officer on the staff of the general commanding the port of embarkation. This medical department, with headquarters in Hoboken, N. J., had jurisdiction over operations on the Atlantic coast from Canada to Florida and had on 31 July 1918, 33 medical department organizations, with 529 officers, 110 contract surgeons, 342 nurses, 2,649 enlisted men and 65 civilians. The divisions included those on personnel, correspondence, dental service, history and statistics, sanitary inspection, property, finance, transport supply, transport, transportation (with seven hospital trains and 23 ambulances), transatlantic transport service, medical detachment, overseas casualty camp, sick and wounded, medical supply depots, nurses' mobilizing stations, attending surgeons, laboratory (for pathological, bacteriological, chemical and microscopical examinations and analyses), hospital building and domiciliary hospital (in charge of convalescent hospitals in private homes, with capacity of from two to 50 patients each and a total of 1,200 patients) in addition to the hospitals. The 13 hospitals had 12,500 beds, of which 11,000 were ready for occupancy on 1 Oct. 1918. A man found sick in a unit about to go across was quickly sent to an embarkation hospital; when he recovered he went as a casual and probably was placed in a unit other than that to which he originally belonged. Embarkation Hospital No. 1, at Hoboken, had 763 bed capacity; No. 2, for scarlet fever, mumps and measles, was at Secaucus, N. J.; and No. 3, for communicable diseases, off Hoffman's Island, had 694 beds. On the Columbia University oval, Williamsbridge, New York City, was General Hospital No. 1, with 1,100 bed capacity; United States Auxiliary Hospital No. 1 (Rockefeller Demonstration Hospital, for demonstrations and carrying on scientific investigations), was at 66th street and Avenue A, New York City, and it had 150 beds; Port Newark Terminal, N. J., had a post hospital with 30 beds; the base hospital at Camp Merritt, Tenafly, N. J., had 1,846 beds; the base hospital at Camp Mills, Long Island, had 1,506 beds, and the hospital at Schützen Park, N. J., was planned for 400. At the debarkation hospitals the patients were sorted and sent to various special hospitals, sanatoria, restoration clinics or convalescent homes, throughout the United States. The debarkation hospitals were: No. 1, Ellis Island, 1,075 beds; No. 2, Fox Hills, Staten Island, 1,762 beds; No. 3 (Greenhut Department Store)

MEDICAL ORGANIZATION IN THE ARMY



Sixth avenue and 18th street, New York City, 2,814 beds; No. 4, Long Beach, L. I., 1,800 beds, and No. 5, the Grand Central Palace, Lexington avenue, 46th and 47th streets, New York City, rented for $385,000 yearly, with 3,300 beds.

The general hospitals, of which there were 27, were the only ones for troops returning from Europe. Twenty-two were in September 1918 completed, or nearly so. The total bed capacity in these general hospitals was about 20,000. It was planned to have one general hospital for each of the 16 draft districts of the country, distributed so that sick and wounded soldiers could recover near home. Orthopedic hospitals were established at Washington, D. C., Baltimore, Md., and Colonia, N. J. There were neuropathic hospitals at Fort Porter, N. Y., and New York City.

The surgeon-general designated the following 15 general military hospitals for the work of physical reconstruction: Walter Reed General Hospital, Washington, D. C.; General Hospital No. 2, Fort Henry, Md.; General Hospital No. 3, Colonia, N. J.; General Hospital No. 6, Fort McPherson, Ga.; General Hospital No. 7, Roland Park, Baltimore (for the blind); General Hospital No. 8, Otisville, N. Y.; General Hospital No. 4, Fort Porter, N. Y.; General Hospital No. 9, Lakewood, N. J.; General Hospital No. 11, Cape May, N. J.; General Hospital No. 16, New Haven, Conn.; General Hospital No. 17, Markleton, Pa.; Letterman General Hospital, San Francisco, Cal.; United States Army Hospital, Fort Des Moines, Iowa; Plattsburg Barracks Hospital, Plattsburg Barracks, N. Y.; General Hospital, Fort Bayard, N. M.

No man was brought to this side as long as there was a reasonable chance of his being able to return to the firing line. Eighty-five per cent of all wounded were returned to the firing line in a comparatively short time. Fifteen per cent of the total sick and wounded were not able to return to the firing line within six months and they were classified and tagged in France according to wounds, sickness and disease, all located on arrival on this side and sent by train to the various general hospitals. Of the 15 per cent brought to the United States, one-third were later capable of some kind of military service. Of these, some were sent back to the firing line of trained for limited military service.

Those disabled to the extent that they were unfitted for further military service, if it was deemed desirable, were fitted again for their former employment; or if their injury precluded or circumstances indicated that change of occupation would be to their advantage, they were encouraged to take advantage after discharge of the benefits afforded for vocational training by the Federal Board for Vocational Education, which had charge of the rehabilitation, generally, of this class of ex-soldiers and sailors. It was recognized that a small group was and will be unfit for any work.

It was estimated that about 1 per cent of the men mobilized would be subjects for vocation training; as the United States mobilized 4,000,000 men, there are 40,000 to retrain. Half of the men susceptible of recuperation need medical rather than surgical care. Of the 20,000 surgical cases, about 2,000 are "dismemberment" cases, where there has been actual loss of arm, leg, hand or foot. Of the 2,000, about 250 have lost legs, and about 175 an arm or arms.

There were seven hospital trains in the United States. Each train was in charge of a transportation officer. In each train there was a convalescent capacity for 250 patients, and a bed patient capacity of 30. The trains were provided with every convenience and there were several types of coaches, kitchen cars, dining cars and unit car for the staff. On occasion, special coaches were provided for disabled returning soldiers to be attached to passenger trains. There were six hospital boats, ready with picked crews and nurses.

Staffs of hospitals were administrative and professional. The commanding officer in charge of a general hospital was a colonel or lieutenant-colonel of the Medical Corps. He had, as adjutant, a major of the Medical Corps whose staff of 17 includes sergeant, privates and civilian employees. The registrar was a major or captain of the Medical Corps; he had a staff of nine sergeants and privates. The quartermaster was a major or captain of the Medical Corps; his staff of 61 included a captain or lieutenant of the Medical Corps (who was in charge of the hospital mess) and 60 sergeants, corporals and privates, and civilian employees. Officer of the day, officer of the guard and chaplain completed the administrative staff. Professional division — the chief of the medical service was a major and serving under him were two sergeants and two privates. The surgical service consisted of one major, one captain or lieutenant, one sergeant, four privates and five army nurses. In the wards there were 12 captains or lieutenants of the Medical Corps, 6 sergeants of the Hospital Corps, 70 privates, Hospital Corps, and 53 nurses of the Army Nurse Corps. In the laboratory there was a captain or lieutenant of the Medical Corps, a sergeant first-class, two sergeants and four privates, all of the Hospital Corps. The dental service was in charge of one lieutenant of the Dental Corps, who had one private of the Hospital Corps as assistant. The nursing service comprised one chief nurse, nine assistants and 53 nurses. One head nurse in each ward served eight hours daily and was on night duty one month in three. In each convalescent camp there was a captain or lieutenant of the Medical Corps and one sergeant first-class, one sergeant and six privates, all of the Hospital Corps.

The grade classification of the personnel of a general hospital was as follows: Twenty medical officers (1 colonel commanding, 1 major, operating surgeon; 18 captains and lieutenants, including quartermaster, pathologist, eye, ear, nose and throat specialist, 2 assistant operating surgeons, 12 ward surgeons, dental surgeon); 8 sergeants first-class (1 general supervisor, 1 each in charge of office, quartermaster supplies and records, kitchen mess, detachment and detachment accounts, patients' clothing and effects, medical property and records, dispensary); 16 sergeants (1 in dispensary, 2 in storerooms, 1 in mess and kitchen, 4 in office, 2 in charge of police, 6 in charge of wards); 14 acting cooks; 115 privates first-class and privates (68 ward attendants, 3 in dispensary, 5 in operating-room, 1 in laboratory, 14 in kitchen and mess, 6 in storerooms, 4 or-

derlies, 5 in office, 4 outside police, 1 assistant to dentist, 4 supernumeraries); 46 nurses, female (1 chief nurse, 1 assistant to chief nurse, 41 in wards, 2 in operating-room, 1 dietician).

A subsequent development necessitated by the war was the creation of mobile hospitals compactly contained in motors and susceptible of rapid setting up and, if emergency dictated, removal. A mobile hospital section, consisting of 14 motor trucks in charge of a chief surgeon and an assistant, with 20 to 40 enlisted men and 10 army nurses, remained near a base hospital about 15 miles back of the battle front. Summoned by telephone, the section proceeded forward with doctors and set up its operating tent, the construction of the motor trucks being readily adaptable to the formation of a compact hospital unit with electrically lighted plant, sterilizing outfit, X-ray apparatus and small frame operating pavilion. Two of the trucks carried tents and hospital supplies, the whole plant when erected making a temporary field hospital with 120 beds. Each mobile hospital had its own headquarters and staff — lieutenant-colonel, 2 captains, lieutenant and 3 enlisted men — in addition to the surgeons and men on call service. The main headquarters of the mobile hospital branch was in charge of a colonel and 5 chiefs of the surgical staff for 5 sections.

Hospital trains specially fitted and arranged for the comfort of the wounded were used in the theatre of operations to convey the wounded from the evacuation hospitals to the base hospitals. One of the American hospital trains in operation in France was 930 feet long and consisted of 16 coaches. There was a fracture ward and an infectious diesease ward, and the train accommodated 360 patients in cots, or 480 sitting down and at the same time 120 in cots, making 600. Each ward had 36 cots hung in tiers of three. The equipment was as complete as that of any hospital in the United States. The staff of the train included 3 medical officers, a manager, 2 lieutenants, a sergeant first-class, 2 sergeants, 2 cooks and 31 enlisted men. Operating-room, kitchen, pharmacy, stores and staff carriages were also provided.

Hospitals for prisoners of war were located adjacent to prison camps and stockades.

The three hospital ships, the *Solace, Mercy* and *Comfort,* placed in commission, were originally 10,000-ton merchant ships. The *Mercy,* a typical hospital ship, carried 321 bunks for the sick, and it was possible to use space for 100 to 200 more by use of cots and Gosso beds. Every department found in a well-equipped hospital was provided and there were surgical, medical, genito-urinary, eye, ear, nose and throat, contagious and convalescent wards. Each department was presided over by a specialist with an assistant, regular or reserve force officers of the navy. There also were roentgenologists, laboratory men, dentists, 3 pharmacists, 8 pharmacists' mates and 3 trained male nurses. There was a library, and as recreation for convalescents, music was provided by a band and victrolas, and there were facilities for moving pictures. The ship was provided with 2 large ambulance motor boats, each accommodating about 16 stretchers.

Regulations provided that military hospital ships might not be captured while hostilities lasted, their names having been communicated to the belligerent powers before their use, but they might in no wise hamper the movements of the combatants. They were constructed or adapted specially and solely with the view to aiding the wounded, sick and shipwrecked. Each was painted white with a broad horizontal band of green.

The personnel of a hospital ship having 200 bed capacity consisted of 5 medical officers (1 lieutenant-colonel or major, 4 captains and lieutenants, 1 sergeant first-class, 4 sergeants, 5 acting cooks, 30 privates first-class, of whom 29 were nurses and 1 an orderly).

The Division of Roentgenology provided X-ray apparatus and trained specialists to cooperate with surgical units. The importance of the X-ray as the modern substitute for the probe was recognized and X-ray laboratories were established in hospitals in the United States and France. Mobile X-ray units also came into use. Each vehicle was a standard army ambulance with a few modifications, having complete X-ray equipment including a darkroom in which plates and films could be developed. It had its own power-plant distinct from the propelling engine of the vehicle. An X-ray ambulance in a road test traveled 900 miles to Hamilton, Ontario, for the meeting of the British Medical Association, averaging 24 miles an hour for the journey. About 50 such units were sent to France. The crew of each consisted of 1 officer and 3 enlisted men, all of whom had comfortable sleeping accommodations.

In the Air-Service Division, flight surgeons and physical directors were appointed, the corps being large enough to equip each training field and camp for fliers in the United States and in France, with a proper organization. The medical branch of the air service selected the fliers and looked after their care and condition, so as to reduce to the minimum accidents due to physical unfitness. The flight surgeon at a camp prescribed rest, recreation or temporary relief from duty. as the case required. He made sick calls on aviators, visited cases in hospitals and consulted attending physicians regarding these cases. Tests were conducted to determine effects of rarefied air upon aviators. The flight surgeon and the physical director, who is his assistant, lived in close touch with the fliers. The physical director supervised the recreation and physical training. For use in emergency at flying fields, there were ambulance air planes or flying ambulances — standard training planes with the rear cockpit cleared and enlarged sufficiently to permit of a combination stretcher seat to enable the injured man to be propped up and rest easily. These air ambulances were of value because of their speed, ability to reach places not readily accessible by automobile ambulance, and because they assured a gentle and comfortable journey. The flight surgeon and a skilled pilot went in the flying ambulance when emergency arose, the surgeon taking necessaries for first-aid and minor operations. Flight surgeons qualified as pilots whenever possible.

Army medical men used the results of chemists' research and modern invention to combat and overcome poison "mustard" gas and the various other scientific diabolical methods of warfare in which Germany set the pace. The Division on Gas Mask Defense (later placed under the Chemical Warfare Service,

a separate branch of the War Department) established schools in each camp, in which every officer and man was instructed in gas defense. A gas mask giving far greater protection than the German mask and at least equal to that used by any other army was devised and supplied to both the men and horses in the American forces. Special sections provided the masks, instructed in their use in daily drills and attended to repairs overseas. Soldiers were required to adjust masks in six seconds.

The Army Medical Museum and Library of the surgeon-general's office are important aids in the work of the Medical Department and instruction in military medical matters. The Museum, of which Col. William O. Owen was for many years the officer in charge, is operated for medical and scientific research and is a central clearing-house for pathological specimens. It contains the most remarkable collection of gunshot fractures in existence (from the Civil War), also laboratory workshops, art department, complete motion picture department. Pathological specimens from the front were assembled and exhibited here, and catalogued and co-ordinated with the corresponding clinical histories for investigation purposes. The library, which is really the National Medical Library, is a source of medical information to the Medical Corps and to the medical public in general. It is second only to that of the Paris Medical Faculty in number of volumes and is the most useful and valuable of all medical libraries in that it has the finest collection of medical periodicals in the world.

Here the *Military Surgeon*, the literary organ of the Medical Corps and of the Association of Military Surgeons, is edited and published. the surgeon-general passes on medical articles for publication by medical officers through the board of publications. Much valuable material bearing upon the Great War has already been issued with his sanction.

Records of health conditions, reports and statements of sick and wounded, and all manner of other data will be here available for the 'Medical and Surgical History of the War,' which is being compiled, to be published within five years after peace is declared. Medical and surgical material of value bearing on epidemics, group diseases or unusual surgical cases, were sent in by the base hospitals. The division after September, 1917, made tabular statements concerning the movement of preventable diseases, based upon periodic telegraphic reports made to the Division of Sanitation from the 31 separate cantonments. This compilation will be made a first installment of the history of the mobilization of the United States army.

The senior medical officer on the staff of the commander of a field army is a *chief surgeon;* the senior medical officer of the line of communication is a *surgeon*, base group; the surgeon in charge of the zone of the advance is a *division surgeon*, with the grade of colonel; of a brigade operating independently, *brigade surgeon;* of a detachment (regiment or small command), *the surgeon*. When guards from the line are detailed to sanitary formations and the commander of the guard is a commissioned officer, he confers with the medical commander as to the character of guard duty desired, but exercises no control over the sanitary formation. Guards may use their arms in self-defense or in defense of the sick and wounded. Field hospitals when not parked with divisional trains are ordinarily guarded by ambulance companies. All sanitary troops and armed detachments or sentinels detailed to guard sanitary formations, falling into the hands of the enemy do not become prisoners of war, but are disposed of under Article 12 of the Geneva Convention, 1906.

The mobility of an army is essential; therefore the Sanitary Service must operate efficiently, in such a manner as not to obstruct military operations, and with a minimum amount of transportation and personnel. In the Zone of the Advance the medical administration provides only emergency treatment and prompt transportation of the wounded to the rear, always with such disposition that men fit for duty are retained at the front and the fighting force relieved of the impediment incident to the presence of men incapacitated for duty. When battle impends, the resources of the Sanitary Service behind the Zone of the Advance are placed in readiness to meet the demands for the care and transportation of the wounded which may reasonably be expected, and personnel and supplies are advanced as near the seat of operations as practicable, reaching forward into the Zone of the Advance if conditions warrant it. The Sanitary Service of the Line of Communication (1) provides such facilities that the wounded may return to the front without delay; (2) furnishes prompt evacuation service so that the fighting forces will be promptly relieved of wounded and the Sanitary Service of the Zone of the Advance can keep in touch with their combatant organizations; (3) furnishes a system of supply to enable the sanitary troops in the Theatre of Operations to replenish equipment and supplies by direct method and without delay; and (4) maintains satisfactory sanitary conditions among the troops on the Line of Communication and, if necessary, takes charge of sanitation among the inhabitants of occupied territory.

The Ambulance Service supervises transportation of wounded from the first-aid stations to the base hospitals. On the march not in the immediate presence of the enemy an entire ambulance company may be placed with the advance guard. Ambulances of one or more companies may be distributed through the main body, an ambulance following each regiment or independent battalion; later, these join their companies. An ambulance company operates in two parts, with personnel at war strength as follows: (a) With the dressing station, including the litter bearers, with equipment on pack mules; four officers, one sergeant first-class, six sergeants, one acting cook, 40 privates first-class and privates — all of the Medical Department — and (b) with the wheeled transportation; one officer, one sergeant first-class, one sergeant, one acting cook, 28 privates first-class and privates (one as farrier, one as saddler, 20 musicians, 12 as ambulance drivers and 12 as ambulance orderlies) — all of the Medical Department; also, one sergeant (blacksmith) and three privates (drivers) of the Quartermaster Corps. Regulations provide that all ambulances, wagons, animals, hospital trains, ships and boats, with their personnel assigned to the Medical Department, shall not be diverted from the medical service. Supplies for the sick

and wounded are transported so far as possible by the medical superintendents of the Transport Service. For evacuation of the wounded to the rear, all transport available is pressed into service, including combat wagons, field train wagons, automobiles and other civilian transportation of all kinds.

While the organization of the Medical Department may logically be treated first with a general consideration of the various branches of the service and divisions of the surgeon-general's office, and with the successive steps taken in building the service from the interior to the battlefield, in considering the Theatre of Operations one must visualize the entire cone above the base, through the Line of Communication and Zone of the Advance to the very forefront of battle. And as casualties regularly pursue a course backward from the active front, consideration of medical activities in the Theatre of Operations may well be in this order.

The wounded man applies a dressing from his own first-aid or converts his belt or shoe lace into a tourniquet if able — or a comrade does it for him if he is incapacitated — when medical aid by a regimental medical orderly is not available. As the engagement develops, an Aid Station is established for each regiment as the number of wounded brought in by the field ambulance bearers warrant. (In many cases bandsmen are assigned to duty as stretcher bearers for first aid). The time and place for opening an aid station are determined by the organization commander, unless he has authorized the surgeon to use his discretion in the matter. In this case, the surgeon of each regiment, with the necessary equipment carried on a pack mule, establishes the station. The Aid Station is always in immediate touch with the combatant unit. The requirement that the sanitary personnel with combatant organizations keep in touch with those organizations may make it necessary for them to leave the wounded where they fall, pausing only to administer such aid as may be absolutely essential. In the case of mounted troops, the sanitary detachment accompanies troops during the whole course of the engagement, pausing only long enough to render first aid and to collect the wounded at a place where they can be turned over to an inhabitant to be cared for. Cases left behind will be collected and cared for by the dressing station party as it advances. In some cases dressing station and aid station are located together. Treatment at the Aid Station at which the wounded are originally assembled by the Sanitary Service is usually limited to first-aid and to readjustment of dressings, with sometimes an emergency operation. During and after an engagement diagnosis tags are attached to all wounded (and also the dead) as soon as practicable; they are made out in duplicate. At these stations the Sanitary Service with the troops connects with the service of the sanitary train. Men with trivial wounds are sent back to their commands when the wounds are dressed. Those slightly wounded but able to walk are directed to the station for slightly wounded, several miles in the rear, so that dressing stations and field hospitals may not be congested unnecessarily. If time has permitted the installation of a more elaborate system, the wounded may be taken by trolley from the trench first-aid station through a communicating trench to the Advance Dressing Station; otherwise they are taken on hand-stretcher or perambulator.

Each ambulance company establishes a dressing station (or field ambulance) in a protected location, usually some distance in the rear of the aid station (in trench warfare about 400 yards from the front trench) and an advanced surgical post adjacent, where urgent operations under bomb-proof are performed. The number and location of dressing stations are determined by the division surgeon, acting under instructions of the division commander, and the director of ambulance companies supervises their opening. At these dressing stations light nourishment is provided, dressings are examined and adjusted, splints applied, antitetanus serum injected, morphia tablet given if the man is suffering acutely, and an iodine cross marked on the forehead to show that this attention has been given. Patients requiring transportation are made as comfortable as possible until it is practicable to transport them by horse litter to the advanced surgical aid post, or by ambulance — possibly by motorcycle with two-story side car — to the field hospitals. The site for a dressing station should have the advantages of protection from rifle fire and from direct artillery fire, accessibility for wheeled transportation (motor transport if possible) and a supply of water. There are five departments: dispensary, kitchen, receiving and forwarding, slightly wounded, seriously wounded. As soon as a dressing station is opened, bearers proceed under the direction of a medical officer to the front as far as the enemy fire permits. Ordinarily they will be divided into as many sections as there are aid stations, and each section under a noncommissioned officer will proceed toward an aid station. These men direct wounded able to walk to the station for slightly wounded, and they transport other wounded from the aid station to the dressing station. As soon as the line of evacuation of the wounded is determined, ambulances are brought to the dressing station; they must arrive as early as possible, even at the risk of losses. Quickly loaded, they carry wounded from the dressing station to the nearest field hospital. The system may also include transportation by narrow-gauge railroad from the advanced surgical post to the field hospital, man-power push-carts being used.

If the wounded man arrives at the field hospital in good condition, he is not unloaded but is sent on to the evacuation hospital. The field hospitals generally have only a limited equipment, no beds or cots, but straw over which blankets are spread, and aim to provide shelter, nourishment and emergency treatment. The mobile hospitals coming into use are fully equipped. Field hospitals are placed one to three miles in the rear of dressing stations, and care for the sick and wounded of the division until the sanitary service of the line of communication takes charge of them. The stopping of hemorrhages, cleansing of wounds and such emergency operations as will permit the removal of the wounded to the rear are performed here. The field hospitals are in charge of a medical officer with the rank of major, designated as director of field hospitals. The field hospital personnel includes a major (commanding); five captains and lieutenants (one

of whom is an adjutant and quartermaster and four are ward surgeons); three sergeants first-class (one acting first sergeant in general supervision of the hospital and in charge of medical property and records; one in charge of transportation and quartermaster property and records; one in charge of mess supplies and cooking); six sergeants (one in charge of dispensary, one in charge of operating equipment, one in charge of patients' clothing and effects, three in charge of wards); three acting cooks; 55 privates first-class and privates (45 attendants, one dispensary assistant, one artificer, four orderlies, three supernumeraries), and of the Quartermaster Corps, one sergeant (wagonmaster) and seven privates (drivers).

The regimental camp infirmaries and the four ambulance companies are all in charge of one major, designated as director of ambulance companies. He makes frequent inspections, supervises the removal of wounded and directs the opening of dressing stations and advanced surgical posts. He is assisted by a sergeant and a private first-class or private, hospital corps, both mounted.

The evacuation hospital (casualty clearing station) has been styled the keystone of the military hospital system. It is the first sanitary unit in which provision is made to retain patients for any length of time, and it is in the evacuation hospital that the great mass of rapid war surgery is done. Evacuation hospitals are often located in pairs and occasionally with special hospitals for shock and head cases in connection. They are from 5 to 10 miles from the front, but as near up as possible and on good roads, often on railroads. But all their equipment is light and mobile, so that it can be quickly removed if the exigencies of the conflict require. They have facilities for X-raying, the location of the foreign body being indicated by an indelible cross on the patient's skin. Teams of expert young surgeons perform the operations in these units, and these surgeons get 90 per cent primary healings in war surgery. It is a rule that no war wound that is to pass out of the control of the operating surgeon before it is healed is to be closed primarily. If operation is deferred, wounds are thoroughly cleansed and packed with gauze soaked in Carrel solution, the entire area is wrapped in compresses, solidly bandaged, strapped or splinted, and the patient is ready to be shipped 100 miles. In some cases an evacuation hospital is pushed forward and takes charge of the patients in the location of the field hospital. In other cases vehicles from the advance section of the line of communication are sent forward to the field hospital to receive the patients, and in many cases the trucks going to the rear for supplies will transport the patients back to the refilling point, where they will be turned over to the vehicles sent forward from the advance section. The evacuation hospital is equipped with cots, blankets and comforts, but ordinarily it will be cleared of patients as early as practicable in order that it may be ready to receive others from the front.

Between the evacuation hospitals and the base group there are rest stations and Red Cross units comprising an intermediate group, the medical officer in charge being known as surgeon, intermediate group.

Patients usually are brought back by trains or boats to the base hospitals, where all possible comfort and facilities for their care are provided. The sick and wounded who will be able to return soon for duty will be retained in these hospitals rather than turned over to the service of the interior. These base hospitals are operated with methodical régime and have all facilities for substantial surgical work and to expedite convalescence. By far the greater proportion of the operations here are "civil surgery" as distinguished from "war surgery." The bed capacity in the rear of the zone of the advance is aimed to be adequate to care for 10 per cent of the total forces when troops take the field, with facilities for rapid expansion. One base or general hospital is established for each 500 beds to be provided. The base hospitals are centres of great medical activity. Often there are contagious disease hospitals in connection. Here are located medical supply depots, materials being accumulated here and sent forward as required. Here also are field laboratories and casual camps for sanitary troops. There are also Red Cross units. Sanitary inspectors having the rank of lieutenant-colonel, and who are assistants to the division surgeon, supervise the medical operations, with the surgeon, base group, in immediate charge.

FRANKLIN MARTIN, M.D.,
Chairman Committee on Medicine and Sanitation, Advisory Commission, Council of National Defense.

MEDICAL PEDAGOGY. The theory of education in its application to medicine still is mostly traditional, like many of the subjects it includes, for the pedagogy of the great number of medical schools has no steady, carefully arranged and planned-for, fought-for, curriculum based on personal and educational psychology and knowledge of the modes in which a young (or old) person learns. Both the method and the curriculum at present are largely traditional, like much of medicine in general.

The origin of this method has a certain amount of historic interest. As every one knows, a century ago and less the becoming "doctor" received all that he knew of medicine before approaching his victims from long and intimate attendance on one or more, usually one, more or less successful practitioners. It was the same condition as obtained and is still in use in the study of the law, only here the young man was more dependent on his "preceptor" than in the case of the "reader" and the old judge in his law office. The remnants of this old preceptor-system, as late as the year 1900, say, were to be seen in the medical schools even in New York City.

Some of the more ambitious and some also of the more lazy students joined a tutoring or "quiz" class in each of the important subjects of the curriculum; they were vigorously quizzed once or twice per week and enthusiastically "crammed" before the carefully calculated examinations. Some students took in small classes, as many as six or eight of these private courses, and the cost of each ranged from $5 to $25 for a year's quizzing. The preceptor, usually a college-bred, successful, wide-awake practitioner, was often young, always energetic, was called a "quiz-master," and, much admired by his students (to whom often he gave much personal and social care and help), he was at

least tolerated by the colleges, already aware that their course was in a sad lack of recitational reviews. Not infrequently the instructors held private quizzes.

When systematic laboratory work developed, largely in the richer medical schools, and recitations began to be systematically held, this preceptor-system — employing a practitioner to be guide, philosopher and friend, as well as tutor — gradually disappeared, except as still maintained in or about all institutions of learning in some form or other. In this pedagogic respect, then, the medical school tends continually to imitate more and more successfully the didactic methods of the university, which, of course, are ancient.

"The requirements for admission to and graduation from colleges holding membership in the Association of American Medical Colleges are 14 units of high school work and two years (60 semester hours) of college work.

The High School Requirement.

	Units
(A) Required, 7 units.	
Mathematics (minimum 2 years, maximum 3 years), algebra and plane geometry	2
English (minimum 2 years, maximum 4 years)	2
One foreign language (minimum 2 years, maximum 4 years)	2
History and civics	1
Total number of required units	7
(B) Elective, 7 units.	
To be selected from the following:	
English language and literature (in addition to the required work)	1 to 2
Foreign languages, additional, Latin, German, Italian, French, Spanish or Greek (not less than 1 year in any one)	1 to 4
Advanced mathematics, advanced algebra, solid geometry and trigonometry (½ year each)	1
Natural science, chemistry 1 year, physics 1 year, and biology, botany, physiology and zoology (½ to 1 year each)	½ to 2
Earth science, physical geography, geology and agriculture (½ year to 1 year each)	½ to 1
Astronomy (½ year)	½
Drawing (½ to 1 year)	½ to 1
History, ancient, medieval and modern, and English (1 year each)	1 to 3
Economics (½ year)	½
Manual training (1 year)	1
Bookkeeping (½ to 1 year)	½ to 1

One unit in any subject is the equivalent of work in that subject for four or five periods per week for a year of at least 36 weeks, periods to be not less than 45 minutes in length. One unit is equivalent to two semester credits or two points.

Premedical College Course.

SCHEDULE OF SUBJECTS OF THE TWO-YEAR PREMEDICAL COLLEGE COURSE.

Sixty Semester Hours* Required

	Semester Hours
Required Subjects:	
Chemistry (a)	12
Physics (b)	8
Biology (c)	8
English composition and literature (d)	6
Other nonscience subjects (e)	12
Subjects Strongly Urged:	
French or German (f)	6–12
Advanced botany or advanced zoology	3–6
Psychology	3–6
Advanced mathematics, including algebra and trigonometry	3–6
Additional courses in chemistry	3–6
Other Suggested Electives:	
English (additional), economics, history, sociology, political science, logic, mathematics, Latin, Greek, drawing.	

* A semester hour is the credit value of sixteen weeks' work consisting of one lecture or recitation period per week, each period to be not less than 50 minutes net, at least two hours of laboratory work to be considered as the equivalent of one lecture or recitation period.

Medical Curriculum.

DIVISION 1.— ANATOMY, 720 HOURS (18 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) Gross anatomy (including applied anatomy)	510	120	390
(b) Histologic and microscopic anatomy	135	30	105
(c) Embryology	75	30	45

DIVISION 2.— PHYSIOLOGY AND CHEMISTRY, 600 HOURS (15 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) Inorganic chemistry	180	60	120
(b) Organic chemistry	75	30	45
(c) Physiologic chemistry	104	30	75
(d) Physiology	240	140	100

DIVISION 3.— PATHOLOGY, BACTERIOLOGY AND HYGIENE, 450 HOURS (11.25 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) Bacteriology	135	30	105
(b) Hygiene and general dietetics	45	45	
(c) Pathology	270	60	210

DIVISION 4.— PHARMACOLOGY, MATERIA MEDICA AND THERAPEUTICS, 240 HOURS (6 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) Pharmacology	105	40	65
(b) Materia medica and pharmacology	80	..	..
(c) Therapeutics	55	..	..

DIVISION 5.— MEDICINE AND MEDICAL SPECIALTIES, 970 HOURS (24.25 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) General medicine (including clinical microscopy)	640	..	..
(b) Pediatrics	150	..	..
(c) Nervous and mental diseases	105	..	..
(d) Jurisprudence, ethics and economics	30	..	..
(e) Dermatology and syphilis	45	..	..

DIVISION 6.— SURGERY AND SURGICAL SPECIALTIES, 720 HOURS (18 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) General surgery	510	..	..
(b) Orthopedic surgery	45	..	..
(c) Genito-urinary diseases	45	..	..
(d) Eye	60	..	..
(e) Ear, nose and throat	60	..	..

DIVISION 7.— OBSTETRICS AND GYNECOLOGY, 300 HOURS (7.5 PER CENT).

	Hours	Lect. Rec. Dem.	Lab. Wk.
(a) Obstetrics	195	..	..
(b) Gynecology (including some abdominal surgery)	105	..	..

Colleges may reduce the number of hours in any subject not more than 20 per cent, provided that the total number of hours in a division is not reduced. Where the teaching conditions in a college are best subserved, the subject may be, for teaching purposes, transferred from one division to another. When didactic and laboratory hours are specified in any subject, laboratory hours may be substituted for didactic hours.

NOTE.—At the 1916 meeting the Committee on Education and Pedagogics was instructed to revise this curriculum to meet the present requirements.

Women in Medicine.— During the past year there were 581 women studying medicine, or 29 less than last year, but 15 more than in 1916. The percentage of women to all medical students is 4.3, a percentage approximating those of previous years. This is true also in regard to women graduates. There were 106 women graduates this year, 47 less than last year and 28 less than in 1916. Of all the women matriculants, a smaller percentage were in attendance at the two medical colleges for women, while 511 (87.9 per cent) were matriculated in the sixty coeducational colleges. From the two women's colleges there were 12 graduates while 94 secured their degrees from coeducational colleges. This increase of women students in coeducational colleges is not surprising, since in recent years some of the largest and oldest medical schools, as Columbia, Tulane, the University of Pennsylvania and Harvard (and McGill University in Canada), have thrown open their doors to women." (*Journal American Medical Association*, Vol. 7, No. 7, 17 Aug. 1918).

but they seldom have any knowledge worth while concerning educational theory. An assistant or teaching fellow in almost any university department of education would be of more use in a really conscientious medical school than the wealthiest and most dignified of these committees.

The principles of pedagogic fatigue, of overwork, and of under-recreation are ignored in most medical schools, with a consequent great waste of mental energy. As has already been hinted, the medical student needs normal recreation as much as any other student, if not more. A course in the economics of learning should be given in the first semester of every medical freshman year.

This suggests medical psychology in general. The everyday psychology of the emotions, for example, especially in relation to the functions of the body and its growth, should be studied and even understood by every medical man while yet a student. The present writer happens to be one of the early ones to say this, namely in *Science* in July 1901. Medical psychology was offered year after year, the Tufts College 1901–02 catalogue-announcement of this pioneer course being as follows: "*Normal medical psychology* — An optional course in normal medical psychology will be given to the fourth-year class in weekly lectures during the first half-year. Its aim is to discuss in their more general relations certain topics of great practical importance to the medical practitioner: such topics for example as suggestability and hypnosis, temperament, mood, the numerous habits, sexual mental differences, will-power, the emotions, pain and pleasure. Knowledge of subjects such as these prepares the student better to understand his patient as an individual and so better to treat his disease. But, in addition to this, the chief value perhaps of such information, the lectures will afford a brief basis of general psychology, which will tend to make the mental phenomena of the diseases of the mind and nervous system more easily understood" (Professor Dearborn).

It is distinctly disclaimed that in the following remarks there is any intention of finding "fault" with the present and bettering methods of medical education. This mode of discussion is the most convenient one, that is all, for pointing out the present pedagogic status of "studyin' to be a doctor." It would be invidious to find fault with so good a system without offering something to replace it; ideally to destroy without immediately afterward reconstructing the plan in a better form; and it may frankly be said that no such reconstruction is contemplated in this little article, or even hinted at.

Many medical schools need, and as much as anything else at all, except it be finances, an adequate survey by some wise and practical professional educator — one who would point out, for example, some of the inconsistencies and the lack of co-ordination between the different courses. "Visiting" committees frequently try to demonstrate to chance readers of their reports their own personal importance,

herent materialism of the medical schools has begun to soften, without a doubt, and to-day some of the very best medical colleges realize practically that education, any kind of education, that has ignored the study of mind and motive and behavior is incomplete and false in quite the most fundamental kind of way. This common lack of adequate psychology, however, seems still to be the chief pedagogical defect of medical education — man is both mind and body.

Whatever just criticism may be made of American medical education, it still remains the best in the world, its monetary wealth having put it practically ahead even of the famous old schools of England.

GEORGE VAN NESS DEARBORN, M.D.,
Medical Corps, United States Army.

MEDICAL SCIENCE AND THE WORLD WAR. Army medical departments everywhere had, before the war, prepared for the treatment of surgically clean wounds made by modern fire-arms in distance engagements. The soldiers "First Aid" kit, with its sterilized dressings sealed from contamination, was expected to maintain this freedom of wounds from infection almost without exception. Aseptic wounds assure prompt and uncomplicated recovery. Serious injuries of important organs would still often be fatal, but all others, as a rule, would be followed by convalescence without delay or complication. These anticipations were sadly disappointed by the immediate recourse to trench warfare as almost the sole mode of conflict. In trenches recently dug in fields which had been under cultivation for hundreds of years, bacteria abounded and infections inevitably occurred. Two extremely fatal forms of infection, tetanus and gas gangrene, raged among the troops. Both of these were often fatal and the gas bacillus caused long illness and often extensive mutilation, even when recovery took place. Tetanus, after the early sad war experience, was prevented by injections of anti-tetanus serum as soon as the wounded came under observation, the injections being repeated at regular intervals if convalescence from the wound was prolonged, for it was found that delayed infections occurred. The gas bacillus proved a much more difficult problem because of the utter unfamiliarity with it at first. It was unknown in Great Britain before the war, was not seen during our Civil War, and is very rare in civil life. Some 70 per cent of the wounds received in the trenches during the first year of the war were infected by it. It was never noted in wounds of the face or neck where the blood supply is abundant and the tissues well oxygenated, for the bacillus of it, discovered by Welch at Johns Hopkins, like the tetanus bacillus, is anerobic, that is, grows best out of the presence of the air. The successful methods of treatment included thorough opening up of wounds, the use of hydrogen peroxide, so as to provide additional oxygen for the tissues, and after careful investigation, the use of serums for curative and prophylactic purposes, elaborated by various agencies.

The large number of badly infected wounds to come under treatment proved very discouraging to the surgeons at first and iodine was found so valuable that it was used in large quantities until it was suggested that this would be known in medical history as "the Iodine War." The noteworthy difference between the healing of the wounds of soldiers and sailors led to an important development in the treatment of large shell wounds and penetrating wounds of various kinds in which foreign particles were carried deeply into the tissues. Soldiers thus wounded in the trenches suffered almost invariably from septic developments, often fatal and always with a protracted convalescence. Months after a bad shell wound, a soldier, if he recovered, would only be past the border line of danger, while sailors with similar wounds would usually be entirely well at the end of a month. The sailors had often been subjected to exposure to cold sea water, sometimes for an hour or more after the reception of their wounds. The influence of salt water as an application to the surfaces of large wounds was studied and it was found that when of about the specific gravity of sea water, it caused a pouring out of serum and a consequent cleansing of the wound by the discharges. Besides, the blood serum was distinctly bactericidal and the outward current set up carried off septic materials which would have been serious if allowed to remain. Mainly through the observations of Sir Almroth Wright, salt water was used extensively as a dressing for wounds, with some excellent results, and the principle is evidently to be of service after the war.

The important development in the treatment of wounds came when Dr. Alexis Carrel of the Rockefeller Institute was put in charge of a French hospital in Compiègne during the second year of the war. He set about the practical application of Lister's principles. Ordinary surgical antiseptics were too poisonous to be used for the flushing out of large wounds. A solution of hypochlorites proved to be bactericidal, yet non-toxic and non-corrosive to tissues. After experiment, Dakin's fluid, so called from the inventor of it who had been the director of the Herter Chemical Institute, New York, was found the most efficient solution of the hypochlorites. The important part of this treatment was the bacteriological control. After removal of all foreign particles and all injured tissues, wounds were thoroughly flushed with Dakin's fluid many times a day, until it was found by careful microscopic examination that the secretions contained very few bacteria and none to be feared. The wound was then closed up and permitted to heal without further interference. The results were excellent. Healing took place rapidly as a rule, convalescence was brief and absorption of septic material so as to produce constitutional disturbance rare and without danger. The after result was better than that produced by any other method and the hospitals where it was employed took on a new aspect from that which had been seen in the war hospitals before.

The most important development of the surgical treatment of war wounds has been what is called by the French *débridement*, that is the thorough excision of all injured portions of tissue. The extent to which this clearing out of the wound was carried in war practice would have seemed utterly unjustified in civil surgery before the war. Where a penetrating bullet wound shows signs of infection, a cylindrical

portion of the tissue around it is removed. In larger shell wounds, a layer of injured tissue is, as far as possible, removed from every portion of the wound so as to present perfectly fresh vital surfaces for healing purposes. Large amounts of tissue are thus often removed, for experience has shown that it is in the end ever so much better for the patient. Any injured cells allowed to remain are of low resistive vitality, have a tendency to die and then break down into material which forms an excellent culture medium for microbes. Where drainage is instituted, most of this will come away, but that is a much slower process and much more exhausting to the patient, and lowers the healing qualities of the part. It has been found by actual bacteriological observations that while very few bacteria are present shortly after the wound is infected, these multiply rapidly in the brood chamber created for them in the tissues, on the good medium for growth, while the healthy cells are handicapped by the presence of injured cells in their struggle against bacteria.

The war's experience with head injuries has developed a mode of treatment quite different from that in common use before. The surprise for military surgeons has been the wonderful tolerance of the brain to injuries. It was not an unusual thing to have wounded soldiers come into dressing stations as «walking cases,» who were suffering from fracture of the skull, even complicated by other injuries. The best surgery for these cases has proved the greatest possible limitation of intervention. Depressed bone fractures must, of course, be lifted, but missiles should not be searched for. There is least danger for the patient when the missile is left *in situ*, unless symptoms directly traceable to its presence develop. As a rule, antiseptic rather than aseptic precautions are most valuable in saving lives in these cases. The experience of four years seems to indicate that the after effects of the retention of foreign bodies within the skull does not justify manipulations in reaching them.

The use of poison gas has given rise to the most unsatisfactory medical feature of the war. In spite of the German signature to The Hague Convention article condemning the use of gas, the Germans proceeded to employ this mode of attack and found the Allies and the medical departments unprepared for it. At first heavy gases containing mainly bromine were used, favoring winds carrying them. Later gas hand grenades were employed. These gases had an intensely irritant effect and produced suffocation or were followed by severe purulent bronchitis. Pulmonary edema often proved fatal. Gas masks overcame this mode of attack. Then long range gas shells were employed, sometimes with delayed action, so as to lull against precautions. At times, shells containing «sneezing» or «vomiting» gases were used for the displacement of masks. In the last phase of the war, «mustard gas,» said to be chemically dichlorethylsulphide, was employed. It was persistent and would hang about for hours and make dugouts perilous for days. It burned the skin, and clothes moistened with it produced escharotic effects. Many of the most important German advances were made by means of these gases as a preliminary. The Allies learned to neutralize and reply effectively to all of them.

When the gas was not concentrated enough to produce suffocation or set up fatal pulmonary edema, the men usually recovered, though many of them went through a period of awful discomfort which was, of course, the reason why the use of gas was forbidden at The Hague. Comparatively few of those who survived presented serious lung lesions, though they had to be treated by the open air method, as for tuberculosis, as much as possible. We have learned from tuberculosis how tolerant the lungs are of even severe pathological conditions and how readily, after a time, compensation is secured. The question whether gasing predisposes to tuberculosis has been settled in the negative, though undoubtedly in certain cases latent foci of tuberculosis were made active by the process.

Comparative mortalities from wounds and disease in modern war show what a great gain was made by surgery and sanitary science in the war. In the Russian campaign against Turkey in 1828, some 80,000 died of disease and about 20,000 of wounds. In General Scott's campaign in Mexico the deaths from disease were over 33 per cent of the effective strength. In the Crimean War, out of a total force of 300,900, the French lost by disease 75,000 and by wounds 20,000. In the Prussian war against Austria, of but seven week's duration, the losses by disease were 6,427 and by wounds 4,450 in an army of 437,000. In the Spanish-American War 2,565 deaths were from disease and 345 deaths from wounds, in an army of 274,717. In the South African War the deaths from disease were 69 per thousand strength; from wounds, 42 per thousand. In the Russo-Japanese War the deaths from disease were 41.8 per thousand strength and from wounds 72.9 per thousand strength, the ratio for the first time reversed. Out of 300,000 dead in the Civil War, in the armies of the North over 200,000 were from disease. In the Confederate armies, of 200,000 deaths, three-fourths were estimated as due to disease and one-fourth to the casualties. (Figures furnished by the United States Surgeon-General's Office).

According to the 'Medical and Surgical History of the Rebellion' (Medical volume, part 1, pages xxv and xxvi), there were in the Northern armies altogether 235,583 gunshot wounds with a resulting mortality of 33,653 or 14.2 per cent. These figures represent the total returns from about nine-tenths of the mean strength of the Union army and exclusive of the injuries of those killed in action. In the late war, so far as the figures are available from the beginning, the deaths from wounds, that is of all those who came to the surgeons alive, no matter how badly wounded, have been calculated to be less than 5 per cent. This is, of course, merely an approximation but made on reasonable grounds. Exact figures will not be available probably for some time. The serious infections with tetanus and the gas bacillus at the beginning of the war make the available statistics much worse than would otherwise be the case. With the control of these the mortality among the wounded in the closing phase of the war was probably below 3 per cent.

The health of army camps at the beginning of the war was most satisfactory. As Doc-

tors Vaughan and Palmer said in their article on "Communicable Diseases in the National Guard and National Army of the United States" (*Journal of Laboratory and Clinical Medicine,* August 1918), "Preventive medicine has made it possible to prevent half a million cases of disease and save the lives of ten thousand soldiers," and they give the figures from the Civil War and the recent war for corresponding six months to show the truth of this. The improvement has affected every form of infectious disease. There has been only about one-tenth as much mouth and throat inflammation, less than one twenty-fifth as much intestinal trouble, not one-hundredth as much fever. Malaria, which even in the Northern army was extremely common, has now become a negligible morbidity factor and the mortality from tuberculosis and pneumonia is more than cut in two.

The sad epidemic of influenza proved that it was not the general hygienic conditions that brought improvement but the specific sanitary precautions against particular diseases. Unprepared for influenza in this virulent form, it raged very seriously, while the well-known camp diseases were kept entirely under control.

Typhoid or enteric fever which has played such a fatal part in all previous wars, carrying off in the Spanish-American War more than five times as many as the bullets of the enemy and in the Boer War causing ever so much more havoc among the British than the Boers did, has had almost no place in this war. The reason was better sanitation and careful provision of uncontaminated water with the guarding of latrines from flies and other insects that might find their way afterward to food, but above all, the typhoid immunity of the armies was due to typhoid vaccination, that is the inoculation of the soldiers with cultures of typhoid germs prepared under conditions that produced immunizing results. There is no doubt at all that this is the genuine source of the great saving of life that has been effected. The inoculations cause almost no disturbance of the general health,—soldiers have gone into battle the same day,—and only rarely have any serious effect. It is evident that in civil life travelers in distant countries or to parts of the country of whose sanitation they are not sure, will take such vaccinations against typhoid as a protective.

Trench fever was an affection peculiar to this war and replacing typhoid fever somewhat in its ravages among the soldiers. The men came down rather suddenly with a considerable degree of temperature lasting for from three to seven days, gradually disappearing and causing a great deal of prostration. After some days of normal or sub-normal temperature, the fever occurs again and the relapsing character of the affection has been quite marked. Careful investigation has shown that the disease is distributed through the body lice which have proved such a pest to the soldiers under the very difficult conditions as regards cleanliness to which they have been subjected. The discovery has made possible the prevention of the spread of the disease to a great extent, while the segregation of the relapsing and chronic cases in camps by themselves under favorable conditions of health has brought about such a reaction as has enabled the patients to throw off the disease. The study of trench fever, its etiology and its successful treatment as well as prevention, has been one of the triumphs of the war.

The great medical surprise of the war was the development of a large number of cases of a very severe form of functional nervous disease. Men lost control of themselves completely, very often had disturbances of the special senses,—deafness was rather common, blindness not so frequent,—and sensory disturbances of other kinds, with mutism and tremor or paralyses of various kinds, were noted. At first a great many of the cases were set down as forms of insanity and the patients were sent to insane asylums, but after careful study the purely neurotic character of the affection was determined. The cases were called "shell shock" and unfortunately, early in the war were grouped under this term, besides the neurotic cases, a number of latent injuries to the central nervous system, as from actual wounds by minute particles of shells at high velocity, severe concussions and the like. It was thought for a time that the intense compression of the air with immediate release near an exploding shell caused air at high pressure to be given off from the blood, leading to rupture of capillary arteries of the central system or other definite physical lesions resembling those of caisson disease. The prompt and complete recovery of many serious cases under proper treatment contradicted this theory and made it clear that there must be no organic basis. The term shell shock was suggestive of something much more than a psycho-neurosis, which the affection really was, and the term *nervousness,* the word sick or wounded in parentheses being added to the diagnosis "according to the external conditions to which the man was exposed at the time of breakdown," was suggested for it. This would have been a much better term but the original name maintained itself, as so often happens. The condition was entirely due to an emotional storm with loss of control over nerves, and nothing else. Its importance will be readily appreciated from the fact that during the first half of the war, one-seventh of all the discharges from the British army, or one-third of the discharges if those from wounds were not included, were for "shell shock." It was four times as prevalent among officers as among men. Cowardice was excluded as the basis and there was no malingering, except in cases readily recognizable. The study of the affection has thrown great light on the psycho-neuroses of civil life and above all has been valuable in the matter of treatment.

These patients need special treatment in special hospitals. In ordinary military hospitals, surrounded by sufferers from actual physical conditions, they are the subject of unfavorable suggestion and little incentive to get well. They must not be kept under circumstances, either at home or in hospital, where much sympathy is afforded them and their stories must not be listened to sympathetically, for they have the tendency of all neurotics to assimilate as their own, experiences gleaned from various sources. The first requisite of successful treatment is a careful examination which determines absolutely that no organic morbid condition is present. Then the patient must be given the feeling that his case is of no special signifi-

cance, but, on the contrary, is well understood and above all, has nothing exceptional in it. He must be made to understand that just as soon as the attending physician has the time to give to him, he will be able to remove his symptoms without delay. Three principles are insisted on in the methods of treatment. (1) suggestion, (2) re-education, (3) discipline. The aim of suggestion is to make the patient believe firmly that he will be cured and then after treatment that he is cured to stay so. Re-education overcomes the bad habit of lack of confidence that has been formed and discipline breaks down the psychic-resistance of the patient to the idea of recovery. For such symptoms as mutism or deafness, the patient is told that electricity will cure him and that as soon as he feels the current when the electrode is applied, his power of speech or hearing will be restored *pari passu*, with sensation. The same method is used for blindness and other sensory symptoms. Paralyses are favorably affected the same way, though tremors are harder to deal with. A cure in a single treatment is the best method, for the patient readily relapses unless he has been made to feel that he has recovered his powers completely and that it would be his own fault to permit his symptoms to recur. The cases partake of the nature of hysteria, though typical hysterical symptoms, crying, the making of curious noises, hysterical convulsions, are rarely seen at the front. The experience has made it clear that rest is nearly always an abuse in the treatment of such cases and inveterates the symptoms. The physical condition must be improved but the state of mind must be changed completely at once, if cure is to be effected.

A very interesting development of the treatment of these affections among the French, who had large experience, requiring over 20,000 places in their hospitals for the cases, was with regard to the value of severe discipline. In refractory cases, patients were put in solitary confinement without reading or writing materials or tobacco. This changed the mental attitude and helped to make counter-suggestion effective. In certain cases, strong Faradic currents were used which caused severe pain, so that patients who were mute had to scream out and those who could not use muscles were compelled to move them. Once it became known that treatment of this kind was being used, symptoms were much less persistent. The reason why the neuroses in officers were more difficult of treatment was that these measures were seldom employed on them. It became clear that the infliction of pain on a neurotic patient up to the point where he yields up his pathological suggestion is effective therapeutics. Some older severe methods of dealing with these cases which were condemned in our milder day are now justified by war discipline.

The surgical feature for which this war will be noted is the definite reconstruction work for the wounded which has been organized for the first time in history. Not only have artificial limbs and helpful apparatus of various kinds been provided, but the crippled have also been trained to do the work they are particularly suited for in their maimed condition. It has been found that some 95 per cent of those who lose an arm or hand can go back to their old occupations, while a very large proportion of those who have lost a leg can be trained to bench trades or given clerical or similar occupations which will make them thoroughly independent of assistance. Even with the loss of both legs, a man can be self-supporting. Indeed, the care exercised in training the crippled has resulted in a great many cases in giving them a better occupation in life than they had before. The temper of this aid has been such as to give men a hearty spirit of courage in facing life, so that they do not feel their handicap as an incubus, but on the contrary, are ready to do their bit in civil life as well as they did in war. The idea that they are crippled is not allowed to overcome them and the old custom of having begging cripples after the war is not to be allowed. Even the blind and the deaf are made self-supporting and at the same time given such occupation of mind as keeps them from being depressed. The effect of example on the part of some of the more courageous has proved a wonderful stimulus, so that though the war is to leave many maimed men, it is not going to create many helpless and the spirit of helpfulness does not provide useless sympathy and paralyzing charity, but just such encouragement as enables the men to help themselves.

Chronic affections of various kinds which have developed as a consequence of the war are being treated by the same far-seeing after-treatment that is given to the maimed. In a word, the soldier taken in health is either dismissed, after thorough examination, in as good health as before,—or usually much better,—or else he is given the advantage of scientific thoughtfulness and pre-vision in regard to his case, so as to restore him just as far as possible to his former usefulness as a member of the community.

JAMES J. WALSH, M.D.,
Author of 'The Thirteenth Greatest of Centuries.'

MEDICI, mĕd'ę-chē or mā'dē-chē, a Florentine family who rose to wealth through commerce, became prominent in the affairs of the state, gained supreme power and were in general known as patrons of literature and art. GIOVANNI (1360–1429) rendered important service to Florence and became gonfalonier in 1421. His son, COSMO, the Elder (1389–1464), was called "Pater Patriæ," gained vast wealth, was a munificent patron of art and letters and combined statecraft with commercial enterprise. He was for 34 years the sole arbitrator of the republic and the adviser of the sovereign houses

of Italy. His grandson, LORENZO THE MAGNIFICENT (1449–92) governed the state in conjunction with his brother GIULIANO (1453–78) till the latter was assassinated by the Pazzi, a rival Florentine family. Escaping from this massacre he conducted a war with Ferdinand of Naples, with whom he signed a definitive peace in 1480. The rest of Lorenzo's reign was passed in peace and in those acts of profuse liberality and magnificent patronage of arts and sciences, in which he rivaled or excelled his grandfather. He left three sons — PIETRO (1471–1503), GIOVANNI (afterward Pope Leo X), and GIULIANO, Duke of Nemours. Pietro succeeded his father, but was deprived of his estates when the French invaded Italy in 1494. He finished his career in the service of France. His eldest son Lorenzo came to power by the abdication of his uncle Giuliano, who became Duke of Urbino. He died in 1519, leaving a daughter, the famous Catharine de' Medici (q.v.), queen of France. After several reverses in the family, Alessandro, an illegitimate son of the last-named Lorenzo, was restored to Florence by the troops of Charles V, and by an imperial decree was declared head of the republic, and afterward Duke of Florence. The next name of importance in the family is that of COSMO "the Great" (1519–74), in 1537 proclaimed Duke of Florence and afterward Grand Duke of Tuscany. A learned man himself, he was a great patron of learning and art, a collector of paintings and antiquities. FRANCISCO MARIA I, his son, obtained from the Emperor Maximilian II, whose daughter Joanna he had married, the confirmation of his title of grand duke in 1575, which continued in his family until it became extinct in 1737 on the death of Giovanni Gasto, who was succeeded by Francis, Duke of Lorraine. MARIE DE MÉDICIS (q.v.) (1573–1642), queen of France, was daughter of Francisco I. See FLORENCE; ITALY — HISTORY; LEO X, and consult Armstrong, Edward, 'Lorenzo de' Medici' (London 1896); 'Cambridge Modern History' (Vols. I and II, New York 1903–04); Fabroni, Angelo, 'Magni Cosmi Medicei Vita' (Pisa 1789); Heyck, Eduard, 'Die Mediceer' (Bielefeld 1897); Hyett, F. A., 'Florence' (London 1903); Horsburgh, E. L. S., 'Lorenzo the Magnificent' (London 1908); Meltzing, Otto, 'Das Bankhaus der Medici und seine Vorläufer' (Jena 1906); Roscoe, W., 'Life of Leo X' (5th ed., London 1846); id., 'Life of Lorenzo de' Medici' (10th ed., 1872); Ross, Janet, 'Lives of the Early Medici' (London 1910); Vaughan, H. M., 'Medici Popes, Leo X and Clement VII' (New York 1908).

MEDICI, Banks of the. The opulent house of Medici owed its origin, like that of the scarcely less wealthy house of Fuggers (q.v.), to the profits of the woolens trade, the progenitors of both houses having been weavers and dyers of woolen cloths, in their time the principal constituent of European garments; the cultivation of cotton and manufacture of cotton cloths being as yet monopolized by the Saracens. Schoenhof informs us that in 1422 Florence (under the Medici) had more than 70 banks, which by the year 1472 were merged or consolidated into 33. So important were these institutions to the Florentine republic, that they earned the sobriquet of the "Fifth Estate." The Medici had 16 banking houses in different European cities. (*Journal American Bankers Association*, September 1916). In the 15th century one of the Medicis was appointed treasurer to the Papal See; in the 16th century one of the Fuggers held the same high office. It is an interesting circumstance that the former became a Platonist, while the latter joined the Reformation. Lorenzo de Medici's appointment as treasurer was made by Sixtus IV in 1471; Huldric Fugger's, by Paul III about 1549. Both of these popes afterward assailed their appointees; but the banks they controlled and the important trades they financed rendered them too powerful to be easily overthrown. The Medicean banks received deposits of money for safekeeping, loaned the same out upon collateral, discounted commercial paper, issued bills of exchange, and traded in foreign coins and bullion. They possessed mints in Florence, Urbino, Barile, Pezza and other places, in which they struck their own coins, the series beginning in 1204, upon the fall of the Greek Empire, the dates in the old calendar being 10 years earlier. These coinages enabled the Medicean banks to make highly profitable exchanges of old coins and bullion at the various emporia in Europe and Asia which were brought within the circle of their commercial influence. Their earliest gold coin (the Florin) was struck in 1252, the series being issued by the gonfalionere (Standard-bearers) of the Republic of Florence until 1533, when they were struck by the Medici as dukes of Florence, afterward as dukes of Etruria. Maintained at their full legal weight (56 English grains, fine gold) the florins continued to be current in all the ports of Europe for centuries, their only rivals being the sequins or ducats of Venice. For the history of other ancient banks. See BARCELONA, BANK OF; BYZANTIUM, BANK OF; FUGGERS, BANK OF THE; GENOA, BANK OF; TYRE, BANK OF; VENICE, BANK OF.

MEDICINE, American Academy of. See AMERICAN ACADEMY OF MEDICINE.

MEDICINE, Eclectic, embodies the principles and practice of the only established American school of medicine. The term Eclectic was not the most fortunate, for at no time has it adequately defined the school's position. When chosen, the term was very popular and was borne by several education systems and books, and was moreover well known to the laity. The name American School of Medicine, as proposed by Dr. A. H. Baldridge, one of its pioneers, would have been more expressive, would have avoided misunderstandings and would have saved the school much criticism regarding its position among the existing systems of medicine. Eclecticism is the direct successor of the American Reformed System of Medicine originated by Dr. Wooster Beach of New York City in 1825. It should not be confounded with Thomsonism (Thomsonianism), or the doctrines of the steam and herb doctors, promulgated and practised in the early part of the 19th century by Samuel Thomson of New Hampshire, the peculiar theories of which the Eclectic school never adopted; the majority of the followers of Thomson being among their most bitter antagonists. In later years, however, many of the Thomsonians joined the Eclectic school and creditably assisted in up-

building it. The most successful organizer of the Eclectic school was Dr. Thomas Vaughan Morrow of Kentucky. The investigations in medical botany and materia medica by Schoepf, Benjamin Smith Barton, W. C. P. Barton, Constantine Rafinesque, William Tully and others gave an impetus to the movement which resulted in the establishment of the new school. The Reformed School of Medicine, by which name what was later denominated Eclecticism was first known, was organized in opposition to the drastic practice of the dominant school of medicine,— bleeding, blistering, and the abuse of the salts of mercury and antimony,— against which Eclectics, as well as the followers of Thomson and Hahnemann, protested. Instead of these barbarous remedies the reformer sought to substitute milder measures and to employ vegetable medicines whenever possible. Yet, in the light of the present the substituted practice of the early reformers would be regarded as but little less barbaric than that which they sought to supplant. The basis of Eclectic philosophy was the sustenance of the vital forces, the avoidance of depleting remedies, and the selection, as with the ancient Eclectics, of the best of remedies and means from all sources, even despising not the primitive medicines of the untutored American Indians. They did not rest contented, however, with merely "selecting the best"; they endeavored to improve on such selections. To the reformer the practice of the dominant school was cruel and inhuman, the remedies barbaric. Out of the common stock of remedies he chose those best suited to his purpose in what he believed to be a more humane practice. He looked forward to certain ideals and objects not in accord with the views and practice of the dominant school. For his presumption in thus opposing the authorities in medicine and by inaugurating unwelcome innovations he was branded an irregular; was ostracised by the self-styled regular physicians. An outcast, he was thus forced to organize a school in accord with his theories and practice.

There are three epochs in the history of Eclectic medicine,— the period of reformed medicine, from 1825 to 1845; the formative period, from 1845 to 1869, which was largely concerned in organization, and study of plant remedies; and the period of specific medication, from 1869 to the present, in which the best work of the school has been accomplished, and during which the theory of specific medication was promulgated and has been most largely practised.

The educational history of Eclecticism dates from 1825, when Dr. Beach privately instructed students at his clinic in New York, where, in 1827, he established an Infirmary, which in 1829, he expanded into the Reformed Medical Academy. In 1830 it assumed the more dignified title of the Reformed Medical College of the City of New York. It was well equipped and continued in operation until about 1838. Textbooks of a high order were prepared by Dr. Beach. A national society was formed and from this body an expansion movement was begun by the selection, in 1830, of Dr. John J. Steele as an agent to proceed westward and explore the towns on the Ohio River with a view to selecting an eligible site for a branch of the New York College. A circular of the society having reached Worthington, Ohio, Col. James Kilbourne, president of Worthington College, invited the promoters to establish their school in that town. Dr. Steele accepted and Drs. Thomas Vaughan Morrow and Ichabod Gibson Jones were sent to perfect the organization. The Reformed Medical Department of Worthington College, as this school was called, entered upon a successful career in 1830, with Dr. Morrow as the leading spirit, but lack of proper facilities, the machinations of enemies, internal dissensions, and the financial crisis of 1837 caused it to be suspended in 1842. Dr. Morrow next removed to Cincinnati, Ohio, and assisted by Drs. Lorenzo Elbridge Jones and Alexander Holmes Baldridge, at once organized the Reformed Medical School of Cincinnati. In 1845 this college was chartered by the State of Ohio as the Eclectic Medical Institute. From this time the term *Eclectic* has been employed to designate the system and its physicians.

The formative period of Eclecticism began with the chartering of the Eclectic Medical Institute in 1845 and ended with the introduction of specific medication in 1869. During this period large classes attended the Institute. *The Western Medical Reformer*, begun in Worthington in 1836 and suspended in 1838, was now revived and published as the *Eclectic Medical Journal*. Barring a brief half year suspension this periodical has continued to be published to the present time. In this period, Dr. John King, justly styled the father of modern materia medica, began the publication of his numerous textbooks, among which the 'American Dispensatory' gave the school an enduring and monumental work on materia medica. The pharmacy of the school advanced from crude drugs in powder, infusion and decoction past the resinoid and alkaloid distraction to improved galenicals. In this connection be it recorded that Professor King discovered and introduced the resins of podophyllum and macrotys, which together with the alkaloids of hydrastis and sanguinaria, were afterward prepared by Dr. William Stanley Merrell. These valuable agents together with the oleoresins of iris and capsicum attracted the attention of pharmacists. A host of indefinite compounds was added by others and the market was flooded with what purported to be Eclectic resinoids or concentrations. This heterogeneous class of pharmacals was denounced by Professor King and others who had sought to introduce only elegant and definite compounds. This much abused class of resinoids served, however, a temporarily useful purpose in the evolution of a more perfect materia medica. Of these preparations, only those made after the methods of Dr. King, and the alkaloids of hydrastis and sanguinaria have survived and singularly are now mostly employed by practitioners of the dominant school. During this period Eclectic colleges were established at Rochester and Syracuse, Louisville, Philadelphia, New York and Cincinnati. The majority of these were short lived and some of them had a strong leaning toward the system of botanic medicine now represented by the physio-medicalist. The Eclectic Medical College of Pennsylvania for many years in good repute, finally drifted away and during the later years (since 1871) was neither recognized by Eclecticism nor others. In 1856, a portion of the faculty of the Eclectic Medical Institute formed a rival college in Cin-

cinnati which had a large following. This school was absorbed by the Institute in 1859. The Civil War seriously threatened the educational progress of the cause and the withdrawal of a large quota of Southern students caused a marked shrinkage in the attendance at the Northern schools. Times were hard and the outlook gloomy. Dr. John Milton Scudder, a graduate of the Eclectic Medical Institute in 1856, now became the head of that institution. By strict business management he inaugurated a period of renaissance and Eclecticism soon became a recognized force in medicine in America. Specific medication, introduced by Dr. John M. Scudder in 1869, though at first vigorously opposed, is at present the basis of practice of fully three-fourths of the Eclectic physicians and is the leading therapeutic doctrine taught in all the Eclectic colleges. In fact modern Eclecticism is the practice of specific medication. Its theory is as follows:— Disease is a wrong or impairment of life. It is manifested clinically by certain well-defined symptoms. The totality of symptoms express a condition, to which, in the usual nosological classification, a special name is given. This disease name is of value only in the study of the natural history of diseases, for statistical data, for the purpose of recognizing contagious and infectious diseases, and for establishing a prognosis, certain necessarily fatal diseases allowing only of palliative treatment. The specific medicationist, like practitioners of other schools, pursues such a method of nosological diagnosis for the purposes named, but not as a guide to treatment, in which to him it is of little or no value. For therapeutic purposes he reverses this process and studies his case by analysis, not by synthesis, to discover, if possible, the varying conditions which make up the disease, as evidenced by specific and well-defined symptoms revealing disease expressions. Remedies have a certain force, and are definite in action. Like effects follow like causes. Hence, having found, by repeated experimentation, the opposing action of a drug in a certain condition of disease, as expressed by certain specific symptoms, objective or subjective, the same remedy will always relieve or cure like abnormal conditions. The believer in specific medication holds that there is a fixed relationship between drug force and disease expression.

The Eclectic has no specifics for *diseases* but specific remedies for specific conditions of such diseases. Specific diagnosis implies diagnosis to discover the condition curable by a certain remedy, as established by previous experimentation, and specific medication means the application of the known remedy for the pathological condition so found. Specific diagnosis is therapeutic, not nosological diagnosis. In practice the specific medicationist is guided in the selection of his remedy by "specific indications," as illustrated by the few following examples: The strong, excited, bounding pulse indicates veratrum viride; sharp, cutting or lancinating pain in serous tissues. bryonia; the full, oppressed pulse with a sensation of præcordial fulness and dyspnœa, lobelia; marked periodicity, with moist tongue, open pulse and freedom from nervous excitement, quinine; cadaverous odor of the secretions, potassium chlorate, etc.

The modern Eclectic recognizes no law of cure, and does not accept a remedy as a specific until the extended successful employment of it in some particular condition has given it the right to be so called. Empiricism and experimentation are the foundations of knowledge concerning each remedy denominated a specific medicine. The havoc wrought Eclectic pharmacy at the close of the formative period had now to be remedied. The school had been nearly shipwrecked on the shoals of commercial selfishness, as seen in the instance of the resinoids. Calamities often bring about future good, so in this instance the commercial mistakes of a few gave a renewed impetus to better the conditions of Eclectic pharmacy. Uncertain preparations were supplanted by definite medicines. As a result the school has now a materia medica and system of therapeutics much sought by the descendants of those who endeavored to block the efforts of the pioneer Eclectic, in his zealous contention for pure and representative medicines. Dr. Scudder, supported by Dr. King and others, advocated office pharmacy as a step toward a better knowledge of drugs and to secure definite remedies. Special attention was given green and freshly dried products. Formulas were published for the preparation of specific medicines. Finally, in order to secure the integrity of these medicines and protect them from conscienceless manufacturers, Dr. Scudder copyrighted the labels. These bore the title "Specific Medicines" and gave the specific indications for their use. The manufacture of medicines bearing these labels was entrusted to competent pharmacists and from that time the school has been free from objectionable pharmacy. Dr. Scudder advocated the use of specific medicines in the study of the relationship of medicine to disease expressions. The Eclectic of the formative period selected from other schools, but endeavored to improve. He substituted milder for harsher methods; he opposed the use of the lancet and blister, and the abuse of mercury and antimony salts. The modern American Eclectic advocates the use of kindly curative remedies, and the avoidance of depressing or depletive medication. He has been the pioneer in the study of the indigenous materia medica, with special reference to specific indications and specific uses of medicines employed. He contends for the best possible pharmacy so that the minimum amount of medicine may accomplish maximum results. Harmful medication as exemplified in excessive drugging he has consistently opposed, heroic over-drugging having been one of the most potent causes leading to the necessity for the establishment of an Eclectic school. He advocates liberality of thought, the highest medical education, the cultivation of professional dignity, and the ethics that govern gentlemen.

The position of the Eclectic school of medicine is now well established, and the attitude of malice and persecution formerly shown it by rival schools is fast becoming a memory. The school numbers upwards of 8,000 Eclectic physicians. For a period of about 10 years this numerical relation has remained nearly stationary, but because of better facilities for teaching, enlarged literature, and harmony in the ranks of the school it has never occupied so favorable a position nor had a better outlook for the future than it has to-day. Never before in its history has it been so free from internecine bickerings, attacks by rival schools, and unpleasant entangle-

ments and alliances. It challenges all ages in the wealth and completeness of its materia medica. Recognizing the merit of the work accomplished the regular profession in many localities now invites Eclectics to join its associations providing they drop their distinctive title. This the Eclectic is unwilling to do, believing that the school has earned the right to be regarded and recognized as a distinct sect in medicine. Its work in the special fields of materia medica and specific diagnosis and specific medication entitle it to this right. The Eclectic school has a strong national organization and numerous State and local societies. A national reform association was founded in 1829, and a second at Worthington, Ohio, in 1836. In 1848 the first National Eclectic Medical Association was organized in Cincinnati, Ohio, with Dr. T. V. Morrow as president, and it held annual sessions until 1858. The present National Eclectic Medical Association was organized at Chicago, Ill., in 1870, with Dr. John W. Johnson, of Connecticut, as president. It holds annual sessions, meeting in various cities throughout the United States. Eclectic practitioners now hold positions as examiners in the more important life insurance companies, and are not now debarred from the army and navy medical service as in the earlier days of medical ostracism. No discrimination is now made against them as surgeons for the great railway systems. These recognitions have been earned in the face of vigorous medical opposition, by the consistent and honorable course pursued by the Eclectic school as a whole. The Eclectic Medical College of Cincinnati, Ohio, the parent school of medical Eclecticism, chartered in 1845 as the Eclectic Medical Institute, is the leading college of this American system of medicine.

HARVEY WICKES FELTER, M.D.,
Prof. of Materia Medica and Therapeutics, and Medical History, Eclectic Medical College, Cincinnati, Ohio.

MEDICINE, History of. Within the past three centuries the average working life of English-speaking men has doubled. A few lived as long as now, and some strong or favored ones had efficient working powers as long; but the common life was worn out in what is now middle age. In Shakespeare's time the 50's were venerable: «Old John of Gaunt, time-honored Lancaster,» was 58 when supposably so addressed; and Admiral Coligny, murdered at 53, is described by his contemporary biographer as a very old man. Now, when we hear of a death in the 60's we instinctively feel it an untimely cutting off in what should be still fresh and vigorous age, and even at 80 it seems but just fair ripeness for the sickle. The three factors which have wrought this change are advanced physical comfort, medicine and its handmaid hygiene, and surgery. And in the mitigation of the frightful mass of actual pain, of physical torment which has racked every age down to the present, and which has scarcely even been alleviated till the past century, medicine stands incomparably first.

Some good foundations had been laid, it is true, in the century previous, and men were at work in the true scientific spirit. Great masters had stimulated their successors to study in the essential preliminary subjects, the constitution and functions of the body. The mighty Boerhaave of Holland (1668–1738) had revolutionized clinical observation; Morgagni of Italy (1682–1771) had «introduced anatomical thinking into medicine» (Virchow), and had done something the same service for pathology which Haller of Germany (1708–77) did a generation later for physiology; while John Hunter (1728–93) had not only introduced capital improvements into operative surgery, but had set the pace in research into anatomical and physiological problems. But the influence of old theories, founded on guesses and imperfectly interpreted observation, still lay heavy on the body of practitioners. The chief general theories in the 18th century were those of William Cullen (1710–90) and his pupil and assistant, John Brown (1736–88), of the University of Edinburgh; the former — a great advance on the older theory of «humors,» and on the right track — made the nervous system the seat of diseases; the latter divided all diseases into two classes,—the sthenic, resulting from over-excitation and treated by depletion, and the asthenic, resulting from under-excitation and treated by stimulation. On the Continent, Hahnemann (1755–1843), his great theory propounded at Leipzig (1796–1810) soon after took adverse ground in his «homœopathy,» — a very different thing from what later passed under the name, though the latter retained the underlying basis. Besides his «law of similars,» which Hippocrates had formulated before him, he rejected theory utterly, declaring that it was impossible to know anything about pathological changes out of sight; that we can only know symptoms, and if those are removed it indicates of necessity that the disease which produced them must be gone also. He also alleged that the fact of a given dose causing certain symptoms in a healthy person was obvious proof that it must be too large for a sick one; further, that to possess healing power the dose must be too small for recognition by the senses or chemical analysis; and that trituration, or dilution and shaking, of minute doses caused molecular changes which infinitely increased their power — «dynamization,» he termed it. The exaggeration of symptomatics and empirics was a reaction against the current reliance on unbased theories; the paradox of infinitesimal doses, against the monstrous boluses and draughts with which patients were often gravely injured; there was usefulness in both reactions, but he went so far as to declare that a child could be cured while asleep by holding the pellets near it.

But the reign both of guesswork theorizing and of groping empirics, as exclusive methods, was coming to an end, and the first great blow was delivered in the first year of the century. France now came to the front where other countries had thronged. Bichat, a genius who wore himself out at 31, as did Clifford at 34, published the year before his death (1801) a work on general anatomy, in which he remade the entire science by showing that the different organs have membranes and tissues in common, and therefore that the seat of disease was in the constituent tissues and not in the organs as such. This not only simplified anatomy and physiology in much the same way that the alphabet simplified hieroglyphics, but threw the investigation of pathological changes into an entirely new channel. Parallel with this work, the followers in the footsteps of Morgagni were carrying on his work in studying morbid anat-

omy, the appearances of diseased organs; this, too, was remodeled on Bichat's discoveries. In 1808 and 1816 Broussais of Paris (1772–1838) published valuable works whose theory is merely the sthenic and asthenic idea of Brown, but which led to renewed research in pathological anatomy and local ailments. Percussion had been devised by Auenbrugger of Vienna (1772–1809) in 1761, and Corvisart of Paris (1755–1821) revived it; but a greater effect was created by the introduction of auscultation 1816–19 by the Breton Laennec (1781–1826) at Paris, where he was Corvisart's pupil. He invented the stethoscope to diagnose diseases of the lungs, heart and abdominal organs, by means of alteration in the normal sounds of their action; and his own use of it, and observations on the diseases of these organs, were the greatest advance made in clinics since Boerhaave, and may be said to have founded modern clinical science. In 1827, Richard Bright at London (1789–1858) first published his recognition of the true nature of the kidney disease since called by his name, and of the general characteristics of renal complaints, the foundation of our knowledge of them.

A special branch of investigation and analysis in the first half of the century was in discriminating the continued fevers; one of the most active and anxious battle-grounds for practitioners and theorists since modern medicine took its rise; though eruptive and malarial fevers were well differentiated. The first to be discriminated was typhoid, by Louis of Paris (1787–1872). His American pupils, W. W. Gerhard (1809–72) and Alfred Stillé (1803), with C. W. Pennock (1799–1867), all of Philadelphia, and George B. Shattuck of Boston, proved that typhoid and typhus, theretofore loosely classed together, were independent diseases, though generated by similar causes. This was confirmed by the work of A. P. Stewart at Glasgow and Sir William Jenner at London. Dengue or break-bone fever, yellow and relapsing fevers, and their kind, were carefully studied. Among the other names associated with this labor are R. J. Graves (1797–1853) and William Stokes (1804–78) of Dublin, George Budd (1808–82) of London, and Daniel Drake (1785–1852), S. H. Dickson (1798–1872) and Austin Flint (1812–86) in America. This work was soundly based by 1860 in regard to fever clinics.

Development in the United States.— When the 19th century opened there were only three medical schools in the United States, and only two of importance,— those connected with Harvard College and the University of Pennsylvania,— and only two general hospitals. Medical education was somewhat on a footing with divinity education: physicians took apprentices for some years and clergymen took private pupils in divinity. Those who wished and could afford a more systematic medical education went to London or Edinburgh. The literature of the profession was English and (translated) French almost wholly; Rush and a few others had published books, but not of moment, and there were only two or three medical journals. There were but two medical libraries except in private hands, those at the New York and the Pennsylvania hospitals. The physicians of most reputation were Benjamin Rush and Philip S. Physick of Philadelphia, David Hosack and Samuel L. Mitchill of New York, and James Jackson and John C. Warren of Boston. The smaller places did not lack for able men, though of less widespread repute: such as Daniel Drake of Cincinnati, and Nathan Smith, founder of the medical schools both of Dartmouth and of Yale. But the great repute of the French medical investigators in the first quarter of the century — Bichat, Corvisart, Laennec, Louis, etc.— took an increasing number of American students there, and the new spirit they brought back revolutionized American practice for a time. The enormous increase in American population, however, enlarged the demand upon its stock of medical knowledge far faster than that could be legitimately developed: educated physicians could not be turned out so fast as the thronging populace needed them, and it was the golden age of the half-educated. Perhaps, too, the masses had the same ideas of the needlessness of training in medicine as in public life. The machinery was multiplied indefinitely, and the product turned out depreciated in proportion. Up to about 1870 the medical schools sprung up everywhere, both public and private, and their competition for pupils degraded the standard very low indeed. Diplomas were given for two years' work, and short sessions at that; and the instructors were sometimes as incapable of giving competent education as the authorities were unwilling to enforce severe study or careful experiment. The first place to exact a new and much higher standard was Harvard, about 1870. The rapidity with which the rest of the country, in the better institutions, followed its lead, showed that there was a large instructed upper class which appreciated the need of thorough education in this as in other departments of knowledge, and understood that medicine was a great science as well as a delicate craft. As always, the rich were glad to give when they knew where to give intelligently, and endowed generously both study laboratories and general and special hospitals. It would be a grateful task to enumerate these, did space permit; here can be mentioned only such names as Pierpont Morgan and Andrew Carnegie, Johns Hopkins and Vanderbilt, Sims, Strathcona, Mount-Stephen, Payne and Lane.

Methods of Investigation.— The last century of course did not invent experiment in medicine or psychology: the method was recognized by the great Greek and Latin physicians, used by the two great Bacons, Roger and Francis, fully developed by Harvey, and utilized with superb skill by Hunter. But though these great men did not lack sound ideas, they lacked tools and the mass of laboratory facilities gradually built up in our age. The research laboratory is the development of the 19th century, and well along toward the middle of it. The workers in it experiment along three main lines,— the condition and functions of the organs in a state of health; the nature of the functional changes produced by disease, and the causes of the changes; and the prophylactic or curative agencies which can neutralize the disturbing agents. The results of these studies have created a new knowledge, which is to that of even 1800 like the relation of an adult to a baby. The physiological and pathological revelations have not merely left the knowledge accumulated in the previous centuries possessed of a merely archæological interest, but they have weaned us from

the sway of any authority whatever; recognizing that even the seemingly soundest conclusions of the present are but working hypotheses, which may have to be abandoned at any time on fresh evidence,— the true scientific spirit. No part of life has been left as it was, the digestive and assimilative, circulatory, respiratory and excretory, reproductive and directive functions have all been illuminated by a flood of light. Especially has this been wonderful in the study of the brain, whose functions not only are so intangible and elusive, but apparently so impossible of experimentation without destroying the subject of experiment. Not only have we penetrated deep into the secrets of the paths and operations of sensory and motor impulses, the localizations of functions and the mechanical implements of thought and memory, but we have been enabled to apply with great success a number of curative measures not before dreamed of, or even if so, not deemed possible of use.

Another marked feature of the age is the development of specialism, in which we have to set off a lack of co-ordination and breadth of knowledge or judgment against an extension of knowledge not possible by any other method. Scientifically, no other means has been so potent in extending and deepening the realm of demonstrated fact. Practically, no other has been so effective in developing curative processes. This specialism must not be confounded with that of the "lung doctors" and "fever doctors" of former days, mere guesswork empiricism of uneducated practitioners; it rests on a basis of competent general medical knowledge and thorough education in the specialty besides. The physicians who give their time and thought to one limited field — diseases of women, of children, of eyes and ears, of throat, of teeth, of the brain, or who, though less exclusively, choose diseases of the heart or the liver or other organs for their preferred field — have won for the profession some of its most signal triumphs. American physicians especially have stood at the very head of those who have perfected dentistry and ophthalmology, as well as gynæcology or diseases of women. In this branch the blessings they have conferred not only on women in ordinary disease, but on both them, their male relatives, and their children, by the saving of life and health, in the special crises of the sex, cannot be estimated.

One of the finest branches of this specializing is that of alienism: and the change in the mental attitude of the public toward it in consequence of that study has been most remarkable and gratifying. From a matter of derision, as it was largely in the Middle Ages, or ineffectual commiseration as an act of God, or mere terror and aversion, it has come to be sympathetically studied, often relieved, and always recognized as a mere functional disease. Starting from the labors of our own Rush, of the English Tuke, of the German Jacobi and Hasse, and the French Pinel and Esquirol, this reform has built up a body of physicians in every civilized country not only to study mental aberration scientifically, but to introduce humane and rational methods into its care and cure. America is not behind any other in the treatment of the insane; but the curse of so many good causes in America — politics — is a blight upon this science still in too many States.

Prophylactics.— "Prevention is better than cure" has reached its most brilliant exemplification in the 19th century. It is true that nations far back in antiquity have grasped some of the chief conditions under which diseases most prevail, and have even carried systems of public hygiene much farther than even yet we have re-attained to. The law of Moses furnishes a remarkable example, in its insistence on cleanliness, isolation and diet; the Greeks systematized diet and exercise and general physical training thoroughly, their ideal being "the fair mind in the fair body" (and had discovered that professional athletes do not make good soldiers, from lack of endurance); the Romans and Greeks made the bath almost a fetish, far beyond even the English, and the public benefactor of the day gave his city baths, not libraries. But modern science goes much farther: it discerns the causes which create the disease itself, and removes or neutralizes them. In the 18th century some light had been thrown on this: Howard had seen that typhus was in direct ratio to the crowded condition of jails. Captain Cook and Sir Gilbert Blaine had perceived and removed the conditions that generate scurvy. Jenner had gone still farther and anticipated the methods of modern preventive medicine by vaccination. But all these could only be feeble and groping attempts until there was a scientific basis for them. This was furnished by bacteriology, and a few words upon that are needed to make later explanations intelligible.

The Bacteriological Basis of Preventive Medicine.—The ancients speculated with great eagerness and sometimes acuteness on the origin of life, and had guessed that disease and living germs were in some way related; and the relation of disease and putrefaction was not doubted. As soon as the first weak crude microscope was invented, it was used to investigate the organisms of decay. The Jesuit Kircher in 1671 examined the "minute worms" in putrid milk and cheese and meat; in 1675 a Dutch merchant named Leeuwenhoek improved his lenses and studied the "animalcula" in rainwater, saliva, intestinal fluids and putrid substances; and the physicians of his day were quick to suspect and suggest that these organisms might be the cause of all diseases. In 1762 the Viennese Pleincz, who had studied fluids in all conditions, gave his firm adhesion to this belief. But this was not the whole; whence came these organisms — were they self-generated, or simply transmitted from other bodies and multiplied? Despite even the microscope, the theory of spontaneous generation maintained itself tenaciously far past the middle of the century. A distinguished chemist maintained as the result of careful experiment that germs were so generated, and even the proof that the organisms were forms already existent did not convince him or his followers. It was reserved for Pasteur in 1861, and finally (with Koch and Cohn) in 1876, to crush this theory forever. Following quickly on the first came the discovery of the anthrax germ by Pollender and Davaine in 1863; shortly afterward Lister's epoch-making researches into wound infection, making possible the triumphs of antiseptic surgery; then swifly followed the isolation of the germs of relapsing fever, leprosy, and typhoid. But towering above all, from the

enormous difficulties overcome, were Robert Koch's isolations of the tuberculosis germ in 1882, and of that of Asiatic cholera in 1884. Thence on, a crowd of discoveries of the germs of other diseases have left but few — unfortunately, some of the worst — unrevealed, diseases of animals and insects having been investigated as well as those of men.

Thus much for the history of discovery; but what are these germs? The popular mind is very confused on the subject. Bacteria are generally thought of as a sort of worm. In fact, they are not members of the animal but the vegetable kingdom; the smallest organisms known. They are protoplasm, a jelly-like substance, enclosed in a hard membrane exactly like wood fibre. They are classified by shape in three groups: cocci (spherical), bacilli (rod-like), and spirilla (corkscrew or undulatory shape). The cocci are found in pairs, fours, clusters, or chains; they include the smallest known organisms, some of them being as small as 1/150,000 of an inch in diameter. The bacilli are larger but vary much, from 1/25,000 to 1/4,000 of an inch in length, and 1/125,000 to 1/16,000 in diameter; some of them have organs of locomotion, called *flagella.* The spirilla are longest of all, sometimes 1/600 of an inch. They all increase either by fission into two, or by developing a spore or seed. Their rate of multiplication does not seem rapid, but that is because we forget our old arithmetical «catches.» A bacterium dividing each hour, and each division thus dividing, would obviously have increased to 8,388,608 in 24 hours; and in three days to a number beyond all verbal expression, weighing nearly 7,500 tons. Of course this is a *reductio ad absurdum,* as the body they feed on would be exhausted early in the series; but outside of starvation, nature has other ways of arresting their multiplication.

Before discussing this point, let us look at the nature of bacteria as a whole. It is a misapprehension to think of them simply as a principle of disease and death. They are a universal principle of life as well, and the few species which cause harm are lost in the myriads which do good. But for them, organic existence would perish; it has been suggested that the first organic things on earth were bacteria,— organisms needing only nitrogen for support, — and life means their multiplication. They abound in air and water, in the soil to nine feet deep or so, and in the outsides and insides of all organisms; but naturally their number varies with the conditions for sustaining existence, and there are none at extreme altitudes or in glacier ice, and few in the polar regions or the deep seas. Those conditions are (1) moisture, without which all die; (2) air, as to which there are three classes,— aerobes which must have it, anaerobes which must not have it, and facultative anaerobes which care nothing either way; (3) food, which must be living tissues for a few, may be dead ones for most, and can be mineral salts or atmospheric nitrogen for some: (4) temperature, which has for possibilities of their multiplication, though not of their life, extremes of 32 and 170° F.; for an average most favorable tract 60 to 104°; and for disease germs (as evolution would imply) 98.4°, or blood heat is most favorable; (5) light, of which direct sunlight is death to all, and common daylight, of no importance either way to most.

Their enormous number gives them a power of accomplishment seemingly almost miraculous, and certainly far superhuman. The quality of farm products and dairy products, of fatted stock or wool, of hides or horn, and many other familiar articles, is due to them; and they are the scavengers of our water supply from pollution, as well as some of them deriving powers for harm from it. Still more to our surprise, peas and beans certainly, and all plants probably, gain their life from the soil through the medium of bacteria which live in their roots, decompose nitrogenous minerals and feed on atmospheric nitrogen also, turning both kinds over to the plant for its nourishment.

Hence the processes of health and disease alike are functions of bacteria. What medical science has specially to do is to trace the progress and manifestations of that spread of harmful bacteria commonly called «infection,» and the methods by which the system's natural tendency to starve or poison them can be reinforced. Before entering upon the phases of prevention and cure, we must indicate briefly how they obtain entrance, how they produce their effects, and what is the reaction of the body thereupon.

The first is naturally limited in variety: they enter by being injected from the bites of animals or insects, from wounds or abrasions, from inhaling infected air, from eating or drinking substances containing them. Specific cases will be considered later. The action of the microbes is by generating a set of poisons known as toxins, which produce either languor, loss of appetite and vague general discomfort, or more active pains, headaches, fever, inflammations of the tissues, perhaps entire stupor. The action of the body is complex and difficult, and not thoroughly worked out; but some things are known. The normal blood and tissues have a germicidal power, varying in different bodies even of full health, and varying still more as to specific germs, each body having its own set of germs to which it is congenial or maleficent. The struggle of the body against their multiplication, dependent on this unfavorableness of soil for their propagation, is called «general resistance,» and on its strength depends the immunity against ordinary disease; and the secret of inoculation is, that if the soil favorable to the propagation of a specific bacterium is eaten up, it is usually very slow in fresh growth. The disease microbe gains no lodgment because there is nothing to live on. But in addition to this passive resistance, an active one is carried on by the white cells or «leucocytes,»— the wandering cells, and those of the tissues chiefly invaded, as well as those of the spleen and lymphatic glands; these and others seem to work among the toxins and produce a change in their chemical constitution, at last elaborating counter-poison or *antitoxins* which neutralize the first, and enable the cells to carry on the war against the disease microbes till one or other is overcome; and as said, if there is recovery, a partial or complete immunity is afforded against further ravages of the same class of microbe.

But it is evident that if this process can be shortened and made more certain, so that the antitoxins can perform their work before the

disease microbes arrive at all, a great system of prophylactic or preventive medication can be had; and if the antitoxins are used in a case of similar disease, they will strengthen the natural power of the body to develop them, and greatly aid it in throwing off the disease. This is the new system of serum-therapy, begun by Pasteur in 1877, and continued by a set of brilliant experimenters since. The serum of the infected blood is chosen as a medium for injection into the blood of the patient. Pasteur with fowl cholera, Raynaud with cowpox, Salmon and Smith in this country in 1886 with hog cholera, fully proved the possibility of the treatment, curing animals previously inoculated with the most virulent disease poisons, and rendering healthy animals immune; but these excited but languid interest till Behring's announcement in 1892 of a diphtheria antitoxin, with incontestable proof of its value. Oddly, not only laymen but physicians in many cases opposed it; partly from misunderstanding, partly from humanitarianism as involving experiments on animals. Most of its opponents have now been won over, from the crushing weight of evidence, and the brilliant work of its supporters. Diphtheria alone has reduced its mortality one-half since the introduction of the serum treatment little more than a decade ago.

To illustrate the general methods of preparing all the serums for infectious diseases, that of diphtheria will serve as a model. The bacilli are cultivated for 8 or 10 days in alkaline beef broth, found to develop a peculiarly virulent poison under its work; the toxin is then isolated and its strength precisely estimated, then set aside in sterilized vessels. A healthy horse, found by experiment the most suitable animal, has injected under the skin of its neck or forequarters 20 cubic centimeters of toxin and perhaps half that of antitoxin, three times five days apart; then it is given heavier and heavier doses of toxin alone, a week apart, till it can endure doses speedily fatal at the outset. After two months it is bled and its serum tested; if satisfactory, it is dosed as before for another month, when the maximum quality of serum is usually reached. The animal is then bled sufficiently, the blood being caught in a sterilized vessel and placed in a refrigerator. The coagulation finished, the serum is drawn off from the clot and its strength accurately determined in the laboratory, an antiseptic is added to keep it, and it is bottled for use. Antitoxins for tetanus and snake bite have been similarly prepared, and the present century will see probably every infectious disease and every venom with its bacterial antidote.

Specific Results of Preventive Treatment. —An abstract of the work already done in preventive medicine can best be given by a note of the great maladies of men and animals more or less controlled by it, with their bacteria. But it must be noted that of the ones cited, the bacteria of smallpox and hydrophobia (though the former has been almost exterminated by vaccination), as well as scarlet fever and measles, have not yet been isolated. The reason may be excessively small size, since that of cattle pleuro-pneumonia is barely visible under the microscope; or it may be that the organisms are not bacteria but unknown beings.

The diseases may be classified variously, and some admit no special classification, but we will begin with the great scourges which have desolated the world in the past, and which have owed their virulence and destructiveness, though not their direct origin, to filth and overcrowding and general unsanitary conditions.

(1) The Great Plague, or Bubonic Plague. The frightful devastations of this in the past need not be recited; it will be remembered that it was the "Black Death," which swept off from a third to a half the population of Europe in the latter part of the 13th century. Long thought almost extinct, it reappeared with fearful intensity at Hongkong in 1894, spread to India, and had several occasions of violent outbreak, raged in Turkey and on some parts of the Mediterranean coast, and in small volume has shown itself in Glasgow, South American ports, New York and San Francisco. But in western Europe and America it has been easily put down, and serum inoculation has been fairly successful in India. Its bacillus is known to enter the body by wounds of the skin, and very largely by bites of fleas from infected rats.

(2) Asiatic Cholera. This terrible plague even in the middle of the 19th century swept away thousands of lives in America; now it has been so thoroughly controlled that it is not feared even to the extent of disturbing commerce when it appears. It originated on the banks of the Ganges in India, where Koch found its spirillum and the means of its spread, —almost entirely through drinking infected water, though very slightly by contact,— so little that since 1873 the disease in Great Britain and the United States has never got farther than the port of entry. How thoroughly a city's immunity depends on its water supply is strikingly shown by the twin city on the Elbe in 1892; Hamburg, using the unfiltered river water, had about 18,000 cases and 8,000 deaths: Altona, with a filtration plant, had 516 cases, largely refugees from Hamburg.

(3) Typhus Fever. It is hard to believe that this was once so steady and frightful a curse in the West that one investigator says its history would be that of Europe. In all the large cities, in camps and ships, hospitals and jails, it was almost permanent and its rate of mortality appalling. It depended so entirely on filth and overcrowding that mere city sanitation and cessation of packing, sewers and a good water supply, have practically exterminated it except in a few slums. The rate has been reduced in England from 1,228 per 1,000,000 in 1838 (typhus and typhoid together, not then discriminated) to 137 typhoid and 3 typhus at the present time. In 1915 announcement was made that the bacterial origin of typhus fever had been established.

(4) Typhoid Fever. This disease, long identified with typhus, is now not only known to be separate, but dependent on somewhat different generating conditions. It depends not so much on dirt and crowding as on sewer gases and contaminated water and milk. Given pure water and perfect drainage, a city practically has no typhoid,— except when its milk supply is drawn from infected sources, as often happens; while seaside resorts are notorious generators of the disease, from the sand-driven wells and the crowded privies draining into them. The germ was discovered by Eberth in 1880,

and called *bacillus typhosus*. The continued prevalence of the disease in our cities is due partly to the great hardiness of the bacillus, which can exist in the body of a patient long after recovery and be a means of contamination. The outbreak in the Spanish-American War seemed due to over-crowding, but more likely to the contaminations caused by it, as in the seaside cases. In the country districts there is no mystery about it: often there is no rural sanitation and even the wells are grossly neglected, sometimes on a slope below a barn. In the typical example at Plymouth, Pa. (about 8,000 people), the evacuations of a typhoid patient were thrown out during the winter on the banks of a stream which fed the town reservoir; the spring thaw carried them into it and the town had a typhoid epidemic which struck down 1,200 people. The people precautions are the use of boiled water and of distilled-water ice, the thorough inspection of dairy surroundings and water sources and great care on the part of physicians and nurses to disinfect discharges, are the true prophylactics.

(5) Diphtheria. This bacillus was discovered in 1883–84 by Klebs and Loeffler, and has been given their joint names; it enters either by inhalation or the stomach. The antitoxins thus made possible of preparation have reduced the mortality one-half; the hygienic precautions have greatly reduced the primary prevalence. The latter are isolation and disinfection, watchfulness during convalescence, careful examination of the least throat disorder and — since the mild and often unsuspected cases where the children go about and to school freely are the worst in spreading the disease, because not guarded against — regular inspection of school children's throats. Children's teeth and mouths should also be carefully attended to and the tonsils removed where tonsilitis is frequent.

(6) Yellow Fever. The germ of this has not yet been isolated. Its dependence on dirt, however, would seem almost as close as typhus, thorough sanitation having practically eradicated it in its favorite tropic home, Havana, and in the Southern cities once ravaged by it. Jamaica has been almost freed from it in the same way.

(7) Smallpox. This once widespread and sometimes destructive scourge, almost more dreaded for life than for death, has been so nearly eradicated by vaccination, and vaccination alone, that the persistence of a strong section of the community opposed to it is one of the strangest of phenomena. The evidence is overwhelming. Wherever smallpox breaks out, it is in an unvaccinated district, country or body of people, and the fatalities are almost all among the unvaccinated and never among the re-vaccinated; where two bodies of men lie side by side under the same conditions, as the French and German armies in 1871, the vaccinated body scarcely suffers, the unvaccinated one is decimated; and in Egypt, where the natives are compulsorily vaccinated and the foreigners escape it, the fatalities are five foreigners to three natives, though the latter are far poorer, worse housed and fed and medically cared for, and would naturally be supposed the chief victims. If all the people of a country were vaccinated and re-vaccinated at fair intervals, the disease would absolutely disappear, as it has in the German army: it is the ones who escape vaccination that maintain its existence. The ravages still among the unvaccinated French Canadians are a constant example of what it has been. For instance, on 1 April 1885 there was a smallpox death in the Montreal hospital the Hôtel Dieu; the patients who had not had it were sent home; the disease spread like wildfire, and by the end of the year 3,164 persons died of it, the city's business for the winter was destroyed, and the loss was millions. It has been proved that not above one in 100 of the vaccinated takes the disease when exposed and almost none die; of the unvaccinated, fully 99 per cent take it and 25 to 30 die. It must be remembered, however, that there cannot be perfect security without frequent re-vaccination, as the power of the cowpox varies with different persons and is rarely permanent, sometimes not over a year or two. With animal lymph there is no danger of the introduction of other diseases, the fear of which is made an excuse for refusal.

(8) Tuberculosis (including "consumption" of the lungs), called by Holmes the "white plague"; the most destructive single agency of death, and responsible for 120,000 deaths a year in the United States, more than all other infectious diseases together, except pneumonia. Formerly believed hereditary (the truth in a very slight degree), it is now known to be the product of a bacillus, isolated by Koch in 1880–82; and the hereditary conditions are mainly environment, with some tendency to anæmia. The communication, though in a few cases by infected milk, in the overwhelming mass proceeds by inhalation of the particles of dried sputum from other consumptives' lungs, blown about in the dust of streets or houses, or even wards of hospitals. Naturally, the greatest mortality is in places where free circulation of air is not possible, as jails and "institutions." Nature seems to have provided for the largest possible distribution of them: one patient not in extremes has been known to give off from two to four thousand millions of germs in 24 hours; they are shaken from handkerchiefs, from the beard or mustache, from the furniture and other things handled by consumptives, beaten up from contaminated floors. So universally diffused are they that it seems probable there are few persons who have not some tuberculous lesion of some organ, for it is not confined to the lungs. The great weapons against it are, first, maintaining the standard of nutrition and cleanliness as high as possible; with careful protection of the chest; second, the education of the public in the dangers of the dried sputa; third, enforcement of notification and registration of cases; fourth, public sanatoriums for treatment of early cases; fifth, special hospitals for incurables. Immense progress has already been made: the rate in Massachusetts, one of the chief seats of the disease, has fallen from 42 to under 21 per 1,000 since 1853; and in New York, Glasgow and other great cities the drop has been similar.

(9) Pneumonia. Frankel in 1886 isolated this germ, a coccus growing in pairs and chains and entering by inhalation; and with one-fifth of healthy persons, present in the saliva. This is almost the one disease which has not diminished under medical and hygienic science, and has apparently increased, ranking

next to consumption in deadliness. It is especially a disease of languid circulation, as in the aged (their typical disease) and invalid and the intemperate; but it lays low vast numbers of the strong as well. The treatment has been revolutionized from the bottom, but still from one-fifth to one-fourth of all attacks are fatal. Thus far the most valuable novelties have been measures to prevent sudden heart failure.

(10) Malaria. Till a generation ago, this was one of the obscurest diseases on our list; it still remains one of the worst drawbacks to civilization, preventing general Caucasian settlement in the tropics. It was known to have an intimate connection with wet ground, marshes or the building up and sewering of new districts; to prevail chiefly in the fall, and be caught chiefly from dusk to dawn; and to be noncontagious. But nothing more was known till M. Charles Laveran, a French surgeon who had gone to Algeria specially to study the disease, discovered the germs in the red blood-corpuscles of patients; not bacteria, but small protoplasmic bodies which begin as transparent rings inside the corpuscle, feed and enlarge on its coloring matter and form blackish grains from it, and on attaining a certain size divide and redivide in vast multitude, giving off a toxin which causes the acute spasm of fever, and apparently of chill also. Each variety of the fever is caused by a special form of the parasite. It was suggested by Dr. Patrick Manson of London that the communicating agent might be mosquitoes, also products of wet ground and active after dusk; and an army surgeon of India, Ross, found that mosquitoes did transmit similar parasites between birds,— developing them in their stomach cells into filary bodies, which pass into the saliva and so through bites into the bodies of others. It is now thoroughly established that this is the chief means of transmission among human beings. The mosquito is not the common *culex* of the northern United States, but chiefly the *anopheles*, which develops and transfers the parasites as just described. The crucial experiments are, that these mosquitoes, allowed to bite malarial patients and subsequently healthy persons in nonmalarious regions, infect the latter, and that in the deadly *campagna* around Rome, two persons during the worst season, from 1 June to 1 Sept. 1900, lived entirely immune by simply keeping behind tight netting after dusk, while exposing themselves freely during the daytime. The net result is that swamps and stagnant pools should be drained, that persons having malaria should be thoroughly treated with quinine so that they may not transmit the disease if bitten by mosquitoes, and that Europeans can live in the worst districts by not being out after dusk and by thoroughly wiring their houses.

(11) Venereal Diseases. These are in one respect by far the worst of all we have to mention; for they are the only ones transmitted in full virulence to innocent children, to fill their lives with suffering and which involve equally innocent wives in the misery and shame. In the victim the infection does not stop with the parts originally affected; and it has not been seriously checked, from the nature of its causes making it impossible for society to stamp out or much diminish the actions which involve it. Physicians and the public have each solemn duties in this matter: the former to act as apostles of continence, especially with the bachelors who pretend to believe that their health needs the indulgence and will not marry, and to use every effort to prevent the disease being carried to others; the latter to let no scruples of delicacy or affected ignorance stand in the way of thorough public supervision. The opposition to this is natural: women feel it adding an unfair stigma to an already shameful load of injustice; decent people feel that legal recognition is legal palliation and defense, and there is the real danger shown by experience, that if it is once shielded by the law the weight of the police force will be thrown on the side of protecting instead of abating houses of ill-fame, as with liquor saloons, but with far more disastrous results. But any risk is preferable to the present shocking conditions, which make city brothels a stream of contamination to what should be the purest of homes.

(12) Puerperal Fever. Remembering not merely the former fatality of this disease — terribly frequent in private practise, and in maternity institutions rising from 5 even to 10 per cent — but the double bereavement it usually involves, the almost entire extermination of this disease is one of the grandest triumphs of modern medicine. Its contagiousness had long been suspected, when Oliver Wendell Holmes in 1843 published a full and clear statement of the facts leading to the belief; but for many years the profession generally scouted it — a wit and poet could be no authority in medical science. Others gradually took his view, but it was the Lister antiseptic treatment which enabled it to be fully tested. Now the mortality is but about one-third of one per cent.

(13) Hydrophobia. This disease, though widely distributed among animals, is not very common among human beings in America, but excites a widespread horror from the multitude of pets, any one of which may chance to be stricken and to communicate it; in Europe it is less rare. The germ has not been isolated, but Pasteur ascertained its calculable effects on the nervous system, and that certain inoculations could render healthy animals immune and neutralize a powerful dose of the virus. He founded an institution in Paris for its treatment, and the mortality among those bitten by certainly rabid animals was reduced to less than one-half of one per cent. In dogs, quarantine and muzzling are the only precautions.

(14) Leprosy. This is caused by a bacillus which probably enters the body through abrasions of the skin, and probably only from contact with another person; even so, it is but slightly contagious, contrary to the popular notion. It was discovered by Hansen in 1879, and since then an active and very hopeful investigation into prophylactic conditions has been carried on. Known to be old and widespread in Asia, it is not generally known that it came into San Francisco with the Chinese, that the Norwegians have given it a considerable foothold in the Northwest and that in Louisiana there is an endemic condition of it, and slightly in some other southern States. It exists in New Brunswick likewise. Still more important for the United States is its great

abundance in Hawaii and the Philippines. It can be readily kept in check by segregation and inspection.

Some other bacilli may be mentioned, of which the discovery has not as yet been followed by large results in prevention. The deadliest known is that of lockjaw or tetanus, discovered by Nicolaier in 1884; it enters by wounds, and in some tropic parts all lesions tend to develop tetanus as surely as other sections do gangrene. Influenza, or "the grip," has one of the smallest bacilli known; it is spread by dried nasal discharges and enters by the nasal tracts. Anthrax is a disease mainly of cattle and sheep. Its bacilli were the first micro-organisms of disease to be isolated and can enter either by inhalation, infected food or abrasions.

Changes in Therapeutic Method.— It is only restating the same fact to say that new practice has followed on new theory, or rather new scientific knowledge of the nature of diseases. The only object of acquiring the knowledge was to embody it in practice. With the discovery of the zymotic principle in disease, traced finally to bacterial action, there could not be the same or like treatment as when the body was supposed to be possessed by conflicting "humors"; or when a fever was supposed to be an abnormal increase of vital fluids needing to be drained off; or when diseases were supposed to have no relation to any function of the body except the organs furnishing the dominant symptoms; or when one school supposed them waves of some sort, to be overborne by more powerful waves of the same class, and another school refused to entertain any theoretical suppositions at all, but relied on the history of cases, printed or traditional or experimental. But it may be said that the greatest revolution in the century, or at any rate the last half of it, is in the position assigned to drugs. At the outset the old faith in bleeding still held great sway: Boerhaave himself had made almost the whole art of medicine consist in its proper application, and at the end of the 18th century Washington had been sacrificed to it. But by the middle of the century it began to diminish. Both the homœopathic and the regular schools based their practice, and many still base it, on the study and administration of drugs. They differed in the size and strength of doses, from huge boluses or powders or draughts whose efficacy was supposed to be in proportion to their nauseousness, to small bland triturations or dilutions; but not in the assumption that in them lay the one efficient method of dealing with disease.

The advanced school of the present does not discard medicines; so far from it, it studies them with more care than ever, and values a few, well tried and certain of quality and action, as highly as ever. It knows the mass of current medicines to be inert or worse, uncertain of action and applied to human functions of still more uncertain action; but it seeks to study thoroughly and apply scientifically the few real medicines or healing agents which must be used — quinine and digitalis and opium, iron and mercury and iodide of potassium, etc.— instead of a swarm of dubious and varying materials. It is significant that some of the stand-bys are extremely old; iodine, as ashes of burnt sponge, was known in classic times, and ergot impressed its peculiar action on stock-raisers' minds from very early ages; even Peruvian bark is nothing new. We have not as yet made as many additions to the stock of panaceas as we might. But chemistry has done vast services for us, and will probably do far more. Aside from the discovery of new substances like cocaine, it has given us the active principles, of calculable strength and purity, in place of crude drugs of varying strength at best, and of varying purity and age, and there is no reason why we may not have new specifics as sure (and for as important diseases) as quinine.

But the new school does not feel itself under obligation to give any medicines whatever, while a generation ago not only could few physicians have held their practice unless they did, but few would have thought it safe or scientific. Of course there are still many cases where the patient or the patient's friends must be humored by administering medicine or alleged medicine where it is not really needed and indeed often where the buoyancy of mind which is the real curative agent can only be created by making him wait hopefully for the expected action of medicine, and some physicians still cannot unlearn their old training. But the change is great. The modern treatment of disease relies very greatly on the old so-called "natural" methods, diet and exercise, bathing and massage — in other words, giving the natural forces the fullest scope by easy and thorough nutrition, increased flow of blood and removal of obstructions to the excretory systems or the circulation in the tissues. One notable example is typhoid fever. At the outset of the 19th century it was treated with "remedies" of the extremest violence — bleeding and blistering, vomiting and purging, and the administration of antimony and mercury and plenty of other heroic remedies. Now the patient is bathed and nursed and carefully tended, but rarely given medicine. This is the result partly of the remarkable experiments of the Paris and Vienna schools into the action of drugs, which have shaken the stoutest faiths; and partly of the constant and reproachful object lesson of homœapathy. No regular physician would ever admit that the homœopathic preparations "infinitesimals," could do any good as direct curative agents, and yet it was perfectly certain that homœopaths lost no more of their patients than others. There was but one conclusion to draw — that most drugs had no effect whatever on the diseases for which they were administered.

These "natural methods" have been indicated above, but some further analysis of the individual elements is worth while. It will be noted that this is not, as a hasty reader might assume, the discarding of all the results of civilization and a return to barbarism. That the natural methods are efficient is precisely because scientific knowledge and modern improvements in appliances, as well as the thousand civilized devices for comfort and cleanliness, unattainable even a generation ago, have raised them to the level of first-rate therapeutic agents.

Perhaps foremost in the rank is the trained nurse, who is not only a greater agent of philanthropy than many professed altruists, but sets free the physician from a load of care and anxiety. In place of ignorant and stubborn

usually conceited and often superstitious women, who pride themselves on defying all the doctor's commands, these intelligent and loyal women can be relied on to carry out all his injunctions, to watch carefully for indications of danger and to furnish notes enabling him to view the progress and hourly changes of a critical case.

The importance of diet in therapy, and indeed in the preservation of health before the system becomes a subject for the physician, has never been wholly lost sight of, but at no time has it been so thoroughly recognized, so firmly insisted on, raised to so high a place in therapeutic agencies. Too much food, improper or ill-prepared food, over-haste in eating, all have their part in the dyspepsia which is a by-word among foreigners as the national malady, and though much lessened, is still most formidable. Over-eating, too, is largely responsible for the prevalent Bright's disease and degeneration of the arteries. Sweetmeats and the mixtures of the drug-stores, ice-cream soda and artificial flavors, are other potent causes; especially among girls is the eating of candies between meals. The business man's five-minute meal at the lunch counter saves his business time often to the permanent ruin of his health. The question of alcoholic drinks is usually left to the forum of morals or politics, but it has a serious bearing on health, though not nearly so much as one or two generations ago. The introduction of light beers has not only lessened drunkenness, but organic diseases of the liver, stomach, heart and arteries.

Few influences on general health have been greater or more beneficial than the enormous multiplication of the means of cheap enjoyable outdoor exercise in America within the past generation. Owing to the climate it is much harder to keep up habits of steady exercise here than in Europe, and unless there can be sociability with it, most people will not put themselves under the stress. We have not been a people addicted to sport or play, and formerly there were not sufficient means provided for us. Now tennis and golf and the bicycle and their kind are improving the constitutions, especially the nervous condition, of vast numbers. Of course there must be judgment in these matters, and probably some elderly people injure themselves by indulging in severe athletic sport only fit for young people with sounder tissues.

Massage need only be mentioned; its aim is primarily to remove obstructions to circulation. The normal blood should be sufficient to establish normal bacterial and other conditions, and massage gives it the freest play. The essence of bathing, called when practised scientifically "hydrotherapy," is the same, save that its special function is to free the obstructed perspiratory system.

To these might be added a fourth, which in some sense is the most natural of all; for it has been practised in ages more remote by many thousands of years than the suspicion of either of the others, and by savages almost at the bottom of the human scale; that is, some form of suggestion or hypnosia. The main difficulty of this sort of treatment is that so little has been done to make it utilizable in practice, or to provide any certain means of assuring a definite result. Another is, that as with all the forms of mental science, its vagueness, its mystery, the impossibility of regulating its manifestations, surround it with so hopeless an atmosphere of fraud and of that open-mouthed credulity which irresistibly invites fraud. Yet after all, the psychical method has always played an important though largely unrecognized part in therapeutics. It is from faith, which buoys up the spirits, sets the blood flowing more freely and the nerves playing their parts without disturbance, that a large part of all cures arises. Despondency or lack of faith will often sink the stoutest constitution almost to death's door; faith will enable a bread pill or a spoonful of clear water to do almost miracles of healing, when the best medicines have been given over in despair. The basis of the entire profession of medicine is faith in the doctor and his drugs and his methods. This is no new discovery: it was said by Galen that "he works the most cures in whom most have faith," and the doctor-chemist-charlatan Paracelsus, who died of taking a universal panacea too poisonous even for his confidence, told his patients to have full faith and a strong imagination and they would see the effects of it.

The subject of hypnotism, originally called mesmerism from its 18th century describer and practiser, can only be touched upon. Different practitioners have had such varying results from its use as to suggest that here too the personal equation is very important. Braid of Manchester, England, who first made a scientific study and attempt at utilizing it, was not successful; while an English surgeon in India, Esdaile, was highly successful, performing 268 operations on patients with all the effect of anæsthetics, not then introduced. Its possibilities have been greatly exaggerated, not so much by the claims of the persons using it (except impostors) as by the eager credulity of the public. It seems not so much to create a new condition of sensitiveness to suggestion as to increase what normally exists. In organic disease it is practically useless. Its great service has been found to be in various affections which may all be classed as of the nervous system: hysteria, spasmodic functional complaints, children's vicious habits, and the victims of the drug and alcohol habits; occasionally in childbirth and surgery, but it is precarious and not free from serious dangers. It should no more be practised without witnesses present than dentists give nitrous oxide, and the law should restrict its practice to special licensees or physicians of a certain grade.

WILLIAM OSLER, M.D.,
Regius Professor of Medicine, Oxford University.

MEDICINE, Preventive. See PREVENTIVE MEDICINE.

MEDICINE, Recent Progress in. Of none of the departments of human knowledge can it be said that it is thoroughly and positively progressive more than of the science of medicine. The new birth of medicine may be said to be associated with the names of three men, Virchow, Pasteur and Lister (qq.v.), all of them men of the 19th century.

Virchow, while not the discoverer of the different cells of the body, determined that its tissues were entirely composed of cells of various kinds, and he particularly identified the different types of diseased structure of the

tissues by the form of cell which predominated in each of them. Pasteur opened to the vision of the world the vast field of the infinitely small, discovered and described many varieties of bacteria, separated them from one another, cultivated them on artificial media and demonstrated their enormous significance for good or evil. As the father of the science of bacteriology (q.v.) he was one of the greatest benefactors the world has ever had. Lister, who died in 1912, may justly be called the apostle of cleanliness. To him more than to anybody else is due the demonstration that cleanliness is really next to godliness. By avoiding dirt of all kinds, by the use of chemicals to destroy germ life and finally by the simple practice of absolute cleanliness in every department of surgery he revolutionized that art, and made possible, as matters of everyday occurrence and of comparative safety, procedures which before his time were considered extra hazardous and which in the great majority of cases resulted fatally.

The stimulus produced by investigation of Lister in the realm of antisepsis during the seventh decade of the last century was quickly responded to by surgery. The chief points in Lister's recommendations consisted in cleanliness of wounds and all their surroundings; cleanliness of the surgeon, especially of his hands and finger-nails; the use of carbolic acid, particularly in the form of spray in the operating room during an operation, to destroy the disease germs in the atmosphere, and the use of antiseptic dressings or coverings upon wounds.

The older surgeons smiled at all these details which seemed to them foolish and unnecessary. After 25 years practically all opposition had been overcome. The results compared with the results under the old system simply compelled the adoption of the new principles. But experience also showed that the use of powerful chemicals was unnecessary in the treatment of wounds, and that often it was really injurious. It was then determined that the sterilization of every thing which had any relation to a wound could be accomplished quite as effectually through heat and moisture as with chemicals and with a greater degree of comfort and safety. Consequently the instruments, the dressings and all the apparatus connected with an operation were subjected to a high temperature sufficiently long to destroy all germ life, and the surgeon himself and all his assistants put on freshly laundered white clothing, and washed and scrubbed their hands, face and arms with soap and water sufficiently long to ensure relatively complete cleanliness. Then rubber gloves were put on as an additional safeguard against the contamination of the wound which was about to be made.

This is practically the procedure which is now carried out at a surgical operation in every modern hospital throughout the world. Such precautions enable surgeons to penetrate any portion of the body with absolute fearlessness, and with the confidence that in the great majority of cases in which proper judgment has been shown in selecting the case, and proper skill possessed by the surgeon, the patient will recover. It will not bring the dead to life, but it will often restore those whose lives hang by a mere thread. Thus surgeons are able to perform operations within the skull, within the cavity of the chest, within the cavity of the abdomen, and within the joints and upon the brain, the heart and lungs, the stomach, liver, spleen, intestines, pancreas, ovaries and uterus and the kidneys, ureters and bladder, which were impossible before the time of Lister, or if they were performed the patients almost invariably died.

One of the most recent developments in surgery consists in the transfer of blood from the arm of a healthy person directly into the circulation of one who is almost at death's door either from loss of blood, from the shock of a surgical operation or from some other cause. An attachment is made between an artery in the arm of the healthy person and a vein in the arm of the sick person by means of a suitable tube which is carefully adjusted into openings made in the vessels above mentioned of the two persons, the outflow being so gauged that it will be known when the proper quantity has been withdrawn. The method has proved life-saving in a number of instances, but it is not without danger, for should a clot or clots form in the outflowing blood it would quickly check the circulation in the receiving person or might quickly cause death by interference with the heart action.

Another important procedure which has been perfected during the past 25 years is what is known as the Cæsarean section, which consists in removing a child from the womb of its mother through incisions in the abdominal wall and the womb. This is a very ancient operation and is attempted when it is believed that the child cannot be born by the ordinary channel. The result was formerly fatal in the great majority of cases to the mother if not to the child. Under the modern methods of surgical procedure it is now done with great frequency, sometimes even by doctors of inferior surgical skill and experience, and in most of the cases both the mother and the child recover.

Under the influence of the reforms instituted by Lister the practice of obstetrics is far safer, both for the mother and for the child than ever before. Fifty years ago a maternity hospital was little better than a graveyard. If a mother survived the immediate danger of parturition she was very likely to die from the blood-poisoning or septicæmia which followed. Now, thanks to the influence of Semmelweiss, Holmes, Lister and those who have followed them, a maternity hospital is the safest place in the world for a woman to give birth to her child, not alone because the doctors in such hospitals have more skill than formerly, but because they are clean themselves, and everything around them is clean.

In the treatment of disease great advances have been made. There are many more drugs upon the market than formerly and doctors seldom write out a surgical prescription nowadays. The medicine makers have forced their wares upon the profession, and for every disease it would seem as if there were a hundred remedies. Some of these remedies are valuable, but the greater number are valuable chiefly in the eyes of those who make and sell them and who can induce the public to use them and have faith in them.

But there is one marvelous remedy which

has been brought forward within the past few years which is known as "Salvarsan," or popularly as "606" because its discoverer, Professor Ehrlich, made 605 chemical combinations before he hit upon this one. (This number has since been increased to 914, the new compound being called "Neosalvarsan"). This substance is a compound of arsenic and is used in the treatment of syphilis, which is one of the most deadly diseases, in the wide extent of its ramifications, of all the diseases of which human beings are victims. A single injection of this substance into the tissues will sometimes cure a case of many years' duration. But it is not infallible, it sometimes is followed by bad results, it must sometimes be used during a considerable period of time and its best effects are sometimes obtained when it is combined with a suitable preparation of mercury, which heretofore has been the mainstay in the treatment of syphilis.

Investigations have been constantly proceeding to endeavor to find a cure for that greatest scourge of the human race — cancer. Many so-called remedies have been discovered and announced, only to be quickly abandoned. As cancer is known to be a local disease in its incipiency, it is often cured by the surgeon's knife when attacked sufficiently early and with sufficient thoroughness.

The recent studies of Wassermann and Ehrlich in the endeavor to find a substance, synthetically composed, which shall have a selective action for the cells of cancerous tissues and be inactive upon other tissues seems to have been successful in cancer in mice, which form one of the few species of animals, if not the only one, in which the disease may be transmitted from human beings. If the result should prove what there is great reason to believe it will prove, it would be one of the greatest victories in all the annals of medicine.

Tuberculosis is yielding to the steady attacks which are being made upon it in city and country. It has long been known that it was curable, all that it has needed has been a concerted attack upon it, and now by means of a few drugs, a proper diet, plenty of pure air and an out-of-door life, the conquest of this terrible enemy is almost in sight. Sanitariums and open air institutions of treatment, public and private, for men, women and children are being established in all suitable parts of the country, and the number who are being radically cured of the disease is increasing enormously every year. What is really better is the intelligent perception and comprehension of the disease which will prevent people from contracting it, and in course of time we may expect it will occur with comparative infrequency.

There is no disease into the study of which more enthusiasm has been thrown in recent years than that of tuberculosis and many sanatoria have been established in various parts of the country for the care of the tuberculous.

One of the most important aspects in the treatment of this disease consists in the care of the children of tuberculous parents. It has led to the organization of open-air homes for their treatment. One of the most useful of this class of institutions is the Preventorium, as it is called, which has an estate of 170 acres at Farmingdale, N. J., with suitable buildings and equipment. It takes selected children of tuberculous parents, debilitated and susceptible to disease, between the ages of 4 and 14, to a comfortable place where they will have plenty of wholesome food, 12 hours of rest in bed at night and an additional hour after the midday meal. It gives them two and a half hours of school instruction and requires a few trifling household duties. The remaining eight and a half hours are devoted to play in the woods and fields.

One of the great discoveries of the past 20 years was what is known as the X or Röntgen rays. Their power of making invisible things visible is well known and their application to the photography of the interior of the body has been of priceless value. They have also been used in the treatment of certain diseases, sometimes with alleged success, but often with positive harm. Their influence in producing severe burns, which it is almost impossible to cure, is well known. In not a few cases their use has led to the development of cancer in those who worked with them. Quite a number of physicians have lost their lives as the result of malignant disease produced by their influence.

The influence of serums, vaccines and cultures of bacteria and their products in the treatment of disease is a subject which is now absorbing a vast amount of attention both in the laboratory and in the treatment at the bedside. It would seem as if we were at the threshold of an entirely new order of things in this respect. Fever which has long been considered baneful is now regarded as frequently beneficial.

The bacteria which are constantly in the body are found to be harmful, or beneficial or indifferent according to the conditions of the body. Harmful bacteria when killed and injected into the body may sometimes cure diseases which at other times they would cause. The constituent elements of the blood are ingredients in a great reservoir, some good and some bad, and good or bad according to certain conditions.

The statements which have been made in the last few paragraphs will indicate the trend of thought at the present time, which is largely in the direction of preventive medicine (q.v.). Prevention is, of course, better than cure, and the great object now seems to be to find substances which will make one immune or proof against the attacks of various forms of disease. In pusuance of this doctrine inoculations with properly prepared germs or their products are now made for smallpox, diphtheria, typhoid-fever, lock-jaw, pneumonia and various other diseases. It is a field which is full of promise and of hope.

This article should not be concluded without a word in regard to the great triumphs which have been achieved by the development of sanitary measures. It is known that certain diseases are propagated by insects. Malaria is propagated by a particular species of mosquito and the same is true of yellow fever. It is known that the mosquito breeds in stagnant water. The elimination of these diseases from the places where they abound would seem therefore to be dependent upon the elimination of the mosquito. This has been tried on a grand scale in the building of the Panama Canal (q.v.) and in the cleaning up of the city of Havana. The drainage and sanitation of

the Canal Zone are the work of an army doctor, Colonel Gorgas. Without this work the canal could not have been built. By doing this work the Canal Zone has been transformed into an agreeable health resort.

The recent history of medicine has also been marked by the establishment of sanatoria for the treatment of particular forms of disease and of various institutions and laboratories for special investigation and research. Fifty years ago none of these were in existence. The plan of these institutions is to study exhaustively a single disease or group of diseases, experimenting patiently and continuously upon human beings and animals by means of chemical and biological procedures, by mechanical measures and by means of every other form of assistance which human ingenuity can devise.

This work is prosecuted unceasingly until the cause of the disease is ascertained, and when that point has been reached the study is continued for the removal of the cause or for its effective overcoming. In other words, a life and death struggle is going on between the forces of disease and the intelligence of man as never before, and one after another of the strongholds of disease is being battered down. Not only in this country, but in all the countries of the civilized world has this spirit of inquiry into the cause and treatment of disease infected men as with a consuming fire.

The institutions of investigation and research may be devoted to the study of a single disease, like cancer with its wide ramifications, an illustration of which is the laboratory for the study of cancer at Buffalo, N. Y., or they may take up a single disease, study it until all possible information has been gained, and then take up another disease and treat it in a similar manner.

This is the method of the Rockefeller Institute (q.v.) in New York.

One of the best illustrations of progress in medicine from an institutional point of view is seen in the development of our boards of health and sanitary organizations, municipal, State and national. In many of our cities, especially in those of the first class, they are very highly organized.

Besides the usual care for infectious diseases they have the responsibility for the purity and healthfulness of the water supply, for the quality of the milk supply, including the condition of the dairies from which it is derived, or the quality of the food supply in general, for the ventilation and safety of public buildings, for the sanitary condition of tenement houses, for the inspection of school children and the general supervision of their health, and for a great many other functions which have a bearing upon the public sanitary condition.

One of the most important departments of their work concerns their laboratories where evidences of suspected disease are investigated, diagnoses of physicians confirmed or negatived, inoculation material prepared for the treatment of infectious disease among the poor and a great deal of very useful additional work done of which the public at large knows little or nothing.

Hospitals for certain diseases, especially those which are highly infectious, like diphtheria and scarlet fever, are also under their care in some of the cities, and are means for obtaining valuable data concerning the history of such diseases. Of the sanatoria, public and private, which have been established in recent years for the care and investigation of disease, those which are of a public or semi-public character are, as a rule, the ones which have accomplished most in throwing light upon the problems which relate to disease.

It is impossible here adequately to represent the wealth of contributions to medical science which have been literally pouring in in recent years, both in medicine and surgery (see WAR SURGERY), but a few instances of recent advance will be mentioned. The establishment of the bacterial origin of typhus-fever was announced in 1915, and the fact that it is transmitted by lice and other body insects. The worst epidemic of typhus in modern times began in Serbia and was combated successfully by American physicians under the direction of Richard P. Strong of Harvard University, after it had reached a stage where, in April, 9,000 new cases were reported daily. In the same year an epidemic of the plague started in New Orleans and was successfully confined to a narrow compass by the United States Public Health Service. This included the spraying of buildings, the fumigation of vessels with hydrocyanic acid gas and the extermination of a half a million of rats. This is a highly gratifying result of the improved state of medical education which quickly senses the advantages of public health work. Efforts to improve the knowledge of physicians who have taken their degrees, but who are too much occupied with their work to be able to go to a distant medical school for post-graduate work, are now being made through a system of post-graduate work at home, a plan originating with the Medical Society of the State of Pennsylvania, in a series of clinics and discussions before county medical societies. This plan was also adopted in North Carolina. The Great War in Europe has brought out extraordinary resources in medicine with the result that while the conditions known to former warfare have been repeated on a scale of unexampled magnitude, there have been new elements, such as the intensity of the explosives, causing "shell-shock," and the new features such as poisonous gas. Poison gas, "mustard gas" (dichlorethyl-sulphid) was hurled in shells in liquid form and resulted in burns of various severity. When inhaled it caused inflammation of eyes, nose, throat and lungs. As its poisonous effects are produced only in moist conditions and as it has itself very little odor, the results are not manifest for some time. Distress in the stomach and vomiting ensue after several hours, accompanied with acute conjunctivitis, running of the eyes and photophobia, or oversensitiveness to light, frequently complicated with laryngitis and bronchitis. If the skin is touched by the liquid, burns result producing blistering and desquamation. In spite of the much more deadly methods used in modern destructive warfare, the deaths due to disease have been reduced from 97 per cent of all deaths in the Napoleonic wars, where only 3 per cent died in battle, and in the Boer War, where the deaths from disease were 67 per cent to 4 per cent in the late war.

A tendency to develop research in medical

fields solely through laboratories in which the intimate structure of the body was studied and the influence of the chemical constituents of the various organs upon each other, and that of the pathogenic elements, both endogenous and exogenous, resulted in a high degree of specialization in which the general practitioner found himself at a loss to keep up with the advances in knowledge. He was therefore more and more in the habit of referring his patients to specialists who confined their researches to the physiology and pathology of a single organ, such as the eye, the ear, the stomach, the intestines, etc., and the interrelation of the exceedingly complicated details of physiological process was almost impossible adequately to realize. The weakness of the laboratory and specialist method of treating disease was felt mainly because of the fact that only the advanced or at least well developed stages of the disease came to the laboratories. This procedure failed utterly to take into consideration the registration of the disease in its early stages, a physical condition which is of course actually present, though not visible. These methods, too, relied exclusively on what are known as "physical signs." These, which are but a limited portion of the true symptoms of disease, are among the last to appear as evidence of the presence of a diseased condition. It has therefore been realized that there are symptoms of great importance in certain conditions which may be but premonitory of a later organic disease, and that these symptoms are not physical signs but are mental. This enlarges the function of the general practitioner, whose knowledge of the lives of his patients and of their antecedents is much more valuable for the treatment than any amount of such knowledge collected by laboratory methods could be. It is also in line with a tendency which is most prominent to-day in practical medicine, namely that which has developed the subject of preventive medicine (q.v.) to its present proportions. This recognition of the mental registration of disease antecedent to its physical registration as a physical sign is supplemented by the introduction into psychotherapy of psychoanalysis (q.v.), a procedure which originally included only the mental treatment of mental diseases. But it is now recognized that many physical diseases as well as giving mental signs of their onset before the physical signs have a mental origin, are in other words psychogenic, a point of view which opens a new field not only to medicine but also to education. Indeed it is now seen that much of what was formerly attributed to purely physical causes must now be assigned to faulty or incomplete mental processes. Therefore the modern physician needs to know all he can possibly learn of human psychology and its advances into the knowledge both of conscious life and of the unconscious; and the old materialistic attitude of the physician who thought that the physical signs and the drugs or operation "indicated" constituted the whole of therapeusis, is giving way to that of the modern practitioner who finds that almost nothing is irrelevant to the total situation as presented to him, and that he cannot treat the body exclusively. If he thinks he is doing that, he is shutting his eyes to the very patent fact that by his authoritative position he is producing a mental effect upon the patient which in turn has a secondary physical effect which he cannot afford to ignore. In short it may be said that the field of medicine has in recent years both widened enormously and has at the same time deepened, including as it does not merely the mental signs of approaching illness, as well as the formerly recognized physical signs of its later and well developed stages, but also the unconscious as well as the conscious element in the mental factor, a condition which has quadrupled the sphere of usefulness of the physician of to-day as compared with that of the specialist of yesterday.

SMITH ELY JELLIFFE.

MEDICINE BOW MOUNTAINS, a range of the Rocky Mountains on the west side of Laramie Basin in central Wyoming. Medicine Bow Peak, the highest summit, is 12,005 feet above sea level. Most of the area is a high plateau covered with pine forest and included in the Medicine Bow forest reservation.

MEDICINE DANCE, a common practice among the American Indians; dances being conducted by the medicine men of the tribe for various purposes, and in preparation for different events, like warfare, the hunt, etc. Both in the dance before a battle and in the conflict itself the medicine chief is the one man most worthy of consideration. If war takes place he courts the thick of the fight if for no other reason than to show his immunity from danger. The funeral dance of the Yaqui tribe is a representative example of the medicine dance; the chief medicine man arranging the ceremony, which ensures the safe passage of the dead to the spirit world. The dancers to the number of half a hundred appear in the centre of the assembled tribal gathering, naked except for a cloth about the loins. Their bodies are painted in imitation of skeletons. Over their heads they wear masks fringed with long horse-hair, dyed in many hues, eyelashes and eyebrows hang over the rudely designed faces and beards reach nearly to the waist. On their legs they fasten strings of rattles cut from rattlesnakes, and the sound of these is most grewsome to the spectators. Each dancer carries two knives, one in each hand, with which he gesticulates violently in imitation of the act of slaying imaginary enemies. Every man dances after his own ideas, each seeming to outdo the other in the violence of the motion. Music for the dance is furnished by tomtoms. After the dance a great feast follows, continuing until midnight.

MEDICINE HAT, Canada, a city in the southeast corner of Alberta, 600 miles west of Winnipeg and 167 miles southeast of Calgary,

in lat. 50° 2′ N., and long. 110° 40′ W., and is 2,181 feet above sea-level. It is situated on the slope of the South Saskatchewan River which gives it a drainage much superior to towns on the open prairie. The city took its rise in 1883 from the advent of the Canadian Pacific Railway. It is on the main line of the railway and is the terminus of the Crow's Nest Line. For many years it remained a centre for the cattle ranching industry for which the surrounding country was excellently suited, the chinook winds which prevail in this part of the country enabling the horse and cattle to range in the open throughout the winter as during the summer. But the large ranches are rapidly disappearing as the land is being brought under cultivation by the homesteaders. In 1899 Medicine Hat was incorporated as a town and in 1907 as a city. As its earlier development was due to ranching and then farming its late development is due to the rise of manufactures. Like Lethbridge it is one of the four principal coal mining centres of the province but its most valuable resource is gas. It lies in the centre of one of the largest fields of natural gas on the continent. The gas was first discovered about 1885 when the Canadian Pacific Railway bored on the banks of the river to find coal deposits. The first gas well was drilled in 1890 by a company of local citizens. For many years the gas was gradually developed for domestic consumers but from 1909 it has been more extensively developed as a cheap and excellent fuel for manufacturing purposes. Both gas engines and steam boilers heated by gas are used. The analysis of the gas is as follows: methane 99.49 per cent; hydrogen .51 per cent; B.T.U.s per cubic foot 1,100. The city has 17 gas wells with an average daily open flow of two million cubic feet and distributes this to domestic consumers at 15 cents and to manufacturers at 5 cents per 1,000 cubic feet. The city owns and operates its own utilities. The electric plant and the water plant are operated in conjunction, the same boilers producing the power for operating the pumps and the dynamos. The city water supply, taken from the Saskatchewan River, is passed through a sedimentation basin and filter beds and is pumped to a reservoir on a hill overlooking the city from which it is carried by gravity pressure. There is also a sanitary sewage system, the sewage being deposited in the river some distance below the city. The streets are all 66 feet wide, are all macadamized and have been well planted with trees. The sidewalks are of cement. The manufacturing and business section is built of brick while the private residences are mostly of wood construction. There is a dry-farming demonstration farm, also a business college, a general hospital, a grain elevator, flour, linseed-oil, rolling and planing mills, brick works, a steel plant, lumber, glass works, foundries and machine shops. Pop. 9,272.

MEDICINE MAN, among the American Indians, South Sea Island tribes and other savages, a man supposed to possess mysterious healing powers. Among most savages the medicine man occupies much the same position as that held in civilized communities by two of the learned professions — medical and clerical. The medicine man is both priest and physician, and is at once the repository of all that a tribe knows, fears and believes. In very low stages of human development, however, he is at best only a magician, dealing in terrors, possessed of occult powers, but laying claim to no special medical knowledge. Thus, among the aborigines of North Queensland, the tribal doctors do not attend on the sick — an invalid being cared for by wife or mother. They are not ostentatious, a medicine man being distinguished by no insignia save a small bag for his talismans, death charms and other "credentials." Among the North American Indians medicine men are treated with great respect, and form a secret society with exclusive privileges and "exercise a terrible influence in degrading the people." It is curious to find that, as in Australia, the Indian medicine men are chiefly concerned to do positive harm. In co-operation with good and bad spirits, they bring about the deaths of men or dogs at a distance. Among the Ojibways they are a kind of brokers in vengeance, and a coward or a hypocrite who wishes to be covertly avenged upon an enemy will bribe his tribal medicine man to employ the medical attendant of his victim. Then, if the victim dies, the instigators remain, unsuspected, and the actual perpetrator of the crime probably goes scot free. Indian medicine men affect to suck out poison from a patient's body, or they cough up an arrow point or small, sharp piece of stone or bone which they suppose has been transferred from him to them by the evil spirit of another sorcerer. The medicine men of the Eskimos are even more extravagant in their pretensions. They profess themselves able to change into wood, stone or animal, or even to walk on the water, or to fly, but they make a condition, which is that "no one must see them." See INDIANS.

MEDICINE AND PSYCHIATRY, Psychology in. Although the great power of suggestion has been recognized from the earliest human times and the powerful influence of the mind on the body somewhat understood for centuries, the medical schools obviously have in general belied their high privilege of first studying and then teaching the relations and mutual dependence of body and mind. They have neglected psychology. It has been a characteristic of modern scientific medicine that it has *integrated* inadequately, and therefore been unduly narrow (in this respect) in its range,— these two facts indeed being but natural results of the plain over-guidance by the tradition of materialism. And this is strange to the average man and unaccountable to a degree, for the best English and, to a less extent, French attitude was one of adequate and practical realization of the health's frequent dominance by the mind, and the width and depth and misunderstood complexity of the influence of that which we designate as mental. John Locke influenced the experience of early English medicine more than did the materialist Thomas Hobbes; but America somehow narrowed if it did not "harden" its medical heart.

The practical result of this trend has been a regrettable, not to say surprising, slowness in medical education's recognition that the practitioner invariably should know the broader rudiments at least of psychology; have systematic, however brief, acquaintance with the founda-

tion-principles of the relation of body and mind; and above all be forced to realize, against the old traditional materialistic prejudice, that every patient is mind quite as importantly as body. Every reader knows this for himself.

Because, in part, of his varied education, the present writer was almost a pioneer in practical attempts to correct this particular narrowness of American medical education, although laboring meanwhile under quite characteristic difficulties, such as the tradition of the schools and lack of time and of funds. To repeat part of an article in *Science*, 18 years ago (26 July 1901):

The education given to the medical student seems in general too grossly materialistic, too somatic. He learns but one side of this two-sided story; from the first year to the fourth, from the dissecting room to the gynecological or otological clinic the routine student sees and hears of muscles and bones, and viscera, sense-organs, nerves and vital fluids, but little, unaccountably little, of that other aspect of men and women which to these very men and women is their life, while these other, these organs, are but needful instruments of that life's attainment. And their point of view, it need not be said, is also that of philosophy; shift it, and illogical confusion follows. The layman cares little or nothing for his stomach's condition so long as it gives him no pain and takes good care of what his will and his appetite lead him to supply to it. The woman in search of a happy family life thinks seldom of her reproductive mechanism so long as it gives her healthy children whom she can love. There is something beside cell-built tissue for the gynecologist in charge of an operative case to consider when of two women, alike in vigor, who undergo identical ovariotomies, for example, one goes in three weeks from the hospital a new woman, cheerful, capable and happy, while the other becomes an hysteric wreck never perhaps to equal her former self in happiness or in health. As every surgeon knows, such differences are met continually and they puzzle him. Why is it that present medical education takes no account of the principles underlying phenomena like this?

So far as the student is concerned, the course, four years or three years long, quite ignores in general the emotional and temperamental factors which in one way or another, directly or indirectly, less or more, enter into almost every chronic case and into many of the acute cases which the general practitioner is called upon to treat. Instead of striving to teach the student what conditions underlie mental habits and idiosyncrasies, medical instructors are now content to practically ignore them regardless of possible great benefits to come from their study as psychological data.

Too often is the medical man the most materialistic-minded member of a community, when his view should be much deeper, into the controlling forces of life. This is the natural outcome when in a long medical course no part of the individual is shown to the student except what he can feel with his hands or see through the microscope. Yet how commonplace is the assertion that the man, the real man or woman, is not his or her body, but the will, affections, habits, character, of the individual, while (what is more immediate to our argument) these same aspects of consciousness are often the direct molders, or destroyers of disease and, as one side of an inseparable psychophysical organism, have more control or influence over the functions purely somatic than the average practitioner of medicine appreciates. Not mind controlling body nor body controlling mind, but both together always sensitive to the stimuli of a common environment, combined into the actual individual.

The whole trend of modern biologic science is toward the appreciation that neither factor of personality, body or mind, in justice to the medical student and through him to the public may be longer ignored.

Agreeably to such convictions, the catalogue of the Tufts College Medical School of 1900–01 contained announcement of a course in "Normal Medical Psychology." This was continued for nine years, when by arrangement with Prof. Morton Prince, it was developed into a course termed "Psychopathology and Psychotherapeutics." In 1912 (for lack of funds to pay the lecturers) the psychological work was abandoned. Such a record of pioneer development in medical curriculum is instructive in several respects to all of those who believe that a physician should realize that his patients have minds influential to a degree at present quite indefinable but more and more appreciated. So far as known, the Johns Hopkins medical department alone preceded in the practical and systematic realization of this basal fact.

The slowness with which adequate courses in normal medical psychology are made required parts of medical curricula, is another depressing sign of the essential narrowness of the average professional outlook into life and philosophy, just as it is another evidence that medicine is for some of its practitioners still largely a trade wherein no facts are either of interest or desirable, no breadth of view admittable, that has not a bank-note or its equivalent closely attached. Hasten the progressive day when without the broadening education of the college bachelor's course at least no man or woman shall be allowed for gain to take charge of the human personality of a fellow mortal! For without his psychology he knows only about half of the being whom he pretends thoroughly to understand.

The reasons in particular for this insistent need of psychology in medical education the writer already in part has summarized in an article in the New York *Medical Record* of 30 Jan., 1909.

The Physician's Need of Psychology.—The most obvious and immediate need for systematic medical psychology comes, of course, from psychiatry and neurology. That the demand does not come even more insistently than it does from the teachers of these subjects, especially of the former, is one of the anomalies of the whole matter. When one does not expect a student to understand the deranged movements of the heart who has never seen a healthy heart or a representation of one, why should the multitude of third- and fourth-year men who know nothing of the processes of perception and imagination be expected to comprehend an hallucination? Or those who have never been told of the mechanism of the emotion of fear to understand the depression and misery of melancholia? One asks too much in

expecting any man to really comprehend a case of paranoia who has no notion of the processes of ideation. And neurasthenia, the bread-and-butter malady to practitioners of nervous disease, does any suppose it is not so intertwined with mental relationships that to unravel it in full is to make use inevitably of no little various and intricate psychology? The modern variants of the "rest cure" require a knowledge of the motor relationships of the mind, and else this valuable system of retraining the mind back to health through controlled voluntary use of the muscles would lose much of its precision and basal usefulness.

In a less technical way, perhaps, but quite as importantly in the long run, the surgeon as a surgeon needs to be familiar with mental processes. It is especially important that he should realize the often surprising life-lengthening support and stimulation, technically called dynamogeny, that belongs to the joyful emotions. Scarcely less useful oftentimes, explain it as one may, is the vitalizing influence of determination, of vigorously expressed will to thrive and to live. Aristotle and John Hunter down to the latest of them all agree in admitting these facts, however the future science of normal medical psychology shall in detail interpret and explain them. Does the sceptic (if such, perchance, persist into these "latter days") know of a single really great surgeon who does not inevitably inspire the almost perfect confidence of every patient under his care? Can the master-surgeon actually cut us up invariably so much better than his struggling neighbor in the next block uptown? Or is his far greater success due in part to his exaction of confidence in his knowledge of human nature as really it is — mind as well as body,— giving us confidence and so inspiring hope and all the guarding and reparative powers of pleasant and stimulating emotion? The physiology and psychology of this important influence we now fairly well understand.

In a still more general way, the successful practitioner in medical cases as distinct from surgical, consciously or otherwise, uses the principles of psychology in a very large proportion of his practice. One need not attempt the laborious task of specification here, for every practitioner must nowadays realize to some extent the mental factors in every complex disease.

The Need of Psychological Instruction for Breadth.— In all departments of the science of medicine there is always an urgent demand for a broader outlook than the average medical student can obtain without a preliminary college course. It is easy to underestimate the influence and the importance to humanity of the profession of medicine.

Medical philosophy reaches out into almost every aspect of human relationship, and thus it pervades, and in considerable part directs, every phase of modern human society. That it does not do so to even a greater extent than it does is largely because the nature of personality is not adequately studied in the medical school. Many phases of the individual are often exhaustively considered, but at present it is no one's business to combine these scattered parts into the wholeness of the individual child or man or woman. And yet every patient is an individual, a personality, and has a heart and kidneys and nervous system and all the rest only as parts ministering to this personality. It is one of the important tasks of the medical psychologist to weave these scattered threads of organic knowledge into this actual personality. Then at last the average physician will know, in some measure at least, how to follow the sound advice of the numerous orators at commencement who advise the graduates "to treat not the disease but the individual suffering from the disease." The somatic aspects of the man are adequately treated in many, and perhaps in most essential, respects, but of the inner side of the "arc of personality" one hears but little as yet from the teaching faculties of medicine. The tide, however, is coming in!

The psychology of sex is a phase of education for which there is continually a more obvious demand from a grossly wronged and degraded society, and consequently from educators.

The course in legal medicine in the medical schools demands for its greatest usefulness the basis of psychological knowledge which should precede it in the curriculum. Human misery and crime often depend on motives more psychical than physiologic.

Psychology's Influence on the Physician Personally.— Medical instruction in psychology undoubtedly would make the physician more sympathetic with his patients than sometimes he now is. With this added sympathy he would serve them better because more understandingly. He would tend to approach then the ideal of the oldtime family practitioner, "guide philosopher and friend." Knowledge of the processes and relations of mind would be to the physician himself a source of great and unending satisfaction. Related to it is not only the knowledge of human nature, that never tiring source of interest and delight, but psychology leads outward in all directions into the true wisdom of divine philosophy.

In 1913 the American Psychological Association, by a committee, investigated the status of psychology in American medical schools. One of the questions asked the deans related to the advisability of special instruction in psychology. Of the 71 schools (only 71) answering this question, 73 per cent replied in the affirmative, 12 per cent in the negative, while 15 per cent gave a qualified answer one way or the other. How slow is the recognition that emotions and ideas control the body!

Psychology in Relation to Psychiatry.— It is obvious that the medical care of insanity cases, if more than "asylum" is to be offered these "unhappy" souls, must depend as much on the physician's knowledge of psychology as on somatic medicine. At present it is in a widespread area of our country nothing less than a reproach that so few professional psychologists are trying to relieve and to cure the insane. In every case, from the irrational paranoiac to the terminal dement, much knowledge of the normal mind would seem to be a not wholly unreasonable requirement in an attending physician! As yet the percentage who have such knowledge is so small as to constitute a reproach to organized medical efficiency and nothing less than that. Even the superintendents of these institutions conducted for the cure or the care of diseased minds are seldom or never psychologists. And still many

of the hospitals have no such modern improvement about the place.

GEORGE VAN NESS DEARBORN,
Medical Corps, United States Army.

MEDICINES. See CHEMISTRY, PROGRESS OF.

MEDICK, a plant genus of the natural order Leguminosæ, native of the temperate and warm belts of the Old World. The pods have spiral twists and the genus includes very many species, both annual and perennial, with trifoliate leaves closely resembling the clovers. Some species have been introduced into the United States, of which lucerne and alfalfa are economically the most important. Several Russian species which require little moisture have recently been introduced in the arid and semi-arid regions of the West and have been proved a success. See MEDICAGO, and consult 'Bulletin 108' of the Texas Agricultural Experiment Station (1908) and 'Bulletin 165' of the Alabama Agricultural Experiment Station (1912).

MEDILL, mĕ-dĭl', **Joseph,** American journalist: b. New Brunswick, Canada, 6 April 1823; d. San Antonio, Tex., 16 March 1899. Having early removed to Massillon, Stark County, Ohio, he was admitted to the bar in 1846, practised at New Philadelphia, and in 1849–51 published at Coshocton the *Republican,* a Free-Soil paper. In 1852 he established at Cleveland the *Forest City,* a Whig organ, which in 1853 was united with the *Free Democrat* and called the *Leader.* In 1855 he sold his interest in the *Leader,* removed to Chicago, with two partners purchased the *Tribune,* advocated radical anti-slavery measures and supported Lincoln in 1860. He was a member of the Illinois constitutional convention of 1870; United States civil service commissioner in 1871 and in that year was elected mayor of Chicago. In 1874 became editor-in-chief of the Chicago *Tribune,* in which relation he remained until his death. It was largely due to his individual efforts that the city of Chicago was selected for the World's Fair of 1893.

MEDINA, José Maria, hō-sā' mä-rē'ä mā-dē'nä, Central American politician: b. Honduras, about 1815; d. Santa Rosa, 8 Feb. 1878. He was president of Honduras in 1862–63 and was re-elected in 1864–66 and in 1870. The war with Salvador in 1871 disturbed his hitherto successful administration and at the next election he was defeated by the Liberal party who elected their candidate Arias. Defeated again by Leiva in 1874 Medina raised an unsuccessful revolt in 1875–76 and in 1877 a second revolt was punished with death by court-martial.

MEDINA, José Toribio, Chilean bibliographer: b. Santiago de Chile, 1852. He received his education at the National Institute and the University of Santiago, being graduated in law at the latter institution in 1873. At the age of 22 he was appointed secretary of legation at Lima. In that city he made investigations in the archives and in 1878 after his return to Chile he published a history of Chilean literature. Already in 1874 he had published a metrical translation of Longfellow's 'Evangeline.' In the war with Peru, Medina served in the army and at the close of the war was made judge in the provinces ceded by Peru. He was made secretary of legation at Madrid in 1884 and here also he delved into the Spanish archives dealing with the Spanish in America and especially the history of Chile. He returned to his native country after several years' residence in Europe. He went abroad again in 1902 and also visited the United States to make further historical studies. Medina's great work is the 'Biblioteca hispano-americana, 1493–1810' (7 vols., 1898–1907), which contains notices of 10,000 works. Other bibliographical works are 'Historia y bibliografia de la imprenta en el antiguo virreinato del rio de la Plata' (1892); 'La imprenta en Manila desde sus origenes hasta 1810' (1896); 'Biblioteca hispano-americana septentrional' (1897); 'Biblioteca hispano-chilena, 1523–1817' (3 vols., 1897–99); 'La imprenta en Bogotá, 1739–1821' (1904); 'La imprenta en Guadalajara de México, 1793–1821' (1904); 'La imprenta en Guatemala, 1660–1821' (1910); 'La imprenta en la Habana, 1707–1810' (1904); 'La imprenta en Lima, 1584–1824' (4 vols., 1904–07); 'La imprenta en México' (1907—); 'La imprenta en puebla de los Angeles, 1640–1821' (1908); etc., etc. Medina's historical works are also important since they are based on manuscript sources. They include 'Historia de la Inquisición en Lima' (1887); 'El Tribunal del Santo Oficio de la Inquisición en Chile' (2 vols., 1890); 'Juan Diaz de Solis' (2 vols., 1897); 'La Inquisición en las Islas Filipinas' (1899); 'La Inquisición en México' (1905); 'El Portugués Estebán Gomez' (1908); 'El veneciano Sebastian Caboto' (2 vols., 1908); 'Medallas coloniales hispano-americanas' (1900); 'La instrucción pública en Chile' (2 vols., 1905); 'Diccionario biografico colonial de Chile' (1906). He edited 30 volumes of 'Colección de documentos ineditos para la historia de Chile.' Consult Chiappa, V. M., 'Noticias acerca de la vida y obras de Don José Toribio Medina' (Santiago 1907).

MEDINA, or **MEDINEH,** mę-dē'na, Arabia, the native Medinah-al-Nabi or City of the Prophet (also Medinat Rasul Allah, City of the Apostle of God), 500 miles southeast of Palestine, 250 miles north of Mecca and about 110 miles east of Yembu on the Red Sea. It is reached from Damascus by an 820-mile railway journey. The city is celebrated for containing the tomb of Mohammed, whence it ranks second to Mecca as a pilgrimage resort of Islam. It is situated in the most fertile spot of all Hejaz, the streams of the vicinity tending to converge in this locality. An immense plain extends south from it; in every direction the view is bounded by hills and mountains. The town forms an oval, surrounded by a strong stone wall, 30 to 40 feet high, that dates from the 12th century, and is flanked with towers, while on a rock, at its northwest side, stands the castle. Of its four gates, the east Bab-el-Misri, or Egyptian gate, is remarkable for its beauty. Medina has no large buildings except the great mosque, two smaller ones, a college and public baths. The houses are of stone, two stories high. Beyond the walls of the city, west and south, are suburbs consisting of low houses, yards, gardens and plantations. These suburbs have also their walls and gates. The mosque of the Prophet stands at the east side of the city and resembles that at Mecca on a smaller scale. Its court is almost 500 feet in length, the dome is high and the three minarets picturesque. The tomb of the Prophet, who died and was buried here in 632, is enclosed with a

screen of iron filigree, at the south side of which the pilgrim goes through his devotions, for all of which he pays, but is consoled with the assurance that one prayer here is as good as a thousand elsewhere. The tombs of Fatima (Mohammed's daughter) and Abu Bekr (father of his wife Ayesha), and of Omar, the first calif, are also here. The mosque dates from the period of Mohammed, but has been twice burned and reconstructed. Omar and Othman both enlarged the original simple brick structure. It was again enlarged by the Calif Walid, so that it enclosed the three tombs. It was destroyed by lightning, probably about 850, and the graves almost forgotten. In 892 the place was cleared up, the tombs located and a fine mosque built, which was destroyed by fire in 1257 and almost immediately rebuilt. It was restored by Khaid Bey, the Egyptian ruler, in 1487. It is estimated that one-third of the pilgrims to Mecca go on to Medina, the pilgrimage to which may be performed at any time of the year. In the time of Ptolemy the town was known as Lathrippa. There never was much population until the place acquired fame as a resort for pilgrims. The city has been built up by acquisitions from visiting pilgrims, who recognized the opportunities for making money here by catering to visitors. For this reason the local people are heterogeneous and stand for nothing but keeping up the crowd of pilgrims. Since 1814 Medina has been the capital of the north pashalic of Arabia. Pop. 40,000. In June 1916 the Grand Shereef of Mecca proclaimed his independence of Turkey. Mecca thus, with the founding of the new kingdom of Hejaz, was lost to the Turks; Medina held out, however, until 13 Jan. 1919, when the Turkish garrison under Fakhri Pasha surrendered to the Emir Abdullah, the representative of King Hussein of Hejaz. Consult Burton, Sir Richard Francis, 'The Pilgrimage to Al-Medinah and Meccah' (London 1855). See MOHAMMED.

MEDINA, mẹ-dī'nạ, N. Y., village, in Orleans County, on Oak Orchard Creek and on the Erie Canal, and on the New York Central and Hudson River Railroad, about 35 miles northeast of Buffalo and 12 miles from Lake Ontario. The first settlement was made about 1830. In 1832 it was incorporated as a village. It is in a fertile agricultural region in which the chief products are grapes, apples, strawberries and other fruits and dairy products. In the vicinity are valuable sandstone quarries from which is obtained excellent building stone. The water-power is excellent and has been increased by a storage dam. Electricity is used as a power in manufacturing as well as for light. The chief manufactures are pumps, iron, foundry products, shirts, shoes, vinegar, flour and furniture. It has a large trade in fruit and sandstone. The Medina Falls are visited annually by a number of tourists. The government is vested in a president and board of trustees. Pop. 5,683.

MEDINA, Ohio, village and county-seat of Medina County, on the Baltimore and Ohio and Northern Ohio railroads, 30 miles southwest of Cleveland. Here are located the Sylvester Library, the Pythian Sisters' Home and Spring Grove Cemetery. Its industrial establishments comprise bee-supply works, foundries and bending works. Pop. 2,734.

MEDINA SERIES, *in geology,* a term introduced by the New York Geological Survey for a subdivision of the Upper Silurian series apparently the base of that system. It is named from Medina, N. Y.; occurs throughout the Atlantic States; and includes shales, conglomerates and sandstones. For the Medina sandstone see LEVANT.

MEDINA SIDONIA, mā-dē'nā sē-dō'nē-ä, Spain, a city in the province of Cadiz, 20 miles southeast of Cadiz and 55 miles northwest of Gibraltar, built in the form of an amphitheatre on a broad eminence, in the middle of an extensive plain, noted for its agricultural products and cattle rearing, which constitute the chief occupations of the population. A fine Gothic church, a town hall and the ancestral palace of the famous dukes of Medina Sidonia are the principal buildings. Pop. about 11,000.

MEDINET EL FAYUM, Egypt, capital of the province of Fayum, on the Bahr-Yusuf, 155 miles south of Cairo. It contains a fine bazar and a mosque. It has an extensive trade in grain, woolens and roses. Woolens are manufactured. An American mission is established here. Pop. 37,320.

MEDITATIONS OF LAMARTINE. The 'Méditations' (1820) and 'Nouvelles Méditations' (1823) of Lamartine should be counted rather as heralds of the Romantic School of French poetry than as products of it. The former, its author's first publication — he was then 30 — appeared five years after Waterloo. Its sentimentalized melancholy voiced so admirably the temper of that period of political reaction and moral exhaustion that it achieved a success in its day hardly paralleled. Its appeal was to the cultured only, but 40,000 copies of the 'Méditations' were sold in four months. The modern reader must strive to realize the temper of 1820 if he would comprehend how these rather thin and always superficial reflections on the relations of man to «Nature» — a creation of the poet's morbidity, with little relation to reality — rather than to his fellowmen found admiration so ardent, that successive volumes of verses, in his own phrase, «fell from my pen like drops of evening dew,» while the poet found himself «incapable of the exacting labor of the file and of criticism.» «The soul of the poet,» he writes in a volume of 'Confidences,' «is a running brook which writes its murmurs and sings them, but we write them with human notes and Nature with the notes of God.»

The 'Méditations' were the work of an army officer, but it was the army of the Restoration, more responsive to Rousseau's call for a return to nature and to Chateaubriand's for a return to religious emotionalism than it was to any summons to action. When that mood passed and France recovered the energy that showed itself in politics by the Revolution of 1830 and in literature by the Romantic School, the 'Méditations' soon came to be little read though still conventionally admired. Unquestionably, however, they were the most complete literary reflection of the sentiments and aspirations, the self-deceptions and illusions of the generation of 1820. This gives them a lasting value, greater than their merit of content or of form.

Lamartine's verses preserve much of the

verbal mannerisms of the earlier period. They are harmonious, refined, delicate, graceful, sincere, spontaneous, "the indolent pleasure of a too-richly gifted mind." On the other side they are conventional in expression, monotonous in feeling, elusive in development. The themes are throughout those of the true lyric — nature, love, death. The essence of all Lamartine's voluminous poetic effusion can be seen in its full potency in some of the very earliest of the 'Méditations,' for instance, in The Lake (Le Lac), accounted by some to be Lamartine's best poem, in Loneliness (L'Isolement), and in the vague pantheistic melancholy of Prayer (La Prière). In the 'Nouvelles Méditations' the poet's congenial marriage is reflected in the happier vein of the Love Song (Chant d'Amour), Wisdom (La Sagesse), Ischia and The Preludes (Les Préludes), but the poet soon resumes the melancholy pose. The Ode on Bonaparte in this collection goes deeper and rises higher than is usual in Lamartine; as indeed there is unwonted grace in Ischia and force in The Crucifix. Never so popular as the earlier book, 'Nouvelles Méditations' are preferred by many critics, and Brunètière even pronounced them "at once the noblest and the most *voluptueux* in French poetry." It is juster to say, with Lanson, that if, and so far as, poetry is essentially sentiment, disengaged from the ideas and facts that produce or accompany sentiment, the 'Méditations' are great poetry and Lamartine is among the most poetic of poets. Consult 'Life of Lamartine' by H. R. Whitehouse (New York 1919).

BENJAMIN W. WELLS,
Author of 'Modern French Literature.'

MEDITATIONS OF MARCUS AURELIUS, The. There is probably no more romantic story of a book in the history of literature than that of the volume known as the 'Meditations of Marcus Aurelius.' It is merely the commonplace book or diary of a Roman emperor (121–180 A.D.), who at the end of a very busy and troublous reign, just when worries were thickest, jotted down all the serious thoughts that came to him with regard to the meaning of life and the way it should be lived. He called his little book simply "To Himself." It was probably meant only for his own perusal when he was in meditative mood. He so loved the Greek Stoic philosophers whose writings had been his inspiration and consolation that he wrote in Greek. It is not good Greek any more than the 'Imitation of Christ' is good Latin. He paid little attention to the style of it, and yet Headmaster Rendall of Charterhouse in his Introduction to the 'Meditations' does not hesitate to say that "in the whole range of Greek literature, no work (excepting the New Testament) has wider vogue and currency than these untutored meditations of the imperial moralist."

The book created a *furore* in the Renaissance when it was first edited and printed, but it has never ceased to be the favorite reading of thoughtful scholars. John Stuart Mill declared the 'Meditations' as "almost equal in ethical elevation to the Sermon on the Mount." Matthew Arnold went so far as to say that "Marcus Aurelius remains the especial friend and comforter of all clearheaded and scrupulous, yet pure hearted and upward striving men in those ages most especially that walk by sight, not by faith, but yet have no open vision." Americans will be interested to know that the 'Meditations' of Marcus Aurelius were with Machiavelli's 'Art of War' the daily study of Capt. John Smith, the Virginia pioneer whose romantic history might seem to indicate some less stern and stoic reading. The Roman emperor's little book has often since been the daily resource or even the boon companion of men of action in the field as well as of statesmen worried over matters of politics, and of scholars with time on their hands.

It has been suggested that perhaps this last of those Spanish Cæsars, under whose rule for 80 years Gibbon thinks that the world was happier than it has ever been before or since, had the idea while he was jotting down these scattered thoughts on life that some time or other they might be of service to his son Commodus. If that were so, the book might serve as the contrast to Chesterfield's letters. The modern English nobleman wrote an epitome of worldliness; the ancient emperor a manual of otherworldliness. But if Marcus Aurelius wrote for the eye for his son, he was sadly disappointed, for Commodus was probably one of the worst rulers of history. For his weak selfishness no advice would have availed.

The 12 books treat of: I, The debts that he owes for all that has come to him in life — (here are tributes to his grandfather — his father died when he was very young — to his wife "so docile, so affectionate, so simple," and to many dear friends); II, On doing what you do; III, That to obey God is liberty; IV, That there is no such thing as chance; V, On the real goods of life; VI, That the inner life is all that counts; VII, On repressing impulse and finding self-content; VIII, On equanimity; IX, Fate leads the willing man, but drags the unwilling; X, Look around you, look behind you, look ahead of you; XI, Unselfishness; XII, (In conclusion) "Depart then satisfied for he who also releases thee is satisfied."

When the Emperor Julian whom the modern world knows as the Apostate would sum up the life of Marcus Aurelius in a single phrase he gave an excerpt from a dialogue supposed to take place not long before his predecessor's death: "Then Hermes, looking at Marcus, said, 'And to you, Verus [Marcus' family name], what seemed the noblest end of life?' Quietly and gravely he replied, 'The imitation of God.'"

Consult Watson, 'Life of Marcus Aurelius' (New York 1884); 'Marcus Aurelius,' in Matthew Arnold's 'Essays in Criticism'; Rendall, 'Marcus Aurelius Antoninus' (London 1901); Long, 'The Meditations of the Emperor Marcus Aurelius Antoninus' (London 1862); Canon Farrar, 'Marcus Aurelius,' in 'Seekers After God.'

JAMES J. WALSH.

MEDITERRANEAN (med"i-tē-rā'nę-an) **SEA,** the great inland sea between the continents of Europe, Africa and Asia, the remnant — according to Professor Suess — "of a great ocean which at an early geological epoch, before the formation of the Atlantic, encircled half the globe along a line of latitude." From its eastern extremity in Syria to the Strait of Gibraltar it is about 2,300 miles long; its maximum width from Venice to the Bay of Sidra

is 1,200 miles; its average width 300 miles. Its area is variously estimated as from 815,000 square miles to 1,145,000 square miles. The shores of Europe are on the north and northwest, those of Africa on the south and those of Asia on the east. The Mediterranean is connected with the Atlantic by the Strait of Gibraltar, and on the northeast with the Black Sea through the Dardanelles, Sea of Marmora and the Bosphorus, which form a continuous waterway. It is irregular in shape and by the projection of the south part of Italy, and of Cape Bon in Africa and the interposition of the island of Sicily, is divided, near its centre, into two distinct portions, an east and a west. In addition to these, the other important subdivisions are the Tyrrhenian or Tuscan Sea, between the west coast of Italy and the islands of Sardinia and Corsica; the Adriatic Sea or Gulf of Venice, between the east coast of Italy and the west coast of Turkey in Europe and Dalmatia; the Ionian Sea, between the west coasts of Turkey in Europe and Greece, and the south part of Italy and the island of Sicily; the Ægean Sea or Archipelago, between Turkey in Europe and Greece on the west and Turkey in Asia on the east; and the Levant, which is usually understood to include the whole sea east of the island of Crete. The largest gulfs are, on the shores of Europe, those of Lion or Lyons, Genoa, Taranto, Lepanto, Koron, Kolokythia and Salonica; on the shores of Asia, Adrymiti, Smyrna, Adalia, and Skanderoon; and on the shores of Africa, Sidra and Cabes. The largest and most important islands are Sicily, Sardinia, Corsica and the Balearic Isles, in the west division; and Cyprus, Rhodes, Crete, the Ionian Isles and Malta, in the east division. The principal rivers which discharge themselves into the Mediterranean are the Ebro, Rhone, Po and Nile; but its communication with the Black Sea entitles it to claim it as part of its basin, and, consequently, also the great rivers Don, Dnieper, Dniester and Danube. Between Cape Bon and the Sicilian coast, where the sea is shallowest, the depth varies from 30 to 250 fathoms; but in almost all other places, particularly at a distance from the shores and islands, the depth is very much greater, the maximum depth in the eastern division being 2,150 fathoms, in the western division, 2,040 fathoms. The mean depth is practically equal in the east and west divisions, about 883 fathoms. However, half the area is less than 500 fathoms deep. The depth temperatures are very much warmer than in the Atlantic. Owing to the very narrow channel which connects the Mediterranean with the main ocean, there is very little tide; though in some places, as in the Ionian Sea, the Adriatic, on parts of the African coast, etc., a rise of more than six feet sometimes occurs. The prevailing winds are the southeast and southwest in spring, and the northeast and northwest during the rest of the year. They often rise suddenly and with great violence. The most remarkable are the historic Euroclydon or Levanter, mentioned in Acts xxvii, 14, a northeast wind of dangerous whirlwind characteristics; the Bora in the Adriatic; the Etesian and Tramantona in the Ægean; and the burning Sirocco from the African desert. The Mediterranean abounds with fish, some 400 species having been noted, and also furnishes the finest coral and sponge. The evidences of volcanic action along its shores are present in the active volcanoes of Vesuvius, Etna and Stromboli (qq.v.). Consult Playfair, 'The Mediterranean, Physical and Historical' (1890); Cook, J., 'The Mediterranean and Its Borderlands' (Philadelphia 1910).

MEDITERRANEAN SUBREGION, a zoogeographical district of the Nearctic Region embracing the basin of the Mediterranean and the plains of Syria. Faunistically this region is allied to Europe rather than Africa or Asia, from which it is separated by deserts. It includes many sub-tropical forms, rarely or never seen north of the Alps or south of the Atlas Mountains. See ZOOGEOGRAPHY.

MEDJIDIE, mĕ-jĕd'ē, a Turkish order equivalent to knighthood, instituted by the Sultan in 1852. It has been conferred on numerous foreign officers, soldiers and seamen, who have taken part in wars on behalf of Turkey. It is divided into five classes, indicated by the difference in size of the decoration. Recipients of the first order, in addition to the large gold and red decoration, receive a star to be worn on the left breast. The accompanying ribbon is red and green. The name is also given to a modern Turkish silver coin, value about 85 cents.

MEDLAR, a small tree or shrub (*Mespilus germanica*) of the apple family and a native of southern Europe where in the wild state it has thorns, but in cultivation it is thornless. It differs from various near relatives such as apple and pear, in bearing solitary large, white, terminal flowers upon leafy growths of the current season, and, like the quince, in having no detachable peduncle to the fruit in which the receptacles do not completely overgrow the ovaries. It is widely grown in Europe but much less in America. In Central New York it is fully hardy and produces well with no special care. The top-shaped fruit, which is about the size of a small pear, should be allowed to hang until after a frost, which mellows its austerity and assists the process of "bletting," as ripening in cool dry rooms is called. When in a state of incipient decay the softened fruits are eaten by those who enjoy tart flavors, or are made into preserves.

MEDOC, mā-dŏk, a wine which derives its name from a district of France, in the ancient province of Gascony. The modern locality is termed Charente-Inférieure; it is mostly covered with vineyards, which are cultivated with great care, and the wines produced from which have a high reputation. They are dry, still and delicate, resembling Bordeaux wines, which territory is immediately south of Medoc. See WINE AND WINE-MAKING.

MEDULLA, *in botany,* the pith of a plant-stem. See PITH.

MEDULLA OBLONGATA, the brain-stem, or that part of the nervous system that lies between the *pons,* or *pons Varolii,* at the upper end, and the spinal cord proper, with which it is continuous, at its lower end. It is a very old part of the nervous system, judged from the standpoint of evolution, and in it are located the important centres of most of the cranial nerves, including the centres that govern the nerves of the heart and of respiration. It

is a triangular cone-like portion of the nerve-axis, about an inch in length and one-half to three-quarters of an inch thick, being tubular below and flattened above. Below, it closely resembles the cervical cord in its internal construction, but above great changes take place to accommodate important new structures. One of the most conspicuous features of the medulla consists in a triangular enlargement of the central canal of the cerebro-spinal axis, constituting what is known as the fourth ventricle. The lower seven cranial nerves have their apparent origin in the medulla, and the first spinal nerve also originates in the medulla proper. The internal anatomy of the medulla is complicated. At the lower end the chief motor tracts, the pyramidal tracts that come from the motor area (q.v.) in the brain cross one another to pass down on opposite sides of the spinal cord. It is because of this decussation that a hemorrhage of the brain of the right side causes a paralysis of the muscles of the left side of the body, and *vice versa*. Just above the decussation of the pyramids the end-stations (nuclei) of the two chief sensory tracts of the body are located. It is into these nuclei — the gracilis and the cuneatus — that all of the sense-impressions from the body below the head are collected, to be passed to higher cerebral centres through the lemniscus or sensory fillet. The chief gray masses in this part of the brain are the nuclei of the cranial nerves referred to, and of the olives, two structures of undetermined function. The best description of the oblongata at present is that of the model of the medulla and pons by Dr. Florence Sabin, which is figured in Barker's 'Nervous System.' Consult also Buck, 'Reference Handbook of the Medical Sciences,' article "Brain," and Johns Hopkins Hospital Reports, Welch Memorial Volume. See BRAIN.

MEDUM, Egypt, village on the Nile, 40 miles south of Cairo, near the Pyramid of Snefru. See PYRAMID.

MEDUSA, mẹ-doo'sạ. See GORGO.

MEDUSA, a disk-bearing jellyfish (q.v.).

MEDWAY, England, a river which rises in the county of Sussex and flows northeast in a winding course across Kent, past Tunbridge and Maidstone, to Rochester and Chatham. Below Chatham it spreads out into a broad tidal estuary, in which are several islets, and joins the Thames at Sheerness. It is 70 miles long and is navigable to Penshurst, 20 miles above Chatham.

MEEHAN, mē'ạn, **Thomas**, American botanist: b. Potter's Bar, near London, England, 21 March 1826; d. Philadelphia, 19 Nov. 1901. From his father, a gardener, he learned facts of natural history when a child; at eight made and recorded an original discovery in herpetology; taught himself from books read at night after daily tasks; at 12 began to publish scientific papers; soon after produced the first hybrid fuchsia; and was nominated to membership in the Royal Wernerian Society. For two years he held a position at Kew Gardens. In 1848 he came to America and took charge of Bartram's Gardens in Philadelphia. In 1854 he established the Germantown Nurseries, which he conducted until the end of his life. For 30 years (1859-89) he edited the *Gardeners' Monthly*, and contributed papers to many other periodicals and to scientific societies. For 23 years he was senior vice-president of the Philadelphia Academy of Natural Sciences, in whose proceedings were published his important 'Contributions to the Life History of Plants.' In 1875 he was elected a fellow of the American Academy for the Advancement of Science, before which, among other noteworthy papers, he read 'A Contribution to the Doctrine of Evolution and the Theory of Natural Selection,' which showed him as a coworker with Darwin and other evolutionary scientists, in whose field he also was a discoverer. From the creation of the office until his death he served as State botanist of Pennsylvania, at one time was a member of the board of visitors of Harvard, and was one of the American editors of the 'Encyclopædia Britannica.' His travels and researches extended throughout the country, including Alaska. In 1878 he began the publication of 'Native Flowers and Ferns of the United States,' an illustrated serial covering a wide field of floral distribution, the main features of which he continued in *Meehan's Monthly*, founded in 1891. Many learned societies abroad enrolled him, and he held intimate relations with nearly all the leading scientists of his time. Among his closest friends was the Comte de Paris, a devotee of plant-study. Meehan was the third American to receive the Veitch medal, awarded to him for "distinguished services in botany and horticulture." Apart from scientific work he devoted himself to public labors; was a member of the Philadelphia common councils from 1882 until his death; during the same period served on the local school board; in both capacities introduced many reforms; and chiefly through his efforts nearly 30 small parks were added to the city. A work of permanent value is his 'American Hand-book of Ornamental Trees' (1853).

MEEK, mēk, **Alexander Beaufort**, American jurist: b. Columbia, S. C., 17 July 1814; d. Columbus, Miss., 30 Nov. 1865. He was graduated from the University of Alabama in 1833 and admitted to the bar two years after. He served in the Seminole War 1836; was attorney-general of Alabama 1836; judge of Tuscaloosa County 1842–44; and member of the legislature in 1853. While there he established the free-school system of Alabama. In addition to a legal digest (1842) he wrote: 'The Red Eagle' (1855); 'Songs and Poems of the South' (1857); 'Romantic Passages in Southwestern History' (1857), etc. His best-known poem is 'The Charge at Balaklava.'

MEEK, Fielding Bradford, American palæontologist: b. Madison, Ind., 10 Dec. 1817; d. Washington, D. C., 28 Dec. 1876. His educational advantages were limited, but his interest in natural history made study imperative to him, and in 1848 he became assistant to David D. Owen in a geological survey of Iowa, Minnesota and Wisconsin. He assisted James Hall at Albany in 1852–58, spending several summers in a geological survey of Missouri and Nebraska, and in 1858 went to Washington, where he devoted the remainder of his life to palæontologic investigations under the government. He was elected in 1870 to the National Academy of Sciences, and was a member of

other scientific organizations. Among his writings are 'Check List of the Invertebrate Fossils of North America' (1864); 'Report on Invertebrate Cretaceous and Tertiary Fossils' (1876), etc. For a complete list of his works, see bibliography published by the Smithsonian Institution.

MEEKER, Royal, American statistician: b. Silver Lake, Susquehanna County, Pa., 23 Feb. 1873. In 1898 he was graduated at Iowa State College and in 1906 took the degree of D.Ph. at Columbia University. He also studied at Leipzig. In 1904–05 he was professor of history, politics and economics at Ursinus College, Collegeville, Pa. In 1905 he became preceptor at Princeton and from 1908 to 1913 was assistant professor of political economy there. On 12 Aug. 1913 Dr. Meeker was appointed commissioner of labor statistics by President Wilson. In 1918 he was appointed member of the United States meat commission. He published 'History and Theory of Shipping Subsidies' (1905).

MEEKINS, mē'kinz, **Lynn Roby,** American journalist: b. Salem, Md., 14 Nov. 1862. He was graduated from Western Maryland College, Westminster, Md., in 1882, and devoted himself to journalism. He was literary editor of the Baltimore *American* 1882–89, when he became managing editor of the Philadelphia *Saturday Evening Post,* and since 1903 has been editor of the Baltimore *Herald.* He has published 'The Robb's Island Wreck' (1894); 'Adam Rush' (1902), etc.

MEERANE, Saxony, town, 10 miles north of Zwickau and 36 miles south of Leipzig. It contains a mediæval church. Meerane is one of the largest textile-producing centres of Germany, turning out vast quantities of woolen and mixed cloths. It has also extensive dyeing establishments, machine works, tanneries, boiler works, motor factories, button, paper box and cement works. The town has a Realschule, a textile school and a school of commerce. Pop. 26,005. Consult Leopold, 'Chronik und Beschreibung der Fabrik-und Handelstadt Meerane' (1863).

MEERKAT. See SURICATE.

MEERSCHAUM (Sepiolite), mēr'shâm or -shum, a name given to one of the silicates of magnesium; it is a mineral of a whitish or creamy color, and received its name from its appearance and the position in which it is sometimes found suggesting that it was petrified foam of the sea. It is obtained from various places, but the best quality comes from Asia Minor, rich deposits of it existing about 20 miles southeast of Eskichehir, at a place called Sepetdje. Here are some 20,000 pits in a space of six miles, of which only 150 are worked, all the others being exhausted. It is said that these mines were opened 1,000 years ago, which is not incredible, as it is well known that magnesia was formerly used for many purposes, other than the fabrication of pipes; moreover, fuller's earth was once worked on a vast scale by the ancients. The meerschaum mines are worked by some 500 miners, who live in the surrounding villages. At Gheikli, in the neighborhood of Sepetdje, there are 3,000 pits, of which only 100 are worked, giving employment to 400 miners. The mineral is mined in blocks, which are taken to Eskichehir, where the blocks are cleaned, the operation consisting of scraping and cutting the blocks with a sharp instrument or knife, the meerschaum being still soft and easily cut into any shape or form. Over 1,100 persons are occupied in cleaning and shaping these blocks, which, after being thoroughly cleaned, are separated into four classes, according to size and quality. These blocks being ready for sale, a bargain is struck between the pipe manufacturers and the commission agents and merchants at Eskichehir, of whom there are about a dozen. The latter then pack the blocks of these four classes with very great care into boxes of equal size, each block being wrapped in cotton to avoid any friction or shock between the pieces. The actual annual output of these mines varies from 120 to 150 tons. It is soft when dug up, but becomes hard when dry. Most of it is sent to Vienna, where it is chiefly made into tobacco-pipes, many of them highly artistic. Similar pipes are also made in Paris, London and elsewhere.

MEERUT, India, the capital of the district and division of the same name, in the United Provinces, situated 40 miles northeast of Delhi on the Northwestern Railway. The city is irregularly built, with narrow, filthy streets. It contains several mosques, a fine town hall, a college, normal school and church schools. At Meerut is one of the largest cantonments in India. Flour and soap are the principal manufactures. The first outbreak of the Indian Mutiny of 1857 occurred at Meerut. The city has a good water supply and an excellent drainage system. Pop. 116,227.

MEES, Arthur, American musical director: b. Columbus, Ohio, 13 Feb. 1850. He was graduated from Concordia College, Fort Wayne, Ind., and studied music in Berlin. He has been assistant director, and later director, of some of the leading operas and musical associations, and has published, in addition to his annotated programs for the New York Philharmonic Society and the Chicago Orchestra, 'Chorus and Choral Music.'

MEGACLES. The most illustrious Greek of this name was the head of the family of the Alcmæonidæ at Athens in the time of Solon. After twice expelling Pisistratus, who in 560 B.C., had made himself "Tyrant" of Athens, he was himself exiled by the latter together with all his family.

MEGALENSIA, or MEGALESIA, an annual festival at Rome (4–10 April) in connection with the foreign cult of Cybele, the *Magna Mater* or Great Mother of the Gods, celebrated by a procession of her eunuch-priests, by circensian and theatrical shows, and at the close a carnival.

MEGALITHIC MONUMENTS. See DOLMEN; MENHIR; STONES, STANDING; STONE CIRCLES.

MEGALONYX. See GROUND-SLOTHS.

MEGALOPOLIS, měg-ą-lŏp'ō-lĭs, **or SINANON,** Greece, a ruined city on the ancient Helisson, in the nomarchy of Gortynia, 5 miles north of Leondari. It was founded 370 B.C. by Epaminondas (q.v.) as the federal capital of Arcadia and was a magnificent walled city, five and one-half miles in circumference; it was frequently but unsuccessfully attacked by the

Spartans. In 222 B.C. it was captured and partially destroyed by Cleomenes III. From 1890–93 the British School at Athens excavated the site and revealed the Precinct of Zeus Soter, the Agora, the Stoa of Philip and the Stoa of Myropolis on the right bank of the river, and on the left bank, the hemispherical Theatre 400 feet in diameter, and the Scanotheca, the Thersileon or great assembly hall, altars and remains of other buildings described by Pausanias. Consult Schultz and Loring, 'Excavations at Megalopolis' (1892); Haigh, A. E., 'The Attic Theatre' (Oxford 1907).

MEGALOSAURUS, mĕg″ą-lō-sâ′rús, a genus of huge carnivorous dinosaurs of the group *Theropoda.* Their remains occur frequently in the European oölitic rocks. The extreme length was about 50 feet. They were covered with scales and built like lizards, but with proportionally longer, heavier legs. See DINOSAURIA.

MEGAPHONE (a Greek word meaning "great sound"), an instrument magnifying the sound of the voice many times, so that one can be heard at a considerable distance. In its simplest form it is a cone-shaped trumpet, and the speaker shouts into the small end, the instrument directing the sound waves wherever it is aimed. This form is used by announcers at base ball games, etc. The form invented by Thomas A. Edison consists of two large funnel-shaped receivers in which the waves of sound are collected and concentrated and carried by means of flexible tubes held to the ears of the person using the instrument. In the instrument called telephone-megaphone, the mouthpiece of the telephone is connected with four transmitters which multiply the usual telephone sound of the voice by four, and it is sent by wire, so increased, into the megaphone, which sends it forth into space with sufficient intensity to carry it with perfect distinctness throughout a large church or hall. One form of megaphone is largely used by deaf persons.

MEGAPODES, a general name for the brush-turkeys or mound-birds of Australia constituting the gallinaceous family *Megapodiidæ,* so named in reference to the disproportionately large size of the feet; and remarkable for their breeding habits. The family, although mainly Australian, is represented in many of the South Sea Islands and in the Philippines, replacing the pheasants, which are absent from that region. There are 7 genera and 20 or more species, mostly with restricted individual ranges, and varying in size from that of a turkey to that of a large pigeon, the sexes being always alike in plumage. The general colors are browns and yellows with the naked wattled parts brightly colored. They have a short, strong bill; the head and neck almost naked and wattled; the wings short and round, the tail large; the legs and feet large, strong and provided with great claws. Megapodes are terrestrial birds found in hill-valleys, among thickets or along river and sea beaches. They run well, but if hard pressed will take to trees where they hop about awkwardly; their flight is heavy, but may be long sustained. Hoarse, chuckling, cackling or mewing cries express the utterances of the different species, which are often heard at night. The food consists of fallen fruit, seeds, berries, worms, snails, insects and even small crabs. The flesh is dark-colored and not good, though palatable to the Australian aborigines.

One of the best known species is the brush-turkey or mound-turkey (*Catheturus lathami*), also known as the wattled talegalla and the New Holland vulture, the latter name being given to it on account of its yellow, naked head and neck, covered in part with fleshy wattles. It is rather common in New South Wales, inhabiting the most thickly wooded parts. It is a large bird, about the size of a turkey, with blackish-brown plumage. It is shy, and when pursued, endeavors to escape by running through the thickest brush, or by leaping to the lowest branches of a tree, and thus avoids the dingoes or native dogs, which, however, often hunt it down on open ground. It is easy game to the sportsman, who finds it roosting under shelter of the branches of trees during the heat of the day, and although several of a flock are shot, the rest keep their place undisturbed. They are generally seen in small flocks, and make their nests together, the females heaping up, by means of their feet, mounds of several cartloads of earth and decayed leaves, which are used from year to year, new materials being added every year. The eggs are separately buried, often by several females, within the mass, where they are hatched by the heat of the fermenting mound. The parent birds partially uncover them during the day. Nearly a bushel of eggs may sometimes be found in a single heap. The male bird pays great attention to the young after they are hatched, covering them up partially in the mound at night for warmth. The flesh of the talegalla is excellent, and the eggs are also very delicate and eagerly sought after. Two other species occur in New Guinea.

South and West Australia have another familiar megapode in the mallee-hen or "native pheasant" (*Lipoa occellata*)—a large gray-brown bird with eye-like markings on the wings and back, and the naked neck and wattles blue; its mounds are comparatively small and often made individually. A bird often confounded with this in books because of similarity of name is the maleo (*Megacepalon maleo*) of North Celebes, which has the singular habit of making a general migration in the breeding season to the sea-beach, where small groups of females dig large holes in the sand just above high-water mark, and day by day bury eggs there until the quota of each is laid; these gradually hatch under the influence of the hot sand. The largest genus is *Megapodius,* whose 15 species are scattered over all the island region between Samoa, the Philippines and the Micobars, each group having a distinct species. The most widely distributed and best known is *M. tumulus,* the common mound-bird or scrub-turkey of Northern Australia and the Papuan archipelago, which fashions mounds 10 or 11 feet high in the densest woods, continues to use them year after year, and lays pale, coffee-colored, thin-shelled eggs in straight burrows penetrating the mound. In some islands the eggs of these birds are an important food resource. The young are well fledged when they emerge from the egg and scramble out of the mound, but are attended to by their parents for some time. Consult Newton, 'Dictionary of

Birds' (1869); 'Proceedings,' Zoological Society of London, 1876, 1888, etc., and works on the ornithology of Australia and Oceanica.

MEGAPOLENSIS, Joannes, Dutch Protestant missionary to the North American Indians: b. Koedyck, Holland, 1603; d. New York, 24 Jan. 1670. His family name, van Mekelenburg, he Hellenized to Megapolensis. In 1642 Van Rensselaer, the first Patroon, brought him to New York from Holland, and he soon learned the Mohawk tongue and preached successfully among the Indians near Albany, several years before John Eliot's mission or any other Protestant preaching to the Indians. From 1649 until his death he was pastor of the Dutch church in New York, where he showed little tolerance to Lutherans and Independents. He advised peaceable surrender to the English in 1664. His account of the Mohawks is published in the third volume of the New York Historical Society's 'Collections' (1870).

MEGARA, Greece, the capital of ancient Megaris (q.v.), between Attica and Corinth; also a modern town in the eparchy of Megaris, of 6,500 population.

MEGARION SCHOOL OF PHILOSOPHY, a Greek school of philosophy based on and developed from a part of the Socratic system. Euclid of Megara was the first to give definite form to its teaching. Eubulius was also a prominent member of this school, which confined itself mainly to dialectic methods, and sought to unite the Socratic ethical principle and the Eleatic theory of the One, to whom only true being might be attributed.

MEGARIS, měg'ą-rĭs, Greece, the name of an ancient state or small district bounded north by Bœotia, east by Attica, south by the Saronic Gulf and the territory of Corinth, west by the Corinthian territory and the Corinthian Gulf; area, about 143 square miles. It is a mountainous country, the only plain being that on which the capital was situated. Mount Cithæron was on the north boundary, separating it from Bœotia. The people were traders and sold their textiles over a large area. The only important town was Megara, situated a mile from the sea, opposite the island of Salamis. It contained a Pelasgian citadel, called Caria, on a hill northwest of the city, with a temple to Demeter called Megaron, from which the name of the town is supposed to be derived. It had flourishing colonies at an early period, and its navy was so powerful that it was only after a long struggle with it that Athens obtained possession of Salamis. It afterward became annexed to Attica, of which Megaris formed one of the four ancient divisions. It was successively conquered by the Dorians and the Corinthians, but afterward asserted its independence, and became wealthy and powerful.

MEGASTHENES, a Greek historian, who about the year 300 B.C., as ambassador of King Seleucus Nicator at the court of the Indian king Sandracottos, gathered the material for a geographical and historical account of India that, reaching us in the form of fragments and worked over in Strabo, Diodorus and Arrian, is our chief source of knowledge of that country in antiquity. There is an edition of the fragments by E. A. Schwanbeck (Bonn 1846); also a translation by McCrindle, 'Ancient India as Described by Megasthenes and Arrian' (Calcutta 1877).

MEGATHERIUM, a gigantic fossil ground-sloth, the largest known edentate, representing the family *Megatheriidæ*, and especially the species *Megatherium americanum*, whose remains are found plentifully in the Pleistocene strata of Argentina and Patagonia. These early edentates were so generalized, that, as compared with modern forms, they exhibit the head and teeth of a sloth, associated with the vertebræ limbs and tail of the ant-eater. Some of them attain a gigantic size, at least as large as an elephant, but with shorter limbs and a bigger tail, and the latest species are the most bulky. *Megatherium*, according to Woodward, seems to have been entirely destitute of dermal armor. The only one of its allies in which bony plates have been discovered is *Mylodon*, and they are very small and not fused together. The pelvis and hind limbs are heavily formed, showing that the animal was in the habit of standing on them, steadied by the powerful tail, like a kangaroo. They fed on the branches of trees. The mylodons were somewhat smaller than the megatheria, with a skull and teeth more like those of the modern sloths, and the three inner digits of the forefoot bear claws, about equal in size, instead of the huge middle-finger claw of the Megatherium. In both animals the hind foot lacks digit I, but II and III bear claws. The typical species of mylodon (*M. harlani*) was about as large and of much the same form as a rhinoceros, and inhabited the southwestern United States, while various other species lived in South America. The long-headed South American genera, *Scelidotherium* and *Megalonyx*, are other forms of the same family. See GROUND-SLOTHS. Consult the palæontological writings of Leidy, Lydekker and Woodward, also Scott, G. B., 'History of Land Mammals' (1913).

MEGIDDO, an important fortress city of ancient Canaan. Thothmes III captured it in the 23d year of his reign, and took therefrom magnificent spoils. The city is mentioned several times in the Tel-el-Amarna correspondence. Though nominally in the territory of Manasseh (Jos. xvii, 12, 13; Judg. i, 27, 28) it remained in possession of the Canaanites. Near the "waters of Megiddo" Barak and Deborah defeated the Canaanites under Sisera (Judges v, 19–21). Solomon restored the fortifications (1 Kings ix, 15) and Ahaziah is said to have died there (2 Kings ix, 27). Finally it was at Armageddon (*Har-Megedon*, mountains of Megiddo) that the great conflict of Revelations xvi, 16, was to take place. The site of Megiddo may now be considered as proved to be Tel-el-Mutesellim, a great mound four miles northwest of Tel Taanach. It was evidently of great strategic importance since it commanded the pass from the Plains of Sharon to the Plain of Esdraelon, which in all the centuries from Thothmes III to Allenby in 1917–18 has been the route of armies. Fortifications preceding 2000 B.C. have been uncovered on the site, together with the remains of several cities which rose here successively and vanished. Here too was found the seal of Shama, servant of Jeroboam (II?). In Roman times the place was a fortified post — the *Legio* of

Eusebius, the modern *el Lejjun*. Consult Schumacher, 'Tell el Mutesellim: Bericht über die 1903 bis 1905 veranstalteten Ausgrabungen I' (Leipzig 1908).

MEGNA, měg'nạ, or **MEGHNA**, India, the estuarine outlet of the Ganges and Brahmaputra (qq.v.), in Bengal. There are four principal mouths, producing three islands. The tidal bore is characterized by its velocity, which endangers navigation, advancing at the rate of 15 miles an hour, and frequently attaining a height of nearly 20 feet. As the bottom is loose sand; it shifts continually, making navigation difficult.

MEGRIM. See MIGRAINE.

MEHEMET (mā'hĕ-met), or **MOHAMMED** (mō-ham'ĕd), **ALI**, viceroy of Egypt: b. Kavala, Macedonia, 1769; d. Cairo, 2 Aug. 1849. An orphan, he was brought up by a janizary captain, governor of Kavala, who married him to a kinswoman and made him a militia officer. When the French invaded Egypt he was sent there, rose rapidly, became the confidant of Koshrew, pasha of Egypt, and, by treachery both to the pashas and the Mamelukes and by a liberal use of his wealth, in July 1805 became pasha of Cairo, whence his power quickly spread over the rest of Egypt. His utterly unscrupulous policy was shown by his massacre of nearly 1,700 Mamelukes in 1811. He extended the limits of Egypt by wars on the Arabian Wahabees, by the possession of Nubia and Kordofan, and by the treacherous conquest of Syria, in which he aimed at independence of the Porte. This first break with Turkey was settled by the Powers; and in 1839 the Sultan was forced to call on the Powers to help him turn Mehemet out of Syria: by the treaty then concluded he surrendered Syria, Candia and Hejaz: but was made hereditary pasha. His internal administration was vigorous; both agriculture and manufactures flourished, thanks to French capital solicited by Mehemet, who also introduced European methods into his army, and established a system of education. He was insane during the latter part of his life, and was succeeded by his grandson; his son, who took his place as regent in September 1848, died in November of that year. Consult Murray, C. A., 'Memoir of Mehemet Ali' (London 1898).

MEHRING, Franz, German historian, critic and socialist philosopher: b. Schlawe, Pomerania, 27 Feb. 1846; d. Berlin, 29 Jan. 1919. He was of middle-class Pomeranian origin, but became interested early in life in the struggles of the poor. His life is an interesting example of the career of a political thinker who passes out of the organizations of his own class and into those of the lower classes, by natural sympathy, although in Mehring's case this process took a long time. He attended the University of Berlin, where he obtained the Ph.D. degree, simultaneously working for a democratic newspaper, *Zukunft*, under the direction of Johann Jacoby and Dr. Guido Weiss. After this paper was suppressed (1871), he became a member of the staff of *Die Wage*, a weekly edited by Dr. Weiss. In 1873 appeared Mehring's first socialistic pamphlet, "Herr von Treitschke, der Sozialistentöter, und die Enziele des Liberalismus," which, as its title indicates, is an attack upon Treitschke (q.v.). When the two chief socialistic bodies in Germany united at Gotha in 1875, Mehring was sympathetic to the new party but did not become a member, and a rather personal controversy which he had with Leopold Sonnemann, editor of the *Frankfurter Zeitung*, for which Mehring had been Berlin correspondent, removed him more and more from the activities of the Social-Democratic party. From 1877 to 1882, Mehring was unfavorably disposed toward the leaders of the party, and in his 'Geschichte der deutschen Sozialdemokratie,' which he began writing in those years, he made many attacks upon them, for which he was seriously taken to task at the Dresden Party Congress. He defended himself in a little book 'Meine Rechtfertigung' ('My Justification'), in which he asks forgiveness for having been so foolish as to believe that the monarchic régime might develop into an honest democratic republic, which idea, he explains, has been completely corrected by the anti-socialistic laws as administered by the Prussian government. Yet Mehring still hoped that it might be possible to found a bourgeois democratic party in Germany, in which work, which was foredoomed to failure, he was associated with Lenzmann (1884). He was editor-in-chief of the *Berliner Volkszeitung* (1885–89), but was forced to resign from that paper because of a controversy with Paul Lindau (q.v.), arising out of the latter's maltreatment of the actress Elsa von Schabelski (by a curious coincidence, Paul Lindau's death in January 1919, coincided almost to a day with that of Mehring). Mehring has written profound historical analyses, among which the best are 'Die Lessing-Legende' (1893) and 'Gustavus Adolphus' (1894). As a man of 70 his hostility to the German Imperial government was still unbroken, and together with Rosa Luxemburg and Karl Liebknecht he wrote, in January 1915, a pamphlet attacking the militaristic system that had plunged Europe into war, known as the "Junius" pamphlet. This appeared in Switzerland and was secretly circulated in Germany (English translation: 'The Crisis in the German Social-Democracy,' New York 1918). He spent considerable parts of 1916 and 1917 in jail, under "preventive detention," but had to be released because of his failing health. In January 1918 he was elected a member of the Prussian Landtag, on the socialist ticket, and distinguished himself in that body by his biting comments on the inability of the Prussian military leaders; Mehring had always had a sort of amateur interest in military affairs; a number of his pamphlets deal ably with questions of this kind. Shortly before (September 1918) the final defeat of the German armies (October) on the western front, Mehring predicted that the hope of the militarists in the inability of the United States to land sufficient troops in Europe would be disappointed. His death was due to pneumonia, and coming, as it did, close upon the murder of Liebknecht and Rosa Luxemburg (15 Jan. 1919), it considerably depressed the hopes of the radical element ("The Reds") of the German Social-Democracy. Of the four chief leaders of the so-called "Spartacus" group, three had therefore met death in one month, and only one, Klara Zetkin (q.v.), an old woman, herself seriously ill, was still alive

in April 1919. Consult also *Die Neue Zeit* (1882 et sequitur, Stuttgart); *The Class Struggle* (New York 1917 et sequitur).

JACOB WITTMER HARTMANN.

MÉHUL, Etienne Henri, ā-tē-ĕn ŏn-rē mā-ül, French musical composer: b. Givet (Ardennes), 22 June 1763; d. Paris, 18 Oct. 1817. For some years he substituted the name Nicholas for Henri. He studied at Paris under Gluck; and after the departure of the latter for Vienna, Méhul presented to the Royal Academy of Music the opera of 'Cora and Alonzo,' the representation of which was delayed for six years. He then turned to the Opéra Comique, which gladly received his 'Euphrosine and Coradin' in 1790. His patriotic hymns, 'Chant du Départ,' 'Chant de Victoire,' and 'Chant Retour,' greatly increased his fame. He was chosen a member of the Institute in 1796, of the Academy of Fine Arts in 1816, and a knight of the Legion of Honor in 1802. His chief operatic work is 'Joseph' (1807). His style as a composer is remarkable for dramatic force and coloring. There is a 'Life' by Pougin (1889). His statue was erected in his native town in 1892.

MEIBOMIA, a genus of erect perennial herbs of the pea family, of which about 150 species are natives of warm and temperate America, Africa and Australia. More than 40 species belong to the United States, some of the more familiar of which are called "tick-seeds."

MEIDERICH, Prussia, town of the Rhine province, 15 miles northeast of Krefeld. It contains several large iron and steel mills, machine shops, brickyards, phosphate works and saw mills. Coal deposits are worked in the vicinity and there is a large cattle trade. Its history as an industrial centre began in 1850. It was annexed to Duisburg in 1905. Pop. 40,000. Consult Graeber, 'Tausendjährige Geschichte von Meiderich' (1893).

MEIER, Edward Daniel, American mechanical engineer: b. Saint Louis, Mo., 1841; d. 1914. In 1858 he was graduated at Washington University and subsequently studied four years at the Royal Polytechnic College at Hanover, Germany. In 1863 he enlisted in the 32d Pennsylvania Volunteers; served later in the artillery and in the engineers and was a cavalry lieutenant at the close of the war. He entered locomotive works at Paterson, N. J., after the war, became superintendent of machinery of the Kansas Pacific Railroad in 1867; chief engineer of the Illinois Coke Company in 1870; and two years later constructing engineer of the Meier Iron Company. He founded the Heine Safety Boiler Company of St. Louis in 1884, of which he was president in 1914. For many years Mr. Meier was president of the American Diesel Engine Company. In 1908–14 he was president of the American Association of Boiler Manufacturers and of the Machinery and Metal Trades Association. In 1911 he was president of the American Society of Mechanical Engineers.

MEIGGS, mĕgz, **Henry,** American contractor: b. Catskill, N. Y., 7 July 1811; d. Lima, Peru, September 1877. He was engaged in the lumber business in New York and other places but met with financial reverses and in 1848 went to California, where he again took to the lumber business and gained an immense fortune. Reverses, however, once more swept away his wealth, leaving him with an indebtedness of more than $1,000,000. He fled with his family to Peru, where he soon embarked upon a series of bridge- and railway-building enterprises which won for him immense wealth and a world-wide fame as a railway contractor. His engineering achievements in South America comprise some of the most daring feats in the history of the profession. The construction of the Callao, Lima and Oroya road, which crosses the Andes and ascends to a height only 136 feet lower than the summit of Mount Blanc, was his crowning achievement, and was practically completed at his death. He paid in full the enormous obligations incurred by his failure in San Francisco, contributed generously to charities in the United States and Peru, and by the laying out of a beautiful park, which he presented to the city of Lima, materially changed for the better the appearance of the city.

MEIGS, Charles Delucena, American physician: b. Saint George, Bermuda, 1792; d. 1869. In 1809 he was graduated at the University of Georgia, and in 1817 at the medical college of the University of Pennsylvania. In the same year he established his practice in Philadelphia and became prominent as an obstetrician. He was professor of obstetrics and diseases of women and children at the Jefferson Medical College from 1841 to 1861. He was one of the first editors of the *North American Medical and Surgical Journal,* which he helped to found in 1826. Dr. Meigs published 'The Philadelphia Practice of Midwifery' (1838; 2d ed., 1842); 'Lectures on Some of the Distinctive Characteristics of the Female' (1847); 'Females and their Diseases' (1848; 2d ed. with title 'Woman; Her Diseases and Remedies,' 1851; 3d ed., 1854); 'Remarks on Spasmodic Cholera' (1849); 'Obstetrics' (1849; 3d ed., 1856); 'Observations on Certain Diseases of Children' (1850); 'Treatise on Acute and Chronic Diseases of the Neck of the Uterus' (1854); 'On the Nature, Signs and Treatment of Childbed Fevers' (1854); translations of Hufeland's 'Treatise on the Scrofulous Disease' (1829); Velpeau's 'Elementary Treatise on Midwifery' (1831); Colombat de L'Isère's 'Treatise on the Diseases and Special Hygiene of Females' (1845). Consult Meigs, John F. 'Memoir of Charles D. Meigs' (Philadelphia 1872).

MEIGS, Montgomery, American civil engineer: b. Detroit, Mich., 27 Feb. 1847. He was educated at Harvard and in Germany, and was for several years in the employ of the Northern Pacific Railroad. Since 1882 he has had charge of the Des Moines Rapids Canal under the government. He is the inventor of a "canvas coffer-dam." He also constructed the United States dry dock at Keokuk. In 1898 he proposed a new method of improving country roads by using oil with a sprinkler to make a water-tight surface and lay dust, which attracted wide attention and has since been generally adopted. He built and designed many steamboats and steam dredge tenders for the United States. In 1910–13 he was the government local inspecting engineer in the construction of the great lock, dry dock and power developments in the Mississippi River at Keokuk, Iowa.

MEIGS, Montgomery Cunningham, American military officer: b. Augusta, Ga., 3 May 1816; d. Washington, D. C., 2 Jan. 1892. He was graduated from West Point in 1836 and entering the engineering corps the next year was engaged in the construction of forts Delaware, Wayne, Porter, Niagara, Ontario and Montgomery until 1852, when he took charge of the building of the great Potomac aqueduct. In 1860 he built Fort Pickens in Florida, and in 1861 was appointed quartermaster-general of the United States army and given rank as brigadier-general. He was promoted major-general in 1864, and in 1875–76 he was sent by the government to Europe to make an inspection of various staff-departments, the quartermaster's in particular. After his retirement in 1882 he was engaged in preparing plans for various public buildings in Washington. He was a regent of the Smithsonian Institution and of many scientific societies, and was at his death architect of the Pension building.

MEIGS, Return Jonathan, American soldier and pioneer: b. Middletown, Conn., December 1734; d. at the Cherokee agency, Ga., 28 Jan. 1823. At the commencement of the Revolutionary War he raised a company of men and marched to the American camp at Cambridge, subsequently accompanied Arnold on his expedition against Quebec, where he was taken prisoner, and after his release was commissioned a colonel in the Continental army. He signalized himself by a brilliant expedition against a British post at Sag Harbor on Long Island, for which he received the thanks of Congress and a sword, and took a distinguished part in the capture of Stony Point under General Wayne, and elsewhere in the course of the war. In 1788 he emigrated to Ohio, and established himself at Marietta. In 1801 he was appointed by President Jefferson Indian agent of the Cherokees, among whom he passed the remainder of his life.

MEIGS, Return Jonathan, American soldier and politician, son of the preceding: b. Middletown, Conn., November 1765; d. 29 March 1824. He was graduated from Yale in 1788, went to Marietta, Ohio, with his father in 1788 and rose to prominence there as a lawyer. He was chief justice of the Ohio supreme court 1803–04; served in the army as a brevet colonel 1804–06; was a judge in Louisiana 1805–06; and in Michigan for the two years following. After being senator from Ohio 1808–10 he was governor of that State for the next four years, in which period he was an active supporter of the war measures of 1812–14. He was postmaster-general of the United States 1814–23.

MEIGS, William Montgomery, American lawyer and biographer: b. Philadelphia, 12 Aug. 1852. He was graduated from the University of Pennsylvania in 1872, studied law and was admitted to the bar in 1879. In addition to his law practice he has devoted much time to literary work and is author of 'Life of Joseph Meigs' (1887); 'Life of Charles Jared Ingersoll' (1897); 'The Growth of the Constitution' (1900); 'The Life of Thomas Hart Benton' (1904), etc.

MEIJI, may-ee-jee, the name of the most famous era in the history of Japan (1868–1912). From the introduction of almanacs and chronology from China, 645 A.D., it has been customary to select a nengo, or year-period, from certain words, mostly of happy augury, contained in the Chinese cycle of 60 years (a "cycle of Cathay"). The two words united in Meiji mean Enlightened Government. Of old, it was customary to change the nengo for arbitrary reasons, but from 1868 the rule was fixed to have each year-period begin and end with the emperor's reign. Succeeding the Meiji era, in 1912, was that of Tai-sho, or Great Righteousness. All the dates in Japanese historical records, before 1868, are given in year-periods and the months and days according to the lunar calendar. In 1880, Mr. William Bransen, in Tokio, after elaborate investigation, published his great work, which enables one to express all the Japanese dates, of the 243 year-periods, from 645 A.D., in terms of the Gregorian or European calendar, which in 1875 was adopted in Japan. Consult Clement, 'Handbook of Modern Japan' (1913), and Bransen, 'Japanese Chronological Tables' (Tokio 1880).

MEIKLEJOHN, mī'k'l-jŏn, **Alexander,** American educator: b. Rochdale, England, 3 Feb. 1872. He came to America in 1880; was graduated from Brown University in 1893 and from Cornell in 1897. In 1897–99 he was instructor in philosophy at Brown University; was associate professor 1899–1903. In 1906–12 he was professor of logic and metaphysics there, and in the latter year was called to Amherst as president and professor of logic and metaphysics.

MEIKLEJOHN, mī'k'l-jŏn, **George D.,** American lawyer: b. Weyanwega, Wis., 22 Aug. 1857. He was graduated from the University of Michigan in 1880 and established himself in a law practice at Fullerton, Neb., in that year. He held several public offices and in 1884 and 1886 was elected State senator. In 1889 he was elected lieutenant-governor of Nebraska and in 1893–97 served as member of Congress. He was appointed Assistant Secretary of War in 1897 and filled that post through the war with Spain, retaining his office after the resignation of Secretary Alger, until 1901, since which time he has been engaged in his law practice at Fullerton.

MEILHAC, Henri, ŏn-rē mā-yăk, French playwright: b. Paris, 25 Feb. 1831; d. there, 6 July 1897. His work as a dramatist, begun in 1855, was attended at first by scant success, but he finally became a favorite playwright. Much of his work was done with Halévy (q.v.). He furnished the book for Offenbach's 'Grande Duchesse,' 'La Périchole,' and 'Les Brigands,' and other works of that composer. Among his independent plays are 'Petite Marquise' and 'Décoré.' In 1888 he was elected to the Académie Française.

MEILLEUR, Jean Baptiste, Canadian author and educator: b. Saint Laurent, near Montreal, 1795; d. 1878. He received his education at the Collège Saint Sulpice de Montreal; studied for the bar, but later took up the study of medicine at the Carleton Medical College, Vermont, where he was graduated in 1825. He became editorial writer on the *Tessier Journal* and was elected to the Legislative Assembly of Lower Canada in 1834. In 1842 he became superintendent of public instruction and retained this post until 1857. Several educational in-

stitutions were founded during his administration which was eminently successful. Meilleur became postmaster of Montreal in 1862. He was a founder of the Collège de l'Assomption. His published works included textbooks on chemistry, education and grammar, all in French.

MEININGEN, mī'nĭng-ĕn, Germany, the capital of the small Duchy of Saxe-Meiningen, in a narrow, well-wooded valley, on the Werra, 40 miles southeast of Erfurt. It is an attractive modern town with regular and handsome streets, having been practically rebuilt since the disastrous fire in 1874 which destroyed the old town. The principal buildings are the new town-house and the ducal palace with a church, private and public library of 55,000 volumes, picture gallery, museum, etc., attached. The stock company of the local theatre which for 16 years enjoyed a European reputation for the excellence of its acting and staging, was dissolved in 1890. The industries are only of domestic importance and include brewing, woolen and cotton-weaving. Pop. 17,186.

MEISSEN, mī'sĕn, Germany, a town of Saxony, founded by Henry I in 922–33, 14 miles northwest of Dresden, on the left bank of the Elbe, at the confluence of the Meisse and Triebisch. It has a noble old castle originally built in the 10th century and rebuilt in the 15th century on a precipitous rock above the town, recently restored. There is a fine old Gothic cathedral, 500 to 600 years old. Also the Franciscan church, a large and magnificent edifice, used as the custom-house; the church of Our Lady, or city church; the ancient church of Saint Nicholas; and other public buildings. The royal porcelain factory, first established by Bœttcher (q.v.), and now at some distance from the town, is the great industrial establishment of the place; there are also manufactures of matches, stoves, iron foundries and machine-works, a jute-mill, breweries, etc. Meissen is the see of an archbishop. Pop. about 35,865.

MEISSONIER, Jean Louis Ernest, zhŏn loo-ē ĕr-nā mā-sō-nyā, French painter: b. Lyons, France, 21 Feb. 1815; d. Paris, 31 Jan. 1891. He came to Paris in early youth and entered the studio of Cogniet, meanwhile forming his style on the Dutch masters as represented in the Louvre. He first attracted attention by his illustrations of the Bible, Bossuet's 'Universal History,' 'Orlando Furioso,' 'Paul and Virginia,' etc. His earliest paintings in genre to be exhibited in the Salon were 'The Little Messenger' and 'The Chess Player' (1836). His reputation grew rapidly on the successive appearance of 'The Monk' (1838); 'The English Doctor' (1839); 'The Chess Party' (1841). The times of Louis XIV and Louis XV with all the accessory richness and variety of costumes, weapons and domestic luxury, began to find in him their most successful delineator. In the many canvases which he produced in this narrow department of genre he showed a keen and strong, but not too florid, power of characterization, which was accompanied with a marvelous technique in the handling of stuffs, metals, etc. But modern history eventually claimed his attention and he found a congenial field for the exercise of his special gifts in the campaigns of Napoleon. His pictures were often small, but finished with minute and delicate virtuosity, a good example of which may be seen in his 'Cuirassiers of 1805'; but he is perhaps less successful in large canvases and elaborate figure compositions than in his small paintings. Among his most famous pictures of the Napoleonic cycle are 'Napoleon I with his Staff' and 'Napoleon III at Solferino' (1864); 'Napoleon I at Friedland' (1875), now in the Metropolitan Museum of New York. In his latter days he painted Venetian scenery and architectural views with his usual dash, thoroughness and originality. In his works he shows the best qualities of the Dutch school with all its life-like expression, truthfulness and spirit combined with the delicacy of French sentiment and abandon. His water colors, etchings and lithographs bear admirable witness to his versatility and vigorous industry. His pictures have always fetched a high price, 'Friedland or 1807' having been sold for $60,000, a sum scarcely disproportionate to that given for smaller canvases. He is to be looked upon as the founder of the new school of military painters represented by his son Jean Charles Meissonier and Edouard Detaille, his most illustrious pupil. Consult Claretie, 'Meissonier' (1881); Larroumet, 'Meissonier' (1893).

MEISTERMANN, Barnabas Francis Joseph, German archæologist and missionary: b. Pfaffenheim, Alsace, 27 March 1850. He received his education in the seminary of Strassburg and in 1873 was ordained to the priesthood of the Roman Catholic Church. In 1875 he joined the Franciscan Order, was sent to France and England for a time, and from 1887 to 1893 labored as a missionary among the Chinese. Since 1893 he has resided in Jerusalem, engaged in teaching, writing and research work. His works include 'La Portioncule' (1884); 'Le Mont Thabor' (1900); 'La Montagne de la Galilée où le Seigneur apparut aux Apôtres' (1901); 'Deux questions d'archéologie palestinienne' (1902); 'Le prétoire de Pilate et la forteresse Antonia' (1902); 'Questions de topographie palestinienne' (1903); 'Le tombeau de la Sainte Vierge à Jerusalem' (1903); 'La ville de David' (1903); 'La patrie de Saint Jean-Baptiste' (1904); 'New Guide to the Holy Land' (London 1907); 'Guide du Nil au Jourdain par le Sinaï et Pétra' (1909). He contributed to the 'Catholic Encyclopedia.'

MEISTERSINGERS, mīs'tĕr-sing-ĕrz, or **MASTER-SINGERS** (Ger., *Meistersinger*), a society of German singers formed in the 14th century. During the long evenings of winter the worthy burghers of the German cities assembled to read the poems of the minstrels. Some of the hearers were naturally led to try their own skill in verse; others followed, and the spirit of the age soon embodied these votaries of the muse into societies after the fashion of corporations. Charles IV gave them a charter and a coat of arms. They met on certain days and criticized each other's productions, in which external correctness seems to have appeared to them the chief object; few, indeed, had an idea of the difference between poetical and prosaical ideas or expressions. Their attempts in the lyric style were chiefly limited to spiritual songs; in the epic to rhymed versions of the scriptural narratives. They were also

fond of the didactic style. The rules by which the members of the societies were to be guided as to the metre, etc., of their compositions were written on a table, and called *tabulatur*, for the sake of enforcing a strict observance of purity in language and prosody. The chief faults to be avoided were collected; they were 32 in number, and distinguished by particular names. He who invented a new metre, invented also a new tune, the names of which were the drollest and sometimes the most senseless imaginable. Besides their stated meetings they held public meetings, generally on Sundays and festivals in the afternoon in churches. In Nuremberg, where the master-singers flourished particularly, such meetings were opened with free singing, in which anybody might sing, though not belonging to the corporation. In this the choice of the subjects was left comparatively uncontrolled; then followed the chief singing, when only those who belonged to the corporation were allowed to sing, and only on scriptural subjects. The judges were called *Merker*, and sat behind a curtain. There were four: one watched whether the song was according to the text of the Bible, which lay open before him; the second whether the prosody was correct; the third criticized the rhymes; the fourth the tunes. Every fault was marked, and he who had fewest received the prize, a chain with medals. Whoever had won a chain was allowed to take apprentices, to have many of whom was a great honor. Money was never taken from apprentices. After the expiration of his poetical apprenticeship the young poet was admitted to the corporation, and declared a master after having sung for some time with acceptation. These strange societies originated toward the end of the 14th century at Mainz, Strassburg, Augsburg and continued in several free cities of the empire until the 17th, in Nuremberg to the 18th century, where probably the renown of Hans Sachs (q.v.), the famous shoemaker and poet, kept them longer in existence. The last society of the kind was that of Ulm, which was dissolved in 1839. Richard Wagner, in his musical drama, 'Die Meistersinger' satirized the art of these early masters. Consult Mey, K., 'Der Meistergesang in Geschicht und Kunst' (1892); Nagel, W., 'Studien zur Geschicht der Meistersanger' (1909).

MEJERDA, or MEJIRDA, mĕ-yĕr'da, the ancient BAGRADAS, a river of North Africa, formed by the union of several head-streams rising in the Atlas Mountains in Algeria, and flowing through Tunis to its outlet in the Mediterranean, 24 miles north of the city of Tunis. The mass of sediment which it brings down has enlarged its delta and changed the coast line, its mouth formerly being at Bu-Chateur, seven miles southward. Its whole course is about 200 miles.

MEKONG, mā-kŏng', or **CAMBODIA,** a river of Indo-China. See CAMBODIA.

MELA, mē'lä, **Pomponius,** a geographer who flourished during the 1st century of the Christian era, probably under the Emperor Claudius. Little more is known of him than that he was a native of Spain, and the author of a treatise in three books in the Latin language, 'De Situ Orbis,' containing a concise view of the state of the world so far as it was known to the ancient Romans. Mela is edited by Tzschucke (1807), Parthey (1867), and Frick (1880).

MELACONITE. A black copper ore consisting of oxide carrying 79.7 per cent of copper. Occurs in many mines.

MELAMPUS, in Greek mythology, son of Amythaon, who was the first mortal endowed with the gift of prophecy, and who first practised the medical art. He is said to have introduced the worship of Bacchus into Greece. According to the legend, he could converse with animals, and was favored by Apollo, who taught him divination. His powers saved his life when he was imprisoned in Thessaly. The worms in the wall informed him that the structure would soon fall, and he told his jailers, who withdrew, taking him with them. They informed the king and Melampus was at once in demand, courted and feted. He married one of the king's daughters and was given large estates. In ancient Megaris he was worshipped and a temple erected in his honor.

MELANCHOLIA. See INSANITY.

MELANCHTHON, Hellenized name of Philipp Schwarzerd (Eng. "black earth"), German reformer: b. Bretten, in the Palatinate, 16 Feb. 1497; d. Wittenberg, 19 April 1560. He was left an orphan in his 10th year and taken into the house of his grandmother, a sister of Reuchlin (see REUCHLIN, JOHANN), the great German humanist, by whom he was affectionately treated and encouraged in his studies. In his 12th year he entered the University of Heidelberg and two years later was graduated bachelor. While he was occupied as tutor to the son of Count von Löwenstein, he continued to give attention to his own progress in Greek; in 1514 was made master of arts at Tübingen and thenceforth devoted himself to humanism, lecturing on Cicero, Terence and Greek grammar. He also gave much time to the study of theology, jurisprudence and medicine. Here he first became acquainted with Erasmus' edition of the New Testament, and was through the influence of Reuchlin elected professor of Greek in the newly founded University of Wittenberg. He delivered an inaugural address (29 Aug. 1518), 'De Corrigendis Adolescentiæ Studiis,' which produced a revolution in German educational methods and above all met with the approbation of Luther, professor of philosophy at Wittenberg. From this time Melanchthon became 'Preceptor Germaniæ' (The Schoolmaster of Germany), and the 'Ally of Luther.' These two champions of the Reformation were brought still closer together by their union at the 'Leipzig Disputation' (1519), in which they were confronted by Dr. Eck (see ECK, JOHANN VON) the great opponent of Luther and the movement he was inspiring. In his handling of this adversary, both orally and by his writings, Melanchthon showed himself to be the leader of Protestant controversialists and the most learned, judicious and ready of Protestant disputants.

In 1520 he married Katharina Krapp, daughter of the burgomaster of Wittenberg, and "Master Philip," as he was familiarly called, as he settled down to domestic life, was placed on the theological faculty of the university, and the first fruit of his increased application to the theological study and teaching was his 'Loci Communes Rerum Theologicarum,' which was

the first declaration of the Protestant position delivered in formal terms of dogmatic theology. The volume ran through 60 editions in his lifetime, and established its author's position as Luther's complement — in some respects the lesser spirit of the Reformation movement, but the scientific talent which supported on the intellectual side the genius and the faith of Luther. Melanchthon, by his historic learning, by his power over the classic languages, was enabled to communicate to the learned world the real principles of the new movement and the facts of the past on which it was founded. He brought to bear his deep knowledge of theological philosophy, his acquaintance with the precise terms in Greek and Latin of scriptural, patristic and scholastic statement on the main question of the dispute, and he had the calmness of the well-balanced humanist which enabled him to direct with cool and even mind the movements of his party and to keep it as free as possible from the fury and blindness of intolerance. His knowledge of Greek made him as useful to Luther in translating the Bible as Parnell was to Pope in the production of his 'Iliad.' His pen had an immense influence in securing the after success of the initiative taken by bolder but less cautious and reasonable spirits, and left a mark on the German Reformation deeper, more permanent and characteristic than that of any among his most enthusiastic contemporaries. His 'Epitome Doctrinæ Christianæ' became from the first an influence which establishes its claim to be called the pandect and code of European Protestantism.

The spirit of Melanchthon was distinctly irenic. The Reformation had resulted not only in a German revolt from the papacy, but in the creation of a host of jarring Protestant sects. Melanchthon's broad and far-seeing spirit was averse to division of any kind. The Augsburg Confession which was presented to the diet in 1530 surprised even the Roman Catholics by its moderate tone. It was drawn up by Melanchthon in accordance with memoranda supplied by Luther and it has all the breadth, calmness and judicial cautiousness of Luther's friend and good genius. But this spirit of compromise, hopefulness and patience was out of harmony with the passion for controversy which made Wittenberg a centre of storm and strife. Melanchthon, however, stuck to his post at Wittenberg long after the great power and influence he once wielded had passed from him into the hands of more positive, violent and aggressive leaders. There occurred a breach between the Philippists, the followers of Melanchthon and the Lutherans, who adhered to the extreme views of his friend on the subject of free will and irresistible grace, on the doctrine of the Lord's Supper, and on the "adiaphora" indifferent matters, as the former was inclined to term the ceremonies of the Roman Catholic Church. He and his followers were assailed as "rogues" and "worshippers of Baal." Luther stated his own views on the sacrament with such violence that the recollection of his 'Short Confession respecting the Lord's Supper' filled him with remorse on his death bed, where he acknowledged to his friend "Dear Philip, I confess to have gone too far in the affair of the Sacrament." The death of Luther left Melanchthon to the mercy of such zealous and fiery sectaries as had been engendered in that teeming period of intellectual and theological movement, which the monk of Wittenberg had inaugurated. He survived Luther four years, waiting for death, he said "as a refuge from the phrenzy of theologians," and praying that the Protestant world might find its way at last to reunion, a prayer which as yet remains unfulfilled.

Melanchthon's important part in the Reformation movement has often been lost sight of in the blaze of Luther's more striking and popular personality. Yet he may with some reason be called the brains of the Reformation. More than that, he was a man who, while he stood for progress, was averse to revolutionary change. In one sense he was the Mirabeau of a religious revolution, a constructive rather than a destructive reformer, a man born in a generation, which he could only affect by presenting an example of intellectual refinement, moderation, tolerance and conservation, which the warring giants of the Reformation refused to follow. In 1865 a statue was raised to him at Wittenberg and in 1883 a group comprising Melanchthon and Luther at Leipzig. His works are found complete in 'Corpus Reformatorum,' 28 vols. (1834-60). Consult Schmidt 'Philipp Melanchthons Leben und ausgewählte Schriften' (1861); Richards, 'Philipp Melanchthon' (1898); Neander, 'Vita Quattuor Reformatorum' (1846); Hartfelder, Karl 'Philipp Melanchthon als Præceptor Germaniæ' (Berlin 1899).

MELANESIA. (Greek, *melas*, black *nēsos*, island), in which the reference is to the extreme blackness of the people rather than of the islands themselves, is the designation applied to the islands of the western region of Oceanica. They extend northwestward in three interlacing chains, from New Caledonia on the south to the Bismarck Archipelago on the north. East of New Caledonia lie the Loyalty Islands, northeast of the Loyalty Islands begin the New Hebrides, and these are succeeded by the Santa Cruz, the Banks and Swallow groups. A little to the west of these begin the Solomon Islands, and considerably east of this archipelago lies a chain of small islands which are geographically to be classed in Melanesia, but ethnologically are distinctly Polynesian. In the partition of the Pacific among the European powers New Caledonia and the Loyalty Islands belong to France, the New Hebrides are held jointly by France and Great Britain, the Santa Cruz and the Solomon Islands form a British protectorate. Bougainville and Buka, the northernmost of the Solomon Islands, joined for purposes of administration with the Bismarck Archipelago, formed a part of the German colony of Kaiserwilhelmsland; this colony was captured in September and October 1914, by the Australian contingent, on its way to the World War. Economically, Melanesia has been but little exploited. The French in New Caledonia have worked with considerable success extensive mineral operations, the garnierite being the richest known ore of nickel and being found in beds which in general may be worked as open quarries. In the New Hebrides the French have established extensive plantations with every promise of future industrial success. The other islands of Melanesia remain in almost unmodified savagery, and only within the last few

years has any considerable attempt been made to utilize their extensive groves of coconut. Missionary effort in Melanesia has for the most part followed the flag; Catholic missionaries are engaged upon the conversion of the New Caledonians, Presbyterian missions have engaged with the southern New Hebrides, the Melanesian Mission of the Church of England is active in the New Hebrides and the Solomons, and in the Bismarck Archipelago the Australian Wesleyan Connection had a flourishing mission at Mioko before the German annexation, after which they were paralleled by the efforts of German missions, both Catholic and Protestant. The inhabitants of Melanesia vary so considerably in form and language as to lead to the conclusion that probably three distinct racial types are to be found within the area, in addition to a certain admixture of Papuan characters which have filtered into the northern areas of the region. Between island and island, even between village and village on the same small island, the difference of speech amounts to complete incomprehensibility. In general it is to be said that the Melanesians are very close to the lowest level of savagery; polygamy, infanticide and cannibalism are constantly practised, yet the people are of an agreeable disposition and very attractive to all such as are brought into contact with them. The cultural position of the Melanesians is markedly distinct from that of the Polynesians in several important particulars: The bow is in use. the art of pottery is very generally practised, the loom is found in one area, the taboo does not exist in any sense of moral control, the authority of chiefs is very limited and scantily invested with the idea of hereditary succession, shell money is used as a circulating medium, and over a large and increasing area of Melanesia sirih (betel) chewing is extensively practised. Consult Codrington, R. H., 'Melanesian Languages' (Oxford 1885); id., 'The Melanesians: Studies in their Anthropology and Folk-Lore' (Oxford 1891); Haddon, A. C., 'Head-Hunters, Black, White and Brown' (London 1902); Guppy, 'Solomon Islands and their Natives' (ib. 1887); Imhans, 'Les Nouvelles-Hébrides' (Nancy 1890); Seligmann, 'The Melanesians of British New Guinea' (Cambridge 1910).

MELANESIANS. See MELANESIA.

MELANISM, an excess of pigment in the skin and its appendages, producing real or comparative blackness; the opposite of albinism (q.v.). Melanism is less frequent than albinism, but more inclined to affect large numbers of individuals of a species, forming melanistic varieties and is seen not only in man but in other mammals and in birds, reptiles, fishes, and in insects as, for example, certain moths which are found in Labrador and in the White Mountains of New Hampshire, showing a possible connection between melanism and cold or high altitudes. Moisture is also considered to be a determining factor, as is indicated by the fact that the darkest races of men inhabit the warmest and dampest regions of the earth. A conspicuous example of melanism is afforded by the American "black" squirrels, which are melanistic varieties of various species, especially the fox-squirrel (*Sciurus niger*) and the gray squirrel (*S. carolinensis*). These varieties prevail in certain parts of the country, as the region of the Great Lakes and upper Mississippi Valley, and rarely occur elsewhere. Thus a black squirrel is almost unknown in New England or the Hudson Valley. Another familiar example is found in the black leopards, which in a direct light seem absolutely black, but under reflected light betray a pattern of spots similar to those of the ordinary leopard. Such examples, as is the case with other melanistic animals, often occur in the same litter of young with normal forms. In many of the lower animals, as butterflies, melanistic tendencies are developed under certain conditions, especially of excessive moisture. The pigments in the skin are mainly of the class called Melanins, which produce dark hues. Total abnormal melanism in man is unknown, but cases of partial melanism are on record. In one instance one-half of the face was white, the other black. A case is on record of a 16-year-old girl, a laundress, whose neck, face and upper chest became blue on certain occasions. She was otherwise apparently normal but the skin was so pigmented that when she blushed her color was blue instead of red, the change appearing with chameleonic rapidity and being associated with the accession of blood to the skin. A white towel was stained blue by being rubbed over her skin. Other cases of skin discoloration are that of a man who became black in places and yellowish brown in others, and that of an unmarried woman white until she was 21 and thereafter black as a negro. The cause of this condition is unknown. Melanoderma, chloasma, and liver-spots are terms applied to irregularly shaped yellow, brown and black colorations of the skin. Some of these spots are due to scratching following the bites of body-vermin, to prolonged pressure upon a portion of the skin, prolonged use internally of preparations of silver, to racial admixture, general diseases, such as cancer or tuberculosis, etc. See COLORING MATTERS; COLORATION, PROTECTIVE.

MELANITE (Gr. "black"), a very black variety of garnet, especially the lime-iron variety, in which lime largely preponderates in the protoxides. Melanite occupies a place midway between schorlomite and the garnets pure and simple; this is notably true of the sort containing the rare element titanite (q.v.). The group includes all the darkish garnets, with the exception (made by Dana) of the precious garnet, technically the pyrolite, which varies from red to black. With the green demantoids the blackish melanites make up the greater part of Dana's second class of garnets, the iron garnets.

MELANORRHŒA, mel"ą-nō-rē'ą. See VARNISH TREE.

MELANOSIS. See TUMOR.

MELANTERITE (Gr. *μελάντερος*, "blacker"), in mineralogy, the native hydrous sulphate of iron; iron vitriol. It is the native form in which copperas occurs, is green in color and has a glassy lustre.

MELASMA (Gr. "black spot"), a disease marked by discoloration of the skin. The term is rightly used in connection with a pigmentation of the skin, sometimes diffuse (color varying — dusky yellow, greenish brown, or even

black), and believed to be dependent upon degeneration of the suprarenal capsules or the semilunar ganglia. (See ADDISON'S DISEASE). Sometimes the term is applied to the conditions known as liver-spots and "moth-patches."

MELASTOMACEÆ. See DEER GRASS.

MELBA, Nellie, Australian prima donna: b. Melbourne, about 1860. She studied there in the Presbyterian Ladies' College; then took up music under Marchesi in Paris. On 15 Oct. 1887 she made her début in Brussels in 'Rigoletto'; at that time gave up her family name Mitchell and took the stage name Melba, which is said to have been suggested by the name of her native city; in 1889 she appeared in Paris at the opera, where she stayed for three years, during which she appeared in London in Italian répertoire; and after 1892 toured Europe and America. Her best rôles are Ophelia, Juliette, Lucia and Nedda in 'I Pagliacci.' She was married to Charles Armstrong in 1882. Consult Murphy, G. A., 'Nellie Melba' (London 1909).

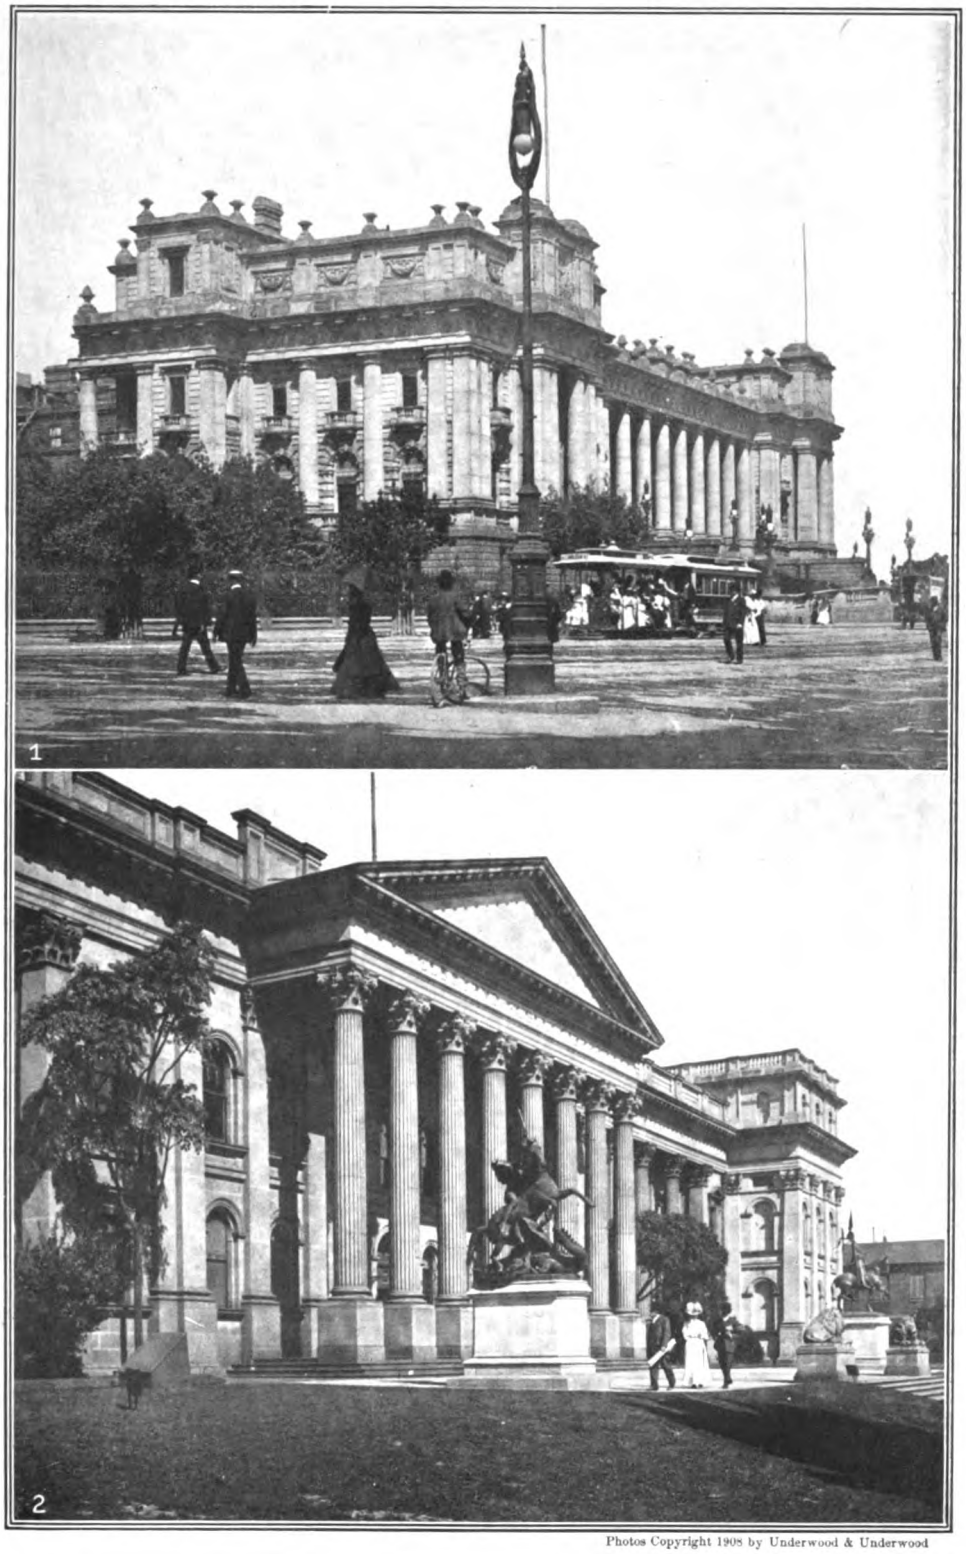
MELBOURNE, měl'bèrn, **William Lamb,** VISCOUNT, English statesman: b. 15 March 1779; d. 24 Nov. 1848. Carefully trained by his mother, he entered Eton in 1790, Trinity College, Cambridge, in 1796, and Lincoln's Inn in 1797; studied law in Glasgow; was called to the bar in 1804; and in 1805 was elected to the House of Commons, where he followed Fox, leader of the opposition. He lost his seat in 1812 because of his vote for Catholic emancipation; was returned in 1816; served as chief secretary in Ireland in 1827; and in 1828 entered the House of Lords upon his father's death. Only then did he begin to figure in politics, and that only because of his popularity, for he had no official ability, being neither diligent nor brilliant. As home secretary under Grey in 1830 he was a failure; but in July 1834 the king induced him to form a ministry, and again in 1835, in spite of the king's effort to foist Peel on the country in November 1834, he became Premier. He remained in office until August 1841, thus covering the early years of the reign of Victoria, whom Melbourne ably instructed in the duties of her position. His tuition of the young queen seems, however, the only event of his long administration, and he must be classed rather as a politician than as a great statesman, since he was scarcely more than indifferent to the reform measures of the day. He was a man of much learning, of a rather attractive, though coarse and habitually profane, wit and of a strange admixture of constitutional conservatism and political liberalism. His wife, Lady Caroline Ponsonby, whom he married in 1805, was separated from him in 1825; she wrote several novels and was a friend of Lord Byron. See NORTON, CAROLINE ELIZABETH; and consult Torrens, W. M., 'Memoirs.'

MELBOURNE, Australia, the capital of the state of Victoria, and the largest city of Australasia, situated around Hobson's Bay, at the northern extremity of Port Phillip, 40 miles north of its entrance from the ocean between Points Lonsdale and Nepean. The city and its numerous suburbs occupy an extensive undulating area, with the Yarra River, a stream of no great size, winding through it. The central and most important business part of the city is on the north bank of the Yarra, two miles by a direct railway line from the river's outlet in Hobson's Bay, but nine miles by the meandering water route. The city is built on a rectangular plan with fine wide streets lined with handsome and substantial public buildings and residences. Numerous lines of railway connect with the interior and the extensive suburban districts, which include such important places as Collingwood, North Melbourne, Fitzroy, Carlton, Brunswick, South Melbourne, Richmond, Prahran, Saint Kilda, Port Melbourne, etc. The city is well lighted, and paved, and is abundantly supplied with water, but the drainage, although much has been done toward its improvement, is still defective. Street railways traverse all the principal city and suburban thoroughfares.

The public buildings of Melbourne are noteworthy. The Houses of Parliament form a remarkable pile with a splendid west façade. Government House is a palatial building conspicuous from every part of the city, with a tower 145 feet high. Other public buildings include the law courts, forming an extensive square, the post-office, the custom-house, the treasury, the land and mining offices, the mint, the free library with some 300,000 volumes; the university, with an admirable museum belonging to it and a splendid hall (the Wilson Hall) in the Gothic style; the Ormond Presbyterian College; the town hall, with a large assembly room containing a splendid organ; the exchange, observatory, meteorological station, and athenæum. The ecclesiastical buildings include an Anglican Cathedral, a Roman Catholic Cathedral and the Scots church, with a fine steeple. There are several "sky-scraper" office and store buildings; many banks and business premises are attractive; and the Exhibition building deserves notice. At the head of the educational institutions is Melbourne University (about 930 male, 320 female students annually), with which are affiliated the three denominational colleges, Trinity (Episcopal), Ormond (Presbyterian), and Queen's (Methodist). Charitable and benevolent institutions are numerous. There are several parks and other grounds for public recreation, and among these the Botanic Garden deserves special notice on account of its extent (100 acres), its beauty, and the value of its collection of trees and plants. The beautiful Fitzroy Gardens also deserve special mention. Melbourne is the see of a Roman Catholic archiepiscopate and of an Anglican bishopric. The United States is represented by a consul-general. The chief industrial products of Melbourne are leather, furniture, clothing, flour, ales, cigars, ironware, woolen, etc. The shipping trade is large both in exports and imports, the chief of the former being wool and gold, of the latter manufactured goods. Most imports are subject to a heavy duty. Vessels of 26 feet draught can ascend the Yarra. Its navigation has been much improved, and the Coode canal shortens the passage. The largest vessels are accommodated at Port Melbourne and Williamstown, with depths of about 30 feet, both on Hobson's Bay; Port Phillip Bay affords unlimited anchorage for the largest vessels. The tonnage of vessels entered 1915-16 was 5,290,318. Pop. of Melbourne, including the suburban municipalities, 684,000, nearly half the population of the state.

The first settlements on the site of Melbourne were made in 1835, and a year or two

MELBOURNE, AUSTRALIA



1 Parliament Building, Melbourne

2 Public Library, Melbourne

after it received its present name, being so called after Lord Melbourne, who was then British prime minister. It was incorporated in 1842 and became a bishop's See in 1849. In 1851 it became capital of Victoria (then established as a separate colony), and received an immense impetus from the discovery of gold fields.

A centennial exhibition was held in 1888 in celebration of the founding (in 1788) of the Australian colonies. A great conflict between labor and capital took place in 1890, and a strike by the labor-unionists took place on a very extensive scale both in Victoria and New South Wales. In 1892–93 Melbourne suffered severely from commercial depression, financial crises and banking disasters. The first Parliament of the Commonwealth of Australia was opened in the Exhibition Building on 9 May 1901 by the Duke of Cornwall and York (afterward George V). Consult 'Victoria and its Metropolis, Past and Present' (1889); Gordon and Gotch, 'Australian Handbook' (1906).

MELCHERS, Paulus, German cardinal: b. Münster, Westphalia, 6 Jan. 1813; d. Rome, 14 Dec. 1895. He studied law at Bonn and theology at Munich and Münster; was ordained priest in 1841; in 1857 became bishop of Osnabrück, and in 1865 Pope Pius IX nominated him archbishop of Cologne. At first opposing the doctrine of papal infallibility at the Vatican Council, Melchers afterward accepted it, in agreement with the majority, and dealt severely with professors who sought to prevent its declaration. In the Kulturkampf (q.v.) his conspicuous activity brought him into collision with the representatives of government, and in 1876 he was removed from his archbishopric. His writings include 'Eine Unterweisung für das heilige Altarsakrament' (1878); 'Die katholische Lehre des Herrn' (1883), and 'Das Leben der allerseligsten Jungfrau und Gottesmutter' (1884).

MELCHITES, mĕl'kīts, those Christians of western Asia and of the Levant who acknowledge the supremacy of the Roman Pontiff and accept the dogmas of the Roman Catholic Church. The Syriac and Egyptian congregations of this name in the main belong to the Greek Church though in some unimportant matters of ceremony and discipline they take an independent course. They are, however, under a chief bishop of their own, who is styled patriarch of Antioch. The term Melchites is a nickname. It means "Royalists" and was given to them by the orthodox Greeks with the implication that they accepted the decrees of the Council of Chalcedon merely at the dictation or in conformity with the example of the emperor. Celibacy is imposed upon their bishops, but their priests are at liberty to marry. Their liturgy is in the Arabic language; they use unleavened bread in the Eucharist and in their monastic houses they follow the Basilian rule. There are said to be 100,000 of them. Consult Neale, 'History of the Eastern Church.'

MELCHIZEDEK, mĕl-kĭz'ĕ-dĕk ("king of righteousness," that is, righteous king), in the story of Genesis, king of Salem and priest of "Supreme God." He met Abram on his return from the victorious expedition against Chedorlaomer, gave him his blessing and received tithes from him. The antelegal king-priest stands in Psalm cx as a figure typical of the Messiah the vicegerent of Jehovah, and in Hebrews vii, 3, of the kingly priesthood of Jesus. There are various views as to the identity of Melchizedek, as he is named in many ancient writings. Rabbi Kaufmann Kohler of the Hebrew Union College, Cincinnati, states in the 'Jewish Encyclopedia' that the personality of Melchizedek rests upon ancient Jewish tradition, and identifies him with Malki-Zedek, first king of Zedek, the ancient name of Jerusalem. Philo speaks of him as the "Logos"; others believe he was Shem, ancestor of Abraham. The chapter in Genesis containing his story is a unique passage of the Pentateuch, and according to Wellhausen is one of its latest additions. Ewald counts it the earliest portion of the history and based on old Canaanitish records; others, as Nöldeke, explain it as utterly unhistorical.

MELCHTHAL, mĕlH'täl, **Arnold von** (ARNOLD AN DER HALDEN), Swiss patriot. He is considered by some authorities to be a mythical character, but was supposed to have lived in the 14th century. He incurred the wrath of the governor and was compelled to flee to escape punishment, whereupon the governor seized Arnold's aged father and had his eyes put out. The son, enraged at this barbarity, with two friends planned a revolt against the Austrian power which they successfully conducted. Consult Ægidius Tschudi, 'Chronicon Helveticum' (1505–72).

MELDOMETER. See MELTING POINT.

MELEAGER, according to Greek legend, the hero of the Calydonian boar hunt. The earliest form of the story is found in the 'Iliad,' according to which Meleager is son of Æneus, a king of Ætolia, and Althæa, daughter of Thestius. When the boar had devastated the land Meleager gathered a band about him and after a great struggle and with considerable loss of life slew the monster. A quarrel over the spoils arose between the Ætolians and the Curetes, the latter being under the leadership of Meleager's maternal uncles. In the quarrel the latter were killed by Meleager, who was now cursed by his mother, who prayed the Furies and gods of the nether world to destroy him. The hero withdrew from the fight until the Curetes stormed the town when he launched forth to save his people and was slain, according to some, by the Furies, according to others by the hand of Apollo. Other versions of the story were current in later times, one of which is preserved in an ode of Bacchylides. The Calydonian Hunt was a favorite subject with artists from early times, and a copy of a work by Scopas, executed originally for one of the pediments of the temple of Athena Alea at Tegea, is now in the Vatican, Rome. In the Fogg Art Museum of Harvard University is an excellent replica of the Vatican copy.

MELEDA, Austria, an island off the southern coast of Dalmatia in the Adriatic. It is about 25 miles long and the Austrian name is Babinopolie. It is believed by some to be identical with Melita on which Saint Paul was stranded.

MELENDEZ VALDES, Juan, hoo-än' mā'lĕn'dĕth väl-dās'. DON, Spanish poet: b. Ribera del Fresno, Badajoz, 11 March 1754; d. Montpellier, France, 24 May 1817. He studied law at Salamanca, where he attracted attention by his poems in the old ballad manner and was taken up by the poet Cadalso. In 1780 he received the first prize in a competition under the control of the Spanish Academy for his pastoral 'Batilo,' and, in 1784, his comedy, 'Las Bodas de Camacho,' won a prize from the city of Madrid, although unsuccessful on the stage. In Madrid he won the favor of Jovellanos, who appointed him professor of the classics in the University of Salamanca and urged him to enter upon an unfortunate political career; he became judge in 1789, a judicial chancellor at Valladolid in 1791, and fiscal in the Supreme Court in Madrid in 1797. He suffered brief exile after the fall of Jovellanos (q.v.) in 1798; but in 1802 returned to Salamanca. His sympathy with France, however, made him more than ever unpopular, and after the expulsion of Joseph Bonaparte, he went into exile in France. He was one of the most prominent figures in Spanish literary life during the 18th century.

MELETIUS, (1) founder of the sect of Meletians. He was bishop of Lycopolis in the 4th century, and antagonized Peter, patriarch of Alexandria, by refusing absolution and communion to the lapsed, that is, those who under the stress of persecution had renounced their faith. A schism resulted from the dispute and Meletius traveled through Egypt and Syria gathering thousands of followers, until the Council of Nicæa, 325, deprived him of authority and he died soon after, a merely titular bishop. (2) Another Greek ecclesiastic of the same name and century, who was made bishop of Antioch in 360, when the Arian controversy was at its height.

MELGAREJO, Mariano, mä-rē-ä'nō mälgä-rä'hō, Bolivian soldier: b. Cochabamba, Bolivia, 18 April 1818; d. Lima, Peru, 23 Nov. 1872. He entered the army at an early age and by his courageous though somewhat unprincipled conduct in the many revolutions in his country, rose to be chief adviser of General Acha in 1862 and was made a general. In 1864 he turned against Acha who was then President, instigated a revolution and seated himself in the presidential chair. During a brief absence of Melgarejo the ex-President Belzu returned and reinstated himself in the presidency only to be shot by Melgarejo himself, who then became dictator. He crushed a revolution in 1866 and in that year formed an alliance with Spain against Peru and Chile. Revolutions followed and he was compelled to flee the country in 1871 and was killed in a quarrel at Lima.

MELIC GRASS (*mel,* honey), delicate genus of grasses growing in the shade of woods, of the order Gramineæ, having a lax panicle and spikelets of 2–5 awnless florets, of which one generally is imperfect. *M. uniflora* is of graceful and delicate appearance; cattle are fond of it. This species is common in Europe. *M. nutans* is common in the United States west of the Rockies. *M. altissima,* a Siberian species, growing to the height of three or four feet, has been introduced in parts of Europe, and yields a considerable bulk of herbage. It is perennial.

MELICERTES, son of Athamas and Ino. In fear of Athamas, whose children by Nephele, Phrixus and Helle, she had tried to kill, Ino jumped into the sea with Melicertes. She became the sea divinity **Leucothea,** he Palæmon, whom the Romans identified with their god of harbors, Portunus. Some identify him with Moloch. It is recorded that children were sacrificed to him at Tenedos.

MELICOCCA (*μέλι,* honey —*κόκκος,* berry), genus of trees or shrubs of the natural order Sapindaceæ, comprising about six species, one of which *M. bijuga,* native of the West Indies, is there universally cultivated for its fruit. It is called the honeyberry and the Jamaica bullace plum; by the Spaniards, Monos; by the Dutch, Knipnee. It is 16 to 20 feet high. The fruit has an agreeable flavor and varies in color from yellow to jet black. It is now grown in California and Florida. When roasted the seeds may be eaten after the manner of chestnuts. Some other species also yield edible fruits.

MELIHAH, the salting of meat according to Jewish ceremonial, that it may be without blood and ritually fit for eating, thus complying with the law (Gen. ix, 4).

MELIKOFF. See LORIS-MELIKOFF.

MELILITE, or MELLILITE, a native silicate of sodium, calcium, magnesium, aluminum and iron. Potassium is also commonly present to some extent. Melilite crystallizes in the tetragonal system and has a vitreous or resinous lustre and usually a honey-yellow color, from which circumstance it derives its name (Greek, "honey"). It is brittle, translucent (at least in thin layers), and distinctly pleochroic. It has a hardness of about 5 and a specific gravity of 3. The mineral occurs in basic eruptive rocks and is also observed, quite frequently, in the slag from furnaces. It is sometimes called mellite.

MELILLA, Africa, a port of Spanish Morocco, about 150 miles east of the Strait of Gibraltar. The exports in 1915 totaled £168,145. A Spanish military command is located there, a wireless station and an aviation corps, the latter having a range of 320 miles. It has been used by Spain also as a penal settlement. Pop. about 9,000.

MELILOT, a genus (*Melilotus*) of annual, biennial and perennial herbs of the family *Fabaceæ.* The species of which there are about a dozen, are natives of western Asia and the Mediterranean region and have become widely distributed in temperate and subtropical climates. They are upright, alfalfa-like plants with small yellow or white flowers which are borne from late spring until frost. The pods are few-seeded and not twisted as in the closely related genus *Medicago* (q.v.). The two best known species are yellow melilot (*M. officinalis*), an annual, and white melilot (*M. alba*), a perennial, which are common weeds in waste places, the former especially upon dry, clayey soils, the latter in damp situations. Like other members of the genus they are sweet-scented, particularly while drying, and their flowers are used to some extent for perfumery.

MELINE, James Florant, American lawyer and author: b. Sacket's Harbor, N. Y.; d.

Brooklyn, N. Y., 14 Aug. 1873. He was graduated at Mount Saint Mary's College, Emmettsburg, Md., and went to Cincinnati, where he was one of the professors at the Athenæum, and, while teaching, studied law. He was also one of the editors of the *Catholic Telegraph*. After spending some time abroad in study and travel he returned to Cincinnati, was admitted to the bar and commenced the practice of law; later he relinquished his profession and established a banking business, also holding consulates for France and other nations. In 1860 his business failed and shortly afterward he enlisted in the Federal army. He served throughout the Civil War under General Pope, attaining the rank of colonel, and after the war was for two years chief of the Bureau of Civil Affairs in the third military district. At the end of that time he went to New York and devoted himself to literary work, writing for the *Galaxy*, the *Nation* and the *Catholic World*. In the latter periodical he first published the articles controverting Froude's statements and conclusions in regard to Mary Queen of Scots; these articles, which aroused wide interest, were afterward revised and published in book form under the title 'Mary Queen of Scots and Her Latest English Historian' (1871). He also wrote 'Two Thousand Miles on Horseback' (1867); 'Commercial Traveling' (1869), and 'Life of Sixtus the Fifth' (1871).

MÉLINITE, mā'lĭn-īt, an explosive employed by the French government late in the 19th century, in charging torpedo shells and in the preparation of rupturing charges for the use of the engineer corps and cavalry in effecting demolitions. As originally used it was composed of 70 per cent of picric acid mixed with 30 per cent of pyroxylin dissolved in 45 parts of acetone. Later it consisted exclusively of fused picric acid which was poured into the shell when in the molten condition and cast there in such a manner as to leave a central canal in the mass in which the fuse terminated in a mercuric fulminate detonator by which the charge was fired. By the use of this fuse the detonation of the charge was delayed sufficiently to allow the shell to penetrate armor and reach the farther side of it before the explosion. Mélinite was very thoroughly tested at Bouchet in 1892 to determine the degree of safety that it possesses when exposed to shocks, fire and the accidental rupture of receptacles containing it, and the results were most favorable. The name, like that of other explosives, is going into disuse because of the practice of describing explosives by their principal constituents.

MELIORISM (Lat., *melior,* better), the belief that the improvement of the world by human effort is possible, and implying also the further belief that the world is *de facto* being gradually so improved and that such improvement is a law of evolution. The term was used first in conversation by the novelist, George Eliot, who desired to formulate a *via media* between the views of optimism and pessimism so prevalent in her day. Sully adopted the term in his 'Pessimism' (1877), since when it has come into general use. By Sully meliorism is described as "the faith which affirms not merely our power of lessening evil — this nobody questions — but also our ability to increase the amount of positive good. . . . By recognizing the possibility of happiness and the ability of each individual consciously to do something to increase the sum total of human welfare present and future, meliorism gives us a practical creed sufficient to inspire ardent and prolonged endeavor." The opponents of meliorism have connected it with the theory of evolution. Evolution by them is presented in a semi-religious light, inasmuch as they believe in a gradual abatement of evil through progressive evolution. This view is not confined to philosophers of this school, however, but is now the view of many agnostics, who unwarily have assumed this unconsciously religious conception of the universe. Consult Fraser, 'Theism.'

MELISSA, a plant. See BALM.

MELISSUS, mĕ'lĭs-ŭs, Greek philosopher: b. Samos, about 480 B.C. He was the son of Ithagenes, and is said to have been a friend of Heraclitus and to have commanded the fleet opposed to Pericles in 440 B.C. in the Samian War. Some fragments of a prose work of his, written in the Ionic dialect, have come down and have been collected and published by Brandis and by Mullach (1846). From these he appears to have been a philosopher of the Eleatic school and to have reached more definiteness and consistency than Parmenides. He reasoned that being was eternal, and could not have a beginning, else it would start with non-being; by like reasoning, there can be no destruction of being, for it would have to become another and opposite thing. Void he holds to be nothing, which is not, and therefore unthinkable. He concluded that being was incorporeal, because a body has size and parts.

MELITA, mĕl'ĭ-tą, the island on which Saint Paul, on his voyage to Rome, was cast away. This has generally been considered to be the Island of Malta, the ancient name of which was Melita, and one of whose bays has from immemorial time borne the name of Saint Paul; but some critics have attempted to prove that it was an island, the modern Meleda (q.v.), on the coast of Dalmatia, in the Adriatic.

MELKART (Phœnician, "God of the City"), name of the presiding deity of the city of Tyre and of the whole Tyrian nation, namely, Baal (q.v.), the sun god. He is sometimes identified with the Heracles or Hercules of the Greeks. He was the patron god of mariners and the Phœnician colonies of the West, in Africa and Spain, were under his protection. To him has been ascribed the subjugation of the savage races who anciently peopled these regions and the building of early Phœnician towns. The institution of order and legislation in these cities was also said to have been his work. Many are the voyages which he is related to have made. One of his exploits was the rescue of Astarte from the darkness in which the moon had imprisoned her in the West; he afterward made her his wife. For an account of the Temples of Melkart at Tyre consult Jeremias, 'Tyrus bis zur Zeit Nebukadnezzar' (1891).

MELKITES. See MELCHITES.

MELL, Patrick Hues, American educator: b. Walthourville, Ga., 19 July 1814; d. Athens, Ga., 26 Jan. 1888. He was educated at Amherst and after teaching for several years was appointed professor of ancient languages at Mer-

cer University in 1842 and was also ordained a Baptist minister in that year. In 1856 he was appointed to the same chair in the University of Georgia, and in 1870 he became vice-chancellor, which post he resigned in 1872. In 1878 he was appointed chancellor and in 1880 was elected to the chair of metaphysics and ethics, which offices he occupied at his death. He held several pastoral charges and was president of different conventions in addition to his educational work and published 'Baptism' (1852); 'Parliamentary Practice' (1868); 'Church Polity' (1878).

MELL, Patrick Hues, American scientist: b. Penfield, Ga., 24 May 1850. He was a son of the preceding, was graduated at the University of Georgia in 1871 and was State chemist in 1874–77. In 1878 he was called to the chair of geology and botany at the Alabama Polytechnic Institute and continued in that position until 1902, when he accepted the presidency of the South Carolina Agricultural and Mechanical College. In addition to his work in the universities he was connected in 1884–1902 with the Alabama Weather Bureau and the Agricultural Experiment Station and he invented a system of weather bureau signals which has been adopted by the United States Weather Bureau. He has published 'Southern Soapstones and Fireclays' (1882); 'Study of Cotton Plant' (1890); 'Life of Patrick Hues Mell, Sr.' (1895); 'Biological Laboratory Methods' (1902); etc.

MELLEN, Charles Sanger, American railroad president, b. Lowell, Mass., 16 Aug. 1851. He was educated in the public grammar and high school of Concord, N. H. He began his railway service 22 Sept. 1869 as clerk in the cashier's office of the Northern New Hampshire Railroad. In 1872–73 he was clerk to the chief engineer of the Central Vermont Railroad, in 1873–80 superintendent's clerk to the chief clerk and assistant treasurer of the Northern New Hampshire; assistant to the manager of the Boston and Lowell Railroad in 1880–81; auditor 1881–83; superintendent 1883–84; general superintendent 1884–88 of the Boston and Lowell and Concord railways. In 1888 Mr. Mellen became general purchasing agent, in 1889 assistant general manager, in 1889–92 general traffic manager of the Union Pacific system. In 1892 he became general manager of the New York and New England Railroad at Boston; from 1892 to 1896 was second vice-president of the New York, New Haven and Hartford; from 1896 to 1903 president of the Northern Pacific and from 1903 to 1913 president of the New York, New Haven and Hartford Railroad. From 1910 to 1913 he also served as president of the Boston and Maine Railroad. Mr. Mellen's administration of the New Haven road was severely criticized because of the efforts to secure a monopoly of transportation in New England. Trolley and steamboat lines were bought out and the equipment of the parent road was depreciated to such an extent that numerous wrecks resulted. Mr. Mellen retired from business in 1915.

MELLILITE. See MELILITE.

MELLO, Custodio José de, koos-tō'dē-ō hō-sā' dā mā'lō, Brazilian admiral: b. about 1845; d. 16 March 1902. In 1889 he took a prominent part in the revolution, was promoted to be admiral and was appointed Minister of the Navy. Four years later he formed a plot in behalf of the Federal party and the navy, against the party of the army and its candidate for re-election, President Peixoto; bombarded and blockaded Rio de Janeiro; and, when forced out of the harbor by vessels of foreign navies, notably American, occupied Rio Grande do Sul. He could not agree with his lieutenant, Saraiva, however, and so surrendered to the government of Argentina. In 1901 he was accused, in spite of his former republicanism, of plotting to establish an empire and was interned upon the island of Cobras.

MELLONI, Macedonio, mā-chā-dō'nē-ō mēl-lō'nē, Italian physicist: b. Parma, 11 Apr. 1798; d. Portici, near Naples, 11 Aug. 1854. He became professor of natural philosophy at the University of Parma, where between 1824 and 1831 he taught hygrometry. Political events having compelled him in the latter year to expatriate himself, he went to Geneva, where he made several important discoveries respecting the radiation of heat, which he presented in 1833 to the French Academy of Sciences. Later discoveries won him the Rumford medal from the Royal Society of London. Through the influence of his friends, Arago and Humboldt, he was enabled to return to Italy, and was appointed by the king of Naples director of the meteorological observatory on Mount Vesuvius. Among the results of his labors at this institution was the discovery of heat in lunar light, which led to the determination of the analogy of radiant heat to light. Political troubles again interrupted his labors, and for his presumed sympathy with liberal principles he was in 185- ejected from his post. In 1850 he published the first volume of a work entitled 'La termocrasi, o la colorazione calorifica,' containing an account of his theory of the "coloration of light," and of his experiments on the diffusion of heat by radiation, and particularly of its transmission through transparent media. Subsequently he gave much attention to the study of electricity and combated the conclusions of Faraday with regard to the transmission of currents over submarine wires.

MELOCACTUS, a cactus typical of the tropical American melon-cactus family, *Melocactidæ*. It consists of a globose or conical stem, having rows of spines at intervals and flowers at the top on a hemispherical or cylindrical head. There are more than 20 species. *M. communis* of the West Indies is the Turk's, Englishman's or Pope's-head cactus. The head bearing the flower is red and like a Turkish fez in form.

MELODEON, a musical wind instrument with a row of reeds and operated by keys. The rocking melodeon, known in America since about 1825, was unsightly, tardy in sounding and of harsh tone. Jeremiah Carhart in 181- conceived the plan of acting on the reeds by suction instead of blowing, and reversed, to this end, the bellows and reeds, inventing the present instrument in 1836. He thus secured prompt sounding and a flute-like quality of tone; "voiced" the note by curving the reeds, and made many other improvements. In a single year 22,000 of these instruments were manufactured in the United States, and they

were popular until the cheap parlor organ displaced them.

MELODRAMA (from the Greek *melos*, song, and *drama*, action), originally and properly a half-musical drama, or that species of drama in which the declamation of certain passages is interrupted by music. It is usually a tragedy of common life, filled with surprises, acts of violence and all that excites and sustains the attention of the audience, mixed up with dancing and music and sometimes with scenes of a rudely comic character. Probability is freely sacrificed for the sake of striking situations. The object is to be sensational and to catch the applause of the gallery. See DRAMA, THE.

MELODY, *in music,* a succession of single tones so arranged as to express a musical thought. A solo for one instrument or voice with or without accompaniment is the most typical example of a melody.

Melody is one of the most comprehensive terms used in music, being properly applicable to as few as two notes or to as many as the entire principal vocal or instrumental part of a composition. An example of the first is the motif of woe in Wagner's 'Der Ring des Nibelungs.'

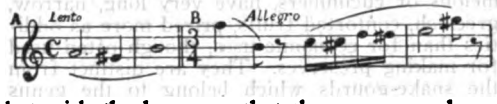
Examples of the latter are too numerous to require mention.

The term is also appropriately applied to a phrase or portion of a phrase in a part that has been subordinate to the principal one and which for a moment gains importance on account of its greater melodic significance. In concerted music, vocal or instrumental, the highest part is usually the melody, though as stated above an inner one may temporarily assume it. In polyphonic music all the parts are equally melodic.

Melody is the outgrowth of the improvised recitatif. The early Greek singer standing before his audiences holding his four-stringed lyre or chelys, *χέλυς* plucked a string and recited his poem on that note until fancy impelled him to change it. From this crude ancestor has sprung melody as we understand it to-day, which with rhythm and harmony form the great trinity necessary for the complete expression of music. Melody is the only one of the three capable of suggesting enough of the other two to be satisfactory by itself. The folk-song of old and the popular song of to-day may be sung by a single voice without any

accompaniment and yet convey a very definite idea of the rhythm and something of the harmony that would naturally accompany the tune. Such a performance is, of course, incomplete and only effective in music of the simplest character. Yet it conveys much more than the mere rhythm of the tune played on a drum would give and still more than the mere harmony played without either the melody or the rhythm. It is curious that the Greeks with all their extraordinary achievements in all other forms of art should have advanced so little in music. No doubt they used music in their religious feasts and the cross flutes *πλαγίαυλος* and lyres supplied what they must have thought melody, but they do not seem to have ever dreamed of musical accent or rhythm, without which we cannot to-day call a succession of sounds melody, while harmony was unthought of for many centuries.

Melody is greatly affected by the harmony that the composer has wedded to it, and it is to this fact perhaps more than any other that originality continues possible, for with but 12 different notes from which to form a melody it is evident that even with all the variations that rhythm can add the melodic material is capable of exhaustion in the enormous and growing number of compositions. The following phrases of melody, especially the first, have no particular suggestion played alone:



but with the harmony that the composers have added they have an entirely different signification, the one of the great solemnity and foreboding, the other of harsh cynicism and sneering.

Motif of Fate "Die Walkuere"—Wagner.

HENRY GORDON THUNDER,
Conductor Choral Society of Philadelphia.

MELOIDÆ. See BLISTER-BEETLE.

MELON-CACTUS, or **MELON-THISTLE.** See MELOCACTUS.

MELON-PEAR, or **SHRUB.** See MELONS.

MELONS, a popular name for several unrelated plants, but more particularly for two members of the family *Cucurbitaceæ*, the muskmelon (*Cucumis melo*) and the watermelon (*Citrullus vulgaris*). The more important other fruits similarly known are the Chinese preserving melon (*Benincasa cerifera*) of the same family; the melon papaw (*Carica papaya*) of the family *Caricaceæ*, and the melon-shrub or melon-pear (*Solanum muricatum*) of the family *Solanaceæ*.

The muskmelon is an annual trailing herb which has been introduced by man into all tropical, subtropical and many temperate climates from southern Asia where it is native. It is characterized by long, running, hairy and somewhat prickly vines, roundish heart-shaped leaves, yellow monœcious flowers and usually edible fruits of very various forms and sizes. The following are the principal varieties: Variety *cantaloupensis*, the cantaloupes, or rock-melons, which have hard, warty or scaly rinds more or less furrowed, and flesh of various colors from white to red, green or yellow. In the United States the name "cantaloupe" is loosely applied to horticultural varieties of

other groups. Variety *reticulatus* includes the nutmeg or netted melons which have softer rinds, sometimes smooth, but usually more or less netted. To this group belong the larger part of the so-called cantaloupes in American markets. Variety *saccharinus* comprises the pineapple-melons which have very sweet flesh, but are not clearly distinct from the preceding group. Variety *inodorus*, the winter muskmelons, which have less hairy, lighter-colored vines and foliage and whose long-keeping fruits are deficient or entirely lack the characteristic muskmelon odor. This group is less cultivated in the United States than in the Mediterranean region, but because the fruits can be kept until Christmas or later when properly grown, gathered before frost and slowly ripened in a cool, rather dry room, they should become more widely popular where the seasons are long enough to permit their reaching such a stage of maturity. Variety *flexuosus*, the snake-melons or cucumbers, have very long, narrow, greenish, contorted fruits, prized more as oddities than for economic uses, though often used for making preserves. They are distinct from the snake-gourds which belong to the genus *Lagenaria*. A variety *chito*, called orange-melon, melon-apple, garden-lemon and many other popular names, bears orange- or lemon-like almost scentless fruits with white or pale yellow flesh, which is grown to some extent for preserving. Variety *dudaim*, the pomegranate-melon, Queen Anne's pocket-melon, dudaim melon, etc., has small brown and yellow fruits valued solely for their exquisite perfume.

Melons are propagated wholly by means of seeds, which may be sown directly in the field or started under glass upon inverted sods, in flower-pots, berry-boxes, etc., and transplanted to the field as soon as danger of frost has passed. The former method is practised most extensively in the South and in other warm climates where the seasons are long; the latter in the North because the shortness of the season demands that the plants obtain an early start. The soil best suited to melons is a light sandy loam well drained, well exposed to the sun and well supplied with plant-food. It should be deeply plowed, thoroughly harrowed and kept clean of weeds, especially before the plants are set and until the vines cover the ground. After harrowing, the ground is marked in checks about five feet square and 10 or 12 seeds, or five or six plants, are set in each "hill," from which all but the two or three strongest vines are removed after the insects have had their share. Often, especially upon rather poor or tenacious soils, two or three shovelfuls of well rotted manure is mixed with the earth of the hills to give the plants a little impetus. The fruits are gathered when they will readily separate from the stems, preferably in the early morning.

During the closing decade of the 19th century the demand for highly flavored melons was greatly increased by the apperance in the eastern markets of the Rockyford melon, a small fruit grown in Colorado. Its appearance in large quantities drew public attention to numerous other high flavored melons grown in other sections. As a consequence many inferior varieties have nearly disappeared from cultivation. Besides the Colorado melon fields there are large areas devoted to melon-growing in New Mexico and California. New Jersey, Maryland and Delaware produce immense quantities, the first-mentioned State especially; and the product is consumed largely in the cities of Pennsylvania and New York. The Mississippi Valley States also send considerable quantities to Northern markets.

The watermelon is an annual trailing herb, a native of tropical and southern Africa, whence it has been introduced by man into all tropical, subtropical and many temperate climates for its watery sweet fruits, which sometimes weigh more than 75 pounds, but usually range between 20 and 50 pounds. The vines are more hairy, lighter green, longer running than those of the muskmelon and the leaves are deeply notched, in some cases approaching the compound form. Except for a horticultural group of firm-fleshed varieties known as preserving watermelons or more popularly as citrons, the watermelon seems to have no varieties worthy the name of sub-species or botanical varieties, and even this group appears not to have received such designation.

In general, the watermelon requires the same treatment as the muskmelon, the soil being, if anything, lighter and more sandy, and the distances between hills about double, except for the smaller growing sorts. The principal producing regions are Georgia and Colorado, but the watermelon is grown largely in all the southern States, and some of the short-season varieties as far north as Michigan and Ontario. The watermelon is more easily shipped than the muskmelon, since the tough-rinded kinds may be placed in cars two or more feet deep, the smaller specimens upon the bottom, and shipped long distances. Muskmelons, being more delicate, must be barreled or crated. The fruits are used exclusively in the raw state and have no by-products such as vinegar, sugar, syrup or brandy. The rinds, however, when deprived of the hard exterior, are often preserved with raisins, etc.

Both muskmelons and watermelons are subject to the attacks of several insects, among which the small, black, striped cucumber-beetle (*Diabritica vittata*), the squash vine-borer (*Mellitia ceto*), the melon-caterpillar (*Margaronia hyalinata*), the cucumber flea-beetle (*Crepidodera cucumeris*), the squash-bug (*Anasa tristis*) and the melon-louse (*Aphis gossipii*) are the most important. Tobacco dust and plant protectors are largely used to prevent the attacks of the first, the adults of which feed upon the under sides of the leaves and the larvæ upon the roots. The melon-louse is fought with kerosene emulsion sprayed upon the under sides of the leaves or by fumigation with carbon disulphide. No effective remedy has been suggested for the borer. Arsenical sprays have been recommended for the caterpillars and other chewing insects. Since the insects are believed to spread diseases from plant to plant, melon-growers seek to prevent insect injury as far as possible and practicable. The diseases, of which a large number have been described, are much the same as attack cucumbers, and may be similarly controlled where control has been found possible. Some diseases, as wilt, have defied all tried remedies. This disease generally ruins the vines a week or 10 days before the fruits would be ready to harvest. Many of the complaints as to the

poor quality of eastern-grown muskmelons result from the sale of melons that have been gathered from blighted fields.

Consult Bailey, 'Cyclopedia of Standard Horticulture,' (New York 1916).

M. G. KAINS,
Crop Expert.

MELOPIANO, an invention by which sustained sounds can be produced on a pianoforte. It consists of a series of small hammers set into very rapid vibration by the winding up of a spring. See MUSICAL INSTRUMENTS, MECHANICAL.

MELOS, mē'lŏs, **MILO,** or **MILOS,** Greece, an island in the Ægean Sea, in the southwest portion of the Cyclades, about 65 miles east of the mainland. Its length, east to west, is about 14 miles and it is about eight miles in extreme breadth; area, 64 square miles. It is mountainous, Mount Ilias rising 2,543 feet, of volcanic formation, has hot mineral springs and mines of sulphur. The island was once famous for its riches, fertility and population, and corn, wine, cotton, oranges and other fruits are still grown. Sulphur, manganese ore, millstone, gypsum, etc., are exported. Plaka is the principal town and nearby are the ruins of Melos, the ancient capital. Kastron is a large village on the north coast. The island of Melos was first colonized by Phœnicians and afterward by Dorians. During the Peloponnesian War it was the faithful ally of Sparta till 416 B.C., when it was taken by the Athenians and its inhabitants massacred or sold as slaves. From 1204 till 1537 it formed part of the Venetian duchy of the archipelago. At the latter date it was taken by the Turks, with whom it remained till the epoch of Greek independence. Its ancient prosperity is claimed to be due largely to the fact that obsidian was found here, which was quarried and sold for making knives, hatchets and tools. In 1820 a peasant discovered here the celebrated statue known as the Venus of Milo now placed in the Louvre at Paris; the Poseidon in the National Museum at Athens was also discovered here. There are numerous interesting archæological remains, chief of which are those of the Hall of the Mystœ on the site of the ancient capital near the village of Klima, and those of prehistoric Phylakopi, which were excavated by the British School at Athens from 1896 to 1899.

MELPOMENE, měl-pŏm'ę-nē, one of the Muses, daughter of Zeus and Mnemosyne. She presided over tragedy and was generally represented as a young woman with vine leaves surrounding her head, and a tragic mask covering her face.

MELROSE, Mass., city in Middlesex County, on the Boston and Maine Railroad, about eight miles north of Boston. It was settled about 1632, and until 1649 it was a part of Charlestown. It remained a part of Malden until the next year (1650), when it became a separate municipality. It was chartered as a city in 1900 and includes the villages of Fells, Wyoming and Melrose Highlands. It is a residential suburb of Boston, but has considerable manufacturing. The chief manufactures are rubber boots and shoes. There are 25 factories of all sorts, employing about 1,200 persons, with an invested capital of over $2,000,000 and annual gross products of $2,825,000. The State Reservation, Middlesex Fells, 1,800 acres, and Spot Pond, a natural reservoir, are attractive features. It has municipal waterworks and a lighting system. The government is vested in a mayor, elected annually, and a council. The subordinate officials are chosen by the mayor and council; the school board by election. Pop. 18,000. Consult Drake, 'History of Middlesex County'; Goss, E. H., 'History of Melrose' (1902).

MELROSE, Minn., city in Stearns County, on the Great Northern Railroad, 100 miles northwest of Saint Paul. It contains flour mills, granite works, planing and saw mills. The municipality owns and operates the electric-lighting plant and the water-supply system. Pop. 2,600.

MELROSE, Scotland, a village of Roxburgshire, on the south bank of the Tweed at the base of the Eildon Hills, two miles east of Abbotsford, the home of Sir Walter Scott, whose 'Lay of the Last Minstrel' gave Melrose and its ruined abbey world-wide celebrity. The village had a population of 2,166. The famous abbey, now the property of the Buccleuch family, is admitted to be the most beautiful of all the ecclesiastical ruins in Scotland. The architecture is in the late flamboyant Gothic style, and the chief remains are part of the nave, the transept, choir and the southern aisle with several chapels, of the abbey church and fragments of the cloister. The church originally was 258 feet long, with a width at the transepts of 137 feet. It was founded by King David I in 1136, destroyed by Edward II in 1322 and rebuilt by Bruce in 1326. It is the burial place of the heart of Robert Bruce, the good Lord James Douglas and the Knight of Liddesdale. It was partly demolished by the English in 1545.

MELROSE PARK, Ill., village of Cook County, about 10 miles west of Chicago, on the Chicago and Northwestern and other railroads. It contains iron works, can factories and stone quarries, but is best known as a residential suburb of the Windy City. The water-supply system is the property of the municipality. Pop. 4,800.

MELTING POINT, the temperature at which the solid and liquid states of a body can coexist, without the fluid part of the mixture solidifying, nor the solid part melting. The melting point of a body which is crystalline in nature (like ice) is usually quite definite, and a body of this kind, when it melts, passes at once from a state of perfect solidity into a state of perfect fluidity. The melting point of an amorphous body, such as wax or pitch, is often very indefinite; and when a solid of this sort is gradually heated it grows soft and passes into the fluid state by a process which is practically (or even absolutely) continuous. The phenomena of the fusion and solidification of amorphous bodies like wax are not yet understood as well as those that attend the change of state of a crystalline body; and it is to be understood that what follows in the present article is stated with particular reference to the crystalline class of substances, in which the melting point is definite.

In general, solid bodies expand upon melting, the original solid having a greater density than the liquid that results from its fusion. In

the case of water, as is well known, the reverse is true; the fact that ice floats in water proving that the water is denser. The fact that the density of a substance changes upon fusion implies (as may be proved by the mechanical theory of heat) that the melting point of the substance cannot be entirely independent of the pressure. This fact was discovered in 1849 by James Thomson, who showed that the melting point of a substance like ice, which contracts upon melting, must be lowered by pressure; while the melting point of one which expands upon melting must be raised by pressure. These theoretical conclusions have since been abundantly verified by experiment. In the case of ice, for example, it has been found by Dewar, that the melting point is lowered by 0.0130° F. per atmosphere of increase of pressure, up to 700 atmospheres.

When a substance passes from the solid to the liquid state, it absorbs a very considerable amount of heat, which is known as the "latent heat of liquefaction"; and the liquid which is formed cannot be all reduced to the solid state again until an exactly equal quantity of heat has been abstracted from it. When heat is added to a mixture composed of a solid and its liquid (pounded ice and water, for example), it does not increase the temperature of the mixture, but merely causes a certain amount of the solid to melt. This continues so long as any of the unmelted solid remains; each addition of heat merely bringing about a corresponding amount of liquefaction, while the temperature of the mixture remains unchanged. It is only after all of the solid has melted that the further addition of heat will produce elevation of temperature. The melting points of compounds undoubtedly depend, in some manner, upon their molecular constitutions, but we have, as yet, no definite knowledge of the nature of the dependence. We know that in a homologous series of organic compounds, the melting points show a strong tendency to increase, as the molecular weights of the members of the series increase; but the change in the melting points is irregular as we proceed from member to member, and no law has yet been discovered which takes the changes fully into account. The melting point of a mixture (such as an alloy) is often lower than that of any one of the constituents, and the effect of the presence of an impurity in a given substance upon the melting point of that substance is often out of all apparent proportion to the quantity of impurity present. This fact implies that in the determination of a melting point it is highly important that the substance under examination shall be as nearly pure as possible. The presence of slight, unrecognized and apparently negligible impurities has sometimes led to entirely erroneous conclusions. In 1860, for example, Kolbe announced the discovery of an acid isomeric with benzoic acid, but having a lower melting point; but Beilstein afterward proved that the substance in question was merely ordinary benzoic acid contaminated with a quantity of chlorobenzoic acid so small as to be barely recognizable by analysis.

For determining the melting point of minerals, the instrument devised by Joly and known as the meldometer, is sometimes very convenient. It consists essentially of a strip of platinum foil, upon which small fragments of the minerals are laid. The platinum is then gradually heated by the passage of an electric current, until the mineral melts; the temperature of the foil being obtained by a calculation based upon the resistance of the platinum, the observed strength of the current and the rate at which heat is radiated from the foil, as determined by separate observations. This method is especially useful for minerals which can be had only in small fragments.

The term fusing point is often used instead of melting point, where a high temperature is required to melt. Following are the melting or fusing points of a few familiar elements in degrees F.: Mercury, 38; ice, 32; potash, 104.5; soda, 204; sulphur, 235; bismuth, 517; tin, 551; lead, 850; aluminum, 1,160; flint, 1,600; silver, 1,750; gold, 1,913; copper, 1,931; nickel, 2,642; iron, 2,912; platinum, 3,225; carbon, infusible. Alloys show vastly different melting points; thus 93 per cent bismuth with 7 per cent zinc melted at 479° F.; 44 per cent lead and 56 per cent bismuth at 253°. See FREEZING POINT.

MELTON MOWBRAY, mō'brĕ, England, an ancient market town in Leicestershire, 14 miles northeast of Leicester, on the right bank of the Wreak, at the junction of the Eye, 105 miles north by west of London. Melton Mowbray is famous for its pork pies and Stilton cheese. It owes its prosperity chiefly to being the seat of the Melton Hunt, which attracts the sporting world in great numbers during the winter months, extensive and luxurious hunting establishments being maintained here. Pop. (urban district) about 8,000.

MELTZER, Charles Henry, Anglo-American playwright and journalist: b. London, England, 7 June 1853. He was educated in London and Paris, where he became correspondent of the Chicago *Tribune* and later of the New York *Herald,* for which paper he traveled over Europe and Egypt. In 1888 he was appointed dramatic and musical critic of the New York *Herald,* holding that position for four seasons. From 1893 to 1896 he was dramatic reviewer of the New York *World,* also for seven years New York correspondent of the London *Daily Chronicle.* His experience was utilized as literary associate in connection with a course of modern plays at Carnegie Lyceum, New York, and in Washington, Boston and elsewhere. In 1907 he became musical critic and special writer, in the United States and abroad, of the New York *American* and the *Cosmopolitan Magazine.* In 1914 he was appointed dramatic critic, New York *American.* Among his plays are 'The Story of Rodion the Student' (original, founded on Dostoievsky, novel); 'Manon Lescaut' (original, founded on the romance of Abbé Prévost); 'The First Duchess of Marlborough' (original, historic comedy); besides English versions of 'Hannele' (Hauptmann); 'Mme. Sans Gêne' (Sardou and Moreau); 'L'Arlesienne' (Daudet); 'The Sunken Bell' (Hauptmann); and a farce, 'His Honor the Mayor' (with A. E. Lancaster). From 1902 to 1907 he was secretary and librettist to the management of the Metropolitan Opera Company. He has made English versions of 'Das Rheingold'; 'Die Walküre'; 'Königskinder'; 'Les Contes d'Hoffmann'; 'Das Heimchen am Herd'; and 'Orfeo' (Monteverde).

MELTZER, Samuel James, American physiologist: b. Russia, 22 March 1851. He

received a general education at Königsberg, Prussia; studied philosophy and medicine at the University of Berlin 1875–82 and removed to the United States in 1883 since when he has practised his profession in New York. Since 1906 Dr. Meltzer has been head of the department of physiology and pharmacology at the Rockefeller Institute for Medical Research and consulting physician at Harlem Hospital. In 1917 he was commissioned major in the Medical Reserve Corps. Dr. Melzer is a member of many medical and surgical societies. He is the author of over 200 papers on biology, physiology, scientific medicine, etc.

MELUSINA, mĕl-oo-sī'nạ, or **MELUSINE,** in French myths, a beautiful nymph or fairy, who is represented as the daughter of Helmas, king of Albania, and the fairy Persine; and as having married Raymond, Count of Toulouse, who built the magnificent castle of Lusignan. Like most of the fairies of that period, she was doomed to a periodical metamorphosis during which the lower part of her body assumed the form of a fish or serpent. On these occasions she exerted all her ingenuity to escape observation; but having been once accidentally seen by her husband in this condition, she swooned away, and soon afterward disappeared. Her form is said to be seen from time to time on the tower of Lusignan, clad in mourning and uttering deep lamentations. Her appearance was believed to indicate an impending calamity to the royal family.

MELVILLE, mĕl'vĭl, or **MELVILL, Andrew,** Scottish reformer: b. Baldovie, near Montrose, Forfarshire, 1 Aug. 1545; d. 1622. He was educated at the grammar school of Montrose and the University of Saint Andrews; studied two years (1564–66) at the University of Paris; went to Poitiers to pursue his studies in the law; there became regent in the College of Saint Marceon; and through the influence of Beza received an appointment to the chair of humanity in the academy of Geneva. Returning to Scotland in 1574, he was at once appointed principal of the University of Glasgow, and in 1580 was made principal of Saint Mary's College, Saint Andrews. In 1582 he presented a petition to King James against the undue interference of the court in ecclesiastical affairs, for which he escaped imprisonment by going into England. Returning in 1585, he resumed his duties at Saint Andrews, and was moderator of the General Assembly in 1587, 1589, 1594. In 1606 he was summoned to London by the king to confer on Church matters, but because of his outspokenness he was committed to the Tower, and there remained until 1611. He was then released upon the solicitation of the Duke of Bouillon, retired to France and became professor in the university at Sedan, which, according to some accounts (others say London), was the place of his death. Consult 'Lives' by McCrie (1819); Morrison (1900).

MELVILLE, Sir **George,** British administrator: b. Aberdeen, Scotland, 1 July 1842. He was educated by private tutors and at Edinburgh Academy. He entered the imperial service in 1862; and was employed in the colonial civil service from 1874–1905. Between 1899 and 1903 he acted successively as administrator of British Honduras, the Falkland, Bahamas and Leeward islands, Saint Lucia and Windward Islands. He was created K.C.M.G. in 1900.

MELVILLE, George Wallace, American naval engineer: b. New York, 10 Jan. 1841; d. 17 March 1912. Educated Brooklyn Polytechnic; entered the navy as assistant engineer 1861; served through the war; and in 1879 accompanied the De Long expedition on the *Jeannette* to discover the northeast passage. Of this party he was one of the few survivors; most of the others owed their lives to his indomitable courage and herculean strength — he carried a brother officer, weighing 175 pounds, upon his back, through ice and snow, at the same time superintending all movements of the crew and on occasion helping with the boat. He also commanded the subsequent search expeditions which recovered the *Jeannette's* records and De Long's body. In 1887 he was made chief engineer of the navy, a post from which he retired in August 1903, having entirely reformed the service, put navy engineers on a professional rather than an artisan footing, introduced the triple screw on such successful ships as the *Columbia* and *Minneapolis*, saved the department a tremendous sum by his refusal to adopt a boiler which had proved unsatisfactory in the British navy and designed 120 ships of over 700,000 horse power. Melville was made rear-admiral in 1899, and retired in 1903. His book, 'In the Lena Delta' (1885), describes his experiences in the *Jeannette* expedition.

MELVILLE, Herman, American novelist: b. New York, 1 Aug. 1819; d. there, 28 Sept. 1891. His grandfather was the original of Holmes' 'Last Leaf.' His father, an importing merchant, died when Herman was a boy, and in 1837 his education in the Albany Classical School and in New York City having been completed, he shipped as a cabin boy. Then he taught school for several years, but in 1841 sailed on a New Bedford whaler, from which in 1842 he made his escape with a comrade on one of the Marquesas. His experiences among the warlike natives and his rescue by an Australian whaler are described in 'Typee, a Peep at Polynesian Life' (1846), a great success and an excellent portrayal of life in the South Seas. In 1847 he married the daughter of Justice Lemuel Shaw of Massachusetts; from 1850 to 1863 lived in Pittsfield; was employed in the New York custom-house from 1866 to 1885; and then retired because of ill-health. Melville's writings apart from a few small volumes of verse are mostly taken up with the life of the sailor; some of his better known titles are 'Omoo, Adventures in the South Seas' (1847); 'White Jacket, or the World in a Man-of-War' (1850), which effected the abolition of flogging in the United States navy; 'Moby Dick, or the White Whale' (1851), and 'Pierre, or the Ambiguities' (1852). These stories were justly popular. Several "philosophical romances" met with little success. 'Battle Pieces, and Aspects of the War' (1866) is Melville's best verse. His four best romances of the sea were re-edited in 1892. See Moby Dick.

MELVILLE ISLAND, (1) an uninhabited island of the Arctic regions crossed by lat. 75° N., long. 110° W., and separated on the

west by Fitzwilliam Strait from Prince Patrick Island. Its greatest length is 200 miles; greatest breadth 130 miles. It lies north of Melville Sound, and was discovered in 1819 by Parry, who gave the island its name and wintered there. The formation is mainly sandstone with lime and coal beds. It was visited by Bernier in 1908. (2) An island at the entrance to Van Diemen Gulf, off the shore of the Northern Territory of Australia, with an area of about 1,800 square miles. It is hilly and densely wooded, especially with several species of eucalyptus. The earliest British settlement was made in 1824.

MELVILLE PENINSULA, North America, a northeastern projection of Keewatin in the Northeast Territories of Canada, about 400 miles north of Hudson Bay. Bounded on the north by Fury and Hecla Strait and on the east by Fox Channel. It is about 250 miles long by about 100 miles broad.

MELVILLE SOUND, North America, a channel about 250 miles long by 200 miles broad, extending southeast of Melville Island, and communicating with the Arctic Ocean on the west by Banks' Strait, and with Baffin Bay on the east by Barrow Strait and Lancaster Sound. Much of its contour was measured by Hansen in 1903.

MEMBER, a subdivision of a formation (q.v.) not usually considered of sufficient importance to map separately, but given a separate description or mention in the text of a report.

MEMBRANE, *in anatomy and physiology,* a thin sheet-like tissue, more or less elastic, varying in structure and vital properties. Membranes absorb or secrete fluids, connect certain parts of the body, separate, envelop or form certain organs or act as partitions between two fluids or gases, permitting them to mingle. Mucous membranes line the canals, cavities and hollow organs which communicate externally by different apertures on the skin; for example, the digestive, respiratory and genito-urinary tracts. These membranes are soft and velvety and have on their free surface cells for absorption or motion and in their substance follicles which secrete mucus for lubricating and other purposes. Such secretions are saliva, gastric juice and pancreatic juice. Serous membrances, such as the peritoneum, pleura, the unicæ vaginales and pericardium, facilitate the motion of the organs they envelop (abdominal digestive organs, the lungs and heart) by reason of the serum they secrete, and also maintain the shape of these organs. Allied to the serous membranes are the synovial membranes lining movable joints. By reason of their smoothness and by aid of their lubricating serum the ends of bones move readily upon one another. Fibrous membranes (for example, periosteum, dura mater and perimysium), not moistened by any particular fluid, augment the solidity of organs they envelop, retain them in position, favor their motion and form canals and rings for the passage of different organs. The membranes which envelop the brain and are extended to cover the spinal cord are called meninges. (See MENINGITIS). The membranes enclosing the fetus are called the placenta (q.v.). Other special membranes are Descemet's membrane, which is the fourth layer of the cornea of the eye, and Bowman's membrane which is the second.

MEMBRE, mŏñ-brā, **Zenobius,** French missionary in America: b. Bapaume, France, 1645; d. Fort Saint Louis, Tex., 1687. He became a member of the Récollet Order; was sent as a missionary to Canada in 1675; accompanied La Salle in his western expedition; was with Tonti at Crèvecœur, where he helped bring about peace between the Iroquois and the Illinois; in 1682 went down the Mississippi with La Salle, and in the same year returned to France. For a time he was warden of a convent in his birthplace. But in 1684 he set out again with La Salle for the mouth of the Mississippi. He was left by La Salle at Fort Saint Louis and there massacred by the Indians. He wrote a description of his trip down the Mississippi, which was incorporated by his cousin, Christian le Clerq, into his 'Etablissement de la Foi dans la Nouvelle France' (1691), and which was later unscrupulously copied by Hennepin (q.v.). This narrative has sometimes been attributed to La Salle.

MEMEL, mā'mĕl, Germany, an important fortified seaport of Prussia, near the Russian frontier, at the north extremity of the Kurisches Haff, at its opening into the Baltic, 70 miles north by east of Königsberg. It was almost wholly destroyed by fire in 1854, and was rebuilt in modern style. It has a large harbor, and exports from Lithuania and Russia great quantities of timber, also flax and linseed, coal, manure, grain and herring; has also manufactures of brandy, soap and chemicals, sawmills, iron foundries, breweries and ship-building yards. Memel was founded in 1252 by the Livonian order, who gave it to the Teutonic Knights, by whom it was fortified in 1404. It suffered severely in the Lithuanian wars (13th and 15th centuries). Here in 1807 Frederick William III of Prussia took refuge and a treaty with England was signed. It was seized by Russia in 1812 and again in 1914, but on each occasion they were obliged to give it up. The town gives its name locally to the Niemen River (q.v.). Pop. 21,470.

MEMLING, or **MEMLINC, Hans,** Flemish painter: b. Mainz, about 1430; d. Bruges, 1495. He settled at Bruges 1478, of which town he was a prosperous citizen until his death. While all that is handed down of his biography is apocryphal, it is evident, from his works, that he was an imitator of Roger Van der Weyden, although he avoided the harshness and ungraceful drawing of that artist's style. He stood alone among the Flemish painters of his day in the religious tenderness of his pictures, their life-like expression, their exquisite coloring and modeling. His chief works are to be found in Saint John's Hospital, Bruges, namely, the altarpiece, 'Marriage of Saint Catharine' (1479); 'Portrait of Maria Moreel as Sybilla Persica' (1480), and the 14 scenes illustrating the legend of Saint Ursula and the 11,000 Virgins of Cologne (1589). In the Academy of Bruges is a triptych of his in the central panel of which are Saints Christopher, Maurus and Ægidius, and on the wings Burgomaster Moreel (who offered the picture) with his family. In the Royal Gallery at Turin is his 'Seven Dolors of Mary'—a passion picture; in the Pinakothek at Munich a compan-

ion picture, 'The Seven Joys of Mary.' Consult Michiels, 'Memlinc, sa Vie et ses Œuvrages' (1883); Wauters, 'Sept Etudes pour Servir à l'Histoire de Hans Memlinc' (1894).

MEMMI, měm'mē, **Simone.** See MARTINI, SIMONE.

MEMMINGER, měm'mĭn-jẽr, **Christopher Gustavus,** American politician, secretary of Treasury in the Confederate government: b. Württemberg, Germany, 17 Jan. 1803; d. 7 March 1888. He was brought to America in infancy, and was educated at South Carolina College. He studied law; began to practise in Charleston in 1825; entered politics as a leader of the Union party; attacked the States' Rights party in a satire called 'The Book of Nullification' (1832); reformed the public school system of the State, and for 20 years was in the State legislature, much of the time acting as head of the finance committee. In 1859, after John Brown's raid, he was commissioned by South Carolina to consult with other delegates in Virginia as to the best method of warding off attacks of Abolitionists. From the formation of the Confederacy until June 1864 he was Secretary of Treasury, and his mistaken policy in that office did much to ruin the Confederacy financially.

MEMNON, in Greek mythology, the son of Eos (Dawn), an Ethiopian prince, nephew of Priam, for whom he fought at Troy. After he had killed Antilochus he was defeated by Achilles. The post-Homeric legend adds that his mother wept bitterly for him, even after he had been made immortal. Memnon's kingdom was localized on the west bank of the Nile, and one of the colossal statues of Amenhotep III, as early as the 1st century A.D., became connected with the myth. It was said to portray Memnon, and the musical note emitted when the sun's rays struck the statue in the early morning (probably due to the action of sudden heat on the chilled damp stone) were explained as Memnon's greeting to his mother. The statue, rehabilitated by Severus, is still sonorous. The name Memnonium was applied in the Ptolemaic period not only to the west bank of the Nile, as "Memnon's land," but to a temple near Abydus, excavated by Mariette in 1859, which contains the famous "gallery of kings." This has a list of 76 Egyptian kings, and dates from the time of Seti I and his son, Rameses II. This Memnonium contains many other important sculptured documents.

MEMOIRS OF CARLO GOLDONI ('Mémoires de Carlo Goldoni'). This work is celebrated among the many of this class in literature, and yet, in a general way, is comparatively little known. The 'Memoirs' were written in French, when Goldoni was 80 years old, and first appeared in Paris in 1787 (3 vols.). An excellent edition, reproducing them entire and accurately, was published on the second centenary of the author's birth 1907, by the Florentine firm Barbèra, edited with Italian notes by Guido Mazzoni. It was in 1760, a year before Goldoni was called to Paris, that he conceived, as he states in the preface to the 'Memoirs,' the idea of an autobiography. On seeing that the first Florentine edition of his plays had become the subject of universal pillage, no less than 15 editions having been published without his knowledge and very incorrectly, he resolved to publish a second edition at his own expense and insert in each volume a part of his life, imagining that in this way the history of his person and his plays might be completed together. Moreover, it occurred to him that possibly a collection of his works might some day be discovered in a corner of some old library and awaken curiosity to know something about the writer who undertook to reform the Italian theatre and wrote 150 comedies of character and intrigue. But as the years rolled on and the work which was to extend to 30 volumes and become completed in eight years had only reached the seventeenth volume, Goldoni realized that his project would not be completed during his life. So setting to work six years before his death, abridging and translating into French the contents of the historical prefaces of his 17 volumes of the Venice edition of the plays which related mostly his early life, and continuing with an account of the reformation of the Italian theatre, due largely to the author's theatrical genius, he completed the first part of the 'Memoirs.' The second part gives an account of the composing, construction and outcome of his many plays, together with the criticism of them and rivalry excited by them. The third and final part of the 'Memoirs' relates the author's personal experiences in France from 1762 to their close in 1787.

The 'Memoirs' of Goldoni have been called his most amusing comedy and pronounced by no less a literary light than Gibbon, "more truly dramatic than his Italian Comedies." They have been the subject of admiration of some of the most distinguished of litterateurs not only in Italy but in England, France and Germany, is proven by such testimony as that of Byron, Voltaire and Goethe. But to appreciate and enjoy Goldoni's entertaining personal reminiscences, no such extraordinary literary talent is necessary,— far from it, for the average reader can hardly fail to get enjoyment from them, especially if he be at all interested in 18th century life in Italy. As a faithful picture of the life of this period, especially the life of the humbler classes, the 'Memoirs' of Goldoni rival his plays and are unexcelled. The parts that relate to Venice, Chioggia and to life in the Italian cities where Goldoni had his many and varied youthful experiences have that genuine ring found in his best plays in Italian dialect depicting life among the common people. The portions relating to the author's life in France, although far from lacking in interest, have not the charm that the parts of the 'Memoirs' have which relate to Italy. There is an English translation of the 'Memoirs' by John Black (2 vols., London 1827). The same, abridged and edited, together with a luminous introduction by William Dean Howells (Boston 1877). For everything concerning Goldoni and his works, consult H. C. Chatfield-Taylor's masterly work 'Goldoni, a Biography' (New York 1913).

JAMES GEDDES, JR.

MEMORIAL ARCH, an arch usually built across an avenue or street, or at an entrance to a park, garden or other public place, to commemorate some person or event. The

Washington Arch in Washington Square, New York City, is a well-known American example of the memorial arch. It is built of marble and is adorned with elaborately carved figures.

MEMORIAL ARCHITECTURE. See SEPULCHRAL ARCHITECTURE.

MEMORIAL DAY. See DECORATION DAY.

MEMORY IN ANIMALS is to be studied in the light of comparative psychology, as between the human and the animal mind. To one class of thinkers this difference seems only one of degree; the mind of the animal to them is of the same nature as that of man, but is less developed by reason of limited experience, lack of stimulus because of comparatively small means of intercommunication of ideas, and general inferiority in complexity of brain structure. To another class of thinkers there is an essential difference — a permanent gulf between the mental processes and powers of brute and human beings. Memory is one of the most important attributes of mind and must vary with varying mental abilities. Thus it is hardly, if at all, perceivable in animals of low organization, but is more and more recognizable as we ascend the scale of animal organization, until at the top its operation is clearly visible. In studying it as regards animals we are met, however, with this initial and constant difficulty, that while we are able not only to question ourselves and report what we find for comparison with and discussion of the self-examination by other men, we cannot see into an animal's mind and must judge of its processes by their outward signs. Thus we may assure each other that we possess imagination, which is a high function of memory; but how are we to discover whether an animal indulges itself in such a mental exercise? When a horse goes slowly and with hanging head on an outward journey but becomes instantly animated and brisk in his gait when he is turned toward home, is that because he pictures in his mind the comfortable stable and good food awaiting him? If so, is that not an example of imagination? It has been customary to attribute all such acts as nest-building and the like to "instinct," but innumerable examples of both faulty and beneficial work of this kind discourage faith in so simple a solution; and when a bee ingeniously stays a falling comb by a new brace or guy of wax, or a beaver overcomes a change in his pond by altering the direction of his dam or by building another in a new place, must these creatures not exercise imagination in order to plan and carry out the new way of meeting an unexpected difficulty? Each is applying his experience, recalled by memory, in the way he pictures (must picture) to himself the result of what he purposes to do, or he could not carry out his intention. That the animals we know best, horses, dogs, cats and so forth, have a very retentive memory, at least in certain directions, every one knows. The theory of many students of the matter is that this is purely "associative," that something they see or smell or hear recalls a group of facts connected with it; and that it is impossible for them to recall this group without such a concrete suggestion. Much evidence may be produced throwing doubt on this limitation of their power.

ERNEST INGERSOLL.

MEMORY AND ITS DISORDERS. Locke has defined memory as "the power the mind has to revive perceptions which it once had, with the additional perception that it has had them before." Ribot distinguishes three functions of memory: (1) the preservation of certain states, (2) their reproduction and (3) their recognition. In view of the fact that the collection of gray matter in the cerebro-spinal axis below the cortex is capable of storing impressions and that probably all parts of the sensory nervous system are concerned in mind action and in memory, it will be necessary to speak not merely of memory but of memories in the sense of reproductions of like sense quality with the original impressions. Modern psychology accepts the concept of unconscious memory, which would imply that all impressions upon all sense organs are permanently retained in the organism. In this case the question is not so much how we remember as why we forget. An answer to this question has been found by the present day analytical psychology of the unconscious. Up to the time of the acceptance of these views the determinants of memory were considered to be frequency of repetition of the stimulus, or its intensity, or its interest or a combination of these factors. From a purely mechanical point of view memory is interpretable as a result of a biochemical phenomenon. The sensory nerve cells, being acted on by certain stimuli, whether of touch, taste, hearing or sight, undergo certain molecular changes. Repetition of similar impulses induces similar reactions and a habitual response in the affected cells results. A line of least resistance is established and in these habitual responses the germ of the idea of memory is to be found.

From this point of view the nerve-cells retain something as a result of a previous experience, and the repetition of the stimulus finds the cells in a receptive state. Continued repetition of the stimuli constitutes a memory, and in this sense the training of a certain mechanism has bound up in it this mechanical theory of memory. Thus a muscular effort, as in tennis, or skating, or piano-playing, becomes by repetition remembered in automatic action, frequently without consciousness. It is the usual rule that many muscular acts which in their acquisition have called for conscious memories soon become automatic, and the effort no longer rises into consciousness, perhaps because of its diminished intensity. A similar point of view may be held for sound-impressions, for taste, for touch, for sight, in each individual case a different series of nerve-cells and nerve-fibres being involved. Thus the memory for a poem may mean a habit-response to a series of sight or sound impressions, or of the muscular memories of the speech mechanism that has learned to repeat the phrases. The actor who automatically says his lines, often not conscious of what he is saying, the pianist who mechanically plays, or the golfer who unconsciously drives true, all show the same class of memory adaptations, involving different nervous chains.

There are thus not only a visual memory, but an auditory memory, or memory for sounds, a gustatory memory for tastes, an olfactory for smells, and special memories for the other special classes of sensation. Older psychology

was concerned with the question as to the fidelity and longevity of these special memories or types of memory, as related to each other, and with the discovery of laws according to which they might be revived. (See MNEMONICS). But with the introduction of the unconscious as a dynamic factor, the recalling of a previous experience is explained on a new principle. Memories are thus seen in the form of ideas to be reproduced into consciousness by virtue of forces which are mainly unconscious, and over which consciousness has only an indirect control, and the study of memory as such retires to an importance secondary to the study of the causes why some things tend to be remembered and others tend to be forgotten. This trend or tendency on the one hand to be forgotten or on the other to be remembered is now known to be determined by the unconscious wish, a force which is termed the *libido* and which is the prime mover, although uniformly unrecognized, of all the activities of the ego, both conscious and unconscious.

The mental mechanisms by which the unconscious pervades and indirectly controls all the conscious expressions, whether activities or thoughts, will be discussed under the title PSYCHOANALYSIS. In connection with memory it is necessary here only to point out that what we remember is only the residua after the work accomplished by the processes of repression, during which most of our former experiences are forgotten. On the fundamental principle that what is unpleasant in experience is from earliest infancy rejected by the individual ego, and regarded as if it did not exist, we may regard the ego as similarly rejecting or repressing the memories of impressions associated with the unpleasant or painful incidents. This explains why some things are forgotten and others are remembered. The unconscious, which functions solely on the principle of accepting or striving for the pleasurable and rejecting or repressing the painful, therefore furnishes the motive force for injecting certain ideas into consciousness, and restraining other ideas from entering. On this fact depends the further phenomenon that the dynamic factor called the libido, in becoming attached to certain ideas which are thrust out of consciousness, may be *converted* and its force applied to vegetative functions of the body producing in many cases certain forms of disease. See PSYCHOTHERAPY.

Memory, however, does not depend on repetition of stimulus alone. There are variations in intensity and duration of stimuli, modifications in plasticity of the nerve-cells themselves, the quality of attention, and above all the native individual character of health of the nerve-tissue itself—all of which factors enter into the everyday variations in memory that are familiar to all. The fixity and enduring quality of the memories of childhood are proverbial, and are due to the great plasticity of the youthful nerve-cells, as well as to the intensity of the early pictures. That one person should have a good visual memory and a poor auditory memory, and vice-versa, must naturally be interpreted as due to variations in individual capacity. Modern pedagogy has slowly recognized these variations, and the greater prominence given to play, and to methods of precision, be they manual, lingual, auditorial or visual, and less to distinctly formal methods of memorizing as a purely visual process from a printed page, may be regarded as evidence of this wider recognition that memory should be a generalized function, and not a pedantic cramming of any sort. A well-trained muscular system may be of far greater use to a man than any of his acquired knowledge. It is impossible to train certain children to do certain things, whereas in other directions training may result in great proficiency.

Disorders of Memory.— The classifications of disorders of memory into those of defect and those of excess is based on the old psychology which laid most of the defects to lesions in the cortex of the brain. The newer view, while admitting the loss of memory evinced by the physical defect in the brain or nerve substance, admits also a purely functional deficiency in various memories which is determined by the unconscious wish and is entirely independent of any organic lesion or defect. It is agreed by most psychologists that the native retentiveness in any given individual does not itself alter, although there may be in one individual a finer nerve and brain structure than in another, enabling one to perceive and therefore retain finer distinctions. But the ability to recall at will, which is the essential quality of a good memory in the ordinary sense, is dependent solely upon the proper alignment of the unconscious wish with the desires of the conscious life, which are determined by the social environment of the individual.

The general term for deficiency or loss of memory is amnesia, although this term fails to express the various distortions of memory, the illusions or slight absences; and there are no technical words to distinguish temporary or permanent, periodic or progressive stages of the amnesic process. Inasmuch as memory is not one thing, but a great assemblage of processes which reflect a vast variety of psychological functions, situated not in the brain alone, but almost anywhere in the nervous system, a "defect in memory," as defined by Jastrow, "is an expression of the incapacity of a group (or of certain groups) of centres to exercise their normal functions; or a tendency which they show to functionate in an abnormal manner." Defects of memory may be general or special. General defects may be due to an incapacity on the part of nervous centres to establish residua. This type is found in those people who never remember what they see, and, notwithstanding frequent repetition of an act, never acquire proficiency in it. Occasionally a reverse general condition is manifest wherein the power of memory is unduly exalted and impressions of past experience reappear with unusual brilliancy. Such states are known in fevers, in intoxications of various kinds as of alcohol, opium, etc., and in the hypnotic trance. Special defects may arise in which particular isolated experiences are cut out of the mind. Thus alcoholic amnesia, that may forget even a committed crime, is an illustration. Somnambulism and other hysterical states are characterized by defects of this special type. Another form of defect is observed when associated memory-groups are blotted out, as in the special disorder aphasia. (See APHASIA; SPEECH, DEFECTS OF). Memory may be falsely localized in time, or in order; imaginary additions to

real events may be present; or illusory remembrances of what has never been experienced occur. Disorders of memory are never primary conditions but depend upon either the physical nerve or brain defect for which there must always be a corresponding deficiency in memory or upon the psychological conditions referred to above, where the specific memories are inhibited by associations with unpleasant or painful situations. Through the technique of psychoanalysis a great amount of forgotten material can be restored to memory by means of living over again the situations in which occurred the events responsible for the apparent obliteration of the memory.

Psychologically considered, memory defects may occur either in the storing or retentive part of the nerve-cells, or they may involve the much more complicated and associated process of reproduction of the retained images. Both processes may be involved at the same time. In imbecility, idiocy, dementia, etc., a born or acquired loss of retentive power is present. In pianists — for example, Paderewski — or chess-players — Morphy, Pillsbury, etc., a state of localized hyperamnesia is present. This group would include all such prodigies. Occasionally one sees these two groups represented in one individual, as in an imbecile who has great power for mathematical calculation, etc. A case of this kind proves that the old assumption of closely localized memory-centres is false. Memory may be said to reside in all parts of the sensory nervous system. In another group the ordinary amnesias may be placed. These vary with each individual and depend largely on the healthy tone of the nervous system. A third group would include the paramnesias, or illusions of memory. In this condition (1) there is a loss of distinction between memory of things which really did happen and an imagination of things which never did or could. The so-called "constitutional liar" is an example of this inability to distinguish between real and imaginary, and many types of insane persons are similarly affected in an extreme degree. The reverse of taking an imagination for a real thing is (2) taking a real thing experienced for the first time as a memory of something experienced before — thought of having seen, heard or felt "just that same thing before," also called "deja vue." Such a feeling has nothing to do with native retentiveness, but only with the "feeling of familiarity," which is essentially the presence of an organic sensation which is absent in the simple paramnesia. In some insanities this form of double memory is very prominent and leads to the belief on the part of the person so affected that he is prophesying when he is only recalling what he experienced before. (3) There is also an associated paramnesia in which things actually experienced suggest ideas falsely taken as memories of other things never experienced. This condition is seen in children and often leads to false testimony. It is also responsible for most "presentiments" or alleged antecedent knowledge of what has happened. Examples of such memories of the actually non-existent are seen in the stories of faith cures, where all the healing is that of ills that never really existed, save as associated false memories. On these false memories is erected much of the complicated structure of spiritualism, second sight and other similar phenomena. See IDIOCY; PERSONALITY AND ITS DISORDERS; SPEECH, DEFECTS OF; and RETENTIVENESS.

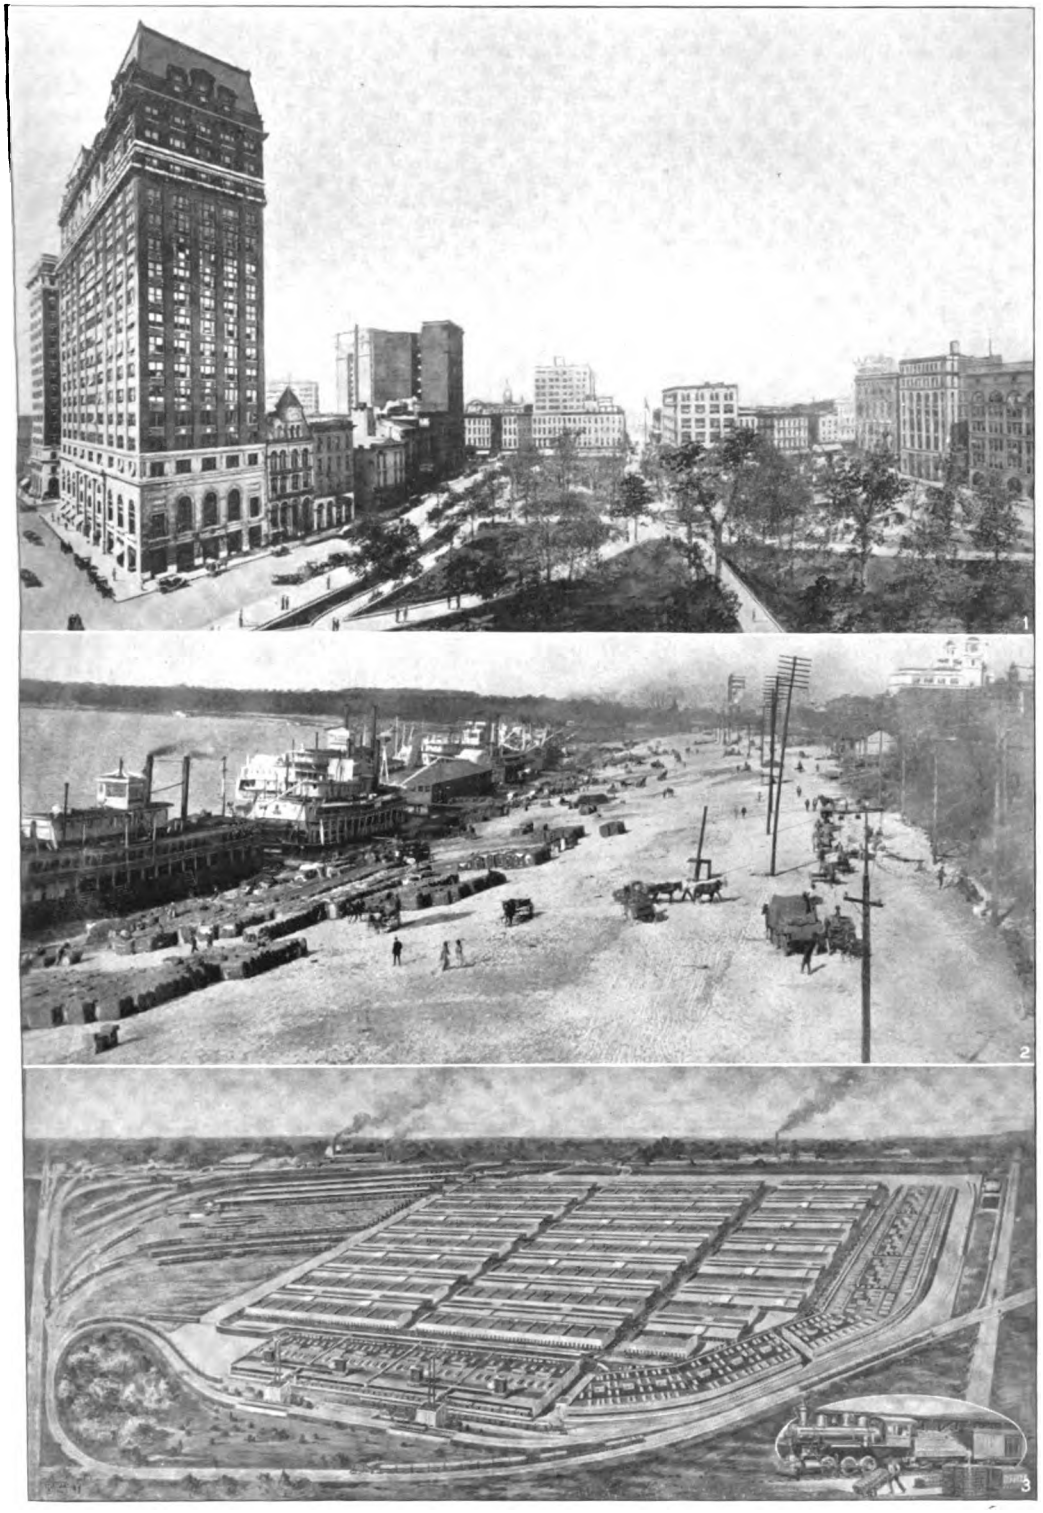
SMITH ELY JELLIFFE, M.D.

MEMPHIS, mĕm'fĭs, Egypt, an ancient city near the apex of the Nile Delta, 12 miles south of Cairo, according to Herodotus, founded by Menes, the first king of Egypt. It was a large, rich and splendid city, and the second capital of Egypt. After the fall of Thebes it became the sole capital. Among its buildings the temples of Ptah, Osiris, Serapis, etc., and its palaces were described as remarkable. At the time of the conquest of Egypt by Cambyses (524 B.C.) it was the chief commercial centre of the country and was connected by canals with the Lakes of Mœris and Mareotis. With the rise of Alexandria the importance of Memphis declined, and it was finally destroyed by the Arabs in the 7th century. In Strabo's time (20 A.D.) it was, in population and size, next to Alexandria; in biblical history it is mentioned as Moph and Noph. The name Memphis is a corruption of Men-nofer, "good abode." Edrisi, in the 12th century, describes its remains as extant in his time. Among the works specified by him are a monolithic temple of granite 13½ feet high, 12 long and 7 broad, entirely covered within and without with inscriptions, and statues of great beauty and dimensions, one of which was 45 feet high, of a single block of red granite. These ruins then extended about nine miles in every direction, but the destruction has since been so great, chiefly for the construction of Fostat, an Arabic city on the opposite bank of the Nile, that although Pococke and Bruce fixed upon the village of Mitrahineh as the site (where prone on a mound are two colossal statues of Rameses II), this was not accurately ascertained until the French expedition to Egypt, when the discoveries of numerous heaps of rubbish, of blocks of granite covered with hieroglyphics and sculpture, and of colossal fragments scattered over a space of three leagues in circumference, decided the matter. The views of the great temple of Ptah, the palace of Apis, the sepulchre of the Apis bulls, portions of the White Wall and of pyramids have been identified. Consult Petrie and Walker (in 'Publications,' Egyptian Research Account, London 1908).

MEMPHIS, Mo., city, county-seat of Scotland County, on the Keokuk and Western Railroad, about 160 miles north by west of Saint Louis. It is in an agricultural region, and is the trade centre for a large part of Scotland and adjacent counties. The principal outgoing shipments are farm products and live-stock. There are bituminous coal fields in the vicinity. Pop. 2,400.

MEMPHIS, Tenn., city, county-seat of Shelby County, on the Mississippi River, at the

MEMPHIS, TENN.



1 Court Square, showing Exchange Building 2 Down on the Levee
3 Memphis Terminal Corporation Plant, covering an area of 170 acres of ground, and handling annually 1,000,000 bales of cotton

head of all-the-year-round navigation, is the largest city in Tennessee, the fifth in size of the cities on the Mississippi River and the most important commercial centre and distributing point between New Orleans and Saint Louis.

Communications.— Steamer transportation on the Mississippi River and its tributaries reaches all the river and gulf ports, connecting with New Orleans, 394 miles; Mobile, 383 miles; Galveston, 661 miles; Savannah, 665 miles; Charleston, 726 miles; Norfolk, 961 miles; New York, 1,158 miles. Ten trunk lines operating 17 railroads, with two bridges over the Mississippi River, include the Illinois Central; Frisco Railroad; Louisville and Nashville; Nashville, Chattanooga and Saint Louis; Yazoo and Mississippi Valley Railroad; Southern Railway; Missouri Pacific Railway; Saint Louis and Southwestern Railway; Mobile and Ohio Railway; and the Rock Island Railway. The principal inland cities reached by direct lines are Birmingham, 251 miles; Saint Louis, 305 miles; Louisville, 380 miles; New Orleans, 394 miles; Atlanta, 417 miles; Kansas City, 484 miles; Cincinnati, 497 miles; Chicago, 534 miles; Washington, 931 miles. The Cumberland Telephone and Telegraph Company (Bell System) has 18,547 telephones in Memphis served by three exchanges. There are a total of 133 long distance circuits connected with the Memphis exchange, and subscribers are connected with the lines of the Bell System, which covers the entire United States and Canada.

Topographical Conditions.— Memphis is located in the most rapidly developing agricultural section of the country. It is the trade centre from the famous Mississippi Delta, and Saint Francis Basin, the combined area of which is in excess of some of the Eastern States. It is the home of the first successful Farm Development Bureau, which is doing great work in bringing about diversification of crops. The Memphis territory is no longer a one crop country. It now not only grows cotton successfully as before but most all of the other crops that are grown anywhere in the temperate zone. Suburban truck routes are operated whereby merchandise of various kinds and produce are handled between Memphis and suburban towns and farms in the Memphis district. This materially simplifies the complex national problem of handling freight on short hauls. The food conservation problem is far better taken care of in this territory, farmers not only feeding themselves but being enabled to make convenient and prompt deliveries of their farm products to the city; this being especially true in connection with dairy products, fruits and vegetables.

Industries, Commerce, Banking.— Memphis is the largest inland cotton market handling actual cotton in the world. The receipts run between 700,000 and over a million bales per year, according to the size of the crop. These receipts will be very materially increased when the opening of the 10,000,000 acres of land in the Saint Francis Basin is finished. This basin has been protected by secure levees and is being rapidly developed. As a market for short fibre cotton, such as linters and cotton hull fibre, there is no market that can compare with Memphis. There are more fibre mills in Memphis than in any other city and the trade in linters is far above the trade of any other market. Over one-half of the total crop of the country is sold through Memphis concerns. This city is the greatest centre for the manufacturing of cotton seed products in the country, including crude and refined cotton-seed oil, meal, hulls and fibre. Memphis also is the largest hardwood producing lumber market. There are in this city 28 hardwood saw mills, with an annual capacity of 370,000,000 feet; 15 lumber yards and 32 woodworking plants. Just outside of the city there are 46 hardwood mills operated by Memphis firms, the capacity of which is 500,000,000 feet. In addition there are many other hardwood mills in the timber districts surrounding Memphis, producing an amount of hardwood lumber equal to the amount manufactured by Memphis firms. Therefore, Memphis may properly be considered as the centre of a production of approximately 2,000,000,000 feet of hardwood annually. A forest products mill has been established in the city, which utilizes slabs, culls and unmerchantable timber into the manufacture of large quantities of wood alcohol and similar products. Charcoal is also produced in large quantities by this mill. The manufacture of sweet feeds is becoming an important industry in Memphis. Cotton-seed products, alfalfa and molasses are produced abundantly in this territory. This industry is being rapidly advanced by the present system of diversified farming. Foreign exports aggregate approximately $100,000,000 yearly, including three-quarter million bales of cotton and 5,000 cars of lumber.

There are 800 manufacturing industries of all kinds in Memphis and its suburbs. These include cotton-seed-oil mills, ice factories, grain elevators, wholesale grocery houses, wholesale dry goods houses, wholesale drug houses, furniture factories, woodworking establishments of all kinds, foundries, machine shops, flour mills, pulp and paper mills, fibre plants, saddlery and harness factories, potteries, car works, pump works, wagon and carriage shops, pure food products, bread, cracker and candy factories, patent medicine works, sugar plantation machinery works, barrel and skewer factories, spoke factories, golf stick works, shuttle block works, trunk, screen door and window factories, basket and box factories, egg case works, horse collar factories, engine and boiler works, electric supplies, refrigerator and cold storage machinery works, cotton gins, stove and range factories, handle and coffin factories, shaft and pole works, cider presses, distilleries and breweries. Memphis has the largest automobile wheel factory in the world. Memphis also is one of the great horse and mule markets of the world.

There are 18 commercial and savings banks in Memphis; also two industrial loan banks and two private banks. The deposits in the 18 commercial banks at the time of the last report amounted to $75,000,000. The total amount of transactions for the year 1918 amounted to $3,441,112,365. The two largest banks carry deposits of $23,500,000 and $17,000,000 respectively.

Civic Conditions.— The city is well laid out and well built. The wide, well-shaded and well-paved streets, the fine public and private buildings, the parks with numerous large trees, all make the city most attractive. The streets are paved with asphalt, vitrified brick, macadam

and gravel. There are 1,056 miles of paved roads in Shelby County. The steel cantilever bridge 1,895 feet in length across the Mississippi, costing $3,000,000, opened 12 May 1892, has been supplemented by another bridge costing $5,000,000, which combines an interurban trolley service, double railroad tracks, pedestrians' walks and a free wagon way. Memphis has 160 churches. Its superior educational advantages include three departments of the University of Tennessee, Tennessee State Normal School, Christian Brothers College, business colleges, high schools, 40 public schools, vocational schools, art galleries, libraries and museums, free endowed circulating library (Cossitt) with 15 branches; endowed (Goodwyn) Institute, with auditorium and reference library. Its free lyceum lecture course attracts the world's leading artists, thinkers, men and women of letters. Outside of the public schools, there are 19 parochial and miscellaneous schools and a number of private schools for boys and girls; coeducational, such as the University School, The Misses Hutchinson School and others.

The largest hospitals are the Baptist Memorial, the new Methodist hospital (built in 1919), Saint Joseph's, Presbyterian, Lucy Brinkley, the United States Marine Hospital and numerous small hospitals, sanitaria and homes. The Y.M.C.A. occupies its own building, which is the largest in the central South. This building is equipped with a splendid library, gymnasium, swimming pool, club-rooms, dining-rooms and all other features going with the highest class of Y.M.C.A. work. The leading theatres are the Orpheum (capacity 2,250), Lyric (capacity 1,780), Lyceum (capacity 1,400). There are numerous other show houses and film theatres in the heart of the city and in the suburbs of various capacities from 200 to 900. The leading clubs are the Tennessee, the Chickasaw, the Rex, the old Business Men's Club, which is now the Memphis Chamber of Commerce — The Memphis Chamber of Commerce continues the club features. The country clubs are The Memphis Country Club, with a membership of 450, and the Colonial Country Club with a membership of 300. The B. P. O. Elks occupy a very fine home here, centrally located. The Khaki Club for the exclusive use of soldiers is located in spacious rooms on Second street in the heart of the city, and there are numerous smaller clubs. The leading hotels in Memphis are Gaysos, 300 rooms; Peabody, 310 rooms and Chisca, 400 rooms. There are about 50 hotels in all, mostly located in the down town district — a few in the vicinity of the depots.

Parks, Public Buildings, Etc.— Memphis has 1,200 acres in improved parks, and has highly improved fair grounds containing 111 acres. Belting the city on three sides is a magnificent parkway system — the most extensive in the South. The largest park is Riverside Park on the east bank of the Mississippi River, just south of the city, containing 427 acres highly improved and a splendid specimen of landscape gardener's skill. Next to the largest is Overton Park, the finest park in the South, in the northeastern portion of the city, containing 335 acres. Within its boundaries is located the Memphis Zoological Garden which is as complete as that of Chicago, and the largest free zoological garden in the United States. Both Overton and Riverside parks have fine municipal golf links. There are several other parks scattered throughout the city. Memphis has more space in proportion to its total area in parks and parkways than any other city in the South. Adding to recreation afforded by the parks may be mentioned the Alaskan Rose Garden with a capacity of 1,500 and pleasure excursion boats up and down the Mississippi River. Notable among the city's fine buildings are the union station, the city hall and court-house, the police station, the exchange building, custom-house and post office, Goodwyn institute, Masonic temple and Scottish rite cathedral.

Modern sanitary methods obtain in Memphis, the sewer system being the Waring, the same as in New York. The water supply of the city is obtained from 64 artesian wells, the depth of which reaches 600 feet. The present pumping capacity of the water supply is 30,000,000 gallons per day, and the daily consumption is 15,000,000 gallons. Among the cities of the United States with a population of 100,000 or over, Memphis ranks second in general healthfulness. The death rate is 13.07.

History.— The history of Memphis begins almost with the history of the United States. It was a landing and tenting place for the early explorers and missionaries. It was the home of the Chickasaw Indians, and the bluffs on which the city is located, 40 feet above high water and 80 feet above low water, have always been known as the Chickasaw Bluffs. In 1698 the French built forts on the site of what is now the city, and in 1794 the Spaniards erected forts at a time when Spain was claiming exclusive right to lower Mississippi. Some of the foremost men in the United States owned lands in this vicinity and were interested in holding for their own country a right to free navigation on the Mississippi to the Gulf. Andrew Jackson, James Winchester and John Overton sent to Memphis in 1819 a small colony who established the first permanent settlement. In 1826 there were 500 persons in the settlement which was then incorporated as a town, and in 1849 a city charter was granted. The Union and Confederate forces tried to gain possession of the city at the beginning of the Civil War. On 6 June 1862 a Federal fleet under Commodore Davis conquered a Confederate fleet under Commodore Montgomery, thus placing Memphis in possession of the Union forces. General Forrest in command of Confederate forces entered the city in August 1864 and took several hundred prisoners. Memphis has always progressed commercially except during the Civil War, and when visited formerly by yellow fever epidemics. The great growth industrially has come within the last three decades. The location has made the city a great railroad centre; the surrounding forests made it a great industrial centre; and the alluvial lands of the Saint Francis Basin, Yazoo Delta and the valley of the Mississippi River will always make it a great commercial centre. In 1855 yellow fever attacked the city, and again in 1867, 1873, 1878 and 1879. The epidemics of 1878 and 1879 so paralyzed the industries of the city that in 1879 Memphis was unable to liquidate the cur-

rent indebtedness and the charter as a city was revoked. The former city was designated by the State legislature as "the taxing district of Shelby County." The control of the district was vested in a board of public works composed of five members, and a governing council composed of three commissioners. The council instituted the sewerage system, which practically eliminated the recurrence of yellow fever, improved civic conditions, liquidated the debts and in 1891 the place was reincorporated and again chartered as a city.

Population.—After the Federal census of 1890 the city limits were extended; but the population as given in 1890 included both urban and suburban districts, and the increase from 1890 to 1900 was remarkable. The growth of the city may be seen from the Federal census reports. Pop. (1850) 8,841; (1860) 22,623; (1870) 40,226; (1880) 33,592; (1890) 64,495; (1900) 102,320; (1910) 131,105; (1918) 175,000. Within a radius of 50 miles of Memphis there is a population of 800,000, according to Dun's 1917 report. The foreign born population does not amount to over 1 per cent throughout the whole territory and a careful estimate of the white race is 54 per cent and of blacks 45 per cent. Consult Davis, 'History of the City of Memphis' (1873); Keating and Vedder, 'History of the City of Memphis' (1888).

GEORGE W. FOOSHE,
Memphis Chamber of Commerce.

MEMPHIS (Tenn.), Capture of. At dusk 5 June 1862 the Union flotilla under command of Com. C. H. Davis appeared near Memphis and anchored two miles above the city. The Confederate flotilla, Com. J. E. Montgomery, commanding, was lying at the Memphis levee. At daylight the Union fleet began to drop down toward the city, and the Confederates advanced to meet it. There were no troops protecting the city. The flotillas were composed of the following vessels:

Union	Guns	Confederate	Guns
Benton	16	Little Rebel	2
Louisville	13	Bragg	3
Carondelet	13	Beauregard	4
Cairo	13	Price	4
Saint Louis	13	Sumter	5
Queen of the West	ram	Lovell	4
Switzerland	ram	Thompson	4
Monarch	ram	Van Dorn	4
Lancaster	ram		
	68		28

Besides having more than twice the number of guns, the Union ordnance was much superior to that of the Confederates. The latter, however, made a desperate fight, which finally ended 10 miles below the city, with the result that the *Lovell, Beauregard* and *Thompson* were destroyed; and the *Little Rebel, Price, Sumter* and *Bragg* captured. The *Van Dorn* escaped. On the Union side only the *Queen of the West* was disabled.

Immediately after the fight the mayor, in reply to a summons to surrender, informed Commodore Davis that there were no troops with which to oppose him. The next morning detachments from troops under Col. C. N. Fitch, which accompanied the fleet, landed and took possession of the city.

General Grant arrived at Memphis 23 June and established the headquarters of the District of West Tennessee. He was recalled to Corinth 15 July and General Sherman was ordered to Memphis, reaching the city 21 July. He restored the mayor and the city government, and made them responsible for civil order. He continued in command at Memphis until his forces left to join General Grant in the final campaign for Vicksburg, having previously participated in the first move against that city.

The raid of Gen. N. B. Forrest, of Confederate cavalry fame, into Memphis occurred 21 Aug. 1864. The Union forces and commanding officers were completely surprised and barely escaped capture. Gen. C. C. Washburn, in command of the District of West Tennessee; Gen. R. P. Buckland of the District of Memphis, and Gen. S. A. Hurlbut were asleep in the city. General Forrest left the vicinity of Oxford 18 August, with three brigades, making a forced march of nearly 100 miles. A strong detachment rode into the city at 4 o'clock in the morning, running over a regiment of 100-days men on picket, and capturing about 250 of them. This force divided into three and at once surrounded the quarters of the three officers named. Each, however, escaped. General Buckland succeeded in reaching his troops and promptly directing offensive operations. With the exception of inconsiderable skirmishes in its vicinity, Memphis thereafter remained in undisturbed Union control.

MEMPHREMAGOG, mĕm-frĕ-mā'gŏg, a lake in the southern part of the province of Quebec, Canada, extending into Orleans County, in Vermont. It is about 30 miles long, north and south, and from three-quarters of a mile to three miles wide. It is irregular in shape, and along its shores are several striking indentations, in some places low and in some other parts high and rocky. The land on the west shore is mountainous, the altitude of the highest points being about 2,800 feet. The outlet is the Magog River, which flows into the Saint Francis River. Along the shore are a number of villages, and in summer a steamer plies daily on the lake, connecting the chief towns and villages.

MENA, Juan de, Spanish poet: b. Cordova, Spain, about 1411; d. 1456. He was educated at Salamanca and at Rome and afterward was appointed secretary and court historian to John II, king of Castile. His allegorical poems, 'Coplas de los Siete Pecados Mortales,' 'Le Coronacion,' and 'El Laberinto' (The Labyrinth), a poem founded on the 'Divina Commedia' and published in the year 1496, all show the influence of Dante, for whom he held great respect and admiration. They were very popular, but possessed little literary merit. His collected works were published in 1528, entitled 'Copilación de todas las obras de Juan de Mena.'

MENA, Ark., city and county-seat of Polk County, 85 miles south of Fort Smith, on the Kansas City Southern Railroad. It is the seat of Saint Joseph's Academy, contains a public library, a splendid park and is also of good repute as a summer resort. The lumber industry is the city's largest interest, although there is a good trade in cotton and fruit. The water-

works are the property of the municipality. Pop. 3,953.

MENABREA, Luigi Federigo, COUNT, Italian soldier and statesman: b. Chambéry, in Savoy, 4 Sept. 1809; d. there, 25 May 1896. After completing a course in mathematics at the University of Turin and joining the engineers in the Sardinian army, he accepted the professorship of technical science at the military academy and at the University of Turin. Having been promoted to the rank of captain, he was used in the diplomatic corps for some time; was then elected deputy, serving both under the Minister of War and the Minister of the Interior; and upon the outbreak of the war of Sardinia and France against Austria in 1859 he was appointed chief of the engineer corps. After Savoy was ceded to France, Menabrea was made a senator by Victor Emmanuel, and chief of the department of engineers, and as such planned the fortifications of Bologna, Piacenza and Pavia; in 1860 he was created a lieutenant-general, in that year laying siege to and after three months of fighting taking Gæta. In 1861 he joined the Cabinet of Ricasoli as Minister of Marine, in 1862 also taking over the portfolio of Minister of Public Works. In 1866 he was Italian ambassador to the council which brought about the Treaty of Prague and ceded Venice to Italy. In 1867, when Rattazzi resigned, he formed a new ministry, himself becoming Minister of Foreign Affairs. As Premier he did much to place Italy in cordial relations with the outside world, and to settle internal dissensions, but his imprisonment of Garibaldi and the prevalent financial straits of the nation lost to him the confidence of the House of Deputies, and on 16 Nov. 1869 he resigned. In 1870 he became Italian Ambassador at Vienna, was appointed to the same post at London in 1876 and in 1882 went to Paris, where he was stationed for 10 years. The most important of his works are 'Etudes sur la série de Lagrange' (Turin 1844–47); 'Le genie italian dans la campagne d'Ancone et de la Basse-Italie' (Paris 1866), and 'République et Monarchie dans l'état actuel de la France' (1871).

MENAGE, Gilles, French philologist and satirist: b. Angers, 15 Aug. 1613; d. Paris, 23 July 1692. After completing his early studies he became an advocate, practising for some time at Paris, but, having conceived a profound disgust for that profession and all its adherents, he became an ecclesiastic, and for some time was a member of the household of the Cardinal de Retz, but subsequently took up his residence in the cloister of Notre Dame. A witty satire, entitled 'Requéte des Dictionnaires,' published shortly after this time and aimed at the 'Dictionary' of the French Academy, prevented his becoming a member of that society. His most important works are 'Dictionnaire étymologique, ou Origines de la Langue Française' (1650–94); 'Origines de la Langue Italienne' (1669); 'Miscellanea'; 'Remarques sur la Langue Française'; 'Historia Mulierum Philosophorum'; 'Poésies Latines, Italiennes, Grecques, et Françaises,' and 'Anti-Baillet.'

MENAGERIE, a collection of wild animals, exhibited in zoological gardens, in museums and by circus companies traveling from city to city. The term is now confined almost wholly to a collection exhibited in connection with a traveling circus, a permanent collection being styled a zoological park or "zoo." The menagerie of the typical circus is usually shown in a separate tent, so arranged that the public can make the round of the cages before taking their seats. The principal exhibits are usually elephants, a giraffe (when one is to be had), hippopotamus, rhinoceros, tapir, lions, tigers, bears, leopards (and others of the cat family), lynx, kangaroo, varieties of deer, monkeys, a few cages of snakes, and minor animals. See CIRCUS; ZOOLOGICAL GARDENS.

MENAI (mĕn'ī) **STRAIT,** the channel between Wales and the island of Anglesey, is 13 miles long, and varies in width from 250 yards to two miles. A suspension bridge and the celebrated Britannia Tubular Bridge connect Anglesey with the mainland. The tides and current are very strong at times, so that large vessels avoid the strait. See BRIDGE.

MENAM, mā-nām', or **MEINAM,** the chief river of Siam, rising in the Laos country, and flowing generally southward to enter the Gulf of Siam below Bangkok. The headwaters are named the Nam Nan. Its length is about 900 miles, and for a considerable portion of its course it is navigable for small craft. It is subject to periodical overflows on which the crops of the rice fields along its banks are dependent.

MENANDER, the name of two Greek writers, (1) the comic dramatist: b. Athens, 342 B.C.; d. there, 290 B.C. He was the pupil of Theophratus, himself the pupil and successor of Aristotle as head of the Peripatetics, and author of 'Characteres,' a somewhat more literary and popular enlargement of some ruling ideas of the Nicomachæan Ethics; he was by such a teacher well trained for his dramatic vocation. He was, moreover, a friend of Epicurus from early life, and may thus have been imbued with that bonhommie which rendered him so genial an interpreter of manners. He wrote a hundred comedies which are distinguished from those of Aristophanes by their refinement, their freedom from personal and political virulence, and their graceful, sometimes beautiful, delineation of feminine character. He was, however, outrivaled in popular favor by his contemporary Philemon, whose ribaldry was irresistible to the Athenian playgoers. Only some fragments of his works survive in the original, the most important of these relics having come to light in Egypt (1898). He was, however, closely imitated by Plautus and Terence, and in the 'Bacchides,' 'Stichus' and 'Poenulus' of the former, and the 'Andria,' 'Eunuchus,' 'Heautontimorumenos' and 'Adelphi' of the latter we have very good representatives of the Greek dramatist's method and spirit. A fine antique statue of Menander is to be seen in the Vatican. (2) A Greek rhetorician who flourished in the latter half of the 3d century B.C. He has left the rhetorical treatise 'De Encomiis,' and from his analyses of the orations of Demosthenes most of the scholia on that orator have been compiled. Consult (on Menander the dramatist), Guizot, 'Ménandre' 1855); Horkel, 'Lebensweisheit des Komikers Menander' (1857); (on Menander the rhetorician), Ritschl,

'Der Rhetor Menander und die Scholien zu Demosthenes' (1883).

MENANT, Joachim, French Assyriologist and jurist: b. Cherbourg, 16 April 1820; d. Paris, 30 Aug. 1899. Having studied law he was appointed to the magistracy of the civic tribunal in the city of Havre, but soon turned his attention to deciphering the old Assyrian inscriptions, for which he was elected a member of the Académie des Inscriptions. Chief among his works are 'Zoroastre' (1844); 'Recueil d'Alphabets des Écritures cunéiformes' (1860); 'Eléments d'Epigraphie assyrienne' (1860); 'Inscriptions assyriennes des briques de Babylone' (1860); 'Inscriptions de Hammourabi, roi de Babylone au XVI siècle avant notre ère' (1863); 'Exposé des Éléments de la Grammaire Assyrienne' (1868); 'Leçons d'épigraphie assyrienne profesées aux libres de la Sorbonne' (1873); a collection of texts, 'Annales des rois d'Assyrie' (1874), and 'Babylone et la Chaldée' (1875); 'Manuel de la langue assyrienne' (1880).

MÉNARD, mā-nār, **Michel Branamour,** American pioneer: b. Laprairie, Lower Canada, 1805; d. 1856. He was of French parentage, and after working some time for a Detroit fur-trading company entered the service of his uncle, also a fur-trader, in Missouri. The Shawnees made him their chief, and he acquired great power among various Indian tribes. Soon after 1830 he went to Texas, where he continued fur-trading with the Indians, and also dealt with Mexicans. When the Texans revolted against Mexico he held the Indians in check and kept them from acting against the insurgents. As a member of the convention at which the Texans declared their independence, and afterward of the Congress of Texas, he exerted an influence in the formation of that State. The greater part of the site of Galveston was included in a purchase made by him in 1836, and of that city he, more than any other man, is to be considered the founder.

MENASHA, mē-năsh'ą, Wis., city in Winnebago County, at the mouth of the Fox River, on Lake Winnebago, on the government canal of the Fox and Wisconsin River Improvement Company, and on the Chicago, Milwaukee and Saint Paul, the Saint Paul and Sault Sainte Marie, and the Chicago and Northwestern railroads, about 90 miles north by west of Milwaukee. The first permanent settlement was made in 1847 and the incorporation was in 1874. Menasha, like other places on Lake Winnebago, is a favorite summer resort. It is in an agricultural region in which the lumber interests are prominent. There is abundant water power. The chief manufactures are flour, lumber, paper, brick, machine-shop products, woodenware, furniture, leather and woolen goods. The city has good public and parish schools and a public library. Pop. 6,081.

MENASSE, mā-năs'ā, **Ben Israel,** Jewish scholar and writer: b. Lisbon, 1604; d. Middelburg, 20 Nov. 1657. He was in his 18th year rabbi of a synagogue in Amsterdam; mastered 10 languages and published numerous works on theology and hermeneutics. After the decapitation of Charles I of England he took measures to secure a repeal of the statue of Edward I, by which Jews were excluded from England. Cromwell appointed a commission to consider his petition, and in 1655 the legal restrictions were removed. Among his most notable works is 'Vindiciæ Judæorum,' which was translated into German by Mendelssohn, 1782. Consult Kayserling, 'Menasse Ben Israel' (1861).

MENCIUS, mĕn'shĭ-ŭs, the Latinized name of Meng-tse, that is, Meng the Teacher, a Chinese philosopher and recluse: b. province of Shan-Tung, about 372 B.C.; d. there, about 289 B.C. He was educated by his mother with such success that the approbation contained in the phrase "the mother of Meng" has become proverbial. Mencius was one of the greatest of the early Confucians. During his time the governments of China were oppressive, and Mencius for many years wandered about in search of a prince who would consent to govern in accordance with true and just principles. Failing to find any such, he retired to his former seclusion and spent the rest of his life in perfecting his system and training disciples. His works contain some enlightened views on man and society. He believed in the moral nature of man and had unbounded faith in the possibilities of progress under a good social and political system. He regarded all governments as from God, but at the same time he believed in the responsibility of rulers to their people and the people's right to depose or even put to death unworthy rulers. In a nation the people are the most important element, second comes the government and third the monarch. The aim of a government, according to him, should be the happiness and education of the people, and any ruler who was content to leave his subjects in ignorance and misery deserved to be deposed. The teachings of Mencius were written out by his disciples in dialogue form, under the title 'The Book of Mencius,' which has been translated into Latin by Julien (1824) and into English by Collin (1828). Consult Legge, 'Life and Works of Mencius' (1875); Faber, 'Lehrbergriff des Philosophen Mencius' (1877); Watters, 'A Guide to the Tablets in a Temple of Confucius' (1879).

MENDAITES. See NAZARENES.

MENDEANS. See NAZARENES.

MENDEL, Johann Gregory, abbot of Brünn, now known as the discoverer of the law named after him (see HEREDITY): b. Heinzendorf bei Adrau, Austrian Silesia, 22 July 1822, of peasant parents; d. 6 Jan. 1884. In 1843 he entered the Königinkloster, an Augustinian foundation in Altbrünn, as a novice; and was ordained priest in 1847. From 1851–53 he studied natural science at Vienna; and, on his return to the cloister, taught in the Realschule. About 1869 he became abbot of Brünn; and later took part in the Ultramontane movement. It was in 1854 that he began those experiments, on *Pisum,* in the cloister gardens, that, after the lapse of half a century, have brought him posthumous fame. In 1865 he contributed his now memorable paper, 'Versuche über Pflanzenhydriden,' to the Society of Naturalists of Brünn; and, in 1869, another, on *Hieracium* hybrids. After 1869 he seems to have discontinued his work in hybridizing, and died unrecognized by science. This seems inexplicable, as his researches were of a nature to commend them to his studious contemporaries, among them Darwin, who entirely missed his

contribution, even though the Brünn society exchanged with the Royal Society of London. But Mendel had the satisfaction of realizing that he had established a law in heredity as to the numerical ratios of the types developed in hybridizing — the grand fact for which we now prize his unobtrusive labors. His theories have given us the word Mendelism. He called himself a student of Kollar; and for some time he was president of the Brünn society. Since the verification of his experiments, simultaneously, in 1900, by De Vries, in Holland, Correns, in Germany, and Tschermak, in Austria, and of the translation of his paper appearing in the 'Journal of the Royal Horticultural Society of England' (1901), the literature has been full of "Mendel's Law." Consult Bateson, W., 'Mendel's Principles of Heredity' (Cambridge 1902).

MENDELEEFF, Dimitri Ivanovitch, Russian chemist: b. Tobolsk, Siberia, 7 Feb. 1834; d. Saint Petersburg, 2 Feb. 1907. He studied at the Institute of Pedagogy, Saint Petersburg, where he gave special attention to natural science; in 1856 became docent at the University of Saint Petersburg; was at Heidelberg in 1859–61, where he published his monograph 'On the Capillarity of Gases,' soon followed by 'Organic Chemistry.' In 1863 he became professor of chemistry at the Saint Petersburg Institute of Technology, and in 1866 was appointed to a similar professorship in the University of Saint Petersburg. The results of his researches on the compression of gases, which he closely pursued from 1871 to 1875, were set forth in his work 'On the Elasticity of Gases.' He was commissioned in 1876 to report upon the petroleum industry in the Caucasus regions and in Pennsylvania. His 'Aqueous Solutions' (1886), a work on experimental chemistry, has taken its place among the most important contributions to that branch of science. In 1890 his 'Tariff Elucidated' presented the protectionist views of which he had already become a well-known advocate, and which, as a member of the Council of Commerce and Industries, he actively propagated. When the Chamber of Weights and Measures was established by the Department of Finance, in 1893, he was appointed conservator of the weights and measures. His proof of the periodic law (q.v.), first presented in 'Elements of Chemistry' (1868–70), is his crowning achievement in pure science. Consult Thorpe, 'Essays in Historical Chemistry' (1894).

MENDEL'S LAW, the law of heredity discovered by Johann Gregor Mendel (q.v.) and first published in 1865 under the title "Versuche über Pflanzenhydriden" in the *Proceedings* of the Society of Natural History of Brünn, Austria. Mendel made prolonged experiments in crossing varieties of the pea (*Pisum sativum*). His paper was overlooked until attention to his remarkable results was called by De Vries in 1900; he and also Correns and Tschermak at the same time independently rediscovered Mendel's law. Mendel selected seven pairs of characters, such as the shape of the ripe seed, of the cotyledons, of the seed-pod, color of the seed-skin, length of stem, etc. Large numbers of crosses were made between peas differing in respect of one of each of these pairs of characters. It was found, says Bateson, that in each case the offspring of the cross exhibited the character of one of the parents in almost undiminished intensity, and intermediates which could not be at once referred to one or other of the parental forms were not found. "In the case of each pair of characters there is thus one which in the first cross prevails to the exclusion of the other." This prevailing character Mendel called the dominant character, and to the other he gave the name of recessive character.

This law of dominance has been found by Bateson and by Castle to apply to animals as well as plants, and thus is a most important biological law. Thus when mating occurs between two organisms, whether vegetable or animal, differing in some character, the offspring frequently all exhibit the character of one parent only, in which case that character is said to be "dominant." For example, on crossing white mice with gray mice, Castle found that the offspring are gray, that color-character being dominant. The character which is not seen in the immediate offspring is called recessive, for though unseen it is still present in the young, white in the experiment being the recessive color.

The law of dominance has its exceptions; the hybrid often possesses a character of its own, instead of the pure character of one parent, as is true in cases of complete dominance. The hybrid form often resembles a supposed ancestral condition, when it is usually regarded as a reversion. Examples are the gray hybrid mice, which are indistinguishable in appearance from the house mouse; also slate-colored pigeons resulting from crossing white with buff pigeons.

One result of Mendel's discovery is the purity of the germ-cells. As stated by Castle: "The hybrid, whatever its own character, produces ripe germ-cells which bear only the pure character of one parent or the other." To breeders Mendel's law is of great importance because, as remarked by Castle, it reduces to an exact science the art of breeding in the case most carefully studied by him, that of entire dominance. "No animal or plant is 'pure' simply because it is descended from a long line of ancestors possessing a desired combination of characters, but any animal is pure if it produces gametes (germ-cells) of only one sort, even though its grandparents may among themselves have possessed opposite characters."

The bearings of Mendel's discovery, confirmed by De Vries' experiments, on the origin of species are most important. The problem is whether aberrations, sports or discontinuous variations may not sometimes result in the formation of new species and types, or whether species are all the result of slow, continuous variations. As stated by Castle, "A sport having once arisen affecting some one character of a species, may by crossing with the parent form be the cause of no end of disintegration on the part of any or all of the characters of the species, and the disintegrated characters may, indeed must, form a great variety of new combinations of characters, some of which will prove stable and self-perpetuating.

Mendel's discoveries also explain the principle that new types of organisms are extremely

MOSES MENDELSSOHN

variable, whereas old types are subject to little variation. A new type which has arisen as a sport will cross with the parent form. The offspring, says Castle, will then inherit some dominant character, others latent, and this will result in polymorphism of the race. Thus the suggestion of Galton that species may arise from sports is confirmed, while added cases are afforded by the recent remarkable experiments of De Vries, resulting in the origination of seven new species of primrose by sudden variations, or what he calls "mutations." Consult Bateson, W., 'Mendel's Principles of Heredity' (Cambridge 1913); Castle, W. E., 'Mendel's Law of Heredity' (Cambridge 1903); Morgan, T. H., 'The Mechanism of Mendelian Heredity' (New York 1915). See HEREDITY; SEX.

MENDELSSOHN, mĕn'dĕls-sōn, **Moses,** German Jewish philosopher: b. Dessau, Germany, 6 Sept. 1729; d. Berlin, 4 Jan. 1786. His father, Mendel, a schoolmaster, though very poor, gave him a careful education. He lived several years on the charity of persons of his own religion, devoting his time to study, chiefly in Hebrew and Hebrew literature, but also in mathematics and modern languages. In 1750 he was appointed by a silk manufacturer named Bernhard, a Jew, tutor of his children. At a later period Bernhard took him as a partner in his business. In 1754 he became acquainted with Lessing, with whom he contracted a close intimacy, which had a great influence on his mind. Intellectual philosophy now became his chief study. His 'Briefe über die Empfindungen' were the first-fruit of his labors in this branch. Mendelssohn contributed to several of the first periodicals, and now and then appeared before the public with philosophical works, which brought him fame, not only in Germany, but also in foreign countries. The most celebrated of these is 'Phædon,' a treatise on the immortality of the soul, first published in 1767. It has been translated into most European languages. He established no new system, but was, nevertheless, one of the most profound and patient thinkers of his age, and the excellence of his character was enhanced by his modesty, uprightness and amiable disposition. He knew how to elude with delicacy the zealous efforts of Lavater to induce him to declare himself a Christian. To this encounter between Lavater and Mendelssohn German literature owes one of its greatest dramas, Lessing's 'Nathan der Weise,' in which the author, in the person of the hero, commemorates the virtues, the tolerant spirit and comprehensive mind of his friend Mendelssohn. His 'Jerusalem, oder über religiöse Macht und Judenthum' (1783) was much misunderstood, partly because he attacked many deep-rooted prejudices of his race. 'Morning Hours' (Morgenstunden) was published in 1785. The last work of Mendelssohn was in defense of his friend Lessing, of whom Jacobi had asserted that he was a Spinozist, was entitled 'Moses Mendelssohn und die Freunde Lessings' (1786). Consult Kayserling, 'Moses Mendelssohn' (1882).

MENDELSSOHN-BARTHOLDY, Jakob Ludwig Felix, German composer: b. Hamburg, 5 Feb. 1809; d. Leipzig, 4 Nov. 1847. The kindly influences which, like a halo, encircled the life of the illustrious man, are reflected in many of his best compositions. He was born in prosperity, reared in plenty and at nearly all times was surrounded by conditions conducive to success. It has been said that in no way was Mendelssohn's naturalness and naiveté more evident than in his constant reference to his own foibles; and further, that the hearty way in which he enjoyed idleness and boasted of it were delightful in a man who got through so much work, who was singularly temperate and whose only weakness for the products of the kitchen was for rice, milk and cherry pie. "I do not in the least concern myself," said he, "as to what people wish or praise or pay for; but solely as to what I myself consider good."

It is doubtful whether the history of any other great musician discloses so wide a combination of qualities. Some of his biographers have expressed the thought that his happy disposition prevented his work from attaining that degree of depth which it might have done had his genius been subjected to fiery trials. Be this as it may, the fact remains that among all the German composers there is not one who has enjoyed such universal popularity, certainly in America and England, as Mendelssohn. His oratorios, 'Saint Paul' and 'Elijah,' are sung everywhere, while his 'Hymn of Praise,' the 'Overture to the Hebrides,' his symphonies, sonatas, concert-overtures, settings for certain Psalms and 'Songs without Words' are familiar to all.

Seventy-two of Mendelssohn's numbered works were published before his death and 47 later, while 23 of his compositions, many of them including two or more pieces, had no "opus" numbers assigned to them. Six other of his published compositions have been recorded, while his unpublished pieces, mostly in autograph and principally composed before he was of age, are quite numerous, including 12 symphonies, several fugues, concertos, sonatas, studies, fantasias, etc.

Felix was the second child and eldest son of Abraham Mendelssohn, a Jewish banker of Hamburg, and Lea (or Leah) Salomon, a resident of Berlin, and a Jewish lady of considerable property and attainments, to whom he was married on 26 Dec. 1804. The grandfather of Felix was Moses Mendelssohn (q.v.), who settled in Berlin in 1762 and married Fromet, daughter of Abraham Gugenheim, of Hamburg. Moses' father was named Mendel, a poor Jewish schoolmaster of Dessau, on the Elbe. Thus the name Mendelssohn (son of Mendel) simply perpetuates the Oriental method of name-making.

When not three years old Felix was taken to Berlin, and five years later (1816) his father took him and his sister Fanny, four years the senior of Felix, to Paris on a business trip. While there they both received lessons on the piano from Madame Bigot, but it was not till after their return to Berlin that their systematic education commenced. Ludwig Berger became their piano instructor and Zelter taught them thorough-bass and composition. In 1824 Moscheles became acquainted with the family, and while he declined to accept Felix as a pupil consented to offer him suggestions and advice. In the same year Spohr visited Berlin and renewed his friendship with the family, which had been formed at Cassel in the summer of 1822 where the family had gone for

the purpose of introducing Felix to him. In his eighth year Felix played the piano with remarkable ability, and about a year later (1818) he made his first formal public appearance. This was at a concert given by Joseph Gugel, a virtuoso on the horn. At 11 he joined the Singakademie as an alto. In 1820 Felix commenced systematic work as a composer, although before that time he had written from 50 to 60 complete movements. The earliest date of which a dated autograph is preserved was attached to a cantata entitled 'In rührend feierlichen Tönen,' which he completed on 13 January of that year.

The following year was eventful. He composed five symphonies, nine fugues, several pieces for the piano, two operettas and a number of songs. It was in this year, too, that he visited Goethe at Weimar. The poet was delighted with his talent. While at Weimar he played before the Grand Duke and Duchess and improvised before the court and also before Hummel. His compositions in 1822 were very numerous, and during this and the following year he wrote six symphonies, five concertos, a piano quartet, a violin sonata, a Magnificat and Gloria, and an opera in three acts, entitled 'Die beiden Neffen, oder der Onkel aus Boston.' On 31 March he played for the second time in public, at Aloys Schmitt's concert, taking part in a duo for two pianos, and again, on 5 December, he played at a concert given by Madame Milder-Hauptmann, when he gave one of his own concertos. It was probably in this year, too, that the practice of having informal musical performances on alternate Sunday mornings at the Mendelssohn home was begun. Felix directed, his sister Fanny presided at the piano, his younger brother, Paul, played on the cello, and his second sister, Rebecca, sang.

In 1824 his musical genius showed marked advance, as evidenced in his symphony in C minor, composed between 3 and 31 March. In the summer he was taken to Doberan on the Baltic, a seaside resort, and there received the impressions which later found expression in his 'Meeresstille Ouverture.' His wonderful power of extemporizing and his readiness to play the music of other composers are noteworthy features, and Hiller, who was with him in Frankfort in 1825, was carried away with his performances. In this year he met Cherubini in Paris, whither he accompanied his father on a visit. Toward the end of 1825 Mendelssohn's father purchased a large mansion, surrounded by spacious grounds, and under the influence of this charming home he became more and more devoted to his work. The beauties of Shakespeare were here unfolded to him. Felix was especially charmed with the 'Midsummer Night's Dream,' and probably then conceived the idea of the exquisite composition bearing that name which forms opus 61 and was first produced in Potsdam 14 Oct. 1843. The overture to a 'Midsummer Night's Dream' appeared earlier, and as a piano duet, its first public performance being given at Stettin in February 1827. Either during this or the previous year, Felix entered the University of Berlin, where he showed evidences of decided literary powers. On his return from Stettin he made preparations for his opera 'Die Hochzeit des Camacho,' but owing to the opposition of the director, Spontini, it was performed only once at that time, although, strange to relate, a complete performance of it was given at Boston, Mass., on 19 March 1855.

The principal compositions during 1828 were a cantata for the Tercentenary Festival of Albrecht Dürer, a cantata for a Congress of Science, an antiphona for four voices, and a concert overture. He also completed his overture to Goethe's 'Calm Sea and Prosperous Voyage.' During this year he organized a choir of 16 voices for practising Bach's Passion music. The year 1829 was an important one for Felix. Hitherto his father had not permitted him to regard himself as a professional musician, but this now being determined on, arrangements were made for him to visit some of the great capitals, with a view of gaining materials for his greatest works. His first journey was to England, where he arrived on 21 April 1829. He was received with much enthusiasm and also scored a success in society. His delightful manners and unfailing animation charmed every one. In November he was again in Berlin, and during the winter he completed the 'Reformation Symphony' for the Tercentenary Festival of the Augsburg Confession. He declined the professorship of music in the university, preferring to carry out the program which his father had mapped out for him. In May 1830 he visited Weimar, where he again met Goethe, afterward going to Munich, and later to Italy. Preparations for his return began in June 1831, and after visiting many cities he arrived in Munich where his concerto in G minor was performed for the first time on 17 October.

Another visit to London was made in the spring of 1832, during which he composed with unabated vigor. Among the more important productions of this time were his musical representation of Goethe's 'Walpurgis Night,' and the 'Fingal Overture,' which was finished in Rome. Again in Berlin in July 1832, he gave several concerts, producing the 'Walpurgis Night' at one of them. His time was fully occupied in composing, playing and conducting. His 'Italian' symphony was completed in March 1833, and sent to London where it was produced on 13 May under his personal direction. Later in the month, we find him conducting the Lower Rhine festival in Düsseldorf, where, as a result of his success, he was engaged as director of "all the public and private establishments of the town" for three years with a salary of 600 thalers. He resigned, however, during the second year to accept the position of conductor of the famous Gewandhaus Concerts at Leipzig, then considered the highest position in the musical world of Germany. Thither he proceeded in August 1835, to make arrangements for the season which began on the 4th of October following. Seven concerts were given between that date and 20 November, when he was shocked by the news of his father's death which had occurred the day before. For the first time his radiant disposition forsook him and he fell into a despondent mood. During this season of sadness, however, he was able to finish the oratorio of 'Saint Paul' while he also maintained the excellence of the concerts for which he was responsible. The great oratorio was first produced at the Lower Rhine Festival at Düsseldorf 22 May

1836. About this time he took charge of the Frankfort Cäcilien-Verein during the illness of the director, and there made the friendship of Madame Jean-Renaud and her family. He became devotedly attached to her youngest daughter, Cécile, to whom he was married on 28 March 1837. Returning to Leipzig he conducted another successful season, closing with a performance of 'Saint Paul,' for the first time produced in that city. In August 1837, he left his bride for the purpose of conducting 'Saint Paul' at the Birmingham Festival. This was his fifth journey to England, and before he returned he held conferences with his friend, Klingermann, over the plan of a new oratorio having the prophet Elijah as the central figure. He reached Leipzig on 1 October in time to conduct the first concert of the Gewandhaus on the same evening.

The year 1839 was notable for the composition of the 'Ruy Blas' overture for the Leipzig Theatre and the setting of the 114th Psalm to music. In the following year the invention of printing was celebrated in Leipzig by a festival, and the 'Festgesang,' for men's voices, and 'Lobgesang,' or 'Hymn of Praise,' were composed for the occasion. During this year Mendelssohn accepted the direction of the musical department of the Berlin National Academy of Arts, but before entering his duties he made another visit to Birmingham to conduct a performance of the 'Hymn of Praise. On his return he was installed as General-Musik-Director in Berlin, but having the privilege of living where he pleased, he returned to Leipzig. About this time he composed the music for the 'Antigone' and 'Œdipus Coloneus' of Sophocles, Racine's 'Athalie' and Shakespeare's 'Tempest' and 'Midsummer Night's Dream.'

Another sad trial now befell him in the death of his mother, 12 Dec. 1842, and in November of the following year he removed to Berlin. The king of Saxony had recently established a conservatory of music, a plan which Mendelssohn had long cherished, and he and Schumann were appointed professors of composition and the piano. Meanwhile the Gewandhaus concerts were left in charge of Hiller. In 1844 he visited London for the eighth time in response to an invitation to direct several concerts of the London Philharmonic Society. In October he resigned his position as General-Musik-Director in Berlin and took a much-needed rest until the autumn of 1845 when he again assumed charge of the Gewandhaus orchestra.

Early in 1846 he was back in Leipzig where he took charge of two classes in piano and composition, and among his pupils were Goldschmidt, De Sentis, Tausch and others. The season of 1845–46 was unusually brilliant in concert work and the program showed a great breadth of selection. At the eighth concert he brought with him Jenny Lind, who was then heard for the first time in Leipzig. On 5 Aug. 1846, a preliminary rehearsal of 'Elijah' was held in Leipzig and soon after he started for England on his ninth visit, the complete score having been sent over a month earlier for translation. First there was a rehearsal with piano accompaniment at Moscheles' house, followed by two full rehearsals at the Hanover Square Rooms, and later by rehearsals in Birmingham, where on 26 August the oratorio was performed for the first time in public. One of his biographers states that "there was a mad rush at the close of the performance to grasp the hand of the hero of the day, who thanked all present for their share in the performance with which he was so deeply gratified." Returning to Leipzig he remodeled the oratorio, however, making so many changes that scarcely a movement stands to-day as it was originally written. The complete edition was published in July 1847. The Sacred Harmonic Society of London now invited Mendelssohn to give a production of 'Elijah' in its revised form in Exeter Hall, and for the tenth and last time he visited London in April 1847. Four performances were given, Queen Victoria and the Prince Consort being present at the second of the series. After giving other productions of the 'Elijah' in Manchester and Birmingham, followed by a performance with the Philharmonic Society, he returned to Frankfort, weary and utterly worn out. To add to his now unhappy condition, his sister Fanny, whom he had loved devotedly, was stricken with paralysis and died 14 May 1847. On hearing the sad news he fell fainting and for several weeks was utterly prostrated. Seeking diversion, he revisited Switzerland during the summer, where, it is said, he applied himself to water-color painting and made excellent progress in that direction. Later he resumed composition, numbering among his productions at that time the beautiful quartet in F minor (Opus 80), and he also wrote some parts of a newly commenced oratorio, 'Christus,' which he left unfinished. He returned to Leipzig in September, but attempted nothing serious in a musical way. His spirit was broken and he dreaded to appear in public. The beginning of the end came on 9 October while calling on Madame Frege, whom he was accompanying in his last set of songs. She left the room to order lights, says one of his biographers, and on her return found him shivering and suffering violent pains in the head. He rallied somewhat, but another relapse occurred on 3 November and he never spoke again. He died the following day and on Sunday, the 7th, was borne to the Paulinen-Kirche, preceded by a band playing one of his 'Lieder ohne Worte' (Book V, No. 3), which Moscheles had scored for the occasion. Thence the coffin was taken to the Alte Dreifaltigkeits-Kirchhof in Berlin, where it was deposited in its last resting place.

A cross on the grave bears this inscription: "Jakob Ludwig Felix Mendelssohn-Bartholdy: geboren zu Hamburg, am 3 Feb. 1809; gestorben zu Leipzig am 4 Nov. 1847."

Bibliography.— Mendelssohn's 'Letters from Italy and Switzerland,' translated by Lady Wallace (2d ed., 1862); 'Letters from 1833 to 1847,' with catalogue of all musical compositions, translated by Lady Wallace (1863); 'Letters of Mendelssohn to Ignatz and Charlotte Moscheles,' translated by Felix Moscheles (1888); 'Reisebriefe von Felix Mendelssohn-Bartholdy,' edited by Paul Mendelssohn-Bartholdy (1862); also Benedict, 'Sketch of Life and Works of Felix Mendelssohn-Bartholdy' (1850); Hogarth, 'The Philharmonic Society of London' (1862); Lampadius, 'Life of Felix Mendelssohn-Bartholdy,' translated by W. L. Gage (1865); Devrient, 'My Recollections of Felix Mendelssohn-Bartholdy,' translated by

Coleridge (1873); Hiller, 'Mendelssohn: Letters and Recollections,' translated by M. E. von Glehn (1874); Karl Mendelssohn-Bartholdy, 'Goethe and Mendelssohn 1821–31,' translated by M. E. von Glehn (1872); Horsley, 'Reminiscences of Mendelssohn' (in Dwight's 'Journal of Music'); Dorn, 'Recollections of Felix Mendelssohn and his Friends' (*Temple Bar* for February 1872); Hensel, 'Die Familie Mendelssohn 1729–1847' (1879); 'Thematisches Verzeichniss der in Druck erschienenen Compositionen von Felix Mendelssohn-Bartholdy' (1882); Eckhardt, 'Ferdinand David und die Familie Mendelssohn-Bartholdy' (1888); Little, 'Mendelssohn's Music to the Antigone of Sophocles' (1893); Grove, 'Dictionary of Music and Musicians'; Elson, 'Great Composers and their Work' (1898); Ryan, 'Recollections of an old Musician' (1899); Hubbard, 'Little Journeys to the Homes of Great Musicians' (1901); Stratton, 'Mendelssohn' (1901); Pearce, 'Mendelssohn's Organ Sonatas Technically and Critically Discussed' (1902)

R. I. GEARE,
United States National Museum.

MENDENHALL, men'dĕn-hâl, **Thomas Corwin,** American physicist: b. near Hanovertown, Ohio, 4 Oct. 1841. He was educated in the public schools and by his own efforts obtained a knowledge of physics and higher mathematics. In 1873 he became professor of physics and mechanics in the Ohio University, where he remained until 1878, when he accepted a call to the chair of physics at the Imperial University in Tokio, Japan. There he founded a laboratory, an observatory, a scientific society, inaugurated a system of lectures, which work was highly approved by the Japanese government. In 1881 he returned to the Ohio University, and in 1884 accepted a position in the Signal Service at Washington. In 1886 he was elected president of the Rose Polytechnic Institute, but resigned in 1889 to become superintendent of the United States Coast and Geodetic Survey, and from 1894–1901 was president of the Worcester Polytechnic Institute. He has published several scientific papers and a book entitled 'A Century of Electricity' (1887).

MENDENHALL, Walter Curran, American geologist: b. Marlboro, Stark County, Ohio, 20 Feb. 1871. In 1895 he was graduated at Ohio Normal University; studied at Harvard in 1896–97 and at Heidelberg, Germany, in 1899–1900. In 1894–96 he was geologic aid, in 1896–1901 assistant geologist and since 1901 geologist on the United States Geological Survey. He had charge of the ground-water investigations of the survey in 1907–10 and since the latter year has served as chief of the Land Classification Board. He is the author of various memoirs and articles on professional topics.

MENDES, Catulle, kä-tül mŏṅ-dās, French writer: b. Bordeaux, 22 May 1841; d. Paris 8 Feb. 1909. His verse is marked by extreme devotion to form. He also wrote a great deal of prose — short stories, longer works of fiction, dramas. There is much affectation about them all. Among his books are 'Poésies' (1878); 'Monstres Parisiens' (1882); 'La Rose et le Noir' (1885); 'Grande Maguet' (1888). Of his plays may be cited 'Le Capitaine Fracasse' (1872) and 'Fiamette' (1889).

MENDES LEAL DA SILVA, José, hō-sā' mān'dāsh lā-äl' dä sēl'vä, Portuguese statesman and poet: b. Lisbon, 18 Oct. 1818; d. Cintra, 14 Aug. 1886. He was Minister of the Navy and of Foreign Affairs; Ambassador to France, 1874–83; and to Spain, 1883–86. His vogue as a poet has been very great in his own country and his 'Songs' ('Canticos') were first collected in 1858. He wrote also a large number of plays, some of them very popular on the Portuguese stage, as 'Uncle Andrew from Brazil'; and 'The Sportsman'; and also several romances. He became a member of the Portuguese Academy in 1845.

MENDEZ-PINTO, mān'dāsh pēn'too, **Fernao,** or **Fernam,** Portuguese traveler: b. Montemor-o-Velho, near Coimbra, Portugal, about 1510; d. Almada, near Lisbon, Portugal, 8 July 1583. He departed for the Indies in 1537, returning in 1558, and after his death a very curious relation of his voyages, 'Peregrinacao de Fernam Mendez-Pinto' was published, which has been translated into French, English and other European tongues. Congreve, in his 'Love for Love,' called him "a liar of the first magnitude," and from that time his narrative was considered as a romance: but his good faith and veracity are now generally admitted.

MENDIBURU, mān-dē-boo'roo, **Manuel de,** Peruvian soldier and historian: b. Lima, 1805; d. there, 21 Jan. 1885. While a student he joined the patriot forces in 1821, was captured by the Spanish and held prisoner till the close of the war. Among various civil and military posts afterward held by him were those of Minister of War and Finance. He published a 'Diccionario historico-geografico del Peru,' a work of great value and highly prized by scholars. The first part, in eight volumes, deals with the Inca and colonial periods, and its publication, begun in 1874, was concluded after General Mendiburu's death. The second part was not published.

MENDICANCY, a condition of permanent pauperism, where professional beggars are so numerous that government laws are necessary to remove or control them. A population of mendicants naturally results in a criminal community and all countries containing this element have endeavored to remove this evil by legislation. There were beggars in biblical times. As early as 1351 France was compelled to pass laws against "Lazy persons, truants, and able-bodied beggars." Laws were passed in England on this subject as early as the time of Henry VIII. Mendicity has been found to exist to a greater extent in South European countries than elsewhere, and in Spain and Italy the professional beggar has been one of the greatest evils, the standard of prosperity, morality and intelligence declining as mendicity increased.

According to the census statistics of 1900 there were 91,227 professional beggars in Spain, of whom 51,948 were women. In some of the cities beggars are licensed to carry on their trade. Seeking alms is recognized as a legiti-

mate business, and the municipality demands a percentage upon the collections. Seville is the only city in the kingdom which forbids begging upon the streets. In some of the other towns beggars are allowed to come out and ply their trade one day in the week, perhaps Friday or Sunday, when the streets swarm with them as they go from house to house, sometimes on horseback, and it is said sometimes in carriages also. In Madrid there is no restriction and no license, and the streets are lined with them.

The United States gathers no figures of beggars as their existence is illegal. If paupers, they are supposed to go to the almshouses. The 1910 census showed 73,645 so cared for, 9,500 in New England, 10,272 in New York, 8,653 in Pennsylvania, 7,400 in Ohio, 5,395 in Illinois, 2,927 in Indiana, 2,641 in Wisconsin, 2,600 in California, etc.

In Mexico, both Indians and native Mexicans to the number of thousands make up the army of professional beggars, and Mexico appears to have no laws to regulate them. In the Mexican cities and at fairs and festivals the mendicants are to be seen in astonishing variety; some maimed, some blind and able-bodied fellows with most artistic "make-ups" of tattered garments and unkempt hair and beards. Some of these stand before one silently with a dumb appealing look in their eyes. Others kneel in the midst of the way and fill the air with their doleful stereotyped appeals for charity. These beggars are humbugs after the manner of their kind the world over.

In the United States, where labor is in greater demand and better paid than abroad, there seems to be no excuse for mendicity, and yet there are many professional beggars here, largely able-bodied foreigners. The laws of Massachusetts, New York and some other States make vagrancy a crime and authorize the commitment of tramps to the workhouse, house of correction and common jail for varying periods. In the Atlantic Coast States the evil is a serious one.

New York City is a beggars' paradise. Between 6,000 and 8,000 professional mendicants make that city their home. Every other city in the United States suffers from the professional beggar, but not to the same extent as New York. The outdoor officer of the Charity Organization Society says that mendicants from all parts of the country flock to New York because the indiscriminate giving there is so common. Cities and States ship their beggar population to New York. About 10 per cent of these beggars are women.

MENDICANT ORDERS. See MONACHISM.

MENDIVE, mān-dē'vā, **Rafael Maria de,** Cuban poet: b. Havana, Cuba, 24 Oct. 1821; d. Matanzas, Cuba, 1886. His first collection of poems (1847), entitled 'Passion-Flowers,' is widely popular. Banished in 1869, he lived alternately in New York and Nassau, writing legends and stories in verse. He was one of the most notable of Spanish-American poets; and many of his verses received English, French and Italian translations.

MENDOCINO. See CAPE MENDOCINO.

MENDOTA, Ill., city of La Salle County, 80 miles west of Chicago, on the Chicago, Milwaukee and Saint Paul, the Illinois Central and the Chicago, Burlington and Quincy railroads. The city contains the Blackstone School, Lincoln School, a public library, agricultural implement works, machine works, water-tank heater works, etc. The municipality owns the water-supply system and the sewage system. Pop. 3,806.

MENDOTA LAKE. See FOUR LAKES.

MENDOZA, měn-dō'thā, **Antonio de,** Spanish administrator: b. about 1485; d. Lima, Peru, 21 July 1552. In 1535 he was appointed by the Emperor Charles V, with whom he was in great personal favor, viceroy of New Spain (Mexico), being the first of 64 viceroys, with the longest administration and that which shows the best record in the history of that provincial government. He made many reforms, especially in relieving the oppressed natives; developed agriculture and mining; established the first Mexican mint; founded the first college; and introduced the first printing press. In 1551 he became viceroy of Peru, where he caused to be prepared a code of laws that has been the basis of the colonial and, to a large extent, of the present legal system of the republic. It was under Mendoza's administration in Mexico that Francisco Vasquez de Coronado (q.v.) undertook his famous exploring expedition.

MENDOZA, Diego Hurtado, dē-ā'go hoortā'do, Spanish author and statesman, great-grandson of the Marques de Santillana (q.v.): b. Granada, 1503; d. Madrid, 15 April 1575. He was educated, as a younger son, for the Church, but, after studying Arabic at Granada and the humanities at Salamanca, entered the army and in 1525 fought at Pavia. He acted as Charles V's Ambassador to England in 1537, to Venice in 1538, to the Council of Trent in 1545 and to the Papal See in 1547, when he became governor of Siena. With Philip II he quarreled and in 1564 was interned in Granada, only returning to court in 1574, soon before his death. To his stay in Italy was due his influence in making the Spanish lyric thoroughly Italianate; and from Italy he brought an unusual knowledge of the classics as well as a fine collection of Greek manuscripts. Mendoza also perfected the Spanish poetic epistle. The famous romance, 'Lazarillo de Tormes,' has been ascribed to him. But his greatest work is his history of the Moorish insurrection, 'Guerra de Granada,' a model of historical impartiality and on a theme for which knowledge of Arabic peculiarly fitted him. So impartial was this work that it was not published complete for many years, and even now a good edition is a desideratum. Consult the biography in German by Fesenmair (1882).

MENDOZA, Pedro de, Spanish explorer in America, founder of Buenos Aires: b. Guadix, Granada, about 1487; d. at sea, 1537. He was a favorite of Charles V; fought bravely in Italy; and in April 1535 left Spain with 12 ships and 800 men, sailed up the Plata River and founded the city then called "Nuestra Señora de Buenos Ayres." His further movements were unfortunate; Indians and disease attacked his men, three-fourths of whom, including his own brother, were lost. The natives captured and burned the city, and Mendoza, rescued none too soon by his brother, who came with reinforcements, set sail for

home. But his health and reason were undermined and he died on board ship.

MENDOZA, Argentina, a province in the western part, on the eastern slope of the Andes Mountains; area, 56,502 square miles. Mount Aconcagua, 22,427 feet, is on the northwestern boundary. The western part of the province is mountainous, the eastern part pampa land and fertile where watered by the streams or by irrigation, but the climate is hot and dry. There are four important rivers, the Mendoza, Atuel, Diamante and Tunuyan. The Transandean Railway from Valparaiso to Buenos Aires divides the territory. There is also a railway to San Juan and San Carlos, and a southern line from San Rafael east. It is rich in minerals, especially silver and copper. Coal and petroleum abound. Grapes grow luxuriantly and a large quantity of wine is shipped to the other provinces. Cattle, hides and wool are the chief exports. Wheat and corn are increasing in importance. Pop. 277,535.
