**MUSCOVITE**, or **COMMON MICA**, a native silicate of aluminum, potassium and hydrogen, occurring in crystals that belong to the monoclinic system, though usually hexagonal or rhombic in general form, and distinguished by the facility with which it may be split into thin laminae. Muscovite also occurs in massive forms and in scaly aggregates. It occurs in various colors, and has a lustre that is vitreous or pearly. It is transparent or translucent, with a hardness of from 2 to 3, and a specific gravity of from 2.8 to 3. It is a very common mineral and is an essential constituent of granite, gneiss and numerous other rocks. The transparent varieties, when obtainable in considerable size, are used for the manufacture of gas-burners chimneys, for covering the windows of stoves and the "peep-holes" of furnaces, and for other purposes where transparency must be combined with infusibility and with a considerable power of resisting the prolonged action of heat. Consid-

erable quantities of it are mined in Bengal and in Switzerland, and fine deposits occur in many parts of the United States. Perfectly transparent plates a yard in diameter are sometimes found at Grafton, N. H., and similar specimens also occur in the western part of North Carolina. Pulverized muscovite is employed in the preparation of certain kinds of paint and in the manufacture of insulating material for use about electric machinery. Muscovite is not affected by acids, but decomposes upon being fused with the alkaline carbonates. The name "muscovite" is derived from the older popular name "muscovy-glass," which is supposed to refer to the fact that the Russians used it for window-panes. See **MICA**.

**MUSCOVY DUCK**, or **MUSK-DUCK**. See **DUCK**.

**MUSCULAR SYSTEM**, Development of. Two main forms of muscle-tissue (see **MUSCLES**) exist in the human body, the striated muscle-tissue, which makes up the muscles of the bony framework of the body, and which responds to willed or wished impulses passing through the brain structures, and also to vegetative stimuli of the unstriated muscle-tissue, which chiefly responds to automatic stimuli of unconscious nature by means of the vegetative or sympathetic nervous system. Some control of vegetative functions may be exercised by conscious processes. (See **NERVOUS SYSTEM**). The heart-muscle is regarded as an intermediate form, resembling striated muscle-tissue, but in its development more nearly allied to the more primitive unstriated muscle-tissue. Non-striated muscle-tissue is formed by a direct transition of certain cells in the middle germinal layers (see **EMBRYOLOGY**) or mesenchyme. At first these muscle-fibres are irregularly distributed, but later they are collected into small bundles or into layers, and become associated with the individual organs with which they functionate. Striped muscular tissue develops from the same layer, but the details of development, as is the case in the histogenesis of the heart-muscle, are extremely complicated. The cells at first develop a mesh-like structure or reticulum. This reticulum develops small discs, which later become small columns of muscular tissue. The columns at first develop at the periphery of the cell, and gradually fill in around the nucleus, which in the heart-muscle lies in the centre of the cell, whereas in the muscles of the skeleton the nucleus is pushed to one side, or disappears, new nuclei appearing just beneath the sarcolemma-sheath. The skeletal muscles develop in regular order from the different segments (somites) of the mesoderm. In the early stages the distribution is very symmetrical, but later it becomes extremely uniform by reason of the irregular welding of different segments of the bony skeleton. There remains, however, a regular association of the muscular myotomes and their embryonic nerve supply, and the homologies of structure may be traced by the nerve-supply, although the muscles themselves may have shifted from their original position. This is a question of highly technical nature, but has many practical bearings in modern medicine. Thus the great broad muscle of the back, the *latissimus dorsi*, which arises from the seventh and eighth cervical segments, but later migrates

and is fastened all the way down the spine as far as the crest of the hip-bone, is supplied by a nerve which also develops from the seventh and eighth cervical nerves. The development history of each skeletal muscle can thus be traced by means of its nerve-supply. The whole process is one of extreme intricacy and should be studied in special monographs.

**Evolution of Muscular Tissue.**—As in the development of the muscular system in man there has been a gradual evolution of the plan of muscular arrangement, so in the animal series there has been a gradual development of a muscular system from the very simplest types of contractile protoplasm. Even in plants definite movements may occur which may be very slow or very rapid. Yet no muscular tissue proper has ever been found in plants. Many of the lowest plants, the *Algae*, are motile and are provided with vibratory cilia, but these minute hairs, although capable of rapid motion, cannot be regarded as muscular organs. In the contracting protoplasm of the lowest animals, the rhizopods, although movements take place, there is no muscle-tissue. Nor is muscle-tissue found in the next higher group, the *Infusoria*, although very actively moving forms are known, for example, the familiar microscopic animal *Paramecium*. The bell-animalcules, *Vorticella*, *Stentor*, etc., have stalks that coil and uncoil with great rapidity, but they contain no muscle-tissue proper. They do, however, contain what are termed myronemes, and spironemes, which are longitudinally striated and have as many functionate as muscular organs. In another genus of infusorians (*Bursaria*) there is a contractile band about the body of the animal. It has been regarded as a true sphincter muscle. It has not the structure of the developed unstriped muscle-cell. In the closely allied sponges (*Porifera*) certain elongated cells with rod-shaped nuclei are found, and may be considered the ancestral forms of the unstriped muscle-cell, although it is not until the group of the *Cœlenterates* is reached that true unstriped muscular tissue is present in its more advanced forms. In many of the hydroids a form of external neuromuscular cell is found. This is a type of cell half nerve, half muscle, but not resembling true muscular tissue. In the jelly-fishes of this order both neuromuscular tissue and true unstriped muscle-fibres are found. In the sea-anemones unstriped muscle is abundant. It is mostly developed, however, from the external layers of the body, and thus embryologically is not comparable to the muscle-tissue that in practically all the animals higher than the *cœlenterates* is formed in the middle germinal layers of the developing animal. In one of the higher *cœlenterates*, the common water-hydra, some muscle-cells are found imbedded in the deeper tissues of the body, thus foreshadowing the higher type of muscular tissue. In the next great family of animals, the *Echinodermata*, to which the sea-urchins, star-fishes, and sea-cucumbers belong, unstriped muscular tissue is common, but no evidence of striated or striped muscle is yet present. In the worms the muscular tissue is unstriped and abundant. In the mollusks, the foot of the soft clam, the muscle of the oyster, are made up of unstriped muscle fibres. A higher order, the *Arthropods* or *Crustaceans*, including the

crabs, lobsters, etc., contains a well-developed muscular system, which is made up of striated muscle, practically the first appearance of this type of muscle in the animal kingdom. In these animals, moreover, there is a type of development of the muscles that anticipates the regular segmented type, metameres or myomeres, of higher animals.

From the crustaceans onward both types of muscle-tissue are found. In the low vertebrates, *selachians* and *fishes*, typical heart-muscle cells, striated and with central-lying nuclei, are found. Consult McMurrich, 'Development of the Human Body,' with full bibliography (1902); Parker, 'The Elementary Nervous System' (1919); Bayliss, 'General Physiology.' See ANATOMY.

SMITH ELY JELLIFFE, M.D.,  
Editor 'Journal of Nervous and Medical Disease.'

**MUSCULUS, Wolfgang**, German scholar and Protestant theologian: b. Dieuze, Lorraine, 1497; d. Bern, 30 Aug. 1563. He entered the Benedictine Abbey of Lutzelnstein and was ordained priest. He was converted to the Protestant faith by Luther's writings, withdrew from his order in 1527 and in 1531 became pastor of a church at Augsburg. In 1536 he assisted at the Wittenberg assembly, and in 1540 was appointed by the Augsburg senatus a delegate to the ecclesiastical conferences at Worms and Ratisbon. He subsequently became professor of theology at Bern. Among his works are 'Commentarii in Genesim' (1557); and an edition of Polybius.

**MUSES**, goddesses of the liberal arts and sciences; originally nymphs of inspiring fountains. Different accounts are given of their origin. There is also a great difference in their names and attributes. The most celebrated are the daughters of Zeus and Mnemosyne. According to Homer they lived upon Olympus. At first three Muses only were known: Meletê (meditation), Mnêmê (memory, for the immortalizing of great deeds), and Aoidê (song, for the accompaniment of story). Four Muses are sometimes mentioned as the daughters of Zeus and Plusia, namely, Meletê, Aoidê, Archê and Thelxinoê. At other times they are said to have been seven, at others eight in number. Nine Muses are also enumerated as the daughters of Pierus, king of Emathia; but these are usually held to be different from the nine Muses who ultimately came to be generally recognized in Greece; and although the genuine Muses are sometimes called Pieridæ, they are said to have derived the epithet not from Pierus but the district of Pieria. The names finally recognized as those of the Muses were Clio, Euterpe, Thalia, Melpomene, Terpsichore, Erato, Polyhymnia, Urania and Calliope. Among the adventures of the Muses their three contests with the Sirens, with the daughters of Pierus and with the bard Thamyris, in all of which they were victorious, are particularly famous. The customary occupation of the Muses was singing and dancing. Separate attributes were not till a comparatively late period assigned to the individual Muses. Calliope became the Muse of epic poetry. She was the most distinguished among the Muses, the protectress of kings, whom she endowed with eloquence and song.

Clio became the Muse of history; Euterpe of lyric poetry and music, particularly of wind-instruments; Thalia of comedy; Melpomene of tragedy; Urania of astronomy; Erato of lyric and erotic poetry; Polyhymnia of the sublime hymn; and Terpsichore of the dance. They are commonly represented as beautiful virgins, adorned with wreaths of palm leaves, laurel, roses or the feathers of the Sirens. They dance in a circle, together with Apollo, who in later times was styled Musagētēs, or leader of the Muses. Their worship extended from Greece to Italy. In Rome they had a separate temple, and a grove was sacred to them. The swan, the nightingale and the grasshopper were also sacred to them.

**MUSEUM OF ART, Metropolitan.** See ART, METROPOLITAN MUSEUM OF.

**MUSEUMS** are institutions for the preservation, study and display of natural objects, or of those made by man, while as a sequence of study comes the publication of information thus derived. The word museum originally signified merely a grove or other locality sacred to the Muses, but with the development of the museum the word has undergone a parallel course of evolution until it has come to have its present meaning. The next use of the term was for an institution devoted to the study of philosophy, literature and art, but not including the preservation and display of objects; in this sense it was applied to the famous Museum of Ptolemy Soter at Alexandria. While this was in the nature of a university, there is some reason to believe that collections of plants and animals were attached to the institution so that it may be regarded as the prototype of the more modern botanical and zoological garden. In modern sense public museums are of comparatively recent establishment, and as educational factors, of later date than art galleries and libraries, although like these having their beginnings in the gratification of the desires of private individuals. The origin of the art museum is to be found in the collections of statuary, paintings and other works of art, made by kings, nobles and men of wealth; the germs of the modern museum of natural history were the cabinets of miscellaneous curiosities brought together by students, merchants, or men of leisure. Many of these collections subsequently developed into important public museums, the most striking example, and the one most frequently cited, being the British Museum (q.v.), which was the final outgrowth of the cabinet and library of Sir Hans Sloane. In the United States the Museum of Comparative Zoology, at Cambridge, Mass., has grown from the collection made by Louis Agassiz (q.v.) for his own use, until it has become one of the most important museums in this country. Even the United States National Museum, if not the direct outgrowth of a private collection, was indirectly due to the labors of individuals, for its nucleus is to be found in the specimens gathered by the National Institution (later the National Institute), a body organized with the avowed purpose of directing the bequest of James Smithson (q.v.) and engaging in pursuits in accordance with its terms.

The lineal successors of the cabinets of private collectors were the museums of scientific societies where specimens were gathered for

purposes of study and display, and while these still exist they have largely given place to museums supported by the State or municipality. Private collections are more numerous than ever, but these are rarely formed with any intention of displaying their contents to the public, although there are some notable exceptions, as in the museum of the Hon. Walter Rothschild at Tring. Ultimately, however, a large proportion of these private collections find their way to public museums through the liberality of their owners, or by bequest.

Another step toward the establishment of public museums was the formation of collections of objects of more or less popular interest and their exhibition to the public on the payment of a fee. Notable examples of these abroad were those of Sir Ashton Lever and Charles Bullock, which flourished in London during the latter portion of the 18th century and first part of the 19th. It is interesting to note that one of the earliest cabinets formed in the United States, that of Mr. Arnold, of Norwalk, Conn., was sold to Sir Ashton Lever, while later on the "Leverian Museum" was sold and its specimens scattered among the great museums of Europe.

**Early American Museums.**—In this country the principal recent museums of this character were the Boston Museum and Barnum's Museum in New York, in both of which the idea of amusement predominated, the first named being a rather incongruous introduction to a theatre. Both, however, contained some really valuable specimens of natural history and Barnum was among the first to exhibit living fishes. Of a very much earlier date and more scientific in their aims were the museums conducted by Charles Willson Peale and his son, Rembrandt Peale, in Philadelphia, established in 1785 as the Philadelphia Museum, and from 1822 to 1828 installed in Independence Hall. This museum is of particular interest from the fact that many of Peale's ideas as to the arrangement and educational value of museum collections were in advance of his time. In his use of painted backgrounds and the addition of nests and eggs to the exhibits of mounted birds we have the germ of the elaborate habitat groups shown in modern museums.

The modern "dime museum" with its exhibit of "freaks" is a survival of this phase of museum development, and the catalogues of some celebrated old collections will show that they comprised many very similar objects, as well as those of real value from a naturalist's standpoint.

**Government Museums.**—The final step in the establishment of public museums, the transfer of collections from private to governmental ownership, may be said to date from the founding of the British Museum in 1753. At first admission was by ticket and limited to 30 persons per day; in 1810 the museum was made accessible to the public for three days a week, and not until 1879 was it open to the public daily. The United States National Museum was only formally created in 1876, although so early as 1846 the government possessed collections which were in the custody of the Smithsonian Institution. Exploration has done so much for museums that it may almost be included among the causes that have led to their

formation. The colonization of America brought to Europe many examples of new plants and animals, while the Dutch East India voyages did the same for southern Asia, and it is surprising to see how large a number of species from these regions was described by Linnaeus and others so early as 1760.

In more recent times the Wilkes Exploring Expedition of 1838-42 and the government surveys for a route for the Pacific Railroad had a very decided influence on the origin and growth of the United States National Museum, and there is scarcely an institution that has not been benefited in a similar way. It is but a step from expeditions in which scientific results were subordinate to practical ends to those undertaken solely for scientific purposes, and the systematic exploration of our Western Territories for fossils by such institutions as the American Museum of Natural History and the Carnegie Museum, and by Yale, Princeton and other universities, has become a matter of almost daily news. Another most important factor in the development of museums has been national or international exhibitions. These have had a direct effect in bringing together collections illustrative of natural or industrial resources, and a more indirect influence in stimulating methods of arranging and displaying such material. The London Exhibition of 1851 led to the establishment of the South Kensington (now Victoria and Albert) Museum, and the ethnological museum of the Trocadero was one of the outcomes of the Paris Exposition of 1889. Our own Centennial Exhibition was the direct cause of the erection of a building for the United States National Museum and of the founding of the Pennsylvania Museum of Art, while from the Chicago Exposition came the Field Columbian Museum, the Chicago Art Institute and the Philadelphia Commercial Museum. Other causes play minor parts in influencing the lines of growth of museums both small and great. Thus the extensive colonial possessions of Great Britain have been largely instrumental in making the vertebrate collections of the British Museum, the greatest in the world, while the museum at Leyden is not far behind owing to the former extensive commerce of Holland. In the United States the large deposits of fossil vertebrates in the West, their general accessibility, the imposing appearance of many of the specimens and the important results to be derived from their study have given a great impetus to the formation of palaeontological collections, while special attention has been given to the preparation and exhibition of this class of material. The display of fossil vertebrates in the American Museum of Natural History is unrivaled, and other notable exhibits are to be found in the Museum of Yale University, and in the Carnegie, Field and United States National museums. The National Gallery of Art and the Freer Collection, installed in a building of its own, both forming parts of the United States National Museum, were respectively the gifts of William T. Evans and Charles L. Freer.

**Popular Display of Specimens.**—What may be termed the popularizing of museums has but recently taken place, and while the display of objects has always been regarded as one of the functions of museums, it is a branch which

has received particular attention only during the past 30 years. Originally the larger part of the specimens of birds and mammals were placed on exhibition, but it became evident that this meant the injury or even loss of many, and that the public cared little for large monotonous series of stuffed animals. At present the number of objects on exhibition is relatively small compared with those in the reserve or study series, and there is a very general effort to display at least a part of the specimens amid their natural surroundings. The influence of the private collector has probably had much to do in bringing about this change, and the British Museum, under the administration of Dr. Günther, was the first of the great museums to introduce groups of birds, with their natural surroundings, as a part of its exhibition series. These were largely added to under the directorship of Sir William Flower, who took great interest in the problem of rendering museums attractive and instructive, while, following this example, the American Museum of Natural History took the lead in this direction in the United States. To the museum of Leyden, Holland, however, belongs the credit of having before this departed from the tradition that mammals must be stuffed in stiff and formal attitudes and caused some to be mounted that bore some resemblance of life. Change in the character of the exhibits has been accompanied by equal changes in the matter of labeling and to some extent in the publications issued by museums, so that from being merely storehouses of material for the benefit of a few they have become great schools of instruction for the many.

**School Work of Museums.**—In direct line with what may be termed passive educational work by means of carefully arranged and well-labeled exhibits is the active participation of museums in the work of public schools of all grades by means of circulating loan collections, the giving of lectures at museums or sending lecturers to the schools, and the loaning of series of lantern slides to illustrate such subjects as natural history, geography, history or technology, and in this connection motion pictures have been found most helpful.

The initiative in this line seems to have been taken by the Buffalo Academy of Sciences in 1872 and the Davenport Academy of Sciences in 1878, in both cases by means of lectures given at the museum. The Public Museum of Milwaukee appears to have been the first to loan definitely selected material; the American Museum of Natural History, under the administration of Professor Bickmore, the first to give systematic courses of lectures more or less correlated with school work. This latter institution was also the first to establish a department of public education (instruction) for the sole object of co-operating with the public schools.

Following in the lead of these institutions, or acting independently, many other museums have actively engaged in school work, notably the Commercial Museum of Philadelphia, Chicago Academy of Sciences and the Educational Museum of the Saint Louis public schools. This last, the first to be devoted exclusively to school work, though founded by the board of education in 1904 as an outcome of the exposi-

tion of that year, is a museum of distribution rather than of exhibition, its work being the loaning of specimens, charts, models and similar objects to the public schools.

**Classification.**—Museums may be grouped or classified by their contents, or according to the purposes for which they were established. Following the first method Dr. Goode has divided them into museums of art, history, anthropology, natural history, technology and commerce. A museum may be established for any of these great subjects as a whole or for one of the many branches in to which they may be subdivided. Thus a museum of natural history may comprehend both animals and plants, or one of the other of these primary divisions; it may include the animals of a single continent, a single geographical region or be restricted to those of one locality; it may be devoted to some large group, as mammals, birds or insects, to some minor division, as birds of prey, butterflies, etc., and may or may not include fossil species. Technology may be greatly subdivided, and while the favorite and more striking subjects are shipbuilding and railroads, there are also museums of hygiene and textile fabrics, while the United States National Museum contains collections illustrating the development of electrical apparatus. And technology may trespass on art in the matter of ornament, or, like art, be included in a historical collection illustrating the progress of mankind or of one nation.

According to the purposes for which they are founded Dr. Goode distinguishes national museums; local, provincial or city museums; college and school museums; professional or class museums; and museums or cabinets for special research owned by societies or individuals. This scheme of classification is open to the objection that it confuses purpose with ownership or administration, since, for example, national and municipal museums are not merely for the display of objects found within their boundaries, but for those belonging to the nation or city.

College and school museums have for their immediate purpose the formation of collections that shall aid students in understanding various problems connected with science, technology or art, but they are usually extended beyond this and become more or less general in their character. This has been the case with the museums of Harvard and Yale universities and is notably true of many foreign museums, such as that of the Royal University of Prussia, which is the national museum. The professional museum is for the illustration of some special occupation or line of research such as mining, medicine or even psychology, which has a museum at Florence founded by Mantegazza. The largest institution of this kind is the Museum of the Royal College of Surgeons, London, which has developed from the private collection of John Hunter.

The Army Medical Museum, Washington, had its inception during the Civil War as a museum of pathology and military surgery, but its scope has been so extended that it offers a fairly comprehensive history of the progress of medicine and surgery. The library established in connection with this museum has grown to be the first medical library in the world.

**Modern European Museums.**—Europe nat-

urally has the greatest number of governmental museums, the capital of almost every state claiming at least one museum of natural history and an art gallery, and often anthropological and technological collections as well. Paris, with some 30 museums, probably leads in the matter of national collections, while Berlin and Vienna have respectively about 20 and 15 museums. Turkey forms a notable exception to the above statement, for Friedlander's Directory contains no mention of a Turkish museum, although a commercial museum has been established at Constantinople. Great Britain has the largest number of local museums, those devoted to the preservation and display of objects illustrating the natural history and archæology of the immediate vicinity, and, as a whole, these are better administered than those of other countries, great care being devoted to labeling, arranging and otherwise making the collections interesting and instructive to the public.

Europe in general and Germany in particular possess many technological museums devoted to the illustration of such subjects as mining, pottery making, weaving, shipbuilding, machine construction and operation and similar topics. Perhaps the most important of these is the Deutsche Museum of Munich, which among other exhibits has a considerable number of working models of such machines as locomotives, so constructed that a large number of the parts is visible, and may be set in motion by the visitor.

**Modern American Museums.**—There are now nearly 600 museums in the United States, about three-fourths of them attached to colleges or under the supervision of societies, but comparatively few of these are active or important. Nearly half of the whole number are entirely or chiefly devoted to natural history and about 10 per cent to art, though this proportion seems on the increase and the past decade has witnessed the establishment of several important museums of art. A considerable number of museums are general in their character, including both art and natural history.

About 25 per cent of our museums include or are devoted to history, but here again few are active, though there are noteworthy exceptions, such as the Essex Institute of Salem, Mass., and the Historical museums of Chicago and Buffalo, the latter of which makes a specialty of publication.

The United States is strangely poor in technological museums or even in extensive technological collections, though these are steadily on the increase. There is, for example, no museum of naval architecture in this country, the nearest approach to it being the collection of the United States National Museum, in which certain phases of the subject are well represented.

Our oldest existing museum, as well as the first public museum in America, is the Charleston (S. C.) Museum, founded by the Charleston Library Society in 1773, later incorporated in the College of Charleston and recently passing to municipal control, thereby taking on a new lease of life. Next to this is the Peabody Museum of Salem, the successor of the East India Marine Society Museum, founded in 1799; it also includes the natural history collections of the Essex Institute.

The Museum of Comparative Zoology, Harvard University, holds the first place among college museums. It is not confined to zoology, as its name might imply, but covers the entire field of natural history. The mineralogical collection dates back to 1793 and is probably the oldest of its kind in America, while the botanical section includes the Gray Herbarium. The nucleus of the Museum of Comparative Zoology was the private cabinet of Louis Agassiz, which was purchased by subscription for \$12,000 in 1852. In 1858 an allowance was made for the maintenance of the museum and in 1859 the State of Massachusetts assumed an interest in the institution, at the same time appropriating \$100,000 for its increase; \$71,000 was also raised by private subscription. In 1876 the State assigned its rights to Harvard College and since that time the museum has been maintained by the university, although the great increase in its collection was principally due to the liberality of Alexander Agassiz, who expended over \$1,000,000 for that purpose. An important museum of anatomy is attached to the Harvard Medical School. The Museum of Yale University contains the Marsh collection of fossil vertebrates, comprising many types, as well as the largest collection extant of fossil footprints, while brachiopods and sponges are well represented. In other departments are a fine series of modern corals and many rare archaeological specimens. The Museum of Yale University is temporarily in storage and there is no immediate prospect of a new building—nevertheless the collections exist. The Museum of Princeton University possesses large and important collections of fossil mammals from Patagonia and our Western States, a good collection of North American birds and many examples of ancient and modern art. The Museum of Archaeology, University of Pennsylvania, has the best collection of Babylonian antiquities in America and is also particularly strong in America archaeology; also attached to the university is the Wistar Institute of Anatomy. To Amherst College belongs the Appleton Cabinet of fossil footprints, containing the specimens described by Prof. E. Hitchcock, and the University of Kansas is rich in Cretaceous vertebrates and large North American mammals. On the Pacific Coast Stanford University and the University of California both have museums; at present these are largely working collections, but both have art collections apart from these.

The most important as well as oldest museums under the control of scientific societies are those of the Academy of Natural Sciences, Philadelphia, and the Boston Society of Natural History; the first dating from 1812, the latter from 1831, although it was the successor of the Linnæan Society, founded in 1814. Each contains large collections of birds comprising many types of species described by our earlier ornithologists, such as Wilson, Bonaparte, Cassin and Lawrence. The academy has the largest collection of mollusks in America, and one of the largest in the world, including many types of Tryon, Say and Pilsbry. These two institutions may be looked upon as the predecessors of public, scientifically arranged museums in the United States, the majority of our museums being of very recent origin.

There are few museums in the United States

directly owned or administered exclusively by municipalities, as are public libraries, almost the only one being the Public Museum of the city of Milwaukee, but there are many to which the city has contributed or does contribute, either by grants of land, erection of buildings or annual appropriations for financial support, and there is a growing tendency toward this co-operation between city and citizens as the educational value and practical importance of museums are recognized. About 15 per cent of our museums belong in this class, including many of the largest and most active, the chief among them being the American Museum of Natural History.

There is, however, a large and constantly growing number of State museums, that of New York standing first, while those of Ohio, Illinois and Pennsylvania are most important. The scope of these State institutions is somewhat general, comprising natural history and history, this latter being usually treated in a somewhat desultory way.

In the category of museums supported by endowment or by private funds and municipal aid are to be found all the art museums in the United States, not one having been established by the national government or that of any State. Local museums are practically lacking in the United States; for most of the smaller museums, even, make the attempt to cover the same ground as the larger institutions when they could achieve much better results by confining their attention to the immediate vicinity. In conclusion it may be said that while public museums are not so numerous in the United States as might be expected from the size, resources and wealth of the country, the last 25 years has not only witnessed a great increase in their number but in the growth and educational efficiency of those already established.

**Bibliography.**—For detailed information as to museums and their administration, cases, labels and the arrangement of exhibits, consult 'Museums Association, Report of Proceedings, etc.' (London 1890 to 1900); since that date 'Journal of the Museums Association' and 'Proceedings of the American Association of Museums' from 1907; the museums of the United States are listed in 'A Directory of American Museums,' published by the Buffalo Society of Natural History, 1910; those of Great Britain and her colonies in 'Directory of Museums in Great Britain and Ireland' London 1911). For the history of the Smithsonian Institution, United States National Museum, classification and administration of museums, consult 'A Memorial of George Brown Goode' (Report of the United States National Museum for 1897, Part 2, Washington, D. C.).

A work in three volumes on 'Museums, their History and their Use, with a Bibliography and List of Museums in the United Kingdom,' by Dr. D. Murray, has been published by James Maclehose & Sons, Glasgow.

The volume of museum literature in the shape of reports, bulletins, general guides and special leaflets is to-day very considerable and many museums issue regular periodicals for the information of their sustaining members and the public.

FREDERIC A. LUCAS,  
*Director, American Museum of Natural History.*

**MUSGRAVE, William Everett**, American physician: b. Farmington, Tenn., 12 Sept. 1869. He was graduated (1901) at George Washington University and became (1902-09) pathologist of the Bureau of Science at Manila, P. I., then chief of clinics and later director of the Philippine General Hospital and dean of the College of Surgery, University of the Philippines. He was (1903-04) president of the Manila Medical Society and (1905-06) president of the Philippine Islands Medical Association. He is editor of the *Bulletin of the Manila Medical Society*.

**MUSH**, moosh, Asiatic Turkey, the chief town of the Mush sanjak, vilayet of Bitlis, 79 miles south of Erzerum, near the Kara-su, the eastern affluent of the Euphrates. It is built on a plateau 4,800 feet above sea-level, rising on the south side of a mountain-girt and fertile plain. It is an ill-built, unclean town, peopled by Turks and Armenian Christians. It has Gregorian and Roman Catholic bishops and an American Protestant mission and schools. A thriving trade is carried on in the tobacco, grape vine, wheat and other agricultural products of the adjacent plain. Mush is mentioned by Xenophon and Moses of Khorene, and came into prominence in 1894, owing to the massacre of Armenians at Sasun, in the neighborhood. Pop. about 20,000.

**MUSHROOM**, a popular term loosely applied to many species of higher fungi, especially such as have a cap (pileus) upon an erect stalk. Primarily, the mushroom is *Agaricus campestris* (see FUNGI), the only species cultivated upon a commercial scale. Though more than 700 species of mushrooms have been proved edible within the last half century, and though many others will doubtless be proved harmless, the novice should be cautious in trying new species. Each unfamiliar kind should be subjected to rigid examination first by smell, and malodorous ones discarded; then by taste, a small piece being nibbled but not swallowed. If no ill results follow in the course of several hours, a small piece may be swallowed. If no evil effects follow, but the flavor raw is unpleasant, cooked morsels may be cautiously tried, and results noted. Each individual must decide what species agree with him, because some systems will not endure kinds innocuous to others. Nervous fear of fancied bad symptoms must be controlled, or real illness may be induced by the imagination.

Several species are popularly reputed virulent which do not produce any marked effect upon the health for several hours, and which are widely feared as deadly. Since the two commonest of these (*Amanita muscaria* and *A. phalloides*) are often mistaken for the common mushroom, the novice should never gather any toadstools in the woods under the impression that they are the proper mushroom, which grows in pastures, lawns, etc., and not in shady places. Further, all species with yellow or white gills should be avoided until known to be edible. The common mushroom has pink gills when young, and purplish-brown or black gills when mature.

Several of the thousand species of the genus *Agaricus* are valued for food, but the common mushroom (*A. campestris*) is the most important. It is occasionally found in open and

grassy glades; never in the deep forest, but most frequently in old pastures and lawns, especially in autumn, but often when conditions are favorable during the summer. It grows about three inches tall, has a fleshy cap about three inches broad, generally white, sometimes reddish or brownish above and pink beneath. Its stem does not rise from a cup-like base as does that of *Amanita phalloides*. It is generally gathered in the "button" stage, that is, before the cap has expanded. Among its near relatives the best known is probably the horse mushroom (*A. arvensis*) which is much larger, whiter above, lighter below, the gills being white when young, but otherwise resembling the common species.

Success in mushroom growing seems to depend more upon the individual grower than upon the method, since two growers may each succeed equally with very different methods. The essentials seem to be decaying organic matter in abundance, uniform but not excessive moisture and equable rather low temperature. The most popular places for cultivating this plant are caves, abandoned mines and quarries, cellars, pits and similar places, where the temperature is naturally suitable or may be artificially controlled. The beds are usually made by spreading a layer of well-rotted manure and loam over a firmly packed deep layer of fresh horse-manure. After the violent heat of fermentation has passed and the temperature has fallen to or below 90° F., the mushroom "spawn" is planted. This spawn consists of the mycelium of the fungus in bricks (English) or flakes (French) made of equal parts of horse and cow manure and loam; it is a commercial article and its manufacture constitutes a business distinct from mushroom growing. After sowing, the bed is kept moist by mulching with straw or covering with mats which are replaced in about 10 days with a layer of loam about two inches deep. In America the mushroom is rarely cultivated out of doors; in Europe it often is, the temperature and moisture there being more favorable. It is frequently found growing wild in sufficient quantities to make commercial shipments profitable.

Besides the species already mentioned, several common American species are among the most desirable edible fungi. *Coprinus comatus*, the horse-tail or shaggy-mane mushroom, grows sometimes six inches tall, has a nearly cylindrical white shaggy cap with often black scales and white gills when young, but these turn black and liquefy with age. It is commonly found in lawns, waste places, rubbish heaps, etc., from midsummer until the coming of frost, especially after showers. *C. atramentarius*, the ink-cap, resembles the preceding in general appearance and places of growth. *C. micaceus*, the glistening coprinus, is a brownish species smaller than the preceding. It grows upon decaying wood. *Lepiota procera*, the parasol mushroom, and *L. naucina*, the smooth lepiota, grow in lawns, pastures and occasionally in gardens. They have white spores and a ring on the stems, to which the gills are usually not attached. *Cantharellus cibarius*, the chanterelle, grows about three inches tall, measures nearly as much across the cap, has an irregular top-shaped yellow or orange cap and has much-branched gills. It grows upon the ground in woods. *Maras-*

*mus oreades*, the fairy ring or champignon, is a small cream-colored or reddish species, which tends to grow in circles upon lawns and pastures. It is rather tough and solid, but is valued for its nutty flavor and its drying qualities. Its gills are alternately long and short. *Lactarius deliciosus* has an orange cap, an orange milky juice and with age shows greenish tints where bruised. *Boletus edulis*, the edible pore-mushroom, has a yellowish or brownish cap, with convex tubes which change with age from white to greenish yellow. It is commonest in chestnut, pine and oak woods during autumn. *Fistulina hepatica*, the liver-fungus, grows upon decaying wood, is stemless and of irregular form, red, succulent and fibrous. It is often called beefsteak-fungus on account of its edible qualities. *Morchella esculenta* and several relatives, popularly known as morels, are of various colors, but usually grayish or yellowish. The top somewhat resembles honeycomb, which makes them easily recognized. They delight in potash and are common where the land has been burned over or wood-ashes have been thrown; also in orchards and woods. *Lycoperdon giganteum* and other species of puff-balls, which are common in pastures, are considered among the best edible fungi if used while still white. They are more or less globular in form. The species mentioned sometimes attains a diameter of several feet.

Mushrooms are often said to be equal to meat in nutritive qualities, but these statements are not warranted by analysis, which show that fresh mushrooms contain about 88 per cent of water, 3.5 per cent of protein, 6.0 per cent of nitrogen-free extract, and generally less than one per cent each of fat, fibre and ash. The protein content is therefore less than one-fifth that of porterhouse steak, less than one-third that of dressed codfish and but little more than one-fourth that of hens' eggs. Indeed, according to analysis, they seem to be inferior to most vegetables. Their chief value is therefore in their flavors, which vary with individual species as much as among higher plants. They are eaten by various animals (see FUNGUS-EATERS).

**MUSIC** is the science of combining tones in melodic, rhythmic and harmonic order, so as to excite the emotions or appeal to the intellect. For untold ages it was purely emotional. With its development as a science, in the Middle Ages, it appealed almost entirely to the intellect, this species of music culminating shortly before 1600. At the present time that music is considered best which appeals both to mind and emotion. It is the combination and equipoise of these two factors which causes Beethoven to be considered one of the chief

masters, and the music of Wagner, with all its intensity of passion, to appeal also to the mental processes by its peculiar treatment of *Leitmotive*.

Spencer and Huxley suggested imitations of nature (bird-songs, etc.) as a possible commencement of emotional music. Palæolithic man had his music, even instrumental music, as may be deduced from a primitive flute of reindeer's horn, found in a cave which was inhabited during the Stone Age. Many prehistoric horns of metal have been unearthed among the relics of the Bronze Age.

From two or three notes the scale grew into various intricate and widely differing forms. The five-toned (pentatonic) scale is the most primitive now in use among civilized nations. It was chiefly employed by the Chinese, even 4,000 years ago, but is also used in some hymns ('There is a Happy Land') and in many Scottish songs, such as 'Ye Banks and Braes,' or 'Auld Lang Syne.'

About 600 B.C. Pythagoras (see PYTHAGORAS) established the proportions of the intervals, and Music, always an artificial and a human product, was given a natural foundation. (See MODE; INTERVAL). It may be doubted whether harmony existed at all in the ancient world. It is absolutely certain that the Chinese, who were well advanced in the art in ancient days, and who formulated many acoustical principles before the time of Pythagoras, used melody without supporting harmonies. It is possible that the Greeks had a crude accompaniment of drone bass to some of their songs. The Scriptural music, loud ecstatic, and of an improvisational character, is a blind alley and does not lead to modern development of any kind. The music of both the old and new Testaments was orally transmitted and is not to be traced. Ancient Rome copied the Greek music but without fully understanding it. Rome conquered Greece but could not assimilate its culture, and in the first centuries of our era the musical art was retrogressing. The influence of the Christian Church stayed the decadence and gave a new direction to the art. Ambrose (about 340-398) and Gregory (540-604), stemmed the tide of decay and rescued some part of the ancient systems or modes. The power of music in the early Christian ritual is not only shown by the praises of the Fathers of the Church, but by the fact that the Emperor Julian in 361 endeavored to found a musical conservatory in Alexandria to educate boys to sing in the pagan rites as his adversaries were singing in the Christian churches. The Roman influence now extended the Gregorian chants all over the civilized world. Boethius (475-524) had written a treatise on the Roman system which became the misty textbook of the earliest days (see BOETHIUS). In 790 Pope Adrian sent singing teachers into France with missals illustrating the Gregorian modes. An antiphonarium was left at Saint Gallen which still exists and proves the earnestness of the musical mission. The music of this early period, however, is still very vague to us, since no practical notation existed. The musicians of this epoch sometimes employed alphabetical letters as notes (which could be deciphered) but more frequently a system of lines, curves, dots and dashes, called the

*Neumes*, which were only to aid the memory of one who had learned the song orally, but meant nothing definite to anyone who had not thus studied it.

A step forward was made by a monk named Hucbald, in Saint Amands, who improved the notation somewhat by using a staff (it is very doubtful if he invented it) and by writing certain rules regarding the union of different parts in music simultaneously. The reform seems, at first, to be a very great one, meaning nothing less than the birth of part-music, the evolution of a new science; but, when one knows that these parts were simply consecutive fifths or fourths, or other equally harsh progressions, one can only marvel that the men of the Middle Ages bore it so patiently. The new system was called the *Organum*, since it was often played upon the great wind instrument which had disappeared when Rome went down, and reappeared in Europe in the reigns of King Pepin and the Emperor Charlemagne.

A much greater reformer than Hucbald came upon the scene about 1000 A.D. Guido, an excellent monk of Arezzo, founded the system of sight-reading, by establishing a vocal scale on the syllables still in use. He noticed that the hymn to Saint John (patron saint of singers) rose step by step from C to the following words:

- (C) UT queant laxis,
  - (D) REsonare fibris,
  - (E) MIRA gestorum,
  - (F) FAMuli tuorum.
  - (G) SOLve polluti
  - (A) LABii reatum.
- Sancte Johannes

causing his choir-boys to memorize the syllables from the melody of their chief hymn, he soon taught them intervals by this simple means, and his treatise "De ignoto cantu" was the first practical mode of singing "an unknown song" (that is, a song unknown before to the singer), in short, the birth of sight-singing. It must be confessed, however, that Guido's claims to this tremendous discovery have been contested, and that every point connected with the rise of the science of music is more or less wrapped in vagueness and doubt.

We come to somewhat firmer ground a little later when notes of definite length are introduced. Franco of Cologne may be credited with the first clear treatise upon such a system (he calls it "Ars Cantus Mensurabilis") in the first half of the 13th century.

And now there came a recession from the evil-sounding fourths and fifths that had existed in the 10th century, and from some equally harsh progressions that were countenanced long after this. The troubadours in France and the minnesingers in Germany had brought forth secular music that broke many of the old rules yet sounded infinitely better than the more "regular" music. The musical canons of the ecclesiastics began to broaden. Marchettus of Padua and Jean de Muris, both in the middle of the 14th century, began to urge new progressions and the consecutive fifths were tabooed, only to reappear copiously in the most modern works of the 20th century.

It will be impossible in an outline sketch to give all the attempts that were made in evolving the new science, from the 11th to the 14th cen-

turies. Suffice it to say that out of these efforts there grew the first real school of composition, and instead of its having birth in Rome, it was born in the Netherlands and in Flanders. Yet the Flemish school at once gave its services to the Church, and many of its greatest representatives in its earliest stages went to Rome as servants of the Catholic cause. The Flemish school may be called the true beginning of the science of music, since now, for the first time, a race of composers existed who worked according to definite rules in the production of intricate counterpoint, and were able to impart their knowledge to their pupils. William Dufay was the first of this line of composers. His epoch is mistakenly given in many histories as falling in the 14th century, but the researches of F. X. Haberl have proved that he was born shortly after 1400. He died 27 Nov. 1474. The chief of his contemporaries were Hobrecht, Eloy, Brasart and Binchois, who have, however, left little more than their names, and even of Dufay very little music is extant.

The first great teacher of the school was John Ockeghem or Ockenheim (about 1430-1513), and among his pupils was the first great contrapuntist of that time, practically the first great composer that the world had ever possessed,—Josquin Des Pres,—whose music Martin Luther delighted in. Des Pres was born about 1440 and died either in 1515 or 1521. Other pupils of Ockeghem were De la Rue, Brumel and Agricola. All the music of the foregoing composers was purely intellectual, but with Des Pres we find the first glimmerings of emotion mingled with the musical mathematics, and he taught that dissonances could be used to express passionate feeling.

The greatest figure in the Flemish school, however, is Orlando Di Lasso (1520-94), who composed works which are beautiful even to modern ears. The Flemish school ended with this culmination. It had existed about two centuries and in that time it had brought forth the science of composition and some 300 composers.

There was, however, another country which helped greatly in this result. The first musical dictionary ever written, by John Tinctor (1476), gives the credit of the invention of counterpoint to the English, and a manuscript of a canon for six voices, in the British Museum, would seem to show that there were very skilful composers in England as early as in the 13th century. This canon "Sumer icumen in") ascribed by some to John of Reading, in 1250, by others to a much earlier date, is a surprisingly advanced work for its epoch. A mysterious figure looms up as an English contemporary of Dufay, in John Dunstable, but of the music of this Englishman (who died about 1458) very little is known, only a few fragments remaining.

Contemporaneous with the later Flemish writers one finds a few Italian composers forming a school of their own. The first of the old Italian school was Costanza Festa, a Florentine, who died in 1545. But the one great master in this field was Palestrina (born probably in 1524—there is much doubt about the date of birth,—and died 1594), who was without doubt the greatest composer up to that time. He combined the Flemish ingenuity with a lofty dig-

nity and sometimes (as in his 'Improperia') with emotional power.

The year 1594 was an epoch year in music. The Flemish school ended in that year, with Di Lasso's death; the Italian school lost its chief master in Palestrina; a revulsion against the intellectuality of music took place,—and the first opera was written.

We pause here, therefore, to sum up a few other points in musical evolution that had preceded this important date.

Although the chief scientific music of the world had been ecclesiastical up to this point, the troubadours in France, and the minnesingers in Germany, had turned the attention of cultured minds to the beauties of secular singing. Instrumental music was as yet a Cinderella among the arts. The strolling jongleurs and wandering minstrels amused the people, and sometimes the nobility, with displays of skill upon various instruments, combined with juggling tricks. They were generally under the ban of the law and led a very precarious existence. Troubadours and minnesingers wrote melody only, without harmony.

One of the *trouvères* of France,—Adam de la Halle,—in the latter half of the 13th century, had written a musical play, entitled 'Robin et Marion,' which was the precursor of light opera. It is the earliest popular work of which we have any record, but it was written by ear, and not by any teachable rules. Venice, partly through the efforts of Flemings, partly through Italian influence, had become a centre of organ-playing. Adrian Willaert (1480-1562), a Fleming, had become organist of St. Mark's in Venice and drew many pupils thither, among them Di Rore, Zarlino and Andrea Gabrieli. The last-named taught his nephew, Giovanni Gabrieli, who became one of the noblest composers of the Venetian school. He was born in 1557 and died in 1613. Zarlino taught many German pupils, and through the Venetian school of organ-playing. Germany for the first time came in close musical touch with Italy. Zarlino taught Scheidt, Praetorius and Scheidemann, while the elder Gabrieli had Hans Leo Hassler as a pupil. Zarlino and Willaert were the first to agitate for a tempering of the musical scale (see TEMPERAMENT), but its establishment came much later through the wisdom of Bach.

Claudio Merulo (1533-1604) established the organ *toccata*, probably the earliest form of technical instrumental display in the modern sense. One other form of scientific secular music had arisen, thanks to the Netherlanders; the madrigal, an unaccompanied vocal composition displaying the most intricate counterpoint had come into vogue, and Willaert and Di Lasso had achieved triumphs in this school. Luca Marenzio (1556-99) had also done good work in this field. But the most charming madrigal composers were to be found in England, where this style of singing met with especial favor. It is customary to vaunt the glory of the Elizabethan poets, but if the tremendous name of Shakespeare be eliminated, the excellence of the contrapuntists at this time rivals that of their literary brethren. Tallis, Weelkes, Wilbye, Morley, Farrant, Byrd, Bull, Ford, etc., may well be cited as balancing Beaumont, Fletcher, Massinger, Marlowe, Jonson, etc.

Music-printing (see PRINTING) had also been established, in 1502, by Petrucci of Fossombrone, and caused the compositions of all these men to spread from country to country with great rapidity.

The change from the old school of pure counterpoint to a more emotional style, from intricate choral works to solos both vocal and instrumental, had its first practical demonstration in 1594 (some place the date two years later), by the composition and performance of the first opera, entitled 'Daphne.' The work was the outcome of the efforts of a coterie of cultivated amateurs who began their meetings in Florence, and endeavored to bring into music something of what they supposed it to have possessed in ancient Greece. The men who were active in this movement, which caused the renaissance of music, were Giovanni Bardi (Count Vernio), Vincenzo Galilei, Strozzi, Mei, Rinuccini, Caccini and Peri. Their first opera met with great success, but their second,—'Euridice'—was an epoch-making work, since it contained in embryo an entirely new mode of musical treatment. Counterpoint was replaced by monody, solo singing began, and recitative allowed musical declamation to take the place of intricate tonal construction. The libretto was the work of Rinuccini, while the music was written by Peri and Caccini in two versions, that of the former being the better.

The new school spread quickly to all countries, only in France its progress was checked by the power of Lulli, who devoted himself chiefly to ballet-music. The latter was largely introduced into Molière's plays and obtained the favor of Louis XIV, who sometimes appeared himself in the dances.

The opera was not the only form of the period of phenomenal musical activity which marked the closing of the 16th century and the beginning of the 17th. The oratorio also had its beginning in this wonderful era. Filippo Neri (1515-95), who has since been canonized by the church, was an enthusiast in the matter of good church music and at his church in Rome he frequently had religious meetings apart from the regular services, in which he portrayed Scriptural subjects in the shape of musical plays. His friend Palestrina often assisted in this pious work, and may have had a hand in the development of the great sacred form. As these entertainments did not take place in the body of the church, but in the Oratory (Oratorio), the origin of the name of this form will readily be seen.

But the real establishment of the form came with Emilio del Cavaliere (1550-98), who wrote a large work in the new style, entitled 'L'Anima e Corpo.' This was first performed in 1600, probably in the church where Neri had labored, and was given upon a stage, with costume and action, exactly as it were an opera. Although both Neri and Cavaliere were dead, such minute directions were left regarding the mode of presenting the work that one may presume that the intentions of the composer were thoroughly carried out. This first oratorio was so entirely in the new school of monody and declamation that one may doubt as to whether the establishment of opera is not in a large degree to be credited to Del Cavaliere.

Besides the opera and oratorio, instrumental

forms were established at this time as well. Dancing is the mother of instrumental form. The dances of Spain had gradually made their way into France and exerted a strong influence upon classical music. In an effort to obtain contrasts several of these were joined together in one large composition, which was at first called a partita, but afterward became a suite.

Free instrumental forms also sprang from the organ toccatas already alluded to. Frescobaldi (1588-1653) was to Rome what Willaert had been to Venice half a century before. Frescobaldi has been called the father of true organ-playing. He improved the toccata and called it *sonata* (a sounding-piece,—that is, an instrumental piece), to distinguish it from the *cantata*,—the singing piece. Corelli (1653-1713) gave to the old sonata a form, which, although much less important than the later, classical shape, had yet within itself the elements of the noble form. Its first movement was a large three-division shape, exposition, development and recapitulation; and this led to the *Sonata-Allegro*, the first movement-form of the classical symphonies and sonatas, the form of many noble overtures.

Amid all these remarkable advances the fugue remained rigid and lifeless, a survival of the old intellectual problem-music. As yet the fugue was little more than a canon, a continuous imitation of a given melody. It waited its liberator—Bach.

During the century which followed we find Italy combining contrapuntal skill with the less educated enthusiasm which marked the early operas, and such men as Monteverde (1568-1643) and eventually Alessandro Scarlatti (1659-1725) make of the new school something far better than its founders had dreamed of. Stradella, Carissimi, Lotti and Rossi added to the advance of the great new school which was to cause Italy to be justly called the "Mother of Music." The school was established in England too by Henry Purcell (1658-95), who even introduced the Italian musical signs and expression-marks into his native country. Purcell, who was the greatest musical genius that England ever produced, founded his own English operas upon the Italian models, but his works had characteristics entirely their own and extend all the way from the melody of 'Lilliburlero' (the revolutionary song of 1688) to the loftiest anthems and brightest operas.

In France the great Lulli (1633-87) was bringing forth the most dainty and graceful ballets. In Germany Reinhard Keiser (1673-1739) began the 18th century by endeavoring to form a German school of opera, but the Italian operas soon resumed their sway.

In Germany, also, the effect of the numerous students who had gone down to Venice in the 16th century and the beginning of the 17th, was beginning to make itself felt. Luther's influence had established the chorale as a sturdy root whence much sacred music was to grow. Perhaps the three men who most helped the growth of Germany's sacred music in its earliest post-Lutheran stages were the "three Ss"—Schütz (1585-1672), Scheidt (1587-1654) and Schein (1586-1630), who not only helped Italian music in the Fatherland, but elevated the style of organ-playing far above anything that Italy had done. Musical settings of the Passion began to

appear in Germany, and the oratorio took a nobler path than in Italy, even before the appearance of Bach and Handel. To Germany also was due the new arrangement of part music, which took the melody out of the tenor voice, where it had always been in the Flemish and old Italian music, and placed it in the soprano, a change due to the choral-singing of the 16th and 17th centuries.

Out of the great musical epoch at the beginning of the 17th century there came also a radical change of notation. The notation of Franco of Cologne had been improved by the invention of many additional rhythms and the employment of smaller notes. In the music of Palestrina and of Orlando di Lasso, that is to say up to 1594, one finds some half-dozen tonalities (keys) employed, and notes and rests down to 16ths. But one does not yet discover a rational division of music into measures. This great advance came shortly after 1600, with the new monody, the declamatory music of the early operas, and with this came also, for the first time, the use of terms of tempo and of expression. Even the grouping of notes was invented in the latter part of the 17th century, so that this epoch saw the establishment of the greater part of our present notation system. Music of the better class, printed after 1700, is without any very important difference from that printed to-day.

And now the procession of the tone-masters who are prized by the modern world begins. Bach (1685-1750) and Handel (1685-1759) were so exactly contemporaneous that many speak of them as if they had been the Siamese twins of music. Yet their influence was very divergent. Bach leaned toward the old school of pure counterpoint; Handel was impelled toward modern dramatic effects. They faced different ways. Handel led toward orchestral experiments and was more directly melodic than Bach. We owe to him the noblest form of oratorio, which, by the way, he did not attempt seriously until after his 50th year.

To Bach we owe debts far more varied and even greater. He reconciled the old diatonic style of composition with the newer more modulatory school; by his great organ works and his clavichord fugues he founded modern technique; he was the father of the best school of organ-playing; he composed the greatest mass (that in B minor) which the world possesses, and also the noblest Passion music, and he was absolutely the inventor of freedom of modulation. Before his time, by what is called "mean temperament," it was possible to modulate into some three or four major and minor keys. Bach in 1722 gave to the world the first book of his "Well-tempered Clavichord," the composer's declaration of independence—"We hold that all keys are created free and equal!" (See TEMPERAMENT). In 1740 he wrote the second book, riveting the great reform.

Opera in the meantime had lost its opening splendor. Intoxicated by the success of the new style of music the composers began to believe that poetry was a secondary matter in the wedding of the arts, and in allowing their music to pursue an independent path all dramatic purport was soon lost. A reformer was needed and he soon came. Gluck (1714-87) began a crusade against the meaningless character of many of the beautiful melodies of the

Italian opera. In 1776 his opera of 'Orpheus' (which still holds the stage) began the dramatic school of operatic music. Beethoven followed in this path, and Mozart managed to reconcile melodic grace and dramatic content.

In carrying this sketch to its conclusion we must now trace three intertwining paths—piano music, orchestral music and operatic and other vocal music. Naturally we shall be able to allude only to epoch-making composers.

In 1709 Cristofori, an Italian, invented the pianoforte. The instrument was at first neglected. Bach thought it fit only for rondos. Mozart used the spinet, as did Haydn. It was Beethoven who first turned the tide toward the new instrument. Instrumental technique grew up in the train of the new invention. Domenico Scarlatti (1683-1757) led toward a piano style while writing for the spinet. In 1752 Philipp Em. Bach published the first valuable book of technique, which could be applied to the piano, to the clavichord, or the spinet.

The classical piano sonata grew gradually from a combination of the ideas of the suite and of the first movement of the old sonata as established by Corelli. Haydn first established it, Mozart improved it and Beethoven brought it to its culmination. The symphony was but a larger form of sonata, for orchestra, and the same process of evolution took place. Seldom has a form reached its zenith more quickly; from the first symphony, composed by Haydn (in three movements and for eight instruments only) in 1759, to the tremendous ninth symphony of Beethoven, composed in 1824, is but 65 years, yet these years contain all that is pertinent to the birth, growth and climax of every form of sonata,—in which we include classical chamber music, string quartettes, quintettes, etc., and orchestral works such as symphonies and concertos.

Just as there was a most significant musical epoch from about 1590 to 1620, so we find the "classical period," from about 1775 to 1825 to present not only a marvelous amount of creative energy, but a change in the musical taste of the world, a transformation of the scope and style of music. Only the opera went on its uninterrupted path. Yet here, too, there were some changes.

Beethoven (1770-1827) was an instrumental, an orchestral composer, par excellence. His one opera, 'Fidelio,' great art-work though it was, exerted no special influence upon any school of composition. Mozart (1756-91) improved the style of the Italians in opera, but did not actually strike out a new path. His 'Don Giovanni,' for a long time the masterpiece of the world in the operatic form, was but a culmination of what Italy had already attempted. Rossini (1792-1868) with a pernicious habit of creating the most beautiful melodies whether they fitted the text or not, set back the hands of the clock of musical progress, as far as opera was concerned, for a good half-century.

The first ringing note of the newer and truer school of dramatic opera was heard when Von Weber (1786-1826) in 1820 completed his 'Freischütz,' an opera built upon the sure foundation of the folk-song, a dramatic work, thoroughly wedding its poetry and music.

The sacred forms, during the classical epoch, did not change materially. Beethoven wrote a

most intricate mass, but it was only an echo of Bach with his great polyphonic B minor mass. Mozart composed, almost upon his death-bed, a noble requiem, but it was only an addition of operatic flavor to the requiems that had preceded. Cherubini (1760-1842) wrote a couple of requiems that were as great as any of the school—but were not in any sense innovations.

Piano and orchestral works advanced the most in the classical half-century. The vastest piano-work existing to-day is probably Beethoven's B flat sonata, Op. 106.

The orchestra, in the modern sense, had its birth in the classical half-century. Bach and Handel made only outline sketches of their orchestral works, leaving much for modern commentators to fill in. But when Haydn came to England, in 1791, he directed a complete orchestra and he published complete orchestral scores, an epoch in the history of orchestral development. Mozart had, however, before this time, written a large number of symphonies in complete score, many of which were published at a later period. Although the modern orchestra and the full score had their origin in this remarkable epoch, the art of conducting came later. Mendelssohn and Berlioz may be named as the first really great conductors in the modern definition of the word. The use of the baton in conducting only became established after 1800.

One other important evolution must be added to the work of the 50 years which form such a golden epoch of musical creation. The songs of Europe, such as had any real worth, were almost altogether folk-songs, melodies which grew up as the briar rose by the wayside of art, not the careful product of great composers, but the spontaneous voice of the people. The songs of the composers were generally dull and artificial things, made so, perhaps, by the fact that the poets were not concerning themselves with short and lyrical forms. But when Goethe and Heine, in Germany, began writing beautiful lyrical poems, the song-composer was sure to follow soon. Franz Schubert (1797-1828) was the genius who evolved the 'Lied,' the artistic song which, however short, was yet a complete and perfect whole; as a tiny Meissonier painting is as perfect in its way as the largest canvas. Schubert added glorious works to the symphonic repertoire, his piano-works practically founded the "Minuet-form," yet he thought vocally, and his most spontaneous and most important works we consider to be his 'Lieder,' which songs began a new school.

We may now follow the three distinct musical paths,—vocal forms (including opera), piano music and orchestral music,—each by itself, to the present time. Continuing the song development, we find Schumann (1810-56), and Robert Franz (1815-92) following in the footsteps of Schubert and bringing the miniature vocal form to perfection. The operatic form took a wide deviation.

The work of Rossini was baleful only in the fact that it paid no heed to the wedding of words and music in dramatic unity. In light operas Rossini was a model, and his 'Barber of Seville' is a masterpiece. Once, and once only, he proved that he could write a truly dramatic opera, and produced 'William Tell.' Donizetti (1797-1848), Bellini (1802-35), and others, fol-

lowed his lead and wrote charmingly, but untruthfully. France compromised and united prettiness and some degree of dramatic feeling in the works of Gounod (1818-93) and of Ambroise Thomas (1811-96). The real reform, however, of this *mésalliance* of poetry and music was made by Richard Wagner (1813-83).

Wagner's combat and triumph have been too recent to require detail here. We need only state that his theories of opera, or "music-drama" as he preferred to call it, were:

1. The abolition of a set form (that is, ending as one began), and the use of any shape that the poem suggested.
2. Absolute unity of the entire work. No division into songs, duets, choruses, with applause between and sometimes even encores. Continuity from beginning to end.
3. The music is always to interpret the poetry. Its entire character is to be dictated by the words: "Music is Truth." "In the wedding of the arts Poetry is the man, Music the woman"; "Poetry must lead, Music must follow"; "Music is the handmaid of Poetry"; are a few of Wagner's apothegms.
4. Abolition of mere tune and the substitution of a melodic recitative, called the "Melos."
5. Absolute freedom of modulation. Not necessarily a fixed tonality to any work or part of it. "Swimming in a sea of tone."
6. Excellence of libretto. No book is fit to be used for the text of an opera unless it would make a successful drama by itself.
7. A constant use of the *Leit-motif* (a musical figure expressing a definite meaning) by which the orchestra speaks a language that can be comprehended, somewhat like the chorus used to do in the old Greek tragedies. (See *LEIT-MOTIF*.)

These are not all of the theories that Wagner evolved, but they are the most important. They did not spring into being at once. One sees a few of them in 'Tannhäuser,' more in 'Lohengrin,' but the fulness of his reforms is first revealed in 'Tristan und Isolde.'

Wagner's work has influenced all the modern opera composers. Verdi (1813-1901) had begun his career in Italy almost upon the lines of his predecessors. Thanks to his genius he soon began to carve out a better vein for himself. In his 'Aida' he began to lead Italy to a much finer and truer school of opera than it had ever possessed. In 'Otello' and 'Falstaff' while carefully discarding the "*Leit-motif*" he seems to arrive at almost all the other Wagnerian conclusions, although his Italian personality prevents any great resemblance in results. In France, Bizet (1838-75), the best of French operatic composers, was starting upon a similar path with 'Carmen' when death interrupted his career. America has begun to add to the repertoire. Paine and Chadwick began the modern work, but important operas have since been composed by Horatio Parker, Nevin, Cadman, Gilbert, Herbert, Converse, Damrosch and others.

Tracing the piano path from the time of Beethoven we find three great "Cs" in technical writing—Czerny (1791-1857), Clementi (1752-1832) and Cramer (1771-1858). These led to a modern technique and this bore fruit in two different directions. Liszt (1811-86) became the king of the piano and brought its technical power to a point that had never been suspected before his time. Chopin (1809-49) came as the poet of the piano and gave to the instrument its most beautiful phases of expression. A host of piano composers have sprung up in every civilized country. Russia furnishing a great number.

In connection with the rise of technique we

may speak of the advance in other branches of music. Italy had great singing schools in the 18th century, and some of the most famous vocal teachers. Nicolo Porpora (1686-1766) was the most eminent of these, and had as pupils some of the most renowned singers of his day, among them Farinelli (Carlo Broschi) who was reputed to be unrivaled in flexibility and in power. Pistocchi was another of the famous teachers of this epoch and his most famous pupil,—Senesino,—disputed the palm even with Farinelli, in England in Handel's time. Vocal technique could scarcely go further than it advanced in the 18th century, although the 19th furnished such singers as Catalani, Malibran, Mario, Rubini, Lablache, Jenny Lind, and later such artists as Jean De Reszke, Adelina Patti, and, in the dramatic school, Materna, Tietjens, etc.

In violin technique the chief advance was begun in the 17th century, when Corelli (1653-1713) was the most prominent teacher of Italy. At about this time, too, the golden period of violin making began and the Amatis, Stradivarius and the Guarnerii made the name of Cremona (the city in which they worked) famous all over the world. The king of all violinists, speaking entirely from the standpoint of virtuosity, was Paganini (1784-1840) who advanced technique so far that even to-day the greatest living violinists are unable to conquer all of the difficulties which he left as a legacy to the world. Since his time the sceptre has passed to Joachim (1831-1907), who held it for many years, but in his old age, saw it contended for by a host of advanced players. Paganini influenced violin music toward mere virtuosity, while such players as Joachim, Wilhelmj or Wieniawski combined musical feeling with technique in their work. In recent days Ysaye and Kreisler take the lead in this field.

Orchestral advance has been absolutely phenomenal since Beethoven made his developments in tone-coloring. Berlioz (1803-69) was the first to improve upon the great pioneer's work and achieved remarkable results by his various experiments with new combinations. Wagner carried the art of orchestration still higher in his operas, and since his death a whole host of great tone-colorists have arisen. Russia has contributed very much to this advance, and it is not an absurd prophecy to predict that the Slav may attain the orchestral supremacy of the world in the near future. Tchaikowsky (1840-93) appears to be the greatest genius in this field that Russia has yet produced.

In Russia, however, there was, at the end of the 19th century, a decided movement toward a national school, headed by the so-called "Big Five"—Rimski-Korsakoff, Borodin, Cui, Moussorgsky and Balakireff, and such composers as Rachmaninoff, Glazounoff, Tanaieff, Scriabine and Stravinsky have helped the orchestral advance, the two latter being especially radical and ultra-modern in style.

France has also advanced greatly in the orchestral field thanks chiefly to the naturalized Belgian, César Franck (1822-90), who taught many of its chief composers of recent days and himself wrote many noble works. Massenet, Saint Saens, D'Indy, Charpentier, Piérne, Chabrier and many others have advanced the orchestral standard or have written what may be called symphonic operas. There is much free-

dom of form in the neo-Gallic school. Debussy (1862-1918) and Ravel have established a new school of orchestral treatment, the former being remarkable in delicacy and subtle coloring as well as for the frequent employment of a scale consisting entirely of whole tones.

Germany has developed chiefly along the Wagnerian lines, not an unmixed blessing when applied to purely orchestral music. After Beethoven there came a period of dulness in the symphonic field. Mendelssohn (1809-47) wrote much symmetrical orchestral music, but in spite of his melodic grace and symmetrical style he was not of the stuff of which epoch-men are made. It was Schumann (1810-56) who led the campaign against following too slavishly the classical paths and through this the romantic school and the freer sonata forms came into modern music. Brahms (1833-97) by his great symphonies and other sonata forms has proved, however, that the classical school does not merely belong to a by-gone epoch. Richard Strauss (1864-) has followed the Wagnerian system in all of the theories given above. He has exhibited overwhelming skill in both operatic and orchestral works, and occasionally genius, but "Richard, the second" has not yet rivaled his predecessor in the power of his ideas, although he may be classed as a very important living composer. German music has gravitated rather toward skill than poetry in its recent manifestations, and Max Reger and many others have striven for very large scores and many instrumental complexities.

Under the lead of Richard Strauss the chief modern orchestral tendency is toward "Programme-music," instrumental music, which by means of its title or program notes gives a definite picture. Along with Berlioz, Franz Liszt (1811-86) was the founder of this school of work. It is beginning to dawn upon the world that Liszt's orchestral works were fully as important as his piano compositions. He has led to great brilliancy of tone-coloring, and in his 'Poèmes Symphoniques,' to freedom of form and dramatic power.

England too has heard the modern voice and her precise and correct contrapuntal school as represented by Mackenzie, Stainer and others, has given way to a much freer and bolder expression as shown in the works of Elgar, Delius, Bantock, Holbrooke, etc.

Even Italy is influenced by the orchestral tendencies of the present and the operas of Puccini, Wolf-Ferrari, Mascagni and Leoncavallo, and the cantatas of Bossi, no longer give the voice great preponderance over the orchestra and no longer treat the latter as a mere accompaniment. One Italian, Ferruccio Busoni, has plunged headlong into the German school of advanced orchestral works of freest form.

Scandinavia deserves great credit for the nationalism of her best music. As in Russia, her chief composers endeavor to reflect the spirit of their native folk-music in their classical works. Grieg (1843-1907) was the chief founder of this style, but Sinding and Sibelius have given important works in the same vein and the last-named has recently attempted the most free and radical modes of modern expression.

America has been especially fertile in the

orchestral field. The real classical beginnings were made by John K. Paine, and a little later by George W. Chadwick, but at present Foote, Converse, Carpenter, Hadley, Schelling, Gilbert, Cadman and many others are writing in the largest forms. MacDowell's (1861-1908) orchestral works, as well as his piano compositions, have a place in the standard repertoire of all nations, and Horatio Parker has composed the first great American oratorio—"Hora Novissima."

Women composers are more numerous now than at any previous epoch in the world's history. Ethel Mary Smyth, in England; Mrs. H. H. A. Beach, in America; Augusta Holmes (1847-1903), in Paris, and many others, have composed good works in the largest musical forms.

It is difficult to prophesy what the future may bring in musical development. Music is the most changeable of arts. Like language it is an invention of man, and even if founded upon natural laws it is still an artificial and, therefore, a changeable product. There is at present a decided tendency toward great complexity and cryptic expression; heavy scores and epic prolixity are constantly in evidence. Whether this is but a passing phase time only can show. Conservative musicians are aghast at the many bold experiments which are being attempted. We believe, however, that when the experimental stage is passed the tremendous orchestral skill that has been won will be retained, but that it will be again combined with the melodic grace and beauty of the older masters, and that Beethoven's apothegm will be re-established—"Music, even when picturing something ugly, must itself remain beautiful."

LOUIS C. ELSON,

*Instructor at New England Conservatory of Music, Lecturer and Author.*

**MUSIC, Children's**, a somewhat ambiguous phrase which may be applied to music written specially for children or music produced by them. As used in this article, the term covers the broad, educational phase of the subject as to what may and should be done to make the noblest of the arts an important factor in the child's spiritual development. The purpose of this article is, therefore, to point out the necessity for intelligent treatment of children's music and to outline some ways and means by which the musical side of a child's nature may be developed fully and naturally. The need of such an encyclopædic article is obvious. There is hardly a subject that is so shamefully overlooked and so little understood by parents and others as the educational and cultural significance of music. Even in our schools, where better consideration and fuller comprehension might be expected, music teaching falls far short of its cultural possibilities. In our homes, naturally, the state of music and musical instruction is generally worse, due largely to the mediocrity of the average music teacher. "It is doubtful," says one of our foremost musical educators, "whether there is any subject of instruction which is taught so carelessly, so ignorantly, so improperly, and by so many people who are by nature and training unfit to teach, as music."

But methods of teaching, save in their general educational aspect, do not come within the scope of the present article. These and the various other technical phases of music and music-teaching are adequately treated under their appropriate headings.

**The Educational Value of Music.**—Quite apart from such general considerations as have long been adduced in support of music's claims as the purest, the noblest and the most universal of the arts—which, of course, cannot be

enumerated here—there are several very weighty reasons why music is peculiarly fitted to serve as the first art in the education of the young. One of these is found in the fact that music, although the most abstract (subjective) of all the arts, is the only art that can be apprehended in early childhood. The normal human infant sings and is susceptible to song long before he can talk or walk—certainly very long before he is sufficiently sensitive to color vibrations and other complex sensory impressions. Thus, at an age when children can neither draw nor mold nor read nor write, they can enter the kingdom of beauty through music. "By singing, and by singing only," says Mr. T. W. Surette, "a little child of five may come in contact with a pure and perfect form of beauty." Just because music is an abstract art, an art which has no necessary objective reference (like painting and sculpture, for instance), it lends itself so admirably to the expression of that idealism with which every normal child is endowed by nature.

Another important educational advantage possessed by music is its great socializing tendency. For very young children music means, or should mean, primarily singing; and singing for them should imply, principally, group-singing. Now, such singing, be it the spontaneous duets of the nursery or the more conscious choruses of school and other assemblies, is a decidedly social activity requiring a degree of co-operation and self-abnegation not called forth by any other abstract. When children sing in unison—and adults, too, for that matter—their natures tend to lose much of their angular, anti-social individuality. Incidentally, such exercises afford invaluable practice in concentration and co-ordination—concentration of attention and co-ordination of eye, ear and mind—which promote a degree of mental alertness and precision hardly result from participation in any other cultural art.

A third reason for the educational pre-eminence of music—and many others could be given, did space permit—is found in the fact that, being the purest of the arts, music is, in the words of Montesquieu, "the only one of the arts which cannot corrupt the mind." That this is another very important educational advantage goes without saying. For, however young or immature a child may be, its mind cannot be debased by bad music in the manner of "spicy" stories or obscene pictures. Music as such is neither moral nor immoral, as has been repeatedly pointed out; it is *amoral*. It is not before music is wedded to some other means of expression (language, acting, etc.) that it assumes any definite meaning. If the result of such union proves to be ethically undesirable, the objectionable element is not the music, which is not definitive like sculpture or painting, but the concrete medium with which it happens to be united. Even in the sad case of "rag-time," the "dime-novel of music," as it has been aptly called, the harm lies more in the vulgar and highly suggestive words than in the meretricious melody. Thus, while cheap and noisome music, if long persisted in, may pervert a child's musical taste, it cannot undermine its morals. The loss in the former case is negative; in the latter, positive. The first belongs to the sphere of æsthetics; the second, to that of ethics. It is this negative quality of music,

the ideal of all art, that makes it so well suited to serve as the first and foremost cultural art in the spiritual education of the young—an art which, properly presented, enlarges a child's sympathies, broadens its emotional experience, gives greater play to its innate idealism and increases its capacity for joy in numberless ways.

**The Need for Early Music-Training.**—In view of the great educational, social and cultural importance of music, its neglect in our homes is as inexcusable as it is unaccountable. Yet, so general is this neglect that most children grow up to manhood and womanhood without ever becoming really musical. Even "of the thousands of people who consider themselves musical," say two prominent American writers on music, "it is surprising how few have any real appreciation of it." But if American adults are, as a class, unmusical, while American children are for the most part musical—and both are facts generally admitted by musical educators—the fault can lie only in the wasted musical opportunities of childhood. "If the natural taste of our children for music were properly developed," says a distinguished musical authority, "they would continue to practice it and to find pleasure in doing so." This neglect is chargeable partly to our homes, whose prevailing music is still of a cheap and vulgar character and where music-making is rarely pursued as a family function, and partly to our schools, where musical education is still apt to be considered as an extra subject for the talented few rather than as the rightful heritage of the many. That the other fine arts fare no better in this respect does not, of course, improve the musical situation in the least.

Just because music is, as already stated, the only art-form accessible to very young children, neglect to cultivate it properly in the home is far more irremediable than is the case with any other art. Yet, how rare is the American home in which music-making is pursued as a family function or in which children may naturally acquire a love for musical art. Even in intelligent homes—and intelligence in other departments of art does not necessarily argue musical understanding or appreciation—music is still regarded too much in the light of a fashionable accomplishment, and not as an indispensable part of a thorough education.

If children are to grow up with any greater fondness and appreciation for music than the average adult manifests—a desultory liking, at best—there must be a fuller realization among parents and educators of the need for proper musical education. In other words, until parents come to understand the true mission of music and afford their children adequate means for its realization, no real progress can be made in this direction. "The matter cannot be safely left to the schools," says Mr. Surette, "as at present constituted." It is the home, therefore, that must radically change its attitude toward art in general and music in particular, if the present generation of music-tasters is to be succeeded by a new generation of true music-lovers.

**Ways of Promoting a Child's Musical Development.**—Coming now to the consideration of ways and means by which the musical education of children may best be promoted, it

must be said at the outset that environment and example play a far greater part than precept and instruction. That much music and morals have in common. Musical homes are the greatest promoters of a child's musical development, while unmusical parents are apt to be its greatest hindrance. In general, it is as wise to expect music-loving children in unmusical homes as tropical fruit in the frigid zone. But as most children are potentially musical, developing a child's musical taste and understanding is a question of allowing this potentiality to be realized—that is, of supplying the proper objective and subjective stimuli.

"The surest and most rational method of teaching children to know and to like music," says Thomas Whitney Surette, "is through personal experience and contact with good music." This can be done in at least three ways: (1) By singing and hearing beautiful songs, which train the ear and cultivate good musical taste; (2) by learning to play good music on some standard instrument, which gives one a deeper insight into musical form and structure; and (3) by cultivating the art of intelligent listening, which enlarges one's musical understanding and familiarizes him with musical literature. In other words, the three specific aids to musical development are—*singing, playing and intelligent listening*. We shall consider each of them in the order given.

(1) Just as musical educators insist that a child's musical education should begin in the cradle, they keep on reiterating that singing is the best means for this early training. A mother's sweet lullaby is the time-honored and unexcelled child's song-primer. "The baby should hear soft, melodious, correct singing every day," says Dr. Frank Damrosch. "If the parent cannot supply this, so much the worse for both parent and child. The next best thing is to get a nurse who can sing nursery songs correctly. It is as important as any other qualification necessary for the proper care of the child. The singing of good, simple songs to children in their earliest years is one of the most valuable means for inducing not only a correct musical ear, but also a love for music as such. A child brought up in this way will never be tone-deaf, and will probably sing before it can talk—certainly long before it learns to talk correctly." That singing is the only rational foundation for a child's musical education is the opinion of every prominent musical educator. "Singing by ear spontaneously and without technical instruction, but rather for the joy of doing it, and for the formation of taste on good models," writes another eminent musical authority, "is the proper beginning of all musical education." Singing beautiful songs is not only the best preparation for an intelligent understanding of the masterworks of musical literature, but a positive joy in itself, a supreme joy to every normal child. "The joy which a child gets in reproducing beautiful melodies," this writer points out, "is like no other experience in life. In the process of doing so, its whole being—body, mind, heart and soul—is engaged. The song, for the moment, is the child. There is no possible realization of the little personality comparable to this. . . . Through this [singing] children can feel a beauty and order and se-

quence which their minds are incapable of grasping." Hence, whatever instrument a child is to take up later, the first essential is to learn to sing songs intelligently and for the joy of the thing.

As young children are so impressionable and their memories so tenacious, their songs cannot be chosen with too much care. The cheap artificial vulgarities that pass by the name of music—those coarse, unimaginative conglomerations in which rhythmic excitement is the common substitute for musical ideas—must be as rigidly excluded from our homes as are foul air and tainted food. The effect of the former may be less apparent or immediate, but it is just as pernicious and more irretrievable. "Artificial and false methods," says Mr. Surette, "are less harmful to children than the poor, vapid and false songs by means of which the taste is slowly and surely disintegrated." On the other hand, the influence of good songs is even more indelible. "In all the reminiscences of days gone by," wrote Phillips Brooks, "there is nothing that so haunts the spirit as the songs to which we were accustomed in childhood." Yet, the great majority of parents—parents who may be deeply concerned over the cut of their children's clothes and the style of their shoes—do not give a moment's thought to the kind of songs their children are singing. Certainly, children's music deserves as much attention as their manners or morals; and the task of selection or exclusion is a comparatively easy one, if begun early enough, since most children whose ears have not been debauched by abominable "rags" instinctively prefer good songs. That much musical taste seems to be theirs as part of their natural endowment. So much the greater is the parental crime in allowing it to become debased.

For the first stage of a child's musical education, which should be as spontaneous and as informal as possible, the traditional folk-song affords abundant and most appropriate material. "Folk-song," writes a distinguished musical authority, "was the beginning of what we call 'melody,' and the best specimens of it are quite as perfect within their small range as are the greatest works of the masters." Its simple but beautiful melodies, the common heritage of the ages, are musically invaluable both as a means and as an end. As a means, they prepare children for an intelligent appreciation of the compositions of the great music masters, which, according to some musical educators, many adults deprived of such preparation can never attain to. How great is the debt of these musical masterpieces to the old folk-songs and dance tunes may be judged from the fact that even the symphony, the highest and purest form of music, pays its everlasting tribute to their melodic fertility and rhythmic diversity.

But this educational value of folk-songs, great as it is, would hardly justify their exclusive use with children if their own charms were insufficient, since nothing so effectually kills musical interest in young children as dull, non-pleasurable singing exercises. It is as an end in itself, and not as a means to some other end, that the singing of folk-songs, folk-ballads, and folk dance tunes makes so strong an appeal to both young and old. "What-  
ever has at any time appealed to the best emo-

tions and moved the hearts of a people," says Dr. Claxton, Chief of the United States Bureau of Education, "must have for their children and their children's children political, historical and cultural value. This is especially true of folk-tales and folk-songs." Thus, while cultivating good musical taste and storing up musical melodies to be recognized as old acquaintances later, these folk-tunes establish most enduring ties between the generations of men.

(2) If a child's songs have been wisely chosen from infancy and his singing has been made a pleasurable experience to him, he should show by the time he is seven whether he is really musical or not. In the latter case, the informal period of musical training has been no loss, but a clear gain to the child; in the former eventuality it has been a most rational preparation for the second period—the more formal one—which is to involve one or another of the standard musical instruments.

The choice of a musical instrument should never be haphazard; it must be made very carefully and intelligently, and always with full regard to the particular aptitudes and powers of the learner. Musical educators greatly deplore our unfortunate custom of selecting instruments regardless of their fitness for the individual child who is to learn to play upon them. Says one of them: "The majority of the children who have private instruction in music take lessons in pianoforte playing" because "it has become a custom; the pianoforte is an article of domestic furniture; pianoforte playing is a sort of polish to a cursory education. . . . It is the line of least resistance; there are plenty of teachers of pianoforte playing, but few teachers of music, so parents accept that which is available." Parents who have the best musical interests of their children at heart will do well to consult some reputable, disinterested musical educator as to the choice of an instrument. In view of the deplorable vogue of the piano and the even more deplorable dearth of intelligent piano players, this costly and ponderous instrument should be viewed with special suspicion. Its indiscriminate choice is said to end fatally for nine-tenths of our music pupils, pupils whose painful fingering leaves them nothing but a sad memory of much valuable time needlessly wasted. Everything else being equal, therefore, almost any standard musical instrument would seem to be preferable to the piano for non-professional purposes. The latter should be chosen "only when a child possesses a certain amount of that physical co-ordination which is absolutely essential to playing the pianoforte." In the interest of chamber music, a most excellent aid to amateur music study, preference might well be given to the violin or the violoncello. Certainly in homes really musical such variety will be sought as will promote the cultivation of chamber music. If such musical foresight were more common, our children would pursue music with greater enthusiasm and profit; while our family circles could become intimately acquainted with the masterpieces of sonata literature which are now a closed book to them. With such convenient and inexpensive means for building up correct musical taste in our very homes, so-called unmusical children would become as rare as unmusical parents are now common. Only then might we all cease worshiping mere virtuos-

ity or technique and learn to love music for its own sake. Only then shall gross incapacity to appreciate music be classed with other forms of ignorance as being equally discreditable.

As to the age at which a child is to begin formal music study opinions differ. An authority already quoted in this article thinks seven the earliest age; another (Albert Lovignac) makes six the lowest limit; while others place it anywhere from five to 10. "I shall never advise allowing a child that is not to be exhibited as a phenomenon at shows and circuses," writes Professor Lovignac, "to study any musical instrument whatever before the age of six *at the earliest*." Of course, it is not a child's age that should be considered, but his musical readiness and responsiveness. Only when a child has gone through the singing stage of musical development—that is, when a child has been singing beautiful songs for several years and has had his musical instincts developed thereby—is he ready to take up instrumental music with pleasure and profit. "I question the wisdom," says Mr. Surette, "of forcing children to play who are not qualified to do so; and I think playing should, in any case, be postponed until the musical faculties are awakened by singing." Before this awakening comes, no real musical education is possible—and the sooner parents and teachers recognize this fact, the better for all concerned. "A great deal of nonsense is talked nowadays," says a writer on the human side of music, "about the necessity for taking the fingers when they are young and supple. I believe that, generally speaking, they are quite as young and supple as is necessary at fourteen or fifteen; and that a single hour of practice, reinforced by the enthusiasm of one who has his eyes fixed on the enchanted castle—the lure of chamber music parties and amateur symphony orchestras—is worth fifty hours of forced and grudging grind. . . . A large amount of needless indifference to good music and even active hatred for it is caused by putting children at dry piano scales and Czerny-with-the-metronome before ever they have developed a single spark of enthusiasm for the classic beauty to which the excellent Czerny is such an obvious and supple finger-post. To do this is to teach them to regard the choicest portions of musical literature as all of a piece with the literature of the spelling-book."

Not less important perhaps than the choice of an instrument is the selection of a music teacher. Elsewhere in this article an authoritative opinion was cited as to the sad state of present-day music teaching. In view of this, parents should exercise special caution in engaging music teachers for their children. Without much circumspection in this regard they are more likely to encounter the incompetent instructor, who blights a child's love for music, than the real music master who encourages and promotes its growth. The harm done by mediocre music teachers—teachers who understand neither their art nor the child they undertake to teach—is both positive and negative. Their employment is absolutely inexcusable and never fails to lead to remorse and disappointment on the part of those misguided parents who share the fallacy that any kind of teacher will do for musical beginners. The fact is that the best

teacher is none too good for the earlier stages of music study, for "cheap teachers" may lay such a faulty and insecure foundation as will make all future musical progress well-nigh impossible. In other words, they prove a most wasteful economy and must be studiously avoided by every well-intentioned parent and guardian.

In order that such may know what the qualifications of a good music teacher are, the following summary (from Dr. Frank Damosch's 'Some Essentials in the Teaching of Music') is here appended in full. "He must be a person of culture and good breeding; a good musician, able to play with ample technical skill, accuracy, intelligence and taste; thoroughly grounded in the history of music; equipped with a wide knowledge of musical literature and acquainted with the standard compositions in every field of musical art; and, finally, he must have high art ideals and be able to arouse and maintain them in his pupils." And, it should be added, the more such a man knows about the other arts, about the science of education and about the psychology of childhood, the better a music teacher he will make. Unless parents can provide such private instruction in music as these qualifications promise, the musical education of their children were better entrusted to a reputable school or conservatory, where the professional standards are apt to be above those prevalent among private music teachers, with their proneness to overindulge the whims and tastes of their unmusical employers.

With good musical instruction—instruction that places greater emphasis on appreciation than on execution—and with parents intelligent enough not to clamor for tangible and quick results—results measured by mechanically acquired repertoires—the child's musical education is most auspiciously begun. Even though the child does not acquire a wonderful technique, it will be sure to acquire that which transcends in value all mere dexterity—real understanding of music itself. Even if a child acquires but the ability to read music at sight, it gets an educational advantage comparable to the ability to read verbal language, an advantage which means an open door to the world's musical literature. But under proper encouragement and intelligent guidance, even children who may not be destined to become good musicians will grow up to be true music lovers, a far greater attainment, as we shall see presently, and one really worth striving for.

(3) Whether a child pursues his musical studies in the instrumental field or not, his musical appreciation should go on developing through intelligent listening. The latter is certainly as good a means for developing one's musical faculty as drawing a bow or manipulating a keyboard. Indeed, it is owing to our unfortunate emphasis on "executive ability" as the sole test of musicality that there are far more performers than real music-lovers in the world. But until this emphasis is shifted from performing music to its appreciation, the progress of music education can have no firm basis. Music, as the noblest of the arts, must never be confused with mere titillation of the ear and finger gymnastics; and any view of music is erroneous which places technical dexterity—at best a means to

an end—above the end it is to serve. "Pieces well played," the everlasting desideratum of parents, may be more tangible results of music study than appreciative listening, but the latter is a surer and more permanent means to lifelong musical enjoyment. "The capacity properly to listen to music," says H. E. Krehbiel, dean of American musical critics, "is better proof of musical talent in the listener than skill to play upon an instrument or ability to sing acceptably when unaccompanied by that capacity. It makes more for that gentleness and refinement of emotion, thought and action which in the highest sense of the term it is the province of music to promote. And it is a much rarer accomplishment." Moreover, it should be remembered that not all can be performers of music. "Distaste or inability in the matter of learning to play the piano," says Professor Macpherson, "is hardly to be regarded as a proof either of an unmusical nature or of a dislike for music. . . . In the case of literature, we should not go to the length of depriving children of good books if they were to prove themselves unable to recite, or unfit to write verses; why, then, starve them musically simply because, from comparable reasons, they prove themselves unable to reproduce with any degree of success the *musical* literature on the piano? . . . I am convinced that we shall never create a community of really intelligent listeners until we realize that their training should consist of something more than the abortive struggles at the keyboard, which at present too often pass as musical education in many schools and private families."

Every child, therefore, should be given frequent opportunities to hear good music, vocal and instrumental. This course alone, consistently and judiciously pursued, might make the younger generation more musical; for "being musical," it should be remembered, "does not necessarily lie in performing music, but is a *state* of being which every individual who can hear is entitled by nature to attain to in a greater or less degree." While a theoretical knowledge of music undoubtedly enhances one's pleasure in listening to it, such knowledge is no more essential to real musical enjoyment than the ability to perform. Just as exquisite enjoyment may be experienced in viewing a beautiful landscape without any knowledge of botany or geology, so great pleasure may be derived from hearing the world's musical masterpieces without any technical knowledge of their structure or form. Yet, true musical appreciation is not passive, like simple sensations, but calls for active co-operation on the part of the listener. "Music," says Prof. Dickinson, "like all fine art, demands an active exercise of the will, as well as a sensitiveness to physical elements and a vague response to suggestion. . . . An earnest mind cannot be satisfied with a pleasure, however pure and elevating, that quickly dissolves, leaving no residue to be worked over by the memory."

Musical appreciation can and should be cultivated from earliest childhood. The need for such special cultivation arises from the well-known fact that every art requires habituation to its peculiar language, forms and lines of excellence. Repeated impressions and frequent associations are the indispensable conditions for

the study of all art. "Just as one cannot take in at a glance the artistic beauties of a Whistler portrait or the linguistic beauties of a Miltonic poem," says Mr. Surette, "so one needs constant experience in hearing music to learn to appreciate all the melodic depth and inventiveness of the works of Brahms, Bach and Beethoven."

Like the drama, music has been too much regarded as a pastime—too much as our diversion rather than as our spiritual salvation—even among intelligent listeners. Therefore, whatever else children learn about music, they must learn to regard it an art that is far above mere recreation and amusement; as an art that appeals to the intellect as well as to the emotions; as an art whose pleasureableness grows upon one with the degree of serious attention he brings to it; and, finally, as an art the proper understanding of which is just as great a mental achievement as an understanding of the higher forms of literature or the abstract sciences—certainly a far higher achievement than learning to play an instrument without distinction or to sing without musical taste.

But musical appreciation grows slowly; it cannot and must not be forced. Children should be allowed to absorb the best music unconsciously at first. They should not be expected to appreciate compositions that are far beyond their stage of musical development. Cramming a Beethoven symphony into a young child's ears is just as judicious as cramming Miltonic poetry down his throat. Both must bide their time. Although children can grasp and aesthetically comprehend music far beyond their ability to perform, there are, of course, obvious limits which wise parents and teachers will do well to bear in mind. But, unless children are forced in their musical education, there is no danger in their hearing musical compositions that transcend their understanding. If a child is musical, much of this musical experience will bear fruit later; if not, no harm can come of this premature exposure to its elevating influence.

The non-technical means and objects, then, of musical education for children are—to sum up in the words of another—"observation, discrimination, reflection; cultivating the memory for musical phrases and melodies, disciplining the senses, enlarging the scope of the imagination, and nurturing the sense of beauty. By such a process we attain in some measure to that joy which is one of the chief objects of art in general and of good music in particular."

**Bibliography.**—Owing to the dearth of literature bearing directly on this subject, a few magazine articles, entered alphabetically under the names of the periodicals, are included in the following list of references: *Atlantic Monthly*, 'Children's Music' (March 1916); Britan, 'The Educational Value of Music' in 'The Philosophy of Music' (New York 1911); Brower, 'Home Help in Music Study' (ib. 1918); *Craftsman*, 'Music and Our Children' (October 1915); Damrosch, 'Some Essentials in the Teaching of Music' (New York 1916); *Delineator*, 'Giving the Children an Ear' (October 1911); Dickinson, 'The Education of a Music Lover' (New York 1911) and 'Music and the Higher Education' (ib. 1915); *Education*, 'The Cultural Value of Music' (Novem-

ber 1911); Farnsworth, 'Education Through Music' (New York 1909); *Journal of Pedagogy*, 'The Musical Interests of Children' (October 1898); Krehbiel, 'How to Listen to Music' (New York 1906); Lavignac, 'Musical Education' (Singleton's translation, ib. 1903); Macpherson, 'The Musical Education of the Child' (Boston 1916); Mills, 'The Study of Music as a Means of Education' in 'Music and Education' (London 1905); *Monthly Musical Record*, 'The Children and their Music' (August 1916); *Musical Leader*, 'Music as Part of a Child's Education' (May 6, 1915); Patterson, 'How to Listen to an Orchestra' (London 1913); *Proceedings of the National Education Association*, 'Musical Appreciation—How it is to be Developed' (1912); Schauffler, 'The Musical Amateur—A Book on the Human Side of Music' (Boston and New York 1911); and Surette and Mason, 'The Appreciation of Music' (New York 1907).

DAVID A. MODEL.

**MUSIC, Education in.** The question as to the effect of music on the moral life and character of the individual is one which has been discussed from time immemorial, but regarding which no definite conclusions have yet been reached. The Greeks had an exalted opinion of the art in this respect: it had wonderful powers of molding the nature of man, far beyond anything to be observed to-day. Consequently it played an important part in their scheme of education. But Greek music, we must remember, included poetry and dancing, and thus occupied a position of eminence which would not have been warranted by the exercise of mere tonal art. Furthermore, the scales of Greek music were intimately connected with certain fixed aspects of life. One, for example, was used for martial and patriotic purposes, another for religious ceremonies, and a third again for the expression of feelings of love. Thus the scales became imbued with a power and significance which were not their own, but were drawn from the circumstances with which they were associated.

In more recent times the eulogy of music has been less pronounced, yet the art is still heralded as a positive moral and educational agent. Luther was emphatic in his praise of it, and advocated its employment in the training of youth. Herbert Spencer taught that it had the function of developing the emotional element of speech, and since speech is a means of arousing feelings in others, of enhancing sympathy. According to Mr. Haweis it is an efficacious method of exercising and disciplining the emotions. Opposed to these views, however, we have the opinions of other thinkers who doubt the moral value of music, or even regard its effects as deleterious. Edmund Gurney denies any direct effects at all, though he makes full allowance for the indirect. Hanslick grants a certain elemental power over the emotions, but insists that this stands in inverse ratio to the individual's culture. Tolstoi seems to detect an influence for evil rather than good; while William James, though not referring especially to music, shows how the frequent evaporation of emotions without results in conduct,—and this characterizes many musical emotions,—produces a tendency toward evaporation in general, and so weakens the moral fibre.

In explanation of the divergences of opinion it may be pointed out that there are temporary and permanent effects to be considered. There is no doubt that music can produce momentary expansions and elevations of spirit—and it may be that these were held in mind by its champions—but it by no means follows that such ebullitions are of lasting value. Indeed, it is even possible, according to James, for good emotions to work harm if they do not issue in corresponding actions. Then again, as already indicated, there may be differences of opinion according as one considers the art in its narrower sense or includes the circumstances with which it is associated. A succession of tones by itself may not be good or bad, but the words, dancing and general circumstances in connection with which it is heard may be good or bad, and their moral quality may be transferred to the tones themselves.

This is not the place to go into the details of the arguments which seek to establish the moral quality of music. It must be confessed, however, that many of these arguments are of a vague and general character, and are more convincing as evidences of the fervor and enthusiasm behind them than as demonstrations of the propositions which they seek to establish. To speak in eloquent words about beauty and harmony, as if the mere hearing of a major triad were sufficient to bring peace into a man's troubled spirit, is little more than a rhetorical flourish. It is a case where the proverb about cup and lip is decidedly applicable. As well try to prove that the constant exhibition on the stage of the dire results of sexual immorality will engender chastity among actors. A mere reference to the life of the foremost composer serves as a refutation of such lines of proof. For though Beethoven's career may have been picturesque and heroic, it was certainly the opposite of harmonious both subjectively and socially.

A rational way of approaching the problem is the empirical one of recourse to experience. We may ask: are the musical nations and individuals superior to the unmusical? The reply must certainly be in the negative. The Italians, Germans and Slavs are musical, the French less so, and the English rather unmusical, yet there is no corresponding agreement in the scale of ethical valuation. Likewise there is no correspondence between the moral value of individuals and their taste for the art of tones. People with no musical ear whatever may be upright and reliable, people who are susceptible to the art given to weaknesses and vice. The situations are complicated, to be sure, and there may be antagonistic influences which obscure the action of music, but in the absence of proof that this is so we are compelled to say that the facts do not favor the assumption of a definite and pronounced effect like that in question.

We must conclude, accordingly, that the proposition regarding a directly moral or educative effect of music is still lacking demonstration; indeed, the evidence that we have seems rather to be of a negative character. But this does not apply with the same force to the indirect effects, or detract from the total value of the art. To begin with, music affords a pure and high species of pleasure. And why should this not be sufficient? Do we expect the rose to

teach us a moral before being legitimized, or the clouds to deliver a sermon? Pleasure may not exhaust the meaning of existence, as the utilitarians would have us believe, but it subserves a highly important function in the scheme of creation. Its anticipation by the individual is one of the chief incentives toward action, and its actual enjoyment of the greatest importance as a relief from toil and fatigue. Furthermore, since pleasure will and must be enjoyed, any exercise of it in pure and refined forms—as in music—ought to be welcomed, taking the place, as it does, of the more noxious kinds of enjoyment into which people are constantly tending to fall. Here the recourse to experience may be of help. The English may not be inferior to other peoples in a profound ethical sense, as indicated, but they are notoriously given to intemperance, while on the other hand they are emotionally somewhat too sober. Is it unreasonable to suppose that these conditions would be remedied if, like continental peoples, they took more interest in music and art? In addition to producing pleasure, music serves as a framework and beautifier of social activities. It embellishes the play, dignifies the commencement exercises, graces the household meeting of friends, lends emotional power to the worship of God. This influence may at times acquire considerable importance. Of Luther, indeed, it was said that he won as many adherents through his chorals as through his religious teachings. Finally, where immediate rather than remote effects are desired, as in the onward rush of battle, music may even produce direct dynamic results of great power.

So then, there is enough reason for the cultivation and teaching of this art, even without the direct effects of which we have spoken. Music is and will remain an important element in the life of the individual and community. Nor will the phonograph, wonderful though it is, ever quite replace its personal exercise. We shall always require artists to create new records; there is a pleasure flowing from actual singing and playing that is unique; and the social effects of co-operation in the rendition of pieces can likewise be obtained in no other way. Indeed, to judge from the outlook at present, music is going to gain in recognition rather than lose. Provisions are being made for its cultivation on a scale more extensive than ever before. In the past, public instruction has been confined largely to singing in class. And this, in fact, may be the best way to arouse that sympathetic glow of feeling which it is a function of the art to foster. But higher attainments of course demand individual instruction. Hitherto this has been gained chiefly through outside lessons, or, in the case of prospective musicians, conservatories of music. Both of these methods have disadvantages. In the conservatories there is practically no education apart from music, to the disadvantage of general culture. And with the outside lessons there is too little incentive for the rigid prosecution of music itself. As the work in school is supposed to fill the child's time, it follows that he has no energy left for extra studies. Or if he attempts to do justice both to his school work and his lessons, it is the health which is likely to suffer. Under the circumstances the rational thing to do is to make provision for music in

the school curriculum itself, even when taken outside of school hours, and allow it to count toward graduation. And this, in fact, is beginning to be done. Several cities of our country have already adopted the plan suggested, it has the sanction of prominent educators, and there seems but little doubt that it will spread until it has become universally established. The result will be a great impetus toward the cultivation of the art. Those who possess talent in this direction will have time and opportunity to develop their powers. Music will no longer be considered as a mere accessory in the education of youth, but will take its place in worthy co-ordination by the side of all those other studies that go to the fashioning of educated men and women.

ALBERT GEHRING.

*Author of 'The Appreciation of Music,' etc.*

**MUSIC, The Psychology of.** Psychology as applied to music can be considered from the point of view of the listener, the performer and the composer.

I. So far as the listener is concerned, the object of the science is to give a thorough analysis of the process involved in hearing music, and account for the accompanying pleasure. Beginning with the impact of the sound waves on the ear, it must be shown in the first place how that organ is physically affected. The elementary conscious effects must then be elucidated, whereupon associative relations will be traced, and higher intellectual and emotional reverberations accounted for. Such a treatment, to be sure, is at present a mere desideratum toward which we are moving, but the complete realization of which is still a long way off.

Only in regard to the first stages of the process have we reached anything like fairly satisfactory insight. Helmholtz's great work on *Sensations of Tone*, while perhaps not final in every particular, has established certain acoustic facts which are fundamental and will always remain as a basis of musical æsthetics. In general, Helmholtz's treatise deals with the subject of partial tones, combinational tones and beats. Partials, he has shown, accompany most tones of a musical character, and are the source of their differences of timbre. Dissonances are explained as the result of rapid beats, while consonances owe their purity of sound to their comparative freedom from the same. Minor chords are accompanied by combinational tones that are foreign to the harmony, and hence produce a veiled, mysterious effect. The relative harmoniousness of different chord positions is also dependent on the absence or presence of foreign elements. Many other propositions receive elucidation from Helmholtz, but the reader who would learn about them is referred to his classic work itself or the well-known translation of the same by Ellis.

The higher and more psychical reaches of the matter have been approached with considerable skill by various writers, although the results are by no means as clear and incontrovertible as the more elementary ones of Helmholtz. Among the valuable dissertations to be mentioned are Gurney's *Power of Sound*, Stumpf's *Tonpsychologie*, and an essay in

Lazarus' *Leben der Seele* entitled *Die Wirkung der Musik*.

A central problem of musical psychology and æsthetics is that of accounting for the pleasure derived from the art. Among the theories that have been invoked for this purpose, two of the best known, though they likewise belong to the most untenable, are those of Darwin and Spencer.

According to Darwin, music is the result of sexual selection. Those of our pre-human ancestors who could sing best were chosen as mates by the opposite sex. The emotions of love, rivalry and combat incident to the breeding season were thus associatively welded to the perception of tones, so that we, in listening to music, have called up "vaguely and indefinitely the strong emotions of a long-past age."

According to Spencer, on the other hand, the art owes its stirring power to its suggestions of excited and emotional speech. The cadences of music are an intensification of those of language, and arouse the corresponding emotions in exaggerated form.

Later writers on the subject have for the most part either ignored these theories or cast them aside. And it must be admitted that they do not take account of the vast complexity of the subject with which they deal, nor afford much in the way of positive proof.

There is no doubt, for example, that the pleasure we derive from the art is due to a variety of causes. These may be reduced to five: the elementary power of tone, form, association, symbolization and sympathetic agitation through parallelism of tonal process. All of these contribute to the final result. There is an effect of tones which is purely physiological in nature, and unsusceptible of further analysis. Structural beauties are a source of distinct delight, especially in compositions of an elaborate character. Associations are involved, symbolizations play their part, and there are numerous points of resemblance between the flow of tones and the flow of thought and feeling. It would seem, however—and here Darwin and Spencer may be right—as if the peculiarly unique and intense enjoyment afforded by music when it thrills us to the core must likewise be due to a unique cause, or it may be unique combination of causes. What this is has so far not been satisfactorily explained. However, the most promising suggestions are those which have been offered by the "symbolistic" and "parallelistic" theories. The theory of Schopenhauer is fascinating and in some respects highly plausible, but it is metaphysical in nature and so does not fall within the scope of the present article.

A further problem, from the point of view of the listener, is that of the moral effect of music on the individual, which would branch out into the broader questions of its social effects and its place in the life of the community. The question why some people are susceptible to emotional stirring by tones, while others are callous, is an interesting branch of the general problem of musical enjoyment, which likewise has not yet received a satisfactory solution.

II. From the point of view of the performer the task of psychology is to describe

accurately the physical and mental processes operative in the rendition of compositions; more especially the easiest and most effective processes by which the desired results may be achieved. The practical benefit of such knowledge would lie in its help to musical pedagogy. With adequate insight of this kind it would be possible to show wherein the numerous "methods" are both valuable and faulty, and prescribe the best method for any particular case.

A psychology of "learning," applied to music, would elucidate the quickest and most effective means of mastering particular compositions and attaining general proficiency. Tests would also be valuable as aids in the work of the teacher. With their assistance it would be possible to determine on the spot whether a student had talent or not; likewise what his weak and strong points were, and what kind of treatment he would accordingly require.

So far, not much has been done along these lines. The educational psychology of music has, for various reasons, lagged behind that of other branches of pedagogy, both in its theoretic results and the disposition made of these results. It is a rare thing for a prospective teacher to acquaint himself with the conclusions of psychological research; and to tell the truth, the material at his disposal is by no means ample.

III. The methods and habits of composers in creating their works furnish material for many interesting anecdotes, but these would gain scientific value only in case they yielded a better understanding of the laws governing musical inspiration in general, and thus enabled us to produce at will the conditions favorable for such inspiration.

Of greater general interest, at present, is the question of the manner in which a composition reflects the individuality of the composer, as well as the nationality to which he belongs and the age in which he lives. There must be exact marks by which the emotional qualities of a man can be detected in his works, and exact laws according to which a mood or permanent state of mind transmits itself into a composition and gives it a characteristic stamp. Likewise there must be a relation between the nature of a composition and the nationality and era of which it is the product. To a considerable degree such relations have been noted, and they belong to the most interesting facts of musical psychology. There is hardly a doubt, for example, that the rapid tempos of Haydn and Rossini are a reflection of the buoyant, sprightly nature of these men, while the slower and more massive progressions of Beethoven evince a heavier temperament. Similarly the sharp dissonances and syncopations of the latter composer must be an expression of his temperamental explosions and tragic moods. There are relations between the nature of a country's songs and its dances and inflections of speech, resemblances between the music of a period and the contemporaneous literature and art. But most of the foregoing correspondences are sporadic and fragmentary, and have not so far been systematized into general laws. Knowing the nature of a man, we can in many instances detect traces of that nature in his works, but we are not as yet able to reverse the procedure

and draw a picture of the man on the basis merely of his compositions.

Another problem which up to the present has defied solution is that of the apparent incapacity of the feminine sex for the task of composition. There is hardly a more peculiar problem in the entire psychology of sex. The plea that woman has had no chance is not tenable, for the girls that study music far outnumber their masculine competitors. And yet, though there is no dearth of reproductive artists,—singers and instrumentalists,—there is not a single woman composer of primary importance. Literature has produced many famous novelists and poets, art has contributed several noted painters, but the domain of musical composition seems to be a field which has been all but untrodden by the members of the feminine sex.

The psychology of music, then, represents a realm of problems and mysteries. It is a region of beginnings rather than attainments. Some of the problems, bound up with the hidden and subconscious aspects of mentality, may be slow of solution, some perhaps may never be solved. Most promising are those which deal with the reproductive mastery of the art. The questions of pedagogy, indeed, are not so intricate but that a thorough analysis may be expected at a day which is not too remote. The advantages will be varied. There will be a sifting of the fit from the unfit. Those who obviously have no talent for performance will leave this task to their more favored brethren, and save their energies for congenial pursuits. The talented, on the other hand, will have their labors facilitated by an accurate methodology. There will be a saving of nervous wear and tear, and greater results will be achieved in a shorter time.

ALBERT GEHRING,

Author of 'The Appreciation of Music,' etc.

**MUSIC-BOX.** See MUSICAL INSTRUMENTS, MECHANICAL.

**MUSICAL DRAMA.** See DRAMA; MUSIC.

**MUSICAL ELEMENTS AND TERMS.**

Music is the science or art which treats of tones produced by the mathematically regular vibrations of resonant bodies, in contradistinction to a confusion of irregular vibrations created by noise or a jumble of sounds.

Modern music, therefore, considered on its technical side depends upon a perfected system of mathematics and acoustics, evolved through centuries of gradual development, an evolution sketched in the historical and descriptive article on MUSIC in this work, to which refer, as also to GREEK MUSIC; MODE; MODULATION; TEMPERAMENT; WELL-TEMPERED CLAVIER, and related subjects.

By its manipulation of space and time in the process of development, the whole science of music has resolved itself into the mathematical measurement, combination and distribution of sound waves. Tones, considered simply as to their duration, are magnitudes of time, which stand in a descending geometrical progression the exponent of which is 2:1,  $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{16}$ ,  $\frac{1}{32}$ , etc. The time is expressible in fractions ( $\frac{1}{2}$ ,  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{16}$ ,  $\frac{1}{32}$ , etc., time), which indicate in numbers how many parts of time (○) are contained in each bar. In space, tones

can be considered as magnitudes of sound, and their distances from each other in the scale are expressed in numbers, which have reference to a mathematical division of the space between two sounds, adopted as limits (the octave, the third, seventh, etc.). Similar proportions exist between the various voices, the soprano or treble, bass, etc., and between the various keys. In instrumental music, the depth and height of the tones depend upon the proportions of the thickness, length and lightness of the chords, the quality, diameter and distance of the openings in wind instruments and the like; and all these proportions are determined and measured according to mathematical rules. Middle C, shown in the scale farther on, has about 132 vibrations to the second, and is produced by sound waves from eight to nine feet apart. Waves at half that distance apart, produce a tone one octave higher, half that again the next higher octave, and so on. In large organs C four octaves below middle C, with  $16\frac{1}{2}$  vibrations per second, is reached, but the effect is imperfect. The piano reaches  $^{\#}4$  with 3,520 vibrations per second, and sometimes  $^{\#}5$ , with 4,224 vibrations. The highest note taken in the orchestra is probably  $^{\#}5$ , on the piccolo, with 4,752 vibrations. The practical range in music is from 40 to 4,000 vibrations per second, embracing seven octaves. The human ear is, however, able to compass 11 octaves, that is, notes vibrations ranging from  $16\frac{1}{2}$  up to 38,000 in a single second of time.

As may be gathered from the preceding paragraphs, the simplest form of musical sound is the Tone, distinguished by the three properties of length, pitch and power. These three properties constitute the elemental departments of music: RHYTHMICS, treating of the length of tones, the structure of phrases, sections and periods; MELODICS, treating of the pitch and succession of tones; and DYNAMICS, treating of the power or force of tones, and the manner or form of delivery.

Tones are represented by characters called Notes, named by some nations, including the English-speaking races, after the first letters of the alphabet, A, B, C, D, E, F, G; and, by Latin nations generally after syllables, as Do, Re, Mi, Fa, Sol, La, Si. Notes by their positions on the Staff of five lines give the pitch of the tones, and indicate their length by their form. The notes in common use are the

WHOLE-NOTE    HALF-NOTE    QUARTER    EIGHTH    SIXTEENTH    THIRTY-SECOND

the names indicating the relative length of their tones. In modern music, the Whole-note, occupying all of an allotted amount of time, is regarded as the unit, although a character representing a tone twice as long as the Whole-note, and called a Breve or Double-note (Ⓞ) is sometimes used.

Rests,—characters used to indicate silence,—correspond in length of time to the notes which they represent, as indicated by their names:

WHOLE-REST    HALF-REST    QUARTER    EIGHTH    SIXTEENTH    THIRTY-SECOND

A Dot placed after a note or rest increases the duration of either by one-half; two Dots

increase by three-fourths, the second dot adding one-half the length of the first.

A curved line (∩), called a Tie or Bind, placed over or under two notes of the same pitch, indicates that they represent a single tone equal to their united lengths; the curved line drawn over two or more notes which differ in pitch, is called a Slur, and indicates that these notes are to be sung or played legato, that is, smoothly and fluently.

The Pause (∩) or Hold is placed over or under a note and indicates a prolongation of the sound according to the judgment of the performer.

Three equal notes may have their length diminished or reduced by placing the figure 3 above or below them; so marked they are termed Triplets, and their length equals two of the same kind.

To facilitate interpretation and performance, musical compositions are divided into short sections of equal duration called Measures and Parts—into measures by single bars and into parts by double bars. If a part is to be repeated, dots, called Repeating Dots, precede the double bar. (See characters at end of article).

The regular succession of these parts is called Meter, and this mathematical division of sounds by means of measures, metrical divisions and notes, is called Time. The time of each measure is the same as that of every other measure in the part and is determined by two figures, in the form of a fraction placed at the beginning of the piece, or at the beginning of a part. The Numerator of the fraction indicates the number of beat counts into which the measure is divided; the Denominator indicates the form of note which will represent the beat. Thus  $\frac{6}{8}$  shows that there are six beat counts in the measure and that an eighth-note will fill each beat.

According to the division of the Measure into parts, it is respectively called Double, Triple, Quadruple or Sextuple measure. Each kind of measure may have several varieties, according with the length of the notes expressed by the denominator of the fraction. For example:—

DOUBLE.	TRIPLE MEASURE.	QUADRUPLE MEASURE.	SEXTUPLE MEASURE.
P P P	P P P P P	P P P P P P	P P P P P P P P
P P P P	P P P P P P	P P P P P P P P	P P P P P P P P P P

Accent—the life of Rhythm—is a stress given to certain parts of the measure. In Double and Triple measures, the first part is accented; in Quadruple measure, the first and third parts; in Sextuple measure, the first and fourth parts. In measures containing two accents, the first is the principal and stronger.

Rhythm, defined in its broadest application, is the swing and sweep of a musical composition, emphasized by the accents ringing out in their proper places, and attaining a series of climaxes in the special stress given to each metrical division of the work.

A Syncopated Note is one that begins on an unaccented part of a measure and continues on an unaccented part, giving the not unpleasant hiatus or jump to the rhythm, characteristic of much of the popular modern American music.

The length of the beats in each measure is indicated by certain Italian words, the chief of which are *adagio*, *allegretto*, *allegro*, *andante*, *andantino*, *largo*, *larghetto*, *lento*, *moderato*, *presto*, *prestissimo*, the definitions of which will be found in the table of musical terms incorporated with this article.

In the elemental department of MELODICS, the staff is used to represent the relative position and pitch of tones. The staff consists of five lines and four spaces, each line and space being called a degree. Added lines, called Ledger or Leger lines, are used to represent tones which are too high or too low to be represented upon the staff. They may be placed above and below the staff to any extent desired, as they are simply a continuation of the staff, the note immediately above or below the staff being in a space. The lines and spaces of the staff are named from the lowest upward, first line, first space, etc., the added lines and spaces above or below also being respectively enumerated first line above or first line below, etc.

Each degree or line and space is designated by one of the first seven letters of the alphabet, determined by the character of the Clef. The Clef is the character placed at the beginning of the staff to show how the letters are to be applied. The Clefs in common use are the G or treble clef marking the position of G on the second line of the staff, and the F or bass clef marking the position of F on the fourth line of the staff. In four-part songs, the soprano and alto are written in the treble, and the tenor and bass in the bass clef. The C on the first line below the treble staff, and the first C on the first line above the bass represent the same tone which is known as Middle C.

The staff as here represented embraces the compass of every singing voice, and extends over a range of 31 notes, or four and a quarter octaves.

Voices are usually considered under three divisions for the male: bass, baritone and tenor; and four for the female sex, contralto, alto, mezzo-soprano, and soprano. The usual range of the bass is from E below the bass clef (phenomenal voices sometimes descending to lowest C) ascending two octaves to f; baritone from G on first line of bass clef, two octaves

C D E F G A B C D E F G A B c d e f g a b c' d' e' f' g' a' b' c' d' e'

to *g*; tenor, from *C*, two octaves to *c'*; contralto, the deepest female voice, from *F* to *c''*, or two and one-half octaves; alto, two octaves, from *F* to *f*; mezzo-soprano, from *A* to *a'*; and soprano from *c* (middle *C*) two octaves to *c''*, which is also indicated as *c'*. Following natural and mathematical laws the tones of the female voice are an octave higher than those of the male, therefore a soprano solo sung by a tenor is rendered an octave lower than the notes in which it is written.

Besides the treble and bass clefs, others are used by certain orchestral instruments, as the alto clef for the viola, marking the position of *C* on the third line, and the tenor clef used for the trombone and marking the position of *C* on the fourth line.

The different vocal and instrumental parts are commonly represented by two or more staves, united by a Brace, and called a Score.

The Absolute Pitch of Tones, that is the pitch independent of scale relationship, is designated by the letters naming the degrees of the staff; as *A*, *B*, *C*, *D*, *E*, *F*, *G*. The position of these letters is fixed and unchangeable while the clef remains unchanged.

The difference of pitch between any two tones, as from *A* to *B*, from *A* to *E*, from *C* to *G*, etc., is called an Interval, and in the regular succession of the natural tones, there are two kinds of intervals, larger and smaller. The larger intervals are called Tones and the smaller semi-tones. In the major scale the semi-tones occur between the third and fourth notes and between the seventh and eighth notes, the other five notes of the scale representing each a tone. These two half-tones in the octave afford infinite variety in music. Were the eight natural sounds in the octave equidistant one from another, there being no semi-tones, the keys would differ only in acuteness and not in quality, as now. Between any two tones of the staff having the interval of a step, another tone may be inserted, dividing the step into two half-steps. These inserted tones are represented on the degrees of the staff by the aid of characters called Sharps and Flats. Thus, a tone inserted between *C* and *D*, is named *C* sharp, or *D* flat.

A Sharp  $\sharp$ , placed on a degree, raises the pitch of a tone a half-step; a Flat,  $\flat$ , placed on it, lowers the pitch of a tone a half-step below that named by the letter. The power of a sharp or a flat may be canceled by a character called a Natural,  $\natural$ . A Double Sharp,  $\times$  is used on a degree affected by a sharp, to represent a tone a half-step above the one affected by the sharp; its power may be canceled by a sharp and natural,  $\sharp$ . A Double Flat,  $\flat\flat$ , is used on a degree affected by a flat, to represent a tone a half-step below the one affected by a flat; it may be canceled by a flat and natural  $\flat$ .

The Signature of a Staff is the part between the clef and the fraction; it is named from the number of sharps or flats which it contains, and indicates the key in which the composition is to be sung or performed. If there is no signature, the key is that of *C* or its relative minor *A*, and the notes correspond with the white keys of piano or organ. A sharp or flat in the signature applies not only to the degree on which it stands, but also to all others which

represent the same pitch. A sharp, a flat or a natural, placed outside the signature, is called an Accidental, as appearing accidentally in the measure, and applies only to the degree on which it stands. If not canceled, its influence extends no farther than the measure in which it appears, except when the last note of a measure is flat or sharp, and the first note of the following measure is the same letter; then, if it is syncopated, the influence of the accidental extends to that note.

The Relative Pitch of Tones is indicated by a Scale, or Tone Ladder. The Diatonic Scale, generally called the Scale, consists of a regular succession of intervals from the key-note to the octave, 1st, 2d, 3d, 4th, 5th, 6th, 7th, 8th or octave, by a compromise called TEMPERAMENT (q.v.), it having been found most agreeable to join to the seven sounds of one group, the first of the next higher, making eight in all. The key-note is the first note in the scale. This scale is also called the Major scale to distinguish it from another scale, having its semi-tones in different order, and called the Minor scale. In the compass of the scale there are five whole tones or degrees, and two semi-tones or half-degrees. Commencing on *C*, that is making *C* one of the scale, these semi-tones are found between the third and fourth and seventh and eighth degrees and between the first and third degrees are found two whole tones, marking the distinctive feature of the "Major" or greater third. All music written on the scale when so constructed is said to be in the major keys; and this scale can only be formed from notes following this natural order. There is, however, another series of notes, equally well fitted for expressing musical ideas, which is formed by commencing on *A* instead of *C* or the equivalent note of any other Major key-tone. In this scale the semi-tones always fall between two and three and five and six, between the first and third degrees, there being not two whole tones, but only a tone and a half, making the "minor" or lesser third. All music written on a scale so constructed is said to be in the minor key, and is often most impressive. The Minor scale has various forms. In the Natural form as already shown, the half-steps occur between two and three, and five and six, and is formed from the Major Scale, by taking the last two notes above and placing them below. The Harmonic form differs from the Natural form by the introduction of sharp-seven. The Melodic form in ascending has sharp-six and sharp-seven, while it usually descends by the Natural form. The Minor scale, based upon six of the Major scale, is called its relative minor; and the Major scale, based upon three of the Minor scale, is called its relative major. The signature of a minor piece of music is the same as its relative major, the additional sharps or flats being introduced before the proper notes in the piece. Thus, a minor piece in the key of *E* has the signature of *G* major, that is  $F\sharp$ ; and  $D\flat$  is used instead of *D*.

The key-note is One of the scale, and is called the Tonic. As already explained a minor third above the tonic characterizes the Minor scale; a major third, the Major. The Fifth of the scale is the Dominant; the Fourth, the Sub-Dominant. The key of a piece of

music is the fundamental tone, or one of the scale in which it is written, and is indicated by the signature. The key of C has no signature. The other key signatures are G, one sharp—F♯; D, two sharps—F♯, C♯; A, three sharps—F♯, C♯, G♯; E, four sharps—F♯, C♯, G♯, D♯; B, five sharps—F♯, C♯, G♯, D♯, A♯; F, six sharps—F♯, C♯, G♯, D♯, A♯, E♯; F, one flat—B♭; B♭, two flats—B♭, E♭; E♭, three flats—B♭, E♭, A♭; A♭, four flats—B♭, E♭, A♭, D♭; D♭, five flats—B♭, E♭, A♭, D♭, G♭; G♭, six flats—B♭, E♭, A♭, D♭, G♭, C♭. Notice that beginning with C the dominant or fifth note of each scale forms the tonic or key-note of the next scale, and thus interweaves the 11 scales into a completed circle.

An interval is the difference of pitch between any two notes in the scale. Unisons are of the same pitch. A major second consists of a step; a minor second of a half-step. A major third consists of two steps; a minor third of a step and a half-step. A perfect fourth consists of two steps and a half-step; an augmented fourth of three steps. A perfect fifth consists of three steps and a half-step; a diminished fifth of two steps and two half-steps. A perfect sixth consists of four steps and a half-step; a diminished sixth of three steps and two half-steps. A major seventh consists of five steps and a half-step; a minor seventh of four steps and two half steps. A perfect octave consists of five steps and two half-steps. These are called diatonic intervals, as they are all found in the diatonic scale. Other intervals, called chromatic intervals, may be formed by the use of sharps and flats. When the lower note of the two representing an interval is placed an octave higher, or the upper one an octave lower, the interval is said to be inverted. The degrees of an interval are counted upward, unless the opposite is stated; and the degrees occupied by the notes, as well as the ones between them, are counted.

The Chromatic Scale is a regular succession of semi-tones, the tones named from those of the diatonic scale or the letters of the staff, the intermediate ones taking their names from one or the other of the tones between which they occur, with the addition of the word "sharp" or "flat." Thus the tone inserted between C and D, when named with respect to absolute pitch, is called C sharp or D flat; and with respect to relative pitch is called sharp one or flat two.

Passing Tones not essentially belonging to a melody are often introduced, and are usually represented by small notes.

A Chord is a pleasing combination of tones sounded together, and Harmony (q.v.) is a succession of chords, according to the rules of progression and modulation.

Dynamics or the power of tones and the manner or form of their delivery constitute the third elemental department of music. The power of tones is usually indicated by words, marks of expression, characters and abbreviations, mostly of Italian origin, affixed in the positions desired on the composition by composer, editor or technical interpreter.

The following alphabetical list includes the dynamic marks of expression, together with the terms which indicate the relative time move-

ment of a composition, and certain other terms and phrases, commonly used in music. Important terms treated separately in this work, under their respective titles, are designated by the reference (see special article). Terms which are practically in anglicized form and self-explanatory are omitted.

- A. (*It.*) — By, for, from, to, at, in.  
 ABBANDONE, ABBANDONO, CON (*It.*) — With self-abandonment; despondingly.  
 A BATTUTA (*It.*) — In strict or measured time.  
 A BENE PLACITO (*It.*) — At pleasure as to time.  
 ANSATZ (*Ger.*) — A section, cadence or phrase.  
 A CAPPELLA (*It.*) — In the church style.  
 A CAPRICCIO (*It.*) — At will, agreeable to fancy.  
 ACCELLERANDO (*It.*) — With gradually increasing velocity of movement.  
 ACCENT. — (See special article).  
 ACCIACCATURA (*It.*) — A grace note forming a species of arpeggio.  
 ACCIDENTS or ACCIDENTALS. — Occasional sharps, flats and naturals, placed before notes in the course of a piece.  
 ACCOMPANIMENT; ACOUSTICS. — (See special articles).  
 ADAGIO (*It.*) — A very slow degree of movement, demanding much taste and expression in the performance.  
 ADAGIO ASSAI or MOLTO (*It.*) — Very slow and expressive.  
 ADAGIO CANTABILE E SOSTENUTO (*It.*) — Very slow, singing and sustained.  
 ADAGISSIMO (*It.*) — Extremely slow.  
 A DEUX (*Fr.*); A DUE (*It.*) — For two voices or instruments.  
 A DEUX TEMPS (*Fr.*) — Two equal times or measure-notes in a bar, such as in the Valse a deux temps, with six steps to every two of the ordinary waltz.  
 AD LIBITUM (*Lat.*) — At will or discretion. This expression implies that the time of some particular passage is left to the pleasure of the performer; or that he is at liberty to introduce whatever embellishments his fancy may suggest.  
 AFFETTUOSO, AFFETTUOSAMENTE, or CON AFFETTO (*It.*) — With tenderness and pathos.  
 AFFLIZIONE, CON (*It.*) — Sorrowfully, with affliction.  
 AFFRETTANDO, AFFRETTATE (*It.*) — Accelerating, hurrying the time.  
 AGITATO, CON AGITAZIONE (*It.*) — With agitation, anxiously.  
 AL, ALL', ALLA (*It.*) — To the, or occasionally, in the style of.  
 ALLEGREMENTE (*It.*) — With quickness.  
 ALLEGRO (*It.*) and derivatives. — (See special article).  
 ALL' IMPROVISTA (*It.*) — Extemporaneously, without premeditation.  
 AL SEGNO, AL SOLO, or the character ♯, signifies that the performer must return to a similar character in the course of the movement, and play from that place to the word FINE, or the mark over a double bar.  
 ALT, ALTA (*It.*) — Higher; as Ottava Alta, an octave higher.  
 ALTISSIMO (*It.*) — Extremely high as to pitch.  
 ALTO (*It.*) — In vocal music indicates the counter-tenor or highest male voice. In instrumental music, it also indicates the tenor part.  
 AMABILE (*It.*) — Amiably.  
 AMOROSO, AMOREVOLE, or CON AMORE (*It.*) — Affectionately, tenderly.  
 ANDANTE (*It.*) — This term often modified, both as to time and style, by the addition of other words, broadly implies a movement somewhat slow and sedate, but in a gentle and soothing style.  
 ANDANTINO (*It.*) — Somewhat slower than andante.  
 ANIMATO, CON ANIMA, ANIMOSO (*It.*) — With animation; in a spirited manner.  
 ANLEITUNG (*Ger.*) — An introduction, a term often occurring in the titles to German publications.  
 ANTHEM. — A composition in the sacred style, of English origin, the words of which are generally selected from the Psalms.  
 ANTIPHONE. — Responses made by one part of the choir to another, or by the congregation to the priest.  
 A PIACERE; A PIACIMENTO (*It.*) — At the pleasure of the performer. (See *Ad libitum*).  
 APLOMB (*Fr.*) — Self-contained; steady; exactitude as to time.  
 APPASSIONATO, APPASSIONAMENTO (*It.*) — With intensity of feeling.  
 APPOGGIATURA (*It.*) — A grace note or note of embellishment which as a passing tone precedes an essential tone on an accented part of a measure.  
 A QUATRE MAINS (*Fr.*); A QUATRO MANI (*It.*) — For four hands. A pianoforte duet.  
 ARDITO (*It.*) — Boldly, energetically.  
 ARIA (*It.*) — An air, or song. ARIOSO (*It.*) — In the style of an air; vocal, melodious.  
 ARPEGGIO (*It.*) — An imitation of the harp produced by playing the notes of a chord in rapid succession, instead of altogether.  
 ASSAI (*It.*) — Very, extremely.  
 A TEMPO. — In time.  
 ATTACCA, ATTACCA SUBITO (*It.*) — Attack suddenly or commence immediately.

- AUDACE, CON (It.)** — With boldness.
- A UNA CORDA (It.)** — On one string.
- A VISTA (It.)** — At sight; **A PRIMA VISTA**, at first sight. **BAR**; **BARCAROLE**; **BASS**; **BEAT**. — (See special articles).
- BEGLEITUNG (Ger.)** — An accompaniment.
- BELLIÇOSAMENTE, BELLIČOSO (It.)** — In martial, bellicose or warlike style.
- BELLEZZA, CON (It.)** — With beauty of expression.
- BEN (It.)** — Well; as **BEN MARCATO**, in well-marked time.
- BENE PLACITO (It.)** — At will.
- BIS (Lat.)** — Twice; indicating that a passage, distinguished by a curve drawn over or under it, must be performed twice.
- BOLERO; BRAVURA (It.)** — (See special articles).
- BREVE**. — A note twice the length of the semi-breve or Whole Note, seldom used in modern music.
- BRILLANTE (It. and Fr.)** — An expression indicating a showy and sparkling style of performance.
- BRIO, BRIOSO, CON BRIO (It.)** — With fire, brilliancy and spirit.
- BRISÉ (Fr.)** — Sprinkled, broken into an arpeggio, in treating of chords.
- BUFFO, BUFFA (It.)** — Comic; as opera buffa, a comic opera.
- CADENCE; CADENZA**. — (See special articles).
- CALANDO (It.)** — Gradually diminishing in tone and quickness; becoming softer and slower by degrees.
- CALCANDO (It.)** — Pressing on, hurrying the time.
- CALMATO (It.)** — With tranquility, repose.
- CALORE (It.)** — With much warmth and animation.
- CANON**. — (See special article).
- CANTABILE (It.)** — In a graceful and singing style.
- CANTATA; CANTICLE**. — (See special articles).
- CANTILENA (It.)** — The melody, air or principal part in any composition; generally the highest vocal part.
- CANTOR (It.)** — A singer; (*Lat.*) A precentor. **CANTORIS** — The name given to the north side of the cathedral, the left side facing the altar occupied by the cantor or precentor, and opposite to the side occupied by the dean, or dean and priests.
- CANTUS (Lat.)** — A song, chant, or melody; **CANTUS FIRMUS**, the plain-song or chant.
- CANONET**. — (See special article).
- CAPELLA, ALLA (It.)** — In the church style.
- CAPO (It.)** — The head or beginning.
- CAPRICCIO; CAPRICCIOSO (It.)** — In a fanciful, capricious style.
- CAROL; CAVATINA; CHANT; CHOIR; CHORALE; CHROMATICS; CLEF**. — (See special articles).
- CODA (It.)** — A few bars added at the close of a composition, beyond its natural termination.
- COL, COLLI', COLLA (It.)** — With; as col arco, with the bow.
- COLLA PARTE (It.)** — Implies that the accompanist must follow the principal part in regard to time.
- COMMODO, COMMODAMENTE (It.)** — Quietly, with composure.
- COMMON TIME; CON; CONCERTO; CONCORD; COUNTERPOINT**. — (See special articles).
- DA CAPO OF D. C. (It.)**; **DIAPASON; DIATONIC; DILETTANTE; DISCORD; DISSONANCE; DOLCE; DOMINANT**. — (See special articles).
- DAL (It.)** — By; as **DAL SEGNO**, from the sign; a mark of repetition.
- DECANI (Lat.)** — See **CANTORIS**.
- DECISO (It.)** — With decision, boldly.
- DECRESCENDO (It.)** — Gradually decreasing in quantity of tone.
- DELICATEMENTE, DELICATO**. — Delicately; **CON DELICATEZZA**, with delicacy of expression.
- DESTRA (Lat.)** — The right hand.
- DIMINUENDO OF DIM. (It.)** — Diminish gradually the quantity or intensity of tone.
- DIVERTIMENTO (It.)** — A short, light composition, written in a familiar and pleasing style.
- DEVOTO (It.)** — Devoutly, in a solemn style.
- ELEGAMENTE; ELÉGANTE (It.)** — With elegance.
- EMPIFUNG (Ger.)** — Emotion, passion.
- ENERGICO, CON ENERGIA OF ENERGIAMENTE (It.)** — With energy.
- ENHARMONIC**. — (See special article).
- ESPRESSIVO OF CON ESPRESSIONE (It.)** — With expression.
- EXTRAVAGANZA**. — (See special article).
- FALSETTO; FANDANGO; FANTASIA; FIFTHS; FIGURED BASS; FUGUE; FUNDAMENTAL BASS**. — (See special articles).
- FORZANDO OF FORZ, OF FZ.** — Implies that the note is to be marked with particular emphasis or force.
- FRETTA, CON (It.)** — With speed; hastily.
- FUOCO, CON, POCOSO (It.)** — With fire, intense animation.
- GALOP; GAMUT; GAVOTTE; GREGORIAN CHANT**. — (See special articles).
- GEBUNDEN (Ger.)** — Tied or connected in regard to the style of playing or writing.
- GIOCOSAMENTE; GIOCOSSO; GIOJOSO (It.)** — Humorously; joyously; with sportiveness.
- GRUO (It.)** — In just and exact time.
- GLEE**. — A composition for three or more voices, generally in a cheerful style.
- GLISSANDO, GLISSICATO (It.)** — In a gliding manner.
- GRANDIOSO (It.)** — In a grand and elevated style.
- GRAVE (It.)** — A very slow and solemn movement; also a deep, low pitch in the scale of sounds.
- GRAZIOSAMENTE, GRAZIOSO, OR CON GRAZIA (It.)** — In a flowing and graceful style.
- GUSTO, GUSTOSO, OR CON GUSTO (It.)** — With taste, elegantly.
- HARMONICS; HARMONY**. — (See special articles).
- HAUPTSATZ (Ger.)** — The principal subject or theme.
- HAUPTSTIMME (Ger.)** — A principal part.
- HOMOPHONY**. — In unison.
- IMPONENTE (It.)** — Imposingly, haughtily.
- INTERMEZZO (It.)** — An interlude; intermediate, placed between two others.
- INTERVAL; INTONING; INVERSION**. — (See special articles).
- ISTESSO (It.)** — The same, as *istesso tempo*, the same time.
- KEY; KYRIE**. — (See special articles).
- LARGO (It.)** — A very slow and solemn degree of movement.
- LARGHETTO**, slower than *largo*. **LARGHISSIMO**, extremely slow.
- LEADING NOTE**. — The seventh note of the scale of any key, when at the distance of a semi-tone below the key note.
- LEBHAFT (Ger.)** — Lively.
- LEGATO (It.)** — In a smooth and connected manner. **LEGATISSIMO**, exceedingly smooth and connected.
- LEGGIERO OF CON LEGGIEREZZA (It.)** — With lightness and facility of execution.
- LENTO (It.)** — In slow time. **LENTANDO**, with increased slowness.
- LOCO (Lat.)** — Implies that a passage is to be played just as it is written in regard to pitch; it generally occurs after *8va alta* or *8va bassa*.
- LUSINGANDO (It.)** — Soothingly, persuasively.
- LUSTIG (Ger.)** — Gay, sportive.
- MADRIGAL; MAGNIFICAT; MAJOR; MATINS; MAZURKA; MEASURE; MELODY; MELODRAMA; METRONOME; MINUET; MODE; MODULATION; MOTIF OR LETMOTIF; MUSIC**. — (See special articles).
- MA (It.)** — But; as *allegro MA non troppo*, quick but not too much so.
- MAESTOSO (It.)** — With majestic and dignified expression.
- MAIN (Fr.)** — Hand; as *main droite*, main gauche, or *M. D.*, *M. G.*, the right or left hand in piano music.
- MANO (It.)** — Hand; *mano dritta*, the right hand; *mano sinistra*, the left hand.
- MARCATO (It.)** — In a marked and emphatic manner. **MARCATISSIMO**, very strongly marked.
- MARZIALE (It.)** — In a martial style.
- MENO, OR MEN. (It.)** — Less; as *men. presto*, less quick; *men. forte*, less loud; *men. piano*, somewhat softer; *men. vivo*, with less spirit.
- MESSA DI VOCE (It.)** — A swelling and diminishing of the voice on a long holding note.
- MESTO (It.)** — Mournfully, sadly, pathetically.
- MEZZA VOCE (It.)** — With moderation as to tone; rather soft than loud.
- MEZZO (It.)** — In a middling degree or manner; as *mezzo forte*, rather loud; *mezzo piano*, rather soft.
- MEZZO SOPRANO (It.)** — A female voice of a lower pitch than the soprano or treble. A C clef for this voice used to be placed on the second line of the staff.
- MOLTO (It.)** — Very, extremely; as, *molto allegro*, very quick; *molto adagio*, extremely slow.
- MORDENTE (It.)** — A beat or transient shake.
- MORENDO (It.)** — Gradually subsiding in regard to tone and time; dying away.
- MOSSO (It.)** — Movement; as *piu mosso*, with more movement, quicker; *meno mosso*, slower.
- MOTO, OR CON MOTO (It.)** — With motion, agitation, energy and animation.
- NACHDRUCK (Ger.)** — Emphasis, accent.
- NOCTURNE**. — (See special article).
- NON (It.)** — An adverb of negation, generally associated with *troppo*; as *non troppo presto*, not too fast.
- NOTATION**. — The art of representing musical sounds and their various modifications by notes, signs, terms, etc.
- OFFERTORY; OPERA; OPERA BUFFA; ORATORIO; ORCHESTRA; ORGAN; OVERTURE**. — (See special articles).
- OBLIGATO OR OBLIGATI (It.)** — A part or parts of a composition indispensable to its just performance, and which cannot be properly omitted.
- OCTAVE; OTTAVA**. — An interval of eight notes.
- PASTORALE; PIANISSIMO; PIANO OF PIANO-FORTE; POLONAISE; PRELUDE**. — (See special articles).
- PARLANDO; PARLANTE (It.)** — In a speaking manner; accented, as if with words in a declamatory style.
- PESANTE (It.)** — With weight and importance, impressively.
- PIACERE (It.)** — Will, pleasure; as a *piacere*, at the performer's pleasure in regard to time.
- PIETOSO (It.)** — With pity, compassionately.
- PIÙ (It.)** — More, an adverb of augmentation; as *più presto*, quicker.
- PIZZICATO OR PIZZ. (It.)** — In violin or violoncello music, the twitching of notes with the finger, instead of playing with the bow.
- POCO (It.)** — A little, rather, somewhat. **POCO A POCO**, by degrees, gradually. **POCHETTO, POCHEITINO**, a little, as *fiand. un pochettino*, play somewhat slower.
- POGGIATO (It.)** — Dwelt upon, impressive.
- POI (It.)** — Then; as *piano poi forte*, soft, then loud.

**PORTAMENTO** (*It.*) — The manner of sustaining and conducting the voice. A gliding from one note to another.

**PRESTO** (*It.*) — Very quick. **PRESTENZA, CON**, with rapidity, quickness. **PRESTISSIMO**, the most rapid degree of movement.

**PRIMO** (*It.*) — First; as *tempo primo*, in the first or original time.

**QUASI** (*It.*) — In the manner or style of; as, *quasi allegretto*, like an *allegretto*.

**QUIETO** (*It.*) — With calmness or repose; quietly.

**R.** or **R.H.** — Indicates the right hand in piano-forte music.

**RALLENTANDO** (*It.*) — A gradual diminution in the speed of the movement, and a corresponding decrease in the quantity of tone.

**RECITATIF** (*Fr.*) — (See special article).

**RESOLUTION**. — (The concord which necessarily follows a preceding discord.

**RETARDANDO, RITARDANDO, RITARDATO, RITENENTE, RITENUTO** (*It.*) — A gradual retarding and decrease in the speed of the movement.

**RHYTHM**. — The theory of musical cadence, as applied to melody—more broadly defined in the first part of this article, to which refer.

**RICERCARI** (*It. plur.*) — Difficult exercises, usually fugal, for the voice or for some instrument.

**RICORDANZA** (*It.*) — With recollection, remembrance.

**RINFORZANDO, RINFORZATO, RINF. OR RF.** (*It.*) — With additional tone and emphasis.

**RONDEAU or RONDO; ROUND**. — (See special articles).

**RUBATO or ROBATO** (*It.*) — Robbed, borrowed. *Tempo rubato* is applied to a style of performance in which the interpreter, to express some emotional mood, holds some notes longer than their legitimate time, curtailing others of their proportionate durations in order that, on the whole, the aggregate value of the bar may not be disturbed.

**SANCUS; SARABAND; SERENADE; SOLFAING; SOLFEGGIO; SONATA; SOPRANO; STABAT MATER; SYMPHONY; SYNCOPATION**. — (See special articles).

**SCHERZANDO, SCHERZANTE, SCHERZO, SCHERZOSO, or SCHERZ** (*It.*) — In a light, playful and sportive manner. **SCHERZANDISSIMO**, in an exceedingly playful style.

**SCIOLTO** (*It.*) — With freedom and boldness.

**SDRUCCIOLATO** (*It.*) — Sliding or gliding the finger along the keys, or strings of an instrument.

**SEGNO or \$** (*It.*) — A sign; as *al segno*, return to the sign; *dal segno*, repeat from the sign.

**SEGUE, SEQUITO** (*It.*) — Now follows, or as follows; *segue il coro*, the chorus follows; *segue la finale*, the finale now follows. It is also used in the sense of in similar or like manner, to show that a subsequent passage is to be played like that which precedes it.

**SEMPRE** (*It.*) — Always; *sempre staccato*, always staccato or detached; *sempre forte*, always loud; *sempre più forte*, continually increasing in force.

**SENZA** (*It.*) — Without; as *senza pedale*, without pedals.

**SENIESTRA** (*It.* from Lat. *sinistra*). — The left hand.

**SPORZANDO, SPORZATO or SF.** (*It.*) — Implies that a particular note is to be played with emphasis and force.

**SINO or SIN'** (*It.*) — As far as.

**SMORZANDO** (*It.*) — A gradual diminution as to tone.

**SOLMIZATION**. — The same as *solfaing*.

**SOSPIRANDO** (*It.*) — Desponding, with apprehension.

**SOSTENUTO or SOST.** (*It.*) — Sustained, continuous in regard to tone.

**SOTTO** (*It.*) — Below, under; as *sotto voce*, in an under tone.

**STACCATO** (*It.*) — Implies that the notes so marked are to be played distinct, short and detached from one another. **STACCATISSIMO**, very detached.

**STREPITO, STREPITOSO, STENTATO** (*It.*) — In a noisy, boisterous manner, for some particular effect.

**STRETTO** (*It.*) — The knot. That part of a fugue in which the subject and answer succeed one another at a very short interval of time. In modern music it is sometime used to imply an acceleration of the time near the close of the piece.

**STRINGENDO** (*It.*) — Accelerating the degree of movement.

**TARANTELLA; TEMPERAMENT; TEMPO; THEME; TONE; TREBLE; TRIO; TRIPLET**. (See special articles).

**TANTO** (*It.*) — Not so much; not too much.

**TENERAMENTE, TENERO, or CON TENEREZZA** (*It.*) — Tenderly.

**TENUTO, TENURE, or TEN.** (*It.*) — Implies that a note or notes must be held on, sustained or kept down the full time.

**THROUGH BASS or FIGURED BASS**. — A bass part with figures placed over the notes which indicate the harmony to be played to each note, and serve as a guide to the accompanist.

**TOCCATA** (*It.*) — A composition of indefinite form and rapid movement somewhat in the style of the fantasia (q.v.).

**TRANSPOSITION**. — Changing from one key to another for performance or transcription.

**TRAURIG** (*Ger.*) — Sad.

**TREMOLO** (*It.*) — The reiteration of a note or chord with great rapidity so as to produce a tremulous kind of motion.

**TRILL or TR.** — A shake.

**TUTTI** (*It. plur.*) — All. A term used to point out those passages where all the voices, or instruments, or both, are to be introduced.

**VA** (*It.*) — Go on; as *VA CRESCENDO*, continue to increase in loudness.

**VARIAMENTO** (*It.*) — In a varied and free style of execution.

**VELOCE or CON VELOCITA** (*It.*) — In rapid time. **VELOCISSIMO**, with extreme rapidity.

**VIBRATO, VIBRANTE, VIBRATE** (*It.*) — With a strong vibrating quality of tone.

**VISTAMENTE** (*It.*), **VITE, VITEMENT** (*Fr.*) — With quickness.

**VIVACE, VIVAMENTE, or CON VIVACITA** (*It.*) — With briskness and animation.

**VIVO, CON VIVEZZA** (*It.*) — Lively, vivaciously.

**VOCALIZE**. — To practise singing on the vowels.

**VOLANTE** (*It.*) — In a light and rapid manner.

**VOLANTÉ** (*Fr.*) — Will, pleasure, as a *volonté*, at will.

**VOLTA** (*It.*) — Time of playing a movement; as *prima volta*, the first time of playing.

**VOLTI SUBITO or V. S.** (*It.*) — Turn over the page quickly.

**VOLUNTARY**. — An organ piece, generally consisting of two or three movements calculated to display the capabilities of the instrument and the skill of the player, and used before or after service, or during the offertory.

**ZOPPO** (*It.*) — In a halting or limping manner. A style of melody in which a long note is always placed between two short notes.

Characters indicating the various degrees of loud and soft:

 Crescendo or gradual increase of tone.

 Decrescendo or gradual decrease.

 Indicates first a crescendo, then a decrescendo.

 Indicates first a decrescendo, and then a crescendo.

Marks of accent and expression:

 Indicate a stress or marked accent on any single note or chord. The abbreviations *rf.*, *sf.*, *sfz.*, *fp.*, or even *f* over a single note are also used for the same purpose.

 Dashes indicate notes struck staccato or very short, that is, not held their full value.

 Dots, notes struck short, but not in so marked a way as the preceding.

 Curves and dots. Notes still less staccato.

 Slur, or legato mark.

 Grace. — Indicates the *appoggiatura*, whether superior or inferior.

 Turn.

 Inverted turn.

 Turn with the note above made flat.

 Turn with the note below made sharp.

 shake.

 The vibration or close shake.

 Indicates that the chord before which it is placed must be sprinkled or arpeggiated.

Characters used to separate a movement into its component parts or strains, marks of repetition, etc.:

Bar lines, dividing a movement into small equal portions of duration.

Double bar, indicating the limit of a measure.

Double bar, with a repetition of the preceding strain.

Double bar, with a repetition of the following strain.

Double bar, with a repetition of the strain on each side.

The close, or character indicating the end of a piece of music.

**MUSICAL FESTIVALS**, series of performances with large choral and orchestral auxiliaries usually held in large cities yearly or bi-yearly. While musical festivals were of periodical occurrence among the ancient Greeks at Delphi during the Olympic celebrations (see GREEK MUSIC), their first mention in modern history is at Bologna, Italy, in 1515, when at an interview between Francis I, king of France, and Pope Leo X, the musicians of both courts united for a performance. Musical festivals were also known in Rome, France, Bohemia, Austria, etc., but in the modern acceptance of the term the great musical festivals date from the Handel Commemoration in London (1784-87). Festival performances of Handel's oratorios were subsequently given in Berlin and other Continental cities. In the United States the better-known entertainments of this kind are the Cincinnati, Ohio, the Worcester, Mass., and the Bethlehem, Pa., musical festivals. See ORATORIO.

**MUSICAL INSTRUMENTS**, mechanical devices from which musical sounds are produced by the vibration of strings, the movement of air-columns in tubes and the vibration of solid and hollow bodies of resonant materials. Of very ancient origin, their earliest forms were probably derived from suggestions offered by inanimate nature. The earliest authentic record of a musical instrument giving a complete diatonic scale is that of a flute of Egyptian origin; but it is more than probable that the first instruments were those of percussion, such as drums, cymbals and gongs, which were suggested by the clapping of the hands, the stamping of the feet and the resonance of hollow trees under the impact of blows. These were followed by the wind instruments, such as whistles and flutes, suggested by the sighing of the wind through standing reeds and bam-

boo grooves. They were first used, probably, for hunting purposes; subsequently, to express human emotions and for purposes of amusement.

When the human ear learned to recognize variations of pitch and to distinguish tune from time, the twanging of bowstrings probably suggested the stringed instruments, such as the harp, lute and lyre.

These three stages of the development of musical instruments are very clearly established by existing examples of gongs of stone and flutes of bone, found among the flint implements of the ancient cave-dwellers and in the tracings of the later forms—stringed instruments, in the sculpture of ancient Babylonia, Egypt and Greece. It is impossible, however, to determine the exact origin of any one of the higher classes, such as those of the third stage; since even that of the lyre is ascribed by Egyptian and Greek mythology to the god Toth (Hermes), thus throwing the entire question of origin beyond the pale of written history.

Prehistorical forms of musical instruments have their counterparts among the many savage tribes and nations of civilized mankind who inhabit the various parts of the world at the present time. African Kaffirs, the Caribs, Peruvians and Indian races of the American continents and the wild inhabitants of Australia, New Zealand and the other Polynesia Islands, use various forms of gongs, flutes and harps. The war trumpets of the Maoris are of remarkable power, the sounds of which are capable of being heard at a distance of several miles. Among the more highly civilized nations, the Chinese possessed a system of music and its instruments centuries before the birth of the Greek and Roman empires. The invention of these is ascribed to a traditional emperor, Kai-tien-chai, who ruled about 2500 B.C. The eight instruments he made are supposed to reproduce the sounds of eight substances—tanned skin, stone, metal, clay, strings of silk, wood, bamboo and calabash or gourd. They consisted of drums, musical stones, bells, clay whistles or flutes, called "hiuen," the "kin," a form of lyre with seven strings, the "che," of 25 strings, and the "siao," a pan-pipe of 16 bamboo pipes bound together. All of them are used at the present time, together with the "cheng," an elementary reed organ equipped with a calabash, which supplies the necessary resonance. Trumpets and banjos are also used, and a stringed instrument on a frame resembling a mallet, the sounds of which are of the most execrable character. Its value in an orchestra appears to be quite beyond the appreciation of any but a Chinese ear. They have two scales corresponding to the white and black keys of the modern piano, and, although by employing both of these scales they could reproduce modern Occidental music, they appear to be satisfied to confine themselves to the five-note scale, and produce a slow music overlaid with a great amount of noise and clatter, through which it is impossible to distinguish the underlying truly musical notes of great rhythmic beauty.

Almost all of the Chinese instruments, slightly modified, are used by the Japanese. The "kin" and "che" are represented by the "koto," of 6 to 13 strings. They have also the

"samisen" of three strings, which are plucked by a plectrum, and the "kokiri," an elementary violin played with a horse-hair bow. Their orchestra is usually composed of one large drum, two small drums, two little bells, a pair of modern clappers and a flute, which is the only one of the seven capable of giving more than a single tone. Bells and metal in other forms, such as chains and gongs of various sizes, are extensively used in all Oriental countries to produce metallic music. In Pegu, Siam and Burmah, arrangements consisting of 20 bells united in one instrument, which is sounded by being struck with a stick, are frequently employed. The Javanese bells, usually arranged in sets of 12, when heard at a distance sound like an orchestra of stringed instruments.

In Hindustan and all of the countries contiguous to that great peninsula, the principal instrument is the "vina," a form of guitar. It consists of seven long metal strings strung on a hollow bamboo body, at each end of which a gourd is fixed to increase the resonance. It has a finger-board like that of the guitar, upon which the frets are stuck with wax by the performer. The strings are tuned at large intervals, and its full, delicate tone is capable of rendering rapid and brilliant passages. It reached its highest state of perfection in the 17th century, when the Hindu, Djivan Shah, became renowned as its most famous player. Some of the other important Hindu instruments are the "magoudhi," also of the guitar type; the "serinda," with three strings of spun silk; and the "ravanstron," a two-stringed violin. The two last named are played with a simple bow. They also use a great many varieties of drums, gongs and bells.

Among the Singalese, the favorite instrument is a drum commonly known as the "tom-tom," a name which literally signifies its peculiar quality of music. It is made in various sizes, and consists of a short cylinder of wood from four to six inches high and one to four feet in diameter, with sides one-half to one inch in thickness, over which a skin is mounted. Before using, they are heated to a high temperature to increase the tension of the skin, and are then played upon by the hands, the blows being delivered in rapid succession on the edge of the drum. The performers are always women, and the test of the ability of a player depends upon the amount of noise produced and the duration of a continuous play.

With the westward advance of civilization, the development of Arabian music produced the "rehab," an instrument of two strings, which were at first plucked like those of a guitar. It was subsequently played with a bow, and is supposed to be the progenitor of the modern violin. Other Arabic instruments are the "lute"; the "canon," a stringed instrument; the "dulcimer," with strings tuned in sets of three—a system adopted in the modern piano; the "zamar," the prototype of the modern oboe; the "nefye," a form of trumpet; the kettle-drum and various kinds of flutes.

The Egyptians used harps, guitars, mandolins, several forms of lutes and the lyre, as early as the beginning of the 18th dynasty. Their percussion instruments were large and small drums with sides of baked clay, over which the skins were stretched. Like the Singalese "tom-tom," they were heated prior to

being played upon. Metallic music was produced by the "sistrum," a set of metal bars which were struck or shaken rhythmically. Although their instruments were often employed in orchestral combinations, it is impossible to determine whether they were played in harmony or merely in unison.

While the Egyptians showed great genius in the invention and adaptation of musical instruments, those of the ancient Hebrews were borrowed almost entirely from other nations. They used the "kinnor" or harp, and the "asor," an instrument of 10 strings, both of which were forms of lyres; the "neble," a modification of the Arabian dulcimer, and the "timbrel," a small tambourine or hand drum. They also used flutes and trumpets, the guitar and the sistrum. Their organs were simple sets of pan-pipes, which varied in the number of pipes set up and the number of tones given by each pipe. The most famous of these is the one mentioned in the Talmud as set up in the Temple at Jerusalem. It is stated that its sound could be heard at a distance of 10 miles. Its name, "magrepha" (fire-shovel), leads to the inference that it might have been operated by the pressure of hot air, or even steam, like some of the various forms of eolipiles.

The ancient Greeks employed the music produced from stringed instruments, by striking or plucking, as an accompaniment to the recitation of their epic poems, the chants of their religious ceremonies and in connection with martial evolutions. Their most important instrument was the "kithara," a lyre of seven strings, which were sounded by being plucked with a plectrum. They also used several kinds of single and double reed flutes, in the playing of which they acquired surpassing skill. In the rendering of refined music, trumpets were discarded at a very early date, but continued in use for military purposes and at the public games, down to a comparatively late period.

The music of the early Romans was merely an imitation of the Greek art, but their representative instrument was the "tibia," a wind instrument of the flute type. Stringed instruments played with two bows were unknown among them, and the historical statement that "Nero fiddled while Rome burned" must certainly be relegated to the domain of myths.

For a long period of time after the fall of the Roman Empire, the decadence of the art of music limited the use and retarded the development of musical instruments. During the Dark Ages the musical thread was continued by bands of strolling players, whose efforts were of the most superficial character, and music thus remained latent until the 12th century, when the poetry of the "troubadours" in Provençal literature was converted into the emotional songs of the "troviers" and the German "minnesingers," and required instrumental music for accompaniments. Those brought into use again were several forms of lutes, violins and bag-pipes, which were played upon proficiently by the "jongleurs," some of whom played also upon psalteries, organistrums, guitars and tambours with great skill. These instruments were made in unique forms, especially the organistrums, which were lutes operated by wheels and keys.

Under the impulse of the Renaissance, a large number of other instruments were developed, such as flutes, flageolets, clarinets, trom-

## MUSICAL INSTRUMENTS

- 1 Wurst fagott
- 2 Bassett horn (nineteenth century)
- 3 Oboe (France. Camus, eighteenth century)
- 4 Transverse flute
- 5 and 6 Double flutes
- 7 Flageolet (French, nineteenth century)
- 8 Double flute
- 9 and 10 Flutes à bec

- 11 Clarinet (Italy, early nineteenth century)
- 12 Clarinet (France)
- 13, 14, 15, 16 and 17 Transverse flutes with keys
- 18 Flute polyphonique (Italy, seventeenth century)
- 19 Serpent
- 20, 21 and 22 Trombones
- 23 Serpent (made in England, 1820)

## MUSICAL INSTRUMENTS

- 1** Alto viol, with six strings and pegs (made in France, eighteenth century)  
**2** Baryton (Viola di Bordone, 1779)  
**3** Pochette D'Amour (France, eighteenth century)  
**4** Mandora (made in Italy, eighteenth century)

- 5** Lyre guitar (eighteenth century)  
**6** and **7** Guitars  
**8** and **9** Lutes  
**10** Theorbo (made in Italy, eighteenth century)  
**11** Harp Lute (1800. Light London)

bones and various forms of monochords, their development keeping pace with the evolution of music up to its higher forms; but it was not until about the end of the 16th century that any attempt was made to combine them into a definite orchestra, the development of which is coincident with that of the opera.

The first approximation to an orchestra was the group of instruments employed in connection with the production of Cavalieri's oratorio, ('La Rappresentazione dell' Anima é del Corpo,') at Rome in 1600; but the first definite orchestra was the one that accompanied the first opera ever performed in public—Peri's 'Euridice'—at Florence, in the latter part of the same year. It was composed of a harpsichord, a guitar, a viol da gamba, a theorbo or large lute and three flutes. In both cases the combination of the instruments was designed to afford the simplest possible accompaniment to the dramatic recitative; but a few years later Monteverde noted the individual peculiarities of the several instruments, and introduced a new system of orchestration by which the number of pieces was greatly increased and the instruments given a score practically free from the limitation of the vocal parts. His opera, ('Orfeo,') produced at Mantua in 1608, was accompanied by 36 pieces, 22 of which were stringed instruments, mostly viols, thus making them the foundation of the orchestra. With the evolution of the dramatic work to higher forms, better accompaniments were required, and the preponderating viols were superseded by violins, during the earlier part of the 18th century, while later on, during Handel's time, Lully introduced flutes into the French orchestra to double in unison the parts of the stringed instruments. The strengthening of the violins is shown to a marked degree by the orchestras of Scarlotti and Lyrenzi, as many as 20 violins entering into their composition. Up to this time, however, the real art of writing for the strings was unknown. The works of the elder Bach, probably the greatest master of part writing, and those of Handel, subsequently reorchestrated by Mozart, show a great lack of appreciation of tonal coloring, and it remained for Haydn to lay the true foundations of the modern science of instrumentation. He dispensed with the obsolete instruments employed by his predecessors and arranged five combinations by the skilful use of which are produced the great orchestral effects of the present time. They are (1) the complete string band, composed of two violins, violas, violoncellos and contrabasses; (2) the string band supported by wind instruments playing in unison with the string parts; (3) the string band supported by the wind instruments in the free parts; (4) the string band with wind instruments playing in the separate passages; and (5) the string band supported by and contrasted with a complete wind band.

The instruments entering into these combinations in a modern orchestra may be conveniently arranged into four general groups, according to the means employed to produce their sounds, and in the order of their respective importance, as follows: (1) stringed instruments; (2) wind instruments; (3) instruments of percussion; (4) instruments operated by keys arranged in a keyboard.

The stringed instruments may be subdivided into two classes: (1) bowed instruments, or those in which the sound is produced by drawing a horse-hair bow across the strings; and (2) those in which the sound is produced by twanging the strings with the fingers, or with a plectrum of bone or ivory. To class 1 belong the violins, violas, violoncellos and the double bass. Plate I shows typical forms of some of the 18th century makes.

The violin is the most important instrument in an orchestra and the first violinist ranks next to the conductor himself, and ought to be a performer of the greatest ability and fully capable of playing the obligato passages that occur frequently in modern scores. It is the most personal of all instruments, because of the wide range of vibrations which may be utilized, rendering it capable of expressing every human emotion from sadness to merriment and from the deepest love to the utmost frenzy of hate; its use in the orchestra is varied, continuous and extensive. In the violin quartet the next important instrument is the second violin, which, being played in a lower part of the accordence, gives the difference of sound heard between itself and the first violin. The viola or tenor takes the third place and is a fifth lower in the accordence, the open notes being C and G below, and D and A above, middle C. It is played exactly like the violin, and its part in the score is notated in the alto clef. It has a wonderfully beautiful and peculiarly plaintive and melancholy tone quality. The fourth place is filled by the violoncello or bass viol. Its strings are tuned in fifths, one octave lower in pitch than those of the viola, the accordence being C below and C, D and A in the bass clef. It has a compass of three and a half octaves, and its tone color, like that of the violin, is capable of expressing with surpassing faithfulness all the human emotions. Its harmonies are rich and full; the "pizzicato," especially telling in effect, while the tone of the A string is the most suitable of all instrumental music for passionate expression. The contrabass or the double bass is used to double the part of the violoncello an octave deeper. While the violoncello is the bass of the stringed instruments, the contrabass is the bass of the whole orchestra. They are of two types, those with three strings tuned in A, D, below G in the first space in the bass clef, and those with four strings tuned in E, A, D and G, in ascending order, an accordence rendered necessary by the works of modern composers. Its tone is gruff and ponderous, unfitting it for use as a solo instrument, but it is used with great effect to give an ominous significance in solo passages, and in imitating such effects as the rumblings of a thunder storm, frequently employed by many of the great composers.

To class 2 belong the mandolin, guitar and banjo, instruments of a few strings, and the harp and zither, instruments of many strings. Of these the harp is the most important. Of very ancient origin, probably Assyrian, it has been used by the musicians of almost all of the ancient and modern nations. The "minnesingers" employed it in combination with the guitar to accompany the songs of the troubadours. In 1720 Handel introduced harp parts in one of the choruses of the oratorio of 'Esther.' Gluck employed it to play the part

of the lyre in the hands of Orpheus. Mozart wrote a concerto for it in combination with the flute, and Wagner introduced eight of them in the closing scene of 'Das Rheingold,' their shimmering music giving an indescribable splendor to the entrance of the gods into Valhalla. The great musical value of the harp is its sympathetic tone quality and the power of its full-sounding "arpeggios" or sweeping chord effects. Almost all of the music written for the pianoforte can be reproduced effectively on the harp, but it is almost incapable of rendering the chromatic passages. It is the only instrument of this class that forms a part of a regular orchestra, the mandolins and zithers being used only in the orchestration of large compositions. The tones of the guitar are especially suitable as an accompaniment for the human voice and are notably used for this purpose by Rossini in Almaviva's air in the 'Barber of Seville.'

As previously stated, wind instruments were introduced into the orchestra by Lully merely to double in unison the parts of the stringed instruments; but since then various changes and improvements have been made by eminent flutists and skilful flute-makers, especially those of the 19th century, until their importance is hardly exceeded by that of the stringed instrument.

They may be divided into two classes, according to the materials of which they are made: (1) wood-wind, and (2) brass instruments. Many of both classes are of the transposing type — instruments in which the sounds actually produced are a key either above or below that in which the composition is written. To the wood-wind band belong the flute, piccolo, flute à bec, horn or cor anglais, bassoon, double or contra-bassoon, flageolet and the clarinet. They are usually made of wood, and sometimes of ivory and silver; but their particular tone qualities do not depend so much upon the material of which they are made as upon their form and the elasticity of the sides of the tubes. The flute, which is the most facile of them all, has a full chromatic compass from middle C to G, two octaves above the treble clef C, a range of three octaves. This compass is partly obtained by altering the pressure of the blowing, all of the notes below D in the treble being produced by the normal pressure, while the harmonics D in the treble clef and A and B above it are attained successively by over-blowing. In the orchestra the flute goes with the violins, its part in the score being written at the top in G clef. It is also used to sustain the long notes of the other wood-wind instruments, and, being the closest approximation of artificial sounds to the human voice, is used effectively in the conversational passages, and enhances the characteristic charm of orchestral music. In the form of the "piccolo," or octave flute, it is more frequently employed to double the melody in the highest octaves and to accentuate brilliant points of effect in the score. It is exactly an octave higher than the flute proper, and is very shrill in the over-blown notes, so that, unless very carefully played, tends to vulgarize the music. Other forms are the D-flat or minor ninth transposing piccolo; the flute d'amour, a minor third below the ordinary flute; the E-flat or "jierce," and the fife. The last named, in its

old cylindrical form, gave low, piercing notes, and was extensively used in military music, but it has been entirely superseded for that purpose at the present time by a small flute, still called a fife, which forms a component part of a modern fife and drum corps.

Next in importance to the flutes is the family of oboes, represented during the 16th and 17th centuries by the little schalmey, the discant schalmey, the alto, the tenor and the pommers. The modern oboe was evolved from the discant schalmey, and is a double-tongued reed instrument. Its fundamental sounds are reproduced an octave higher by over-blowing, its scale being thus increased to two partially chromatic octaves, which are made completely chromatic by the use of keys which permit the lengthening of the air column in the lower tones, and the introduction of other partial tones than the first harmonics in the higher notes. Like the flute, it has only the soprano register — B-flat below middle C to F above the treble clef, about two octaves and a fifth. The basis of the scale is D major, and its place in the orchestra is between the flute and the clarinet. A modern orchestra employs two oboes — the non-transposing treble oboe, for which the music is written in G clef, and the "cor anglais," a transposing instrument, the mournful sounds of which are especially suitable to accentuate the depressing effect of the sad or serious dramatic passages.

The bassoon is the bass of the oboe and fulfils that function to the entire wood-wind band. It was evolved from the pommers, bombards, tenors and basses of the 16th century, and possesses advantageous tonal characteristics and adaptability. It has a compass of three octaves — from B-flat, an octave below that in the bass clef, to B-flat in the treble clef — and is usually played with the violoncello, the united tones of the two instruments being very effective. The contra-bassoon is an octave below the violoncello and is the deepest instrument of the orchestra. Its compass extends as far as B-flat, next to the lowest note of the pianoforte. It is but rarely used, although its grand sounds, like those of a great organ pipe, may be used effectively, as in the grave-digging scene of Beethoven's 'Fidelo,' and in Handel's anthems, written for the coronation of George II in 1727. Although a wood-wind instrument, it is now also made in brass with a reed mouth-piece. The sarrusophones, invented by Sarrus of France, comprise a complete family of this type. They are larger than the corresponding wooden oboes, and are therefore louder in tone and are extensively used in military bands. Other forms of double-reed instruments are the "cormorne," made of wood and cylindrical in shape, with the lower end turned up like a shepherd's crook. The name is derived from the German *Krummhorn*, and the French call it the *tournebout*. It has a bleating tone. The familiar Highland bagpipe, and various forms of oboe instruments equipped with reservoir of air and furnished with drones enclosing single reeds, such as the "cornemuses," and the "musettes," complete the series.

Of the single-reed instruments, the "clarinet" is the most important. It was invented by Christopher Denner of Nuremberg, in 1690, and embodies the very ancient principle, that of the

'squeaker' reed, which is commonly made by children even at the present time.

Of the several forms of clarinets those in A- and B-flat are used by the modern orchestra, while the B-flat and E-flat instruments are used in military bands, in which their functions correspond to that of the violins in the orchestra. The C clarinet with its shrill tone is seldom used. Their color varies according to the register. The ordinary notes are eloquent, heroic and tender; in the lower register they become spectral, and impressively sombre in the bass. Although the last instrument introduced into the orchestra, all the great composers wrote for it, and considered it favorably. With Mozart it was one of the leading instruments of the orchestra, and in his beautiful E-flat symphony, written in 1788, clarinets are employed even in the place of the oboes.

As in the case of the double-reed woodwind instruments, in which the mouthpiece is used with a metal tube and gives the sarrusophone, the adaptation of the clarinet-reed to a brass tube gives the family of "saxophones," invented by Adolph Sax in 1846. They resemble the clarinets very closely in shape; have a full, rich, penetrating tone-color, and are extensively used by the military bands of France and Belgium, and have also been used with great advantage in the French orchestras.

Of the "brass instruments," the most important are the horns, cornets, trumpets, trombones and tubas. Two other forms, the ophicleide and the serpents, though frequently employed in the older orchestral scores, are now obsolete, having been entirely superseded by the tuba.

There are two important differences between the wood-wind and the brass instruments. In the former the tones are produced by vibrating air-columns, or by vibrating single or double reeds, and alterations of pitch are accomplished by shortening the air-columns, while in the latter the vibrations utilized are those of the player's lips, which are pressed against a round, cup-like mouthpiece, and the air-column is lengthened to alter the pitch. The brass instruments are capable of giving a much larger number of partial tones naturally than the flutes, oboes and clarinets, which use only a few notes of the harmonic series, and derive such partial tones from the fundamental tones, or from the overtones. Horns and cornets furnish romantic tone-coloring, and are effectively used in connection with forest and hunting scenes, while the trumpets are employed to express brilliant martial passages depicting heroic deeds. Trombones and tubas are grand, sonorous tubes which afford a solemn and menacing tone-color to the splendor of a full orchestra, and are also advantageously used to depict coarse and brutal scenes. All of them are valuable components of modern military bands. Plate II illustrates various types of wind instruments, developed from their original forms into perfect instruments during the latter part of the 18th and the earlier part of the 19th centuries.

The instruments of percussion are those which are incapable of giving many tones, or playing definite melodies, like the stringed and wind instruments already described. They are of two classes—those that give an actual tone, such as the kettledrums, glockenspiel and xylophone; and those without any definite pitch, such as the bass and small drums, tambourines,

cymbals, castanets and triangles. Of these, the kettledrums are the most important, and, together with the cymbals, are extensively used to emphasize military effects; while the others serve to express those that are purely rhythmic. For detailed descriptions of all of the instruments mentioned, see special articles under their respective titles; also ORCHESTRA, INSTRUMENTS OF THE. For descriptions of keyed instruments, see articles on the ORGAN and the PIANOFORTE.

**Bibliography.**—For further detailed information consult Elson, 'Orchestral Instruments and their Use' (Boston 1903); Hawkins, 'General History of the Science and Practice of Music' (London 1875); Hofmann, 'Katechismus der Musikinstrumente' (Leipzig 1890); Vidal, 'Les Instruments a Archet' (Paris 1878), and Schletterer, 'Die Ahnen moderne: Musikinstrumente' (Leipzig 1882).

**MUSICAL INSTRUMENTS, Mechanical.** The record of inventions and devices in this field shows a great variety of shapes, sounds and methods of operation. One of the most famous in this class of music-producers was Barnum's steam calliope, used for many years in circus processions. Organs of all sizes and shapes, set in motion by the occasional turning of a crank or pressing a button, are widely used for purposes of public entertainment. Swiss music boxes with cylinders and American music boxes with discs are embraced in the same class. There are also mechanical banjos, violins, zithers, mandolins and trombones.

**Progress of the Piano-Player.**—Since the advent of the first piano-player, a few years ago, rapid strides have been made in the creation and production, by purely mechanical methods, of classical and popular music. The perforated paper roll, passing over a perforated wooden cylinder, so that a current of air may pass at stated times, still forms a leading feature of the automatic idea in many pianos. See PIANO.

The earliest efforts of those who undertook to create and introduce mechanical harmony effects yielded crude, unsatisfactory and unpromising results. Progress was blocked at every turn by practical difficulties not contemplated in theoretical calculations and experiments.

**First Products.**—Among the first products of the mechanical piano-playing movement was an odd-appearing, seemingly over-elaborate accumulation of rubber-tubes, strikers, bellows and pedals, nearly all of these contrivances and accessories being fixed to a wooden frame and inserted in the back part of the piano, between the frame-posts. It was found impracticable to include all necessary material without increasing the size of the piano proper. This was accomplished by adding several inches to the piano's depth.

**Portable Players.**—Notable among the next succeeding stages of piano-player development was the invention and perfecting of a movable and easily-portable player, having cylinder, perforated rolls and pedal action. About half the regular piano width and only a trifle higher than the keyboard, this "supplement" can be moved at will to the centre of the piano, in front. Operation of the pedals results in the bringing of any one or more of a series of

hammers or strikers in direct contact with the key surfaces, speed and force being regulated by several thumb-pieces projecting from the player top or side. Players of this description, with many variations, are still in use but have been partially superseded by more elaborate contrivances.

**Interior Players.**—After many costly experiments, covering several years, an interior player, which has been very successful thus far and promises to revolutionize the whole industry of piano-making, was perfected. It was found possible to minimize the parts in such a way that practically the entire player apparatus, excepting, of course, the pedals, could be placed above the keyboard in front of the action and behind the fallboard, the latter hiding it completely from view. Thousands of these pianos containing mechanical players have been made and sold. Makers of pianos of all grades have accepted this interior player, with modifications, as permanent, and it is becoming a standard feature in regular piano styles.

**Electricity Introduced.**—In the interval between the perfecting of "movable" and "interior" piano-players, an enterprising practical New York electrician and piano-action maker secured certain important player rights and privileges and set to work on the problem of electrical operation. Experiments, extending over several years, were finally successful. Electrical attachments were devised and introduced in such a manner as to make it possible for any person or firm, in any part of the world, having a simple electrical connection, to start and stop the player at will. The advance in usefulness of the mechanical piano-player thereby reached a stage where it only needed the occasional insertion of a perforated roll to produce, without any further physical effort whatever, perfect musical effects, including correct tempo and proper expression.

**Continuous Rolls.**—Since that time, continuous rolls have been devised to admit of several tunes being played successively without any interference on the part of the person who applies the electrical connection and turns on the current. The electrical-attachment device just referred to, with numerous variations, is now largely in use throughout the United States, Canada and other countries for the entertainment of guests, travelers and others in restaurants, hotels, saloons, railroad stations and similar public resorts. Some are operated by use of an electric button conveniently placed at tables, hotel desks and in private apartments. Others start by the insertion of a coin in a metal slot at the side of the instrument.

The manufacture of pianos in the United States gives employment to 24,000 persons, and piano materials 10,500 more. Organs and organ materials employ 3,300; other musical instruments and materials 2,000. These figures do not include phonographic machines for reproducing music. The musical instrument industry centres mainly in Indiana, Illinois, Massachusetts, New Jersey, New York and Michigan.

**MUSICAL SAND**, beaches which emit musical tone or other sound when the sands are pressed under foot or struck together in a bag. They occur throughout the world, notably in the peninsula of Sinai, on the great musical mountain of Jebel Nagous; near Colberg in Pomerania; on the East Prussian coast; in the

United States, where there are such sonorous beaches on the Atlantic, on the Wisconsin River (near Kilbourn City, Wis.), on the Mississippi (opposite Carondelet) and on the Pacific Coast; in Hawaii, where there are "Barking Sands" on the southwest coast of Kauai; in Africa (Liberia and West Griqualand); in Botany Bay, New South Wales; and in Brown's River Bay, Tasmania. The sound is a mere squeak unless the sand is very dry; then it is musical. Hence the common explanation that the sound is due to the "rubbing together of millions of clean sand-grains very uniform in size" is less likely than the hypothesis that it is caused by the oscillation of the particles which are prevented by elastic air-cushions from actual contact.

**MUSK, or MUSCOVY, DUCK.** See DUCK.

**MUSK-DEER**, a small deer-like animal (*Moschus moschiferus*) of the sub-family *Moschina* differing from typical deer in the absence of antlers in either sex, in having only one lachrymal orifice, in the presence of a gall-bladder, and, in the male, of the musk-bearing glands to which the animal owes its name. Other peculiarities are the smooth brain, long tusks (canines) of the upper jaw of the male and the character of the feet, where the "false hoofs" come to the ground. These and other characters led Flower to declare it "an undeveloped deer"—a representative of an ancient type.

The musk-deer is of small size, about 20 inches tall, grayish, marked with obscure stripes on the fore quarters and neck, thick-legged and ungraceful in form, but agile in movement. The species is confined to the highlands of Tibet and northward, where they frequent the pine woods, going to the heights above them in summer. They dwell alone or in family parties, are timid and secretive, feeding rarely except at night, and then subsisting partly on roots dug with their great teeth.

The males alone yield the musk secretion, which is furnished by a glandular sac or pouch situated on the abdomen, and averaging the size of a hen's egg. The secretion is resinous and unctuous, and becomes granular and of a dark color when dried. About 190 grains is stated to be the average quantity obtained from a single animal. When the musk-sac is first opened the odor is said by Tavernier to be so powerful that it causes the mucous membrane of the nose to bleed. The bag or "pod" is cut out by the hunters and its orifices are tied, nevertheless the contents are often found much adulterated. The substance also reaches the market in a granular form, having been scraped off rocks where it has been deposited by the animal. The best comes by way of India and China, and is known as Tongking musk; a poorer quality comes from Siberia. Formerly musk had some value in medicine, but now is used almost wholly by perfumers; and the demand is so great that the animals are now comparatively rare, and the price of musk-pod has greatly advanced over former rates.

A somewhat similar secretion is possessed by many other mammals and reptiles, and in some cases, as of the muskrats (q.v.), is very strong, especially in the mating season. The biological significance of it, no doubt, is sexual

1 Musk Deer

2 Musk Ox

attraction. A similar odor belongs to certain plants. Consult Flower and Lydekker, 'Mammals' (London 1902).

**MUSK-OX**, a singular ruminant (*Ovibos moschatus*), now confined to the Arctic regions of North America, but once circumpolar, and in Pleistocene times an inhabitant of all Europe and in America as far south as Kentucky. In general appearance it much resembles a large hairy sheep. Its body is clothed in long, brownish hair, with a warm undercoat of wool, very thick and tufted on the neck and shoulders, and elsewhere long and flowing, so that it hangs down almost to the feet. A lighter saddle-shaped patch marks the middle of the back. The tail is short and invisible. The legs are short and strong, and the hoofs of unequal size and shape, the outer being much broader than the inner one. The horns are broad at the base, covering the forehead and crown, much as do those of the Cape buffalo, then curve downward between the eye and the ear and then upward and backward. The average size of the male is that of a small domestic ox. This animal seems intermediate in structure between oxen and sheep, having part of its characteristics bovine and the other part caprine. A thorough exposition of its anatomy by Dr. Lönnberg may be found in the 'Proceedings' of the Zoological Society of London for 1900. The musky odor which belongs to them is not emitted by any special gland, but seems a general emanation, and is not very strong.

In habits these animals are gregarious, each herd numbering from 20 to 30 members. They migrate in winter from the most northern and exposed places to those farther south, or where food is more accessible, and are constantly hunted by the Esquimos as an important source of food. To this is added much destruction by fur-traders, whalers and explorers, and their numbers are much diminished. Their present winter range is rarely south of the Barren Grounds (q.v.), between Hudson Bay and Great Slave Lake. Their food consists of moss, lichens, herbage and twigs of the dwarf willows and birches which grow in parts of their country. They are extremely wary, and their hunting requires great skill and endurance. Their flesh is good, their hides very useful and from their wool might be woven an admirable cloth could it be obtained in sufficient quantity. Consult books by Arctic explorers and Allen, J. A., 'Ostogenetic and Other Variations in Muskoxen' (*American Museum of Natural History, Memoir*, Vol. I, N. S., New York 1913); Grinnell, Wister and Whitney, 'Bison, Musk-Ox and Sheep' (New York 1904).

**MUSK PLANT**, a popular name for several unrelated plants. The one most cultivated in the United States is *Mimulus moschatus*, of the family *Scrophulariaceae*, a native of the Western States. It is very popular in cool greenhouses and window gardens and, being hardy, in damp, shady places out of doors. In Europe the name is most applied to *Eurodium moschatum* of the family order *Geraniaceae*, a native of the Mediterranean region, growing in gardens from annually sown seeds. The name is applied in the West Indies to *Guarea grandifolia*, which is also known as musk wood, and

to *Trichilia mosehata*, also called musk tree. This last popular name is also applied to a Tasmanian tree (*Olearia argophylla*). An East Indian plant (*Euryangium sumbul*) is probably best known in the markets as musk root. Its starchy roots are used as a substitute for musk in perfumery.

**MUSK-SHREW**. See MUSKRAT, INDIAN.

**MUSK-TURTLE**, or STINKPOT. See MUD-TURTLE.

**MUSK-WOOD**, a tree (*Guarea grandifolia*) of the family *Meliaceae*, so called in the West Indies because the bark smells so strongly of musk that it may be used as a perfume. Although the tree attains timber size the wood contains a bitter resinous substance which unfits it for many purposes. The bark of several trees of this genus is used as an emetic and purgative.

**MUSKEGON**, mŭs'kĕ'gŏn, Mich., city, county-seat of Muskegon County, at the mouth of the Muskegon River, on Muskegon Lake, and on the Grand Rapids and Indiana, the Grand Trunk, the Pere Marquette, and the Grand Rapids, Grand Haven and Muskegon Electric railroads, about 95 miles northwest of Lansing and 38 miles northwest of Grand Rapids. Lake Muskegon, upon which the city is situated, is connected with Lake Michigan by a channel 300 feet wide and of sufficient depth for large vessels. This gives the city an excellent harbor for lake steamers, which connect it directly with all the important lake ports. The harbor is clear of ice all the year. Muskegon was first settled in 1834, although a temporary trading post was established here in 1812. It was incorporated as a village in 1861 and chartered as a city in 1869. The chief manufactures are furniture, curtain rollers, refrigerators, flour, beer, knit-goods, paper, pianos, iron products, automobile engines (Continental) and auto parts, many large foundries in malleable steel and gray iron products, electric cranes, leather and cutlery. It has a large trade in lumber, the manufactures of the city, fruit, celery, vegetables and farm products. The city has been greatly favored by the numerous donations of one of its own citizens. He has presented a public library, a gymnasium, an art gallery, a manual training school, an endowed hospital and a square upon which has been erected a soldiers' monument, and several bronze statues. The government is vested in a mayor, who holds office one year, and a council. The waterworks are owned and operated by the city. Pop. 35,765.

**MUSKET**, a small hand-gun with which infantry soldiers were formerly armed. When first introduced, early in the 16th century, it was discharged by means of a lighted match, and was so heavy that it had to be laid across a staff to be fired. To make use of it the soldier required to carry a slow-burning match with him which was apt to be extinguished in wet weather. The wheel-lock followed, the chief feature of which was a wheel made to revolve by means of a spring, and to cause sparks by friction against a flint. The next improvement was the flint-lock proper (about 1625), in which sparks were produced by one impact of a piece of flint on the steel above the priming powder. Musketeers were soon intro-

duced into all armies, and in the beginning of the 17th century infantry consisted of pikemen and musketeers, and all changes in regard to the relative proportion of the two arms were always in favor of the latter. The flint-lock musket was introduced into the British army toward the end of the 17th century, and was the British musket of the days of the Peninsular war and Waterloo, known familiarly as "Brown Bess." It was superseded by the percussion musket in 1842, this musket being in turn superseded by the rifle. See ARMS AND ARMOR; FIRE ARMS; RIFLE.

**MUSKETRY**, the science and art of shooting small arms (q.v.), particularly the musket or rifle (q.v.).

**MUSKHOGEAN** (musk-hō-gē'an)  
**STOCK**. See CREEKS.

**MUSKELLUNGE, MASKINONGE**, etc., the great pike (*Lucius nobilior*) of the lakes of the interior of North America. See PIKE.

**MUSKINGUM**, müs-king'güm, a river of eastern Ohio with a course of about 120 miles wholly within the State. It is formed by the junction of the Tuscarawas and the Walhonding at Coshocton in the county of the same name, and it flows in a general southeast direction through a fertile valley to Marietta, where it joins the Ohio. The chief towns on its banks are Zanesville, McConnellsville and Marietta. It is navigable for 90 miles to Dresden. The Ohio and Erie Canal follows its course as far as Zanesville.

**MUSKINGUM COLLEGE**, in New Concord, Ohio, founded, under the auspices of the United Presbyterian Church, in 1837. In 1917 there were connected with the institution 30 professors and instructors, and about 760 pupils. There were about 7,500 volumes in the library. The courses lead to the degrees of A.B. and B.S.

**MUSKMELON**. See MELONS.

**MUSKOGEE**, müs-kō'gē, or **MUSCOGEE**, Okla., city and county-seat of Muskogee County, on the Missouri, Kansas and Texas, the Missouri, Oklahoma and Gulf, the Midland Valley and the Saint Louis and San Francisco railways. It is situated 45 miles from the eastern border of Oklahoma and about 130 miles from Oklahoma city, in a fertile agricultural region well adapted to the cultivation of wheat and other cereals and to cattle-raising. There are also abundant supplies of oil and natural gas. Industrial activity is manifested in the oil refineries; in the manufacture of oil-well supplies, of hardware, mattresses, cotton goods and agricultural implements; in the corrugated iron and steel works and the railway shops. Noteworthy are the educational establishments: the high school, Saint Joseph's College, Bacon University, etc. Other features are the new post-office building, waterworks, the property of the city and valued at \$1,000,000; public parks (100 acres) and fair grounds; Carnegie library and the Town and County and Traveling Men's clubs. Muskogee is the headquarters of the government Indian agent. The commission form of government was adopted for the city in 1910. Pop. 45,000.

**MUSKOGI INDIANS**. See CREEKS.

**MUSKOKA**, müs-kō'ka, Can., a county of Ontario, bordering on Georgian Bay, the name also being borne by a beautiful lake and river, and comprehensively applied to the extensive region, 4,000 square miles in extent, lying between Georgian Bay on the west, Lake Nipissing on the north, Ottawa River on the east and Lake Simcoe on the south. The capital of the county is Bracebridge, on the Grand Trunk Railroad. The region with between 800 and 1,000 lakes and smaller bodies of water, chief of which are Muskoka, Rosseau and Joseph lakes, all abounding in fish and studded with beautiful islands; several rivers and picturesque waterfalls, notably High Falls and South Falls on the Muskoka River and Bridal Veil Falls on the Shadow River, and extensive forests filled with game, is a paradise for sportsmen. It is one of the most popular summer resorts in Canada, and is visited annually by 30,000 people. During the summer steamboats ply on the principal lakes connecting with the Grand Trunk, Canadian Northern and Canadian Pacific railroads.

**MUSKRAT**, or **MUSQUASH**, an aquatic rodent (*Fiber zibethicus*) numerous throughout North America, and yielding a valuable fur. It is a member of the rat family (*Muridae*, q.v.), and is, in effect, a gigantic vole or meadow-mouse, with a tail flattened sideways into a powerful swimming instrument, and fringed with stiff hairs; the hind feet are set obliquely to the leg; the ears are very small and buried in fur, the muzzle is blunt and furry; the palms and soles are naked and fringed with hairs. The average total length is about 21 inches, of which the tail is more than a third, measuring as long as the body without the head. The color varies above from almost black to pale brown; sides of head and body chestnut-brown; under-fur bluish gray; feet dark brown; tail black. Those of the Rocky Mountain region are smaller and paler than Eastern ones. The musky odor of these animals is due to a thick fluid secreted in two small glands near the generative organs, which imparts a taint to the flesh that makes it unpalatable to most persons.

These animals reside along small streams, and in swampy places generally, being most abundant around Chesapeake Bay and in the marshy lakes of the upper Mississippi region and northward to Hudson Bay. Where the banks have some elevation they form extensive burrows, which have entrances below the surface of the water, and gradually ascend till they terminate in a chamber above the level of high water. These burrows are most frequently made under the roots of trees, or in other situations of difficult access. The excavations are of great injury to artificial embankments along canals and rivers, by permitting the water to undermine and to make large breaches in them, and in some parts of the country they do serious damage to canal embankments and river-dikes. When, however, these animals inhabit low and marshy situations, they construct conical houses usually surrounded by water, not unlike those of the beaver but smaller, composed of reeds, etc., mixed with clay. These houses have subterranean passages leading to them, and are inhabited by many individuals during the winter; but in the warm weather they desert them entirely, and dwell in pairs in

a bank-burrow while they rear their young. The houses contain a large, smooth-walled chamber, above the water-line; and when frozen are sufficiently solid to form a protection against all but the largest carnivora; but they are usually destroyed and swept away in the spring floods, so that a new house is erected every season.

The muskrat feeds mainly upon aquatic vegetation, especially the rootstocks and basal parts of stems, and is especially fond of the pond-lily. These it brings to the shore to eat, almost always during the night, for it is essentially nocturnal, although often seen abroad in the daytime. It is very fond of mussels, and brings great quantities of these ashore, always, when possible, at the same place, so that piles of their shells accumulate to indicate favorite feeding-spots. In summer the muskrats feed on shore-herbage somewhat, and frequently go some distance to get a meal of growing corn, garden vegetables or fallen fruit. They are accused also of occasional fish-catching, and are unwelcome in waters devoted to fish-culture. Because of the commercial value of its fur and of its destructiveness in some places, or for amusement, the muskrat is incessantly persecuted by man, as well as preyed upon by many natural enemies—minks, wolverines, foxes, wildcats, badgers, wolves, birds of prey, water-moccasins, snapping-turtles, pikes and others, which capture many young and some adults. Nevertheless they are so secretive and so prolific, and have found so many advantages in the civilized parts of the country, that they survive even in the most thickly settled districts, and are likely to maintain their numbers indefinitely. They produce from three to nine young at a birth, and often breed two or three times a year.

The fur of the muskrat is dense and soft, but inferior to that of the beaver. It was formerly little esteemed, but during the last century has come more and more into use, beginning with a demand early in the 19th century for making "beaver" hats. When this industry was ended by the introduction of silk hats the demand diminished, but revived again, until, about 1870, London was receiving about 4,000,000 skins annually besides some 500,000 consumed in America and 1,500,000 sent to Germany, principally Leipzig. The price then began to fall, but the product amounted in 1906 to about 5,170,000 pelts. The best "no. 1 black" skins averaged in London, in 1910, about 42 cents.

"Muskrat fur," according to a recent authority, "is used more extensively in Europe than in America, the Russians and Germans being especially large consumers. It is employed in making gloves, collars, caps, capes, muffins, trimmings, linings, etc., and is made up either natural, plucked, plucked and pointed or plucked and dyed black or various shades of brown. Large quantities are used as linings for overcoats and long wraps, from 40 to 60 being necessary for each garment. Sometimes the under parts are used separately for this purpose, the natural white color being quite effective. The skins of young animals are especially suited for linings. The unplucked skins are frequently dyed to imitate mink, and sold as 'Alaska mink,' 'water mink' or 'black mink.'"

Muskrats are taken by shooting, spearing in

winter (through their houses, or through the ice), or, most numerous, by trapping. Ordinary steel traps are used, placed under the water inside a broken house, or in a runway or landing place, baited with an apple, or bit of parsnip, and often scented with musk or an aromatic oil, and fastened by a heavy chain so arranged, if possible, as to lead the animal to drown itself in its struggles. In certain districts, as along Chesapeake Bay, men make a regular business of trapping muskrats in winter; and even own, or rent, large spaces of marshland for that purpose. See MURIDÆ.

The books of Audubon, Godman, Hearne, Richardson, Merriam and all general writers on American mammals should be consulted; also Herrick, 'Mammals of Minnesota' (Minneapolis 1892); Stone and Cram's 'American Animals' (New York 1902); Hollister, N., 'Systematic Synopsis of the Muskrats' (United States Biological Survey, North American Fauna, No. 32, Washington 1911); Lartz, 'The Muskrat' (United States Department of Agriculture Farmers' Bulletin No. 396, Washington 1910); and the files of the *American Naturalist* and of *Forest and Stream*.

**MUSKRAT, Indian**, a name among the British residents in India for a shrew (*Crocidura cerulea*), about the size of the common rat, which comes into houses at night hunting for cockroaches and similar insects, and makes its presence known by occasional shrieks. This animal emits a peculiarly strong and penetrating odor of musk, which clings to everything the little beast touches, and arises from two large muskglands beneath the skin of the side of the body a short distance behind the forelimbs.

**MUSKWAKI INDIANS.** See SAC AND FOX INDIANS.

**MUSLIM, or MOSLEM.** See MOHAMMEDANISM.

**MUSLIN**, a fine cotton fabric. The name is said to be derived from the city of Mosul in Mesopotamia. The texture of muslin is usually plain, but sometimes adorned with figured patterns. The manufacture of muslin was introduced into Europe from India about the end of the 17th century, and it is now largely carried on both in Great Britain and in France.

**MUSQUASH**, a name in the Canadian Northwest for the local muskrat (q.v.).

**MUSSEL-PECKER**, a bird, the oyster-catcher (q.v.).

**MUSSELBURGH**, müs'l-bür-ð, Scotland, a town and seaport of Midlothian six miles east of Edinburgh, on the Firth of Forth, at the mouth of the Esk, which divides it into two parts, Musselburgh proper and Fisherrow. It has noted golf-links, a bridge of Roman origin, and a curious old tollbooth built in 1590, out of materials from the celebrated chapel of Loretto, Pinkie House, a fine Jacobean mansion, in which Prince Charles Edward slept the night following the battle of Prestonpans, and Loretto School, a famous establishment, are in the burg. David Macbeth, the author of 'Mansie Waugh,' was a native. The chief manufactures are leather, paper, twine and fishing-nets by machinery. Coal is mined in the neighborhood, and there are a number of

market gardens. There is a large fishing population located in Fishermrow. The battle of Pinkie, in 1547, was fought in the vicinity. Pop. (1911) 15,938.

**MUSSELS, Fresh-water.** See FRESH-WATER MUSSELS.

**MUSSELS, Marine.** The marine mussels belong to a family (*Mytilidæ*) of bivalve mollusks which have the anterior retractor muscles very small, the posterior large and the two valves of the shell equal and covered by a thick horny layer. Numerous species occur in all seas, and, because of the comparative delicacy of their flesh, and their habit of forming immense beds, many are of commercial importance. Foremost in this respect is the edible mussel (*Mytilus edulis*) which has a smooth, dark-colored, wedge-shaped shell with the umbo, or beak exactly at the hinge end. This species is circumpolar in its distribution, and on our Atlantic coast extends southward to North Carolina. Wherever rocky reefs, piles or other suitable objects for attachment occur at low water, combined with currents for bringing food, this mollusk multiplies into extensive colonies. In Europe it is valued much more highly than in this country, where it is chiefly used for bait, although considerable quantities are canned in New York. Under certain conditions mussels seem to be poisonous. Besides the fisheries on natural beds this mussel is regularly cultivated in France by methods akin to those used in European oyster culture. The genus *Modiola*, containing the so-called horse-mussels, is distinguished by the more oblong shell inflated toward the hinge end, from which the umbo, though close, are quite distinct. The best-known one (*M. modiolus*) is a large species distinguished by the nearly unribbed surface and the coarse hairy epidermis. It has nearly the distribution of the *Mytilus*, and abounds in the north on rocky shores at low water and below to a considerable depth. *Modiola plicatula* is distinctly ribbed and has a thinner epidermis. This is an American species which ranges from Nova Scotia to Georgia and is extremely abundant at low water on the mud-flats of the New Jersey coast, where it is doubtless effective in the upbuilding of sedimentary areas. These two species are less valued for food than the *Mytilus*, but are largely utilized in certain localities as fertilizers. Consult Goode, 'Fishery Industries of the United States,' Sec. 1 (1884); Cooke, 'Mollusca' (London 1895); or any other work on mollusks.

**MUSSET, mü-să, Louis Charles Alfred de,** French author: b. Paris, 11 Dec. 1810; d. there, 2 May 1857. His father was a man of letters who held several important ministerial posts. Alfred's home environment did much to engender a literary spirit. He was educated at the Collège Henri Quatre, where he won a prize for his essay on the 'Origin of our Feelings.' After this, he tried to study law and medicine, but became dissatisfied and gave himself up entirely to literature. At Paris he met the famous literary men of the day, among them Hugo, Merimée and Sainte-Beuve, who inspired him to write verse and plays. He began composing rhymes and in 1830 appeared his first volume of poems, 'Cortes d'Espagne et d'Italie,' a parody on the latest works of the romanti-

cists which gained him a great reputation. In 1830 his play 'La Nuit Venitienne' proved a failure. This discouraged de Musset so much that he refused to write plays for production until the public should demand them. There followed a new collection in 1831 entitled 'Poesies Diverses,' and in 1833, a third, bearing the general title 'Un Spectacle dans un Fauteuil' in which the chief pieces are a comedy of light and delicate grace called 'A quoi revent les jeunes filles,' and a poem 'Namouna' written after the manner of Lord Byron. The success of this volume led to his connection with the *Revue des Deux Mondes* in which he published 'André del Sarto' (1833) and 'Caprices de Marianne' (same year). In this play, which for many years enjoyed a distinguished place in the repertory of the Théâtre Français, he combines the best features of the romantic and classic schools of drama. It combines swift action with high loftiness of theme and thought; blends comedy and tragedy with Shakespearean excellence. 'Rolla' was the next piece to appear in the *Revue*. In the same year, 1833, de Musset conceived a violent passion for George Sand, and accompanied her to Italy. But the liaison which was only the attraction of genius for genius lasted but two years. The story is told in his volume 'Lui et elle,' by de Musset and 'Elle et lui,' by George Sand. But the affair affected de Musset profoundly. It emphasized a deep melancholy strain in his nature and a morbid sensitivity which appears in his later writings. In Italy he wrote 'Ou ne badine pas avec l'amour.' In 1835 there appeared 'Lucie'; 'La Nuit de Mai'; 'Le Chandelier'; 'Une Lettre à Lamartine'; 'L'Espoir de Dieu' and other poems. His 'Confession d'un enfant du siècle' (1836) is an autobiographical novel, containing the analysis of his state of mind; his moody introspection, his revolt from all the unpleasant necessities and labor of life. It contains also an interesting account of his reactions to Bonapartism, and a true story of his unfortunate liaison. Among his other works are 'Stances a Madame Malibran,' a volume 'Comédies et proverbes' reprinted from the *Revue des Deux Mondes* (1840); 'Nouvelles,' a play 'Un Caprice' performed at the Théâtre Français in 1847, which succeeded by the truth of the characters and the charm of the dialogue, rather than by its regard for stage customs. In 1848 'Il ne fait jurerde rien' was successfully played at the Théâtre Français. His last plays 'Bettine' and 'Carmosine' were written between 1848 and 1851. De Musset was made librarian of the Department of the Interior in 1836, of which post he was afterward deprived, and of the Department of Public Instruction in 1855. In 1852 he was admitted to the French Academy. He has been ranked after Hugo as the third French poet of the 19th century. His wit, his fine satiric power, his many and diverse moods mark him a man of genius. A monument was erected to him on the Place du Théâtre Français in 1906. Consult biographies by Paul de Musset (1877; Eng. trans. by H. W. Preston, 1887); Barine, Arvède, in 'Grand écrivains français.' His correspondence with George Sand was published in 1904. See NIGHT OF MAY, A; ONE MUST NOT TRIFLE WITH LOVE.

**MUSSEY, Reuben Dimond**, American surgeon: b. Pelham, N. H., 23 June 1780; d. Boston, 21 June 1866. He was graduated at Dartmouth in 1803; studied medicine at the University of Pennsylvania; practised in Salem, Mass.; taught in the Dartmouth Medical School 1814-20 and 1822-38, at Bowdoin 1833-35, at Ohio Medical College 1837-50, and at Miami Medical College, which he founded, 1851-58; and spent the last eight years of his life in practice in Boston. He was a famous operator, the first to remove the shoulder blade, or to tie both carotid arteries, and successful in his operations for stone, for removing ovarian tumor, for strangulated hernia, and in subcutaneous deligation in varicocele. Mussey wrote 'Health: Its Friends and Its Foes' (1862).

**MUST**, the juice of the grape, which by fermentation is converted into wine. In the wine countries this unfermented sweet must is distinguished from the sour must or unripe wine of a year old.

**MUSTANG**. See BRONCO.

**MUSTARD**, a genus of annual, biennial and perennial herbs (*Brassica*) of the family *Brassicaceae*. The species, of which about 100 have been described, are characterized by yellow four-petaled flowers and linear or oblong pods containing one row of seeds. All are noted for their more or less biting flavor for which some are valued as esculents. Strictly speaking, cabbage, kale, cauliflower, turnip and other similar vegetables are mustards, but specifically the name is restricted to a few species of which the following are the most important: Black mustard (*B. nigra*) so called from its dark brown seeds, white mustard (*B. alba*), the seeds of which are yellowish; Indian mustard (*B. ramosa*), and charlock (*B. arvensis*). These are all cultivated for their seeds which when ground constitute the popular condiment, mustard. Sometimes flour and turmeric are added to the mustard to dilute and color it. The young plants are often eaten like spinach or as a salad. They may be easily obtained from seed sown in any garden soil.

**MUSTARD GAS**, a persistent though not deadly poisonous gas, first used by the Germans, at Ypres in 1917, as a very powerful weapon of war, and is officially known as *yellow cross* gas. Its chief effects are on the eyes and lungs. The eyes inflame and become very sore, the lids swell and blister, but no permanent injury to the eyes takes place, although the victim may be temporarily blinded. The effects developed in the lungs are equally painful and consist of severe inflammation and bronchitis, which if not well looked after may develop into pneumonia. "Duds" collected during the European War show that the mustard gas liquid is a chemical called *dichlorethyl sulphide*, a liquid that gives off its vapor slowly. Respirators and the blanket protection of dug-outs keep out the gas, but if a dug-out gets a direct hit with a mustard gas shell, it must be left empty for some days, as the liquid cannot be removed by ventilation with either fires or fans. In battery positions the most annoying feature of the mustard gas is the length of time it persists. In the shell holes it is partly de-

stroyed by sprinkling with chloride of lime. The British invented a method for firing a large number of drums of gas simultaneously. These drums are used chiefly against the front-line troops and are generally filled with pure phosgene. See MEDICAL SCIENCE AND THE WAR; MEDICINE, RECENT PROGRESS IN; POISON GAS.

**MUSTARD OIL**, a volatile, pungent, colorless, irritating oil formed in mustard seed when crushed and wet. See OIL OF MUSTARD.

**MUSTELIDÆ**, a family of small carnivorous mammals classified between the dogs and the bears, and traceable in geological history back to early Eocene time. The special characteristic of the family is the reduction of the molar teeth in the upper jaw to a single one. The dentition in general resembles that of the cats. The family is divisible into five subfamilies: Weasels (*Mustelinæ*), otters (*Lutrinæ*), badgers (*Melinæ*), skunks (*Mephitinæ*) and sea otters (*Enhydrinæ*) and thus include the ermine, mink, fisher, sable, marten, polecat and wolverine. The habitat is worldwide outside of Australasia and Madagascar, but it is in the subarctic and temperate regions of the Northern Hemisphere that the *Mustelidæ* are most numerous and produce the most valuable pelts. The sea otter and the skunks are exclusively American. All are small animals, the largest (the sea otter and the wolverine) being about three feet long. They are characterized by strength, nimbleness and especially bloodthirstiness, and in general have slender bodies, rather short legs, round heads, powerful jaws and strong teeth. They possess anal glands which in some genera, as the skunks, are highly developed, enabling them to discharge at will, as a means of defense, an acrid, malodorous fluid. Some of the *Mustelidæ* are arboreal, but most are terrestrial, living in burrows. Their food consists of small mammals, birds, birds' eggs, crustaceans, fish and insects. Their lust for killing seems to bear no relation to their food requirements; for example, a mink, gaining access to a chicken house, is likely to kill as many fowls as it can seize. The trapping and hunting of the *Mustelidæ* has long been an important industry in both Europe and North America. Consult Coues, E., 'Fur-Bearing Animals' (Washington 1877); Ingersoll, E., 'Life of Mammals' (New York 1909).

**MUT**, moot, in *Egyptian mythology*, a goddess of heaven and queen of earth, the wife of Ammon and the mother of Chons. Her name signifies "mother."

**MUTA NZIGE**, moo'tā nze'gā, Africa, the local name for a lake discovered by Stanley in 1876, explored by him in 1889, and renamed the Albert Edward Nyanza (q.v.).

**MUTANABBI**, moo-tā-nāb'bē, Arabic *Abu 't Tayib*, Arabian poet: b. Kufa, 915 A.D.; d. Sept. 965. He studied in Syria and, for a period, proclaimed himself a prophet, whence the title "el Mutanabbi" (the one who would be a prophet). From 948 he resided at Aleppo under the patronage of the Prince Saif ed Daula and from 957 he lived in Egypt, Bagdad and Persia. He was killed by Bedouin robbers near the Tigris. His greatly admired 'Diwan' consists of a collection of 289 poems and shows

great talent and national spirit besides richness of language, but there are defects of exaggeration in poor taste and certain flattery that is lowering to the general dignity of the verses. Dieterice edited the work, together with the 'Commentary' of Wahidi, who died 1075, under the title 'Mutanabbi carmina' (Berlin 1861); and that of 'Ukbari, who died 1219, was published at Calcutta, Cairo and Bulak with other 'Commentaries.' Hammer-Purgstall translated (poorly) the 'Diwan' (Vienna 1824). Consult Bohlen, 'De Motenabbio' (Bonn 1824); Dieterici, 'Mutanabbi und Seifuddaula' (Leipzig 1847).

**MUTATION THEORY**, a hypothesis of organic evolution which accounts for development by sudden changes or "leaps" rather than by slow and successive degrees; sometimes styled saltatorial evolution. It is illustrated by "Sports" (q.v.),—sudden aberrations from the normal, more familiar in botany than in zoology, but often occurring there. This mode of evolution has always been regarded as effective to some degree, but its general application was urged by Prof. Hugo De Vries, of Amsterdam, in his work 'Die Mutationstheorie,' published in 1901. Professor De Vries showed that the objections urged against the Darwinian theory on the ground of the prodigious length of time needed for the development of species could be explained away by a due regard to the phenomena of mutation. He showed that new species are produced in this way not only on a single occasion, or with single individuals, but repeated continually and in large numbers. In the field of botany to which Professor De Vries' investigations were confined, he established the fact that mutations take place in the seed, independently of the vicissitudes of growth in the field, and in accordance with certain apparent laws. The new species which results from mutation remains constant but exhibits a tendency to throw off an ever increasing series of variations. Consult De Vries, H., 'Species and Varieties' (Chicago 1906); Lock, R. H., 'Recent Progress in the Study of Variation.'

**MUTHER**, moo'ter, Richard, German art historian: b. Ohrdruf, Germany, 25 Feb. 1860; d. 1909. He was educated in the University of Heidelberg and the conservatory of Munich and devoted his attention to the history of art in which subject he was professor at the University of Breslau since 1895. He has published 'Anton Graff' (1881); 'Meisterholzschnitte aus den Jahrhunderten' (1887); 'Geschichte der Malerei des 19ten Jahrhunderts' (1893; Eng. trans., 'History of Modern Painting,' 4 vols., 1907); 'Geschichte der Malerei' (5 vols., 1899-1902; Eng. trans. by George Kriehn, 2 vols., 1907).

**MUTINY** (Fr. *mutin*, refractory, stubborn; *mutiner*, to rise in arms). Two hundred years ago the word mutiny was often used in describing insurrection or sedition in civil society; but it is now applied exclusively to certain offenses by sailors and soldiers. Properly it is the act of numbers in resistance of authority; but by statutes, certain acts of individuals are declared to be mutiny. The act of Congress of 3 March 1835 defines mutiny or revolt in the following language:

If any one or more of the crew of any American ship or vessel on the high seas, or on any other waters within the maritime and admiralty jurisdiction of the United States, shall unlawfully, wilfully, and with force or by fraud, threats, or other intimidations, usurp the command of such ship or vessel from the master or other lawful commanding officer thereof; or deprive him of his authority and command on board thereof; or resist or prevent him in the free and lawful exercise thereof; or transfer such authority and command to any other person not legally entitled thereto; every such person so offending, his aiders and abettors, shall be deemed guilty of a revolt or mutiny and felony.

The same statute provides for endeavors and conspiracies to excite mutiny. In construction of the act it has been held that mere disobedience of orders by one or two of the seamen, without any attempt to excite a general resistance or disobedience, and insolent conduct or language toward the master or violence to his person, if unaccompanied by other acts showing an intention to subvert his authority as master, are not sufficient to constitute the offense of endeavoring to excite mutiny. An indictment for this crime, it is said, must set forth a confederacy of at least two of the men to refuse to do further duty, and to resist the lawful commands of the officers. The offense of making a revolt was by the act of April, 1790, punishable by death. By the act of 1835, it is punished by fine not exceeding \$2,000, and by imprisonment and confinement at hard labor for not more than 10 years, according to the nature and aggravation of the offense; while attempts to excite a mutiny are punishable by fine not exceeding \$1,000, or by imprisonment not exceeding five years, or by both. Mutinous conduct in the army and navy is provided for by the acts of 10 April 1806 and of 23 April 1800. By the former, "any officer or soldier who shall begin, excite, cause or join in any mutiny or sedition, in any troop or company in the service of the United States, or in any party, post, detachment, or guard, shall suffer death, or such other punishment as by a court martial shall be inflicted." Under the latter, "if any person in the navy shall make, or attempt to make any mutinous assembly, he shall, on conviction thereof by a court martial, suffer death." These laws are embodied in the present articles of war and articles for the government of the navy, except that death is not now mandatory in the navy. The law of mutiny in Great Britain is in general similar to the United States statute, except that the penalty of death is not imposed.

**MUTOSCOPE**, a mechanical apparatus for exhibiting instantaneous pictures of moving objects taken by the kinetograph or similar instrument. Photographic prints from the series of pictures thus obtained are mounted in consecutive order around a cylinder standing out like the leaves of a book. When this cylinder is slowly revolved, the picture cards being held back by a stop, and allowed to snap past the eye one by one, as one thumbs the leaves of a book, an apparently moving picture is the result. See CINEMATOGRAPH; MOVING PICTURES.

**MUTSU**, mut'sü or mut's', Munimitsu, COUNT, Japanese statesman: b. Wakayama, 1842; d. Tokio, 24 Aug. 1897. After six years' foreign services and as governor of the province Kanagawa he was appointed (1874) secretary of the senate. He suffered a long imprisonment, from 1878, for participation in the Saigo Rebellion, but was pardoned in 1882 and

was again employed in foreign affairs by the state. From 1888-90 he was Ambassador to the United States, then becoming Minister of Agriculture in the Japanese Cabinet. During the Ministry of Marquis Ito (1892-96) he was Minister of Foreign Affairs, being a member of the peace plenipotentiary party that arranged the treaty with Li Hung Chang at Shimonaseki, for which he was rewarded (1895) with the title of count. In 1894 he negotiated a treaty with Great Britain in which the latter renounced extra-territorial jurisdiction from July 1899. Lung troubles enforced his retirement from political activity in 1896.

**MUTSUHITO**, moo-tsu-hee-to, the 121st in the line of mikados or emperors of Japan and, according to the impersonality ruling in all Japanese history, posthumously called after the year-period, the Meiji Tenno: b. Kyoto, 3 Nov. 1852, 2d son of the Emperor Komei (1831-67), declared heir-apparent 10 July 1860; succeeded to the throne January 1867; inaugurated as sovereign, with the three imperial symbols, mirror, jewel and sword, 31 Oct. 1868; married 28 Dec. 1868 to Haruko, then 19, and the 3d daughter of the noble of the 1st rank Ichijo. No children were born of this union, but of the issue from imperial concubines, four sons and four daughters survive in 1918. From the first, brought up amid sounds of battle and in sight of the war fires of contending clansmen in Kyoto, as the old and new forces struggled for mastery, and, happily, early surrounded by men of vision and liberal minds, some of whom had been in Occidental countries, Mutsuhito was from the first in hearty and active sympathy with modern progress and civilization. One of his first public acts was to take the famous charter oath of five principles. In one of these he promised a national deliberative assembly, and in the other to seek for talent throughout the world for assistance in relaying the foundations of his empire. He became a shrewd judge of men and motives and a lover of peace. He signed in autograph the treaties, entered warmly into measures of reform and in erecting memorials to the martyrs and those who had advocated mikadoism and unity of government, traveled all over the empire to see his people, paid unique honors to his wife in public and private, and was a laborious servant of the nation. By personal tastes and habits thoroughly Japanese to the end of his days, he was a cosmopolitan in mind and sympathies, and his character as well as his office turned the scale in great crises, when grave debate was held by rival statesmen in his presence. Every word of the text of the constitution of 1889 was, during the two years of deliberation, discussed before him. Most notable and fiercely debated was the guarantee of religious liberty. His reign was marked by many wonderful events and a most extraordinary outburst of intellectual, industrial and military energy. On the 25th anniversary of his marriage, memorial postage stamps were issued and the empress was notably honored, marking a new era in the history of Japanese womanhood. The days of his last illness saw a prayer-meeting that was national and without regard to creed or class, all gods being petitioned, and the general sorrow was sincere and profound. His mausoleum in Kyoto cost over \$1,000,000. His con-

vol. 19—42

sort, a true helpmeet and of finest character, followed him in death 8 April 1914. Both sovereigns were notable poets. From about 1870 the Japanese ceased to use the ancient poetical term mikado and adopted the native term tenshi, or tenno (son of heaven, or heavenly king), or emperor, as best according with the new status of Japan as a world-power. Consult Griffiths, 'The Mikado's Empire' (1909), and 'The Mikado: Institution and Person' (1915); and Mrs. Fraser's 'Letters from Japan' (1899).

**MUTTON-BIRD**, a sailors' name for the shearwater (q.v.).

**MUTTRA**, is the northwestern district of the Agra Division, United Provinces, lying between lat 27° 14' and 27° 58' N., and long. 77° 17' and 78° 13' E., with an area of 1,445 square miles. It lies on both sides of the Jumna and in the centre of the western border; the Arvallis Mountains extend in the form of a low range of hills. There are no rivers besides the Jumna, but there are canals, wells and marshes. The climate is hot and dry, with extremes of temperature. There is very slight rainfall. Muttra contains 14 towns and 837 villages. The population has been frequently devastated by famine, but better road facilities and irrigation have lessened these difficulties. About 90 per cent of the people are Hindus and less than 10 per cent are Mussulmans. The principal crops are millets, pulse, cotton, wheat, barley and sugar cane. The administration is under a member of the Indian Civil Service and three deputy collectors. According to Ptolemy, Muttra was the capital of the ancient kingdom of Surasena and was an important religious centre, as the many antiquities discovered here testify. It was sacked by the Mahmud of Ghazni in 1019, but played only a slight political part. It was revived during the Buddhist period as a centre of faith. Its history was merged into that of the Jats of Bharatpur; and after changing hands several times came under British dominion in 1803. In 1857 it mutinied but was put down in the same year and has since remained friendly. Consult 'Gazetteer of India' (Vol. XVIII, Oxford 1908).

**MUTUAL BANKS AND CO-OPERATIVE SOCIETIES.** See BANKS AND BANKING—WORLD'S SYSTEMS.

**MUYSKAS**, mü-ě'skă. See CHIBCHAS.

**MUZAFFAR-ED-DIN**, moo-ză-fer'ed-dên'; Shah of Persia: b. Teheran, 25 March 1853; d. there, 9 Jan. 1907. He was governor of Azerbaijan; succeeded his father, Nasr-ed-Din (q.v.), 1 May 1896. Influenced by European civilization, he showed great tolerance toward the Christians, and did much to reform the internal administration of Persia by lightening taxes and by establishing a parliamentary government. He visited Europe several times.

**MUZAKOVA**, mü-zhă-kô'vá, Johana. See SVETLA KAROLINA.

**MUZIANO**, moot-sě-ă'nō, Girolamo, commonly known as BRESSANO, Italian painter: b. Aquafredda, near Brescia, 1528; d. Rome, 27 April 1592. He was a pupil of Romanino (see ROMANINO GIROLAMO) and of Titian at Venice, and subsequently imitated Michelangelo. He was a skilled mannerist who could paint in

any style while possessing none of his own. The Academy of Saint Luke was founded at his instigation. Among his most successful pictures are 'The Taking Down from the Cross,' in the Borghese Gallery, Rome; 'The Gift of the Apostolic Keys,' in the Vatican. There are also some frescoes of his still to be seen in the Vatican.

**MY PRISONS ('LE MIE PRIGIONI')**, one of Italy's most noted books, was written by Silvio Pellico (1789-1854) and published in Turin in 1832. The work is autobiographical, relating the 10 years' experience of the author, charged with conspiracy and condemned by the Austrian government, first to death and subsequently to 15 years of imprisonment in the prisons of Venice and Spielberg, near Brünn in Austria. The work itself is of the simplest character, written, as he says in his preface, to comfort unfortunates like himself by showing that under the most unfavorable conditions humanity is not as black as it is painted. Had Pellico aimed directly to expose the inhumanity and cruelty of the Austrian government, as might have been expected he would have done, his effort would likely have fallen far short of what he actually accomplished in doing just that in this pathetic tale of his sufferings borne with the utmost Christian resignation. No hatred nor vindictiveness toward his arrogant persecutors escapes the unfortunate victim. In fact it is just here that the recital is most open to criticism. The patient sufferer is too submissive, too long-suffering. Inoffensive and saintly as he is, that virility, which, because founded on righteousness, must ever command respect, is conspicuously lacking in him. His sad story awakened throughout Italy the most profound sympathy. Its moral effect may be compared to Chateaubriand's 'Genie du christianisme,' which was worth an army to Napoleon. Pellico's 'Le mie prigioni' was, as Cesare Balbo, who counseled the author to write the story, has said, worse for Austria than losing a battle. It is not primarily as an author that Pellico's place is secure in the hearts of his countrymen, for his literary work as a whole is rather commonplace, but as a Christian martyr upon whom an odious enemy has placed a crown of thorns. From the time of the appearance of this story, the hateful domination of Austria was judged and condemned by the fairminded not only of Italy but of Europe. Nothing has ever been written better adapted to cause and to perpetuate feelings of hatred toward a despicable tyrant. And even to-day the influence of 'Le mie prigioni' on Italian sentiment toward Austria is abiding. Many translations of 'Le mie prigioni' have appeared in many languages and English versions are easily procurable in the large libraries.

JAMES GEDDES, JR.

**MYCALE**, mik'a-lē, Asia Minor, the classical name of the modern Samsun, a mountain of south Ionia, with the promontory of Cape Santa Maria opposite the island of Samos as its seaward termination.

**MYCENÆ**, mi-sē'nē, Greece, an ancient city of Argolis in the Peloponnesus, six miles northeast of Argos, built on a steep hill dominating the passes to Corinth. Its ruins since Schliemann's excavations in 1876 have yielded

an abundance of archæological treasure of the greatest value and interest, illustrating the distinctive Mycenaean period of civilization, which preceded the culminating era of Hellenic culture. Mycenæ is said to have been founded by Perseus, and before the commencement of the Trojan War was the residence of Agamemnon, in whose reign it was regarded as the leading city in Greece; it was also the scene of the domestic tragedies of the house of Atreus (q.v.). It declined in importance after the invasion of the Dorians, but its cyclopean walls, citadel and other features, chief of which are the Lion's Gate, and the vaulted building of megalithic architecture called the Treasury of Atreus (q.v.), stood through succeeding centuries, and still stand, as monuments of its ancient grandeur and importance. Consult Schuchhardt-Sellers, 'Schliemann's Excavations' (1891); Hall, 'The Oldest Civilization of Greece' (1901); Tsountas and Manatt, 'The Mycenaean Age' (1897).

**MYCORRIZA** is a general name for a group of subterranean fungi that spread their growing, feeding part (mycelium) through the loose damp soil (humus) of the floor of a forest or wood-lot. They are symbiotic with a great variety and number of green-leaved plants, including forest trees of several families. The first root of one of these affected plants, just born from the seed, remains free, but as fast as the lateral roots push out they are enveloped in the mycelium of the fungus, and their ramifications become entangled in it as they spread, and this connection continues throughout life. Wherever a root or rootlet extends underground the fungus accompanies it. The mycelial filaments may form a dark-brown, felt-like coating over the whole surface of the root, or, in other cases, depending on the species, may make a net-work of spider-web-like mesh. At various points the spore-producing hyphae proceed outward through the soil from the mycelium; they look like rootlets and seem to perform a similar service. This mycelium (called "spawn" by mushroom growers) represents an unknown number and variety of species of fungus, and it abounds in the humus of forests and uncultivated heaths where the top-soil is the result of vegetable decay. The coating of roots by this mycelium is to be seen wherever plants grow, but it does not affect every kind of plant. It is restricted to the flowering plants, among them all the Pyrolaceæ, Vaccinæ (whortleberries), and Arbutæ, and most if not all the heath family (Ericaceæ), rhododendrons, daphnoids, a great number of conifers and all the Cupuliferæ—a group that includes the oak, beech, alder, chestnut and many other forest trees; also many isolated trees, as willows and poplars, and the genista and several other familiar garden herbs.

This association of the mycorrhiza with the flowering plants is in each case a partnership of mutual benefit. Covering the root with a mantle it prevents, it is true, the absorbing pores from performing their function of withdrawing from the soil the dissolved elements that constitute the food of the plant, but in compensation the fungus takes on itself this function, absorbing the required nutriment and delivering it to the plant. It is enabled to do

this because the mycelium has the power of secreting "those special enzymes, or ferments which render soluble the organic ingredients they touch." In return for this service it receives from the plant-root nourishment for itself, which has been elaborated in the leaves and distributed to every part of the plant, including its uttermost rootlet. This, indeed, is only following the custom of all fungi, which, having no chlorophyl with which to derive nourishment from the air through chemical dissolution and recombination, must get it from vegetable sources. This association of the mycorrhiza with plant-roots is therefore really a parasitism, yet it seems not only harmless but decidedly beneficial—in fact, those plants participating in this association will not do well, and perhaps will fail to grow at all, in a soil wholly free from suitable mycorrhiza. Hence the special value of the addition of wood-mold to garden or window-pot soil is that it brings with it this advantageous, and sometimes indispensable, mycorrhiza mycelium.

ERNEST INGERSOLL.

**MYDDELTON**, or **MIDDLETON**, **SIR Hugh**, British contractor: b. Galch Hill, Denbigh, Wales, about 1560; d. 10 Dec. 1631. He was by trade a goldsmith, banker and cloth-maker of London, but became (1597) an alderman of Denbigh, then was elected member of Parliament for that town in the years 1603, 1614, 1620, 1623, 1625 and 1628. The lack of water supply for the rapidly growing city of London induced the Parliament to pass a bill for the construction of the "New River" to tap the springs in Hertfordshire, and he contracted to carry out the undertaking. Powerful opposition from the landed proprietors forced him to call in the king's aid and James I paid half the cost in return for half the profits. The canal, begun 1609, was completed in 1613 and was then 38 miles long, 20 feet wide, with a depth of but four feet. Until after his death the project was unprofitable and he lost considerably though the New River Company later became, after his death, one of the most profitable undertakings of centuries, its shares (known as "King's" and "Adventurers") being broken up in 30-second parts, bring immense dividends to this day. In 1617 he made considerable profit in the exploitation of lead and silver mines in Cardiganshire. He was created a baronet in 1622.

**MYELITIS** (from Greek *μυελός*; marrow), an inflammation, attended with more or less softening, of the substance of the spinal cord. It may be acute or chronic and is a rare disease. Some of the maladies formerly ascribed to chronic myelitis are now known to be due to chronic induration and thickening (sclerosis). The most common causes of myelitis are: irritation of the cord by fractured, dislocated or diseased vertebrae, by the pressure of a tumor, or by hemorrhage into its substance. The disease is aggravated by intemperate habits. It begins usually with pain or other uncomfortable sensations in the spine or extremities, and fatigue, followed by an uncertain gait, paralysis and very frequently death. There are four different forms of the disease according to the position of the inflammation, which may be in the midthoracic region, the most common form, or in the lumbar or lum-

bosacral region, in the cervical region or it may, instead of affecting only a certain definite locality such as those already mentioned, involve a number of small areas in the whole length of the cord and brain. This form is called disseminated myelitis. If the inflammation involves the upper part of the cord above the origin of the respiratory nerves, respiration is interfered with and death results from asphyxia. This is, however, exceedingly rare. If the inflammation exists lower down, in addition to the loss of motor power in the extremities the bladder and rectum may be paralyzed, the evacuations are discharged involuntarily and death occurs from exhaustion. The tendency of the inflammation is to spread. Treatment consists of salvarsan and mercury for the cases of syphilitic origin. Absolute rest in bed must be required, an air or water bed being preferable as bed sores are very likely to occur.

**MYERS, Abraham C.**, American Confederate soldier: b. in South Carolina, 1811; d. Washington, D. C., 20 June 1889. When a boy he removed to Louisiana, was appointed to West Point, and in 1833 was graduated and entered the army. He served several years on the frontiers, in the War with Mexico, and then entered the quartermaster's department as lieutenant-colonel. When Louisiana seceded, Myers resigned and was soon appointed Confederate quartermaster-general with the rank of colonel. Myers rendered great service to the Confederacy in organizing its transportation and supply departments. On 10 Aug. 1863 he resigned. His life after the war was uneventful.

**MYERS, Henry L.**, American legislator: b. Cooper County, Mo., 9 Oct. 1862. He was educated at private schools and practised law (1885-93) at Boonville and West Plains, Mo., then at Hamilton, Mont., from 1893. From 1895-99 he was prosecuting attorney for Ravalli County, Mont., becoming Democratic member of the Montana senate 1899-1903. He was (1907-11) district judge of the 4th Judicial District of Montana, becoming (1911-17), United States Senator for Montana, to which position he was re-elected for the present term (1917-23).

**MYERS, Jerome**, American artist: b. Petersburg, Va., 20 March 1867. He received his first art education in Cooper Union, New York, and also at the Art Students' League. In 1903 he won a Saint Louis Exposition bronze medal. His 'Night Mission' is in the New York Metropolitan Museum of Art and other works are in leading galleries of private collections. His favorite subjects are taken from local sources, New York's "East Side" especially.

**MYGALE**, the technical and book-name of the Theraphosidæ a species of trap-door spider (*Mygale avicularia*) which has been known to catch small birds and kill them. It is a native of India, Australia, Africa and South America. It is the largest of all the spiders, being very stout, dark brown or black in color, and its thick legs covered with hairs mingled with longer bristles. It builds its nest in trees. Similar species are brought into our ports in bunches of bananas. These spiders are nocturnal in their habits and feed usually on in-

sects, but they do not hesitate to attack any living creature which seems unable to resist them. The fact that the bird-spider will actually kill birds and suck their blood was asserted by Madam Meriam in 1705. Her statements were received with doubt, but long after were verified by Bates. The specimen he observed on the Amazon River was nearly two inches in length, the legs expanding seven inches. He saw the monster on a tree-trunk beneath a deep crevice in the tree, across which was stretched a dense white web. "The lower part of the web was broken, and two small finches were entangled in the pieces; one was quite dead, the other was still living and was smeared with the filthy liquor or saliva exuded by the monster." The natives call them *aranhas caranguejeiras*, or "crab-spiders." The hairs on the body and legs come off when touched, and "cause a peculiar and almost maddening irritation." This, Bates thinks, is not due to any poisonous quality residing in the hairs, but to their being short and hard, and thus getting into the fine creases of the skin.

**MYIASIS**, a diseased condition in humans caused by the larvæ of flies. House-flies may affect the skin of man by depositing eggs in wounds and on ulcerations, or may invade the external cavities of the body. The eggs hatch, and the maggots cause much local irritation and symptomatic fever; or in the case of the bot-fly (q.v.), penetrate the skin deeply and produce large abscesses. The maggots, as a rule, do not penetrate other tissues. The principal flies that infect wounds, etc., are the flesh-fly (blue-bottle), blow-fly, screw-worm fly, which deposits its eggs in the noses of persons who sleep unprotected during the day, and house-fly (qq.v.). Internal myiasis may result from swallowing the eggs of flies in raw vegetables containing them, and sometimes eaten in salads, when the resulting larvæ are got rid of by vomiting or purgation. Consult Howard, 'The Insect Book' (1901).

**MYLITTA**, mi-lit'ta, an Assyrian goddess, identified by the Greeks with Aphrodite. She was, as goddess of the moon, the female principle of generation.

**MYLODON**, the "ground sloth," a genus of extinct edentate mammals, of sloth-like structure and large proportions, the remains of which occur along with those of the *Megatherium* and *Megalonyx*, in the recent or post-Tertiary deposits of South America and also scattered widely over the United States from Pennsylvania on the east to Oregon on the west. In size the *Myiodon robustus*—the most familiar species—attained a length, in some instances, of 11 feet. A large piece of the very thick hide of one of these mylodons, found in a cave in Patagonia, shows that they were covered with a dense coat of yellow-brown furry hair, similar to that of the brown bear of the Rocky Mountains. See **GROUND-SLOTHS**; **MEGATHERIUM**.

**MYNA**. See **MINA-BIRD**.

**MYOPIA**, mi-ō'pī-a, nearsightedness. See **ASTIGMATISM**; **COLOR BLINDNESS**; **EYE**; **EYE STRAIN**; **VISION, DEFECTS OF**.

**MYOSIN**, or **MYOSIN-FIBRIN**, a simple proteid substance, usually classed as a globulin (see **GLOBULINS**), which separates

from muscle plasma after death, in the form of a clot, which is analogous to the clot of fibrin that is formed under similar circumstances in blood. Its average composition is carbon, 52.28 per cent; hydrogen, 7.11 per cent; nitrogen, 16.77 per cent; sulphur, 1.27 per cent, and oxygen, 22.03 per cent. It does not exist in the living muscle, being there represented by two other proteids called *myosinogen* and *paramyosinogen*, respectively. The stiffening of the muscles after death (technically known as the "rigor mortis") is due to the formation of the myosin-fibrin and myogen-fibrin clots in the cells of the muscles. Myosin is insoluble in water, but dissolves in dilute saline solutions. It is soluble also in dilute acids and alkalis, which convert it promptly into albuminates. Consult Hammarsten, O. (Mandel's translation), 'A Textbook of Physiological Chemistry' (New York 1908).

**MYOSOTIS**. See **MOUSE-EAR**.

**MYRES**, mirz, John Linton, English classical scholar: b. Preston, Lancashire, 3 July 1869. He was educated at Winchester and studied at New College, Oxford. From 1895-1907 he was tutor at Christ Church and lecturer in classical archæology (1903) at Oxford University, junior proctor (1904-05), secretary to committee for anthropology (1905-07) and examiner in final classical school (1906-08). From 1907-10 he was Gladstone professor of Greek and lecturer in ancient geography at the University of Liverpool, then Wykeham professor of ancient history at Oxford. He traveled through Greece and Asia Minor, conducted excavations in Cypress (1894 and 1913), and reorganized the Government Museum (1894). He has written 'A Catalogue of the Cyprus Museum' (1899), in collaboration with Dr. Ohnefalsch-Richter; 'A History of Rome' (1902); 'The Dawn of History' (1911); 'Handbook of Cesnola Collection of Antiquities' (in Metropolitan Museum of Art, 1914). He also wrote many papers on anthropology, geography and archæology for the scientific periodicals.

**MYRIAPODA**, a group formerly classified among the arthropodan animals, but now better known. It includes the groups of *Chilopoda*, or centipedes, and the *Diplopoda*, millepedes or galley-worms. The features common to all are the elongate worm-like body consisting of a head and behind this the trunk of numerous similar leg-bearing segments, not divided into thorax and abdomen. They are all inhabitants of dark and obscure places,—under logs and stones and the bark of trees. All but two species are terrestrial; those two are semi-aquatic, living between the high and low-water levels on the sea-coast. Closer analysis shows that the chilopods are related to the crustacea while the diplopods are allied to the worms. In the chilopods the head bears a pair of groups of simple eyes, a pair of antennæ and three pairs of jaws (mandibles, maxillæ, labium), while the first pair of trunk appendages becomes connected with the head and serve as poison-jaws. The trunk-segments are all similar, and each bears one pair of legs, the number of segments ranging from 15 to 170 or more. The body-segments are flattened and the reproductive openings are at the hinder end of the body. Most of the chilopoda are carnivoro

PODA AND ARACHNIDA

1. Scorpion    10. White-plume Moth    11. Ringed Gnat    12, 13. Breeze-fly and Larva    14. Hawk-fly    15. Leptis  
 2. Bot-fly    24. Blue-bottle    25. Forest-fly    26. Flea    27. Beetle-bug    28. Wood-bug    29. Phytocoris  
 3. Cicada and Larva    36, 37. Cicada and Larva    38. Burrowing Cicada    39. Frog-hopper    40. Centrotus Cornutus  
 4. Garden Spider    47. Millepede    48. Centipede    49. Pill-worm    50. Scorpion    51. Book-scorpion  
 5. Scolopendra    57, 58. Hunting Spider    59. Scarlet-mite    60. Water-mite

ous and ferocious and are very quick in movement. The most noticeable members of the group are the centipedes (*Scolopendridæ*) of the tropics, some of which are nearly a foot in length and have considerable poison powers. See CENTIPEDES.

In the diplopoda the head bears but two pairs of jaws (mandibles and lower lip or gnathochilarium), while the trunk-segments are usually circular in section, and each, except a few near the head, bears two pairs of legs, an exception to the otherwise universal rule among arthropoda of a pair of legs to a somite. The range of segments is even greater than in the chilopods, there being nine in *Pauropoda* and 200 in some *Polyzoindæ*. The reproductive organs lie ventral to the intestine, and the external openings are a little behind the head. The *Diplopoda* live mostly upon decaying vegetation and are extremely slow in movement. For protection they rely upon the very thick and hard walls of the bodies, and in some species upon peculiar stink glands which open on the sides of the body. See MILLEPED.

Fossil Myriapods appear in the Devonian rocks and they are found in all parts of the world to-day. Most of the American species are described in Bollman's 'Myriapods of America' (United States National Museum, 1893).

**MYRICIN**, a substance formed by the combination of palmitic acid with an organic radical known as "myricyl." It has the chemical formula  $C_{26}H_{52}O.CO.C_{18}H_{36}$ , and occurs in beeswax, forming the chief portion of that part of the wax which is insoluble in alcohol. Myricin melts at  $162^{\circ}$  F., is readily saponified by alcoholic potash, and may be obtained in the form of feathery crystals by deposition from its solution in ether.

**MYRISTIC ACID**, an organic acid occurring in the form of a glyceryl ether in nutmeg butter, from which it may be prepared by saponification and subsequent distillation at a pressure materially below that of the atmosphere. It is a component also of butter, wool fat, cocoanut oil and oil of quince seed. It has the chemical formula  $C_{14}H_{28}COOH$ , and is insoluble in water. It is very soluble in hot alcohol, however, from which it separates, upon cooling, in the form of lustrous laminæ, melting at  $129^{\circ}$  F., and boiling at  $250^{\circ}$  F. It may be prepared by melting stearolic acid with potash. A number of compounds of myristic acid with the metals are known, as well as several ethers and other organic compounds. Myristic acid gives their characteristic name to the myristica fats of which it forms the predominating part as trimyristil glyceride.

**MYRMECOPHILY**, in its broadest sense, signifies a condition of friendship with ants, and includes the subject of the various insect and other guests kept or entertained in their nests by ants. The side of it to be considered now, however, is the relation of certain plants to ants, when this relation is, or is supposed to be, of mutual advantage. Such plants are termed myrmecophilous and are of great variety, especially in the tropics. That ants inhabit all sorts of cavities in trees and large vascular plants, such as cacti, is well known, and often they dig out the pithy interior or otherwise modify these cavities into homes

fully adapted to their requirements. "The rigid vegetable tissues are an excellent protection against enemies," as Wheeler points out, "and the cavities are moist, dark and free from molds, so that they make perfect nurseries for the larvæ and pupæ." It is a matter of common knowledge also that in most cases the plants thus utilized furnish a good deal of food-material for the ants. The great mass of observations bearing on this matter have been interpreted by many naturalists to support the view that many plants have developed as an adaptation through natural selection elaborate structures to be used as ant-lodgings or even to furnish these insects with food-substances in order to attract certain pugnacious ants whose stings are formidable, because they will protect the plants from leaf-cutting ants or other leaf-destroying enemies. In this alleged symbiotic arrangement the insects profit by the supply of special food-material growing on the plant and return the service by warding off harm; and it is said that mutual adaptations have occurred between the chosen kind of plant and the species of ant that inhabits its appointed cavities. The great body of facts collected by Fritz Müller, Schimper, Belt, Semper, Beccari and others are accepted, and some of their interpretations are admitted, but recent students of the matter regard the theory as far overstrained and doubt that true symbiosis can be shown to exist in any case. The latest and fullest treatment of the matter will be found in William M. Wheeler's 'Ants' (New York 1910).

**MYRMIDONS**, mèr'mi-dōnz, a former people on the southern borders of Thessaly, who accompanied Achilles to the Trojan War. They were said to have received their name from Myrmidon, a son of Zeus and Eurymedusa, the daughter of Cleitos, whom Zeus deceived in the disguise of an ant. He was married to Peisidice by whom he became the father of Antiphus and Actor. For Æacus, a descendant of this branch, Zeus changed the ants of the island of Ægina to men. This legend was the origin of the belief that the Myrmidons emigrated to Thessaly under the leadership of Peleus.

**MYROBOLANS**, the dried fruits of various species of East Indian trees, all having more or less astringent properties. They are used for dyeing and tanning, especially the latter. The trees are of the genus *Terminalia*, family *Combretaceæ*, the chief being the belleric myrobolan (*T. bellerica*), and the chebulic (*T. chebulica*).

**MYRON**, Greek sculptor: b. Eleutheræ, a seaport of Bœotia, about 450 B.C. He was, along with Phidias and Polycletus, a pupil of Ageladas, the founder of the Peloponnesian school of sculpture, and made his renown at Athens as a versatile and masterly worker in bronze, silver and every other art material. He executed statues of gods, heroes and especially of athletes, many of which were set up in the temples at Delphi and Olympia. The most celebrated among them was that of swift-runner Ladas, and the Discobolus, or hurler of the discus, a work of art highly admired by the Romans, as is proved by the many Italian copies of it made in marble, the finest of which is that now in the Lancelotti Palace, Rome. On

medals, basins and reliefs there are still extant copies of his Athenian work, 'Athene Throwing Away the Flute,' etc. A marble copy of his 'Marsyas' is in the Lateran Museum at Rome, and one in bronze is to be seen in the British Museum. He was equally successful in the representation of animals. His 'Cow' in the market at Athens was the subject of many a laudatory epigram and was brought to Rome in the time of Cicero. Myron gave a somewhat exaggerated slenderness to the human form, which he modeled with exquisite beauty and anatomical accuracy, but was not a master of facial expression.

**MYRRH**, a popular name for a gum resin produced by *Commiphora myrrha* of the family *Burseraceæ*; also for a garden plant *Myrrhis odorata* of the family *Apiaceæ*. The resin is obtained from Arabia and adjacent Africa from a small, prickly, stunted, gray-barked tree which bears few small denticulate leaves and smooth, brown, egg-shaped drupes as large as currants. The drops, granules or tears which in commerce are brown, red or yellow are at first rather oily, yellowish and soft, becoming brittle with age. They have a pleasing balsamic odor and lasting, bitter, aromatic taste. From earliest times they have been used for making incense and other perfumes and have been reputed useful in medicine, especially for cleansing the mouth and sweetening the breath.

Myrrh, the garden plant, also known as sweet cicely, has been cultivated for ages as a sweet herb for flavoring salads and culinary preparations. It is little grown in the United States except by people of rather recent European ancestry.

**MYRTACEÆ**, a family of trees and shrubs, the myrtle family, comprising about 70 genera and more than 2,000 species widely distributed in warm climates, but sparingly in temperate. It is one of the most important families of economic plants. Some of the species, such as pomegranate (*Punica granatum*), guava (*Psidium spp.*), luma and ugni (*Myrtus*) yield important fruits; some such as cloves (*Eugenia sp.*), allspice (*Pimenta*), furnish highly valued spices; and still others, especially species of *Eucalyptus*, are leading timber trees of the world. The species are characterized by simple, entire leaves generally dotted with glands; perfect flowers in racemes or sometimes cymes, and various kinds of fruits. See **MYRTLE**.

**MYRTLE**, a popular name for several unrelated plants of which the following are probably the best known: Crape myrtle (*Lagerstræmia indica*) of the family *Lythraceæ*; running myrtle (*Vinca spp.*) of the family *Apocynaceæ*; sand myrtle (*Leiophyllum spp.*) of the *Ericaceæ*. When unqualified the name generally refers to various species of *Myrtus* of the family *Myrtaceæ*. The common myrtle (*M. communis*) is an evergreen shrub native of the Mediterranean region and western Asia, whence it has been introduced into gardens throughout the warmer temperate climates of the world for its foliage and flowers. It was used in Greek festivals as sacred to Venus and as the symbol of beauty and youth. Its aromatic leaves and berries were formerly used in medicine and its bark in tanning, uses still made of them to some extent in southern

Europe. The small leaved myrtle (*M. microphylla*), the luma (*M. luma*) and the Chilean guava (*M. ugni*) yield edible fruits, for which they are planted in South America and to some extent in California.

**MYRTLE TREE**. See **BEECH**.

**MYSIA**, mish'i-ā, Asia Minor, a name anciently applied to a district which varied greatly in extent at different periods. The name first occurs in the legend of Telephus, who became king of Mysia. Under the Persian Empire Mysia was the name of the section between Lydia on the south and the range of Ida on the north. It was united with the region on the north and with Lydia in forming a single satrapy. After the overthrow of the Persian Empire by Alexander the Great, Mysia fell to Lysimachus (311 B.C.). Subsequently it formed part of the Græco-Syrian kingdom, then of the kingdom of Pergamus, and finally, in 133 B.C., was bequeathed with the rest of the kingdom of Pergamus, by Attalus III to the Romans, by whom it was made a part of the province of Mysia. When the divisions of Asia Minor were settled under Augustus, the name of Mysia was given to the whole of the northwestern district, bounded on the north by the Propontis (Sea of Marmora), east by Bithynia and Phrygia, south by Lydia and west by the Ægean Sea. Under the later empire Mysia was erected into a separate proconsular province and received the name of Hellespontus. The inhabitants were thought by some ancient writers to be of Thracian or Lydian descent.

**MYSORE**, mi-sōr', or **MAISUR**, mi-soor', India, the dynastic capital of the native state of the same name, 250 miles west by south of Madras, in a valley 2,450 feet above sea-level, dominated on the southeast by Chamundi Hill 1,040 feet higher, with a temple on its summit. It is on the Mysore State Railway. Modern enterprise on European methods has greatly improved the town. The streets are broad and regular, the houses intermingled with trees and temples, and there are several fine modern public buildings, including the British residency. The fort built in European style, and separated from the town by a promenade, encloses the maharaja's palace, and the dwellings of his officials.

**MYSORE STATE**, or **MAISUR**, a native state in Southern India, lying between lat. 11° 36' and 15° 2' N. and 74° 38' and 78° 36' E. Its area is 29,433 square miles; the greatest length north and south being about 230 miles; east and west about 290 miles. It is bounded by Madras districts on all sides except on the northwest where it is bordered by two Bombay districts and toward the southwest where Coorg intervenes. It consists of an undulating table land, much broken up by chains of rocky hills and scored by deep ravines. Its form is that of a triangle with the apex to the south at the point where the western and eastern ghât ranges converge in the group of the Nilgiris. The general elevation rises from about 2,000 feet along the north and south to about 3,000 feet at the watershed which separates the basin of the Kistna to the north from that of the Cauvery to the south. Isolated rocky peaks called "droogs" appear on all sides at an elevation of from 4,000 to 5,000 feet. The drainage

of the country finds its way east to the Bay of Bengal and there are three great river systems; the Kestna on the north, the Cauvery on the south and the Penner, Ponnaiyār and Pālār on the east. None of these is navigable, but they are sometimes used for floating lumber. They support an extensive system of irrigation by means of channels formed by immense dams, these channels tracing a course of more than 1,200 miles. There are no natural lakes in Mysore, but by embanking streams, tanks or reservoirs of all sizes are formed numbering some 30,000. Mysore is divided naturally into two regions: the hill country or Malnād on the west—a picturesque mountain land, with fine forests—and the open country on the east comprising the greater part of the state, known as Maidān or Bayalshime, where the towns are located. The products of the country vary with the water supply and nature of the locality. The level plains of black soil in the north grow cotton or millets; the tracts in the south and west are covered with plantations of sugarcane and rice; the lands irrigated from tanks yield coco-nut and areca palms; the red soil in the east produces rāgi and dry crops; the central parts covered with areas of coarse grass relieved by shady groves, are good for grazing. The principal mountain ranges besides the Ghāt ranges are the interior range, from 10 to 20 miles wide running between 77° and 77° 30' E. to the frontier; and a corresponding range in the west. The highest point is Mulainagiri, at an elevation of 6,317 feet. Granites and granite gneisses of the Achæan occupy the greater portion of the state and traversing these are metamorphic schists of Pre-Palæozoic Age. There are other more recent deposits. Granite exists in large irruptive masses. Wild animals and reptiles are abundant in the forests and streams of the south. Large fish are found in the west.

There are three seasons, rainy, cold and hot. The country is visited by two monsoons, the southwest, from June to November, followed by the cold season. The temperature ranges from 64° to 84° in the rainy season; and from 51° to 80° during the cold season. In the hottest season it ranges from 66° to 91°, rarely reaching 96°. The rainfall varies from 19 inches in the north centre to 360 inches on the crest of the Western Ghāts.

Mysore yields 95 per cent of the gold of India. Iron is found in small quantities and asbestos is an undeveloped industry. The manufactures consist of fabrics, silk and carpets, gold ornaments, copper vessels. Sandal wood carving is extensively carried on. Coffee, cotton-ginning, bricks, tiles, etc., are also among the manufactures. A system of railways radiates from Bangalore; the length of the railway open to traffic in Mysore is about 500 miles. For postal services, Mysore is now part of the Madras circle. There are Mysore state savings banks and life insurance companies. Famine, due to lack of rainfall, has often carried off many of the people, but measures have been taken to alleviate this condition, such as the extension of railways, irrigation and plans for relief work.

The government is vested in His Highness the Mahārājā, a chief justice and a court of three judges. The capital is at Mysore City,

but the administrative headquarters are at Bangalore. The administrative districts of the state are Bangalore, Kolār, Tumkūr, Mysore, Hassan, Spimoga and Chitaldroog. The officer in charge of a district is called the deputy commissioner who has a staff of assistants. The villages have local government under a pātel, a hereditary office. A representative assembly meets once a year, when the annual statement of finances is made. The government of India is represented by a resident. There are military systems, lesser courts, systems of land tenure and revenue, police departments, etc. Education was at first introduced by European missionaries and has been developed into a fine public system. There are now about 3,800 schools of all grades with some 125,000 male and 25,000 female students. Hospitals and asylums are also provided in the larger cities. The population of the entire district according to the most recent census is 2,871,572. Hindu castes predominate the Lingayats forming the strongest sect. There are about 50,000 Christians, about 8,000 of whom are white. The principal cities are Bangalore, Mysore, Kolār, Tumkūr, Channapatna, Davangere and Tarikere.

The authentic history of Mysore as gathered from inscriptions, begins after the invasion of Alexander the Great in 327 B.C. After his retirement the north of Mysore came under the rule of the Andhra of Sātavāhana dynasty, extending down to the 2d century B.C. The various parts were under petty local princes who were frequently at war with each other, until in the 14th century the territory became a part of the Ballala Kingdom of Delhi, after the invasion of the Mohammedans. After their downfall a new Hindu sovereignty arose at Vijayanagar on the Tungabhadra. In 1565, this dynasty was defeated at the battle of Talikota and petty chieftains again divided up the state. The most important of these, the wcdayar of Mysore, seized the fort of Seringapatam in 1610 and founded the present state. Under Deva Raja it became a powerful kingdom. In the 18th century this dynasty was overthrown by the Mohammedan Hyder Ali, who, after a brief but brilliant reign, was defeated at Seringapatam in 1799, and the government was left to an infant descendant and an unscrupulous regent, Purnaiya. The British government took over the administration in 1831. In 1867, it was determined to permit the native rule, under British surveillance. In 1881, Maharaja Chamarajendra took the rule of the state, maintaining the standard of administration. In 1902 the ruler was vested with full powers. Consult 'Imperial Gazetteer of India' (Vol. XVIII, Oxford 1908).

**MYSTERIES** (Latin *mysterium*, from Greek *mystes*, initiate)—in ancient history, were among the Greeks, and afterward also among the Romans, secret religious assemblies, in which no uninitiated person was permitted to take part. They originated at a very early period. They seem to have had a double object—first, that of handing down the traditions relating to the divinities in whose honor they were celebrated; and secondly, that of teaching and practising religious rites. The true value of the mysteries did not lie in dogmatic teaching, but in the moral improvement apparent in

the votaries, in the comfort the rites gave in the present life, and the hopes they inspired for the world to come. The most important Greek mysteries were (1) the Eleusinian; (2) the Samothracian, which were celebrated in honor of the Cabeiri in all the places where these divinities were worshiped. (3) The Dionysia, at Rome called Bacchanalia, which were celebrated in honor of Dionysus or Bacchus. These latter mysteries were of so licentious a character that they were first forbidden in Thebes, and afterward in all Greece, as prejudicial to the public peace and morals. This was likewise done in Italy by a decree of the Roman senate in 186 B.C. (See **BACCHUS**). (4) The Orphic, consecrated to Dionysus Zagreus, the son of Zeus and Persephone. (See **ORPHEUS**). See also **MIRACLE PLAYS**.

**Eleusinian Mysteries** were generally held by the Greeks to be the most sacred of all the mysteries; and their great secrecy, intricate ritual and dramatic features were undoubtedly strongly influential in shaping the form of the ritual for many succeeding secret orders. They were connected with the worship of Demeter and Cora at Eleusis in Attica; and they appear to have had their origin in the ceremonies connected with the birth and death of the grain spirits. Demeter, in the ceremonies of initiation through which the candidate had to pass in order to become a member of the mysteries society, finally bestows agriculture upon man. The mysteries seem to have had degrees suggestive of the degrees in modern secret societies. All candidates had to become members of the society of the Lesser Mysteries at Agræ (near Athens), before they could enter that of the Greater Mysteries at Eleusis; and six months had to elapse between the two initiations. At both initiations the candidate made his own personal offerings or sacrifices to the gods, accompanied by fasting and other ceremonial practices in the nature of purifications; after which he wandered, or was led, through dark and intricate passages until finally he emerged into the presence of the deity upon whom streamed the light. As the Lesser Mysteries were celebrated in the early spring and the Greater Mysteries in the fall, the first probably represented the coming to life of dead nature and the latter the death of vegetation. A sacred peace declared some days previous to the opening of the ceremonies and continuing several days after their close permitted the pilgrims to the shrines and the candidates to come and go in peace, without any fear of molestation. The public ceremonies of the Greater Mysteries began with the bringing from Eleusis to Athens of certain sacred relics to be placed in the Eleusinia; the following day the celebrants put in an appearance and on the third day all the initiates (*Mystæ*) marched in procession to the Phalerum beach where they performed the necessary ceremonial bathing which was symbolical of purification. This was followed by two days devoted to offerings presented at various shrines throughout Athens. Early on the morning of the next day the relics were returned to Eleusis, escorted by a great religious procession, in the midst of which was the image of Iacchus. This occupied all day. The following four days and nights were given up to the secret ceremonies of the mysteries,

under the direction of the Hierophant, the Dadouchos (torchbearer), the Hierokeryx (herald) and the officiating priest. Eleusinian mysteries were also celebrated in various other places in Greece proper and outside of it, among these being Megalopolis, Phlius and Andania (in Messenia). The mysteries undoubtedly dated back to considerable antiquity, far as the earliest notice we have of them, they are possessed of an organized priesthood and the custom of choosing the Hierophant from one family (the Eumolpidæ of Eleusis), and the Dadouchos from another (the Kerykes). It is probable that these families, in early times, derived their family names from their offices, as the Jewish priests did.

**Samothracian Mysteries.** These which were originally two, were known as those of the Cabeiri. In the course of time they became four, Axieros, Axiokersa, Axiokersos and Kasmilos, in popular phraseology; though the grammarians identified them, respectively, with Demeter, Persephone, Hades and Hermes. It seems probable that they were the survival of tribal deities belonging to the same great family religion.

Gradually as time went on these mysteries, which had much of the spectacular and the mysterious which always appeal to humanity, spread throughout Greece, in their own form and under their own name or in the shape of evident imitations or of other closely related tribal mysteries. The worship of the Egyptian moon and mother goddess, Iris, which had early been introduced into Greece, spread rapidly throughout all the land round the Mediterranean and later into the cultured sections of western Asia. With this worship came foreign mysteries, which seem to have originated in the same form of nature worship as the native Greek mysteries. Other foreign mysteries, apparently also of similar origin, were introduced into Greece and appear to have taken root there. The Greeks seem to have been very fond of these semi-religious, semi-social mysteries and most of the prominent citizens appear to have belonged to one or more of them, much as people to-day belong to secret societies. The mysteries, however, had a deep meaning for the Greek, which the modern secret society does not have for its members.

**MYSTERIES OF UDOLPHO**, published in 1794, is the best known of the several novels of Mrs. Ann Radcliffe (1764-1822). The book was exceedingly popular at the time, the author receiving the unusual sum of £500 for it, and it was translated into French. Though the novel to-day is usually cited as an example of the florid, romantic style of the later 18th century, it is as a matter of fact an interesting and in many respects a powerful novel. It tells the romantic history of a young French lady, Emily d'Aubert, a heroine of much sensibility, but of considerable character, who has many trying and mysterious adventures in France and in Italy, and her marriage to the hero, Valancourt. The plot is an intricate and eventful one and the story deals with kind parents, unkind relatives, fine feelings, rude behavior, ruffians, and with mysteries, both of character and of circumstance, which are ultimately explained as natural. Perhaps the most distinguished parts of the book are the fine and often beautifully poetical descriptions of nature. The characters are less interesting in that nearly all seem to the modern reader to be unreal and melodramatic. The novel contains many good poems by Mrs. Radcliffe in the 18th century style. The tale is high in its class, but was, of course, overshadowed by the greater power and popularity of the Waverley novels, which owe something to it.

WILLIAM T. BREWSTER.

**MYSTERY OF EDWIN DROOD**, novel by Charles Dickens. It was the last work by this noted author and was never finished. Only eight numbers appeared, which were published in 1870, the year of the author's death. Numerous conjectures as to the outcome of the plot started or have been published from time to time, but his notes for the continuation of the work lead little toward unraveling his intent.

**MYSTIC SHRINE, Ancient Arabic Order of Nobles of the**, an order said to have been founded at Mecca in the year of the Hejira 25. The American order is composed only of Knights Templar and 32d degree of the Ancient and Accepted Scottish Rite, Masonic Order. The governing body is the imperial council with 101 subordinate branches called temples. The membership in America amounts to 200,500. See MASONIC FRATERNITY.

**MYSTICISM**, mis'ti-siz'm, a term derived from the Latin *mysticus*, Greek *μυστικός* mystical, secret, from *μύσθης* a mystic, one initiated into mysteries, and from *μύσθιν*, to close the lips or eyes. Mysticism has for many minds a repellent sense, owing, as a recent writer has acutely observed, to its association with the delusions of visionaries and the extravagance not only of gnostics and Neoplatonists, but of many so-called Christian mystics, who, misled by a resemblance in terminology and statement, as well as in practice and discipline between the false and the true, have failed to observe a difference of infinite movement in principle and substance, and have striven to mingle into one system utterly antagonistic elements. Against extravagances such as these common sense has justly rebelled, while philistinism has found in them a pretext for making a clean sweep of

everything that would seem to raise religion above the plain man's apprehension and criticism.

For many, mysticism means simply an abandonment of all attempt to reconcile the "religious sentiment" with intelligent thought, a deliberate yielding of one's self to any unchecked and unverifiable fancy or speculation which seems to interpret the vague yearning of the soul after a transcendent being. Or it suggests a morbid quietism effected by a complete deadening of the affections and stupefaction of the mind, an Oriental contempt not only for everything material and natural, but even for all desire and existence; thus giving a Buddhist interpretation to the Christian discipline of self. Or at best the term stands for the exalted state of a few saint-like beings who have attained to a preternatural state of communion with the Deity, a state that has no practical interest to the ordinary mortal. But merely to tabulate the countless divergent senses associated with the term, not only in common usage but by authors of high repute, would exhaust the limits of the present article. The reader interested in the matter can consult some such work as that of Mr. Inge, mentioned below. One reason for the great discrepancy of usage has been already suggested. The confusion results mainly from the failure to view mysticism objectively in its ultimate meaning and relations, its origin and finality; an omission on which has followed a confusion of a primary and an essential property of human nature with one or other of its merely contingent modifications or partial tendencies; and thus abnormal and insane phenomena have come to be associated with a term which radically expresses the deepest movement and loftiest aspiration of man's being.

Like all other words of similar structure, the term mysticism connotes both a tendency or a realized experience, and a theory conversant therewith. For the sake of brevity the former acceptation may be here subsumed under the latter. The finality inherent in all creation—a tendency so imminent in nature that the effort to explain it away by reducing it to merely mechanical motion is impugned by the very ideas and terminology in which the attempt is conceived and expressed—reaches its highest expression in man's nature. Whether it be viewed as a process of natural selection, an adaptation to environment, a part of the struggle for existence, or under any other biological metaphor, this tendency to a purpose is as essentially—nay, surpassingly more so—a property of man as it is of any of the lower forms of life, vegetable or animal. If it be asked what is this purpose, this goal to which man ever presses, the answer may be given in terms of universal significance, that ultimately it is the realization of the plan of the universe. To this end, however, man strives unconsciously, and in a certain sense mechanically and involuntarily. Proximately, on the other hand, man is forever seeking self-realization, the development of his total self. This self, however, is perfected only in and by the exercise of its highest activity, and that activity can reach its complete perfection only when directed to and exercised on its highest object. Now man's

highest activity to which all other forms of energy within him are subordinate is mental, intellectual and volitional, and the highest object answering thereto is the True and the Good. The true as perfective of the intellectual side of human nature is identified with the Good as it satiates the appetitive or conative side, and both are concretely realized only in the Supreme Being, the Infinite, the Absolute, God. Now the mystic is one who, whether explicitly or implicitly, recognizes this essential relation of his nature to God and strives to adjust his life accordingly. It may of course be said that this is a conception of mysticism in the abstract, as seen from some transcendent viewpoint of man's personality, but not of mysticism in the concrete, as it occurs in actual life and history. In some measure this may be admitted. On the other hand it is the conception realized in those who have lived it out in the sanest form and the most perfect degree, and is inapplicable only in the case of those who directing their energies to some one or other partial object; to an object answering to only individual tendencies of their nature, to the neglect of the demands of their complete selves, have thrown their lives into disorder and confusion and have brought mysticism into obloquy and derision.

It is almost impossible to make any classification of mysticism that shall be adequately comprehensive. For the purposes of this article it will suffice to consider it as a rationalistico-natural or purely philosophical, and as a Christian-theological or primarily religious experience and theory; though these distinctive qualifications are far from being mutually exclusive; on the contrary they overlap at more than one point. Christian mysticism is substantially *philosophical* and of course rational; but it introduces a *supra* (not *contra*) rational element. On the other hand what is here called *rationalistico-philosophical* mysticism may and does with many of its disciples include Christian doctrine and practice, and in so far may claim the latter title. For the rest the distinction will become plainer from what follows.

**I. Rationalistic Mysticism.**—As a philosophical theory this attributes to the human mind the natural ability to rise to an immediate intuition of the Absolute, that is, God, and therein and thereby to an intuition of all truth. This immediate vision whilst reflective and contemplative is not attained so long as the mind remains on the lower level of ordinary discursive reasoning. Such thought being, it is claimed, confined to the sensible, to empirical phenomena, cannot attain to higher ideal truth. To contemplate the Absolute, man must withdraw his mind from the world of sensuous phenomena, inhibit all discursive activity, and concentrate his mental energy. As the mind escapes from the mists of earth the rising light of a higher vision is felt. In that vision the lower cognitive powers become inactive, the very consciousness of self is obliterated and the mind is absorbed in ecstasy. The ecstatic state is a condition pre-required for the contemplation of the Absolute. This state, however, is attained only through ascetic practices and he alone who reaches its heights is enabled to contemplate pure ideal truth and manifest it to others as he has perceived it. In ecstasy, more-

over, the mind becomes interpenetrated, even identified with God. Nay more, ecstatic vision is one and the same with the act in which the Deity contemplates His own self: "the eye with which the ecstatic sees God is the eye with which God sees Himself." Philosophical mysticism thus terminates in pantheism.

**II. History.**—The birthplace of this form of Mysticism is the Orient. Brahmanism (q.v.) is a finished mysticism. For it Brahma is the sole existent. What is Brahma, and what is not Brahma is nothing. Things mundane are distinct neither from Brahma nor from one another. They are simply modifications of Brahma. So long as the mind conceives of them as distinct it is in a state of delusion. From this delusion it must free itself by penetrating into the vision of the unity of all things in Brahma. To this end man must perform works of penance and sacrifice, cut himself loose from the sensible and sensuous world, and by concentration of his entire physical energy absorb himself in the All; that is, lay aside all self-activity and allow the One alone to work within him. Then will the light of vision rise on his mind and in everything he shall see the Brahma, the eternal self-existent One, the All. Oriental mysticism was transplanted to the West by the Neoplatonists in the form of emanational pantheism. God is here the primal One and the primal Good; from Him emanates directly the *νοῦς* (*Nous*) wherein are contained the ideas of all things and from which proceeds the world-soul. The human mind is in turn an emanation from the world-soul and, remaining essentially included therein, it lives in essential connection with the *Nous* even as the latter remains in essential union with the primal One. Thus is the soul enabled to rise to an immediate vision of the primal unity. Sense cognition is simply a dream of the soul from which it should withdraw and sink itself in its centre, the *Nous*; and as the latter is essentially the universal *Nous* revealing itself in the human soul and absorbed in the contemplation of the primal One, therefore is the human soul likewise through the indwelling *Nous* able to reach this same contemplation of the original unity; and when it arrives at this state all images, thoughts and even self-consciousness disappear and the subject enters the state of ecstasy.

This mysticism more or less modified played its part in later times. Aside from the Persian Sufi, who in the Middle Ages cultivated mysticism within the pale of Islam, there appear among the Christian people of the West tenets that strongly suggest the Indian and Neoplatonic mysticism, for example, with Meister Eckart (q.v.) and the school of German Mystics emanating from him. Eckart is at present defended against the charge of pantheism; nevertheless it is undeniable that his mysticism touches very closely on the boundary line that separates the Christian from the pantheistic world-view. Eckart distinguishes two factors; the "basis" (*Fünklein*, spark) and the powers of the soul, analogously to his distinction in God between the basis or "ground" and the divine persons. The "ground" of the soul he places in essential union with the "ground" in God. There is something in the soul, he says, that is identified with God, that is one with

and not simply united to Him. It is uncreated. This something is the "spirit" the ground or basis of the soul. Here the "ground of God is my ground and my ground is God's ground." Now this divine spark in the soul he continues, is the organ of mystical contemplation. The "powers" of the soul do not reach God immediately. If man is to see God, the vision must be mediated by a light which is God Himself. And this light shines in the "ground" of the soul. Therefore does the soul see in the "spirit" God's pure essence as it is in itself. The "spirit" or "ground" of the soul penetrates into that "ground" in God, in which the latter is pure simple unity neither Father nor Son nor Holy Ghost. There, in this its "ground," the spirit seeks God, there to know and love Him without medium or veil. There is "my eye and God's one eye, one vision, one knowing, one love. The eye whereby I see God, is the same eye wherein God sees me. In order, however, to reach this vision of God in His "essence" (ground) man must first of all forsake all sin by genuine repentance. Next he must withdraw from all outward things, from himself and his "powers" and concentrate himself entirely within the essence of his soul; and having reached this state he must "leave" himself to God, hold himself passive and allow God alone to work within him. (Gottlassenheit.) Then will there arise in the essence of his soul (ground) a heavenly light. In this light God reveals to man the entire "ground" of the Deity; the whole essence of God becomes revealed to man. The soul likewise flows into God; its essence and life passes over into the essence and life of God; man is deified, is born a son of God; just as is the Eternal Word.

Subsequently the mystical Theosophists Valentine Weigel and Jacob Böhme built on the teaching of Luther who was in close sympathy with the "German Mystics," a form of mysticism which in many respects surpassed what most men will call the extravagance of Neoplatonism. A few expressions of Böhme will suffice in this connection. The soul he teaches has its source and origin in the essence of the Godhead; in its "ground" the light of God is kindled. Now in and by this divine light the soul is enabled to enter into the very heart of the Deity and to see therein without any intermediate the primal generation of God in the three principles of being, and the process of becoming of all things. As I then, he says, earnestly uplifted myself to God, the spirit of God broke through me and my spirit broke through unto the inmost generation of the Deity and in this light did my spirit see all things. The influence of Böhme is seen later in the philosophy of Schilling (q.v.).

Neoplatonic mysticism modified by Protestant doctrine reappears in the 17th century in the mystical speculations and practices of the Cambridge Platonists Cudworth, Henry More and John Smith. Other noteworthy mystical writers in England during the same century were George Herbert, Francis Quarles, Henry Vaughan, and in the following century William Law.

**III. Christian Mysticism.**—A recent writer has greatly simplified this subject by defining mysticism as "the love of God," and he quotes

in confirmation an author whose genius and amiable personality have endeared him hardly less to those who differ from him in religious belief than to those who venerate him as Saint Francis de Sales. Speculative theology, he says, tends to the knowledge of God. Mystical theology to the love of God,—mental prayer and mystical theology are one and the same thing. They are neither more nor less than the loving intercourse which the soul holds with God. In this sense every Christian whose practice accords with his profession is more or less of a mystic and differs from the highest mystic, the saint, not in his mysticism but in the degree of his mysticism. The term, however, is usually restricted to the higher degree of unitive insight. This simplification of the subject will doubtless be mistrusted, mostly by those who insist on associating all mysticism with mystery and in placing both if not against at least above reason. They should, however, remember that all even human love in a measure transcends reason. Feeling, instinct, sympathy, antipathy, telepathy, likewise, how quickly and far they elude psychological dissection! It may well be then that in the intimate communion of God with the soul which He permeates there are psychical acts and states of which reason and common sense can give no distinct account, "upraising strains that from the memory slip and fall away," as was the case in Dante's experience. But while mystical phenomena have in common with many ordinary psychical, especially emotional, experiences that they escape rigorous analysis, they lend themselves equally with their familiar analogues to a philosophy and even a certain though higher psychology. This statement will of course be a commonplace to those who are familiar with the great masters of mystical theory, such as Saints Dionysius, the so-called Areopagite, Augustine ('Confessions,' Engl. trans.), Bernard (Engl. trans.), John of the Cross (Engl. trans.), Thomas à Kempis, or the more modern authors mentioned below. For the benefit, however, of those who are not thus informed a very brief summary of the principles of Christian mysticism is here subjoined.

1. As in the macrocosm, the world of living organisms, the law is universal that all life emanates from life, *omne vivum ex vivo*, and as in the scale of their various kingdoms the higher raises up and assimilates the lower the latter receiving an essentially new and greater perfection from the former, so in the microcosm, the minor world of the human individual. Here, too, life is from life and life is from above; and the perfection of the lower consists in assimilation to the higher.

2. Beyond the natural life in man, the soul or mind, Christian Mysticism discerns a supernatural life consisting radically in a principle of activity higher than that of man's purely mental and volitional operations and consequently energizing in higher forms of thought, belief, hope, aspiration, love, etc.

3. The existence and supernatural character of this life and its activities are accepted in the first instance on faith, the data of this belief being found in the Bible, especially the New Testament. The foundations of this faith it is claimed are rational and the workings of the

higher life are confirmed by experience and attested by manifest effects.

4. Essentially and objectively this higher life consists in the vivifying operation of the Divine Spirit within the human soul; accidentally and subjectively it consists in the responsive co-operation of man's mental activities with the Divine influences.

5. The reception of this higher life is normally conditioned by certain spiritual dispositions and lines of conduct—notably of faith, love, prayer, repentance and self-discipline. The soul is thus prepared by alienation from carnal and inordinate propensities and rendered more sensitive to higher stimuli.

6. According to the degree of the soul's co-operation with the indwelling Spirit of God the former becomes proportionately assimilated to the latter. The soul thus passes from what is known as the purgative to the illuminative stage of mystical life.

7. This assimilation culminates in the act of contemplation which is distinguished from meditation in that it is not elicited with mental strain and does not apprehend its object, the divine presence or cognate truths, by inference; but in consequence of the immanent light simply gazes intuitively thereon; *contemplatio pertinet ad simplicem intuitum veritatis*, as all the mystics teach. The clarity of this act or state of vision begets sentiments of admiration, *contemplatio est perspicuae veritatis jucunda admiratio*, as Saint Augustine says, and fills the consciousness with joy and rapture. The faculties are herein not merely *passive*, for contemplation is a *vital activity*, though the divine influence is the primary source of its elevation and application to the corresponding truths. The Church censured the teaching of the Spanish mystical writer Molinos on the question of the soul's passivity in contemplation,—a theory which was taken up by Madame Guion in France, and eliciting Fenelon's (q.v.) sympathy, entailed the well-known controversy with his great contemporary Bossuet (q.v.).

8. The unitive or contemplative state in so far as it is susceptible of psychological analysis is essentially intellectual, the mind being absorbed in intuition; it is, however, no less essentially volitional and in the sanest sense emotional, the whole adhesive power of the soul being drawn out in love of the object contemplated. Obviously, however, the two forms of energy—intellectual and emotional—act and react upon one another and in the intenser states of mental absorption entirely interfuse, all psychological differentiation being obliterated and the entire field of consciousness bathed so to say in light and love of the object contemplated. With the intellectual activity is generally though not always associated representations of the imagination wherein the object contemplated is symbolized. The object-matter of contemplation is primarily God or some of his attributes. Secondly it may be any divine manifestation in the created, inanimate or animate order, above all in this respect the humanity of Christ. With many of the mystics the suggestion of the divine perfections reflected from almost any object in nature was enough to lift them at once to a condition of wrapt contemplation.

9. The strictly contemplative condition varies in duration from moments to several hours,

independently on preternatural and natural conditions. In the highest stage it may become practically habitual and yet leave a normal residue of attentional energy amply sufficient for all the demands of every-day life. Oftentimes it is associated with extraordinary psychical phenomena such as ecstasy, supernal revelations, visual or auditory—states wherein the mind sometimes though not always loses consciousness of self and of all else save the object contemplated. These are not, however, as many suppose, essential properties of mystical experience, but are rather effects resulting from the absorption of the psychical energy. An asserted similarity of these states to the well-known phenomena transpiring under the various forms of somnambulism, obsession, divided personality and the like, has led many psychologists to confound all mystic states with abnormal psychoses. The subject here opened out is a large one. The reader will find it fairly discussed in 'The Psychology of the Saints.' Suffice it to note with M. Joly that the true mystical state as realized in the saints' experience is not a "disintegration" of the powers of the mind; it is an aggregation of the closest possible kind, which derives its strength from a higher principle under the control of which it forms and sustains itself. It is not a "narrowing of the field of consciousness" but rather the opening out of a wider field, at the cost, if we may use the expression, of a narrowing of the field of passing sensations and empty illusions. Neither is it a "division of the personality" although it certainly evokes what may be called a "new personality," and that at the cost of great sacrifice and much suffering. This "new personality" is not a medley of divided and disordered parts. It exhibits a cohesion, a strength and a unity above anything else which psychology can show us. This "new personality" also retains whatever was best of the original personality and these surviving elements combine peacefully with the new.

10. None the less the Saints, the typical mystics, were fully alive to the fictitious semblance of purely natural, both normal and abnormal, subjective states to genuine mystical experience and writers on the subject have laid down certain signs for discerning the true from the false. Usually they point to the "fruits of the Spirit" as enumerated by Saint Paul (Gal. 5, 22); "charity, joy, peace, patience, benignity, goodness, longanimity, mildness, faith, modesty, continency, chastity." The essence of all these fruits of true mysticism is self-denial, love of self-sacrifice and humility; only where such dispositions are habits can the subject be said "to walk by the Spirit." This mental attitude the mystics observe shows itself in subjection of the will to God and to lawful authority, a care to avoid self-obtrusiveness, a tenderness of conscience, zeal for self-control, deep interior peace even in the midst of misunderstandings and persecutions. On the contrary, they say, where the opposite signs prevail, self-conceit, obstinacy, an appetite for singularity, moroseness, refusal of humiliation, sentimentality in devotional observances, unrest and such like—all being indications of pride, vanity or some form of sensuality—there the subject, though seemingly wrapt up to the third heaven, will be

found to be the victim of an active or a passive delusion.

11. From the foregoing principles it should be inferred that *Christian* differs essentially from purely rational mysticism in the primacy it gives to *divine* influence in mystical experience. The uplifting and sustaining of the intellect and will in communion with God are due not in the first instance to purely innate endowments but to a transcendent light and energy. Christian mysticism as a theory ignores or pretermits none of the ascertained facts and legitimate inferences of psychology and philosophy, but it claims to supplement this knowledge with principles and deductions of a religious and theological character. The higher influences thus postulated though distinct from are nevertheless continuous with the normal psychical life of the mind, just as the higher mental powers are themselves distinct yet not severed from the sentient and organic activities. Thus genuine mysticism by its sharp distinction between the mental activities and the immanent Deity steers clear of pantheism. The terms "deification," identification with God and the like in which mystical writers speak of the contemplative state are meant to express the close *union* of the soul with God but not a *unity* or substantial identity.

**IV. History of Christian Mysticism.**—Mysticism as an experience is as old as humanity. The patriarchs Abraham, Isaac, Jacob, Moses, are described in the Bible as men who while not exempt from human failings, lived more or less habitually in converse with God, while the prophets from Samuel to the Baptist passed much of their lives in the abiding realization of the divine presence. The unitive or highest form of mystical life culminates in Christ, who though of necessity perpetually conscious of His Divine Personality nevertheless frequently retired from human association to commune with His Father in the solitude of the mountain or desert. Christ became for all future time the pattern of the mystical life while His Personality, deeds and words have formed ever since the chief subject-matter whereon the genuine mystical mind has been nourished. As his example and teachings spread abroad and the realization of their power deepened in the Christian consciousness the tendency to devote more and more of life to mystical contemplation increased. Spontaneously and gradually at first and accelerated afterward by the pagan persecutions which drove numbers of the early Christians into the deserts the eremitical and subsequently the monastic state grew up and developed, at first in the East and in Egypt and later on throughout western Europe. Monasticism (q.v.) was and is essentially an institution established as a means to facilitate and conserve the contemplative life. Some of the religious orders were founded almost exclusively for this end. Others, and these the majority, aimed at combining the contemplative with the active life, a so-called mixed status wherein the cultivation of an abiding consciousness of the Divine Presence should fructify and energize in labor for human welfare. How successfully this aim was accomplished is told in the history of monasticism and the biographies of such men as the Gregories, Basil, Benedict, Bernard, the Fran-

cises, Dominic, Borromeo, Loyola; and of such women as Hildegarde, the Elizabeths, the Catharines, Teresa and other well-known heroes and heroines, of human as well as of divine charity; all of whom drew inspiration and energy for lives of continued self-sacrifice from an almost uninterrupted communion with the Unseen.

Though monastic retirement and discipline facilitate and foster the genesis of mystical habits, they are by no means essential thereto, as is patent from the case of numberless men and women who in every age have successfully united a high degree of contemplation with every variety of secular occupation. Here again the lives of the true mystics, the Saints, show that the cultivation of an abiding converse with God culminating frequently even in deep mystical union is compatible with all the duties and reasonable demands of social life.

**V. Mystical Theology.**—It is with mysticism as with every other human experience, theory follows on life. Speech precedes grammar, thought logic, conduct Ethics. *Primum est vivere deinde philosophari.* As mystical tendencies and habits spread and strengthened, there gradually grew up a mass of facts and inferences which constituted in time the body of a mystical theory, or what is known as mystical theology, and which took its place in the evolution of Christian doctrine as a sequent of moral theology. Mystical experiences were analyzed and systematized, principles induced therefrom and clarified in the light of Biblical and Patristic teaching, and practical rules for discernment and guidance in the mystical life were formulated; the whole developing by degrees into an organized science or discipline. The writers eminent in the formative stage of mystical theory were Saints Basil, Gregory of Nyssa, Gregory of Nazianza, Chrysostom, John Climacus, Cassian, Gregory the Great, Ambrose and Augustine. The first systematic work on the subject was that of Dionysius, the so-called Areopagite. In the intense intellectual ferment that followed the triumph of Christianity the Neoplatonists endeavored to set up against Christianity a world-religion whose controlling tenet it was that the universe is simply a phenomenon of the divine life, the human individual a manifestation of the divine essence, God coming to consciousness in man. Dionysius opposed this teaching, vindicating the Christian doctrine that in the union of the human soul with the Deity it retains its distinct entity. During the Middle Ages the works of Dionysius became for the mystical writers what the 'Sentences' of Peter the Lombard was to the Scholastics, a text for the numerous commentaries of eminent writers such as Hugh and Richard of Saint Victor, William of Paris, Bonaventure, Dionysius the Carthusian, Gerson and others. The Scholastics, likewise, especially Aquinas, based their treatment of mystical phenomena on the Areopagite. The influence of Neoplatonism (q.v.) lingered, however, in the writings of Erigena, even though he translated the works of Dionysius.

A tinge of Neoplatonism moreover clings to the 14th and 15th century writers, Tauler, Suso and Ruysbroek, who theorized more in the interests of an intellectual union with God, while the most eminent teacher of practical

mysticism—union of will—was at this time Thomas of Kempen. In the subsequent centuries practical mysticism is systematically represented by Saints Teresa, John of the Cross, Francis de Sales and Ignatius of Loyola. The works of these writers have for the most part been translated into English. Among the later mystical authorities may be mentioned Louis of Blois, John of Avila, Louis of Granada, Louis da Ponte, James Alvarez, Alphonsus Rodriguez, Nieremberg, Lancicius, Surin, Godinez, Scaramelli, Benedict XIV and Schram.

F. P. SIEGFRIED,

*Saint Charles Seminary, Overbrook, Pa.*

**MYSTROPETALON**, a genus of leafless root-parasites constituting the tribe *Mystropetalæ* of the order *Betanophoreæ*. It contains two South African species. It is known by the two or three free stamens, cubical pollen-grains, and the two-lipped staminate and bell-shaped pistillate flowers. The stem is sheathing covered by imbricated scales; the flowers in dense heads or spikes. They are monœcious, the male flower being on the upper and the female on the lower part of the spike. The fruit is a rounded achene.

**MYTENS**, mī'tēnz, Daniel, Dutch painter: b. The Hague, about 1590; d. Holland, 1642. He went to London, England, and was welcomed at the court of James I; he was appointed painter royal by Charles I and was much favored by the king and aristocracy. Many of his portraits, which are bold and spirited in conception, broad in treatment and of admirable color, are in Hampton Court. When Van Dyck came to England he gradually eclipsed in royal favor the glory of his predecessor, who returned to Holland.

**MYTH**, a general name for certain kinds of folk-lore stories, historic tales setting forth the processes of nature, or beliefs about religion, custom, tradition, etc., and differing from fable (q.v.) and from legend (q.v.). See MYTHOLOGY.

**MYTHICAL ISLANDS**, imaginary islands described in popular fable, romance and song, supposed to have existed in all ages in the several oceans of the world. The Islands of the Blessed were creations of the Greeks, who there placed the homes of all who had been first mentioned by Plato, and situated in the realm of eternal bliss. The lost Atlantis was first mentioned by Plato, and situated in the same part of the world. The fairy isle of Avalon is a feature of Celtic mythology, presenting

an exact counterpart to the Greek Island of the Blessed. The mythical land of Saint Brendan is also of Celtic origin and was thought to lie off the west coast of Africa, where, even as late as the 18th century, frequent expeditions searched for it. The Island of Seven Cities was also long sought for, and its settlement is ascribed in legends to the Christian refugees from the Iberian Peninsula, who had been driven out by the Mohammedans. Marco Polo's 'Cipango' was probably Japan. Probably the best known mythical lands or islands during the Age of Discovery were the island of Bimini, in the Bahamas, and the island of Brazil.

**MYTHO, MITHO, or MITO**, French Indo-China, a town of Cochin-China, on the northernmost branch of the Mekong delta, about 50 miles by rail southwest of Saigon. Mytho is an important trading centre for the produce of Cambodia and Annam, and the railway from Saigon was the first built in the country. It has a college and a hospital. Pop. 30,000.

**MYTHOLOGY.** (Latin *mythologia*; Greek *μυθος*, a myth, and *λογία*, an account), includes the whole body of myths of a nation; the explanation, comparative study and interpretation of these myths. In the popular acceptance of the term, mythology, however, is used to signify the religious conceptions of races expressed in the form of tales and other accounts of their deities. This is a very restricted part of the broad field of mythological activity; for mythology covers the whole sphere of activity of races before the knowledge of the laws of nature came to replace the exercise of the imagination in the explanation of natural phenomena. It includes physical, historical, philosophical and religious myths, generally so intermingled and interdependent that it is often difficult or impossible to separate the one from the others, since the imagination was the great source from which they all sprang either as a whole or in part. Owing to this constant play of the imagination, such history as primitive races possessed rapidly became myth, and the myths assumed the form, appearance and intent of history. During the pre-scientific ages, the greatest of all virtues was credulity in the scientific, philosophical and religious beliefs of the mass of one's fellows. Thus creed became a synonym for religion, or the true religion. To-day the Pueblo Indian speaks of one who holds to the faith of his ancestors, as "the true believer."

**How Primitive Man Thought.**—Man has apparently, since ever he began to reason, tried to explain the natural phenomena which most impressed him; and his success has always been in proportion to his scientific knowledge. At the beginning of his investigation of the phenomena of nature he was handicapped by an absolute ignorance of all natural law, and he was forced to reason from his experiences, much as the higher forms of animals do to-day. To him all life meant activity of some kind, generally translated into motion, and conversely, all activity meant life and volition. Thus when the sun, the moon and the other planets appeared and disappeared or changed form or position in the sky or appearance, they did so by their own volition. Behind the rushing of the wind, the fierce heat of the sun, the blighting cold of the north, the thunder of the clouds,

the destructive fury of the hail and the lightning, the insatiable greed of the fire, the reviving force of water and of the midnight mists and summer showers were so many powerful intelligences, human in every respect except in their magic power, working each his sovereign will. So primitive man peopled the physical world about him with a multitude of beings essentially like himself in their ambitions, desires, motives, loves and passions. These he classified unconsciously according to their apparent swiftness, strength, cunning and constancy, the primitive virtues by which he set great store, and the impenetrable mystery by which they were surrounded. These were the supernatural people in contradistinction to the human race, which belonged to the natural people. But it is necessary to understand in what sense the word supernatural is here used. It never implies beings in any sense different from man himself except in the power of their magic. Even the form in which a supernatural being appeared was not of great moment, since he generally had the power to exchange his shape for another at will. The Sun-father, the Moon-mother, the Thunder-man, Morning-star, the great hunter, the Spirit of the Northland, the Summer-queen, the four great Wind Spirits, the ghostly spirits that rode upon the tempests, the dark beings from the under-world, the bright beings who peopled the Cloud-land, the Sky-land and the Sun-land were essentially human; and each lived in strict conformity with his surroundings and attributes. The Sun-father and the Moon-mother inhabited a shining wigwam in the Sky-land, the Frost-spirit a yellow ice tepee in the far North, on the outer border of the world. The Great Spirit sat far up upon the mountain and smoked his pipe; the four winds blustered and quarreled and had ambitions and loves, hatreds and jealousies essentially human. The waters moved, rippled and roared; the trees swayed and whispered; the leaves rustled; the clouds raced across the sky or lazily disported themselves in the sun. All displayed animation which made them fellow-actors with man on the stage of human activity. Into this curious world so unlike our own scientific age, the study of mythology introduces us. Here all nature is not only alive but instinct with the motives that move humanity to action; and no explanation or interpretation of mythology which fails to keep constantly in mind primitive man's ignorance of the laws of natural phenomena, and its effects upon his religious, scientific and philosophical views can be effective.

**The Spirit of the Myth.**—To understand the spirit of the myth one must learn to live over again the age which produced it. Without this, the practice of minute analysis of myth forms and derivation of myth names, the division of mythical stories into historical, scientific, religious and folk-tales and the minute grubbing of the ordinary scientific methods are of little avail. The study of mythology, like that of history, requires the power of imagination coupled with the patience and the trained methods of the scientific mind. However well the division of myths into classes may serve the uses of scientific study, the farther investigation is carried into the past the more all classes of mythological stories come into contact, min-

gle or blend with one another and reveal to us man trying to solve the primitive problems presented to the race. He develops these problems as he sees them and he explains them in conformity with his mode of science. In the very infancy of experimentally acquired knowledge he began to record his racial or tribal experiences in the form of stories, songs, symbols, dances and fixed ceremonies coupled with mystical formulæ and incantations. However unreasoning these may seem to the scientifically trained mind of to-day, they were nevertheless perfectly reasonable to primitive man who propounded them. The primitive myth-maker, which is but another name for the primitive philosopher and scientist, noticed that the sun moves away from the equator in the winter and that then the days are shorter and the nights longer, and he invented a legend or tale to account for it. This tale conformed in every respect to the belief of himself and the people of his day. The sun was a great and powerful being. The night spirit grew jealous of him and came and persuaded the people that the sun was an impostor, that he was not at all powerful since he allowed himself to be driven daily across the sky in the self-same track. So the people mocked the sun and taunted him with his impotence, whereupon he became angry and vowed to leave them in darkness. As he moved farther and farther to the north and the days became shorter and colder and the frost spirits seized upon all the land and froze over the lakes and rivers, the people became terrified and made sacrifices and offered dances and music to the Great Spirit, who finally relented and came back to them. But to remind them of the fact that he is all powerful and to make sure they shall never forget the insult they offered him, the sun goes north for a part of each year and shortens the days and lengthens the nights. In this myth the sun is essentially human and he acts as an all-powerful kindly human being would do, especially in a primitive age, were he insulted. To the primitive mind the scientific fact around which the story is woven was satisfactorily explained by the story itself. The existence of summer and winter is accounted for by a similar nature myth and though the two myths explain what is practically the same phase of nature, yet to primitive man there was no inconsistency in the stories simply because to him the gradual retreat of the sun northward and the coming of winter were two distinct events in no way connected with each other. Nor for him was the coming of summer dependent on the going away of winter, though the events happened to be coincidental, for both summer and winter were powerful beings each of which acted of his own volition. An Algonquin myth brings them together through the Great Spirit who went northward, with the spirit of summer in his hunting-jacket, and routed the spirit of winter out of his ice tepee and brought the summer to the northland.

**Man and Nature.**—To primitive man all nature was a struggle, not of elements, but of wondrously powerful and intelligent beings who were so real to him that they may be said to have formed as active and concrete a part of his existence as his household, his friends and his enemies. About these beings of his

imagination he built up a mass of traditional lore which was carefully handed down from father to son. In this lore he grouped and classified these supernatural beings; and to each he attached myths to explain their attributes, powers, functions and affections. Quite philosophical were these myths from the point of view of their creators. The earth received the seed and the sky sent the water that made it grow. The union of the two gave birth to the plant. Thus the earth and the sky became wife and husband. The sun was the greater light that ruled the day, the moon the lesser light that ruled the night, so in many theologies the former was the husband and the latter the wife, while the morning star, which appears with the sun, was their offspring. However, frequently in northern mythologies, where the light of the sun loses its great power for a part of the year, the latter frequently becomes the wife and the moon the husband. The moon governed the night, the season when the mists most frequently descend upon the land. So she becomes the goddess of fertility and as such is closely connected with all the water and vegetation deities. In Egypt Egyptian women prayed to Isis, the moon goddess, that she might look kindly upon them and bless them and make them fruitful. Roman women about to be married invoked Juno, the queen of heaven, that she might make them bear children; and Greek women made the same prayer to Hera, the mother of the stars, the queen of heaven, the moon goddess, the great deity of growth and fertility. Among the Aztecs and other cultured races of America, Indian women prayed the moon to make them fruitful; and offerings are still presented to the moon throughout Indian America with the same end in view. So strong is this belief that the Indian of Latin America frequently associates the name of the ancient moon goddess with that of the Virgin; and so powerful has the influence of the Indian become that not only Indian but also educated white women go to certain shrines of the Virgin to pray that they may be blessed with children. Indian women still hold up their new-born children to the moon-mother that she may bless them and make them, in their turn, fruitful. Being the patroness of growth, birth and fertility the moon became the deity of doctors and of medicine, and among Egyptians, Indo-Europeans, Aztecs, Mayas, Zapotecas and Mixtecas alike she took a kindly interest in people of feeble mind or those afflicted with skin or other scrofulous diseases. She was also the protectress of young children and animals both in Europe and America. She was the goddess of hunters and is frequently represented as armed for the chase. A close examination of all these functions and attributes of the moon goddess will show that they are closely related, interdependent and that the one naturally grew out of the others. The moon, in most of the Indian mythologies of America, was also the mother or the grandmother of the winds or some of them, who are themselves the bringers of the fruitful rains and mists. Here again the mythology is consistent.

**Growth of Myths.**—Examples might be given ad infinitum, but the foregoing are sufficient to show that the mythologies of most ancient races represented systems of thought,

of philosophy and religion which followed what were then rational lines of reasoning to those holding them and passing them on to succeeding generations. These ancient myths were at once religious, philosophical and scientific in that they contained within themselves the religious, philosophical and scientific knowledge of the race or what passed for such. Behind all mythologies are broad, general principles which lead, everywhere, to similar results. This accounts for the similarity of apparently unrelated myths in widely different parts of the earth, a similarity more marked in the nature myths. The comparative study of myths is of as much importance in the development of the science of mythology as is the comparative study of languages in the development of the science of philology; since the general laws that govern the making of myths seem to produce as closely related results as those that govern the formation of languages. Fairy tales, folk-tales, historical, philosophical, religious and scientific myths are continually running into one another. Often one short tale contains all these elements. Hence the field of study is not only very extensive, but the lines of thought are continually crossing and recrossing one another. Out of this confusing maze have come many theories, explanations and systems of mythology, most of them defective in that they have failed to survey the whole field and to take into account its broad general significance. Mythologies are like rolling stones, they take new forms as they move onward; and when they come to rest they gather extraneous mosses, which disfigure them often to such an extent as to hide their original forms. These changes are due to both external and internal influences, to action and reaction. Dissimilar myths are often found side by side apparently unaffected by one another; others are blended, while still others are so confused from long contact with one another that their original functions and attributes are not clearly discernible. Tribal influences, captives, slaves, foreign teachers and philosophers, servants, broken-down mythologies and the myths of subject people all have had their part in the shaping of the myths of nations. The constant rising and dying of religious, scientific and philosophical ideas, throughout the long unwritten history of man's progress toward civilization molded and shaped his myths; so that it is safe to say that however primitive myths may seem to us, there are probably no primitive myths in existence, since man even in his lowest stage of development to-day, has passed far beyond the condition of his ancestors when they first began to formulate their philosophy of the world about them in the stories that we have named mythology. In the days when the Romans had conquered the civilized nations surrounding them, Rome had already become the meeting-place of creeds or mythologies as had Athens in the days of Paul. And often there, the same deity was worshiped in separate temples and under separate guise. There were temples to Juno and Luna, both moon deities, to Hera the Greek goddess of the moon and Isis the Egyptian moon divinity. Each was the sovereign lady of the sky. And when Christianity stepped in and drove out the heathen deities, her triumph was only partial, for the converted heathen could

not so easily forget his past. To his new Christian saints he attributed the powers and virtues of his ancient gods. Upon the Virgin, as the lady of heaven, he lavished all the adoration given to the moon divinities, and he long loved to depict her as standing upon the crescent (the symbol of the moon). Thus the mythologies of the past have followed us into the present. In art, architecture, literature, philosophy, science, their names and influence greet us at every turn; for the dead past has not buried its dead. To-day the Christianized Indian throughout Latin America, in his Christian devotions, thinks as frequently in terms of his ancient gods as of his new faith. To the Virgin he attributes the power to send the rain, to fertilize the earth, man and beast; and he still puts food on the graves of the departed that they may have provision for their journey to the future world. Once a year, on the "día de los muertos" (day of the dead), when the dead are popularly believed to revisit the earth, he decorates their resting-places in like manner. Thus the present teaches that the mythologies of the past were constantly being modified and changed while they were exerting their influence upon dying or supposedly defunct mythological systems. This is the same principle that was at work when Greece, Rome, Egypt, Assyria, Arabia, Persia, India and the broken-down mythologies of the races who preceded them, acted and reacted upon one another. To these must be added the modifying influences of the Celt and the Arab, the German and the Mongol, who each, in his own way, left his mark upon the mythologies of northern Africa and southern Europe and Asia.

**Classes of Myths.**—Myths fall into several more or less well-defined classes: myths of origin, myths of the stars and the sky-land, folk-tales, myths of the future world and of ancestors, and myths relating to or explaining the elements. Origin myths account for the creation of the universe, of man, the other animals and plants; for the customs and habits of animals, trees and plants and for their peculiar markings and characteristics; for the origin of tribes and races and for their racial names, tokens and customs. Under this head come the culture gods, the inventors and bestowers upon humanity of the arts, trades and sciences, of which they naturally became the patron divinities. The myths of the sky-land and the stars, as the name indicates, deal with the solar, stellar and lunar stories and their relationship to one another and to the other dwellers in the sky-land. They are, in many mythologies, closely related with the creation and the culture myths. The moon-mother as the fructifier and the goddess of medicine is in the category of the culture heroes, of whom she is generally the mother or grandmother or near ancestor. The sun, as the vivifier, the sender of life and death, has a close relationship with the deities of vegetation. The myths of the future world deal with the mystery of death and connect the earth with the sky, the sun-land and the under-world. They include tales of the life beyond the grave, of visits of mortals to the land of the dead and of their adventures in the future world. Very varied are these myths among different peoples; and yet they are frequently wonderfully similar in

widely separated localities. They range from simple primitive tales to long heroic, circumstantially told stories in which the hero generally meets with many superhuman difficulties on his visit to the land of the dead. Closely connected with these tales are the ancestor myths, which form such an important part of the mythologies of many races. Myths relating to or explaining the elements are many and varied. The deified winds become the culture gods; the thunder, the great thunder-bird. The woods, clouds, mountains and streams are populated with spirits belonging to the elements who, for the most part, are kindly disposed toward man and spend their time in helping him, when so inclined. In the Indo-European mythologies the sky was populated with a great host of supernatural and powerful beings and the mythologies of the more cultured of the American races were almost as liberal in their colonization of the ærial regions.

To these classes of myths already enumerated must be added the vast body of folk-tales which may be related to none of them, some of them, or all of them. Many races have numerous folk-tales, part of which may have once belonged to a now displaced and broken-down mythology. Side by side with these are often found moral tales which appear never to have had mythological significance or connection. These tales are quite plentiful among many of the American races, and those possessed by the Pueblo Indians are especially numerous and rich in incident. Tales of adventure linked to magic and consisting of a series of superhuman acts find a place among the Algonquin, the Ojibway, the Plains Indians and numerous of the Pacific tribes. These tales approach more closely to the European story than probably any other class of American tales. The characters in these stories are generally mythological in origin, however much they may seem to have lost their primal significance. Thus in the Indian story of Chácopee the Giant Killer, the hero who lives all alone in the heart of a great forest with his grandfather, follows a white rabbit who shows him a village of cannibal giants and tells him he has been born into the world to destroy them. He gives Chácopee a magic white feather for plume, a bag, a magic cord and a magic pipe. When Chácopee smokes the pipe out of it come the souls of the dead slain by the giants, who are frightened by them. With the aid of the cord he trips up the giants one after another, kills them and wins a race he runs with each of them except the grandfather-giant whom he is enabled, with the aid of the rabbit's charms, to defeat, after numerous adventures, all of a miraculous character. In most civilized or semi-civilized races the folk-tales are likely to be the largest body of popular stories in the language because they have been fashioned not only from long ages of folk-tales, but from the broken down myths and creeds of their ancestors and the races who preceded them. Folk-tales are especially plentiful among the Mongolian and Indo-European races. To this class of story belong the imaginative Celtic fairy tales. Folk-tales of a more primitive class are very plentiful throughout Africa and Polynesia; and many of a higher and more interesting type exist among the American Indians, some of which bear a curious resemblance to the

folk-tales of northern Europe and northwestern Asia.

**Transformation.**—The pre-scientific world firmly believed in transformations. This was the natural outcome of the personification of all nature. The wind was a person, yet he became invisible; the sun, also a person, hid himself, as did the moon and the morning star, behind a mask. The spirits of the forest whispered or roared or chatted, but they could not be seen by human eyes, either because they were hidden within the trees or because they had actually changed themselves into trees. The rivers, the mountains, the clouds were persons; but because of this power of self-transformation they could not be seen by earth-beings. If spirits could hide in trees and other moving things they could just as easily hide in sticks and stones. So inanimate objects, the residence of such spirits, became fetiches and wonder-working charms. Thus all nature, animate and inanimate, to the ancient myth was the abode of life, active, free and powerful as human life itself. All these different possessors of life might, on occasions, have the power of self-transformation. The simple fact of their appearing in some other than the natural human form was sufficient proof of their power of self-transformation. There were also, according to the belief of the mythological ages, other powerful beings who, in addition to possessing the ability to transform themselves, could bestow upon another the power of transforming himself. This was generally accomplished through the presentation of some wonder-working feticch which enabled the owners to effect self-transformation. Thus the hunter, in the Algonquin tale of the 'Wolf-Man,' takes from the breast of the wolf-man himself a powerful amulet, which enables him to transform himself into any form he desires. Though the wolf-man pursues him and overtakes him at sun-down each day for six days in succession, he outwits him each time by his transformations and succeeds finally in drowning him by the same means on the seventh. In the tales of 'The Witch and the Wind-Man' the Mole-man shoots his magic arrow into the cloud on which his brother, the wind-man, is riding and drives it backward with terrific force. This he does several times until finally he wins the race against him. In the same tale the Old Witch changes herself into a monster white rabbit and thus lures the nine brothers to her den; but the wind-man rides the wind into the cave of the supernatural people and rescues the brothers before the witch has had time to get them fattened enough to eat. Many similar Indian tales are built about the supernatural power of self-transformation. Nanabozho, the great culture hero of the Algonquian races, under his many tribal names, is an adept at transformation; and in nearly all his adventures in which he takes the leading part he makes use of it. The heroes of the Plains Indians are constantly subjecting themselves to self-transformation. Everywhere throughout Indian America the belief in transformation is strongly exemplified in the mythology and folk-tales. Witches, wizards and other evil-disposed beings had the power of self-transformation, and unnumbered are the myths, legends and folk-tales in which they figure. In the rivers and the lakes and pools were other evil-dis-

posed spirits who delighted in luring people to death. These characters are well known in Latin and Greek mythology; but just as picturesque tales are told of them in the stories of other races. Under the name of the Malinche, the water siren shows herself as a beautiful woman on the tops of certain mountains in Latin America and lures men to her only to tear them in pieces. As the Llorona or "Crying one" she inhabits pools, lakes and rivers where she cries like a lost child in the night and draws her victim on to his death; for when he falls into the water she drags him down; so that there is no chance of escape for him. Or she may change herself into a "fool's-light" and lead some unfortunate into a bottomless swamp where death is equally certain. In all these stories self-transformation is the chief motive.

**Ritual,** supplying as it does the means whereby the correct relation to the various superhuman powers may be properly maintained, forms a very considerable part of mythology. Since the beings to be worshiped or propitiated are varied in attributes and powers the ritual and ceremonies dedicated to them must be varied also. In an age when the virtues of magic, charm, song, incantation, ceremonial dancing and instrumental music were firmly believed to be effective means of protection against adverse powers or of attracting the favorable attention of divine beings, extraordinary importance was placed upon the literal rendering of ritual and all other ceremonial forms. This belief helped to preserve ritual myths in a substantially unchanged form for generations; and many partially broken down myths repeated by primitive and other races are the survivals of the stories that once formed part of or went with rituals to explain them or to account for them.

**MYTHOLOGY, American.** See AMERICAN MYTHOLOGY.

**MYTHS.** See MYTHOLOGY.

**MYTILENE.** See MITYLENE.

**MYXEDEMA**, a peculiar state of the nerve tissues of the body causing many nutritive changes in the body. Its cause is a loss of function of the thyroid gland (q.v.) and a resulting diminution in the supply of its secretion to the blood. It is strictly a fibrosis of the thyroid. The disease was first described by Sir William Gull of London in 1873. A similar condition results from removal of the gland by operation. Women are the principal sufferers, furnishing 80 per cent of the cases. Myxedema is found in cold climates, and probably most frequently in Europe; in certain districts for instance in Switzerland, France and Italy, it appears to be endemic. It is believed that certain mineral constituents in the water in these regions is the cause of the endemic cretinoid degeneration, as the water was brought from a distance to a certain goitrous region in Rupperwill and the disease disappeared. The onset of the disease is gradual, and the symptoms are loss of activity, sensitiveness to cold, falling of the hair, decay of teeth and nails, rough, dry skin, spongy gums, diminution of perspiration, yellow tint and swelling of the face, paleness of the mucous membrane, subnormal temperature, constipation, albuminuria, impairment of sight and hearing, headache, slow intellection, hallucinations and,

in some cases, a hypothyroid psychosis. A most striking symptom is the oedema, which develops principally in the loose subcutaneous tissues, appearing like a considerable swelling. The face, the back of the hands and the upper limbs first present enlargement; but in time it involves the whole body. The thickening and enlargement of the face renders the patient unrecognizable.

What has been called infantile myxedema by some writers is characterized by a failure of the child to develop bone in the normal manner, the result being a fat dwarfish individual. The dentition is imperfect and the anterior fontanelle does not close for many years.

Treatment consists in the administration of thyroid gland and of tonics. Grafting of a partial or entire thyroid gland taken from an animal into the subcutaneous tissue has not been very successful. Internally a glycerine extract of sheep's thyroid is given, or a dry extract, or an emulsion may be made and used hypodermically. This treatment was first suggested by Murray, of Newcastle-upon-Tyne, in 1891. The remedy must be used cautiously, especially if cardiac or vascular disease exists. Thyroid may cause vomiting, diarrhoea, fever, profuse perspiration, headache, glandular swellings and prostration. The dose should be graduated so as to avoid these symptoms of poisoning. After many months of treatment the disease disappears. The dose should then be diminished, but the patient must continue to take thyroid all her life, lest the myxedema return. (See CRETINISM; THYROID GLAND). Consult Gull, 'On a Cretinoid State Supervening in Adult Life in Women' (in *Clinical Society's Transactions*, London 1874); Gimlette, 'Myxedema and the Thyroid Glands' (London 1895); Jelliffe and White, 'Diseases of the Nervous System' (3d ed., 1919, 'Endocrinopathies').

**MYXOSPORIDIA**, or fish psorosperms, are Protozoa belonging to the class Sporozoa. They are characteristic fish parasites, occurring on the gills, in the skin and muscles, and free in swimming bladder, gall bladder and urinary bladder. Serious epidemics and common diseases among fishes are due to their excessive multiplication under favorable circumstances. The spores which are produced in large numbers in the protoplasm of their bodies contain 1, 2 or 4 polar capsules with a coiled thread like the nematocysts of the hydra.

# N

**N** the 14th letter of the English and several other alphabets is classed as a dental-nasal consonant; it is pronounced when a voiced sound is emitted through the nose while the tip of the tongue is in contact either with the front upper teeth or with the front of the palate; the position of the tongue, whether touching the teeth or the palate, distinguishes the *n* of one language from that of another; the *n* of English speech is produced by placing the point of the tongue against the palate just behind the gums. When *n* is followed by a guttural either the *n* and the guttural form one nasal sound, as in ring, or the *n* becomes distinctly guttural and the guttural retains its own sound-value, as in rink; but when the *n* and the guttural belong to different syllables, as in the words engage, include, concave, unkind, the *n* usually retains its pure sound; yet the rule has many exceptions recognized by orthoepists, who while they regard the *n* of syncarpy, syncretist, as pure, mark the *n* of syncope and many other words as nasal, equal to *ng*. In words ending with *n* preceded immediately by *l* or *m*, the *n* is silent: kiln, hymn; in the beginning of a word a consonant preceding *n* is silent: know, gneiss, mnemonic, pneumatic. In many words is seen an intrusive *n*, as in passenger, messenger, though the words from which these are formed, passage, message, have no *n*. The initial *n* of newt, nickname, and a few other words is the *n* of the indefinite article which became inseparably attached to ewt, ekename, etc.; conversely, by dropping the initial *n* in the forms nadder, nauer, napron became adder, auger, apron. The alphabetical character *n* has remained almost unaltered in shape from Phœnician to English. See ALPHABET; PHONETICS.

**N-RAYS**, a supposed form of new radiation discovered by M. Blondlot, while experimenting upon the polarization of the X-rays. The rays were said to be invisible, but could be deflected, and by means of appropriate screens could be seen, and were marked out in great detail by Blondlot and his followers. These rays were declared to be susceptible to the attraction of gravitation; and were decided to lie in wave-length between the shortest electromagnetic rays and the longest of Rubens rays. Many interesting discoveries were supposed to be made concerning the N-rays; they were detected as issuing from various objects in a state of tension or torsion, such as a cane forcibly bent; a stick of crystallized sulphur; compressed rubber; ice at zero; or a piece of tempered steel: the rays disappeared when the temper was drawn. An eminent French physiologist asserted that he had seen these rays issuing from muscles, when active, and from nerves after death. One curious thing about

the supposed rays was that, while some of the observers could see them clearly, others were quite unable to see them, nor could their instruments detect their operation. Blondlot and his disciples asserted that this was due to the fact that those who were unable to see the rays possessed defective vision, and that, while the rays really existed, only those peculiarly endowed could perceive them. Two other forms of these rays were announced, the *N*<sub>1</sub>-rays and the *N*<sub>2</sub>-rays. These rays were believed in for several months by an increasing number of eminent scientists, though doubt as to their existence had begun to be aroused, when experimenter after experimenter failed to detect them. Finally, after a prolonged series of experiments the conclusion was reached that these rays were subjective in character and had no real existence. A summary of the very voluminous literature published on the subject may be found in the *Journal of the Franklin Institute* (Vol. CLXIV, Philadelphia 1907).

**NABAL**, in Biblical history (1 Samuel xxv), the name of an Israelite of the tribe of Judah. David, having afforded protection to Nabal and saved his flocks and herds, his property and even his life when in danger, some time after sent to him to supply his troops with provisions. This Nabal refused; on which David, stung with the ingratitude of the man, vowed to take summary justice on the ungrateful Jew and exterminate his family; and taking with him 400 men set out for the residence of the mercenary Hebrew. Abigail, Nabal's wife, hearing of her husband's conduct and David's resolve, collected such provisions as the army required, and, attended by a train of servants, set out to meet the approaching king. Her beautiful person, combined with the excuses she made for her husband's conduct, so softened the heart of David that he accepted her gifts, averted his wrath, and Nabal having been "smitten by the Lord" a few days after, David married his widow.

**NABATÆANS**, a Semitic race of people whose kingdom extended from Damascus on the north to Al-Hajr (Hegra) on the south. They were in possession of the country as early as 312 B.C. for Antigonus and afterward his son Demetrius tried in vain to conquer them. Judas and Jonathan had relations with them at the time of the Maccabean struggles (1 Macc. v, 25; ix, 35). The Edomites were forced up into southern Judah by them. They are chiefly known by inscriptions, written in Aramaic, which seems to establish the fact that they were either of Aramaic origin directly, or of Arabaic extraction later influenced by the Aramaic. These inscriptions give information concerning the rulers, but since they are mostly

funerary, they furnish no other historical data. Their commerce was very important, as their capital Petra (q.v.) was on the route from Egypt to central Arabia. A temple to their native deity was found at Puteoli, an Italian port—which indicates the presence of a Nabatæan colony there and points to the extent of their vast trade. A coinage of the country dating from the 2d century B.C. bears the names of the rulers. These, with their approximate dates, are Malchus I (145 B.C.); Obodas I (97-85 B.C.); Aretas III (85-62 B.C.); Obodas II; Aretas IV (2-50 A.D.); Malchus II (50-70 A.D.); Rabel (70-95 A.D.). There are also coins of Alexander Jannæus, Hasmonean king of Judea, who captured some of the trans-Jordanic cities and struck coins in them. The Nabatæans were very powerful in the 1st century B.C., but lost Hauran and Peræa to Herod, retaining fortresses on the edge of the desert. Under Augustus the country became a Roman dependency and lost its warlike nomadic character. Some later inscriptions have been found which are in Arabic, but the word Nabatæan is generally used as synonymous with Aramæan. (For their alphabet see plate under ALPHABET). Their national temple was at Al-Hijr, and the chief gods seem to have been Dusares, Manat, Kais, Allat and Hobal. Consult Cooke, G. A., 'North Semitic Inscriptions' (pp. 214-262, 1903); Head, 'Historia Nummorum' (pp. 685-686, 1887); Vincent, F. H., 'Les Nabatéens' (in *Revue Biblique*, pp. 567-588, 1898); Mommson, 'Provinces of the Roman Empire' (pp. 160-171, 1887); Schürer, 'History of the Jewish People' (Vol. I, Eng. trans., New York 1896).

**NABOB**, or **NABAB**, the title applied to the administrator of a province ruled by the viceroy. The name was also given to unofficial wealthy natives as a term of derision.

**NABOB**, *The*, a novel by Alphonse Daudet, published in 1877. This is one of the most highly finished of the author's works. It is a romance of manners and observation.

**NABONASSAR**, nāb-ō-nās'ar, Era of. See **BABYLONIA**; **NEBUCHADNEZZAR**.

**NABONIDUS**, nab-ō-nī'dūs, or **NABONADIUS** (Babyl. *Nebūna'id*), last king of Babylon (555-538 B.C.). He was elevated to the throne by his fellow-conspirators in the murder of Prince Labossoracus (or Laborosoachard). Soon after his accession he concluded with Lydia and Egypt an offensive and defensive alliance against the Persians under Cyrus. He then greatly strengthened the defenses of his capital. It was not, however, until 539 B.C. that Cyrus, who had already defeated the impetuous Cresus, marched upon Babylon. Nabonidus followed the traditional Oriental strategy in opposing his foe. He fought a battle within sight of Babylon, was utterly defeated, and then, while most of his army found safety within the great walls, he himself with a small force entered Borsippa, an important town southwest of Babylon; possibly hoping by this movement to force Cyrus to divide the Persian host. His stepson, Belshazzar (Bil-shar-uzur), familiar through the scriptural narrative in Daniel, and apparently cosovereign, conducted the defense of Babylon. After the fall of the capital, Nabonidus surrendered, was kindly

treated by Cyrus, and even made governor of the province of Carmania. Some of his inscriptions show that he was a personage of historical interest. See **BELSHAZZAR**; **CYRUS**.

**NABOPOLASSAR**, nā'bō-pō-lās'sar, Babylonian king, founder of the New Babylonian empire. He was a Chaldean, not of the kingly line, and erected an independent kingdom in Chaldæa in the second quarter of the 7th century B.C., thence extending his power to Babylon about 626. With his ally, Cyaxares of Media, he conquered Nineveh about 606, which brought about the destruction of the Assyrian Empire. The Chaldean Empire became under him the greatest power in the Euphrates Valley. He died about 605 B.C., leaving the empire to Nebuchadnezzar, his son. Nabopolassar improved the irrigation of the country round Babylon and did much to beautify the city. Consult Rogers, 'History of Babylonia and Assyria' (1900); and likewise the histories of Hommel, F. (Berlin 1885); Winckler, H. (Leipzig 1892); Sayce, A. H. (London 1900); Johns, C. H. (ib. 1911).

**NABOTH**, an Israelite, owner of a plot of ground in Jezreel, during the reign of Ahab, king of Israel, about 897 B.C. This plot lay on the eastern slope of the hill of Gilboa and in addition to this he owned a vineyard. The palace of Ahab immediately adjoined this vineyard, which became an object of the king's desire and he offered to purchase it or give another in exchange for it. When Naboth refused to part with the "inheritance of his fathers," Ahab was bitterly disappointed, but his wife sent a warrant in Ahab's name, sealed it with his signet and caused Naboth to be apprehended, brought to Samaria, tried for blasphemy and treason on the testimony of two suborned witnesses and stoned to death with his sons. Their mangled remains were devoured by the dogs and swine and the blood from their wounds ran down into the large tank or reservoir which still is seen on the slope of Samaria. This crime brought down the curse of Elijah upon the guilty couple (2 Kings ix, 2-26), which was fulfilled soon after in the fate of both. See **AHAB**, **JEZEBEL**.

**NABU**. See **NEBO**.

**NABUA**, nā'bwā, Philippines, a pueblo of the province of Ambos Camarines, island of Luzon, situated in the southern part of the province, on the Buhi River, 20 miles southeast of Nueva Cáceres. It is in a marshy region where rice is grown, and is connected with the neighboring towns by a good road. It is a military and telegraph station. Pop. about 19,000.

**NABULUS**, nā-boo-loos', or **NABLUS**, nāb-loos', Palestine, the ancient Schechem, and one of the chief cities of Samaria, 30 miles north of Jerusalem, on the highest part of the fertile and fruitful pass between Mounts Ebal and Gerizim, leading from the Mediterranean to the Jordan. It is a busy trading and industrial centre, the seat of a governor, the see of a Greek bishop, and is visited by great numbers of pilgrims attracted by the tombs of Joshua and Joseph, Jacob's Well and the Tree of the Sanctuary, three miles south on the road to Jerusalem. As a Canaanite city it was destroyed by Abimelech, a son of Gideon the

judge. Rehoboam was crowned king of Israel here, and during the Greek occupation Justin Martyr was born here. It figured conspicuously during the Crusades. It was the religious centre of the Samaritans (q.v.), whose descendants inhabit the southwest quarter of the town. Pop. about 20,000.

**NACHTIGAL**, nāh'tē-gäl, **Gustav**, German explorer in Africa: b. Stendal, 23 Feb. 1834; d. at sea near Cape Palmas, 19 April 1885. He studied medicine; became a military surgeon; in 1861 went to Algiers; in 1863 became surgeon to the army of the Bey of Tunis; and in 1868 was sent with presents from the king of Prussia to Sultan Omar of Bornu in recognition of kindness shown to German explorers. His journey through Tibbu and Tibesti was over country hitherto untraversed by a European. He arrived at Kuka in 1870, thence explored Borku, Kanem and the country south of Bornu and on his way back to Cairo passed through Wadai. The years from 1875 to 1882 he spent in Germany arousing national interest in German colonization. He entered the consular service in 1882, becoming consul to Tunis, and in 1884 was German commissioner for the annexation of Togoland, Kamerun and Lüderitzland. He died on his way back to Europe. Nachtigal's work marked a distinct era in the exploration of northern Africa and even more notably in German colonial policy. He wrote 'Sahara und Sudan' (1879-89). His letters are collected in Berlin, 'Erinnerungen an Gustav Nachtigal' (1887). Consult also the life by Ruhle (1892).

**NACIMIENTO MOUNTAINS**. A prominent ridge in Sandoval County, N. Mex., lying between the headwater of Puerco and Jemez rivers. The length is about 40 miles and highest portions have an altitude of about 9,500 feet. To the north they merge into San Pedro Mountain. The rocks are uplifted granite with limestones, sandstones and volcanic tuffs on the flanks. Copper ore is mined on west slope at San Miguel and Senorito.

**NACOGDOCHES**, nāk-ō-dō'chēz, Tex., city, county-seat of Nacogdoches County; on the Texas and New Orleans, the Houston and the East and West Texas railroads, about 120 miles north by west of Beaumont and 130 miles north by east of Houston. It is in a rich agricultural region, in which the chief products are cotton and tobacco. A government experiment station for testing the tobacco is located here. The industrial interests of the city, outside the government station, are connected chiefly with the preparation of cotton and tobacco and lumber for market. Nacogdoches was first settled by Spaniards in the early part of the 18th century; it was first a mission, the headquarters for the converted Indians of the surrounding region. It figured in the United States quarrel with Spain over the Spanish possessions in the Southwest. Magee and Gutierrez captured it in 1812 when it came into the possession of the United States. Pop. 3,369.

**NACRE**. See MOTHER OF PEARL.

**NACRITE**, a class of white unctuous minerals possessing a pearly shining lustre. They are usually found with mica slate and also occur native in granite and gneiss, crystallizing in four-sided prisms. The constituents are usually alumina 28.844, silica 64.440, with varying por-

tions of lime and the protoxides of iron and manganese. Nacrite is found in various localities, notably near Brunswick, Me., and in some parts of Ireland.

**NADAL**, Ehrman Syme, American author: b. Lewisburg, W. Va., 13 Feb. 1843. He was graduated from Yale in 1864 and was a secretary of the United States legation at London, 1870-71 and 1877-84. He has published 'Impressions of London Social Life' (1875); 'Essays at Home and Elsewhere' (1882); 'Zweibach or Notes of a Professional Exile' (1895).

**NADCHES INDIANS**. See CREEKS.

**NADEN**, Constance Caroline Woodhill, English poet: b. Edghaston, Birmingham, 24 Jan. 1858; d. London, 22 Oct. 1889. She studied at the Mason College, Birmingham, in 1881-87; became interested in sociological problems and lectured with effect. She was an investigator of Spencer's system of philosophy and became the advocate of a doctrine, taught also by Dr. R. Lewins, called "Hylo-Idealism," an attempt to furnish a metaphysical system reconciled with the science of modern times. She is chiefly remembered for her volumes of 'Songs and Sonnets of Springtime' (1881) and 'A Modern Apostle and Other Poems' (1887). The poems were commended for their promise by Gladstone in a review in the *Speaker*.

**NADIA**, nā'dē-ā, or **NUDDEA**, India, town and district of Bengal: (1) the town, capital of the district, on the Bhagirathi River, 54 miles north of Calcutta, is a place of sanctity, the seat of native Sanskrit schools and was the residence of the last independent Hindu king of Bengal in 1203. Pop. 14,105; (2) the district has an area of 2,982 square miles. The Ganges here known as the Padna skirts its northwestern boundary and from it branch the three "Nadia rivers," the Bhagirathi, Jalangi and Matabhanga, which irrigate the district and are valuable thoroughfares for communication and trade. Its capital is Krishnugger.

**NADIR**, in astronomy, that point of the heavens which is diametrically opposite to the zenith or point directly over our heads. The zenith and nadir are the two poles of the horizon; the zenith, nadir and centre of the earth are in one straight line.

**NADIR SHAH**, nā'dēr shā, or **TAMASP KULI KHAN**, king of Persia: b. Khorasan, 1688; d. Fethabad, 19 June 1747. He was of Turkish blood and poor family; early showed his cunning by his attempts, while in the service of different governors of Khorasan, to get this province for himself, but was unsuccessful. Putting himself at the head of a band of robbers he got possession of several strongholds in Khorasan; and in 1726 entered the service of Tamasp II, for whom he checked the Afghans and defeated the Turks and from whom he received four provinces. When Tamasp was defeated at Hamadan by the Pasha of Bagdad and was forced to cede the provinces on the Arauxis to the Turks and to make a disgraceful peace, Nadir dethroned him, put his son Abbas III in his place and took the regency upon himself. The lost provinces were won back from the Turks and in 1736 upon the death of Abbas Nadir came to the throne, invaded Afghanistan and conquered it, took most of India from

the grand mogul, Mohammed XIV, pillaged Delhi and was everywhere so successful that his empire reached from the Indus and Oxus to the Euphrates and Caspian. He made peace with the Turks in 1746, but was assassinated by the officers of his guard, who were weary of his brutal cruelty. Consult Maynard, 'Nadir Shah' (1885).

**NAEGELE**, nā'gē-lē, Charles Frederick, American painter: b. Knoxville, Tenn., 8 May 1857; d. about 1912. He studied figure and portrait painting under C. Myles Collier, William Sartain and William M. Chase in New York. He has received many awards in competitive exhibitions and has painted portraits of Peter Cooper, Charles L. Tiffany, ex-Governor Roswell P. Flower, Gen. Joseph D. Bryant, Gen. Edwin A. McAlpin, John W. Gates and others. For his oil painting 'Divinity of Motherhood,' he won a gold medal at Boston.

**NÆNIA**, or **NENIA** (Latin), a funeral song among the ancients, sung generally by women. Nænia was also the goddess of lamentation.

**NÆVIUS**, nē'vī-ūs, Gneius, early Roman poet: b. probably in Campania between 274 and 264 B.C.; d. Utica, Africa, 204 B.C. or 202 B.C. He wrote in the old Saturnian verse an epic on the First Punic War; but was better known as a dramatic writer, particularly for his comedies. Most of his plays, of which the earliest was produced in 235 B.C., were translations or adaptations from the Greek. His attacks on the Metelli, of the Roman nobility, provoked their anger and he was banished from the city and retired to Utica. Fragments only of his works have come down to us. These have been edited by Klussmann, Vahlen and most recently by Ribbeck ('Fragmenta Scænicorum Romanorum').

**NÆVUS**, a birth-mark, port-wine mark or mother's mark. This disfigurement, which occurs most frequently on the head and trunk, but may also appear on the extremities, is essentially an enlargement of the minute veins or venous capillaries, which are dilated and anastomose or unite among themselves to form a vascular patch generally of a deep-red color. The lesion is confined to the upper layer of the true skin. No pulsations are observable in the nævus, but if the circulation in the neighborhood is obstructed in any way, turgescence is seen and the color deepens. The familiar name of "mother's mark" or "longing mark," is applied to nævus from a former belief that the lesion was the result of fear, fright, unnatural longing or some such irritation acting upon the mother's constitution and communicating its effects to the unborn child, in the shape of this mark. Nævus, apart from questions as to its exact cause, appears to be invariably congenital in its nature. After birth it usually enlarges and after attaining a certain size may remain to constitute a permanent lesion or it may be absorbed with or without inflammatory action. The name birth-mark is in some cases a misnomer because the nævus may appear at different periods of life. Nævus has been treated in various ways, by excision with the knife, ligature, caustics, etc. The ligature has until recently been most commonly employed for its removal, threads being passed under the base

of the nævus and tied so as to produce strangulation of the vessels. Electropuncture and electrolysis have also been much used, but the best of all discovered means is the use of carbon dioxide snow, a cone of which is made and pressed upon the nævus for a quarter or half a minute. This causes a blister, which dries and come off, leaving no scar. In cases where a nævus is of limited extent and does not produce disfigurement or where from its situation it may not be seen at all in ordinary circumstances, the surgeon's advice generally is to let it alone. In subcutaneous nævus the lesion is more deeply seated. Subcutaneous nævus generally accompanies the more superficial form, but may bleed spontaneously and weaken the patient unless removed.

**NAFA**, nā'fā, **NABA**, or **NAVA**, Japan, the principal seaport town of the Liu-Kiu Islands, on Okinawa. It is on the west coast of the island, and carries on a considerable export trade in silk, cotton and sugar. Pop. about 50,000.

**NÄFELS**, nā'fēls, Switzerland, parochial village in the Canton Glarus, junction of the Zürich-Glarus-Linthal and the Näfels-Weesen railways. Its industries are chiefly cotton spinning, printing and structural iron material, besides agriculture. It was here that, on the 9 April 1388, 400 Glarus natives defeated 6,000 Austrians, a feat still commemorated yearly. In 1799 Suwarov was defeated by the French under Molitor here in the Russian attempt to force a way into France. Its inhabitants numbered 2,818 in 1910. Consult Heer, G., 'Zur 500 jährigen gedächtnissfeier der Schlacht by Näfels' (Glarus 1888).

**NAFTIA**, nāf'tē-ā, **Lago**, or **LAGO DEI PALICI**, Sicily, a historic lakelet of volcanic origin, in an ancient crater over 900 feet in circumference, near Palagonia, in Catania. Its nauseating naphtha-like emanations are fatal to birds and small animals; its waters thick and greenish, and in a frequent state of ebullition from the under-pressure of escaping carbonic acid gas. The lake was regarded with superstition by the ancients, and here the Siculi, the earliest known inhabitants, had a temple to two chthonic gods, the Palici of the Romans, which was the seat of the conspiracy and revolt against Rome 104 B.C. Consult Freeman, E. A., 'History of Sicily' (Vol. I, Oxford 1891).

**NAGA**, nā'gā, Philippines, (1) a pueblo of the province of Cebú, situated on the east coast, 12 miles southwest of the town of Cebú. It is a port of call for steamers and coasting craft going to Cebú by the southern passage, and is on the east coast road. Pop. 16,884. (2) The former name of Nueva Cáceres (q.v.).

**NĀGA**, in Hindu mythology, the name given various deified serpents, which are represented as the sons of the Muni Kasyapa and his wife, Kadrii. Their king is Sesha, the sacred serpent of Vishnu.

**NAGA**, **INAYA** or **BÍCOL RIVER**, a river of southern Luzon, Philippines, rising in the mountains of the province of Albay, within four miles of the Pacific Coast and flowing northwest to Bató Lake, on the boundary between Albay and Ambos Camarines. Passing through the lake, it continues its northwest

course across Ambos Camarines, and empties into San Miguel Bay. It is navigable to Nueva Cáceres for vessels of 150 to 200 tons.

**NAGANO**, nā'gā-nō, Japan, a city of Hondo, 96 miles northwest of Tokio. It has an active trade in silks, woollens and other textiles, and is a noted Buddhist pilgrim resort, visited for its celebrated Zenkoji Temple, dating from the 7th century.

**NAGASAKI**, nā-gā-sā'kē, Japan, capital city of the province Hizen and one of her principal and deepest seaports on the west coast of the island Kiushiu, located at the end of a long narrow bay and beautifully surrounded by high hills on three sides, and protected on the west side by the island Takaboko, from whose steep heights many hundreds of Christians were once thrown to death. The town has narrow streets and a Chinese quarter in its rear; the foreign quarter is roomy and clean. It contains a hospital, school of medicine, lunatic asylum, arsenal, prison, botanical gardens and modern waterworks. Its considerable imports consist of cotton, wheat, flour, whale-meat, sugar, beer, machines and railway equipment, petroleum, cement, coal, bone for fertilizer, etc. Of exports the chief commodities are raw silk, tea, sea-products (except fish), furs, salt, vegetable wax, paper, etc. It has steamboat connections with Korea, China, Hongkong, Vladivostok and North America. The harbor was first opened to the Portuguese (1639) and up to 1859 was opened to the Dutch and Chinese only but the treaty of 1858 rendered it accessible to all foreign commerce. Pop. 161,000.

**NAGCARLÁN**, nāg-kār-lān', Philippines, a pueblo of the province of Laguna, Luzon, situated in the centre of the province between the headwaters of the Santa Cruz and the San Diego rivers, 12 miles south of Santa Cruz. It is on the road between Majayjay and San Pablo. Pop. 13,000.

**NAGEL**, nā'gēl, Albrecht Eduard, German ophthalmologist: b. Danzig, 14 June 1833; d. Tübingen, 24 July 1895. He studied medicine at Königsberg and Berlin and established a practice in Danzig in 1856. In 1864 he was privat-docent at Tübingen and 1874 he became professor of ophthalmology there. He developed the theory of the identity of the retinas. He edited the 'Mittheilungen aus der ophthalmiatriken Klinik in Tübingen' after 1880, and published 'Das Sehen mit zwei Augen' (1861); 'Die Anomalien der Refraction und Accommodation des Auges' (1880); 'Die Vordrbildung zum medicinischen Studium' (1890).

**NAGEL**, nā'gēl, Charles, American lawyer and cabinet officer: b. Colorado County, Tex., 9 Aug. 1849. He was educated at Saint Louis and studied Roman law and political economy (1873) at the University of Berlin, when he was admitted to the bar and practised at Saint Louis. He was (1903-05) member of the firm Finkelnburg, Nagel and Kirby, and (1903-05) of Nagel and Kirby. From 1885-1909 he was lecturer at Saint Louis Law School and was member of the Missouri house of representatives from 1881-83. He was (1893-97) president of Saint Louis city council and (1908-12) member of the Republican National Committee. President Taft made him (1909) Secretary

of Commerce and Labor, which position he retained during the life of that administration. In 1872 he was given the degree of LL.B. by Saint Louis Law School, and was made LL.D. (1911) by Brown University, Villanova University, Pennsylvania, and Washington University, Saint Louis.

**NÄGELI**, nā'gē-lē, Karl Wilhelm, Swiss botanist: b. Kilchberg, near Zürich, 27 March 1817; d. Munich, 10 May 1891. He studied in Zürich, Geneva and Berlin; began (1842) the teaching of botany in Zürich; became extraordinary professor at the university there in 1848, full professor in 1852 at Freiburg, and at Zürich three years later. Afterward he held the professorship of botany at Munich. His most important work for science was in the physiology and morphology of plants. His writings deal chiefly with morphological and cytological subjects, and the transformation of species is fully treated in his 'Mechanisch-physiologische Theorie der Abstammungslehre' (1883). Most of his publications appeared first in scientific journals, those contributed to the Royal Bavarian Academy of Sciences being published as three volumes of 'Botanische Mittheilungen' (1861-81).

**NAGLEE**, nāg'lē, Henry Morris, American soldier: b. Philadelphia, 15 Jan. 1815; d. San Francisco, 5 March 1886. Entering the Union army early in the Civil War, he participated in the Peninsular campaign of 1862, and in the following year was appointed to the command of the 7th Army Corps and of the District of Virginia. He retired from the army in 1864, and later went to California, where he cultivated a vineyard at San José, and gave his name to a well-known brandy.

**NAGOYA**, nā-gō'yā, Japan, the chief town of Owari province, in the island of Hondo, near the head of Owari Bay, 92 miles by rail east of Kioto. It was formerly a city of great importance, being for a time the capital of the empire. It is still the fourth city in Japan in respect of population and an important centre for the production of pottery and fancy ware, silk and cotton goods, and other manufactures. The chief edifices are the 17th century castle of Owari with its valuable art collection, and the Higashi Hongwanji Buddhist temple. Pop. 389,272.

**NAGPUR**, nāg- or nūg-poor', or **NAGPORE**, India, a city, district and division of the Central Provinces. (1) The city, capital of the district and division, and also of the Central Provinces, 520 miles by rail east of Bombay, although at an elevation of 1,100 feet above sea-level, occupies an unhealthy situation on the banks of the Nag. The municipal limits include, besides the town proper, the native suburb of Sitabaldi, the European station of Sitabaldi, the small suburb of Takli, and a considerable area of land under cultivation. In the centre rises Sitabaldi Hill, crowned with the fort, which is garrisoned by a small detachment from the British regiment at Kamptee, nine miles distant. There are some Hindu temples and mausolea built in the best style of Mahratta architecture, and several schools. The chief manufactures are cotton and woolen cloths. There is a trade in wheat and other grain, salt, country cloth, European piece and miscellane-

VIEW OF HARBOR AND CITY OF NAGASAKI, JAPAN

ous goods, silk, etc., and coal is obtained from a bed at a depth of 200 feet, which is estimated to contain 17,000,000 tons. Here, in 1817, a British force of 1,350 men defeated a Mahratta army of 18,000 men. Nagpur was formerly the seat of a line of rajahs, which became extinct in 1853, when their territory was annexed to the British dominions. Pop. 101,415. (2) The district of Nagpur has an area of 3,483 square miles; pop. about 800,000; (3) the division of Nagpur, divided into five districts, has an area of 23,521 square miles. Fruits, vegetables, cotton, rice, maize oilseed and oranges are cultivated. The locality is also rich in minerals, coal, antimony, ochre, gold being extensively mined. The territory was annexed by the British in 1853, previous to which it had been part of the Mahratta kingdom under the rule of the rajahs of Berar. Pop. 3,109,838.

**NAGUILÍAN**, nā-gē-lé'án, Philippines, a pueblo of the province of Unión, Luzon, situated on the Bauang (or Baoang) River, four miles from the mouth and 10 miles southeast of San Fernando. Pop. 11,885. A small town (pop. 2,200) in the province of Isabela, Luzon, has the same name.

**NAGYAGITE**, a sulpho-telluride of lead and gold with about 7 per cent of antimony, with the formula  $Au_2Pb_3Sb_2Te_2Sr$ . Besides these elements it often contains traces of copper and silver. It is found native in foliated masses and is hence sometimes called "foliated tellurium," also granular. It crystallizes, but rarely, in tabular diametric forms and its specific gravity is 6.85 to 7.2. It melts easily under the blow-pipe and burns with a blue flame. In color it is blackish lead gray, and exhibits a brilliant metallic lustre. It is found in Colorado and Virginia, but derives its name from Nagyag, Transylvania, where it was first found.

**NAGYBANYA**, nōj'y'-bān'ya, Hungary, a royal free town formerly known as Frauenstadt (Magyar Aszonympataka), located in the county Szatmár on the Szatmár-Nagybanya and the Nagybanya-Zsibó railways. It was at one time fortified, is handsomely built, and contains beautiful squares and a Minorite monastery. Its industries consist of mining and fruit culture, the manufacture of linens and cotton fabrics, pottery and alcohol, besides having considerable trading. The mines produce gold, silver, lead and copper. Pop. about 30,000.

**NAGYKÁROLY**, nōj'y'-kā'rōl'y', Hungary, city in the county Szatmár, on the Debreczin-Szatmár, the Magykároly-Zilah and the Nagy-károly-Csap railways. It has a handsome church, a Piarist monastery, the Károlyi Palace and park. Its industries consist chiefly of the manufacture of coarse peasant linen and woolen cloths, leather, art furniture, decorative locks, bricks, besides its electricity, wine and tobacco works. Its population in 1910 was 43,692 for the commune. This has been the seat of the Károlyi family since the 14th century.

**NAGYKIKINDA**, nōj'y'-kē'kēn-đa, or **GROSS-KIKINDA**, Hungary, city in the county Torontál, junction of the Szegedin-Temesvár and the Gross-Kikinda-Gross-Becsterek railways. It has a modern town-hall, oberegymnasium, court of justice, etc. Its chief trade is in grain, cattle and milling. It was at one time the principal location of a privileged

Serbian district. Its inhabitants in 1910 amounted to 32,987, consisting of Serbians, Germans, Magyars, etc.

**NAHANT**, nā-hānt', Mass., town, in Essex County, on Massachusetts Bay. It is on a peninsula, which extends into the bay about four miles. The surface is uneven, the east coast rugged, in some places bold cliffs are along the shore; the west coast is low and more regular. There are two small villages in the town, one Nahant, the other Little Nahant. The whole peninsula is a residential section; many of the handsome dwellings are the summer homes of Boston men. Nahant is four miles from Lynn, the nearest railroad station, and about 10 miles northeast of Boston. Formerly it was part of Lynn, but in 1853 it was made a separate town. Pop. 1,184. Consult Hurd, 'History of Essex County, Mass.' (Philadelphia 1888).

**NAHR-EL-ASI**, nār'ēl-ā'sē. See ORONTES.

**NAHUA** (nā'wā) **INDIANS**, a Central American collective name given to the Indian tribes which were the most powerful in Mexico at the time of the Spanish Conquest. See AZTEC CONFEDERACY.

**NAHUA MYTHOLOGY**. See MEXICAN MYTHOLOGY; YUCATAN; PALENQUE; QUETZALCOATL; MAYA; CHOLULA.

**NAHUEL-HUAPI**, nā-wāl' wā-pé', or **TIGER LAKE**, Argentina, a lake on the boundary between the territories of Neuquen and Rio Negro, on the east slope of the Andes. It is 75 miles long, 10 miles broad and has an area of 300 square miles, dotted with several islands. It is fed by numerous mountain torrents and is drained by the Limay affluent of the Rio Negro. In 1690 the lake was discovered by Jesuit missionaries.

**NAHUM**, nā'hūm (Hebrew for "rich in God's comfort"), one of the 12 minor Hebrew prophets of the Old Testament, whose only record is the book, attributed to 607-606 B.C., that bears his name, a reference in Nehemiah vii, 7, as "Rehum" being a copyist's error. Nahum is described as "The Elkoshite," either the son of a man named Elkosh, or native of a village of that name in Galilee, the location of which is uncertain. Saint Jerome states that the village in Galilee which bore the name of Elkesi in the 4th century A.D. was the prophet's birthplace, and the Galilean village Capernaum, signifying the "village of Nahum," has also been vaguely speculated upon. The tomb of the prophet is pointed out at Alkush near Mosul—ancient Nineveh—and his life has been associated with the great city, the destruction of which he prophesied. His book entitled 'The Burden of Nineveh. The Book of the Vision of Nahum the Elkoshite,' should be compared with that of Jonah which illustrates the remission of God's judgments, while Nahum describes their execution, in a style full of animation, fancy and originality, and at the same time clear and rounded. His language throughout is classical and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem. Nineveh was at that time the capital of the great and flourishing Assyrian Empire. It was a city of vast extent and population; the centre of the principal commerce of the world. Its wealth, however, was not

altogether derived from trade. It was a "bloody city," "full of lies and robbery," chap. iii, 1. It plundered the neighboring nations; and is compared by the prophet to a family of lions, which "fill their holes with prey, and their dens with ravin," chap. ii, 11, 12. At the same time it was strongly fortified, its colossal walls, 100 feet high, with their 1,500 towers, bidding defiance to all enemies. Yet so totally was it destroyed that, in the 2d century after Christ, not a vestige remained of it; and its site was for centuries a matter of doubt and uncertainty. The book is surpassed by none in sublimity of description. It consists of a single poem which opens with a superb vision of God's coming to judge the nations, vs. 2-8. Then follows vs. 8-14, an address to the Assyrians describing their confusion and overthrow; vs. 12-13 parenthetically consoling the Israelites with promises of future rest and relief from oppression. Chapter ii depicts in vivid colors the siege and capture of Nineveh by its foes, the Medes and Chaldeans, and the consternation of the inhabitants. Chapter iii describes the utter ruin of the great city and the various contributing causes. The fall of No-Ammon, Thebes in Egypt in 668 B.C., about half a century before, under the judgment of God, is cited, vs. 8-10, to illustrate the punishment coming on the Assyrian Empire and the deliverance and restoration of Israel. With a wide view of the working of Providence, an avoidance of all moral or homiletic utterances, this powerful prophecy advances with majestic unity from its noble primum to its close. Consult Davidson, A. B., "Nahum, Habbakuk and Zephaniah" in 'Cambridge Bible' (1896); Driver, S. R., "Nahum" in 'Century Bible' (1906); Smith, G. A., 'The Book of the Twelve Prophets' (2 vols., 1876-77); Haller, "Nahum" in 'Die Religion in Geschichte und Gegenwart' (1913); also the numerous commentaries, notably by Bickell, Billerbeck and Jeremias, Gunckel, Marti, Norvack, Wellhausen, etc.

**NAIADACEÆ**, a small family comprising one genus, *Naias*, of submerged fresh-water plants, differing from the *Potamogetonaceæ* (q.v.) in having the flower declinuous, with one stamen and one ovary. There are about 12 species and varieties found generally over the world. In the United States some members of the family are found in the fresh-water lakes and ponds from New York to Florida, others in the Mississippi Valley and others still in California.

**NAIL**, an elastic horny plate on the upper or dorsal surface of the end of a finger or toe, as in man and monkeys. Hoofs, claws, talons, sheath-horns and the bills of birds are analogous. Nails and claws of all kinds are modifications of the epidermis, identical in formation and mode of growth. The root of the nail rests in a matrix which is a fold of the dermis, particularly rich in vascular papillæ from which the nail-cells are produced. The pink color of a healthy nail is due to the blood beneath. The little white area toward the root of a nail, called lunula from its crescentic shape, has less blood under it. When nails are destroyed new ones will be formed if the matrix is uninjured. Nails are a support and a defense to the ends of the fingers and toes, assist in picking up small objects, and if healthy and

in good condition add comeliness to the parts to which they are attached. To most animals possessing them they are of great importance, giving a needed rigidity to fingers and toes, and adapting them to a great variety of necessary utilities, as firmly seizing and holding prey (perfected in the retractile apparatus of feline claws), scratching, digging, searching crevices for food and as formidable weapons. In horses, cattle and other ungulated animals, they enclose some or all the digits and are called hoofs (q.v.). In the sloths the nails assume a relative size and are used as a chief means in arboreal progression. In the Amphibia—as in some toads, efts, etc.—the nails are represented in their simplest form and appear as mere thickenings of the skin at the extremities of the digits.

In man the nails appear about the third month of foetal or embryonic life. After birth the nails of the hand grow at the rate of about one millimeter per week, those of the foot about one millimeter per month.

The health of the nails is affected, as is that of the skin, by local or general diseases. They may become thickened (hypertrophy) as the result of inflammation or a degeneration of nerves; diminished in size (atrophy) from traumatic influences; malformed as the result of disturbed function of the matrix; degenerated from faulty nutrition and discolored in various diseases, the discoloration probably being in the tissues beneath. Nail-biting is a bad habit not only leading to a morbid condition of the nails themselves but also sometimes being an indication of some types of nervous disease. The nails are also subject to parasitic diseases. A hang-nail is a sliver of skin attached at one end; it should be cut off close to the point of attachment. The familiar white areas on the nails are considered to be injury received by the nails in being manicured. The painful affection called ingrowing nail usually occurs in the great toe, not through alteration in the nail itself, but from constant pressure of the adjacent soft parts against its edge by a tight shoe. The irritation often results in the formation of an ulcer, extremely sensitive, and subject to continual aggravation from the embedded nail, and in some cases necessitates a slight operation to excise a portion of the nail and the nail fold.

**NAILS**, headed spicules of metal, varying in size from those a little larger than ordinary pins to those several inches in length and from 1/40 to 1/4 of an inch in thickness. Up to the beginning of the 19th century they were made by hand as a household industry in various countries. In England, Birmingham was the centre of the industry, at one time giving employment to over 60,000 persons, and requiring a weekly supply of 200 tons of nail-rods from the iron-works of that district. In the United States, New England held a corresponding position and is even to-day the centre of the industry in America, with Taunton, Mass., as the great tack-making centre of the world. Almost all of the nail output of England was consumed at home and similar conditions obtained in the United States, France and Germany.

Hand-made nails were known as wrought or forged nails and were made from metal plates rolled to the required thickness and then

slit by slitting-rollers into nail-rods or split-rods of various sizes, corresponding to the required size and character of the nails to be forged and were sold to the nail-makers in bundles. The hand-nailer's outfit consisted of a forge for heating the nail-rods, an anvil (a small cube of steel), a hammer resembling that of a file-cutter (the face being sloped toward the handle), and a few "swages" (stamps or dies for producing ornamental or stamped heads).

To make a nail, a nail-rod was heated on the forge, hammered on the anvil and a portion of it the length of the required nail was cut off on a chisel attached to the anvil. The head was shaped in a vise which gripped the shank of the nail and had a counter sunk in the jaws of the vise into which the head was hammered to shape it. Various forms of heads were produced by employing different kinds

Principal Forms of Nails.

of counters. These forged or wrought nails included at least 300 different types, with at least 10 sizes in each type, representing a total of over 3,000 different names. The retail terms—fourpenny, sixpenny, tenpenny, etc.—were not only indefinite in themselves, but varied in different countries and even in different localities of the same country. Therefore, nails were generally designated by terms defining their use, as deck, scupper, pail, mop, hurdle, etc., or according to the forms of their heads, as clasp, rose, diamond, etc., or the shape of their points, as flat, sharp, spear, etc. Their thickness was expressed as fine, barbed and strong, and their length in inches, generally in connection with the weight (expressed in pounds) of 1,000 of the nails referred to. The principal forms of these old-time English nails are illustrated by the accompanying drawing and their uses may be briefly stated as follows: (1) "Rose-sharp" and "fine-rose": the former used for coopering, fencing and other rough work employing hard wood; the latter, with broad spreading heads of greater holding power, used in pine and other soft woods. (2) "Flat-point rose": used in wood liable to split by the wedge-like action of sharp-pointed nails. They were driven with the edges of their flat points across the grain of the wood and not only avoided splitting but also held more firmly. (3) "Clasp" nails: commonly used by carpenters in deal and similar woods. The edges of their heads projected downward and, when driven below the surface of the wood, held tightly by clasping a portion of it altogether, and also allowed a plane to pass over them in finishing work. (4) "Clout" nails, with flat circular heads and round sharp-pointed shanks: used for nailing iron-work and other substances to wood. (5) "Counter-clout" nails, with counter-

sinks under their heads, and chisel points: extensively used by wheelwrights and smiths. (6) "Fine-dog" and "strong-dog," with solid, slightly countersunk heads, round shanks and speared points: used for nailing down stout iron-work, in which the heads are not required to lie flush with the face of the metal. (7) "Kent-hurdle" and "Gate" nails, with broad thin rose heads, flat shanks and good spear-points: used for nailing together and clenching the oaken bars of hurdles, fences and gates. (8) "Rose-clench" nails, with points cut square: used in nailing wood-sheathing and the manufacture of packing cases and boxes, in which the soft wood is liable to split unless bored before being nailed. The square heads of the nails punch out their own holes by driving a portion of the wood before them. The term "clench" was derived from the mode of their employment in boat-building, where they were clenched by hammering down or by riveting the end over a "rove" (a diamond-shaped metal plate), thus drawing the planks together firmly. (9) "Horseshoe" nails, with square or countersunk heads: made of the best refined iron and capable of being drawn out fine without breaking in the hoof. (10) "Brads and tacks": a class of small very useful nails, employed for a variety of purposes too numerous to mention. The latter were sometimes made so small that 1,000 did not exceed 20 grains in weight. In the United States nails are designated as to kind as wrought, cut and wire nails; as to type by the purpose for which they are to be used, as lath nails, shingle nails, etc.; and as to surface, as smooth, barbed, etc. In sizes they range from the two-penny (2-d) to the sixty-penny (60-d) nails. Above these sizes they are called spikes; below them, brads. The smooth wire two-penny nails run almost exactly 1,000 to the pound; of larger sizes the count runs about as follows: three-penny, 600; four-penny, 300 to 450, according to gauge of wire; five-penny, 275 to 400; six-penny, 175 to 300; eight-penny, 100 to 150; 10-penny, 70 to 90; 12-penny, 65; 16-penny, 50; 20-penny, 30; 40-penny, 18; 60-penny, 11. Six-inch spikes run about nine to the pound and 12-inch spikes three to the pound. For many years nails have been marketed by the keg containing 100 pounds. Through the use of a recently developed packing machine, which, through the agency of magnetism, arranges the nails in parallel, nails are in the market in cardboard cartons from 10 pounds upward and in large quantities in wooden boxes which occupy only half the space required by the "keg" with its helter-skelter contents. The small nails or brads are usually packed in telescope containers, holding from one-quarter pound up to one pound.

The credit of inventing nail-making machinery appears to belong to the United States, a patent having been granted in 1786 to Ezekiel Reed, of Bridgewater, Mass., for a "cut-nail" machine. About the beginning of the 19th century nail-making machines had been generally introduced in England, but the first English patent was granted to John Clifford in 1790. In making cut nails strips of metal of a breadth and thickness corresponding to the length and thickness of the required nail and about a foot in length are heated to a black heat and fed into the machine end first. A slicer cuts off the

nail-blank, which in falling is clutched at the neck and held until a moving die strikes its upper end and forms the head; it is then liberated and passes out into the trough. In small nails the taper of the shanks and points is obtained by cutting the nail-blanks alternately, the metal strip (of uniform thickness) being turned over after each cut so that the points and heads are taken from the opposite sides of the blank; while in the larger nails the metal strip is rolled so that its cross-section corresponds to the required taper. These machines turn out nails at a rate of 10 to 1,000 per minute, according to the size of the nails. Cast nails are produced by the ordinary process of molding in sand. They are relatively brittle, but are cheap, and are used for rough purposes, such as lathing and in the manufacture of stout boots and shoes. Wire nails were first made in France, hence sometimes called "French nails." They were used in the woodworking trades and up to 1850 were made by hand. The wire was cut into the required lengths; a wire-blank was pinched in a vise, with a small portion projecting, which was flattened into a head by a few blows of the hammer. Subsequently machines were invented into which the wire was fed and the cutting, heading and pointing were performed automatically.

In the United States William Harsel, of New York, produced the first hand-made wire nails in 1850. Shortly afterward French machines were imported, but they were soon superseded by those of American make, which were awarded medals over those of French and German manufacturers at the Centennial Exhibition in 1876. The new industry, however, was of slow growth. Up to 1885 there were about 25 firms engaged in it, but since then these nails have been widely adopted in the manufacturing trades. The United States Census of Manufactures for 1914 reported 64 establishments devoted exclusively to the manufacture of nails, tacks and spikes. The factories employed a total of 2,644 wage-earners to whom was paid annually in wages the sum of \$1,507,689. The aggregate capital invested was \$7,883,371. The value of the year's production was \$7,198,600, of which \$3,604,281 had been added by manufacture. In addition to this product, however, the steel rolling mills of the country made nails to the value of \$1,469,780 and railroad spikes to the value of \$4,201,388; brass and bronze factories made brass nails to the value of \$40,262, the wire mills made wire nails to the value of \$23,368,633; and other metal-working establishments made a value of \$321,256. The aggregate output of these concerns not classed as nail-makers is thus shown to be \$29,401,319—more than four times the output of the recognized nail industry. With the exception of horseshoe nails, which to a considerable extent continue to be made by hand, from fine grades of wrought iron, all nails are now made of mild steel by machines. In the United States the production is in excess of the consumption and American wire nails, especially, have been exported to European and other countries in increasing quantities for several years. The money value of the export of 1891 was but \$420,697, while that of recent years has exceeded \$5,000,000 annually. Consult Smith, B., 'Wire: Its Manufacture and Uses' (New York 1891); Swank, J. M., 'His-

tory of the Manufacture of Iron in All Ages' (Philadelphia 1892).

**NAIN SING**, Hindu explorer: b. Numaon; d. Morabad, 1 Feb. 1882. He received from a military officer, Colonel Montgomerie, instruction and stimulus for the work of exploration, which he afterward carried on in central Asia, first in Cashmere and Ladak (1856-57), and later in Tibet, making a journey (1865-66) to Lhasa (q.v.), which won him recognition from the Royal Geographical Society. This was followed by other important journeys, chief of which was that across the Tibetan Plateau (1874-75), of which he was the first explorer. The *Geographical Magazine* (London 1876) published an account of this journey, with a map.

**NAINI TAL**, India, a town of the United Provinces in the district of Kumaon. It has a beautiful situation beside a lake, 6,409 feet above sea-level, between spurs of the Himalayas, 70 miles north of Bareilly. It is a popular health resort, the summer headquarters of the provincial government, and has a military convalescent hospital. A disastrous landslide here in 1880 destroyed 150 lives. Pop. about 14,000.

**NAIPALI** (nī-pā'lē) **LANGUAGE**, a dialect spoken in Nepal, India. It resembles the Hindu. The literature of the language is very scanty. Consult Turnbull, A., 'A Nepali Grammar and English-Nepali and Nepali-English Vocabulary' (Darjeeling 1887).

**NAIRNE**, nārn, **Carolina Oliphant, BARONESS**, Scottish poetess: b. Gask, Perthshire, 16 Aug. 1766; d. there, 26 Oct. 1845. Her father was a staunch Jacobite, and named her after the young Pretender. In 1806 she was married to her cousin, William Murray Nairne, who in 1824 became Baron Nairne. Her poems were issued in 1846 as 'Lays from Strathearn,' and in 1869 Charles Rogers edited a volume entitled 'The Life and Songs of the Baroness Nairne,' of which a revised edition appeared in 1886. Among her poems are several of the most popular Scottish songs, such as 'The Land o' the Leal'; 'The Laird o' Cockpen'; 'Caller Herrin'; 'The Auld House'; 'Charley is my Darling.' Consult Oliphant, K., 'Jacobite Lairds' (Grampian Club 1870).

**NAIROBI**, nī-rō'bē, British East Africa, capital city of the province Ukamba, a station of the Uganda Railway, and 327 miles by rail northwest of Mombasa. It is located on the Athi plains at the foot of the Kikuyu hills. It has a town-hall, Protestant, Catholic, Mohammedan and Hindu places of worship, schools, hospital, waterworks, etc. Its bazaar is the centre of a thronging populace of traders. The European inhabitants find their dwellings in the higher lands. Pop. about 30,000.

**NAIRS**, nā'ārz, a Mohammedan caste in Malabar, who have peculiar marriage customs, polygamy and polyandry thriving side by side.

**NAKED BAT**, strangest of all chiroptera is the *chiromeles torquatus* or collared bat of the Malayan region. It measures five and one-quarter inches in length exclusive of the tail and has 26 teeth. Except the collar of thin-spread hairs surrounding the neck the puckered skin is practically naked. Its muzzle is long and pig-like but the most curious characteristic

of this repulsive creature is the deep pouch on the underside of the body below the arm-pits existing in both sexes and holding the young while suckling. These strange creatures are found on the islands of Java, Sumatra and Borneo in dense forests where they repose till the sun reaches the horizon.

**NAKONG**, nā-kōng, one of the four species of harnessed African antelopes. It inhabits the swamps of Central and South Africa and East Africa and is known also as the sititunga (*Tragelaphus spekei*). This species has the distinctions of having a perfectly uniform grayish brown color, while the young are faintly striped and spotted, the hair being more silky and longer than the others; the horns, forming nearly two complete turns, are smooth, slender and strongly ridged. The male stands about three foot seven inches. They go in pairs never in herds. They are highly prized by the natives as game.

**NAKSHATRA** (Sanskrit, "Celestial luminary" or "star"), in the Vedas simply means a star, but later was used of what in the mythological astronomy of India are called mansions of the moon, in which that planet periodically rests in its course through the heavens; these were small clusters of stars or asterisms, 27 or 28 in number. They were mythologically personified as the daughters of Daksha, wives of the moon. Their introduction into the Hindu system has been variously accounted for. Consult Thibaut, G., 'Astronomie, Astrologie und Mathematik'; 'Grundriss der Indo-Arischen Philologie und Altertumskunde' (Strassburg 1899).

**NAKSKOV**, naḱ'skōv, Denmark, seaport town on the west coast of the island of Laaland, on Nakskov Fiord and on the Nykjøbing-Nakskov Railway. Its chief industries are the manufacture of sugar and machines, a trade in grain, besides its ship-building and shipping. It was once fortified and was captured by the Swedes in 1658. Its inhabitants in 1911 numbered 9,480.

**NALA**, nā'la, in Hindu mythology, a legendary king of ancient India, whose love for Damayanti, the daughter of Bhīma, king of Vidarbha, and the adventures arising therefrom, forms a celebrated episode of the 'Mahābhārata' (q.v.), as also of a separate poem, the 'Nalodaya,' attributed to Kalidasa. Consult Macdonell, A. A., 'A History of Sanskrit Literature' (London 1900).

**NALTUNNETUNNE** (nāl-tū-nā'tū-nā') **INDIANS**, an American tribe of the Athapascan family, formerly residing on the Pacific Coast south of Rogue River, in southwest Oregon, between the Tututni on the north and the Chetco on the south. They had no separate villages, and spoke a dialectic variation of the Tututni language. Their tribal name signifies "people among the mushrooms." A few descendants of the race now live on the Siletz reservation, Oregon.

**NAMALAND**. See SOUTH WEST AFRICA.

**NAMANGAN**, nā-mān-gān', Russian Turkestan, a town of Ferghana, on the Sir-Daria, near the confluence of the Narin, about 50 miles northeast of Khokand. It is in a rich oasis, and is the trading centre for the surrounding nomadic tribes. Near it naphtha and coal are

found. The principal industries are soap and leather manufactures. Pop. 78,942.

**NAMAQUALAND**. See SOUTH WEST AFRICA.

**NAMAS**. See HOTTENTOTS.

**NAMAYCUSH**, the great lake-trout (q.v.).

**NAMES** of persons in the very earliest ages no doubt had some significance and meaning, but no record is handed down to us. The Old Testament names are almost all original, that is, given in the first instance to the individual bearing them, and either originated in some circumstance of birth as an expression of some religious sentiment, thus—Jacob (supplanter), Isaac (laughter), Isaiah (salvation of Jehovah), etc. The names of women had equal significance: Rachel (ewe), Hannah (favor), Deborah (bee), etc. In Old Testament times the name was often changed on the occasion of an important event in one's life, Abram becoming Abraham, Jacob becoming Israel, and so on. Neither the Hebrews, Egyptians, Assyrians, Babylonians, Persians nor Greeks had surnames; and in the earliest period of their history the same may be said of the Romans. In course of time, however, every Roman citizen had three, the prænomen or personal name, which was placed first, and commonly written with one or two letters, for example C. for Gaius, Cn. for Gneius, M. for Marcus, Q. for Quintus, and so on. Then followed the nomen, the name of the gens or clan, as Cornelius, Julius, Fabius, from the Cornelian, Julian and Fabian gentes. Lastly came the cognomen or family name, as Cicero, Cæsar, Scipio, etc. Conquerors were occasionally complimented by the addition of a fourth name or agnomen, commemorative of their conquests, as Coriolanus, Africanus, Germanicus, etc. While the earliest Greek names were expressive of some quality in high estimation, as Callimachus (excellent fighter), Apollodorus (gift of Apollo), the Roman names were less dignified and ambitious in their origin; thus Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, as Naso (longnosed), Paulus (little), Crassus (fat), Cæcilius (one-eyed). Celtic and Teutonic names had often equal significance, as Gottfried (God's peace), Conrad (bold in counsel), Bertha (brightness), Ethel (noble), etc. Times of great public excitement have had a very considerable influence in modifying the fashion in names. Thus the English Puritans preferred Old Testament names and such as directly expressed religious sentiment. Among the Scottish Covenanters Old Testament names were also prevalent. At the French Revolution the names of the most famous Greek and Roman republican heroes were in general favor. Among primitive races, names of familiar objects were first given to clans, local groups, and finally very loosely to individuals.

The principal of the modern system of personal nomenclature now adopted in most countries in Europe is to have one name for the individual (Christian or baptismal name) joined to a second name which is common to the family to which he belongs (surname). It is impossible to state with any degree of certainty when this system became general. No instance is known, we believe, of any Anglo-Saxon family bearing a surname from generation to gen-

eration. They were introduced by the Norman adventurers, but were for centuries confined to the upper classes. Surnames became general in Scotland about the 12th century. In some of the wilder districts of Wales they can hardly be said to have been adopted even yet. The principal sources from which surnames are derived are personal characteristics, rank, or profession, localities, animals, or natural objects, and patronymics. Thus from the first source, personal characteristics, we have Black, Brown, Grey, Green, Whyte; Little, Long, Short, Broadhead, Lightfoot, Cruickshank. From rank or profession we have King, Prince, Pope, Bishop, Abbot, Prior, Stewart or Stuart, Smith, Wright, Carpenter, Taylor, Baker or Baxter, Weaver or Webster, Falconer, Fletcher (arrow-maker), Glover, Bowman, Chapman or Marchant, Miller, Brewer or Brewster, Shepherd. From localities, animals or natural objects, come Hill, Dale, Wood, Forest, Brookes or Burns, Grove, Shaw; Bird, Lyon, Hogg, Crabbe, Fox, Roebuck, Bull; Stone, Tree, Flint, Steele. From patronymics are derived Andrews, Anderson, Alexander, Sanderson, Sandison; James, Jameson, Jamieson; Jones, Johnson, Jonson, Jackson; Williams, Williamson, Wills, Wilson; Thom, Thomson; Roberts, Robertson, Robinson. Surnames in many other languages are derived from like sources; thus Black, Whyte, Brown, are with the Germans Schwartz, Weiss, Braun; with the French, Lenoir, Leblanc, Lebrun; the Gaelic prefix Mac, the Irish O', the Norman-French Fitz, the German affix -shon or -son, the Scandinavian -sen, the Russian -vitch, are all equivalents of the English affix -son. The Hebrews, as already stated, had no surnames proper, nor had the Arabians; but to distinguish two men of the same name the former used the form Solomon ben David (Solomon son of David), and the latter Abraham ibn Esra (Abraham son of Esra). The Welsh used the word ap in the same way; Evan ap Richard (John son of Richard). In most nations the wife changes her surname on marriage to that of her husband; in Spain, however, she retains it, while the son may adopt either the paternal or maternal name. In Great Britain a man may now change his Christian name and surname without an act of Parliament, royal license or even public advertisement; but there is no law to compel third parties to use the new name. In the United States names can only be changed by special act of State legislatures.

Nicknames of persons are most difficult to classify owing to the great variety of origins. Physical peculiarities, complimentary (as Strongtharm), derogatory, as Spindleshanks, Sheepshanks, Crookshanks, Heavisides, etc.; mental attributes, as Grave, Stern, Wise, Sage, Moody, Proud, Courteous (Curteis), on one hand, and on the other Blythe, Gay, Foolhardy, Jolly, Meek, etc.; nicknames from complexion and color of the hair, as Black, White, Brown and Browning, Ruddy, Readman, Hoare, Grey, etc.; nicknames from peculiarities of dress, Curtmantel, Shorthose, etc.; from social position, as Bastard, Lacklands and so on; from the animal and vegetable kingdoms, from birds and fishes. Then compounds were made by applying a sobriquet to a Christian name, as Micklejohn, Littlejohn, Brownjohn; if he was a comely, well-made fellow, he was Properjohn.

These names appear again in Norman guise, as Grosjean, Petitjean, Bonjean, from which comes Bunyan—so that when we speak of good John Bunyan we are (perhaps unconsciously) only translating the name of "the inspired tinker." See NATIONAL NICKNAMES. Consult Barber, 'British Family Names' (1894); Bardsley, 'Dictionary of English and Welsh Surnames' (1901); Innes, 'Concerning Some Scotch Surnames' (1860); Yonge, 'History of Christian Names' (1863).

**NAMOUNA**, nā-moo-nā', in Persian mythology, an ever young and beautiful enchantress, born long before any other created thing, yet still retaining all her youthful attractiveness. The idea probably originated in the observation of the changes of nature, the dying of vegetation and its renewal. The same conception has been held concerning the moon for the same reason. Among various American Indian tribes a very similar myth prevailed. The Navajos personified nature in their goddess Estsánatlehi, "the woman who rejuvenates herself." When she grows to be an old woman she becomes a young girl again. She is always changing but she never dies. She was the mother of the twin war gods by the sun. These sons destroyed the alien gods and bad spirits and aided the sick suffering from witchcraft. The power of her two sons over witchcraft would seem to connect Estsánatlehi with the moon and also with the sun of whom the moon is generally the wife.

**NAMUR**, nā'moor (Fr. nā-mūr'), Belgium; (1) a city, capital of the province of the same name, at the confluence of the Sambre and Meuse, 35 miles southeast of Brussels. The old fortifications have been razed since 1866 with the exception of the picturesque citadel dating from 1784, built upon steep rock, high above the confluence of the rivers. A cordon of five large and four small modern forts now defend the town. The town is beautifully situated and well built, with spacious streets and several handsome squares. Frequent sieges and bombardments destroyed almost all its ancient buildings. Among those of more recent times are the cathedral dedicated to Saint Aubin, one of the most handsome modern churches of Belgium; the church of Saint Loup, the church of Notre Dame, the Hôtel de Ville and the belfry tower. Namur is the seat of a bishop; it possesses a chamber of commerce, a royal atheneum, a public library, a museum, an agricultural society, normal and various other schools and numerous benevolent institutions. Namur is famous for its cutlery, its leather-works and its iron and brass foundries. The trade is greatly favored by the two navigable rivers. Steamers ply on the Meuse; and railways communicate with Brussels, Mons and the French frontier. Namur dates from the 7th century, under the names of Namucum, Navinucum Castrum and Namon. It was taken by Louis XIV in 1692, and retaken by William III of England in 1695. Pop. before the World War, about 33,000. The Germans occupied Namur on 23 Aug. 1914. (2) The province is bounded on the north by Brabant, northeast by Liège, east by Luxembourg, south and southwest by France and west by Hainaut; greatest length, north to south 57 miles; greatest breadth, 37 miles; area, 1,413 square miles. The surface

is greatly diversified, well watered by the Meuse, with its tributaries, the Lesse and the Sambre. About one-half of the whole surface is cultivated. The chief vegetable productions are the ordinary cereals, oil-seeds, chicory, fruit and medicinal and dye plants. In some places the vine is cultivated. The extensive forests furnish good timber and the prevailing carboniferous strata yield coal, iron, limestone, etc. The industry of the province, both manufacturing and commercial, is largely developed. Namur was an independent country as early as the 10th century. At the close of the 12th century it came into the possession of the counts of Hainaut, and early in the 13th century fell to Peter of Courtenay, emperor of Constantinople. It was sold by his son Baldwin to Guy of Dampierre, Count of Flanders, with whose descendants it remained till 1420, when it was purchased by Philip the Good, Duke of Burgundy, for 132,000 gold ducats, and afterward shared the fate of the other Burgundian states. Pop. before the war, about 365,000, nearly all of whom speak Walloon. See WAR, EUROPEAN.

**NAN-CHANG-FU**, China, the chief town of the province of Kiangsi, 176 miles southeast of Hankow, on the Kan-Kiang, near its entrance into the Po-yang. It is noted for its porcelain industries. Pop. 150,000.

**NANA**, a novel by Emile Zola, one of the Rougon-Macquart series, which appeared in 1880.

**NANA SAHIB**, nā'nā sā'hīb, Mahratta leader of the Sepoy Rebellion: b. near Cawnpore, 1825; d. Nepal, about 1859. His real name was Dhandu Panth, and he was the adopted son of the last Mahratta peshwa of Poona, whose great wealth he inherited, but whose annual pension of about \$400,000 was not continued to him by the British government. He lived as a native prince, moving in European society, and when the Sepoy mutiny broke out he secretly encouraged it, but openly offered aid to the English. He marched on Delhi at the head of native troops; promised the English a safe conduct from Cawnpore, but shot or drowned all of them but four; and before leaving the city killed all Europeans, women and children included, that he found in the city and threw their bodies into the famous well of Cawnpore. He fled to Nepal, was repeatedly defeated by the English, who ultimately drove him out of the English province, and was not heard of after 1859. Consult Landon, P., 'Under the Sun, Impressions of Indian Cities with a Chapter Dealing with the Later Life of Nana Sahib' (London 1906); Burgess, J., 'The Chronology of Modern India, 1494-1894' (Edinburgh 1913).

**NANAIMO**, na-ni'mō, Canada, a city of British Columbia, on Departure Bay, on the east coast of Vancouver Island, opposite Vancouver on the mainland, with which it has daily steamer service. Its harbor is deep and safe, though often closed by ice in winter. It is connected with Victoria, 73 miles from Victoria by the Esquimault and Nanaimo Railway. The coal mines at Nanaimo and in the vicinity produce more than 1,000,000 tons a year. It exports large quantities of coal, lumber and herring. It also has extensive freestone quarries, large saw-mills and is the centre of

a great fruit-growing district. It is the seat of a United States consular agent. Pop. 8,300.

**NĀNAK**, nā'nāk, **NĀNEK**, or **NĀNUK**, Hindu religious leader, founder of the sect of the Sikhs: b. Talwandy (now Nankana), in Lahore, 1496; d. Kirtipur, 1538. A member of the warrior caste, he early associated with Kabir, leader of a monotheistic sect, and came under other mystical influences. He traveled to all the holy places of India, made the pilgrimage to Mecca and Medina, and as a result of his studies of Brahmanism and Islam wrote the 'Adi-Granth,' which frequently quotes Kabir, and in general is a mixture of the Vedas and the Koran. This gospel he preached through India; it became the national religion of the Sikhs and was proclaimed by Nānak's successors from Labona down to Govind Singh, who died in 1708. The 'Adi-Granth' preaches the worship of one god, the equality of man, the duty of loving all men and the need for frequent ablution. See SIKHS.

**NANCRÈDE**, C(harles) B(eylard) Guerard de, American surgeon: b. Philadelphia, Pa., 30 Dec. 1847. He was educated at the University of Pennsylvania and at Jefferson Medical College; began practice in Philadelphia; and after 1889 was professor of surgery and clinical surgery and surgeon of the university hospital at the University of Michigan, retiring in 1913. In the Spanish-American War he served as surgeon at the front and in 1908-09 was president of the American Surgical Association. He is the author of 'Principles of Surgery' (1899; 1905); 'Essentials of Anatomy' and is a contributor to Wood's 'Handbook of the Medical Sciences' (1887); 'The International Encyclopædia of Surgery' (1881-95); 'Cyclopædia of the Diseases of Children' (1890); 'Cyclopædia of Diseases of Nose and Throat' (1893); 'Dennis' 'System of Surgery' (1895); 'American Practice of Surgery' (1908), etc.

**NANCY** (Fr. nōn-sē), France, the capital of ancient Lorraine, of the former department of Meurthe and since 1872 of the department of Meurthe-et-Moselle, situated in a fertile plain, near the left bank of the Meurthe, 218 miles east of Paris, on the railway to Strassburg. It is divided into the old and the new town, has extensive suburbs and is strongly defended by isolated "forts d'arrêt." The old town is irregularly built, with streets narrow and winding; but has several fine public buildings. The new town has straight and spacious streets, intersecting each other at right angles, and traversed by tramways; the houses, almost without exception, are handsome. The Place Stanislas, surrounded by several fine public buildings, and communicating, by a triumphal arch, with the Place Carrière, has a fine statue of Stanislas Leszczyński, king of Poland, who passed the latter years of his life here as Duke of Lorraine and bestowed upon the town many of its finest modern embellishments. There are statues also to General Drouot, Thiers and other notabilities. The Cours Léopold, occupying the highest part of the town, and finely planted, is the principal promenade; another is the Pépinière, a large planted area. Among the chief edifices are the cathedral, a modern structure in the Italian style; the church of Saint Epvre, with a lofty tower and a fine

portal, one of the finest specimens of modern Gothic in France; the church of the Cordeliers, built in 1484, and containing the tombs of several dukes of Lorraine; the 19th century churches of Saint Peter, Saint Vincent and Saint Leon; Hôtel de Ville (17th century); ducal palace, an elegant specimen of flamboyant Gothic, with a fine porch (16th century); public library; seven handsome gates or triumphal arches. Nancy is the see of a bishop and the headquarters of the 20th Army corps. At the head of its educational institutions is the celebrated university founded at Pont-à-Mousson in 1572 and removed to Nancy in 1768; it has faculties of law, philosophy, natural science, mathematics, medicine and a school of pharmacy; Nancy also has a lyceum, a botanical garden, a school of forestry, a theological seminary, etc. The manufactures consist of broadcloth and other woolen stuffs; cotton and cotton yarn, hosiery, lace, all kinds of embroidery, stained paper, tobacco, etc. There are also iron-works, dye-works, breweries and tanneries. In a battle fought under its walls, the Duke of Burgundy (Charles the Bold) was defeated and slain by René II, Duke of Lorraine, in 1477. On 12 Aug. 1870 it surrendered to the Germans, by whom it was occupied until 1 Aug. 1873. The population was largely increased by the influx of Alsatians after the annexation of Alsace to Germany. During the great European War, Nancy was a centre of great military activity. Under the personal command of Kaiser Wilhelm II, who arranged to make a triumphal entry in the ancient Lorraine capital, beginning 6 Jan. 1916 with a bombardment by 15-inch guns at a distance of 16 miles, the Germans unsuccessfully besieged the city for several days. (See WAR, EUROPEAN. Pop. about 120,000.)

**NANDUS**, a Brazilian name for the South American ostrich or rhea. See RHEA.

**NĀNEK**, or **NĀNUK**. See NANAK.

**NANINI**, nā-nē'nē, **Giovanni Maria**, Italian composer: b. Vallerano, Italy, about 1540; d. Rome, Italy, 11 March 1607. He studied music in Rome and opened there the first Italian public school of music. He was appointed Maestro di Cappella at Santa Maria Maggiore in 1571. In 1577 he became a member of the Pontifical Choir, and in 1604 maestro of the Sistine Chapel. His compositions are of great value; among them are 'Hodie nobis Cœlorum Rex'; 'Cento cinquanta sette Contrappunti e Canoni.' His manuscript works are preserved in the private collections of the Sistine Chapel and the Vatican Library. His published compositions take various forms: motets, madrigals, canzonets as well as Church music. They are of the Palestrina period. Consult Radiccotti, G., 'Giovanni Maria Nanini' (Pesaro 1906).

**NANKEEN**, or **NANKING CLOTH**, a sort of cotton cloth, which takes its name from the city of Nanking, where it was originally manufactured. It was formerly imported extensively from China, but has generally been superseded by other fabrics. It is now imitated in most other countries where cotton goods are woven. The English manufactures have now so completely driven the Chinese from the market that large quantities are shipped from that country to Canton.

**NANKING**, nān-king' (officially *Kiangning*, that is, Southern Capital), China, capital of the province of Kiangsu, and vice-regal headquarters for the three provinces of Kiangsu, Kiangsi and Ngan-hui, near the south bank of the Yang-tse-Kiang, 560 miles south by east of Peking. It is 18 miles in circumference and is surrounded by a wall 40 feet high. The principal streets are of moderate width, clean, well paved and lined with handsome stores; but the houses are, in general, mean, and only one story high. The part of the city occupied by the Manchus is separated by a wall from the Chinese town. There are extensive manufactures of fine satin and crape, and the cotton cloth which foreigners call nankeen derives its name from this city; paper and ink of fine quality, and beautiful artificial flowers of pith paper, are produced here. Nanking is celebrated also for its scholars and literary atmosphere, having many large libraries. Nanking was the capital of the Chinese Empire from 1368 to 1403, but when the seat of government was transferred to Peking it lost its importance and a great part of its population, while about a third of its area is now unoccupied. The only remarkable remains of royalty are the sepulchral Ming statues situated near the walls. The famous porcelain tower of nine stories and 260 feet in height, completed in 1432, was destroyed during the Taiping Rebellion. The city was held from the spring of 1853 to July 1864 by the Taipings, who made it their capital. At its capture by the rebels and recapture by the Imperialists it suffered severely. By the French treaty of 1858 Nanking was made a treaty port, but never attained any importance as such, owing to the vicinity of Chinkiang-fu. Pop. estimated at 300,000.

**NANNA**, nān'nā, in Scandinavian mythology, the wife of Balder and the goddess of immaculate purity. Her name means "Blossom" and she was the daughter of Nip, which means "Bud," and a goddess. In the myth of the 'Death of Balder the Beautiful,' his wife, Nanna, falls dead by the side of the corpse of her husband and is placed upon the bier with him that she may accompany her beloved even in death. When Hermod visited the land of the dead to gain the freedom of his brother, he found Nanna ministering to him as he lay sick and pale on a couch. Balder wished Hermod to take Nanna back with him; but she refused to leave her husband. Balder is the personification of life-giving light and his wife, Nanna, is the personification of vegetation which dies when the great light giver, the Sun, goes on his winter journey to the south. Balder is generally called the "radiant god of sunshine"; and his wife, like the classical Proserpine, goes down into the underworld.

**NANNACUS**, or **NANNAKOS**, according to a Greek legend, the king who predicted Deucalion's flood.

**NANNING**, China, city in the province Kwangsi on the Yu-Kiang River, the chief southern tributary of the Si-Kiang. It is surrounded by a strong wall and lies in a plain enclosed by hills. Before the Taiping revolution the place was of much greater importance but still has a considerable trade in opium and met-

als carried on with Canton, Yunnan, etc. It has a population estimated at about 40,000.

**NANSEN**, Fridtjof, frēt'yōf nän'sën, Norwegian Arctic explorer: b. Great Frøen, near Christiania, 10 Oct. 1861. He studied at Christiania University and in 1882 made an Arctic voyage in a sealing vessel in order to have opportunities of studying animal life in the higher latitudes. On his return he was appointed curator of the Bergen Natural History Museum. In 1888 he crossed Greenland from sea to sea a little north of latitude 64°, an account of this journey being published in England in 1890, under the title 'Across Greenland.' He returned in 1889 and was appointed curator of the Museum of Comparative Anatomy in Christiania University. In 1893 he sailed on board a specially built steamer (the *Fram*) in the expectation that, entering the Polar ice in the neighborhood of the New Siberian Islands, he would be drifted by a current over the Pole and would come out on the east side of Greenland. This expectation was based on the fact that articles belonging to the *Jeannette*, an Arctic expedition vessel lost in 1881, had drifted in about three years from Bering Strait across the Polar regions to Greenland. After being carried to lat. 83° 59', he left the *Fram* and crew, and with a single companion, Lieutenant Johansen, and with sledges, dogs and kayaks, took the ice. In this way he reached a higher latitude than any previously attained, 86° 14' (8 April 1895), and then turned southwestward to Franz Josef Land. There he spent the winter of 1895-96, and on 17 June 1896 fell in with members of the Jackson-Harmsworth expedition, with which he returned to Vardø. The *Fram*, under Captain Sverdrup, had reached lat. 85° 57', and had been for four months fast in the ice. Nansen was received everywhere with the greatest enthusiasm and medals and other honors were conferred upon him, including a professorship of zoology in Christiania University. In 1897 he published an account of his voyage, which appeared in English as 'Farthest North,' the most interesting of all narratives of Arctic travel. A translation of a work by him on 'Eskimo Life' was published in 1893. His further works include 'Northern Mists' (1911); and 'Through Siberia' (1914). He was strongly favorable to the separation of Norway from Sweden (on which he wrote a volume) and was Minister for Norway at London 1906-08. In 1906 the Grand Cross of the Victorian Order was conferred on him. On his return to Norway he became professor of oceanography at Christiania University. Consult Dolman, F., 'Dr. Nansen: the Man and His Work'; Brøgger, W. C., and Rolfsen, N., 'Fridtjof Nansen' (London 1861-92; trans. by Archer, ib. 1906).

**NANSEN**, Hans, Danish statesman: b. Flensburg, 28 Nov. 1598; d. Copenhagen, 12 Nov. 1667. He entered (1621) the service of the Danish Icelandic Company and made many trading voyages to Iceland. In 1644 he was made burgomaster of Copenhagen, and from 1658-60, during the storm and stress period, his city's trust in his abilities enabled him to obtain from Frederick III the anti-aristocratic reform of 1660. The resulting absolute monarchy is said to have been contrary to his wishes, but he retained his honors, going largely into commercial life and omitting poli-

tics. Consult Nielson, Oluf, 'Kjöbenhavn's Historie' (Vol. III, Copenhagen 1877).

**NANTERRE**, nän'tär, France, town in the department of Seine and arrondissement of Saint-Denis, located at the foot of Mount Valérien and on the West Railway, a few miles from Paris. Its chief industry is the manufacture of chemicals. This is the traditional birthplace of Saint Genevieve and the Revolution hero Henriot was born here. Pop. 21,350.

**NANTES**, nänts (Fr. nânt), France, capital of the department of Loire-Inférieure, and an important commercial port, on the right bank of the Loire, where it receives both the Erdre and the Sèvre, 248 miles by rail west-southwest of Paris. The Loire here forms a number of islands, two of which are among the finest quarters of the town, and are connected by several bridges. The situation, on an important navigable river, within 40 miles of the ocean, is advantageous for commerce and has been enhanced since 1891 by the construction of a ship-canal to Saint Nazaire, at the mouth of the Loire, and by considerable expenditure in harbor improvements since 1914. Nantes is so well placed and so regularly, and in some parts so splendidly built, that it justly ranks as one of the finest towns in France. It has a number of elegant squares; and its quays, which line the banks of the rivers, extend nearly five miles. The notable public edifices are the cathedral, in the flamboyant style, dating from the 15th century; the handsome modern church of Saint Nicholas in the Gothic style of the 13th century, with a tower 278 feet high; the celebrated ducal castle, an edifice of the 14th century, partly modernized in the 16th, flanked with massive round towers; the palace of justice or law courts, a large and handsome building; the Hôtel de Ville; the exchange, restored and enlarged in 1891; the museum of natural history; and the new museum (1897); the large picture gallery; public library of 102,000 volumes; chapter-house, and Hôtel Dieu or infirmary. Nantes is the see of a bishop; it has courts of first resort and commerce, a chamber of commerce and exchange, a college, diocesan seminary and secondary ecclesiastical school; a secondary school of medicine and a hydrographical school of the first class. The manufactures consist of blankets, serge, flannel, printed stuffs, canvas, ships' boilers and machinery, cordage, chemical products, glue, ship biscuits, etc.; there are also cotton mills, sugar refineries, iron works, glass works, bleach fields. Sardines and preserved meats are important articles among its industrial products. The ship-building docks are of great extent. Nantes carries on a large foreign trade, vessels of 1,700 tons being able to reach the town. The trade includes a variety of articles both for the home, the colonial and the foreign markets. Before the conquest of Gaul by the Romans, Nantes was the capital of the Nannetes. In 1445 it valiantly withstood a siege of 60 days by the Huns. During the 9th century it was thrice taken by the Normans and almost entirely ruined. In 1118, when it had again become prosperous, an accidental fire reduced the greater part of it to ashes. During the English wars in France it suffered much, repeatedly falling into the hands of opposite parties. For a long time it formed one of the most valuable

possessions of the dukes of Brittany, but in 1499 the heiress of the dukedom, Anne of Brittany, who was born here, having married Louis XII, it passed with the rest of her possessions to the Crown of France. The most memorable event connected with the history of Nantes is the famous edict (see EDICT OF NANTES) issued by Henry IV, 30 April 1598, securing the Protestants in the free exercise of their religion, and making them eligible to all civil and military employments. This edict was revoked by Louis XIV in 1685. The *noyades* or drownings of the monster Carrier during the Revolution were perpetrated here. (See CARRIER). Pop. about 171,000.

**NANTES, Edict of.** See EDICT OF NANTES.

**NANTEUIL, Robert,** nān'té'y, French copperplate engraver: b. Rheims, 1630; d. Paris, 1678. His father-in-law, Nicolas Regnesson, was his first instructor and in 1647 he went to Paris and worked under the eye of Philippe de Champagne (q.v.). Louis XIV appointed him designer and engraver to the king. He employed in his work a simple line which grew gradually thicker at the shade point and died away toward the high light in faint and fainter stipple points; in this way he produced the fine color values which characterize his engravings. In his portraits, of which about 200 exist, he exhibits powerful modeling and life-like drawing. They include portraits of Louis XIV, Anne of Austria, Madame de Sévigné and other renowned persons. Some of these latter works are after the paintings of Lebrun, Du Chastel and others. He also executed some excellent pastels. Consult Loriquet, 'Robert Nanteuil' (1886); Metcalfe, 'Prints and Their Makers' (New York 1912).

**NANTICOKE,** nān'ti-kōk (Nentigo, "tide-water people"), a former American Indian tribe of the Algonquian family residing, when first discovered by the whites, on the east shore of the Nanticoke River, where according to Smith their principal village, also called Nanticoke, was situated in 1608. Their language was very closely related to that of the Delaware. They were great fishers, trappers and hunters and according to tradition they had, at an earlier period in their history, gone southward in search of game, when their old hunting grounds had become too densely populated for a nomadic race. Tradition also says that a league existed between the Nanticoke and other tribes covering a large extent of territory, for many generations. Already in 1642 the Nanticoke had been declared enemies of the Maryland colony; but in 1678 a treaty was made with them; and 20 years later reservations were set apart for them. About 1725 they began to move northward gradually, going up the Susquehanna and finally settling at Oswego, Chenango and Chugnut in the State of New York. A part of the tribe, however, under the name of Wiwash, remained behind in Maryland. Some of those in New York State amalgamated with the Iroquois; but most of them, feeling the pressure of civilization, went west into Ohio and Indiana and there joined the Delawares about 1784.

Among all the neighboring tribes the Nanticoke Indians had the reputation of being great magicians; and they were greatly feared on this account. A head chief ruled over all the vil-

lages, thus binding together the interests of the tribe or tribes composing the Nanticoke people. Apparently this chief was sometimes a woman. They fortified their towns against the enemy. In the "Nanticoke Confederacy" were included the Nanticoke proper, Arseek, Cuscarawao, Nause and Sarapinagh and perhaps Ozinies and other sub-tribes. In southern Delaware there are still numerous half-breed Nanticoke.

**NANTICOKE,** Pa., borough in Luzerne County, on the Susquehanna River and on the Delaware, Lackawanna and Western, the Central of New Jersey and the Pennsylvania railroads, about 80 miles north by east of Harrisburg. The town of Nanticoke was surveyed, plotted and streets laid out in 1793. It is situated in an anthracite coal region in Hanover and Newport township, and has extensive water power which is utilized in manufacturing. The industry contributing most to the wealth of the town is coal mining. This is the greatest coal deposit and the richest mining district in the world. The chief manufacturing establishments of the city are mining and agricultural implement works, large hosiery mills, knitting factories, canning factory, flour and grist mills, lumber mills, silk mills and cigar factories. It has considerable trade in coal and its own manufactures. There is an excellent school system with 12 modern school buildings. The government is administered under the original charter which provides for a burgess, who holds office three years, and a council. Pop. 23,000.

**NANTUCKET,** Mass., town, county-seat of Nantucket County, embracing the islands of Nantucket, Tuckermuck and Muskeget. It is about 25 miles from the mainland of the State and 100 miles southeast of Boston. On the north is Nantucket Sound, on the east and south the Atlantic Ocean and on the west Muskeget Channel, which separates it from Martha's Vineyard. The main island, Nantucket, is about 15 miles long, and averages about two miles in width. The area of the whole town is about 60 square miles. The most populous part of the town is along the north shore of the largest island. There are several villages in the town; the largest, Nantucket, on Nantucket harbor, was founded in 1673. The first settlement was made in 1659 by a colony in charge of Thomas Macy, at the place called Madeget. Nantucket is a famous summer resort; the island is dotted with handsome summer villas. The residents claim that the climate is antagonistic to asthma, hay fever and malaria. At one time Nantucket was the headquarters of a great whaling industry, but the chief industries of the present are agriculture and fishing. A flourishing coastwise trade is carried on by a number of the islanders. Muskeget Park is one of the attractions. The town has a public library (the Athenæum), and the Coffin High School. At the "town meeting" the administrative officials are annually elected. Pop. 2,962. Consult Hinchman, 'Early Settlers of Nantucket'; Worth, H. B., 'Nantucket Lands and Land-owners' (Nantucket 1901-10); Duglas-Lithgow, 'Nantucket' (New York 1914).

**NANTYGLO** (nān'ti-glō) **AND BLAINA,** blā'na, England, town in Monmouthshire near

**Abergavenny.** Its importance lies in its large coal-mining and iron industry. Pop. 15,395.

**NAON**, nā-ōn', Rómulo S., Argentine diplomat: b. Buenos Aires, 17 Feb. 1875. He studied at the University of Buenos Aires and later became professor of philosophy at the Colegio Nacional de Buenos Aires, then professor of constitutional law and member of the directive council faculty of law and social sciences. He entered political life (1902) as representative of the National Congress and was re-elected (1906), becoming Minister of Justice and Public Instruction (1908). He was (1911-14) Envoy Extraordinary and Minister Plenipotentiary to the United States and in the latter year became the first Ambassador of Argentina to the United States. He was re-elected (1912) to the National Congress but resigned to remain with the United States. In 1917 he resigned his office because his country's government refused to declare war against Germany. He served as general secretary of the Argentina delegation to the second Hague Peace Conference, was a member of the A. B. C. (Argentine-Brazil-Chile) Peace Conference (1914) at Niagara Falls, to avoid war between the United States and Mexico, a delegate at the Pan-American Conference (1915). For his valuable services he has received numerous decorations. He has written several works on political science and constitutional law, and has received, among other diplomas, that of LL.D. from the universities of Pittsburgh, Yale, Harvard and Brown.

**NAOROJI**, now rō-jē, Dadabhai, first Indian member of the British Parliament: b. Bombay, 4 Sept. 1825; d. 2 July 1917. The son of a Parsi priest, he was educated in the Bombay school, later the Elphinstone School and College, where he was the first native professor of mathematics and natural philosophy (1854). In 1855 he went to England, where he afterwards, for the most part, resided. In 1867 he assisted in founding the East India Association; through his efforts in 1870 the civil service was opened to native Indians; and he accomplished much for the improvement of Indian finance and industries. He became Prime Minister to the Prince of Baroda in 1874; from 1875 to 1887 he held important municipal and legislative positions; and in 1886 and 1893 was president of the Indian National Congress. For many years he was president of the London Indian Society. From 1892 to 1895, as a Liberal, he represented Central Finsbury in the House of Commons, and in the latter year was made a member of the royal commission formed to inquire into Indian expenditure, etc. He published 'England's Duties to India' (1867); 'The Wants and Means of India' (1870); articles collected in 1887; 'Poverty and Un-British Rule in India' (1901), and 'The Rights of Labour' (1906).

**NAPA**, nā'pā, Cal., city, county-seat of Napa County, on the Napa River and on the Southern Pacific Railroad. It is in an agricultural region in which large quantities of fruit are raised, and in the vicinity is an extensive deposit of cement rock. It was settled in 1847 and in 1863 was incorporated. The city has excellent transportation facilities as the Napa River is navigable, thus making direct water

communication with San Francisco and other cities. The chief manufactures are gloves, leather and shoes. There is a large trade in fruit, Portland cement (made at Napa Junction), and the manufactures of the city. The scenery around Napa is beautiful; some of the attractions are the petrified forests, the mineral springs and the Napa Redwoods. It has the State Hospital for the Insane. Pop. 7,000.

**NAPANEE**, Canada, a port of entry and the county-seat of the united counties of Lennox, Addington and Ontario, 24 miles west of Kingston, on the Bay of Quinté, about seven miles from the mouth of the Napanee River. It is the terminus of the Quinté and Napanee Railroad and is on the Grand Trunk and Canadian Northern railroads. It has flour-mills, factories, brick and tile works, motor boat and carriage works, and is the centre of a rich agricultural district. Pop. 2,807.

**NAPERVILLE**, na'pér-vīl, Ill., city in Du Page County, on the Du Page River and on the Chicago, Burlington and Quincy Railroad, about 28 miles west of Chicago. It was settled in 1830 and in 1857 was incorporated. It is in an agricultural region. It is chiefly a residential city, the seat of the Northwestern College, established in 1861 under the auspices of the Evangelical Association. It has good public and parochial schools, the Nichols Library, a theological seminary, Y. M. C. A. building, the Edward Tubercular Sanatorium, Saint Procopius Bohemian College, a convent and orphanage. The city's manufactures include couches and davenport, flynetting, gloves, ice, butter, ice-cream, etc. There are two large nurseries also in the city, which is under the commission form of government. Pop. 3,449.

**NAPHTALI**, nā'f'ta-lī (Hebrew, "wrestler"), the seventh son of Jacob by Bilhah, Rachel's maid, one of the 12 patriarchs and eponymous founder of one of the 12 tribes of Israel. The territory of Naphtali lay to the northwest of the Sea of Galilee; of this tribe was Barak, the hero and deliverer of Israel in the days when Deborah, the wife of Lapidoth, judged Israel. This frontier tribe was exposed to the incursions of the adjoining heathen, and is specially mentioned in the Song of Deborah as among those who "jeopardized their lives under the death" in the battle against Jabin the Canaanite king. Tiglathpileser when he overran the north of Palestine carried off the whole population to Assyria, after which Naphtali disappears from history. The district became famous under the name of Galilee as the home of Jesus Christ and most of his apostles. Capernaum, Tiberias, Magdala and Chorazin lay within the ancient boundaries of the tribe of Naphtali.

**NAPHTHA**, in the commercial sense a product of the fractionation of crude petroleum, obtained by the redistillation of benzine, being the heavier constituent after the benzoline has distilled over. It is also called "mineral naphtha." Another commercial article is "solvent naphtha," a somewhat similar liquid obtained in the fractionation of coal-tar, distilling over between the temperatures of 250° and 330° F. In the chemistry of the ancients the term included all inflammable liquids, especially the more fluid sorts of asphalt or bitumen; the word which is of Persian origin and signifies "moist" being

first used of the Persian product and then applied more generally. In modern usage and among chemists the term is applied to any volatile inflammable liquid product of organic decomposition, as the distillation products from peat, wood, india-rubber, bones, etc. These vary in density from 0.67 to 0.72, and in gravity from 90° to 60° Beaumé. American petroleum naphtha constitutes from 6 to 20 per cent of the crude petroleum. Russian petroleum is only 5 or 6 per cent naphtha. Scotland produces a naphtha called shale-spirit, being 4 or 5 per cent of the crude shale oil, and rather heavier than most other naphthas, but not so heavy as the coal-tar naphthas, which vary in specific gravity between .850 and .950. Caoutchine is another name for india-rubber naphtha. The uses of naphtha are various, the lighter grades being utilized as detergents in the cleansing processes preparatory to dyeing, and in the dry cleaning of clothes and gloves. The coal-tar naphthas are largely employed as solvents in making india-rubber goods. The Scotch shale-spirit is the liquid component of a wood preservative. Naphtha is also used very largely as a solvent in the extraction of oils from oil seeds, and of essential oils in the manufacture of perfumes and essences.

**NAPHTHA-POISONING.** While the vapors, and even the ingestion of naphtha in small quantities, have not been found poisonous to human beings, the fumes resulting from the burning of naphtha are deadly if in admixture with the air in a confined place. This poisoning effect is due to the large proportion of carbon monoxide—about 7 per cent—contained in the residual gases. A proportion of one-tenth of 1 per cent in the air renders it dangerous to the majority of persons. A considerable number of fatal accidents have been caused by breathing the exhaust gases from a gasoline-burning automobile in the restricted space of a small garage. See PETROLEUM-POISONING.

**NAPHTHALENE, or NAPHTHALIN,** a coal-tar product consisting of carbon and hydrogen, with the chemical composition  $C_{10}H_8$  and a certain chemical similarity to benzene.

Its peculiar chemical composition may be represented by the graphic formula known as the condensed benzene rings, as below. These are generally written without the letter symbols, as at b.

Naphthalene is prepared from the middle or "carbolic" oil obtained in the distillation of coal-

tar between the boiling point temperatures of 410° and 460° F. The naphthalene crystallizes out on cooling, is then centrifugalized, pressed, warmed, stirred with caustic soda and, after the addition of sulphuric acid and several washings with hot water, is either sublimated or distilled. Physically, naphthalene is a white solid, with brilliant, leafy crystals, melting at 175° F. to a colorless liquid, which boils at 425° F. It burns with a sooty flame and pitchy odor. It is insoluble in cold water, slightly soluble in water at a higher temperature and easily soluble in the essences, in boiling alcohol or in ether. Naphthalene forms a multitude of various compounds, mostly by simple addition; the most important are the various sulphonic acids, such as  $C_{10}H_7SO_3H + H_2O$ , used in the manufacture of dyes. The nitro-derivatives of naphthalene are also extensively used as intermediates in dye-making. Under the popular name of "moth balls" or "coal-tar camphor," naphthalene is used to keep moths and other insects from clothes. It vaporizes slowly with no residue, and is useful to some extent as a disinfectant and deodorizer. Consult Tinkler, C. K., and Challenger, F., 'The Chemistry of Petroleum and Its Substitutes,' (New York 1915).

**NAPHTHOL,** in chemistry, a substance derived from naphthalene in the same way that phenol is derived from benzene.—that is, by replacing one of the hydrogen atoms of the

hydrocarbon by a molecule of hydroxyl, OH. Its chemical name is hydroxynaphthalene. The empirical formula for naphthalene being  $C_{10}H_8$ , the corresponding formula for naphthol therefore is  $C_{10}H_7.OH$ . In benzene the substitution can be made in only one way, because the molecule of that substance is chemically symmetrical, its hydrogen atoms being all similarly related to one another, and to the carbon atoms. In naphthalene, however, two essentially different kinds of substitution are possible, according to the position of the hydrogen atom that is replaced. This will be understood by reference to the structural formula of naphthalene, as presented herewith. The hydrogen atoms in the positions marked "a" are more directly associated with the central pair of carbon atoms than are those in the positions marked "b"; and we must therefore admit that two chemically different naphthols are possible, according as the hydrogen that is replaced by hydroxyl is an "a" atom or a "b" atom. These two naphthols are in fact known, and to distinguish them from each other the prefixes

“alpha” and “beta” are attached to the name. Thus “alpha-naphthol” is the compound obtained by replacing one of the “a” hydrogen atoms by OH, and “beta-naphthol” is the compound obtained by a similar replacement of a “b” atom. Both of the naphthols resemble ordinary phenol (or carbolic acid), and both are used as antiseptics and also in the preparation of certain of the coal-tar colors. The naphthols exist in coal-tar in very small quantities in the fractions made at a high boiling point and may also be prepared by the action of fuming sulphuric acid upon naphthalene, followed by treatment with sodium hydroxide. In the making of a naphthol the sulphuric acid treatment is conducted at a temperature ranging from 175° to 190° F. For B-naphthol the temperature is kept at 390° F. Alpha-naphthol crystallizes in short lustrous monoclinic needles, which melt at 201° F. and boil at 543° F. Beta-naphthol crystallizes in flat plates or tablets, melts at 253° F. and boils at 547° F. Both are slightly soluble in hot water, and both dissolve freely in alcohol, ether and benzene. The solution of A-naphthol in water has a violet color; that of B-naphthol a yellow color. The naphthol derivatives of most value in the arts are their sulphonic acids, and di-sulphonic acids, and the tri-sulphonic acid of A-naphthol, and chromotrope acid or chromogen; all used in the production of coal-tar dyes.

**NAPHTHYL**, a hydrocarbon radical  $C_{10}H_7$ , occurring in the compounds and derivatives of naphthalene. It is a merely hypothetical group as it appears only in compounds. If its existence be assumed, naphthalene ( $C_{10}H_8$ , or  $C_{10}H_7.H$ ) is merely its hydride; naphthol or naphthyl alcohol in the same way might be considered a hydrate of naphthyl, since its formula may be written  $C_{10}H_7.OH$ . Dinaphthyl ( $C_{20}H_{14}$ ) is a carbide formed by the action of heat upon naphthalene; it is a solid and is fusible at 154° C.

**NAPIER**, nā'pī-ēr, SIR Charles, British naval commander, cousin of Sir Charles James and Sir William Napier (q.v.): b. Merchiston Hall, Stirlingshire, 6 March 1786; d. Merchiston Hall, Hampshire, 6 Nov. 1860. At 13 he entered the navy as a volunteer and in 1805 was promoted lieutenant. In 1807 he became commander, and from the gallantry he displayed in the pursuit of three French line-of-battle ships in 1809 was shortly after made post-captain. He was then put on halfpay and joined the British army in Portugal where he took part in the battle of Busaco. In 1814 he was dispatched to the United States, and led an expedition against Baltimore. In 1827 he received the command of the *Galatea*, in which he was employed on the coast of Portugal and the Azores. Becoming acquainted with the Duke of Terceira and other Constitutionalists, he accepted the command of their fleet, and by his defeat of the Miguelites in a naval engagement effected the relief of Oporto and the establishment of Donna Maria on the throne. For his services the Portuguese government created him Count Cape Saint Vincent and nominated him admiral-in-chief. He soon returned to England and in 1839 was ordered to the Mediterranean, where, upon the outbreak of the war between Mehemet Ali and the Porte,

and the co-operation of Britain with Russia and Austria on behalf of the latter power, he performed some of his most gallant exploits, including the storming of Sidon and the capture of Acre. Having blockaded Alexandria, he concluded on his own responsibility a convention with Mehemet Ali, by which the latter and his family were guaranteed in the hereditary sovereignty of Egypt on resigning all claim to Syria. In 1841 he was elected member of Parliament for Marylebone, and proved himself a warm advocate of liberal measures and naval reform. In 1847, while in command of the Channel fleet, he compelled the emperor of Morocco to grant compensation for the injuries inflicted by him on British commerce. On the commencement of the Crimean War he was nominated to the command of the Baltic fleet, but in this capacity had few opportunities for striking a decisive blow, which at the time somewhat disappointed his country. Sir Charles Napier was an author as well as a commander and published ‘The War in Portugal’ (1836); ‘The War in Syria’ (1842); ‘The Navy, its Past and Present State’ (1851). Consult Elers Napier, ‘Life and Correspondence of Admiral Sir Charles Napier’ (1862); Williams, H. N., ‘The Life and Letters of Admiral Sir Charles Napier, K.C.B.’ (London 1918).

**NAPIER**, SIR Charles James, English soldier and administrator: b. London, 10 Aug. 1782; d. Oaklands, near Portsmouth, Hampshire, 29 Aug. 1853. He entered the army as ensign in his 12th year and within four months was gazetted lieutenant. Having become captain in 1803, he accompanied his regiment to the Peninsula and distinguished himself at Coruña, where he had the rank of major, and where, after receiving five wounds, he was taken prisoner. In 1810 he returned to the Peninsula and fought at Busaco. After obtaining the rank of colonel and taking part in most of the leading events of the Peninsular campaigns, he returned to England on the conclusion of peace. He was in the United States during the War of 1812, and after his return took part in the storming of Cambrai in 1815. From 1822 to 1830 he was governor of the island of Cephalonia, where he pleased the inhabitants better than the authorities at home. In 1841 he sailed for the East to assume the chief military command within the presidency of Bombay. He was shortly afterward called to Sind in consequence of the determination of Lord Ellenborough, then governor-general, to punish the ameer for alleged misconduct during the Afghan war. This policy was ably carried out by Napier, first by the splendid victories of Meanee (17 Feb. 1843) and Hyderabad (24 March) and afterward by the administration of Sind as a conquered province, of which Lord Ellenborough made him governor. He retired in 1841, but during the Sikh war of 1848-49 he sailed once more for the East as commander-in-chief of all the forces in India. Having taken a step which subjected him to an unceremonious rebuke from the Marquis of Dalhousie, the governor-general, he resigned and returned to England the next year. Consult Bruce, ‘Life of General Sir Charles Napier’ (1885); Butler, ‘Sir Charles Napier’ (1890).

**NAPIER, John**, Scottish mathematician: b. Merchiston, near Edinburgh, 1550; d. there, 4 April 1617. He was educated at Saint Andrews, traveled in Europe, returned to a life of proprietorship and leisurely study, and published in 1593 his 'Plaine Discovery of the Whole Revelation of Saint John,' which was an original work, without a predecessor in its line. For a time he busied himself with devising instruments of war, such as burning-glasses for firing hostile vessels; a piece of artillery for destroying everything round the arc of a circle; and a round metal chariot, from which shot might be fired through small openings while the enemy became "abased and altogether uncertain." Sir Thomas Urquhart ('The Jewel,' 1652) says that the artillery was tried on a Scottish plain with the slaughter of many sheep and cattle. His great work, 'Mirifici Logarithmorum Canonis Descriptio,' appeared in 1614. This explained the nature of logarithms (q.v.), then styled "artificial numbers," and supplied the table for their application. It astonished Europe and deeply interested Kepler, who helped to extend the use of logarithms. With Henry Briggs, Napier devised the new canon in which 0 represented the logarithm of unity and 10,000,000,000 that of the entire sine. His 'Mirifici Logarithmorum Canonis Constructio' (1619) explained the method of constructing the table; and the 'Rabdologia' (1617) was a description of enumeration by bone or ivory rods, which, known as "Napier's rods," were widely employed in Europe for assistance in multiplication, division and the extraction of the square and cube root. Consult Napier, Mark, 'Memoirs' (1834).

**NAPIER, Robert Cornelis**, LORD NAPIER OF MAGDALA, English soldier: b. Ceylon, 6 Dec. 1810; d. London, 14 Jan. 1890. Educated at the Military College, Addiscombe, he entered the Bengal Engineers, and during the second Sikh war (1848) was present as chief engineer at the siege of Multan, and after its fall took part in the battle of Gujarat. When the Mutiny broke out in 1857 he was appointed chief of the staff to Sir James Outram, and in the second relief of Lucknow he constructed the engineering works which enabled Sir Colin Campbell to capture the city. In the Chinese campaign of 1860 he was second in command, and in 1865 became commander-in-chief of the Bombay army. He commanded in 1868 the expeditionary force against King Theodore of Abyssinia, defeated the king's forces, released the English prisoners and stormed the mountain fortress of Magdala (April 1868). For his services in this short but brilliant campaign he was rewarded with a peerage and a pension. Subsequently he was appointed commander-in-chief in India (1870), governor of Gibraltar (1876) and constable of the Tower (1887). At his death he was buried in Saint Paul's with military honors. Consult Markham, 'History of the Abyssinian Expedition' (1869), and Escott, 'Pillars of the Empire' (1879).

**NAPIER, Sir William Francis Patrick**, British soldier and author, brother of Sir Charles James Napier (q.v.): b. Kildare, Ireland, 17 Dec. 1785; d. Scinde House, Clapham, Surrey, 12 Feb. 1860. At 14 he entered the army with his brothers Charles and George,

took a distinguished part in the Peninsular campaigns, receiving seven decorations for the share borne by him in as many principal actions, including Busaco, Salamanca, the Nivelle and Orthez. Some years later he began his celebrated 'History of the Peninsular War' (6 vols., 1828-40). It furnishes the best and most interesting record existing of the momentous transactions which it chronicles, though from its opposition to the prevailing politics of the day its merits were at first insufficiently appreciated. In 1841 he was advanced to the rank of major-general, was appointed lieutenant-governor of Guernsey the following year and in 1848 created a K.C.B. Criticisms on his brother's proceedings in India called him forth as his champion, and produced successively the 'Conquest of Scinde' (1845); 'History of Sir Charles Napier's Administration of Scinde' (1851); and 'Life and Opinions of the Late Sir Charles Napier' (1857). He also wrote 'English Battles and Sieges in the Peninsula.' Consult 'Life' by Lord Aberdare (1864).

**NAPIER OF MAGDALA.** See NAPIER, ROBERT CORNELIS.

**NAPIER.** The chief town and port of the district of Hawke's Hill, east coast of North Island, New Zealand. It is the centre of a large district of squatters and is rather wealthy for its size. Being a peninsula, it has excellent harbors. Its bay ranks with that of Naples for picturesqueness. The exports are wool and frozen meats. The town has freezing plants and a number of other prosperous industries. Its exports were recently valued at £1,532,422; the imports at £467,837. Napier is a famous winter resort.

**NAPIER'S RODS**, in *mathematics*, a set of rods contrived by John Napier in 1617 for the purpose of facilitating the numerical operations of multiplication and division.

**NAPLES**, nā'plz, Italy, the capital of the province of Naples, and previously of the former kingdom of the Two Sicilies (q.v.), the largest city and most important seaport of the kingdom, situated on the celebrated Bay of Naples, 150 miles by rail southeast of Rome. Its site is of singular beauty, occupying an area about five miles long and three miles broad, on the north side of the nearly semi-circular bay, partly along the shore and partly climbing the adjacent slopes. It is bounded on the one side by the picturesque heights of Posilipo and on the other by the lofty, volcanic mass of Vesuvius (q.v.). The environs are densely peopled, among neighboring towns and villages being Portici, Resina, Castellamare, Casoria, Pozzuoli, etc., and the classic sites of Herculaneum and Pompeii (qq.v.), all connected by rail. The bay, 20 miles wide, and extending inward 10 miles, with a coast line of about 35 miles, has Cape Miseno as its northwest extremity, off which lie the islets of Procida and Ischia; Campanella Point forms the southeast extremity, with the beautiful isle of Capri lying beyond. The city is divided into two unequal parts by a steep ridge projecting from the height on which stands the castle of Saint Elmo, and terminated by a rocky islet surmounted by the Castello dell' Ovo. The largest and most ancient part of Naples lies to the east of these heights. This now forms the business quarter

and is intersected from north to south by the main street, the Via di Roma. The western and more modern part of the city, the fashionable quarter, has a superior situation, and commands magnificent views; the chief street in this quarter is the Corso Vittorio Emanuele, nearly three miles long. The streets are mostly well paved with lava or volcanic basalt, and the houses are large, lofty and solidly built, and have flat roofs. Since the cholera epidemic of 1884 a plan of municipal improvement on an extensive scale has been carried out, including a new water supply, a modern sewerage system, the destruction of the narrow streets, alleys and lanes, the former abodes of filth, misery, vice and crime, and the building of new quarters, with wide thoroughfares and modern houses. There are few remains of ancient times, but there are five castles, dell' Ovo, Nuovo del Carmine, Capuano, Saint Elmo, the gates Porta del Carmine and Capuano, all of mediæval construction, and Virgil's tomb.

Among the chief public edifices is the cathedral, dating from 1272, a large Gothic building erected on the site of two temples dedicated to Neptune and Apollo. It is held in high veneration in consequence of possessing the relics of Saint Januarius or Gennaro, including the phial of his blood which liquefies periodically in a miraculous manner. Other edifices are the church De' Santi Apostoli, said to have been originally founded by Constantine the Great on the site of a temple of Mercury; the church of Saint Paul, built in 1817-31 in imitation of the Pantheon at Rome; the Palazzo Reale (Royal Palace), a building of great size in the lower part of the town; the palace of Capo di Monte, situated on a height in the outskirts; the old palace, where the courts of justice now hold their sittings; the Galleria Umberto I; the Palazzo dei Pubblici Studi, formerly occupied by the university, but now converted into the Museo Nazionale, a museum containing not only a valuable library of over 600,000 volumes and pamphlets and many rare manuscripts, but also the older and more recent collections belonging to the Crown, the Farnese collection of paintings and sculpture from Rome and Parma, and an unequalled collection of gems, bronzes, vases, etc., chiefly obtained from the excavations of Pompeii and Herculaneum. Naples has a university, dating from 1224, and attended by over 5,000 students; many other educational institutions, including the celebrated zoological station with marine aquarium and laboratory, and numerous hospitals and charitable foundations. It is the see of an archbishop and an important naval and military station, with an arsenal and gun works. The manufactures include steel and engine works, woollens and cottons, silk known as *gros de Naples*, glass, china, soap, chemicals and macaroni, their products being largely exported, other exports being gloves, perfumery, artificial flowers, paper, olive oil, wines and fruits. The imports include manufactured goods, Colonial produce, iron, coal and cotton yarns. The harbor affords magnificent anchorage, the depth at the end of the mole being 65 feet and at the arsenal 26 feet. In 1915 8,913 ships entered; total tonnage, 7,603,106 tons. Naples is an important port for transatlantic emigrants.

Naples is one of the most densely populated cities of Europe, and one of the features

of the city is its unique population, which swarms incessantly in the thoroughfares, where throngs of sellers, buyers and idlers intermingle with asses, mules, hand carts and vehicles, dazzling the eye with their brilliant variety of costume, and the expressiveness of their frantic gestures and attitudes, while the ear is stunned by the shrill cries of the itinerant dealers, the songs of the improvisatore and the high-pitched patois of the seething crowds. The Marinella, an open beach fronting the east part of the city, was formerly the abode of the *lazzaroni*, a class which has now lost its distinctive features, the term being now generally applied to the fishermen.

Naples was founded by a Greek colony from the town of Cumæ many centuries before Christ. It took the name of Neapolis ("New City") to distinguish it from a still older Greek city adjoining called Parthenope. It passed to the Romans in 290 B.C. In 536 A.D. it was taken by Belisarius, and was pillaged by Totila in 542. In 1130 the Norman Robert Guiscard united the south of Italy and the adjacent island of Sicily into one political unity, Naples being recognized as the metropolis. It was afterward successively under the sway of the emperors of Germany and the kings of France and Spain. Under the latter it became the capital of an independent kingdom, but having been brought within the vortex of the French Revolution, was handed over by Napoleon, first to his brother Joseph, and then to his brother-in-law Murat. The Congress of Vienna having restored the legitimate sovereignty, Naples received back its former masters. After a long period of misrule they were ejected by Garibaldi in 1860, and Naples was then incorporated into the kingdom of Italy. Pop. 697,917

The province of Naples covers an area of 351 square miles; pop. 1,360,324.

**NAPLES YELLOW**, or **NEAPOLITAN YELLOW**, a permanent orange-yellow pigment much used in oil painting and in glass and porcelain painting. It is essentially an antimonate of lead with an excess of lead oxide. It is prepared by fusing at a moderate heat, for two hours, a mixture of chemically pure tartar emetic, lead nitrate and sodium-chloride. When cooled the common salt dissolves, leaving a fine yellow powder.

**NAPO**, nā'pō, Ecuador, an affluent of the Amazon, which rises on the north side of Cotopaxi, and after a southeasterly course of about 800 miles, forming for a considerable distance the boundary between Colombia and Ecuador, joins the Amazon just beyond the eastern boundary, at Corocha, Peru. It is navigable nearly 500 miles for steamers; it flows through a region rich in mineral and vegetable wealth, but comparatively destitute of inhabitants.

**NAPOLEON I**, emperor of the French: b. Ajaccio, Corsica, 15 Aug. 1769; d. Longwood, Saint Helena, 5 May 1821. He was descended from the Italian family of Bonaparte (q.v.), of which the Corsican branch through him became the historic representative. Napoleon Bonaparte was the son of Charles Bonaparte, an advocate of some repute, and of Letitia Ramolino, whose family were Florentines. Of 13 children born to them, he was the fourth, and was the second son. At 10 he was sent to the military school of Brienne, where he remained till 1784,

His school companions regarded him as taciturn and morose; but as he was a Corsican, speaking very little French, and poor as well as proud, his conduct is doubtless to be ascribed as much to his circumstances as to his temperament. Toward those who, like Bourrienne, showed him sympathy, he was susceptible of strong and lasting attachments. From the annual report of the school it appears that he "distinguished himself in mathematics, was tolerably versed in history and geography, weak in Latin, general literature, and other accomplishments; of regular habits, well behaved and studious, and enjoying excellent health." His favorite author was Plutarch. In October 1784 he repaired to the military school at Paris to complete his studies for the army; and in September 1785 received his commission as second lieutenant in the artillery regiment of La Fère. Soon afterward he was promoted to be first lieutenant in the regiment of Grenoble, then stationed at Valence. While here he devoted some attention to literature, gaining a prize offered by the Lyons Academy. He had the intention of describing an excursion he made to Mont Cenis in the style of Sterne's 'Sentimental Journey,' then much in favor on the Continent; but a much more suitable task was a 'History of Corsica,' which he began and communicated to Paoli, then living in exile in London.

Meantime the Revolution was rapidly developing. Many of Napoleon's fellow-officers at Valence openly took part with the Royalists, but he chose the popular side, though in a quiet and undemonstrative way as he had little liking for the turbulence of mobs. On 6 Feb. 1792 he became captain of artillery by seniority and, being in Paris the same year, he witnessed the insurrections of 20 June and 10 August. He was accompanied by his friend and biographer, Bourrienne (q.v.), who relates that on one of these occasions, when Napoleon saw the mob break into the Tuileries and force the king to don the red cap, he exclaimed, "It is all over with that poor man! A few discharges of grape would have sent all those despicable wretches fleeing!" Soon after he left for Corsica, where Paoli then held the chief command. The excesses of the Septembrists and Terrorists, however, induced Paoli to break with the Convention and seek the assistance of England. This brought him into conflict with Napoleon, who adhered to the Convention, which so exasperated the Corsicans against him that after a few skirmishes he was driven from the island along with his whole family. He made a short stay at Marseilles, where he published a small pamphlet, 'Le Souper de Beaucaire,' Republican in sentiment, but not Jacobinical, as has been asserted. He then set out for Paris, where he spent a part of the summer of 1793; and in September of that year was sent, with the commission of lieutenant-colonel of artillery, to assist in the reduction of Toulon, then in the hands of the English. The place was captured 19 December entirely through his strategic genius; and in the following February he was made a brigadier-general of artillery. Later in the year he was sent to Genoa to examine the state of the defenses of that city and to ascertain the political disposition of its inhabitants.

In the beginning of 1795 he was again in Paris in search of employment, but in spite of

his known abilities was not at first successful. In his letters to his brother Joseph, written about this time, he complains of poverty and ennui, and seems to have thought of offering his services to the sultan of Turkey. On the 13th Vendémiaire IV (5 Oct. 1795), when the sections of Paris had risen against the Convention, Napoleon, named by Barras (q.v.), was commander of the 5,000 troops provided for its defense. Although he had had but a night in which to make arrangements for the dispersion of the populace, when the National Guards, as the defenders of the sections were called, advanced to the number of 30,000 along the quays of the Seine, the Rue Saint Honoré and the other approaches to the Tuileries, they found every point securely guarded. To their feeble musketry fire Napoleon replied by murderous discharges of grape. In less than an hour of actual fighting victory was secured for the Convention, which recognized the value of the young victor's services by appointing him to the command of the Army of the Interior.

About this time he made the acquaintance of Josephine Beauharnais, to whom he proposed marriage and was accepted. The ceremony took place 9 March 1796, and less than a week afterward he had to depart to assume the command of the Army of Italy, which for three or four years had been carrying on a desultory warfare against the Sardinians and the Austrians amid the defiles of the Alps and the Ligurian Apennines. His army consisted of only 40,000 men, and even those were badly fed and clothed, while the Allies could oppose him with a much larger force. In the end of March he set out from Nice and came up with the Allies at Montenotte, and inflicted on them a disastrous defeat (11 April). This victory separated the Sardinian from the Austrian army, and Napoleon, determined to crush them in detail, pursued the former and beat them at Millesimo (13th and 14th), and then fell on the latter at Dego (14th and 15th).

This opened up for him both the route to Turin and to Milan. Napoleon lost no time; the Sardinians who were retiring upon Turin, were overtaken and beaten at Mondovi (22d), and compelled to sue for peace; and the Austrians, who were falling back on Milan, were signally defeated at the battle of Lodi (10 May). On the 15th he entered Milan, where heavy contributions were levied on the state, and the principal works of art were seized and sent to Paris. Naples, Modena and Parma hastened to conclude a peace; the Pope was compelled to sign an armistice; and the whole of northern Italy was in the hands of the French. Mantua was the next object of attack. Wurmser, at the head of large Austrian reinforcements, advanced through the Tyrol to its defense; he was defeated at Castiglione 5 August and again at Bassano 8 September, which compelled him to take refuge behind the walls of Mantua. Not yet disheartened, Austria sent a third army in two divisions under Marshal Alvinczy and General Davidovich. This for a while held the French in check, but on 15 November a battle was begun at Arcole, which, after three days of hard fighting, gave the victory again to the French, and decided the result of the campaign. In January 1797, Alvinczy opened a fresh campaign by advancing at the head of 50,000 troops from Roveredo to the

**NAPOLEON BONAPARTE**

After a Painting by Paul Delaroche

relief of Mantua, but was completely routed by Napoleon on the 14th at Rivoli; and on 2 February Wurmser was compelled by famine to surrender at Mantua. On the same day Napoleon put an end to the armistice with the Pope, and invaded the states of the Church, beat the papal troops on the Senio, and took in quick succession the towns of Faenza, Ancona, Loreto and Tolentino: On the 19th the Pope was compelled to conclude a peace by which he surrendered Avignon, Bologna, Ferrara and the Romagna to France. Napoleon next entered the Tyrol, driving before him the Archduke Charles, who had undertaken another invasion of Italy. An armistice was agreed upon, 7 April, and Austria gave territory and indemnity to France, receiving Venetia in return. This closed the great Italian campaigns, in which Napoleon, by ingenuity of plan, celerity of movement and audacity in assault, far out-generated all his antagonists.

In December 1797 Napoleon returned to Paris; the enthusiasm of the Parisians was immense, and the festivals in his honor innumerable. About this time the Directory seems to have had the intention of invading England, and had brought an army together for that purpose. The command was conferred on Napoleon, who at first professed to favor the design, but who well knew its impracticability. It has been thought by many that this proposal was merely a feint to cover the real design of the Directory, namely, the invasion of Egypt, as a preliminary step to the conquest of British India. By 10 May 1798 an army of 36,000 men was collected and embarked at Toulon in a fleet commanded by Brueis (q.v.). A body of scientific and artistic explorers accompanied it. On 9 June the French landed at Malta, and the next day took possession of the island, in which they left a garrison. Ten days after the fleet resumed its voyage, reaching Alexandria on 1 July, and that city being taken, Napoleon and the army advanced on Cairo. Here they encountered a large body of Mamelukes, which, after a long and bloody struggle, known as the battle of the Pyramids, they repulsed. Many of the surrounding tribes thereupon submitted to the French, who thus for a while held a seeming possession of the whole of Egypt. Thinking himself secure in his conquest Napoleon immediately set about reorganizing the civil and military government of the country; but fortune was preparing for him a terrible reverse. The English admiral Nelson, who had long been in pursuit of his fleet, found it moored in the Bay of Abukir, and, with the exception of four vessels which contrived to escape, utterly destroyed it.

All means of return to Europe for the French were thus cut off, and to add to their misfortunes the sultan declared war against them, and a short time after serious disturbances broke out in Cairo, which were only suppressed by horrible massacres. Napoleon resolved to meet the Turkish forces assembling in Syria. In February 1799 he crossed the desert with about 13,000 men; took El-Arish and Gaza, and stormed Jaffa, where a great number of Turkish prisoners were deliberately massacred. On the 17th he reached Acre, which was defended by a Turkish garrison under Djezzar Pasha, assisted by Sir Sydney Smith and a small body of English sailors and

marines. After 60 days he gave up the siege and returned to Egypt, leaving the whole country on fire behind him. He re-entered Cairo 14 June, having lost 4,000 men in the Syrian expedition. About the middle of July the sultan landed a force of 18,000 at Abukir, which Napoleon attacked and almost annihilated on the 25th. His position was far from agreeable, however; he had signally failed in the great objects of his expedition, and besides news had reached him of disaster to the French arms in Italy and of confusion in Paris. On 22 August he embarked in a frigate and 9 October landed at Fréjus, having narrowly escaped capture several times by the British Mediterranean cruisers. He arrived in Paris in time to take advantage of the political intrigues then rife. The credit of the government was wholly gone and its authority over its generals impaired. A revolution in the government 18 June had not made new directors more competent than their predecessors. Another change became necessary. Napoleon secured the co-operation of Moreau and the other generals then in the capital, and abolished the Directory on the 18th and 19th Brumaire (9-10 November). A new constitution was then drawn up, chiefly by the Abbé Siéyès, under which Napoleon was made first consul. As, however, he had the power of appointing to all public offices, of proposing all public measures in peace and in war, and the entire command of all administrative affairs, both civil and military, he was virtually ruler of France.

From this time Napoleon's policy developed itself more distinctly; its objects were to establish order at home and to humiliate the enemies of the nation; but personal aggrandizement was an end scarcely less conspicuous. With sagacity, activity and boldness he undertook to reform civil affairs. He recruited the national treasury by various expedients, repealed the more violent laws passed during the Revolution, such as punishment for matters of opinion, reopened the churches and suppressed the Vendean insurrection by a series of decided but conciliatory measures. But he was well aware that his genius was essentially military, and that his most striking triumphs were those won on the battlefield. He offered Austria, England and Turkey, in theatrical phrases, terms of peace, which were rejected. He resolved to strike a blow first at Austria by a renewal of the glories of his former Italian campaign. An army of 36,000 men was concentrated with unparalleled rapidity and secrecy on the shores of the Lake of Geneva. On 13 May 1800 he began his daring march across the Great Saint Bernard, and almost before the Austrian general Melas was aware, had entered Milan (2 June). After several unimportant skirmishes he encountered the Austrians at Marengo (14 June), where he achieved another brilliant victory, which put all the Piedmontese fortresses, for the second time, in possession of the French.

Having established provisional government at Milan, Turin and Genoa, he returned to Paris 3 July. As his general, Moreau, had defeated the Archduke John in the decisive battle of Hohenlinden (3 December), Austria was reduced to sue for peace, and on 9 Feb. 1801 signed the Treaty of Lunéville, which was

mainly based on that of Campo Formio. Treaties were subsequently concluded with Spain, Naples, the Pope, Bavaria, Portugal, Russia, Turkey, and finally 27 March 1802, the Peace of Amiens. Thus it seemed as if a universal cessation of hostilities were about to mark the history of Europe, and allow Napoleon the opportunity to crush the insurrection of the blacks in San Domingo. An army was sent out under Leclerc, some 20,000 of which were swept away by disease or the sword; the blacks were provoked by brutal cruelties to still more fearful massacres, in which about 60,000 whites perished. Toussaint l'Ouverture, an able and courageous negro who had made himself the leader of his unfortunate countrymen, was seized during a truce and carried to France, where he died in prison.

But the great occupation of Napoleon was the improvement of the interior affairs of the nation. A general amnesty allowed all the *émigrés* to return home; the Legion of Honor, a new order of knighthood, was established. Considerable attention was paid to such departments of education as tended to promote efficiency in the public service. Mathematics and physical science were encouraged at the expense of philosophy, ethics and social and political science. All prefects of departments and all mayors of cities were appointed by Napoleon, so that not a vestige of provincial or municipal freedom remained. On 2 Aug. 1802, Napoleon was proclaimed by a decree of the Senate consul for life, a step confirmed by a plebiscite of 3,000,000 votes. A *senatus consultum* issued some days after, reconstructing the electoral bodies and reducing the tribunate to 50 members, showed, however, that Napoleon was not yet satisfied with the authority he was clothed with, and many persons saw in the movement a step toward still more absolute power. It is to this period that the greatest of his services to France belongs. He assembled the first lawyers in the nation, under the presidency of Cambacérès, to draw up a code of civil laws. See CODE, *Code Napoleon*.

Meanwhile the state of Europe was beginning to look serious. Disturbances in Switzerland in the early part of 1802 induced Napoleon to resort to an armed mediation in its affairs; in August of the same year Elba was incorporated with France, Piedmont 11 September and Parma in October. England regarded these proceedings as an infringement of the Treaty of Amiens, and as remonstrances were ineffectual, there was in a short time a resumption of hostilities. On 18 May 1803, England declared war against France, having laid an embargo on all French ships in British ports. France retaliated by a decree that all Englishmen found on her territory should be detained as prisoners of war; and General Mortier was sent to occupy Hanover, as belonging to Great Britain. While these events were taking place a conspiracy for the overthrow of the first consul and the re-establishment of the Bourbons was discovered and thwarted. Napoleon pretended to see an accomplice of the conspirators in the Duc d'Enghien, and caused him to be arrested in neutral territory, brought to Vincennes and, after a mock trial, shot. Napoleon now seems to have thought it necessary that he should assume the imperial dignity. An appeal

was made to the nation, and upward of 3,000,000 votes were given in favor of conferring on him the title and prerogatives of emperor, while less than 3,000 were against it. On 18 May 1804 Napoleon assumed the imperial title; and in order that due solemnity should not be wanting, he requested Pius VII to perform the ceremony of his coronation. The Pope assented and went to Paris 2 December. He was only allowed to perform part of the ceremony, however, as Napoleon snatched the crown from the pontiff's hands and placed it on his own head, performing a like office for his consort, Josephine. On 26 May 1805 he was also crowned king of Italy in the cathedral of Milan; and Eugène Beauharnais, his stepson, was appointed viceroy. He created a nobility with sounding titles; surrounded himself by a brilliant court; established all the etiquette of royalty; and introduced many practices marked by ostentation and parade.

Meanwhile the Northern powers listened to the solicitations of England, and united in a coalition against the new emperor. Russia, Austria and Sweden all joined in the charges of aggrandizement laid against Napoleon by the English government; but Prussia, tempted by him with the promise of Hanover, could not be brought to enter the coalition. The emperor abandoned his design of making a descent on England, broke up the camp at Boulogne, and concentrating his widely scattered forces at Mainz, September 1805, he marched at once across Bavaria at the head of 180,000 men, and compelled the Austrian general Mack to capitulate at Ulm, with 23,000 men (20 October). On 13 November he had reached Schönbrunn, near Vienna, where he received news of the victory of Nelson at Trafalgar, over the united fleets of France and Spain. Entering the Austrian capital, he made rapid preparations to meet the combined armies of Russia and Austria, then concentrating on the plains of Olmütz. On 2 December the three armies, each commanded by an emperor, met at Austerlitz. The struggle was desperate and long but at last victory was won by Napoleon. The rout of the Allies was complete. The Austrian emperor instantly sued for peace, giving up to France all his Italian and Adriatic territories. The Russian emperor retired behind his own frontiers, and Hanover was handed over to Prussia. As the king of Naples had received English and Russian troops into his dominions, Napoleon construed this act into one of direct hostility. In February 1806 a French army occupied the Continental part of the Neapolitan States, of which Joseph Bonaparte was declared king on the deposition of their former sovereign. The Bavarian republic was transformed into a kingdom dependent on France and given to another brother of the emperor, Louis, who took the title of king of Holland. Various districts in Germany and Italy were erected by the conqueror into dukedoms and bestowed on his most successful generals.

But the most important change of all was the formation of the Confederation of the Rhine on 12 July, and the dissolution of the old German Empire. On the death of the English Minister, Pitt, and the accession of Fox, negotiations were entered into for the cessation of hostilities between France and England, and as

propositions were entertained toward the restoration of Hanover, the eyes of the Prussians were at once opened and war, however hazardous, was determined on and was declared on 8 October, the emperor being already at Bamberg directing the movements of his troops, which had remained in Germany. On the 14th Napoleon met the enemy at Jena, and inflicted on them a severe defeat; while his general, Davout, added on the same day to the French triumph by the brilliant victory of Auerstädt. On the 27th Napoleon entered the Prussian capital. After garrisoning all the important fortresses and reducing such towns as made a show of resistance, he issued the celebrated Berlin decree (see CONTINENTAL SYSTEM), directed against English commerce. This policy nearly ruined the commerce of France and the other European nations, while it increased the prosperity of England. Her fleets and cruisers swept the seas; nothing could be obtained from the colonies save through her, and the Continental merchants engaged in an extensive smuggling trade with the British, which it was impossible to prevent.

After the capture of Berlin Napoleon marched north against the Russians, who were advancing to assist the Prussians. He called on the Poles to rise, but was answered with little enthusiasm. At Pultusk, 28 Dec. 1806, and at Eylau, 8 Feb. 1807, he met with severe checks, and retired on the line of the Vistula; in the course of a few months, however, having received heavy reinforcements, he once more took the offensive. On 14 June was fought the battle of Friedland, which was so disastrous to the Russian arms that Alexander was compelled to sue for an armistice. The Peace of Tilsit was concluded 7-9 July, and by it the king of Prussia received back half of his dominions, and Russia undertook to close her ports against British vessels. The duchy of Warsaw was erected into a kingdom and given to the king of Saxony; out of the Prussian territories west of the Elbe the kingdom of Westphalia was formed and bestowed on Jerome, Napoleon's youngest brother; and Russia obtained a part of Prussian Poland, and by secret articles was allowed to take Finland from Sweden. Soon after the Peace of Tilsit was signed Napoleon entered into a war against Portugal, as that nation had refused to respect the Berlin decree, and Junot was sent to occupy Lisbon (30 Nov. 1807). The Pope refusing to carry out the Continental blockade and to recognize Joseph Bonaparte as king of Naples, Rome was occupied 2 Feb. 1808. The administrative affairs of Spain having fallen into inextricable confusion, Napoleon sent into that kingdom an army under Murat, who with difficulty took possession of the capital and by the Treaty of Bayonne Charles IV resigned the Spanish crown, which was given to Joseph Bonaparte, Murat (q.v.) receiving the vacant sovereignty of Naples.

The great body of the Spanish people rose against this summary disposal of the national crown, and England assisted them with immense supplies. Thus began the Peninsular War (q.v.), which lasted seven years. The Spaniards were at first successful; a French squadron was captured by the English at Cadiz, 14 June; General Dupont surrendered at Bay-

len, 22 July, with 18,000 men; Junot was defeated 21 August by Sir Arthur Wellesley at Vimeira. But Napoleon rushed to the scene of action in October at the head of 180,000 men, and entered Madrid in spite of all resistance by the Spaniards, 2 December. The British troops which had advanced to the aid of the Spaniards were driven back on Coruña, where they made a successful stand, but lost their general, Sir John Moore, 16 Jan. 1809. In the meantime Austria, alarmed at the aggressive policy of Napoleon, who had seized Tuscany and the states of the Church, and determined to profit by his absence in Spain, again declared war, and got together an effective army under the Archduke Charles. Napoleon hurried into Bavaria, encountered the archduke at Eckmühl (22 April), and completely defeated him; on 13 May he again entered Vienna. Reorganizing his shattered army, Charles likewise advanced toward Vienna on the opposite bank of the Danube. The French seized the island of Lobau, threw a bridge across the river and attacked the enemy at Aspern and Essling on the 21st and 22d, but were repulsed and thrown back on the island, which they proceeded to fortify, waiting the arrival of Eugene with the Army of Italy. On 5 July they debouched on the left bank of the Danube, and on the 6th the Austrians were crushed at Wagram. This enabled Napoleon to dictate his own terms of peace, which were agreed to on 14 October at Schönbrunn. On the preceding day an unsuccessful attempt was made to assassinate him by a young German enthusiast named Staaps. Whether the subsequent marriage with the daughter of the Austrian emperor was in course of negotiation at Schönbrunn is doubtful, but soon after his return to Paris Napoleon informed Josephine of his determination to divorce her. He seems to have arrived at the conclusion that he could only put an end to the machinations of the old legitimate dynasties by intermarriage. Josephine, too, had borne him no children, and he was ambitious of perpetuating his power in his family. On 16 December an act of divorce was passed by the commissioners of the Senate, and by proxy 11 March (formally 2 April) 1810 he was married to the Archduchess Maria Louisa. The fruit of this union was a son, Napoleon François Charles Joseph, born 20 March 1811, and proclaimed in his cradle king of Rome. See REICHSTADT, DUKE OF.

The years 1810-11 were the period of Napoleon's greatest power. On the north he had annexed Holland, Friesland, Oldenburg, Bremen and all the coast-line as far as Hamburg, and on the south Rome and the southern papal provinces. His empire thus extended from the frontiers of Denmark to those of Naples, with Paris, Rome and Amsterdam as its first, second and third capitals, and it was divided into 130 provinces, having a total population of 42,000,000. He may also be said to have exercised almost unlimited control in Spain, the Italian kingdoms, Switzerland and the Confederation of the Rhine (q.v.). But now the tide began to turn. Russia found it impossible to carry out the Continental blockade without permanent injury to her great landowners; Sweden, which had accepted Bernadotte, one of Napoleon's generals, as king, was in a like

predicament. The Berlin decree was frequently evaded, which involved Russia particularly in fresh complications, and in view of the war now inevitable that nation formed an alliance with Sweden. In May 1812 Napoleon declared war against Russia, and determined in spite of the dissuasion of his most prudent generals to invade the country. On 16 May Napoleon was in Dresden making arrangements for the great Russian campaign. The army he organized for it has been estimated at from 640,000 to 680,000 men, inclusive of Prussian, Austrian, German, Polish and Swiss auxiliaries. An army of 300,000 Russians, under Barclay de Tolly and Bagration, assembled on the banks of the Niemen to oppose him. On 24 June he crossed that river at Kovno, and the Russians retired step by step before him, deliberately wasting the country, carrying off all supplies and avoiding as far as possible general engagements. The French, however, pushed rapidly forward, overtook and routed the rear guard of Barclay's army at Ostrovno, 25 July, and on the 28th occupied Vitebsk. On 16 August the Russians made a stand at Smolensk against an advanced division of the French army, and when the latter entered the city on the 18th it was in ruins.

Both the opposing armies now took up their march toward Moscow. Kutusoff, who had succeeded Barclay, resolved to dispute the passage of the Borodino. An obstinate battle ensued 7 September, which cost the French nearly 30,000 men, and their opponents about double that number. On the 15th Napoleon entered Moscow, which had been deserted by its inhabitants, and which was nearly destroyed by a fire that began on the same night and lasted five days. The baffled French were compelled to seek shelter in the desolate surrounding country. Napoleon vainly attempted to negotiate with Alexander; it was impossible to pursue the Russians farther; nothing remained but retreat. The French army was now reduced below 120,000 men. For some time the weather was favorable, but the winter set in earlier than usual, and with extraordinary severity.

The line of retreat, too, led through the very districts which had been wasted on the advance. Swarms of mounted Cossacks incessantly harassed the French, now sadly demoralized by cold, famine, disease and fatigue. When the invaders left Smolensk (14 November) they numbered only 40,000 fighting men, and when they had fought their way over the Berezina (27th) there remained but 25,000. At Smorgoni Napoleon quitted the army (5 December), leaving Murat in command.

Napoleon reached his capital on the 18th and immediately ordered a fresh conscription, still determined on prosecuting the war. But the spirit of Europe was now fairly roused; kings, ecclesiastics and people rose unanimously against the devastator of the Continent, the terror of whose name had been destroyed by his disastrous reverse. A sixth coalition, consisting of Prussia, Russia, England, Sweden and Spain was formed, which early in 1813 sent its forces toward the Elbe. Napoleon had still an army of 350,000 in Germany. For some months he was everywhere victorious. On 2 May he defeated the Allies at Lützen, and on the 21st at Bautzen. He reached Breslau 1 June, and on

the 4th concluded a six weeks' armistice, which gave the Allies time to reorganize and concentrate their forces and, what was of equal consequence, to gain over Austria. The campaign was reopened 16 August. The Allies advanced on Dresden, where Napoleon had his headquarters. The battle which ensued (see DRESDEN, BATTLE OF) 26-27 August was another dearly bought victory for the French, who were now so outnumbered that their chief was compelled to fall back on Leipzig. There he was completely hemmed in, and in the great "Battle of the Nations" (Völkerschlacht), as this battle of Leipzig is called, fought 16-19 October, he was completely defeated. The retreat across the Rhine was almost as disastrous as that from Moscow.

On Napoleon's arrival at Paris, 9 November, he succeeded in obtaining from the Senate, in spite of the opposition in the legislative body and the prevalent discontent of the people, a decree for a conscription of 300,000 men. With a fertility of resource and a genius for combination almost miraculous, he was able to enter on another campaign, which was this time to be conducted in France. From January to March he confronted the combined hosts of the Allies, inflicting defeat after defeat on them. But numbers were against him; a new and formidable enemy, Wellington, was rapidly advancing on the capital from the south. On 30 March the Allies, after a severe engagement, captured the fortifications of Paris, and on the 31st Alexander and Wellington entered the city amid the acclamations of the people.

On 6 April Napoleon abdicated at Fontainebleau in favor of his son. He was allowed the sovereignty of the island of Elba, with the title of emperor, and a revenue of 6,000,000 francs. After bidding his army adieu he departed for his new abode, landing from the British frigate *Undaunted* at Ferrajo 4 May, and Louis XVIII was restored. After a residence of 10 months, most of which was spent in intriguing with the Republicans and his own adherents, he made his escape from the island, and landed at Fréjus 1 March 1815, with an escort of 1,000 of his old guard. As soon as his arrival was known Ney and a large part of the army joined him, and he made a triumphal march on Paris, which he reached on the 20th. Louis was driven from his throne without a shot having been fired. The Allies were startled at the astounding event. Their armies once more marched toward the French frontier. Napoleon, hastily reorganizing the government on a rather more liberal basis than that of the empire, and having made vain attempts to open negotiations for peace, advanced to meet them. On 15 June he crossed the Sambre at the head of 130,000 men to attack the English and Prussians under Wellington and Blücher. On the 16th he defeated Blücher at Ligny, while at Quatre-Bras the English were held in check by Ney. The Prussians made an orderly and leisurely retreat, pursued by a division of the French army under Grouchy.

In order to preserve his communication with the Prussians, Wellington fell back upon Waterloo, where he was attacked by Napoleon on the 18th. The British held their ground obstinately during the greater part of the day, and in the evening, when Blücher, who had outmaneuvered Grouchy, came up, the French were completely

crushed, and Napoleon's power forever broken. The retreat was a disorderly flight. The Allies marched without opposition on Paris. On the 22d Napoleon again abdicated in favor of his son; but being threatened by Fouché, who had assumed the direction of the government, and seeing no hope of escape from France, he surrendered at Rochefort to Captain Maitland of the British warship *Bellerophon*, claiming the hospitality and protection of the British government. Captain Maitland was instructed to detain him as a prisoner, and then transfer him to the *Northumberland*, which was to convey him to the island of Saint Helena, where he was to be confined for the rest of his life, according to a convention signed at Paris, 20 August, between Great Britain, Austria, Russia and Prussia. He landed there 16 October. In July 1816 Sir Hudson Lowe was sent out as governor of the island. From the very first Napoleon seems to have quarreled with that officer, and he appealed to the sympathy of the world through reports of the ill treatment he was subjected to. The governor had no power to remedy the chief causes of the prisoner's complaint. In September 1818 Napoleon's health began to fail. He refused medicine, would not ride, toward the end of 1820 grew worse and died at last of cancer of the stomach. On 8 May 1821 he was buried on the island; but in 1840, in accordance with his own wishes, his remains were removed to Paris, and there, under the dome of the *Hôtel des Invalides*, they found their final resting-place. See WATERLOO, BATTLE OF; NAPOLEON'S TOMB; FRANCE, HISTORY OF.

**Bibliography.**—Thiers, 'History of the French Revolution' (1823-27) and 'History of the Consulate and Empire' (1845-61); Scott, 'Life of Napoleon' (1827); Bignon, 'Histoire de France sous Napoléon' (1829-50); Thibaudau, 'Le consulat et l'empire' (1834-35); Lanfrey, 'History of Napoleon' (1869-75); Jung, 'Bonaparte et son temps' (1880-81); Ropes, 'The First Napoleon' (1885) and 'Campaign of Waterloo' (1893); Fournier, 'Napoleon I, eine Biographie' (1886-89); Sargent, 'Napoleon Bonaparte's First Campaign' (1894) and 'Campaign of Marengo' (1897). For the relations of Napoleon with the United States, Adams, 'History of the United States, 1801-17' (1889-91) should be consulted. The 'Correspondance de l'Empereur Napoléon I' (1858-70) is a main source of original documentary history. Of works of a more personal character, dealing with the life of Napoleon from various points of view, among the more important are those of Bourrienne, Talleyrand, Metternich, Rémusat, Marbot, Montholon, Pasquier, Ségur, Las Casas, O'Meara, Sachet, Messéna, Marmont and Roederer. As recent writings of another sort bearing on Napoleon's personal history, those of Levy and Mason deserve particular notice. The work of Rose, 'Life of Napoleon I' (1901), is the latest complete biography in English. Channing's essay on Napoleon, and Emerson's chapter in 'Representative Men,' as well as Carlyle's pictures in 'Heroes,' are still worthy of attention.

**NAPOLEON II**, son of Napoleon I. See REICHSTADT, DUKE OF.

**NAPOLEON III** (CHARLES LOUIS NAPOLEON BONAPARTE), emperor of the French: b. Paris, 20 April 1808; d. Chiselhurst, England,

9 Jan. 1873. He was the son of Louis Bonaparte (q.v.), king of Holland. He was taken by his mother, Queen Hortense, to Switzerland in 1816, was educated at the gymnasium of Augsburg and the military school at Thum, joined the unsuccessful Italian revolt against papal rule in Romagna, and by a conspiracy at Strassburg on 30 Oct. 1836, was declared emperor. He was arrested and sent without trial to the United States, returned to Switzerland in 1837, lived in London in 1838-40, and on 6 Aug. 1840 landed at Boulogne for a fresh attempt against Louis Philippe. This time he was imprisoned in the fortress of Ham, under a life sentence; but he contrived his escape 25 May 1846. During this time he had leisure for the exercise of his literary abilities, and the result was the works 'Aux manes de l'Empereur'; 'Fragments Historiques'; 'Analyse de la Réveries politiques'; 'Réponse à M. de Lamartine'; 'Extinction du Paupérisme'; besides contributions to the 'Dictionnaire de la Conversation,' and several articles to democratic newspapers. On the outbreak of the Revolution of 1848 he hastened from England to Paris, and in a letter to the provisional government declared that he came to serve under the republican flag (28 Feb. 1848). On the day following he issued another letter announcing that as the government deemed his presence in Paris dangerous he would immediately quit the country. He accordingly returned to London, where he served as a special constable on the occasion of the great Chartist demonstration of April (1848). In the election of September he was put forward by Paris and three other departments. He returned to Paris and on 26 September took his seat.

He at once commenced through his zealous associates his candidature for the Presidency. On the day of the election, 10 December, it was found that out of 7,500,000 votes Louis Napoleon had obtained 5,434,226. On the 20th the prince-president, as he was now called, took the oath of allegiance to the republic. For a time the greatest harmony seemed to be re-established; the President selected his ministers from the ranks of the various political parties, and strove to gain a majority in the assembly by the adoption of a strictly conservative policy. On 2 Dec. 1849 was formed a new ministry, the members of which were merely tools of the President. It was evident that a crisis was approaching. At last on 2 Dec. 1851 the *coup d'état* came. Paris was overawed by the army; there was needless butchery in the streets; reports of approval by Paris of this course were sent to the provinces. The empire was re-established in Louis Napoleon by a vote of 8,000,000 to 640,000. On 29 Jan. 1853 the new sovereign married Eugénie Marie de Montijo, Countess de Teba. In 1854 Napoleon, in conjunction with England, entered the Crimean War in the interest of Turkey against Russia—a war which was carried on by all the parties with great vigor, until a peace was concluded, 30 March 1856, the terms of which were the neutralization of the Black Sea, the abandonment by Russia of her protectorate of the Danubian principalities and a rearrangement of frontier territory between Russia and Turkey, to the advantage of the latter power. (See CRIMEA, History). About the beginning

of the year 1859 it was evident that another European war was imminent. Northern Italy was groaning under the Austrian yoke; Sardinia demanded a separate government for Lombardy and Venetia, which Austria refused to grant. War was declared between that country and Sardinia about the end of April, and Napoleon took up arms in favor of his Italian ally, Victor Emmanuel. The two allied sovereigns took the field in person. Montebello, Magenta, Marignano and Solferino were brilliant victories for the Allies. By the terms of the Peace of Villafranca, Austria ceded Lombardy to Italy, and the provinces of Savoy and Nice were given to France.

A second distant expedition was undertaken, but had not a like success. Toward the end of 1861 France, England and Spain agreed to dispatch a joint expedition to Mexico for the purpose of exacting redress of injuries of long continuance inflicted on the subjects of the respective allies, and the enforcement of pecuniary claims, which were obstinately contested by the Mexican government. The extravagant demands of M. de Soligny induced the English and Spaniards to believe that Napoleon had some ulterior object in view, and they withdrew from further intervention (April 1862). The French army continued the quarrel alone. On 10 June General Bazaine led his troops into the Mexican capital amid many demonstrations of enthusiasm. An imperial form of government was initiated, and Maximilian (q.v.), Archduke of Austria, was placed at its head with the title of emperor. The United States considered this a piece of treachery, and after the Civil War dispatched Sheridan with troops who speedily put an end to French aggression and Mexican instability. Maximilian's death caused Napoleon's policy to be viewed with suspicion in France. The emperor opened the Suez Canal, entertained Europe at the World's Exposition, rebuilt and greatly beautified Paris. But France lost slowly in prestige, and there was a decline of administrative integrity.

On the conclusion of the Austro-Prussian War of 1866, Napoleon, jealous of the growing power of Prussia, demanded a reconstruction of frontier, claiming, by way of compensation for his non-intervention in the quarrel, Prussian territory on the Saar, a claim peremptorily refused. The ill-feeling between the two nations was increased in 1867, when the king of Holland signified his intention to cede Luxembourg to France. The cession was strongly resisted by Prussia, and at the London conference (7-11 May) the neutralization of the duchy was agreed to by treaty under the guarantee of the Great Powers. It could no longer be concealed, however, that a rupture between France and Prussia was imminent, and in 1870, on the Spanish crown being offered to Leopold of Hohenzollern, Napoleon demanded that the king of Prussia should compel that prince to refuse it. Notwithstanding the subsequent renunciation of the crown by Leopold, war was declared by France (19 July). (See FRANCO-GERMAN WAR). On the 28th Napoleon set out to take the chief command. After Sedan, he had a personal interview with King William, who assigned to him Wilhelmshöhe, near Cassel, as a place of residence during his captivity. One of the immediate consequences of this disaster was

a revolution in Paris. Gambetta, Jules Favre and several other members of the Corps Législatif proclaimed a republic and the dethronement of the emperor (4 September). The empress and her son secretly quitted Paris and repaired to England, where they took up their residence at Camden House, Chiselhurst. Here they were rejoined by the emperor, when he regained his freedom in March 1871, and here he remained till his death.

Napoleon III was rather a student and littérateur than a statesman. He was not an efficient administrator and was most unfortunate in his advisers and subordinates. At the time of the Franco-German War he appears to have been quite deceived as to the military strength of France and its readiness for the conflict. Besides the literary works already mentioned, Napoleon III is the author of an uncompleted 'History of Julius Cæsar' (1865-66), and various productions collected and published in 1854-69 and 1873. (See FRANCE; *History Since 1815*). Consult Gottschalk (1871); von Sybel (1873), and Jerrold (1877) for biography; also Hugo, 'Histoire d'un Crime' (1877) and various standard histories of modern Europe; also De la Gorce, 'Histoire du second empire' (4 vols., Paris 1885-98); Simson, 'Über die Beziehungen Napoleons III zu Preussen und Deutschland' (Freiburg 1882); Ebeling, 'Napoleon III und sein Hof' (Cologne 1891-94); Imbert, A. L., 'The Court of the Second Empire' (Eng. trans., 1898); Hugo, 'Napoleon the Little' (Eng. trans., 1909).

**NAPOLEON, Eugène Louis Jean Joseph**, Prince Imperial of France, only son of Napoleon III: b. in the Tuileries, Paris, 16 March 1856; d. South Africa, 1 June 1879. He fought for the Imperial arms in the Franco-German War of 1870-71, but when disaster seemed imminent was sent to join his mother in England, whither she had fled. He was proclaimed Napoleon IV by his adherents in 1874. In 1879 he joined a British expedition against the Zulus in South Africa and was killed in ambush. He was buried beside his father at Farnborough, England. Consult Barlee, Ellen, 'Life of Napoleon, Prince Imperial of France' (London 1889); Martinet, A., 'Le prince impérial' (ib. 1895); Barthez, E., 'Empress Eugénie and her Circle' (New York 1913).

**NAPOLEON, Joseph Charles Paul**, PRINCE, a son of Jerome Bonaparte. See BONAPARTE, JEROME.

**NAPOLEON**, Ohio, village, county-seat of Henry County, on the Maumee River and the Miami and Erie Canal, and on the Lima Northern and the Wabash and Detroit railroads, about 38 miles southwest of Toledo. Its chief manufactures are flour and dairy products as well as windmills, tanks, threshing machinery, separators, flour, etc. It has considerable trade in farm and dairy products and livestock. The village owns and operates the electric-light plant and the waterworks. Pop. 4,007.

**NAPOLEON**, a piece of French money valued at \$4 or 20 francs. See LOUIS D'OR.

**NAPOLEON GUN**. See ARTILLERY.

**NAPOLEON LE PETIT**, le pé-tê ('Napoleon the Little'), the title of Victor Hugo's

savage satire on Louis Napoleon. (Brussels 1852).

**NAPOLEON'S TOMB**, the burial-place of Napoleon Bonaparte under the dome of the Invalides in Paris. It has the form of a circular crypt 20 feet deep and 36 in diameter, open at the top. The tomb was designed by Visconti, and on the walls are 10 marble reliefs by Simart. The sarcophagus is 13 feet long, 6½ wide, 14½ high, cut from a single block of red porphyry, 67 tons in weight, surrounded by 12 victories by Pradier. The inscription above the entrance to the crypt is taken from Napoleon's will: "I desire that my ashes shall rest on the banks of the Seine, in the midst of the French people that I have loved so well." Two adjoining tombs are those of the emperor's friend, Duroc, and his companion, Bertrand. Napoleon's remains were brought here in 1840 from Saint Helena.

**NAPRAPATHY**, nāp-rāp'ā-thē, the science of drugless healing, revolutionizing the treatment of disease without surgery or medicine. It is founded upon the researches of Dr. Oakley Smith, who discovered that human ailments are traceable to sprained or diseased ligaments connected with the spinal column, thorax and pelvis. By overcoming these, with scientific manipulation, which relieves the pressure upon the nerves and the arterial system, most of the diseases of the human body cannot only be overcome but a permanent cure affected. Diseased conditions which are regarded as incurable by older methods are found to yield readily at the hands of the skilled naprapath.

**NAQUATEZ** (nā'kwā-tēz) **INDIANS**. See **CREEKS**.

**NAQUET**, nā'kă', Alfred Joseph, French chemist and social reformer: b. Carpentras, 6 Oct. 1834; d. Paris, 10 Nov. 1916. In 1867 he came into prominence, losing his professorship in the faculty of medicine in Paris and being condemned to 15 months' imprisonment for his share in the activities of a secret society. In 1869 he fled to Spain after the publication of his book, 'Religion, propriété, famille.' He returned September 1870 and in the Revolution became Secretary of National Defense. Soon after he was elected to the Chamber of Deputies and began agitation against the French marriage laws. His agitation for the re-establishment of divorce resulted in the law of 1884, and in 1886, through his continued efforts, divorce became legal after three years of definite separation, on the demand of one of the parties concerned. Besides a professional work, 'Principes de chimie fondés sur les théories modernes' (1865; 5th ed., 1890; Eng. trans. 1868), he wrote numerous works on social questions, including 'Le divorce' (1877; 2d ed., 1881); 'La loi du divorce' (1903); 'L'Humanité et la Patrie' (1901); 'L'Anarchie et la collectivisme' (1904); 'Désarmement ou alliance anglaise' (1908).

**NARAKA**, or **NURUK**, in Hindu mythology, a term equivalent to the English word hell. In Naraka there are 28 divisions, in which sinners of as many different classes are confined and subjected to tortures corresponding to the gravity of their offenses.

**NARBADA**, nār-bā'dā. See **NERBUDDA**.

**NARBONNE**, nār-bōn, France, the chief town of an arrondissement in the department of Aude, in a beautiful hill-girt plain, eight miles from the Mediterranean and 36 miles by rail east of Carcassonne, and commanding the entrance into Spain by the southwest. Boulevards occupy the site of the mediæval ramparts removed since 1865. The town, traversed by the Robine Canal, has dark and winding streets lined with ill-built houses and is generally unattractive. It is, however, of historical interest as the Roman Narbo Martius, their earliest colony (118 B.C.) beyond the Alps. It flourished under Tiberius, its schools for a long time rivaling those of Rome. About 309 A.D. it became the capital of Gallia Narbonensis, and had its capitol, forum, theatre, aqueducts, triumphal arches, etc., of which there are few remains owing to the vandalism of Francis I in using them as building materials. In 412 it was taken by the Visigoths, in 719 by the Saracens, from whom it was recovered by Pepin in 759, to fall a century later to the Northmen. During the 11th and 12th centuries it was a prosperous manufacturing city, but subsequently deteriorated owing to the silting of its harbor. Its port, La Nouvelle, is 13 miles distant by canal. The principal edifices are the Romanesque church of Saint Paul Serge (1229); the quondam cathedral of Saint Just (1272-1332), only the fine Gothic choir of which, 131 feet high, has been completed; and the former archbishop's palace, now the city hall, in which are a good museum, a library and a picture gallery. A seminary and hydrographical school are among its educational institutions. The white heather honey of Narbonne maintains its ancient celebrity; the wine is chiefly used for blending purposes, its production being now carefully supervised by the œnological station founded in 1894. The manufacture of bricks and tiles, sulphur refining, cooperage and the distillation of brandy are among its industries. Pop. 28,173.

**NARCISSISM**, nār-sīs'sizm'. In the newer analytic psychology Narcissism is the stage in the development of the human psyche, when the ego derives the gratifications of its libido (q.v.) from the projections of its own mental states. In the development of the child the autoerotic pleasures derived from merely masturbatory sources in different parts of the body give way, in the average individual near or after the time of puberty, to a need for gaining satisfactions from activities exercised upon the world of external reality and not upon self. In the love life of the individual this change from autoerotism to the final selection of the love object of the opposite sex passes through a stage called Narcissism. Thus the child takes pleasure in or pain from the treatment it gets from other people in contradistinction to the adult satisfaction of giving pleasure or inflicting pain on other people. That is, the child, receiving as it does the pleasure at first solely from its own states and activities, learns eventually through experience to associate pleasurable and painful sensations with certain external happenings; e.g., from having burned itself it associates pain with the sight of a stove or a match, and from having gotten pleasure from eating jam, it associates the pleasure

with the jam. Or, if it eats too much, and is of the proper grade of intelligence, it may associate unpleasant feelings with jam. At any rate there is here a projection (see MECHANISMS, MENTAL) of the really subjective pleasure or pain feeling, which is thereby attributed to the jam as a quality which jam uniformly has. This process, which is psychological, but not logical, is the same as that carried out when the child forms a concept of another person. Therefore the concept of this other person than itself is made up of feelings which really belong to the child but which it irrationally attributes to other persons.

The intermediate transitional stage in the development is where the individual not merely regards his own body as a source of gratification (pure erotism) but with absolute naïveté looks upon his own personality or some other which he identifies with himself in the same light as he will later regard the true object love. That is, the autoerotic satisfaction comes from an exercise of the child's own body on itself or, as is seen in day-dreaming, or romancing of almost any kind, from an exercise of its own mind with its own mental material, uncorrelated with external reality. In the Narcissistic stage of the development of the human psyche the young person shifts from a crassly subjective form of gratification of the libido to a more objective form, without, however, realizing the actual differences between the projections of his own mind and the concrete facts of the characters of other people. The narcissistic youth finds some other person to love, but naively endows that other with his own qualities, not making, or perhaps not able to make, the necessary discriminations between what he thinks the other is and what the other really is. Thus a young person will find some other personality attractive and suppose that because some elements of the other are agreeable, the rest of the elements are so, and be very much disturbed, if not disordered, at the occasional outcroppings of uncongenial traits. Just as in the legend of Narcissus, who is fabled to have fallen in love with his own reflection which he perchance saw in a pool, and later to have pined away in ungratified desire for the being he saw but could never touch, so the ordinary person of to-day may, through constitution or lack of proper training, become a modern Narcissus, who desires merely the gratification of his projected unconscious wishes. He thinks his own thoughts will be given external reality simply by wishing for it, either unable or unwilling to see the discrepancy between his essentially autoerotic desires and the actual nature of external reality. The average child is taught by experience to derive satisfaction from exerting the limit of his ability upon external reality in order to make it conform to his wishes, and to take so much pleasure from the exertion that there will be no pain from the necessary disappointment of his wishes. This the fabled Narcissus never did, but tried again and again to embrace the beautiful being in the pool, where the average youth would have seen the impracticability of such action.

The subject of Narcissism is extremely important in the modern analytical explanation of the mental disease paranoia. In this disease,

which is characterized by a systematized suspicion and delusion of persecution, the subject takes unconsciously and crystallizes the attitude expressed by Narcissism. The process of mental development which shows how vitally important in the usual development of the psyche is the next and last step to adulthood, may be outlined somewhat as follows: The various phases of the situation have been illustrated by the development of the implications of the simple statement "I love him," supposing, for the sake of illustration, that the subject "I" is a male. If the idea represented by the sentence is followed out in real life, there results a more or less veiled homosexuality and the lack of adaptation of the individual to external reality is not so great as if the idea "I love him" is completely repressed into the unconscious. The idea "I love him" in the ego of a male, however, particularly if thus repressed, is always inevitably transformed, by virtue of the principle of *ambivalence* into "I hate him," and the inference from that is readily made to "He hates me," which is the basis on which this type of paranoid trend is built. Men who have this buried homosexuality in their unconscious are helpless without analysis, because they do not know of the existence of it and can never find it themselves. Therefore persons who are unduly suspicious of those around them have frequently the germ of a very serious mental disease, the cure of which requires a very special technique and the prevention of which would be of the utmost importance. Narcissism is thus seen to be an unconscious subjective homosexuality, differing from other forms of autoerotism in being applicable only to the whole individuality instead of to parts of it, and by reason of its total applicability being the cause of the tendencies which, when allowed to become extreme, lead to paranoia or paranoid states, as well as to alcoholism and various drug addictions. Consult Jelliffe and White, 'Diseases of the Human System' (1917).

**NARCISSUS**, nār-sīs'ūs, in Greek mythology, the son of the river god Cephissus. Narcissus was of surpassing beauty, but excessively vain and inaccessible to the feeling of love. Echo pined away to a mere voice because her love for him found no return. Nemesis determined to punish him for his coldness of heart, and caused him to drink at a certain fountain, wherein he saw his own image, and was seized with a passion for himself of which he pined away. The gods transformed him into the flower which still bears his name. See ECHO; MYTHOLOGY.

**NARCISSUS**, a genus of plants of the order *Amoryllidaceæ* (q.v.). The species, numbering from 16 to about 50, according to different authors, have bulbous roots, narrow grass-like leaves, and generally white or yellow flowers borne singly or in small clusters and protruding from a dry spathe at the summit of a leafless scape. Because of their hardness, ease of cultivation, habit of blooming in early spring, beauty and fragrance, many of the species and their numerous hybrids and varieties have been general garden favorites for centuries. A few produce their blossoms in the autumn (for example, *N. serotinus*, *N. ele-*

**NARCISSUS**

*gans* and *N. viridiflorus*); but they are rarely cultivated. Some are useful for winter forcing, especially the polyanthus narcissus (*N. tazetta*), with its popular forms the "paper white" and the "Chinese sacred lily." In general, the garden species succeed best in well-drained garden soil of medium texture and richness. The bulbs should be planted in autumn about five inches deep and three inches apart, and should not be disturbed until they appear to be failing, perhaps after three years. Then when the foliage has died down the clumps may be dug, the bulbs divided, cleaned and stored in a cool dry place until planting time. Among the most popular species are the poet's narcissus (*N. poeticus*), also known as pheasant's eye, the jonquil (*N. jonquilla*), and *N. tazetta* mentioned above. The Lent lily (*N. pseudo-narcissus*), or daffodil, is also one of the most widespread and hardy. See DAFFODIL.

**NARCOSIS**, or **NARCOTISM** (Greek, "stupor"), insensibility more or less profound, the result of absorption by the blood, and subsequent action on the brain, of certain drugs in poisonous amount, or of certain excretory elements, as in uræmia.

**NARCOTICS** (from Greek *ναρκωδν*, to be numb), substances which have the property of stupefying. In small (medicinal) doses they either quiet undue irritability of the nervous system, producing sleep and relieving pain or spasm, or they excite or stimulate the normal irritability. Opium and alcohol, for example, are sometimes used as "bracers." Narcotics are too frequently used for slight ailments or fancied ones because the repeated or habitual use of small doses is dangerous, as it is apt to excite a craving for and the use of larger or poisonous doses. (See POISONS). Poisonous doses produce stupor, coma and sometimes convulsions and death. Though the effects of most of the narcotics resemble more or less those of opium each narcotic affects the system in a peculiar way. Belladonna, for example, dries the throat, dims the vision, dilates the pupils of the eyes (opium contracts them), and produces delirium. Some narcotics produce constipation, others do not. Some act principally upon the brain, others on the alimentary canal or bronchial tubes. The principal narcotics are opium (with its alkaloids, such as morphia, codeine and thebaia, and preparations of it—paregoric, laudanum, etc.), belladonna, camphor, hyoscyamus or henbane, caffeine, chloral hydrate, alcohol, Indian hemp, hops, bromide of potassium and stramonium. There is also a group of chemical organic compounds which are narcotics, such as paraldehyde, sulphonal and trional. Narcotics should be used with extreme caution, as the susceptibility to their poisonous effects varies in different persons. Of late years the market has been flooded with so-called paincures, carminatives, cordials, soothing-syrups, etc., warranted to be harmless, but which are in fact narcotics, in mixtures more or less agreeable to the taste, but none the less liable to do harm. Children are more susceptible to the influence of narcotics than adults, hence the risk of giving them to children is greater. See ANÆSTHETICS; ANALGESICS; COAL TAR; HYPNOTICS; TOBACCO.

**NARCOTINE**, an alkaloid which forms from 5 to 6 per cent of the opium from Asia

Minor and a larger proportion of the opium from India and Persia. It has the chemical formula  $C_{20}H_{23}NO_7$ , and acts as a narcotic poison. It may be prepared as follows: The morphine content of the opium is first dissolved out with water—in which narcotine is almost entirely insoluble. The residue is then exhausted with dilute hydrochloric acid, forming narcotine hydrochloride. The alkaloidal bases that the extract contains are precipitated by the addition of caustic potash. The precipitated bases are then redissolved, and the solution is treated with oxalic acid to precipitate the papaverine that it contains, after which the filtered solution is treated with ammonia to throw down the narcotine. The precipitate so obtained is purified by recrystallization from alcohol. A simpler method, but more expensive, is to boil the opium with ether in which the narcotine dissolves. Narcotine was the first alkaloid obtained from opium, of which it constitutes from 1 to 8 per cent by weight. It is almost insoluble in cold water, moderately soluble in alcohol and in ether, and readily soluble in chloroform. It crystallizes in trimetric prisms, or in radiating needle-like forms, which melt at 345° F. Aqueous solutions of the alkaloid are neutral, and solutions in other menstrua are but feebly alkaline. Narcotine (unlike the other alkaloids that opium contains) appears to exist in opium in the free state, and not in the form of a salt. Its salts do not crystallize readily, their aqueous solutions are acid, and are decomposed when evaporated, with separation of free narcotine. A larger dose of narcotine is required to produce the same effect as a given quantity of morphine or codeine.

**NARD**, a plant, spikenard. See ARALIA.

**NARES**, nārz, SIR George Strong, English vice-admiral and Arctic explorer: b. Aberdeen, 1831; d. 15 Jan. 1915. The son of a naval officer, he was educated at the Royal Naval College and entered the navy in 1845. After serving on the Australian station he was appointed mate on the *Resolute* in the Arctic expedition of 1852-54, taking part in some long sledge journeys, covering 665 miles in 69 days and later 586 miles in 56 days. He next served in the Crimean War; on the Mediterranean station; and lieutenant in charge of cadets, for whose instruction he wrote 'The Naval Cadet's Guide' (1860), afterward published under the title of 'Seamanship.' In 1866-67 he surveyed the coasts of Australia; in 1869 the Gulf of Suez, and from 1872 to 1874 commanded the *Challenger* on a deep-sea exploration round the world. In 1875 he was placed at the head of the North Polar Expedition, consisting of H. M. S. *Alert* and *Discovery*, with the object of reaching the Pole via Smith's Sound. Leaving the *Discovery* in Lady Franklin Bay, Nares proceeded in the *Alert* along the western shore of Robeson Channel, reaching the then highest latitude (82° 27') and long. 61° 22'. The sun disappeared for 142 days from 12 Oct. 1875; on the return of daylight, a sledge expedition of 53 men attempted a "dash" to the Pole, returning after 72 days, suffering intensely from the cold and scurvy. They had planted the British flag in lat. 83° 10' 26" N. Returning home in Oct. 1876, Nares was employed in various duties till 1878, when he was

sent in the *Alert* to survey Magellan Strait, South America. He was created K. C. B. in 1876. For 18 years he was next engaged at the Board of Trade as professional officer of the harbor department; then he became Acting Conservator of the River Mersey, retiring in 1886. He published a number of reports on his voyages.

**NAREW**, nā'rēf, Russia, river in Poland rising in the government of Grodno out of the swamps of Byelovyehz and becoming navigable near Tikozyń, it flows past Lomza and Pultusk entering the Bug below the latter town. It has a length of 271 miles. The Niemen is connected with this river by the Augustowo Canal.

**NARIAKI**, Daimyo, of Mito, a member of the Gonsanké, or three princely Tokugawa families of Kiushiū, Owari and Mito, who ranked first among the territorial nobility of Japan. He flourished in the middle of the 19th century, and was noted as the leader of the seclusion policy of Japan. While working hard to improve the military and educational systems and to stir up her warlike spirit which the long years of peace had greatly diminished, he recognized that his country must soon be called upon to take her place among the nations of the world, yet he deliberately proclaimed the doctrine of the seclusion of Japan, in the meantime working strenuously to transform Japan along the lines of the very civilization and culture he pretended to be fighting. Nariaki's personality was the strongest and his intelligence the keenest, in his day, in Japan, and he soon was able to make his cry of the "expulsion of the barbarians" that of the whole country. History shows that he was, by far, the best informed man in his day, in Japan, on "foreign ways." He fully appreciated the importance of providing Japan with the armaments and sciences of the western nations; and as early as 1849 he had begun spending comparatively large sums of money in the manufacture of arms along the latest European models. Against all opposition he prepared Japan for her wonderful leap into the arena of western civilization, while all the time he was misunderstood at home and abroad. Consult Okuma, Count Shigénobu, 'Fifty Years of Japan' (English trans. by Marcus B. Huish, London 1909).

**NARIÑO**, nā-rē'ño, Antonio, Colombian politician: b. Bogota, Colombia, 1765; d. Leiva, Colombia, 13 Dec. 1823. He was educated in the college of San Bartolome in Bogota and entered the magistracy. His writings of a revolutionary character brought him into trouble and in 1795 after a tedious trial he was transported to Spain under sentence of 10 years' penal servitude. Escaping in 1797 he returned to his own country but was again imprisoned and not released until the Revolution of 1810, when he joined the patriot army. He was elected President in 1811 and later dictator. On the outbreak of civil war Nariño defeated the Federalists, and then resigning his dictatorship marched against the Royalist forces in the south. His success was followed by defeat at Pasto in 1814 when he was captured and sent a prisoner to Spain. He was held a prisoner until 1820 when he returned to his own country. In 1821 he was elected senator, but declined the

vice-presidency in 1822, and ill-health compelled him to retire soon after his appointment as commander-in-chief in 1823.

**NARNI**, nār'nē, Italy, town known to the ancients as Nequinum and later as Narnia. It is located in the province Perugia on a cliff beneath which, in a deep ravine, flows the Nera (the ancient Nar). It is on the Rome-Foligno Railway, is seat of a bishop and has a cathedral dating from the 11th to 15th centuries, besides other churches erected from the 9th to the 15th century. Here are also ancient dwellings and castle, a town-hall dating from the 13th to 16th century, strong remains of a Roman bridge (of Augustus), an ancient aqueduct, etc. Its industries number leather and rubber-ware factories and oil presses. This is the birthplace of the Emperor Nerva and of Pope John XIII. Pop. 12,943.

**NARO**, nā'rō, Italy, town in the province Girgenti, Sicily, on the coastal river Naro, 12 miles from Girgenti. It has a castle dating from the Middle Ages and Early Christian catacombs. In the vicinity are large sulphur pits. The population in 1911 was 13,802.

**NARRAGANSETT** (nār-ə-gān'sēt) BAY, an inlet of the Atlantic Ocean, extending into the State of Rhode Island about 28 miles. At its entrance, from Sakonnet Point to Point Judith, the bay is about 8 miles wide. One of its channels, on the east, is called Sakonnet River, and the chief arms of the bay are on the east, Mount Hope Bay, on the west, Greenwich Bay. The principal rivers which enter the bay are, at its head, Providence River, from the east Taunton, from the west Pawtuxet. The largest island in the bay is Rhode Island, and others are Conanicut, Prudence and Hog. Several places of importance are on the shores of the bay, chief of which are Providence at the mouth of the Providence River, Newport on Rhode Island and Fall River, at the mouth of the Taunton. Narragansett Bay is of great importance to the State, as it gives opportunities for commerce and transportation. The first explorers of the northeast coast of the United States mention this bay. Consult Bacon, E. M., 'Narragansett Bay' (New York 1904).

**NARRAGANSETT INDIANS**, an American tribe formerly occupying the territory now comprised in the State of Rhode Island and the eastern part of Long Island. Shortly after the arrival of the pilgrims they manifested symptoms of hostility; and as an expression of sentiment Canonicus, their chief, sent to Plymouth a bundle of arrows wrapped in the skin of a rattlesnake; to which Bradford, the governor, replied with the same skin filled with powder and shot. This significant retort secured, if not the good-will, at least the peaceableness of the sagacious chief. In the Pequot War they aided the colonists, but not unambiguously. In the winter of 1675, during King Philip's War, that chief having taken refuge with the tribe, the colonists, apprehending that they would join his cause, made a secret attack upon their principal fort, killing about 1,000 warriors, destroying all their provisions, and exposing those who escaped to cold and famine, of which very many died. The Narragansetts from this time waged incessant war with the whites. They have now entirely disappeared as

a race, although some of their descendants of mixed blood are to be found in one or two localities in Rhode Island.

**NARRAGANSETT PIER, R. I.**, a famous summer resort, in Washington County, on Narragansett Bay, and on the Narragansett Pier Railroad, a connecting line with the New York, New Haven and Hartford Railroad, about 10 miles from Newport and 28 miles from Providence. The railroad was built in 1876 and extends from Kingston Station to the "The Pier," a distance of about 12 miles. A steamer plies daily during the season between Newport and "The Pier." The chief attractions are the climate and the scenery. Narragansett Heights, about three miles distant, are about 400 feet above sea-level and the colored rocks nearby and the long beach are attractive. There are a number of fine hotels, handsome cottages and excellent bathing houses and pavilions. The place was settled in 1675, and the same year an engagement took place nearby between the colonists and the Narragansett Indians. General Winslow, who commanded the colonists, about 1,000 in all, captured 600 Indians and killed 300. The loss of the whites was about 150 wounded and 85 killed. The pier, from which the place takes its name, was built in 1815. Pop. of town 1,250.

**NARRATIVE POETRY.** The telling of a story in verse is in modern times rather exceptional than normal, owing to the extraordinary rise in importance of prose fiction. But in early periods narrative poetry was the most abundant and important kind, owing to the primitive tendency to devote poetry largely to objective purposes, in contrast with the subjective tendency of modern poetry. For the various types, see under **LITERARY FORMS**.

**The Ballad.**—In general this is the most primitive type of narrative poetry, and is assumed to have existed among practically all peoples, though in many instances no early examples have survived. This proportionately large disappearance of early ballads is due to their belonging to the period of oral composition and transmission, as distinguished from that of written literature; and this oral element is the fundamental characteristic of the type. It is connected, too, with the element of song; for the primitive ballad may always be assumed to have been sung. A surviving evidence of this is the frequent appearance of a refrain, perhaps originally joined in by the whole company of persons present at the ballad singing. Closely connected with these characteristics is the *communal* spirit of the old ballad: the form arises from a state of society when the individual poet is of relatively slight importance and when the content of poetry is not the experiences and feelings of the individual singer but those of the group. Hence in the ballads we do not look for individuality of style; of this their universal anonymity is a sign. Their language is simple, unsophisticated, but conventional, marked by abundant repetition yet by rapidity of narrative method,—in a word, the language of an age, as Ten Brink put it, whose poetry is "oscillating perpetually between reminiscence and improvisation." Very many of the ballads, if not all, had their origin in the versifying of a real fact, gathering up mythical elements in

the manner of popular tradition. Often there are many different versions of the same story, some differing only in details, others in essential elements, such as changes from supernaturalism in the direction of realism, or variants characteristic of particular localities or social groups.

Of ancient ballads of Greece and Rome no remains survive, though evidence of their nature is thought to be traceable in elements of the ancient epics. Macaulay, in his 'Lays of Ancient Rome,' made a brilliant but rather sophisticated attempt to conceive the matter and spirit of ballads of the early Roman people. Of the Latin races the Spanish branch has preserved the greatest number of ballads, some of those still extant dating from the early 11th century; most famous are those concerned with the story of "the Cid," in the 12th century. Of French balladry the remains are more fragmentary. The early Germans are known to have made abundant use of ballads, and a collection of them was made under the direction of the Emperor Charlemagne; a surviving fragment of a "Hildebrand song" is supposed to date from the 8th century. Later, in the 15th and 16th centuries, a new era of German balladry developed; and toward the end of the 18th century modern scholars, led by Herder, began the systematic collection of the ballads of the race. There are also rich remains of the ballads of the Scandinavian peoples, dating from the 11th, 12th and 13th centuries; a collection was made in Denmark as early as 1591, while one of the greatest of modern ballad collections is that of the Danish scholar Grundtvig. The Slavic peoples have preserved an abundant ballad tradition, and some of them, notably the Serbians, are to this day in the ballad-making and ballad-singing period. Of the early English ballads no remains are preserved; but there are numerous survivals of the mediæval and modern periods of ballad-making, both in Scotland and England, beginning perhaps in the 13th century and extending as late as the 18th. The Robin Hood group includes the most famous of these,—a cycle thought to have originated in the 13th century. A monumental collection of the English and Scottish ballads was made by the American scholar F. J. Child.

The revived interest in balladry characteristic of the romantic movement in the late 18th century led to the writing of various modern adaptations and imitations, of which one of the most famous is the German poet Bürger's ballad of 'Lenore,' which was translated by Walter Scott. Wordsworth and Coleridge also adapted the ballad form to two different types of narrative verse found in their volume of 'Lyrical Ballads' (1798),—types represented respectively by Coleridge's 'Ancient Mariner' and Wordsworth's 'Lucy Gray.' Finally, one must note the distinction between these ballads which in one way or another hark back to the old folk poetry and the so-called ballad which is characteristic of the age of printing, and was abundantly produced, in doggerel verse, in the 16th and 17th centuries; these compositions, which are usually destitute of literary value, are sometimes called "broadside ballads," from the most common form of their printing.

**The Epic.**—This type may be viewed as an elaboration of the ballad, developing similar

material more formally and at greater length, and representing a state of society more highly organized, socially and politically. Frequently a definite racial or national spirit underlies the epic, its subject, as Hegel expressed it, being some action which "includes the whole life of a nation and the history of an epoch." Like the primitive ballad, the primitive epic belongs to the period of oral transmission, but is associated with recitation rather than song, and with the art of professional entertainers, such as the German *scooper* and the French *jongleur*. In some of the more elaborate ballads, notably the expanded ballad called 'A Gest of Robin Hood,' one may see something of the transition to epic elaboration and individual art-composition; and certainly when we reach the full epic form, though it is still representative of communal material and interests, we recognize the skill of highly developed individual workmanship, giving unity and form to great masses of material. It is customary to distinguish between the folk-epic, based originally on ballad tradition, and showing comparatively little of the spirit of the individual artist, and the art epic, consciously and imitatively developed by a poet of a literary age. Of the former the conventional example is the Greek 'Iliad' of Homer, dealing with the hero Achilles and the Trojan War; of the latter, the Roman 'Æneid' of Virgil. But the distinction cannot be maintained with accuracy, since there is indefinite gradation from the communal to the individual method. Thus the Greek 'Odyssey,' on the wanderings of Ulysses, which is traditionally attributed to the same poet as the 'Iliad,' shows far less of the national and communal, and more of the individual, spirit. Other epics of the more or less primitive type are the 'Mahabharata' of India, based on the mythologic legends of the Hindu people; the German stories of the 'Nibelungen' and 'Gudrun,' dating from the 13th century; the French *chansons de geste*, or heroic songs, abundant in the 11th and 12th centuries, of which the chief is the 'Song of Roland'; the Spanish 'Poem of the Cid,' of the 12th century; and the old English 'Beowulf,' in its present form dating from the beginning of the 8th century, but representing an earlier period and Scandinavian rather than English matter. The old Norse lays of the 'Elder Edda' approximate epic form, but in unity and elaboration the prose 'Saga of the Volsungs' is nearest, for the Scandinavians, to the true epic. Epics half way, in a sense, between the primitive and the sophisticated type, are the Indian 'Ramayana,' the Persian 'Shah-Nameh' (made by the court poet Firdausi from primitive epic material), and the Finnish 'Kalevala' (compiled by the modern philologist Lönnrot). To the same hybrid class belong the partly compiled, partly composed Celtic "epics" of James Macpherson, 'Fingal' and 'Temora' (1762-63), based on more or less genuine materials from the Scottish Highlands, attributed to a traditional bard named Ossian.

The imitative or art epic has been well represented in every literature which came under the influence of the classical tradition. For Greece itself there was a considerable number of these poems, commonly called the "epic cycle," whose authors undertook to complete the epic treatment of national material left untouched by Homer; and, in the Alexandrian

age, the 'Argonautica' of Apollonius of Rhodes. For Rome, as we have seen, the great example is the 'Æneid,' which remains the most successful reproduction by art of the spirit of the folk epic; for Virgil celebrated a theme of national significance at the moment when the national life of the Romans was at its height. Later Roman epics were the 'Pharsalia' of Lucan and the 'Thebais' of Statius. In the mediæval period the epic form, like all literary forms, was turned to the service of the Church, and there was a considerable production of Christian epics, beginning with the 'Historia Evangelica' of Juvenius, in the 4th century. Highly characteristic, too, of this era are narrative poems of allegorical or symbolic type, having something of the dignity and elaboration of the epic but without its usual themes or methods; one may note examples as different as the great 'Divine Comedy' of Dante and the English poem of 'Piers Plowman.' The Renaissance was followed by various experiments in formal epic, such as the 'Lusiad' of Camoens in Spain (1572) and Tasso's 'Gerusalemme liberata' (1581) in Italy. In the 18th century Voltaire attempted to revive the glory of the form in his 'Henriade' (1723). In Germany the most notable modern epic is Klopstock's biblical 'Messias' (1773); there is also a 19th century version of the Nibelungen epic by Wilhelm Jordan. In England the Renaissance poets were rather less interested in the epic than those of the Continent, though Spenser doubtless regarded the allegorical narrative of his 'Faery Queene' (1590-96) as in the epic tradition; and the same thing is true of historical poems like Warner's 'Albion's England' (1586), Daniel's 'History of the Civil Wars' (1595), and Drayton's 'Mortimeriados' or 'Barons' Wars' (1596, 1598). It was reserved for Milton to make the only really vital application to English poetry of the old epic method, in his 'Paradise Lost' (1667), a work dealing with the supreme conflict of the whole human race instead of a special branch of it. Cowley had already produced a biblical epic in the 'Davideis' (1656), and Davenant an historic epic in the 'Gondibert' (1651),—both highly praised in their time, but now considered unreadable. Equally lacking in vitality were the English epics of the 18th century, such as Blackmore's 'Alfred' (1723); Glover's 'Leonidas' (1737), and Wilkie's 'Epigoniad' (1757); on the other hand the taste of this age for the epic form found expression in Pope's famous translation of Homer. In the early 19th century the epic method was revived by Southey in a series designed to represent the great religions of the world: 'Thalaba,' 'Madoc,' 'The Curse of Kehama,' and 'Roderick' (1801-14). The taste of the modern period, however, turned very definitely either to romance or realism, both of which found expression in Byron's great satiric-romantic-realistic epic of 'Don Juan' (1819-24). Something of the old epic method was again revived by Tennyson for his rather mysteriously termed 'Idylls of the King' (1859-85), and— with far more regard for the primitive tradition—by William Morris in 'Sigurd the Volsung' (1876). But the finest example in modern poetry of classical epic style is found in the episodic 'Sohrab and Rustum' of Matthew Arnold (1853),—a version of a brief

portion of the Persian 'Shah-Nameh.' Once more, at the opening of the 20th century, a vigorous effort has been made to revive the national epic, in the 'Drake' of Alfred Noyes.

Finally, we may note that in every period there have been burlesque or satiric epics, taking their point from the very dignity of the traditional form in contrast with the triviality or meanness of its new application; such are the ancient Greek 'Battle of the Frogs and Mice,' Butler's 'Hudibras' (1662); Boileau's 'Lutrin' (1674), and Pope's 'Rape of the Lock' and 'Dunciad' (1712 and 1728).

**The Metrical Romance.**—This type of narrative poem is especially characteristic of the mediæval period, or, more generally, of the age of chivalry as distinguished from that of primitive heroic life and literature. Between many of these poems, however, and the epic, the line is a very doubtful one. The greatest representatives of the type are found in Chrestien de Troyes, a *trouvère* of France in the late 12th century, and two German poets of the early 13th century, Gottfried of Strassburg and Wolfram of Eschenbach, of whom the former rewrote the story of Tristan and Isolde and the latter the story of Parsifal. But besides these, in every country of western Europe, there were uncounted nameless authors both of individual poems and of those which go to make up the great "cycles" like those of Arthur, Tristram, Gawain and other popular heroes. It is common to divide these romances according to the geographic source of their material, which is thus classified as "Matter of France," "Matter of Britain" (that is, the primitive Celtic region, whether continental or insular), "Matter of the Orient," etc. But in the actual authorship and distribution of the romances, linguistic, racial and geographic lines play comparatively little part, a good portion of them having become the property of all the European peoples of their age. Like the epic, these romances represent the age of recited poetry and of professional entertainers; Scott's 'Lay of the Last Minstrel' at once describes the type and exemplifies the way in which he came to pass from the study of the early romances to the writing of modern originals. In England the finest of the romances are as late as of the 14th century; notably, for the more popular sort, the 'Sir Gawain and the Green Knight' of a genius whose name has been lost, and for the more literary, the 'Troilus and Criseyde' of Chaucer, in which a familiar episode of the old Trojan war story is treated with an interest in characterization and in realistic humor which make it anticipatory of the modern novel. On the border, again, between the mediæval and the modern spirit was the popular Italian romance of the Renaissance, Ariosto's 'Orlando Furioso' (1515). In the neo-classical period, especially the 18th century, this loose and unauthentic type of poetry was naturally regarded with little favor, and for equally obvious reasons it was enthusiastically revived by the representatives of the "romantic revival." In England the metrical romances of Scott, already referred to, were the most important results of the movement, especially 'Marmion' and 'The Lady of the Lake' (1808 and 1810). In the introduction to 'The Bridal of Triermain,' Scott distinguished the form from epic poetry as being free from all rules save "those which

good sense, good taste and good morals apply to every species of poetry." In the later 19th century it was again revived by William Morris in various imitations of the work of mediæval romancers; while in Germany a notably successful specimen was Scheffel's 'Trompeter von Säckingen' (1853).

**The Tale, etc.**—In all periods, and especially in modern times, narrative poetry tends to overrun the bounds of fixed types, and to appear in forms which may be vaguely called metrical tales or otherwise. In classical literature the most influential example of this form is the 'Metamorphoses' of Ovid, whose material sifted down into a great part of mediæval and Renaissance poetry. In the mediæval period the supreme example is the 'Canterbury Tales' of Chaucer, which drew upon every type of story material, combining sentiment and humor, realism and romance. In the Renaissance the Ovidian type of narrative poem is represented by Marlowe's 'Hero and Leander' and Shakespeare's 'Venus and Adonis' and 'Lucrece.' Dryden's 'Fables' (1700) are a landmark in another period, but are largely versions of tales by earlier poets. Like the metrical romance, the poetic tale was abundantly revived in the period of the romantic revival, sometimes with a view to the attainment of realistic simplicity, as in Wordsworth's 'Michael' or (in Germany) Goethe's 'Hermann and Dorothea,' sometimes with a preference for highly romantic elaboration, like 'The Eve of Saint Agnes' of Keats. Byron's "tales," nine in number, published between 1813 and 1823, went far to supplant the popularity of Scott's metrical romances, and in some cases might very well be called by that name themselves. Space does not permit the tracing of the varied development of the less defined types of narrative poetry through the 19th century. Perhaps the most remarkable experiment made in that period was Browning's 'The Ring and the Book' (1868), in which a single story is told 10 times over, in a series of monologues supposed to be uttered by various persons concerned. Tennyson, on the other hand, told the story of 'Maud' (1855) in a series of monologues and lyrics supposed to be uttered by a single person, forming a "monodrama." Both these works are characteristic of the trend of narrative poetry in modern times, toward subjective and spiritual qualities, as opposed to the objectivity of the increasingly rare epic method. On the other hand, the early 20th century has seen some return to the more objective tale in the Elizabethan narratives of Alfred Noyes's 'Tales of the Mermaid Tavern' and the realistic contemporary narratives of John Masefield, notably 'Dauber.'

**Bibliography.**—For the nature and development of the more primitive types of narrative poetry, consult Gummere's 'The Beginnings of Poetry' (New York 1901) and 'The Popular Ballad' (Boston 1907); Ker's 'Epic and Romance' (London 1897); Hart's 'Ballad and Epic' (Harvard Studies and Notes, Boston 1907); Saintsbury's 'The Flourishing of Romance and the Rise of Allegory' (London 1897); Billings's 'Guide to the Middle English Metrical Romances' (New York 1901); Schofield's 'English Literature from the Norman Conquest to Chaucer' (New York 1906); the introductions to the translations of 'Beowulf'

and the 'Song of Roland' in the 'Riverside Literature Series' (Boston); and the volume of 'Arthurian Chronicles' in 'Everyman's Library.' On the Greek epic, consult Lang's 'Homer and the Epic'; on epic poetry in general, Dryden's Preface to his translation of Virgil and Clark's 'History of Epic Poetry' (Edinburgh 1900); on English narrative poetry, Dixon's 'English Epic and Heroic Poetry' (London 1912).

RAYMOND M. ALDEN,  
*Professor of English, Leland Stanford Junior University.*

**NARRENSCHIFF**, năr'ên-shîf, Das ('The Ship of Fools'), Sebastian Brant's celebrated work (1494). See BRANT, SEBASTIAN.

**NARROWS.** See TRELISED DRAINAGE and STREAM PIRACY.

**NARROWS, The**, a narrow part of New York Bay, a channel which connects Upper New York Bay with Lower New York Bay, and separates Long Island and Staten Island. At the south entrance of The Narrows are two forts, Fort Hamilton on Long Island and Fort Wadsworth on Staten Island. See map of Greater New York and vicinity under NEW YORK.

**NARSES**, năr'sêz, Byzantine general: b. Armenia, 472; d. Rome, 568. He was a eunuch when he entered the imperial household in Constantinople, of which he soon became chamberlain. His ability soon advanced him to the office of treasurer to Justinian, who sent him to Italy in 538 to keep an eye on Belisarius. Narses was recalled in 539 and in 551 succeeded Belisarius as commander-in-chief in Italy and speedily drove thence the Franks and Goths, and re-established Byzantine control. He took possession of Rome and was appointed prefect of Italy in 554. In spite of his able administration he was removed by Justinian's successor, Justin II, on the ground of his avarice which caused him to levy severe taxes on the people. Legend says that he was insulted by the Empress Sophia upon his dismissal, and that he thereupon went over to the Lombards. He was equally famous as general and statesman. Consult Hodgkin, 'Italy and Her Invaders' (1885-95, Vols. IV and V); Bury, 'Later Roman Empire' (Vol. I, 1889); Gibbon, E., 'Decline and Fall of the Roman Empire' (London 1898); 'Cambridge Mediæval History' (Vol. II, New York 1913).

**NARTHEX** (Greek, a reed, hence any oblong figure), the term used in ecclesiastical architecture to designate the westernmost division of an ancient Greek church, running like a cloister from the north to the south wall. It was a vestibule, separated from the nave proper by a screen or railing, beyond which catechumens and those under Church censure or penance were not permitted to advance. It had three door-ways, one on the west as well as one in the northern and southern walls. The western was the principal entrance and was known as "the beautiful" or "royal gate." The doors leading through the screen into the nave were named according to the classes who used them, "the priests' gate," "the men's gate," etc. The narthex was also used for funerals and public meetings; baptism was celebrated there and the font, which had formerly been

in a building adjoining the church, was also placed in the narthex. There was sometimes an inner and an outer narthex. Consult Bingham, 'Christian Antiquities'; Siegel, 'Christliche Alterthümer'; Walcott, 'Sacred Archaeology.'

**NARUSZEWICZ**, nă-roo-shă'vich, Adam Stanislaw, Polish historian and poet: b. Pinsk, Lithuania, 20 Oct. 1733; d. Janow, Galicia, 8 July 1796. He became a Jesuit in 1748; taught in the Jesuit schools in Vilna and Warsaw; and after the suppression of the Order became bishop of Smolensk, and later of Lutsk. His poetry, consisting of translations, odes, fables, epigrams, satires and idylls, was first published in 1778. In prose, he translated Tacitus, wrote a biography of Chodkiewicz (1781), composed a history of Crimea (1787), and on the suggestion of his patron, King Stanislaus Augustus Poniatowski, wrote his greatest work, a history of Poland down to 1386 (1780-86, new ed. 1859-60), which, because of its style and its protest against the abuses of a monarchy or an aristocracy, won him the name of the Polish Tacitus.

**NARVA**, năr'vă, Russia, town in the government of Petrograd, on the river Narova, 100 miles southwest of Petrograd. It contains several Greek and Lutheran churches, has a fine town-hall, a castle, two gymnasia, a theatre and technical schools in connection with the cotton and woolen mills nearby. Cotton and lumber are the principal items of trade. The town was founded by the Danes in the 13th century, and after being held briefly by the Russians passed to the Swedes in 1581. Peter the Great took it in 1704. Here, on 30 Nov. 1700, was fought a battle between 8,000 Swedes under Charles XII and 80,000 Russians under General Dolgorouki. The Russians were besieging Narva, and after driving in 10 large bodies who occupied advanced positions, Charles boldly attacked their entrenched camp. After a brief cannonade the Swedes stormed the Russian trenches, and although the Russian artillery stood to their guns, the defenders were driven out in disorder after three hours of hard fighting. The Russians lost 18,000 men in the trenches and many more in the open fight; the Swedes only lost 600. Pop. 21,478, Germans, Esths and Russians.

**NARVACAN**, năr-vă-kăn', a pueblo of the province of Ilocos Sur, Luzon, situated 13 miles southeast of Vigan, the provincial capital. It is on the main road and one of the most important towns of the province, being next the capital in population. Pop. 19,500.

**NARVAEZ**, năr-vă-êth', Pánfilo de, Spanish soldier in America: b. Valladolid, about 1470; d. near mouth of Mississippi River, November 1528. He came to America about 1498, settled first in Santo Domingo and then in Cuba, where from 1512 until his death he was under Velasquez in the command of an auxiliary force in the conquest of the island. The disobedience of Cortés in Mexico, whither he had been sent by Velasquez, led the latter to send Narvaez in 1520 to supersede and punish Cortés. This expedition was entirely unsuccessful. Narvaez landed at Vera Cruz in April; was defeated in May at Cempoala by the army of Cortés; lost one eye in the battle, and was deserted by the remnant of his army, which

joined Cortés. He was captured, but soon released; returned to Spain, where he was appointed governor of Florida in 1526, and sailing from Cuba in March of 1528, landed at Apalachee Bay, lost half his men on the march inland, retreated to the shore, where he found that his ships had been destroyed, and having built boats, sailed westward along the coast, only to be shipwrecked with all but four of his men. Consult Bourne, E. G., 'Spain in America' (New York 1907); Alvar Nñez Cabeza de Vaca, 'Relación' (in J. F. Jameson's, ed., 'Original Narratives of Early American History' (Vol. II, ib. 1907).

**NARVÁEZ, Ramón María, DUKE OF VALENCIA**, Spanish general, and statesman: b. Loja, Andalusia, 4 Aug. 1800; d. Madrid, 23 April 1868. He entered the army in 1815; fought against the French and in 1822 assisted in putting down the uprising in the Royal Guards; lived in retirement at Loja from 1823 until the death of Ferdinand VII in 1833; in 1836 defeated the Carlist leader, Gomez; and in 1838, after clearing La Mancha of brigands, was made captain-general of Old Castile. He led an insurrection against Espartero, in 1840, his old chief, but was beaten and fled to France, where he joined the party of Maria Christina. He returned to Madrid in July 1843; Espartero left the country; and from May 1844 to February 1846, and from October 1847 to January 1851 Narvaez was Prime Minister, in recognition of his services to Maria Christina. In 1845 he was made grandee of Spain of the first class and Duke of Valencia. He began by changing his policies to the more conservative form, revising the Liberal constitution of 1837. He held the same post in 1856-57 and 1864-65, being Minister to Paris and Vienna in the intervals. During the military rising of 22 June 1866 Narvaez commanded the loyal soldier, and in July succeeded the defeated O'Donnell as Ministry President and Minister of War. A Liberal in early life he became more and more conservative and spent his last years in attempting to keep Isabella on the throne. Consult Mazade, 'Les révolutions d'Espagne' (Paris 1869); Pirala, A., 'Historia contemporánea' (Madrid 1871-79).

**NARVIK**, nár'vik, Norway, small town on the Ofoten Fjord, with beautiful mountainous surroundings. It is also known as Victoriahavn, and is the terminus of the Ofoten Railway which transports an enormous tonnage of Swedish iron ore. It is used by the tourists visiting the lovely Lofoten Islands. It is a station for coastwise trading steamers. Pop. about 4,643.

**NARWHAL**, a large porpoise which inhabits the Arctic Ocean. It belongs to the family *Delphinidae* and was named *Monodon monoceros* by Linnæus. Its most striking characteristic is the possession by the male of a very long, straight, spirally-grooved tusk, which projects forward from the left side of the upper jaw in line with the axis of the body. When full-grown the narwhal has a length of about 16 feet. The head is rounded, the back has a very low ridge instead of a fin and the pectoral fins are short and broad. The color of the body is gray above and white below, everywhere mottled and spotted with gray and black. The young are darker colored, while

old individuals are often nearly white throughout. The vertebral formula is as follows: Cervicals, 7; dorsals, 11; lumbar, 6; caudals, 26; total, 50. The cervical vertebrae, unlike those of other true porpoises, except the beluga or white whale, are all free. The skull is depressed, with a broad rostrum.

The massive tusk or maxillary tooth of the narwhal is developed only in the male, and with rare exceptions, only on the left side of the jaw. Normally the corresponding tusk or tooth of the right side remains concealed in the maxillary bone during life. In females neither tusk is visible. All other teeth are wanting in adults of both sexes. Occasionally, both tusks are developed in males and in females as well. About 16 such heads have been preserved, including one from Prince Regent Inlet, in the National Museum, Washington. The largest narwhal tusks are about eight feet long, with a girth of about nine inches at the base. They are hollow for a considerable proportion of their length.

The tusk is a secondary sexual character like the antlers of the stag, the spurs and comb of the cock, etc. It has been suggested that the narwhal makes use of the tusk to break the ice, to transfix its prey, or in combat, but these ideas lack confirmation.

When first introduced into Europe, the true origin of the tusks not being known, they were supposed to be the horns of the mythical unicorn. For a considerable time they were highly prized on account of their reputed medicinal properties, and are still made use of in China as a drug.

Narwhals occur in large herds or schools among the ice of the Arctic Ocean, northward of lat. 65° N. They migrate to higher latitudes as the ice recedes and return in the fall. Very rarely individuals stray southward along the coast of Europe as far as Scotland.

The narwhal resembles the beluga or white whale in many important characters, not shared by other porpoises, and forms with it a separate sub-family, the *Delphinapterina*.

**NASBY**, nāz'bi, **Petroleum V.** See LOCKE, DAVID ROSS.

**NASCENT STATE**, in chemistry, the state or the peculiar reactionary power possessed by an element at the instant of liberation from a compound or combination in which it has previously existed. At the moment an element is liberated from a compound of which it has been a constituent it acquires a higher power of chemical reaction than it displays some time after its liberation. One theory of the nascent state of an element is that the molecules at the instant of liberation are separate and independent; and that an appreciable length of time is required for their final arrangement; and that while they are in this free state they possess an extraordinary power of reaction, which power is otherwise exerted and expended in the act of molecular arrangement. For instance, it has been advanced by some chemists and physicists that hydrogen in a nascent state is made up of single atoms, while hydrogen in a gaseous state is composed of molecules, each molecule containing two atoms. Another theory is that nascent hydrogen is simply hydrogen under great pressure, for a mere increase in pressure will make ordinary hydrogen act

like nascent hydrogen. Thus many substances, such as aldehyde, will combine with nascent hydrogen which utterly refuses gaseous hydrogen.

**NASCOPI** (nā-skō'pē) or **NASCAPEE INDIANS**, a Labrador tribe, the most northeasterly known branch of the Algonquian family. They formerly occupied the interior table-land extending from Lake Mistassini to the Atlantic Ocean.

**NASEBERRY**, the fruit of *Sapota achras*, one of the finest West India fruits. The bark of the tree has astringent and febrifugal properties. See *SAPOTACEÆ*.

**NASEBY**, nāz'bī, England, a village of Northamptonshire, 12 miles northwest of Northampton (pop. 456), on the north side of which, on 14 June 1645, Fairfax and Cromwell, commanding the Parliamentary troops, defeated Charles I and his army, taking 5,000 prisoners and capturing the royal cannon and baggage. An obelisk marks the site. Pop. about 700.

**NASH, Abner**, American politician: b. Prince Edward County, Va., 8 Aug. 1716; d. Philadelphia, Pa., 2 Dec. 1786. He studied law and removed to New Berne, N. C., where he practised successfully and in 1774 he was a member of the first provincial congress of North Carolina. He served as member of the council which framed the State constitution in 1776 and was speaker of the senate in 1779. He was governor of the State from 1779-81 and in 1782-86 sat in the Continental Congress.

**NASH, Francis**, American soldier: b. Prince Edward County, Va., 10 May 1720; d. Germantown, Pa., 7 Oct. 1777. He was a brother of Abner Nash (q.v.), and early removed to North Carolina, where he was clerk of the Superior Court of Orange County. He was a member of the assembly in 1771, 1773-75. He served under the Crown with a captain's commission, but resigned and was a member of the provincial congress which met in 1775 when he was appointed lieutenant-colonel in the Continental army. In 1777 he was commissioned brigadier-general by the Continental Congress and at once joined Washington, under whom he commanded a brigade and was mortally wounded at the battle of Germantown.

**NASH, George Kilburn**, American politician: b. York Township, Medina County, Ohio, 14 Aug. 1842; d. 28 Oct. 1904. A descendant of Thomas Nash, he was educated at Reserve University and at Oberlin College (1862-64), studied law and was admitted to the bar in 1867. He was editor of the *Ohio State Journal*, and in 1879-82 was prosecuting attorney of Franklin County, Ohio. He established a law practice in Columbus in 1883-85. In 1880-83 he was attorney-general of Ohio and in 1883-85 served as member of the State Supreme Court commission. In 1880-81 and 1897 he was chairman of the Republican executive committee. In 1899 he was nominated for governor, was elected in November of that year and re-elected in 1901, his second term expiring in January 1904.

**NASH, Sir John**, English architect: b. London, 1752; d. East Cowes Castle, Isle of Wight, 13 May 1835. He studied and practised architecture under Sir Robert Taylor; then retired

from business until 1793; and upon his re-entry into the profession gained much royal and noble patronage. He laid out Regent's Park and the street leading up to the park, now called Regent street; remodeled Buckingham Palace and altered the Brighton Pavilion. He was particularly fond of single façades, of projecting colonnades and of a plentiful use of plaster and stucco. The use of cast-iron girders was principally introduced by Nash, who patented several varieties. Personally he was an estimable man, but unpopular because of George IV's display of favoritism toward him.

**NASH, Richard**, called **BEAU NASH**, English leader of fashion: b. Swansea, Wales, 18 Oct. 1674; d. 3 Feb. 1762. He studied at Jesus College, Oxford, was for a time in the army, but finding military discipline not to his liking, entered at the Inner Temple. In 1705 his skill in gaming took him to Bath, which in 1703 had become a much frequented watering-place. He determined to improve the provincial character of the spa, and soon became a self-appointed but arbitrary master of ceremonies. He was known as the "King of Bath" and his rule was celebrated in prose and verse. His code included the prohibition of swords within his realm, a restriction which tended toward that consideration for the public peace which was then growing in England. His vanity grew with his power; he appeared in a monstrous cream-colored beaver and invariably journeyed by post-chariot with three span of grays, footmen and outriders. Gambling was prohibited by law in 1740, and Nash, by 1745, had lost his trade. The town granted him an annuity of £10 a month. Goldsmith wrote his life (1762). Consult also Jerrold, C., 'Beaux and the Dandies' (New York 1910).

**NASH, or NASHE, Thomas**, English satirist and dramatist: b. Lowestoft, Suffolk, 1567; d. 1601. He studied at Cambridge in 1586, spent some time on the Continent, and before 1588 came to London. In 1589 he published his 'Anatomic of Absurditie.' In the literary warfare carried on between the Puritans and bishops Nash took an active part in behalf of the latter. Under the pseudonym 'PASQUI' he published the tracts 'A Countersuffe Given to Martin Junior' (1589) and 'Pasquil's Apologie' (1590). In 1592 he issued his powerful satire on contemporary society, 'Pierce Penniless his Supplication to the Divell.' His 'Christes Teares over Jerusalem' (1593) followed in repentant mood, and he affected to dismiss satire, in which, he said, he had "prodigally conspired against good houres." His notable work of picaresque fiction, 'The Unfortunate Traveller, or the Life of Jack Wilton' (1594) to a certain extent anticipated Defoe. Involved in a paper war with Gabriel Harvey, who had boasted of having put him to silence, he thereupon published 'Have with you to Saffron-Walden, or Gabriel Harvey's Hunt is Up' (1596), brimming with scorn. Nash also wrote plays, in whole or in part. He completed, unsatisfactorily (1594), Marlowe's 'Dido.' His 'Summers' Last Will and Testament' (1593), comedy, was first published in 1600. A play, 'The Isle of Dogs,' led to his imprisonment for attacks contained in it. He died having, as one epitaph put it, "never in

his life paid shoemaker or tailor." Nash's personality was somewhat unique in Elizabethan literature. His prose was vigorous and his verses were at times those of a poet. His works were edited by Grosart (1883-85).

**NASHUA**, năsh'û-ă, N. H., city, one of the county-seats of Hillsboro County, on the Nashua River and on several branches of the Boston and Maine Railroad, about 33 miles south by east of Concord and 38 miles northwest of Boston. The first settlement was made in 1655 and in 1673 it was incorporated by Massachusetts as Dunstable township. In 1746 it was reincorporated by Massachusetts, and in 1836 it adopted the name Nashua. It received its city charter in 1853. It is an important manufacturing city; the water power is obtained from the Nashua River by means of a canal three miles long, 60 feet wide and eight feet deep. The chief manufactures are cotton goods, paper, shoes, iron and steel products, edge tools, hardware, saddlery, refrigerators, registers, sash, doors and blinds, ice-cream freezers, stationary engines, caskets and furniture. It has a United States fish hatchery, city and county buildings and several fine church buildings; Saint Francis Xavier (R. C.) is the largest. There are excellent public and parish schools and two academies. A new charter which provides for a mayor and 15 aldermen has been in force since 1913 and is working well. City elections are held entirely separate from State and national elections. The school board is chosen by popular vote. Pop. 26,000.

**NASHVILLE**, Ill., city, county-seat of Washington County, on the Illinois Southern and the Louisville and Nashville railroads, about 110 miles south by east of Springfield. It is in an agricultural region, in which there are large coal fields. The chief manufactures are flour, dairy products and agricultural and mining implements. Coal mining and cattle raising contribute to the industrial wealth of the city. Pop. 2,135.

**NASHVILLE**, Tenn., capital of Tennessee, the second largest city in the State, and county-seat of Davidson County, 186 miles southwest of Louisville, Ky., and 234 miles northeast of Memphis. Nashville is on the Cumberland River and the Nashville, Chattanooga and Saint Louis, Louisville and Nashville and Tennessee Central railroads.

**Topography.**—The city has an area of 18.2 square miles and is regularly laid out on gradually rising ground, sloping back from the river to an elevation of 654 feet above the sea. The streets are wide and well paved, about 242 miles of thoroughfare being covered with macadam and about 39 miles paved with granite, brick and bitulithic pavement. Around the city in every direction are the green hills of Middle Tennessee, where there is much commercial timber and mineral wealth. The soil in the vicinity produces every fruit and vegetable not absolutely confined to the tropics. The average rainfall for 31 years has been 48.82 inches; the average winter temperature 39° and summer temperature 79°; mean temperature for the year 59°.

**Government.**—Nashville has a commission form of government, of five commissioners, of

whom the mayor, commissioner of police and public welfare is chairman. The other commissioners are commissioner of finance and street lighting; commissioner of streets, paving and sewers; commissioner of waterworks, street sprinkling and alleys; commissioner of fire and buildings. The various other officers are elected by the city commissioners, who also serve as a board of civil service commissioners; the vacancies on the park commission, however, are filled by the surviving members of that commission which is self-perpetuating. The city expends annually \$2,000,000 for maintenance; the principal items being \$467,000 for schools; \$2,000 for interest on debt; \$213,000 for police department and \$230,000 for waterworks. The waterworks are owned by the city; the system which comprises 200 miles of mains cost over \$2,000,000. The electric lighting plant is also owned by the municipality. Over \$1,000,000 has been expended in recent years on a new and improved sewer system. The street railways operate over 95 miles of track, all converging at a central transfer station.

**Buildings.**—Prominent among the noticeable structures are the State capitol, costing \$1,500,000; United States Government building; Davidson County court house; the city hall; Tennessee School for the Blind; Tennessee Industrial School; the State penitentiary; the Parthenon; city hospital; Confederate Soldiers Home; Vendome Theatre; the Union depot; Hermitage hotel; Stahlman building; Independent Life building and the various churches and educational institutions.

**Education.**—There is no city in the South as prominent in educational interests as Nashville. Here is the seat of the Vanderbilt University; the University of Nashville; George Peabody College for Teachers; Ward-Belmont College; Boscobel College; Watkins Institute; Buford College; Nashville Bible School and many others; Saint Cecilia Academy; Fisk University; Roger Williams University; Walden University. The State Library contains 40,000 volumes. The Carnegie Library cost \$100,000 and has a fine rapidly increasing number of volumes. The Tennessee Historical Society has a large and valuable library, many rare manuscripts, portraits, etc. The public schools are of the highest rank; and embrace, in addition to the ordinary studies ranging into the high school education, departments of industrial education, stenography, typewriting, bookkeeping.

**Parks and Cemeteries.**—Nashville have 480 acres in parks. In the park surrounding the State capitol building is the tomb of James K. Polk (q.v.) and an equestrian statue of Andrew Jackson. The Hermitage, the former home of Jackson, is 10 miles east of the city. To the north is the National Cemetery where are buried 16,643 soldiers who fell in the Civil War. A Centennial Park has been made on the grounds of the Tennessee Centennial Exposition of 1897, and the former history building is now a museum and art gallery. In the park is a fine monument honoring James Robertson, the founder of Nashville. Watkins Park is to the west. Shelby Park, to the east of the city, is a natural shaded tract with a river frontage. Glendale Park, to the south, is a place of unrivaled beauty. There is also here

Mount Olivet Cemetery, with the beautiful Confederate soldiers' monument, and the Cumberland Driving Park.

**Manufactures.**—The industries of Nashville, which are more extensive than any other city in the State, had in 1919 aggregate capital of \$115,000,000, and manufactured products valued at \$150,000,000. The manufactures include flour, grist-mill products, lumber and timber products, fertilizers, cotton goods, clothing, harness, saddlery, soap, stoves, ranges, hollow ware, coffins, shoes, candles, tobacco, wagons, carriages, confectionery, printing, clothing and cars. There is a large export trade and extensive wholesale traffic in drygoods, boots and shoes, groceries, drugs, hats millinery, paper and hardware. The wholesale trade is estimated at over \$250,000,000 annually. Almost at the doors of Nashville, and tapped by every line of railroad entering the city, are apparently inexhaustible fields of coal of the highest grade. The bountifulness of the supply is attested by the fact that during the prolonged anthracite coal strike, when coal was selling at almost prohibitive prices in every other section of the country, there was no advance in the price of coal in Nashville.

**History.**—The city was settled in 1780 by a band of pioneers under the leadership of James Robertson. It was named in honor of Gen. Francis Nash, a distinguished officer in the Revolutionary War, and was called Nashborough until 1784. During the early years of its existence Nashville was repeatedly attacked by the Cherokees and other Indian tribes. It was chartered as a city in 1806; was the seat of the State legislature in 1812-15, and became the permanent State capital in 1843. The Federal army occupied the city in 1862 and around the city in 1864 was fought one of the greatest battles of the Civil War. (See NASHVILLE, BATTLE OF.) In 1896 the State celebrated the centennial of Tennessee's admittance into the Union, and a great industrial exposition was held here the following year.

**Population.**—Nashville in 1830 had a population of 5,566; (1850) 10,165; (1860) 16,988; (1870) 25,865; (1880) 43,350; (1890) 76,168; (1900) 80,865; (1910) 110,364; the 1910 total included 2,993 persons of foreign birth and 36,523 of negro descent (1919) 145,000.

**NASHVILLE**, the name of a Confederate privateer that left Charleston in 1861 on a cruise to England and captured booty to the amount of \$3,000,000. In March 1863 she was sunk by a Federal ironclad in the Savannah River.

WILL R. MANIER,

*Secretary, Commercial Club of Nashville.*

**NASHVILLE, Campaign and Battle of.** When General Sherman's picked army of 62,000 left Atlanta 15 Nov. 1864 for the March to the Sea, the Confederate army under Hood, strengthened by Forrest's cavalry, was on the Tennessee River in the vicinity of Tuscumbia and Decatur, with S. D. Lee's corps across the river and in advance of Florence. Active preparations were making for a move on Nashville with the Ohio as a possible objective. General Thomas had been sent to Nashville six weeks before to organize a force to resist Hood. Toward the last of October the Twenty-third corps, Schofield's, and the Fourth, D. S. Stanley's, were ordered to Thomas, who sent them

under General Schofield to Pulaski, with orders to delay Hood as long as possible to allow of the needed concentration and organization at Nashville. This infantry force at Pulaski aggregated 18,000 effectives, one division of the Twenty-third corps being detached, and was further strengthened by four brigades of cavalry under Gen. James H. Wilson. Forrest's force of Confederate cavalry was four times Wilson's. General Sherman thus describes the force with General Thomas at Nashville at the time of Hood's advance on Pulaski: "General Thomas was at Nashville with Wilson's dismounted cavalry, and a mass of new troops and quartermaster's employees amply sufficient to defend the place." Of the sound men sent back to Thomas by General Sherman when he was fitting out a perfect army for the March to the Sea, he lost 15,000 from expiration of service, or from furloughs previously granted, within a week after Hood's advance from Florence. In place of these 15,000 Thomas received 12,000 newly enlisted recruits. To secure Chattanooga Sherman telegraphed General Steedman, who held the place with a small force: "You must organize and systematize the hospitals and men sent back to Chattanooga"; and to a suggestion that he might make use of some of the convalescents he was receiving from Atlanta he replied: "So far, all such detachments reported from the front are with furloughs and are awaiting transportation home."

Under such conditions General Thomas was working most energetically at Nashville to organize an army to meet Hood, while General Schofield, with his inferior force, was holding against him with the utmost stubbornness to gain time for Thomas.

Hood was baffled in his attempt to intercept General Schofield at Pulaski and Columbia, Schofield reaching the latter place, forming solidly before Hood, who arrived 27 November, and holding him there to the limits of possibility. Again, by skilful work, Schofield reached Franklin in advance of Hood, marching his troops at night within rifle-shot of the enemy's lines at Spring Hill. Here Hood threw his army *en masse* upon Schofield, who had taken position around the town. The attack was delivered at 4 P.M., and lasted into the night. It was one of the most desperate assaults of the Confederates on any field, and most depressing for them in its results, five general officers being killed, six wounded and one captured. (See FRANKLIN, BATTLE OF.) The night of the 30th Schofield withdrew to Nashville, and the morning of 1 December Thomas' army was united.

A part of A. J. Smith's veteran division arrived at Nashville during the battle of Franklin, but not in time to be sent to General Schofield. The rest of his division, and General Steedman's division from Chattanooga also arrived 1 December.

Hood advanced the day after the battle of Franklin and established his lines in front of Nashville 2 December. Not until Hood appeared before Columbia with the entire army that had confronted the three armies under Sherman, re-enforced with Forrest's 10,000 cavalry, and the fact appeared that Schofield was fighting a gallant, almost desperate game to

**NASHVILLE, TENN.**

**2 Vanderbilt University, Science Hall**

hold him back while Thomas was working energetically to organize his forces, did the authorities at Washington and City Point realize that Thomas had been left with wholly inadequate means. In reply to a telegram from General Grant in which he was directed not to "let Forrest get off without punishment," General Thomas, 24 November, thus stated his real condition.

Your despatch of 4 p. m. yesterday just received. Hood's entire army is in front of Columbia, and so greatly outnumbers mine at this time that I am compelled to act on the defensive. None of General Smith's troops have arrived yet, although they embarked at Saint Louis on Tuesday last. The transportation of Generals Hatch's and Grierson's cavalry was ordered by General Washburn I am told, to be turned in at Memphis, which has crippled the only cavalry I had at this time. All of my cavalry was dismounted to furnish horses to Kilpatrick's division, which went with General Sherman. My dismounted cavalry is now detained at Louisville, awaiting arms and horses. Horses are arriving slowly, and arms have been detained somewhere en route for more than a month. General Grierson has been delayed by conflicting orders in Kansas, and from Memphis, and it is impossible to say when he will reach here. Since being placed in charge of affairs in Tennessee, I have lost nearly fifteen thousand men discharged by expiration of service and permitted to go home to vote. My gain is probably twelve thousand perfectly raw troops. Therefore, as the enemy so greatly outnumber me, both in infantry and cavalry, I am compelled for the present to act on the defensive. The moment I can get my cavalry, I will march against Hood, and if Forrest can be reached he shall be punished.

This created a feeling at Washington and City Point approaching a panic. It was feared that Hood might avoid Thomas, cross the Cumberland and carry out President Davis' plan to have him push on to the Ohio. This fear was redoubled when the necessity appeared for Schofield to retire from Franklin. It was not so clearly seen that his stubborn holding against Hood had saved the situation which Sherman created. Instead of leaving Thomas, who up to that time had never lost a movement or a battle, to deal with Hood as his full knowledge of the situation might suggest, it was insisted that he should at once attack. The straits of the situation were recognized at City Point, and the day after Schofield's arrival Grant telegraphed: "Arm and put in your trenches your quartermaster's employees, citizens, etc." The fourth day Thomas was peremptorily ordered to attack. He calmly went on with his energetic preparations to deal a final blow to Hood. His despatches, clearly showing his situation and his active work, were ridiculed by Stanton and Halleck, and Grant repeated his orders to attack, and next directed Halleck to relieve him, first with Schofield, and next with Logan, and Grant himself started to take general direction, although Thomas had explained that while he had the troops ready to attack, a sleet-storm had covered the country with a sheet of ice upon which neither men nor horses could move, but that the moment it melted he would attack. When Logan reached Louisville he was met with the news of an overwhelming victory.

The two-days' battle, 15 and 16 December, was remarkable for its perfection of plan, and for the fact that in its progress to the end this plan was closely followed.

The Confederate main and advanced lines were entrenched on bold hills about two miles from the city. Their advanced salient was established within three-eighths of a mile of the Union centre. The Union lines extended from the river above the city to the river below it. The Confederate lines were compact be-

tween the Murfreesboro Railroad at their right and the Hillsborough Turnpike, which ran south from the centre of the city, across the Union centre. Thus the Confederate lines covered less than half of the Union position. Cheatham's corps was on the right, Lee's corps formed the centre, and Stewart's corps the left.

More than half the inner line was held by quartermasters' employees under Quartermaster-General Donaldson, and the rest of that line by new troops under Gen. J. F. Miller. Gen. A. I. Smith's corps held the right of the advanced Union line, Gen. T. J. Wood's line the centre and General Schofield the left. General Steedman's division was in echelon to the front on the left. The night before the battle General Schofield's corps was moved to the left and front of Wood's line, and prepared to take prominent part in turning the Confederate left. The morning of the 15th fog veiled the rapid formation of Union forces in front of their works.

The battle began at 8 o'clock by a successful attack by General Steedman's division upon the earthworks commanding the extreme left. This attracted the enemy's attention to that quarter. About 10 o'clock Smith's corps moved against Hood's left, and Wilson's cavalry corps of 9,000 horsemen and 3,500 dismounted men swung off in its wide circuit against the left and rear of the Confederate works, one division extending to the river below the city, and forcing back Hood's cavalry reserve under General Chalmers. Forrest's main body had been sent to attack Murfreesboro. Smith's corps moved obliquely against the Confederate left flank and took it in reverse. Schofield by a wide detour, penetrated still further to the rear. At the same time Wood assaulted in front. Wilson's troopers carried earthworks, captured 27 guns and swept squarely into the rear of the Confederate left. These movements compelled its withdrawal for two miles. The next afternoon the same tactics were continued by Smith, Schofield and Wilson, while Wood on the Union centre, and Steedman on the left, pushed forward to Hood's new line. This had been reformed with Cheatham on the left, Stewart in the centre and Lee on the right. The Union lines began the attack upon Hood's position at 3 o'clock with an unsuccessful assault by two brigades from Wood and one from Steedman upon the Confederate right. Soon after 4 o'clock Smith and Wood's corps on the front, with Schofield operating on their right and against the Confederate left flank, attacked in force, soon carrying the entire line. This attack and its results General Hood thus described in his official report: "The position gained by the enemy being such as to enfilade our line caused in a few moments our entire line to give way, and our troops to retreat down the pike in the direction of Franklin, most of them, I regret to say, in great confusion, all efforts to reform them being fruitless." Here 54 guns in position were captured. There was immediate and hot pursuit for nine days, led by Wilson's cavalry, when the remnant of Hood's forces crossed the Tennessee, having suffered a loss during his campaign of over 13,500 prisoners and 72 guns, and here the Union pursuit ended. Over 2,000 deserters came into the Union lines.

The result vindicated Thomas' insisting upon waiting for the remounting of his cavalry, since Wilson with his troopers formed an essential and controlling element in the battle and in a pursuit which were designed to disintegrate an army.

The records do not show the number of men with which Hood reached Tupelo. He claims that there were 18,500 left there after 3,000 were furloughed. He further says that of 14,000 that left Tupelo to join Gen. J. E. Johnston in North Carolina 9,000 deserted. General Johnston's reports show that when Hood's forces reached him they numbered 3,953 officers and men. Thus, after Nashville, Hood's splendid force of Confederate fighters did not again appear as an army on the theatre of war.

Even this complete victory, defeating the contemplated advance of the Confederate army to the Ohio, did not fully allay the panic at Washington lest Sherman's movement to the sea should prove to have left the Central West without sufficient protection, and while every possible effort in pursuit was being put forth in horrible weather, General Halleck thus telegraphed Thomas:

Permit me, General, to urge the vast importance of a hot pursuit of Hood's army. Every possible sacrifice should be made, and your men for a few days will submit to any hardships and privations to accomplish the great result. If you can capture or destroy Hood's army General Sherman can entirely crush out the rebel military force in all the Southern States. He begins a new campaign about the first of January, which will have the most important results if Hood's army can now be used up. A most vigorous pursuit on your part is, therefore, of vital importance to General Sherman's plans. No sacrifice must be spared to obtain so important a result.

General Thomas, nagged beyond endurance, put an end to this style of despatches by the following reply:

Your despatch of 12 M., this day, is received. General Hood's army is being pursued as rapidly and as vigorously as it is possible for one army to pursue another. We can not control the elements, and you must remember that, to resist Hood's advance into Tennessee, I had to reorganize and almost thoroughly equip the force now under my command. I fought the battle of the 15th and 16th instant with the troops but partially equipped; and, notwithstanding the inclemency of the weather and the partial equipment, have been enabled to drive the enemy beyond Duck River, crossing two streams with my troops, and driving the enemy from position to position without the aid of pontoons, and with but little transportation to bring up supplies of provisions and ammunition. I am doing all in my power to crush Hood's army, and, if it be possible, will destroy it. But pursuing an enemy through an exhausted country, over mud roads completely sogged with heavy rains, is no child's play, and can not be accomplished as quickly as thought of. I hope, in urging me to push the enemy, the department remembers that General Sherman took with him the complete organization of the Military Division of the Mississippi, well equipped in every respect, as regards ammunition, supplies, and transportation, leaving me only two corps, partially stripped of their transportation to accommodate the force taken with him, to oppose the advance into Tennessee of that army which had resisted the advance of the army of the Military Division of the Mississippi on Atlanta, from the commencement of the campaign till its close, and which is now, in addition, aided by Forrest's cavalry. Although my progress may appear slow, I feel assured that Hood's army can be driven from Tennessee, and eventually driven to the wall by the force under my command. But too much must not be expected of troops which have to be reorganized, especially when they have the task of destroying a force, in a winter's campaign, which was able to make an obstinate resistance to twice its numbers in spring and summer. In conclusion, I can safely state that this army is willing to submit to any sacrifice to crush Hood's army, or to strike any other blow which may contribute to the destruction of the rebellion.

This changed the tone of despatches from Washington and City Point. Grant and Stanton sent congratulations, and Grant, in his

official report, after setting forth his impatience and apprehensions that Hood would go north, said of Thomas: "But his final defeat of Hood was so complete, that it will be accepted as a vindication of that distinguished officer's judgment." H. V. BOYNTON.

**NASHVILLE, CHATTANOOGA AND SAINT LOUIS RAILWAY, The.** The first advocate of the building of the Nashville and Chattanooga Railroad, the first railroad completed in the State of Tennessee, was Dr. James Overton, a man of far-reaching sagacity, dauntless courage and great faith in his well-matured convictions. In 1843, he offered himself a candidate for the legislature, basing his canvass on the promise that he would do all in his power to secure the construction of a railroad from Nashville to Chattanooga, to connect with the proposed Western and Atlantic Railroad, chartered to be built from Atlanta to Chattanooga, thus creating a large link in a great trunk line to extend from the Atlantic Coast to the Mississippi River. At that period, Chattanooga, or Ross Landing as it was then called, was but a small trading point in a wild, mountainous region, lately vacated by the Indians. Dr. Overton, with a keen foresight, however, recognized that this was the focus to which the lines of traffic from the Southern States must converge, and he believed that if connections should be opened between that point and Nashville the latter place would be able to control the large cotton trade of Georgia and Alabama. These arguments made little impression on the minds of the people, however, and Dr. Overton was not only defeated but the title "Old Chattanooga" was applied to him by those who derided his scheme as the impracticable dream of a visionary. Two years after the defeat of Dr. Overton the necessity for other outlets from Nashville besides the Cumberland River brought the subject of railroads under agitation again, and, through the pressure of many influential citizens of the State, the legislature passed an act on 11 Dec. 1845 incorporating a railroad from Nashville to Chattanooga. In 1847 this act was amended to permit the town of Nashville to subscribe the sum of \$500,000 for the benefit of the road, and "to raise money on loans by pledging the faith of the corporation; by pledging a portion of its taxes; by mortgage or otherwise to an amount not exceeding what might be demanded for the calls on the stock." The town of Murfreesboro, Tenn., also subscribed \$30,000; the city of Charleston, S. C., \$500,000; and the Georgia Railroad and Banking Company of Augusta, Ga., \$250,000. The balance of an approximate capital stock of \$2,000,000 was subscribed by individuals in Nashville and along the line of the proposed road. Shares of stock had then a par value of \$25 each and in many instances the subscriber paid for his stock by actual work on the line or in materials furnished. The State also gave material assistance by lending its endorsement to the bonds of the company issued from time to time on completed miles of road.

The first general meeting of the stockholders was held in the City Hall at Nashville on 24 Jan. 1848. V. K. Stevenson, who had so earnestly labored in the interest of the road, was elected the first president. Other presidents of the

road to date are as follows: Michael Burns, 17 Feb. 1864 to 15 Aug. 1868; E. W. Cole, 15 Aug. 1868 to 15 Sept. 1880; J. D. Porter from the latter date to 10 Sept. 1884; J. W. Thomas, Sr., from then to 12 Feb. 1906; J. W. Thomas, Jr., 28 Feb. 1906 to 17 Dec. 1913; Maj. E. C. Lewis, 19 Dec. 1913 to 1 April 1914; and John Howe Peyton from the latter date to the present time. The first contract for any of the actual construction was let in August 1848 for cutting the tunnel under the Cumberland Mountain. Construction on other parts of the line began the latter part of that year. The first train ran from Nashville to Antioch on 13 April 1851, and when, on 4 July of the same year, a train arrived at Murfreesboro the event was made the occasion of a great celebration, people from all the country round being on hand to greet this sign of progress. By April 1852 the road had reached Bridgeport, Ala., on the Tennessee River, from which communication was immediately established with Chattanooga with the aid of steamboats; but the entire line, 151 miles in length, was not completed until February 1854. At that time the equipment of the road consisted of 17 engines, bearing names instead of numbers, among which were the *Tennessee*, *Nashville*, *Chattanooga*, *Governor Sevier* and *Governor Blount*; 11 passenger cars and 164 freight cars. The iron rail used in track was purchased in England and delivered at Nashville for about \$45 per ton. In November 1871 the company acquired by purchase from the State of Tennessee the railroad properties of the Nashville and Northwestern Railroad Company, a line extending from Nashville, Tenn., to Hickman, Ky. In 1873 the name of the corporation was changed from that granted in the original charter, "The Nashville and Chattanooga Railroad Company," to "the Nashville, Chattanooga and Saint Louis Railway." The Western and Atlantic Railroad, extending from Chattanooga, Tenn., to Atlanta, Ga., is leased for 29 years from 27 Dec. 1890. The Paducah and Memphis division, extending from Paducah, Ky., to Memphis, Tenn., with a branch from Lexington to Perryville, is leased from the Louisville and Nashville Railroad Company for 99 years from 14 Dec. 1895. The several branches of the present system were built under separate charters, some of them by independent corporations. The parent company, therefore, operates its present mileage under the charters granted originally to the various corporations which have been merged from time to time into its line.

The total number of miles of line operated at present are approximately: main track, 1,230.76; second track, 54.10; spur track and sidings, 482.53. Its main line extends from Hickman, Ky., through Nashville and Chattanooga, Tenn., to Atlanta, Ga., and from Memphis through Jackson, Tenn., to Paducah, Ky. At the latter point physical connection has been made with the great system of the Chicago, Burlington and Quincy Railroad by means of about 12 miles of line of the Paducah and Illinois Railroad Company and a double track bridge across the Ohio River opposite Metropolis, Ill. It also reaches the great cotton manufacturing city of Huntsville, Ala., while other ramifying branches extend to various mining

centres, agricultural districts and timber regions. To-day the road has few superiors, whether we consider the excellence of its road-bed; its admirable equipment; the beauty and historical interest of its scenery, or the fertility of the country through which it passes, while its strategical position in relation to the commerce of the land is not surpassed by that of any other railroad system in the South. At many of the termini of its divisions it connects with a cluster of railroad systems that run to every point of the compass. It is also brought in closest touch with the great river trade of the Mississippi and its tributaries at several points, reaching the Mississippi River at Memphis and Hickman, Ky.; the Ohio River at Paducah, Ky., and the Tennessee River at Johnsonville, Tenn.; Bridgeport, Ala.; Hobbs Island, Ala.; Guntersville, Ala., and at Chattanooga, Tenn. It strikes the Cumberland River at Nashville and crosses the Chattahoochie River near Atlanta, Ga. The company in a recent statement reported its capital stock was \$16,000,000; funded debt, \$10,122,000; investment in road, equipment, etc., \$37,707,297.02. The average yearly gross revenue is more than \$12,000,000. Since beginning operations it has paid cash dividends of 185 per cent on its capital stock and in 1873 it gave the stockholders a stock dividend of 200 per cent. A majority of its capital stock has been held since about 1880 by the Louisville and Nashville Railroad Company, but its stockholders number above 600, located in 26 different States and three foreign countries. About 260 of its stockholders are women. According to the same statement its equipment consisted of 273 engines, 10,919 passenger, freight and work cars, two steamers and three transfer barges. Its roadbed for the main line is of full rock ballast and the weight of steel rails thereon is from 80 to 90 pounds to the yard.

During the Civil War the line of railroad was in charge of the Federal military authorities from 7 March 1862 to 15 Sept. 1865. Most of its equipment, however, was moved South at an early period in the war and operated on the rails of other lines in the interest of the Confederacy. Many important battles of the Civil War were fought along the line of its road and the territory contiguous thereto and its scenery is rich in historical interest. The corporation has maintained in an unusual degree the good will of the communities which it serves and is endeavoring to the utmost to advance the development of the country along its lines.

**NASHVILLE**, University of, in Nashville, Tenn., a coeducational institution founded in 1785 by the State of North Carolina as Davidson Academy. In 1806 after Tennessee had been founded, the name was changed to Cumberland College, and in 1826 to the University of Nashville. The school was closed during the Civil War. The trustees of the university and of the Peabody Education Fund united in 1875 in establishing a normal school for the training of teachers, which has since become, through co-operation of the university, a separate corporation — George Peabody College for Teachers (q.v.). Montgomery Bell Academy, the preparatory department, has six instructors and about 200 pupils. The other collegiate depart-

ments, both literary and medical, have been discontinued. The library contains over 2,000 volumes, and the grounds, buildings and furnishings are valued at \$150,000; the productive fund is about \$100,500; and the annual income about \$10,000.

**NASHVILLE CONVENTION**, in American history, a convention of delegates from the Southern States held at Nashville, Tenn., 10 June 1850, called to consider the slavery question and the encroachments of Northern abolitionists. The Wilmot Proviso and the Missouri Compromise were disapproved, but resolutions of open resistance advanced by Texas, South Carolina and Mississippi were voted down. The convention, which was never generally popular, met again in November and again moderate resolutions were adopted. For text of the resolutions adopted at both meetings consult Harper's 'Encyclopedia of United States History' (Vol. VIII, New York 1915).

**NASIK**, nā'sik, or **NASSICK**, India: (1) the capital of a district of Bombay on the Godavari, 31 miles from its source, and 100 miles northeast of Bombay. It is the headquarters of Brahmanism in the Deccan and one of the most sacred of Hindu pilgrim resorts; the banks of the river here are crowded with temples and shrines. Nasik is the *Nasica* of Ptolemy and was anciently a Mahratta capital. It has noted manufactures of brass and copper work, paper and cotton. Interesting relics of the religion were found in the Lena caves excavated in the 2d or 3d century A.D. Pop. about 35,000. (2) The district has an area of 5,940 square miles; pop. about 825,000.

**NASMYTH**, nā-smith, **Alexander**, Scottish painter: b. Edinburgh, 9 Sept. 1758; d. there, 10 April 1840. He chose portrait painting as his specialty; became Allan Ramsay's pupil and subsequent assistant and accompanied that artist to London. He returned to Edinburgh (1779); and traveled in Italy (1782), where he devoted himself to landscape and historical painting. Among his works is the famous portrait of Burns in the London National Gallery; the large 'River Scene' owned by the Society of Arts; 'The Port of Leith' (1824); and 'The Lawn Market' (1824); in 1822 he published 16 scenes described by Sir Walter Scott. His landscapes are finely composed and very impressive, though he is inferior as a painter to his son Patrick (q.v.). His style is simple, rarely striving for grand effects. His scenes are naturally picturesque and well chosen. His coloring is somewhat weak and his execution of a neat and detailed rather than a vigorous character. The Nasmyths were an artistic race and between 1829 and 1866 no less than six woman painters of the family exhibited in London.

**NASMYTH**, **James**, Scottish engineer: b. Edinburgh, 19 Aug. 1808; d. South Kensington, 7 May 1890. He was the son of Alexander Nasmyth (q.v.). After study at Edinburgh University, he went to London in 1829, offered his services to Maudsley, founder of a well-known engineering firm, and was appointed assistant in his private workshop. There he remained till 1831, when he returned to Edinburgh and constructed a set of engineering tools with which he began business in 1834 at

Manchester. Here he was so successful that he had soon to erect a large new workshop at Patricroft near Manchester, where he became famous as a machine constructor and inventor. Chief among his inventions was the steam-hammer, designed in 1839 and in 1842 patented in an improved form. The first hammer was constructed from a view of Nasmyth's sketches by Schneider at Creuzot, in France, about 1841; but the first British one was erected by Nasmyth at Patricroft in 1843. Among Nasmyth's further inventions are a nut-shaping machine, a hydraulic punching-machine and a flexible shaft for driving small drills. In 1856 he retired from the firm of Nasmyth, Gaskell and Company, which which he had founded, and devoted himself to the study of astronomy. He was the first to observe the mottled appearance of the sun's surface known as "willow-leaves" or "rice grains" (1860). He is author of 'Remarks on Tools and Machinery' in Baker's 'Elements of Mechanism' (1858); 'The Moon Considered as a Planet, a World and Sattellite' (1874), with James Carpenter, and an autobiography edited by Dr. S. Smiles (1883, latest ed. 1895).

**NASMYTH**, **Patrick Milner**, Scottish painter: b. Edinburgh, 7 Jan. 1787; d. Lambeth, London, 17 Aug. 1831. He studied under his father and developed a great talent for landscape, though he labored under the difficulties of ill health and a crippled right hand which necessitated the use of the left in painting. He came to London in his 20th year and made his reputation by his first picture exhibited at the Royal Academy, 'A View of Loch Katrine' (1809). He invariably painted *en plein air*, and in his last sickness was raised on his bed that he might watch through the window the violent thunderstorm that was raging outside and in the progress of which he expired. His pictures are highly valued and his 'View in Surrey' sold in 1892 for \$13,125.

**NASO**, nā'sō. See OVID.

**NASR-ED-DEEN**, nās'r-ēd-dēn', Shah of Persia: b. 24 April 1831; d. 1 May 1896. He was not the eldest son but the ability and influence of his mother induced his father, Mohammed Mirza, to proclaim him his heir and he succeeded to the throne in 1848. His accession was disputed by the reformer, El Bab, but the new Shah crushed the opposition mercilessly and became the ablest ruler that Persia had had in many years. He studied European methods of warfare and proved himself a master of finance. He crushed the insurrections which broke out in various provinces and by his occupation of Herat in 1856 provoked a war with Great Britain which was concluded in 1857. In 1873-78 and in 1889 he visited western Europe and endeavored to establish more friendly relations with England, soon, however, returning to his friendship with Russia. He favored progress and Western civilization in so far as it did not conflict with his despotic rule and under his reign the telegraph through Persia connecting Europe and India was built. He was assassinated in 1896. Consult Morgan and Burger, 'Nasr-ed-Din, Schah und das moderne Persia' (Dresden 1889); Greenfield, J., 'Die Verfassung des persischen Staates' (Berlin 1904); Jackson, A. V. W., 'Persia Past and Present' (New York 1906).

**NASSAU**, nās'sow, **Joan Mauritz van**, COUNT OF NASSAU-SIEGEN, Dutch general and statesman: b. Delft, Holland, 17 June 1604; d. Cleves, Prussia, 20 Dec. 1679. He was governor-general of the Dutch possessions in Brazil in 1637-44 and had a brilliant and prosperous administration. He defeated the Spanish and Portuguese and upon his return to Holland was made lieutenant-general of cavalry; in 1647 he was governor of Cleves and in 1665 commanded the army of the Netherlands. In 1671 he was made field-marshal and led the forces against Louis XIV in the Spanish Netherlands. He became governor of Utrecht in 1674. Consult Driessen, 'Leben des Fürsten J. Moritz von Nassau-Siegen' (Berlin 1849).

**NASSAU**, nās'ā, the capital of the Bahama Islands (q.v.), situated on the north coast of New Providence, the largest island of the group. The town is built on a steep hill, is well laid out and has fine government and other public buildings and handsome residences. The climate is mild and healthful and Nassau is a popular winter health resort for Americans and West Indians. There is a good harbor and an active general trade is carried on. The United States is represented by a consular agent. It was founded by the English in the 17th century, destroyed by the French and Spaniards in 1703 and rebuilt in 1718. It was fortified 20 years later and opened to free trade. Pop. 10,000, chiefly colored.

**NASSAU**, Germany, a former independent duchy, now as Wiesbaden, forming a district of the Prussian province of Hesse-Nassau (q.v.). The chief town is Wiesbaden (q.v.). The family of Nassau, the elder branch of which reigned till 1866, dates from the 10th century. The younger branch inherited in 1544 the principality of Orange, and as the princes of Orange took an important place in European history. The reigning Duke of Nassau sided against Prussia in 1866 and his duchy was incorporated with Prussia. (See PRUSSIA; GERMANY). On the extinction of the male line of the Orange branch by the death of William III of Holland, in 1890, the Duke of Nassau became Grand-Duke of Luxemburg.

**NASSE**, nās'sē, **Erwin**, German political economist: b. Bonn, 2 Dec. 1829; d. there, 4 Jan. 1890. He was educated in Bonn and became prominent as an economist. In 1869-79 he served in the Prussian Lower House and in 1889 became a member of the House of Peers. He founded and was president of the Verein für Socialpolitik. He published 'Über das preussische Steuersystem' (1861); 'Über die mittelalterliche Feldgemeinschaft in England' (1869); 'Agrarische Zustände in England' (1884).

**NASSICK**. See NASIK.

**NAST**, **Thomas**, American caricaturist: b. Landau, Bavaria, 27 Sept. 1840; d. Guayaquil, Ecuador, 7 Dec. 1902. His mother brought him to this country in 1846. He was employed as doorkeeper in Bryant's Art Gallery, Broadway and 13th street, New York, where he spent his spare time copying the paintings. For six months he studied in a drawing class, then became a draughtsman for *Frank Leslie's*. In 1860 he was sent to England to draw for the *Illustrated News* the Heenan-Sayers prize fight;

in 1861 drew sketches of the Italian campaign; in 1862 joined the *Harper's Weekly* staff and by his clever cartoons soon became famous. But with his purely political and personal caricatures dating from 1871-73, when he attacked the Tweed Ring in New York City, drew the money-bag head of Tweed and the first Tammany tiger and largely contributed to the defeat of the Ring, he came to new fame and power. He bitterly opposed Greeley in 1872, Tilden in 1876 and Hancock in 1880, urging against each of these nominees his inevitable connection with Tammany Hall. In 1884 he attacked the Republican candidate for the only time, but with unusual bitterness. He left *Harper's Weekly* in 1887 and in 1894 became a member of the staff of the *Pall Mall Gazette*. In May 1902 he was appointed United States consul at Guayaquil, where he died of yellow fever. For several years he published 'Nast's Almanac,' with his own illustrations to text by various authors and illustrated 'Pickwick Papers' and 'Pictures from Italy.' Nast did some oil-painting, especially of scenes in the Civil War. He was a great caricaturist, as realistic as the French masters in his groups and as dignified as Tenniel in his single figure cartoons. Consult Paine, A. B., 'Thomas Nast: His Period and His Pictures' (New York 1904) and 'Life and Letters of Thomas Nast' (ib. 1910).

**NAST**, **William**, American clergyman and editor: b. Stuttgart, Germany, 15 June 1807; d. Cincinnati, Ohio, 16 May 1899. He was educated at Blaubeuren and studied theology at the University of Tübingen, but became a rationalist and took up literary work till 1828. He then came to America and was tutor at Duncan's Island, Pa., becoming (1830) librarian and instructor of German at West Point Military Academy. Resigning (1832), he became instructor of German, Greek and Hebrew at Kenyon College, Gambier, Ohio. He next (1835) joined the Methodist Episcopal Church and was appointed missionary evangelist for Cincinnati. Continuous persecution made his labor hopeless during his travels in the State and he returned (1838) to Cincinnati and founded the first German Methodist society in the United States, thus becoming the originator of German Methodism which now is in every State and extends to Germany and Switzerland. In 1839 he founded *Der christliche Apologete* at Cincinnati, a German organ of the Methodist Episcopal Church, being its editor for 53 years. Many German publications of the Church were edited by him. He wrote 'Wesley's Sermons,' 'Das Christentum und seine gegensätze' (1883); 'A Commentary on the New Testament — Matthew, Mark and Luke' (1864); 'The Smaller and Larger Catechism' (1868).

**NASTURTIUM**, the Indian cress (*Tropaeolum majus*), a climbing annual plant, native of South America, with pungent fruits and showy orange flowers; or *T. minus*, a smaller species. See TROPÆOLUM.

**NASUA**. See COATI.

**NAT TURNER'S REBELLION**, in American history, a term applied to a negro insurrection at Southampton, Va., in 1831. The rebellion was led by Nat Turner, a negro slave, who believed himself chosen by God to free the

colored race. At an appointed time he set out with several hundred followers, going from house to house with the intention of killing all white persons. Before the authorities dispersed the rebels 55 persons were killed. The faithfulness of many of the slaves saved the lives of many whites. Many States enacted more stringent laws governing slaves, free negroes lost their privileges, suspects were killed or maltreated and the manumission movement received a staggering blow. See TURNER, NAT, and consult Drewry, W. S., 'The Southampton Insurrection' (Washington 1900), and Weeks, 'The Slave Insurrection in Virginia' (in *Magazine of American History*—New York, June 1891).

**NATA**, nā'tā, in Mexican mythology, the name of a former legendary prophet, who in the "Age of Water" (Atonatiuh) escaped with his wife, Nena or Xochiquetzal, from the general destruction of mankind by the deluge, in a boat made from the trunk of an ahuehuete, or Mexican cyprus tree, or according to another version, either in the hollow of the tree or on the trunk of the tree itself. The proper name of this legendary Nahuatl Noah is "Coxcox," the term "Nata" being apparently correlative with "Tata," the "old father," or uncle or simply the "old one." The legend of Coxcox was common not only to all the Nahuatl tribes, but it was recounted by the Zapotecas the Mixtecas and other cultured races of Mexico. According to this flood legend, Coxcox and his wife landed at Mount Colhuacan (Place of the Colhuas); and their children increased very rapidly; but they were all born dumb. Finally a dove took pity on them and gave them the power of speech. But they all spoke different languages. Of the descendants of Coxcox or Nata, 15 chiefs spoke the same tongue or nearly so; and from these were descended the different tribes of the Nahua race. According to a Michoacán version of the same myth, their deluge hero who was called Tezpi escaped in a large boat with his wife, his children and numerous animals and various kinds of grain for seed. According to still another version of this story, the people drowned in the deluge did not die but were turned into fishes; for the earth-ocean and the sky-ocean drew near to one another and they were overwhelmed in the down-pour of the sky-waters into the earth-waters, which swallowed up even the highest mountains for an Aztec century (52 year.).

**NATAL**, nā'tāl, Africa, an original province of the Union of South Africa, formerly a separate colony on the southeast coast, bordering on the Indian Ocean and bounded by Portuguese East Africa, the Transvaal and Orange River colonies, Basutoland and Cape Colony. Including Zululand, annexed in 1897, it has an estimated area of 35,019 square miles. In January 1903 the former Transvaal districts of Vryheid, Utrecht and part of Wakkerstroom were transferred to Natal.

**Topography.**—The chief natural boundary on the land side is formed by the Drakensberg Mountains, separating it from the Orange River Colony and Basutoland. The Tugela River separates Natal proper from the Zulu country; on the southwest the Umzimkulu and Umtamvuma partly separate it from Cape Colony. The 400 miles of coast-line contains the mouths of numerous streams, but is destitute of creeks

and bays, having only one sheltered anchorage at Port Natal (on which stands the seaport Durban), a fine circular bay completely landlocked, capacious enough to contain whole fleets and deep enough within to float the largest vessels. The surface is finely diversified, rising by successive terraces from the shore toward the lofty mountains on its western frontiers. The chief summits are Champagne Castle, 10,357 feet; Mont aux Sources, about 10,000 feet, and Giant's Castle, 9,657 feet. From the main chain numerous transverse branches proceed nearly at right angles and form a series of minor watersheds, separating the different streams. The mountains descend very gradually on the west and may be regarded as the abutments of a very elevated table-land, but they present precipitous fronts to the east and are so broken by chasms and ravines that they were at one time regarded as impassable.

**Hydrography.**—Natal has a great advantage over most of the districts of South Africa in its abundance of perennial streams, though these are all too shallow to be navigable, while many flow through precipitous ravines and rocky gorges. The most important rivers are the Tugela, which has a course of about 150 miles, its tributary, the Buffalo or Umzinyati, being also a considerable stream; the Umvoti, Umgeni and Umkomanzi, farther to the south and the Umzimkulu, which partly separates Natal from Cape Colony.

**Geology and Mineral Resources.**—The prevailing stratified rocks are sandstone and slate, often thrown into confusion and pierced by igneous rocks, particularly basalt, greenstone and porphyry, which assume the form both of continuous ridges and isolated hills and often cover extensive areas. The mineral productions are principally coal, iron-stone, limestone and marble. Coal is worked and is used on the railways and the iron-stone is also being utilized. About 3,000,000 tons is the normal annual output of coal and of gold about 2,000 ounces. There are rich gold-fields in Zululand.

**Climate.**—The climate on the whole is extremely salubrious. On the coast the range of temperature is from 47° to 88°, giving an average in summer of 76° and in winter of about 55°; in the interior, at the town of Pietermaritzburg, the mean temperature of July, the coldest month, is 55°; of February, the hottest, 80½°; and of the whole year, 67°. During the rainy season (October to March) thunder showers are of almost daily occurrence. Long droughts are almost unknown.

**Vegetation.**—Under such a climate, and with a soil of considerable fertility, vegetation is obviously vigorous. Timber-trees everywhere exist in sufficient numbers for the wants of the colony and on the western frontiers as well as elsewhere form considerable forests, for the most part unencumbered by the underwood which prevails in Cape Colony.

**Fauna.**—The wild animals include the leopard, hyena, tiger-cat, antelopes, jackal, ant-bear and porcupine. The hippopotamus has still his haunts in several of the rivers and there are numbers of small crocodiles; while snakes, some of them venomous, are also plentiful. The birds comprise the vulture, several varieties of eagle and the secretary-bird, etc.

**Agriculture.**—In the level districts of the interior, wheat, barley, oats, beans and vege-

tables of almost every description have been largely and successfully grown; but the chief crop everywhere is maize, of which even two good crops can be raised in the year. About 2,000,000 muids (200 lbs.) is the average annual output. In many parts the vine thrives well, various fruits are cultivated and could be produced in unlimited quantities. In the coast districts, where the climate is tropical, the sugarcane is cultivated with success. In similar localities tobacco, arrowroot, ginger, bananas, pine-apples, etc., also grow well. Tea has begun to be cultivated with good prospects and coffee is also grown to a small extent.

**Commerce, etc.**—The total value of exports amount to about \$25,000,000, wool being by far the largest, others being gold, sugar, coal; the imports are valued at about \$60,000,000, mostly manufactured goods. The railways, which belong to the government, have a length of 1,053 miles and extend into the Orange River Colony and Transvaal. Separate trade returns are not available since the establishment of the Union.

**Constitution and Government.**—Natal, which had been annexed to Cape Colony in 1844, was placed under separate government in 1845 and under charter of 15 July 1856 was erected into a separate colony. By this charter partially representative institutions were established and, under a Natal Act of 1893, the colony obtained responsible government. The province of Zululand was annexed to Natal in 1897. The districts of Vryheid, Utrecht and part of Wakkerstroom, formerly belonging to the Transvaal, were annexed to Natal in 1903. In 1910 the colony was merged in the Union of South Africa. The seat of the provincial government is Pietermaritzburg. There are an administrator appointed by the governor-general for five years and a provincial council of 25 members elected for three years, each council having an executive committee of four, the administrator presiding at its meetings. In the Union Assembly at Cape Town Natal has 17 members.

**Education.**—With the exception of higher education, which is under the control of the Union, education comes under the provincial administration. There are three government high schools, two preparatory schools, 73 government primary schools, two government art schools, one agricultural and trades school, five government Indian schools, two government schools for colored children, besides 107 government-aided schools and 163 government-aided farmhouse schools for European children. Also there are two technical institutes, 34 Indian schools, 302 native schools and 17 colored schools, all of which receive government aid, and a considerable number of private schools in the province. Three of the aided schools are secondary schools for girls. The aggregate number of European pupils in regular attendance at the government and inspected schools was 19,892 in 1916; the average daily attendance 86 per cent of the number on the registers. At the government high and preparatory schools there is an average daily attendance of 1,274 pupils. About 1,500 children attend private unaided schools and it is estimated that only a very small percentage of white children are receiving no education. The direct government expenditure on schools for 1916

was \$628,300 (excluding expenditures for furniture, buildings, but including maintenance). Fees paid by pupils in government schools in the same year amounted to \$114,445. The number of European children receiving gratuitous education was 3,695. The 302 schools for natives had a total enrolment of 21,700 and received in 1916 grants in aid aggregating \$107,935 and the 34 Indian schools had a total enrolment of 4,438, for which a grant of \$28,295 was expended.

**History.**—Natal owes its name to having been discovered on Christmas Day, 1497, by Vasco da Gama. In 1823 a small English settlement was formed on Port Natal. Subsequently large numbers of discontented Boers from the Cape Colony entered the country as settlers. A treacherous massacre of part of the Boers by Dingaan, chief of the Zulus, in 1838, led to hostilities, in which Dingaan was ultimately driven beyond the frontiers. In 1839 the Boers proclaimed themselves an independent republic, also declaring their determination to establish diplomatic relations with European powers. The establishment of a hostile settlement at the only port between Algoa and Delagoa bays, and at a valuable entrance from the coast to the interior of South Africa, was so obviously incompatible with British interests that a force was dispatched from the Cape and after some fighting the Boers submitted, except a discontented section, who retired beyond the Drakensberg range. The territory was proclaimed British in 1843. It formed an integral part of the Cape Colony until 1856, when it was erected into a separate colony. Its prosperity has been affected by the Kafir troubles, as well as by the British complications with the Transvaal Boers; and in 1899–1900 it suffered severely in the South African War (q.v.). There was a Zulu insurrection in the Tugela region in 1906, thousands of the natives losing their lives in the subsequent fighting. By referendum in 1908 Natal determined to join the Transvaal, but in the following year was admitted as an original province of the Union of South Africa. Pop. 1,108,754, including 1,011,645 native or colored and 97,109 Europeans.

P., 'Mounted Police of Natal' (London 1913); Bosman, W., 'The Natal Rebellion of 1906' (ib. 1907); Robinson, 'A Lifetime in South Africa' (ib. 900); Russell, 'Natal' (ib. 1900).

J. B. McDONNELL.

**NATAL, Brazil,** the principal seaport and capital of the state of Rio Grande do Norte, on the right shore of the Potengy River near the Atlantic, 150 miles north of Pernambuco. Notwithstanding the sand-bars at the entrance to the harbor, considerable export trade is carried on chiefly of cotton, sugar, rubber, hides, lumber, etc., about \$1,000,000 annually. The United States is represented by a consular agent. Natal was originally called *CIDADE DOS REIS*. Pop. 15,000.

**NATALIE**, năt'ă-lē, a queen of Serbia: b. 14 May 1859. She is a daughter of Pierre Ivanovitch Keschko, a Russian officer, and married Prince Milan, afterward king of Serbia, in 1875. The marriage turned out unhappily and the union was broken in 1888, when Milan obtained a divorce. The king abdicated in the following year, and Natalie, returning to Belgrade, the Serbian capital, resided there for a time with her son, King Alexander, enjoying the favor of the people; but in 1891, at the request of the National Assembly, left the country on account of political interests. Becoming reconciled to Milan in 1893, she resumed her former relations with the royal family; and returning to Belgrade in 1895 she was greeted by the people with every token of popularity. Her residence has since been chiefly in Biarritz, France; and after the assassination of King Alexander (1903) the political authorities at Belgrade decreed that she should not again enter the Serbian kingdom. She became a Roman Catholic in 1902.

**NATATORES**, an obsolete group of birds, the swimmers, artificially allied by Illiger on their likeness in pursuing an aquatic life, but structurally having relationships with several natural orders. Similar illogical groupings in the same by-gone but once popular classification were *Clamatores*, the screamers; *Scansores*, the climbers; *Cursores*, the runners, etc.

**NATCHEZ**, năch'ěz, Miss., city, county-seat of Adams County, on the Mississippi River, and on the Yazoo and Mississippi Valley, the Mississippi Central, the Natchez and Southern and the Saint Louis, Iron Mountain and Southern and Louisiana and Arkansas railroads, 297 miles by rail and 470 miles by river from Memphis, and 214 miles by rail and 265 miles by river from New Orleans. It has steamer connection with all the Mississippi River ports. The country surrounding Natchez is chiefly devoted to livestock and agriculture; cotton is the principal product. The principal industries of the city are packing plants, box factory, cotton mills, broom factories, oil mills and candy factories. It has ice factories, planing mills, foundries, machine shops and furniture factories. Natchez has a large trade in cotton, shipping each year thousands of bales. Considerable rice and sugarcane are shipped from this port. The city has a Confederate Memorial Park, Baker Grand Theatre, Duncan Memorial Park and public buildings, Institute Hall, several excellent hotels and a large number of handsome residences. It is the seat of Jefferson Military College; Natchez Institute; and Natchez College (colored); has good public and parish schools, the Fisk library and the Carpenter Public Library. Natchez has one Associated Press paper. There are four orphanages, a charitable hospital, three sanatoriums and a number of private schools. The government, in accordance with the charter of 1877, is vested in a mayor, who holds office two years, and a council. The school board are elected by the council. The waterworks are municipal property. The city is built on a bluff about 200 feet above the river. On this bluff was located the first settlement, by Bienville, who built here Fort Rosalie in 1716. The place was destroyed and many of the inhabitants murdered, in 1729, by the

Natchez Indians. The fort came into possession of the English in 1763, when the name was changed to Fort Panmure. In 1779 the Spaniards took possession, and in 1793 the United States became undisputed owner of lands east of the Mississippi, which included Natchez and much of the adjacent territory. From 1798 to 1820 Natchez was the capital of Mississippi; in 1803 it was incorpofated as a city. During the Civil War the city suffered considerable loss of property and damage. In 1862 Commodore Porter shelled the city, and in 1863 Federal troops took possession and retained control until peace was declared. On a bluff just outside the city limits is a national cemetery and an observatory affording extensive views. Pop. 15,000.

**NATCHEZ**, nă-chăz, Les, a romance by Chateaubriand, published in 1825-26, many years after the author first planned it. The work was written during his exile in England, long after his journeyings in America, of which country it contains his views as well as setting forth his psychological speculations and philosophy of life.

**NATCHEZ INDIANS**. See CREEKS.

**NATCHITOCHEs**, năch-i-tôch'ěz, an American Indian tribe formerly living along the banks of the Red River, in Louisiana. They were driven from their homes by the Natchez and united with the Caddoes in 1731. They made homes in rough dwellings covered with sod. Certain phases of their religious practices demanded human sacrifice.

**NATCHITOCHEs**, năk-i-tôsh', La., town, parish-seat of Natchitoches Parish, on a short stream which flows into the Red River, and on the Texas and Pacific Railroad, about 150 miles in direct line northwest of Baton Rouge. The town is on the site of what was once a French trading post established in 1714. It is situated in an agricultural region in which the chief products are sugar-cane and cotton. Considerable attention is given to stock-raising. The principal industries of the town are connected with the shipment of the agricultural products and livestock. It is the see of a Roman Catholic bishop, and there is a State Normal School and Saint Mary's Academy (R. C.); it has a high school, public and parish elementary schools. Pop. 2,600.

**NATHAN**, Hebrew prophet in the time of David and Solomon. He was in his day the latest direct descendant and representative of the school of the prophets under Samuel. Saint Jerome mentions a Jewish tradition which identifies him with the eighth son of Jesse, but there is no ground for this supposition. His earliest appearance in the history of David is as the king's counsellor, first advising the building of the temple and then after a vision announcing that the time had not yet come (about 1010 B.C.). His power, eloquence and tact as a prophet are shown by his exquisite apologue of the ewe lamb which brought David to a sense of his guilt in the case of Bathsheba (1000 B.C.). On the birth of Solomon the prophet named the child Jedidiah, "friend of the Lord," and was entrusted with his education. When the end of David's reign approached Nathan advocated the succession to Solomon, counseled Bathsheba to secure it, and rebuking the indifference of the king obtained his presence

and assistance at the inauguration of his successor (977 B.C.). Nathan's sons occupied high posts in the new court, Nabud being "the king's friend" and principal officer or chamberlain, while Azariah was over the "twelve officers which provided victuals for the king and his household." It was in accordance with the counsels and suggestions of this prophet that David, the year after his son's accession, crowned the work of his life, as poet, musician and promoter of a rich temple ritual, by introducing into public worship an orchestra of Levites. Eccles. ix, 14-16, a passage attributed to Solomon, is evidently an imitation of 2 Sam. xii, 1-4, which shows how the influence of Nathan was perpetuated in the literature of succeeding ages. In I Chron. xxix, 29, and II Chron. ix, 29, he is mentioned as historian of the reigns of David and Jonathan. He died about 935 B.C., and his grave is still pointed out at Halhul, five miles north of the ancient Hebron. An echo of his parable of the rich man with many flocks is found in the Koran, Sura xxxviii, 20-25.

**NATHAN, Maud**, American reformer: b. New York, 1862. She was educated at private school and Green Bay, Wis., High School. In 1880 she married Frederick Nathan; was speaker before the International Congress of Women, in London (1899), at Berlin (1904) and International Peace Congress, New York (1907), and International Conference of Consumers' Leagues, Geneva (1908). In 1908 she was also a delegate at the International Congress for Labor Legislation, Lucerne (1908), since which she has preached and lectured in the principal cities of the country. She was a delegate to the International Woman Suffrage Convention at Stockholm (1911) and at Budapest (1913) and numerous other conferences abroad. She has been president of the Consumers' League of New York (1897-1917) and vice-president of the National Consumers' League. Numerous periodicals have published contributions from her pen, and she has taken an active part in three municipal campaigns in New York.

**NATHAN THE WISE.** Lessing's immediate occasion for writing 'Nathan der Weise' ('Nathan the Wise') (1779) was the necessity of finding a form, to which the censor could take no exception, for final utterance of some sentiments on the subject of personal religion which he had very much at heart. During a controversy with the Pastor Goeze in Hamburg he had had abundant experience of the pharisaical intolerance of the Lutheran orthodoxy of his day; and, on the other hand, his dear friend Moses Mendelssohn gave him an example of one of the gentlest, most enlightened of spirits in a member of a despised and persecuted sect. The idea of a dramatic poem on the subject of 'Nathan' goes back, however, some 25 years before this time.

The central motif Lessing adopted to his purposes from one of the stories of Boccaccio ('Decameron,' first day, third novel): Saladin, desiring to extort money from the Jew Melchizedek, invites him to declare which is the true religion. The Jew begs leave to tell a story: a father, possessed of a precious ring and having three sons equally dear to him, causes two rings to be made so nearly like the true one that he himself can hardly tell which is which, gives each son one ring, and nobody

can decide who is heir of the original. So it is with the three principal religious faiths. Lessing's version attributes to the true ring the special virtue of making its wearer acceptable in the sight of God and man, provided he wears it confident of that effect. Proof, then, for each son that his ring is genuine will appear in the use that he makes of it. The moral is obvious: faith is the working out of salvation, not the possession of the truth. And from this follows a sufficient principle of conduct: act so as to deserve, and the right that you earn is right indeed, so far at least as any human being can judge.

As a dramatic poem this noble plea for humanitarianism certainly leaves much to be desired. The dialogue is too rationalistic and the versification too mechanical. These very defects, however, being in the direction of realism, secured for the German drama after Lessing the opportunity for a new development in verse, of which the artificial Alexandrines of the school of Gottsched contained no promise. And on the stage the great scene (III, vii) between Nathan and Saladin is as dramatic in effect as it is sublime in idea. Conflicting interests on the part of the other characters are also resolved in dramatic manner by a change of heart; but the discovery of blood relationship between some of the more important, while it enhances the potential tragedy in the previous state of misunderstanding, takes from the dramatic impressiveness of the dénouement somewhat to add to the impressiveness of that doctrine of human brotherhood which the whole piece inculcates. Accordingly, 'Nathan the Wise' has been theatrically most successful in times when its doctrine was particularly at issue. But never has it lost its claim to respectful attention as one of the classic plays to be regularly presented as a matter of course.

Translated by Ellen Frothingham (New York 1892), and by E. K. Corbett (London 1883). Edited by G. O. Curme (New York 1898) and by J. G. Robertson (Cambridge, England, 1912). Consult Gustav Kettner, 'Lessings Dramen' (Berlin 1904).

WILLIAM G. HOWARD.

**NATHANAEL**, one of the earliest believers in and follower of Christ. He was a native of Cana in Galilee and attached himself to Jesus on becoming convinced of the Messiahship of the son of Mary by his miraculous insight and power of reading the heart (John i, 46-49). On the hypothesis that he was one of the 12 he has been identified with Bartholomew, but on insufficient grounds. There is a tradition that Nathanael was the bridegroom at the marriage at Cana, and Epiphanius implies that he was one of the two disciples whom Jesus overtook on the way to Emmaus.

**NATHORST**, nāt'hörst, Alfred Gabriel, Swedish scientist: b. Wäderbrunn, near Nyköping, 7 Nov. 1850. He studied at Lund and Upsala, served (1874) as privat docent in geology at Lund and (1873-84) as geologist on the royal Swedish geological research, becoming (1885) intendant of the palæontological plant collection of the Stockholm Riks Museum. In 1870 and 1882 he was exploring in Spitzbergen and (1873-84) in South and central Sweden. In 1883 he accompanied the Nordenskiöld expedition to Greenland and (1898) led an Antarctic

expedition. His researches in the field of glacial flora fossils were very fruitful. He wrote 'Jordens historia' (Stockholm 1888-94); 'Sveriges Geologi' (ib. 1892-94); 'Zur fossilen Flora der Polarländer' (ib. 1894—); 'Två somrar, i Norra Ishävet' (ib. 1901); 'Polarforskningen' (ib. 1902). He also edited (1895-98) the periodical *Ymer*.

**NATICA**, a genus of sea-snails, forming the type of the family *Naticidae*. The shell is globose in form, the spiral portion being minute and indistinctly marked, smooth and porcelain-like and its aperture of large size and semi-circular form. The animal appears large in proportion to the shell, the foot especially being extensive. The mantle-lobes partly conceal the shell, and an operculum is always present. Most of the genera of this family are marine, and the white, chalky *N. heros* is a familiar species all along the eastern coast of the United States, and lays its eggs in a collar-shaped mass of glutinous material mixed with sand which often excites the curiosity of the stroller by the seaside. This shell is the one most frequently chosen by our hermit-crabs. It may attain a diameter of three and a half inches and a length of five inches. South of Cape Cod *naticon duplicata* is common. Consult Arnold, 'The Sea-Beach at Ebb Tide' (1901).

**NATICK**, ná'tík, Mass., town in Middlesex County, on the Charles River and on the Boston and Albany Railroad. The head of Cochituate Lake, one of the sources of the water supply of Boston, is in the northwest part of the town. The place was founded by John Eliot (q.v.), and from 1651 to the time of the founder's death it was used chiefly as a home for converted Indians. In 1781 it was incorporated as a town. The chief manufactures are shirts, men's clothing, boots, shoes edge tools, boxes, baseballs and supplies for athletic games. A monument in honor of John Eliot is in one of the public parks and a soldiers' monument in another park. Some of the educational institutions are the Morse Institute, the Walnut High School for young women and the Bacon Public Library. Pop. 10,026. Consult Hurd, 'History of Middlesex County, Mass.'; Bacon, 'History of Natick.'

**NATION**. See NATIONALITY; NATIONALISM.

#### NATIONAL ACADEMY OF DESIGN.

An American association devoted to the fine arts, membership in which is limited to 125 painters, 25 sculptors and 25 architects and engravers. In 1906, joined by the Society of American Artists (q.v.), the National Academy became affiliated with Columbia University and the Metropolitan Museum of Art. The school of design conducted since 1825 in connection with the academy, in recent years is located at Amsterdam avenue and 109th street and is open for instruction from October to May; the home and exhibition building of the society is at 215 West 57th street. The instructors in the school are selected from the governing council of the academy, which consists of its officers and six members. The average annual attendance of students is between 200 and 300. The annual exhibitions of the National Academy are features of the art life of the metropolis, interest being focussed on the

awards of the Inness gold medal for the best landscape, the Hallgarten prizes respectively of \$300, \$200 and \$100, and the Clarke prize of \$300. First known as The New York Drawing Association, a secession in 1825 of young artists from the first academy of arts in New York founded in 1802, the present name was adopted in 1828 when the society composed of 30 members with Prof. S. R. Morse (q.v.) as president, was incorporated. Consult Cummings, T. S., 'Historic Annals of the National Academy of Design' (Philadelphia 1865); Catalogues of the Annual Exhibitions (New York 1826, to date).

**NATIONAL ACADEMY OF SCIENCES**, The, an American institution, founded in 1863, consisting of 100 members, elected from among the most distinguished scientific men of the United States; analogous to the Royal Society of London.

**NATIONAL APPROPRIATIONS**. See APPROPRIATIONS, AMERICAN SYSTEM OF; BUDGETS, AMERICAN.

**NATIONAL ASSOCIATION OF CORPORATION SCHOOLS**, The. In 1911 The New York Edison Company established a commercial school to correct faulty fundamentals of employees of that company; to train employees in the duties they were then performing, and for more advanced work. As the movement progressed there was publicity in the New York press which resulted in a large number of inquiries from members of industrial institutions throughout the United States as to: (1) Why the school was established. (2) What was taught in the school. (3) What results had been attained.

The volume of such requests led to the conclusion that there was need for a clearing-house to which those interested might contribute and from which they might secure information. This plan was discussed by the organizer and a few acquaintances who were interested in the subject of better education and better training for the workers of the United States.

After several months of preliminary effort an organizing convention was held at New York University on 24 Jan. 1913; 35 industrial institutions sent delegates. A provisional organization was perfected and officers chosen.

On 4 April following the executive committee met, declared the charter closed and The National Association of Corporation Schools was a reality. In the fall of 1913 the first annual convention was held in the Hall of Education of the National Cash Register Company at Dayton, Ohio, and in 1914 the annual convention was held in the auditorium of the Curtis Publishing Company in Philadelphia. The 1915 meeting was held at the Hotel Bancroft in Worcester and in 1916 convention at the Carnegie Institute of Technology in Pittsburgh. In 1917 the association met as the guests of the Larkin Company at Buffalo. The 1918 convention was scheduled to be held in Chicago, but upon the entrance of the United States into the World War the association pledged its members and its resources to the government. Because of the peculiar fitness of membership nearly all of the active workers were taken into government service in some

capacity, which prevented the meeting at Chicago.

The commercial school established by The New York Edison Company was not the first corporation school in the United States. There are different claims as to where the first school of this character was held. The Pennsylvania Railroad Company, prior to the Civil War, held conferences at its Altoona shops, and the Werner Book Publishing Company of Akron, Ohio, held conferences of its salesmen. Other industrial institutions have come forward with claims of having established schools, but the most authentic information regarding educational activities on behalf of employees of an industrial institution indicates that the first school to be called a *school*, inaugurated by an industrial institution was held by the National Cash Register Company in April 1896. This school has been convened more or less consecutively from that time on down to the present date.

The growth of the Association has been steady, and now embraces in membership a total of 117 industrial institutions, including over 70 different branches of the industries of the United States.

**NATIONAL ASSOCIATION OF MANUFACTURERS.** The. A convention, consisting of several hundred representative American manufacturers, met in Cincinnati, Ohio, 22 Jan. 1895, and provided for the organization of a national association of manufacturers. At the first annual convention of the Association held in Chicago 21 Jan. 1896, the name "The National Association of Manufacturers of the United States of America" was adopted, a preamble setting forth the objects of the Association was published, and a constitution was adopted. The constitution has been revised, elaborated and amended several times to cover the constantly expanding activities of the Association, and in 1908 a new constitution was adopted.

The general objects for which the Association works are: (1) the promotion of the industrial interests of the United States; (2) the fostering of domestic and foreign commerce; (3) the betterment of the relations between employers and their employees; (4) the education of the public in the principles of individual liberty and the ownership of property; and (5) the support of legislation advancing development along the lines above defined, and opposition to legislation retarding it.

To the individual manufacturer the Association offers its trained and practical assistance in supplying accurate and reliable information on pertinent subjects, and organized protection against abuses and unlawful and unjust exactions, unbiased mediation in cases of dispute, and the furtherance of cordial relations between the several members.

The foreign trade department has been highly organized in three divisions devoted to (1) Latin-American trade; (2) Russian trade and (3) Far-Eastern trade; and in six bureaus devoted to general information; foreign buyers; credits; translations; trademarks and publicity. These are in charge of a staff of experts in the several lines, and are in constant communication with a corps of over 2,000 correspondents located in every city and town of

commercial importance in all foreign lands. To the individual member of the Association the foreign trade department offers quotations and suggestions from foreign markets; confidential reports on foreign trade opportunities; advice as to advertising, financing foreign accounts, foreign collections, etc.; reports on the financial standing of foreign firms; translations of foreign letters; information as to the customs duties of all countries and shipment thereto; registration of trademarks, etc.

The law department is devoted strictly to matters which pertain to the pursuits of the Association, and aims to keep its members fully abreast of all decisions and interpretations of the law which can in any way affect their business interests.

In the home department the Association has a number of committees specializing on health and safety; industrial betterment; industrial publicity; industrial education; immigration; banking and currency; trade acceptances; uniform State laws and foreign trade.

Through its business corporation, "The National Manufacturers' Company," the Association publishes a monthly magazine under the title *American Industries*, and issues periodically *The American Trade Index* containing alphabetically paragraphs concerning the business and products of its several members. These are indexed in several foreign languages and are sent to prominent merchants and buyers in foreign countries. Nearly 44,000 copies of this index have been thus distributed.

The membership consists of individuals, firms and corporations actually engaged in manufacturing. The executive officers, the president and the treasurer are elected annually by ballot and the secretary is appointed annually by the executive committee. The executive committee consists of the president, the treasurer, secretary, a vice-president from each of the 12 States having the largest recorded membership in the Association upon election day of its annual convention, and six members at large elected by the executive committee as thus constituted. The members paying the same annual dues, \$50, are exactly similar in voting power in the annual conventions, and the democracy of management is still further secured by the choice of vice-presidents by the different State delegations attending the annual convention. The entire income of the Association is expended in the interest of its members; the president, vice-presidents and the directors serve without compensation. The Association maintains an extensive reference library at its general offices in New York City.

**NATIONAL ASSOCIATION FOR THE STUDY AND PREVENTION OF TUBERCULOSIS.** The, an organization composed of prominent American physicians who are especially interested in preventing the further spread of consumption. The headquarters are at 105 East 22d street, New York.

**NATIONAL BANKING ACT.** See BANKS AND BANKING.

**NATIONAL BANKING SYSTEM.** See BANKS AND BANKING — NATIONAL BANKING SYSTEM.

**NATIONAL BANKS.** See BANKS AND BANKING — NATIONAL BANKING SYSTEM (Arti-

cle 9) and BANK ORGANIZATION AND MANAGEMENT.

**NATIONAL BOARD OF HEALTH, The,** a Federal body, instituted by Act of Congress, 3 March 1879, to consist of 11 members— one army surgeon, one navy surgeon, one medical officer of the marine hospital service, one officer of the Department of Justice and seven physicians from civil life appointed by the President. Industrial development had rendered all sections of the country interdependent in matters of health, and isolation was no longer possible. At the period of the passage of the Act of Congress there were only State and local systems of quarantine in existence in the United States, and Congress did not regard them as adequate to meet all the emergencies that had arisen or that might arise in the prevention of the introduction of contagious and infectious diseases from foreign countries. The Act was designed to establish a complete and effective system of quarantine to the United States. National authority was required to secure : (1) International sanitary co-operation; (2) the collection and distribution of sanitary information; (3) the preparation of maritime sanitary regulations; (4) the enforcement of maritime sanitary inspections in foreign ports; (5) the erection and maintenance of refuge stations; (6) the aid of State authorities; (7) the organization of quarantine where none exists; (8) the power to add necessary rules to any deficient quarantine. A further act (2 June 1879) defined the powers and duties of the Board and transferred to it the quarantine work formerly conducted by the Marine Hospital Service. This Act limited the duration of the Board to four years so that it expired by limitation 2 June 1883. Its work was carried on during 1884 and 1885, when, the appropriation being exhausted, its activities ceased.

The work is now performed by the Bureau of the Public Health Service under the direction of the surgeon-general, and as a part of the Treasury Department. Consult Allen, 'Rise of the National Board of Health' (1899).

**NATIONAL BOUNDARIES.** See BOUNDARIES OF THE UNITED STATES.

**NATIONAL BOUNDARY CHANGES.** For the decisions and awards of the Peace Conference relating to the various nations, see WAR, EUROPEAN.

**NATIONAL BUDGETS.** See BUDGETS, AMERICAN; APPROPRIATIONS, AMERICAN SYSTEM OF.

**NATIONAL CEMETERIES** are burial grounds, instituted by Act of Congress, for the interment of United States soldiers and sailors who have fallen in battle or all men and women who have died in the regular or volunteer military or naval service of the United States after having been mustered out or honorably discharged. The presentation of the commission warrant, letter of appointment, certificate of discharge or pension certificate, provided there be no dishonorable charges connected therewith, are sufficient evidence for interment. Wives of officers and enlisted men may be interred in national cemeteries, according to certain regulations. Na-

tional cemeteries are under the charge of the quartermaster-general, who is represented by the officer of the corps nearest to the cemetery. There are 84 cemeteries, all of which are within the continental limits of the United States, except one in Mexico. The following is a list of national cemeteries:

Alexandria, La.	Grafton, W. Va.
Alexandria, Va.	Hampton, Va.
Andersonville, Ga.	Jefferson Barracks, Mo.
Andrew Johnson, Greenville, Tenn.	Jefferson City, Mo.
Annapolis, Md.	Keokuk, Iowa.
Antietam, Sharpsburg, Md.	Knoxville, Tenn.
Arlington, Va.	Lebanon, Ky.
Balls Bluff, Leesburg, Va.	Lexington, Ky.
Barrancas, Fla.	Little Rock, Ark.
Baton Rouge, La.	Loudon Park, Baltimore, Md.
Battleground, Washington, D. C.	Marietta, Ga.
Beaufort, S. C.	Memphis, Tenn.
Beverly, N. J.	Mexico City, Mexico.
Brownsville, Tex.	Mill Springs, Nancy, Ky.
Camp Butler, Ill.	Mobile, Ala.
Camp Nelson, Ky.	Mound City, Ill.
Cave Hill, Louisville, Ky.	Nashville, Tenn.
Chalmette, La.	Natchez, Miss.
Chattanooga, Tenn.	New Albany, Ind.
City Point, Va.	Newbern, N. C.
Cold Harbor, Va.	Philadelphia, Pa.
Corinth, Miss.	Poplar Grove, Petersburg, Va.
Crown Hill, Indianapolis, Ind.	Port Hudson, La.
Culpeper, Va.	Quincy, Ill.
Custer Battlefield, Crow Agency, Mont.	Raleigh, N. C.
Cypress Hills, Brooklyn, N. Y.	Richmond, Va.

Fredericksburg, Va.	Vicksburg, Miss.
Gettysburg, Pa.	Wilmington, N. C.
Glendale, Va.	Winchester, Va.
	Woodlawn, Elmira, N. Y.
	Yorktown, Va.

**NATIONAL CITY BANK OF NEW YORK, The,** chartered 16 June 1812, under "An Act to incorporate the stockholders of the City Bank of New York," was directly related to the dissolution of the first Bank of the United States, the charter of which, dated 1791, had expired in 1811, and was not extended, owing to political opposition to the Bank of the United States. The closing of the bank creating a need for a new strong banking institution in the metropolis, the directors of the City Bank of New York arranged that the holders of stock in the Bank of the United States might exchange that stock, upon equitable terms, for stock in the City Bank, and this offer was availed of to the extent of 10,000 shares, or \$500,000 par value, of City Bank stock. As this comprised more than a majority of the original capital, the City Bank may be fairly said to have been a direct offspring of Alexander Hamilton's Bank of the United States. It opened for business in the banking-room that had been occupied by the New York branch of the Bank of the United States, at 52 Wall street, and remained in that location until it moved in 1908 into its present home, a handsome modern structure with a perfect equipment at 55 Wall street. The authorized capital of the bank was \$2,000,000

in shares of \$50 each, but it commenced business with \$800,000 of capital paid up at one of the most critical periods of the country's history. The records of the institution afford complete evidence of the political and commercial activities and condition of the nation from 1812 onward. Upon the establishment of the national banking system the bank surrendered its State charter and entered the new system as The National City Bank of New York. The efforts of successive management have always been energetically directed toward broadening and perfecting the service of the institution for the accommodation of the rapidly expanding business interests of the United States, and the volume of business handled by the bank has increased until all banking records for an institution without branches in its own country have been surpassed. The bank has been foremost in its efforts to develop international trade, it has established branch banks in South America, the West Indies and in Carribean countries. It has also acquired the International Banking Corporation, which has branches in many parts of the world; a large number of these are located in the Orient and Far East. For over 16 years The International Banking Corporation has been serving the commercial interests with banking facilities. At the present time the bank has 51 branches doing a general banking business and aiding in the development of international commerce. The latest statement, 4 March 1919, shows the capital at \$25,000,000, surplus and undivided profits \$54,495,613, loans, discount investments, \$484,153,179, deposits \$770,263,453, total resources \$894,270,410. Night and day forces are continuously at work. The bank's staff consists of 1,700 employees and connected with the clerical force is the City Bank Club organized in 1904, and now numbering practically all employees as members. Educational work with recreation is systematically carried on; notable among the activities are the advanced courses of instruction, largely attended, in economic banking, foreign-exchange, law and kindred subjects.

#### NATIONAL CIVIC FEDERATION,

The, an American organization, founded 16 Dec. 1901, the outgrowth of a number of local conventions representing capital and labor. Its purpose is to seek, by an organization of the best thought in the country, a solution of industrial problems; to assist in the enlightening of public opinion through study and discussion of national questions; and to promote progressive social and industrial legislation when it seems desirable. It is entirely non-partisan in principle, considering such topics as imperialism, trusts, tariff, taxation, etc., with a view of obtaining the clearest understanding of them. The Federation is controlled by a national executive committee of three factors: *the public*, represented by the church, the bar, the press, statesmen and men of affairs; *employers*, represented by large manufacturers, corporation heads and officials of employers' organizations; and *labor*, represented by official members of labor organizations. This committee, numbering 54, meets annually, or at such other times and in such localities as may be deemed advisable. Its membership consists of men from all parts and of all occupations of the

country, including a large number prominent in the various pursuits of life.

In the natural expansion of its activities the work of the Federation has been very highly organized under nine general departments, as follows: (1) *Trade Agreement Department*, devoted to the advancement of industrial peace; (2) *Industrial Conciliation Department*, dealing particularly with actual or threatened strikes or lockouts, the adjustment of labor disputes by arbitration and the creation of definite contractual relations between employers and employees; (3) *Industrial Economics Department*, devoted to the study and discussion of the practical phases of economics as applied to industrial problems; (4) *Industrial Welfare Department*, with the duty of promoting sanitary working conditions, technical training, housing of employees, the conduct of insurance and pension systems and savings and loan operations, etc.; (5) *Public Employees Welfare Department*, devoted particularly to the economic benefit of that much neglected class of workers; (6) *Public Ownership Commission*, assigned to the study of the results of public ownership of public utilities in all countries; (7) *Immigration Department*, concerned with the questions arising from immigration, governmental regulations and safeguards of the country at large, and individual localities in particular; (8) *Political Reform Department*, devoted to the teaching of practical non-partisan politics, the enlightenment of voters and the promotion of active participation in civic and national politics; (9) *Woman's Department*, in which nearly all the members are women who are actively interested in industrial enterprises as stockholders, and in active welfare work, such as prison reform, rural betterment, community nursing and the like.

Under the general departments there are committees almost without number assigned to carefully delimited lines of investigation and operation, their members selected especially for notable aptitude in their specific subjects. With the entrance of the United States into the great war, the Federation has found an entirely new series of problems presenting, and its membership has furnished well-equipped minds to attack them intelligently and effectively.

Within recent years the work of the Federation has been intensively developed by the organizations of State councils all over the country, to aid in uniting laws on intrastate matters and to further co-ordination of State and Federal legislation on subjects of public welfare.

At the present moment the industrial economics department has under way a comprehensive survey of social and industrial conditions under 26 separate committees, each composed of members specializing in the particular phase of the investigation to which they are assigned.

The chief mission of the National Civic Federation being educational, one of its most important functions is to give publicity to its labors. This duty is assigned to a bureau of publicity, which besides issuing large numbers of pamphlets and leaflets for general distribution conducts a monthly magazine, *The National Civic Federation Review*, in which is preserved the records of results achieved by the several committees.

**NATIONAL CONFERENCE OF CHARITIES AND CORRECTION**, an American association composed of State boards of public charities and various charity organizations. The national conference is held each year in some city determined upon at a preceding meeting. At these conferences papers are read and general subjects embraced under charity and correction are discussed. The Conference publishes its *Proceedings* and a *National Bulletin* annually, and maintains a bureau of information on all subjects concerning charities and corrections.

**NATIONAL COVENANT**, a league formed by Scotch Presbyterians in 1638. See **COVENANT**.

**NATIONAL CONVENTION**, in France, a legislative body constituted in the hall of the Tuileries 17 September and formally opened 21 Sept. 1792. The third assembly of the deputies elected by the French people after 1789 decreed the suspension of the king 10 Aug. 1792, and voted the election of this National Convention. Its first act was to make France a republic by abolishing the throne, and this was followed by the trial and sentence to death of the king. Internal dissensions arose between the Jacobin or Montagnard party and the Girondists, resulting in the overthrow of the latter. The convention sent thousands of its political opponents to the guillotine, and the Reign of Terror under the dictatorship of Robespierre was followed by his downfall and the suppression of the Jacobins. The convention then existed till a new constitution was organized, and the executive directory was installed at the Little Luxembourg, 1 Nov. 1795. The Chartists in England formed a national convention in 1839. In the United States a national convention is the meeting once in four years of a political party assembled to select a Presidential ticket. See **ELECTION**.

**NATIONAL CONVENTIONS**. See **CONVENTION, POLITICAL**.

**NATIONAL DEBTS OF THE WORLD**. Debt incurred by the nations has developed with startling rapidity in recent years. National debts in the year 1700 were, as nearly as can be determined, about \$1,000,000,000, and in 1800 approximately \$5,000,000,000. By 1900 they had grown to \$31,000,000,000. At the beginning of the great European War in 1914 they were about \$45,000,000,000, and in 1919 aggregated \$225,000,000,000.

The first great increase in national indebtedness of the modern period was that caused by the Napoleonic Wars, which in 15 years increased the national debts of the world from \$2,500,000,000 to over \$7,000,000,000. From 1814 down to the middle of the century, a period of comparative peace, the growth of the national debts was slow, the total of all the debts of the countries for which statistics are available having been in 1850 approximately 9 billions, a net increase of but about 2 billions in 35 years. Then came the heavy expenses of our own Civil War, also of the Crimean, Franco-Prussian and other wars, and by 1874 the world's total stood at 22½ billion dollars. By 1900 it was 31 billions, and at the beginning of 1914 45 billions. Then with the demands of the European War upon the nations participat-

ing the already large total was practically quintupled, advancing from 45 billions in 1914 to about 225 billions in 1919, and this does not include the large sums of paper currency issued by the warring nations to meet such part of their current requirements as they were unable to provide by bond issues.

While wars are usually looked upon as the great cause of the rapid growth of national indebtedness in the past century, a careful consideration of the history of this growth shows that much of the increase prior to 1914 was due to other causes. In the 40 years between 1874 and 1914, in which national indebtedness grew from 22½ billions to 45 billions, there were few costly wars. The great European nations increased their standing armies and navies, this armed peace adding greatly to their expenses and in some cases to their indebtedness. There were, however, other causes. The period was one of great activity in development of the new areas of the world. South America, Africa, Canada, Mexico, Australia and New Zealand show a rapid development in that period, in railways and other transportation facilities, and a large proportion of such development was met by the governments, which necessarily contracted large loans for that purpose. In many of the European countries great railway systems were developed at government expense, which necessitated large borrowings. The railways of the whole world in 1874 were about 150,000 miles, and in 1914 over 700,000 miles, of which about one-third was government owned. Telegraphs, owned in most countries by the government were in 1874 but 300,000 miles and in 1914 1,500,000 miles. Many public improvements other than railways and telegraphs were also made at public expense. Harbors were deepened, rivers made navigable, inter-oceanic canals created, great and costly buildings erected and as the debt grew, so did the burden of interest.

Other causes, however, contributed largely to the "debt habit" among nations. Among these contributive factors were the increase of world money, and increase of wealth, which made borrowing by nations comparatively easy when contrasted with earlier conditions. Down to 1848 the world's production of gold was but about 12 million dollars per annum, in 1860 it was 122 millions per annum, in 1900 it amounted to 254 millions and in 1913 to 460 millions. The total money of the world, gold, silver and uncovered paper, as estimated by competent authorities, was in 1800 about 2½ billion dollars, in 1850 a little over 4 billions, but by 1900 had grown to 12 billions, and in 1913 was 18 billions. The world's money—gold, silver and uncovered paper—practically trebled in the 40 years in which the national debts doubled and this increase in available currency encouraged the borrowing habit among nations. With the entrance upon the European War the issues of paper currency rapidly increased, the paper money issued by 15 responsible governments of the world during the war period aggregating \$36,000,000,000; and during that same period national debts increased \$180,000,000,000, bringing the total national indebtedness up to \$225,000,000,000 in 1919.

The quantity of available wealth to which nations might appeal was another temptation.

Borrowing became comparatively easy. It is quite impossible, of course, to accurately measure the wealth of the entire world, especially at the earlier dates under consideration, for even at the present time we can only estimate the wealth of a score of the principal nations, but an examination of the wealth figures of a few countries for which data for earlier years can be had shows an extremely rapid growth in the last 40 years, and suggests that the available wealth of the world upon which the nations requiring loans were able to draw had very greatly increased during that period in which they developed great debts for other than war purposes. The wealth of the United Kingdom, for example, is estimated as having been about 30 billion dollars in 1865 against 90 billions in 1914; that of France is estimated at 25 billions in 1865 and 65 billions in 1914. Thus the wealth of these two fairly representative countries of Europe, speaking in broad terms, trebled in the half century immediately preceding the World War. In the case of the United States, a newer country and having special facilities for the increase of its wealth through the development of its producing powers, the rate of growth has been much greater, increasing from 16 billion dollars in 1860 to approximately 200 billions in 1914, our own wealth having been in 1914 fully 12 times as much as in 1860, a rate which could not of course be applied to the world as a whole. In certain other countries, Canada, Australia, South Africa and parts of South America, the gain was also rapid, but the rate of growth of the world's wealth is fairly exemplified by that of France and Great Britain, and it seems probable that the world's available wealth practically trebled in that 40-year period, in which the nations of the world were doubling their national indebtedness in times of comparative peace.

The purposes to which the increase in debts was devoted are not difficult to find. A half century ago the world was calling for railroads, steamships, inter-oceanic canals, better harbors, waterways on land, telegraphs and ocean cables to further facilitate intercommunications and the interchange of merchandise and its equivalent, money and credits. About one-third of the railways of the world are now governmentally owned, and have been largely paid for by borrowed money. Of the 220,000 miles of railway in Europe about 120,000 are government owned; of the 70,000 in Asia, 45,000 belong to the governments of the countries in which they exist; of the 28,000 miles in Africa about 17,000 are owned by the governments of the respective colonies into which that continent has been divided or by the governments of the countries controlling those colonies; of the 23,000 miles in Australia over 20,000 were constructed by the government, while of the 360,000 miles in America only about 10 per cent are government owned. A large part of the railways of Russia, Germany, Austria-Hungary, Italy, Egypt, India, Japan, Australia, New Zealand and the Dutch East Indies are owned and in most cases operated by the respective governments. All of the telegraph lines of the world, except those in the United States, are owned by the governments of the countries in which they operate. When we add to this the cost of the great undertakings in water

transportation, inter-oceanic canals, harbors, inland canals and the deepening of rivers it will be apparent that the mere matter of transportation has absorbed a very considerable part of the indebtedness accumulated in the half century prior to 1914.

While much of the growth of national debts between the great war periods was for legitimate improvements in transportation and world progress, it must be admitted that the preparations for possible wars had much to do with the large national expenditures which encouraged the debt habit. During the 40-year period of debt making without war the countries of Europe built up and maintained as a permanent part of their establishments enormous standing armies, which not only withdrew large numbers of persons from the productive industries, but required large sums of money for their equipment and maintenance, and at the same time they greatly enlarged their navies, and this was undoubtedly one of the important causes of the very large increase in the world's accumulation of indebtedness during the period 1874-1914, in which world debts doubled in a time of comparative peace. The 1913 debts of the European countries were in round terms \$32,000,000,000, Asia \$4,000,000,000, South America \$2,300,000,000, North America \$2,100,000,000, Africa \$1,500,000,000 and Oceania \$2,000,000,000. Of the world's national debts in 1874, which aggregated at that time about 22½ billion dollars, about 15 billions were owned by European countries, and the remainder distributed among the other grand divisions, that of North America alone being approximately 3 billion dollars.

Of the 45 billion dollars of national debts in existence at the beginning of the year 1914 about 34 billion dollars were owed by the countries which entered the war. France stood at the head of the list with an indebtedness of \$6,346,000,000; Germany (including the German states), \$5,027,000,000; Russia, \$4,536,000,000; Austria-Hungary, \$3,869,000,000; United Kingdom, \$3,486,000,000; Italy, \$2,921,000,000; Australia, \$1,433,000,000; Japan, \$1,241,000,000; United States, \$1,028,000,000; Portugal, \$948,000,000; Belgium, \$826,000,000; Turkey, \$624,000,000; Canada, \$483,000,000; New Zealand, \$438,000,000; Rumania, \$316,000,000; Bulgaria, \$135,000,000. This list of countries whose total debts at the beginning of the war were \$33,657,000,000 includes only those which actively participated in the fighting, and in the war period they practically sextupled their indebtedness as shown by the tabular statement which follows this discussion.

The relation of national debts to national wealth is of course of great importance, but can only be discussed in very general terms, owing to the fact already mentioned, that no country other than the United States takes a wealth census, and figures on the wealth of other countries are at the best only estimates; while figures as to income of a country are therefore estimates based on estimates. Accepting estimates which have been made of the wealth of the principal countries in 1919 it would appear that the ratio of debt to wealth in 1919 would be in case of the United States about 8 per cent, Great Britain, France and Italy 33 per cent. The per capita indebtedness of the principal countries in 1919 is: United States, \$223;

Great Britain, \$790; France, \$800; Germany, \$675; Italy, \$350.

Practically all of the loans made by the great nations of Europe have been issued by the governments at less than their face or par value. The first of the British war loans in the great European War (that of November 1914) which bore an interest rate of  $3\frac{1}{2}$  per cent was issued by the government at 95 per cent, or at 5 per cent below par; a part of the third was issued at par and a part at 95 per cent. The German loans were issued at slightly below par,  $97\frac{1}{2}$  per cent in some cases, 98 per cent in others and 99 per cent in one instance; those of Italy at from 90 to 97 per cent of their face value, while in the case of France the first National Defense Loan bore an interest rate of  $5\frac{1}{2}$  per cent and was sold by the government at 88 per cent of its face value, and in the second loan, which bore an interest rate of 5 per cent, the issue was made at 88 per cent while a still later loan was issued at about 70 per cent of its face value, the Austria-Hungary loans which bore interest at the rate of  $5\frac{1}{2}$  per cent in most cases were issued at from 93 to 97 per cent of their face value. As a result of this the amount of money which European governments have actually received upon their loans issued since the beginning of the war is nearly 3 billion dollars below the par value of the securities issued, upon which par value the present generation must pay full interest while the later generations who meet the principal of the bonds will have to pay approximately 3 billion dollars more than was received by the governments which issued them. The United States is in fact the only one of the great nations making popular loans in behalf of the war which actually sold its bonds at their full face value. And many of the securities of the European countries sold at less than par have also been paid for in a paper currency more, or less depreciated.

A very large proportion of the national loans issued by governments other than the United States in former years were also sold by the issuing governments at less than their face value, in most cases at from 2 to 5 per cent below par.

Loans made by the United States government have usually been issued at their full face value. In the very early days there were a few exceptions to this general rule. A 22-year bond issued in 1796 was sold at  $87\frac{1}{2}$  per cent of its face value; a 16-million dollar issue in 1813 was sold at 88 per cent; another in August of that year at  $11\frac{3}{4}$  per cent discount, and in 1814 sundry issues at a discount of 20 per cent. Again in 1842 there was one small issue at  $97\frac{1}{2}$  per cent, and in 1861 two larger issues at 89 per cent of their face values. During the Civil War apparently all of the numerous bond issues made by the government were sold at par, and in a few cases above par, but were paid for in the depreciated currency of that period—greenbacks—which were accepted at their face value.

Of the world's national debts which existed at the beginning of 1914 a large part were held in Europe, and practically all of those issued after 1914, aside from those of the United States, were taken in Europe. Of the total of the world's national debts at the begin-

ning of 1914, 45 billion dollars, about 32 billions were the obligations of European governments, approximately 4 billions those of Asiatic governments,  $2\frac{1}{4}$  billions South American, 2 billions Oceania and  $1\frac{1}{4}$  billions Africa. Practically all of the European government issues, amounting to 32 billion dollars, were then held in Europe, most of them in the countries by which they were issued, except in the case of Russia, Italy, Spain, Portugal and certain of the Balkan States. A very considerable proportion of the Russian securities aggregating about  $4\frac{1}{2}$  billion dollars at the beginning of the war were held in France, Germany and Great Britain, and this was true to a considerable extent of those of Italy, Spain, Portugal and the Balkan States. Of the South American securities, a large proportion were held in Great Britain and France. Those of North America were chiefly held at home; those of Asia in part in Great Britain, France and Germany, but a considerable share was held in Asia, while those of the British colonies in Africa and Oceania were largely held in Great Britain. Practically all of the great loans made by the European countries since 1914 (with the exception of the \$500,000,000 marketed by the British and French in the United States) were placed among the people of the country issuing them, in the form of "popular loans," though some parts of the early Russian loans were probably taken in Great Britain and France. This fact, that most of the obligations of the nations are held by their own people, is the one mitigating feature of the enormous increase in national indebtedness of today. The payment of the debts will not send out of the country the money so paid, while the greatly increased interest payments are also distributed among home population.

#### NATIONAL DEBTS OF THE WORLD.

1700	\$1,000,000,000	1872	\$22,500,000,000
1790	2,300,000,000	1882	26,300,000,000
1820	7,400,000,000	1900	31,200,000,000
1848	8,400,000,000	1913	43,850,000,000
1862	13,500,000,000	1917	120,000,000,000
		1919	225,000,000,000

#### NATIONAL DEBTS OF THE PRINCIPAL COUNTRIES PARTICIPATING IN THE EUROPEAN WAR OF 1914.

	1913	1919
Austria-Hungary*	\$3,870,000,000	\$21,750,000,000
Germany†	5,030,000,000	41,100,000,000
France	6,436,000,000	32,100,000,000
Italy	2,921,000,000	12,200,000,000
Russia‡	4,536,000,000	27,000,000,000
United Kingdom	3,490,000,000	36,980,000,000
United States	1,030,000,000	24,000,000,000
Japan	1,241,000,000	1,229,000,000
Turkey	624,000,000	1,011,000,000
Canada	483,000,000	2,007,000,000
Australia††	1,433,000,000	2,987,000,000
New Zealand	438,000,000	650,000,000

\* Includes debts of Austrian Empire and Hungarian Kingdom.

† Includes debts of German states chiefly created prior to formation of empire.

‡ Does not include debts created by Bolshevik government.

†† Includes debts of the six colonies of Australia, created prior to their incorporation as the Commonwealth of Australia in 1901.

O. P. AUSTIN,

Statistician, National City Bank, New York.

NATIONAL EDUCATION, Systems of.  
See EDUCATION, NATIONAL SYSTEMS OF.

**NATIONAL EDUCATION ASSOCIATION**, since 1870 the name adopted for the National Teachers' Association founded at Philadelphia, Pa., in 1857, an organization composed of teachers and other persons interested in education. Its purpose is the discussion of topics relating to the education of the whole people, to the end that the profession of teaching may be elevated in its character, that its interests may be advanced and that the cause that it represents may be promoted in the United States. The Association exists as a body corporate of the District of Columbia, under the name of the National Education Association of the United States, by virtue of an act of incorporation passed by Congress and approved by the President 30 June 1906.

Section 2 of the act provides that "This corporation shall include the National Council of Education and the following departments, and such others as shall be created by organization or consolidation, to-wit: the departments (1) of superintendence; (2) of normal schools; (3) of elementary education; (4) of higher education; (5) of manual training; (6) of art education; (7) of kinder education; (8) of music education; (9) of secondary education; (10) of business education; (11) of child study; (12) of physical education; (13) of natural science instruction; (14) of school administration; (15) the library department; (16) of special education, and (17) of Indian education, the powers and duties and the number and names of these departments and of the National Council of Education may be changed or abolished at the pleasure of the corporation, as provided in its by-laws."

The membership consists of three classes: active, corresponding and associate members. Any eligible person may become an active member upon application endorsed by two active members by paying an enrolment fee of \$2 and the annual dues of \$2 for the current year. Teachers and all who are actively associated with the management of educational institutions, including libraries and educational publications, are eligible for active membership. Only active members have the right to vote and to hold office. All active members are entitled to a volume of the *Proceedings*. Corresponding members, whose number shall not exceed 50 at one time, shall be eminent educators not residing in America. They shall be elected by the board of directors and shall receive the volume of *Proceedings* without the payment of any fee. Associate members pay an annual fee of \$2 and may receive the volume of *Proceedings* by formal application. The board of trustees consists of four members, elected by the board of directors for a term of four years and the president of the Association, who is ex officio a member during his term of office. The details of officers and of management may be found in full in the *Proceedings* (1906 et seq.). The several departments engage in the special work of education which their names indicate. The National Council of Education is a deliberative body, whose functions need brief elaboration. One of them is the proposal to the board of directors of suitable subjects of investigation and research and the recommendation of the amount of money that should be appropriated for that purpose. When

the board of directors authorizes special studies and investigations the council selects the membership of the committees to make them. Several important reports have issued from such committees and may be obtained by correspondence with the secretary of the Association. The council consists of 60 members, selected from the membership of the Association. The board of directors annually elects five members and the council the same number, each to serve for six years and until their successors are elected. All members become honorary members on the expiration of the terms for which they are elected. They are privileged to attend the sessions of the council and participate in its discussions. No State is entitled to more than eight members.

*History.*—The Association was organized in 1857 as the National Teachers' Association. It was an extension of the State association idea to the country at large. To T. W. Valentine, president of the State Teachers' Association of New York, belongs the credit of initiating the movement. In conference with D. B. Hagar, of the Massachusetts Association, a call for a convention was agreed upon and prepared by the latter in 1856, in pursuance of which a small number of men gathered in Philadelphia 26 Aug. 1857. At this meeting the National Teachers' Association was founded with Zalmon Richards of Washington, D. C., as president. There were 43 members enrolled but 12 States and the District of Columbia were represented. At the Indianapolis meeting of 1866, the word "person" was substituted for "gentleman," in the section defining eligibility for membership. Women were thus admitted to full membership. Meetings were held annually in the different States and before 1870 all discussions were held before the whole Association as a body. In that year the department feature of the Association was introduced and the name changed to the National Education Association. Some of the departments had existed previously as independent associations. This was true of the department of normal schools, formerly the American Normal School Association, and organized at Norwich, Conn., in August 1858 and of the department of superintendence, which was previously the National Association of School Superintendents, organized at Harrisburg, Pa., in August 1865. Although the Association drew its membership from all parts of the country the attendance at its meetings was small, never reaching the 400 mark in the first quarter century of its existence. The 1884 meeting was the turning point in the fortunes of the organization. The financial difficulties had been extremely embarrassing. It had been impossible to print the addresses without contributions from liberally disposed members. The president for that year, Thomas W. Bicknell, conceived a plan of enlisting the interest of the railway people and the days of poverty were a matter of history. The enrolment reached 2,729. The Association was freed from debt and a permanent fund started. While the number varied widely in succeeding years, it has steadily increased, the most remarkable record being that at the Boston meeting of 1903, at which 34,983 members were enrolled.

The movement to secure a permanent membership was inaugurated at the Denver meet-

ing in 1895. The old scheme by which one could purchase a life membership for \$20 and a life directorship for \$100 was abolished. In its stead, the present plan of the payment of annual dues, whether in attendance at the meeting or not, was adopted. In consequence the society now has a permanent membership of about 10,000 active, and a far greater number of associate members. Since 1898 a permanent secretary is employed by the board of trustees. He is chosen for a term of four years. Reference has been made to the special studies that have been conducted in an exhaustive way by committees composed of experts in the subjects under consideration. They are among the most notable publications of the Association. The following reports, among others, have been widely circulated and have had no little influence in determining policies in the fields which they cover: of the Committee of Fifteen on 'Elementary Education'; of the Committee of Ten on 'Secondary Studies'; of the Committee of Twelve on 'Rural Schools'; of the Committee on 'Salaries, Tenure of Office and Pensions of Teachers,' on 'Taxation as Related to Public Education.' The permanent invested fund of the Association amounts at present to \$188,500, yielding a net revenue of \$7,178. The annual receipts in a recent year amounted to \$42,529; the expenses, \$37,158. Consult 'History of the National Education Association of the United States' (Washington, D. C., 1892); the 'Annual Report,' 'Proceedings,' etc., of the Association; the most important publications on pedagogy now in the United States; the 'Reports' of committees referred to above.

**NATIONAL GALLERY, The,** the British national art gallery; a collection of paintings, in Trafalgar Square, London. It originated in a collection formed by Mr. Angerstein, consisting of 38 pictures, 29 by old masters and 9 by British painters, and purchased with public funds in 1824 for \$280,000 as the nucleus of a national gallery. Since that time the collection has been greatly enlarged by purchases out of funds provided by Parliament, as well as by bequests and gifts. Of the latter the most munificent has been that of Mr. Vernon in 1847, a collection of 157 works of English painters. Another highly valuable section is that of the pictures and drawings by Turner bequeathed to the nation at his death in 1856. In 1871 a valuable prize was secured by the purchase for \$375,000 of Sir Robert Peel's collection, consisting of 77 paintings and 18 drawings. In 1885 Parliament voted \$350,000 for the purchase of a single picture, the 'Ansidei Raphael,' together with \$87,500 for another, Van Dyck's 'Charles I on Horseback.' The National Gallery now comprises over 1,200 pictures and though specially strong in examples of the British school of painting, foreign masters are fully represented. The various early and late Italian schools are extensively illustrated; there are good examples of the chief representatives of

Italian art, as Raphael, Correggio, Paul Veronese. There are also good examples of Murillo and Velasquez and the Spanish school, and the great Dutch and Flemish painters, Rembrandt, Rubens, Van Dyck, etc., are well represented. The original building of the National Gallery dates from 1838 but has since had additions to accommodate the increasing collection.

**NATIONAL GEOGRAPHICAL SOCIETY.** See GEOGRAPHICAL SOCIETY, NATIONAL.

**NATIONAL GOVERNMENT AND CORPORATIONS.** See CORPORATIONS, LEGAL.

**NATIONAL GRANGES.** See GRANGERS; and GRANGER CASES.

**NATIONAL GUARD.** See MILITIA.

**NATIONAL HYMNS.** A national hymn as usually understood is the official song rendered on ceremonial occasions, fêtes and other public gatherings. It is sometimes an air (without words) that is recognized by the government, a march played by bands and orchestras to stimulate patriotism and loyalty to the ruler. While the oldest of national hymns now extant date back less than five centuries, lines breathing the spirit of patriotism were written by Horace and other poets of ancient times. The national song is intimately related with and probably grew out of the folksong. Words and music should convey something of the national temper, should voice the aspiration of a people and express to some extent the ideas that a nation stands for. Love of fatherland and pride in one's country are the keynotes of many national anthems. In some of them religious feeling is blended with patriotic sentiment. The tune as well as the lyric should be by a native composer. In Europe the writers of national hymns have usually been enlisted in the service of institutionalism. Their productions have been often inspired by devotion to church and state, also by love of home. Considering the lack of poetical merit in most national songs, their influence has been very great. Wars and revolutions have sometimes called them into being and in these especially the note of freedom is emphasized.

**Argentina.**—'Oid, mortales, el grito sagrado' (1810) (Hear, O mortals, The Sacred Call.) Music is by D. V. Lopez.

**Austria.**—The Austrian national hymn in the days of the empire, 'Gott erhalte unsern Kaiser,' or, according to the monarch's name, 'Gott erhalte Franz den Kaiser,' was written in 1797 by Laurence L. Haschka (1749-1827); music by Joseph Haydn (1732-1809). A stanza is quoted:

God preserve our Franz in glory, Franz our Emp'ror good and great!

High in wisdom, famed in story, we his praises celebrate; Love of subjects young and hoary bind his crown of regal state.

God preserve our Franz in glory, Franz our Emp'ror good and great!

**Belgium.**—The Belgian national hymn is 'La Brabançonne' (the Song of the Brabantines); music by François van Campenhout (1780-1848). The words were written by Jenneval, a French comedian, who was playing in a theatre of Brussels when the rising took place which resulted in Belgium's independence from Dutch rule in 1830. The refrain plays on the word "orange," referring to the reigning house

of Orange in the Netherlands. The first stanza is appended:

Who would have thought the arbitrary  
And scheming despot would bring force?  
Against us comes a sanguinary  
Princeling, with shrapnel in his course.  
'Tis done, o'er Belgians comes a change.  
No more with Nassau shameful pact shall be.  
The grape-shot's shattered the orange  
Upon the tree of liberty.

Three other versions of 'La Brabançonne' were written — that by Lonlay in 1848, another by Campenhout and one by Hymans in 1852 — relating to the political situation in those years.

**Bohemia.**—Bohemia has two well-known national songs, the 'War-song of the Hussites' (dating back to about 1460) and 'My Fatherland,' composed centuries ago. The names of author and composer are forgotten. The first stanza of this favorite national ditty is:

Where is my house? Where is my home?  
Streams among the meadows creeping,  
Brooks from rock to rock are leaping,  
Everywhere bloom spring and flowers,  
Within this paradise of ours;  
There, 'tis there, the beautiful land!  
Bohemia, my fatherland!

**Bolivia.**—Words by J. I. de Sanjines and music by B. Vincenti.

**Brazil.**—Words by Medeiros Albuquerque and music by L. Miquez.

**Burma.**—'Kayah Than' (Sound the Trumpet).

**Canada.**—'The Maple Leaf Forever,' words and music by Alexander Muir.

**Chile.**—'Dulce Patria' by Carnicer.

**Costa Rica.**—'De la Patria' by M. M. Guierrez.

**Denmark.**—The Danish national hymn, 'Kong Christian stod ved højen mast' (King Christian stood beside the mast), was written by Johannes Evald (1743-81); music adapted from an old air by John Hartmann (d. 1793), a German who settled in Copenhagen in 1768. Longfellow's version of this spirited poem is well known.

**Ecuador.**—'Salve, O Patria.'

**Egypt.**—'Salaam Effendi' (March of the Khedive).

**Finland.**—'Vårt Land' (Our Land). Words by J. L. Runeberg; music by F. Pacius.

**France.**—The history of 'La Marseillaise,' the most famous of all national hymns, is dealt with elsewhere. See MARSEILLAISE.

The national hymn of the Second Empire (1852-70) was 'Partant pour la Syrie'; words by A. de Laborde and music by Queen Hortense.

**Germany.**—Germany's national hymn, 'Die Wacht am Rhein' (The Watch on the Rhine), is treated under that head (q.v.). A national song very popular among Germans is 'Deutschland über Alles,' written in 1841 by August H. Hoffmann (1798-1874), generally known as Hoffmann von Fallersleben. It is sung to the music of the Austrian national hymn. The first stanza of 'Das Lied der Deutschen' is thus translated:

German Empire over all things, over all things in the world,  
When for safety and defiance its proud banner is unfurled,  
From the Maas unto the Memel, from the Etsch to sea  
waves curled —  
German Empire over all things, over all things in the world!

The Prussian national hymn is 'Heil dir im Siegerkranz' (Hail to thee laurel-crowned), written in 1790 by Heinrich Harries (1762-1802).

It is sung to the tune of 'God Save the King.' A general favorite is 'Preussened' (Song of the Prussians), written in 1830 by Bernhard Thiersch (1794-1855); melody composed in 1839 by H. A. Neithardt (1793-1861). The Bavarian hymn is 'Heil unserm König, Heil' (Hail to our monarch, hail).

**Great Britain.**—The British national hymn, 'God Save the King,' was composed in 1739 by Henry Carey (1692-1743), who was partly indebted to others for the words. He borrowed and rewrote the air from the French. The music has been adapted for the national hymns of the United States, Switzerland, Prussia and other German states. *Welsh.*—'Hen Wlad Fy Nhadau' (Land of my Fathers), was written by Evan James; melody by James James. The first stanza, as translated by Eben Vardd, is as follows:

The land of my fathers, the land of my choice,  
The land in which poets and minstrels rejoice;  
The land whose stern warriors were true to the core,  
While bleeding for freedom of yore.

Among the patriotic songs of various parts of the British Empire are 'The Song of Australia' (words by Mrs. C. J. Carleton and music by Carl Linger) and Canada's 'Maple-leaf Forever' (music by A. Muir).

**Greece.**—The Greek national hymn is the war song, 'Sons of Greece, come, arise,' which dates back to the days of the Greek struggle for independence (1821-29). Byron translated it.

**Guatemala.**—Words by P. Molina and air by R. Alvarez.

**Hebrew.**—The songs of the Hebrew nationalists is 'Hatikva.'

**Honduras.**—Music by L. Campos.

**Hungary.**—Among the patriotic songs of Hungary the one most frequently heard is 'Isten áldd meg a Magyart' (Lord, bless the Hungarian) by F. Koseley, which is wed to a striking melody. The renowned 'Rákoczy March,' by an unknown composer, has even greater power over Hungarians.

**Ireland.**—The patriotic songs of the Irish have for their themes episodes in the glorious but tragic history of the race. A song still popular is 'The Wearing of the Green,' dealing with the rebellion of 1798. In the latter half of the 19th century it was supplanted somewhat in popular favor by T. D. Sullivan's 'God Save Ireland' (1867). The new century and the new nationalism have produced the stirring call to freedom in the native tongue, 'Sinn Fein Linn Fein mar Iadsan,' now only rivaled by the popular ballad, 'Who Fears to Speak of Easter Week,' dealing with the rising of Easter Week (24 April-1 May 1916).

**Italy.**—The only national air of Italy is Gabetti's 'Marcia Reale Italiana' (Royal Italian March), played on all official occasions. The famed Garibaldi's 'Hymn' (q.v.) is a martial strain, and the other patriotic songs are sectional.

**Japan.**—The Oriental national airs are very simple. That of Japan 'Kimi Ga Yo Wa,' by Hayashi Hiromori, contains four lines:

Let Mikado's empire stand  
Till a thousand years, ten thousand years shall roll.  
Till the sand in the brooklets grow to stone,  
And the moss these pebbles emeralds make.

The Japanese have borrowed G. F. Root's 'Battle Cry of Freedom.'

**Mexico.**—The Mexican national hymn, 'Mexicanos, al grito de guerra' (Mexicans, at the cry of war), was written by F. G. Bocanegra; air composed in 1853 by James Nunó.

**Mohammedan.**—Some Mohammedan countries of Africa have sultans' hymns. The national air of Liberia is by Olmstead Luca.

**Montenegro.**—'Onward! Onward!'

**Netherlands.**—Holland has two national songs that are often sung on public occasions—'Wilhelmus van Nassouwe' (dating back to about 1568) and 'Wein Neerlandsch Bloed.' The latter hymn, by H. C. Tollens (1778-1856), begins:

Let him in whom old Dutch blood flows,  
Untainted, free and strong;  
Whose heart for Prince and country glows,  
Now join us in our song;  
Let him with us lift up his voice,  
And sing in patriot band,  
The song at which all hearts rejoice,  
For Prince and Fatherland!

The *Boer* national hymn is by Catherine F. Van Rees, who wrote both words and music. There are three stanzas, of which the first runs as follows:

Know'st thou a race, of freemen bred,  
Who broke the tyrant's might;  
Who burst their bonds and fought and bled  
For freedom and for right?  
Come, burghers! Raise the flag on high  
That led to victory;  
The hour of bondage has gone by—  
Free men, free men are we!

There are two stanzas in the national hymn of the Orange Free State; words by H. A. L. Hammelsberg and music by W. F. G. Nicolai.

**Nicaragua.**—Music by Blas Villatas.

**Norway.**—The Norwegian national hymn is 'Sang for Norge' (Song for Norway), written in 1859 by Bjørnstjerne Bjørnson. Three stanzas of this admirable lyric have been translated by Rasmus B. Anderson. The first is:

Yes, we love with fond devotion  
Norway's mountain domes,  
Rising storm-lashed, o'er the ocean,  
With their thousand homes;  
Love our country, while we're bending  
Thoughts to fathers grand,  
And to saga-night that's sending  
Dreams upon our land.

Another patriotic song is 'Sønner af Norge' (Sons of Norway), by H. A. Bjerregaard (1792-1842); music by C. Blom (1782-1861).

**Persia.**—'Salmati Shah.' Music by A. Le-maire.

**Peru.**—'Somos libres, seámoslo siempre' (We Are Free, Let Us Be So Forever).

**Poland.**—Besides the Polish song referred to under Russia (below) the Poles have a national song entitled 'God for Poland.'

**Portugal.**—Portugal's national hymn is the 'Hymno Constitucional,' written about 1861 by Dom Pedro I, emperor of Brazil. Upon the accession of Dom Carlos I (21 Dec. 1889), a new national air was composed by H. M. Jurior.

**Rumania.**—In 1861 the Rumanian government offered a prize for the best national hymn, which was won by V. Alexandri's stanzas, 'Traasca Regale' (Long live the king); music by E. A. Hübsch.

**Russia.**—The former Russian national hymn, 'Bozhe Zaria Chraný' (God preserve the Tzar), written by Jukovsky, is a prayer. The air by Alexis Lvoff dates from 1830, when Nicholas I ordered it sung as the national anthem. The revolt of 1830 produced the stirring

battle song by Wybicki, 'Poland's not yet dead in slavery,' which has been called the Polish national hymn.

**Salvador.**—'Saludemos la Patria' (Let Us Hail Our Country). Words by J. J. Canas; music by J. Aberle.

**Serbia.**—Serbia has two: 'Rise, Oh Serbians'; and 'God in His Goodness,' set to music by D. Jenko.

**Spain.**—The Spanish national air is the fine 'Hymno de Riego,' by Huerta (1803-80).

**Sweden.**—The Swedish national hymn is 'Ur Svenska Hjärtans' (From the depths of Swedish Hearts); words by Strandberg; music by Lindblad. Equally popular is 'Fosterjorden' (Land of my Birth), by Richard Dybeck (1811-77); melody from Jemtland (a province in western Sweden) arranged by J. N. Ahlstrom. C. T. Hanson's translation is:

Oh, ancient beloved Northland of my birth,  
The happiest of nations though lowly,  
I greet thee, most beautiful land upon earth,  
Thy green hills, thy sun, thy heaven blue and holy.

The thought of thee brings back the days that are gone,  
The same in thy royal beauty ever,  
O'er all lands and seas thy sweet name is borne,  
Oh, I would live among thy hills forever!

**Switzerland.**—The Swiss national hymn, 'Dem Vaterland' (To the Fatherland), by J. R. Wyss (1781-1830), is sung to the tune of 'America.' The first stanza of this inspiring lyric is

Call'st thou, my Fatherland?  
See us with heart and hand  
Vowed to thee, all!  
Helvetia, hail to thee!  
True still thy sons shall be,  
Like them Saint James did see  
Leap at war's call!

**Turkey.**—Turkey has no national hymn. Each sultan has an imperial air composed in his honor. There are several Ottoman war songs full of national feeling.

**United States.**—The national anthem of the United States is the 'Star Spangled Banner' (q.v.) written in 1814 by Francis S. Key. The melody is that of an old drinking song. Other patriotic songs that divide honors with it are: 'Hail, Columbia' (1798), by Joseph Hopkinson (1770-1842), sung to music composed by Fyles in 1788; and S. F. Smith's 'America,' written in 1832 to fit the air of 'God Save the King.' It is now generally conceded that 'Yankee Doodle' is the true national American air. Its origin is obscure. The most probable account ascribes to the tune an English origin and the words of Dr. Shuckburgh, an army surgeon, about 1755, soon after which, during the American Revolution, it came extensively into vogue. Other popular American national songs are 'John Brown's Body' and 'Dixie.'

**Uruguay.**—'Himno Nacional de la República Oriental del Uruguay.'

**Venezuela.**—'Gloria al bravo pueblo' (1811) (Honor to a Brave Nation). Words by V. Salvias, music by J. Sandaeta.

Consult Bantock, G., 'Sixty Patriotic Songs of All Nations' (Boston 1913); Smith, 'Music of the Waters'; Smith, 'Stories of Great National Songs'; Fitzgerald, 'Stories of Famous Songs'; Sousa, J. P., 'National Patriotic and Typical Airs of All Lands' (Philadelphia 1890); Kappey, 'Songs of Eastern Europe'; Engel, 'Study of National Music'; White, 'National Hymns.'

### NATIONAL IDEALS IN THE WAR.

In the strain of the great war the national ideals of all the peoples were severely tested. Articles of political faith previously accepted without much question were challenged to defend themselves in the face of a new criticism and of directly antagonistic ideals. And this warfare of ideals was no mere "battle of the books"; it was fought with machine guns and heavy artillery, with dreadnaughts and submarines, with battle-planes and poison gases. Once again, as so often in the past, men asked themselves what were the essential principles for which they were ready to make the supreme sacrifice? Thus the war made necessary a thorough reconsideration of national ideals.

President Wilson's war message was read to Congress almost exactly 52 years after the surrender of Lee's army at Appomattox. More than half a century, therefore, had passed since the last conflict which seriously tested the *morale* of the American people. With few exceptions the generation which knew at first hand the real meaning of that struggle—what it involved for the civilian as well as the soldier—had passed away. Among those in youth and middle life, there was little appreciation of the responsibilities and the sacrifices by which the national fabric had been established and maintained. Furthermore the issues of the great war were such as to demand of the citizen a quite unusual capacity to see the interest of his country in matters lying beyond his ordinary horizon, an ability to take long views, which has rarely, if ever, been demanded of any democratic community. The rights of the United States had indeed been seriously invaded, but the enemy seemed very far off. It was not enough to depend upon the primitive instinct which calls men to the defense of their own home against a pressing danger. The patriotism of Americans was not stirred, like that of France, by hostile armies upon the actual soil of their country. The appeal was rather, in a quite unusual degree, to permanent, as distinguished from immediate, interests, to ideal, rather than purely material, gains.

**National Ideals on the Eve of the War.**—The foundation of American political thought is the old English tradition of self-government and representative institutions—the right of the people to a share in their own government. With the coming of independence, this ideal was broadened into a more absolute doctrine of popular sovereignty, now interpreted to mean literally that governmental authority of every kind must proceed directly or indirectly from the qualified voters. In the century that followed, the application of this principle was carried much farther than was expected or desired by the founders of the republic. Notwithstanding important variations in practice, the orthodox American doctrine came to be that of individual manhood suffrage. Restrictions based on color disappeared in theory, if not in practice. A large number of women had already secured the suffrage by State action before 1914 and the movement for equal suffrage by an amendment to the Federal constitution was gaining headway.

In other respects also 20th century American democracy is far more radical than that of the fathers. The framers of the early State governments and of the Federal Constitution

were much occupied with the dangers, as well as the advantages, of popular government. Their remedy for ultra-radicalism was the system of "checks and balances" and the frequent use of indirect elections, notably in the Federal Constitution. The President was to be chosen by electors exercising a real discretion; senators were elected by the State legislatures, who also had in many instances the choice of governors and other State officers; even State constitutions were put into effect without ratification by the voters. Gradually the scope of direct action by the voters was extended. Presidential electors became merely counters; governors were everywhere chosen by popular vote; and even that safeguard of conservatism, the Senate of the United States, was brought within the scope of the same principle. From elections the principle was extended to nominations through the system of direct primaries for the choice of party candidates and committees. The voters also sought to exercise a closer control upon the process of legislation by the initiative and referendum; and there have been numerous protests against judicial action declaring unconstitutional measures approved by public opinion. In short, American democracy of the 20th century is far more absolute in its scope, more impatient of restrictions upon the immediate execution of the popular will than that of 1776 or 1789.

With this advance in political democracy there has developed a different way of thinking about the sphere of government in general. The radical democrats of the 18th century were chiefly anxious to free individual energy from the restraints imposed by the old arbitrary governments. America seemed a land of boundless resources; on the frontier, especially, equality of opportunity seemed to ensure the maintenance of a democratic society as well as a democratic government. By the end of the 19th century this optimistic faith in *laissez-faire* was much shaken. The free play of individual energy brought unexpected results, antagonistic to democracy rather than favorable to it. Resources, apparently inexhaustible and open to every one, were seen to be limited after all, and more and more coming to be concentrated in the hands of a comparatively few individuals and corporations. To conserve these resources and ensure their use in the public interest, democratic control must be extended more largely, in the economic, as well as the political, sphere. Many men who might otherwise have clung to the old *laissez-faire* type of democracy were reconciled to the new policies by realizing that in the long run democracy in government rests upon some approximation to equality and democracy in the social order. Undue concentration of economic power must in the end produce an undesirable distribution of political influence. This new type of democracy found expression in statutes regulating commerce, industry, transportation and labor conditions; also in many new administrative divisions, charged with the oversight and control of individual and corporate business.

Not only was the new democracy more ready to use governmental agencies for the promotion of economic and social ends; it was also adjusting itself to greater centralization. The State sovereignty idea, already weakened by the Civil War, was even more seriously

undermined by the industrial development of the next half century. The great corporations which controlled transportation, commerce, manufactures and finance could not be dealt with on a purely state basis without endless confusion. As interstate organizations of capital were confronted by interstate organizations of labor, it became increasingly evident that labor problems must receive national rather than merely local or state solution. Thus American democracy was becoming more and more nationalistic.

The transformation which modern science and its application to industry had brought about in the nation was also powerfully affecting the international position of the United States. Though independence had been achieved through a foreign alliance and largely because of certain conditions in European politics, the founders of the republic were soon convinced that the safety of their political experiment could best be secured by political isolation. In 1823 the danger of intervention in American affairs by the reactionary governments of Continental Europe produced the Monroe Doctrine, setting forth the republican ideals of America, disclaiming interference with monarchical Europe, but insisting that the European system should not be further extended to any part of the American hemisphere.

This tradition of isolation was still the orthodox American theory on the outbreak of the European War; but it was maintained with increasing difficulty and with some inconsistencies as the 20th century opened. Steam navigation, the ocean cable and wireless telegraphy increased the number of international problems for which the United States was forced to assume some responsibility. The Spanish War and the acquisition of island possessions in the Pacific brought new relations with the European powers which had similar interests there and in eastern Asia. We were presently taking a large part in international counsels for the protection of China. While still expressly reserving the principle of the Monroe Doctrine, the United States took an active part in The Hague Conferences and even in the fateful conference of Algieras on African affairs. American intervention hastened the close of the Russo-Japanese War and American public opinion followed with deep interest and sympathy the proposals for a new world organization to establish the reign of law for nations as well as for individuals.

**America and the World War.**—So matters stood at the outbreak of the European War. The President's proclamations of neutrality were quite in accord with traditional policy. Even when the invasion of Belgium showed Germany's cynical disregard of international law, American interest and responsibility in the matter were apparently very remote. The assumption of such responsibility by the government would have been possible only if the nation as a whole had clearly understood the issues of the European conflict, thus creating a unified public opinion. This was obviously not the case in 1914. The strongest body of American opinion favored the cause of the Allies, but the pro-German element was aggressively and highly organized. The largest group of all, especially west of the Alleghenies, was composed of those who could hardly real-

ize what was happening in Europe and thought chiefly of America's protection from the horrors of European warfare. Under these circumstances, many even of those who sympathized with the cause of the Allies were convinced for the time being that the government must remain neutral. There was also among the more idealistic elements a strong desire that America, by holding somewhat aloof, should leave itself free to exercise a mediatory influence in the interest of a lasting peace.

The abandonment of the neutrality policy came by a very gradual process, which is partly reflected in the speeches of President Wilson, especially during the year 1916. The development of the President's policy was undoubtedly much too slow for those who had felt from the beginning that France and England were guarding democracy and international justice against the militaristic traditions of the Central Empires. On the other hand, his gradual assumption of American responsibility in the international crisis was, up to the date of his war message of 2 April 1917, somewhat in advance of the great body of American opinion. He had, however, by that time so far won the confidence of this uncertain group, both as to his understanding of the international situation and the political ideals toward which he was working, that it was willing to accept his leadership.

The direct menace to the United States of German methods and German aims was brought home more and more by the recklessness of the submarine warfare; by the intrigues of German agents in the United States and the acts of violence instigated by them; by their persistent appeals to the separate consciousness of the German-born element; and lastly by their efforts to disturb the friendly relations of the United States with Latin-America. From a strictly nationalistic point of view, these things fully justified the President in asking and Congress in voting the declaration of war in April 1917.

There was, nevertheless, an important group which was not satisfied by any purely nationalistic conception of the issue. These men were patriotic, but American loyalty meant to them not only the defense of immediate national interests but allegiance to American ideals. In the Civil War Lincoln had summoned to the preservation of the Union not merely the sentiment of American patriotism but the devotion of those who valued America as the chief representative in the world of democratic ideals—of government by the people. On that ground also he asked the moral support of European liberals, especially the British working-classes. More and more the great European War seemed to involve equally momentous consequences for civil liberty. The victory of a highly organized military monarchy like Prussia over the democracies of western Europe was likely to discredit democracy as the less efficient form of government and thus exert a reactionary influence on political thinking everywhere. This issue was clarified when the Revolution of March 1917 overthrew the Russian autocracy and the conflict became more distinctly than before one of the free nations against the most aggressive exponents of the monarchical tradition. So President Wilson was able to reinforce the nationalistic appeal by raising the larger issue. As Monroe's message asserted the

interest of the United States in the preservation of the Latin-American republics, so Wilson, dealing with a world far more closely knit together, made his plea, that the "world" should "be made safe for democracy."

In his presentation of war aims, the President also appealed to the growing sentiment among thoughtful men everywhere, nowhere stronger than in the United States, for some escape from national egoism and international anarchy. Such men followed with sympathy the President's stubborn refusal to be drawn into an imperialistic policy toward Mexico; they defended his extraordinary patience in the face of German aggression; and they hoped to the last that the United States, without actually entering the war, might contribute something to the establishment of a just and lasting peace. The clearest expression of this idea that America must accept a more definite responsibility for the establishment of a new international order is to be found in the President's speech to the Senate of 22 Jan. 1917. The time had come, he said, "to lay afresh, and upon a new plan, the foundations of peace among the nations." "It is inconceivable," he continued, "that the people of the United States should play no part in that great enterprise. To take part in such service will be the opportunity for which they have sought to prepare themselves by the very principles and purposes of their policy and the approved practices of their government ever since they set up a new nation in the high and honorable hope that it might in all that it was and did show mankind the way to liberty." It must be said, however, that this emphasis on the larger responsibility of the United States aroused the antagonism of certain senators who urged the danger of abandoning the traditional policy of isolation.

A few days later the German government by its announcement of practically unrestricted submarine warfare not only declared virtual war against the United States but proclaimed its entire lack of sympathy with the international ideals of which the American President had become the chief exponent.

**Phases of Public Opinion.**—When Congress, acting upon the recommendations of the President declared war on the German Empire, there was still opposition in Congress and in the country at large, an opposition more serious indeed than is indicated by the overwhelming majorities in both houses (72 to 6 in the Senate and 373 to 50 in the House). This is shown by a study of the Congressional debates and by reports from various sections in the press and elsewhere. In this as in many other cases it was inevitable that even a democracy should depend in some measure upon the guidance of its chosen representatives and especially of the executive. It is equally evident, however, that the decision once made soon received a more general and effective support from public opinion than any similar decision in the history of the country. There was not at any time after the outbreak of the war an opposition comparable in relative strength to that of the Tories in the War of Independence, of the Federalists in 1812 or the "Copperheads" in the Civil War. Those who supported the war did so on various grounds—some undoubtedly as a simple matter of acqui-

escence in a decision already made. A more definite analysis of opinion brings out certain other facts of interest.

The war and the nature of the ideals for which the United States was fighting were not a distinctly party issue. The pro-German element had some influence in both the leading parties before the war but became almost negligible after its outbreak. Much the same thing may be said of the pacifist element, which, sympathizing with Wilson's international peace program, had accepted his conclusion that the first step toward such a goal must be the military defeat of the Prussian oligarchy.

To the Socialists the war brought a more difficult problem. They had always emphasized the solidarity of the working class interests as more important than strictly nationalistic aims. Nevertheless, after the outbreak of the European War, the majority of the Socialists in Europe supported their respective governments. In the United States, however, the majority wing of the Socialist organization persisted in its opposition to the war as a measure conceived in the interest of the capitalistic classes. This majority, made up of various elements, included genuinely idealistic pacifists, advocates of revolutionary socialism who were ready to fish in troubled waters and a distinctly pro-German group, which was possibly the leading factor in determining the position of the party. On the other hand a considerable group of Socialist "intellectuals" dissented from the party decision and left the party. It is impossible to analyze accurately the Socialist vote in recent elections so as to determine the strength of pro-Germanism and pacifism as distinguished from economic discontent.

Before the outbreak of the war the sentiment in favor of American participation was most evident in the Northeastern States among the educated classes of that section who were most closely connected with the allied nations of Europe by various ties, economic, social, intellectual. This was in part, at least, the obvious effect of geographic proximity. On the other hand, the large cities of the East furnished considerable centres of pacifist and Socialist opposition, especially among their imperfectly Americanized immigrant population. In the Middle West the unification of public opinion on war issues was delayed by the presence of a strong German element, by a somewhat antiquated type of anti-British feeling and a certain lack of interest in international relations. The last consideration naturally operated with still greater force in the rural areas of the South and in the States of the Far West. When, however, the war had actually begun the hearty acceptance of it as a great national enterprise was nowhere more striking than in many of the areas where the opposition had at first seemed most serious.

The attitude of labor was seen from the first to be one of crucial importance. How far would it accept the Socialist view that this was a "Wall Street War" in which the working class had no real interest? Fortunately for the country, the leaders of organized labor as a whole accepted the President's definition of the conflict as a war for democracy and depended upon his influence to safeguard their interests. There was some opposition to the policy within the ranks of organized labor, but the policy of the

leaders was in general carried out. With the extreme radical wing of the labor movement, represented conspicuously by the I. W. W., the situation was quite different. Recruited outside the ranks of union labor from comparatively ignorant unskilled workers, and to a large extent from recent immigrants, it was easy for the leaders to draw their followers into unpatriotic and anti-social forms of opposition. Probably this opposition would have been much less formidable if the employing class had laid more emphasis on constructive measures and less on mere repression.

In short, the war has revealed to an even greater extent than could have been expected the national unity of the American people. Most striking of all has been the loyalty of the great majority of the foreign-born population, including even those of German ancestry, not only to the national government, but to the ideals for which America stands among the nations.

**National Ideals in the Conduct of the War.**—The national temper was revealed not only in the decision which brought America into the war, but no less clearly in the measures adopted to secure its effective prosecution, especially when these measures involved a radical departure from normal American practice. It was seen from the outset that American participation in the war must involve co-operation with the allied governments, to an extent beyond precedent since the days of the American Revolution. To make such co-operation cordial and effective, it was necessary to use every possible means to remove antiquated prejudices and promote a better mutual understanding between the United States and its European associates. This new spirit of international co-operation was promoted by the exchange of special missions between the United States and the allied governments,—notably the French Mission of Marshal Joffre and M. Viviani and the British Mission headed by Mr. Balfour, the British Foreign Secretary. The first thought of many Americans was that the part of this country would be chiefly financial and naval. Such co-operation was indeed given at once and on a large scale. It soon became evident, however, that the raising of a great American army for service abroad was also an urgent necessity. How was such an army to be raised? Notwithstanding the previous national tradition in favor of the volunteer system, public opinion rapidly took shape in support of the selective draft as the most democratic method of enlisting the citizenship of the country for the national defense. No less important were the measures adopted to secure the necessary economic support for the armies in the field. Funds for the use of the United States and the Allies had to be secured through national loans, unprecedented in amount and requiring the co-operation of millions of people who had never before invested in government bonds. The success of the Liberty Loans was a striking example of what may be accomplished through the co-operation of volunteer service with governmental agencies. The effect on the national *morale* was no less important than the financial return. Never before had so large a number of citizens become conscious partners in a great national enterprise.

In earlier wars, notably in the Revolution, the War of 1812 and the Civil War, the government, fearing the effect of heavy taxes on public opinion, had depended too largely on loans and paper money, weakening the national credit and depreciating the currency. As to the precise proportion of war costs in the Great War, to be raised respectively by taxes and loans, there were sharp differences of opinion; but there can be no doubt in any case that the Americans of 1917–18 set a new national record of willingness to carry the necessary burden of war taxes.

The successful prosecution of the war required not only the financial co-operation of governments, but acceptance by the American people of a new responsibility for the food supply of the allied nations which the submarine warfare had brought dangerously low. To secure this result it was found necessary to organize through the Food Administration a governmental control of commerce in food products, as for instance by fixing the price of wheat, which went squarely against traditional American ideas. On the other hand, the government depended largely on appeals to the patriotism of producers, middlemen and consumers to stimulate production and lessen unnecessary consumption. The result was seen not only in an increase of food exports to the Allies, but again, as in the case of the Liberty Loans, in the awakening of a new sense of civic responsibility.

The spirit of civic co-operation was shown also in the support of various auxiliary agencies, such as the Red Cross, the Y. M. C. A., the Knights of Columbus and various other organizations, religious and philanthropic. All of these agencies required and secured for their operations voluntary gifts on a scale which before the war would have been thought improbable. It is in these various forms of voluntary co-operation even more than in any formal votes that the future historian will find the best evidence of national solidarity in support of the war aims of the United States.

No honest historian of national ideals can leave out of the record the darker shades of the picture. War unquestionably develops the spirit of self-sacrifice, but it also gives new opportunities to those who are willing to profit by the necessities of the nation. The problem of the profiteer is as old as war itself and is writ large in the record of earlier wars. In the present war this danger to the national *morale* was perhaps more clearly foreseen than ever before and appropriate safeguards were carefully considered; it was hardly reasonable to expect that it would be avoided altogether.

It soon became apparent that the necessities of war reconciled public opinion to extraordinary extensions of governmental authority. Step by step Congress authorized the taking over by the Federal government of various kinds of business—the railroads, the telegraph and telephone service, and to a large extent the shipping business. Through the War Industries Board and the Food and Fuel Administrations the government controlled to a large extent the production and distribution of products, directly or indirectly related to the efficient prosecution of the war. In the exercise of all these functions, the government did not escape sharp criticism, some just and some unjust; but public opinion

accepted these radical changes with surprising composure. This comparative unanimity was partly due to the conviction that the measures in question were intended to meet a temporary emergency. None the less, they were in line with certain tendencies existing before the war began, and may have a permanent influence on the political philosophy of the American people. As in the period of the Civil War, the stress of a great national crisis had not only developed the authority of the national government as a whole; it had also immensely expanded the authority of the President as the chief agent of the national will. The people and their representatives in Congress had in large measure accepted his judgment on the main issues of international policy, and American confidence in this leadership was strengthened by the President's new position as the most generally approved spokesman of the Allied nations. In the carrying out of national policies also an extraordinary concentration of authority in the President was necessary in order to secure united and efficient action. Not only was he the commander-in-chief of the army and navy, but he directed through officials responsible to him the immense powers of the Food, Fuel, Railroad and Wire Administrations and the War Industries Board. To the statesmen of 1789 the concentration of such power in an American President would have been unthinkable; yet it is, in the main, only the application to new conditions of the war powers, whose latent possibilities were revealed in Lincoln's administration during the Civil War. Then as now they were accepted, not as desirable in themselves, but because concentration for executive purposes is in time of war one of the necessary measures by which the National Democracy is to achieve its ends. It must not be forgotten, however, that while the sentiment of nationality has been greatly strengthened, it is a nationalism increasingly conscious of international responsibilities, and ready to sacrifice not only material resources, but even those points of prestige which often prevent effective co-operation among allies. Striking examples of this spirit of international comity are the decision to allow American troops to be brigaded with those of the Allies, and the active part taken by the United States in securing the final acceptance of a unified military command. These were decisions of the President as commander-in-chief but they were cordially supported by public opinion.

Finally in the background of American thought during the war were the great problems of reconstruction, the growing recognition among thoughtful men of new problems, political, industrial, educational and ethical, which cannot be met by routine methods and purely emotional modes of thought—which demand on the contrary the effective use of all our intellectual and spiritual resources.

**NATIONAL LEGISLATIVE ASSEMBLY.** See CONSTITUENT ASSEMBLY.

**NATIONAL LIBRARY (BIBLIOTHEQUE NATIONALE) OF FRANCE,** one of the world's most famous libraries. Some of its historians find its origin in the books of Charlemagne and Charles the Bald but this is doubtless mere legend. Saint Louis is said to have formed a collection in the 13th century, but whether his books are among those of the Bibliothèque Nationale is not known. At any rate, the real founder of the Royal Library was King John, who bequeathed his collection of manuscripts to his successor Charles V, who transferred it from the Palais de la Cité to the Louvre. The first librarian of record was Claude Mallet, the king's valet de chambre, who made a sort of catalogue 'Inventoire des Livres du Roy nostre Seigneur estans au Chastel du Louvre.' Jean Blanchet made another list in 1380 and Jean de Bégue one in 1411 and another in 1424. Charles V was a patron of learning and encouraged the making and collection of books. It is known that he employed Nicholas Oresme, Raoul de Presle and others to transcribe ancient texts. This first collection of the King's Library was sold by Charles VI to the English regent of France, the Duke of Bedford, who transferred it to England in 1424. It was apparently dispersed at his death in 1435. Charles VII and Louis XI did little to repair the loss of these books, but the invention of printing resulted in the starting of another collection in the Louvre. Louis XI added to this characteristically by confiscating libraries that struck his fancy, as also did Charles VIII, who seized the collections of the kings of Aragon. Louis XII, who had inherited the library at Blois, incorporated the latter into the Bibliothèque du Roi and further enriched it with the splendid Gruthuyse collection and with plunder from Pavia. Francis I transferred the collection in 1534 to Fontainebleau and merged it with his private library. During his reign, fine bindings became the craze and many of the books added by him and Henry II are masterpieces of the binder's art. Under librarianship of Amyot, the collection was transferred to Paris during which process many treasures were lost. Henry IV again moved it to the Collège de Clermont and in 1604 it was housed in the Rue de la Harpe. The appointment of J. A. de Thou, the famous historian and bibliophile, initiated a period of development that made it the largest and richest collection of books in the world. He was succeeded by his son who was replaced,

when executed for treason, by Jerome Bignon, the first of a line of distinguished librarians of the same name. Under de Thou, the library was enriched by the collections of Queen Catherine de Medici. The library grew rapidly during the reigns of Louis XIII and Louis XIV, due in great part to the interest of the Minister of Finance, Colbert, one of the most indefatigable collectors of books. The quarters in the Rue de la Harpe becoming inadequate, the library was again moved, in 1666, to a more spacious house in Rue Vivienne. The Minister Louvois took quite as much interest in the library as Colbert and during his administration a magnificent building to be erected in the Place Vendôme was planned. The death of Louvois, however, prevented the realization of this plan. Louvois employed Mabillon, Thevenot and others to procure books from every source. In 1688 a catalogue in eight volumes was compiled, and under the administration of Abbé Louvois, the Minister's son, the library was thrown open to all scholars. Abbé Louvois was succeeded by the Abbé Bignon, or Bignon II as he was termed, who instituted a complete reform of the library's system. Catalogues were made which appeared from 1739-53 in 11 volumes. The collections increased steadily by purchase and gift to the outbreak of the Revolution, at which time it was in grave danger of partial or total destruction, but owing to the activities of Renouard and Van Praet it suffered no injury. The Revolution appears to have benefited the library for many of the books of the emigrés and the suppressed religious institutions found their way to the shelves of the Bibliothèque Nationale, as it was now called. Furthermore an administrative organization was established that is the basis of its present system. Napoleon took great interest in the library and among other things issued an order that all books in provincial libraries not possessed by the Bibliothèque Nationale should be forwarded to it, subject to replacement by exchanges of equal value from the duplicate collections, making it possible, as Napoleon said, to find a copy of any book in France in the National Library. Napoleon furthermore increased the collections by spoil from his conquests, a good share of which, however, was restored after his downfall. During the period from 1800 to 1836, the library was virtually under the control of Joseph Van Praet, to the development of which he consecrated the whole of his energies. At his death it contained more than 650,000 printed books and some 80,000 manuscripts, many of them of exceeding rarity. His work has been carried on by Taschereau, Delisle and Marcel Homolle under whom the collections have grown to their present size of 4,050,000 volumes, 11,000 manuscripts.

**NATIONAL MUSEUM.** See UNITED STATES NATIONAL MUSEUM.

**NATIONAL NICKNAMES,** the collective names of a people or nation, usually originating with the people themselves. John Bull was first given to the people of Great Britain by John Arbuthnot in his 'Law is a Bottomless Pit.' He also gave the names Nicholas Frog to the Dutch and Jean Crapaud (toad) to the French people. John Chinaman is a popular name for the Chinese; Taffy for the Welsh; Jean Baptiste and Camuck for the French

Canadians, and Ivan Ivanivitch for the Russians; Paddy for the Irishman; Jacques Bonhomme for the French peasant; Sawney for the Scotch, and Blackamoor and Sambo for the negro in America.

In the United States the two popular national names are Brother Jonathan and Uncle Sam. The former was first used. General Washington, on assuming command of the New England Revolutionary forces, was in great straits for arms and war material. The governor of Connecticut, Jonathan Trumbull, was a man of excellent judgment and an esteemed friend of Washington. In the emergency, Washington said, "We must consult Brother Jonathan." This expression was repeated on other difficult occasions and became a convenient name for the whole people. The name Uncle Sam is an extension of the letters U. S. (United States), printed or stamped on the government property. It was first used in Troy, N. Y., in 1812, when certain goods purchased for the government and branded U. S. were officially inspected by Samuel Wilson, whose nickname was "Uncle Sam." The coincidence of initials suggested the application of this nickname to the government. In the World War, the names given to the soldiers of the various countries were English, Tommies; American, Sammies; German, Boches or Fritz; French, Poilus.

**NATIONAL PARKS AND MONUMENTS.** The former are large tracts of public lands in the central and western parts of the United States retained, maintained and improved by the Federal government for such purposes as are mentioned in the National Parks Service Bill, creating in the Department of the Interior "a service to be called the National Park Service, which shall be under the charge of a director who shall be appointed by the Secretary." That service "shall promote and regulate the use of the Federal areas known as national parks, monuments and reservations," the object being "to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such a manner and by such means as will leave them unimpaired for the enjoyment of future generations." National monuments, on the other hand, are defined in an act approved 8 June 1906, entitled "An act for the preservation of American antiquities" as historic landmarks, historic and prehistoric structures and other objects of historic or scientific interest that are situated upon lands owned or controlled by the government of the United States.

There are at present 16 national parks. The oldest, Hot Springs, was created in 1832; the most recently created, the Hawaiian and the Lassen, date from 1 Aug. 1916 and 9 Aug. 1916, respectively. The following list gives, beside the name of each, its location, date of creation, area in square miles and distinctive characteristics:

Hot Springs, 1832, middle Arkansas, 1½ square miles. There are 46 hot springs possessing curative properties; many hotels and boarding-houses; 20 bathhouses under public control.

Yellowstone, 1872, northwestern Wyoming, 3,348 square miles. A greater number of gey-

Photographs by George L. Baum, Denver, Colo.

1 "The Court Group," Colorado National Monument, near Grand Junction, on the Denver and Rio Grande Railroad. (An idea of the immense size may be obtained by noting the minute figure of a man near centre of picture, half-way between camera and rock)

2 "Independence Rock," (side view), Colorado National Monument, on the Denver and Rio Grande Railroad. Height from bottom of canon to top of rock, 800 feet

sers than in all the rest of the world; also boiling springs, mud volcanoes, petrified forests; grand canyon of the Yellowstone, remarkable for its coloring; large lakes, streams and waterfalls; wilderness inhabited by deer, elk, bison, moose, antelope, bear, mountain sheep, beaver, etc.—the greatest wild animal and bird preserve in the world; altitude, 6,000 to 11,000 feet.

Yosemite, 1890, middle-eastern California, 1,125 square miles. The valley is famous for its beauty; there are high cliffs, waterfalls, three groves of big trees, high sierra, large areas of snowy peaks, the "waterwheel" falls; and here, as in several other national parks, good trout fishing.

Sequoia, 1890, middle-eastern California, 237 square miles. The big tree national park, containing 12,000 sequoia trees over 10 feet in diameter; mountains and precipices.

General Grant, 1890, middle eastern California, 4 square miles. This was created to preserve the "General Grant tree," 35 feet in diameter; it is six miles from Sequoia National Park and under the same management.

Casa Grande Ruin, 1892, Arizona,  $\frac{3}{4}$  square mile, a prehistoric Indian building.

Mount Rainier, 1899, west-central Washington, 324 square miles. The largest accessible single-peak glacier system, containing 28 glaciers, some of large size, 50 to 500 feet thick; also sub-Alpine wild-flower fields.

Crater Lake, 1902, southwestern Oregon, 249 square miles; the lake, extraordinarily blue, lying in the crater of an extinct volcano. The sides are 1,000 feet high; the lava formations are interesting.

Wind Cave, 1903, South Dakota,  $16\frac{1}{2}$  square miles, a natural cavern with passages or galleries 90 miles in aggregate length.

Sully's Hill, 1904, North Dakota,  $6\frac{1}{4}$  square miles, a wooded hilly tract on Devil's Lake.

Mesa Verde, 1906, southwestern Colorado, 77 square miles; most notable and best preserved prehistoric cliff dwellings in the United States.

Platt, 1906, southern Oklahoma,  $1\frac{1}{2}$  square miles; sulphur and other springs possessing curative properties.

Glacier, 1910, northwestern Montana, 1,534 square miles. This is a rugged mountain region of Alpine character. In it are found 250 glacier-fed lakes of romantic beauty; 60 small glaciers; peaks of unusual shapes and precipices of great height.

Rocky Mountain, 1915, north-middle Colorado, 358 square miles; embracing a snowy range with peaks from 11,000 to 14,500 feet in altitude in the heart of the Rockies. Here are seen remarkable records of the Glacial Period.

Hawaiian, Hawaiian Islands, 56 square miles; including three volcanoes and a lake of blazing lava.

Lassen, 1916, California, 106 square miles. This includes a volcano—the only one in the United States that is still potentially active.

**Purposes Served by National Parks.**—The Secretary of the Interior writes that there is no reason why the United States should not make its public health and scenic domain as available to all its citizens as Switzerland and Italy make theirs. The aim is to open the national parks thoroughly by road and trail "and give access and accommodation to every de-

gree of income"; accordingly renewed efforts are promised, "to outfit the parks with new hotels which should make the visitor desire to linger rather than hasten on his journey." The Secretary's comment on the Yellowstone Park concludes: "Its great size, its altitude, its vast wildernesses, its plentiful waters, its favorable conformation of rugged mountain and sheltered valley and the nearly perfect protection afforded by the policy and the scientific care of the government have made this park, since its inauguration in 1872, the natural and inevitable centre of game conservation for this nation. There is something of significance in this. It is the destiny of the national parks, if wisely controlled, to become the public laboratories of nature-study for the nation." From them specimens may be distributed to the city and State preserves, as is now being done with the elk and may be done later with the antelope. The report of the general superintendent and landscape engineer of national parks for 1915 contains the observation that the first step in the consideration of a general policy for the administration of the national parks is the determination of just what functions they perform. The general superintendent expresses the opinion that "the fostering of recreation purely as such is more properly the function of the city, county and State parks." We must note the clear distinction between the character of such local parks and those which are national. The latter form a class that should be of national interest; and in the category of national parks no reservation should be found that is of local interest only. The national parks should serve three functions: The stimulating of national enthusiasm or patriotism, the furthering of knowledge and health and the diverting of tourist travel to the scenic areas of the United States. The claims of the national parks upon the attention of tourists and others are thus summarized: "In Yellowstone are the geysers, in Yosemite the highest of waterfalls, in Sequoia the largest and oldest trees on earth, trees that were 3,000 years old when Christ was born. In Wind Cave National Park is a cave that comprises over 90 miles of sparkling passages. At Arkansas Hot Springs and Platt National Park are medicinal waters that have dispelled the pain of legions of sufferers. In Mesa Verde National Park are the crumbling dwellings of a forgotten race."

**The National Monuments.**—There were 30 "national monuments" (as above defined) at the close of 1917, two which formerly existed having been eliminated by the creation of Lassen National Park. Their names, State and areas (in acres) are given in the following list: Devil's Tower, Wyoming, 1,152; Montezuma Castle, Arizona, 160; El Morro, New Mexico, 160; Chaco Canyon, New Mexico, 20,629; Muir Woods, California, 295; Pinnacles, California, 2,080; Tumacori, Arizona, 10; Mukuntuweap, Utah, 15,840; Shoshone Cavern, Wyoming, 210; Natural Bridges, Utah, 2,740; Gran Quivira, New Mexico, 160; Sitka, Alaska, 57; Rainbow Bridge, Utah, 160; Lewis and Clark Cavern, Montana, 160; Colorado, Colorado, 13,883; Petrified Forest, Arizona, 25,625; Navajo, Arizona, 360; Papago Saguardo, Arizona, 2,050; Dinosaur, Utah, 80; Sieur de Monts, Maine, 5,000; Gila Cliff Dwellings, New

Mexico, 160; Tonto, Arizona, 640; Grand Canyon, Arizona, 806,400; Jewel Caves, South Dakota, 1,280; Wheeler, Colorado, 300; Oregon Caves, Oregon, 480; Devil Postpile, California, 800; Mount Olympus, Washington, 299,370; Big Hole Battlefield, Montana, 5; Cabrillo, California, 1. Of these 30, the first 20 are administered by the Interior Department, the next eight by the Agricultural Department and the last two by the War Department.

An article entitled 'Our National Parks' in the *Scientific American*, 11 Nov. 1916, includes an observation on the commercial value of tourist traffic: "It is estimated that in time of peace Switzerland's annual revenue from tourists is \$150,000,000, that of France \$600,000,000. It is claimed that Americans have spent \$500,000,000 a year in travel abroad. The pine woods of Maine are estimated to bring a revenue of \$40,000,000 each year on account of the visitors they attract. Every dollar, therefore, which is spent by the nation on national parks may be considered an investment on capital account which is likely to bring in a very satisfactory return upon the money invested." (See also separate articles CASA GRANDE RUIN; CRATER LAKE; GENERAL GRANT; HOT SPRINGS NATIONAL PARK; YELLOWSTONE NATIONAL PARK, ETC.). Consult Yard, R. S., 'The Book of the National Parks' (New York 1919).

**NATIONAL PORTRAIT GALLERY, British**, an institution that owes its origin to the zealous and enlightened efforts of Earl Stanhope. A board of trustees was appointed late in 1856, and by the end of the following year 23 portraits had been secured—some of them purchases and others gifts. The difficulty of the trustees is to guard against improper admissions in the way of donation, and therefore no donation can be accepted unless approved of by at least three-fourths of the trustees present at a meeting. At present the National Portrait Gallery contains over 2,000 portraits, under the varieties of paintings, busts, medallions, etc. Its treasures were for a time accommodated in the Bethnal Green Museum, but a new building, erected for it mainly by private munificence (funds being provided by W. H. Alexander), beside the National Gallery, was opened in 1896. The arrangement of the portrait is chronological, beginning with Richard II (1366-40). The large picture of the "Reform Parliament" hangs in the lower exhibition hall, while the portraits exhibited include representative works of Van Dyck, Gainsborough, Reynolds, Raeburn, Lawrence, Watts and other great masters.

**NATIONAL REPUBLICAN PARTY**, in American history, the name taken by those who deserted the old Democratic-Republican party after the defeat of Adams by Jackson in 1828. Clay was defeated. In 1835 the party, reinforced by other elements, took the name of Whig. See WHIGS.

**NATIONAL ROADS**. See ROADS AND HIGHWAYS.

**NATIONAL SOCIETY OF THE SONS AND DAUGHTERS OF THE PILGRIMS, The**. Organized at Providence, R. I., Monday, 21 Dec. 1908, by 10 gentlemen, most of whom were of *Mayflower* ancestry. The plan and purposes of the Society originated with Thomas W. Bicknell of Rhode Island, who had, for a

year, consulted with men and women of Pilgrim ancestry in several States as to the needs and work of such a society. The term "Pilgrim" was used in the broad sense to include all those who settled in any one of the American colonies, between 1607 and 1700. This period the English historian Green calls the "Pilgrim Century" in the great western trans-Atlantic settlement. During that century, many thousands of the yeoman class, with a sprinkling of nobility, crossed the ocean and made permanent homes on the eastern coast of America, between the Saint Lawrence and the Gulf of Mexico, and their descendants, numbering many millions, are located in all the States of the Union.

The objects of the Society are to perpetuate the memory and to foster and promote the principles and virtues of the Pilgrims; to publicly commemorate, at stated times, principal events in the history of the Pilgrims, and to erect durable memorials of historic men and events; to encourage the study and research of Pilgrim history, especially as related to the foundation of civil government on the principles of soul liberty; to foster and to establish such departments of study and of organization as shall seem best to promote social rights, civic virtue, industrial freedom, political equality, the supremacy of just laws, the value and sacredness of the ballot, the purity of the home, temperate and godly living, and the dependence of individuals, communities, states and nations on the guidance of Almighty God, as taught by the Pilgrims. Any person of good moral character, in lineal descent from Pilgrim ancestry in any colony prior to 1700, is eligible to membership. The officers are a governor-general, a deputy governor-general for each State, seven assistants, a secretary-general, a treasurer-general, a captain, an elder, an historian and a board of commissioners of seven members, of which the governor-general and the secretary-general are members, *ex officio*. These officers constitute the General Court of the Society. They are elected annually in the month of December of each year, hold office for one year or until their successors are elected. The secretary-general, who is the executive of the General Court, is elected by that body.

Local chapters and State societies are formed under the direction of the secretary-general. The headquarters of the National Society are in Providence, R. I. Thomas W. Bicknell, the founder of the Society, is the secretary-general.

**NATIONAL SOCIETY FOR VOCATIONAL EDUCATION**, New York City, an association to aid in the evolution of sound aims, methods and practices and to promote the further development of practical vocational education for agricultural, commercial, home-making and industrial occupations. It was the first national organization to promote interest in publicly supported vocational education, and until 1918 its title was the National Society for the Promotion of Industrial Education. Through its earlier conventions and publications it crystallized the public opinion that led to the enactment of legislation in the States which pioneered the development of public vocational schools. Its organization is democratic. Its membership includes industrial managers, educators, labor leaders, social workers,

manufacturers and other public-spirited men and women. See VOCATIONAL EDUCATION.

**NATIONAL SOLDIERS' HOMES.** See SOLDIERS' HOMES.

**NATIONAL SONGS.** See NATIONAL HYMNS.

**NATIONAL OR STATE GUARD.** See MILITIA.

**NATIONAL TRANSCONTINENTAL RAILWAY** (Canadian Government Railways). This railway is the eastern section, extending from Moncton to Winnipeg, of a railway spanning the continent, the western section of which, from Winnipeg to Prince Rupert, is called the Grand Trunk Pacific Railway. The entire system was the joint enterprise of the Canadian government and the Grand Trunk Railway. Owing to the inability of the Grand Trunk Pacific Company to operate the eastern section it was taken over by the government as part of the government railways in 1915. The great bridge across the Saint Lawrence River above Quebec, completed in 1917, is on this line. In the year ending 30 March 1917 receipts from passengers were \$5,916,550; operating expenses \$7,883,177; cost of line \$152,802,746. The length of lines operated is 2,009 miles. For an account of the enterprise see GRAND TRUNK PACIFIC RAILWAY.

**NATIONAL UNION**, an American fraternal and beneficial organization, incorporated in 1881 under the laws of Ohio. In 1917 there were 702 councils and 57,817 members in the order. Over \$150,000,000 in insurance is carried by the members and \$44,476,088 has been paid out in death benefits since its organization. The headquarters of the Order are located at Toledo, Ohio.

**NATIONAL UNIVERSITY. History.**—The proposition to establish a national university was first made by George Washington. He discussed such a university in his first Presidential message to Congress and from his private fortune bequeathed \$25,000 to the nation as a basal sum around which a national university might be built. President Madison likewise urged upon the Congress the wisdom of establishing such an institution. Three of his Presidential messages deal with the matter. John Quincy Adams returned to the subject in a message to Congress, urging upon that body the consummation of Washington's plans. Congress was hostile to the plan. Jefferson opposed it. In 1811 a Congressional committee reported against a national university, pronouncing the scheme unconstitutional. Since then the proposal has been revived by several Presidents and by many statesmen but without favorable results, in spite of the George Washington endowment fund and a popular subscription fund of \$30,000, which was paid in in 1795.

In 1869 the National Education Association espoused the cause of a national university by appointing a permanent committee of the association to promote the plan. Through this committee the subject was kept alive for more than 30 years. In 1899 a majority of the committee was composed of university presidents and rendered a report calling for Federal aid, but vigorously opposing Federal control of national education and declaring against a university

maintained by the Federal government at the national capital. In 1907 the National Association of State Universities pronounced in favor of organized facilities for research in the scientific departments of the Federal government, but opposed a national university as a degree-conferring institution.

**Educational and Research Facilities in Washington.**—The various bureaus, departments, libraries, literary and scientific collections, museums, etc., maintained by the Federal government in Washington in themselves constitute valuable facilities for university research. They are equipment for university work. While these facilities are not organized in institutional form, they are open to investigators by resolutions passed by Congress in 1892 and again in 1901. The Act of Congress, 3 March 1901, provides:

"That facilities for study and research in the government departments, the Library of Congress, the National Museum, the Zoological Park, the Bureau of Ethnology, the Fish Commission, the Botanic Gardens, and similar institutions hereafter established shall be afforded to scientific investigators and to duly qualified individual students and graduates of institutions of learning in the several states and territories, as well as in the District of Columbia, under such rules and restrictions as the heads of the departments and bureaus mentioned may prescribe."

The resources for study at the national capital are very great. The Library of Congress ranks high among the libraries of the world. The Smithsonian Institution has great value to the scientific student. In addition to departmental records and collections in various fields, there is the Corcoran Art Gallery, the Patent Office, the Geological Survey, the Medical Museum, the National Museum and various scientific bureaus, which together constitute an educational equipment far greater in value than that of any one organized educational institution anywhere in the world. Its value has been roughly estimated at \$75,000,000. In a real sense this vast equipment is part of the equipment of every university in the United States in so far as such university makes use of it. In its best sense this is a national university where research is carried on under most favorable circumstances; its equipment is maintained by the national treasury; but the seal of approval for scientific achievement is granted in the form of degrees conferred by the universities located in the various States.

#### I. INTRODUCTORY DEFINITIONS.

No concepts in history, politics or sociology are to-day more important or evident, and, yet, at the same time, more difficult to define than the terms *nationality* and *nation*. To the writer it seems that a *nation* is a culturally homogeneous social group, which is at once conscious and tenacious of its unity of psychic life and expression. Some writers, especially Ernest Renan, have emphasized the "will" or desire to live together as the essence of a nation, but as more profound students, particularly the sociologists, have made clear, this will

to live in, and to preserve the unity of, the group exists only where there is a very high degree of cultural and psychic likeness and unity. The most fundamental basis and characteristic of a nation, then, is cultural homogeneity, from which the will to exist in contiguity naturally proceeds. If such a group is at the same time politically organized within a given territory it may then be designated a *national state*. The term *nationality* is frequently used to describe a culturally homogeneous group which has not yet attained complete national and political unity, but it seems that this view only brings a confusion of terms. Rather, the term *nationality* should be used as a general descriptive and collective expression somewhat analogous to the broader meaning of the term *politics* in relation to a study of the state. It is a generic and comprehensive concept which refers to and describes that variable ensemble of physical and psychic elements which generate the cultural homogeneity and group self-consciousness and solidarity forming the foundations of a nation. The dynamic expression of the cultural and political activities and ambitions of a nation or national state is most usually and logically known as *nationalism*. While frequently used in the invidious sense, indicating political or cultural aggressiveness, such an implication is not essentially involved in the definition, even if it is normally to be observed in the practical operation of nationalism. In the static or analytical sense, nationalism is conventionally used to designate the modern political system or order, based as it is upon the unit of the national state. The history of nationalism then is essentially the tracing of the rise and development of the nation and the national state.

The history of the development of nations and national states is a most complicated problem. So difficult is it to determine just when tribal or pre-political society ends and political society begins and so many and deep-seated are the aspects of psychic life and cultural characteristics which are carried over from the tribal period into the political, that it is well-nigh impossible to say that one can fix any definite period as marking the origin of nations. One can scarcely agree with Israel Zangwill that the tribally organized Jews of ancient Palestine constituted a national state in the sense in which that term would be used to describe the Germany of Bismarck and Treitschke and Reventlow, or the Italy of Crispi and Carducci and Sonnino, and, yet, it is not easy to deny the force of his criticism of those writers who find nations to be wholly a phenomenon of very recent origin. Rather, it is best to agree that modern nations have their constituent psychic elements deeply rooted in the tribal past and that the history of nationalism and of nation-building is essentially the tracing of the expansion of cultural entities and of the sociological centres of emotional fixation; in other words, the record of the expansion and rationalization of "herd-instinct." As human society has undergone tremendous transformations in the period from the gradual breakdown of tribal society to the 20th century, there are differences of corresponding scope and significance between the nature and the mode of expression of group psychology and culture in tribal society and in the national states of to-day. The most

profound and far-reaching of these contrasts are connected with the conversion of the basis of group solidarity, from the standpoint of social control, from blood-kinship, real or assumed, to a definite territorial habitat, and with the development of what is conventionally known as "political society." The distinctions will appear clearly only upon the careful historical analysis of the development of the constituent principles of the nations of to-day. It is this fact that renders such a survey of vital importance, entirely aside from the specific content of the historical facts enumerated.

## II. A BRIEF HISTORICAL SKETCH OF THE STAGES IN THE ORIGINS OF NATIONALITY AND NATIONS PREVIOUS TO THE RISE OF THE MODERN NATIONAL STATES.

1. *Tribal Society*.—It is now generally agreed among students of cultural anthropology that the earliest well-defined units of social organization were either the village and local group, or the clan, both of which were normally grouped with others of the same type in a larger and looser entity—the tribe. While much of the psychology of tribal relationships and activities has been carried over into modern society, the contrasts between tribal society and the modern national state are many and obvious. Tribal society was primarily based upon blood-kinship, either real or assumed, and tribal relations were personal rather than political. Force, custom and blood-feud were the foundation of tribal juristic concepts and methods. The "instinct of the herd" had a much fuller sway over the group than it has at the present day. Cultural solidarity was more intense and there was little personal individuation, except that which set off a few leaders from the mass of the group. An intense religious loyalty and attachment to all the symbols of group unity were ever present and evident. So great was the domination of the group over the individual that some eminent students, such as Durkheim and his school, have even gone so far as to claim that all of the categories of religion, thought and knowledge in the primitive group were derived from the expressions of, and reactions to, group life and activities. Indeed, Durkheim finds that the essence and foundation of religion is but the psychic exuberance or stimulation from group life and activities and Trotter holds the "instinct of the herd" to be the primordial and all-pervading psychic force controlling man from the origin of the race to the present day. Whatever may be the exaggerations of these writers in matters of detail, it is generally agreed that the struggle for the preservation and extension of group solidarity has been the basic factor and process in the evolution of mankind, and it was inevitable that the psychic traits developed in this process would become grounded deep in the mental life of humanity. The tremendous importance of this discipline in group life for the subsequent development of humanity has been admirably summarized by Professor Hankins: "Man is in fact fundamentally social by nature. He has never lived in isolation but always in groups. Lacking special organs of defense he found strength, as did the ants and the bees, in group solidarity. Consequently the struggle for existence on the human plane has been fundamentally a struggle of group with group. Since his survival turned

largely on the perfection of his gregarious instinct, there has been achieved in man a keen sensitiveness to the call of the group. This herd instinct, as Trotter calls it, is, therefore, the very basis of human society and the most profound aspect of man's social nature. It is for the group what the instinct of self-preservation is for the individual. It is aroused only in times of stress and danger; group fear in some form is essential to its development; when awakened it not only grips every tribesman in an atmosphere of electrified suggestibility, but stirs within his bodily mechanism the internal secretory apparatus whose products are essential to deeds of valor. It is in its strength and vigor an assertion of the group will to live, and is therefore as deep and mysterious and indeed as permanent as the eternal *nisus* of nature, the insistent push of everything that throbs with life and energy." Further, tribal groups were relatively small, as compared to modern political aggregates, and were little attached to any particular territory. While such groups often held with great tenacity to particular areas on account of special economic advantages, such as better fishing or hunting grounds, it was the economic phases of the attachment rather than the purely territorial which played the predominating part. There was little hesitancy in leaving a particular locality to follow migrations of game or fish. This matter has been well summed up by Professor Robinson: "Patriotism, the love of one's *terra patria*, or natal land, is a recent thing. During far the greater part of his existence man has wandered over the earth's face as a hunter and can hardly have had any sweet and permanent associations with the tree or rock under which he was born. But the fore-runners of territorial emotion were the group loyalties of the tribe, clan, family and totemistic group, in whatever order and with whatever peculiarities these may have originated and come to exist side by side."

**2. Early City-States.**—The transition from tribal groupings and modes of life to the city-state, the earliest type of political organization, was gradual and slow. The chief contrast between tribal society and that of the proto-historic city-states was that in the latter the basis of group and individual relations was gradually coming to be political and territorial, rather than purely personal and consanguineous. For many and diverse reasons, groups tended to consolidate about certain vantage points determined by considerations of fortification and protection, religious significance, economic superiority and better potentialities for robbery and brigandage. Stability replaced the earlier nomadic life, and the habitat became more or less permanent. The early city-states did not, however, at all resemble the modern urban centres of life and industry. Life was still primarily agricultural, and the "city" was little more than a citadel surrounded by the homes of the peasants who would retire within the walls in time of danger. As trade developed and the division of labor between city and country was established, the early city-states assumed more of a commercial character and the coming of foreign merchants produced those problems of assimilation and the extension of citizenship which were the chief force in breaking down the remaining vestiges of

tribal society and in creating the origins of the modern political order. A few historical or semi-historical instances of this specific and all-important change from tribal to civil society have been preserved in historical records. Such were the occupation and retention of ancient Palestine by the Jews and their subsequent choice of a king; the constitutional reforms of Cleisthenes in Attica at the close of the 6th century B.C.; the alleged reforms of Servius Tullius in early Rome and the subsequent constitutional struggle between the patricians and plebeians; and the breakdown of Teutonic tribal society and the establishment of political relations in the interval between Arminius and Alaric—the transition which Paul Vinogradoff has called "one of the most momentous turning-points in the history of the race." Important as were the city-states of antiquity as a stage in political and social evolution, they were soon submerged in the great patriarchal empires which arose in the "state-making age" through the superior force and aggressiveness of one of these cities which compelled the submission and enforced the subjection of others. The ancient Egyptian Empire was a product of the forcible subjugation of the numerous city-states of the Nile Valley; the Babylonian, Assyrian and Persian empires were built up out of the progressive amalgamation of the city-states of the valleys of the Tigris and Euphrates and the coast of Asia Minor. Only the cities of ancient Hellas retained their independence long enough during the historical period to give any adequate conception of the type of cultural solidarity and political reactions which characterized the antique city-state. Here personal and kinship relations had been replaced by the institution of citizenship, based upon residence and naturalization instead of blood-relationship or elaborate initiation ceremonies designed to confer the sanction of artificial relationship. Groups were generally more populous and civilization more advanced than in tribal society. Most of the psychic characteristics of tribal life, however, were, if in a modified degree, present in the civilization of Athens, which may be taken as the most advanced product of the ancient city-state civilization. Group solidarity was still intense. The elements of common culture were prized even to the extent of being vested with a sacred significance. Ceremonies, costumes, legal and political forms and practices, moral codes, religious festivities, and even amusements were tinged with the divinity of their alleged origin. The gods were limited to the group and were regarded as wholly solicitous for the welfare of the particular political and social entity. The attitude toward foreigners was well exemplified by the well-known contrast between "Greek and Barbarian," in which Aristotle was able to find a justification for the subjection of inferior peoples to the Greek "genius" for governing. The group leaders passed after their death into the realm of the gods or supermen and their magnified and exaggerated prowess became a most highly prized group possession. In addition to these phases of group solidarity and symbolic unity, which had their roots in tribal psychic life, a new attachment to territorial possessions arose when fixity of habitat had become the rule. Not only were particular sacred places, such as

Olympus and Delphi, prized and venerated, but the whole habitat of the group was valued as a special gift from the gods. Aristotle found that the fortunate situation of the Greeks in their geographical habitat served sufficiently to explain the "superiority" of Greek genius. The ancient city-states seemed well on the way toward transforming group life from the tribal to the modern national basis and had made notable advances in that direction. Had their progress not been arrested by the development of the great patriarchal empires, mentioned above, the national state in its completeness might have been a product of antiquity. For better or worse, however, this was not to be, and even Athens itself was swallowed up in the imperial domains of the Macedonian conqueror after its African and Asiatic prototypes had long before bowed to the might of Thebes, Memphis, Babylon, Nineveh, Ecbatana, Sardis and Susa. James Bryce has admirably described the general absence of anything approaching a national cultural or political union before the conquests of Rome: "Men with little knowledge of each other, with no experience of wide political union, held differences of race to be natural and irremovable barriers. Similarly, religion appeared to them a matter purely local; and as there were gods of the hills and gods of the valleys, of the land and of the sea, so each tribe rejoiced in its peculiar deities, looking on the natives of other countries who worshipped other gods as Gentiles, natural foes, unclean beings. Such feelings, if keenest in the East, frequently show themselves in the early records of Greece and Italy; in Homer the hero who wanders over the unfruitful sea glories in sacking the cities of the stranger; the primitive Latins have the same word for a foreigner and an enemy; the exclusive systems of Egypt, Hindostan, China are only the more vehement expressions of the belief which made Athenian philosophers look upon a state of war between Greeks and barbarians as natural, and defend slavery on the same ground of the original diversity of the races that rule and the races that serve."

### 3. The Patriarchal Empires of Antiquity.

—The formation of the extensive and autocratic patriarchal empires in what Bagehot has somewhat loosely called "the nation-making age" was one of the most important and sweeping transformations in the political and social evolution of humanity. Paradoxical as it may seem, they both stifled and promoted the growth of nations and nationalism. Their development was invariably brought about by the cumulative extension of the power and prestige of some more powerful and aggressive city-state at the expense of its neighbors. This very process naturally produced an enormous inflation of group pride and egotism on the part of the conquering city. Also, while subject cities were severely treated and their national culture sternly repressed, nothing makes a group so proud and tenacious of its cultural characteristics and possessions as persecution, and the conquerors unwittingly only intensified the particularism and local pride of such subject communities as maintained and preserved their corporate existence. The history of the ancient empires is little more than a record of constant warfare produced by the attempt of the ruling city

and dynasty to repel and suppress the revolts of subject cultural groups. This process of ancient empire-building culminated in the expansion of imperial Rome, in its task of absorbing most of the then-known world and of bringing into existence the ideal "reign of universal peace" and uniform law. It is probable that the process of Roman expansion marked the nearest approximation to the spirit and methods of aggressive nationalism that was witnessed before the dynastic wars surrounding and accompanying the development of the modern national states. The crude and almost tribal expression of collective egotism in "international" policy; the public theory that all her wars were "defensive" and that Rome was always threatened by aggressive states; the alleged conviction that the gods were always favorable to these defensive wars; the control of diplomatic and military policy by the landed "Junker" aristocracy—the Senate: the ambition for private or family glory in war, as manifested by Claudius in the first Punic War and by Flaminius in the second Macedonian War; the "surplus population" argument for expansion; the "scrap of paper" attitude toward treaties as evidenced in the second Samnite War; the harsh and brutal treatment of conquered populations, extending to the devastation of fields, the burning of cities and the enslaving of populations; the insatiable greed for further expansion; the disregard of the "rights of small nationalities"—all of these aspects of Roman expansion, which are so familiar to students, sound exceedingly modern and seem quite capable, with some few changes of names, of furnishing the proper categories for the analysis of the development of the German Empire from the acquisition of Brandenburg in 1415 to the present momentous collapse of 1918. While this process of the formation of empires was most influential in creating the tradition of the glory of territorial expansion which was to serve as an important impulse to the aggressiveness of the modern national and territorial state, it should not be forgotten that there was a most radical difference between the political and cultural basis of such a political entity as the Roman Empire and the German Empire of the present day. Though there was a uniform and universal political system, there was no cultural homogeneity or common sentiment of loyalty, which are the indispensable foundations of the national state. Only the citizens of Italian Rome felt any emotional thrills of patriotic reaction at the triumphal processions of the conquering emperors or generals and at the recitation of the Virgilian epic of the growth of the *Pax Romana*. Though the subject peoples might formally acquiesce in the apotheosis of the Roman emperor and render a lip reverence and allegiance they preserved openly or secretly their admiration for their own heroes and leaders and retained their deeper loyalty and allegiance to their own pantheon. A common spontaneous patriotism and a general loyalty to the sovereign imperial state was quite unknown in the ancient empires, and the cultural homogeneity which must precede the political expression of national life was as remote from realization. Even the prevailing political philosophy—Stoicism—decried the sentiment of nationalism and patriotism, and lauded the notion of the

brotherhood of man and the cosmopolitanism of world-citizenship. Mr. Bryce thus depicts the nature and operation of the Roman imperial system, so different from the modern political order based on the national state: "No quarrels of race or religion disturbed that calm, for all national distinctions were becoming merged in the idea of a common Empire. The gradual extension of Roman citizenship through the *coloniæ*, the working of the equalized and equalizing Roman law, the even pressure of the government on all subjects, the movement of population caused by commerce and the slave traffic, were steadily assimilating the various peoples. . . . From Rome came the laws and language that had overspread the world; at her feet the nations laid the offerings of their labor: she was the head of the Empire and of civilization, and in riches, fame and splendor far outshone, as well the cities of that time as the fabled glories of Babylon or Persepolis." Had Rome continued to exist with an improved method of imperial administration and economics for 2,000 years after her "fall," it might have been possible for her to have welded her diverse subject populations into a single loyal and unified national unit, but the experiment was not allowed. In 378 A.D., the Teutonic barbarians from the North, who had been gradually filtering into the empire for three centuries, broke their leashes and started on their migrations, which submerged the ancient world in the return of pre-classical barbarism and produced a Clovis, a Charlemagne and an Otto the Great to repeat the tasks of an Agamemnon, an Alexander and an Augustus. The ancient world, then, passed without producing the complete parallel of the modern national state, but it laid the psychological and political basis upon which it could develop, though it must not be forgotten that the growth of the modern national state has been to a large degree a progress *sui generis*, primarily independent of ancient impulses, even if influenced by ancient models. The psychological contributions of Rome to modern nationalism and the continuity of Roman egotism and jingoism with modern militarism and patriotism have been eloquently stated by Professor Muzzey in the following citation: "The Roman spirit was bequeathed to Europe. Beneath all the art and letters, all the industry and commerce, all the advance in humanity throughout European history, that Roman idea remains. When the old nations speak of patriotism they mean the memory of their glorious wars. War has been their constant occupation and preoccupation. Not a generation that has passed since Virgil, but has paid its terrible toll on the field of carnage to the ideal of pacifying the world by arms. It is not alone Germany, with the celebration of its men of blood and iron from Otto the Great to Otto von Bismarck. The French too, rejoice in the Napoleonic legend. They have their glorious wars of the *Grand Monarque*. They bow before the white plume of Henry of Navarre, and thrill to the echo of Roland's horn at Roncesvalles. The English have their proud memories of Agincourt and Blenheim and Crecy and Waterloo and celebrate their Napiers and Nelsons and little "Bobs." All these nations of old Europe have their glorious traditions of war, and each one can find enough

victories in the uninterrupted course of slaughter through the Christian Ages to justify its belief in its own invincible prowess—nay, even in its divine mission to rule the rest. The Roman ideal still lives in them all. Great Cæsar's ghost still walks as at Philippi. He stalks, gaunt and terrifying, before the chancelleries at London and Berlin, at Vienna, Paris and Rome."

4. **The Middle Ages.**—The political, social, economic and cultural conditions of the "Middle Ages" were no better adapted to the production of the national state than was imperial antiquity. The unit of political organization and administration was the domain of the feudal lord, which varied greatly in extent, but never in any way approximated identity with any cultural or national entity. Usually the domain was but a small isolated element in the feudal hierarchy, and it made for political decentralization and local immunity rather than for national unity. The centre of social life was the infinite number of isolated and minute mediæval manors and the many small and scattered mediæval towns. The units of agrarian and urban industry, the manors and the towns, respectively, were isolated, self-sufficient and narrowly selfish and provincial, and were wholly unadapted to providing any firm economic foundations for national unity. The pivotal points in mediæval cultural activity were the towns, but they were too few, too poorly connected with others by the way of communication and too much governed by the spirit of localism and jealous isolation to be able to bring into being any degree of that general cultural homogeneity, so all-essential to the existence of any degree of national unity.

Not only were these local units of the mediæval period ill-adapted to the creation of nations and national states, but there operated from the other extreme powerful forces and institutions making for a continuance of that universalism which had characterized the Roman Empire. Indeed, it has usually been held that universalism and cosmopolitanism were the dominant ideals of the "Middle Ages"—a sentiment best summed up in Dante's 'De Monarchia,' with its vision of a church and empire universal. Set off against the actual political diversity and localism of the feudal system was the political symbol of unity and cosmopolitanism—the Holy Roman Empire. Whatever its actual weaknesses, its symbolic power over the mind of Europeans was sufficient to cause so ardent a nationalist and so blasé an advocate of *Realpolitik* as Frederick the Great to bow before it, even in the days of its declining strength. A universal moral and religious control over mediæval life was provided by the Roman Catholic Church, whose growth has been described by an eminent authority as "the rise of the new Rome." With its control over the religious, and to a large extent the mental, life of the mediæval period through its elaborate hierarchies for administration and for the control of the sacraments, the mediæval church, with the aid of the inquisition against heresy, brought about a degree of psychic unity throughout Europe never before equalled. Under its greatest popes, such as Innocent III, the Church also exercised a degree of control over European politics never

matched by any emperor of the period. The three leading crowned heads of Europe were in turn disciplined by Innocent. The learning of Europe was no less markedly universal. The Church prescribed a single theology for all western Europe, which was embodied in the 'Book of Sentences' of Peter Lombard and the 'Summa Theologica' of Thomas Aquinas. As theology was regarded throughout the mediæval period as the "queen of the sciences," and education was chiefly in the hands of the churchmen, the realm of learning was no less unified than that of the spiritual world. Again, there was a striking unity of language and literature during the period. While the vernacular languages and literatures began to appear in the 11th and 12th centuries, Latin was, during the greater part of the Mediæval Age, the language of politics, business and learning throughout western Europe. The literature read by the vast majority of those who were able to read was not less uniform than the language; the Bible, the works of the leading "Fathers," the few theological manuals extracted from them, and the crude Latin encyclopedic compilations by Isadore and Rhabanus Maurus and their like, were almost the only books read until the prose and verse of the vernacular languages began to appear at the height of the mediæval period. Mr. Bryce in the following brilliant passage characterizes the remarkable unity which was at least symbolically brought to the mediæval period by the church and empire universal: "It is on the religious life that nations repose. Because divinity was divided, humanity had been divided likewise; the doctrine of the unity of God now enforced the unity of man, who had been created in his image. The first lesson of Christianity was love, a love that was to join in one body those whom suspicion and prejudice and pride of race had hitherto kept apart. There was thus formed by the new religion a community of the faithful, a Holy Empire, designed to gather all men into its bosom, and standing opposed to the manifold polytheisms of the older world, exactly as the universal sway of the Cæsars was contrasted with the innumerable kingdoms and republics that had gone before it. The analogy of the two made them appear parts of one great world-movement toward unity; the coincidence of their boundaries, which had begun before Constantine, lasted long enough for him to associate them indissolubly together, and make the names of Roman and Christian convertible. Ecumenical councils, where the whole spiritual body gathered itself from every part of the temporal realm under the presidency of the temporal head, presented the most visible and impressive examples of their connection. The language of civil government was, throughout the West, that of the sacred writings and of worship; the greatest mind of his generation consoled the faithful for the fall of their earthly commonwealth, Rome, by describing to them its successor and representative, the 'City which hath foundations, whose builder and maker is God.'"

In spite of this unique prevalence of the universal and the uniform in fact and symbol during the mediæval period, however, forces were working beneath the surface that were to rend asunder this artificial unity for centuries.

As early as the Strassburg Oaths of 842 there could be detected the first beginnings in the differentiation of those vernacular languages which were to lay the literary basis for national diversity and rivalry. Moreover, it should not be forgotten that in a curiously indirect and obscure, but nevertheless real, manner the mediæval period furnished a psychological impulse to the growth of nationalism by its influence on the "Romanticists" many centuries later. It was in part from an imperfect understanding of the Mediæval Age that this school obtained its sentimental impulse, which operated powerfully in the creation of the new nationalism during the French Revolution, and its notion of the unique and indigenous nature of national character, which formed the basis of much of 19th century nationalistic philosophy and historical literature. The revival of Roman law in western Europe in the 12th and following centuries became a powerful instrument making for royal supremacy and the rise of the dynastic state. The new commerce with the East, which had been built up by the Italian cities in the period of the Crusades, was to produce the Italian city-states, which first successfully defied the principle of imperial unity and were the harbingers of the repetition of that process on a vastly greater scale in northern Europe, when the opening of the new trade routes with the East and West should usher in the "Commercial Revolution" and with it the dawn of the Modern Age.

III. THE COMMERCIAL REVOLUTION AND THE RISE AND DEVELOPMENT OF THE MODERN DYNASTIC NATIONAL STATES.—In October 1492 Columbus landed on San Salvador in the Bahamas and in May six years later Vasco de Gama reached Calicut on the coast of India, and the two most significant steps had been taken in bringing about that great revolution in commerce, thought and politics, which, in the totality of its dynamic reactions on European civilization, was to produce the modern world and to initiate that process of national development, differentiation and rivalry which has since persisted without abatement and is not likely to be suspended until a supernatural organization shall have been erected with power to curb aggressive nationalism and vested with a function for mutual service which will attract the loyalty of the several component parts of the general world organization.

The older generation of historians, under the spell of the exaggerations and incomplete knowledge of Burckhardt and Symonds, were wont to regard the origin of the modern state system as the product of the so-called "Renaissance," or, guided by the enthusiasm of Ranke and Schaff for the Lutheran revolt, conventionally dated the emergence of nationality from the Protestant revolt and its resulting political adjustments in the Peace of Augsburg and the Treaty of Westphalia. A more profound study of modern history by such writers as Brandt, Cunningham, Shepherd, Cheyney, Robinson, Abbott, Beard and Hays has revealed the fact that both "Renaissance" and "Reformation," in their broadest aspects, were but phases or results of that great transformation which marks the origin of the modern world and the national-state system—the "Commercial Revolution." By this is meant

not only the discoveries, the revival of trade and the "intervention of capital," but also the reactions of these innovations upon the whole basis of European civilization. The permanent intellectual progress which followed the so-called "revival" of the 15th century was not so much the result of the resurrection of an antique culture as it was the product of the new psychic reactions which came from the contact of cultures and the intellectual curiosity stimulated by the discoveries. The modern intellectual world grew out of the work of Galileo, Kepler, Newton, Boyle and Lavoisier, and not out of that of Petrarch, Bruni, Poggio and Boccaccio. Not less disruptive of older doctrines has been the result of more critical research upon the deeper significance of the "Reformation." After three centuries of befogging the real issues at stake under the mask of theological controversy, scholars have at last come generally to accept the doctrines of Sleidan, the greatest of contemporary authorities, that the Protestant revolt was primarily the result of the political and nationalistic ambitions of the North German princes, who found Luther's theological rebellion a timely "moral and religious issue" under which to hide their secular ambition to secure political independence from the Holy Roman Empire. The successful impulse to the religious wars that won the day for Protestantism came not from the zeal of the German princes for the triumph of "justification by faith," but from their eagerness to attain unto the "cuius regio eius religio" clause of the Peace of Augsburg (1555) and the recognition of their full political sovereignty by the Treaty of Westphalia (1648).

The chief impulse that the Commercial Revolution brought to the growth of national states came from the rise of the middle class and their alliance with the monarchs in the attempt to destroy the anarchy and decentralization of the feudal system. Hitherto the kings had been compelled to depend upon the feudal lords for the administration of law, the provisions of royal funds and the military protection of the realm. It can scarcely be supposed that the feudal lords would render effective aid to any policy designed to limit their powers or terminate the political order to which they owed their existence. There was, therefore, no possibility of bringing about that all-essential step in political progress, the destruction of mediæval feudalism, until a new class had arisen with sufficient strength to furnish the kings with the loyal aid necessary to cope with the recalcitrant upholders of the old order, and until a source of royal income had been provided which would enable the kings to hire loyal officials and armies without relying for their financial support upon feudal taxes. Both of these all-important prerequisites for the growth of administrative centralization, political concentration and the rise of the dynastic national state were supplied by the Commercial Revolution. A loyal officialdom, opposed to the feudal aristocracy, appeared in the new "Noblesse de la robe"—the middle class merchants and lawyers that filled the royal offices, and, through the "intervention of capital" coming into the royal treasuries from the national share in the profits of the new commercial and industrial enterprises, the kings were provided with the all-essential financial

power to hire their own officialdom and to support a national army independent of the feudal lords. Then began that relentless war of the national monarchs against their old feudal rivals which extended from the accession of Henry VII of England in 1485 to the close of the last century. While this process involved a great development of royal absolutism and tyranny, as an inevitable accompaniment of the growth of national and dynastic centralization, the movement as a whole was one of the most important in the history of the political development of humanity. All the horrors of the domestic tyranny and foreign wars which have accompanied the rise of national states since 1500 have been the price which mankind has paid through the wasteful economy of nature in attaining to that stage of national independence and self-government which had to precede the ultimate goal of internal democracy and international concert, alliance or federation. Expensive as the process has been, students of the history of civilization unanimously recognize that the evolution of the national state and of large political aggregates had to be brought about before the basis could be provided for an intelligent, amicable, just and practicable arrangement between the states of the world. An international order arising directly out of the feudal system is inconceivable.

The emergence of the national dynastic state in modern times was first manifested in the case of England, due to the appearance in 1485 of a shrewd and vigorous monarch in the person of Henry VII, and to the fact that in England alone had the feudal nobility been gracious and self-effacing enough to prepare their destruction by a war of self-extermination—the War of the Roses (1455–85). Henry VII filled the royal coffers by taxing the feudal nobles through the use of "Morton's Fork" and other ingenious devices, haled recalcitrant and rebellious feudal lords before the Court of the Star Chamber, and encouraged the new commerce by treaties such as the "Intercursus Magnus" and by subsidizing such explorers as the Cabots. His son, Henry VIII, broke with Rome and gave a religious basis to the growing English nationalism. Elizabeth profited by the labors of her father and grandfather, and her reign witnessed the first great cultural expressions of English nationalism, as well as the emergence of England as a leading naval and colonizing nation. By the close of the Tudor period (1603) England had become a highly centralized dynastic national state. Feudalism in its political aspects had passed, and the middle class had so developed its political strength that a half-century later it was able to demonstrate its superiority over the Crown. After brief but brilliant development of Portuguese nationalism (1498–1580), Spain was next in the order of national development. Charles V had been an imperialist rather than a nationalist and had hoped to revive the Mediæval Empire, but his son and heir in Spain, Philip II (1555–98), was a true Spanish nationalist and proceeded to attempt to bring unity not only to Spain but to the Spanish possessions in the Netherlands. His over-ardent nationalism, however, brought disruption rather than centralization, and in 1567 the Dutch, led by William the Silent, broke into active revolt. The

new Dutch national state declared its independence in 1581 and secured the European confirmation of its action at Westphalia in 1648. A century after England had emerged from civil war with a strong national monarch at the head of the state, Henry IV, the founder of the French Bourbon dynasty, came forth victorious over his opponents in the civil wars and was crowned king in 1589. Capturing not only Paris but France by a "mass," he began with his great minister, Sully, the building of the dynastic national state in France. His work was cut short by his untimely death at the hand of the assassin, Ravaillac, but his work and plan was carried on with vigor and determination by the great ecclesiastics and statesmen, Richelieu and Mazarin, until, by the time of the suppression of the Fronde in 1651, the feudal system as a dominating political power in France had passed away. The fruit of the work of Henry, Sully, Richelieu and Mazarin was appropriated by Louis XIV, in whose reign France reached not only the height of her dynastic centralization, but attained to the cultural primacy of Europe. The Thirty Years' War (1618-48) brought with it a multitude of nationalistic movements and demonstrated the fundamental political nature of the Protestant revolt. The stirrings of national ambitions in Bohemia (1618-20) and in Denmark (1625-29) were speedily repressed, but Sweden forged to the front as a great national state (1630-32) and maintained her position until it was lost through the insane ambitions of her warrior king, Charles XII (1697-1718). The Treaty of Westphalia first gave general European recognition to the growing national state system and to the existence of independent national sovereignty. It brought diversity rather than unity, however, to Germany and necessitated the postponement of German unification until the latter part of the 19th century, when this anachronistic and belated process was to disturb the peace of the world. But if a unified national German state was not the product of this general period of the development of dynastic national states, there appeared the dynasty and the state which were ultimately to bring centralization and unity to Germany-Prussia under the Hohenzollerns. After having developed from robber barons into wealthy city magnates of Nuremberg in southern Germany, the Hohenzollerns appeared upon the north European stage through the purchase of the mark of Brandenburg by Frederick Hohenzollern from the bankrupt Emperor Sigismund in 1415. Through fortunate marriage arrangements they secured the possession of Prussia in 1618. The basis of the Prussian bureaucracy and military system was laid by Frederick William the Great Elector (1640-88) and the process was carried to completion by Frederick William I (1713-40). Starting with these contributions of his ancestors, Frederick the Great (1740-85) was able by diplomatic duplicity and military genius to raise Prussia to the rank of a first rate European power and to create that German political dualism which erected a final barrier to German national unification until Austria had been humiliated and ousted in 1866. In the latter part of the 17th century Poland had attained to a degree of power which enabled her to save Christendom from the Turk in 1683,

but unfavorable geographical situation, ethnic, religious and social diversity, and unrestrained feudal anarchy prevented Poland from attaining permanent national unity and condemned her to a steady decline and then to a century and a half of dismemberment and servitude. Even semi-Asiatic Russia did not remain immune in this general European process of national differentiation and centralization. Under her barbarous and brutal, but able, Tsar, Peter the Great (1696-1725), political power was centralized, a national royal army was established, European manners and customs introduced and Russian foreign policy given a westward orientation. By 1721 the Baltic provinces had been taken from Sweden and the all-important "window to the west" secured. While neither Prussia nor Russia were seriously affected directly by the Commercial Revolution, the growth of nationalism in these states during the 17th and 18th centuries was indirectly almost wholly a result of the political reactions of this great economic movement. In both states the nationalistic policies were adopted as a direct and obvious imitation of the administrative and military methods of the monarchs of the new order of national states. The Great Elector copied the policies, methods and measures of Richelieu, Mazarin and Louis XIV, and Frederick I took as his model William III of England. Peter the Great learned from England and Holland the secrets of the new industry and commerce, while from Louis XIV he obtained his pattern for political centralization and military reorganization. By the middle of the 18th century, then, national states had been created in most of Europe. Only in Germany, Italy and the Balkans was this process postponed until the next century, with results so disastrous to humanity at large.

The growth of nationalism during the period of the Commercial Revolution was forwarded by other forces than political centralization. The narrow and selfish nationalistic commercial policy, known as "Mercantilism," which developed more or less universally after 1500 as the general body of economic and commercial doctrines which governed European trade and industry until the middle of the 19th century, operated strongly in the way of increasing national consciousness, self-interest and jealousy, and was a potent stimulant to international friction. Commerce during this period became little better than a collective or national piracy, in which the "rights" of other nations were ignored or denied. In addition to this powerful economic impulse to nationalistic and militaristic policies, a strong intellectual influence arose in the remarkable development of vernacular literature after the spell of the classical revival, known as "Humanism," had passed. Italy produced Machiavelli, Guicciardini, Ariosto and Tasso; France, Rabelais, Montaigne, Corneille, Molière and Racine; Spain, Cervantes, Lope de Vega and Calderon; Portugal, Camoëns, Miranda and Ferreira; England, More, Spenser, Shakespeare, Jonson, Marlowe, Bacon and Milton; Germany, Sachs, Ayser, Opitz and Fleming. Even Holy Scripture was no longer a unifying force in literature, but in the translation of Luther and the King James Version became a powerful vehicle in the development, popularization and improvement of the vernacular language and a

subtle and effective force making for nationalistic divisions. The vernacular literature not only gave literary expression to the growing differentiation of national cultures, but constituted a national possession of first-rate importance, which served as a patriotic inspiration for the generations to come. When the religious divisions created by the Reformation coincided with national boundaries they constituted a formidable psychic force making for national cohesion and self-satisfaction. Before the end of the 18th century, then, Europe had ceased to be either feudal or imperial and had come to be primarily national in political organization, economic policy and intellectual tastes and expression. What was further needed to perfect the nationalistic system was the psychological thrill furnished by the French Revolution and its results, and the provision of a real nervous system for the new nationalism in the improved or revolutionized methods of communication and transportation which came as a part of the Industrial Revolution.

#### IV. THE FRENCH REVOLUTION, THE NAPOLEONIC PERIOD AND THE POPULARIZATION OF NATIONAL SENTIMENT IN EUROPE.

The Commercial Revolution was not only the most potent force leading to the creation of the dynastic national state, but, curiously enough, it also contributed more than anything else before the Industrial Revolution to its ultimate downfall. The middle class, which it created and advanced in power and prestige, in time turned against the kings in the more progressive countries of western Europe, destroyed the dynastic state and brought into being that control by the middle class which was to prepare the way for the growth of 19th century democracy. The nature and significance of this all-important revolt of the middle class against the dynastic state is effectively set forth by Professor Hayes in the following illuminating citation: "Driven on by insatiable ambition, not content to be lords of the world of business, with ships and warehouses for castles and with clerks for retainers, the bourgeoisie placed their lawyers in the royal service, their learned men in the academies, their economists at the king's elbow, and with restless energy pushed on to shape state and society to their own ends. In England by the close of the 17th century they had helped to dethrone kings and had secured some hold on Parliament, but on the Continent their power and place was less advanced. For the 18th century was still the grand age of monarchs, who took Louis XIV as the pattern of princely power and pomp. 'Benevolent despots' they were, these monarchs meaning well to govern their people with fatherly kindness. But their plans went wrong and their reforms fell flat, while the bourgeoisie became self-conscious and self-reliant, and rose up against the throne of the 16th Louis in France. It was the bourgeoisie that started the revolutionary cry of 'Liberty, Equality, Fraternity,' and it was this cry in the throats of the masses which sent terror to the hearts of nobles and kings. Desperately the old order—the old régime—defended itself. First France, then all Europe was affected. Revolutionary wars convulsed the Continent. Never had the world witnessed wars so disastrous, so bloody." Along with the

destruction of the dynastic aspect of the early national state, there came an intensification and popularization of national sentiment quite unknown in the earlier autocratic form of political organization.

As in England there was witnessed the first emergence of the dynastic national state, there also the middle class first came into power, due primarily to the more complete influence of the Commercial Revolution there than elsewhere. In 1649 the English middle class beheaded a would-be autocratic king and 40 years later they completed the process of putting the middle class in political control by driving his son into exile when he attempted to ignore the constitutional barriers to the exercise of unlimited royal power. In France the "bourgeoisie" did not triumph until a century later. In 1614 they had been too weak to defy the monarch and the feudal nobility, but in 1789 and the following years they gave objective evidence of their increase of power during the previous century and three-quarters by crushing both royalty and nobility and establishing themselves as the supreme power in the state. Threatened by the exiled French aristocracy and their foreign sympathizers, the Revolutionists, held together by the new shibboleth of *fraternité*, arose as a "nation in arms" to defend their freshly won liberty against the champions of the old régime. A vast change took place in the nature of national sentiment as a result of this popularizing force of fraternity. At the close of the 17th century Louis XIV had held that the state and the monarch were one and the same; at the close of the 18th bourgeois officials were declaring that the *nation* had a glorious existence quite independent of the king. Professor Hayes has well expressed the importance of this new Revolutionary watchword of "Fraternity" in the process of popularizing the sentiment of nationalism. "Of all the political and spiritual elements in the 'old régime' of the 19th century, one of the most stubborn and impressive was the growth of nationalism. Taking definite form in the days of the French Revolution, under the fair name of fraternity, it appeared as a revolt of a self-conscious people in behalf of their individual liberty and equality against the tyranny or inefficiency of contemporaneous divine-right institutions. By the French idea of fraternity every European country was soon affected, so that formerly latent sympathies were galvanized into a most lively sentiment, and theorists from the domains of history or philosophy or even of economics could find popular approval for their solemn pronouncements that people speaking the same language and sharing the same general customs should be politically united as nations." As a result of the 23 years of general European war following 1792, the national sentiment of well-nigh every European country was transformed from the autocratic and dynastic type to a popular form, generally diffused through the whole body politic. This came about either directly, where Napoleon conquered and carried the French reforms, or indirectly, as a defense reaction against the great military genius of the time by the other states which found it necessary to arouse a similar patriotism in their citizens in order to cope with Napoleon. The French Revolutionary patriotism was carried

directly from France into the Rhine provinces, Italy and Poland and appeared as a defense reaction in the Germanies, particularly Prussia, in Spain and her colonies and, to a lesser degree, even in England and Russia. No state in Europe wholly escaped the wave of patriotic enthusiasm that swept over Europe from 1792 to 1815. The remarkable contribution of Napoleon to the growth of nationalism in modern European history, through giving a widespread dissemination to the forces and tendencies of his time, is thus stated by Professor Robinson: "So long as states were composed of *subjects* rather than of *citizens*, the modern emotions of nationality could scarcely develop. Nationality, in our meaning of the term, is a concomitant of another mystical entity, democracy. The French Revolution began, it is true, in a period of philosophic cosmopolitanism, since that was the tradition of the *philosophes*,—and the French armies undertook to liberate other peoples from their tyrants in the name of the rights of *man*, not of *nations*. But Napoleon, in a somewhat incidental and left-handed fashion, did so much to promote the progress of both democratic institutions and of nationality in western Europe that he may, in a sense, be regarded as the putative father of them both. His plebiscites were empty things in practice, but they loudly acknowledged the rights of peoples to decide on vital matters. He was a friend of constitutions—so long as he himself made them. Then his attempt to seat brother Joseph on the Spanish throne produced a really national revolt, and led to the Spanish constitution of 1812 and all its later revivals and imitations. In Italy he stirred a desire for national unity and the expulsion of the foreigner which had been dormant since the days of Machiavelli's hopeless appeal. He is the founder of modern Germany. He succeeded in a task which had baffled German emperors from the days of Otto the Great; for in 1803 he so far consolidated her disrupted territories that the remaining states, enlarged and strengthened, could in time form a strong union and become a great international power. His restrictions on the size of the Prussian army after his victory at Jena suggested to Scharnhorst, Gneisenau and Boyne a subterfuge which made Prussia the military schoolmaster of Europe, and cost the millions of lives since offered up in the cause of nationality." To these European effects of the influence of the Napoleonic period upon the growth of nationalism should be added the contagion of this process which extended to America. The rise of national independence in Latin America was immediately related to the influence of Napoleon upon Spain. As Mr. Fisher has said: "If the South American democracies value their independence, statues of Napoleon might with propriety be raised in the squares of Valparaiso and Buenos Ayres." The naval and commercial aspects of the struggle between England and France greatly stimulated that development of national unity in the United States which was involved in the preparation to meet the insults to this country and the ravages on its trade. Finally, the purchase of Louisiana, made possible by Napoleon, was the greatest nationalistic event in the first half century of our history as an independent state. So great was the momentum which the

popularized sentiment of nationality gained that not even Metternich, the most astute statesman of the first half of the 19th century, could check it. In spite of his temporarily successful efforts to leave Italy and Germany mere "geographical expressions" in 1815, the arrangement he produced was cast to the winds by those great nationalistic statesmen Cavour and Bismark in the unification of Italy and Germany, while the national sentiment surged violently, if with less success in gaining full political expression, in Greece, the Balkans, Bohemia, Poland and Hungary. But the French Revolution, as the final political and nationalistic expression of the Commercial Revolution, only gave the initial impulse to this new or democratic phase in the development of nationality. A much more profound revolution was already in process of development in the factories and mines of England, and the greatest transformation in the history of the race was there being prepared, which could not fail to have a far-reaching reaction upon the growth of national sentiment and the activities and attitudes of the national states.

#### V. THE INDUSTRIAL REVOLUTION, NATIONAL IMPERIALISM AND THE LATEST STAGE IN THE EVOLUTION OF NATIONALISM.

The term "Industrial Revolution" was given by W. S. Jevons and Arnold Toynbee to the great series of mechanical inventions that followed the introduction of John Kay's "flying shuttle" in 1738 and have completely transformed the economic, political and social, as well as most of the intellectual, foundations of civilization. The general significance of the Industrial Revolution has been eloquently set forth by Professor Shotwell in the following quotation: "It has brought into existence a vast working population, embodied in iron and steel, drawn from mines and forests, from steam, gas and electricity by the mysterious genius of the human brain. It has transformed the face of nature and the life of the whole world. These are not mere economic facts. They form the largest and most wonderful chapter in the history of mankind. What is the Renaissance or Reformation, the empire of Charlemagne or of Cæsar, compared with this empire of mind and industry, which has penetrated the whole world, planting its cities, as it goes, binding the whole together by railroad and telegraph, until the thing we call civilization has drawn the isolated communities of the old régime into a great world organism, with its afferent and efferent nerves of news and capital reaching to its finger tips in the markets of the frontier. A nickle spent for thread in Uganda sets the spindles going in Manchester. Fellaheen by the Nile may be starving because the cigarette factories are building marble palaces for their owners on the banks of the Hudson." Following as a result of the industrial conditions necessitated by the mechanical inventions came the "factory system" and the growth of the modern industrial cities, with all of their attendant social and economic problems. This meant not only a concentration of the industrial population in the newly-created manufacturing cities, but also the completion of the process of separating capital from labor and the creation of the interrelation

between them that has colored the social and economic history of the last century. Socially and politically the most important results of this sweeping transformation were the great increase in the number and strength of the middle or capitalistic class and the creation of the industrial proletariat. The struggle between these classes and of both of them against the landed aristocracy has been the centre of the political history of the last hundred years and the chief dynamic force in the growth of political democracy. The development of means of the communication of intelligence, through the railroad, telegraph, telephone and cheap newspapers, made possible a real psychological unity within each nation, broke up local isolation and completed the process of popularizing national sentiment and perfecting national self-consciousness. It made the various national manifestations of "herd-instinct" more communicable, more responsive and more liable to sudden and hysterical explosions. More fundamentally primitive was the general level of thought and interests on the eve of the Industrial Revolution that the sudden development of the means of communicating these throughout the modern national state tended to give to national thought and emotion the same narrowness and self-satisfied provincialism that had earlier prevailed on a smaller scale. Therefore, it is not surprising that Professor Robinson finds that "Our ancient tribal instinct evidently retains its blind and unreasoning characteristics despite the fact that we are able nowadays, by means of newspapers, periodicals, railroads and telegraphs, to spread it over vast areas, such as are comprised in modern states like Germany, France, Russia and the United States." The world-wide extension of the new mechanism of communication also rendered jingoistic expressions in foreign countries better known and more likely to arouse national antagonisms. Finally, as will be evident from the following discussion, the Industrial Revolution was the most influential force impelling the great modern national states to undertake the building up of new colonial empires in the era of modern imperialism since 1870.

The European Revolutions of 1848 seemed to bring to a focus the two great principles of the first half of the 19th century—nationality and democracy—which had been produced by the combined action of the French and Industrial Revolutions, and for the moment gave promise of making possible the dream of the European liberals that a political order might be created which would give full recognition to both of these aspirations. The enthusiasm thus stirred among the nationalists and democrats in Europe during these momentous years has been eloquently set forth by Mr. Bryce: "So the sympathy, both of America and of Britain, or at least of British Liberals (among whom was then to be found a great majority of the men of light and leading), went out when, in 1848, the crash of the Orleans Monarchy in France had shaken most European thrones, to the Italian revolutionaries, to the Polish revolutionaries, to the Czechs in Bohemia, to the Magyars in Hungary, who, under the illustrious Kossuth, were fighting in 1849 for their national rights against Hapsburg tyranny, to the German patriots who were trying to liberalize Prussia and the smaller king-

doms, and bring all Germans under one free constitutional Government. Men hoped that so soon as each people, delivered from a foreign yoke, became masters of their own destinies, all would go well for the world. The two sacred principles of Liberty and Nationality would, like twin guardian-angels, lead it into the paths of tranquil happiness, a Mazzinian paradise of moral dignity and liberty, a Cobdenian paradise of commercial prosperity and international peace." But the tragic sequence of events in 1848-49 proved that nationality and democracy could then scarcely co-operate in harmony; national jealousy and particularism weakened the cause of democracy and ultimately led to the temporary downfall of both before political reactionaries and anti-national imperialists. The liberals of 1848 believed that when tempered with democracy nationality would be divested of its chauvinistic and aggressive qualities and would insure the coming of perpetual peace, but, as Professor Blakeslee has made clear, neither history nor theory can justify this view: "During the past century the great democracies have been making war, threatening war, and preparing for war, much of the time against each other. Their history shows clearly enough that if their neighbors had also been democratic this change alone would not have prevented wars. Nor is the outlook for the future encouraging. Democratic nations are still willing to fight to defend their national interests and policies; they demand their due share of over-sea trade, concessions and colonies—if they are a commercial or expansionist people—no less insistently because they are democratic. But the interests and policies of one nation conflict with those of another; what one democracy regards as a due share of over-sea trade, concessions, and colonies is an undue share to its rival. Each democracy becomes an excited partisan of its own view, ready to back it by force of arms; and the natural result is, as it always has been, wars and rumors of wars. There are enough conflicts in national policies to-day to lead to a dozen future conflicts, even if all the world should be democratic. There is Japan's insistence upon controlling China; our own Monroe Doctrine, when interpreted in a domineering or selfish spirit; England's Persian Gulf policy; the anti-oriental policy of the United States and the British self-governing colonies; the expansionist policy of all the Balkan states; and the Entente policy, formulated at the Paris Conference, of discriminating against the trade of the Central Powers after the present war shall be over. Unless present conditions are changed, the democratic nations of the world, with their conflicting interests, would find it difficult to maintain world peace, for the next century, even if they wished to maintain it. History, present conditions, and the logic of the situation show that democracy alone will never make the world safe. It is only by a definite concert of states that we may secure a reasonable promise of obtaining a permanent international peace and of becoming a non-militaristic world." The following discussion will show that the more perfect recognition and realization of nationality has as yet achieved even less than democracy to produce the political millennium; rather it has seemingly merited Lord Acton's indictment that "there is no prin-

ciple of change, no phase of political speculation conceivable which is more comprehensive, more subversive, more arbitrary than nationality. Its course will be marked with material as well as moral ruin, in order that a new invention may prevail over the works of God and the interests of mankind."

The 19th century witnessed the belated completion of national unification in two major European states—Germany and Italy—through the efforts of Bismarck and Cavour in the decade and a half following 1855. These statesmen, in deep sympathy with the national aspirations of their countrymen, gathered together under their leadership the various forces working in this direction and succeeded in giving concrete and effective expression to the generally diffused impulse to political unification. In a very real sense they may be regarded as having carried to completion the forces and tendencies first aroused in their respective states by the reactions to the French Revolution and the Napoleonic conquests and statesmanship. Not only were the patriotic tendencies, at the head of which they put themselves, originally set in action by the Revolution and Napoleon, but also the main obstacle to national unification which had to be overcome in both states was the antagonism of that inveterate and implacable enemy of Napoleon and the "French Ideas"—the anachronistic empire of the Hapsburgs and Metternich. The work of Cavour and Bismarck marked a significant stage in that incessant warfare against the medieval imperial concepts and practices which had begun at Westphalia in 1648, was carried on at Utrecht and in the creation of the Confederation of the Rhine, and finally ended in the utter collapse of that obsolete and oppressive political structure in the autumn of 1918, as a result of the growth of national sentiment among its subject peoples and the blow to its military prestige by the collapse which marked the close of the "War of the Nations." Force, chicanery, duplicity and intrigue were employed about equally by both Cavour and Bismarck in achieving their justifiable ambitions, but the resulting political systems created were widely different. "Blood and iron" and *Realpolitik* were used by Cavour merely as a means to the end of creating a liberal and pacific state and a parliamentary government, while with Bismarck they became ends in themselves and were used to repel the very liberalism and democracy which Cavour had established. The temporary vindication of brute force and autocracy in Germany, as a result of the success of Bismarck from 1862 to 1871, gave them tremendous prestige in the newly-formed empire and served to give color to the subsequent history of Germany and the world.

In addition to these larger national states which have appeared upon the European map since 1815, a number of smaller nations have attained in part, at least, to statehood. Greece attained independence in 1829; Belgium gained its independence in 1830 and its neutralization in 1839; Luxemburg became an independent neutralized state in 1867; Serbia, Rumania and Montenegro were recognized as states in 1878; Norway separated from Sweden in 1905; Bulgaria took advantage of the European confusion and tension of 1908 to declare

her complete freedom from Turkey; and in 1913 Austria perversely created the independent Albanian state to block Serbia from an outlet to the sea. But in spite of this considerable addition to the "family of nations" in Europe, national aspirations were by no means satisfied by 1914. Not only did the political map fail to coincide with the national boundaries in the case of every one of the European national states created during the 19th century, but there were great historic nations like the Poles, the Irish, the Czechs of Bohemia and the Finns which were denied any independent political existence. Had the psychology of peoples been the same in 1914 that it was a century and a half before, this condition of incomplete national independence would have produced no very great problem, for potential nations as distinct in race, language and historical traditions as they were at the beginning of the 20th century had long lived without complaint when subjected to the oppression of alien peoples. But the perfection of the dynastic national state, the psychological contagion generated by the French Revolution, the defense-reactions produced by the Napoleonic conquests, the effect of the democracy brought into being by the Industrial Revolution, and their net result in arousing the quiescent "herd-instinct" and in giving it a nation-wide field of operation made any attempt to deny national aspirations a forlorn hope. A boisterous and intolerant chauvinism had developed in the greater states of Europe which inevitably reacted upon the "repressed nations" and aroused similar sentiments and ambitions there. This tendency was powerfully forwarded by the attempt of the great national states to crush out by persecution the national aspirations of the subject nations within their boundaries. Germany oppressed the Poles; Russia the Finns, Letts, Lithuanians, Poles and Ruthenians; Austria the Czechs, Slovaks, Poles and Serbs; Hungary the Rumanians, the Ruthenians and the Croats; and Turkey portions of most Balkan nations and the embryonic nations of Asia Minor. Further, these lesser or "oppressed" nations followed the example of the greater states in arousing an interest in national history and literature and thereby stimulated their hopes for independence by centering attention upon the past glory of their peoples, be it as remote as classical times or the early Middle Ages. Nothing could thwart this force—not even the oldest monarchy in Europe nor the mightiest military state which the world has yet seen. The general nature of the friction and dissatisfaction felt in the Europe of 1914 over the failure of the political divisions to coincide with the national groupings has been admirably summarized by Professor Hazen in the following synoptic outline:

1. Dissatisfaction in Germany on the part of
  - a. The people of Alsace-Lorraine;
  - b. The Poles of Eastern Prussia;
  - c. The Danes of Northern Schleswig.
2. Dissatisfaction in Denmark over
  - a. The position of the Danes in Northern Schleswig.
3. Dissatisfaction in Austria-Hungary on the part of
  - a. The Czecho-Slovaks;
  - b. The Rumanians of Eastern Hungary;

3. Dissatisfaction in Austria-Hungary on the port of — *Continued*
  - c. The South- or Jugo-Slavs;
  - d. The Italians of the Trentino, Istria, and Trieste.
4. Dissatisfaction in France over
  - a. Alsace-Lorraine.
5. Dissatisfaction in Italy over
  - a. Italian Irredenta — Trentino, Istria, Trieste.
6. Dissatisfaction in Serbia over
  - a. The oppression of millions of Serbs by Austria-Hungary;
  - b. Lack of outlet to the sea.
7. Dissatisfaction in Rumania over
  - a. The oppression by Hungary of millions of Rumanians.
8. Dissatisfaction in Bulgaria over
  - a. The boundaries laid down by the Treaty of Bucharest, 10 Aug. 1913.
9. Dissatisfaction in Greece over
  - a. Turkish rule of millions of Greeks.
10. Dissatisfaction of the Poles over the fact
  - a. That Poland does not appear upon the map of Europe, but has been divided among and incorporated with the three partitioning powers of the 18th century, Russia, Prussia and Austria.
11. Dissatisfaction in Russia on the part
  - a. Of the Poles;
  - b. Of the people of Finland, etc."

To these, obviously, should be added the dissatisfaction felt by the Irish nationalists, who, in spite of the eloquent appeals of O'Connell and Redmond and the sympathy they aroused in Gladstone and the English Liberals, were denied their aspiration for "home rule." Joined to these sources of friction and unrest produced by the imperfect realization of patriotic aspirations among oppressed national groups, there were deep-seated and ominous rivalries among the great national states of Europe over purely European national problems. From 1870 to 1914 France was mourning over her "lost provinces," draping the Strassburg Statue and perpetuating the ceremonials of "revanche," while Bismarck alleged that Germany was maintaining and increasing her great armament solely as a protection against the contemplated French war of "revanche," so fiercely urged by Déroulède and his fellow patriots. In spite of a formal alliance, Austria and Italy were fundamentally at odds over the solution of the problem of "Italia Irredenta." The "Mittel-Europa" plan of Germany and Austria was diametrically opposed to the Pan-Slavic scheme of Russia as well as to the national aspirations of the Balkan states. Finally, England's jealousy over Russian longing for Constantinople, which had led her into an aggressive and costly war in 1854-55, was never removed until the mutual loot and partition of Persia was consummated in 1907.

But ominous and troublesome as were the rivalries of national states in Europe over continental problems, these were as nothing compared with those which arose from the struggle over the opening up of backward countries for investment and the planting of colonies in lands beyond the sea. From the period of the close of the Napoleonic wars to 1870 there had

been a decided decline in imperialistic enterprises. Under the reign of "economic liberalism" European countries even went so far as to discuss the very desirability of colonies, and Richard Cobden and his followers believed that the British Empire was quite as much an English liability as an asset. But the results of the Industrial Revolution put an end to this amiable "cosmopolitan dream" of the Cobdenites and produced the revival of the old Mercantilistic policy in the shape of a new scramble for the remaining unappropriated parts of the earth, which could be utilized as colonies and markets for the greatly increased volume of manufactured products. The relation between the great increase of production, caused by the various phases of the Industrial Revolution, and the new national imperialism has been admirably stated by Professor Schapiro in the following passage: "Toward the end of the 19th century there took place a new Industrial Revolution, the results of which were almost as startling as those of its predecessor a century before. The application of science to industry through the extraordinary development of the chemical and physical sciences, the better organization of business enterprise through combination, the larger use of capital and the opening up of new sources of raw material in Asia and Africa increased many fold the production of goods. Gigantic plants, equipped with scientific laboratories, worked by armies of laborers, and capitalized by millions of dollars, brought together in syndicates and 'trusts,' displaced the small factories, or 'mills,' as they were still called. It is estimated that the average increase in the commerce of all the countries of Europe during the 19th century was over 1,200 per cent. . . . The Industrial Revolution at the beginning of the 19th century transformed the economic life of Western Europe only; the new Industrial Revolution at the end of the century caused Europe to burst her industrial bonds and to encompass the entire world in its influences. The new industrialism multiplied production so enormously that markets had to be sought outside the limits of the home country. As competition for the home market within the leading industrial countries became very keen, the eyes of the captains of industry were naturally turned to the many regions that were at the same time densely populated and industrially undeveloped. The vast populations of Asia and Africa were so many potential customers for the business men of Europe. What fabulous profits awaited those who got the opportunity of clothing and shoeing the teeming millions of Chinese and Hindus!" This process of national expansion overseas, in its second or recent phase, set in about 1870, when the effects of the Industrial Revolution had been felt in England and France and were beginning to be experienced to an ever greater degree by Germany. France turned to Africa and Asia, and in Tunis, north central Africa, Morocco and Indo-China sought compensation for the territorial loss of Alsace-Lorraine and investment opportunities for her growing body of capitalists. To obtain a more complete control over the routes leading to India, Disraeli bought the large block of Suez Canal stock in 1875 and started Great Britain on her second

experiment in empire building, which added to her already extensive territorial possessions, Egypt, the Sudan, South Africa, Nigeria, southern Persia and Tibet. Russia extended her sphere of political and economic control in the Far East in the region of Manchuria, and also in the district about the Caspian Sea, including the northern half of Persia. Germany sought her "place in the imperialistic sun" by colonization in Africa and in the islands of Oceania and the Pacific, and by an attempt at the economic control of Asia Minor and Mesopotamia through her Berlin-Bagdad railroad project. Italy, after an unsuccessful attempt to get control of Abyssinia, was compelled to remain content with Somaliland and Eritrea until she was able, 15 years later, to wrest Tripoli and Cyrenaica from Turkey. Finally, nearly all of the above-mentioned states participated in the economic, if not the political, partition of China. The conflict of ambitions in this process of European expansion created many centres of international friction. Germany and England clashed over the distribution of territory in South Africa and over the control of the Persian Gulf. France and Germany precipitated three European crises over their disputes concerning Morocco. France and England nearly went to war over the territory surrounding the source of the Nile. Russia went to war with Japan over Manchuria and Port Arthur, and came to an agreement with England concerning Persia only by a mutual division of spoil in the agreement of 1907. In addition, this new imperialism served to stimulate national pride and aggressiveness on the part of the great national states of Europe through the development of the "mapitis" psychosis, namely, the enthusiasm or chagrin felt by the citizens over the success or failure of their respective states in covering the map of the world with the brilliant colors designating their colonial possessions. Finally, the struggle for markets and the desire to protect national trade and economic interests led to the practical institution of a neo-Mercantilistic era of protective tariffs. Beginning with the Bismarckian tariff bill of 1879 there ensued a general European movement toward nationalistic protective tariffs so high that they would have caused even Frederick List to gasp with astonishment if not with dismay. Only England escaped from this tendency to introduce what practically meant an economic war between the various continental European states. In this manner were economic and political events in and out of Europe contributing to the stimulation of jingoism and international distrust and suspicion in the generation preceding the coming of the calamity of 1914. The writings or speeches of Peters, Reventlow, Rohrbach, Tannenberg, Delcassé, Barrès, Rhodes, Kipling, Maxse, Lea, D'Annunzio, Crispi, Sonnino, Pobiedonostsev, Von Plehve, Berchtold and Tisza presented to the world evidence of the various grandiose programs of national expansion and served to stir up mutual suspicion and antagonism. That this dangerous state of mind in Europe was most marked in Germany was probably due more than anything else to the delayed nature and the forcible methods of her national unification, to her rapid and unprecedented economic development since 1870 and its resulting impulse

toward imperialistic expansion, and to the fact that the "stigmatic" discrepancy between relative European prestige and relative extent of colonial possessions was most marked in the case of Germany. The diplomacy of the latter part of the 19th century and the beginning of the 20th was very poorly adapted to meeting this difficult task of reaching a peaceful adjustment of conflicting international claims. While there can be no doubt that diplomatic theory and practice made great strides in advance during the last century, it is equally certain that it was still essentially Machiavellian, and, as Mr. Weyl has well expressed it, was still controlled by "the approved diplomatic type, the aged, bemedaled, chilly, narrow and conservative, Excellency, very gentlemanly, very astute, fundamentally stupid."

The prospect of a peaceful settlement of the disputes between the European states over European and imperialistic problems was greatly diminished by the vast armaments which were created and increased, ostensibly in the interest of preserving peace, but actually, as subsequent events have proved, to encourage an aggressive nationalistic policy of expansion and annexation. In its origin this militaristic movement dates back to the French Revolution. In 1793 France first introduced the policy of conscription on a general scale and confirmed this practice by law five years later. To prepare for the War of Liberation and to evade Napoleon's arbitrary limitation of the Prussian army to 42,000 men, the Prussian military leaders, Scharnhorst, Gneisenau, Boyne, Grolmann and Clausewitz, introduced into Prussia the system of universal liability to military service in the years following 1808. Austria, in the attempt to cope with Napoleon, tended in the same direction under Archduke Charles and Count Stadion. After 1815 there was a decided slump in military sentiment and activity, associated to some degree with the prevalence of "economic liberalism" and its cosmopolitan tenets. The first military revival was the work of Napoleon III, who assured France and Europe that "the Empire meant peace," but gave practical proof that it meant a restoration of the military traditions of his illustrious uncle. But the Napoleonic restoration of the militarism of a half century earlier was much less consequential for the world than the contemporaneous developments across the Rhine. To revenge Olmütz and humble Austria, King William I of Prussia planned to reorganize the Prussian army as it had been in the great struggle against the first Napoleon. Calling to his aid, in 1862, the most sinister figure in the history of modern militarism, Otto von Bismarck, he was able to carry out not only his army plans, but also his fond ambition to defeat Austria. Extending the new system to the North German Confederation, Bismarck was able to crush France and bring about the long desired unification of Germany. Having "vindicated" the policy of "blood and iron" by three victorious wars Bismarck fastened militarism upon Germany with a deadly grip by a series of laws passed between 1873 and 1887, and the military octopus grew until it culminated in the preposterous act of 1913. The Prussian system, with its great prestige, set the military pace and example for the rest of continental Europe. France adopted the Prussian

system in 1872, and most of the other Great Powers, as well as the lesser Balkan states, did the same in the decade of the "seventies." Even Turkey, in 1883, invited Von der Goltz to reorganize the army of the Sultan on the German plan. Nor was the increase in armament limited to land forces; the great extension of the new colonial enterprises and the development of a larger merchant marine seemed to demand new and larger navies. In view of Great Britain's greater colonial possessions and trade it was but natural that she should begin the movement for larger sea forces. In 1889, Great Britain passed an act providing for a vast increase in her fleet and initiated that policy of keeping her naval strength far in advance of any rival state. Not until 1898 did Germany's interest in "Weltpolitik" lead her to attempt to rival Britain on the seas, but in that year there was passed the first great German naval act, which was supplemented by other more pretentious increases in acts of 1900, 1906 and 1912, which served to arouse British alarm and enmity and to make an Anglo-German concord extremely improbable. Nor were England and Germany alone in this process. All the leading powers, but especially France and Russia, followed their lead. With these great war machines at hand, the European states were little inclined to submit their conflicts and disputes to what were regarded by the jingoistic patriots and imperialists as the pusillanimous and ignoble methods of diplomacy and arbitration.

Accompanying these political and economic forces making for a greater prevalence of jingoism in the last generation of European history, there were psychological causes operating which were not less effective in promoting national aggressiveness and mutual hatred, suspicion and contempt. Anthropological fallacies, growing out of Gobineau's grotesque "Essay on the Inequality of the Human Races" (1854) and Max Müller's hasty generalizations in his "Lectures on the Science of Language" (1861) led to an inflation of racial egotism, the intensification of racial misconceptions and the fatal if fruitless search for the original "Aryan" bearer of civilization among the nations of Europe. That writers more patriotic than scientific could find certain and irrefutable evidence for the original habitat of the primordial "Aryan" in France, Germany, Italy and Russia is sufficient evidence not only of the hopeless scientific confusion, but also of the disastrous patriotic ardor that invited the search. Pseudo-Darwinian sociology represented war as the supreme principle making for social progress, as the struggle for existence had advanced biological evolution. This distortion of half-truth by Gumpowicz and his school was eagerly seized upon by the military and ultra-patriotic writers, such as Moltke, Bernhardt and Von der Goltz in Germany, Déroulède and Barrès in France, Lord Roberts, Wyatt, Cramb and Maude in England, and Lea, Maxim, Mahan and Gardner in America, to give a semi-scientific cloak for their class and clique interests and ambitions. Super-patriotic history, literature and philosophy magnified the past glory and the future heritage of each nation and proportionately disparaged the past and future of their rivals. The emotional impulse from "Romanticism" led to a greatly increased interest in the study of national his-

tory. This was augmented by the patriotic enthusiasm accompanying the growth of nationalism following the French Revolution and the Napoleonic Era. Every country began the compilation of gigantic collections of the sources of national history, of which the "Monumenta Germaniæ Historica," the "Documents inédits" and the "Rolls Series" were only the most notable among many similar enterprises. National narrative histories breathing forth a fiery and defiant patriotic ardor were produced by Giesebrecht, Droysen, Treitschke and Sybel; Michaud, Raynouard, Mignet, Lamartine, Guizot, Thiers, Michelet and Martin; and Freeman, Stubbs, Froude, Carlyle, Macaulay and Napier. Literature became even more chauvinistic. Houston Stuart Chamberlain, building on the risky foundations of the anthropological fallacies of Gobineau, Pöschke and Penka, was able to discover that almost without exception every important figure in history since the beginning of the Christian era had been a German. Even Saint Paul, Dante, Giotto, Michael Angelo and Raphael were included by this undaunted exponent of "Kultur" under the caption of "We Teutons!" Nisard detected the very essence of Reason, herself, in the spirit of French literature. Maurice Barrès found that French culture was a precious and indigenous product of Celtic blood, to which neither Roman nor Teuton had contributed in the slightest degree, and he advocated its preservation by making it the centre of a near Japanese cult of ancestor-worship. Léon Daudet found that nations other than the French exhibited undoubted stigmata of mental and moral decline or deficiency. Rudyard Kipling, the poet of "Saxondom" and British imperialism, indulged in frenzied injunctions to his countrymen urging a greater assumption of the "white man's burden" throughout the non-European world. Carducci made the heroes of Italian unification the theme of the greatest of modern Italian poetry, while d'Annunzio wrought himself up into a neoplatonic ecstasy over the necessity of reclaiming Italia Irredenta. Patriotic state education taught unquestioning loyalty to state or dynasty as the first principle of moral conduct, carefully obscured any questionable occurrences or policies in the national past and frowned on criticism and progressive reform proposals. Slowly, but surely and wilfully, Europe was preparing for the cataclysm of August 1914. As Professor Sumner long before predicted, the vast armaments that had been prepared with the avowed purpose of defense alone invited the transformation of nationalistic and military philosophy from the advocacy of a purely "defensive war" into an exposition of the virtues and necessity of a "preventive war." That this process of the cumulative growth of national egotism and aggressive militarism was undoubtedly most marked in Germany has not obscured the fact that she was separated from the other European national states in this respect by a difference in degree rather than in kind, and that she was able to bow the necks of her citizens under the burden of the military octopus primarily because of the welcome evidence that her neighbors gave to the German military class that they were not unwilling to submit the "rectitude" of their cause to the "test of arms." Nationalistic and ultra-patriotic intoxication

rather than unique Teutonic perversity "applied the match to the European powder-house" in 1914, and if Germany was the only nation which had lost rational and moral self-control, none of her opponents could present an unchallenged record of total abstinence.

While the rise of modern nationalism has been most conspicuous in Europe, this should not obscure the fact that similar forces have produced analogous developments elsewhere, most notably in America and Japan. To an astonishing degree the growth of national unity and of national sentiment in both of these more recent cases of the rise of nationalism has been the product of the same general circumstances and conditions which promoted the development of nationalism in Europe, though in most respects these influences did not have a wholly indigenous origin and expansion, as in Europe, but were introduced from abroad.

Of the American examples of the rise and growth of nationalism that of the United States has, of course, been the most significant. As Professor Cheyney has so convincingly pointed out, the settlement of the United States was quite as much connected with the economic impulses arising from the Commercial Revolution in Europe as it was with the religious revolt from Catholicism and the Established Church of England. Even more consequential were these new commercial forces in promoting unity among the colonists. A century of mutual ignoring of British commercial restrictions had given the 13 colonies a strong common motive for unified action in opposing the proposed enforcement of these long dormant Mercantilistic restrictions—a motive which Professor Schlesinger has recently shown to have been far more powerful than any theoretical or legal abstractions involved in the colonial movement of resistance to British imperial power. In addition to these economic foundations of the shaping of American national sentiment there was a fundamental sociological process in operation which has been aptly termed by Professor Becker "the beginnings of the American people." A widely different geographical, social, political and economic environment acting upon a population originally psychologically variant from the great mass of Englishmen, tended inevitably to create in the colonies a people who became, generation after generation, more and more divergent from their kinsmen across the Atlantic. Not only were these environmental influences working to produce an essential dissimilarity between Englishmen and Americans, but through the fundamental uniformity of the American social environment there was being created a homogeneous and united American people and the beginnings of a national self-consciousness. The American Revolution, initiated by the enterprising and recalcitrant merchants and debtor landlords and carried to success by their courage and audacity and by the not disinterested aid of the French, furnished a unifying force of very great potency for a temporary period, but the reaction in the period of the Confederation for the time being threatened a lapse into anarchy and dismemberment. Thanks, however, to their desire for financial stability and security, the vigorous capitalistic class, led by that great constructive statesman of early nationalism, Alexander

Hamilton, turned the tide of political opinion and practice from separatism and provincialism to nationalism and unity. Their work was carried on by the strongly nationalistic decisions of the great judicial figure in the growth of American nationalism, John Marshall, whom not even Jefferson's enmity could remove. Indeed, the Jeffersonian Republicans, when they came into power in 1800, ceased their negativism and accepted most of the nationalistic program which they had criticized with such vigor and acrimony when carried into operation by Hamilton and Adams. Jefferson could purchase Louisiana, Madison could be won for war with Great Britain, and Monroe could formulate a nationalistic foreign policy. Nationalism in America thus took its origin from the reactions of the Commercial Revolution on the western world; as in Europe, it was completed by the Industrial Revolution. The new factories in the north created an industrial interdependence between the various sections of the country and attracted an immigrant population with no sectional sentiments. The new canals and railroads led to the initiation of that great nationalistic enterprise of the 19th century in America—the conquest of the West, studied with such fruitfulness by Professor Turner and his disciples. While the territorial additions of the middle of the century were temporarily a cause of sectional dispute and friction, they ultimately became a matter of national pride and common interest. Though negro-slavery and the accompanying states-rights movement threatened to disrupt the embryonic nation, the success of the North in the Civil War demonstrated by the verdict of physical force that Webster, rather than Calhoun or Hayne, was right in his interpretation of the nature of the federal union. A permanent political sanction for nationalism was provided by the Fourteenth Amendment. Events and tendencies since the Civil War have been even more conducive to the development of national unity than those of the preceding half-century. An Industrial Revolution, like that which affected New England in the first half of the 19th century, has come to the South and the sharp sectional division of economic characteristics and interests has now been greatly lessened. The further development of railroads, telegraph and telephone lines, and other means of rapid transportation and almost instantaneous communication of intelligence have made this extensive country a national economic and psychological unity to a degree unknown in 1789 even in the meagre territory along the Atlantic seaboard with which the United States started its political existence. The intersectional investment of capital has produced a real financial unity. A national literature has been provided by such writers as Irving, Bryant, Cooper, Longfellow, Lowell, Whitman, Thoreau, Emerson, Hawthorne, Poe, Clemens, Howells and Riley. A collection of the sources of national history was planned and partially executed by Peter Force, and a national historical epic, eulogizing the American past, was created by the writings of Bancroft, Palfrey, Fiske, Holst and Burgess. A "glorious" foreign war at the close of the century gave a great stimulus to the completion of national development, and elaborate national expositions and public projects, such as the Panama Canal,

furnish a successive series of impulses to unity. Many pessimistic publicists believed that the great influx of foreigners in the last 50 years threatened national disruption as seriously as the sectional divisions of the middle of the last century, but the experience of the United States in the Great War has definitely disproved their forebodings and demonstrated that whatever the general results of immigration, they have not brought national disintegration. The participation of the United States in the late "War of the Nations" produced a welling-up of exuberant national sentiment and intolerant patriotism which caused even the older allied and enemy European nations to gasp with astonishment. But while national development in the United States has been the most notable exemplification of this process in the western hemisphere, it has not been the only one. Canada, in spite of a titular connection with Great Britain, has developed a very marked spirit of national self-consciousness, while a century of independent political existence has created a strong feeling of national pride and unity in the various states of Central and South America. Nationalism, then, seems as well established in America as in Europe.

There can be no doubt that the most spectacular rise of nationalism in a 19th century state was witnessed in the case of Japan. After having welcomed European adventurers and missionaries in the middle of the 16th century, Japan suddenly turned against the newcomers, murdered them or drove them from her shores and returned to immobility and isolation for three centuries. This artificial aloofness was broken down following 1853 by commercial concessions obtained first by the United States and then by European states. At first, the feudal princes opposed the entry of foreigners and their civilization, but the more far-sighted among them recognized that Japan could hope to compete with the states of Europe and America only by adopting at least the superior mechanical features of their advanced civilization. By the Revolution of 1867-68 and its immediate results, this reforming element abolished the Shogunate, brought the Mikado out of an inactive retirement, terminated feudalism, reorganized the army along European lines, and accepted the industrial methods and processes which had been produced by a century of economic development in Europe and America. Within a period of less than 40 years Japan passed from a mediæval feudal state to a modern industrial nation, though, as in the case of Germany, this change was limited to the mechanics rather than the philosophy of modern civilization. In no modern state is there such an intense devotion to national ideals as is to be found in Japan. The veneration for the past practically reaches a condition of ancestor worship, while patriotism is in a very real sense the official religion of Japan. When to these conditions there is added the abnormally rapid economic evolution of Japan, it is not difficult to recognize why she has been regarded as the "Germany of the Far East." By successful wars against China (1894-95) and Russia (1904-05) Japan has become the great world power of the Pacific, has acquired important territory on the mainland of Asia and has endeavored to erect and maintain a Japanese "Monroe Doctrine" in China and the Far

East. The present-day exponents of internationalism seem likely to find Japan the most tenacious adherent to the old order of aggressive nationalism and imperialism, but it must be frankly admitted that Japan's contact with the diplomacy of the western world could scarcely have taught her that the day of candor, honesty and generosity has yet arrived in the field of international relations. The rise of the new Japan stimulated the great inert mass of China. Stung by the defeat of their country by the microscopic Island Kingdom, the progressive Chinese patriots attempted to guard against another humiliation at the hands of the Japanese by imitating the Japanese adoption of western civilization. While this movement was temporarily obstructed by the reactionary element in the country led by the Dowager Empress, the liberals overthrew the obstructionists by the Revolution of 1911-12, established a Chinese republic and welcomed western industry and culture. While this remarkable transformation was too rapidly consummated to remain secure and unchallenged, it has persisted to a remarkable degree in spite of temporary set-backs, and China seems well on her way toward development into a modernized national state. In conclusion, it should be noted that no observations on the rise of nationalism in the Far East can ignore the remarkable evidences of national self-consciousness in Australia and New Zealand which were brought out by the recent World War.

The disastrous "War of the Nations," which has just ceased, was not only a product of obsessed nationalism, but also brought with it an unprecedented inflation of national egotism and intolerant patriotism. Never before had a general war occurred when the mechanism for disseminating both information and propaganda was so highly developed or so ruthlessly utilized. The slavish eulogy of national culture and history and the obscuring of national faults and mistakes, which had been so prevalent in the half century before the war, were as nothing compared with the tyrannical censorship and unabashed organized propaganda of every state immediately engaged in the conflict. The greater strictness of the German censorship and the more sinister and extensive nature of German propaganda were, no doubt, indicative of the deeper conviction of ultimate guilt on the part of the Teutonic military autocrats, but no warring state escaped from these activities with an enviable record. Each of the opposing groups of powers represented the gigantic conflict as a sort of Persian eschatology—a struggle between the forces of light and darkness, a clash of the powers of righteousness and iniquity. Within each state an attempt was made to sustain morale by a curbing of all criticism of the "war aims" of the government or its allies and by a carefully planned presentation and reiteration of the past and present criminal record of the opposing states. So powerful and all-embracing was this tidal wave of patriotic defense-reactions that it engulfed not only the "war aim" on the street," but even the most eminent statesmen and publicists, some of whom in the past had seen great virtue in the cultural complex of the enemy. This disheartening spectacle doubtless reached its climax in the "manifesto" of the German professors, but in no state were the intellectual classes im-

immune from the contagion of fervid patriotism, while those who maintained their poise were contemptuously derided as "flabby highbrows" by their over-excited colleagues and critics. The astonishing effect of the wartime patriotism upon the public mind and its stimulating influence in creating a super-nationalism has been brilliantly and accurately set forth by Professor Hankins in the following citation: "Patriotism, like nationality, is not readily definable. It signifies loyalty to one's nation and implies the obligation to serve and defend it. It is thus a passion which all normal men feel, and which in time of our country's peril commands our instant loyalty. Of all the emotions that move men to action it is the most capacious. When it is aroused there is no other social force comparable to it in the completeness with which it dominates all other springs of action in all sorts and conditions of men. It lifts the average man up out of the concerns of a work-a-day world into the noblest spirit of devotion; it quickens the pulse of the sluggard, reforms the wayward, forces generosity from the stingy, arouses the plodder to dreams of heroic deeds, gives courage to the cowardly, and makes the hearts of the shrewd and crafty wolves of society swell with an ostensible love of country. In its face local feuds are forgotten; the bitter struggles of parties and classes are submerged; differences of creed, of social status, and even of race are obliterated. Under these circumstances only the group leaders may speak. The citizen must offer himself in silence as a willing sacrifice on the altar of his country in whatever manner those in authority may dictate. Even honest criticism is anathema; the conscientious objector, who in times of peace is praised as a courageous man who dares to stand against the world for what he believes right, is denounced as a sneaking coward and herded into prison. The individual rights of free speech, press, and assembly so essential to democratic government, so zealously guarded during peace, and so boastfully displayed to an admiring world on the national holidays, not only cease to exist but are even denounced and proscribed as inimical to the public safety. The noble sentiments of toleration are fiercely denounced, as is also individual variation from type which is vigorously defended during peace under the ideals of individual liberty and initiative. Every social institution is brought into line; all organs of public opinion send forth a constant stream of uniform suggestions; the appeal is made through church and lodge and every customary association, until the members of the social group coalesce into a solid sociality that surpasses the fondest imaginings of the utopian Socialist. It is not unnatural that such a titanic social force should stir men's emotional nature to its depths; and especially during war, for war hallows every cause. At such times patriotism, like a resistless and mysterious genius, fills the entire fabric of society with its magical power. Few individuals escape its enchantment, and almost no one dares to speak its hostility. While it ennobles the soul with the sublime spirit of self-sacrifice, it compels men to dilute the honesty of their thoughts; makes cowards of all but the most stalwart souls by forcing them to substitute the worse for the better reason and the lower ideal for one they feel to

be higher. Under its guise every sort of sinister human purpose thrives, for anything which can be made to appear patriotic is instantly and deeply approved. Any counsel of moderation is pounced upon as enemy propaganda, while the advocates of internationalism are accused of silly sentimentalism and treason. To encounter a suspicion of lack of patriotism creates a greater defilement than the violation of an ancient taboo. As in the days of witchcraft, suspects are whipped, tarred and feathered or hanged, or like the distinguished list in 'Who's Who in Pacifism and Radicalism' are immolated on the altar of militarism amid the shouts of the mob and the secret glee of the patriots who find the established social system the best of all possible systems. In other words, patriotism gives full sway to fear, unbridles the lusts and brutalities of savage man, intensifies our innate suggestibility, and subordinates the mind to every sort of delusion and deceit. Unfortunately there is no printed guide for the proper conduct of human affairs, and so deep is the mystery of social processes that only the ignorant and the simple have complete confidence in their solution of social problems. In times of stress therefore the social mind finds refuge in those torrents of instinctive emotion which arise from the deepest recesses of human nature and which propel the social group like a rudderless vessel before the ocean winds. Patriotism makes of national thought 'not a cerebration but a contagion, not an activity but an epidemic.' When one reflects that it was in the midst of such a psychological setting that the Peace Conference had to carry on its work it need cause little surprise that many of the liberal and generous sentiments expressed by the allied leaders have vanished in thin air and that the result of their work bears very evident traces of revenge, a lust for spoil, and rampagious nationalism. These defects, together with the crop of newly emancipated nations, will furnish enough problems to tax the ingenuity of the statesmen of future generations.

#### VI. NATIONALISM AND INTERNATIONALISM.—

While one cannot be blinded to the fact that the untold misery of the wars of the last four centuries has been caused primarily by unrestrained nationalism, dynastic, middle class and democratic, it would be equally futile to deny that the growth of national states has been a necessary step in the development of a permanent and peaceful adjustment of international relations. Expensive as the process has been, national wars seem to have been but the price paid in the wasteful natural economy of political evolution for the all-important growth of national and political aggregates which must always precede the ultimate alliance, federation, partnership or leaguening together of nations. Further, the very evils and excesses of national aggression have, in the past, forced upon the world's attention well-meant schemes for ending war and providing for peaceful methods of adjusting national claims. The destructive Thirty Years' War produced the proposals of Emeric Crucé (1623), Hugo Grotius (1625), and Sully (1638). The dynastic wars of Louis XIV stimulated the growth of international law and invited the pacific plans of William Penn (1693) and the Abbé de St.

Pierre (1712). The reaction against the Seven Years' War, as exemplified in the cosmopolitanism and rationalism of the latter 18th century, brought forth the discussions by Voltaire, Rousseau and Bentham. The French Revolutionary Wars stimulated Kant's proposal for a federation of republics, and the Napoleonic baptism of blood led to Alexander's theological proposition for the assurance of international peace and to Castlereagh's more practicable, if less noble, scheme for periodic European congresses of nations when questions should arise which threatened the peace of Europe. The "concert of powers," which thus originated, proved unequal to coping with the aggressive nationalism of the last 40 years, the promising beginnings in international organization provided at the Hague Conferences proved ineffective, and it has required the most expensive and deadly war in human history to drive statesmen into even a half-hearted determination to take effective steps to prevent the recurrence of such a disaster in the future. When an adequate and workable international organization arises designed to curb aggressive and unscrupulous nationalism and to diminish the opportunities for future wars, the most complicated and perplexing problem in the history of political organization will have been solved and the authors of the enterprise will take their place on the level of the greatest statesmen of all time.

The history of modern Europe, however, from the passage of the "Statutes of Laborers" in the later 14th century to the present day is strewn with the wreckage of political attempts to resist, restrain or control great economic, social or psychological tendencies, forces and movements. A permanent and enduring partnership of nations must anticipate and forward economic fair dealing, social democracy and cultural assimilation. An abiding and effective international organization has to-day a much better prospect of success than ever before in human history, not only because it has as a psychological stimulus the fresh memory of the horrors of the most frightful military cataclysm in the record of human development, but also because there now exists for the first time in such a crisis a real physical, economic and intellectual internationalism which can serve as the foundation for an international political organization. Paradoxical as it may seem, that same Industrial Revolution which, in its immediate effects, greatly forward national development at home and imperialism abroad, also laid the basis for a practical internationalism. The growth of world trade and financial and commercial interdependence have furnished a set of economic motives for pacific adjustments, while the improvement of means of transportation and the communication of intelligence, and the internationalization of science and culture have prepared the way for that growth of intellectual unity and harmony and that development of likemindedness and sympathy which Professor Tenney rightly regards as the all-essential antecedents of any enduring and effectual world organization. But it would, nevertheless, be futile to hope that mankind is far enough advanced in its development to trust merely to the natural course of political evolution for the speedy attainment of world

order and permanent peace. Only by the exercise of the utmost thoughtfulness, candor, tolerance and conciliation will it be possible to bring into existence an international spirit and political organization which will possess any assurance of terminating physical conflict among nations. Exuberant nationalism, political and economic, will have to be curbed before international order can exist. Mr. Morrow has well presented the political adjustment which must be made between nationalism and internationalism; "We must not, however, deceive ourselves. It is most important clearly to recognize that we are trying to get two things. If we want world peace at whatever price, we can take our eyes away from liberty and think only of order, and the principle of nationality will go by the board. If we want unrestricted liberty at whatever cost, we can think only of the separate national states and the price will be the abandonment of a League of Nations. The reconciliation of these two aims—world order and individual liberty—is the problem of the Peace Conference. We must go at our task with open eyes. We must start by admitting that we cannot get something for nothing, that if national states are vital to the orderly development of the world, we must sacrifice some world order for the sake of the development of national characteristics; that if world order is so vitally essential that we must have it, then we must sacrifice some of the power and rights of national states in order to insure a greater measure of world order. This is the reconciliation which the Peace Conference must try to make." Political relations have, however, tended normally to be but the reflection of the deeper economic conditions and forces, and, just as economic unity has always proved the most effective impulse towards political harmony, so economic separatism and suspicion will threaten the dissolution of any political entity. Therefore, it seems clear that any permanent and effective international political or juridical organization must rest upon a basis of economic trust and fair dealing. This phase of the problem has been forcibly set forth by Professor Hankins: "The great stumbling block to internationalism is today the outworn tradition of Mercantilism. This familiar doctrine holds that the nation is the trading unit, that consequently it profits most when it sells much and buys little, and that consequently each nation ought to shut itself up behind trade barriers and, like a hermit empire, prevent the intrusion of the cheap goods of other nations. With the overthrow of the dynastic state nothing now seems to have so firm a hold in popular tradition and hence so close a connection to the galvanic batteries of patriotism as this hoary tradition. . . . If we are to have a lasting peace, then this illusion must also pass into the limbo of outworn creeds; and the peoples of the earth, freed from local fears under the protecting security of a superstate, can become rivals in exploiting the earth rather than each other and mutually enrich each other by a free exchange of their products. Far more certain than the proposed super-alliance of nations as a guarantee of future peace as well as prosperity among men would be a Zollverein of all industrial nations. Likewise

the most prolific source of international jealousy and suspicion in the future seems likely to be trade discriminations, differential tariffs, unfair control and distribution of raw materials and shipping facilities, and other efforts to maintain the economically self-sufficient national state. The immediate problem is the formation of a League of Nations as the means of allaying fear. The problem of the future is the removal of trade barriers and the establishment of an international economic organization of the world. Only thus will the super-national sanction of nationalistic patriotism be transmuted into a supreme loyalty to humanity." When these necessary cultural, political and economic prerequisites of a permanent peace have been secured, and then only, can one hope for a just and effective world order, for, as Professor Giddings has well said: "A league to enforce peace must be composed of nations that will both keep faith with one another and practically act in co-operation with one another against the law-breaker. Practically these requirements can only be met, and will be met, only if the component nations of the league share a common civilization and hold a common attitude towards questions of right, liberty, law and polity."

S., 'International Government.'

HARRY ELMER BARNES,

*Associate Professor of History, Clark University.*

**NATIONALIST**, in British politics, a term applied to the Irish political party whose program includes a partial separation of Ireland from Great Britain. The party was organized by Isaac Butt, and after his death was ably led by Charles Stuart Parnell. After the death of the latter it was split into factions but was re-united in 1899 under the leadership of John E. Redmond. Its principal services to the Irish nation have been the settlement of the land troubles and the establishment of institutions for the higher education of Catholics. The party, however, failed to keep in touch with the younger generation in Ireland; more and more it came to resemble the great parties of England; only men who pledged docility to its leaders received its support at elections. The cleavage between people and party became apparent soon after the outbreak of the war in 1914, and after the revolt in 1916 the support of the masses was withdrawn altogether. At the various by-elections since held throughout the country the party's candidates have been defeated by the Sinn Fein candidates. Its power is gone, and a general election would see it disappear forever. The reasons are not far to seek; as a party it has outlived its usefulness; it is no longer truly representative of the people; new men and new principles clamor for recognition and will not be denied.

**NATIONALITY**. Nationality is both an ethnic and a legal term. As an ethnological concept it has reference to the racial status of an individual or group. Thus we speak of an individual possessing German, Polish, Italian or Greek nationality, without regard to his citizenship, for the terms citizenship and nationality are not synonymous. In general, people who have a common ethnic origin, who speak the same language and who have a common literature belong to the same nationality although they may be citizens or subjects of different states. Thus we find large numbers of persons of Polish nationality in Germany, Austria, Russia and other states; Germans in large numbers are found not only in Germany, but in Austria, Switzerland and other countries; persons of Jewish nationality are widely scattered

over the world and are citizens or subjects of many states. States and nations are, therefore, by no means identical; some states, like Austria, Hungary, Russia and Switzerland, embrace within their territorial limits various nationalities. On the other hand a nation may extend beyond the limits of a single state. Thus the French nation embraces practically the whole of the French Republic and the larger part of Belgium. The Germanic nation extends beyond the limits of the German empire into Austria and Switzerland. The tendency of modern times is in the direction of identification of states and nations, that is, toward the organization of states with boundary lines which coincide with those of nations, this on the principle that the bringing of peoples having a common ethnic origin and language under the same state organization conduces to national unity and stability. The organization of the German and Italian states along national lines during the last century was in accord with this tendency. Disregard of this principle, as for example, by the Vienna Congress in 1815 which undertook to reorganize the states of Europe without regard to considerations of nationality, has led to unfortunate results. Experience teaches that ethnic homogeneity is one of the most powerful sources of political strength and writers are not lacking who maintain that everywhere the boundaries of states and nations should be coterminous, that is, every nation should be organized into a separate and distinct state and that no state should embrace within its territorial limits more than one nation or nationality. In accordance with this theory the Polish nation which was until recently embraced within the limits of three different states has been brought under a single state organization; the Danish, French and Polish parts of Germany have been detached and united to the states to which ethnically they properly belong or organized into new states; the Italian portions of Austria have been united to the Italian state and so on.

As a term of municipal and international law nationality has reference to the status of an individual as a member of a particular state. In this sense the term is synonymous with citizenship (see CITIZENSHIP AND EDUCATION) though not invariably, for an individual may for certain purposes be a "national" of a particular state without being a citizen or subject in the full sense of the term. The term may also have reference to the national status of a ship or cargo. Thus the liability of a ship or cargo to capture during war depends upon its nationality just as the right of an individual to the protection of a particular government or his liability to military service depends upon his nationality.

The nationality of an individual is determined by municipal or state law while that of a ship or cargo is regulated for the most part by the rules of international law. As a consequence of the former principle it may and does frequently happen that two or more states lay claim to the allegiance of the same person. In that case the individual possesses a double nationality. Likewise it may happen that an individual is without any nationality at all, that is, he is *staatlos* or *heimatlos*, as the Germans say. Cases of dual nationality arise from the exist-

ence of two conflicting systems for determining nationality. These two systems are known as the *jus soli* and the *jus sanguinis*. According to the former rule nationality is primarily determined by the place of birth; according to the latter, by the nationality of the parents. The *jus soli* rule grew up in Europe during the feudal period and in time it became the general law on the subject on the continent of Europe. In the later Middle Ages, however, it was largely superseded by the *jus sanguinis* rule which originated in the Roman law. According to the strict principle of the *jus soli* all persons born within the jurisdiction of a particular state, regardless of whether the parents be citizens or aliens, are deemed to be citizens of that state. Likewise all children born abroad, even though their parents be citizens, are regarded as aliens. On the other hand, according to the strict principle of the *jus sanguinis* all persons born within the jurisdiction of a particular state, of parents who are aliens, are themselves aliens, while those born abroad of citizen parents take the nationality of their parents (or rather that of the father, in case of legitimate children, and that of the mother, in case of illegitimate children).

The *jus soli* principle is the basis of the law of Great Britain and the United States; the *jus sanguinis* rule prevails in Germany, Austria, France, Hungary, Switzerland and other states. Few states, however, apply either principle exclusively. Thus according to American law children born abroad of fathers who are citizens of the United States and who have themselves resided here are deemed to be citizens of the United States. Likewise, according to British law, children born abroad of British subjects are treated as natural-born British subjects. Thus both countries, although following in general the doctrine of the *jus soli*, have adopted the *jus sanguinis* principle for determining the status of children born abroad of citizen parents. In many other states a mixed system prevails. Thus according to French law while all children born of French parents anywhere in the world are deemed to be French citizens, those born in France of alien parents and not domiciled in France at the age of their majority are regarded as foreigners. A child, therefore, born in the United States of French parents would be a citizen of the United States *jure soli*, but a citizen of France *jure sanguinis*. We have here a case of double nationality, due to the existence of conflicting rules by which citizenship is determined. In practice the consequences of such conflicts are usually avoided by the policy of states in refraining from asserting their claims in such cases so long as the person whose nationality is in dispute remains outside their jurisdiction. To avoid cases of double nationality it would be necessary to assimilate all the various systems for determining national character, an ideal which, however desirable, is not likely to be realized.

In time of war the national character of an individual may not be the same as that of his political character. It may be that of his domicile or his place of business. Thus if he is domiciled in an enemy country or has a house of trade therein he may for certain purposes be an alien enemy to his own country.

Concerning the test for determining the na-

tionality of ships in time of war there has been much diversity of opinion. The continental European view has generally been that national character in such cases should be determined by the nationality of the owner; English and American opinion, however, has regarded the flag which the ship is entitled to fly as the proper test. The question was considered at the London Naval Conference of 1908-09, and a compromise was reached by the adoption of the rule that the nationality of a vessel should be determined by the flag which it is entitled to fly (article 57) and that the enemy or neutral character of goods found on board an enemy vessel should be determined by the neutral or enemy character of the owner (article 58). During the recent World War, however, the British government rejected the former rule and put into effect the rule that the neutral or enemy character of a vessel should be determined by the nationality of the owner. See also ALLEGIANCE and CITIZENSHIP IN THE UNITED STATES. For bibliography see article CITIZENSHIP IN THE UNITED STATES.

JAMES W. GARNER,  
Professor of Political Science, University of Illinois.

**NATIONS, Battle of the** ("Völkerschlacht"), in the Napoleonic wars, the battle fought at Leipzig, 16-19 Oct. 1813, in which Napoleon, with about 190,000 men, was defeated by the Allies numbering from 200,000 to over 300,000 at different stages of the conflict. The French loss is estimated at 40,000 killed and wounded, and 30,000 prisoners; that of the Allies at 45,000 killed and wounded. The liberation of Germany is practically dated from this event. See NAPOLEON I.

**NATIONS, Law of.** See INTERNATIONAL LAW.

**NATIONS, League of.** See WAR, EUROPEAN.

**NATIVE BEAR,** the Australian koala (q.v.).

**NATIVE COMPANION,** an Australian name for a large local crane (*Grus australasianus*) peculiar to that island-continent.

**NATIVISM,** that theory which bases some tangible part or phase of our knowledge on the inborn nature of mind and not on sense-experience alone. It is opposed to empiricism (q.v.), which finds in sense-experience the origin of all knowledge. While the distinction between truths of reason and truths of sense dates from Heraclitus, or even earlier, Plato was the first to make nativism a leading tenet of his philosophy. Over against the knowledge of sense, he maintained the existence of a knowledge of ideas due to a recollection, stimulated indeed by sensory experience, but reaching back beyond birth. Aristotle's views as to the origin of knowledge, though not greatly emphasized, seem to be essentially of the same nature as those of Plato. The Stoics were the first to use the word *innatus* or truths, applying it primarily to the moral law. The realists of the Middle Ages, holding as they did that universals have a separate existence, were practically driven to nativism, unlike the nominalists, who maintained that nothing is in the intellect which was not previously in sense. In modern times nativism and rationalism have gone hand in hand, and Descartes, Spinoza and especially

Leibniz believed in the existence of innate ideas, such as those of God and of the self. Locke opposed this opinion, and pointed out that the new-born child does not possess a ready-made stock of ideas. Kant maintained a theory of knowledge essentially nativistic, but departed from his predecessors in not making knowledge consist in the possession of representative ideas and in holding that the phase of knowledge independent of sense—the knowledge of pure form—is not so much congenital as extra-temporal. The modern discussion of evolutionism has given a new turn to nativism, in that some writers, such as Spencer, have upheld the view that the knowledge of the individual is in a large measure inherited racial experience. However, according to Weismann's theory of evolution, acquired characteristics cannot be inherited, so that racial experience can have no direct effect on the individual. The innate substratum of the mind, on this theory, is the result of the accumulation of fortuitous variations which have been able to survive through special fitness. Neither this view nor Spencerianism are in the original sense forms of nativism, since the sort of innate knowledge which the classical nativism maintains is the same in nature for all minds.

It is not essential for nativism to maintain that the new-born babe actually has certain conceptions perfectly formed, or that he will form them without any sensory stimulus. An item of knowledge may be innate even if it requires experience to evoke it. For this reason Locke's refutation of Leibniz will not hold water. On the other hand, to be an antithesis to empiricism, the nativist must maintain, not merely that the general nature of man is a condition of all sensory experience, for the empiricist would agree with him in this, but that some phase of knowledge, such as that of necessary truths, is peculiarly dependent on the nature of thinking minds themselves. Consult Aristotle, 'De Anima'; Locke, 'Essay on the Human Understanding'; Kant, 'Kritik der reinen Vernunft'; Leibniz, 'New Essays'; Locke, 'Essays on the Human Understanding'; Mill, J. S., 'A System of Logic' (London 1843); Moore, G. E., article on 'Nativism and Empiricism' in 'Baldwin's Dictionary of Philosophy and Psychology' (new ed., New York 1911); Plato, 'Meno'; 'Phaedo'; 'Theaetetus'; Zeller, 'Stoics, Epicureans and Sceptics' (tr. London 1892).

**NATIVITY**, in *astrology*, the theme or figure of the heavens, and particularly of the 12 houses, at the moment when a person is born, supposed to indicate his future destinies, and synonymous with horoscope. See **HOROSCOPE**; **ASTROLOGY**.

**NATORP**, nã'tõrp, Paul Gerhard, German scholar: b. Düsseldorf, Germany, 24 Jan. 1854. He was educated in Berlin, Bonn and Strassburg and accepted a professorship in Marburg in 1885. He wrote 'Descartes' Erkenntnistheorie' (1882); 'Platos Staat' (1895); 'Platos Ideenlehre' (1903); 'Socialpädagogik' (3d ed. 1909); 'J. H. Pestalozzi' (2d ed., 1910); 'Die logischen Grundlagen der exakten Wissenschaften' (1910); 'Philosophie: ihr Problem und ihre Probleme' (1911); 'Hoffnungen und Gefahren unserer Jugendbewegung' (1914).

**NATROLITE** (from "natron," native carbonate of sodium), a native hydrous silicate of

sodium and aluminum, having the chemical formula  $\text{Na}_2\text{Al}_2\text{Si}_2\text{O}_{10} + 2\text{H}_2\text{O}$ , and crystallizing in slender prismatic forms belonging to the orthorhombic system. It is transparent to translucent, and usually white (or nearly so), with a vitreous lustre, a hardness of from 5 to 5.5, and a specific gravity of from 2.20 to 2.25. It occurs in cavities in basaltic rocks, and in seams in granite, gneiss and syenite. It occurs in many parts of Europe, and fine crystals are found in southern Norway. In the United States the mineral occurs in Connecticut, New Jersey and Arkansas, and also in the Lake Superior region. It is likewise found in Nova Scotia. Natrolite takes a good polish, and has been used as a gem stone.

**NATRON**, a carbonate of soda or mineral alkali,  $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ . It is produced from the ashes of several species of marine plants and is also obtained by evaporating the waters from some mineral springs. It is also found as an efflorescence in the ground. It occurs in nature, but only in solution, and is generally found in an impure state, being mixed with other sodium salts, such as the sulphate and chloride. The soda lakes of Egypt have supplied great quantities of this substance for many centuries; it was used by the ancient Egyptians as an important ingredient in their embalming fluids. A similar but impure hydrogen sodium carbonate is found deposited by evaporation on the shores of the Caspian and Black seas, also on the banks of alkali lakes and springs in California, particularly in the neighborhood of San Bernardino.

**NATTER**, Heinrich, Austrian sculptor: b. Graun, Tyrol, 16 March 1846; d. Vienna, 13 April 1892. He was five years apprentice to a sculptor in Meran and subsequently was taught drawing at Augsburg by Johann Guyer, a famous painter of humorous genre. Subsequently he studied with great profit under Max Widmann (q.v.), the sculptor, in the Munich Academy. Weak health compelled him to travel and he visited Riva on Lago de Garda and Venice, until the war of 1866 called him to active military service. He afterward took up his residence at Munich, where he made his reputation by his portrait busts, sepulchral statues, a colossal statue of the god 'Odin' (1873) and the head of a 'Sleeping Satyr.' A career of wider activity opened for him after his settlement in Vienna, where, besides numerous bust portraits and monuments, he executed the statue of Zwingli for Zürich; the statue of Haydn for Vienna; the portrait statue of Laube and Dingelstedt for the municipal theatre of that city; and the statue of Walter von der Vogelweide for Bolzano (1889). His statue of Andreas Hofer, which is his masterpiece, was unveiled after the sculptor's death on a height near Innsbruck. A poetic delicacy of conception and a certain life-like expression, oftener found in painting than in sculpture, are the characteristic features of his work. His literary remains were published by L. Speidel, under the title 'Kleine Schriften' (1893).

**NATTERJACK**, an Old World toad (*Bufo calamita*), light-brown in color, spotted with patches of a darker hue. It does not leap or crawl like the common toad, but rather runs, whence it has the name of walking or running toad. It has a deep and hollow voice,

audible at a great distance, and is often found in dry situations.

**NATTIER**, nă-tē-ă, **Jean Marc**, French painter: b. Paris, 1685; d. 1766. He was the pupil of Jean Jouvenet, won the Academy prize in 1700 and became professor of the Academy in 1752. His fame as a portrait painter was increased by the visit he paid to Antwerp in 1715 to paint likenesses of Peter the Great and his wife Katharine I; he also painted the portraits of many of their suite. So great was his skill in portraying the fine ladies of his day that he has done as much to immortalize such faces as those of Marie Leszczyńska, Henriette de France, Madame Adelaide, Madame de Chateauroux, Madame de Flavacourt and many others of the court of Louis XV, as Rigaud (see RIGAUD, HYACINTHE) had done for Bosuet, for Louis XIV, his courtiers and other leading men of the period. His subjects are usually treated as mythological themes. Specimens are to be found in the Louvre, Dresden, Stockholm and the various museums of Paris and London. The Princess de Condé as "Diana" is in the Metropolitan Museum in New York. Consult 'Masters in Art' (Vol. III, Boston 1902) and Pierre de Nolhac, 'Nattier, peintre de la cour de Louis XV' (Paris 1910).

**NATTY BUMPPPO**, the central figure in Cooper's (see COOPER, J. F.) stories: 'The Pioneers' (1823), in which he appears as "Leatherstocking," a name lent to the series as the 'Leatherstocking Tales'; 'The Last of the Mohicans' (1826), in which he is known as "Hawkeye" and "Le Longue Carabine" ("The Long Rifle"); and 'The Pathfinder' (1840) and 'The Deerslayer' (1841), in which his respective sobriquets furnish the titles of the volumes. Lounsbury ('Life' of Cooper, 1884) has called him "one of the few original characters, perhaps the only great original character, that American fiction has added to the literature of the world."

**NATUNA** (nă-too'nă) **ISLANDS**, East Indies, a chain of islands in the South China Sea, extending northwest from Cape Api, Borneo, and belonging to the Dutch. The principal islands are Great and South Natuna islands and Stokong. The aggregate area is estimated at over 800 square miles. The islands are mountainous and densely forested; the chief products are coconuts, fish, rice and maize. Pop. 9,000, mostly Malay fishermen.

**NATURAL BRIDGE** and **NATURAL ARCH**. A natural bridge has been defined as a "natural stone arch that spans a valley of erosion. A natural arch is a similar structure which does not span a [true] erosion valley." These forms are produced in numerous ways. Most of our larger natural bridges are the result of the cutting through of the necks of deeply-entrenched meanders (q.v.), so that the river cuts off an oxbow, just as on a typical modern flood plain, except that the meander is in a deep gorge or valley and cuts through the narrow neck of rock *underneath* the surface. (See MEANDERS). This is the origin of the famous Pont d'Arc in France. The group of natural bridges in Southern Utah are also of this type. The most noted of these are the Augusta, Edwin, Caroline and Rainbow bridges. The Augusta Bridge has a height of 265 feet,

a span of 320 feet, a thickness of arch of 83 feet and a width of roadway of 35 feet.

In limestone regions, solution along joints may form long tunnels, or, if only part of the tunnel roof remains, natural bridges. Sometimes in case of waterfalls, part of the water, before reaching the brink of the fall, may work down through a joint in the bed and come out below the fall. If this passageway enlarges sufficiently to accommodate all the water of the stream, the former fall may be abandoned, leaving its old crest line as a natural bridge. The famous natural bridge of Virginia is perhaps of this or similar origin. It is 236 feet high, has a span of about 50 feet and a thickness of arch of about 40 feet. Other natural bridges are formed by various other means, as by wind erosion undercutting ridges in deserts, wave erosion along shore lines, the falling in of parts of roofs of caves, leaving part of the roof as a bridge and many other minor causes. Consult Cleland, 'North American Natural Bridges' (in Bulletin of the Geological Society of America, Vol. XXI, 1910, pp. 313-338).

**NATURAL GAS**. See GAS, NATURAL; MINERAL PRODUCTION OF THE UNITED STATES.

**NATURAL HISTORY**, in its widest sense, that department of knowledge which comprehends the sciences of zoology and botany, chemistry, natural philosophy or physics, geology, palæontology and mineralogy. It is now, however, commonly used to denote collectively the sciences of botany and zoology, or these together with geology, mineralogy and palæontology, exclusive of physics and chemistry, and it is sometimes restricted to denote the science of zoology alone.

**NATURAL HISTORY OF SELBORNE**, *The*, a celebrated work by Gilbert White (q.v.), published in 1789. Its material consists of White's letters to Daines Barrington and Thomas Pennant (qq.v.), in which the writer describes outdoor life in the little Hampshire village which his works made famous and interesting alike to students of nature and to lovers of good books, among which the 'Natural History' ranks as a unique classic of science and of letters.

**NATURAL LAW**. See LAW, NATURAL.

**NATURAL LEVEES**, embankments built by a river on either side of its channel. When a river is in flood and overspreads its flood plain, there is a constant checking of velocity where the moving water of the channel comes into contact with the stagnant water of the adjacent plain. At this point on either side, the greater part of the river's load of mud and sand is dropped, until a ridge is built up on each side, known as a natural levee. By this process the Mississippi has raised its course many feet above the general level of its flood plain.

**NATURAL NUMBERS**. See ALGEBRA.

**NATURAL PHILOSOPHY**. See PHYSICS.

**NATURAL RESOURCES**. See CONSERVATION OF NATURAL RESOURCES.

**NATURAL RIGHTS**. See LAW, NATURAL

**NATURAL SELECTION**, the doctrine advanced by Charles Darwin and almost coincidentally by Alfred Russel Wallace (q.v.), to account for the divergence of animal forms and their gradual separation into distinct species and groups, by a process akin to the selective mating practised by men in rearing and perpetuating breeds of domestic animals. It forms the basis of Darwin's hypothesis of organic development by descent, and depends upon the fact that variations constantly appear in animals, and may in some degree be perpetuated. These variations may be minute fluctuations on either side of a mean, a little more of one character and a little less of another; or they may be sudden steps of considerable magnitude; in other words, they may be continuous or discontinuous. They may visibly affect only one character at a time, or they may affect many parts of the organism at once, as if there were a general movement to a new position of organic equilibrium.

(2) Living creatures are involved in a manifold and intricate struggle for existence, varying greatly in its form and in its intensity, and due to a variety of causes. It is necessitated especially by two facts: first, that two parents usually produce many more than a pair of offspring, and that the population tends to outrun the means of subsistence; and, secondly, that organisms are at the best only relatively well adapted to the external conditions of their life, which moreover are variable. The "struggle" may be for food or foothold, for mates or property, for self-preservation or for the welfare of the young, including much more than an interecine scramble around the platter which contains the necessities of life; the phrase is applicable as regards relative length of life, vigor or constitution, success in having offspring, and so on.

(3) In this struggle for existence the relatively less fit organisms are weeded out or eliminated, and sometimes only a small proportion of those born survive to become adults or reproductive. But it must be clearly understood that elimination does not necessarily involve sudden death or no offspring; it may simply involve, in the first instance, a slightly shorter, less successful life, or a smaller, less vigorous family. Yet whether the eliminative process be gentle or severe, the result is the same—that the relatively more fit variants tend to survive; and since many variations are demonstrably transmissible from generation to generation, and may, through the pairing of similar or suitable mates, or in other ways, gradually increase in amount, the eliminative or selective process works toward the establishment of new adaptations and new species.

The three steps in the argument are thus: (1) The occurrence of transmissible germinal variations is a fact of life; (2) the struggle for existence is a fact of life; and (3) the elimination of the relatively less fit is a fact of life. The result has been, and is, the rise and progress of new adaptations, new varieties, new species, new types.

A formidable objection to the selection theory, first clearly stated by Prof. Fleeming Jenkin, is that variations of small amount and sparse occurrence would tend to be swamped out by intercrossing. In human or "artificial" selection, the breeder takes measures to prevent

this by pairing similar or suitable forms, but what in nature corresponds to this action of the breeder? Various suggestions have been made in answer to this objection. Thus Weismann says: "The necessary variations from which transformations arise must in all cases be exhibited, over and over again, by many individuals," and in his ingenious theory of Germinal Selection he has suggested the internal mechanism by which this result may come about.

But the answer at present most relied on is that worked out by Romanes, Gulick and others—the theory of isolation (q.v.). The theory of isolation emphasizes the great variety of ways in which, in the ordinary course of nature, the range of intercrossing may be restricted, for example, by geographical barriers, by differences in habit, by psychical likes and dislikes, and by those remarkable reproductive variations which cause mutual sterility between two sections of a species living on a common area.

Another point that has been brought out by De Vries (q.v.) is that variations are not necessarily minute at the start, and that new species may spring into existence at once by what he calls a mutation. Of course, the later history of such a species is conditioned by natural selection.

We have given a statement of the theory of natural selection very much as it might have been given in 1859, when Charles Darwin and Alfred Russel Wallace enriched biology by their independent exposition of the selection idea; but since then our knowledge of the nature and origin of variations has greatly increased, the analysis of the various modes of inheritance has become much more precise, the difficulty of proving any instance of the transmission of "an acquired character" or direct somatic modification is generally acknowledged, and we have recognized the value of a second directive factor in evolution, namely, isolation. It may be said that the theory of natural selection is now being subjected to more severe and more dispassionate criticism than it had to encounter in the early Darwinian days, when the validity of the general evolution idea was the central subject of discussion.

Thus there is a demand for some serious attempt to measure the intensity of the struggle for existence in typical cases, and for evidence that the absence of a particular variation in certain members of a stock does really determine their elimination. In other words, evolutionists have awakened to the necessity of testing natural selection in relation to actual cases.

Lastly it should be noted that the doctrines of Lamarck, which were that use-and-disuse, inheritance of acquired characters, and other factors were more potent than natural selection, have been revived and strengthened by a school of naturalists who insist that they must at least be held to have had an important share in the phenomena of biology.

**NATURAL THEOLOGY, or NATURAL RELIGION,** that knowledge of God's existence and nature which mankind learn from observation of the world of nature. Biblical theology, or, as it is more commonly called, "revealed religion," is the knowledge of God's nature and operations derived from revelation; and revelation is impossible unless we first postulate a personal God. Thus natural theology is the foundation of any system which professes to give an account of the Supreme Being as well as of man's origin and destiny.

**Method of Natural Theology.**—The first proposition postulated in this department of speculation is that every effect requires a cause (q.v.). One of the self-contradictions of Lucretius is contained in his axiom *ex nihilo nihil fit* ("nothing can come from nothing"), after pronouncing which he proceeds in his attempt to prove that the order and uniformity of nature proceeds from nothing, that is, random disorder, the fortuitous concourse of atoms. Unless it is admitted that certain events and phenomena are invariably connected as cause and effect, there can be no science of natural theology, which is based upon the assumption that causation is a fact, the truth of which is accepted among the intuitive beliefs of the human mind.

**How far a Science.**—As Natural Theology claims for its domain the physical, intellectual and moral nature of man as well as the world of nature in the midst of which he is set, it starts out by saying with Natural Science that the present constitution of things had a beginning. Plants and animals did not always exist on this planet. The questions arise, Whence did they come? How came man here? The theory that individual species as at present existing was the original form of organic life on the earth has now been abandoned, and two other theories have replaced it: (1) That animals and plants have been produced by forces eternally and necessarily inherent in matter (see NATURALISM); (2) that nature is the product of a personal being, acting with deliberate design. In the history of recent speculation we come upon a suspensive judgment in this question; on the other hand Positivists (see POSITIVISM) have ruled it out from the field of human speculation. Suspensive reasoners do not profess to know because they declare the matter unknowable. This is agnosticism (q.v.) and its adherents style themselves agnostics. On the other hand, observers of nature have remarked in the works of nature an analogy with and a resemblance to the works, contrivances and methods of human artificers. They have accordingly reached a belief in a transcendently great and powerful maker who has originated all things. The existence of man as an individual person has been taken as testimony to the existence of an infinite and eternal being as the one supreme God. It has also been averred that anti-intuitionists destroy the basis of all knowledge and science and that a physicist who denies causation sweeps away the foundation on which his system is reared.

**Main Arguments.**—(1) It is claimed that the idea of God's existence is innate in every human being and is as necessary a fact of consciousness as his own personal identity. In the most rudimentary and debased tribes is found this sense of a Supernatural Power. Lubbock and others deny to some degraded races this innate idea; it is sometimes added that deaf-mutes are in the same mental condition. It does not, however, follow because an idea has not been expressed in language that it is, therefore, not present in the mind. The mind may not have been explored by the subject; the readiness with which belief in the supernatural is accepted by savages and children is one reason for the belief that the response they make to communications on this subject springs from previous divinations of the consciousness in realizing itself. If this idea is not innate it is certain that the faculties of the human mind are such that the study of nature, man, and the obligations of life bring each individual face to face with the notion of God. Descartes, Leibnitz and others aver that the capacity of the human mind to entertain the conception of a being perfect and omnipotent, proves the existence of a reality which corresponds to such a conception; but their argument has not satisfied metaphysicians such as Reid and Stewart and, through the metaphysical subtleties involved in it, must be laid aside as a popular argument. (2) The study of nature and of history, that is, of man as a physical, intellectual and moral being, furnishes material for arguments from design, teleological arguments as they are sometimes called (see TELEOLOGY). This is the simplest and most obvious form of argument to be put forth in Natural Theology and has been put forth in all ages. Socrates constantly stated it; Cicero enforced it among his Roman followers. Although on the first publication of Darwin's and Wallace's theory of evolution it lost its place of importance in Apologetics, it was soon perceived that the theory of Natural Selection in fact multiplied many fold the evidences of design and ordination, and raised the level of intelligence to a higher plane. In consequence Natural Theology has recently been revived and stated with renewed force. The laws of Natural Selection and Survival of the Fittest must have had a law-giver, and the discovery of additional links in the chain of causation does not necessarily destroy its continuity. The argument now includes the concept that the world is not a finished product, but is even now in process of evolution. The Hebrew writers constantly refer to the power and goodness of Jehovah as evidenced both in the works of nature, the events of history and the faculties of mankind. Saint Paul begins his Epistle to the Romans with this argument against the degraded paganism of Rome; the Fathers have enforced it over and over again. Paley's 'Natural Theology' has been a most important statement of the argument from design which has been enlarged in its application by Chalmers, Tulloch, McCosh and Agassiz. The argument from design can of course only prove the existence of a Creator of the world. Man alone is conscious of a Creator, who, however, need not be the self-existent God, but once grant that man has a maker, and it would at once follow that a supreme self-existent God exists who is the

First Cause. Consult Xenophon, 'Memorabilia'; Plato, 'Laws X'; Cicero, 'De Natura Deorum'; Descartes, 'Principia Philosophiæ'; Leibnitz, 'Theodice'; Paley, 'Natural Theology'; Chalmers, 'Natural Theology'; McCosh, J., 'Christianity and Positivism' (New York 1875); Seeley, J. R., 'Natural Religion' (Boston 1882); Robinson, E. K., 'The Religion of Nature' (New York 1906); Shearman, J. H., 'The Natural Theology of Evolution' (New York 1916); Thackray, E., 'The Revelation of God in Nature and Man' (London 1916).

**NATURAL TONES** are tones produced by the natural alteration of nodal points in wind instruments by pressure only. See HARMONICS.

**NATURALISM**, a term which, in the history of philosophical thought, has received a variety of meanings. In general it refers to that which is in accordance with nature. But the sense in which the term nature may be used is not by any means a constant but a variable, and as this sense varies we will find a set of corresponding meanings for naturalism itself. Nature may be considered as that which is the opposite of the artificial, the conventional or the traditional. Regarding nature from this point of view, the term naturalism will be employed in much the same sense as that in which Rousseau used it in his plea for a return to nature in matters philosophical, religious and political. Or nature may be regarded as the external reality which furnishes the material of all our sensations; naturalism will then signify in the Lockean sense that which is original and fundamental in knowledge as opposed to that which is the result of the operations of the human understanding. Again, nature may signify the basis of natural affections and dispositions as opposed to the fundamental principles of conduct which are revealed in the "dry light of reason." In this sense Shaftesbury uses nature and naturalism in contrast to the rationalistic ethic of his day. Naturalism also has been used as a term to characterize such a philosophical system as that of Giordano Bruno, which identifies God with nature, and does not distinguish between the Creator and his works. In the midst of this confusion of meanings, however, the present day discussions in philosophy have established a determinate usage which for the most part is uniformly recognized, and consistently employed. This usage is quite different from any of the phases which have been mentioned, and may be defined somewhat as follows: Naturalism signifies a method of interpreting the subject matter of philosophy, which insists that all phenomena whatsoever are to be explained according to the laws of nature, that efficient causes only are to be regarded, while all considerations of final causes are to be rigorously excluded, as well as those alleged ideal implications of reason which postulate some metaphysical necessity as a mode of interpreting physical phenomena.

In this sense naturalism, as regards psychology, grounds all psychological phenomena upon a purely sensationalistic basis; there is no self in the sense of an organizing power and unitary centre in the midst of the various states of consciousness; the spiritual elements of consciousness are regarded as incidental and determined at the last analysis by the cosmic processes. As a theory of knowledge, there is no

place for an idealistic construction of the data of experience. In ethics, naturalism is a science of what is and not of what ought to be. It allows a science of ethics but not of metaphysics. Its cosmology essays an explanation of the universe in terms of the laws of nature which inductive research may have discovered, but it has no concern or interest as to the question whether "through the ages one increasing purpose runs."

A system of naturalism, however, is not necessarily a philosophy of materialism any more than it is necessarily pantheistic, although it must be acknowledged that naturalism and materialism are often used as synonymous terms. It is not used in the present day as a term opposed to supernaturalism, as it is essentially a philosophical term and not used in a theological sense. It does not deny a supernatural reality in the theological sense; it is merely not interested in the questions which turn upon a beyond and above as regards human thought and human activity.

The antithesis which the term naturalism suggests does not lie in this direction. To understand the significance of naturalism, and it must be understood in order to appreciate in any adequate measure the philosophical problems of the day, the exact antithesis which it implies must be clearly apprehended. The antithesis is between an explanation of the phenomena of existence which can be expressed solely in terms of the laws of nature, and all explanations on the other hand which involve fundamental thought necessities as essential factors. The antithesis is between the natural and the rational, between the natural and the spiritual. This usage of the term we find in such a book as that of Balfour's 'Grounds of Belief,' or in Ward's 'Naturalism and Agnosticism,' or in Sorley's 'Ethics of Naturalism.' When Mr. Balfour's book was first published he was severely criticised in some quarters for his use of the term naturalism. This evoked much discussion, which has served to establish a definite and determinate sense in which the term may be used. A most able and satisfactory defense of Mr. Balfour's usage of the term is to be found in the work of Prof. Andrew Seth, entitled 'Man's Place in the Cosmos.' One of the essays is 'The Use of the Term Naturalism,' and it is one of the best discussions to which any student of the subject can be referred. Without doubt, the element of variability which has attended the history of this term has been to a large extent, if not altogether, removed, and a constant significance has resulted which conforms to the general usage of the present time; and the significance is the one which it has been the endeavor of this article to present.

JOHN GRIER HIBBEN,  
*President, Princeton University.*

**NATURALISTS**, American Society of, an association numbering 230 active members, organized in 1883, for the purpose of bringing together persons interested in topics of natural history.

**NATURALIZATION**, the act of renouncing allegiance to one government and acquiring the rights of citizenship under another. In its broadest sense it signifies the act of adopting a foreigner into the body politic and of clothing

him with the privileges of citizenship. This may result from the annexation of territory, the marriage of an alien woman to a citizen, the naturalization of the parents of children, the purchase of real estate in some countries, service in the army and the navy, etc. In a more restricted sense the term has reference to the issuance of a certificate of citizenship by a court or an administrative officer after the fulfilment by the applicant of certain prescribed conditions. With a few exceptions the rights of the naturalized person are equal in all respects to those of the native-born citizen; thus in the United States, while the civil rights are the same, the Constitution excludes the naturalized citizen from the offices of President and Vice-President. In Great Britain a naturalized subject enjoys all the political and civil rights of a native-born subject except that when he is in the territory of his original state he is not entitled to protection unless the consent of his original government to be naturalized abroad was obtained. The British naturalization commission of 1901, however, recommended that this exception be abolished. The government of the United States makes no such exception in the case of naturalized citizens. They are protected equally with naturalized citizens in their country of origin whether the consent of their governments to emigrate was obtained or not. The act of becoming naturalized, however, does not abrogate the claims of the government under which the person concerned had previously lived and which were operative at the time such person changed his allegiance, especially in the case of attempts to avoid compulsory service in the army of the native country, and the laws of the United States do not afford protection for aliens who simply become citizens of this country for the purpose of escaping such service. But a distinction is made between the obligations of military service that have accrued at the time of emigration and those which have not. In the latter case the government insists that the citizen cannot be held by his original state to a performance of the obligation.

The majority of treaties with other countries call for a continuous residence of five years before admission, the notable exception being Great Britain, with whom the treaty allows of interexchange of citizenship with no stated period of residence. Treaties of this nature were negotiated with the North German confederation, and also with Bavaria, in 1862, but the Bavarian treaty will not allow of natives, who have emigrated to other countries before serving the required time in the army, again becoming permanent residents until they are 32 years of age; but if a certificate of immigration be granted by the terms of this treaty, naturalization does away with the military obligation. Such treaties were also made in 1868 with Baden, Belgium, Bavaria, Hesse, Mexico, the North German confederation, and Württemberg; in 1869 with Sweden and Norway; in 1870 with Austria and Great Britain; and in 1872 with Denmark. At present all states except Russia and Turkey allow their citizens or subjects to expatriate themselves voluntarily and to adopt a new allegiance. The two latter states, however, refuse to recognize the legality of naturalization certificates granted to subjects by foreign governments without their consent

previously obtained. Other states attach certain conditions to the exercise of the right of expatriation. The laws of the United States, however, declare it to be an inalienable right of all peoples and the consent of the government is not required.

In the United States, Congress by the Constitution has exclusive power over the naturalization of citizens, and the power cannot be exercised by the individual States, but this does not prohibit the State from granting the rights and privileges of State citizenship, such as voting at State elections, holding offices, etc. See NATURALIZATION LAWS; CITIZENSHIP IN THE UNITED STATES; ALIENS; ALLEGIANCE; NATIONALITY.

**NATURALIZATION LAWS**, acts placing foreign-born persons in the same legal position as natural-born citizens. The conditions under and the manner in which an alien may be admitted to become a citizen of the United States are prescribed by the United States Revised Statutes.

**Declaration of Intentions.**—The alien must declare upon oath before a Circuit Court or a District Court of the United States or a District or Supreme Court of the Territories, or a court of record of any of the States having common-law jurisdiction and a seal and clerk, two years at least prior to his admission, that it is, *bona fide*, his intention to become a citizen of the United States, and to renounce forever all allegiance and fidelity to any foreign prince or state, and particularly to the one of which he may be at the time a citizen or subject.

**Oath on Application for Admission.**—He must at the time of his application to be admitted declare on oath, before some one of the courts above specified, "that he will support the Constitution of the United States, and that he absolutely and entirely renounces and abjures all allegiance and fidelity to every foreign prince, potentate, state or sovereignty, and particularly, by name, to the prince, potentate, state or sovereignty of which he was before a citizen or subject," which proceedings must be recorded by the clerk of the court.

**Conditions for Citizenship.**—If it shall appear to the satisfaction of the court to which the alien has applied that he has made a declaration to become a citizen two years before applying for final papers, and has resided continuously within the United States for at least five years, and within the State or Territory where such court is at the time held one year at least; and that during that time "he has behaved as a man of good moral character, attached to the principles of the Constitution of the United States, and well disposed to the good order and happiness of the same," he will be admitted to citizenship.

**Titles of Nobility.**—If the applicant has borne any hereditary title or order of nobility he must make an express renunciation of the same at the time of his application.

**Soldiers.**—Any alien of the age of 21 years and upward who has been in the armies of the United States, and has been honorably discharged therefrom, may become a citizen on his petition, without any previous declaration of intention, provided that he has resided in the United States at least one year previous to his application, and is of good moral character.

(It is judicially decided that residence of one year in a particular State is not requisite).

**Minors.**—Any alien under the age of 21 years who has resided in the United States three years next preceding his arriving at that age, and who has continued to reside therein to the time he may make application to be admitted a citizen thereof, may after he arrives at the age of 21 years, and after he has resided five years within the United States, including the three years of his minority, be admitted a citizen; but he must make a declaration on oath and prove to the satisfaction of the court that for two years next preceding it has been his *bona fide* intention to become a citizen.

**Children of Naturalized Citizens.**—The children of persons who have been duly naturalized, being under the age of 21 years at the time of the naturalization of their parents, shall, if dwelling in the United States, be considered as citizens thereof.

**Chinese.**—The naturalization of Chinamen is expressly prohibited by the Laws of 1882. Under the naturalization laws now in force, only "white" persons and persons of "African nativity and of African descent" are eligible to naturalization. Japanese, Burmese and Hawaiians have generally been held by the courts not to be included within either category and therefore not eligible. Indians are excluded under the general laws but they may and often have been naturalized by special acts or by treaty. They may also acquire citizenship by taking up public land and separating themselves from their tribes. Polygamists and anarchists are debarred from naturalization by recent acts of Congress.

**Protection Abroad to Naturalized Citizens.**—The Revised Statutes of the United States declare that "all naturalized citizens of the United States while in foreign countries are entitled to and shall receive from this Government the same protection of persons and property which is accorded to native-born citizens."

**The Right of Suffrage.**—The right to vote comes from the State, and is a State gift. Naturalization is a Federal right and is a gift of the Union, not of any one State. In nine States (Arkansas, Indiana, Kansas, Missouri, Nebraska, South Dakota, Texas, Oregon and Wisconsin) aliens who have declared their intention to become citizens are allowed to vote equally with naturalized or native-born citizens. By an act of Congress passed in 1906, 90 days must elapse before naturalization and the exercise of the right to vote. This law was designed to prevent the wholesale naturalization of foreigners in the large cities for the purpose of making voters of them for the forthcoming election. The Federal naturalization laws apply to the whole Union alike, and provide that no alien may be naturalized until after five years' residence except in the case of aliens who have served in the army and been honorably discharged, in which case one year's residence suffices. Even after five years' residence and due naturalization he is not entitled to vote unless the laws of the State confer the privilege upon him, and he may vote in several States six months after landing, if he has declared his intention, under United States law, to become a citizen.

**In Other Countries.**—In France a foreigner

who has obtained permission to become domiciled in France is entitled to letters of declaration of naturalization after three years' residence. Also, by the French Naturalization Act, 1889, a foreigner who has resided in France for 10 years may at once be naturalized without preliminary ceremony. In Germany naturalization can be conferred only by the higher administrative authorities; the applicant must show that he is at liberty, under the laws of his native country, to change his nationality, or, if he is a minor, that his father or guardian has given him the requisite permission, that he is leading a respectable life, that he is domiciled in Germany, and that he has the means of livelihood. In all countries a married woman is held to be a citizen of the state of which her husband is for the time being a subject, and the naturalization of a father carries with it that of his children in minority. In countries where military service is compulsory naturalization in fraud of this either is prohibited or renders the offender liable to imprisonment, if he returns, and forfeiture of all property subsequently acquired in his native country. In Great Britain five years' residence is necessary, except where the applicant is in the service of the Crown the certificate is granted by one of the secretaries of state. But the British government, unlike that of the United States, will not protect a naturalized subject within his state of origin unless he has ceased to be a citizen or subject thereof in pursuance of its laws or of a treaty stipulation. Thus a Russian or Turkish subject naturalized in Great Britain will not be accorded the protection of the British government upon return to his native state if the consent of his government to naturalization in a foreign country was not obtained. Certain privileges of British nationality may be acquired by the issue to an alien of letters of denization granted by the Crown; and for this no previous residence is required.

**Naturalization by Incorporation.**—Citizenship has often been conferred on large bodies of inhabitants by the annexation of territory as a result of cession or conquest. It was in this way that the inhabitants of Louisiana, Florida, Texas, Alaska and Hawaii became citizens of the United States. For other modes of acquiring citizenship, also modes by which citizenship may be lost. See CITIZENSHIP IN THE UNITED STATES. See also ALLEGIANCE; ALIENS; NATIONALITY.

**NATURE GODS.** See NATURE WORSHIP; MYTHOLOGY; AMERICAN MYTHOLOGY.

**NATURE PRINTING,** a modern process for obtaining impressions directly from objects themselves and printing therefrom. In one method the object which must have a tolerably flat surface such as a fern frond, is placed between a steel plate and one of heated lead and subjected to a strong pressure, forming an exact intaglio copy in the lead from which impressions are taken. The plate is too soft for practical purposes, but it is generally copied by electrotyping on a copper plate if it is to be used many times. The process was invented in 1849 by Alois Auer, director of the state

printing establishment of the Austrian Empire. In 1854 he published a detailed account of this method of printing.

**NATURE STUDY**, an educational means of training the mind of the pupil, by direct observation, to a knowledge and love of the common things about him. Nature study attempts to aid, in the most effective way, through the natural and inherent instincts of all children, the perfect development of the child nature, in accordance with the natural laws of that development. It aims at taking into account the various activities, interests, likes and dislikes of children, their love of activity, their desire to hear, to see and to handle things; to investigate all that they come into contact with and to ask questions about everything that interests them. Nature study accepts the fact that this almost constant activity is the one great law of the child's development, physically and mentally; and it acts upon it. It attempts to direct this activity into the most useful and interesting channels so as to secure for the child the greatest pleasure in doing, with the greatest benefit from the deed accomplished. It seeks to give him direct contact with things rather than to know them by descriptions of them. It makes prominent use of the fact that the human being is essentially an imitator and that the child, especially, is possessed of an irresistible desire or impulse to do what he sees his elders or his companions doing. All these are classed as nature motives; and nature study makes use of them to the exclusion of motives that are merely artificial. In other words, it works on the assumption that every normal child is born with an instinctive desire to investigate things and sensations, and through this investigation and the experience gained thereby, to get a knowledge of his environment.

A second quality as strongly a part of the child nature as his irresistible impulse to investigate is his strong social instinct. This enables him to identify himself with those about him and with all their various interests and to realize his relationship to them; and it creates in him a desire to conform to the social judgment of his associates, that is to public opinion. Nature study attempts to develop the life of the child along the lines of its proper relationship to nature; that is, to mankind and the world about him. Another prominently developed instinct of children is the desire to be useful and helpful. Nature study attempts also to make use of this and all other instincts and tendencies of the child so as thus to be able to lead him along the path of development that nature has destined for him and, in this way, infuse a real interest into his work through the inspiration of a desirable object to be attained. Nature study may, therefore, be said to be an element of practically every subject of study in which the child succeeds in becoming interested. The sawing of a board or piece of wood interests the young child, apart from the actual act of sawing. The nature of the wood; the motions of the person sawing; the teeth of the saw; the saw-dust; the severed pieces of wood; the picking up and carrying of the wood from one place to another; all these actions are naturally related to the child's life; and they are, hence, proper subjects of nature study, just as much as animals, trees and flowers and

their actions, colors, forms, sizes and relationships are.

Nature study recognizes the fact that child life and school life, to a very considerable degree, reflect the life of the community and exhibit the child growing naturally and rapidly into the more extensive life of that community. It attempts to so direct these natural child interests as to enlarge the childish vision and to prepare the child for the coming greater activities of adult life, through proper perception and correct thinking and reasoning. Its sphere is, therefore, the whole field of animate and inanimate life, in which the child gains his early self-education, largely by observation; for with him literally "seeing is believing"; and to this may be added tasting, touching and handling, which nature study helps him to do effectively, intelligently and with added pleasure.

**History.**—Nature study, as a name, is quite recent, but as an actual fact it is old in a part of its development at least. However, it remained for recent advocates of nature study to give it a permanent place upon the curriculum of the public schools, and later, the high schools and colleges. Socrates and Aristotle advocated and employed methods in teaching very much like those insisted upon by the modern teacher of nature study. But probably their methods were but echoes of a very general and widely extended custom of nature study. The American Indians, over practically the whole extent of the two continents, had systems of instruction fitted, in the case of each tribe or nation, to its own peculiar condition and racial requirements. But in every case this instruction was carried on very largely along the lines laid down by the modern advocate of nature study. In the case of the North American Indians, the young brave had practically all his instruction in the haunts of nature where he learned to know all about the wild animals of the forest, the birds, the fishes, the trees, the winds, the weather, the seasons and the manifestations thereof. In short, his life was as close as it possibly could be to nature. Even among the Aztecs, the Mayas and the more cultured races of Mexico, Central America and the west coast of South America, the system of instruction was essentially the same for the great mass of the people, who were kept very much nearer to nature's heart than they are to-day. So nature study is little more than getting back to the earlier methods of instruction which was still very much alive when the Great Teacher said: "Consider the lilies how they grow; they toil not, they spin not; and yet I say unto you, that Solomon in all his glory was not arrayed like one of these." At the beginning of the Christian era the philosophers of the Roman Empire were in the habit of teaching their pupils in the open; and traveling teachers frequently went about from place to place, at times accompanied by pupils who formed a following; and thus accompanied, they taught on the open market places, in front of the temple and other public places where the masses were accustomed to congregate. This custom was undoubtedly the survival of a very much earlier and more general custom in which nature teaching must have played a prominent part, if we are to judge from

survivals of this very ancient open air teaching in many southern countries to-day and of real nature study and teaching among such semi-barbaric and semi-civilized races as have developed systems of instruction fitted to their several needs.

The Renaissance brought forth teachers who strenuously advocated more natural methods in teaching, not only languages but all other subjects. Of these men the most prominent, the greatest and most far-seeing was Rousseau, some of whose more advanced ideas are but beginning to be realized to-day. Pestalozzi, Froebel and their followers and the modern kindergarten teachers have all been working closer and closer to the goal of nature study whose principles they have been following, consciously or unconsciously. The revolution in teaching was bound to come with the Renaissance; but it came very slowly. Men were too busy with the new learning to bother themselves about the methods of acquiring it. The thing itself was to them all important. But as the novelty wore off, teachers began to think about ways of teaching. Hundreds of methods were put upon the market, all echoes and echoes of one another, with here and there a glimmer of new light. But the light, though not very apparent, was really there, though hidden by many clouds of prejudice, custom, habit, misunderstanding and ignorance. The cry of men like Agassiz, Rousseau, Ollendorf, Pestalozzi, Froebel, Berlitz and the whole school of natural method teachers was to get nearer to nature, to have teaching of languages conform to the natural methods by which a child acquires his mother tongue. While these men were builders, they were necessarily anarchistic, to a very considerable degree. They were bent upon sweeping out of existence the old methods which had failed to accomplish what they were intended to accomplish. They were largely anarchistic in their methods also. Let us teach as the child teaches himself, they said. Let us gather facts and impressions from nature just as we come into contact with her, "any old way," provided we accomplish what we aim at. The result was that practically all these "natural methods" were anything but "natural." They followed no line of development or plan; because nature's methods presented themselves to these natural method teachers as evolutionary.

Just when these unscientific methods of teaching had begun to bring discredit upon their authors and more scientific teachers had begun to protest and to replace the somewhat discredited "nature method" designation with that of direct method, teachers of natural sciences in the public schools discovered that the term was still a good one for their purposes. "Let us get nearer to nature in our teaching," was their cry; and they shouted it as enthusiastically as though it had not been already worn threadbare. Science had just been introduced into the public schools and colleges of the country. The science teachers of the lower grades went through the same experiences as the language teachers in getting nearer to nature. The early teachers, in their protest against the too exact and dry methods of the regular science teachers, protested against any method whatever. If teachers would only get nearer to nature everything would be all right,

they preached, for nature, in her kindness, would take care of them. These educational anarchists were soon, however, replaced by men of larger vision, who saw the possibilities of nature teaching if it were only organized and made to follow scientific principles and taught according to properly worked out plans by means of contact with nature supplemented by well organized laboratories of natural objects. This, however, was not done without protests from the ultra wing of the nature study teachers, who talked about the restraints of the unnatural technical science teaching and pleaded for what they denominated the natural, untrammelled development of the child's faculties from the child's point of view. In this there was a small amount of truth and a large amount of misconception of the true functions of teaching. Their cry was a protest against the dry, formal teaching of the school room; and it served its purpose. It quickened the science teacher into action; and nature study methods entered many a science room, many a laboratory, greatly to the improvement of science teaching, and in fact, of teaching in almost every department of school and college life. Nature study was applied to literature, and literature to nature study. The pupil was taught to see the beauties and laws of nature at work in the truest of nature poems, and these poems were read, by nature teachers, as supplementary to their regular studies. This evolution shows two distinct phases, which have been indirectly indicated,—the tearing away from the old methods of teaching; and later on, the building of the new nature study structure scientifically upon the bases of the old.

**Modern Development.**—Nature study made its appearance as such in the latter quarter of the 19th century; and it was due, as has already been said, to the introduction of the teaching of science and vocational studies into the public schools. The common school teacher, finding it difficult to teach pupils science in the orthodox college manner, had recourse to the practice of using concrete examples and of making use of nature herself for the explanation of her moods and phases. This practice gradually grew until, in 1889, considerable attention became fixed upon it owing to the fight made by numerous teachers of elementary science in behalf of more interesting methods of presenting it to younger pupils. In this latter year W. S. Jackman planned a general course in nature study for the ward schools of Pittsburgh, which he was destined to carry out in Cook County Normal School, to which he went in the fall of the same year. Two years later his notes were published for the use of teachers and schools under the name of "Nature Studies for Common Schools." They were much along the lines laid down several years before by Sheldon in the State Normal School at Oswego, N. Y. This movement in 1889 was noticeable in various educational centres in the Eastern States, notably in Massachusetts. In the latter State A. C. Boyden took the lead and for 10 years lectured and gave model lessons in educational institutions all over the State on nature study. He succeeded in creating a great deal of interest in the subject and in establishing centres of nature study with committees or societies, which met frequently. His methods of using printed outlines and illustrating les-

sons was pretty generally followed; and it was not long before it was improved upon. A special committee on nature study, meeting monthly in Boston, helped to direct the work by arranging courses of study and doing other important services for the cause. These prepared courses were distributed all over the State, and they helped to greatly increase the interest in nature study and to extend its field of influence.

**Materials of Study and Organization.**—In the early stages of nature study there was little attempt at the scientific organization of the materials used in teaching. As we have seen, outlines of study were formed for the guidance of teachers in their work; but they were largely suggestive and had little of the scientific about them. But gradually, as the practice of nature spread, extending to the high schools and colleges, trained teachers of science applied their methods of organization to it; and nature study gradually took form and shape as a scientific study, in which the proper relationship between the pupil, the teacher and the materials and objects used in teaching were specified and defined. This called into being large and well-appointed nature study laboratories and took possession of vacant or available used pieces of land for experimental purposes in the growing and observation of plants of many kinds by the pupils under the direction of teachers. It made use of excursions into the woods, fishing, hunting and boating trips and camping out parties. Soon a corps of trained nature study teachers sprang into being; and these, in their turn, as a result of experience gained in their work, proceeded to further organize the subjects, activities and province of nature study. The laboratory teacher, from his inside experiments, helped the work of the nature study teacher doing his work on the outside. Now there is scarcely a summer camping school that does not have its nature study director. The pupils are encouraged to form laboratories or museums of their own made during their nature studies. The school laboratories for nature study contain mounted insects, birds, animals, preserved plants, parts of trees, shrubs, plants, in fact samples of everything pertaining to nature in which the child may be made to take a natural interest. These are supplemented by geological and other specimens, models of a large number of objects of different kinds, drawings, photos, pictures, paintings, plans, designs and castings. These are again supplemented, in the larger towns and cities, by visits to art and other museums, great libraries, factories and other industrial plants, zoological gardens, parks, agricultural farms, truck gardens, hot houses, and in fact any and all places of human activities in which the pupils might be interested.

These and numerous other means of direct contact with nature and human activities and their results in manufactured forms are correlated with art study. The pupils are taught to draw, paint or color, photograph, model and represent in various ways the objects with which they come into contact during their nature study classes. Many schools make a permanent exhibition of this work; and some of these exhibits show very encouraging results, with some really beautiful and talented

work. This correlated art work can, and often is made very extensive, including, for instance, the artistic arrangement of flowers, flower beds, borders, etc., the selecting of flowers and their arrangement in gardens so as to secure the blending of colors, observation of the habits of wild and domestic animals and the study of the lives of reptiles, fishes, and, in fact of all kinds of animal life. In other words, nature study is made to lead up directly to the scientific studies of the class-room. See KINDERGARTEN; FROEBEL; ROUSSEAU; PESTALOZZI.

*Birmingham Southern College.*

**NATURE WORSHIP.** The worship of the heavens, the planets, the elements, the manifestation of all forms of life, vegetable and animal, including the personified life attributed to inanimate objects. Nature worship, though probably everywhere occasioned by the natural impulse of man to fear the terrific manifestations of nature and to show great respect for the powerful and the mysterious, has taken many different by-paths in the development of the various human races and families. The early investigators into the phenomena of natural religions failed to recognize this diversity of development, and they proceeded to build universal theories on divergent growths. Hence all of their theories have either partially or completely fallen by the wayside, or have survived the test of time only as a diminutive part of the original whole. Yet the work of the early investigator has not been done in vain; for, inasmuch as he has thought deeply he has set others thinking. Concerning no part of the extensive field of mythology have more divergent theories been advanced than nature worship. By various writers the origin of worship has been traced to ancestor deification, to the fructification engendered by earth and sky, to the fear inspired in primitive man by the lightning, storms and winds, to the fearful ravages of mysterious all-powerful beings who brought diseases and death. Others claim that the first worship of man was given to powerful and cunning animals and especially to the serpent. Still other writers have maintained that man's first gods were his own ancestors; while others see him worshipping the glory and majesty of the sun and the mystic beauty and mysterious healing powers of the moon. Others have traced his first religious ideas to the rains and the mists and have placed his primitive gods on

the mountains amid the sources of the streams or in the clouds, the home of the rains.

To these early mythological investigators it never seemed to occur that man's early conceptions of this nature were not at all religious in the modern acceptation of the terms; that they grew out of fear and mysterious dread. This primitive religious conception continued one of the strong features of man's worship far down into the monotheistic age of religion. Metaphorically the Jehovah of the Hebrews was a god of mysterious might who rode upon the winds and planted his footsteps upon the storm. At the sound of the horns of the priests of Israel walled cities fell down, just as the forests of old fell before the whistles of the wind gods. The fervid poetry of the greatest of the Hebrew poets is fairly alive with images borrowed from the polytheistic nature worshippers who surrounded them or with whom the race came into contact during its periods of exile. In this Hebrew poetry every phase of nature seems alive, as it is in the Greek and Roman, Egyptian, Babylonian and Indian poetry. In primitive Hindu literature and in the poetic imagery of China and Japan nature appears as one great whole deified in different yet, in many respects, suggestively similar ways. Among the American Indians the deification of the more striking forms of nature is everywhere evident. These primitive ideas became conventionalized, elaborated, amalgamated with other ideas and they long continued to act upon and to be reacted upon by society. A primitive belief was that people were drowned because spirits hidden in the depths dragged them down. The wind was supposed to cry like a lost child. The combination of the two made the Llorona of Spanish lands in Europe and America, who, crying like a lost child, leads the unwary, after nightfall, into a pool or bog where she or her attendants catches him by the legs and drags him down to death. Many primitive nature myths and unions of myths have become much more complicated than the Llorona. In fact little in nature worship even among the most primitive races now existing is to be found in anything like its original form. Hence the analysis of nature myths is a very complex and difficult matter. Yet the general conception of how primitive man thought is not difficult to understand.

**Society and Nature Worship.**—Although apparently simple, all modern manifestations of worship, however primitive, are in reality very complex; for society and its beliefs have, for long ages, been continually acting and reacting upon one another. In the more primitive society existing to-day, the medicine-men are universally believed to possess spiritual or magical powers. They are generally the medium between the people and the powers of the material universe and of the future world. They thus bear, in a sense, a divine character which belongs to them through the natural logic of their official position. Here we see, in the early stage of its development, one of the powerful factors in the organization of primitive beliefs of the nature worshippers into organized and complicated mythology. The governing class, consisting of priests or medicine-men, chiefs and leading warriors, early learned to claim descent from their nature gods, about whom they began to invent and relate the stories which we now

call myths. The sun became the great ancestor of the Peruvian priests and nobility, of the Mixteca warrior class, as of the ruling body of other great races, the most noted of which was the Egyptian. Once this relationship had been attained the glorification of the sun became the glorification of the ruling powers and the consequent subjugation of the masses to them. Ritual, ceremony, a highly organized and disciplined priesthood and religious society followed; and of this the governing class soon became the head. Among the Toltecs in Mexico, Quetzalcoatl the wind god became the ruling deity and his superior priests, who were always chosen from the nobility, were believed to be his representatives upon earth and his lineal, blood descendants. The royal family and the nobles also represented themselves as god-born. Very frequently the king was also high priest of the nation and as such he was known as *the* Quetzalcoatl, or the chief of the gods. The principal races of Chiapas and Yucatan also believed themselves to be descended from the wind god, while the Mixtecas and several tribes of Guatemala called themselves "Children of the Sun." The latter wore upon their breasts and backs the yellow symbol of the sun. In Persia and Egypt the complicated court life centred on the belief of the classes and the masses in the divine origin of the priesthood and the nobility and their descent from Re, the sun god. Thus the relation of religious primitive belief to the rulers of the people developed a complicated religio-political condition that finally became very complex in its nature. Out of this condition grew the acknowledged relationship of the hierarchy of the gods. This was the birth of the great religious systems of Persia, Babylonia and Egypt, which continued to grow more complex until their ultimate decline and disappearance. This, too, is more or less the path followed by the great religions of antiquity, all of which bear plainly the marks of primitive nature worship. The development of a religious theocracy gave very specified functions to the most prominent of the deities. Thus Thoth, the Egyptian wind god, being the original messenger god, became the carrier of souls; and the moon goddess, Isis, the mother of medicine and the healing art. Thoth, as the bearer of moisture and rains and the generator of growth, became the culture god, the patron of learning and the judge of good and evil in men's lives. All these conventionalized ideas of Thoth and Isis are very far removed from primitive man's conception of the wind and the moon as factors in his life. The great changes that took place were due to the peculiar organization of Egyptian society and the antiquity of her civilization.

**Animism.**—Primitive man undoubtedly held beliefs that we can scarcely comprehend to-day. One of these has been termed animism, a designation that appears to mean different things to different investigators and writers using it. It has been variously defined as belief in souls, spirits and magic power.

All recent investigation tends to show that primitive man made practically no distinction as to animation or life, between himself and the active elements of nature around him. The sun, moon, stars, winds, clouds, thunder and lightning were beings like himself who had at

their command very superior magic power. The stories of all Indo-Europeans and the American Indians are filled with myths depicting the contests in magic that took place between their deities and nature heroes. The Indian stories especially present characters essentially human, so human indeed that they are frequently deceived and duped not only by man himself but also by the lower animals and even at times by inanimate things. These hero characters are neither divinities, nor souls, nor spirits in the modern acceptance of the terms. They are simply the wielders of magic power. Therefore, when certain writers on mythology talk glibly about the religious emotion in the presence of nature giving birth to animism, they are speaking about the past in terms of to-day, forgetful of two facts. The first of these is that even races as far advanced in civilization as the Indians of southeastern Canada and the United States seem to exhibit no appreciation of the beauties of nature, as nature itself. The second is, that religious emotion is the result of the teachings of organized religion, exercised consciously or unconsciously to stir up such feelings. Fear and terror of any object inspired respect in all ages of the past as they do to-day. Out of these primal elemental feelings combined with that of admiration, ancient religious beliefs and systems were built up slowly from primitive nature beliefs. The belief in souls and spirits, as things apart from the existence of humanity, came very much later in the religious development of humanity.

**Transmigration.**—Intimately connected with animation is the belief in transmigration. In fact the one presupposes the other; and both seem to belong to certain stages in the social development of all society. The wind was a most powerful agent of destruction, the mysterious beings hidden in the clouds shouted with their thunderous voices and shot forth their darts of fire. Other beings sent forth the rain from the heavens and the mountains. Yet they all remained invisible as did the spirits that moved the trees and the water; therefore, they must possess the power of rendering themselves invisible, reasoned the nature worshipper. The same mode of reasoning accounted for spirits in everything and endowed the personified elements, planets and phases of nature with the magical power of taking upon themselves other bodily forms at will. Out of this idea of transmigration grew the Hindu belief in reincarnation, which, in the case of Vishnu (q.v.), was carried to an almost unlimited number of bodily changes, each one bringing with it a new existence upon earth. Among many fairly civilized races there still exist in the masses at least a belief in spirits that inhabit trees, rocks, lakes, rivers, mountains, hills, clouds, caves and winds; and this belief teaches us how nature worship grew up and long continued to claim the unquestioned faith of humanity. The belief that human souls may be transmigrated into the bodies of animals, and vice versa, is still held by many races and peoples, and the ghost or disembodied spirit has but recently retreated from the stronghold of science; and so recent is its departure that a goodly body of so-called scientists are gravely experimenting with and seeking data as to its existence and habits.

Another development of animism and transmigration was the belief in guardian spirits

which seems to have been almost universal. Very early in his social development man is found attempting to subject to his will and his uses, by his magic, the various mysterious powers of nature. Dances, charms, incantations, amulets, magic potions and other primitive means were made use of to this end. Amulets, believed to be powerful, were carried about on the body for self-protection and the wearer made efforts to get some supernatural being to become his protector. Often this being was supposed to reside in the fetish he carried upon his person. These developed by a complex society became, in the course of time, household gods, probably through totems. Later society made patron saints to replace the grosser conceptions of heathenism. But all hail back to nature worship with its belief in transmigrating spirits, which has been father to ghosts, fairies, pigmies and a host of good and of evil-disposed supernatural beings.

**Taboo.**—Connected with these supernatural beings, which later became classed as gods, demigods, ghosts, or non-natural beings, were many taboos or restrictions on the actions of humanity with respect to these nature spirits. The taboo might be a restriction from doing a certain thing at a certain time or under a certain condition; or it might enjoin the performance of a certain act or ceremony under like conditions. The custom of observing taboos added, in the course of time, a species of veneration and of sacredness to the act and to the object of the taboo. Thus acts intended originally for the protection of the tribe, through continued repetition, grew to be part of the most sacred ceremonies. Thus the taboos of the nature worshipers seem to have played a very prominent part in the building up of their most revered religious rituals. The taboo was closely associated with the tribal totems and with tree and other worship.

Through long years of association with nature worship particular places, days, epochs, trees, streams and persons were looked upon as sacred and, as such, subject to taboo. The emperors of the Aztecs and the Peruvians, at the time of the discovery of America, were believed by their people to be so sacred as to be almost gods; and around them clustered as many ceremonial taboos as about the temples of their most revered deities. But in each case these taboos reacted upon the ruler himself, placing many restrictions upon his actions in public and in private. Moctezuma II might not place his foot upon the bare earth lest his divine character be thus soiled. So he was carried about in a palanquin by official royal bearers, while other attendants spread before him a gorgeous carpet to protect his imperial feet from contamination when he left the palanquin. He might wear a suit of clothes but once, and if state or other reasons required a change of apparel a dozen times a day, it also demanded a completely new outfit. But while to wear a suit of clothes twice would defile the emperor, the representative of the gods, it was likely to bring special heavenly blessings to anyone of noble birth wearing it. So Moctezuma's cast-off clothing was eagerly sought and proudly worn by the highest nobility in the empire. In Peru it was taboo to make the vessels of the temple of the sun in the capital of any other material than gold whose shining color represented the

radiant face of the deity; while all the furnishings of the moon goddess were required to be of silver. This latter example well illustrates the extreme growth of naturalistic ideas from commonplace, natural associations to taboo of the most rigid sacred character. About these nature taboos grew up many legends to account for them or to explain them. The Peruvians asserted that gold was formed from the tears of the sun god; the Mixtecas declared that it was the sacred excrement from his shining body. The Colombian Indians in the neighborhood of Bogotá inaugurated their new emperor into office by painting his naked body completely with gold dust, thus symbolizing that he was the direct representative of the sun, the great racial father upon earth. Such complicated ceremonies with their rigid, uncompromising taboos, imply a long-developed civilization or culture built upon nature worship.

**The Nature Gods.**—Nature worship, which, as has already been said, had its origin in the fear of the destructive forces of nature and a desire to placate them, or in respect for virile qualities in the same, grew in time, as man became more civil in his habits, to be a very complicated institution. Under the Aztecs, Mayas, Quiches, Zapotecas, Mixtecas, Pueblo Indians and Peruvians in America and among the great civilized nations of Europe, northern Africa and southern and western Asia, in the pre-Christian era, nature worship had become organized, in each case, into a most complicated religio-philosophical system which defined the attributes and sphere of action of each of the deities and explained his relationship to the gods as a whole, to the state, to the priesthood, to the nobility and to the masses. This called for an extensive classification and cataloguing of the nature deities. This had already taken place in the religious systems of all the great civilized nations in pre-Christian days. Naturally, under such a system, where almost every phase of animate nature was represented by its special deity, the list of the gods became very great. Yet they all came under a few primary divisions. The upper religions were occupied by the sun, moon and other planets, by the dawn and the darkness, the clouds, the thunder and the lightning, the winds of the four quarters of the heavens and their accompanying night spirits or wind spirits. In most nature religions these regions were divided into the upper heavens, inhabited by the sun, moon, planets and gods of dawn and darkness; and the lower heavens, the home of the clouds, winds, rain gods and other deities of the elements. The earth was the home of the deities of growth and fertility and the general habitat of the household penates and guardian spirits; while the regions within the earth or beyond the borders of the natural world, that is out on the great elemental ocean which, in most mythologies, surrounded the earth, were the regions of death and decay. Within the earth, too, quite frequently were the regions of birth. These ideas and divisions sprang naturally out of nature worship. At death all things go back into the earth; at birth all the vegetable kingdom evidently comes out of it. This was one of the patent facts that first appealed to the imagination of myth-making primitive man. There was a tendency to

divide the deities of these divine regions into beneficent and malevolent beings. Thus arose the idea of the warring of the nature gods.

**The Functions of the Gods.**—Nature worship, originating independently, as it undoubtedly did, in different quarters of the world, naturally developed along different lines among people racially and linguistically different. But as the origin of the pantheistic conceptions that distinguished it were essentially the same, there is a striking similarity in the functions and attributes of the nature gods everywhere. The earth, which gives birth to all things, is the universal mother; the sky, which sends the fructifying rains, is the husband of the earth and the great nature father. The sun, with his vivifying rays is the father of growth. The winds, with their ceaseless movements and their great speed, become the messengers of the gods, the bringers of culture and the purifiers or healers. But there are beneficent winds and harmful winds, gentle winds and destructive winds. Those working in the interest of man are represented as in a constant struggle with those seeking to harm him. This feature of nature worship is strongly evident in many myths. In the Mexican mythology Quetzalcoatl, the beneficent east wind is represented as the culture hero struggling with Tetzcatlipoca, the black spirit of the night, or the night wind. Hiawatha fought and defeated the Great Pearl Feather, the wind that broods over the pestilential marshes; and he fought his own father Mudjikerwis, the west wind and the father of all the winds of heaven, who finally shares his kingdom with him, making him the Keewatin, the northwest wind, the home wind.

**The Serpent in Nature Worship.**—Everywhere the serpent drags its tortuous length through the habitat of the nature gods. Many explanations of its presence there have been presented by students of mythology, but most of these explanations have been unfortunately fanciful or manufactured to fit preconceived theories. The serpent is inseparably associated with the wind gods. Sometimes, he is a kindly deity; at others he is the spirit of malevolence. This is a natural development of nature and in no way demands a supernatural explanation since it fits in with the nature of the winds. Quetzalcoatl (q.v.), the great culture hero of Mexico, Yucatan and Guatemala, was represented as a plumed serpent, and the serpent formed the most conspicuous decoration of his temples. Yet others of the Mexican wind gods also bore the sign of the serpent. The robe of the mother of the gods was represented as consisting of interwoven snakes. The serpent was frequently intimately connected with the deities of fruition and birth, probably because the wind gods were also thus connected. But the destroying force was also represented as a winged serpent in many parts of the world. This is but another form of the evil wind. This latter conception gave birth to the dragons of destruction bearing with them fire or lightning as their destroying agents. From this conception to that of the evil one, the old serpent, the personified force of evil as found in the Persian and other related religions, is but a step. Christianity and the Hebrew faith borrowing the imagery of the nature religions have made it vividly familiar to us.

In Roman and Greek mythologies, the gods of healing are associated with the serpent and not the least of these is Apollo. This association of the serpent with the gods of birth and healing explains their relationship to public worship which has produced so much discussion and investigation and has given birth to the so-called theory of serpent worship. With the Chinese, as with the Toltecs, the wind god (in the case of the Chinese in the shape of a dragon) became a sort of world divinity, the great wisdom, the universal benefactor. As the fructifying rain bringer, the serpent represented kindly forces; as the rain preventer his tendencies were evil.

**The Cross in Mythology.**—Throughout all primitive America and in many of the mythologies of the eastern hemisphere the world was divided into four quarters over which ruled one of the winds, all of which were frequently represented as so many serpents or dragons. Quetzalcoatl, the Toltec culture god, sailed away to the unknown land on a raft of snakes, or in a boat moved by supernatural serpents, which were at once symbolical of his origin as a wind god and his office as the greatest culture hero of the American races and the symbol of divine wisdom and earthly progress. Being the symbol of fertility, the serpent naturally became that of the so-called pallic worship which was also symbolized by the cross, as the representative of the four quarters of the earth in which lived the winds and the rain gods. In pre-Columbian times the cross was the symbolical representation of the activity of the winds as the bearers of fertility throughout Mexico, most of Central America and the Pueblo and some other Indians of the United States. In the form of the swastika (the four-footed cross with the ends bent, generally at right angles), the cross became the symbol of good fortune and (among the American Indians) of generation. The Cretan mother goddess, the great deity of fertility, is represented, in her surviving statues, with snakes coiled about her waist and arms; and she was worshipped in the temple of the sacred cross. Throughout Crete, where her worship seems to have had a very important place, the cross was looked upon as a sacred symbol. Like the rain gods of Mexico and Central America, the mother god of Crete was worshiped on the tops of the hills and the high places from whence descended the fructifying waters. Like the tlalocks and other gods of the rain cross she was connected with death and life, more especially the latter. In the course of time the cross, especially in America, came to form a very important part of the decoration of temples and sacred places in pre-Columbian days. The trail of the cross, like the trail of the serpent, runs across Mexico and Central America and a very considerable part of the United States.

**Fire.**—Along with sunshine, rain, air in motion and regeneration, fire early became for man one of the sacred elements. To him it symbolized (among many races) the sun, the great generator and the source of all heat. By the use of fire it was possible for him to greatly enlarge his range of diet, to fell the huge forest trees and shape his canoes from them.

It enabled him to shatter great masses of rock and to shape them roughly to his ends.

Later on it enabled him to smelt metals and to attach them to his car of progress. As it was hurled from the cloud it became symbolical of the power that hurled it. As it was vomited forth from the volcanoes, it came to signify the titanic forces of the underworld and became inseparably connected with punishment for offenses connected with the infernal regions, in various mythologies. From these primitive beliefs later religious systems borrowed much of their systematized ideas of the nature of future punishment.

**The Future Life.**—As the beneficent beings who brought their favors to the earth occupied the upper air; and as there, too, is the home of the sun, the moon and the planets which were supposed to strongly influence human life for good or evil, very many races looked upon these regions as the home of their future life. Some beliefs held that the souls of the dead went to the sun, others to the moon, still others to the great cloud land, a mid-region between the earth and the home of the superior deities. Some races placed the future world in the far north or northwest, in the region of the northern lights, whose brilliancy probably suggested the idea. Among many Indian tribes the rainbow was believed to be the bridge that spanned the great gulf separating the earth ocean and the sky ocean. Numerous other American tribes believed that the dead went to some great underground region. But all the nature religions presented the future life as essentially the same as that upon earth though surrounded by happier, because more fortunate conditions. Communication was not only possible between the earth and the future world but the rainbow bridge had been climbed or the great gulf had been frequently crossed in the magic stone canoe by the mortal heroes of nearly every United States Indian tribe. Some legends depict the tribal hero as scaling the heights of heaven on the back of a great bird, or in the wicker-car of the star or sun-maidens or in numerous other manners; for to the nature worshiper the universe was one great whole, the parts of which were not essentially different from one another.

**Theories of Nature Worship.**—At the head of the early naturalistic school is Max Müller. He maintains, with the disciples of his school, that the worship of nature was the primary religious efforts of man; and he attempts to prove his position by means of comparative mythology. His theory, which applied only to the Indo-European races, was carried to an absurd limit by many of his school. E. B. Tylor looks upon the worship of the dead as the earliest of human cults and Herbert Spencer takes the same ground. The latter derives from this source all other forms of worship. Tylor traces the history of the so-called animistic faith, while Spencer displays its evolution. Wundt maintains that religion finds its origin in the primitive belief in human souls and in an early animism out of which a belief in magic and fetishism grew. Dunkheim believes that the totemic principle, or belief in mysterious power (the mana or magic power) is the source of all religion. All of these investigators have hit upon certain important truths, but no one of them has been able to grasp the significance of the wide field of mythology, for they all have made cate-

gorical statements upon which they have built up elaborate theories.

JOHN HUBERT CORNYN,  
*Birmingham Southern College.*

**NAUCRATIS**, nā'krā-tis, Egypt, an ancient Greek colony, the remains of which are near Nebireh, 50 miles by rail southeast of Alexandria. It existed as early as the beginning of the 7th century B.C., and was approached by a navigable canal in the western part of the Delta, near the Canopic branch of the Nile. Its chief period of splendor was during the reign of Amasis II, 570-520 B.C., under whom it was recognized as the official capital of the Greeks in Egypt. Its site was rediscovered in 1884 by Prof. Flinders Petrie. Subsequent excavations have uncovered the remains of buildings described by Herodotus, the Hellenium, temples to Apollo, Aphrodite, the Dioscuri, etc., and there have been valuable finds of early Greek pottery and other archaeological treasures. Consult Petrie, W. M. F., 'Naucratis' (1886); Gardner, E. A., 'Naukratis II' (in Egyptian Exploration Fund, *Publications*, Vols. III, VI, London 1886-88); Hogarth, in British School at Athens, *Annual* (ib. 1898-99); id., 'Naukratis, 1903' (in *Journal of Hellenic Studies*, Vol. XXV, ib. 1905).

**NAUCYDES**, nā-si'dēz, Greek sculptor. He flourished in the first quarter of the 4th century B.C. His birthplace was Argos and he was the pupil of the Elder Polycletus of the Peloponnesian school of sculpture. He carved a chryselephantine statue of Hebe for the temple of Hecate at Argos; a bronze statue of Hecate; a Hermes; several statues of Victory; a portrait of the poetess Erinna; 'Phryxus Sacrificing the Ram' (for the acropolis at Athens), and a Discobolus. The younger Polycletus was his pupil.

**NAUGATUCK**, Conn., town and borough in New Haven County, on the Naugatuck River, and on a division of the New York, New Haven and Hartford Railroad, about 40 miles south by west of Hartford and 25 miles north-west of New Haven. In 1844 it was incorpo-

rated as a town and as a borough in 1893. The chief manufactures are rubber goods, paper boxes, knit goods and machine-shop products. It has considerable trade in farm products. It has the largest plant for reclaiming old rubber in the world, also a very large factory for the production of heavy acids used in the brass and rubber industries, and a large chemical plant for the production of chemicals formerly imported. It is well supplied with schools; it has besides the public and parish elementary schools, the Whittemore High School, the Salem School, Saint Francis Academy (R. C.) and the Whittemore Memorial Library. The government is vested in a board of wardens and burgesses, who hold office one year, and who appoint all the administrative officials except the board of education, the members of which are chosen by popular vote. Pop. 15,000.

**NAUGATUCK**, nā'gā-tūk, a river in Connecticut, has its rise in the northern part of Litchfield County and flows south, about 60 miles, and enters Housatonic River at Derby. It flows through a mountainous part of the State and supplies water power to many mills and factories. Waterbury is the chief city on its banks.

**NAUHEIM**, nou'hīm, Germany, town near Frankfort-on-the-Main, in province of Oberhessen, on the Usa, at the northeast foot of the Taunus, and on the Cassel-Frankfort State Railway. It is world renowned for its saline baths, where the visitors are afforded a magnificent Kurhaus, Inhalatorium, extensive park elaborately laid out, etc. Here are three Evangelical, a Catholic and an Anglican church, synagogues, a high school, etc. The medicinal waters are rich in iron, table-salt and carbonic acid, and are, therefore, available for drinking as well as bathing, and for export, and are used in cases of rheumatism, disease of the spinal marrow, gout, obesity and feminine troubles, and especially for diseases of the heart. Before the World War this was one of the most popular bath resorts in Europe, attracting as many as 34,000 patients per annum. Pop. 5,694.

**NAULETTE**, nō-lēt', a large cavern in Belgium, near Dinant on the Lesse in the commune of Furfooz. Here, in 1866, was found the lower jaw of a human, together with the bones of the elephant and rhinoceros. The human remains were assigned to the Mousterian epoch.

**NAUMACHIA**, nā-mā'kī-ā, or **NAUMACHY** (from the Greek *naus*, a ship, and *machē*, a fight), among the Romans a public spectacle, representing a naval action. Cæsar was the first who exhibited a spectacle of this sort, which soon became the favorite amusement of the Roman people. Buildings were erected by the emperors, specially adapted for the purpose. They resembled the amphitheatres, and like them were at first built of wood. Domitian erected one of stone. A *naumachia*, built by Augustus, was 1,800 feet long and 200 wide, and was capable of containing 50 ships with three banks of oars, besides many small vessels. They were suddenly laid under water by means of subterranean canals, so that the ships were raised at once from the dry floor before the eyes of the spectators. These sea-

fighths were exhibited with the same splendor and reckless disregard of human life which characterized the gladiatorial combats. Titus exhibited a sea-fight in which 3,000 men were engaged and ships almost equal in number to two real fleets were shown in combat by Domitian. The crews generally consisted of gladiators, prisoners or condemned criminals.

**NAUMANN**, now'män, **Johann Friedrich**, German ornithologist: b. Ziebigk, Germany, 14 Feb. 1780; d. there, 15 Aug. 1857. He studied with his father, who was an ornithologist, and became professor and inspector at the Ornithological Museum of the Duke of Anhalt-Köthen. His most valuable contribution to the science of ornithology is the 'Naturgeschichte der Vögel Deutschlands' ('Natural History of the Birds of Germany'), published in 1822-24; he prepared the illustrations for this work, making the plates for more than 500 copper engravings. He also wrote 'Taxidermie' (1815); 'Über den Haushalt der nördlichen Seevögel Europas' (1824); and, with Buhle, 'Die Eier der Vögel Deutschlands und der benachbarten Länder' (1819-28). A statue of him was erected at Köthen in 1880, and the German Ornithological Society named its official organ in his honor, *Naumannia*.

**NAUMANN**, **Johann Gottlieb**, German composer: b. Blasewitz, near Dresden, 17 April 1741; d. Dresden, 23 Oct. 1801. Thanks to the interest of a rich Swedish amateur, Weeström, he was taken to Italy when 16, and there studied under Tartini. He became court composer at Dresden in 1765, and kapellmeister in 1774, a post to which he returned in 1786, after six years in Stockholm, where he organized the royal orchestra. His music, including operas, oratorios and symphonies, was essentially Italian in style and is no longer popular. Consult the biography by Nestler (1901).

**NAUMANN**, **Karl Friedrich**, son of J. G. Naumann (q.v.), German mineralogist: b. Dresden, 30 May 1797; d. there, 26 Nov. 1873. He was educated at Freiburg, Jena and Leipzig, and in 1821 made a scientific tour in Norway. He was an instructor in the University of Jena in 1823 and professor at Leipzig in 1826. From 1826 to 1842 he was professor of crystallography at Freiburg, and from 1842 till shortly before his death held a professorship at Leipzig. Among his works are 'Anfangsgründe der Krystallographie' (2d ed., 1854); 'Elemente der Mineralogie' (12th ed., 1885).

**NAUMANNITE**, in *mineralogy*, is the name given to a native selenide of silver and lead found in the Harz Mountains and so called from K. F. Naumann (q.v.). This mineral contains about 26 per cent of selenium, 65 per cent of silver and 6 per cent of lead; in some samples a great part of the silver is replaced by lead. Specific gravity about 8.0. Color and streak iron-black.

**NAUMBURG**, nowm'hoorg, or **NAUMBURG-ON-THE-SAALE**, zä'lē, Germany, a town of the Prussian province of Saxony, on the Saale, near the junction of the Unstrut, 28 miles southwest of Halle. Its chief edifice is the restored cathedral, which has four lofty towers, one the gift of William II, erected in 1894. The town has some manufactures and a

considerable wine trade. Glass and porcelain painting is also an extensive industry. It became an episcopal see in 1029. In the 15th and 16th centuries several treaties were concluded at Naumburg, and the town was of great strategical importance during the Thirty Years' War and the wars of 1806 and 1813. Pop. 26,962.

**NAUPLIA**, nā'pli-ā, Greece, a fortified seaport town, capital of the monarchy of Argolis, at the north extremity of the Gulf of Argos, 25 miles by rail south of Corinth. It was occupied by the Venetians in the 13th century and was taken by the Turks in 1540. From 1824 to 1835 it was the capital of Greece, but declined in importance after the removal of the court to Athens. It is of some importance commercially because of its fine harbors. Pop. about 15,000.

**NAUPLIUS**, nā'pli-ūs, in Greek mythology, the son of Neptune and father of Palamedes. He is said to have revenged the death of his son by deceiving the Greeks by false beacons, as they returned from Troy, and causing their vessels to be wrecked.

**NAUPLIUS**. See **LARVA**.

**NAUSEA** (Latin from Greek *ναυαία*, sea-sickness), a sensation of sickness and distress, of which the leading characteristic is squeamishness of the stomach. The disturbance, however, extends to the entire system. In severe cases languor affects every part; the pulse is small; the skin moist and pale; the flow of saliva increases, and if vomiting does not immediately accompany the sensation the apprehension of it is painfully present. The causes of nausea are many: blows upon sensitive parts, mental shocks, hysteria, pregnancy, irritation or tumors of the abdominal or the pelvic viscera may produce it, as may also the early stage of zymotic disease or epilepsy, diseases of the brain, etc. See **VOMITING**.

**NAUSHON**, nā-shōn', the largest of the Elizabeth Islands (q.v.), off the southeast coast of Massachusetts.

**NAUTCH**, nāch, in India, a dance performed by the dancing girls attached to the temples, called Nautch girls or Nautchee, who are brought up and trained to all the arts and allurements of their profession. It is probably a survival of the ancient custom of sacred prostitution. They move with slow, undulatory movements of the body, while the feet are but little used. They correspond to the bayaderes (q.v.) of the south of India.

**NAUTICAL SURVEYING**. See **HYDROGRAPHY**; **SURVEYING**.

**NAUTICAL TRAINING SCHOOLS**. Schools for training young men in the science of navigation, in the study of marine engineering in all its various branches, in practical seamanship—in all the necessary matters pertaining to the operation of vessels at sea, have long been established both in the United States and in foreign countries. These nautical schools have for their definite object the training of young men who desire to follow the sea as a profession, to enable them to become officers in the Merchant Service and to provide highly trained, efficient officers for the auxiliaries and reserve of the naval forces. Euro-

pean countries, especially England, France and Belgium, have for many years conducted successfully such institutions. In the last few years Japan, Brazil and the Argentine republic have also developed institutions for this purpose.

In the United States, although there have been but three practical nautical schools for this purpose, viz., the New York State Nautical School, the Massachusetts Nautical School and the Pennsylvania Nautical School, they were all of very high order. The schools were maintained on sea-going vessels, usually all sail-rigged with auxiliary power. The course embraced two years and included cruising to foreign waters. During the winter time, when the school-ships were moored at the wharves, theoretical instructions were given and the routine was somewhat similar to a school ashore, but during the summer months practical training under actual conditions prevailing at sea was given and every operation of the ship was combined with intensive study for the purpose of enabling the cadets to obtain proficiency.

Upon graduation from either the New York State Nautical School or the Massachusetts Nautical School (the Pennsylvania Nautical School having been discontinued some few years back) the cadet is entitled to apply for a third officer's or third assistant engineer's certificate. After three months' service at sea he can obtain a second officer's license; after another year's service as second officer on deck he can get his license as first officer, and a year thereafter he can qualify for his master's license.

The coming development of the American Merchant Marine will necessitate an expansion of the nautical school idea in order to enable it to meet the demand for trained personnel. During the war emergency dire necessity caused the Shipping Board to inaugurate emergency schools for the hasty training of officers and engineers, which at the time served to meet the paralyzing deficiency then existent. The Shipping Board schools provided for three months' study, and could in no way be compared to the thoroughness of the education provided by such institutions as, for instance, the New York State Nautical School, which latter has been in existence since 1876.

The success of the New York State Nautical School, as well as the Massachusetts Nautical School, as reflected by services rendered by their graduates in all branches of the Merchant and Naval Service during the World War has impelled, among others, the States of Oregon, California and Maine to establish similar schools to be maintained by the various States.

The Federal government contributes toward the maintenance of the schools by an appropriation granted to reimburse the State in part for the expense of maintaining the school and by loaning suitable vessels, and also, when possible, designating naval officers as instructors. It is hoped that within a short time the Federal government will take a larger interest in this very vital question.

The opportunities thus presented to young men between the ages of 16 and 20, who enter these institutions, who can obtain their licenses as third officers at the age of 19 and who in time of war obtain commissions in the Naval Reserve Force when they reach the age of 21,

are unlimited; numbers of young men have risen to command of ocean-going ships within a period of eight years.

LOUIS WEICKUM,

Secretary, New York State Nautical School.

**NAUTILUS**, a marine cephalopod of the genus *Nautilus* and family *Nautilidae*, a few living species of which are the only survivors of the order or superorder *Tetrabranchiata*, which including both the nautiloid forms and the ammonites (q.v.) is divided into no less than 22 extinct families, so abundant were they in past ages. The nautiloids began in the Cambrian, became greatly differentiated and abundant in the Silurian and Carboniferous, and by the close of the Palæozoic Age had become almost entirely extinct. The more complex ammonites, on the other hand, reached their full development only during the Mesozoic Age. The shell of the pearly or chambered nautilus, described below, is typical of the armature of the group. It is at first simple, but as the animal grows becomes coiled in a flat spiral and divided by internal transverse septa into a succession of chambers, the last one of which is occupied by the animal. This process is continued until about 36 chambers have been formed, all but the last filled with gas which gives a certain buoyancy, but does not enable the animal to come to the surface. Externally the shell is porcellaneous; internally is a layer of mother-of-pearl. The septa are perforated by an opening, through which a membranous tube or siphuncle passes from the posterior end of the animal to the apical or first chamber of the spire. Among other anatomical peculiarities the animal has four gills and four kidneys, calcareous instead of horny beaks, a funnel composed of two lobes instead of one tube, small stalked imperfect eyes and no ink bag. Quite unique are the tentacles, which number about 90. On each side of the head are a hood tentacle, two ocular tentacles and 17 brachial tentacles, and around the mouth four groups of 12 or 13 labial tentacles.

The best-known species is *Nautilus pompilius* which, with two others, inhabit the Indian Ocean and tropical parts of the south Pacific. They live exclusively on or near the bottom in relatively deep waters, are gregarious, more or less migratory and nocturnal. Although fond of any animal matter, they feed chiefly on prawns. In swimming they dart quickly backward for short distances, with the tentacles either radiating or held together and stiffly projecting from the mouth of the shell; but they are inactive and rest most of the time on the bottom. Little is known of their breeding, which is supposed to take place in deep holes. The eggs are very large; including the capsule they measure nearly one and a half by three-fourth inches. They are attached singly by the base, and the capsule is irregularly folded and fenestrated longitudinally in a most peculiar manner. This species is very abundant in about 60 fathoms of water in the Philippines, and large numbers are captured by the fishermen in bamboo fish traps or baskets constructed on the principle of the lobster pots in use on the New England coast and baited with any kind of animal offal. The shells are somewhat used in the arts, but the flesh is little esteemed for food, as is that of the native species by the

Fiji Islanders. Consult Willey, 'Zoological Results' (Part VI, Cambridge 1902), and Lacaze-Duthier, 'Arch. Zoologie Experimentale' (1892).

The "paper nautilus" is a very different animal, for which see ARGONAUT.

**NAUTILUS**, in hydraulic engineering, a diving-bell (q.v.) requiring no suspension. Water admitted through the cock into pipes flows into the exterior chambers, causing the apparatus to sink. The workmen enter through an aperture at the top, closed by an air-tight cover, and can in still water move the machine in any required direction by stepping on the ground and pushing. Air is condensed in a reservoir at the surface to a degree somewhat greater than the condensation due to the depth, and passes through a pipe into the chambers rendering the machine specifically lighter than water and enabling it to lift stones or other objects below. A gauge indicates the amount of lifting power attained as the air is admitted.

**NAUVOO**, na-voo', Ill., city in Hancock County, on the Mississippi River, about 30 miles below Burlington, Iowa. It is situated in an agricultural and fruit-growing region in which grapes and berries are the chief products. The principal industries are connected with the manufacturing of wine and the shipping of wine and fruits. It is the seat of Saint Mary's Academy (R. C.). Nauvoo was founded by the Mormons (q.v.) in 1840, and in 1846 it had a population of 15,000. It had mills, factories, stores, schools, etc. Its most conspicuous building was a temple built of white limestone, 130 feet long and 90 feet wide. The temple was not completed when the Mormons were expelled in 1846; in 1848 it was partially destroyed by fire, and in 1850 it was further ruined by a tornado. A company of French Socialists, called Icarians, took possession of Nauvoo in 1850 and remained until 1857. The "Nauvoo Legion," a Mormon military organization, which embraced all the boys and men between the ages of 16 and 50, was founded here in 1840, and in 1857 was reorganized in Utah. At the last muster, in 1870, it had a membership of 13,000. Pop. 1,020.

**NAVA**, nã'nã, a seaport of Japan. See NAFA.

**NAVAJO** (nãv'ã-hõ) **CHURCH**. This name is given to a remarkable spire of white sandstone rising from the top of the red cliffs just west of the continental divide a short distance east of Gallup, N. Mex. It is visible for several miles from Santa Fé Railroad near Wingate station.

**NAVAJO INDIANS**. An important tribe of the Athapascan stock of Indians, now on a reservation of about 9,503,763 acres in north-eastern Arizona, northwestern New Mexico and southeastern Utah, at an average elevation of 6,000 feet above sea-level. According to Fray Alonso Benavides (1630), the word "Navajo" means "sementeras grandes," "great planted fields," and the name was never applied to the Navajo by themselves, their own tribal designation being "Dine." There is no evidence that the Navajos were seen by the Spanish explorers of the Southwest in the 16th century, although the latter passed through their present territory in 1540, 1583 and 1598; it is therefore

believed that at this early period they were an insignificant agricultural tribe, but gradually increased in population largely through the adoption of natives of both allied and other stocks during succeeding years. Their territory is entirely within the arid region and their lands are chiefly desert; but in the cañons and about the bases of the mesas that abound in their territory, horticulture is practised through deep planting in the sandy soil, while in the valley of the Rio San Juan, which is the largest stream in their country, farming is carried on to a greater extent. Agriculture, however, forms but a meagre part of the Navajo's subsistence, his livelihood being gained principally from the flocks and herds, of which, in 1902, there were 380,000 sheep and 67,000 goats, the former of which, besides furnishing the chief food supply, netted \$150,000 in wool and blankets. These blankets, which have become celebrated, are woven by the women on simple looms and in pleasing and sometimes intricate designs of various colors. Formerly native dyes of rare delicacy of tone were employed, but in recent years these have given way to glaring aniline colors, and the decorative patterns have also been largely modified to meet the demands of the white man, so that as specimens of aboriginal handiwork very few of the Navajo blankets now woven are comparable with those formerly made. The Navajos also weave belts, garters and saddle-girths, and make a few excellent baskets, mostly for ceremonial use. Some of the men are expert silversmiths.

Although more closely related in language to the Apaches than to any other tribe, the Navajos are greatly mixed, embodying elements of Pueblo, Shoshonean, Yuman and even of Spanish blood; hence there is perhaps a greater variety in their physical features than among most Indian tribes.

The typical Navajo dwelling is a conical framework of logs or sticks covered with brush, bark or grass, and earth, with a smoke-hole at the apex and a doorway in one side. Rude shelters with open fronts are erected for use in summer. If a person dies in a house the latter is believed to become haunted and is hence forth tabooed.

Dr. Washington Matthews, United States army, who has studied the inner life of the tribe, discovered the existence of 51 clans, grouped into about a dozen phratries, which latter, however, are probably not homogeneous organizations as among some Indians. A Navajo belongs to the clan of his mother, and a man may not marry a woman belonging to his own clan; or, as a rule, one of his own phratry. The religion of the Navajo is elaborate and complicated. They have a great many ceremonies, most of which are performed for healing the sick, but others are conducted to ensure success in planting, harvesting, building, war, nobility, marriage, travel and for bringing rain. Sacrifice, elaborate dry paintings with sand and pigments, masquerade, dancing, prayer and song are the elements of the ceremonies, the gods being personated by the masked performers.

Almost from the beginning of the 17th century the Navajos were enemies of the sedentary tribes and of the Spanish colonists, and although they were never so predatory and warlike as their Apache cousins, the Spanish villages and

Pueblo settlements suffered almost continuously from their raids up to the time of the conquest of New Mexico by American forces in 1846, followed by the establishment of military posts throughout the Southwest. Treaties were made with the tribe in 1846, 1848 and 1849, but they were of no avail in keeping in check their depredations, which continued at intervals until 1858, expeditions meanwhile being led against them. In the year last named the Navajos killed a negro servant at Fort Defiance, as a direct result of which it became necessary to wage warfare against the Indians from August until December, during which 50 Navajos were killed and a large number of sheep and other stock lost. Another treaty was signed, but during 1860 the depredations continued, and another expedition was led against them, but without success. In April the natives boldly attacked Fort Defiance, but were repulsed. In the winter of 1860-61 an active campaign was made against them, and although practically their only loss was in sheep, they were compelled to sue for peace in February 1861, when an armistice of a year was agreed to, during which the troops were withdrawn. In a dispute over a horserace at Fort Fauntleroy (near the present Fort Wingate), New Mexico, a dozen Navajos were brutally killed. Emboldened by the withdrawal of the troops on account of the Civil War, the Indians resumed their raids, which they continued almost uninterruptedly until 1863, when Col. Christopher ("Kit") Carson began operations against them and a plan was formulated to transfer the Navajos from their old haunts to Fort Sumner, at the Bosque Redondo, on the Pecos River, in eastern New Mexico. It was determined that all who refused to go after 20 July would be regarded as hostile and be treated accordingly, yet by the close of the year only 200 prisoners were at Fort Sumner or on the way thither. Early in 1864 Carson made a campaign to the Cañon de Chelly, in the heart of the Navajo country in northeastern Arizona, where he killed 23 and captured over 200 of the Indians. This taught the latter a lesson, so that by the close of 1864 more than 7,000 of the tribe were held as prisoners at the Bosque Redondo. These were increased to 8,491 in 1865, but it was supposed that this number did not represent more than half of the tribe. The experiment, however, proved a failure, so that after the death of about a thousand of the Indians, the escape of others and an expenditure of about a million dollars in their support in a region ill-adapted to their progress, the remainder, numbering 7,304, were removed to their old country in July 1868, an appropriation of \$422,000 having been made in that year to give them a new start. Since that time the Navajos have been peaceable and industrious. They make good laborers and are slowly developing agricultural pursuits. In 1902 they had 8,000 acres under cultivation, which yielded 1,200 bushels of wheat, 700 bushels of oats, etc., and 3,000 bushels of corn. They earned in addition a quarter of a million dollars by the product of their labor, and besides the sheep and goats above mentioned owned 47,260 horses, mules and burros, and 8,000 cattle. There are also four sectarian missions and two mission schools on or near the reservation. In 1890 a partial census showed 17,204 Navajos; that of 1900, over 20,000; and

a rough estimate of the Indian office in 1906, over 28,500. Since then the tribe is believed to have increased.

**NAVAJO MOUNTAIN.** A prominent peak rising high above the Arizona Plateau in the extreme southern part of San Juan County, Utah. Its altitude is 10,416 feet. It has rarely been ascended by white men. It is a short distance south of the rim of Glen Canyon of the Colorado River and from its summit a great view is obtained of the upper part of the Grand Canyon region, the Henry Mountains, the Vermilion Cliffs and other features of the high plateaus. It is forest clad, several springs issue from its sides and in its north slope are the great Rainbow and Owl natural bridges. The mountain is due to a dome-shaped uplift of the sedimentary rocks and the top is capped by Dakota sandstone. Consult Gregory, H. E. (in United States Geological Survey, Water Supply Paper 380, and professional paper 93).

**NAVAL ACADEMY, United States,** the most important naval school in America, established at Annapolis, Md., in 1845, by a special act of the Congress. The origin of this technical educational institution was due primarily to the efforts of George Bancroft, Secretary of the Navy. The academy was opened 10 Oct. 1845, with Commander Franklin Buchanan as superintendent. For a time during the Civil War the school was removed from Annapolis to Newport, R. I. The Bureau of Navigation of the Navy Department has direct supervision of the academy.

**Admission of Students.**—There are received at the academy three midshipmen for each senator, member or delegate of the United States House of Representatives, two for the District of Columbia and 15 at large. The appointment of midshipmen at large and for the District of Columbia is made by the President. In addition to the above the law authorizes the appointment of 25 enlisted men each year to be selected as a result of a competitive examination of enlisted men of the navy and marine corps who have been in the service at least one year and who are under 20 years of age by 15 August of the year it is desired to enter. The mental and physical requirements for these candidates are the same as for other candidates for midshipmen. One midshipman is also allowed from Porto Rico, who must be

a native of that island. The appointment is made by the President on the recommendation of the governor of Porto Rico. The Secretary of the navy, as soon after 1 June in each year as possible, must notify in writing each senator, representative and delegate in Congress of any vacancy that may exist in his district. The nomination of a candidate to fill the vacancy is made on the recommendation of the member or delegate by the secretary. Candidates must be actual residents of the districts from which they are nominated. They enter the academy immediately after passing the prescribed examinations and are required to sign articles binding themselves to serve in the United States navy eight years (including the time of probation at the Naval Academy), unless sooner discharged. All candidates are required to be citizens of the United States and must at the time of their examination for admission be between the ages of 16 and 20 years. A candidate is eligible for examination on the day he becomes 16 and is ineligible on the day he becomes 20 years of age. The pay of a midshipman is \$600 a year, beginning at the date of admission. The course for midshipmen is four years. Examinations on the ground covered are held at the end of each academic term. During the summer midshipmen of the first, second and third classes go to sea for about three months. Midshipmen after graduation are commissioned as ensigns in the navy and occasionally to fill vacancies in the marine corps and in certain of the staff corps of the navy.

**The Course of Study.**—When a midshipman graduates he must be a seaman, an engineer, a true marine engineer, well acquainted with steam, electricity and ordnance, and a navigator and surveyor and he must have a fair knowledge of his own language with some acquaintance with French and Spanish. To achieve this in four years he must be well grounded in the rudiments; he must have good health and he must work hard. The course must be progressive and the instructors competent and in sufficient numbers to be able to instruct—not merely to examine and hear lessons. Even then the work of studying would be too hard for the average youth were it not for the fact that much of the practical work is good out-of-door exercise and the hard brain work is well-balanced with plenty of physical exercise and healthy amusement. The instruction for the fourth class, that is for the first year, completes the study of algebra and includes trigonometry and descriptive geometry. In English it includes rhetoric and something of the art of writing English and also public speaking. French and Spanish and mechanical drawing are begun. It is a necessity for a naval officer to be able to read a drawing and to make a good working sketch. The naval architect, the marine engineer and the ordnance engineer has each his special methods in drawing with which the midshipman must become familiar. Accordingly he starts drawing with the beginning of his course. All his professional work during this year is practical and is given him during the drill period. The academic year opens on 1 October and closes about 1 June; then comes the practice cruise, which is devoted almost entirely to practice professional work

with some little study of the theory of professional subjects. The cruise ends about 1 September when the midshipmen have a month's leave to visit their homes. Academic life begins again on 1 October. During the third-class year the midshipmen complete their study of geometry and also mathematics with the exception of mechanics, a branch of applied mathematics, which is studied during the first term of the succeeding year. They have trigonometry, analytic geometry, conic sections, differential and integral calculus. In English they study naval history and constitutional law. They continue the study of French and Spanish and mechanical drawing and take up the study of elementary physics and chemistry. Their practical work is continued during the drill period and on the practice cruise at the end of the academic year.

**Second Class Men.**—After the month's leave they take up their life at the academy as second-class men and now begin to take up the study of professional subjects. In the department of mathematics they study mechanics and hydromechanics. They continue the study of English, French and Spanish and begin the study of ordnance, navigation and electricity and magnetism and lay the foundation for engineering in studying the principles of mechanism with marine engines and boilers. The practical work continues during the drill period and has advanced progressively so that the midshipmen are well prepared for the professional subjects of this and the following year. This is their last practice cruise and by far the most important one, as they are now carefully instructed in their duties as officers. They are required to perform the work of officers at sea in handling the ship and managing the motive power, both steam and sail. They must work hard at practical navigation with instruments and charts. In their last year as first-class men they continue the study of French and Spanish, while the periods assigned to English are devoted to public speaking and during the first term they have a course in physiology and hygiene. All other studies are professional. They have seamanship and naval tactics, ordnance and gunnery, navigation, compass deviations and surveying, engineering materials, designing and naval construction and electrical engineering. The practical work goes hand in hand with the theoretical during the drill period. The first class are the officers of the regiment of midshipmen and under supervision perform much of the work of officers.

**Athletics.**—To discuss the training of midshipmen at the Naval Academy without mentioning athletics would be to leave out a most important factor in their character training. Boating, football, baseball, fencing, track athletics and gymnasium work are all encouraged. The various competitive games are a source of amusement to all and of healthy exercise to many. Courage and skill are gained and self-denial must be practised by those who train for the various sports and athletics furnishes one of the most important aids in training a youth to become an officer.

**Academy Buildings.**—In 1895 was commenced a new and improved plan of construction and reorganization of the school buildings

**NAVAL ACADEMY**

**Apperatus for Indoor Training in Handling a Full-rigged Ship**

NAVAL ACADEMY

Apparatus for Indoor Training in Handling a Full-rigged Ship

at Annapolis. The new buildings are largely due to the efforts of two men—the superintendent at that time, Capt. Philip H. Cooper, now rear-admiral, and Col. R. M. Thompson, who graduated in 1868 and was in 1895 a member of the board of visitors. The board recommended the rebuilding of the Naval Academy and the energy of these two men pressed the scheme upon the government. The department was induced to order a board to consider and recommend a comprehensive plan for all the necessary buildings and Colonel Thompson persuaded the New York architect, Ernest Flagg, to consult with the board and with Captain Cooper. A set of artistic plans resulted, recommended by the board and approved by the department. But the Spanish War interfered and it was not till 1898 that an appropriation became available and the cornerstone of the new armory was laid by Rear-Adm. F. V. McNair, who had succeeded Captain Cooper as superintendent. The plan as viewed from the sea front shows the midshipmen quarters extending 729 feet, flanked on one side by the armory and on the other by the gymnasium. These buildings are at right angles to the direction of the midshipmen's quarters, are 428 feet long and similar in appearance. They are connected by colonnades with the quarters. This gives from the sea a harmonious group of buildings extending in a northeast and southwest direction for 1,278 feet with the high roof of the main building of the midshipmen's quarters as a centre. Thirteen hundred feet in a northwest direction, with the main line of buildings parallel to and facing the first group, is the academic building with the chemistry and marine engineering buildings on either flank and with the high roof of the academic building in the centre and balancing the group to the southeast. Between these two groups, facing the Severn River and forming the west side of the rectangle, is the chapel with the superintendent's house and the administration building on either side. The fourth side of the rectangle is formed by the basin. From the steps of this basin and facing the chapel is the best view. On either hand is a handsome group of buildings with the dome of the chapel as the centre. The new buildings involved an outlay of approximately \$10,000,000.

**NAVAL AERONAUTICS.** The importance of the aeroplane in naval warfare is great and varied. It is most useful in scouting, in locating and bombing enemy ships and submarines and in spotting gunfire (observation of the fall of the shots). A squadron of battle cruisers with guns of large calibre, whose fire is controlled by aeroplanes, can defeat an equal or greater number of dreadnoughts that are without this means of fire control. While the military aeroplane made great advancement in efficiency during the European War of 1914-18, comparatively little progress was made in the design of naval aeroplanes and in the development of their tactics. This was evidently due to the fact that nearly all the air operations took place over land and when over sea in localities where flight could originate from smooth water. Real naval aeroplanes must be of the types that can operate from floating bases far from smooth water. The first problem in naval aviation is, obviously, getting into the air and

the hydro-aeroplane, or aeroplane that starts and finishes its flight on water, cannot get into the air unless the water is considerably smoother than in average conditions on the open sea. Hydro-aeroplanes must attain an air speed on the surface that is equal to the low-flying speed limit before they can have sufficient lift to get into the air under control, this speed for the various types ranging from 40 to 60 miles per hour. With satisfactory means of getting into the air at sea, good operation is assured in nearly all kinds of weather; but, if flights must originate from the surface of water then the naval aeroplane becomes a fair weather apparatus having but little naval value except in operations near the coast. In naval aviation the problem of finishing the flight is not as difficult as that of getting into the air and is of much less importance.

For work with a fleet three types of aeroplanes are usually required—the high speed fighting aeroplane, the medium speed torpedo-carrying aeroplane and the slow-speed spotting aeroplane. The *high-speed fighting aeroplane* is a machine with a maximum speed of about 100 miles per hour, carrying one or more guns for attack on other aeroplanes and bombs for attack on dirigibles; it is a fast climber and is designed with little stability so as to be sensitive in its control and thus have good manoeuvring qualities. The principal duties of this machine are to protect the torpedo carriers and spotting aeroplanes, to attack enemy torpedo carriers and spotting machines and to destroy or drive in the enemy's air scouts and dirigibles. On account of its high speed this machine has only a small radius of action when carrying the pilot and observer. On special occasions it can be used as a one-seat machine either to increase climbing ability or to increase its radius of action. The *medium-speed torpedo-carrying aeroplane* is a machine with a maximum speed of about 80 miles per hour, designed primarily to carry a torpedo or an equivalent weight (about 1,800 pounds) of high explosive bombs. It has only a small radius of action when carrying its torpedo or when loaded with bombs, but without these weights it can take on an equivalent weight of fuel and thus add five or six hours to its cruising radius. The principal duty of this type is torpedo attack on the enemy's battle fleet or troop ships, a function of the naval aeroplane that deserves a most important consideration in naval battle tactics. Aeroplanes of this type must have proper escorts of fighting machines to counteract the enemy's best means of defense or attack by his aircraft. This type when carrying extra fuel instead of its torpedo or bombs can be used for scouting and in this condition must be armed for protection in case of a possible contact with the fighting types of the enemy. The *slow-speed spotting machine* is a machine with a maximum speed of about 60 miles per hour. Its chief duty is spotting for control of gunfire and for this reason provides for long endurance and consequent slow speed. This type of aeroplane is most important in naval operations because at long-range firing it is absolutely necessary to control fire by spotting inasmuch as the naval range is inaccurate at long ranges and even when the exact distance of the target is known there are disagreements in the sight

bar ranges and actual ranges that must be corrected by spotting observations, these disagreements increasing with the range. When ships are matched in speed and gun-power, those having aeroplane fire control have a positive advantage over those that control from the tops. This type of aeroplane, and especially the medium-speed torpedo-carrying type, perform the important duty of patrolling the fleet when cruising in war time. On this duty some of the machines carry bombs and guns for attack on submarines.

During the European War airships were used most effectively by the navies in scouting work, locating mine fields, discovering submarines and communicating information to their own vessels either by signal or by radio. Airships are remarkable scouts and under ordinary conditions, in a few hours, can explore an immense horizon and inform surface warships by radio as to conditions for miles around. A fleet covered by a sufficiently large flotilla of such scouts can navigate with a practical certainty of avoiding surprise from a hostile or superior force. As to effectiveness the airship has a great advantage over the aeroplane in long-sustained flights, especially over sea. The aeroplane must land immediately in case of a mishap such as a stalled engine, a fractured propeller blade, etc., while an airship, on the contrary, can remain afloat and make repairs. Every well-balanced fleet should include a flotilla of airships. In the European War when it became necessary to build up a system of protection against submarines, the warring nations pressed into service thousands of small vessels, destroyers, trawlers and submarine chasers; and as fast as they could obtain them they put into service seaplanes and dirigibles to co-operate with the ships in locating and capturing and destroying hostile submarines and in convoying ships, protecting them from submarine attacks. The usual evidence of the submarine's presence is the wake of the periscope. This wake cannot easily be seen from ships, but can always be clearly seen from airplanes. For one thing the aviator is not troubled by the reflection of the rays of light which interfere with the vision of the person on a ship. The aviator, flying at a height of from 1,000 to 5,000 feet, has a range of vision of many miles and the whitish wake of the periscope is clearly visible against the dark surface of the waters even in cases where the sea is fairly rough and white caps are showing. Whatever the future development may be, the basis of any air service is its two-seated observation squadrons who do the work of observation, both visual by day and by night and photographic infantry liaison and artillery adjustment. A squadron of airplanes of this type must be provided for every divisional corps staff and army staff. The plans announced call for coast defense squadrons and observation and bombing squadrons. Inasmuch as the coast defense squadrons under army control are not expected to operate far beyond the range of the coast defense guns, all work further at sea is the duty of the navy. It is impossible to develop a comprehensive and efficient system of naval aeroplane tactics unless there are material and personnel sufficient to permit working with the fleet in large groups. These and many other problems must be worked

out in peace time and the personnel carefully drilled, especially in the co-ordinating features of their work. Because of the high speeds and the great number of units dealt with in naval aeronautics, there is no branch or department of service work where thorough co-ordination is more vital to success. The art of flying is a comparatively insignificant part of a naval aviator's attainments. When in command of an aeroplane he must not only be an expert flyer but he must also be well versed in the whole subject of naval aeroplane tactics as well as being an expert seaman and navigator. See AERONAUTICS, HISTORY OF; AEROPLANE; MILITARY AERONAUTICS.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**NAVAL ARCHITECTS AND MARINE ENGINEERS, Society of.** The Society of Naval Architects and Marine Engineers was organized under the laws of the State of New York 10 May 1893, its object being the promotion of the art of shipbuilding, commercial and naval. In furtherance of this object, annual meetings are held for the reading and discussion of appropriate papers and interchange of professional ideas, thus making it possible to combine the results of experience and research on the part of shipbuilders, marine engineers, naval officers, yachtsmen and those skilled in producing the material from which ships are built and equipped. Annual meetings have been held each year since the organization of the Society, the 25th annual meeting being held this year 15 and 16 November. Classes of membership consist of members, associates, juniors, honorary members and honorary associates and benefactors and permanent members. Its membership comprises all the leading naval architects and marine engineers in the United States as well as the other leading countries of the world. The papers and discussion are combined in volumes which are forwarded to the members as part of their membership as soon as they are compiled and edited. These volumes comprise valuable books of reference and are also on the shelf of all the leading libraries in this country.

**NAVAL ARCHITECTURE** deals with the designing and development of the nautical qualities of ships as distinguished from their construction, which belongs to shipbuilding. The existence of naval architecture as an art probably dates back to the first development of man, but its elevation into a science can scarcely be recognized until the 19th century, as a part of the advance in all mechanical sciences during that period. During the 18th century, and even earlier, some Continental mathematicians had devoted attention to the subject and developed various theorems concerning floating bodies which were likewise applicable to ships. Throughout this period the French were the acknowledged leaders in the development of knowledge relating to such matters. So much was this the case that it seems to have been not unusual for other countries to reproduce the models of French men-of-war, thereby admitting the excellence of the French type and paying deserved tribute to the labors of the naval architects of that country.

Perhaps the most notable attempt, however, to place naval architecture upon a logical and

scientific basis, prior to 1800, was that of the famous Swedish naval architect, Chapman (1721-1808), who, during his long career, achieved special eminence in his profession and wrote a number of treatises relating to various features of naval architecture. One hundred years ago each nation, and, indeed, each master builder, carefully guarded as valuable secrets the methods and theories pertaining to the science of naval architecture, which had been deduced from experience or which had been handed down by those who had conducted previous investigations. This state of affairs, indeed, extended well into the 19th century, but with the rapid development of iron shipbuilding, which started about the middle of that century, came a rapid advance in naval architecture and dissemination of knowledge upon the subject, until, to-day, in the leading shipbuilding countries of the world will be found schools devoted to this subject; and the products of the naval architect's skill differ only in comparatively minor respects, whether turned out from British, European, American or Japanese shipyards.

The primary object of the vast majority of all ships is to-day, as throughout the past, *transportation*, and the problem is only affected in its details in order to conform to the requirements of the articles carried, be they men, merchandise, or, in the case of men-of-war, armor, armament and other appliances for rendering the vessel efficient as a fighting machine. The foregoing statement is quite as true of the humble 10-knot collier, which will carry in coal twice the weight of her hull, machinery and outfit, as of the trans-oceanic passenger liner which carries a comparatively small amount of cargo but a large quantity of bunker coal to enable it to make a high speed, and provides luxurious accommodations for numerous passengers. It is true also of the man-of-war, which carries a proportionately large crew and a fair amount of cargo in the shape of consumable stores, coal and ammunition, besides a considerable weight of armor, heavy armament, and the necessary military adjuncts required by the special service upon which employed. Considering, then, all ships as bearers of burdens, there are two essential characteristics which they must show: They must be able to go from point to point at an appropriate speed and with all reasonable safety for ship, cargo and crew. Ability to keep the sea under all the usual conditions of its intended service is indispensable for every ship, and we will now consider briefly the detailed factors entering into the problem.

**Buoyancy.**—When a ship is entirely waterborne, the weight of water which it displaces is exactly equal to the weight of the ship itself and everything contained in it. To float at all, the volume of the enveloping surface of the ship must be greater than the volume of water which equals in weight the displacement of the ship. Clearly, for safety, there must be a margin, or reserve of buoyancy, in the ship over and above the buoyancy equal to its weight. The percentage of reserve buoyancy varies widely according to the type of vessel, passing from approximately zero in the case of diving, or submarine, boats (when in condition to dive), to as much as 100 per cent or more in the case

of passenger vessels with large deck areas and high sides. In certain types of men-of-war, notably the large cruiser class, the percentage of reserve buoyancy is also very high. In the case of men-of-war, the reserve buoyancy is practically fixed by the design; but, in the case of merchant vessels, and particularly cargo carriers, which are subject to overloading, the reserve buoyancy is now practically determined by the marine insurance companies. The business of insuring ships and their cargoes is a large and important one, but is carried on by a comparatively small number of very powerful companies or associations, and these companies, for their own protection, have a well-equipped, scientific and technical staff and have prescribed conditions affecting the safety, or seaworthiness, of ships, which must be complied with in order to obtain insurance at a reasonable rate. In England, the Board of Trade, which is the department of the government charged with authority over matters relating to shipping, has acted in conjunction with the large insurance companies in laying down requirements for reserve buoyancy, these authorities being still further assisted by representatives of the national associations of naval architects. The actual amount of reserve buoyancy required varies somewhat with the size and type of vessel, and likewise with the character of the service, the maximum amount being required for vessels engaged in winter service in the north Atlantic Ocean. Speaking broadly, the objects aimed at in the load-line requirements are to obtain the greatest possible carrying capacity, compatible with safety of the vessel under all conditions of weather, after making provision for minor casualties which might still further reduce the reserve of buoyancy.

**Structural Strength.**—Buoyancy, however, is not the only requirement for seaworthiness of a ship. It is essential that the ship should be strong enough to withstand the stresses due to the action of the waves. In this direction, also, the insurance companies have taken a prominent position, and laid down minimum requirements acceptable for merchant vessels. Strength is obtained not only by the use of the best materials but by the disposition of the material used in such manner as to best accomplish the desired results. The methods used in determining the strength of ships are very similar to those used in determining the strength of other structures, such as bridges, but there is an essential difference due to the fact that it is practically impossible to determine the maximum load to which a ship may be subjected. It is comparatively easy to calculate the strength of the hull structure, knowing the disposition of the weights and buoyancy of the vessel. The stresses upon each part of the vessel's structure, when floating in still water, may be determined with accuracy; but the maximum stress will occur, not in still water, but among waves, and while we know that, whatever the motion of the sea, the buoyancy of the submerged portions of a ship must equal the total weight of the vessel and its contents (subject to minor corrections, due to the dynamic effect of the motions of the ship itself), it is obviously impossible to foresee the possible combinations and contours of waves to whose action the ship may be subjected and the consequent distribution of buoyant forces

and structural stresses. Hence, the naval architect, in determining the structural requirements of a ship so far as they affect its strength, must be guided largely by experience. If he provides strength equal or superior to that of ships of the same type and not very dissimilar in size, which have shown no weakness in service, he has reasonable assurance that he is safe. But, when dealing with vessels of a novel type or size beyond precedent, the skill and judgment of the designer are taxed to the utmost to accurately estimate in advance and provide against the maximum stresses that may occur in service. In this respect, also, the accumulated experience of the marine insurance societies has been of great value in determining adequate strength associated with weight of structure which is not excessive, and which will permit a maximum development of carrying and other desirable qualities. The natural tendency of such societies, however, is to make sure of adequate strength, necessarily giving to weight and cost merely secondary consideration; so that whenever a novel type of ship is put forward, there is apt to be a period of discussion and unsettlement. The builders and owners naturally desire to provide only the minimum strength necessary, in their judgment, for complete seaworthiness, while from the point of view of the insurer, if any error is made it should be positively on the side of excessive strength. As the results of experience accumulate, these questions adjust themselves, but with the rapid development in the size of ships, and the variations in types which have been witnessed since the last quarter of the 19th century, shipbuilders and the insurance societies have not been entirely in accord on such questions.

**Stability.**—In addition to the elements of adequate buoyancy and strength, there must be considered an equally important factor in the seaworthiness of the vessel,—namely, *stability*. This quality is all-important in rendering the vessel safe and enabling it to resist the capsizing effect of wind and waves. The stability problems which must be solved by the naval architect are practically peculiar to his profession. Sailing vessels, to avoid capsizing, must be handled with skill, and sail must be reduced in ample time to avoid the disastrous consequences of undue wind pressure. Steamers of the present day carry practically no sail, and are liable to be capsized by the sea only. But with them, too, there is room for skill in handling with reference to the direction of the waves, etc. It is the duty of the naval architect to provide a vessel, in either case, which, when handled with ordinary skill, will be stable under all probable conditions of wind and weather. The general feature of the problem of stability are comparatively simple, and may be readily understood by considering a ship floating in still water. Under these conditions, the whole weight of the ship may be regarded as concentrated and acting downward through its centre of gravity. The upward forces of buoyancy may also be regarded as concentrated into a single upward pull through an imaginary point called the metacentre. With the ship at rest, the downward pull through the centre of gravity must be exactly equal to the upward pull through the metacentre. Evidently, if the metacentre is directly below the centre of gravity,

there will be unstable equilibrium, since any slight accidental deflection of the centre of gravity would result in further deflection, the forces of buoyancy and gravity acting as an upsetting couple; if, however, the centre of gravity is below the metacentre, the resultant of the downward pull through the centre of gravity and the upward pull through the metacentre produces a righting moment tending to return the ship to the upright position. The name "metacentre" is supposed to have originated from the Greek word "meta," meaning "limit" or "goal" beyond which the centre of gravity cannot pass. Possibly it would have been more logical if the metacentre had been called the centre of buoyancy, thereby causing the nomenclature of the centre of buoyant forces to correspond more exactly to that of the centre of gravity. But in the naval architecture, the centre of buoyancy is the name given to the centre of gravity of the volume of water displaced by the immersed portion of the ship. The line of action of the resultant upward forces of buoyancy must obviously pass through the centre of buoyancy, and it therefore follows that the centre of buoyancy and the metacentre are always found in one vertical line. The metacentre is not a fixed point but rises and falls as the ship inclines, owing to the varying shape and proportions of the immersed portion of the hull, and in every ship there is finally found an angle of inclination at which the metacentre is found directly below the centre of gravity. For inclinations greater than this, there is a tendency for the ship to capsize instead of right itself. The inclination at which this occurs is called the *capsizing angle*, and the angular range through which the vessel can be inclined without capsizing is called the "range of stability." Generally speaking, the less the freeboard (or height of side above water) the smaller the range of stability. In practice, the range of stability necessary for safety is affected somewhat by the initial metacentric height, or the distance between the centre of gravity and the metacentre when the ship is upright. The greater this distance the greater the effort required to heel the ship, and hence the range of stability may be made less with safety. In practice, with any type of ship the range of stability can seldom be safely made less than 50 degrees, and, in the majority of cases, should be much more. It is frequently over 100 degrees for vessels of high freeboard. For safety alone, it is not always necessary that, initially, when in the upright position, the metacentre should be above the centre of gravity. If the metacentre is slightly below the centre of gravity, the vessel will heel over a few degrees to one side or the other until it reaches an inclination at which the metacentre rises above the centre of gravity and the vessel becomes stable again; if the freeboard of the vessel is high and the range of stability is great, such a vessel may be perfectly safe. Several of the large trans-Atlantic liners are purposely designed with comparatively small initial metacentric height, as such a condition permits the vessel to respond less quickly to wave action and causes easy and slow rolling.

**Rolling.**—Closely associated with the question of stability is the question of rolling in a seaway. When a vessel is floating in disturbed water the effect is to change the relative loca-

tion of the centre of buoyancy so that the metacentre shifts to one side or the other of a vertical line through the centre of gravity, causing a tendency to heel or roll the vessel until the metacentre again becomes immediately above the centre of gravity. Moreover, by this time the vessel has acquired certain angular velocity so that it swings beyond the position of equilibrium. An analysis of the theory of the rolling of ships at sea would be too complicated to be instructive in an article of this character, but, as in the case of stability, there are certain broad, underlying principles. These would be comparatively simple if in a floating body of ship-shape form the metacentre were fixed. In the case of a floating circular cylinder, such a condition does exist, the metacentre being fixed and remaining always at the centre of the cylinder. In such a case, the motion of a ship rolling is very closely analogous to what it would be if the vessel were suspended on pivots at the height of the metacentre. In such an imaginary case, in conformity with the well-known principles covering the motion of compound pendulums, the closer the metacentre is to the centre of gravity the longer the period of oscillation, and the further the metacentre from the centre of gravity the shorter the period of oscillation. In actual ships floating in water; however, the question is complicated by the varying position of the metacentre and the resistance of the water, which, in the absence of new disturbing causes, rapidly brings rolling ships to rest. But the fact remains that vessels of large metacentric height are inclined to roll very quickly, while those of small metacentric height are sluggish in their rolling motion. When floating among waves which are large as compared with the vessel, the vessel of great metacentric height tends to float like a board, keeping its deck fairly parallel to the surface of the water; while the vessel of small metacentric height will at times be found rolling toward the wave crest instead of away from it—a very undesirable condition with low free-board vessels. In practice, vessels vary widely in their periods of oscillation. For a large vessel, perhaps the shortest period met with in practice would be that of a low-freeboard monitor, which, on account of its large metacentric height, may make a single roll from extreme inclination in one direction to the extreme in the other in from two and one-half to three seconds, while a large vessel of small metacentric height may take as much as 20 seconds to the single roll. While rolling through small angles, say under 10 degrees, the motion of a vessel is practically isochronous, that is to say, the period or time of completing a roll varies but little with the angle. This ceases to be true when vessels reach large angles of roll, say 30 degrees or more. If there did not exist a retardation of roll in heavy rolling there would be grave danger of vessels, otherwise perfectly safe and seaworthy, being capsized by an accumulation of roll, every passing wave adding a little to the amplitude of roll,—well illustrated by the fact that with properly-timed impulses comparatively small forces will give large oscillations to a swinging weight. In actual practice, the skilled seaman can do much to limit excessive rolling by shaping the course of the vessel so as to produce complete lack of

synchronism between the period of the ship and that of the waves. The naval architect, however, in the original design of the vessel utilizes the resistance of the water and provides "bilge" or "rolling keels," which aid materially in preventing heavy rolling. Bilge keels are projections at the bilge of the ship, approximately from one foot to three feet in depth, and extending usually for about half the length of the vessel and so situated when practicable as to offer maximum resistance to rolling. When properly fitted, bilge keels will often reduce the maximum angle of rolling, under adverse conditions, to less than half what it would be without them.

**Speed and Resistance of Ships.**—It has already been pointed out that an essential characteristic of all ships is mobility. The speed of a ship is a simple, concrete fact, readily appreciated by anyone and comparable with the speed of other ships; therefore, in many cases, it is considered the most conspicuous and important quality of a ship, whether man-of-war or passenger steamer. The keen interest taken by the general public in the speed records of passenger steamers engaged in trans-oceanic service fully illustrates this fact. The present accepted methods of determining the power necessary to drive a given ship at a given speed, and, conversely, the form of ship best adapted to be driven by a given power, are of comparatively recent development and largely due to the late William Froude, who, through an elaborate series of experiments, established the truth of the fundamental laws upon which are based the present theories of the resistance of ships. The resistance of a given ship, moving at a given speed, is made up of three main factors: first, the skin friction of the water on the surface of the ship. This is dependent only upon the surface exposed and the speed of the ship. It varies slightly with variation of form, due to this variation affecting the velocity of the water over the hull, but this variation is too slight to be taken account of in practice. The second element of resistance is what is called "wave-making resistance," due to the fact that a ship in moving through water produces waves and the force required to produce these waves proportionately reduces the power available for propulsion and thus, in effect, increases the resistance to the motion of the ship. The third element is what is called "eddy making," due to eddies of the water behind square corners of the hull and attachments, such as stern-post, propeller strut, etc. The eddy-making resistance is, however, comparatively small. The skin frictional resistance of a ship can be readily calculated with sufficient accuracy from the results of experiments upon the friction of plane surfaces drawn through water at known speeds. Mr. Froude demonstrated that the remaining resistances (wave and eddy making) of a full-sized ship could be estimated with great accuracy from a careful determination of similar resistances experienced by a small model of a ship when towed at a speed corresponding to the desired speed of the ship, the corresponding speeds of model and ship being in the ratio of the square roots of their linear dimensions. For a ship 500 feet in length, and a small model 20 feet long, the ratio of linear dimensions is 25; so that the actual speed of the model corresponding to 20

knots for the ship, would be  $20 \div \sqrt{25}$ , or four knots. By model experiments, also, it is comparatively easy to investigate the general effect of changes in shape and dimensions of vessels without having recourse to experiments with full-sized ships. The principles applied in passing from models to full-sized ships were also applied by Mr. Froude in passing from one full-sized ship to another,—being quite applicable if the two ships are similar, and applicable with fair approximation if the two ships are reasonably similar in proportions and shape.

**Model Basins.**—Experimental model basins are now found in nearly all shipbuilding countries. That of the United States is located at Washington. It is about 500 feet long, and, at its maximum section, the water is about 42 feet wide and 14 feet deep. Wooden models 20 feet long, made by special machinery, are used in this experimental work, the model being towed back and forth through the water by an electrically-actuated carriage which spans the basin. When erected in 1899, this was the largest experimental basin in the world. Later experimental basins built in Germany, however, are somewhat longer but not so deep or wide. From data obtained with models towed in the experimental basin, the effective horse power, as it is called, necessary to tow the full-sized ship without engines, is determined with great accuracy. It is therefore necessary to establish, from actual trials, the relationship between this effective horse power and the indicated horse power which the ship's engines must exert. This ratio depends upon the friction of machinery, efficiency of propellers and to some extent upon the shape of the stern of the ship and other minor factors; it is found, in practice, that it ranges from .50 to .60, although there is seldom reason why it should not be made as great as .55, a lower value being usually due to mistakes in design of hull, unsuitable propellers or some such cause. The tabulated data obtained from experiments with models in the experimental basin, supplemented by progressive trial data taken under actual seagoing conditions, from the full-sized ships, have in recent years greatly aided the naval architect and the engineer in their design work.

**Materials Used in Shipbuilding.**—As the development of naval architecture has been largely influenced by the materials used in ship construction, brief allusion to these materials seems appropriate. The material used in the construction of ships underwent, broadly speaking, two changes during the 19th century; a change from wood to iron, which dates approximately from about the middle of the century, and a change from iron to mild steel, which dates from about 1880. Wood is still used as material for shipbuilding, many coasting vessels, for instance, in the United States and elsewhere being still built of wood; but the number and importance of wooden ships as compared with those of iron and steel is diminishing yearly, and, at the present date, it may be said that the only structural material of importance for the construction of ocean-going ships is steel. Open-hearth steel, suitable for shipbuilding purposes, with an ultimate tensile strength of about 60,000 pounds to the square inch and an elongation of an 8-inch specimen

of from 20 to 25 per cent before rupture, was introduced between 1870 and 1880. It was practically unknown in the United States in 1880. The contractor for the first steel vessels of the new navy, which were contracted for in 1883, had to make special arrangements for the domestic manufacture of the steel needed in his work, and had to pay for it at that time about seven and one-half cents per pound. The growth of the manufacture of this material in the United States since that date, however, has been astonishing, mild steel of nearly the same characteristics as that used for ships being used in large quantities for bridges, houses and other structures, so that, about 1900, its price had fallen as low as one and one-half cents per pound, as compared with seven and one-half cents per pound some 15 years earlier. The qualities of the steel used in shipbuilding vary little in the different shipbuilding countries, being prescribed, as a rule, for merchant ships, by the marine insurance societies. For men-of-war, a somewhat higher grade of material is prescribed, and the inspection is rather more rigid. The use of nickel-steel, too expensive for commercial vessels, but very superior for armor plates and guns, gives an added strength of 30 per cent over open hearth steel. It retains its fibrous structure under strains and shocks where carbon steel crystallizes and crumbles. Coincident with the development of iron and steel as materials for shipbuilding, there began to develop an increase in the size of ships, due to the greater strength of the material of construction, and probably also to the fact that the use of steam instead of sails for propulsion made it possible to increase the propulsive steam power of the large ships when it would not have been possible to add correspondingly to their sail area. The tendency toward an increase in size has been very marked since 1885, until now ships have reached sizes and dimensions limited only by the draft of water and the docking and wharf facilities available in the ports to which they trade.

The urgent necessity of quickly replacing the shipping destroyed by the German submarines, while it did not and could not alter the basic principles of naval architecture, called for adaptations which departed widely from the practices of the period preceding the Great War. The lack of shipyard facilities and of highly trained shipbuilders led the men in charge of the government program to enlist the structural iron workers of the country in the great problem of producing ships. The "fabricated ship" thus came into being, designed in such fashion that its parts could be constructed by the makers of steel bridges, tanks and frames for skyscrapers. Wherever angles could take the place of familiar bends and curved surfaces the change was made, and quantity tonnage was thus expedited, although the new models were less speedy than the more scientific hulls of former years. The structural shops were able to do nearly all the punching, shearing and bending of the plates, and only the assembling and rivetting and the expert fashioning of bow and stern was done in the shipyards. Another effect of the emergency was the standardization of types of vessels to be built. When the Shipping Board began its work there were many different types of

vessels under construction in the shipyards of the country. The government representatives speedily recognized that much labor was lost in this diffusion of effort and a few types were selected and all agencies concentrated on the utmost possible production of these typical ships. The standard cargo vessel was a single screw steamer of 9,600 tons deadweight, 395 feet in length, 55 feet molded beam and 34 feet molded depth; the engines, geared turbines of 2,500 horse power, and the fuel, oil. Another type was the combined passenger and cargo vessel, arranged for use as a troopship, carrying 2,700 troops and 7,000 tons of supplies. This type with a displacement of 20,900 tons was 522 feet in length, 62 feet beam and was equipped with twin screws driven by two sets of four-cylinder triple expansion reciprocating engines. Its speed was 14 knots which could be increased to 15 knots in emergencies. Another selected type was the 10,000-ton oil tanker, 435 feet long and 56 feet beam, equipped with a single screw, triple-expansion engines and oil-burning boilers. A revival of wooden ships resulted in the production of 3,600-ton vessels, 286 feet in length and 46 feet beam. A particular type of architectural design gave them the title of "Ferris ships," after their designer. While not wholly a development from war conditions the production of the Diesel ships was stimulated by the demand for ocean tonnage, and these, too, were standardized in the interest of rapid multiplication, the selected type being of 9,600 deadweight tons with turbine engines driving twin screws. The compactness of the Diesel engines gave these vessels the advantage of 13 to 14 per cent larger carrying capacity for an equal displacement, and operated with a smaller crew and at a higher comparative speed. Another architectural development was the reinforced concrete ship, successfully built up to 3,500 tons, and with designs approved up to 7,500 tons. The fact that only \$60,000 worth of steel was needed in a 5,000-ton concrete ship as compared with \$300,000 worth in an all-steel ship led to earnest effort in this direction. A special form of concrete lighter than wood and impervious to water was developed by the architects in charge, and the completed ships were found to be unusually free from the vibration common to all-steel vessels. Composite ships of wood and steel were also planned and built to meet the emergency caused by the war.

The present state of development of naval architecture is probably best illustrated by examining the characteristics of some of the most recent products of shipbuilding skill in this country as exemplified in the principal characteristics of the United States battleship *Idaho*, commissioned in March 1919, and the new troopships mentioned above, which are representative of our latest American designs. Commercially, it is found that the large steamer will carry freight or passengers cheaper at the same speed, or faster for the same cost, than the small steamer. The large man-of-war, on the other hand, is able to carry a much greater weight of armor and armament and can maintain a higher sustained sea speed than is practicable in a vessel of small displacement. See WARSHIPS.

**NAVAL AUXILIARY VESSELS.** When the United States became an active participant in the European War it became at once necessary to provide for meeting the demands for vessels for various naval auxiliary uses. Congress, in anticipation of the situation which did arise when the United States became a belligerent, included in the Naval Appropriation Act, approved 4 March, 1917, under the naval emergency fund provisions which were construed as giving the department the right to commandeer vessels needed for naval use in war. To safeguard the interests of the government and avoid as far as possible the payment of unreasonable prices for the vessels so acquired the department arranged for and organized a Board of Appraisal for Merchant and Private Vessels, three members of whom were at the time of their appointment civilians especially qualified by education, previous occupation and experience, and possessing a reputation for knowledge of values of vessel property and for disinterestedness which the department felt would be recognized by owners of vessels sincerely desirous of co-operating with the department without taking advantage of the exigencies of the situation. These men were commissioned as lieutenant-commanders in the Naval Reserve Force. The three other members designated by the department for this board were from the list of regular officers of the navy, one a senior line officer, one an officer of the Constructive Corps of the navy and one a line officer with special engineering experience and knowledge. The board was directed by the department to appraise and fix the fair value of each piece of vessel property which the department considered acquiring, either by purchase or by charter, and the values so fixed were used by the department in its negotiations with the owners of the property. In no case was any vessel property acquired by the navy if the demands of the owner were materially at variance with the findings of this board as to the fair value of the property. The department found a general wish to co-operate on the part of owners and acquired a number of vessels in this way. This spirit of co-operation was especially noticeable among the owners of yachts and other pleasure vessels, a large number of which were required almost immediately after the entry of the United States as a belligerent. It has since been charged that some young owners of such craft were in this way enabled to escape induction into the army.

It became apparent, however, that the powers granted under the naval emergency fund provision of the Naval Appropriation Act were

not sufficient to fully meet the situation, and Congress included in an act making provision to supply urgent deficiencies in appropriations for the military and naval establishments, etc., approved 15 June 1917, provisions granting broader powers under which possession of property needed by the navy for prosecution of the war might be taken possession of by the department subject to the payment of just compensation to the owners, which compensation the act in question provided should be fixed by the President.

Information as to the property taken, its age, the character of the maintenance thereof, the betterments made thereto, the date on which the property was taken by the Navy Department and the condition of the property at the time it was taken, was supplied to the board, in most cases fully, by the Navy Department. At the hearings granted interested parties, they were permitted to present evidence or information regarding the property which had been taken, supplementing or modifying the information supplied by the Navy Department. In special cases the board made investigation of these matters directly or through agents where this course seemed necessary to the proper performance of the duties of the board. In preparation for the deliberations by which the board arrived at the prices or just compensation, the board procured all possible information from every available source regarding: (a) The opinions of experts regarded by the board as disinterested as to the value of the property under consideration; (b) the testimony of experts produced by the interested parties, as to the value of the property under consideration; (c) the prices at which similar property of like character to that under consideration had been sold at or about the time the property under consideration was taken by the Navy Department and the conditions surrounding these transactions; (d) the availability of the property for commercial use; (e) the demand for property of like character for commercial purposes; (f) the original cost of the property; (g) the value of the property under normal conditions; (h) the cost of the property to the owner up to the time the property was taken; (i) the time when the property was acquired by the owner, the use to which the property had been put by the owner and the gross and net earnings of the property in the hands of the owner for a period of from three to five years before possession was taken by the navy; (j) the cost to reproduce the property taken and the time required for such reproduction.

In time of war or during the existence of a national emergency, members of the Naval Reserve Force of sea-going profession who have been employed in American vessels of merchant marine of suitable type for use as naval auxiliaries are required to serve only in vessels of the merchant ship type, except in cases of emergency, to be determined by the senior officer present, when said officer may in his discretion detail them for temporary duty elsewhere as exigencies of service may require. Officers in the Naval Auxiliary Reserve exercise military command only on board ships to which they are attached and in the naval auxiliary service. The annual retainer pay of members

in this class after confirmation in rank or rating is for officers one month's base pay of the corresponding rank in the navy, and for men, two months' base pay of the corresponding rating in the navy. All naval auxiliary vessels are grouped in districts and each group is placed under a commandant of the district, who is a naval officer of rank and experience. In this way the department is able through the various commandants of districts to carry out problems involving patrol and defenses of the coast, mine sweeping, communications, information, industrial developments, housing facilities, commandeering vessels, etc., in a very efficient manner.

EDWARD S. FARROW,  
*Consulting Military and Civil Engineer.*

**NAVAL CONSTRUCTION.** See NAVAL ARCHITECTURE.

**NAVAL CONSTRUCTORS,** officers of the United States navy, detailed to look after the designing, building and repairing of warships. New types of ships are adopted after recommendations of the General Navy Board and chief of operations. The chief constructor and assistants in the Bureau of Construction and Repair of the Navy Department work out the design and details in consultation with the chiefs of Bureau of Steam Engineering and Ordnance. At every navy yard there is generally a naval constructor on duty. These officers are chosen from Naval Academy graduates and are prepared for their work by special education at technical schools. Latest statistics enumerate 51 naval constructors, five captains, five commanders, 23 lieutenant-commanders and 18 lieutenants; assistant constructors number 24, including 14 lieutenants and 10 junior lieutenants.

**NAVAL EDUCATION.** Thorough educative and systematic study constitute the base rock foundation in the grasping of the principles of the art of war, naval or military. No navy nor army can hold its own that fails to keep abreast of sciences that relate themselves to naval or military needs. The educational policy of the most modern navies is based on the fact that the seamanship of the future is dependent on the increasing utilization of the data of science, whether in mechanics, chemistry, physics, electricity, marine engineering or naval construction. Constant experimentation and adaptation, discovery and invention, readiness to abandon the outworn and willingness to try the untried, must go hand in hand with a growing navy, especially with a navy that is itself a vast educational and training school. The new demands, however, do not imply multiplication of studies so much as greater thoroughness in fundamentals. Science is one, though its branches are numerous and ramifying.

**United States.**—Recent acts of Congress and laws increasing the number of midshipmen have largely increased the attendance at the Naval Academy and other naval institutions. The number of midshipmen coming from the enlisted personnel is increasing, and it is to be hoped that the day will soon come when most, if not all, appointments to the Naval Academy will come from the ranks. When a prereq-

uisite to appointment as midshipmen at the Naval Academy is actual practical sea service in the enlisted ranks, the navy will more and more attract the youths who love the sea and have the taste and the qualifications for the naval service. The Naval Academy was established by George Bancroft in President's Polk's administration. His state papers were models, and the Secretary of the Navy is remembered as scholar and writer as well as a secretary with a vision. Bancroft felt the need, as did John Paul Jones and Matthew Fontaine Maury and other naval leaders, of an institution to educate young men for the navy, but it remained for Bancroft to translate their dream into the Naval Academy. The efficiency of the navy of to-day is largely, if not chiefly, due to the character of the instruction and the high standards that prevail at the Naval Academy.

The United States Naval War College was formally established at Coaster's Harbor Island in Newport Harbor, Rhode Island, in 1884. Recently an applicatory system of study, similar to that in use at the Army War College and at the service schools, was introduced at this college and endeavors are now being made to cultivate in the minds of the officers of the navy the habit of systematic reasoning in approaching tactical or strategic problems, such as is given by an "estimate of the situation." An effort is also being made to develop a form of "campaign orders" modifying the field order form to suit all needs and varying conditions. Co-operation in time of war is greatly aided if each service has some personal acquaintance with the other. This acquaintance can be best brought about by the exchange of visits and hospitalities among officers afloat and ashore, and by the exchange of officers in attendance at the service schools and war colleges. The last is deemed of the greatest importance, as thereby selected officers who in time of war may exercise high command or staff duty are thus brought in touch, in a professional way, with the sister service. They find out what may be most probably expected from the other service in time of war; they learn something of the methods and professional opinions of the officers of the other service; and if at the war colleges, they assist in the preparation of the war plans. This interchanging of officers is most fruitful of good results. Army officers are detailed to attend the summer conferences at the Naval War College and navy and marine officers are designated to attend the Army War College and marine officers attend the army service schools at Fort Leavenworth. Along the same line is the detailing of officers of the Coast Artillery corps to attend fleet target practices.

Beyond the training of seamen and firemen, which is the principal general purpose of the stations above mentioned, is the matter of training mechanics, radio operators and many other specialists who must be skilled craftsmen as well as good sailors. There are schools for cooks, also, for well-prepared food is regarded as important enough to justify training in cookery. These men, whatever their origin or previous experience, must be further trained by and for the navy, first in discipline and second in their trades. A plumber, carpenter, electrician, coppersmith, machinist or what not, skilled in his trade as practised in civil life,

has much to learn before he can efficiently ply his trade on board a naval vessel. Prior to the European War, artisan recruits were trained in the naval trade schools maintained for this purpose. These schools were at once expanded as far as conditions permitted, but with the enormously increased demand the schools could not be made large enough to supply the requirements if the entire course of training were conducted in such schools. In conjunction with the establishment of the Students' Army Training corps by the War Department, the Navy Department established naval units in over 90 educational institutions of collegiate grade. The object of these naval units is to extend to ambitious students the opportunity to continue their education along the usual channels, at the same time electing special naval subjects. In addition, the student is under constant supervision and receives military drills and instruction.

At the naval training station, Great Lakes, Ill., is maintained one regiment of about 4,000 men, known as the public works regiment. The officers and petty officers are men of exceptional engineering knowledge or practical ability, and the regiment is so organized that a complete force of any required size, with its engineer officers, foremen, expert mechanics, journeymen and helpers can be quickly assembled as a unit and sent anywhere to undertake emergency construction or repair work involving structural steel erection, woodwork, masonry work with all pipe fitting, plumbing, electrical and similar accessories. Drafts from this regiment are replaced by recruits who are kept in training, both practical and bookwork, to increase their knowledge of their trade. At New London is a ship salvage organization officered by professionals in this line of work, at which men are trained and organized into salvage crews. This is in itself a training school for a wide variety of trades, including diving and the handling of high explosives.

For the benefit of men who enter the navy with some knowledge of or experience in a trade, or special vocation, the navy maintains trade-schools as follows: The Navy Electrical School for the instruction of electricians, both general and radio; the Artificer School for shipwrights, shipfitters, carpenters, blacksmiths, painters, etc.; the Yeoman School for stenographers, typewriters and bookkeepers; the Commissary School for cooks, bakers and commissary-stewards; the Hospital-Corps Training Schools for the instruction of men in nursing, first-aid, drugs, etc.; the Coppersmith School; the Machinist School; the Aeronautic School; the Musician School; the School for Diving; the Torpedo School and the class for instruction in gasoline engines. Not all of these trade schools are open to men on their first enlistment. Some, such as the machinist school and the torpedo school, are open only to men of good record upon re-enlistment. All the schools are conducted, however, for the benefit of enlisted men of the navy who desire to fit themselves for more responsible duty and better pay. In most instances, the training obtained in these schools will stand the men in good stead in civil life should they decide, after a few enlistments, to remain out of the navy. Former bluejackets, who owe their success to the training they received while in the navy,

may be found in nearly every large industry holding enviable positions.

In addition to the practical instruction imparted at the training stations and in the navy trade schools, a course of academic instruction is conducted throughout the naval service. Every recruit is examined as to his educational needs and, if he is deficient in any common school studies, he is assigned to such classes as will supply the education he lacks. The academic instruction does not stop at the training stations, but continues on board ship; and if a young man shows a willingness to advance himself, he is given every encouragement and is afforded an opportunity to demonstrate his ability.

**England.**—Made up of diverse elements, the English system of naval education has a certain unity throughout, which is due solely to the fact that the whole is practically under one head. Except for the gunnery training and the seamanship, which is instilled by some process on board ship, the whole training of officers is under the direction of the director of studies at Greenwich. His control does not go so far as the devising of a general plan; that is a matter for the Admiralty. From the time the young man of 12 or 13 passes his examination for a cadetship down to his last volunteer course as a captain, through the *Britannia*, the course afloat, the sublieutenants' collegiate course and the subsequent voluntary studies, his education is under the Admiralty rules, and it is managed with all the wisdom and judgment that the rules will permit. The importance of this single head for the whole system cannot be overestimated. The expedients adopted with reference to the higher education of voluntary students and the admirable courses of instruction for officers who have taken up one branch of the service, do much to remedy the inherent defects of the system; and the promotion in two grades by selection excludes the most incompetent officers from positions of great responsibility.

**France.**—The following establishments are included in the general system of education of officers of the French navy: The Polytechnic School, Medical Schools, Torpedo School, Machinists' School, Gunnery School and Artillery School. The *Polytechnic School*, founded in 1799, is the preparatory school for the scientific branches of the public service and is under the control of the Minister of War. Its organization is military, with a general officer of the army at its head. The pupils of this school are carefully selected at the start and the examination for admission ensures a high standard of preliminary attainment. The success of this school is so remarkable its influence on the public service of France has become a matter of history and it has taken a place among the very first of schools of its class in the world. In the *Naval School* of Brest, the methods of instruction adopted are similar, in a general way, to those of other French schools and colleges and resemble nothing in America. Recitation in the ordinary sense does not exist and textbooks are almost unknown. A few books of reference are used, including the nautical almanac and the admirable series of manuals published under the authority of the Ministry of Marine. The main feature of the system of instruction is the *cours*, or lecture. The *Engi-*

*neers' School* (constructors) at Cherbourg is simple in its organization. It is under the general supervision of the Préfet Maritime and is inspected from time to time by the inspector-general of the corps of engineers. At its head is a constructing engineer as director. As the profession of naval construction is a favorite branch among the higher graduates of the Polytechnic, coming usually after mines and roads and bridges, the pupils are selected men and distinguished in a higher degree by earnestness, intelligence and thorough scientific attainments. They enter the school of application at the age of 20 or 21. The *Torpedo School* at Boyardville has two objects, the training of officers and men for the torpedo service and the performance of experiments for the development and perfection of the materials of this branch of maritime warfare. The two functions are largely performed by the same officers. The *School of Machinists* at Toulon was established by the decree of 13 Feb. 1879, and took the place of the two schools that formerly existed for a similar purpose at Brest and Toulon. The pupils at the school consist of firemen artificers, candidates for promotion to quartermaster machinists; of quartermasters and machinist pupils, candidates for second masters, and of second masters, candidates for first masters. Admission to the school is obtained after passing a double examination.

**Germany.**—The Naval Academy and Naval School at Kiel form really two establishments united under one government. The academy is devoted to the higher education of officers who have shown marked ability and who come as voluntary students. The school, on the other hand, is attended by midshipmen or acting sublieutenants and by cadets, and its courses are compulsory for all officers. At the academy and school the direction of all matters relating to instruction rests with the committee on studies, consisting of five members, who have extraordinary powers in regard to examinations. The regulations governing attendance at lectures and exercises are exceedingly precise and strict. There is also at Kiel the School of Engineers and Pilotage.

**Italy.**—The Royal Naval School of Italy is composed of two divisions, the first at Naples and the second at Genoa, the Naval School being considered as preparatory to that of Genoa. The general system of education is similar to that of France, there being a *gunnery school* (established by royal decree in 1873), a *torpedo school* (established in 1874) and a *school for engineer mechanics* (established in 1862 at Genoa). The restraints imposed in general by discipline at Italian naval schools are numerous and severe. The students have no standing as officers and are simply designated as pupils. The scale of punishments ranges from the extreme of pettiness to the extreme of severity.

The true goal of the training at the Naval War College and naval schools is efficient co-ordination of effort or unity of action. This unity can be realized only through co-ordinate thinking of all persons in a naval service. The navy is a collection of individual minds, and if these minds are untrained the resultant is intellectual chaos. The intellectual acts of a naval officer in command of a force should follow after methodical thought in the following order: A clear grasp of the intention of in-

structions; a careful examination of all conditions bearing on the situation; a determination of intention; the communication of this intention to subordinates. The best training, as now admitted by all nations, large and small, having navies, is in war. If it were not for the stimulus of necessity, all effort in the world would come to an end. The Naval War College created an artificial war, at first called the *war game* and later known as *chart manoeuvre*. This last term is a happy one, for it accentuates the fact that the strategist's real field of operations is the chart and is in keeping with Jomini's definition of strategy—"War on the map." A further consideration will show that ordinary navigation is merely "sailing on the chart." The war game or map manoeuvre was a notable factor in the wonderful successes achieved by German arms against Austria in 1866 and France in 1870. The map manoeuvre is truly the subcalibre method of training naval strategists. See NAVAL INTELLIGENCE.

**NAVAL GUNS.** See GUNS, NAVAL.

**NAVAL INSTITUTE,** United States, an organization founded in 1873 at Annapolis, Md., by the officers of the Naval Academy. It issues bi-monthly *Proceedings* on naval affairs. It is regarded as one of the most important publications on naval affairs, because of the broad knowledge of its contributors. Each year the institute offers a life membership, a gold medal and a prize of \$200 for the best essay or paper of interest to the naval service. The present membership includes a large portion of the officers of the navy.

**NAVAL INTELLIGENCE.** The Office of Naval Intelligence is charged with the collection and dissemination of such technical information at home and abroad as will be useful to the various bureaus of the Navy Department in the formulation of plans for war and in the development of personnel and material. The exigencies of war impose new and important duties upon naval intelligence. In peace the function of this agency is to keep in touch with naval problems, naval expansion and naval interest in all the countries of the world, so that the President, the naval administration and the responsible naval leaders in Congress may have access to the latest information with reference to naval affairs abroad. Its reports from naval attachés in the leading countries and from other sources furnish the General Board, the Chief of Operations and the bureaus data which give them the benefit of what has been learned or put into practice in other countries. During war its duties increase many fold—in touch with the naval districts and branch offices—it does a most important work in protecting naval and other plants making war material, preventing sabotage and in keeping an eye on alien enemies or others with a destructive propensity. A staff of vigilant and discreet confidential officers and civilians are on the alert to ferret out spies and other dangerous characters and secure their arrest. Close co-operation is had with the Department of State, War, Justice, Treasury and Labor, and, in addition, with the War Trade Board, the United States Shipping Board and the Alien Property Custodian. The interchange of

information and the results of investigations with these departments of the government are most effective and valuable to the prosecution of war.

A detailed account of the work of this office should not be stated as it is of a highly confidential character, but, generally speaking, the scope of its activities include observation, investigation and report of all subjects affecting the navy and the prosecution of war from a naval point of view. It includes naval operations at sea and on land, the status, changes and progress of the material and personnel of foreign navies and a close counter espionage watch at home. This latter includes the investigation of unauthorized radio stations of alien enemies and suspects, of matters connected with the cable and mail censorship which affect the navy, the protection of water fronts and vessels, and of plants having contracts with the Navy Department, with a view of safeguarding those plants against sabotage. The guarding of ships while in port and the guarding against the danger from enemy agents among the passengers and crews are largely performed by the Office of Naval Intelligence. See NAVAL COMMUNICATION SERVICE.

**NAVAL LAW.** See LAW, MILITARY.

**NAVAL MANOEUVRES.** See ARMY AND NAVY MANOEUVRES.

**NAVAL MILITIA.** The first naval militia organization in the United States was established in the State of Massachusetts as a part of the organized militia on 29 March 1890. Other seacoast and lake States soon followed. In 1891 there was included in the Naval Militia Act, as passed by Congress, an appropriation of \$25,000 for "Arming and Equipping Naval Militia." This constituted the first Federal appropriation available for the purchase of arms, equipment, etc. Appropriations have been included annually in the Naval Act since that time. Ships were loaned to the organization and material and equipment issued by the various bureaus of the Navy Department for training purposes, the details being carried on by the "Office of Naval Militia." The States themselves purchased clothing and equipment. Some equipment was loaned by the War Department. Annual practice cruises were made and the training of the naval militia gradually progressed. In February 1914 "An Act to Promote the Efficiency of the Naval Militia and for other Purposes," commonly known as the "Naval Militia Act," became a law, and is the act under which the naval militia has since operated. In accordance with this act, the Division of Naval Militia Affairs was established in April 1914, by taking over all work formerly performed by the "Office of Naval Militia." A National Naval Militia Board, composed of naval militia officers, representing the north Atlantic, south Atlantic, Pacific and Great Lakes regions, convenes in Washington as often as necessary and is freely consulted in all important naval militia matters. Inspections of all naval militia organizations and divisions are made annually by officers of the navy, to determine whether or not the divisions are sufficiently armed, uniformed and equipped to participate in the allotment of Federal funds for the ensuing year. The first of these inspections was made in the spring of 1914, and

as a result several divisions were disbanded. A board of naval officers formulated examinations for officers and enlisted men and standardized, in accordance with the National Militia Act, the qualifications of the naval militia personnel. This board met in Washington and, assisted by the National Naval Militia Board, formulated a report published in the form of a general order, which established the units of organization, distribution of personnel and other matters which in accordance with the act the Secretary of the Navy was authorized to prescribe—the unit of organization being the division (battalion). Aeronautic divisions and marine sections were authorized, while brigade and battalion organizations were maintained for administrative and other purposes. By the Act of 3 March 1915 a naval reserve force was authorized consisting of six classes: (1) The Fleet Naval Reserve, (2) the Naval Reserve, (3) Naval Auxiliary Reserve, (4) Naval Coast Defense Reserve, (5) the Volunteer Naval Reserve, (6) the Naval Reserve Flying Corps. The Fleet Naval Reserve is composed exclusively of ex-officers and ex-enlisted men of the navy who have left the service under honorable conditions and who are citizens of the United States. Men who have served one enlistment creditably and receive an honorable discharge may enroll in the fleet naval reserve with pay at the rate of \$50 per annum. Those with eight years and less than 12 years naval service may enroll with pay at \$72 per annum. Those with 12 years or more naval service enroll with pay at \$100 per annum. Men who have served in the navy for 16 years or more may transfer to the naval reserve at one-third of their base pay plus all permanent additions thereto; and men with 20 years or more may transfer to the reserve at one-half their base pay plus all permanent additions thereto. In addition to these rates of pay men who enroll in the reserve receive an increase of 25 per cent for each re-enlistment. It is required of them, however, that they shall serve at least three months on active duty during each four-year period and re-enroll within four months. Men who transfer with 16 or 20 years' service are allowed a further increase of 10 per cent for extraordinary heroism in line of duty; and those with 20 years' active service are given a further credit of 10 per cent, provided their average marks in conduct for 20 years or more shall be not less than 95 per cent of the maximum. Men transferred to the fleet naval reserve, upon completing 30 years' service, including active and reserve, be retired with the pay they are then receiving plus the retired allowances. Men who enroll in the reserve may be retired after completing 20 years' service in the reserve and receive in lieu of their pay a cash gratuity equal to the total amount of their pay during the last term of their enrollment. Members of the fleet naval reserve may be examined for warrants and commissions in the reserve. Men who enroll in the reserve with four, eight or 12 years' active service are given a clothing allowance, each enrollment amounting to \$30, which amount is increased to \$60 in time of war or national emergency. As with all organized militia, the naval militia, even with the laws of 1914 and 1915, could not, under the Constitution, be called into service as such ex-

cept for limited duties, such as to repel invasion. It could not be used outside the territorial limits of the United States. It is evident that, with such restrictions, militia could hardly meet the requirements of the navy in a foreign war, and to overcome this difficulty the "National Naval Volunteers" were created in the act approved 29 Aug. 1916. Under this act members of naval militia organizations were authorized to volunteer for "any emergency," of which emergency the President became the sole judge. By joining the navy as volunteers instead of being called as naval militia, militiamen can be used for any naval duty, free from the restrictions imposed on the naval militia as such. The value of this law became apparent as soon as the United States entered the European War. Practically every one in the naval militia at once volunteered and was sent to duty, thus giving the country the services of the trained men who otherwise could not have been used until the country was to be invaded. In the same bill that created the national naval volunteers, other laws were enacted that are of vital importance to the navy and country. That bill carried nearly all of the legislation that was needed to give the navy the personnel required for war. It provided organizations that in peace and at minimum cost prepared personnel for war, and the form of the laws was such that the personnel could be expanded to meet almost any emergency. Among the other important measures, the bill (1) provided for the United States naval reserve force; (2) increased the enlisted personnel of the regular navy to 68,700 and provided for further increase by the President to 87,000; (3) provided for the automatic increase of officer personnel in each corps to correspond with increases in enlisted men; (4) provided for naval flying corps, for special engineering officers, for taking over the lighthouse service by the navy in time of war, etc. The creation of the United States naval reserve force was a wise provision. The only training in peace times of reserve man power for the navy was in the naval militia, and even under the acts federalizing it the naval militia met only to a minor extent the deficiencies in personnel for combatant ships alone. It in no way met the requirements for personnel for auxiliaries, aviation, technical duties, etc. A much broader plan was necessary if the navy was to have sufficient man power and of the proper qualifications for war service. The naval reserve force legislation gave the navy the broad organization by which a reserve could be formed. The purpose of the reserve force is to enroll and train in peace time all kinds of personnel which in time of war or when the President declares a national emergency to exist can be called to the colors and thereafter be used in any capacity in the navy. This act became a law only a few months before war came and when only the very first steps to create the reserve had been taken. Nevertheless the law was so wisely drawn that the force could be rapidly built up even in war time. While it provided for the naval reserve force that has stood the country so well in war, the act further provided for war by increasing the permanent enlisted strength to 68,700 and permitting its further increase to 87,500, in the discretion of the President. As the permanent

navy is the foundation of the naval structure, these increases, made when they were, put the navy in a position to expand on a sound basis, and especially so as in the same bill provision was made to automatically increase officer personnel when the enlisted personnel strength was increased. Up to the passage of this act the number of officers allowed for the navy was numerically fixed by law. Even though enlisted strength increased, officer strength could not be increased except by special legislation to that sole end. It is apparent that such a plan of increases was cumbersome and difficult, and upon the recommendation of the department a law was enacted in this bill that automatically changed the number of officers whenever the enlisted strength was changed. All corps and all grades in each corps were provided for in this legislation, so that now, when increases in ships of the navy occur, it is only necessary to authorize the enlisted personnel to meet those increases and the officers' personnel becomes immediately provided for. Had this provision not been in force when war was declared the navy could not have carried on its part in the war so quickly and so successfully. See UNITED STATES NAVAL RESERVE FORCE.

EDWARD S. FARROW,

*Consulting Military and Civil Engineer.*

**NAVAL MINES.** Naval mining is logically divided as follows: (1) Coastal mining, which denies to an enemy suitable ports, undefended or nearly so; (2) advance base mining; (3) off-shore or strategical mining; (4) battle or tactical mining, during an engagement between fleets. *Coastal mining*, outside of areas which are defended by coast fortification guns, does not require large or speedy vessels. Tugs, trawlers and light draught vessels, with naval reserve crews may be advantageously employed for this purpose. These vessels are provided with searchlights and suitable guns in order that they may properly guard their own mine fields. *Advance base mining* is the logical or legitimate duty of the active naval force. For this purpose an organized unit is supplied, consisting generally of several mine ships, six or more seagoing tugs, and two net layers. The mining ships are armed with a sufficient number of guns of proper calibre to defeat any attempt of raiding cruisers from interfering with the work establishing the advance base ashore and the laying of mines for the protection of the harbor. These ships are provided with all facilities to lay and pick up mine fields. The tugs are employed for sweeping areas which are to be used for fleet manoeuvres or to sweep a channel to insure that hostile mines have not been planted. The sweeps, made of wire hawsers and chain, are hung between two tugs so that the bight of the sweep is dragged across the area to be swept. When the sweep fouls a mine it drags it from its moorings and explodes it. The net layers are used for laying submarine entangling nets across the entrance of a harbor or about a fleet when at anchor in an open roadstead. In mining the channels of an advanced base, mines are laid in the principal channels and as a rule are distantly controlled or exploded by observers ashore, when an

enemy ship is sufficiently near them. *Off-shore or strategical mining* is done for the purpose of refusing or denying certain waters to the enemy. A sufficient number of mines are laid to make a venture by an enemy fleet extremely hazardous. For this mining, mine-laying vessels of considerable size and good speed are required, being accompanied by a mine depot ship and tugs. When occasion demands very high speed, scout cruisers or even destroyers should be used. High speed can be given mining vessels only by sacrificing mine capacity. In strategical mining a supporting force should always accompany the mine force to protect it from interference by enemy fast cruisers which might arrive before the mining has been completed. All hostile obstructions should be guarded against continuously. *Battle or tactical mining*, during an engagement between fleets, is accomplished by vessels of very high speed with characteristics on the order of scout cruisers, but with decks arranged to carry several hundred mines. The mines are laid in such localities during the progress of the battle that may be in the line of advance or retreat of the enemy. When an area is properly mined, one of the principal aims of the fleet is to force the enemy over the mine field. Battle mines may be either fixed or floating; but when off soundings, floating mines only can be used.

The United States has two mining branches. One branch is under the coast artillery and is employed as an element in the fixed defenses of the coast and the mine fields are covered by guns in fixed positions. The other branch is under the navy and forms a part of the active fleet. The control of the fixed mine defense belongs with the control of the fortifications and the control of the fixed land defenses and mine fields belong to the navy in order to insure complete co-operation between the mobile and fixed defenses of the coast. The fleet for its own safety should dictate the location of mine fields. As a rule the navies of Europe control the coast fortifications and the fixed mine fields.

Generally speaking, there are two types of mines—fixed and floating. The fixed or stationary submarine mine is fired by contact, electricity, timing device or fuse. Such mines are rugged in design and may contain large charges of explosives. They are placed in position by submarines and other especially equipped mine-laying vessels. Such mines are provided with anchoring devices and are deposited, if possible, in harbors and channels of the enemy or in the paths of ocean travel. Floating mines differ from fixed mines in that they are unanchored, and unless guard boats are at hand to warn friendly vessels of their proximity, may be as dangerous to friend as to foe. Such mines must be, according to laws of war, designed to become inoperative within a few hours or days—after being set adrift. They are often cast adrift in pairs, connected by a line about 100 feet long. If a ship runs between the two mines they are drawn alongside the ship, and exploded. See SUBMARINE MINES.
